# Chinese Students Studying Accounting in Australian Universities: Problems and Solutions

*Asit Bhattacharyya, abhattac@une.edu.au*  
*University of New England, Australia.*

## Abstract

Chinese students are the single largest group of overseas students in Australian universities and they are also the main source of the much needed new accountants. So they are crucial to the economic growth of Australia. This study reports on the major problems encountered by Chinese students in studying accounting in Australian universities, particularly those related to differences in cultural background, learning style, English fluency, accounting standards and local accents and offers some solutions. Twenty current Chinese students of accounting were asked to identify the main problems they face in learning accounting in Australia and to describe their expectations and needs during their study. They were also asked to suggest solutions.

## Introduction

During the past decade, there has been substantial expansion in the probation of under graduate and postgraduate programs for overseas students in Australian Universities. The main sources of such enrolment have been from Asia and Middle-East (Chen et al 1998). The difficulties encountered by Asian Students who come to Australia to study have provided a rich field for research (Ballard & Clanchy, 1991, Volet & Renshaw 1996, Fung & Mackeerras 1998). Research indicates that national culture influences various aspects of human behavior and that culturally based differences in people's values and attitudes significantly affect their behavior in various situations including their learning styles (Biggs 1996). Biggs (1993) set the surface/deep debate in the context of Chinese culture, echoed by Marton *et al* (1993b), namely that, in Asian culture, understanding may come through memorization. This paradox of the Asian learner has been observed as anecdotal evidence of rote learning but high academic achievement.

Chinese students are the single largest group of overseas students in Australian universities and they are also the main source of the much needed new accountants. So they are crucial to the economic growth of Australia. As they are crucial it is very important to better manage and satisfy this group. A common list of needs and expectations of Chinese students will be a very useful tool in the hand of academics to develop a teaching and learning strategy which will encourage students to relate the subject matter in practice in a purposeful way. Otherwise a vast amount of resources, energy and academic time will go in vane.

The main issues/factors of culture and language relevant to teaching and learning in higher education can be identified as English language ability, communication skills, learning style, accent of the local academics.

### **English Language / Communication Skills and Culture Issues:**

Of all the generic skills considered necessary for lifelong learning, communication skills are perhaps the most critical. Many of the international students agree that they require English language support to make a successful transition to tertiary study, particularly in their first and second year of university in Australia (Briguglio, 2000). In her study, Briguglio (2000) found that language and culture issues are extremely closely interwoven, although students themselves may not be aware of the role that culture plays in their 'English language difficulties'. In her study when asked questions relating to their English language needs almost all students indicated they could use some support in all four macro skills of listening, speaking, reading and writing, with writing and speaking given the highest priority. A self-rating scale that students were asked to complete produced similar results, with writing ranked as the skill students thought they most needed to improve.

### **Problems of Teaching and Learning in 'Foreign' Language:**

So much of the educational process is dominated and influenced (embedded) in the culture in which it exists. So

these problems are inextricably tied to and contained / constrained by the cultural and language imperatives of the dominant culture and social structures. The major difficulty in teaching in English in other language dominant environments is communication of ideas. Most university lecturers and teachers have rather large and disciplinary jargon filled language patterns. This creates many problems for students who do not understand the jargon or the expanded language of the university (Collier, 2003). The author in his study, found that students have a cultural imperative to respect age and position. Therefore it was difficult to get them to question and to challenge the assumptions and statement of 'authority'. In Perry's sense, they would be very dual with great difficulty in accepting relativity or context differences. Many of these traditional students look for right answers, and they expect the lecturer, to supply them with these answers. They are, for the most part, excellent at memory skills, and can reproduce volumes of text and facts and quotations.

#### **Learning Style and Cultural Background:**

In comparing the approaches to learning by international (mainly Hon Kong Chinese) and local Australian Business Students, Ramburuth (2000) found that international students displayed significantly higher group means for the surface approach to learning, surface motivation and the use of surface strategies and were different from their Australian counterpart on all dimensions of the surface approach. The international students also demonstrated more frequent use of deep approaches than Australian students and Ramburuth (2000) concluded that the two constructs of deep and surface might not be mutually exclusive.

Based on the results obtained in Study by Wong (2003 & 2004) it was obvious that the majority of Asian international students would prefer a more student centered style of learning. Despite the fact that these Asian international students had come from a so-called 'spoon-feeding' or teacher centered style of learning environment, they are able to adapt to the new style of teaching and learning here within two to three months.

Comparative study between First and Second Year students with Third and Fourth Year students also showed that the longer the students study in Australia the more they are likely to adapt to and adopt the style of teaching and learning here. It would seem therefore that learning styles are not culturally based but contextual. In fact these Asian international students regard the more student centered style of learning here as the strength of Australian higher learning education. There is therefore no apparent necessity for Australian higher learning institutions to adapt to the Asian style of teaching and learning but rather the authorities and personnel concerned should try to understand the initial learning difficulties faced by these Asian international students and take certain measures to support them when needed.

This study offered nine solutions of the various major problems faced by the Chinese students in learning accounting in the Australian Universities.

## **Methods**

To collect information a random sample of twenty Chinese students from the 'Financial Accounting' class of Bachelor of Business course of The University of New England were asked to identify the main problem they face in learning accounting in the university here in Australia and to describe their needs and expectations during their study of accounting. Students were also asked to provide some suggestions to overcome the problems they face. A semi structured questionnaire was given to each student to express themselves. The questionnaire also included some identified problems (from the literature and my past teaching experience) to find out that still the students considered those problems as crucial problem or not.

## **Results**

The most important findings of the study are:

- 1 85% of the students were unable to express themselves clearly. They find it difficult to understand the local accent in the initial period. They reported that lack of English Language ability & Communication skills were the main problems they faced in understanding and writing assignments in the initial periods (about one year) of their accounting study.

- 2 70% of students reported that they had difficulties in understanding the different terms used in lectures, so they find difficulty in comprehending the lecture. They are confused by the differences in accounting standards. Moreover, because of their cultural background, they feel unable to ask questions during lectures or tutorials and so just accept what lecturers say.
- 3 50% believed that the Australian university system does not satisfy their expectation. They were spoon-fed back home; they expect lecturers to provide the solutions for all the problems being discussed during lectures and tutorials. They find it very difficult to adopt the Australian style of individual study in the initial (about one year) study period.
- 4 90% feel comfortable working with other Chinese students. They feel shy about their spoken English so they stay silent in a more cosmopolitan environment.

I have seven years of experience of teaching accounting to non-native English speaker, mainly Chinese students, in Singapore and these findings are congruent with that experience.

Wong (2004), found that 65% of Chinese students studying in Australian universities learn best when learning by them selves with little or no assistance from the lecturer, 21% believed that they learnt better when most of the information was given during lectures; only 14% of the students preferred being spoon-fed by the lecturer; and 12% of the students were not happy with the teaching and learning style they were experiencing in Australian university.

In my study half of the students expressed dissatisfaction about teaching and learning expectation. This result shows a substantial deviation from the result what Wong (2004) found. Most (75%) students preferred a student-centered style of learning which essentially the same proportion as Wong reported (70%). In contrast the preference for spoon feeding (50%) was substantially higher than in Wong's findings (14%).

In view of these results and my past experience in teaching Chinese students, I suggest that the following actions might go a long way to resolve the problems faced by the Chinese students learning accounting in Australian universities.

Getting students to explicitly workshop and negotiate issues around culture, language and learning and how best to respond to their needs (to use this to restructure learning)

- i) Taking individual care to give them confidence,
- ii) Going very slow with the students so that they can understand the concept, (to address their English language problem)
- iii) Extensive use of white board and Power point slides will be used during the lecture to make them understand the various accounting concepts
- iv) Providing lecture notes prior to the lecture so that they may read all these material before attending lecture.
- v) Encouraging students to form informal study group to discuss the problems within themselves.
- vi) Working through step by step the practical problems with the students, (to address the different accounting procedure and standards)
- vii) Try to understand style and culture of their learning,
- viii) Meeting the students in a tutorial session at least once in a week

## Discussion

Briguglio (2000) in his study stated that several students spoke of their frustration when they felt unable to express certain more complex ideas fluently in English. One student expressed it thus:

"I want to contribute during the tutorial. I got an idea inside me that I want to get through, but the problem is I don't know how to express it, in a way. The problem with us from overseas, we tend to think in our native tongue and when we speak, sometimes, we can't put our thoughts into words. We sort of can't speak up. We've got the idea, we want to contribute but we don't know how to express it. That's the problem, I think (student, cited in Briguglio, 2000)"

In her study Briguglio found that tutorials were of more concern than lectures to students, many of whom said that they found it very difficult to participate in them fully: that is, they had trouble understanding everything that was being said as well as contributing ideas. The reasons for this were complex. Generally, students indicated that they were reluctant to take a more active part in tutorials because:

- they were used to being 'spoon-fed' in their previous schooling system
- they were shy about speaking up
- they felt their spoken English was not as fluent as that of 'Australian students'
- they were not used to the Australian tutorial system.

My study also found the similar result as found in Briguglio's study. The result of my study indicated that problems faced by Chinese students in Australian universities were identified before and still they remain the same for the new Chinese students studying in Australian universities. My study offered some solutions to solve these problems.

Students in the Briguglio study (2000) were asked what sorts of lecturing styles/ techniques they found particularly helpful and easy to follow. Students in (Briguglio study) indicated that they found practical examples which illustrate theoretical aspects particularly useful. Other things which were considered helpful included:

- use of overhead transparencies (which are not whipped away before students have time to copy from them)
- lecture notes or lecture outlines, and
- Lecturers' use of concrete examples to which students could relate (i.e. not just Australian and local examples).

Other useful things were: very detailed unit outlines; lecturers who spoke slowly and clearly and did not use 'slang'; and lecturers who had 'good teaching skills'.

In my study half of the students expressed dissatisfaction about teaching and learning expectation. This result shows a substantial deviation from the result what Wong (2004) found (Wong (2004), found that 65% of Chinese students studying in Australian universities learn best when learning by them selves with little or no assistance from the lecturer, 21% believed that they learnt better when most of the information was given during lectures; only 14% of the students preferred being spoon-fed by the lecturer; and 12% of the students were not happy with the teaching and learning style they were experiencing in Australian university). This substantial deviation could be due to three main reasons, (i) student's level of study: all the students of my study were doing their second year of the Bachelor of Business course where as students were drawn from all year levels in case of Wong's study (not known from which level of year), (ii) nature of the subject studied: students in my research were studying accounting where as students in Wong's study were drawn from different disciplines, (iii) Cultural background: Wong selected nine Asian international students from different countries whereas I have selected twenty students all from China in my study.

Most (75%) students in my study preferred a student-centered style of learning which essentially the same proportion as Wong reported (70%). In contrast the preference for spoon feeding of (50%) was substantially higher than in Wong's findings (14%). This could be mainly due to the student's level of study. All the students of my study were doing their second year of the Bachelor of Business course and were studying accounting where as students of Wong's study were selected from different year levels and different discipline. Most of the students in my study joined second year level directly coming from China. As maturity level of the students in my study were much lower than Wong's study and they were relatively new to the Australian university system they could have preferred spoon feeding.

Above discussed findings by Briguglio (2000), Collier (2003), and Wong (2002 &2004) combined with my previous teaching (Seven years of teaching accounting mainly Chinese non-English speaking students in English speaking teaching and learning environment in Singapore) experience supported and reinforced my findings in this study.

## Conclusion

This study identifies the most common major problems faced by the Chinese students in learning accounting and offers a list of nine suggestions those hopefully will help to overcome these problems. The study shows that the problems reported by others with Chinese students continue to be problems. I wish to offer nine interrelated strategies to solve these problems. Suggested methods/ strategies will be very good tools in the hands of academics and Chinese students in teaching and learning accounting more effectively. Given the findings of the literature combined with result of the study and my own experiences with Chinese students, it would appear that the above mentioned suggestions might go a long way to resolve the problems faced by Chinese students.

# Selection of Universities in Africa: Information Requirements and Expectations

*Johan de Jager, dejagerjw@tut.ac.za*  
*Tshwane University of Technology, Pretoria South Africa*  
*Patricia Joubert*  
*University of Swaziland*

## Abstract

Tertiary institutions have a major role in providing relevant education that best meets the needs of the various constituencies served. To meet these needs an assessment of factors that influence their choices becomes imperative. Attracting quality students in a highly competitive education environment is crucial as the large number of students aspire to enter to the University with limited success because of limited spaces and other resource constraints. In striving to curb the problems and enhancing marketability of students in the limited available markets, re-strategising and applying sound marketing principles is imperative. This paper examines the criteria used by South-African and Swazi students, when choosing or evaluating a tertiary institution. The main findings were amongst others that the most important attributes in attracting and maintaining students are: offering relevant degrees and programmes that are aligned to the different country's sectoral needs; financial assistance, ease of location and access, well equipped and approachable staff, good library and computer facilities, and studying in a reputable institution.

## Introduction

Education in Higher Education institutions has been changing rapidly in response to the dynamic national, regional and global developments. Examinations systems, structures and other related processes have changed drastically impacting on the pass rate at the highest school levels and affecting their intake at tertiary level. Consequently, a large number of students relative to available spaces and available government loans/scholarships apply with limited success. Prospective higher education students and the tertiary institutions' administrators normally undertake extended decision making during their processing of applications for courses of study. De Jager and Du Plooy (2006) noted how the decision-making process with regard to a course or a specific institution can be very complex. An increased understanding of the potential higher education student decision-making process would enable Higher Education institutions to market their courses in a more timely and effective way (Moogan et al., 2001:197). Consequently institutions of higher education should be well aware of what aspects students value most in order to make a final decision with regard to a specific institution (De Jager & Du Plooy, 2006). Because institutions of Higher Education are constrained by numerous factors such as limited funding and other resource constraints, entry into these institutions may be difficult as students compete for limited resource facilities (Mulamba, 2003). Consequently Institutions of Higher education should determine the most important variables that are under their control in order satisfy the changing needs of the students. The constraints may also affect the ability of the institutions to match the expectation and needs of students and that of the end users of the universities by-products. Most students in these institutions have dire financial constraints. Generally, only a restricted number of students are admissible to the University. Even if they qualify for entry they compete for limited spaces on the basis of their educational grades, leading to the universities admitting only the top best (Emanyonu, 2006).

**Challenges relating to support facilities, infrastructure, location, ease of access, image and marketing, and academic issues of concern in the tertiary education sector and the marketing aspects thereof,** with specific reference to the service quality associated with the service package provided to students, are reviewed in the two African countries: South-African and Swaziland. In addition it is done in order to facilitate and to identify critical areas that require improvement in managing these institutions and offering relevant programs that equip the students with the relevant competencies needed to revive the two country's dwindling economic performance. The

major challenge is therefore, to develop an inclusive learning environment which accommodates all possible factors that affect the learning environment and hence impacting negatively on the reputation of the institution.

## **Theoretical background**

### **Contemporary challenges in the tertiary education sector in Africa**

Countries in Africa face major challenges that promote and hinder the development of the students, institutions, the respective countries and their ability to compete regionally and globally. In view of the challenges, there is a need for re-strategising to help counteract potential problems of poor service delivery, declining standards, offering of irrelevant or outdated programmes; and marketability of the institutions' products and their students because of deficiencies experienced in various programmes' offerings. The strategic process entails overhauling the institutional environment to embrace all the critical major influences on the institutional and student's development. In Tisdell's (1995: 7) view, creations of an enabling inclusive learning environment should:

*“ reflect the diversity of those present in the learning activity itself in the curriculum and pedagogical/ andragogical style; attend to the wider and immediate institutional contexts in which the participants work and live; and in some way reflect the changing needs of an increasingly diverse society.*

This view emphasise the need for various institutions to ensure that the programmes offered and the institutional context reflect the values of the learners and that of the end-users of the universities products. A similar view was expressed by other researchers (Brown et al., 1988; Wilson, 1993; Anderson et al.,1996) who noted how institutions should realize the link between knowledge, its by-products and context. The by-products refers to the translation of knowledge and skills to socio-economic and other developmental goals. Nkomo (2006) indicated how they are translated to the enhancement of the various communities quality of life and their standards of living. In these roles, higher education promote national development, foster national unity and minimize the potential for conflict as a result of varied cultures, enhance individual talents and enhance opportunities for people's meaningful participation in their socio-economic goals, foster positive attitudes among each other and hence promote social justice and morality (Emenyonu, 2006; Mungai 2002). Kargbo (2002) acknowledges how African universities are a major element in development; at the apex of the educational system is a place for the pursuit and dissemination of knowledge and playing a pivotal role in the onward struggle for national development. To effectively pursue this vital role, universities have to be provided with essential resources for improvement and upgrading of their infrastructure and to also enable them to attract highly skilled personnel for the purpose.

Over the past few years, higher education institutions in South Africa have experienced dramatic changes in their structuring, funding and student numbers. The Tertiary education sector faces many new challenges, including, more recently various mergers and the transformation of technikons into universities of technology. This transformation has not only brought about a change of status in these institutions, but also the mergers of intrinsically different institutions. The broadening of access to higher education in South Africa under the present government policy has seen a growth in the number of applications to tertiary institutions (Bunting & Cloete, 2004). The transformation of higher education institutions in South Africa is one of the concerted efforts to provide the fertile ground for the empowerment of previously disadvantaged groups. This process is one of the numerous efforts geared towards ensuring that higher education institutions respond toward national imperatives for redress, in areas of employment equity and skills development (Diale, 2006). According to Cooper and Subotzky (2001), South Africa has experienced a “revolution” regarding the increase in proportion of African student enrolments in tertiary education thus they have constituted the majority since the middle 1990's. This consequently calls for a re-assessment of the needs of current students in higher education.

Similar to South Africa, Swaziland is transforming its education system in higher institutions of learning in response to developments regionally and globally. It continuously reviews its programs to meet the demands of contemporary society but its efforts are hampered by shrinking funding as more funds are diverted to the funding of orphans and vulnerable children as well as addressing the socio-economic development issues of HIV/AIDS,

shrinking inward investments and the associated high unemployment and poverty issues (Joubert et al., 2006). De Jager and du Plooy (2006) noted how the downward trend in the economic situation and the resultant decline in public finances since the 1980's onwards led in governments' inability to continue to meet the financial needs of higher education whereas a growing demand for access continued. The resultant higher educational constraints discussed are manifesting themselves in political upheavals that involve students, brain drain of the limited country's think tanks and eventually the quality of education will be hampered and hence, hindering the country development. Drastic measures are thus needed to circumvent the effects; that is partly why this study is being undertaken. To address the quality and national relevance issues extensive consultation with key stakeholders and implementation of response action programmes are key solutions to these problems. Proponents of the social-action approach argue for getting solutions from those directly affected by the problem (Burrell & Morgan, 1985; Hammersley & Atkinson, 1983; Goldthorpe et al., 1968). Other researchers have also expressed how learning institutions cannot be separated from the world of action but exist in robust, complex social economic environments made up of actors, actions, and situations (Wilson, 1993; Anderson et al., 1996).

### **Institutional and Programmes' Image to recipients and product end-users**

Barich and Kotler (1991) point out that the critical role of institutional image and institutional reputation in customer's buying intentions are well known in marketing; and Raj (1985) points out that institutional image and reputation are important to develop and maintain a loyalty relationship with customers. An institutions image and reputation may also have impact on student's decision to enrol at a particular institution of higher education or to stay for advanced studies. In emphasizing this view, the public relations officer of George Fox university noted how the University from which a student studies is part of the student's life. A similar view that the manner in which students make choices on type of tertiary institution is fundamental was also expressed by one of the students at the University of Nottingham, hence the argument that their input be solicited (Susie, <http://www.news.bbc.c.uk/Education/>). University students are also branded with their institutions' diplomas/degrees and transcripts and their employers use them as their educational identity (Spokeperson, <http://www.georgefox.edu/about/distinctives/>). Clearly then, the choice of a university and its associated programmes will in part determine employability and success. In order to claim and maintain a competitive advantage, the creation and maintenance of an acceptable image for an organization is one of the most important steps. Ivy (2001) states that as competition for student's increases and funding decrease universities need to create and maintain a distinctive image in the market place. Higher education institutions are becoming increasingly aggressive in their marketing activities and need to be clear about their positioning in order to convey a favourable image to their distinctive interest groups, from students to donors (Russel, 2005; Ivy, 2001) and the labour market. In their study of university image, Paramewaran and Glowacka (as cited by Russel, 2005:67) found that higher educational institutions need to maintain or develop a distinct image to create a competitive advantage in an increasingly competitive market. This requires maintenance of close links with customers and be proactive in their orientation by anticipating challenges and respond to them on time.

### **The Role of Marketing in the Tertiary Education Sector**

In almost all cases, it is important to understand how consumers make preferences for, and choose among existing products or services designed for them. Moreau and Dahl (2005)'s response is that in many situations their needs are more specific and unique and thus require consumers to play an integral part in constructing their own solutions which is why the researchers tackle the problems using a social-action approach.

The increased level of competition in the education environment has led to institutions of higher education employing managerial techniques to improve the efficiency and quality of their provisions (Palihawadana, 1999) and

switch from a passive to a more active market approach (Naudé & Ivy, 1999). The overriding philosophy of education post independence in South Africa in 1994 is offering an education system that is outcome based (Parbhoo, 2006). Therefore, if universities are to satisfy students and the end-users requirements they must be aware of their own offerings and how these are perceived in the market place. It is important for institutional policy makers to be aware of the influential factors and the associated impact on potential students, (Moogan, Baron & Bainbridge, 2001:197) and on the graduates. Therefore a market analysis in the process is very vital for in-depth knowledge of customers' needs and that of the market and the wider business environment served. Tertiary institutions can then identify specific benefits sought by students from their programmes; the factors influencing demand and their purchasing criterion; the associated risks and challenges in buying their products/services. Along with the academic programmes are other related support programmes such as social amenities and ease of networks formation that go along with you when you graduate (<http://www.georgefox.edu/about/distinctives/>).

Higher Education Institutions should understand their own offerings and how these are perceived in the market place, because it could have important marketing and management implications. Various factors influence the choice of potential scholars to study at a specific tertiary institution, including location (Ford, Joseph & Joseph, 1999; Roberts & Allen, 1997), reputation of academic quality (Landrum et al., 1998; Ivy, 2001), course specifics, (Ford et al., 1999) and career opportunities (Ford et al., 1999; Krone et al., 1981). A recent study (2002) by the Human Sciences Research Council (HSRC) in South Africa has found that the most important influence upon choice of institution is its reputation followed by the geographical location. One of the reasons why location is important for students in South-Africa is because is that more than a third of all learners do not have a suitable quiet, place in their homes to study (Cosser, 2002) and might use library facilities to study.

In SERVQUAL (Parasuruman et al., 1998), five generic dimensions of service quality are suggested namely; responsiveness, reliability, empathy, assurance, and tangibles. However, many subsequent studies of service quality in a variety of services, have failed to recover the five dimensions of service quality (Buttle, 1996). The findings on the factors of Higher Education Service Quality diverge-such as the factor structure identified by Ford, Joseph and Joseph (1999) including academic reputation, career opportunities, programme issues, physical aspects, location, and other. Oldfield and Baron (2002) suggest that there are three underlying factors of higher education service quality namely, requisite elements (encounters which are essential to enable students to fulfil their study obligations), acceptable elements (which are desirable but not essential to students) and functional elements (which are of a practical or utilitarian nature). Cheng and Tam (1997) came to the conclusion that based on different conceptions of education quality and the different concerns about achievement of education quality, various people may use diverse indicators to assess education quality and miscellaneous strategies to achieve education quality. It may result in not including all aspects of the input, process and outcome of an education institution. Consequently, our discussion in this paper will focus on the factors emerging from the data.

## **Objective of the Study**

The primary objective of the study is to determine the most important service quality variables for students when selecting an institution of higher education and to determine whether there are significant differences between South African and Swazi students when making the decision.

## **Research methodology**

### **Conceptualising the purpose of the investigation**

In order to achieve the primary objective of the research the service quality variables were grouped into five main categories: Support facilities and Infra structure; Image and Marketing; Academic issues; Administration issues; and Location and access. The following secondary objectives were formulated:

To evaluate the expressed levels of importance of South African and Swazi students with regard to these identified variables;

To determine the existence of significant differences between the South African students and Swazi students with regard to their expressed levels of importance with these variables.

### **Research hypotheses**

With regards to the objectives the researchers formulated the following hypotheses:

Ho: There exist no significant differences with regard to the importance of the service variables between the sample of South African and the sample of Swazi students.

Ho: There exist significant differences with regard to the importance of the service variables between the South African and Swazi students.

### **The sample framework**

A sample of 385 students at a university in South-African and the University of Swaziland were chosen at random. Two hundred and eleven of the respondents were students from a large South African University while one hundred and sixty four of the respondents were student from the University of Swaziland. The sample comprised of 46% male and 54% female students. The attitudes of the two student samples were tested regarding the importance of pre-identified service quality issues when selecting a specific tertiary institution. The list of variables was based on an extensive literature research and the findings of focus groups consisting of students and lecturers. The questionnaires were distributed to randomly selected students in pre-determined classes.

### **The measuring instrument and reliability measures**

A structured questionnaire was used as measurement instrument and included twenty-three variables related to service quality at a higher educational institution. A five-point Likert-type scale (one being very important and five not important at all) was used to measure the levels of importance with regards to these variables at the two institutions of higher education in the two countries.

The data was gathered and captured over a period of six months during the first semester of 2006. The SPSS version 13.0 statistical package was utilised to analyse the data. For this analysis the Kolmogorov-Smirnov Test was employed based on the assumption that if the significant values exceeded 0.5, normality could not be assumed and the researchers had to rely on employing non-parametric analysis techniques. As normality could not be assumed after applying the Kolmogorov-Smirnov Test the researchers employed the Kruskal Wallis test to test the null hypothesis and the alternative hypothesis that there exists no significant difference between the levels of importance between the two groups and there exists significant differences between the groups (SA and Swaziland students).

An item analysis was carried out to test the validity and the reliability of the questionnaire and an overall Cronbach's alpha of a 0,903 was obtained.

## **Findings of the study**

The main findings of the study are discussed by first identifying the overall most important variables and then comparing the South-African and the Swaziland samples with regard to each of the five individual groupings as

identified earlier. The scale on which means are based is 1=very important, 2= important, 3 = not important nor unimportant, 4 = not important and 5 = not important at all.

The means of all the categories (**Tables 1 to 5**) are located between very important and not important nor unimportant with the majority of the ratings generally clustered around important.

TABLE 1: LEVEL OF IMPORTANCE OF LOCATION AND ACCESS WHEN CHOOSING AN EDUCATIONAL INSTITUTION

Location and access		SA		Swaziland		Total		Results of hypothesis test
Item	Item wording	Mean	SD	Mean	SD	Mean	SD	
v80	Location of the Institution	1.78 1	0.84	1.89 4	1.07	1.83 2	0.95	p-value = 0.7471 Conclusion: Ho accepted
v81	Size of student population	2.40 5	1.13	2.34 7	1.17	2.37 6	1.15	p-value = 0.4610 Conclusion: Ho accepted
v82	Distance to institution	1.91 4	1.02	1.84 3	1.08	1.88 3	1.04	p-value = 0.2931 Conclusion: Ho accepted
v83	Availability of public transport	1.85 3	1.15	1.52 1	0.88	1.71 1	1.05	p-value = 0.0050 Conclusion: Ho reject
v102	Attractive campus	1.79 2	0.89	2.10 6	1.05	1.92 4	0.97	p-value = 0.0030 Conclusion: Ho rejected
v86	Hostel accommodation	2.87 7	1.48	1.59 2	0.98	2.31 5	1.44	p-value = 0.0001 Conclusion: Ho rejected
v87	Private accommodation near institution	2.78 6	1.38	1.99 5	1.05	2.44 7	1.30	p-value = 0.0001 Conclusion: Ho rejected

Sig = 0.05

df =1

In the location and access category (**table1**), the availability of public transport (v83) is rated as the most important variable when selecting an institution of higher education in this category. Ho is rejected as significant differences are measured amongst the two sample groups with Swazi students rated it significantly more important compared to the SA sample that rated it in third position. In addition a higher level of consensus exists amongst Swazi students in this regard.

The overall second most important variable when selecting an institution of higher education in this category is the location (v80) of the institution. While no significant differences exist amongst the two sample groups, the SA sample rated it as the most important variable in this category compared to a fourth rated position by the Swazi sample. In addition a much higher level of consensus is measured amongst the SA sample.

The overall third most important variable in this category is the distance to the campus (v82). Although no significant differences exist amongst the two samples the Swazi sample rated it slightly more important (in third place) compared to the SA sample (fourth position) with a higher level of consensus amongst the SA sample. All abovementioned variables were rated between very important and important.

The variable that are overall rated least important is private accommodation (v87) Significant differences are measured amongst the two groups with SA students rated it less important (sixth position) compared to the Swazi sample (fifth position).

TABLE 2: LEVEL OF IMPORTANCE OF SUPPORT FACILITIES AND INFRASTRUCTURE WHEN CHOOSING AN EDUCATIONAL INSTITUTION

Support facilities and infra structure		SA		Swaziland		Total		Results of hypothesis test
Item	Item wording	Mean	SD	Mean	SD	Mean	SD	
V84	Parking facilities on campus	2.40 9	1.41	2.44 9	1.25	2.42 9	1.34	p-value = 0.4618 Conclusion: Ho accepted
V85	Security/Safety conditions on campus	1.36 3	0.70	1.37 3	0.86	1.36 3	0.77	p-value = 0.3979 Conclusion: Ho accepted
V90	Sport facilities of institution	2.19 7	1.08	2.01 7	1.01	2.11 7	1.05	p-value = 0.0770 Conclusion: Ho accepted
V96	Well equipped Computer facilities	1.26 2	0.54	1.25 2	0.59	1.25 2	0.56	p-value = 0.7785 Conclusion: Ho accepted
V97	Well equipped Library facilities	1.21 1	0.49	1.20 1	0.52	1.21 1	0.50	p-value = 0.7788 Conclusion: Ho accepted
V98	Recreation Facilities	1.87 5	0.87	1.86 5	0.96	1.86 5	0.91	p-value = 0.5889 Conclusion: Ho accepted
V106	Tuck shops on campus	2.02 6	0.93	1.94 6	1.02	1.99 6	0.97	p-value = 0.1532 Conclusion: Ho accepted
V107	Dining halls on campus	2.53 10	1.13	2.17 8	1.07	2.37 8	1.12	p-value = 0.0009 Conclusion: Ho rejected
V108	Bookstores conveniently located / stocked	1.69 4	0.83	1.41 4	0.80	1.57 4	0.82	p-value = 0.0001 Conclusion: Ho rejected
V114	Social activities/night life	2.25 8	1.05	2.71 10	1.28	2.45 10	1.17	p-value = 0.0009 Conclusion: Ho rejected

Sig = 0.05      df = 1

In the Support and infrastructure category (table 2), Well-equipped library (v97) and Computer facilities (v96) are regarded as most important and second most important variable by both samples overall and distinctively). This implies that students are aware of the importance of technologically advanced equipment in the training process. Although Ho is accepted for both variables (as no significance differences were measured between the two sample groups), the Swazi sample rated it slightly more important. While there are slightly less consensus amongst them compared to the SA sample.

The Security and safety (v85) condition on campus are overall and distinctively rated as third most important variable in this category. Although no significant differences are measure between the samples, the SA sample rated it slightly more important with a higher level of consensus amongst the respondents.

The overall least important variable in this category is social activities and a night live (v114). Significant differences are measured amongst the two samples with Swazi students rated it significantly less important (in 10<sup>th</sup> position) compared to their SA counterparts (rated it in eight position).

Overall the scholarships available for students (v95) are rated as most important variable in this category (table 3). Significant differences between the two samples exist with Swazi students rated it significantly more important (rated most important) compared to the SA sample (that rated it in sixth position). A higher level of consensus is measured amongst the Swazi sample.

The academic reputation of the faculty (v91) and the reputation of the lecturers (v92) at the institution are both rated the second most important in the Image and Marketing of the institution's category. However, the SA sample rated the reputation of the lecturers at the institution first while it was rated fourth by the Swazi sample. With regard to the academic reputation of the faculty, Swazi students rated it second while rated third by SA students. However Ho is accepted as no significant differences exist between the two countries with regard to these variables.

However while Swazi students hold a slightly stronger view point with regard to the importance of the academic reputation of the faculty the SA sample are slightly more in favour of the reputation of the academic staff.

Consequently the fourth overall important variable is the Academic reputation of the institution (v91) with Swazi students holding a slightly stronger point of view although no significant differences are measured between

the groups. Overall the least important variable is the Sport reputation of the institution (v89). This view is shared by both samples as no significant differences are measured between the two samples.

TABLE 3: LEVEL OF IMPORTANCE OF IMAGE AND MARKETING WHEN CHOOSING AN EDUCATIONAL INSTITUTION

Image and marketing of institution		SA		Swaziland		Total		
V88	Academic reputation of institution	1.534	0.82	1.452	0.80	1.494	0.81	p-value = 0.2470 Conclusions: Ho accepted
V89	Sport reputation of institution	2.389	1.09	2.369	1.12	2.379	1.10	p-value = 0.6935 Conclusions: Ho accepted
V91	Academic reputation of faculty	1.513	0.78	1.452	0.72	1.482	0.75	p-value = 0.5827 Conclusions: Ho accepted
V92	Reputation of lecturers at institution	1.441	0.68	1.474	0.80	1.482	0.75	p-value = 0.9402 Conclusions: Ho accepted
V93	Availability of information about faculty	1.492	0.61	1.546	0.79	1.515	0.69	p-value = 0.9991 Conclusions: Ho accepted
V94	Marketing activities of Institution	2.008	0.84	1.868	1.00	1.948	0.92	p-value = 0.0205 Conclusions: Ho rejected
V95	Scholarships available	1.636	0.78	1.161	0.47	1.431	0.70	p-value = 0.0001 Conclusions: Ho rejected
V103	Reputation of study program	1.687	0.70	1.637	0.78	1.667	0.74	p-value = 0.2588 Conclusions: Ho accepted
V112	Career Advisors (of institution) accessible and informed	1.555	0.70	1.515	0.74	1.536	0.72	p-value = 0.3246 Conclusions: Ho accepted

Sig. = 0.05 df = 1

TABLE 4: LEVEL OF IMPORTANCE OF ACADEMIC ISSUES WHEN CHOOSING AN EDUCATIONAL INSTITUTION

Academic issues		SA		Swaziland		Total		
Item	Item wording	Mean	SD	Mean	SD	Mean	SD	Results of hypothesis test
V99	Small classes for better learning	1.868	0.99	1.978	1.00	1.918	1.00	p-value = 0.2180 Conclusions: Ho accepted
V100	Reasonable class fees	1.371	0.65	1.646	0.89	1.503	0.77	p-value = 0.0024 Conclusions: Ho rejected
V101	Admission requirements	1.534	0.66	1.625	0.77	1.574	0.71	p-value = 0.3102 Conclusions: Ho accepted
v104	Comprehensive educational program	1.666	0.67	1.657	0.74	1.667	0.70	p-value = 0.6663 Conclusions: Ho accepted
v105	Spacious well equipped classes	1.615	0.73	1.614	0.83	1.615	0.77	p-value = 0.5227 Conclusions: Ho accepted
v110	Academic staff approachable/informed	1.453	0.61	1.462	0.71	1.462	0.65	p-value = 0.7737 Conclusions: Ho accepted
v113	Offer wide range of degrees/majors	1.392	0.60	1.261	0.52	1.331	0.57	p-value = 0.0442 Conclusions: Ho rejected
v115	Provide variety of internship/practicum programs	1.737	0.85	1.523	0.77	1.646	0.82	p-value = 0.0087 Conclusions: Ho rejected

Sig. = 0.05 df = 1

A wide range of degrees/majors offered (v113) is overall rated as most important issue in the Academic category (**table 4**), rated most important by the Swazi sample and second by the SA sample. Ho is rejected as significant differences exist between the two sample groups with Swazi students holding stronger feelings in this regard, rating it as most important while SA students rated it second.

The overall second most important variable in the Academic issue category is approachable and well informed academic staff (v110). While it was rated second by the Swazi sample it was rated third by the SA sample. Although no significant difference between the two samples is measured, SA respondents rated it slightly less important. A higher level of consensus is also existed for the SA respondents.

The overall third most important variable in this category is reasonable class fees. Significant differences are measured amongst the two groups with the SA sample rated it significantly more important (rated as most important) compared to the Swazi sample (rated it in sixth position). A significant higher level of consensus existed amongst the SA sample.

Small classes for better learning are rated as least important variable. No significant differences between the two samples are measured although the SA sample rated it less important with a higher level of consensus compared to the Swazi sample. It has to be stated that this variable was overall rated less than 2 on a five point scale indicating that it is still fairly important. This outcome is probably because students, especially from previously disadvantaged population groups, realise the importance of wiping out the backlog in education as a result of political imbalances of the past.

## **Conclusion and recommendation**

In order to achieve the primary objective of the research, the service quality variables are grouped into five main categories in this study: location and access, support facilities and infrastructure; image and marketing; and academic and administrative issues.

In the **location and access** category the availability of public transport is rated as the most important variable when selecting an institution of higher education in this category. Ho is rejected as significant differences are measured amongst the two sample groups with Swazi students rating it significantly more important compared to the South African sample that rated it in third position. In addition a higher level of consensus exists amongst Swazi students in this regard. The overall second most important variable when selecting an institution of higher education in this category is the location of the institution. While no significant differences exist amongst the two sample groups, the SA sample rated it as the most important variable in this category compared to a fourth position for the Swazi sample. In addition a much higher level of consensus existed amongst the SA sample. The overall third most important variable in this category is the distance to the campus. Although no significant differences exist amongst the two samples the Swazi sample rated it slightly more important with a higher level of consensus amongst the SA sample. All abovementioned variables were rated between very important and important.

In both countries the Location and the accessibility of the institution are playing an important role as the students have special requirements to reach the respective universities with limited financial means. This is because the majority of both countries' students are from previously disadvantaged population groups which may in most cases be characterised by financial constraints. Inadequate infrastructure is also contributing to these findings. The Location is important because the majority of the students have to commute long distances to the university on a daily basis. The number of registered students exceeds the available accommodation on the various campuses by far. The importance of public transport thus came as no surprise as most of the students are dependant on it. The availability of Public transport is important as most of the students do not have the financial means to privately own vehicles. Transport to hostels, Private accommodation as well as to other central transport facilities have to be acknowledged and maintained. Non adherence to these needs may result in loosing many prospective students and exacerbate late-coming and absenteeism as this service, provided by both institutions, is regarded as a necessity. This necessity is supported by the relative unimportant rating of private parking facilities. The reason may be because the availability of private parking facilities does not directly affect the students as most of them are making use of public transport. Parking requirements for the latter are attended to by both institutions.

The rating of the availability of private accommodation and university accommodation was considered to be the least important and as revealed by the relative low scores. This may be related to financial constraints that necessitates the provision of an adequate transport system. Promising students that show a need for hostel accommodation should be identified and approached with the offering of financial aid in order to attract and maintain them.

In the **Support and infrastructure category**, Well-equipped library and computer facilities are regarded as most important and second most important variable by both samples. This implies that students are aware of the importance of technologically advanced equipment in the training process. Although  $H_0$  is accepted for both variables as no significance differences were measured between the two countries, the Swazi sample rated it slightly more important although there was slightly less consensus amongst them compared to the SA sample. The provision of access to up to date information in order to support excellent training should be prioritized. Financial provision should be made for the upgrading of computer hardware and soft ware as well as access to the latest literature in order to establish a competitive advantage over other educational institutions. The Security and safety condition on campus are rated as third most important variable in this category. Although no significant differences are measured between the samples the SA sample rated it slightly more important with a higher level of consensus amongst the respondents. This issue becomes extremely important as the high unemployment rate in both countries is partially to be blamed for high crime rates. Assuring a safe environment on campus and while making use of official transportation are therefore important issues to address. As a result of the high crime rate experienced by all citizens in the Republic of South Africa and to a lesser extent in Swaziland, security measures on campus should be strictly maintained and the visibility of security officials should be increased. Technologically advanced methods should be implemented to secure class rooms and hostels to prevent associated risks of theft and that of endangering the lives of students. This could include an electronic card system to monitor entrance to university campuses and to prevent unauthorized entrance. Refraining from putting these measures in place could lead to an undesirable image. A safe and secure environment on campus can create a competitive advantage. The least important variable in this category is social activities and a night live. Significant differences existed amongst the two samples with Swazi students rating it significantly less important compared to their SA counterparts.

Overall the scholarships availability for students are rated as most important variable in the **Image and marketing category**. Significant differences between the two samples existed with Swazi students rating it significantly more important (rated most important) compared to the SA sample (that rated it in sixth position). A higher level of consensus is measured amongst the Swazi sample. The academic reputation of the faculty and the reputation of the lecturers at the institution are both rated second most important in the Image and Marketing of the institution's category.  $H_0$  is accepted as no significant differences exist between the two countries with regard to these variables. However while Swazi students hold a slightly stronger view point with regard to the importance of the academic reputation of the faculty, the SA sample are slightly more in favour of the reputation of the academic staff. Consequently the fourth overall important variable is the academic reputation of the institution with Swazi students holding a slightly stronger point of view although no significant differences are measured between the groups.

The fact that the availability of scholarships is rated as most important variable provides support for previous findings that is related to limited financial resources that is derived from a certain degree of poverty experienced by the population. As mentioned elsewhere, promising students (students that obtained a high score in the selection process) should be encouraged by means of financial aids. Various options may be considered including, government bursaries for the orphans and for the most needy because of their parents status; and/ or reduction on fees based on A, B or C symbol achieved in high school or loans that may be converted into bursaries for most successful students. In arriving at a workable solution all the key stakeholders: government, parents and the students should be involved in the decision-making process. Once a decision is made on these matters it should be communicated to the students on time to facilitate effective planning and not to disrupt the smooth operation of the institutions, particularly in Swaziland where over the years there have been severe disruptions and delays as result of delays in processing of scholarships.

The reputation of the faculty and that for lecturers are rated second and third important variables, respectively, providing an indication that maintaining the overall reputation of the institution should be prioritised and displayed to all the key stakeholders particularly students and end-users of graduates. The overall reputation of the institution is consequently regarded as high priority area to be addressed in the management strategy. This will ensure that the most promising students/employers are attracted. Building and maintaining a good reputation could be done by implementing high quality training of international acceptable standards. International partnerships in training should be high on the agenda and should be emphasised in internal and external communications with employees and alumni. The importance and power of word of mouth communication should not be underestimated. Academic institutions' active involvement in research of highly acceptable standard will ensure a good national and international academic standing and hence facilitate these countries developments and competitiveness regionally and beyond. The recreational amenities of the institution have been rated least important and no significant differences exist between the two groups. Because a significant number of senior students were involved in the survey it may be concluded that at this phase of their academic career, it is agreed upon that academic issues are more important than the extramural activities although a balance should be maintained in life in general.

A Wide range of degrees/majors offered is overall rated as most important issues in the **Academic category** although significant differences exist between the two sample groups with Swazi students holding stronger feelings in this regard, rating it as most important while SA students rated it second. A demand for a wide variety of study areas are expected in order to make provision for employment in a diversified labour market where the unemployment rate is high. The overall second most important variable in the Academic issue' category is approachable and well informed academic staff. While it was rated second by the Swazi sample it was rated third by the SA sample. Although there were no significant difference between the two samples, SA respondents rated it slightly less important. A higher level of consensus is also measured for the SA respondents. Lecturers should consequently be informed about the importance attached to this variable and training sessions should consequently be formulated to prepare lecturers for this need. The overall third most important variable in this category is reasonable class fees. Significant differences are measured amongst the two groups with the SA sample rating it significantly more important compared to the Swazi sample while a significant higher level of consensus is measured amongst the SA sample. Because of the relative high unemployment rate in both countries reasonable class fees are expected to be rated as very important. Annual increases in class fees should be justified, as unjustified class fee increase often results in protests. Financial support, as mentioned several times is an issue warranting serious consideration because of the status of most of the students; they come from poor family backgrounds and/or are orphans, some are heads of their siblings burdened with extra responsibilities as a result of HIV/AIDS and/or unemployment. Small classes for better learning are rated as least important variable. No significant differences between the two samples are measured although the SA sample rated it less important with a higher level of consensus between the samples. It has to be stated that this variable was overall rated less than 2 on a five point scale, indicating that it is still fairly important. This outcome is probably because students, especially from previously disadvantaged population groups, realises the importance of wiping out the backlog in education as a result of political imbalances of the past.

To conclude, the management of higher education institutions should be in touch with the needs of their respective clients of which students and end-users/employers are most important. In order to achieve this most important link, attention should be given, in priority order, starting with attracting and maintaining students and offering of relevance degrees and programmes that are aligned to the different country's sectoral needs; .financial assistance, ease of location and access, well equipped and approachable staff, good library and computer facilities, reputable institution. The scholarship or students loans to enable them access to higher education was considered to be of uttermost importance because of the two countries developmental goals. Secondly, for greater access to bursaries/student loans, tertiary institutions should attract and develop well rounded students to match with the needs and expectations of the labour market and socio-economic goals of their respective countries, more so because of both countries developmental status; and because of the high need for greater competitiveness in the region and globally. Well- rounded students require good marketing strategies to reach out and maintain a cream of students who are reputable and worthy of good performance to the end-users. Resources' availability is the key to the improvement and development of the tertiary institutions' infrastructure; such as well-equipped staff, well equipped

library facilities, well-equipped computer facilities, security and safety on campus and an overall reputable institution.

# Strategic Learning Organization: The New Paradigm of Learning Organization

*Soo-Ra Kwon, soora@hycu.ac.kr*  
*Hanyang Cyber University, Seoul, Korea*

## Abstract

A lot of attention has been paid to action learning in the last decade and the success of such program has also been widely studied. How can action learning program promote organizational learning performance and strategy in small and medium-sized enterprise (SME)? This article discusses the association between strategic learning organization and action learning program and the ability of SME to be strategic learning organization. In the case of Alpaco, action learning program that promote employee communication behavior, knowledge sharing, and organizational learning are found to be positively associated with corporate strategic performance. The results indicate that action learning program in SMEs indeed associated with greater knowledge sharing, learning communication skills and changing organizational culture. Strategic learning organization can be, in turn, positively developed by action learning program for creating competitive advantage. This study offers further support for both the practical perspective on strategic learning organization. The evidence from this case study suggests that the action learning program play a significant role in the development of strategic learning organization of the firm. SMEs seeking to promote ability of learning should consider making investments in action learning program that encourage employee participation in decision making, knowledge sharing, and organizational learning.

## Introduction

A consensus has emerged on the importance of learning organization as a modern mode of organizing economic activity. Especially, action learning program in SMEs has been increasingly recognized as a key practical function necessary for achieving competitive advantage of learning organization. (Clarke, Thorpe, Anderson, & Gold, 2006; Faull, Hartley & Kalliath, 2005; Mwaluko & Ryan, 2000). Also, more recent studies confirm that the competitive nature of learning organization and performance in firms pose fundamental challenges for both academics and practitioners (Kontoghiorghes, Awbrey & Feurig, 2005).

Many studies of learning organizations have attempted to diagnose the characteristics of learning organization and performance (Armstrong & Foley, 2003; Phillip, 2003). Regardless of which outcomes are deemed most important, there is little empirical evidence in the literature that how the practical methodologies of learning organizations affect strategic organizational outcomes. Herein I argue that the competitive success of practical program such as action learning can in part be attributed to strategic learning organization that makes a channel to share competitive knowledge. Furthermore this study examined here is designed to add to the base of empirical evidence through case study regarding the relationship between strategic learning organization and action learning program.

In recent researches, another stream of the learning organization concerns strategic perspective as a source of competitive advantage. Because the learning of knowledge is predominantly competitive advantage, action learning may be critical for the long-term success of learning organization (Davey, Powell, Cooper, & Powell, 2004; Law & Chuah, 2004). Nevertheless, there has been limited empirical work on the development of strategic learning organization through process of action learning and little research has been conducted the relationship of action learning and strategic learning organization. Also, if strategic learning organization-action learning program relationship is viewed as an important element in the firm's strategy or is a major competitive advantage contributor, managers are likely to get more involved in the relationship activities and to share more knowledge through action learning in order to ensure success.

The primary objective of this case study is to examine the nature of relationship between strategic learning organization and action learning in SMEs. To address further understanding of action learning processes in practical field, this study will introduce and empirically investigate the process of action learning components

through Alpaco case study. Finally, the strength of the relationships between strategy, learning organization, and action learning will be examined in light of the possible supportive effects of four important factors: institutional factors, physical factors, technical factors, and leader's role.

## Essential Features of Strategic Learning Organization

In the past, organizational researchers have focused their work on conceptualization of the learning organization, identifying characteristics of such enterprises that have the capacity to learn, adapt, and change. According to the strategic approach to the learning organization, a learning organization requires an understanding of the strategic internal drivers necessary for building learning capability. Garvin(1993) defines a learning organization as “an organization skilled at creating, acquiring, and transferring knowledge, and at modifying its behavior to reflect new knowledge and insights”. Having synthesized the description of management practices and policies related to this construct in the literature, Goh(1998) contends that learning organizations have five core strategic building blocks: clarity and support for mission and vision, shared leadership and involvement, a culture that encourages experimentation, the ability to transfer knowledge across organizational boundaries, and teamwork and cooperation. Further, the strategic building blocks require two main supporting foundations. The First is an effective organization design that is aligned with and supports these building blocks. The other consists of the appropriate employee skills and competencies needed for the tasks and roles described in these strategic building blocks.

The strategic perspective of the learning organization posits that certain managerial practices or strategic building blocks are prerequisites for becoming learning organization. These strategic building blocks can serve as practical guidelines for operational and managerial practice, and along with the supporting foundations they can also provide advice for management. However, in the past, the strategic perspective emphasizes the macro level and thus neglects some of the commonly identified elements of a learning organization, such as individual or practical learning tools. Consequently, this perspective was not selected as practical guide for the development of learning organization, and researchers could not explain directly the relationship between strategic learning organization and practical learning tools.

As a step toward gaining better understanding of the relationship of the strategic learning organization-practical tools, this study was designed to observe the Alpaco's action learning processes.

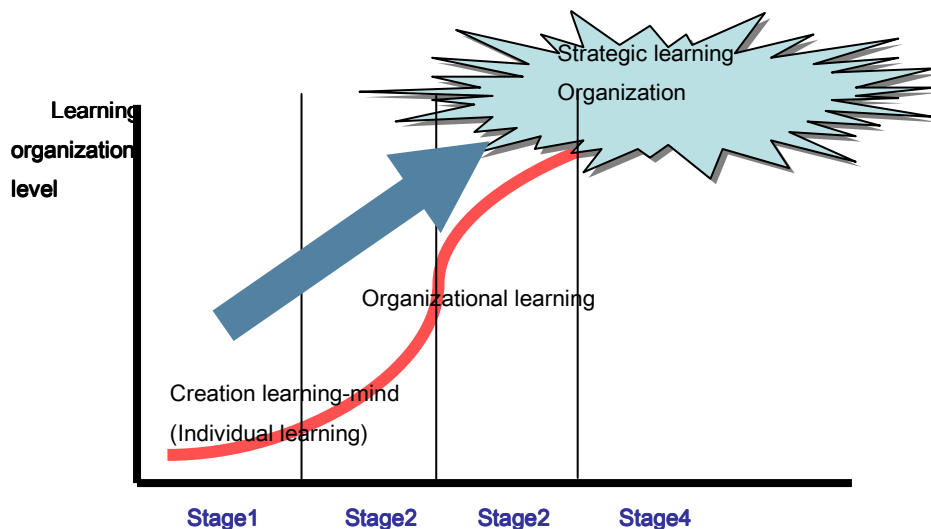

FIG. 1: THE LEARNING CURVE OF ORGANIZATION

## What is Action Learning?

As an important practical tool of the learning organization, the role of action learning in business has been drawing increasing attention recently from management researchers and practitioners alike (Coghlan & Coughlan, 2006; Davey, Powell, Cooper, & Powell, 2004; Law & Chuah, 2004; Johnson & Spicer, 2006). There appears to be a general consensus among researchers that action learning is important and useful in a tool of organizational learning activities, and along with the supporting strategic building blocks (Goh, 1998). Especially researchers noted that the role of action learning in strategic learning organization development is of fundamental importance. The development of learning organization based on action learning create the strategy-learning relationship ties, finally access the strategic learning organization with competitive learning knowledge (Clarke, Thorpe, Anderson, & Gold, 2006; Faull, Hartley & Kalliath, 2005; Mwaluko & Ryan, 2000). In sum, action learning between strategy-learning relationships should be positively associated with knowledge sharing because it provides strategic perspective of support for mission and vision, shared leadership and involvement, creates a culture that encourages experimentation, supports the ability to transfer knowledge across organizational boundaries, and makes teamwork and cooperation.

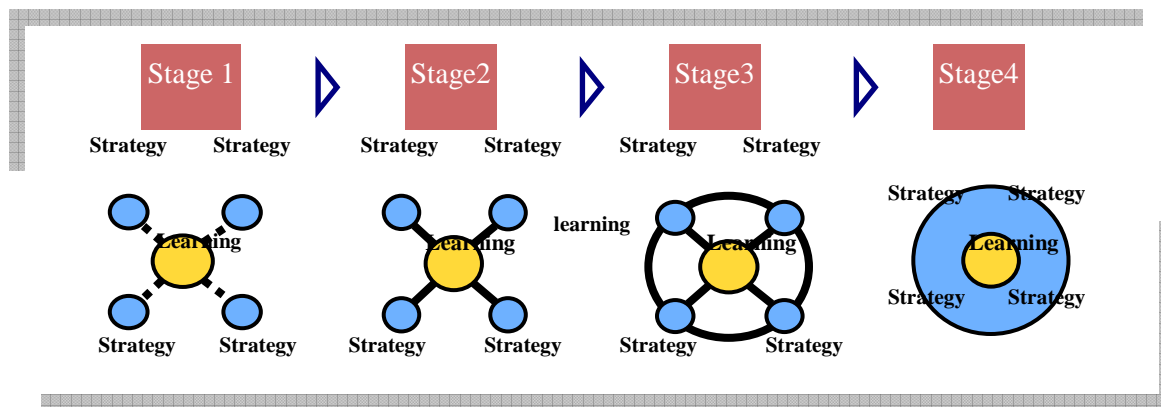

FIG. 2: THE DEVELOPMENT OF STRATEGIC LEARNING ORGANIZATION THROUGH AL

### Action Learning Process

Action learning (Evans, 1998) is a process that embeds a learning culture in groups, facilitating positive change for a wide range of organizations such as Motorola, Xerox, Peace Corps, and United Nations Development Program (Dotlich, & Noel, 1998; Marquardt, 1999). A structural process enables group exploration, definition, actioning, and evaluation of complex and work-related problems. Weinstein (1995) identifies five components of action learning program. The components include the following.

#### The Set

The set is a small group of people, normally five to eight, who meet regularly, ideally once a week for a day.

#### Real Project

These are for each person to work on. Body (1981) writes that on the issue how to generate and select projects it is worth considering a range of project selection styles. He identifies three selection styles, including:

- Ask senior management to suggest projects;
- Generate information from participants about problem areas, formulate into projects by trainers/senior management;
- Participants generate their own projects.

Criteria for selection may include, for instance:

- Relevance of the project to the survival and growth of the organization;
- Commitment of the client to the project;
- Feasibility of implementation in terms of time and skills and authority;
- Complexity of the problem requiring creative solution

#### **The Process**

Conceptually, the action learning cycle consists of four phases (Zuber-Skerritt, 2000). First, the identified problem must be of immediate relevance to the group, within the power of the group to solve and be problems (or opportunities) where no single course of action is evidence. Next, the problem-solving process begins by a process of individual reflection, followed by group discussions to examine critically the language used and reach consensual agreement on the meaning of this language and related concepts. This process facilitates movement from unawareness, feeling of anxiety, unsafe risk, and confusion to a supportive, questioning, and learning environment that engages and extends individual beyond programmed knowledge to pose and explore increasingly insightful questions. The questions, rather than individual, become the focus of attention and the “problem” to be solved, facilitating exploration of possible actions. Thirdly, the group identifies the most applicable action, based on their increased knowledge and implements the action. Finally, they evaluate its effectiveness. If the evaluated solution to a problem does not meet the group’s requirements, further rounds of action learning re repeated to address the problem.

#### **The Set Advisor**

The set advisor is a person who facilitates the process. Casey (1987) identifies five roles of the process advisor. They include:

- To facilitate giving;
- To facilitate receiving;
- To clarify the action learning process and
- To help others undertake the above tasks;
- To act from time to time as personal consultant to set members in the group setting

#### **Time**

Weinstein (1995) writes that action learning program take a duration of between three and six months.

### **A Look at Action Learning Program: an Alpaco’s Case Study**

The following Alpaco case study illustrates the use of action learning to facilitate innovative change and development of the strategic learning organization. Recognizing the potential benefits of using an action learning approach as a means of SME development, a governmental funding body sponsored a yearlong project.

The approach to data collection incorporated a longitudinal component through embedding at all meetings of the action learning program, individual consultant within the sets involved who recorded from an insiders perspective the behavioral responses and outcomes as reported by the facilitators involved program.

#### **The Program**

The program, which took a period of six months, i.e. from May 2006 to October 1996, involved all employees in Alpaco. There were 24 members in total. and they were divided by 4 sets. The set members adopted the conventional action learning process and a variety of decision-making tools(ex. Fishbone analysis or Mind Map) and techniques to accomplish their projects.

Although the program was initiated by the headquarters, the projects were selected by the set members themselves. The criteria for selection included:

- Relevance of a project to create the competitive advantage of corporation

- Ability of the project to promote learning

The following projects were selected by the set members:

- Design and implementation of a high-loyalty customer management program;
- Design and implementation of C-CRMS
- Redesigning of the web mode of education result
- Improving the effectiveness of learning management

**The Super Action Team**

The Super Action Team consisted of 5 members from education division, managerial support division, LMS development Team. In the first meeting, set members introduced themselves and listened to an explanation of the action learning program and its aims. During the second meeting, team members believed that they would have to overcome the problem of customer’s database by identifying the strategic internal drivers to address collectively. So, the advisor reinforced the need to identify a specific issue related to their day-to-day activities, asking them to highlight one for discussion in the next meeting. During the fourth meeting, the idea of a “C-CRMS” for customer was proposed. The C-CRMS would help search the information of customers, reduce operation time and improve the image of the strategic marketing. In educational industry, the strategic marketing approach is very critical. At the tenth and eleventh meetings, members reported on their progress with customer organization. The meetings led to the concept of a “C-CRMS” for construction being modified.

At the end of the action learning program, they said that the successful introduction of a “C-CRMS” would provide;

- Greater access to information about customer enterprises
- Reaction to customer’s request quickly
- Using alpaco’s ERP

FIG. 3: STROY BOARD OF C-CRMS

**Results**

There where a number of very interesting results from in-depth qualitative analysis. I will outline some evidence from evaluation. The factors resulting in success of action learning were the institutional factors; physical factors; technical factors; leader’s role. If any if these factors were not presents, the outcome probably would not have been as positive.

Which suggests that action learning program was an effective learning tool of strategic learning organization. In particular, the significant factors of action learning on strategic learning organization are found across the main process and output.

#### **Institutional Factors**

Alpaco's action learning program could begin with supporting of government policies for SMEs. Especially SMEs such as Alpaco cannot focus on learning organization programmes because of times and cost, government support policies play very important role in structuring learning organization and creating competitive advantages. In this case, government support successfully promoted the climate of learning, interactive teamwork and cooperation, and openness in action learning program. Furthermore, in this study, I identified internal institutional factors supporting strategic learning organization: reward system for result of action learning, relation with performance appraisal. These systems directly effects on motivation of participants to concentrate the action learning program.

#### **Physical Factors**

Actually, physical factors in the process of action learning program such as equipment, learning room played important role in learning effects. The combination of action learning and learning environment had contributed to the implementation of process to organizational learning. Effective equipment and facilities in action learning program promoted more active attitude to learning communication. Also, spaces for action learning meeting helped participants to concentrate the action learning program separated from their own jobs and businesses.

#### **Technical Factors**

In this Case, one of interesting results was using frequently internet community in all teams for interactive communication and transferring the knowledge. Before every meeting, participants shared and transferred their pre-learning knowledge in internet communities, so it was very critical for a team to save meeting time and to adjust the agenda. Therefore, technical factors based on IT network could were key success factors for learning organization performance through action learning program. Moreover, the ability of IT network in the action learning program will be critical to the competitive advantage of a learning organization in marketplace. Participants' knowledge and skills accumulated in communities through action learning can be the foundation of knowledge management system. Additionally, the support of top managers for IT network system to adopt a series of internally compatible learning practices has impact on the fit of the KMS itself and on the KMS with the firm's strategy. Clearly, there is a need for empirical studies to further enhance understanding of the effects of KMS on organizational learning.

#### **Leader's Role**

Powerful support and driving force of Alpaco's CEO were very important for successful implementation of action learning. As a major factor, the CEO's understanding of learning organization and insight into future were crucial in facilitating the strategic learning organization through action learning program in Alpaco. The capability of CEO matters to the effectiveness of the design and implementation of action learning program. The design of a sophisticated action learning program can be well accomplished if the firm's strategy is comprehensive understood by the CEO and managers. Therefore, the capability of CEO, especially in terms of abilities in understanding the importance of learning organization and analyzing the firm strategy, influenced the success of action learning results.

## **Discussion and Future Research**

The purpose of this study is to test empirically the impacts of action learning program and strategic importance on learning organization. To explore the topic of action learning within the organizational settings, Alpaco was studied. Through a case study approach of Alpaco, this study has focused on the process of action learning programs and the relationship between strategy and action learning output by proposing and testing a practical effectiveness that explicitly articulates the role of action learning that in past research received attention only partially and theoretically one another.

The overall results point to the critical role played by action learning program as an effective learning tool of strategic learning organization. In particular, the significant factors of action learning on strategic learning organization are found across the main process and output. These findings do not only coincide with past research that action learning acts as a powerful process on inter-team relationship in organization and performance. They also

provide some new light on the multidimensional process of action learning program across strategic learning organization.

Also, the results shows that the institutional support, physical environment, technical system and leader's role have a significant impact on action learning program success, and a higher level of organizational commitment positively influences participant's satisfaction and performance. Our findings contribute to action learning and strategic learning organization research in several ways. This study helps address the need to detail and to test practical effectiveness of action learning and thus provides evidence of the value of integrating concepts from strategic learning organization and inter-team relationship.

From a practical point of view, this study indicates that action learning program offer significant strategic perspectives for small and medium-sized enterprises. They may be able to actively manage their action learning program and supportive factors to stimulate strategic perspectives and build competitive advantage. Furthermore, government support policy can form the basis for strategic learning organization that may lead to greater value-creation opportunities. There are several limitations of this study. First, our sample was particularly one case, Alpaco, it is unclear how well these results would generalize to a broader sample. At the same time this research has focused on a single dimension of learning organization and strategic perspective and implemented it in one case. To clarify these problems and broaden this study, much in-depth empirical work remains to be conducted before a general theory can emerge. Finally, I believe that the findings presented herein have important practical implications for organizations facing today's challenging environment.

## **Abstract**

Despite the touted benefits of job career planning in the contemporary human resource management (HRM) literature, few workers enjoy engagement with meaningful career development initiatives, yet most people are engaged in work for a high proportion of their waking life. This paper reports a study with 505 respondents who provided robust data that were used to evaluate a relatively compact model that integrated work career planning with predictor constructs and the demographic dimensions of gender and age as well as the outcome variables of commitment and job satisfaction. The results demonstrated significant support for the fundamental predicted linkages of the conceptual model, while disclosing that gender was not a significant mediating variable, but understandably, older employees held substantially less importance for career planning than younger employees. The results are discussed in terms of the paradox of the claimed benefits of HRM practices that incorporate individual career development decisions and the somewhat seldom endorsement of healthy career development initiatives of contemporary organisations.

## **Introduction**

There is increasing evidence that institutions are being challenged to undertake proactive career management. In past periods of relative stability, and somewhat predictable linear progression, the likely career advancement of cadres could be 'written on a wall' as organisations were male dominated, generally employees worked in one company to a retirement age of 65 years, and thus, regular promotion was a feature of seniority (Hind, 2005). But the emergence of a competitive, global marketplace, a shortage of qualified and skilled staff, a lack of leadership strength, and the increasing participation of professional and managerial women (Burke, Burgess and Fallon, 2006) is compelling organisations to revitalise and reposition career management. A dominant contemporary belief is a firm can build competitive advantage, by supporting career aspirations of staff, and thus, ultimately contribute to human capital accumulation.

An impetus for the employment of various career aspirational programmes has been an offshoot of the demise of traditional careers. For instance, the notion of lifetime employment has been replaced by the concept of lifetime employability (Koh, 2006) as advancing technology has compelled a renaissance in core job attributes and job incumbents are scampering to gain educational skill compositions (Bagshaw, 1997; Finn, 2000; *ILO*, 2003). And as the labour market becomes more gender balanced both men and women engage in non traditional career choices (e.g., nursing, teaching). Coupled with these actions is evidence that job holders, irrespective of gender, report more traditional role attitudes (Jome and Tokar, 1998; Lease, 2003), and acquire relatively common managerial work goals (Chatterjee and Pearson, 2006; Pearson and Chatterjee, 2004). However, making career compromise choices may lead to expressions of gender role conflict and dysfunctional job attitudes (i.e., low commitment, job dissatisfaction). Consequently, there are strong grounds for career counsellors to include such considerations in career development programmes (Dodson and Borders, 2006).

Predictably, there is ongoing pursuit to better understand career management processes that include personal and contextual dimensions. Since the mid 1990s a number of social scientists (Judge et al., 1995; Kirchmeyer, 1998; Tharenou et al., 1994) have studied a variety of likely predictors (e.g., family, education, and ambition) of career success with the objective of being able to conceptualise more encompassing models. The departure point for these newer paradigms is rooted in traditional HRM practices, which were developed almost 20 years earlier. Understandably, these earlier HRM arrangements, that were employed to increase job motivation,

improve incumbent task competencies, and to reduce dysfunctional behaviours of poor performance, absenteeism and turnover provide only partial answers for the nurturing of today's employees. Indeed, many institutions have yet to realise the strategic importance of innovative programmes for human resource development, which are likely to build human capital accumulation. Despite the chronicled efforts of leading edge organisations relatively little is known about how managerial women and men experience these initiatives (Eby, Allen and Brinley, 2000). The exploratory study reported here is an endeavour to provide some elucidation of the relativity of situational and personal characteristics with incumbent attitudes in a career management system.

The purpose of this paper, which is in six parts, is to report an evaluation of a conceptual career framework that integrates situational and personal features as well as two important work related attitudes – commitment and job satisfaction. In the first part the theme of the paper focusing on some important dimensions of career development, in terms of its antecedents and outcomes, is outlined. The second part delineates the investigative framework and the theoretical underpinning for the predicted relationships. How this conceptual arrangement was assessed is the third part of the paper, and the fourth section of the manuscript provides findings of the analyses. The final two sections provide a discussion and some concluding remarks to express the relevance of the study findings for career development and the role of this HRM practice in a world of modernity.

## A Model of Career Development

The conceptual model depicting the relationships of the variables is presented in Figure 1. It is shown in Figure 1 that career planning and career management, two primary independent variables, lead to career development. Career development in turn is linked with the two outcome variables of job satisfaction and career commitment. In other words, career development is hypothesised as an intervening variable linking the association of career planning and career management on job satisfaction and career commitment. Also expressed in Figure 1 is a proposition that career development model will include not only situational features, but personal factors, and in particular, age and gender. A detailed explanation of the hypotheses offered by Figure 1 is presented next.

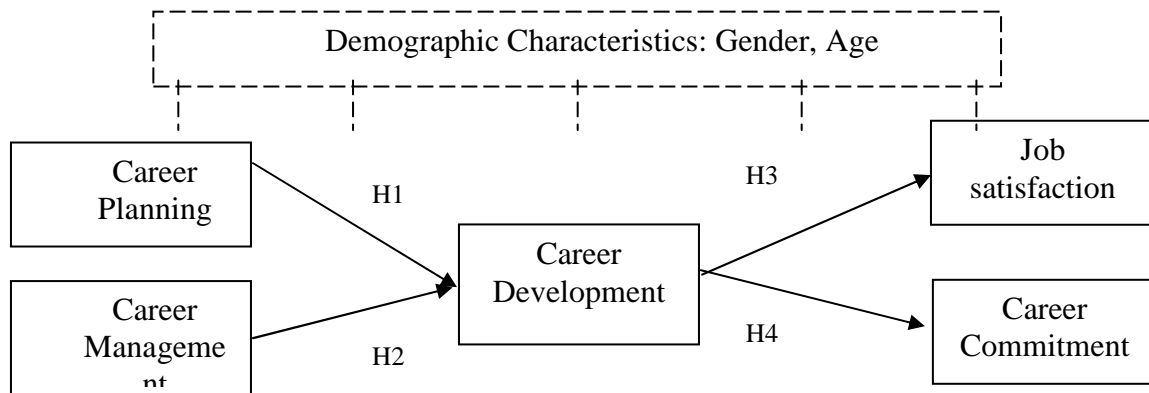

FIGURE 1: CONCEPTUAL MODEL FOR THE RESEARCH STUDY

### Career Planning and Career Development

Career development is a long term complex process. Career development has often been reported as an organisational initiative whereby organisations set up mechanisms, processes, structures and systems to foster career development initiatives among individuals (Herr, 2001; McDaniels and Gysbers, 1992). Indeed, organisations can assist by providing career planning tools or workshops through vocational counselling or by using workbooks or career resource centres to guide employees to conduct self-assessment, analyse and evaluate their career options and preferences, write down their development objectives and prepare the implementation plan (Hall et al., 1986; Appelbaum, Ayre and Shapiro 2002; Leibowitz, Farren and Kaye, 1988).

The notion of individuals pursuing their careers has received widespread attention. In fact, the concept is that given the opportunity individuals can be involved in the shaping, moulding and developing of their career path in order to achieve beneficial outcomes. Pragmatically, there are tangible benefits for both the employer and the employee, but the primary focus is generally on the individual. Halls, et al (1986) defines career planning as a deliberate process for becoming aware of self, opportunities, constraints, choices and consequences, as well as identifying preferred career goals, and programming for work, education, and related developmental experience to provide the direction, timing and sequence of steps to attain a specific career goal. Support for this contention has been given by Leibowitz, Farren and Kaye (1988), who also generally concur with this definition when they define career planning as a process by which individuals determine their skills, interests, and values; consider which options best 'fit' them; and set goals and establish plans for achieving their goals. Furthermore, Leibowitz, Farren and Kaye (1986) argue that individuals are responsible for initiating their own career planning as well as identify their skills, values, interests and seek out their career options in order to set goals and establish their career plans. In summary, career planning is viewed as an initiative where an individual exerts personal control over their career and engages in informed choices as to his occupation, organisation, job assignment and self development (Hall, et al, 1986). These propositions provide underpinning for the first hypothesis H1.

*H1: Career planning is related to career development*

#### **Career Management and Career Development**

Career management is another commonly cited antecedent of career development. Arguably, once individuals have decided upon their career goals, they will require skills, competencies and opportunities to pursue appropriate strategies (i.e., career management practices) that will provide pathways to the ultimate achievement of their career destiny. In other words, the next step after establishing the initial career will be formulation of the plans through appropriate career management practices to achieve the set milestones. In practice, career management is an ongoing process of preparing, developing, implementing and monitoring career plans and strategies undertaken by the individual alone or in concert with the organisation's career system (Hall et al., 1986; Greenhaus, Callanan and Godshalk, 2000).

Career management is a continuous process of integrating dimensions of work life and personal expectations. A satisfying career can promote feelings of fulfilment while poor career decisions can have a devastating effect on a person's sense of well being (Greenhaus, Callanan and Godshalk, 2000). In addition, changing environments such as a change of business strategies which can be linked with organisational downsizing, mergers and acquisitions and technological changes will demand ongoing career management. Thus individuals need to often revisit career options and modify career paths (Greenhaus, Callanan and Godshalk, 2000).

Research work by Greenhaus, Callanan and Godshalk (2000) support the contention that effective career management can enable individuals to make informed decisions that are consistent with their talents, aspirations and values and improve organisation effectiveness. In fact, many researchers have argued that the career management initiative is a nexus between organisations and individuals where organisations endeavour to match individual interests and capabilities with organisational opportunities through planned program encompassing activities such as career systems, career counselling, job rotation and other career management tools and resources (Hall, et al, 1986; Martin, Romero, Valle and Dolan, 2001). Some support has been provided by a few studies that have been done on the association of career management and career development. For instance, a study by Noe (1996), attempts to identify the relationships between career management, employee development and employee performance. The study findings indicate a voluntary increase in development activities and exploratory behaviour, with age, position and manager's support for development, as significant with respect to career management process. These contentions provide support for hypothesis H2.

*H2: Career management is associated with career development.*

#### **Career Development and Job Satisfaction**

The importance of ensuring participants are satisfied with career aspirations is attracting the attention of HRM practitioners. This interest is being promoted because relatively little is known how managerial and professional staff experience career development initiatives (McCracken, 2002; Rutherford, 2005). Indeed, there is emerging evidence that while there are a few reported instances there are growing numbers of U.K. and U.S. organisations that

are implementing practices to support managerial and professional women in career development programmes to achieve their promotion to senior positions (Burke, Burgess and Fallon, 2006). In addition to the primary aim of supporting women's career advancements an important objective of these training and development activities is to improve job satisfaction and general well being.

There is a great deal of literature to support a premise that career development and job satisfaction are related. An early, broadly based perspective suggesting a link between these two constructs was given by Gregson (1987) who contended the emotional state of job satisfaction can develop from the self appraisal of experiencing the job activity and the achieved task results. Other social scientists have suggested a close connection between work and affective responses. For instance Noe (1996) posited job satisfaction as the pleasurable feeling of believing a strong connection between doing the work and attaining valued judgements. A closer relationship was more recently envisaged by Jaspen and Sheu (2003) who commented that the extent of linking a job is an universal aspect of career development. And recently there has emerged evidence (Chen, Chang and Yeh, 2004) to expressly demonstrate that career development programmes have potential to influence job satisfaction. To further corroborate the linkage between career development and job satisfaction, hypotheses H3 is advanced.

*H3: Job satisfaction will be related to career development*

#### **Career Development and Career Commitment**

Career commitment has been reported as an important outcome of career development initiatives. Commitment is influenced by both personal predispositions and organisational interventions (Wiener, 1982). Career commitment is defined by Hall (1971) as the strength of one's motivation to work in a chosen career role (Noordin, Williams and Zimmer, 2002). Colarelli and Bishop (1990) contend that career commitment is characterised by the development of personal career goals, the attachment to, identification with and involvement in those goals. Thus it is likely that organisations that provide career relevant information and assistance will narrow employees' career focus and bind them more closely to an organisation, leading to organisational commitment (Granrose and Portwood 1987). Commitment to an internally defined career may become an important source of occupational meaning and continuity as organisations become more fluid and less able to guarantee employment security (Colarelli and Bishop, 1990). Perrow (1986) highlight that career commitment is also important to the development of ability, because commitment to a career helps one persist long enough to develop specialized skills and also provides the staying power to cultivate business and professional relationships (Noordin, Williams and Zimmer, 2002; Colarelli and Bishop, 1990). Therefore, career commitment would seem to be essential for career progression and development (Noordin, Williams and Zimmer, 2002).

Career development opportunities are viewed as being supportive towards career commitment initiatives among employees. King (1999) points out that psychological force of self identity, self insight and resilience in pursuing career goals represent core components for career motivation and commitment; and for building cooperation, cohesiveness and consensus in an organisation. Career commitment forms a centripetal force inward, protecting the organisation from outside influence, drawing human resources toward countless acts of cooperation with each other (King, 1999). Lee (2000) claims that employees' job satisfaction, organisational commitment and morale levels are important in appropriate career decision frameworks. This theoretical underpinning provides foundation for speculating H4.

*H4: Career commitment is associated with career development.*

#### **Gender as a Mediator**

Interest in the topic of the career development of women has escalated in the past 15 years. Underpinning this interest is the rapid changes in women's lives, and in particular the greater participation rate of women in professional careers and a realisation that traditional 'gender homogeneity' corporations are not well suited for the contemporary global market place. Yet, the representation of women on international assignments is only slowly increasing (Harris, 2004), and few women (compared to their male colleagues) eventually rise to senior executive positions (Belkin, 2003). Also worrying is the evidence that demonstrates only a very small proportion of professional women aspire to further promotion from the middle management levels (Catalyst, 2003). Male world views may well suggest these outcomes are to be expected given basic assumptions about traditional female gender work and family roles that can become a barrier to linear progressive organisational promotion. Alternative perspectives with an emphasis "...to adequately address the uniqueness and complexity of women's career

development.” (Whitmarsh et al., 2007: 11) have led to a great deal of research that has uncovered a wide variety of themes and issues that impact gender differences in career patterns.

Frameworks for evaluating career planning and career decision making patterns and their effects are in transition. For instance, both women and men may work in non-traditional careers, yet there are few studies that have comprehensively evaluated male responses of men who are engaged in non-traditional careers. Hence, further knowledge is required to develop predictive models. The need to revisit the relationships between gender and career choice is gathering support. For example, Whitmarsh and colleagues (2007) state many of the core assumptions that included 1) separation of work and family, 2) reverence for autonomy, 3) work as a central attribute of life, and 4) linear, rational nature of the career development process may only be suitable for gender differences in career behaviours in traditional organisations. The argument for revitalising these frameworks in contemporary work arrangements is advanced by an expanding literature that confirms the importance of a wide range of topics. These items include such features as gender role associations, frames for career directions, work family balance, career changes, personal compromises, and a plethora of individual, social and contextual dimensions. Clearly, these issues are beyond the scope of this paper. At best this study can take guidance from Kato and Suzuki (2006) who suggest many employees follow the general parameters of drift, mist and hope, and eventually are likely to concede their future is already decided for them by their employer who has previously given greater emphasis to male career planning. Instructively, these broad assumptions lead to the relational statement.

*H5 : Female managers are likely to hold lower levels of importance for career patterns than male managers.*

#### **Age as a Mediator**

Research attention on the role of age as a reliable predictor of the soundness of career planning has intensified. This position has been driven by the knowledge that the different expectations job incumbents can have for career planning in contemporary institutions is extensive. A plethora of career path preferences is a reflection of the significantly diminished existence of the phenomenon of linear career paths with many people having multiple jobs or careers in a lifetime (Finkelstein, Allen and Rhoton, 2003), the engagement of older workers as organisational newcomers (Kram, 1996) as well as ‘retired’ people undertaking part time work. Consequently, corporations can experience age diversity across different hierarchical levels and within departments whereas a hallmark of companies in earlier times was the relative similarity and stability of age profiles. It is because of the demographic seachange that chronological age may not be a good linear predictor of organisational initiatives for career development. Moreover, much of the research findings from evaluations of age issues and career planning that were conducted over a decade ago in more ‘traditional’ firms may have limited relevance for contemporary institutions of today and tomorrow.

Organisational age heterogeneity and the flux of demographic profiles promotes a perspective of discontinuity as a feature of career planning models. Additionally, the extent of ‘noviceness’ of the individual is likely to be a factor that reflects the level of active involvement in decision making choice for achieving career advancement adequacy. For example, university or college graduates (who are likely to provide the bulk of younger corporate employees) are likely to express a preference for the financial rewards and an alignment of their core study knowledge with their work. Yet, prior to employment they were job holder novices and would have held relatively high career aspirations (Walker and Levesque, 2006). In later years, when the euphoria of the job has subsided (note no longer a job novice), these advanced employees and other more mature co-workers are then likely to give greater consideration to their immediate and future careers. In the latter stages of organisational life, particularly with the onset of retirement, older employees are likely to give greater consideration to financial planning to achieve retirement income and “...the importance of managing retirement, accumulation and liquidation risks.” (Power and Hira, 2004: 121) rather than further career planning in the employing organisation. Notably, the intensity of the preoccupation with retirement (a new career) planning is being undertaken by novices of the new ‘work organisation’ – retirement lifestyle. As this paper only reports data for employee perceptions and attitudes in terms of career planning for the current employer organisation the retirement environment is not included in this report. Thus, it is intuitively suggested that younger and older employees will demonstrate lower vigour and perceived importance for career planning in their current organisation than cohorts of organisational age profile of the mid ranges. These imperatives provide the foundation for the following hypothesis.

*H6: The importance of career planning will be less for younger and older employees compared to other employees..*

## **Methodology**

### **Site and Respondents**

This research was undertaken in a leading Singapore hotel. The hotel, which was established in 1986 is a five star international residence and the third largest (hotel) in Singapore. The primary reason for choosing this hotel as the research site was underpinned by the fact that its employees have rated 'Opportunities for career development' as the second lowest satisfaction factor in two recent, consecutive, annual Employee Satisfaction Surveys. Furthermore, exit interview data of the second survey demonstrated that one of the first three reasons for leaving the employment of the hotel was a perception of better employment opportunity elsewhere. Currently, the hotel is experiencing a period of rising turnover rates.

The respondents were full time hotel employees. A total of 523 employees, who were working across a wide spectrum of jobs within the hotel, participated in the survey. These participants were employed in a variety of roles which ranged from managerial functions to a variety of customer oriented duties (e.g., reception, housekeeping, administration, kitchen, security and financial activity). As the hotel cadre was 547, the initial participation rate was 95.6 per cent. However, eighteen questionnaires were invalid, leaving 505 valid questionnaires (92.3% of the total hotel cadre) for data analysis.

### **Procedure**

A survey questionnaire was developed from the relevant literature to evaluate the conceptual model. This questionnaire was administered to those employees who wanted to participate in the survey over a span of three days. Employees were assembled in groups and given a specific time period in which they were required to complete the questionnaire. The key objective of the study was explained before respondents were invited to address the survey questions, and further, it was explained that participation in the study was voluntary and anonymous. Respondents were assured that the information they provided would be treated with confidentiality. The questionnaire was completed and returned during the same session.

Two versions of the questionnaire were employed. There was an English version and a Mandarin version, delineating the same set of questions. As the source of the instruments was from Western literature, the original form of the questionnaire was in English. A back translation procedure was employed to create a Mandarin version, with a three stage process. In the first stage, a group of bilingual assistants translated the English version to the Mandarin version. The second stage was undertaken when independent group of bilingual assistants translated the Mandarin version to an English version. In the third stage of the back translation process a third independent group compared the initial English version with the translated, secondary version of the English questionnaire. Where there were obvious and critical differences these matters were referred to the first group of bilingual assistants, who retranslated and 'passed the newer version to the second group of translators. This English version had a literal meaning with the initial English questionnaire. Then the Mandarin version, from with the secondary English version, was accepted. A 'perfect' translation cannot be expected as Mandarin is a language from an extant society that has considerably different religions, cultural dimensions and nuances to a traditional Western society from which the original English version of the questionnaire was sourced. Staff that were less comfortable with English were encouraged to complete a Mandarin version of the questionnaire.

### **Measures**

Three types of variables were measured. First, demographic properties of gender and age were sought. Second, perceptual responses to career planning, career development, and career management, were assessed. Last, two dependent variables, namely job satisfaction, and career commitment, were evaluated. The independent variables, the intervening variable and the two dependent variables were measured with seven point Likert scales (1 = strongly agree to 7 = strongly disagree). Arithmetic means were determined for each variable. The validity of all scales was demonstrated by factor analysis employing the varimax rotation (see Puah and Ananthram, 2006).

### **Career Planning**

Respondents provided perceptual information about the existence of career planning, setting of career goals and importance of career planning in the career development process. The 11 questions used to assess this variable were adapted from King (1999), Gould (1979), and Coachline's career development needs survey (Available : <http://www.orghealth.com/cdn/>).

### **Career Management**

Career management practices were assessed with six items by adapting measurement scales from Chen, Chang and Yeh (2004), and Chay and Bruvold (2003). The measurements were about the importance and availability of career management practices.

### **Career Development**

The intervening variable assessed the importance of career development to the respondents and whether career planning and career management were important elements to attain career development. The five scale questions were developed by adapting Coachline's career development needs survey (Available : <http://www.orghealth.com/cdn/>),

### **Job Satisfaction**

Job satisfaction was assessed with seven items by adapting questions from the Job Diagnostic Survey, which was developed by Hackman and Oldham (1980).

### **Career Commitment**

Career commitment was assessed by adapting eight items from the work of Chay and Bruvold (2003), and Colarelli and Bishop (1990).

### **Analysis**

The analyses were undertaken in five stages using Statistical Package for the Social Sciences (SPSS). First, data robustness was established by principal component factor analysis employing the varimax rotation option to uncover the underlying factors associated with the independent, dependent, mediating and intervening variables. Questions that were cross loaded were excluded from analysis. The second stage of the analyses was the conducting of reliability estimates to ensure consistency and stability of data (Cavana, Delahaye & Sekaran 2001). A Cronbach's coefficient alpha which measures how well the variables are positively related to one another was estimated for each of the interval scale assessed variables. In the third stage, correlation analyses were conducted. The results gave an indication of the strength of the relationship between the variables to evaluate the construct relativities. The fourth key stage of the analysis of the conceptual model was regression analysis. This procedure enabled an examination of the hypothesised relationships shown in the conceptual model of Figure 1. Finally, in the fifth state the impact of age and gender on the hypothesised relationships were assessed using multiple regression analysis, t-tests and analysis of variance measures.

## **Results**

### **Demographic Profile of Respondents**

Table 1 shows the respondent attributes of gender and age. Both genders were well represented. There was also a reasonable distribution of respondents across the three assessed age categories, albeit that nearly 60 per cent of the employees were in the 25 years to 44 years age group.

TABLE 1 : DEMOGRAPHIC PROFILE OF THE RESPONDENTS % (N = 505)

Demographic Characteristic	
<b>Gender</b>	
Male	48.5
Female	51.5
<b>Age (in years)</b>	
<25	21.8
25 to 44	58.4
> 44	19.8

#### Descriptive Statistics and Correlation Analysis

Table 2 presents the mean scores, the standard deviations, the reliability assessments, and the correlations for all the conceptual model variables that were measured with interval scales. The relatively high means shows respondents perceived a high consensus for agreement with the scale items, and the somewhat low standard deviations demonstrate a central tendency of the responses. Further, the reliability assessments indicate the data were robust, while the correlation scores delineate strong support for the forecasted bivariate relationships that are depicted in Figure 1. Overall the content of Table 1 give general support for hypotheses H1 to H4, inclusive.

TABLE 2: DESCRIPTIVE STATISTICS AND CORRELATIONS (N = 505)

Variables	Mean	S.D.	1	2	3	4	5
1 Career Planning	5.32	1.09	<b>0.94</b>				
2 Career Management	4.75	1.20	0.60*	<b>0.87</b>			
3 Career Development	5.54	1.12	0.70*	0.54*	<b>0.91</b>		
4 Job Satisfaction	5.44	1.17	0.64*	0.60*	0.65*	<b>0.90</b>	
5 Career Commitment	5.06	1.18	0.58*	0.66*	0.59*	0.73*	<b>0.92</b>

- Notes: a. S.D. = Standard deviation of the means.  
 b. Correlation is significant at the 0.01 level (2-tailed).  
 c. Bold values across the diagonal are the reliability alphas.

#### Regression Analysis

Regression analyses were employed to test the postulated hypotheses. Each hypothesis was tested independently. Table 3 presents the result of career planning as an antecedent of career development for the Singaporean sample. It is shown in Table 3 that 49.4 percent of the variance in the assessed linkage was explained by the independent variable career planning which provides confidence for the posited relationship between career planning and career development. The significant result at the  $p < 0.001$  level provides strong support for hypothesis H1.

Regression analysis was conducted to test hypothesis H2. Table 3 shows that almost 30 percent of the variance was explained for the bivariate relationship between career management and career development. The significant relationship at the  $p < 0.001$  level provides empirical support for hypothesis H2 specifically that career management is an antecedent of career development

TABLE 3: REGRESSION ANALYSIS FOR THE EFFECT OF CAREER PLANNING AND CAREER MANAGEMENT ON CAREER DEVELOPMENT (N=505)

Dependent Variable	Independent Variable	Adjusted R <sup>2</sup>	F	t
Career Development	Career Planning	0.494	491.477	22.169*
	Career Management	0.299	214.761	14.655*

Notes: a. F = F statistic, t = t statistic.  
b. \* p<0.001.

Table 4 displays the results of regression analyses for assessing hypotheses H3 and H4 that job satisfaction and career commitment are positively related to career development and are both outcomes of career development. The amount of variance explained for the two relationships were 43 percent and 35 percent, respectively providing confidence in the forecasted linkages. Both the relationships were significant at the p<0.001 level providing support for H3 and H4.

TABLE 4 : REGRESSION ANALYSIS FOR THE EFFECT OF CAREER DEVELOPMENT ON JOB SATISFACTION AND CAREER COMMITMENT (N=505)

Dependent Variable	Independent Variable	Adjusted R <sup>2</sup>	F	T
Job Satisfaction	Career Development	0.433	383.997	19.596*
Career Commitment		0.355	277.126	16.647*

Notes: a. F = F statistic, t = t statistic.  
b. \* p<0.001.

#### Impact of Gender on the Hypothesised Relationships

The mediating influence of gender on the four fundamental hypothesised relationships of the conceptual model was assessed by conducting a regression analysis, independently for males and females as reflected in Tables 5a and 5b. Table 5a suggests that the respondent males and females at the Singaporean hotel felt that career planning and career management were significant antecedents of career development. Table 5b also reports the relationship between job satisfaction and career commitment was mediated by gender. The models for the influence of gender on the fundamental hypotheses are reasonable given the adjusted R<sup>2</sup> values.

TABLE 5A: REGRESSION ANALYSIS FOR THE EFFECT OF GENDER ON THE HYPOTHESIZED LINKAGES BETWEEN CAREER PLANNING, CAREER MANAGEMENT ON CAREER DEVELOPMENT (N=505)

Dependent Variable	Independent Variable	Males (n = 245)			Females (n = 260)		
		AR <sup>2</sup>	F	t	AR <sup>2</sup>	F	t
Career Development	Career Planning	.547	295.45	17.19*	.427	193.79	13.92*
	Career Management	.381	151.35	12.30*	.211	70.13	8.38*

Notes: a. F = F statistic, t = t statistic.  
b. \* p<0.001.

TABLE 5B: REGRESSION ANALYSIS FOR THE EFFECT OF GENDER ON THE HYPOTHESIZED LINKAGES BETWEEN CAREER DEVELOPMENT, JOB SATISFACTION AND CAREER COMMITMENT (N=505)

Dependent Variable	Independent Variable	Males (n = 245)			Females (n = 260)		
		AR <sup>2</sup>	F	t	AR <sup>2</sup>	F	t
Job Satisfaction	Career Development	.557	308.00	17.55*	.319	122.28	11.06*
Career Commitment		.385	154.07	12.41*	.319	122.36	11.06*

Notes: a. F = F statistic, t = t statistic.  
b. \* p<0.001.

A comparison of means tests was conducted using the t-test technique to investigate into the significant differences between males and females for each of the assessed variables and the results are presented in Table 5c. From Table 5c, it can be noted that male employees reported significantly higher scores for career commitment than female employees. The mean scores of all other variables were none significantly different between males and females.

TABLE 5C: T-TEST RESULTS ACROSS GENDER FOR ASSESSED VARIABLES

Variables	Male (M)	Female (F)	Mean Difference (M – F)	Sig (2-tailed)	
Career Plan	5.32	5.33	0.00	0.98	n.s.
Career Management	4.86	4.66	0.19	0.07	n.s.
Career Development	5.56	5.53	0.03	0.79	n.s.
Career Commitment	5.18	4.95	0.23	0.03*	M>F*
Job Satisfaction	5.54	5.35	0.19	0.07	n.s.

Notes. a. \*p<0.05.  
b. n.s. = non-significantly different.

#### Impact of Age on the Hypothesised Relationships

The impact of age on the hypothesised relationships was also assessed by conducting a regression analysis on the linkages independently for the three age groups as presented in Tables 6a and 6b. The results of Table 6a suggests that the respondent age groups at the Singaporean hotel valued career planning and career management as significant contributors towards their career development initiatives. Table 6b reports career development initiatives were a significant predictor of job satisfaction and career for all age groupings.

TABLE 6A: REGRESSION ANALYSIS FOR THE EFFECT OF AGE ON THE HYPOTHESIZED LINKAGES BETWEEN CAREER PLANNING, CAREER MANAGEMENT ON CAREER DEVELOPMENT (N=505)

Dependent Variable	Independent Variable	<25 years (n = 110)			25 – 44 years (n = 295)			>44 years (n = 100)		
		AR <sup>2</sup>	F	T	AR <sup>2</sup>	F	T	AR <sup>2</sup>	F	T
Career Development	Career	.347	58.97	7.67*	.477	268.6	16.39	.573	133.9	11.57
	Planning					1	*		1	*
	Career Management	.286	44.70	6.69*	.226	86.96	9.325	.600	149.2	12.21
							*		1	*

Notes: a. F = F statistic, t = t statistic.  
b. \* p<0.001.

TABLE 6B : REGRESSION ANALYSIS FOR THE EFFECT OF AGE ON THE HYPOTHESIZED LINKAGES BETWEEN CAREER DEVELOPMENT, JOB SATISFACTION AND CAREER COMMITMENT (N=505)

Dependent Variable	Independent Variable	<25 years (n = 110)			25 – 44 years (n = 295)			>44 years (n = 100)		
		AR <sup>2</sup>	F	T	AR <sup>2</sup>	F	T	AR <sup>2</sup>	F	T
Job Satisfaction	Career Development	.394	71.99	8.483	.415	209.2	14.46	.532	113.5	10.66
Career Commitment		.337	56.50	7.52*	.307	131.2	11.46	.539	116.9	10.81
						1	*		1	*

Notes: a. F = F statistic, t = t statistic.  
b. \* p<0.001.

Table 6c delineates the ANOVA results for the three age categories utilising the Scheffé means test for the assessed variables. Employees in the first two age categories (less than 25 years and 25-44 years) placed a higher emphasis on career planning and career commitment compared to managers older than 44. Furthermore, career management, career commitment and job satisfaction mean scores were none significantly different across the three age groups.

TABLE 6C: ANOVA RESULTS ACROSS AGE FOR ASSESSED VARIABLES

Variables	Age Categories (in Years)			ANOVA		Means Comparison
	(A) <25 (n = 110)	(B) 25-44 (n = 295)	(C) >44 (n = 100)	F	Sig.	Scheffe test
Career Planning	5.41	5.42	4.96	7.29	.001	A>C*, B>C*
Career Management	4.77	4.70	4.89	0.94	.391	n.s.
Career Development	5.69	5.63	5.13	8.94	.000	A>C*; B>C*
Career Commitment	5.10	5.03	5.10	0.19	0.83	n.s.
Job Satisfaction	5.40	5.47	5.40	0.21	0.81	n.s.

Notes. a. F = F statistic, Sig. = level of significance  
b. \*p<0.01.  
c. n.s. = non-significantly different.

## Discussion

In spite of consensus for the value of career planning seldom is this actively embraced, healthily. Part of this paradox is underpinned by a perennial question of why individuals do not acquire ultimate responsibility for their career development. Another problem for the adoption of career planning by organisations and their employees is the huge amount of information, institutional material and available services, so choice becomes a challenge. A third reason can be that organisations, and sometimes the employees, are more concerned with tangible achievements (e.g., bottom line profits, work life balance), which can lead to less attention being given to engaging in career development planning. The ubiquity of change can be a fourth reason for low levels of interest in career development. A continuity of change, revitalisation and restructuring of organisational architectures together with an overall lack of confident, predictable ability does not encourage individuals and systems to grapple with long term career planning initiatives to articulate goals and objectives of a future 'phantom' situation.

Serious investment in career path planning can be hampered by the forces of globalisation. In particular, globalisation can contribute to environmental volatility and uncertainty as market forces are interrupted by crises, changing consumer expectations and national exigencies. A good example of how global forces can distract

attention for salient career related beliefs is demonstrated by the current Australian 'boom'. In the capital cities of Brisbane and Perth many people who have been engaged in professional and technical vocations and hold sound employment prospects (e.g., teachers, police, chefs, trades) are resigning from their companies in droves. These people are becoming the new employees of 'mineral groups' who are exporting ores and gas overseas and in particular to the People's Republic of China. Salaries in these new jobs are multiples of the payments of the previous employment. And the local workforce, now severely depleted is insufficient so the Australian government is providing restricted visas to an immigrant workforce in an endeavour to 'fill' the 'boom' vacancies. All know that when the 'boom' does collapse (some are predicting within five years) contracts will be cancelled. Within this labour market phenomenon traditional career planning frameworks are unravelling in preference for immediate short term employer and employee milestones.

Marketability of personnel, willingness to relocate and career impatience are also the features of the departure point of the study reported in this paper. Data were captured and analyses were undertaken to evaluate a theoretical, traditional based career planning encompassing conceptual model when it was disclosed by leavers that their expectations for career development were not being met. An analysis of a robust data set revealed the connections between the study variables, of the conceptual model, were as predicted and indeed, significant. In fact, all of the forecasted linkages were supported. Of substantial importance was a finding that both male and female respondents often reported similar high levels of importance for the examined constructs. Not unexpectedly, the cohort of older aged employees held the lowest levels of importance for career planning and career development. A strong inference of these findings is contemporary corporations in traditional HRM frameworks that were established on studies that were conducted a decade or more ago. More encompassing boundary less perspectives will be required to unravel some of the mystique about career planning for employees of modernity.

## **Conclusion**

A major dilemma for contemporary organisations is how to deal with the issue of career planning. Those institutions that fail to adequately pursue a satisfactory solution are likely to continually experience labour market crises. For instance, multinational corporations are adversely affected when the overseas projects suffer and their expatriates return earlier than planned. Furthermore, these companies suffer both direct and indirect costs, when the retention rates of these 'valuable' managerial groups are lost because of poor retention strategies. Clearly, a lack of sequence of the 'journey' and the 'final destination' of managerial cadres is the root of the poor career development of expatriates.

More efficient career planning frameworks will amalgamate employer and employee contributions. In traditional schemes the organisation fostered welfare career planning for employees who worked for their lifetime in the firm. In this arrangement employees abdicated their career planning to the employer who ensured the employee was retained and was promoted regularly (often slowly). This situation is unusual with younger employees in today's organisations. The modern employee is less concerned with preserved employment, but expects an opportunity to learn a bundle of skills that will prepare the incumbent for future jobs, not necessarily in the same organisation. In addition to acquiring skills for future vocational opportunity younger employees see career development to be more than just about a job. They see the process as being able to fulfil numerous personal expectations (i.e., psychological health, favourable work, work family interfacing). These expectations will impose a newer set of demands on employers, who in many instances have yet to realise the strategic importance of employees as partners.

## **Abstract**

Despite the utmost importance of knowledge sharing in modern organizations individuals tend to hoard knowledge and do not transform personal knowledge easily into organizational knowledge. This article is to explore which individual level factors influence the level of intension to share knowledge and the preference to knowledge sharing medium. We specifically focus on personality trait, individual ability, and the level of extrinsic and intrinsic motivation structure. A total of 207 participants answered questionnaires. Results of this study find that expertise; subjective norm and self-efficacy have significant influence on knowledge sharing intention, and agreeableness, reciprocity, self-efficacy have significant influence on knowledge sharing mechanism.

## **Introduction**

Knowledge sharing, or the contributions by individuals to the collective knowledge of an organization (Cabrera and Cabrera, 2002), is increasingly acknowledged as an important research topic. Knowledge sharing is crucial because it helps organizations promote best practices and reduce redundant learning efforts or 'reinventing the wheel' (Hansen, 2002; McDermott and O'Dell, 2001). To succeed in a knowledge economy, organizations need to develop systematic processes to create and leverage knowledge. However, In the KPMG (2003) survey, 78% of respondents believe they are currently missing out on business opportunities by failing to successfully exploit available knowledge. This result signifies that despite a growing understanding of the importance of knowledge sharing, the knowledge sharing within organizations remains a tough challenge (Burgess, 2005).

When knowledge sharing occurs, more people may have that same knowledge, and as a result, that knowledge is considered to be less valuable. Organization experts view the knowledge individuals possess as their intellectual property which gives them a personal advantage they can leverage for the organization they are working for and thus are reluctant to share with other coworkers (Bowman, 2002).

One person's primary motivation for sharing knowledge might be to accrue recognition and rewards, whereas another person might be primarily motivated by a desire to help his or her colleagues. Organizations need to take the initiative to foster such behaviors. Several factors have been identified to help create a high performing knowledge sharing, including leadership, rewards, organizational culture, and so on. Moreover, as more organizations now employ KMS to help them better manage knowledge, people who want to share knowledge may use a combination of many different media.

This paper will examine the effects of individual factors on knowledge sharing intention and knowledge sharing mechanism for two reasons. First, major portion of KM literature has put emphasis on information systems for KM as well as the macro level variables of organizations. However, research is needed on how individual characteristics (e.g., personality, motivation) influence knowledge sharing intention for a better understanding of KM, because people are the fundamental players of KM initiatives. Second, different organizations implement knowledge management in different ways including the use of KMS -a knowledge repository and a message board (Kankanhalli et al 2005; Wasko and Faraj, 2005). Some studies focused on knowledge sharing using COP (community of practice) (Wasko and Faraj, 2005; Ardichvili et al 2006). However, more research is needed to examine individual factors that influence the use of knowledge sharing mechanism.

## Theoretical Background

Organizations have come to realize the importance of capitalizing on the knowledge within the organization itself and have also realized that knowledge sharing would have a positive effect on organization performance.

There are many organizational factors that affect knowledge sharing; organizational structure, organizational culture, leadership and information systems (Davenport, 1998; Bock, 2005; Ardichvili, 2006). Interpersonal factors include avoidance of embarrassment, obligation, trust, and identification (Burgess, 2005; Faraj and Wasko, 2002). Some researchers examine individual factors that influence knowledge sharing such as individual ability greed, self efficacy, extrinsic rewards, fear of punishment, expected rewards, expected associations, expected contribution, perceived costs, extrinsic benefits, intrinsic benefits, anticipated extrinsic rewards, anticipated reciprocal relationships, sense of self-worth, and so on (Bock et al, 2002; Burgess, 2005; Faraj and Wasko, 2002; Wasko, 2005; Kankanli et al, 2005).

However, knowledge sharing is a fragile process comprising conflict of interest among the individuals involved (Von, 1998). Literature reveals numerous elements influencing the decision whether to share or conceal knowledge. For example, it encounters the particular case of a social dilemma (Cabrera, 2002). Social dilemmas are paradoxical situations in which individual rationality, maximizing the individual pay-off, leads to collective irrationality. Maximizing individual pay-off may evoke an individual's reluctance to share knowledge.

Despite its importance, little research has been conducted on how individual characteristics relate to knowledge sharing in spite of the rising interest in issues related to KM. However, in the sense that it is the individuals who are ultimately responsible for managing knowledge, it would be important to examine the intention of individuals to get a better understanding of how we may be able to promote knowledge sharing and better manage employees' knowledge.

There are primarily two different types of KM strategies: the personalization strategy and the codification strategy (Hansen et al, 1999). For those companies employing personalization strategy, the knowledge is usually transferred through direct person-to-person contact. And companies using codification approaches rely primarily on repositories of knowledge. Recently, technologies are commonly adopted for KM not only because of their capacity to store knowledge but also for the reason that with the globalization of the economy, KM processes expand to be across time and geographical distance. Knowledge management systems (KMS) have been used to facilitate organizational learning by storing organizational knowledge and having it available to employees when needed (Alavi and Leidner, 2001).

Knowledge sharing is a process where personnel communicate each other with their own knowledge, and diffuse knowledge from individual level to organization level. In order to make knowledge sharing easier and more popular, it is necessary that organization build a mechanism of knowledge sharing. In terms of mechanisms, Chai and colleagues (2003) defined the knowledge sharing mechanisms as the methods, procedures or processes involved in knowledge sharing within organizations.

Petersen et al (2003) found that firms use written documents as transfer mechanisms more heavily if knowledge is purchased from outside, whereas daily face-to-face communication is preferred for the transfer of knowledge generated by own experience. Alavi and Leidner (2001) identified four knowledge sharing mechanisms, informal or formal, personal or impersonal mechanisms. Informal mechanisms such as unscheduled meetings, informal seminars, or coffee break conversations; formal sharing mechanisms such as training sessions and plant tours; personal mechanisms such as apprenticeships or personnel transfers; impersonal mechanisms such as knowledge repositories. In recent years, Communities of Practice (COP) have gained increasing popularity as a medium of knowledge sharing within organizations (Ardichvili et al, 2006), and have also received significant attention (Wasko and Faraj, 2000; Davenport and Prusak, 1998; Davenport and Volpel, 2001; Ardichvili et al, 2006). In this vein, Bartol and Srivastava (2002) also identified four knowledge sharing mechanisms, that is, database, formal interactions, and informal interactions, and Communities of Practice (COP).

## The Research Model and Hypotheses

The research model shown in Figure 1 proposes an integrated model in which knowledge sharing intention and knowledge sharing mechanism are influenced by four sets of factors: personality traits (agreeableness, conscientiousness) and individual ability (expertise, tenure in the field) and extrinsic motivation (rewards, reciprocity, subjective norm) and intrinsic motivation (self-efficacy, reputation).

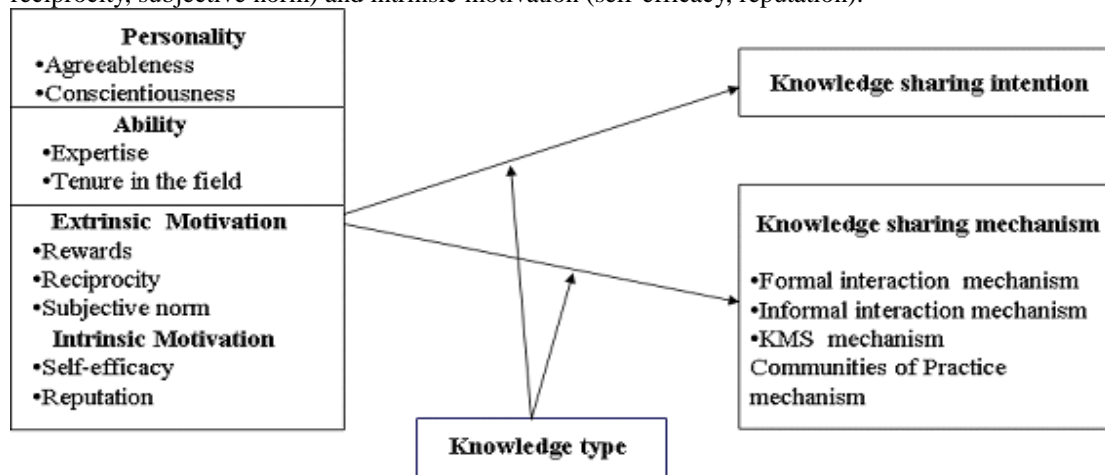

FIG.1: RESEARCH MODEL

### Personality Trait

The definitions of agreeableness show that individuals who are high on these traits also have high level of trust, straightforwardness, altruism, compliance, modesty, and tender-mindedness. It is of their nature to help others. Cooperation is considered to be the essence of agreeableness (Barrick et al., 1998). Highly agreeable individual shows high emotional attachment to, identification with, and involvement in the organization. Particularly, agreeableness contains the facet trust that has been related to knowledge sharing (Abrams et al.2003). Individuals with high conscientiousness have been reported competence, order, dutifulness, achievement striving, self-discipline, and deliberation. Due to these characteristics, people tend to do what is expected of them to accomplish work (Liao and Chuang, 2004). Matzler et al (2005) found agreeableness and conscientiousness were related to affective commitment and documentation of knowledge, which in turn, had an influence on knowledge sharing. Thus, this study expects agreeableness and conscientiousness to directly influence knowledge sharing intention and knowledge sharing mechanism. This leads to the first set of hypotheses.

**Hypothesis 1:** Personality will have a positive effect on one's intention to share knowledge.

**Hypothesis 2:** Personality will have a positive effect on the use of knowledge sharing mechanism.

### Personal Ability

This study view ability as made up of two related factors: expertise and tenure in the field. Before an individual can contribute knowledge to others, that individual must possess a certain level of requisite base knowledge. Even if an individual is highly motivated to contribute knowledge to others, contribution is still unlikely unless he or she has the requisite knowledge to contribute. In addition, people are less likely to contribute when they feel their expertise is inadequate (Wasko & Faraj, 2000). Long time members of an organization are more likely to comprehend the application of expertise (Faraj & Wasko, 2002). It also seems reasonable to posit that the ability of individuals with high level expertise and longer tenure will influence the use of knowledge sharing mechanism. This leads to the following hypotheses.

**Hypothesis 3:** Ability will have a positive effect on one's intention to share knowledge.

**Hypothesis 4:** Ability will have a positive effect on the use of knowledge sharing mechanism.

### Extrinsic Motivation

Employees are extrinsically motivated when satisfaction does not lie in the content of the activity itself (Ko et al, 2005). O'Dell and Grayson (1998) argue that an important leadership role for senior management is to reinforce and reward behaviors for sharing knowledge. Especially, the results of Bock and Kim's (2002) field survey indicate that extrinsic motivation imposed by management is a trigger for knowledge sharing.

Extrinsic motivation is related to rewards, reciprocity and subjective norm. Rewards are a compensation for the contribution to the organization. To encourage sharing knowledge through certain mechanism, organizations may provide various forms of reward such as increased pay, bonuses, job security, or promotion (Ba et al 2001). Surveys have found that the majority of managers and executives do not believe that their organization adequately rewards or recognizes knowledge sharing (KPMG, 2000); nonetheless, companies that have been leaders in knowledge management have utilized extrinsic rewards (Davenport & Prusak, 1998). Extrinsic rewards have also been demonstrated to increase knowledge sharing across work units (Irmer et al, 2002; Burgess, 2005).

Reciprocity refers to the expectation of knowledge contributors that their current contribution will lead to their future request for knowledge being met (Kankanhalli et al 2005). Prior research suggests that people who share knowledge in online communities believe in reciprocity (Wasko & Faraj 2000). Further, researchers have observed that people who regularly helped others in Electronic knowledge repositories (EKR) tended to have a high level of reciprocity expectation (Kankanhalli et al 2005).

The subjective norm construct, defined as a person's perception that people who are important to him think he should or should not perform the behavior in question (Ajzen, 1991; Venkatesh and Davis, 2000), has received considerable empirical support as an important antecedent to behavioral intention (Thompson et al 1991). In particular, Bock et al, (2005) argue that subjective norms have an important influence on intention to share knowledge. This leads to the following hypotheses.

**Hypothesis 5:** extrinsic motivation will have a positive effect on one's intention to share knowledge.

**Hypothesis 6:** extrinsic motivation will have a positive effect on knowledge sharing mechanism.

#### **Intrinsic Motivation**

In contrast to extrinsic motivation, employees are intrinsically motivated when their needs are directly satisfied or when their satisfaction lies in the content of the activity itself. Intrinsic motivation occurs when an activity' is valued for its own sake and appears to be self sustained (Ko et al 2005).

Osterloh and Frey (2000) conclude that intrinsic motivation should enable the transfer of tacit knowledge. O'Dell and Grayson (1998) found intrinsic motivation important to transferring best practices, project management, business reengineering, database administration, and systems integration as illustrated by ERP implementation.

Intrinsic motivation is related to self-efficacy and reputation. Self-efficacy is defined as people's judgments of their capabilities to organize and execute courses of action required to attain designated types of performances (Bandura 1986). When people share expertise useful to the organization, they gain confidence in terms of what they can do and this brings the benefit of increased self-efficacy (Constant et al. 1994). This belief can serve as a self-motivational force for contributors to share knowledge (Bock & Kim 2002), improve work efficiency, or make a difference to their organization (Wasko & Faraj 2000). In particular, self-efficacy significantly impacted EKR usage by knowledge contributors (Kankanhalli et al, 2005).

Reputation refers to the overall quality or character as seen or judged by other people, or the recognition of some specific contribution to the organization by other people. In today's organizations, the importance of reputation is increasing as traditional contracts between organizations and employees based on length of service erode (Ba et al. 2001; Davenport et al.1998). In such working environments, knowledge contributors can benefit from showing others that they possess valuable expertise (Ba et al. 2001), which earns them respect and status. Therefore, knowledge contributors can benefit from improved self-concept when they contribute their knowledge (Hall 2001). Moreover, Wasko and Faraj (2005) found one significant predictor of individual knowledge contribution is the perception that participation enhances one's professional reputation.

This leads to the following hypotheses.

**Hypothesis 7:** Intrinsic motivation will have a positive effect on one's intention to share knowledge.

**Hypothesis 8:** Intrinsic motivation will have a positive effect on the use of knowledge sharing mechanism.

#### **Knowledge Types**

The last factor to consider is the type of knowledge to be transferred. There are suggestions for examining types of

knowledge. The tacit-explicit knowledge classification is widely cited (Alavi & Leidner, 2001). Clearly, tacit knowledge is personal and is hard to communicate to others. Explicit knowledge is much easier to capture and sharing. The transfer of tacit knowledge is far more difficult than explicit knowledge (Argote, 2000). In this vein, Dixon (2000) emphasized that the selection of the appropriate knowledge sharing mechanism within an organization depends on the type of knowledge (explicit and tacit).

Knowledge types are a determinant of estimating the time and cost of knowledge transfer and choice of sharing mechanisms (Pedersen, 2003). This implies that individual's knowledge sharing intention and the choice of knowledge sharing mechanism depends upon the type of knowledge being transferred. This leads to the following hypotheses.

**Hypothesis 9:** Knowledge types will moderate the effect of individual factors on the intention to share knowledge.

**Hypothesis 10:** Knowledge types will moderate the effect of individual factors on the use of knowledge sharing mechanism

## The Research Model and Hypotheses

### Measurement Development

To test the proposed research model using a survey research method the questionnaire items are developed either by adapting measures that had been validated by other researchers or by converting the operational definitions of constructs into a questionnaire format. The variables are measured using five-point Likert type scales. Bases on the typology developed by Parikh (2001) this study classified the knowledge of question into four categories, internal-tacit, external-tacit, internal-explicit, and external-explicit. And based on research developed by Bartol and Srivastava (2002), four major mechanisms to share individual knowledge were identified; Knowledge management system (KMS), Community of Practice (COP), Formal interaction, Informal interaction. Table 1 shows the definitions of the constructs.

TABLE 1: DEFINITION OF THE CONSTRUCTS

Construct	Definition	Reference	Items
Agreeable-ness	People who are agreeable are described as trusting, forgiving, courteous, helpful, and cooperative. The facet scales of this domain are Trust, straightforwardness, altruism, compliance, and modesty. Tender-mindedness.	Barrick & Mount (1991) Liao & Chuang (2004)	6
Conscientious-ness	Conscientious individuals are described as dependable, hardworking, organized, and achievement-oriented. The facet scales of this domain are competence, order, dutifulness, achievement striving, self-discipline, and deliberation.	Barrick & Mount (1991) Liao & Chuang (2004)	6
Expertise	Refers to performing the responsibilities required of professionals to the standards necessary for effective practice	Campbell (1993) Wasko (2005)	4
Tenure in the field	Refers to the number of months individual has been a member of the professional association.	Faraj & Wasko (2002)	1
Rewards	The degree to which one believes that one can have extrinsic incentives due to one's knowledge sharing.	Bock & (2002) Ko (2005)	3
Reciprocity	The degree to which one believes one can improve mutual relationship with others through one's knowledge sharing.	Wasko (2005) Kankanhalli(2005)	2
Subjective norm	The degree to which one believes that people who bear pressure on one's actions expect one to perform the behavior in question.	Venkatesh (2000) Bock et al (2005)	3
Self-efficacy	The degree to which one believes that one can improve the organization's performance through one's knowledge sharing.	Bock (2002) Lu et al (2006)	4

Reputation	The degree to which one believes one can enhance one's status in one's social system through one's knowledge sharing.	Venkatesh (2000) Wasko (2005)	3
Knowledge sharing intention	The degree to which one believes that one will engage in a knowledge act.	Bock et al (2005)	1
Knowledge types	Internal-Tacit, external-tacit, internal-explicit, external-explicit.	Nonaka, 1995, Parikh, 2001.	4
Knowledge sharing mechanisms	As the methods, procedures or processes involved in how knowledge might be shared within organizations.	Alavi, 2001, athryn (2002), Chai (2003)	4

### Survey Administration

The study was conducted in Korea, a country where a number of public and private organizations have conducted KM initiatives. Self-administered questionnaires were distributed out and accompanied by an e-mail survey. Of 180 questionnaires that were distributed to part-time MBA students of Hanyang University and to employees of Korean National Information Society Agency, 141 questionnaires were returned completed. E-mail survey was distributed to three of Samsung subsidiary companies' employees and a total of 81 people completed. Due to incomplete data, 15 responses were eliminated and the remaining 207 responses were analyzed.

### Validity and Reliability

Factor analysis for independent variable yielded 8 components with Eigen-values above 1, with expertise and tenure in the field combined into one component. In order to improve the validity and reliability, two items of the agreeableness construct were deleted due to low loadings; four items were dropped from the conscientiousness construct. One item of the tenure in the field scale had to be deleted due to low loading, one from self-efficacy, and one item was dropped from reputation.

### Hypothesis Tests

We tested the hypotheses using multiple regression analysis (SPSS 12.0 for Windows). All statistical tests were carried out at a 5 percent level of significance, after ascertaining that the constructs meet parametric requirements of the regression test.

### Testing the Main Effects

The  $R^2$  value of 0.179 and adjusted  $R^2$  value of 0.142 indicated that the overall model was acceptable in explaining the variance in knowledge sharing intention. Expertise ( $\beta=0.156, p<0.05$ ), subjective norm ( $\beta=0.170, p<0.05$ ), and self-efficacy ( $\beta=0.181, p<0.05$ ) had a significant relationship with knowledge sharing intention. The  $R^2$  value of 0.163 and adjusted  $R^2$  value of 0.124 indicated that the overall model was acceptable in explaining the variance in knowledge sharing mechanism. Agreeableness ( $\beta=0.172, p<0.05$ ), reciprocity ( $\beta=0.141, p<0.05$ ), and self-efficacy ( $\beta=0.178, p<0.05$ ) had a significant relationship with knowledge sharing mechanism.

### Testing the Moderating Effects

Through multiple regression analysis under the four knowledge type's condition, as may be seen in Table 2, which summarized the regression results under four knowledge type's condition, the moderating variable indicated a significant effect in knowledge sharing intention as well as knowledge sharing mechanism.

### Results of Hypothesis Testing

Table 3 summarizes the results of hypotheses tests. Expertise, subjective norm, and self-efficacy had a significant positive relationship with knowledge sharing intention. Agreeableness, reciprocity, and self-efficacy had a significant positive relationship with knowledge sharing mechanism. As mentioned above, the moderating variable (knowledge types) indicated a significant effect in knowledge sharing intention as well as knowledge sharing mechanism. Individuals' choices of knowledge sharing mechanisms were estimated using multiple regression analysis under the four knowledge type's condition. By comparing the explanatory power of each model under the four conditions, we ranked the individuals' choice of the knowledge sharing mechanism. Table 4 summarizes the ranking of individuals' choice of knowledge sharing mechanism. Furthermore, results indicated that formal interaction mechanism is the most preferred knowledge sharing mechanism within each of the four knowledge

types' condition.

## **Discussion and Implications**

Based on our results, agreeableness did not significantly affect knowledge sharing intention, but significantly affected knowledge sharing mechanism. Indicating that the more agreeable one was, the more likely they affect their choice of knowledge sharing mechanism. This study also found that expertise has a significantly affect knowledge sharing intention, implying that individuals with higher levels of expertise tend to actively share their knowledge, thus, making experts play a vital role in organizations by sharing knowledge to the benefit of others.

The result did not indicate that awards had a significant effect on knowledge sharing intention or knowledge sharing mechanism, whereas many practitioners mentioned that rewards played an important role in knowledge management. Reward may be a trigger for knowledge sharing, but they are not a fundamental force for forming a person's intention to share knowledge.

TABLE 2: THE RESULTS OF REGRESSION UNDER FOUR KNOWLEDGE TYPES' CONDITION

Knowledge type	Dependent variable	Independent variable	Beta(Sig)	R <sup>2</sup>	Adjusted R <sup>2</sup>
Internal Tacit	Knowledge Intention	Self efficacy	.174(.031)*	.093	.061
		KS mechanism	Self efficacy	.250(.001)**	.156
	Reputation	.191(.005)**

External -tacit	Formal interaction	COP	KMS	Informal interaction
Internal-explicit	Formal interaction	COP	Informal interaction	KMS
External -explicit	Formal interaction	Informal interaction	COP	KMS

### Implications

The result shows why there is a lack of usage of knowledge management systems to share knowledge despite a high level of expectation from and investment into the implementation of KMS. Based on our findings, this study proposes the following suggestions to those leading knowledge management initiatives or otherwise desiring to encourage knowledge sharing within their organizations.

First, emphasize efforts to nurture the targeted social relationships and interpersonal interactions of employees before launching knowledge sharing initiatives. In particular, fostering a work context characterized by high levels of organizational citizenship is likely to nurture the mutual social exchange relationships that are apparently important in driving knowledge sharing intentions.

Second, actively support the formation and maturation of robust referent communities within the workplace. In particular, be sure to provide appropriate feedback to employees engaged in (or not engaged in) knowledge sharing. Such actions follow the findings on the importance of exerted pressure from one's referent groups (e.g., peers, supervisors, senior managers, etc) to engage in knowledge sharing behaviors.

Third, should pay more attention to enhancing the positive mood state for social associations which precedes knowledge sharing intention and should provide useful feedback to improve the individual's self-efficacy instead of designing a reward system. Do not stress extrinsic rewards as a primary motivator within knowledge sharing initiatives.

Finally, the individuals are more likely to choose formal interaction mechanism to share knowledge, such as training sessions, seminars, periodic meetings held in teams and departments etc. It might be possible for an organization to allocate certain amount of performance appraisal weight to the sharing of knowledge. Management should hold formal events and sessions for employees to share knowledge, even though it takes time.

### Limitation for Future Research

Although this research has focused on individual factors which affected the knowledge sharing and mechanism, considering the fact that facilitating knowledge sharing is a complex challenge, other factors need to be considered in a more integrative way in practice and in the future research.

While many prior researches have indicated that trust is a significant predictor of knowledge sharing, this study only found that agreeableness, which contains facet trust, has a significant relationship with knowledge sharing mechanism, not knowledge sharing intention. The result of this study suggests that agreeableness for knowledge management may need to be further examined. Future studies should, however take a more comprehensive view and include the remaining three dimensions of personality traits (extraversion, openness to experience, and neuroticism) as predictors. Extroversion contains the facets of warmth, gregariousness, activity, excitement seeking, and positive emotions. Extrovert individuals are likely to communicate with others and provide knowledge so that other people would be able to get to know more about them (Flynn et al, 2001). Openness to experience is described with the attributes such as fantasy, aesthetics, feelings, actions, ideas, and values. This trait could be related to the use of new tools or information technologies that facilitate knowledge sharing. As technological developments signifies high level of functional convergence, and as enhanced mixture of functionality

with channel capacity and mobility be available, the effects of such advanced, rich, and time-sensitive medium also deserve extensive future research.

*Zhiqiong Wang,*

*The University of New South Wales, Australia*

## Abstract

This paper presents a descriptive study of the evolving contemporary franchising industry in China. Recent domestic policy changes have made this an extremely lucrative market for multinational franchisors wishing to enter China. Estimates suggest that the current Chinese franchising market, pegged at USD 25 billion and 2.4 million job opportunities, is growing at the annual rate of 53 percent (China Chain Store and Franchise Association, 2005). While seventy percent of the top twenty franchisors and thirty six percent of the top 200 of the global franchising giants have already entered China, the franchising industry is in its rapid and steady stage. The total amount of franchising systems increased by ten point five percent and amount of franchising systems reaches 2320. Outlets increased by thirty eight percent and amount to 0.168million. The average outlet of each franchising system is 57. The final character of franchising in China will soon be determined by the early franchise systems already in operation in China, and the system that enter the fray in the near future. We also provide an account of prospects and caveats for entering the Chinese market as a franchisor.

## Introduction

Franchising as a method of business operation was introduced to China by US fast food pioneers in the late 1980s in an environment which was by then increasingly receptive to foreign investment and Western concepts under Deng Xiaoping's economic reforms and open-door policies. Since the introduction of franchise regulation in 1997, the Chinese franchising sector has grown rapidly through its adoption by both international and domestic franchising companies. With 2320 franchise systems, China is already the most franchised country in the world in terms of systems, although the scale of operations is still very limited from both per capita and percentage of GDP perspectives. Franchising accounts for only 3 percent of China's retail sales compared to 40 percent in US (Yan, 2005). Systems average 43 outlets compared to 540 outlets in the USA (Guo, 2005).

Since China re-engaged with the international community and commenced a massive economic reform program in the late 1970s, its economic development has been remarkable with an average annual growth rate of over 8%. With its rapid economic growth and its 1.3 billion, increasing wealthy, population, China is potentially the largest market in the world. These factors, in combination with a relatively stable political environment, have made China the most popular destination in the world for foreign direct investment (National Bureau of Statistics of P.R.C, 2003). Franchising has thrived in this environment, but until the franchise pioneers KFC and McDonald's commenced operations in China, the word "franchise" was not a part of the Chinese language. Terry and Wang (2005) point out that ironically despite introducing the franchising concept to China, these fast food pioneers did not initially use franchising to expand their businesses, and even today operate primarily through directly owned and managed "chain" operations. In 1997 the Government promulgated China's first franchising regulation which not only provided a basic framework for the operation of franchising but also facilitated its growth. China's increasing engagement in the global community, together with its accession to the WTO in 2001, has also influenced the development of franchising in China through liberalization of foreign investment in the franchise sector.

If the entry of KFC in 1987 is taken as the first contact China had with franchising, its development can be divided into several stages. The first stage was the introduction of the franchise concept by the US fast food pioneers (1987-1992). The second stage was the adoption of franchising by local enterprises (1992-1997). The third stage was the rapid growth of franchising which has been accompanied by predictable problems (1997-2005).

## Introduction of the Franchise Concept by International Franchisors

Franchising as a method of doing business is a US invention and was introduced to China in the way same it was introduced to other countries - by the international expansion of US franchise enterprises, particularly the fast food systems. English, & Xau (2001). English, & Xau (2001) find out that KFC was the first major US fast-food franchise company to enter China. In February 1986, after nearly three years of negotiations with government agencies, it entered into a joint venture contract with two state owned enterprises – Beijing Corporation of Production and Processing and Beijing Travel and Tourism Corporation. On 12 November 1987, KFC opened its first outlet, in Beijing. Its distinctive outlet and its distinctive product attracted massive consumer interest. The opening day of the 650 seat Beijing restaurant was a great success breaking KFC world sales records. Its initial success led to its rapid expansion throughout China. By mid 1996, KFC had 100 outlets and today it has over 1,500 outlets in more than 260 cities. Its expansion is outlined in Figure 1.

FIG. 1: KFC EXPANSION CHART

Source: [http://www.kfc.com.cn/kfccda/aboutus/index\\_china.aspx](http://www.kfc.com.cn/kfccda/aboutus/index_china.aspx)

McDonald's entered into a joint venture contract with Beijing Corporation of Farming Industry and Commerce in November 1990. McDonald's was a later entrant into the Chinese market opening its first outlet in 1990. Although it first adopted a similar strategy to KFC in establishing a joint venture with a state owned enterprise, it commenced its operation not in the national capital but in Shenzhen in the south of China, one of the first Special Economic Zones established by Deng Xiaoping to experiment with foreign investment. McDonald's soon moved to Beijing and in April 1992 opened an outlet in Wangfu Jin (the major shopping street of Beijing) which is still the largest in its 30,000 plus worldwide chain. Today, McDonald's has more than 600 outlets in China (McDonald's website, 2005).

Since then, other international franchise companies have commenced operations in China. Pizza Hut and hotel chains Marriott and Holiday Inn entered China in the early 1990s. Century 21 appointed its first master

franchisee in 2000 and has expanded rapidly. It now has 500 outlets with 5,000 brokers and a RMB10 billion (US\$1.21 billion) annual turnover. 7-eleven, Carlson Wagonlit Travel, Coldwell Banker Real Estate, Subway, Taco Bell, Domino's Pizza, Sheraton, among others are established in China. Burger King opened its first restaurant in Shanghai in 2005 and plans to have a 1,000 restaurant chain within a decade ( Desutter, S. 2005). Today, of the world's top 20 franchise chains in terms of worldwide sales (Franchise time,2005), 15 are in China.

Although the entry of internationally prominent US franchise systems introduced the concept of franchising to China, their operations currently are primarily through managed chain operations rather than through franchised operations. For example, of KFC's 1,500 outlets only about 70 are franchised (Su, 2005) – a small but nevertheless much greater proportion than for McDonald's which currently has only one franchised outlet in its 600 restaurants network.. Zhou (2005) defines that McDonald's nevertheless plans to commence a franchising strategy, outside the major cities in which it is already established in 2006. Because of a combination of regulatory, commercial and cultural factors, most foreign companies have established joint ventures with local companies, and for similar reasons, have expanded their operations through directly owned and managed owned outlets, rather than through franchising.

### **Adoption of Franchising by Local Enterprises**

The success of the US fast food companies alerted the local business community to the unique advantages of the franchising concept and encouraged its adoption by local entrepreneurs. Li (2000) points out that the first Chinese enterprise to franchise its operations is reputed to be Lining Corporation, a sportswear company established in 1990 by Li Ning – a sporting legend, who won three gold medals in gymnastics of the 1984 Olympics. Li Ning expanded his business from 1993 through franchising, and soon created another legend by developing his system throughout the country.

Another early entrant was the Quanjude Group which was established in 1993 to take over Quanjude - the oldest and most famous Peking duck restaurant in Beijing which originally commenced operation in 1864. The Quanjude Group quickly adopted franchising to expand its operations, and it currently has more than 60 stores of which 37 are franchised. It is one of the few Chinese franchise companies that has franchised outside China with restaurants in the US and Japan and a proposal to open in Chinatown in Sydney Australia (China Chain Store and Franchise Association, 2005)

Lining has become the leading domestic sportswear company and has been a franchising role model for private enterprises. Quanjude has become a role model for anachronistic state owned enterprises diversifying, reviving and re-establishing their relevance. Encouraged by their successes, many other local enterprises have started to franchise, including supermarket chains HuaLian and Lianhua, leisure restaurant Donglaishun, dry cleaning chain Rongchang, and Chinese style fast food chain Malan Noodle. These successful domestic franchisors have led to the wider adoption of franchising by local enterprises.

### **Rapid Growth and Emerging Problems**

The high profile and success of foreign systems, such as KFC, McDonald's and Pizza Hut, and local systems such as Lining and Quanjude, led many Chinese entrepreneurs to believe that franchising was a magic formula and a guarantee of business success. Enterprises traded off the proven success of franchising to promote their franchise systems and their consulting services. Slogans such as “to be the McDonald's of China”, “the 10,000 stores project” and “boss making factory” were frequently used. Guo (1999) notes out that franchising as a business strategy was widely utilized in expanding industry sectors but was practiced by many franchisors, franchisees and consultants without a comprehensive understanding of franchising or an appreciation of the factors on which its success had been built. As its development in other countries, franchising was diminished by inappropriate practices, and by “scam merchants”, who cheated investors using the good name of franchising. Negative comments in the media undermined people's confidence in franchising.

A 1995 speech made by former Premier Li addressed the need for the healthy development of franchising to protect franchisees first signaled the Government's interest in the orderly development of the sector. It was soon followed by China's first official acknowledgment of franchising in the 1997 Opinion on Regularizing the Operation and Management of Chain Stores which defined three forms of chain stores including the "franchise chain" and the 1997 Administrative Measures for Franchising Operation (Trial Implementation) (hereinafter the 1997 Franchise Measures) which defined franchising for the first time in Chinese law and set out an elementary set of administrative rules for its operation. Opinion on Regularizing the Operation and Management of Chain Store issued by the Ministry of Internal Trade on 27 March 1997. Article 4 defines three forms of chain stores:

- Direct managed chain ---- a chain of stores all owned and operated by one head office;
- Voluntary chain --- individual companies voluntarily agree to trade under the same name but maintaining their own independence and autonomy;
- Franchise chain --- franchisor and franchisee continue a relationship under a contract, which allows the franchisee to use franchisor's trademark or trade name, technology, management skill and distribute goods and services produced by the franchisor. The franchise chain under this article is similar to the Western concept of the business format franchise.

The regulatory implications of the 1997 Franchise Measures were obviously significant but their greatest impact has perhaps been on communicating the Government's support for franchising concept and encouragement of its adoption. 1997 is also significant as in that year the China Chain Store and Franchise Association (CCFA) was approved and registered by the Ministry of Civil Affairs to formulate trade regulations on franchising operations develop disciplines in the industry and to provide services to both franchisors and franchisees.

## **Franchising Systems in China**

Although China has recently emerged as the most franchised country in the world in terms of system numbers, the economic impact of its franchise sector is still at an embryonic stage. There is a massive potential for future growth as franchising business currently accounts for only 3 percent of China's total retail sales, starkly behind the 40 percent in the United States (Guo, 2005).

Franchising as a method of business operation in China today is used by both local and foreign companies to access a wide range of industry sectors. Businesses in diverse sectors have used franchising to expand their operations. Currently in Beijing there are 70 types of industries in chain store businesses of which over 40 have utilized franchising. Due to the increased pressures in the workplace and the need for leisure activities there are increased demands on time, and home services are becoming increasingly popular. Franchise systems have quickly responded to this niche. The figure below shows that fast food restaurants, retail and household services are currently the three most popular areas for new franchise investment in China.

Sectors		Average Growth of Outlets %		Average Growth of Turnover %	
		Franchisors	Franchisees	Franchisors	Franchisees
1	Real Estate	75.48%	79.06%	150%	190%
2	Home Decoration	48.7%	85.2%	58%	62%
3	Education	31.2%	41.8%	30.2%	30.5%
4	Bookstores	8.51%	7.43%	8.12%	7.28%
5	Laundry	24.81%	21.43%	46.43%	45.66%
6	Chinese Restaurant	34.72%	37.92%	27.28%	24.59%
7	Clothing	18.07%	15.54%	26.19%	28.22%
Average		33.18%	37.87%	33.94%	40.15%

FIG. 2: AVERAGE GROWTH OF OUTLETS AND TURNOVER  
Source: The 2005 Blue Book Report of Franchising and Chain Performance in China,

Although franchise systems in China account for only a small percentage of retail sales, their sales growth has been extremely rapid. The sales growth of the franchise sector has averaged 40 per cent over the last few years, far greater than the 10 percent annual growth rate for national consumer sales (Bian & Ilan, 2003). However, the growth rates of various industries are different.

FIG.3: DISTRIBUTION OF FRANCHISE SYSTEM IN INDUSTRY SECTORS

The introduction of international franchise brands and the emergence of local franchise enterprises have led to the development of increasing franchising expertise. Chinese franchising is increasingly characterized by growing maturity in the organization of the wider sector. The government promotes franchising in different ways, including supporting the CCFA in its exhibitions and data collection. The CCFA has hosted National Franchise Conference and Expo in Beijing annually since 1999 and International Franchise Forum and Expo in Shanghai annually since 2002. The CCFA also has played an important role in education and obtaining statistical data. Zhu & Li (2004) claim that exhibitions held by national and provincial industry associations and private sector companies have increased to more than three per month on average, and these have grown each year

in terms of franchise brands marketing their systems, potential investors and attendees. Academics have been attracted by the booming franchise sector as a significant research field. The International Franchise Academy of Beijing Normal University in Zhuhai, the University of International Business and Economics and China University of Political Science and Law have played a leading role in sector research. These and other universities offer subjects in franchising and the International Franchise Academy offers a dedicated four year franchising degree, believed to be the first such initiative in the world. Books, magazines and websites devoted to franchise have increasingly appeared and the sector is now the subject of wide general interest.

However, although franchising has been enthusiastically embraced in China by enterprises looking to expand, by individuals wishing to enter business sectors using another's proven system. The development of franchising is uneven across China. Franchising is well developed in the major cities such as Guangzhou, Beijing and Shanghai which have been most exposed to economic reform and Western influences, but the vast majority of Chinese do not live in these major cities. The benefits of economic reforms have not been evenly shared across China and, to the majority of the Chinese population, franchising is still not well known. The chain store (including franchise chain and direct owned chain) and retail enterprises in the municipalities of Shanghai and Beijing and the provinces of Jiangsu and Guangdong account for almost 70 percent of total chain store and retail sales of the whole country.

## **Prospects and Caveats on Franchising in China**

Another reality of the Chinese franchise sector today is that many domestic systems are still at an early stage of development. Successful franchise systems develop from successful prototype business operations and pilot operations, from which the essential operational formats and management systems are tested, refined and documented. Franchising is the replication of a proven business concept through a proven business system. It has been the metamorphosis of franchising from unsophisticated product and trade name distribution arrangements to comprehensive business format franchising arrangements which has driven the growth and development of franchising throughout the world. The essence of contemporary business format franchising is replication of proven systems incorporating comprehensive managerial and operational protocols. However, in China, domestic franchising is generally at an early developmental stage. 30 percent of the franchisors do not have a franchise manual, and 20 percent of them have no operation manual. The term "franchise" is widely used to describe the arrangement which is often simply unsophisticated distribution arrangements offering little in the way of operational formats, assistance and training.

This is not an experience unique to China and most, probably all, franchise sectors in their early stages of development experience predictable growing pains. Many of these problems arise from a lack of understanding of franchising and the intricacies of the franchisor/franchisee relationship. Unethical practices are also common. The problems were summarized by Guo Geping, the Chairperson of CCFA, in her speech to the CCFA International Franchise Forum on 19 October 2004, Shanghai, as follows:

- Franchisors may commence franchising without meeting the basic requirements such as having a registered trademark or sufficient experience or a proven system;
- Franchisors may not disclose information appropriately or sufficiently - information regarding the risk of operation may not be adequately disclosed, or the potential profit may be exaggerated;
- Franchisors may stop supplying ongoing support and services to franchisees after the franchise fees are collected, or engage in other fraudulent practices;
- Franchisors and franchisees may knowingly breach the franchise contract;
- Franchisees may not pay franchise fees as specified or may infringe the franchisor's intellectual property.

Infrastructure necessary to support the sector is still at an early stage of development. While banking, accounting, marketing, insurance and legal services are increasingly available. Supply chain management and logistics, human resources and managerial expertise are developing more slowly and are current obstacles to orderly expansion. The foreign franchisor in China also faces problems arise from cultural traits such as a lack of respect for regulatory regimes for business and feudal ideas of "being the head of a chicken than

the tail of a cow". Such characteristics aggravate the franchisors management challenge and may threaten the unity of franchise systems and harm the entire franchise business.

The problems are exacerbated by the uneven development of commerce and franchising across China. Despite a national language, there is a great variety of dialects in addition to cultural, social and demographic differences. China's growing body of regulatory laws is applied at the regional and local level and the different administrative regimes have complicated the expansion of franchise systems into geographically dispersed regions. Most of the infrastructure issues except the major cities, particularly logistics, are complicated.

In China, as in other countries, the law has a significant role in improving the environment for franchising. UNIDROIT (2005) defines a "healthy commercial law environment" as "one with general legislation on commercial contracts, with an adequate company law, where there are sufficient notions of joint ventures, where intellectual property rights are in place and enforced and where companies can rely on ownership of trademarks and know-how as well as confidentiality agreements". Generally speaking, laws relevant to the franchise operation such as intellectual property protection law, joint venture law, foreign owned enterprise law and contract law have been revised according to the requirements of WTO accession. However, the enforcement of the laws is an ongoing concern.

Franchise specific problems have to some extent been addressed by specific franchising regulation. Besides the USA, China was one of the first countries to adopt specific franchising regulation. The 1997 *Administrative Measures on Commercial Franchising (Trial Implementation)* (the 1997 *Franchise Measures*) were promulgated by the then Ministry of Internal Trade "for the purpose of standardizing franchise operations, protecting the lawful rights and interests of both the franchisor and the franchisee, and further promoting the growth of chain business". The 1997 *Franchise Measures*, together with other relevant regulations, provided a basic framework for the operation of franchising in China at that time, but applied only to domestic enterprises which created doubts as to the status of foreign franchisors and the enforceability of their contracts. To meet its WTO commitments, the Ministry of Commerce issued new *Administrative Measures on Commercial Franchising* (the 2005 *Franchise Measures*) on the last day in 2004, which took effect on February 1 of 2005. The 2005 *Franchise Measures* establish legal requirements for franchise operations in China for both foreign and domestic franchisors. It honored WTO commitments by subjecting domestic and foreign franchising enterprises to the same regulation. (The 2005 *Franchise Measures* nevertheless provide that before a foreign invested company can franchise in China, it must first obtain approval from government agencies, which is not a requirement for a domestic company). The 2005 *Franchise Measures* prescribe the necessary qualifications of franchisor and franchisee and their rights and obligations, (including a requirement for an enterprise to have at least two stores in operation for more than one year within China prior to commencing franchising). They also prescribe prior disclosure requirements, the content of the franchise agreement and sector administration. The 2005 *Franchise Measures* have generally been welcomed not only because of the introduction of a viable regulatory regime for both domestic and foreign franchisors, but also because of their recognition of "freedom of contract" and their emphasis on intellectual property protection. Wang (2004), the Chairperson of CCFA, acknowledges that a more professional and comprehensive specific franchise regulation at the State Council level (as opposed to the current Ministry rules) is an urgent priority for the orderly growth of the franchise sector. Although the State Economic and Trade Commission responsible for the proposed "Commercial Franchise Regulation" stated as early as July 2002 that the new regulation would be implemented before the end of that year (China Daily, 2002), it has still not appeared. The law clearly has an important role in China, as in other countries, to address the growing pains of a rapidly emerging franchise sector. However, it cannot solve all the problems. Balancing localization with standardization is a challenge for both domestic and foreign franchising systems as the observation is frequently made that China is not "one country" from the consumer's and the franchisor's perspective. In relation to domestic franchisors, most local franchising systems are not yet strong enough to be a real threat to established international franchisors because they lack the key elements for a successful franchising system, such as a recognized brand, a proven system and know-how, which are the innate advantages of established foreign franchisors. Foreign franchisors nevertheless face real challenges in that they are unfamiliar with the Chinese commercial environment, consumption psychology and industry conditions. Finding the right partner and senior management is both time consuming and difficult. Cultural

issues require particular sensitivity for foreign franchisors. China is rapidly moving to a more familiar Western business environment, but a 5000 year culture cannot be expected to change overnight. It is not only language – which in its spoken form has many dialects – but more entrenched characteristics. Prominent among these is the concept of “guanxi” – of the prime importance of personal connections, networks and relationships with business partners, government officials, media and trade associations which are forged through sustained cooperation, commitment and contact.

The Chinese adopt the philosophy that: “while nothing is easy, everything is possible”. Despite the challenges, companies which have adopted this attitude have achieved great success in China (Fan, 2006). As noted above, KFC negotiated with government authorities for nearly three years and devoted another 20 months for developing its supply chains training staff and refining its system before the first outlet opened in Beijing. The turnover of its 1,200 outlets of 2004 in China reached RMB12 billion (approximately US\$ 1.5 billion), which is nearly one third of the total turnover of its 5,524 outlets in USA (US\$4.9 billion in 2003) (Huang,2005). Yum! Brands, which owns KFC and Pizza Hut in China claims that “KFC makes almost as much money in China today as it makes in the US” (Novak, 2004). Kodak spent four years conducting seven rounds of negotiation in order to acquire the major Chinese film manufacturers. In 1998 it invested US\$1.2 billion, of which was its largest overseas investment, and it has established a near monopoly position in the film-manufacturing sector in China. It has also expanded its Kodak Express network through franchising with the support of the Bank of China, and now has more than 8000 outlets in China. With its rapid economic growth and “the world’s largest potential market, embracing 1.3 billion people including 412 million young consumers under twenty and with rapidly rising levels of disposable income in economically booming urban area”(Sheppard, 2000), China is an increasingly attractive franchise market for both local and foreign enterprises. Increasing disposable income has made it possible for more consumers to source higher quality products and services. Chinese consumers are increasingly sophisticated and brand conscious. There is an increasing demand for standardized quality which franchise networks can provide and an increasing preparedness to pay more for well-known brands. Post WTO market liberalisation reforms have facilitated foreign investment in the franchising sector and foreign franchisors are entering in increasing numbers.

Not surprisingly, the economic reforms which have made possible the development of franchising have not been without casualties. Jing (2004) argues that the reforms of past twenty years have resulted in some unwelcome and previously unknown consequences, including a rising unemployment rate, which has become a critical problem for the government and the public. It is in part because franchising is seen by the Chinese government as a strategy to solve these problems that its development has been encouraged by the government. The existence of unemployment and the prevalence of entrepreneurship provide an ample supply of potential franchisees (Zhu, 2005). The development of Chinese private companies and the growth of private capital provide a solid foundation for franchising business. China has a great number of potential franchisees with strong sources of funding. Franchising compensates for their commercial inexperience by linking their investments to well-tested concepts and operating systems, comprehensive training and support.

## **Conclusion**

Over the last decade the franchise market in China has been growing at extraordinary speed. Originally under the influence of foreign franchise systems, recently more domestic enterprises have adopted franchising strategy. Rapid growth has nevertheless been accompanied by predictable problems including domestic and foreign enterprises. These problems should become less significant with increasing knowledge of franchising, continuing modernization of the legal system and more effective avenues for enforcement of contractual obligations and intellectual property rights. The experience of the past twenty years of franchise development in China, combined with the increasing sophistication of the economy and its vast potential consumer market, strongly suggest that the continuing growth of the franchise sector is inevitable. There is wide and increasing agreement with the comment of Jerry Wilkerson (2005), the former president of the International Franchise Association, that China, the largest marketplace the world has ever known, “will be a magnificent place for franchising to flourish in the near future”.

# Malaysia's Franchise Friendly Policy: The Role of Perbadanan Nasional (PNS) as Sole Government Agency in Franchise Development and Financing

Mohd Amy Azhar Mohd Harif, amyazhar@uum.edu.my  
University Utara Malaysia, Malaysia

Adzmy Abdullah

Ministry of Entrepreneur Development and Cooperation, Government of Malaysia

Rusdi Ibrahim

Perbadanan Nasional Berhad (PNS), Malaysia

## Abstract

In developing franchising in Malaysia, several organisations are involved and play an important role. Franchising in Malaysia uses strategic partnerships that embrace alliances not just between franchisor and franchisees but also between other parties involved. Malaysian franchising involves a strategic partnership in collaboration with the Malaysian Government, the Franchise and Vendor Development Division, Ministry of Entrepreneur Development (MeCD), Franchise Development Programme (FDP), Malaysian Franchise Association (MFA) and Perbadanan Nasional Berhad (PNS). The first organisation that plays a role in developing the franchising system in Malaysia is the *Malaysian Government*. The second organisation that plays a role in the developing franchising system in Malaysia is the *Ministry of Entrepreneur Development, Malaysia*. There are five major activities and programmes organised and coordinated by the Franchise and Vendor Development Division. Another organization involved aggressively in developing franchising system in Malaysia is Malaysian Franchise Association (MFA). The main objective of the MFA is to support and promote franchising in Malaysia (Awalan 1998). Then, in June 2004, MeCD handed the Franchise Development portfolio to Perbadanan Nasional Berhad (PNS) and recently appointed it as the lead agency to promote the development of Malaysian franchise industry. PNS provide financial assistance to Bumiputera entrepreneur venturing into franchise businesses via equity investment and franchise business financing. PNS have different roles to play towards the development of the Bumiputera franchising in Malaysia. In summary, there are four main organisations involved as active supporters in the development of a franchise industry in Malaysia, including Malaysian Government, Ministry of Entrepreneur Development (MeCD), Franchise Development Program (FDP) and Malaysia Franchise Association (MFA) and Perbadanan Nasional Berhad (PNS).

## Introduction

It was only in the 1950s that franchise systems began to grow (Mendelsohn 1999; Sanghavi 1991). The growth rate of franchises in the United States of America is a useful source of retail business development both in the United States of America (Naisbitt 1986) and in other industrialized nations (Justis 1995). Currently, there are over 600,000 franchised business establishments in the United States of America and about 100,000 more around the world that carry the logo of an American franchise system (Mendelsohn 1999). Employment in franchising in the United States of America including part time workers will probably reach 7.3 million (Mendelsohn 1999).

Franchising in Australia has diverse firms that make up the franchising sector. For example, in 1999, franchising in Australia had sales of goods and services from more than 49,400 outlets and probably reached a AUD\$ 76.5 billion turnover (Frazer & McCosker 1999). The total number of persons employed in the Australian franchising sector including part timers probably reached 553,200 workers.

With this positive progress of franchising, franchise businesses will continue to expand in developed countries such as in Europe, and also the developing countries such as in Asia and Latin America (Chan & Justis 1991; International Franchise Association 1999). Those who do best at international expansion are those who have the foundations of a sound and profitable business at home, the financial resources needed to expand, the manpower resources required to expand, infinite patience, the ability to listen and adapt, the ability to acknowledge that things are different in a foreign country to recognize the difference, and be prepared to adapt to them (Mendelsohn 1994).

Long before Asia became a continent of modern nation states, the West already had links with the region through commerce. The franchise industry continues the tradition of successfully capturing and creating business opportunities especially in Asia (Abdullah 1999). Malaysia followed countries like Australia and New Zealand in establishing more local franchising business networks (McCosker 1995). The local franchising business network will not only benefit the local franchisors but also local entrepreneurs (Hodgetts & Luthans 1997) because the local franchise package is cheaper compared to the imported franchises (Mendelsohn 1994).

Currently, the Malaysian franchising industry is second only to Japan in terms of numbers of franchise outlets in the Asian region (excluding Australia and New Zealand) (Idris 1999). In addition, Malaysia is geographically and strategically well situated to become a regional base for foreign franchises planning to expand into South East Asia (Awalan 1999a). The growing economies of Singapore and Indonesia are within reach, as are Thailand, Myanmar, Vietnam, and Kampuchea. Franchising is growing in Singapore and most international franchisors would view it and Malaysia as a single territory for a master franchise, so they will choose one or the other as their base (Awalan 1999b). In terms of the potential number of franchise business units that can be set up over a wider area and the ease and practicality of administration and management, it would be more appropriate for foreign franchises to base operations in Malaysia than anywhere else.

## Franchising in Malaysia

The above discussion considered Malaysia as an appropriate base to develop and promote international franchises. Now, the growth of franchising will be discussed. The recent history of Malaysian franchising development will now be outlined in order to place it in perspective for international comparisons, as shown in table 1.

TABLE 1: THE HISTORY OF THE DEVELOPMENT OF FRANCHISING IN MALAYSIA

Duration	Events
1940s	Early stage of franchising in Malaysia with the opening of several petrol stations followed by the Singer Sewing Machine Co.
1991	Malaysian government decided to promote franchising as a vehicle for the development of Malaysian entrepreneurs
Mid-1992	The establishment of Franchising Development Programme (FDP) as a special unit in The Implementation and Coordination Unit, Prime Minister Department, Malaysia
March 1992	Malaysian Franchise Association (MFA) was formed
Mid-1995	The establishment of Franchise and Vendor Development Division, Ministry of Entrepreneur Development, Malaysia (MeCD)
Mid-1995	The Franchise Development Programme (FDP) was transferred to the Franchise and Vendor Development Division, Ministry of Entrepreneur Development, Malaysia (MeCD)

*Source: developed for this research*

Franchising first started in the early 1940s with the opening of several petrol station outlets (table 1). Later, the Singer Sewing Machine Co. franchised outlets in Malaysia to sell Singer sewing machines, followed by Bata and automobile dealerships. In the 1970s and 1980s, franchises commenced in the fast food industry such as Kentucky Fried Chicken, McDonalds, Wimpy, and A & W Malaysia, the industry experienced explosive growth (Awalan 1999c; Mat Hassan 1999; Mohd Ali 1995). However, the franchise industry was initiated without much awareness

from the local population. The concept of the franchise business was not well understood and there was little interest by the business community in franchising their businesses (Mohd Ali 1995).

## **The Organisations Involved in Malaysian Franchise Development**

In developing franchising in Malaysia, several organisations are involved and play an important role. Franchising in Malaysia uses strategic partnerships that embrace alliances not just between franchisor and franchisees but also between other parties involved (Idris 1999). Malaysian franchising involves a strategic partnership in collaboration with the Malaysian Government, the Franchise and Vendor Development Division, Ministry of Entrepreneur Development (MeCD), Franchise Development Programme (FDP), Malaysian Franchise Association (MFA) and Perbadanan Nasional Berhad (PNS). Each of these will be discussed next.

### **The Role of the Malaysian Government**

The first organization that plays a role in developing the franchising system in Malaysia is the *Malaysian Government*. Although the franchise industry was introduced in the country in the 1940s, rapid development has only been seen in recent years. In 1991 (table 1), the Malaysia government decided to promote franchising as the vehicle for the development of indigenous entrepreneurs and thus as a catalyst for economic development (Mahathir 1998; Mohd Ali 1995). The government has been an active supporter of the franchise industry ever since 1992 when the Prime Minister, Dato' Seri Dr Mahathir Mohamed, established a special unit dedicated to franchising development within the Prime Minister's Department. The task was then taken up by the Ministry of Entrepreneur Development (MECD) upon its formation in the middle of 1995 to further strengthen and promote the franchise industry (Abdullah 1999). The growth was propelled by the active role taken by the government through the Ministry of Entrepreneur Development (Malaysian Franchise Directory 1999).

### **The Role of Ministry of Entrepreneur Development, Malaysia**

The second organisation that plays a role in the developing franchising system in Malaysia is *the Ministry of Entrepreneur Development, Malaysia*. In 1995, the Malaysian Government set up the Franchise and Vendor Development Division under the Ministry of Entrepreneur Development (MeCD) (table 1). When the Franchise and Vendor Development Division was set up under the Ministry of Entrepreneur Development, there was a noticeable increase in interest of the business community towards the franchise concept and the franchising businesses (Mohd Ali 1995). This division set a vision and objectives, and plays the role of ensuring the progress of franchising in Malaysia.

There are five major activities and programmes organised and coordinated by the Franchise and Vendor Development Division. The first activity is promoting the franchise business, that is, informing and educating the public on the franchising concept and promoting franchising as a viable business option to the population (Mohd Ali 1995). The second activity is franchise recruitment, that is, coordinating recruitment and maintaining a database of applicants intending to take up a new franchise, and then helping the franchisor to carry out the selection process (Mohd Ali 1995). This process helps the franchisor to select suitable entrepreneurs to be a new franchisee (Sam 1999).

The next activity is to organize training for both the franchisor and the franchisees, and to coordinate supervisory visits to check on performance and resolve problems (Mohd Ali 1995). These supervisory visits will ensure the quality and standard of the franchise business in Malaysia (Sam 1999). Then, the Franchise and Vendor Development Division provides consultation and assistance to help those persons who come under the franchise programme, and require assistance and advice about loans, selecting premises, and applying for franchise licences and permits (Mohd Ali 1995). The last and most important activity coordinated by the Franchise and Vendor Development Division is enforcement of the franchise regulations (Sam 1999).

In order to get feedback about the activities organized by the Franchise and Vendor Development Division, a research and development programme was conducted with higher institutions (Sam 1999). The government is proactive toward supporting the growth and development of the franchise industry and has aimed to achieve a target of 1200 franchisees under the Seventh Malaysia Plan (Malaysian Franchise Directory 1998; Mohd Ali 1995). Table 2 shows the planning of franchising in Malaysia in the Ninth Malaysia Plan (from year 2006-2010), with actual growth of franchisees (individuals rather than outlets) towards achieving annual targets. To ensure that the above

target is achieved, the government through the Franchise and Vendor Development Division, Ministry of Entrepreneur Development implemented *seven* strategies (Malaysian Franchise Directory 1999).

TABLE 2: FRANCHISEE APPOINTMENT PLAN DURING THE NINTH MALAYSIA PLAN AND THE ACHIEVEMENT LEVEL UP TO YEAR 2005

Year	Appointment target	Appointment achievement	Appointment achievement % from target
1995	100	54	54.00 %
1996	100	144	144.00 %
1997	124	126	101.00 %
1998	292	146	50.00 %

<b>Total</b>	<b>2000</b>	<b>886</b>	<b>73.83 %</b>

*Source: developed for this research based on Malaysian Franchise Directory (2006)*

The first strategy used by the Franchise and Vendor Development Division Ministry of Entrepreneur Development (MeCD) in developing the franchise industry in Malaysia is identifying and developing potential business concepts and products as franchise businesses, in three ways. The first way is the Ministry undertakes to develop new concepts into viable franchise businesses. The second way is developing existing businesses into franchise systems, and the third way is identifying foreign franchise products with the potential to be franchised to Malaysian entrepreneurs (Malaysian Franchise Directory 1999; Mohd Ali 1995).

The second strategy used by the Franchise and Vendor Development Division is increasing public awareness and knowledge of franchise businesses by conducting promotional activities, trade road shows, and franchise exhibitions (Malaysian Franchise Directory 1999). The third strategy of the Franchise and Vendor Development Division is to increase the number of franchise consultants (Malaysian Franchise Directory 1999), that is, it cooperate with higher learning institutions in conducting training, seminars, and courses. As well, the Franchise and Vendor Development Division conducts studies and research of the franchise industry in Malaysia and has established a database on franchise businesses (Malaysian Franchise Directory 1999).

The Franchise and Vendor Development Division in developing the franchise industry enforces the Franchise Act 1998. The Malaysian Franchise Act was launched on 8 October 1999 by the Minister of Entrepreneur Development, Dato' Mustafa Mohamad (Marzaitul 1999; Mohd Ali 1995). The Act was not meant to stifle the franchise industry but to regulate and ensure its systematic growth. The Malaysian Franchise Act 1998 (table 2.12) will ensure better regulation and supervision of the industry. The Act is an indication of the government's willingness to facilitate the growth of the industry by legislating against problems, fraud, or other abuses of the franchising system (Abdullah 1999). The Act features the registration of the companies, procedures for documentation, the crimes and penalties, financial aspects, and problem solving methods (Marzaitul 1999). By providing the necessary guidelines, the Act will encourage bona fide and fiduciary practices and at the same time protect the franchisor's system and copyright from being illegally duplicated (Marzaitul 1999). Activities of bogus

franchisors are curbed through the proper disclosure of the background of the franchisors. Financial statements for three consecutive years must also be supplied (Marzaitul 1999).

The Malaysia Franchisee Act 1998 has several parts, as shown in table 3, including:

TABLE 3: THE ELEMENTS OF THE MALAYSIAN FRANCHISE ACT 1998

No.	Particulars in Malaysia Franchise Act 1998
Part 1	<ul style="list-style-type: none"> <li>• the appointment of the Registrar</li> <li>• others concerned as well as the proper registration methods of a franchise</li> </ul>
Part 2	<ul style="list-style-type: none"> <li>• details of the franchisee agreement</li> </ul>
Part 3	<ul style="list-style-type: none"> <li>• concerns the termination of a franchise</li> <li>• the acts of the parties involved</li> </ul>
Part 4	<ul style="list-style-type: none"> <li>• the setting up of a Franchise Advisory Board which offers its services to the Minister and the Registrar on franchise related matters</li> </ul>
Part 5	<ul style="list-style-type: none"> <li>• list of the crimes and penalties</li> </ul>
Part 6	<ul style="list-style-type: none"> <li>• touches on various elements such as: <ul style="list-style-type: none"> <li>○ obtaining approvals when intending to sell or to buy a franchise be it local or foreign;</li> <li>○ the power of the registrar to make a public inspection of disclosure documents;</li> <li>○ sale or purchase of franchise advertisements that need to be sent to the Registrar at least five days before the publication or circulation.</li> </ul> </li> <li>• the requirement to inform the Registrar of any sale to a non-Malaysian citizen and of foreigners intending to sell their franchises locally</li> </ul>
Part 7	<ul style="list-style-type: none"> <li>• the franchisor needs to submit various financial documents</li> </ul>

Source: developed for this research

- details on the franchise fee and its refundability. Any other fees to be included must be disclosed such as the advertising and promotion fees, training fee, and management fee (Malaysian Franchise Act 1998);
- the initial investment, which includes landed property, equipment, fitting & fixtures, fixed assets, and deposit (Malaysian Franchise Act 1998); and
- an undertaking by the franchisor to disclose the type of financial assistance provided, if any. Also if the franchisor is leasing any equipment and the charges relating to it (Malaysian Franchise Act 1998).

The Malaysian Franchise Act 1998 authorised the government to monitor the development of the franchise industry in the country, and ensures a more systematic and structured growth. As a result, it is hoped that more entrepreneurs will join the franchise bandwagon and become franchisees. In addition, it also requires franchisor companies to submit several important documents upon registration (Malaysian Franchise Act 1998; Marzaitul 1999; Salleh 1999).

All the documents that are required by the Malaysian Franchise Act 1998 need to be submitted by the franchisor upon the registration a new franchise system, as shown in table 4. In addition, the new franchisor also needs to include other relevant documents such as secretarial form 2 and form 49 (in Registrar of Company Malaysia). Both the forms describe the background of the director and the equity hold by each director (Malaysian Franchise Act 1998; Malaysian Franchise Directory 1999). Annually, all franchisor companies must submit their annual report to the Registrar of Franchise within 30 days of the registration anniversary. Registration for franchisor companies, master franchisees, and foreign companies is required only once throughout the life of the franchise business, except if the Registrar of Franchise issues notices or orders for suspension, termination, or rejection of registration (Malaysian Franchise Act 1998).

The next strategy used by the Franchise and Vendor Development Division Ministry of Entrepreneur Development (MeCD) to develop the franchise industry is cooperating with Malaysian Franchise Association (MFA) and other support institutions. This strategy seeks to facilitate the growth of franchise businesses especially in matters pertaining to the source of funds from financial institutions and securing good business locations from property developers, landlords, and complex management (Malaysian Franchise Directory 1999).

The last strategy using by the Franchise and Vendor Development Division is improving the Franchise Development Programme (FDP). This division should concentrate more and be aware of the selection criteria of franchisors and franchisees joining the FDP, so that only genuine businesses and entrepreneurs are selected to participate. This research was conducted with the FDP.

#### **The Franchise Development Programme (FDP)**

A Franchising Development Programme (FDP) was set up in 1992 (table 1), in the Implementation and Coordination Unit, of the Prime Minister's Department. With the establishment of the Ministry of Entrepreneur Development (MeCD) in mid-1995 (table 1), programmes directly related to the development of entrepreneurs including the Franchise Development Programme (FDP) were transferred to this new ministry. It is now known as the Franchise and Vendor Development Division (Abdullah 1999; Idris 1999; Mohd Ali 1995).

The Franchise Development Programme is a marketing plan based on the Malaysia Incorporated Concept which aims to develop small and medium entrepreneurs (SMEs) in the sector of commerce, service, and industry. The implementation of the franchise system will enable SMEs to enter a mass local and international business networks (Franchise and Vendor Development Division 1999).

- introduce franchising as one of the strategies to develop an advanced and sustainable entrepreneurial society in accordance with the National Development Programme (Idris 1998 /1999);
- increase the number of successful franchisors, master franchisees, and franchisees (Idris 1998 / 1999); and
- stimulate active participation of entrepreneurs, in particular in distributive trade and generally in the service industry, having potential for contribution towards national economic growth (Idris 1998 /1999).

By the end of year 2005, FDP had managed to develop a total of 59 franchisors (21 percent of the 287 franchisors) in various business sectors in Malaysia. All the franchisors in this programme managed to appoint their own franchisees to operate the franchise outlets and a total of 575 franchisees operating franchise outlets have been appointed in this programme. Table 5 shows the number of home-grown franchise businesses developed under FDP, by the business sector.

TABLE 5: HOME-GROWN FRANCHISE BUSINESS DEVELOPED UNDER THE FRANCHISE DEVELOPMENT PROGRAMME (FDP), IN ORDER OF NUMBER OF FRANCHISORS

<b>Business sector</b>	<b>No. of franchisors</b>	<b>No. of Franchisees</b>

Source: adapted for this research from Malaysian Franchise Directory (2000)

To enhance the image and the effectiveness of the FDP, *four* initiatives have been taken up by the FDP (Malaysian Franchise Directory 1999). The first initiative is to provide incentives to franchise industry players. For example, in Malaysia there is a Franchise Award ceremony to recognise franchise achievers. The award is a symbol of recognition by the government (FDP) and the Malaysia Franchise Association of the commitment and effort by the franchisors and franchisees in the franchise arena locally. Among the factors considered for the awards are the growth rate of the outlets and the financial statements of the franchise operations, as investigated by this research (Awalan 1999b).

The second initiative is to introduce the usage of the franchise logo on all franchise outlets. This initiative will make the public aware of the image of home-grown franchise businesses in the FDP programme. The third initiative is that the FDP will assist in solving issues and other conflicts that may arise between franchisors and franchisees. The last initiative involves monitoring the businesses performance of both franchisor and franchisees. The process of monitoring the franchise industry in Malaysia is done in cooperation with the Malaysian Franchise Association (MFA) and will be discussed next. Note that all three franchise system cases in this research were home-grown and thus the MFA does need to be discussed here.

#### **The Role of the Malaysian Franchise Association**

A project paper on the status of the Malaysian franchising was issued in March 1992 by the Ministry of Entrepreneur Development (noted in table 1). From this project paper, guidelines were proposed and subsequently the Malaysian Franchise Association (MFA) was formed.

The main objective of the MFA is to support and promote franchising in Malaysia (Awalan 1998). The Malaysian Franchise Association (MFA) has a grand vision for the franchise industry in Malaysia. One part of the vision is to position Malaysia as the gateway to franchising in Asia (Adzmi 1999b). Although MFA assumes the franchise industry in Malaysia has been experiencing dynamic growth since its introduction in the late 1940s, there are still lack of complete understanding of the Malaysian franchise industry. As such, increasing the awareness of the industry and educating people on the various aspects of franchising remains among MFA's key responsibilities (Adzmi 1999b).

MFA plays different roles from other government bodies such as the Franchise and Vendor Development Division, Ministry of Entrepreneur Development, Malaysia (MeCD), and the Franchise Development Programme (FDP). These government bodies concentrate more on the policy and procedure matters, and aim to develop as many new franchise systems as possible to ensure the target achievement of 1200 franchisees (Franchise and Vendor Development Division 1999). In turn, MFA acts as a coordinating and arbitration body that promotes franchising in Malaysia as well as offering arbitration advice for franchisors and their franchisees. This research considers the franchisee's role in the franchise planning.

As part of its system of the matchmaking prospective franchises and established businesses, the MFA is constantly studying new market niches and helping develop new products (Awalan 1998). MFA together with the government have constantly been in the forefront promoting the franchise industry both domestically and globally to further develop the industry. MFA often provided input for the government and its agencies on matters concerning franchising and its application. Towards this end, MFA has identified strategic business opportunities to be developed either through the local industry or with foreign franchisors (Adzmi 1999b).

#### **The Role of Perbadanan Nasional Berhad (PNS)**

Perbadanan Nasional Berhad (PNS), formerly known as PERNAS, was incorporated on November 29<sup>th</sup>, 1969. Through a management buy-out process, a new acronym "PNS" has been adopted.

PNS is a wholly-owned subsidiary of the Minister of Finance Incorporated (MOF Inc.) and under a purview of the Ministry of Entrepreneur and Cooperative Development (Med). Its paid-up capital is RM751 million and authorized capital RM1 billion.

In June 2004, MeCD handed the Franchise Development portfolio to PNS and recently appointed it as the lead agency to promote the development of Malaysian franchise industry. PNS provide financial assistance to Bumiputera entrepreneur venturing into franchise businesses via equity investment and franchise business financing.

Equipped with relevant experience in franchise industry, PNS uphold the Government aspiration to develop Malaysian franchise industry and increase the number of Bumiputera entrepreneur as well as swelling the size of Bumiputera Commercial and Industrial Community (BCIC).

The vision of PNS is to be the leading corporation in providing Total Franchise Solutions. In addition, PNS's mission is to develop world-class franchisepreneurs through superior delivery of integrated services and comprehensive products. We cater to provide efficient services guided by our vision and mission statement. PNS is committed to develop franchisepreneur within the Bumiputera Commercial and Industrial Community (BCIC).

In summary, there are four main organisations involved as active supporters in the development of a franchise industry in Malaysia, including Malaysian Government, Ministry of Entrepreneur Development (MeCD), Franchise Development Program (FDP) and Malaysia Franchise Association (MFA) (Abdullah 1999).

## **PNS as Sole Government Agency in Franchise Development and Financing**

PNS have different roles to play towards the development of the Bumiputera franchising in Malaysia.

1. Key role - planning, decision making and full accountable for achievement outcomes. In this instance, PNS take full accountability for the specific outcomes, as an example in areas of planning and sometimes responsible for the delivery of specified programmes designed to achieve these outcomes.
2. Support role - facilitator, working with relevant agencies, contribute to decision making process but no exclusive ownership for decision making and Key Performance Index (KPIs).
3. Minimal Role – Provide feedback to relevant ministries/agencies, contribute to decision making (only upon request by relevant ministries/agencies) and accountable for ability to influence decision making. In this instance, PNS merely provides feedback for decision making by others or participate in collective decision making where required.

#### **What is Ninth Malaysia Plan (RMK-9)?**

The Malaysia Plan was designed to develop Malaysian economy and improve the quality of life of its people. Since independent, real gross domestic product (GDP) has grown by an average of 6.5 per cent per annum during 1957 to 2005, one of the highest growth rates achieved by sovereign nations of similar age and size. Within the same period,

GDP per capita in current prices grew by 7.0 per cent per annum, which has translated into substantial improvements in the people's quality of life.

Malaysia has moved into the Ninth Malaysia Plan which encompasses a five years period (2006-2010). The country is now an open trading economy participating in an extremely competitive and fast moving global marketplace. Given the changing domestic and global economic landscape, initiative to enhance national competitiveness and will continue to be given high priority. The Ninth Malaysia Plan period will see changes in the structure and improved performance of the economy with every economic sector achieving higher value added and total factor productivity new growth areas will gain in strength.

Under the Ninth Malaysia Plan, the Government Link Companies (GLCs) has been transformed with an aimed at infusing a culture of high performance and excellence in all GLCs. The implementation of the GLCs transformation programme will be intensified to further enhance shareholder value, including through the additional roll-out of key performance indicators (KPIs) and the introduction of performance-based compensation, operational improvements and cost reduction initiatives. The initial operational and financial result from the transformation programme is expected to be seen in the first half of the Ninth Malaysia Plan.

#### **PNS Role as the Lead Agency in Developing Malaysian Franchise Industry under the RMK-9 Period**

Under the Ninth Malaysia Plan, PNS is responsible in assisting the Government to increase the number of Bumiputera Commercial and Industrial Community (BCIC). The development of BCIC will remain a key thrust in the Ninth Plan to ensure effective Bumiputera participation in the economy and continue efforts at restructuring of society to eliminate the identification of race with economic function.

As such, PNS has been entrusted to spearhead the creation of Bumiputera entrepreneurs in new areas, particularly in sectors or activities where Bumiputera participation is minimal such as franchise businesses. PNS has been entrusted to develop Bumiputera franchisees and local franchise products through research and development, acquire selected franchises from overseas as well as increase public awareness in the business of franchising. The vendor development programme will be expanded to include more industries to generate new opportunities for competitive Bumiputera enterprises. The monitoring and coordinating mechanism will be reactivated to ensure effective implementation of the programme.

Since PNS has been mandated to develop national franchise industry and uphold the government aspiration of increasing the size of BCIC, various programmes have been developed to encourage Bumiputera participation in franchise businesses. In addition, PNS provides financial assistance and consultancy for these young Bumiputera franchise entrepreneur.

Apart from promoting franchise business programmes and schemes, PNS role under RMK9 also covers on increasing Bumiputera participation in retail and services by focusing on niche areas. The expansion of Bumiputera participation in the areas of retail and services is a direct result contributed by growing franchisable clusters, undertaking strategic acquisitions and identifying GLC-led franchises which are suitable for franchising. This will ensure greater success rate in growing Bumiputera franchisees and consequently enlarge the Bumiputera entrepreneur pool specifically in the retail and services sector.

PNS is also responsible in enhancing innovation in area of Bumiputera entrepreneurial capabilities as well as in developing new sectors and products. This outcome is vital in order to ensure that Bumiputera franchisors and franchisees will be in the forefront of innovation in new sectors and products so as to be competitive with firstly regional and ultimately global players.

The agency has also been mandated to develop new market. The objective of PNS in the franchising industry is to enable appropriate economic spin-off via providing advice on market positioning and product development. This economic spin-off can be in the form of Malaysian franchise to expand thereby creating the regional spin-off and the ability of Malaysian franchises to create and develop other local businesses such as vendors that can grow and expand together with them.

#### **Strategic Objectives for Growing Franchisable Business under RMK-9**

PNS aim to provide identify franchisable clusters and nurture them towards adopting the franchising model as a tool for expansion. PNS critical success factors include the ability to identify appropriate sectors/business groups that could be franchised, develop a commonly accepted business concept and format appropriate to all cluster

participants, the ability to subsequently convince individual cluster participants to adopt and use common business formats for their business operations and once the cluster is off a sufficient scale and maturity, the ability to subsequently convince individual cluster participants to convert fully to the franchising concept via a common ownership platform.

PNS critical success factors also lies on the selection of appropriate skilled franchise consultants, appropriate monitoring of quality services provided by franchise consultants, provision of financing to encourage potential franchisors to convert to formatted processes and skilled human resources to provide advice and consultancy in order to build credibility of information.

PNS aims at providing the necessary market intelligence support to be able to develop new ideas, products and processes. However, the agency's critical success factors lies on appropriate and credible content/data/information to support analysis for decision making by customers, and suitable skilled resources to conduct analysis of information and provide recommendations to customers.

PNS also aims at recognizing the weaknesses in branding of local franchisor and suggest that co-branding is a way to fast-track local brand recognition. The agency's critical success factors meanwhile, depends on strong network with established brands and have the potential as co-branding partners.

After being appointed as the lead agency to develop national franchise industry in 2004, PNS have moved forward and measures to aggressively develop the franchise industry for Malaysia, as follow:

1. Develop franchisable cluster – number of clusters/franchisable business created, size of individual clusters, rate of conversion from cluster to franchise
2. Facilitate GLC-led franchises – number of GLC-led franchises created and contribution of franchisees to GLC growth
3. Provide enterprise financing – rate of non-performing loans, percentage of loan growths and adequacy and cost of funds.
4. Undertake strategic acquisition – number of successful franchisees created per franchisor required and business growth of franchisors required.
5. Provide franchise conversion – number of businesses converted to franchises and business growth of franchises converted.
6. Provide comprehensive services and consultation – number of successful franchisees created per franchisors, percentage of man-day spent on advisory services and rate of utilization of facilities such as resource centre.
7. Develop new products/sectors and co-branding – number of new products commercialized, percentage of revenue from new product, number of articles in established publications, number of co-branding initiatives and percentage of revenue from co-branding initiatives
8. New market development – market positioning, number of franchises in prime location and level of brand recognition.
9. Facilitate cross-border expansion – number of home-grown franchisors penetrating regional market and percentage of revenue generated from cross border business.
10. Create strategic alliances and partnership – number of strategic alliances and partnership developed and business growth contributed by strategic alliances and partnership.

#### **How do PNS Push the Industry and Create Awareness Especially Among Bumiputera on the Benefit of Franchise Industry**

Various measures has been undertaken and implemented by PNS, part of its effort in pushing the Malaysian franchise industry and products to the forefront. Among others include participating in international talks and conference, participating in trade missions and exhibitions. The agency organized trade visits to overseas franchise company as part of its effort in sourcing international franchise products to Malaysia.

While looking for new products, measures has also been undertaken to create awareness among Bumiputera on the benefit of franchise businesses since it has yet to be fully tapped by Bumiputera entrepreneur. This has been undertaken via various road shows and seminars organized by PNS throughout the year. As earlier mentioned, PNS with the assistance from the Ministry of Entrepreneur and Cooperative Development (MeCD), has

developed special programmes aiming at making “Entrepreneur as the Career of Choice” especially among graduates and women.

#### **How PNS Make itself Visible in the Franchise Industry?**

Two methods have been used by PNS to make the organization visible in the franchise industry.

1. Participating in various entrepreneur-related exposition and exhibition locally and internationally
2. Lay out aggressive promotional activities to encourage active participation of Bumiputera entrepreneur in the franchise industry.

#### **Programs and Schemes Offered and Developed by PNS**

There are five main programmes and schemes offered by PNS for the Malaysia franchise industry.

1. Special programmes (for franchisee)
  - i. *Graduate Franchise Programme*

The programme was developed with an aim to develop caliber, competent and confident Bumiputera entrepreneur in franchise businesses among graduates. The objective of the programmes is to instill the compulsion of entrepreneurship among educated Bumiputera. This comprehensive programme includes six weeks intensive training and PNS provides financing of up to 90 per cent.
  - ii. *Woman Franchise Programme*

The programme was introduced with an aim to produce caliber, competitive and confident woman entrepreneur in franchise businesses. Similar to the graduate programme, it offers six weeks intensive training programme and provide up to 90 per cent financing.
2. Schemes (for franchisee)
  - i. *Executive Franchise Scheme*

To encourage more Bumiputera employees in public and private sectors to venture into franchise business. Focus would be given to those opting for voluntary separation scheme (VSS) or early retirement.
  - ii. *Youth Franchise Scheme*

To encourage Bumiputera youth to venture into franchise business by providing start-up financing
3. Schemes (for franchisors)
  - i. *Pre-Franchise Scheme*

This is a special schemes aiming at assisting Bumiputera entrepreneur interested in becoming franchisors. The scheme is designed to assist potential Bumiputera franchisors by providing financial assistance for start-up capital or the existing business expansion. PNS provide up to RM2 million financing and assist in consultation on becoming franchisor.
4. Franchise Investment and Financing Schemes
  - a. *Mezzanine*

The scheme is designed to cater for existing Bumiputera-owned franchise businesses seeking financial assistance for expansion purposes.
  - b. *Budding*

The scheme is designed to assist Bumiputera companies who are new franchisors or master franchisees to upgrade their existing businesses to franchise businesses.
  - c. *Smart partnership*

The scheme enables middle-level Bumiputera entrepreneur to own equity in non-Bumiputera companies and allows non-Bumiputera companies to collaborate with PNS in financing their business expansion.
  - d. *Financing Scheme for Franchisees*

The scheme is developed to provide financing to Bumiputera franchisees in starting and expanding businesses.
5. Equity Investment

i. *Mesdaq bound companies*

The scheme aims at promoting middle-level Bumiputera entrepreneur involvement in technology driven and high growth companies. PNS will provide financial assistance to the companies in getting listed on Mesdaq.

ii. *Mezzanine*

The scheme provides development stage financing of target companies/medium scale enterprises (MSE). It is intended to assist the companies to fulfill their growth potential within a period of between two and five years after which they will seek to be listed on Bursa Malaysia.

iii. *Strategic Alliance*

The scheme strongly supports the Government effort to increase Bumiputera equity and management participation in established non-Bumiputera medium scale enterprises (MSEs).

**The Problem and Challenges in Developing Malaysian Franchise Industry**

There are problems and challenges need to be faced by PNS in developing the franchise industry.

1. Experience derived from Graduate Franchise Programme and Woman Franchise Programme
  - i. Limited choice of franchise businesses and products
  - ii. Limited choice of affordable franchise package
  - iii. Limited individual capabilities of the potential franchisees in terms of financial and attitude (mental readiness)
  - iv. Difficulty in securing better business facilities and infrastructure – strategic location for premises and demand
  - v. Mentality of the potential franchisee – venturing into franchise business after fail to secure better job
  - vi. Lack of supports from franchisors during set-up/preliminary stage for example: not supporting or assisting the potential franchisees in identifying and securing viable business locations; and unwilling to accept scheduled installment payment of franchisee fee
2. General experience derived since PNS started its franchise financing in 2004
  - i. Not many borrowers take up the programme and financing that made available despite extensive promotional and awareness programmes. For example the equity financing which has yet to fully utilized due to lack of demand.
  - ii. Some of the potential franchisee/franchisor are not ready to commit full responsibility towards own business as they are not willing/fully ready face the risk.
3. How do PNS tackle the issue pertaining to the problem
  - i. *Promoting the development and registration of new franchise scheme*
    - Implementation of the Development Local Franchise Product (PPFT) and Franchise Products Integrated Scheme (SBPF)
    - Introduction of new scheme such as Pre-Franchise Scheme to allow more existing Bumiputera companies venturing into franchise business by becoming a franchisor or master franchisee
    - Collaboration with government-link companies (GLCs) and other relevant agencies/corporations to promote and encourage Bumiputera entrepreneur and potential franchisee to venture into franchise business
    - Acquisition of foreign franchise rights to allow variety in franchise businesses, for example acquiring franchise rights of a product which has huge potential to grow and up-to-date such as cafés and specialty shops  
Among international franchise products which has the local (Malaysian) franchise rights includes McDonalds, Kentucky Fried Chicken (KFC) and A&W Family Restaurant
  - ii. *Promoting the development & registration of the affordable franchise packages*
    - Closer working corporations with existing franchisors for the development of new affordable packages. Franchisors need to assist PNS on how to ease the burden of franchise fee among

potential franchisee. Franchisee is currently required to pay the franchisee fee in full and it become a set back for potential franchisors.

- Introduction of new financing scheme for the franchisors to cater for their new product development or new franchise package expenses. PNS is encouraging new product development via research and development, and the products is deemed franchisable to hit international market.
- Acquisition of foreign franchise rights with the affordable franchise packages. Although foreign franchise businesses has been seen as profitable for the past few decades, the fee is yet to be made affordable for local franchisee especially among potential young Bumiputera entrepreneur.

iii. *Addressing the issue of limited individual capabilities*

- Family members contribution – at PNS, we encourage individuals to set-up family businesses which involve participation from all members. Such support is required especially in the early stage of setting-up franchise business.
- Joint business ownership – PNS encourage individuals who have a problem of providing initial capital to create partnership with parties who can assist them.
- Reducing the entrepreneurs margin of contribution

iv. *Addressing the issue of securing better located business premises*

- Get the cooperation from relevant government agencies or authorities to provide information on property or premises that is suitable for businesses.
- Support from franchisors – assist franchisee in getting a strategic location to enable them to kick-start the business as soon as possible. Some of the franchisors prefer to keep the strategic locations to themselves rather than sharing it with franchisee.
- Develop closer rapport with owner of the business premises.

v. *Addressing the issue of attitude/perception*

- Review selection criteria, not only on the Graduate Franchise Programme and Woman Franchise Programme but on all schemes. This is encourage active participation of potential Bumiputera franchisor/franchisee
- Intensify awareness programme so it will hit the target market. This may be done by making full use of PNS Franchise Service Centre (FSC) as well as participating in programmes arranged by the Ministry of Entrepreneur and Cooperative Development (MeCD) such as Gerak Usahawan, SDSI, printed and electronic media promotions and interviews.

**The Challenge to Develop Home-Grown Franchise Products and Services**

PNS also need to face the challenges and problems in developing the home-grown franchise products and services.

1. Existing activities and programmes made available to support the initiatives
  - Franchise Product Development Programme
  - Franchise Integrated Programme
  - Pre-Franchise Scheme
  - Government-link companies led programmes
  - Cooperation with State Economic Development Corporations (SEDCs) and other relevant agencies/cooperation
2. Perceived current situation
  - There are many local products/businesses that have the potential to be converted into franchise format
  - The challenge is to identify them and then to convince the owners to agree to convert them into franchise format. Once they agreed, comprehensive development and support packages have to be made available and carried through diligently
  - Certain articles in the Franchise Acts might not be promoting or stimulating the efforts to promote the growth and registration of new franchisors
3. Strategies to “sell” Malaysian franchise products

- Participate in international franchise related exhibition, exposition or conference
  - Research and development on products that is deemed franchisable
  - Venture into international market by setting up an outlet or appoint master franchisee
  - Joint venture or form strategic partnership with local player of the respective countries they're venturing into
  - PNS play the role of providing local franchise information internationally to convince foreign franchises on the soundness and strong fundamentals of the local franchise industry
4. The needs for PNS to develop Malaysian franchise industry and the mileage for Malaysian economy
- To enhance Bumiputera participation and contribution towards Malaysian economy
  - To help increase the number of Bumiputera participation in business via involvement in retail industry such as franchising. This will create awareness among Bumiputera and at the same time educate Bumiputera on how to run a business without having to depend on others
  - To materialize government aspiration of having a sizeable Bumiputera Commercial and Industrial Community (BCIC)
  - To further enhance retail industry's contribution to the country's gross domestic product (GDP) growth via franchise businesses. Retail (biggest contribution comes from services industry) contribute about 5% of the total GDP per annum
  - To attract foreign direct investment (FDI) to Malaysia through franchise thus creating job opportunities in the country and expand job market

#### **Government and PNS Expectation on the Malaysian Franchise Industry**

PNS as semi- government agency and under the direction of The Ministry of Entrepreneur and Cooperative Development of Malaysia have targeted a dramatic growth for the Malaysia Franchise Industry in 10 years.

1. What to expect and achieve in the next five to 10 years
  - Under the Ninth Malaysia Plan (RMK9), we hope to develop 50 new local franchisors and 1,000 new franchisees. This will be achieved through various marketing and promotional programmes, and provide financial assistance to eligible potential Bumiputera entrepreneur
  - Increase the number of franchisors (established businesses converted to franchise)
  - Increase the number of Bumiputera franchisors
  - Increase the number of Bumiputera franchisees
  - Increase in the quality of franchisees
  - Increase in the number of franchisors listed on Bursa Malaysia
  - Increase in local content
  - Increase of home grown brands created
  - Increase of home grown brands penetrating regional market
  - A handful of foreign franchise products and master franchise fee
  - Decrease in failure rates of Bumiputera franchisors
2. How do PNS foresee the industry's growth?
  - Demand is increasing thus providing opportunity for retail businesses to grow. Baring unforeseen circumstances, the industry is expected to grow at 6% per annum. This is again due to demand and social culture.

In conclusion, PNS have a big role and responsibility in developing a Malaysia franchise industry. With the programmes and schemes have been planned and in the progress, PNS have a way forward to achieve the target of RMK9 as a sole agency in developing the Malaysia franchise industry.

# Impact of Perceived Similarity on Member Exchange at Service Work

*Soo K. Kim, [kimso@mail.montclair.edu](mailto:kimso@mail.montclair.edu)  
Montclair State University, USA*

## Abstract

In this empirical study, 101 service employees were asked to complete a survey about their current supervisors, peers, and feelings on the job. The purpose of this study was to investigate the role of service employees' perceived similarity as a potential moderator between LMX and workplace envy at work. Specifically, low level of LMX is proposed to lead to envy, in particular when the comparison referent is someone similar to one's self. The results from a hierarchical regression analysis partially support the moderating effects of perceived similarity on envy. The marginal interaction between perceived similarity and LMX provide some support for the notion that employees with high levels of perceived similarity and low levels of LMX experience are prone to workplace envy. This study highlights the importance of understanding how negative emotions, envy in particular, influence organizational effectiveness. Managerial implications to the service industry are briefly discussed. This study offers new insight to the service leadership and emotions literatures.

## Introduction

Typically, the supervisor's treatment (and hence LMX) varies across employees within the single work unit, thus giving rise to potential conflict among employees or workplace envy (McClane, 1991; Vecchio, 1995; Yukl, 2001). Especially when it comes to the service industry, such unfavorable, negative treatment by a leader has a more critical impact on employees than does favorable, positive treatment (Testa & Ehrhart, 2005). Despite this argument, LMX literature has only focused on the positive side of LMX such as enhanced job satisfaction and performance (cf. Gerstner and Day, 1997). Conversely, very little is known the negative effects of LMX on workplace performance (cf. Graen and Uhle-Bien, 1995). In general, workplace envy has a negative impact on employees. For instance, workplace envy tends to reduce overall group effectiveness while having an amplifying effect on absenteeism. Moreover, prior research suggests that managerial style may foster envy among coworkers (Duffy and Shaw, 2000). We argue that since LMX represents managerial styles, it can induce workplace envy. In LMX, the quality of dyadic relationships between the supervisor and the subordinate varies across employees (Sherony and Green, 2002). Such a differentiated treatment hints at a possible relationship between LMX and workplace envy.

Organizations are natural sources of envy, because employees can compare one another in terms of professional reputation, salaries or promotions (Cohen-Charash, 2000). Envy is driven by social comparison with similar others (Schoeck, 1987), and the higher the degree of perceived similarity, the higher the likelihood of envy (Cohen-Charash et al., 2004; Tesser, 1988). The purpose of this paper was to investigate the moderating role of perceived similarity on the relationship between LMX and workplace envy.

## Review of Literature

### Leader-Member Exchange

Traditional leadership theories assume that a leader acts in a relatively uniform way toward his/her subordinates. Conversely, LMX makes a different assumption in that the leader shows differential treatment towards his or her subordinates (Dienesch and Liden, 1986). LMX can be broadly defined as the working relationship between a leader and a subordinate (Schriesheim et al., 1999). According to LMX, leaders may develop close relationships with only a few employees due to limited time and resources (cf. Gerstner and Day, 1997). These in-group or high-

quality LMX employees get extra support from their leaders in terms of valued tangible and intangible resources such as information, trust, respect, and obligation. On the contrary, out-group or low-quality LMX employees, who have failed to develop close relationships with their leaders do not benefit from such resources (Dienesch and Liden, 1986; Liden et al., 1997; Liden and Maslyn, 1998). The differential treatment by the supervisor can sometimes result in conflicts among in-group and out-group members, thus further inducing feelings of envy (Deluga, 1994; McClane, 1991; Yukl, 2001).

#### **Envy in the Workplace**

The argument of the relationship between LMX and workplace envy can be found in Cohen-Charash (2000)'s study. In a job promotion context, she showed that an employee felt envious when a similar co-worker had something (e.g., promotion) that the target employee desired but lacked. Translated into the LMX context, we argue that when person A (out-group member) notices that a similar other B (in-group member) has a high-quality relationship with the supervisor, then envy is induced. In the service industry, where employees need to regulate their emotions required by their jobs (e.g., emotional labor), leader's different treatment will have greater impact on employees than employees in non-service industries (Testa & Ehrhart, 2005).

Envy can be defined as "a negative feeling occurring when a person lacks another's superior quality, achievement, or possession and either desires it or wishes that the other lacked it" (Parrott and Smith, 1993, p. 906). Envy is a complex emotion in that feelings of envy are hard to control or hide (Parrott, 1991). When envy is focused on one's disadvantage, then feelings of inferiority dominate. In opposition, when the focus is on another's advantage, then resentment is the dominant emotion (Smith, 2000). Envy also easily invokes unfairness or injustice perceptions (e.g., "I made an effort to achieve something more than s/he did, but s/he got more" Ben-Ze'ev, 2000; Miner, 1990; Smith, 1991). Yet, envy might be induced even without perceived unfairness. People often use envy to justify their emotions (e.g., "I feel envy because the situation is just unfair" Ben-Ze'ev, 1992; Cohen-Charash, 2001). Regardless of its source, envy tends to have a negative effect on an individual's self-worth. Such lowered self-worth is caused by an unflattering social comparison, which is driven by perceived similarity to the target person (Smith et al., 1994).

#### **Perceived Similarity as a Moderator between LMX and Workplace Envy**

By nature, envy is a condition driven by social comparisons with others (Schoeck, 1987). When a person perceives that another person who is similar to one's self obtains a valuable outcome the first person failed to obtain, it upsets the first person's sense of balance (Heider, 1954). This tendency to equalize lots can be recognized as a common form and source of envy. An upward comparison occurs when an individual compares his or her similarity with a more successful other (Wood, 1989). Such upward comparisons are likely to prompt negative affect, including envy, shame and hostility (Salovey and Rodin, 1984; Smith, 2000).

We incorporate the notion of upward comparisons in the following way: When a person X perceives that a similar person Y obtains a valuable outcome such as a higher-quality exchange that X has failed to obtain, it disturbs X's sense of balance (Schaubroeck and Lam, 2004). In this study, we propose that perceived similarity moderates the relationship between LMX and envy. Specifically, we suggest that envy is maximized when low-quality LMX employees perceive similar others having a high-quality LMX relationship with the supervisor. Similarity is measured by the individual's evaluations of his or her similarity with the more successful other, either on dimensions that directly pertain to the comparison (e.g., ability on a specific task on which one has been outperformed) or on dimensions that are indirectly related to the specific comparison but which partially define one's self-image (Woods, 1989). Based on the arguments above, we propose the following:

*Hypothesis:* Perceived similarity will moderate the relationship between LMX and envy in such a way those individuals with low levels of LMX and high levels of perceived similarity will experience higher levels of envy than individuals with low levels of LMX and low levels of perceived similarity.

## **Methodology**

### **Participants**

The level of analysis in this study is at an individual level, since in LMX leadership is viewed as being fairly heterogeneous across members within a work unit, (Graen and Uhl-Bien, 1995; Rousseau, 1985). Part-time service employees' perceptions of LMX, workplace envy, and perceived similarity were measured. The dependent variable was envy. One hundred and one part-time service employees were asked to complete the survey. Fifty two percent was female participants, while the average age was 23. The average number of years working with the current supervisor was 2 years.

### **Measures**

Consistent with previous LMX studies (cf. Gerstener and Day, 1997), a seven-point, seven-item LMX7 was used to measure the employee's overall working relationship with their immediate supervisors (e.g., "My working relationship with my supervisor is effective"). Vecchio's seven-point, seven-item scale was used to measure employee envy (e.g., "My supervisor values the efforts of others more than s/he values my efforts."). Perceived similarity was measured with a 7-item, five-point scale tapping into how much employees perceive themselves as similar to their peers (e.g., "My coworkers and I have similar work performance.") [Schaubroeck and Lam, 2004]

## **Results**

Before testing our research hypothesis, the relationships between LMX and demographic variables (e.g., age, gender, number of years worked in the job, and number of years worked with the supervisor) were examined (cf. Bauer and Green, 1996; Duarte et al., 1994; Tsui and O'Reilly, 1989). Since no significant relationships existed, these variables received no further consideration.

As shown in Table 1, all of the Cronbach alpha coefficients were over .75.

TABLE 1: MEANS, STANDARD DEVIATIONS, RELIABILITIES (CRONBACH'S A) AND PEARSON CORRELATIONS

	Mean	SD	$\alpha$	LMX	Envy	Work-PS#	Person-PS
LMX	5.46	1.02	.89	1			
Envy	3.08	1.10	.76	-.269*	1		
Work-PS	4.88	.91	.80	-.191	.247†	1	
Person-PS	4.95	.898	.85	-.201	.233†	.044	1

\* $\langle .05$  † $\langle .10$

To test the discriminant validity of the measures, exploratory factor analysis was conducted. LMX and workplace envy were submitted to a principal components analysis with oblique rotation:

TABLE 2: FACTOR ANALYSIS

Item	Factors			
	1 LMX	2 Envy	3 Work-PS*	4 Person-PS*
LMX1	<b>.590</b>			
LMX2	<b>.812</b>			
LMX3	<b>.869</b>			
LMX4	<b>.801</b>			
LMX5	<b>.814</b>			
LMX6	<b>.820</b>			
LMX7	<b>.681</b>			
Envy1		<b>.785</b>		
Envy2		<b>.797</b>		
Envy3		<b>.501</b>		
Envy4		<b>.718</b>		
Envy5		<b>.914</b>		
PS1 (work experience)			<b>.691</b>	
PS2 (work attitudes)			<b>.881</b>	
PS3 (work performance)			<b>.886</b>	
PS6 (relationship with the same supervisor)			<b>.570</b>	
PS4 (personalities)				<b>.835</b>
PS5 (opinions on most issues)				<b>.641</b>
PS7 (similar type of a person)				<b>.768</b>

\*PS: Perceived Similarity

As expected, envy and LMX emerged as separate factors with Eigen values greater than 1.0 and correlation coefficients at .50 or higher. Perceived similarity was composed of two sub-dimensions: work-related and person-related similarity.

Hierarchical regression analysis was conducted to test the hypothesis that perceived similarity moderates the relationship between LMX and envy. Since perceived similarity was composed of two sub-dimensions, we used a dummy coding for each dimension. Dummy variables are especially useful in regression analysis, because they enable us to use a single regression equation, while representing multiple groups (Trochim, 1999). Envy served as a response variable while LMX, work-PS (perceived similarity), person-PS, and the interaction between LMX and the two perceived similarity measures were predictor variables. Table 3 shows the results from the regression analysis.

TABLE 3: HIERARCHICAL REGRESSION ANALYSIS

	Base Model	Reduced Model	Full Model
LMX	-.269*	-.187*	-.197*
Work-PS		-.125†	1.525
Person-PS		-.119	1.455
LMX*Work-PS			-.787†
LMX*Person-PS			-.699†
$R^2$	.25	.342	.387

\* $\langle .05$  † $\langle .10$

In the first step, LMX was entered and it accounted for 25% ( $R^2 = .25$ ) of variance in envy. In the second step, the dummy codings representing perceived similarity were added, and the combined variables (i.e., LMX, work- and person- PS) accounted for 34.2% of variance explained (i.e.,  $\Delta R^2 = .092$ ). In the final step, the interaction between LMX and the two dummy codings were added to the regression, thus resulting in an R-square of 38.7% (i.e.,  $\Delta R^2 = .045$ ). As indicated in the full model in Table 3, the two interaction terms are marginally significant, ( $F = -.787$ ,  $F = -.699$ , for work-PS and person-PS respectively,  $p < .10$  for both). These results provide partial support for the moderation hypothesis. In other words, if a low LMX (i.e., an out-group) employee perceives a high level of overall working similarity to in-group employees, then envy will be higher. Similarly, if an out-group employee perceives a high level of overall personal similarity to in-group employees, then the likelihood of envy will be higher.

## Discussion and Limitations

The findings of this study suggest that perceived similarity might influence the impact of LMX on workplace envy. The marginal interaction between perceived similarity and LMX provided some support for the notion that employees with low levels of perceived similarity and low levels of LMX experience lower levels of envy than their high similarity counterparts. In other words, perceived similarity seems to amplify the negative relationship between LMX and envy. This finding is particularly important in light of the counterproductive influence of workplace envy in previous studies (Duffy and Shaw, 2000; Schaubroeck and Lam, 2004; Vecchio, 2001).

There is no doubt that workplace envy is harmful to an organization. For example, envy seems to reduce group performance while increasing perceptions of organizational injustice (Duffy and Shaw, 2000; Schaubroeck and Lam, 2004). Moreover, workplace envy might decrease employees' extra-role helping behaviors, which are critical for service organizations aiming at excellent customer service (Sammons, 1994; Waltz and Niehoff, 2000). Consequently, service managers need to learn how to deal with workplace envy.

There are many potential avenues for minimizing workplace envy. As previous research suggests, fair management practices can mitigate workplace envy (Cohen-Chrasah et al., 2004). For example, objective performance measures may be effective in reducing workplace envy and in increasing organizational justice (Dogan and Vecchio, 2001). Or, an open-door policy might decrease workplace envy. If an employee feels comfortable about discussing problems with their supervisors, then the quality of LMX is likely to increase. In a similar vein, informal meetings or social activities might enhance LMX among out-group employees by (Kim et al., 2004), thus having a mitigating effect on envy.

Despite such meaningful results for both practitioners and researchers, this study has several limitations. First, the sample was composed of part-time service employees. Future research should use full-time employees in order to extend the generalization of our results. Second, this study employed a cross-sectional design. Consequently, any inferences about causality must be made with caution. Third, only employees' perceptions of LMX were measured in this study. Future studies might want to include the supervisor's perceptions of the quality of LMX. Finally, future research should use multiple raters or multiple measures in order to minimize common-method bias as a potential threat in the current study.

In conclusion, the purpose of this study is make managers aware of the potential negative effect of low quality LMX in organizational health. The findings of this study suggest that perceived similarity influences the relationship between LMX and workplace envy among service employees. Feelings of envy might be maximized when employees in low LMX or out-group perceive themselves similar to high LMX or in-group employees.

# Criteria for Performance Evaluation of Offshore Projects – The Changing Dimensions

Vasanthi Srinivasan, [vasanthi@imb.ernet.in](mailto:vasanthi@imb.ernet.in)  
Vishnuprasad Nagadevara, [nagadev@imb.ernet.in](mailto:nagadev@imb.ernet.in)  
Indian Institute of Management Bangalore, India

## Abstract

As the outsourcing industry matures, there is a growing recognition that a more holistic evaluation of outsourcing performance is required. The parameters and the criteria for evaluation would change in a long-term strategic oriented outsourcing partnership. This paper attempts to examine how performance measures used by customers change during a long-term partnership. It is an exploratory study to understand the evolution of metrics in a long-term partnership from a vendor perspective. In-depth interviews were conducted with key managers from vendor organizations in India who have been in the business of outsourcing for over 20 years. The findings indicate that there has been a change in the performance metrics and evaluation criteria over the period. While these changes in criteria have evolved over time in mature partnerships, many new partners are attempting to introduce the metrics into projects at an early stage resulting in a more holistic evaluation of outsourcing.

## Introduction

Much has been written about the phenomenal growth of the software services sector in India and its contribution to the national and the international economy. A Nasscom-Mckinsey study cites a 34% increase in software and services export from 2004-05 from \$12.8 billion to \$17.2 billion (Nasscom Mckinsey, 2005). This study also predicts that by 2010, the US IT and BPO off shoring market will be \$ 110 billion. It is also being recognized that Offshoring and outsourcing have been a source of competitive advantage for organizations (DiRomualdo and Gurbaxani, 1998).

The theoretical justification for outsourcing initially has been the transaction cost theory. The goal of an organization is to reduce cost and achieve efficiency. In the initial stages of outsourcing, labour cost arbitrage appears to have played a significant role to propel the growth of outsourcing (Arora and Athreya, 2002). It was also found that organizations would outsource non-core, low value, routine and highly modularized activities in the initial stages. These have typically been “lift and drop” processes—simple tasks with defined interfaces that can easily be taken from one location to another. However as firms look to extract more value from outsourcing, they will need to outsource more complex processes. These processes are more likely to be more deeply embedded in organizations and may be touching up on many other internal processes and relying on multiple IT systems (Chevalier and Robertson, 2005). Evidence from research studies suggests that it is often more profitable from the client perspective to outsource projects that are more complex and strategic in nature (Gopal, Sivaramakrishnan et al, 2003). Some authors have posited through simulations that, a significant value can be gained by off shoring tasks with an “optimal level of complexity that maximizes the return from off shoring at any given time period or experience level under given situation (Gupta, Seshasai and Mukherji, 2007). This will mean that outsourcing will need to be more strategic in nature and will have to build value drivers. Given the time differences, the concept of a 24-hour knowledge factory that attempts to establish a virtually seamless relationship between the vendor and the client is a growing reality. This would necessitate high interdependencies in processes and would require fostering a climate of long-term partnership between the client and the vendor instead of maintaining an arm’s length contractual relationship between them.

The relationship between the client and vendor is going beyond simple contractual obligations and deliverables. Both parties have started to invest in time, efforts and money in managing and maintaining relationships. In a study on managing outsourcing relationships dealing with essential practices for buyers and sellers, a survey of both buyers and providers of outsourcing services was done in April 2006 to better analyze the

link between the value achieved through outsourcing and the effective management of the outsourcing relationship. Out of surveys of nearly 200 experienced buyers, providers and influencers of outsourcing, nearly all of them agreed that at least 10% of the annual contract value of outsourcing deals is at stake when it comes to effective relationship management. 80% of buyers and 60% of providers said that relationship management can account for 30% or more of annual contract value. Effective relationship management creates increased customer satisfaction, delivery of value added projects on time and on budget, quick response time to requests, greater innovation and thought leadership and resources freed internally to do other work. The study quotes "In fact, our study found that buyers and providers alike realized that managing complex outsourcing relationships effectively - both between the buyer and the provider, and among myriad internal stakeholders on both sides - enhances the value to both organizations. But perhaps most importantly, good relationships don't happen by goodwill alone: they require good governance structures, effective relationship management processes, skilled individuals, and more." Some authors (Goes, 2001) propose that a high vendor-client alignment, teamwork, balance of control and process agility in the relationship will lead to more successful outcomes.

The outsourcing activities, which started out of labour cost arbitrage and cost reduction, have slowly started to mature into informal strategic alliances. Drawing on the body of existing literature on outsourcing, conceptualizing it as a strategic alliance between two or more partners would provide scope for examining the nature and role of performance objectives, parameters, criteria and metrics differently.

## **Field of Performance Management**

Performance management as an area of serious academic study at the firm level has gained recognition. It is often described as the "process of quantifying the efficiency and effectiveness of past actions through acquisition, collation, sorting, analysis, interpretation and dissemination of appropriate data" (Neely, 1998). Over time, the field of performance management has evolved from a measurement focus to a management focus (Otley, 1999). With the shift towards management focus, performance measurement systems based primarily on financial performance measures lack the focus and robustness needed for internal management and control (Atkinson, Waterhouse & Wells, 1997). With this changed emphasis, organizations are looking at measures that "effect positive change in organizational culture, systems and processes, by helping to set agreed upon performance goals, allocating and prioritizing resources, informing managers to either confirm or change current policy or programme directions to meet those goals and sharing results of performance in pursuing those goals" (Amaratunga & Baldry, 2002). In the context of manufacturing outsourcing, Lee et al (2003) point out that "unlike the past the performance of an enterprise now depends much on the performance of its partners in the value chain". We believe this comment is relevant in the context of outsourced environment, be it in manufacturing or services.

Some authors therefore propose that collaborative performance management may be the right direction in the realm of performance management (Busi and Bititchi, 2006). The outsourced environment is a "complex web of contracts, both explicit and implicit between two organizations". The explicit contracts are often market based, short term and financial in nature, but the implicit contracts tend to rely on trust, motivation and a learning relationship to deliver intangibles such as service, flexibility and innovation (Atkinson, Waterhouse & Wells, 1997). The contracts are executed through a plethora of relationships across two organizations. These relationships are at multiple hierarchical levels and often call for planning, designing, implementing and operating structures and process which would allow for effective managing. Performance measurement in such a context is therefore not only a function of evaluation of outputs (financial and material) but also the process of collaboration. Collaborative performance according to the authors (Busi & Bititchi, 2006) would consist of the use of the following measures:

- a. Extended process measures: How is the extended process performing?
- b. Collaborating measures: Are the enterprises able to work as a single unit?
- c. Collaboration management measures: Is the management of the companies providing and creating an environment to allow collaboration to flourish?

Such set of measures pose fundamental challenges for organizations: they require a deeper understanding of each other's future strategies and plans, greater and open sharing of information and finally an understanding of the range of qualitative and quantitative measurements that would be required.

## Objectives of the Study

As has been discussed earlier, conceptualizing outsourcing from a "strategic value adding alliance perspective", allows an opportunity to look at collaborative performance measures to assess the efficiency and effectiveness of an outsourcing partnership. The recent literature on outsourcing has greatly hyped the role of "strategic long term value added outsourcing". If this is the reality, then there is a need to examine whether the performance metrics have changed over time. Prior literature on control of outsourced projects (Choudhury and Sabherwal, 2003) suggests that in the initial stages of outsourcing, outcome controls and in particular output and scheduling of outputs are adopted. As the project progressed, behavior controls were introduced. Very few organizations use the self-control or clan control in the project performance assessment. While this is already happening at the level of the project, one would expect a similar trend to continue at the level of the strategic alliance.

To explore this relationship, it was decided to do in-depth interviews with heads of Quality and Customer Relationship Management in a vendor organization in India. The organization is one of the oldest IT services organizations in India and has experience of managing projects, which were as recent as a few months and also project relationships for over 20 years. The interviews focused on the following aspects:

- a. What is the nature of the kinds of outsourcing relationships? What have been the dynamics? How has the relationship between the vendor and the client changed?
- b. How did the projects evolve over a period in time with the long-term clients?
- c. What kind of metrics was being used to evaluate the effectiveness of the organization, in the initial stages of outsourcing and now?

Each interview conducted was for two hours and the above-mentioned themes were explored in an unstructured manner. The key aspects that emerged from the interviews are given below:

### Characteristics of the Industry Have Changed

Since the early days of outsourcing, five significant shifts have happened in the industry:

The shifts collectively can be described as three generations<sup>1</sup>

Characteristics	First generation	Second generation	Third generation
Period	1980's	Early 1990's	Early 2000 onwards
Key decision maker	Chief Information officer	Chief Technology officer	Chief Executive officer
Role of the Vendor	Code delivery	Project manager	Business value creator
Expectation from outsourcing	Cost, quality, delivery	Cost, quality, delivery and functionality	Cost, quality, delivery, functionality and value add
Key influencer	IT and technology personnel in house	Internal IT and line managers, IT consultants	Management consultants

In the early days of the outsourcing industry, the key decision makers in the client organizations were usually the IT departments or the Chief Information Officer.

When multiple projects with differing technologies and platforms began to be offshored, the Chief Technology officers began to play a critical role in influencing decisions, which were based on compatibility and functionality. In the last few years, it appears that the CEO's have become the drivers of outsourcing since IT has increasingly become a driver of strategic performance and a tool for effective management reporting and control.

The vendors have had to move from a functionality driven orientation to a performance driven orientation to a Value creating orientation. As one our respondents mentioned, “Most clients today outsource different modules to different vendors. The challenge for all of us is to understand inter-operability. It is inter-operability that you can bring value. It is not about being good at what you can bring to the table, but it is about being able to integrate what some one else is bringing to the table with what you have to offer”. The challenges of the transition include viewing IT as an enabler of business rather than a technology tool. This calls for a significant mind set change in the vendor organizations.

There is a need for capabilities, which are not just in the realm of technology; there is a need for increasing domain specialists who can bring value to the client beyond technology. One of the outsourcing vendor organizations started to maintain a team of experts who regularly study the client’s operations and business opportunities and advise the client on possible business strategies. In the case of the large third party vendors, there is also an expectation that since they work for multiple clients, they would be able to bring in the industry best practices in their offering. Thus, client-vendor relationship is evolving from providing service into an advisory or even a consultant’s role.

#### **The Role of Changing Metrics in the Evaluation of Outsourcing Success**

Given the context, the first generation outsourcing metrics broadly consisted of the number of deliverables, like design specifications, test plans, software modules, functional requirements etc), time schedules, work effort, number of service requests handled, number of defects per line of code and broad overarching customer measures related to customer satisfaction.

The second generation outsourcing metrics consisted of usability of the software by non IT users, maintainability which focused on the level of difficulty in the maintenance and support of the software and availability or uptime of the system. The perceptible shift in measures is reflective of the phase when IT was seen as a tool to increase efficiency.

The third generation metrics include all the above metrics, which have become a part of the contractual obligation of a vendor. No vendor today can be happy at having delivered on these metrics and most mature clients treat these metrics as “Business As Usual’ metrics. These metrics are taken for granted by the clients. Some of the emerging metrics in this space include:

a. Interoperability of solutions:

Most large complex outsourced projects have multiple vendors. Since most vendors have acquired capabilities in niche areas, it is in the interest of the client to bring in those vendors. In this context, most clients expect the vendors to not just understand their software delivery but also the requirements of the entire software and thereby incorporate features of compatibility with other vendor software.

b. Understanding the client’s customers:

In recent times, a number of clients have been investing in educating their vendors on the end customer. It has led the vendor to realize that what is of utmost importance is not the client’s immediate requirement but the needs of the end customer. This has provided opportunities for many vendors to build domain expertise in certain functional areas, which are relevant to the client. The belief is that a sound understanding of the customers of the client would enable the vendor to make innovations in service delivery. The increasing domain expertise of the vendors is enabling the client organizations to invite them in to strategic conversations, which otherwise would have been internal to the client. This is one of the key indicators of a collaborative performance

c. Repository of best practices:

The third party software vendors are increasingly being viewed as a repository of best practice. Their domain expertise, with an understanding of the client business has meant that they are often seen as possessing greater experience on an application than the client. It is believed that the knowledge and prior experience of the vendor will result in solutions that are state of the art and are best practices in the industry. There is also a belief that the vendors would bring in solutions that would allow productivity gains and mitigate both technical and managerial risks on projects. Increasingly, contracts with incentives for “gain sharing” have been entered into between vendors and clients.

d. Influencers:

Mature partnerships appear to have reached a stage where the client organization in its strategic planning process invites the vendor organization to act as a sounding board for its future policies. The vendor provides information related to their own partnership and also the possible opportunities for pilot testing, research and development. The percentage of investment on new areas for exploration is gradually increasing. This is believed to be the new wave in outsourcing management.

## Summary and Conclusions

This exploratory study indicates that the changes in the context have impacted the outsourcing relationships and this has resulted in differing shades of engagement between the vendor organization and the client. It also appears that increasingly vendor relationships are seen as platforms for collaboration and are viewed as strategic. This has resulted in changing metrics from delivery focus to functionality focus and finally business interest focus. The move to include many process metrics beyond output metrics appears. It is expected that more sophisticated metrics will evolve for measuring collaborations. In mature relationships, the trend seems to be around more holistic measurements of the partnership. Some authors (Misra, 2004) have suggested a life cycle approach to the use of metrics in an outsourcing engagement. This is consistent with our understanding of the current phenomenon. Appropriate metrics allow the parties to create conditions for successful performance.

The dominant role of IT consultants who appear to push these collaborative measurements in to early stage projects requires further exploration. Most of the third generation collaboration measures are measures of trust and a growing recognition and respect for the distinctive competencies that each party brings to the relationship. There is a need for further research on this dimension

## Abstract

In view of the market demand variations and technological revolution have triggered manufacturers to implement the practices of supplier integration. Supplier involvement and collaboration is considered as an imperative strategy to sustain competitive advantage. The works of manufacturing strategy have verifies the truth that the degree of supplier integration facilitate the buying firms to effectively enhance time-based capability. The present study offers a framework for conceptualizing the relationship between supplier integration practices and time-based capability (e.g., delivery promptness, new product development time, delivery reliability/dependability, and manufacturing cycle time). Some hypotheses referring to those two elements are provided based on previous literature. Moreover, several supplier integration practices are discussed such as the degree of supplier involvement, the design of component responsibility, supplier commitment, information sharing, and supplier base reduction. Our study not only serves as a guideline for firms to implement different supplier integration practices for promoting specific kinds of time-based performance, but also makes a theoretical contribution towards further empirical research. **Keywords: supplier integration practices; time-based capabilities**

## Introduction

In last decade, the shorter product life cycle, intensive technology innovation, and dynamic global competition, the time-based capability in terms of the rapid delivery, quick new product development (NPD), and reduced manufacturing cycle time have become market advantage creation and sustaining weapons (Jayaram et al., 1999). Obtaining the time-based capability is to strengthen the critical supplier integration relationship in the supply chain (Ragatz et al., 1997). The supplier integration practices include limiting the supplier to play a simple role of purchasing product design consulter transforming into an active participator in the NPD, even more delegating responsibility in the design in the supplier outsourcing parts and constructing the information sharing mechanism among suppliers. Based on the effective execution of the supplier integration practices, the time-based performance in terms of the rapid NPD and delivery would be improved (Ragatz et al., 2002).

The past studies related to the supplier integration practices and time-based capability only limited to the early involvement degree of the supplier in terms of purchasing NPD. They focus on the supplier integration practices to the effects in the NPD performance or business performance (Carr and Pearson, 2002; Ragatz et al., 2002; Petersen et al., 2003; Ragatz et al., 1997). The supplier integration practices and time-based capability both have multi-dimensional characteristics nature. There are five dimensions of the supplier integration practices including the degree of supplier involvement, the design of component responsibility, supplier commitment, information sharing, and supplier base reduction (Chen and Paulraj, 2004; McIvor and Humphreys, 2004). The measures of the time-based capability comprise of the delivery promptness, new product development time, delivery reliability/dependability, and manufacturing cycle time (Droge et al., 2004). If we only focus on one single or aggregate dimension to conduct research, we would forgo the clarification and identification of each supplier integration practice to different time-based capability. The managerial application and the scope of the related studies would be restricted. We thus integrate the supplier integration practices and time-based performance to construct their own conceptual framework of the one-to-one relationships.

## **Practices of Supplier Integration**

The supplier integration practices are various practices for the manufacturers and suppliers to maintain long-term reciprocal highly cooperation (Droge et al., 2004). In order to respond to the international operating competitive demands and global supply chain function, in the issue of the supplier relationship management, many manufacturing strategy scholars have turned the traditional short-term profit orientation into the long-term cooperation strategy partnership. The operating flexibility and fast responsiveness to the market changes would be thus strengthened. The conventional supplier management selection was based on the price rather than the quality. Therefore, under the mutual short-term profit superseding base, there was few interaction between the supplier and purchasing manufacturer (Liker et al., 1998). Since Toyota and most Japanese manufacturers aggressively establish the long-term partnership with their suppliers and effectively improve the manufacturing advantages including the product quality level, rapid delivery, and fast new product development. How to maintain the highly collaboration relationship between the manufacturer and the supplier has become one of the imperative study issue of the contemporary supply chain management.

Clark (1989) and Clark and Fujimoto (1991) examine the case studies of Japanese manufacturers. They find the supplier adopting the early participation in the NPD, aggressively involving various quality improvement management programs, and maintaining the bona fine cooperation relationship. Funk (1993), Newman (1989), and Hartely et al. (1997a; 1997b) suggest the manufacturer delegating higher responsibility in terms of the outsourcing parts and adopting supplier base reduction strategy both construct the closer trust relationship with the suppliers. Derocher and Kilpatrick (2000) and Evans and Wurster (1997) indicate that the purchasing manufacturer and the suppliers utilize the information sharing mechanism established by the network technology. They apply the necessary information communication and maintain appropriate mutual trust. Lee and Billington (1992) and Kumar (1996) define the supplier commitment is the willingness to conduct critical investment in accordance with the purchasing manufacturer strategic development intention. They also advocate the supplier highly commitment is one of unavoidable important dimension of the supplier integration practices. We summarize the above mentioned scholars and conclude five dimensions of the supplier integration practices including: the degree of supplier involvement; supplier responsibility of the component design; supplier base reduction; information sharing, and supplier commitment.

### **Degree of Supplier Involvement**

The degree of supplier involvement indicates the aggregate participation level in terms of the new product development (product concept development, prototype design, pilot test, or production) and various quality improvement programs. Several studies advocate the early supplier aggressive participation in the purchasing manufacturer new product development would contribute positive shortening in the new product development cycle time (Takeishi, 2001; Swink, 1999). The aggressive involvement in various quality improvement programs would strengthen the time-based capability of the order manufacturing cycle (Liker et al., 1998). Narasimhan et al. (2004) suggest that the supplier involvement incorporating the early participation in the new product development procedure, various product development committees (such as design for manufacturability (DFM) or design for assembly (DFA)), and various quality management program.

### **Design of Component Responsibility**

Asanuma (1989) and Helper (1991) suggest that there are four kinds of parts productions including: in-house design and production, in-house design/supplier production, design and production with suppliers, or fully delegation of the supplier design and production. Traditionally, the outsourcing parts were designed in-house and transformed the part specifications to supplier for production. But recent a lot of manufacturing management literatures support that the Japanese automobile manufacturers have delegated their suppliers in terms of outsourcing design responsibility. The overall supply chain in the automobile industry quality level and competition have been improved. Based on the supplier professional competency and the reciprocal trust establishment, the delegation of the design of component responsibility to the supplier has become a common strategy approach in terms of supplier integration practice.

### **Supplier Base Reduction**

In the past due to the price competition and risk diversification, the manufacturer applied the multiple supplier strategy for purchasing parts (Newman, 1989; Shin et al., 2000). In recent practices, most manufacturers have turned from the traditional multiple supplier strategy into supplier base reduction. The major reason is the cost higher than the price benefit derived from the multiple supplier management. More importantly, the multiple supplier strategy won't establish the long-term cooperation and trust with the suppliers (Gadde and Hakarsson, 1994). Besides the supplier base quantity reduction, the immediate tier reduction of the supply chain is an imperative task of the supplier base reduction. That is the manufacturer as possible as to purchase the assembled system rather than the individual parts in order to reduce the supply chain supplying levels. In this kind of practice, the first tier supplier should directly provide products to the purchasing manufacturer. Compared to the second or third tier suppliers, the first tier supplier has closer relationship with the purchasing manufacturer. The mutual partnership is easier to establish.

### **Supplier Commitment**

The supplier commitment is the willingness and intention for the suppliers to match the operating strategy of downstream manufacturer. The suppliers devote their input resources continuously and maintain reciprocal long-term cooperation relationship (Dion et al., 1992). Lee and Billington (1992) find the effects derived from the overall supply chain performance or the operating advantage of the supply chain members most based on the highly trust and commitment. Several studies advocate that the purchasing manufacturer and their suppliers keep better reliability and commitment would construct the concrete supply chain integration practices (Heide and John, 1990; Handfield and Bechtel, 2002). Canon and Perreault (1999) measure the commitment based on the reciprocal technology investment level among the supply chain members. Prahinski and Benton (2004) apply the mutual trust, length of the long-term cooperation, and the willingness to solve the problems mutually to measure.

### **Information Sharing**

The information sharing is defined as the mutual degree in terms of critical, core, or professional information to exchange and sharing between the purchasing manufacturer and supplier (Towill, 1997). Recent supply chain management advocate that if the upstream and downstream members could establish a sound information communication and sharing mechanism, the rapid responsiveness capability to the market demand would be improved (Sahin and Robinson, 2002). In respect of the information sharing content, Mentzer et al. (2000) indicate the mutual information contents include: strategic information (business strategy plan and product development plan); activity information (production schedule plan and quality management information); market and customer demand information, and distribution information. Prahinski and Benton (2004) and Ward and Zhou (2006) adopt the information sharing channel perspective and suggest that the manufacturer and supplier enable to share reciprocal information through multiple approaches in terms of face-to-face communication, telephone, fax, or internet information technology.

### **Time-Based Performance**

As the highly dynamic customer demand change and shorter product life cycle, most manufacturers ponder how to apply time-based capability to improve their competitive advantage in the global or regional market (Stalk and Hout, 1990; Handfield and Pannesi, 1995). The Boston Consulting Group initially conceptualizes the time-based strategy and applies in the business practices. The strategy management of the time-based competition (TBC) is one of imperative issue for practitioners and academics. Several well-known case studies adopting the time-based capability strategy practices and result impressed performance. Jayaram et al. (1999) find 3M applying time-based strategy approach and shortened the new product development time from two years into two month. The time-based strategy application in Fuji Xerox has successfully reduced the R&D cycle time of the copier machine from four years into two years. Various time-based competition-oriented practices utilizing in Toyota have decreased the new car model R&D time to two years. Toyota has preceded the Big Three automobile manufacturers (GM, Ford, and Chrysler) in the new product development cycle time. Several successful business cases have substantially reduced the new product development time over 75 % (Trygg, 1993). Carter et al. (1995), Tunc and Gupta (1993), and Handfield (1993) find the well-know cellular phone maker- Motorola, the manufacturing cycle has dramatically

reduced to four hours instead of previous several weeks. For Toyota to manufacture an automobile, it only takes two days, compared to their North American counterparts in less than three days. For Johnson and Johnson, their popular Acuvue only takes less than three days to deliver the order and 99.9% prompt delivery rate. This kind of prompt delivery capability results their leading position in the contact lens market.

Carter et al. (1995) and Tersine and Hummingbird (1995) demonstrate the time-based capability showing the multi-dimensional characteristics. Various manufacturing management programs result distinct time-based capability performance. Roth and Miller (1990) explore the relationship between the manufacturing strategy and business performance, they measure the time-based capability by the delivery promptness, delivery reliability/dependability; and new product development time. Vickery et al. (1995) examine the determinants of business performance and suggest the manufacturers enabling to strengthen the time-based capability in terms of the new product development cycle time, the quantity of the new product introduction, manufacturing cycle time, and delivery time. Besides the delivery promptness, delivery reliability, delivery dependability, and new product development time to market, Roth and Maruchek (1993) and Safizadeh et al. (1995) also advocate that the responsiveness capability to the customer need or complaint should be included in the measures of the time-based capability. Therefore, the sound customer relationship would be maintained. When Jayaram et al. (1999) investigate the empirical study of the time-based capability in North American Automobile industry, they suggest that the manufacturing cycle time should be one of important indicator. The promptness of the manufacturing department upon receipt of order till the order completion should be honored. Droge et al. (2004) discuss the time-based capability to attribute the business performance in terms of the new product time to market, manufacturing time to product, and rapid responsiveness as measuring dimensions. The rapid responsiveness capability focuses on the strategy or approach to respond to the customer needs. We summarize the above mentioned scholars aspects and category the following time-based capabilities.

(1) New Product Development Time: the capability which the manufacturer can quickly modify current product quality or develop a new product (Vickery et al. 1995). We measure the numbers of new product introductions or the time required for the new product development.

(2) Manufacturing Cycle Time: the capability which the manufacturer can shorten the time upon receipt of customer's order, placing the production request to the manufacturing department, and the order production completion (Handfield and Pannesi, 1995). This is to measure the promptness of manufacturing department.

(3) Delivery Promptness: the capability which the manufacturer can shorten the time effectively in the receipt of customer order till the product delivery to the customer (Handfield, 1992; Droge et al. 2004).

(4) Delivery Reliability/ Dependability: the capability which the manufacturer can follow the customer delivery time request and deliver the products to the customers punctually and correctly (Handfield and Pannesi, 1995; Roth and Miller, 1990). The delivery dependability indicates the manufacturer can satisfy the order request in terms of the product quantity, type, and specification.

## Proposition

Applied the related research of the supplier integration practices and time-based capability, we demonstrate the following research propositions.

**P<sub>1a</sub>: The degree of supplier involvement leads to positive new product development time.**

**P<sub>1b</sub>: The degree of supplier involvement leads to positive manufacturing cycle time.**

**P<sub>1c</sub>: The degree of supplier involvement leads to positive delivery promptness.**

**P<sub>1d</sub>: The degree of supplier involvement leads to positive delivery reliability/dependability.**

**P<sub>2a</sub>: The supplier design component responsibility leads to positive new product development time.**

**P<sub>2b</sub>: The supplier design component responsibility leads to positive manufacturing cycle time.**

**P<sub>2c</sub>: The supplier design component responsibility leads to positive delivery promptness.**

**P<sub>3a</sub>: The supplier base reduction leads to positive new product development time.**

**P<sub>3b</sub>: The supplier base reduction leads to positive manufacturing cycle time.**

**P<sub>3c</sub>: The supplier base reduction leads to positive delivery promptness.**

**P<sub>3d</sub>: The supplier base reduction leads to positive delivery reliability/dependability.**

**P<sub>4a</sub>: The supplier commitment leads to positive new product development time.**

**P<sub>4b</sub>: The supplier commitment leads to positive manufacturing cycle time.**

**P<sub>4c</sub>: The supplier commitment leads to positive delivery promptness.**

**P<sub>4d</sub>: The supplier commitment leads to positive delivery reliability/dependability.**

**P<sub>5a</sub>: The information sharing leads to positive new product development time.**

**P<sub>5b</sub>: The information sharing leads to positive manufacturing cycle time.**

**P<sub>5c</sub>: The information sharing leads to positive delivery promptness.**

**P<sub>5d</sub>: The information sharing leads to positive delivery reliability/dependability.**

Based on above mentioned discussion between the supplier integration practices and time-based capability, we construct the conceptual framework shown in Figure 1. We would utilize the multiple regressions to verify the five supplier integration practices dimensions and four time-based capability indicators.

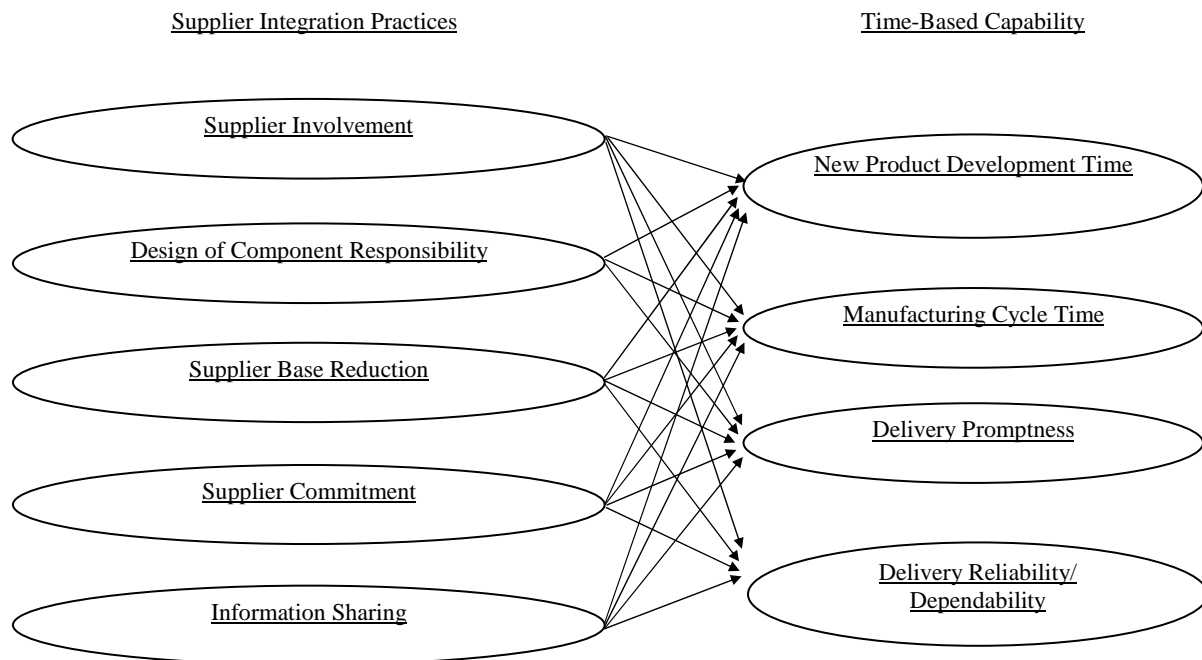

FIG1: CONCEPTUAL FORAMEWORK OF THE RELATIONSHIP BETWEEN SUPPLIER INTEGRATION PRACTICES AND TIME-BASED CAPABILITIES

## Conclusion

Several successful case studies applying time-based strategy and gaining competitive advantage have triggered the academics to explore the determinants of time-based capability. There are different approaches to explore the time-based capability including: (1) advanced manufacturing technology adoption and utilization (Millson et al., 1992; Cordero, 1991); (2) concurrent engineering R&D management mechanism application (Dixon and Duffery, 1990; Mertins and Jochem, 2005; Tan et al., 2006); (3) multi-disciplinary teamwork function (Carmel, 1995; Hershock et al., 1994; Cooper and Kleinschmidt, 1995); (4) modularity design principle and practices (Tu et al., 2004; Schilling, 2000); (5) just in time (JIT) practices implementation (Wang et al., 2003; Gehani, 1995); (6) the degree of the

supplier involvement in the new product development (Ragatz et al., 2002; Petersen et al., 2003). Therefore, the past literature focuses on the process technology, R&D management, cross-functional teamwork, modularity design, and JIT production practices perspectives to explore on how to improve the time-based capability. Therefore, our study proposes five dimensions of the supplier integration practices to affect four time-based capabilities. Our research has innovation and uniqueness compared to previous perspectives.

There were abundant studies regarding the supplier integration practices and time-based capability, but they only limited to the early involvement in the new product development, the effects to the new product development performance, or the business performance. There were scant studies related to the five supplier integration practices influence to the business performance. Obviously, the past research is not rigorous yet. Pertaining to the time-based capability determinants, most studies referring from the aspects of process technology, R&D management, cross-functional teamwork, modularity design, and JIT production practices on how to improve the time-based capability. There were few issues based on the supplier integration practices to conduct the influence to the time-based capability. In other words, we integrate the supplier integration practices and time-based capability to investigate their influential relationship exhibiting innovative and unique presentation.

There are multi-dimensional natures of the supplier integration practices and time-based capability. The past one single or aggregate indicator is not sufficient to delineate or discuss their insightful cause-and-effect relationship. In our study, we identify one-to-one perspectives from the five supplier integration practices to four time-based capabilities. We present a conceptual framework can serve a managerial decision direction. The manager can choose appropriate supplier integration practices for anticipated time-based capability improvement. Our study would be conducted in further investigation for related research.

### Abstract

**This contribution deals with some critical issues of cluster performance management. The first topic discussed is the use of clusters as a tool for increasing the performance of companies and regions in the conditions of globalization, followed by governmental and local policies and their impact on the development of clusters. Finally, some important factors of cluster performance management based on results obtained from surveys and structured interviews of managers of selected clusters are identified.**

### Introduction

There are a number of definitions of clusters in the literature. Cortright [3] concludes that one fixed definition of clusters cannot be made. It is necessary to modify one's definition depending on the purpose of the given study. For the purpose of this paper we will use the definition proposed by Porter. Porter [8] defines a cluster as *"a geographic concentration of mutually interconnected companies, specialized suppliers, providers of services, companies in similar fields and associated institutions, such as universities, agencies and associations of different orientations, which compete, but also cooperate."*

Clusters may represent forms of vertical as well as horizontal integration of companies.

Debate is ongoing as to whether globalization will make clusters more or less important, with the literature leaning towards greater regional importance. Some economists argue that regional specialization and clustering of related activities are becoming more important features of the world economy as a result of globalization.

### Clusters as a Tool for Increasing the Performance of Companies and Regions

The development of clusters seems to promise an answer to the challenges created by increased international competition and the growing importance of innovation in the knowledge economy. Clusters of interrelated firms can be an important source of competitive advantage and active membership of cluster can lead to increased performance of individual firms. Let's try to answer question what could be the reasons for that.

At the beginning, we have to identify possibilities for cooperation among members of cluster. There are several fields for cooperation, particularly:

- ❖ networking
- ❖ human resource management
- ❖ research and development, innovation processes
- ❖ marketing, public relations
- ❖ investments
- ❖ lobbying, etc.

**Networking** represents the creation of conditions for formal and informal flow of information and knowledge within the cluster. It increases the availability and rate of transfer of information and technologies due to the proximity of the companies, strong ties between them and the highly competitive nature of the cluster. It can have the form of short meetings of representatives of individual cluster members, information support by common web site, newspaper, setup information center etc. The management of a cluster may arrange contacts not only among the members of the cluster, but also with suppliers, customers, providers of financial capital, with

educational, research and other institutions, which are not members of the cluster. However, the creation of networks must not be an end in itself, it has to be useful for the companies and move them forward.

**Human resources**, their availability to the companies and the improvement of their qualifications, represent an important field for the cooperation within the clusters. This can be a common vocational guidance and education of employees by organizing courses, common seminars and conferences, by creation of educational centers. A cluster usually organizes these activities in cooperation with educational institutions; it can finance them from its own resources or can use financing from different supporting projects. Cooperation of the cluster with secondary schools, colleges and universities can be significant in creating cooperative networks, helpful in formulation of demands on graduates of these schools according to the needs of industrial practice (orientation of programs of studies, modification of curricula etc.). The presence of a strong cluster in a region may also attract talents from elsewhere.

The experience from the existence of clusters shows that for a dynamic growth of the cluster and of the companies in the cluster it is essential to pay attention to the sphere of **research and innovation**. Innovations maintain the viability and prosperity of companies in the marketplace; research and development create the condition for future growth. The support of innovation is directed towards the development of new products or the improvement of their properties or towards the process improvements. The support of research brings new know-how. These processes are interrelated even if they represent different activities of the cluster. The cooperation of the companies within the cluster may have the form of sharing information and ideas, mutual research projects, support of formation and expansion of spin-off companies etc. Companies may develop a mutual research infrastructure together or cooperate with research institutions (research institutes or universities), which have the necessary materials, technical facilities and equipments as well as properly trained personnel and which are often initiators and operators of „incubators“ and scientific and technical parks. Universities and research institutes can also greatly benefit from the cooperation with clusters - they can better move the results of their research into implementation in practice and commercialization. Skokan [9] shows in his publication that innovation processes are not perceived today as being linear, but as interactive, linked up, integrated and acting on a feedback. It is therefore absolutely essential to create a network environment for the cooperating subjects within the regional infrastructure, which allows the transfer of technologies and know-how to the environment of entrepreneurial subjects.

**The field of business cooperation and promotion** includes activities as joint purchasing and a possibility of a higher pressure on the quality of delivered goods and their pricing, or shared production. There is a possibility to fill large orders or possibility of greater specialization; a cluster may combine companies from different links of the value chain. This enables smaller companies to specialize and compete with larger, vertically linked companies. Additional benefits of cooperation are more effective logistic management; shared expenses for marketing research of trends and markets; joint participation in trade fairs; joint catalogue of products and services for the member of clusters; the possibility to utilize joint logo, trademark, advertisement etc.

Obtaining sources for **financing of investment projects** are very important for the strategic development of a cluster. Attracting investors with advantageous conditions of financing or joint financing can be a significant resource for reducing capital costs and risk. An access to financing can be easier for a cluster than for an individual company. Investors (often venture capital) may be attracted into the region due to positive image created by the presence of a strong cluster. Financing of necessary investment projects creates conditions for a further growth of the cluster.

Another no less important field useful for the growth of a cluster and its members is **lobbying** on behalf of building a necessary infrastructure, improvement of legislature, grant policy etc. A cluster magnifies the power and voice of smaller companies. They can urge the government or regional representation to make investments in specialized infrastructure. Thanks to the visibility of a cluster, cost effectiveness and higher return on investment represented by a cluster, its additional possible investments are more easily justifiable.

For the growth of a cluster, other supporting activities that the cluster management can offer to its members can be important. These activities can secure an effective collaboration in above-mentioned areas, such as *help with preparation and management of projects; securing service in the form of accounting a legislative consulting; banking services; insurance; benchmarking* etc.

From the above it follows that there are many activities that can be implemented within the cluster, which can contribute to the increase of efficiency of individual companies.

Preliminary results from the authors' own survey carried out by interviews of cluster managers in different countries are presented on Figures 1-6. This survey is continuing; in this phase; 20 cluster managers have taken part in this research.

Figures demonstrate shares of joint activities, which:

- (1) clusters currently offer to their members,
- (2) clusters currently do not offer, but plan doing so in few years,
- (3) clusters currently do not offer, but in case of need cluster managements are able to arrange,
- (4) clusters neither offer nor plan doing so.

FIG. 1: ACTIVITIES OF CLUSTERS IN THE AREA OF NETWORKING

Almost all clusters involved in the survey offer information support in the form of joint website, newspaper, information center; common workshops and meetings; and management of clusters arrange contacts between the cluster members. More than a half of clusters arranges contacts with vendors or customers; others are planning to do so or cluster managers are able to arrange them if necessary.

FIG. 2: ACTIVITIES OF CLUSTERS IN THE AREA OF HUMAN RESOURCES

All clusters involved in the survey organize (or could organize, if necessary) joint seminars and conferences, or plan doing so. Half of them offer common training of employees. Almost all of clusters providing these activities cooperate with educational institutions.

FIG. 3: ACTIVITIES OF CLUSTERS IN THE AREA OF RESEARCH AND INNOVATIONS

A good deal of the clusters involved in the survey carry out joint research, innovations of products and processes, and cooperate with research institutions. Almost half of them support spin-offs; further one third of clusters plan doing so in future. Incubator services are offered quite rarely, but additional clusters are able to offer them if necessary or plan them in future.

FIG. 4: ACTIVITIES OF CLUSTERS IN THE AREA OF BUSINESS COOPERATION AND PROMOTION

Most common activities in area of promotion are joint participation in trade fairs, marketing, research of trends and markets and joint logo, trade name or advertisement. Business cooperation in the form of logistic management, joint purchase or shared production are quite rare activities in the clusters, but in case of interest, clusters are able to ensure them in many cases.

FIG. 5: ACTIVITIES OF CLUSTERS IN THE AREA OF SUPPORT ACTIVITIES

The most widespread support activity is a help in preparation and/or management of projects. Support services in a form of banking services/insurance/legal, accounting and tax consultancy and etc. are not provided commonly. Benchmarking is quite popular; almost all clusters use it or are going to use it in close future.

FIG. 6: ACTIVITIES OF CLUSTERS IN THE GOVERNMENTAL/POLITICAL AREA

Lobbying is quite common activity in clusters; almost all clusters involved in the survey consider it.

## Governmental and Local Policies and Their Impact on Cluster Development

Very often the formation of cluster and support of its development is connected with the so-called **cluster initiative**.

The cluster initiative is defined according to the Greenbook of Cluster Initiatives [10] as follows: „*The cluster initiative is an organized effort focused on the increase of growth and competitiveness of a cluster in the region with the participation of cluster companies, government and/or research community*“.

According to Andersen, Bjerre and Hanson [1], cluster initiatives are generally self-identified clusters which in many cases participate in national schemes.

Clusters and cluster initiatives are in a number of countries supported by governmental and regional institutions mainly in the following form:

- Informational support and education by means of „Guides“, seminars, and conferences,
- Grants supporting mapping of potential clusters,
- Grants supporting the implementation of selected projects.

Thus a well-thought-out policy can lead to the growth and competitiveness of selected industries and lines of business; a wrong choice of subjects of support may lead to wasting of public resources and to the limitation of the potential growth of the country and region. It is also important to identify those areas of cooperation of the companies in the cluster, which bring the highest added value and support them. From the foregoing reasons it is therefore unavoidable to set suitable benchmarks for monitoring the effectiveness of spending these resources. This is a very demanding task and there is a great amount of effort expended throughout the world to find an effective measurement and management of the cluster performance.

To achieve an effective allocation of financial resources for the support of growth of clusters, it is necessary to examine the following:

- The impact of subsidy on the performance of the individual companies (cluster member) and of the cluster as a whole,
- The impact of subsidy on the development of the region.

Individual countries and regions have different approaches to founding and development of clusters. Below are few examples of countries with intensive support of development of clusters and cluster initiatives.

Through the National Research Council of Canada (NRC), the Government of **Canada** has made a series of investments in clusters as a part of National Innovation Strategy. NRC is composed of 20 institutes located across Canada. Canada, given its vast geography, relatively small and dispersed population, and the predominance of SMEs, has taken a collaborative approach in building community innovation over the past decade. Increasingly, innovation has taken the form of community-based "technology clusters", a term that describes the growth of a significant concentration of innovative companies around a nucleus of R&D facilities. NRC cluster initiatives have focused on building science and technology-based innovation capacity in areas of local and regional strengths to foster economic growth and improve quality of life. The process involves: bringing the leadership needed to gather stakeholders together to define a collective vision; building trust within a cluster by fostering networking and collaborative R&D between firms engaging in community consultation; providing specialized research infrastructure and highly qualified personnel; supporting the creation, growth, and attraction of firms; facilitating the development of external linkages; and supporting the clusters in attracting new resources. Up to now, 11 cluster initiatives have been established and NRC has received over 300 million CAD in four rounds of funding to establish and reinforce cluster initiatives across the country.

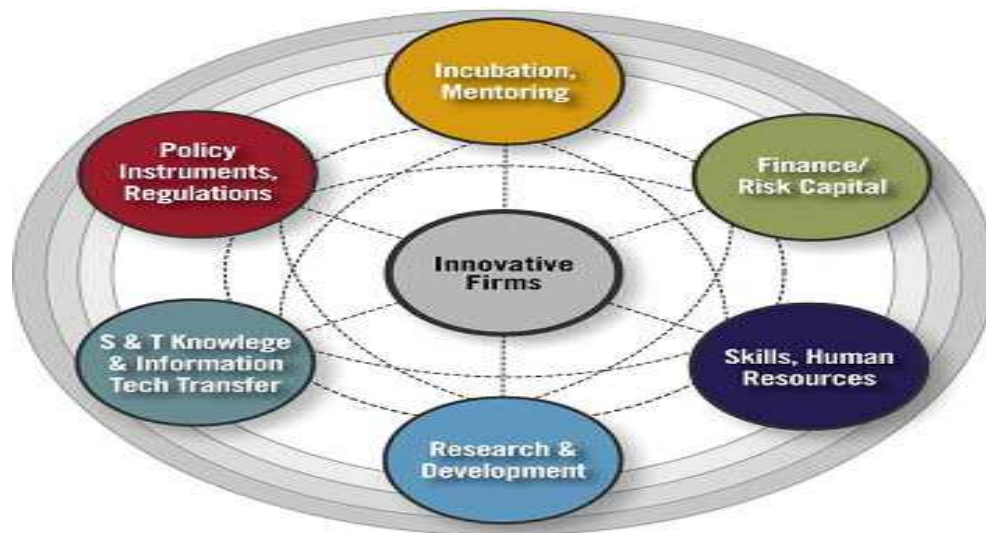

FIG. 7: MODEL OF THE NRC' CLUSTER POLICY [11]

In **Austria**, clusters have been supported from the early 1990s. Each cluster can count on public support in terms of cluster management and cluster funding. Cluster development in Austria operates at different levels: regional clusters, nationwide clusters, and industry-research linking competence centers. Regions are entitled to set their own innovation and technology policies. They take over the active part of building clusters, i.e., cluster management and co-operation platforms. However, national institutions provide a general framework for regional cluster policy: financial support; technology transfer programs; training plans; and R&D policies [6].

Since 1998, the Regional Government of Upper Austria has pursued a cluster-oriented economic and technology policy on the basis of the "Upper Austria 2000+" Strategic Program. The aim is to achieve a sustained improvement in the competitiveness of the location. TMG, the regional institution for the promotion of technology and marketing (owned by the Regional Government of Upper Austria) was given responsibility for cluster management. For period 2005-2010, new Strategic Program "Innovative Upper Austria 2010" was prepared. The focal point of the program is formed by a concentration of capacity on five main areas comprised by: R&D, networks, EU-networking, Upper Austria as an economic and technology location, and professional qualification. Upper Austria is the European leader with regard to economic networking. No other region has such a well-

established climate of cooperation. At present, approximately 1,200 companies, R&D bodies, and educational institutes are partners in the inter-branch network Clusterland Upper Austria, Ltd., as following: Automotive-Cluster, Health-Cluster, Plastics-Cluster, Furniture/Timber-Construction-Cluster, and Mechatronics-Cluster. Clusterland supports cluster and network initiatives. The Clusterland partners employ more than 219,000 people and have total annual sales of € 39.02 billion. The Clusterland sustained more than 220 co-operation projects and more than 500 training events.

Lower Austria's cluster policy has become an important part of regional innovation and technology policy as well. The trend in Lower Austria has turned around from step by step increasing independency for cluster initiatives (as planned in 2001 when the first initiatives started) to a clear mandate for the Regional Development Agency (RDA) to run cluster initiatives as an economic policy instrument to strengthen SMEs. The regional government provides the main part of financial resources to operate the cluster managements for a limited short period of time (5 - 10 years). Companies' financial participation in clusters should be generated from moderate membership fees, fees for workshops or events and sponsoring. Fees foster involvement of companies, but also a service orientation of the cluster team. The regional development agency Ecoplus explores and maps cluster potentials, implements cluster initiatives, provides the financial and information support and employs cluster managers. Ecoplus combines different economic instruments for a better cluster development like technology services, business location development, business parks, and support for start-ups, etc. Ecoplus has already established cluster initiatives in six next-generation sectors: timber, automotive, green building, wellbeing, plastics and food industry. 475 companies with more than 58,000 employees are already participating as partners in these clusters. Around 100 cooperation projects have already been completed, with more than 400 companies participating.

Cluster initiatives in the **Czech Republic** have been supported by the program "KLASTRY", which began in 2004 and has enabled identification and support of new sectors and sub-sectors with potential to improve competitiveness through collaboration and innovation. The program focuses on the financial support to regions demonstrating commitment to innovative clusters. The KLASTRY program is managed by the CzechInvest, an agency of the Ministry of Industry and Trade. The total budget for the program over the years 2004-2006 was approximately 12 million EUR (average of 4 million EUR per year). The budget per cluster may reach up to € 33,000 for activities connected with the creation of a cluster, not to exceed 75% of eligible costs. Eligible costs include items such as studies, meetings, or workshops and associated materials. The budget for the development of the cluster may range from approx. € 100,000 to 1.6million for management and development of clusters (for the total program period of up to three years). Reimbursement cannot exceed 50% of the total project cost based on the following schedule (maximum of 75% of eligible costs in year 1, 50% in year 2, and 25% in year 3). Eligible costs may include cluster staff, tangible and intangible assets for the cluster initiative, consulting services, benchmark studies, cluster promotion, evaluation of economic impact, and research (market, competition, and innovation). Supported clusters must be in the Czech Republic (but not in Prague), include at least 15 firms (min. 60% of members are SMEs), include at least one university or research institute. [5, 12]. Per CzechInvest, there are 51 different clusters or potential clusters across Czech regions. Prior to launching the program, CzechInvest offered a training and cluster awareness sessions to cluster facilitators, academics and regional government and private sector representatives. Periodic training sessions as well as the Annual National Cluster Conference are organized. CzechInvest also plans to develop a formal accreditation process for specific cluster facilitation skills. New program for supporting clusters, pole of excellence and networks – "Cooperation" (financed by EU funds) will be launched in the second half of the year 2007.

## **Cluster Performance Management**

What can contribute greatly to the progress of clusters and to the support of their performance? Since cluster performance is not a single-dimensional concept, it is necessary to look at a range of factors influencing this performance.

Generally, in order for a business to grow, it must be able to access the necessary external resources and operate within a supportive business environment. The macroeconomic framework for the growth of enterprise is the widest dimension influencing the performance of subjects acting here. Much innovation support focuses on individual or groups of companies, helping them address and improve internal competences, e.g. technology, skills, funding. Even if companies have addressed all their internal issues, but they cannot readily access finance to grow, or if there is a lack of suitably skilled staff available, this will limit their development.

National or regional policies can to a high degree contribute to the formation of clusters (mapping of potential grouping) and their growth, as has been mentioned and demonstrated in selected countries. However, clusters can be formed and developed even without a special set-up cluster policy of a government or region.

An organization of cluster activities and mutual communication between the members of clusters can be done by the professional management or by representatives of individual cluster members. The efficiency of cluster management may play a significant role in the development of a cluster and its members, as well as of cooperating institutions.

According to Breschi and Malerba [2], the key feature of successful clusters is related to the high level of embeddedness of local firms in a very thick network of knowledge sharing, which is supported by close social interactions and by institution building trust and encouraging informal relations among actors. The possibility for individual firms to tap into the body of localized knowledge and capabilities depends on the fundamental way on the ability to establish and maintain effective social links and lines of communication. Besides offering an industrial atmosphere favorable to innovation and entrepreneurship, and a social capital supporting trust and a cooperative relationships, the additional key feature of technology-intensive clusters is related to the availability of a common set of resources, some endogenously given, like universities and public research centers, and some others endogenous to the cluster development, like a pool of specialized and skilled labor.

These propositions have been preliminary confirmed by authors' own survey carried out by interviews of cluster managers in different countries (as mentioned above). The following aspects were identified as being essential for the cluster development and cluster performance management:

- Networking and mutual communication among cluster members;
- Professionalism of the cluster management;
- Mutual confidence and communication among cluster members;
- Strong entrepreneurial spirit in companies;
- Joint research or cooperation with a research institutions;
- Access to finances;
- Access of companies to information;
- Cooperation with educational institutions;
- Education of human resources;
- Innovative technologies,
- Subsidies from government/region during the growth of cluster.

Cluster managers do not consider a presence of a company with a foreign owner or of a multinational company and competition rivalry among companies in the cluster as very important factors for cluster development.

More detailed results of survey of cluster managers opinions can be seen in Fig. 8.

## DEVELOPMENT OF THE CLUSTER

FIG. 8: CLUSTER MANAGERS' OPINION ON THE CRITICAL FACTORS FOR THE SUCCESSFUL

## Conclusion

This article has addressed some of the issues pertaining to clusters and the management of their performance. The main areas of cooperation of the cluster members, which can increase their performance and the performance of regions, have been identified. Based on own investigation using interviews with cluster managers, the preferences of individual activities have been evaluated.

In a number of countries, the government implements a cluster policy that has varied forms of support of identification, formation and development of clusters. Selected examples of such policies are presented in this article. At the same time, the necessity of evaluation of effectiveness of investment of financial means for the support of cluster development as well as problems inherent in cluster policies was discussed.

In the last part of the contribution, the factors influencing the performance of clusters, from macroeconomic conditions, through the cluster policy of the government to the actual activities of the cluster management have been discussed. The results obtained from the literature search have been expanded by the results of authors' own investigation among cluster managers, which confirmed the identification of the selected factors significantly affecting the performance on the very level of clusters alone.

## Acknowledgement

Authors are thankful to the Grant Agency in the Czech Republic (GA CR) No. 402/06/1526 for financial support to carry out this investigation.

# Determinants on EU-5<sup>1</sup> and USA Apparel Imports: A Gravity Model Analysis Approach

*K.F. Au, tcaukf@inet.polyu.edu.hk*

*M.H. Chan, Eve,eve.chan@polyu.edu.hk*

*Institute of Textiles and Clothing, The Hong Kong Polytechnic University, Hong Kong*

## Abstract

EU and USA are the major apparel importers by virtue of their strong demand for apparels and the high purchasing power. In 2005, the value of world's apparel imports to EU and USA amounted to US\$ 120 billion and US\$ 80 billion respectively, which together represented 70 per cent of the world's total apparel imports. Specifically, the apparel import values of top five member countries of EU, namely Germany, UK, France, Italy and Spain, amounted to US\$ 85 billion, which represented 74 per cent of the region's total apparel imports. This paper is intended to identify the effects of economic and specific social factors that underpinned the apparel imports of the major consuming countries of EU, focusing on the top five importing member countries as well as USA and their top five apparel suppliers. A gravity model analysis with panel data estimation approach is conducted with the exploration at aggregate level. Taking the data from 1990 - 2005, the economic indicators and the country-specific factors are analyzed statistically to investigate the impacts of these determinants that have affected the apparel imports and the expenditure patterns of EU and USA.

## Introduction

EU and USA are the two largest global apparel consumers because of their sheer size in terms of population, income, high average purchasing power and strong demand for quality apparels at best price. In 2005, the value of world's apparel imports to EU and USA markets amounted to approximately US\$ 120 billion and US\$ 80 billion respectively, which together represented about 70 per cent of the world's total apparel imports. Specifically, the apparel import values of top five member countries of EU, namely Germany, UK, France, Italy and Spain, amounted to US\$ 85 billion, accounted for 74 per cent of the region's total apparel imports.

## Apparel Imports for EU

In 2005, EU-25 was the largest importer of apparel products, the value of apparel imports to this region amounted to approximately US\$ 120 billion, representing 45 per cent of the world's total share of apparel imports. Apparel imports from world to EU-25 were observed rising continuously during 1990-2005, except the slight declines in 1992-1993 and 2000-2001 (Fig.1). Outgrowth in apparel imports resumed and a dramatic increase was witnessed in 2002, when imports expanded substantially from US\$ 84 billion to US\$ 170 billion between 2001 and 2002 due to the influx from relatively low cost Asian suppliers, especially China. This spectacular surging of apparels into EU-25 occurred after the phasing out of quotas on certain apparel products at the third stage of the Agreement on Textiles & Clothing (ATC) since 2002.

## Trends in EU-5 Apparel Imports

For EU-5, their apparel imports amounted to US\$ 85 billion in 2005. As shown in Fig.1, EU-5 apparel imports increased markedly in value after the late 1990s and continued to grow in recent years after the ATC implemented the gradually removal of quota since 1995, although imports fell slightly in 1992-1993 and 2000-2001. In 2002, growth resumed with an increase of 7 per cent to US\$ 59 billion. In value terms apparel imports have continued to increase over the years. In 2005 the import value again rose by 7 per cent when compared with the previous year, reaching US\$ 85 billion. By then, apparel imports by EU-5 have exceeded that of USA and became the largest apparel importers.

## Trends in USA Apparel Imports

USA is the second largest apparel importer in the world and accounted 27.5 per cent of the global apparel imports in 2005. As shown in Fig.1, the continuously upward trend of USA apparel imports was observed in the past sixteen years. The rise in apparel imports was conspicuous from US\$ 27 billion to US\$ 80 billion from 1990 to 2005, reflecting strong demand for apparel products in USA and also illustrated its position as one of the major apparel markets globally. China, HKSAR, Korea and Indonesia were the main clothing suppliers to USA during 1990-2005. Specifically, China is by far the dominant US importer of apparel products with low labor cost, huge manufacture set up and the benefits related to certain categories of non-quota items. Except the Asian countries, Mexico's apparel exports to USA has been increased since the formation of NAFTA in 1994 and also benefited from the preferential treatments of exports to the USA market

FIG. 1: WORLD APPAREL IMPORTS TO USA AND EU-5, 1990-2005 (VALUE IN US\$ BILLION)  
Source: Compiled from *International Trade Statistics Yearbook*, United Nations, various issues.

The major objective of this paper is to explore the impacts of economic and specific social factors that had underpinned the apparel imports of the major consuming countries of EU, focusing on the top five importing member countries<sup>2</sup> as well as USA and their top five apparel suppliers<sup>3</sup> for the period from 1990-2005. The year 1990 is chosen because it was intended to portray the effects before and after the phasing out of quota for apparel items under the Agreement on Textiles and Clothing (ATC) in 1995. In addition, EU-5 and USA are selected since they are the two largest importers of apparel products by virtue of their large population, income and their high purchasing power. The export values of the top five apparel suppliers to EU-5 and USA markets were US\$ 43 billion and US\$ 35 billion respectively in 2005 (Fig.2). Together they accounted for one-third of world's total apparel imports.

### Empirical Analysis by the Gravity Model

The gravity model has a long history in social science studies as well as in international trade research. The model has been used to provide empirical explanations for spatial interaction behaviors of human populations including migration, information and trade flows (Sen and Smith, 1995).

For empirical analysis and verification, the gravity model with the panel data estimation approach is used to determine whether EU-5 and USA apparel imports can be explained by certain economic indicators and the country-specific factors including GDP, per capita GDP, real exchange rate, labor wage, value added, geographical distance and population growth rate. These factors were analyzed statistically to investigate their impacts of principal economic and social determinants that have affected the apparel imports and consumers' patterns of the EU-5 and USA.

Most of the previous trade analyses that employed the gravity trade model have only adopted a cross-section or time-series analytical technique (Matyas, 1997, Glick and Rose, 2002, Anderson and Van Wincoop, 2003). The use of panel data modeling estimation approach in this paper is intended to provide an extensive analysis and to obtain a meticulous study on apparel trading. Also, past investigations were generally related to the general trading scenarios and not clothing specific. Thus, this study aims to fill the research gap and provide insights for the major determinants that have driven major apparel suppliers' exports to EU-5 and USA markets from 1990 to 2005.

## **Theoretical Foundation for the Gravity Model of Trade**

In the 1960s, the gravity model of trade was first introduced by Tinbergen (1962) and Poyhonen (1963) independently in the economic literature to analyze bilateral trade flows between countries in Europe and successfully proved that trade between two countries is proportional to the product of their masses (GDP) and inversely related to the distance between them. Later, Linnemann (1966) added more variables and explored a theoretical justification in terms of a general equilibrium. It was further adopted by Anderson (1979) and Bergstrand (1985 and 1989) together with Armington's (1969) assumption for explaining international trade.

Moreover, Deardorff (1998) reconciled the gravity model with the classical theories of trade, the factor proportions model, which emphasizes differences in factor endowments across trading countries (Huang & Labys, 2001). Similarly, Eaton and Kortum (2002) derived the equation from random technological differences between countries in a Ricardian structure. Apart from these, Evenett & Keller (1998) showed that the gravity model can be adopted from the H-O model under both perfect and imperfect product specializations. They argued that the increasing return of scale model was more applicable than the perfect specialization version of H-O model to explain the success of the gravity equation. In 2002, Harrigan conducted a comprehensive review of the gravity model with reference to different major trade theories, including the Armington model, the monopolistic competition models and the general equilibrium model. Given its parsimony and the often acclaimed empirical robustness, the gravity model of trade has never lost its attractiveness over the past four decades in international trade analysis.

## **Panel Data Estimation with Fixed Effects**

Although the gravity model was popularly used for bilateral trade analysis, Cheng and Wall (2005) indicated that the estimation of the gravity model by OLS has some disadvantages such as multicollinearity effect as well as it cannot detect the invisible factor which may bias the estimation. In order to avoid the weaknesses, the econometric test, the panel data estimation approach is applied in the following estimation.

To conduct the panel data analysis with fixed effects and by taking the difference between the subsequent years, the invisible effect can be eliminated prior to the estimation and any time-constant explanatory variables are also removed along with it (Wall, 2002 and 2003). While import, export and geographical factors are presented in the gravity equation but these factors are not random as they are associated with countries' specific characteristics, the use of the fixed effects method can obtain a more reliable result (Egger, 2000).

Panel data estimation approach has become one of the rising topics of interest in the econometrics literature because of its advantages. It can explore the dynamics of change over time and to enlarge the quality and quantity of data (Gujarati, 2000). Furthermore, it also allows the capturing and disentangling of the time invariant country-specific effect (Egger, 2000) and to monitor the possible unobservable trading-partner-pair individual effects (Martinez-Zarzoso and Nowak-Lehmann, 2003).

Since the previous gravity model studies were concentrated on the general commodity but not specific for apparel trade. The use of panel data estimation approach in this paper is intended to extend an exhaustive analysis and provide an insight into the principal determinants that have affected EU-5 and USA apparel imports.

## **Econometric Analysis**

The initial estimation was analyzed by Best Linear Unbiased Estimator (BLUE) ordinary least-square (OLS) as it is the basic analytical technique and provides estimation about the different independent effect of each factor on the apparel import values (Hufbauer et al, 1997). Unfortunately, it yields a biased estimator because of the multicollinearity effect. In this case, the independent variables, importers' GDP and their per capita GDP are highly correlated that violates the assumption of OLS.

Therefore, in order to get rid of the constraint of OLS estimator as well as to avoid the problem of high multicollinearity between independent variables and specially to negate the effect of unobserved variables, the panel data estimation approach with fixed effects is applied in this analysis.

## Standard Gravity Equation

The gravity model with panel data estimation approach for the import function of apparel to EU-5 and USA can be modeled by the following equation.

$$\ln(IM_{ij}) = \alpha + \beta_1 \ln(GDP_j)_t + \beta_2 \ln(GDP_i)_t + \beta_3 \ln(PCGDP_j)_t + \beta_4 \ln(PCGDP_i)_t + \beta_5 \ln(D_{ij}) + \beta_6 POPGRATE_{it} + \beta_7 REXRATE_{ijt} + \beta_8 WAGE_j + \beta_9 VALADDED_j + U_{ijt}$$

Where,

t (t=1...16) starting from the year 1990 to 2005 represent the time at which trading transaction took place;

$\ln(IM_{ij})$  = Log of import value of apparel in million of US dollars from the top five suppliers to EU-5 and USA,  $i$  represents EU-5 and USA,  $j$  denotes the suppliers' variables;

$\alpha$  = unobserved effect or fixed effects and it does not change over time, it captures all unobserved time-constant factors that affect  $IM_{ij}$ ;

$\ln(GDP_j)$  = Log of GDP of top five apparel suppliers in million of US dollars;

$\ln(GDP_i)$  = Log of GDP of EU-5 and USA in million of US dollars;

$\ln(PCGDP_j)$  = Log of per capita GDP of suppliers in million of US dollars;

$\ln(PCGDP_i)$  = Log of per capita GDP of EU-5 and USA in million of US dollars;

$\ln(D_{ij})$  = Log of the geographical distance (in km) between Washington, the capital of USA, the individual capitals of EU(5) and the capitals of their top five suppliers;

$POPGRATE_i$  = the population growth rate of EU-5 and USA;

$REXRATE_{ijt}$  = the real exchange rate of foreign currency per unit in US dollar;

$WAGE_j$  = Log of the wage of top five apparel suppliers in million of US dollars;

$VALADDED_j$  = Log of the value added amount in apparel industry of top five apparel suppliers in million of US dollars;

$U_{ijt}$  = the time-varying error, because it represents unobserved factors that change over time, and affects  $IM_{ij}$

In order to identify the major determinants of EU-5 and USA apparel imports from their top five apparel suppliers, various factors have been considered. The dependent variable is imported value of merchandise trade, in log form, between pairs of countries from 1990-2005. For the independent variables, based on the gravity principle, per capita GDP of the exporting country is a proxy of capital intensity, since apparel industry is a labor-oriented industry, per capita GDP (PCGDP<sub>j</sub>) of the top five suppliers is used to indicate the impact of monetary condition of the workforce in those countries on apparel exports. Additionally, the economic sizes of the exporting and importing countries are usually measured by gross domestic product, therefore the importing countries and their top five apparel suppliers' GDP (GDP<sub>j</sub>) are considered in order to highlight the economic masses and the effect of apparel exports on the economy as well as the supply capability of labour-intensive products of those exporting countries. To satisfy the curiosity about the situation of EU-5 and USA economy on the apparel imports from those countries, per capita GDP (PCGDP<sub>i</sub>) of the importers are included in the list of independent variables.

According to Leamer and Levinsohn's (1995) survey of the empirical evidence on international trade, the identification of distance effects on bilateral trade have been proved as one of the clearest and most robust empirical findings in economics. Thus, Distance ( $D_{ij}$ ) is considered in the equation. Population growth rates of EU-5 and USA would have a direct relationship with the consumption of manufactured commodities, therefore population growth rate (POPGRATE<sub>i</sub>) is taken into consideration so as to obtain a better understanding of this variable on apparel imports.

Apparel production is considered as a labor-intensive industry, a lot of manual handling is required for garment manufacturing. Moreover, the price competition among apparel suppliers has intensified nowadays as trade liberalization has progressed since the phase out of the ATC in 2005. Therefore, wage of workers (WAGE<sub>j</sub>) in the

top five suppliers is one of the decision factors to relate its importance to the whole apparel trade flow. Lastly, the value added variable refers to the additional value created at a particular stage of production. In modern neoclassical economics, especially in macroeconomics, it adverts to the contribution of the factors of production, i.e., land, labor, and capital goods, in enhancing the value of a product and corresponds to the incomes received by the owners of these factors. The factors of production provide "services" which raise the unit price of a product relative to the cost per unit of intermediate inputs used in the production. Therefore, value added (VALADDED<sub>j</sub>) of apparel suppliers is used to examine whether the additional value of materials and supplies for apparel production has the contribution to the exports.

## **Data Sources**

The model is estimated with data for EU-5, USA and their top five apparel trading partners over the period 1990-2005. Since EU-5 is regarded as a group, we have considered the common apparel suppliers to these EU countries for a single time in the sample so as to avoid repetition. For example, China is the common apparel supplier to various EU countries, and the entire imports from China to EU-5 are counted once in the data. Therefore, in this analysis of EU-5, there are 192 observations (12 exporting suppliers x 16 years). For USA, the size of the sample is 80 observations (5 suppliers x 16 years). Trade data were obtained from UN COMTRADE (import values in US dollars). Data on real GDP, per capita GDP, real exchange rate and population size of countries were secured from International Financial Statistics (IFS) database. The value added and labour wage of top five apparel suppliers were extracted and compiled from the UNIDO Industrial Statistics Database. Finally, distance between countries was obtained from the web site: <http://www.indo.com/distance/index.htm>

## **Empirical Findings**

### **Gravity Equation with Panel Data Estimation**

The panel data estimation approach with fixed effects was applied and used to reduce the multicollinearity among explanatory variables and to improve the efficiency of econometric estimates. The fixed effect model is used because the import, export and geographical factors are not considered random but depended on the countries' characteristics. Another advantage of using fixed effects model is that the error term which is correlated with the individual effects, unlike the OLS approach, would not bias the estimator.

The gravity equation with fixed effects method is a full model that include all the independent factors as discussed in the previous section. The estimation result (presented in Table 1) is more plausible and offers a better explanatory capacity because the R<sup>2</sup> values are quite high which indicate that 80% and 85% of apparel imports to EU-5 and USA can be accounted for the independent variables. The variables tested are highly significant and all showed significance at 95% with many at 99% significance level.

TABLE 1: ESTIMATED VARIABLES FOR THE DETERMINATION OF EU-5 AND USA APPAREL IMPORTS

<b>Dependent Variable: ln(IM<sub>ij</sub>)</b>		
<b>Independent Variables:</b>	<b>Coefficient (EU-5)</b>	<b>Coefficient (USA)</b>
Constant	-9.72***	3.17**
Ln(GDP <sub>j</sub> )	2.34***	2.18***

<b>N=192(EU-5)/80(USA)</b>		

\*\* Significant at .05 level, \*\*\*significant at .01 level

The analytical result was in alignment with other gravity model studies (Tinbergen, 1962; Poyhonen, 1963 and Glick & Rose, 2002) of bilateral trade, GDP of importers and exporters would positively and significantly affect apparel trade. This conforms to the theoretical expectation; a higher GDP has a higher demand for apparel imports and would also create a larger supply for exports. Interpretation of results indicates that with a 10% increase in GDP for EU-5 and USA there would be 6.9% and 8.9% increases in their apparel imports respectively. The same phenomena is expected when per capita GDP of importing countries improved reflecting that they have higher purchasing power and leading to a greater demand for imports, in this case EU-5 and USA apparel imports. These findings suggest that when there are increases in both importers' GDP and their per capita GDP, apparel imports will boost as well.

The result also indicates that apparel exports would increase by 23.4% and 21.8% to the EU-5 and USA markets respectively as a result of a 10% increase in exporters' GDPs. This implies that a larger amount of exports would contribute to a higher GDP growth by apparel suppliers and boost the economy of the countries. Similarly, a rising trend in apparel suppliers' exports would increase their per capita GDP.

Next, physical distance ( $D_{ij}$ ) shows statistical significance and has a negative impact on apparel trading, reflecting that an increase in distance does lead to reduction in apparel imports of EU-5 and USA. This matches with the general prediction which suggests that the farther the distance between bilateral trading destination the lesser the business takes place (Linnemann, 1966; Bergstrand, 1985 & 1989; Frankel & Rose, 2002). Transportation costs would add to the price of a good in the importing country and increase the cost of trade. Therefore, proximity is definitely an essential factor for encouraging trade between countries. European suppliers, such as Italy, Poland, Turkey, France, Portugal, Germany and Romania are located much closer to EU-5 and Mexico is the neighboring country with USA when compared with the Asian suppliers. Lower transportation cost is beneficial for exporting apparel items from European countries to EU-5 and Mexico to USA, which in turn increases the profit and boost the trade between these countries. Proximity helps to reduce the cost of doing business especially in the case of apparel,

since distance is correlated with time to market, as timeliness is also a significant determinant in the fashion retailing business. Garment manufacturers must be able to respond quickly to the change in demand of the consumers. Thus, for EU-5 and USA apparel markets, proximity still count as an important variable in the apparel trade.

The results reveal that real exchange rate plays a crucial role in determining the volume of EU-5 and USA apparel imports. Whenever a real depreciation/appreciation of foreign currencies against US dollars there would be an increase/decrease in apparel exports and vice versa. The population growth rate also demonstrates a positive effect on trade flow between countries. As shown in the analysis, apparel imports would be increased by 8.5% and 8.3% with a 10% increase in importers' population growth rate. This supports the view of Brada & Mendex (1983) that the higher the population growth rate, a greater import value is anticipated.

For the wage variable ( $WAGE_j$ ), the coefficients showed negative signs indicating the variable is significant for apparel trade. This implies that the lower the labor cost with the apparel suppliers, the higher the attractiveness for EU-5 and USA to import apparel products from them. As the consumers always search for the quality apparel products at the best price, once they realize that the competitive advantage of certain countries is lost, the consumers will shift to another production site which provides lower cost and owns a productive workforce. Base on this, Asian countries such as China, India and Indonesia have become the leading and highly competitive suppliers to EU-5 and USA apparel markets. The reason is they possess productive and cheap labor force, a large stock of technical manpower and manufacturing base.

For the variable ( $VALADDED_j$ ), it presents a positive significant impact on the apparel import trends of EU-5 and USA. Result indicates that with a 10% increase in ' $VALADDED_j$ ' of suppliers, there would be 13.1% and 9.5% increases in apparel exports to EU-5 and USA respectively. This shows that the customers are more willing to pay for the apparel items which possess extra value such as an established brand image or relationship marketing. Some Asian apparel suppliers, such as China and Korea have been improving the manufacturing and marketing power to produce higher value-added apparel products as well as investing in apparel production in Central America so as to compete with European and Mexico suppliers for quick response supply to the market.

## Conclusion

This empirical study yields a number of noteworthy findings. The analysis result provides a vigorous support for the gravity model. The estimated coefficients for the variables,  $\ln(GDP_j)$ ,  $\ln(GDP_i)$ ,  $\ln(PCGPD_j)$  and  $\ln(PCGPD_i)$  are positive and statistically significant, indicating that positive GDP growth rate in EU-5 and USA would lead to a greater demand for apparel imports because of their higher purchasing power. Moreover, a greater amount of apparel exports would also contribute to a higher GDP for the suppliers and boost the economy of these countries. Similarly, a rising trend in apparel suppliers' exports would increase their per capita GDP.

The result also suggests that the distance variable remains statistically significant and has a negative impact on apparel exports since the short lead time is the most determining factor in the fashion sector. The study also indicates that the devaluation of the US currency would reduce apparel imports due to the fact that the buyers have to pay higher price for apparel products. The analysis also shows that population growth rates of EU-5 and USA both have direct impact on the consumption of apparel items and trade flows. Moreover, the lower the wages of the apparel suppliers, the higher the attractiveness for EU-5 and USA to import apparel items from those countries because the products are cheaper. Thus, developing countries would be in a better position in the international free trade environment imputable to their asset of a large number of workers with comparatively lower labor cost.

Finally, the ' $VALADDED_j$ ' factor presents a positive impact on the apparel import since the value added apparel products will increase the unit price through brand image or marketing or create innovative features for the apparel products. Thus value adding in apparel products would contribute to a rise in apparel exports.

## End Notes

<sup>1</sup> EU-5: EU has 27 member countries in 2007. The significant apparel importers are EU-5 including Germany, United Kingdom, France, Italy and Spain.

<sup>2</sup> The top five apparel consuming countries among EU-5 are including Germany, United Kingdom, France, Italy and Spain.

<sup>3</sup> The overall top five apparel suppliers to EU-5 from 1990-2005 included China, Italy, HKSAR, Poland, Turkey, France, Portugal, Morocco, Tunisia, Germany, Romania and India.  
The overall top five apparel suppliers to USA from 1990-2005 were China, Mexico, HKSAR, Korea and Indonesia.

## Design and Analysis of Decision Support Systems

### Abstract

Since their creation in the early 1960's, Decision Support Systems (DSSs) have evolved over the past four decades and continues to do so today. Although DSSs have grown substantially since its inception, improvements still need to be made. New technology has emerged and will continue to do so and, consequently, DSSs need to keep pace with it. Also, knowledge needs to play a bigger role in the form of decision making. We first discuss design and analysis methods/techniques/issues related to DSSs. Then, the three possible ways to enhance DSSs will be explored.

### Introduction

Over the four decades of its history, decision support systems (DSSs) have moved from a radical movement that changed the way information systems were perceived in business, to a mainstream commercial information technology movement that all organizations engage. This interactive, flexible, and adaptable computer based information system derives from two main areas of research: the theoretical studies of organizational decision making done at the Carnegie Institute in the 1950's and early 1960's as well as the technical work on interactive computer systems which was mainly performed by the Massachusetts Institute of Technology (Keen & Morton, 1978).

DSSs began due to the importance of formalizing a record of ideas, people, systems and technologies implicated in this sector of applied information technology. But the history of this system is not precise due to the many individuals involved in different stages of DSSs and various industries while claiming to be pioneers of the system (Power, 2003; Arnott & Pervan, 2005). DSSs have become very sophisticated and stylish since these pioneers began their research. Many new systems have expanded the frontiers established by these pioneers yet the core and basis of the system remains the same. Today, DSSs are used in the finance, accounting, marketing, medical, as well as many other fields.

### Background

The basic ingredients of a DSS can be stated as follows: the data management system, the model management system, the knowledge engine, the user interface and the users (Donciulescu, Filip, & Filip, 2002). The database is a collection of current or historical data from a number of application groups. Databases can range in size from storing it in a PC that contains corporate data that has been downloaded, to a massive data warehouse that is continuously updated by major organizational transaction processing systems (TPSs). When referring to the model management system, it's primarily a stand-alone system that uses some type of model to perform "what if" and other kinds of analysis. This model must be easy to use, and therefore the design of such model is based on a strong theory or model combined with a good user interface.

A major component of a DSS is the knowledge engine. To develop an expert system requires input from one or more experts, this is where the knowledge engineers go to work, who can translate the knowledge as described by the expert into a set of rules. A knowledge engineer acts like a system analyst but has special expertise in eliciting information and expertise from other professionals (Laudon & Laudon, 2005).

The user interface is the part of the information system through which the end user interacts with the system; type of hardware and the series of on-screen commands and responses required for a user to work with the system. An information system will be considered a failure if its design is not compatible with the structure, culture, and goals of the organization. Research must be conducted to design a close organizational fit, to create comfort and reliability between the system and user. In a DSS, the user is as much a part of the system as the hardware and software. The user can also take many roles such as decision maker, intermediary, maintainer, operator and feeder. A DSS may be the best one in its industry but it still requires a user to make the final decision.

Power (2003) introduced a conceptual level of DSSs, which contains five different categories. These categories include model-driven DSS, communication-driven DSS, data-driven DSS, document-driven DSS, and knowledge-driven DSS. Defining DSS is not always an easy task due to the many definitions available. Much of this problem is attributed to the different ways a DSS can be classified. At the user level, a DSS can be classified as passive, active, or cooperative.

Essentially, DSS is a computer-based system that provides help in the decision making process. However, this is a broad way of defining the subject. A better way of describing DSS is to say it is a flexible and interactive computer-based system that is developed for solving non-structured management problems. Basically, the system uses information inputted from the decision maker (data and parameters) to produce an output from the model that ultimately assists the decision maker in analyzing a situation. In the following sections, we first discuss design and analysis methods/techniques/issues related to DSSs. Then, the three possible ways to enhance DSSs will be explored.

## **Design and Analysis Methods/Techniques/Issues Related to DSSs**

### **Design Methods**

Today, DSSs hold a primary position in an organization's decision making by providing timely and relevant information to decision makers. It has become a key to the success or survival of many organizations. However, there is a high tally of failure in information systems development projects, even though they are a focal point of industrial concern (Goepf, Kiefer, & Geiskopf, 2006). Designing methods have become an important component that assures a successful information system design. This issue is in relevance to the design of a DSS.

There have been many different strategies employed for the design of a DSS. Current research on DSS design has witnessed the rapid expanding of object-oriented (OO), knowledge management (KM), structured modeling (SM), and design science (DS) approaches.

*Object-Oriented approach.* The characteristic of OO approach is to use object-oriented software engineering with unified modeling language (UML) in the design and implementation of a DSS. OO approach involves basically three major steps. The user's requirements are first captured by using a set of use case diagrams. These diagrams indicate all the functionalities of the system from the user's point of view. Then classes and their relationships are identified and described in class diagrams. Finally, sequence diagrams or collaboration diagrams are developed, which describe the interaction between objects (instances of classes). Tian, Ma, Liang, Kwok, & Liu (2005) designed a DSS with the OO approach for an organization, which was implemented successfully.

*Knowledge Management approach.* In some environment (non-preprogrammed applications), end-users, especially the less experienced end-users, need to have certain knowledge guiding them how to use the system. The KM design approach supports end-users by embedding declarative and/or procedural knowledge in software agents. This approach provides better assistance to inexperienced users of spatial DSS, which requires a design approach that will prioritize knowledge support of the end-users' decision making activities (West & Hess, 2002).

*Structured Modeling approach.* SM approach "uses a hierarchically organized, partitioned, and attributed acyclic graph to represent models" (Srinivasan & Sundaram, 2000, p. 598). It is consisted of three levels: elemental structure, generic structure, and modular structure. The elemental structure intends to capture the details of a specific model instance. The generic structure targets at capturing the natural familial groupings of elements. The modular structure seeks to organize generic structure hierarchically according to commonality or semantic relatedness. The leveled structures allow the complexity of a model to be managed and ranked according to its hierarchies. The graph

feature allows modelers and decision makers to understand the model better. A key advantage of SM is the ease with which structured models can be visualized.

*Design Science* approach. The functionality of a DSS evolves over a series of development cycles where both the end-users and the systems analyst are active contributors to the shape, nature, and logic of the system (Arnott, 2004). Yet system developers have little guidance about how to proceed with evolutionary DSS development. DSS developers are facing the fact that insufficient knowledge exists for design purpose, and designers must rely on intuition, experience, and trial-and-error methods. Design science approach, on the other hand, can facilitate developers to create and evaluate information technology artifacts that are intended to solve identified organizational problems (Hevner, March, Park, & Ram, 2004). Vaishnavi and Kuechler (2006) proposed a design science methodology with the major process steps of awareness of problem, suggestion, development, evaluation, and conclusion. Arnott (2006) proposed a five steps approach, which was adapted from Vaishnavi and Kuechler, for designing evolutionary DSS: problem recognition, suggestion, artifact development, evaluation, and reflection. A research project by Arnott indicates that design science approach can tackle problems of both theoretical and practical importance.

#### **Design Techniques**

As we are advancing in information technologies, business decision makers can now have access to vast amount of information. On one hand they may gain necessary and important information for making informed decisions, but on the other hand they may also become overloaded by the information irrelevant to what they need. Thus, there is a pressing need for decision aiding tools that would effectively process, filter, and deliver the right information to the decision makers. Proper combination of DSSs and agent technologies could prove to be a very powerful tool for rendering decision support (Vahidov & Fazlollahi, 2003/2004).

A software agent performs interactive tasks between the user and the system. The user instructs the system what he/she intends to accomplish. The software agent carries out the task. By analogy, a software agent mimics the role of an intelligent, dedicated and competent personal assistant in completing the user's tasks (Bui & Lee, 1999). In the DSS environment, software agents have been more formally described as autonomous software implementations of a task or goal that work independently, on behalf of the user or another agent (Hess, Rees, & Rakes, 2000). As the traditional, direct manipulation interface of our computing environment is much limited (Maes, 1994), software agents would seem to be a suitable and most needed solution for providing procedural assistance to end-users (West & Hess, 2002). These 'robots of cyberspace' can be effectively utilized in automating many information processing tasks (Vahidov & Fazlollahi, 2003/2004).

In some DSS environment, such as spatial DSS (Sikder & Gangopadhyay, 2002; West, & Hess, 2002), Internet-based DSS (Bui & Lee, 1999), and Web DSS (Vahidov & Fazlollahi, 2003/2004), a multi-agent system should be designed and implemented in the DSS to facilitate the decision makers since decision making involves complex set of tasks that requires integration of supporting agents (Bui & Lee, 1999), and these agents should have behaviors to work in team (Norman & Long, 1994). Vahidov and Fazlollahi (2003/2004) developed architecture of multi-agent DSS for e-commerce (MADEC), in which Intelligence Team (Agents); Design Team (Agents); and Choice Team (Agents) were composed. The multi-agent system was implemented in a prototype of MADEC, which received higher user satisfaction.

### **Three Possible Ways to Enhance DSSs**

#### **Creating Knowledge Warehouses (KW)**

Nemati (2002) proposed that a new generation of knowledge-enabled systems that provides the infrastructure required to capture, enhance, store, organize, leverage, analyze, and disseminate not only data and information but also knowledge (Nemati, 2002). Expanding data warehouses to encompass the knowledge needed in the decision making process is the creation of knowledge warehouses (KW). An important component of KW is a very complex process known as knowledge management. Knowledge management allows for knowledge to be converted from tacit to explicit through such processes as filtering, storing, retrieving, etc., thus allowing it to be utilized by decision makers.

The goal of KW is to give the decision maker an intelligent analysis standpoint that enhances all aspects of the knowledge management process. The main drawbacks of KW are the amount of time and money that need to be invested as well as some of the same problems that are found in successfully implementing DSSs. Among these factors are the users' involvement and participation, values and ethics, organization and political issues within the company, and other external issues. The development and implementation of KW still has much work to be done, however, DSSs seem to be headed toward knowledge enhancement in the future and KW looks to have a promising outlook in the upcoming years as a result.

#### **Focusing on Decision Support**

While knowledge management systems seem like a logical way to advance the shortcomings of DSSs, another view also exists. By removing the word "system" from DSSs and focusing on decision support, decision making might cause some interesting, new directions for research and practice. Decision support (DS) is the use of any plausible computerized or non-computerized means for improving sense making and/or decision making in a particular repetitive or non-repetitive business situation in a particular organization (Alter, 2004).

DS embodies a broader perspective that seems logical in environments where the user does not necessarily need the technical aspects of DSSs. This is based on the belief that most work systems of any significance include some form of computerized support for sense making and decision making. The difference between DSSs and DS is not too drastic but DS is a sensible option for many companies due to the increase in technology since the creation of DSSs; DSSs may not fit the needs of a business as it had in the past.

#### **Integrating DSSs & KMSs**

In line with Bolloju (2002), integrating decision support and knowledge management may correct some of the deficiencies of DSSs. The decision-making process itself results in improved understanding of the problem and the process, and generates new knowledge. In other words, the decision-making and knowledge creation processes are interdependent. By integrating the two processes, the potential benefits that can be reaped make the concept seem more worthwhile.

Integrating DSSs and KMSs seems to be the best choice out of the three possible ways to enhance DSS. The reasoning behind this selection is that integrating the two seems to provide a way for including both options without sacrificing one for the other. More importantly, while KW appears to have a very bright future, KW currently requires a great amount of time and money. The combination of both areas allows for a better overall utilization in the present. In time, KW may not be as time consuming and costly as it is now. However, to achieve a better balance of usefulness and efficiency, the integration of DSSs and KMSs appears to be the smartest choice.

## **Future Trends**

The future of DSSs, Angus (2003) argued and supported by SAS (2004), is in the field of *business analytics* (BAs). BAs differ from that of the recently and previously more common business intelligence (BI). With the fast pace of business and life today it would only make sense for a shift to BA because it does focus on the many possibilities and the future outcomes for production and service.

BAs focus on the future of operations. Opposed to that of BI where it focuses on the past and what can be done to change the past if things were done wrong or repeat if things were done right. However, BAs let managers center on what future trends are developing, which allows them not to accumulate a surplus of inventory of outdated products. It also enables managers to change their prices before the market does, or introduce their new product before anyone else gets the chance to. This is known as first-to-market (Gnatovich, 2006). BAs give the companies that use it a tremendous advantage over their competitors in the market place.

## **Conclusion**

Since their creation in the early 1960's, DSSs have evolved over the past four decades and continues to do so today. Although DSSs have grown substantially since its inception, improvements still need to be made. New technology

has emerged and will continue to do so and, consequently, DSSs need to keep pace with it. Also, knowledge needs to play a bigger role in the form of decision making.

Shim (2002) emphasized that DSSs researchers and developers should (i) identify areas where tools are needed to transform uncertain and incomplete data, along with qualitative insights, into useful knowledge, (ii) be more prescriptive about effective decision making by using intelligent systems and methods, (iii) exploit advancing software tools to improve the productivity of working and decision making time, and (iv) assist and guide DSSs practitioners in improving their core knowledge of effective decision support.

The prior statement sums up the courses of action that need to be taken very well. The successful integration of DSSs and KMSs could revolutionize DSSs and propel it to even greater heights in the future. In closing, DSSs have a storied history that spans the course of four decades; however, the greatest mark may be made in the not so distant future as DSSs continue to evolve.

## Abstract

In the era of globalization and fierce competition, internet based market place has provided a coordination mechanism between two different business entities in supply chain activities. Functional relationship between supplier and buyer in an open market place, leads to investigate the role of both quantifiable and non-quantifiable parameters in coordination mechanism with the aim of achieving higher performance in supply chain activities. In this paper, we develop an e-based supply chain model and a new agent for designing mass-customized on-line services. A cooperative game theory framework is utilized between buyer and supplier in order to increase the supply chain performance. The supply chain is modeled with proposed method and its performance is evaluated by simulation using stochastic Petri nets (SPNs). The model provides a more realistic optimization process by taking into consideration the dynamic information flows in uncertainty environment. **Key words:** Supply chain coordination, e-SCM, Agent, Game theory, SPNs

## Introduction

Globalization of market competition, reducing gap between product in terms of quality and performance are compelling the researchers to rethink about how to manage business operations more efficiently and effectively (Sarmah, acharya and goyal; 2006). Electronic market has added a whole new dimension to the investigation of the business relationship more meaningfully. Electronic markets are defined as a network information system that serve as enabling infrastructure for buyer and sellers to exchange information, transact and perform other activities related to transaction before, during and after transaction (Lancastre and Lages; 2006). The benefits of electrical environments motivate the researchers to align and coordinate the business processes and activities of the net members dynamically as well as to improve the overall performance of supply chain strategies. Threats from competition and other market forces are driving changes in supply chain management (Flynn and Flynn; 2005).

A supply chain can be viewed as a network which the entities maybe owned to geographically diverse locations. Supply chain management (SCM) benefits from a variety of concepts that were developed in several different disciplines as marketing, information systems, economics, system dynamics, logistics, operational management and operation research. In the literature, supply chains are usually described as multi-echelon inventory systems. However, most existing model can only describe a restricted class of supply chains with simplifications (Chen, Amodeo, Chu and labadi; 2005). For instance, most multi-echelon inventory models don't explicitly take account of transportation operations and capacity constraints in supply chain by simply assuming a constant lead time between any two adjacent stocking locations (Tayur et al.; 1998). These models lack flexibility and generality in describing real-life supply chains. The coordination, however, is quite difficult because of the inherent complexity and uncertainty of the supply chains. In fact the use of information systems to ensure visibility of item demand, location and status to all parts of the SC network was identified over a decade ago as an important attribute (Boyson, Corsi and Verbraeck; 2003).

There are large and growing numbers of research efforts on integration of SC since the business firms have commitment in cost reduction and timely response. García-Sánchez, Valencia-García and Martínez-Béjar (2005) applied a methodology that integrates different advanced information technologies with the aim of building a

framework for developing e-commerce application in transaction process (buyer/seller). Thus, electronic exchanges of information lead to the reduction of errors and the increase in the efficiency of the processes involved. Additional challenges are presented by the availability of electronic links with a strong potential to improve the supply chain performance (Poulmenakou and Tsironis; 2003). García-Dastugue and Lambert (2003) survey the role of internet in an integration of business process across the supply chain by facilitating the information flows necessary for coordinating business activity. E-procurement also offers several new advantages to industrial buyers as many of them stem from the ability to reach a wider set of suppliers than before (Hazra and Mahadevan; 2006).

The goal of this study is to provide the mathematical model that can describe material, information and financial flows of a decentralized supply chain in an integrated way as well as provide a tool which can help industrial practitioners to model, evaluate performance and optimize operational policies of their supply chains. In the next section, we provide a brief literature review about coordination mechanism.

## **Coordination Mechanism**

Several strategies such as credit option, buy/back return policies, quantity flexibility and commitment of purchase quantity are used to align the business process and activities of diverse members of supply chains in terms of cost, response time, timely supply and customer service (Sarmah, acharya and goyal; 2006). Supply chain coordination is concerned with the development and implementation of such strategies. There is no universal coordination strategy that will be efficient and effective for all supply chains as the performance of coordination strategy in SC characteristics is dependent (Sarmah, acharya and goyal; 2006). They particularly investigate SC coordination models that have used quantity discount as coordination tool under deterministic environment as well as some integrated buyer-vendor models that improves the performance of the SC.

The concept of dynamics of whole supply chain in order to propose some coordination mechanisms will reduce the bullwhip effect while taking into account operational constraints and maintaining service level. The advent of new information systems and technologies (IS and IT) such as electronic data interchange(EDI), Internet, Intranet, and Extranet, in particular, and inter-organizational communication and coordination mechanisms cast unprecedented opportunities for the integration of supply chains (Mahdavi, Cho and Mohebbi; 2007). Thus, Dynamic and timely information flows in uncertainty environment plays an important role in coordination mechanism. The interested reader may refer to Pant, Sethi and Bhandari (2003) to have better understanding of creation and implementation of e-supply chain systems. The authors draw on research in the areas such as web-based information systems and inter-organizational information systems. Averbakh, Xue (2006) also pointed to supply chain scheduling problems in off-line environment and proposed on-line environment, whose future is unknown.

An interesting development in the field of e-SCM is to exploit the benefits offered by coordination mechanism on functional relationship between buyer and supplier. The buyers in an electronic market fundamentally are faced with supplier selection. Moreover, the presence of multiple suppliers will require the buyer to set-up a competitive mechanism for capacity allocation among the selected suppliers (Hazra and Mahadevan; 2006). The supplier's willing is also to maximize their profit among the net. In this case, a collaborative strategy that can allocate the benefits of coordination among the supply chain members should be applied to align their objectives of coordination. Such a system is regarded as a decentralized supply chain system.

Three dimensions are introduced by Li and Wang (2007) on which the operational activities of a supply chain can be coordinated in order to maximize system profits. First, order quantities that optimize individual performance are often not able to optimize system performance. There is a vast literature on discount policies that suppliers can use to entice buyers to increase their order quantities so as to improve profits (Wang; 2005). Second, orders can be synchronized to reduce system inventory. If the buyers are coordinated to place orders at the same point in time, the supplier may adopt a lot-for-lot policy and carry no inventory. If the buyers aren't coordinated on the timing of their orders, the supplier inventory replenishment cost is double that under the lot-for-lot policy (Wang et al.; 2006). Finally, accurate, timely and easily accessible information can improve decisions. In the context of

SCM, a supplier is able to better match inventory supply with demand when information is available on the buyers' inventory status. Although, the benefits of information depends on how it's used.

The literature on coordination of supply chain inventory systems exist under a framework that is based on supply chain decision structure and nature of demand. The literature in each category will be further reviewed based on time coordination and/or demand and information structure (Li and Wang; 2007). In the next section, we review the concept of centralized and decentralized supply chains as well as the role of supply chain coordination.

#### **Centralized Supply Chain**

A centralized supply chain system is viewed as one entity that aims to optimize system performance. Various production/inventory policies have been developed to optimize the performance of a centralized supply chain system. There are two main categories in centralized supply nets: a) deterministic systems b) stochastic systems.

The objective of deterministic systems is to develop a production/inventory policy to minimize system cost. It's typically assumed that demand occurs at a buyer/retailer continuously at a constant rate. Early studies have focused on the existence and development of optimal policies. However, such policies are usually difficult to implement. Comprehensive review of such models can be found in Li and Wang paper (2007).

In reality, a stochastic model that specifies demand as a stochastic process is often more accurate than its deterministic counterpart (Zheng, 1992). However, a barrier to the application of a stochastic model is that the optimal policy doesn't have a simple structure. This implies that appropriate coordination mechanism are especially necessary (Li and Wang; 2007). Moreover, information sharing contributes another dimension for coordination when demand is stochastic. As the time and cost to process orders are substantially lowered, impressive improvements in supply chain performance have been obtained. It is now a common belief that capturing and sharing real-time demand and stock information is the key to improve supply chain performance (Li and Wang; 2007).

#### **Decentralized Supply Chain**

A decentralized supply chain differs from a centralized system in that members act independently to optimize their individual performance. Although more and more firms have realized that collaboration with their supply chain partners can significantly improve their profit, the centralization of inventory and production decisions for a decentralized is often unrealistic (Li and Wang; 2007). Therefore, the challenge is to devise coordination mechanisms that aren't only able to coordinate the activities but also to align the objectives of independent supply chain members (Chen et al.; 2000). Previous research on the coordination of decentralized deterministic systems has focused on using quantity discount to induce independent buyers to increase their order quantity. Other researches investigate the case of single/heterogeneous retailers and suggest different nearly optimal solutions.

In view of the difficulties in managing centralized stochastic multi-echelon inventory systems, it's an understatement that is a challenge to coordinate a decentralized supply chain with stochastic demand (Li and Wang; 2007). A few important studies fall into this category. Cheung and Lee (2002) discuss the value of sharing information about the retailers' inventory positions which could be used to coordinate shipments from the supplier to enjoy economies of scale in shipments, and for eventual unloading of the shipments to retailers to rebalance their stocking positions. In view of previous studies, for a decentralized supply chain system which the members belong to different firms a coordination mechanism should include at least three components: (i) an operational plan to coordinate the decisions and activities of supply chain members, (ii) a structure to share information among the members, and (iii) an incentive scheme to allocate the benefits of coordination so as to entice the cooperation of all members (Li and Wang; 2007).

In this paper, we have introduced the concept of dynamic supply chain information flows. An agent is designed to analyze and simulate the players' behavior in SC network. We consider price and quality jointly as coordination parameters of decentralized supply chain in order to obtain both the optimum supplier selection for individual buyers and to maximize supplier's profit. We also show how non-quantifiable parameters can affect the price. A cooperative game theory framework is also utilized between the actors in order to increase the supply chain performance.

## Game Theory

Traditional research in operation management focused on providing tools in order to analyze corresponding problems. The tools relied largely upon dynamic programming and other optimization techniques. In the last several years, the evolution of SCM recognized that a business process consists of several decentralized firms and operational decisions of these different entities impact each other's profit and thus the profit of the whole SC (Nagarajan and Sosic;2006). In decentralized supply chain where the members belong to two different firms, the method of bargaining and negotiation solution which is dynamic in nature may result in a better coordination in SC as it compared to static coordination solution in a centralized supply chain. To effectively model and analyze decision-making in such multi-person situation where the outcome depends on the choice made by every party, game theory is a natural choice (Nagarajan and Sosic; 2006). More comprehensive literature review on game theory among supply chain agents can be found on Nagarajan and Sosic' paper (2006).

Game theory is a branch of mathematics devoted to the logic of decision-making in social interactions. The principle objective of game theory is to determine through formal reasoning alone, what strategies the player ought to choose in order to pursue their own interests rationally and what outcomes will result if they do so.

There is a broad division of game theory into two approaches:

- 1) cooperative
- 2) non-cooperative

In non-cooperative game, the intention of the players is to maximize their individual gain while, in a cooperative game both buyer/seller would consider maximizing system profit.

Different types of game models have different solution concept. The bargaining game in cooperative game theory addresses the problems in which a group of two or more agents faced with a set of feasible outcomes, any one of which will be the result if it's specified by unanimous agreement of all participants. In the event that no unanimous agreement is reached, a given disagreement outcome is the result.

In the Stackelberge game, the player who holds more powerful position is called the leader and the other player who reacts to leader decision is called the follower and the solution obtained to this game is the Stackelberg solution (Sarmah, acharya and goyal; 2006). When two players negotiate, it's reasonable to expect that the player with the higher bargaining power receives a larger share of the pie than his weaker counterparts.

Our model of supply chain is composed of three main players: a) supplier b) buyer c) control/optimization service agent. The word supplier is used to represent the upstream member in the supply chain who sells the items to the buyers. An agent facilitates the communication between customers and suppliers and allows us to design, simulate and analyze our collaborative strategies.

## The Proposed Model

Assume that suppliers are located in different nations with a vast network of clearing and forward agents. The integration of these geographically separated supplier locations and the fulfillment of demands of different customer centers are a big challenge. Indeed, Consider a family of products that a buyer would like to procure from an electronic market for which there are some pre-qualified suppliers available to supply as per specification. The information for a rough-cut capacity planning will be carried out at different supplier locations based on actual shift time, total actual time available during the planning period, and the average break-down by supplier-agent interaction. We assume the inventory system of supplier with periodic review ( $s, S$ ) policy which the inventory replenishment decisions are based on position. The agent mediates the interaction between buyers and suppliers in an electronic marketplace. It computes the optimum solution by considering the whole SC profit under game theory frame work.

### Transaction Agent for Control and Optimization

Agent technology provides the distributed environment and great promise of effective communication (Lee, Chang and Lee, 2000; Swaminathan, Smith and Sadeh; 1998). According to Wooldridge (2002) and García-Sánchez, Valencia-García and Martínez-Béjar (2005), agents make the second generation e-commerce systems possible, in

which many aspects of a customer's buying behavior is automated. A comprehensive review of agent-based approaches in supply chain can be found in Parunak paper (1999).

This section describes the functionality of this transaction agent (TA). It plays the most important role in our proposed supply chain system.

**Agent Architecture**

The major components and functions of an agent are as follows:

- a) Offered prices of buyers, quantitative and qualitative attributes related to customers' evaluation (table I),
- b) Desired prices of suppliers based on capacity and inventory carrying cost, quantitative and qualitative attributes related to suppliers' perception (table I),
- c) Preprocessing and building customer profiles and computing the optimum solution with no cooperation in SC net,
- d) Preprocessing and building supplier profile and computing the optimum solution in order to satisfy relevant demand and capacity, and
- e) Preprocessing, building and computing the model based on cooperative game theory framework.

In the next section, we will illustrate the manner of acquisition of rich and accurate profiles in an electronic supply chain system.

TABLE I. QUANTITATIVE AND QUALITATIVE ATTRIBUTES RELATED TO BUYER AND SELLER

	Buyer	Seller
Quantitative Attribute	Lead Time, Transportation Cost, ...	Sales Volume, Capacity, Product Life Cycle,...
Qualitative Attribute	Service Level, Aesthetics, Management,...	Customer Satisfaction, Technological Standard, Geographical Benefit,...

**Buyer Profile**

The agent receives all necessary information about the quantitative and qualitative attributes related to each product from  $m$  customers electronically. Then the agent assigns  $n$  key attributes for each aspect of customer's perception. By obtaining all information from customers we create the vector of comprehensive key attributes as  $CK = \{k_1, k_2, \dots, k_n\}$ . The agent also designs the customer-key attributes incidence matrix as  $CKIM = [c_{ij}]$ , where  $c_{ij}$  represents the frequency value of  $i^{th}$  customer on  $j^{th}$  supplier ( $i = 1, 2, \dots, m$  and  $j = 1, 2, \dots, k$ ) for each elements of  $CK$ . This value indicates the priority and evaluation of the buyers with respect to suppliers on a special aspect of a product. We can also calculate the weight of each attribute as a priority of corresponding key attribute for each buyers view by using formula (1):

$$[W^B]_{l \times 1} = \left( \sum_{j=1}^n \left( \frac{o_{ij}}{\sum_{i=1}^n o_{ij}} \right) \right) / n \quad \begin{matrix} \forall l = 1, \dots, n \\ \forall i = 1, \dots, n \end{matrix} \tag{1}$$

Where,  $o_{ij}$  represents the value of reciprocal matrix for the relative importance of comprehensive key attributes with respect to each buyer.

With this weight we can calculate the weight mean of  $CKIM$  matrix to obtain the buyer profile matrix as given in below:

$$MCKIM = \begin{matrix} b_1 \\ b_2 \\ \cdot \\ \cdot \\ b_m \end{matrix} \begin{bmatrix} a_{11} & \cdot & \cdot & a_{1k} \\ a_{21} & \cdot & \cdot & a_{2k} \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ a_{m1} & \cdot & \cdot & a_{mk} \end{bmatrix}$$

Where,  $a_{ij}$  represents the final priority of buyers on suppliers.

It is evident that, based on the association between the elements of final priority matrix and cost elements, the lower the probability of buying from a supplier, the higher the costs will be. Hence, we have to modify the elements of MCKIM as:

$$[MCKIM'] = [a'_{ij}]_{m \times k}$$

So that  $a'_{ij} = 1 - a_{ij}$  for all entities of the corresponding matrix. This modification produces a matrix that represents the non-desirability of buying from a supplier for individual buyers.

The agent also constitute price matrix separately as follows:

$$[P_{ij}^b] = \begin{bmatrix} p_{11} & \cdot & \cdot & p_{1k} \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ p_{m1} & \cdot & \cdot & p_{mk} \end{bmatrix}$$

The final prices should be adjusted to reflect non-quantifiable factors. Thus, In order to obtain the interaction between price and relevant attributes matrixes, independent multiplication as a relative matching method can be applied as follows:

$$[PA^b] = T_{ij}^b$$

So that,

$$T_{ij} = P_{ij}^b * a'_{ij} \quad \forall i = 1, \dots, m \quad \forall j = 1, \dots, k \quad (2)$$

Therefore, the  $[PA^b]$  matrix introduces the priority of matching between prices and attributes in an electronic supply chain environment.

Finally, we can use this matrix in the following model to obtain optimal solution for buyers with no cooperation in SC network:

$$P(b) = \text{Min}Z = \sum (T_{ij}^b * X_{ij})$$

s.t

demand and supply should be satisfied.

Where,  $X_{ij}$  represent the quantity of commodities which  $i^{\text{th}}$  buyer can buy from  $j^{\text{th}}$  suppliers.

#### Supplier Profile

The agent forwards all information related to each product in the customer profile to all suppliers electronically. Then agent obtains the value of each supplier on key attributes of customers. By obtaining all information from supplier-side we create the supplier-key attribute incidence matrix. The agent designs the supplier-key attribute incidence matrix as  $SKIM = [s_{ij}]$ , where  $s_{ij}$  ( $i = 1, 2, \dots, k$  and  $j = 1, 2, \dots, m$ ) represents the frequency value of  $k$  suppliers on  $m$  buyer for corresponding attributes. This value indicates the priority of suppliers on buyers to satisfy the specific attribute of customers. We can also calculate the weight of each attribute as a priority of corresponding key attribute for each Supplier as shown in the formula (3):

$$[W^S]_{k \times 1} = \left( \sum_{j=1}^n \left( \frac{o_{ij}}{\sum_{i=1}^n o_{ij}} \right) \right) / n \quad \forall l = 1, \dots, n \quad \forall i = 1, \dots, n \quad (3)$$

Where,  $o_{ij}$  represents the value of reciprocal matrix for the relative importance of comprehensive key attributes with respect to each supplier.

With this weight we can calculate the weight mean of *SKIM* matrix to obtain the supplier profile matrix as given in below:

$$MSKIM = \begin{matrix} s_1 \\ s_2 \\ \cdot \\ \cdot \\ s_k \end{matrix} \begin{bmatrix} a_{11} & \cdot & \cdot & a_{1m} \\ a_{21} & \cdot & \cdot & a_{2m} \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ a_{k1} & \cdot & \cdot & a_{km} \end{bmatrix}$$

Where,  $a_{ij}$  represents the final priority of supplier with respect to buyers.

It is evident that, based on the association between the elements of final priority matrix and price elements, the higher probability of selling to a customer, the higher the revenues will be. Hence, we have to modify the elements of *MSKIM* as:

$$[MSKIM] = [a'_{ij}]_{k \times m}$$

$a'_{ij} = 1 + a_{ij}$  for all entities of the corresponding matrix. The agent also constitutes the suggested price matrix of suppliers as follows:

$$[p_{ij}^s] = \begin{bmatrix} p_{11} & \cdot & \cdot & p_{1m} \\ \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot \\ p_{k1} & \cdot & \cdot & p_{km} \end{bmatrix}$$

The adjusted prices of supplier can be calculated as:

$$[PA^s] = T_{ij}^s$$

So that,

$$T_{ij} = P_{ij}^s * a'_{ij} \quad \begin{matrix} \forall i = 1, \dots, k \\ \forall j = 1, \dots, m \end{matrix} \quad (4)$$

The  $[PA^s]$  matrix introduces the priority of matching between prices and attributes in an electronic supply chain environment.

By using this matrix in the following model, the optimal solution for suppliers with no cooperation in SC network will be obtained.

$$P(s) = MaxZ = \sum (T_{ij}^s * X_{ij})$$

s.t

demand and supply should be satisfied.

#### Supply Chain Optimal Solution

In non-cooperative game playing independently, the intention of the players is to maximize their individual gain. On the other hand, in a cooperative game both buyer/supplier would consider maximizing system profit subject to buyer's total annual cost at cooperation should be greater than or at least equal to those at non-cooperation. Similarly, supplier's total annual profit at cooperation should be less than or at most equal to those at non-cooperation. The objective function for this game from the general model can be written as:

$$Max = -\lambda * P(b) + (1 - \lambda) * P(s)$$

*s.t.*

$$p(b) \geq p^*(b)$$

$$p(s) \leq p^*(s)$$

*and*

*demand and supply should be satisfied.*

Where  $p^*(b)$  and  $p^*(s)$  represent the cost and revenue of buyer and supplier before cooperation. Depending upon the bargaining power of supplier and the buyer the value of  $\lambda$  varies between 0 and 1.

## **Simulation and Performance Evaluation of an Industrial Supply Chain**

Petri nets are a powerful tool for modeling and analysis of discrete event systems such as manufacturing systems (Wang; 1998). Since supply chains are also discrete event systems from a high level of abstraction, it's possible to develop a Petri net tool for modeling and analysis of supply chains (Chen, Amodeo, Chu and labadi; 2005). Although the literature of Petri nets is comprehensive, very little work applied Petri net to modeling of supply chains. Supply chains are modeled by using colored Petri net, where each supply chain entity is modeled as a block with action, resource and control which is a subnet of colored Petri net model (Chen, Amodeo, Chu and labadi; 2005). Supply chains are also modeled by using generalized stochastic Petri nets (GSPNs) (Viswanadham and Raghavan; 2000). For inventory systems with independent demand, a basic supply chain entity, they are modeled by using first-order hybrid Petri nets that combine fluid and discrete event dynamics (Furcas et al.; 2001).

### **Implications for Practice**

In the present study, we first apply proposed model to an industrial supply chain and then evaluate its performance through simulation which is based on stochastic Petri net (Java program). The Java script and HTML programs can be used to implement our model on web pages in order to process large amount of information. Fig.1 shows the Petri net model of the SC. The interpretation of the places and the transitions in the model are given by table II and table III, respectively. In the model, the material flow is represented by timed transition t1, t2 (inventory replenishment of suppliers), t3 (delivery preparation) and their associated places and arcs. The information flow is represented by immediate transition t4, t6, t7, t9, t11, their associated places and arcs. The financial flow is represented by transition t10 and their associated places and arcs. For simplicity's sake, we assume a scenario in which supply net is composed of two different suppliers and special family of product will be dealt on supply chain net. We also consider the inventory system of suppliers with periodic review ( $s, S$ ) policy in which the inventory replenishment decisions are based on position. The inventory carrying cost for each part of family is deterministic for suppliers and is based on historical data.

Buyers demand is assumed to be poisson process with ( $\alpha = 2500$ ) whose firing time is subject to an exponential distribution with mean value 0.0355. The demands will be filled if there is sufficient on-hand inventory. Otherwise, the demand will be removed. The inventory policy parameters of two suppliers are taken as ( $S_1=5000, s_1=2000$ ) and ( $S_2=5500, s_2=2300$ ). For financial flow, buyers pay to suppliers within a given time period after receiving finished products. We run the model under this strategy that buyer has more bargaining power than supplier by taking  $\lambda = 0.6$  in SC model.

P3	Record of quantitative attributes (seller)
P4	Record of qualitative attributes (seller)
P5	Minimization of corresponding model
P6	Pending customer orders
P7	Record of offered price (buyer)
P8	Record of quantitative attributes (buyer)
P9	Record of qualitative attributes (buyer)
P10	Minimization of corresponding model
P11	Minimization of cooperative model
P12	Final stocks order in delivering preparation
P13	Updated buyers profile in SC network
P14	Updated sellers profile in SC net work
P15	Record of financial flows
P16	Record of remainder stocks (seller 1)
P17	Record of remainder stocks (seller 2)

Fig.2 and 3 illustrate the lay out of related knowledge definition for buyer/supplier profiles as well as optimal solution. The final result of simulation as SC optimal solution and remainder stocks diagram for each supplier are given in Fig.4. Because of stochastic nature of the model, multiple replication of simulation over a long time horizon should be performed to obtain a reliable estimation of the performance indexes. For the industrial case, the number of replications is taken as  $N=25$  and the simulation horizon is taken as  $T=T_0+10T_0$  time units with  $T_0=200$  (Chen, Amodeo, Chu and labadi; 2005). In this study, we have shown the model with 10 iterations. These outcomes clarify the role of real-time information flows to manage the inventory system for suppliers according to buyers demand as well as the negotiation results in the profit of whole supply chain network.

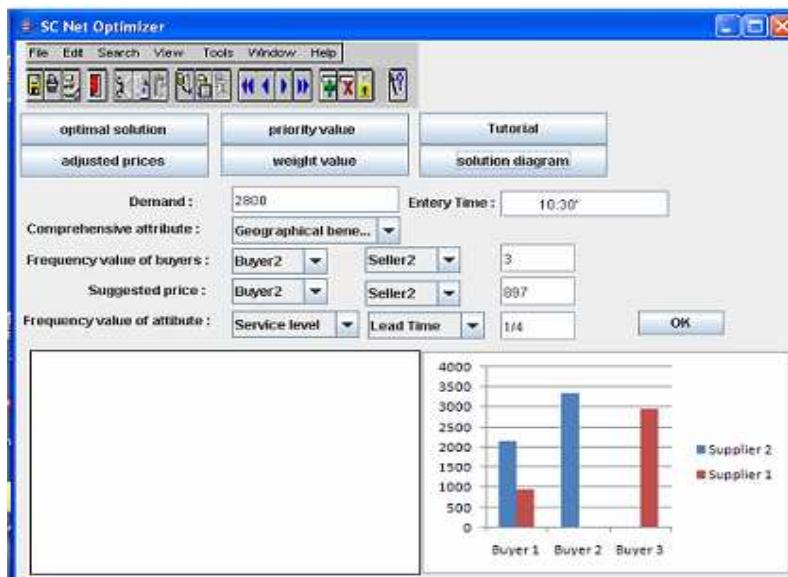

FIG.2: BUYER PROFILE IN SC NET OPTIMIZER

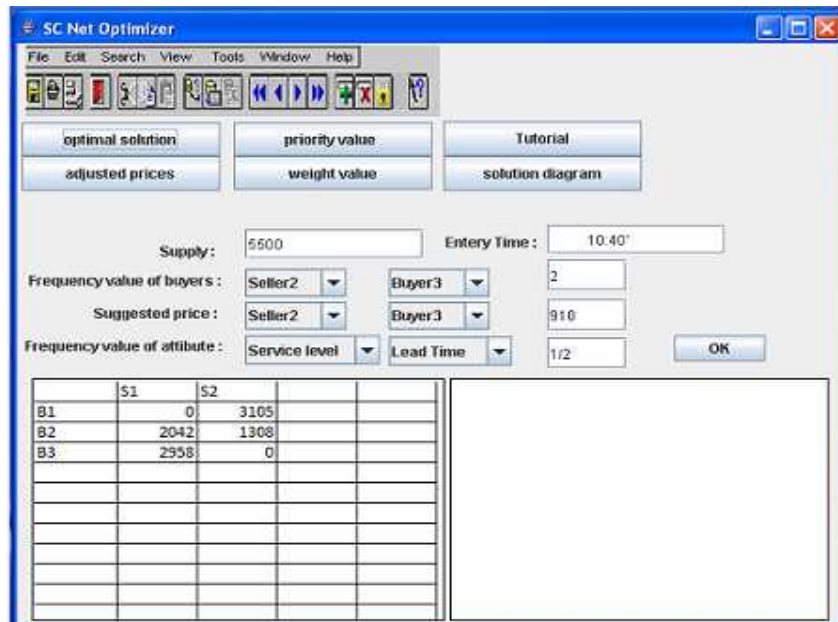

FIG.3: SELLER PROFILE IN SC NET OPTIMIZER

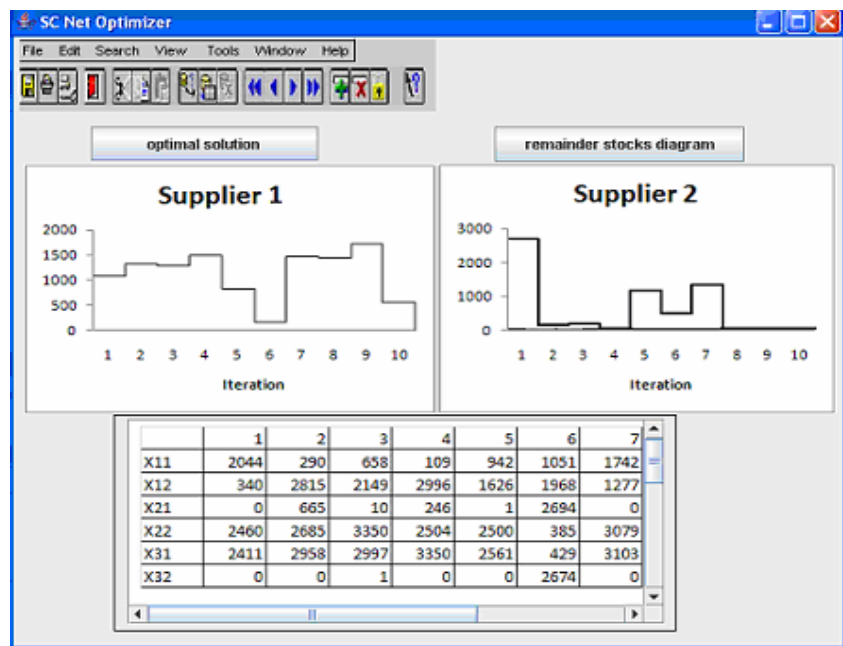

FIG.4: THE SC OPTIMAL SOLUTION

## Performance Evaluation

The performance criteria of the supply chain can include average inventory level and service level for each stock, where the service level is defined as probability that customer orders are filled on time. The first criterion is easy to obtain since it corresponds to average number of tokens in the discrete place representing the stock. For the evaluation of service level, we need to know the total time that the discrete place has no token while the place representing customer orders isn't empty in each simulation. Our SC net simulator provides the graphical results for average inventory level of each supplier and also the visibility of orders for determining inventory policy. The point estimation of each performance index and the standard error of estimation obtained by the simulation can be calculated. Given the point estimation and the standard error, a confidence interval for each performance index can be calculated for any given level of confidence under the condition of the independence of replications (Chen, Amodeo, Chu and Labadi; 2005). A  $100(1-\alpha)\%$  confidence interval for performance index  $\Theta$ , based on t-distribution, is given as follows:  $\bar{\theta} - t_{\alpha/2, N-1} S / \sqrt{N} \leq \theta \leq \bar{\theta} + t_{\alpha/2, N-1} S / \sqrt{N}$

Where  $\bar{\theta}$  and  $S$  are the point estimation and the standard error of the estimation of  $\Theta$ , respectively.  $N$  is the number of independent replications, and  $t_{\alpha/2, N-1}$  is the  $100(1-\alpha/2)$  percentage point of a t-distribution with  $N-1$  degrees of freedom.

## Conclusions

The advent of internet based market places motivate the researchers to investigate the conceptual buyer/supplier coordination models to save the system costs and ultimately improves the performance of the supply chain. A coordination mechanism for decentralized supply chain whereby members are separate economic entities has to include a collaborative strategy to optimize system performance and incentive scheme to distribute the benefits of coordination so as to entice their cooperation. Moreover, the coordination of a supply chain also requires that accurate and timely information about their operational decisions and activities be shared among all members to reduce uncertainties.

Due to the complexity of supply chain systems, we have introduced the concept of dynamic supply chain information flows. An agent is designed to analyze and simulate the players' behavior in SC network. The basic information is obtained in the form of customer-key attribute incidence matrix to achieve real-time customer profile. The supplier profile is designed to analyze the possibility of interaction between two main actors in SC, suppliers and buyers. The interaction between suggested price and comprehensive attributes in each profile is computationally derived to produce more realistic model. To improve the SC performance, these profiles are applied under cooperative game theory framework to give rise to the SC optimal solutions. This approach presents a great potential to resolve several problems in real-world SC systems which are in conflict with each other. The simulation-based approach to an industrial supply chain demonstrates that proposed model and associated methods can solve important supply chain issues such as evaluation of inventory policies and parameters. The use of our model for an extensive empirical analysis on web pages as well as extension of supply chain coordination model will lead to an interesting area of further research.

## Abstract

Port Sector in India is going through rapid expansion and modernization. Currently, the operations at Indian ports are characterized by low capacity, internal inertia and resource constraints leading to low efficiency levels. The efficiency of port operations depends on the extent of modernization and containerization of port operations. The productivity levels of Indian ports fall short as compared to international (Europe and Gulf countries) standards. One way to enhance the productivity improvements in Indian ports is through outsourcing of port operations. One such experiment is already in progress where operations of container port at Cochin are outsourced to Dubai Port Authority. Such strategy need not be limited to Dubai Port Authority only. It could be replicated by other port authorities, which are known for their efficiency in the region. This paper discusses the experience of outsourcing container operations of Cochin port.

## Introduction

India has a long coastline of 5600 kms with twelve major ports and 140 minor ports currently in operation. Major ports are under the administrative control of Ministry of Surface Transport at National level and respective state governments control the minor ports. The recent high-growth rate achieved by Indian Economy (GDP) is reflected in increased international trade in the recent past. This growth trend is likely to continue over the medium term and possibly in the long run. The growth of traffic since 1950 is presented in Table 1. During 1950, the total traffic handled was a mere 22.51 million tones, which had gone up to 568 million tons by 2005-06. The Compound Annual Growth Rate during the last five years at major ports was about 10.63 percent.

TABLE 1: GROWTH OF TRAFFIC THROUGH PORTS (MILLION TONS)

Year	Major ports	Minor Ports	Total
1950-51	20.01	2.50	22.51
1960-61	39.63	4.4	44.03
1970-71	58.14	7.9	66.04
1980-81	80.51	10	90.51
1990-91	152.85	12.78	165.63
1995-96	215.34	25.71	241.05
2001-02	287.59	98	385.59
2004-05	283	120	500
2005-06	423	145	568

Source: Ministry of Road Transport, Government of India

Current growth trends suggest that the Indian ports sector would require a significant increase in capacity to meet future cargo demand. Accordingly, Indian ports have developed expansion plans. Many major ports in India have adopted the build-operate-transfer (BOT) model for the creation of additional capacity.

Global shipping trends indicate that new ships of larger capacity are being increasingly used for international trade. The carrier capacity has increased from 75,000 DWT during 1970 to 183,000 in 2005. Thus, there is a need at major ports in India to upgrade to receive vessels of larger size.

The traffic distribution of principle commodities handled at major ports during 2005-06 is as follows:

POL	-	33%
Iron ore	-	20%
Coal	-	14%
Container	-	14%
Fertilizer	-	3%
Others	-	16%

Thus, the container traffic accounts for a mere 14% across major ports [KPMG 2007]. Containerization of cargo has become the order of the day across the world for easy handling, increasing throughput at the port and its adoptability for multi-modal transportation between sea, road and rail. India is no exception to these phenomena. A number of steps were initiated at all major ports to receive container ships and their handling. The capacity of container ships has also grown steadily from 2000 TEUs in 1970 to 10,000 TEUs during 2005. Container traffic at Indian Ports is growing rapidly and has increased by 102% in the last five years to 3.9 million TEU in 2003-04. It is expected that the growth will continue to be dramatic and by 2016-17, the country may need to handle 15.64 million TEU. The growth of container traffic in Indian ports vis-à-vis global picture is presented in Table 2.

TABLE 2: COMPARATIVE PICTURE OF CONTAINERIZATION

Year	Million TEU (Global)	Million TEU (India)	Percentage Share
1980	37.30	0.13	0.35
1992	85.60	0.65	0.76
1993	112.40	1.20	1.07
1995	130.00	1.45	1.12
1996	144.50	1.55	1.07
1997	195.90	1.70	0.87
2001	379.00	2.41	0.64
2006	750.00	3.9	0.52

Source: Statistical Profile, *Indian Ports*, 2004, 2005 and 2006

The growth of container traffic at different Indian ports is presented in Table 3. However, this needs huge investments in handling facilities, multi-modal transport terminals and GPS systems to locate and identify a specific container within the port area to meet world standards.

TABLE 3: CONTAINER TRAFFIC IN INDIAN PORTS

Port	2004-05		2005-06		Increase (%)	
	Container		Container			
	Tonnage	TEUs	Tonnage	TEUs	Tonnage	TEUs

J.N.P.T	28747	2371	33777	2667	17.50	12.48
Kandla	2754	181	2311	148	-16.09	-18.23
All Ports	54761	4233	61980	4613	13.18	8.98

India would also need to focus on multi-modal transport to facilitate movement of goods from inland locations to ports and vice-versa. This would require development of road and rail infrastructure, improvement in multi-modal transport, and modifications in procedural arrangements to allow smooth flow of traffic.

In the order to meet huge investment needs of port sector, the Government of India has initiated a number of steps to encourage private participation in port sector. The Indian Government has already announced a series of measures to promote foreign investment in the port sector (Ministry of Surface Transport, 2002-03). These are:

- No approval is required for foreign equity up to 51 percent in projects providing supporting services to water transport
- Automatic approval for foreign equity up to 100 percent in construction and maintenance of ports and harbors.
- Open tenders are to be invited for private sector participation on a Build-Operate- Transfer (BOT) basis.

These measures are aimed at attracting new technology, fostering strategic alliances with minor ports to create optimal port infrastructure and enhancing private sector confidence in the funding of ports.

The Government has announced guidelines for private/foreign participation that permit formation of a joint venture between major ports and foreign ports, between major ports and minor ports, and between major ports and companies.

The guidelines permit the formation of a joint venture between:

- i) A major port and foreign ports for the purpose of constructing new port facilities within existing ports, improving productivity of existing ports, and development of new ports.
- ii) A major port trust and a company or a consortium of companies where;
  - A company or a consortium of companies, selected through BOT bidding under the guidelines of private sector participation alliances with a major port trust for improving the viability of the scheme and/or to enhance the confidence of the private sector.

- A company or a consortium of companies is selected under the scheme of innovative/ unsolicited proposals.
- Oil PSUs/a joint venture Company of oil PSUs are/is selected for oil related port facility as a port-based industry.

Through these policies and guidelines, private sector participation is made attractive in port expansion plans.

## History and Development of Cochin Port

Cochin port is situated in Wellington island just 4 kms away from Cochin city. It is strategically located on the East-West trade route at Latitude 9 degrees 58' north and longitude 76 degree 14' East on route west coast of India. Cochin port is only 10 nautical miles away from the direct sea route to Australia and the Far East from Europe. No other Indian port enjoys this proximity to the maritime highway. This port is 930 km away from Bombay and 320 kms away from Kanyakumari.

The Cochin Container Terminal was in the making since 1990s. In order to expand and increase the operations through BOOT route, the first global bids were called in 2002-03, but only one bid from Peninsular and Oriental was received and hence the bid was not accepted. Subsequently, the bids were called again in 2004 and Dubai Port Authority (DPA) won the bid (DP World, 2007). The salient feature of the contract is that the DPA had agreed to share 1/3<sup>rd</sup> of the gross revenues with the government. The agreement was signed in Feb. 2005. On 1 April 2005, Dubai Port International has taken over the operations of Container berth at Cochin.

A separate SPV called India Gateway Terminal (IGT) was set up. The partners are DP World (76%), Container Corporation of India (15%), Chakiat Group (5%) and Transworld Shipping (4%). The concession agreement between Cochin Port Trust (COPT) and IGT has two parts.

The first part includes taking over the operations of existing container berth at Cochin Port, which is referred to as Rajiv Gandhi Container Terminal (RGCT) for 4 years. The second part involves the development of International Container Transshipment Terminal (ICTT) at Vallarpadam and operates the same for 34 years on BOT basis. It is estimated to cost about Rs.2400 crores. There are five conditions precedent to the construction of the ICTT at Vallarpadam.

1. Declaration of the project site as a Special Economic Zone (SEZ)
2. Environment clearance
3. Capital dredging for 14.5 meter draught
4. Rail connectivity to the main line
5. Road connectivity to the National Highway

The throughput of Cochin Container Port had shown significant change in its operations after the takeover by DPA where the throughput has increased from 185,000 TEUs in 2004-05 to 201,000 TEUs in 2005-06 and finally to 226,808 TEUs in 2006-07. Thus in two years, the productivity increased by was about 25%.

The future plans for the container terminal are as follows:

- Plan to increase the throughput to 280,000 TEUs by 2007-08 and 350,000 by 2008-09
- Plan to achieve 1,000,000 TEUs within five years of moving to Vallarpadam island
- April 2009 is the target date for moving to Vallarpadam

The current status of the project is as follows:

1. The project site has already been notified as a SEZ (Special Economic Zone)
2. Environmental clearance has been obtained
3. The first part of the capital dredging of RGCT has been completed
4. The rail alignment, funding and the agency have been finalized
5. The road alignment has been finalized and land acquisition is underway
6. The soil excavation survey and test piles at the project site have been completed
7. The project schedule will be structured as to complete the construction by December 2008.

### Improvement in Operations

It is expected that the efficiency of the container port at Cochin will increase as a result of the takeover by Dubai Port Authority. There are many parameters such as number of moves, number of TEUs handled, tonnage, vessel turn around time etc. for measuring the efficiency of a container port. The average number of vessel calls made per month had increased from 26.00 in the year 2004-05 to 35.33 in the year 2005-06, accounting for a 36 percent increase. At the same time, the standard deviation had increased from 2.73 calls to 7.04 calls during this period indicating a wide variation across the months. During the same period, the average turn around time of the vessels had come down from 39.00 hours to 22.11 hours. The number of moves is also maximum at 13,867 during the same month. During the year 2005-06, the port managed to achieve a maximum throughput of 19,239 TEUs (October 2005). The details of some of these parameters are presented in Table 4.

TABLE 4: DATA WITH RESPECT TO VARIOUS PARAMETERS OF RGCT FOR THE YEAR 2005-06

Month	Moves	TEUs	Vessel Calls	
			Current Year	Previous Year
Apr '05	10957	14742	24	25
May '05	11832	15104	29	22
Jun '05	11797	14892	29	31
Jul '05	13704	17960	30	26
Aug '05	13701	17534	33	27
Sep '05	11567	15394	32	28
Oct '05	13867	19114	41	23
Nov '05	12476	16756	42	26
Dec '05	13848	18344	44	29
Jan '06	14844	19239	47	28
Feb '06	10740	13802	36	24
Mar '06	13512	17362	37	23
Total		200243		
Average/Month			35.33	26.00
Standard Deviation			7.04	2.73

While the data presented in Table 4 indicates a significant improvement in the working of the RGCT, a comparison with the other major container ports presents a different picture. Table 5 presents the data for the two years namely 2004-05 and 2005-06, for the major container ports in India.

TABLE 5: OPERATIONS OF MAJOR CONTAINER PORTS IN INDIA (2004-05 AND 2005-06)

Port	Year	Container		Total	% of Container to Total
		Tonnage '000 tons	TEUs		
Kolkata	2005-06	3234	203	10806	29.93%
	2004-05	2357	159	9945	23.70%
Haldia	2005-06	1911	110	42337	4.51%
	2004-05	2029	128	36262	5.60%
Paradip	2005-06	45	4	33109	0.14%
	2004-05	31	2	30104	0.10%
Visakhapatnam	2005-06	630	47	55801	1.13%
	2004-05	635	45	50147	1.27%
Ennore	2005-06	-	-	9168	
	2004-05	-	-	9480	
Chennai	2005-06	11757	735	47248	24.88%
	2004-05	9864	617	43806	22.52%
Tuticorin	2005-06	3428	321	17139	20.00%
	2004-05	3205	307	15811	20.27%
Cochin	2005-06	2488	203	13887	17.92%
	2004-05	2315	185	14095	16.42%
New Mangalore	2005-06	149	10	34451	0.43%
	2004-05	136	9	33891	0.40%
Mormugao	2005-06	105	9	31688	0.33%
	2004-05	117	10	30659	0.38%
Mumbai	2005-06	2145	156	44190	4.85%
	2004-05	2571	219	35187	7.31%
J.N.P.T.	2005-06	33777	2667	37836	89.27%
	2004-05	28747	2371	32808	87.62%
Kandla	2005-06	2311	148	45907	5.03%
	2004-05	2754	181	41551	6.63%
<b>All Ports</b>	2005-06	61980	4613	383625	16.16%
	2004-05	54761	4233	383746	14.27%
% increase	ALL	13.18%	8.98%		
	Cochin	7.47%	9.73%		

The container operations in terms of tonnage handled by the RGCT have marginally increased from 16.42 percent to 17.92 percent. Even this increase is marginally less than the increase of all the ports put together. More important is the increase in tonnage. The total container tonnage in the country has increased by 13.18 percent where as the increase at RGCT is almost half of this at 7.47 percent. In other words, while there was a generic overall increase in the container operations in the country, the RGCT was not able to achieve similar levels of increase in its operations, even after improving its infrastructure. The percentage increase in TEUs at RGCT is higher as compared to the total. A comparison of this with the increase in tonnage indicates that RGCT is handling

more TEUs but, achieving a lower tonnage. In other words, while the growth in the overall container traffic in the country was in the order of 7219 million tons, RGCT was able to attract only 173 million tons. As a matter of fact, RGCT's proportion of container traffic (as a proportion to the total container traffic in the country) has actually come down from 4.22 percent in 2004-05 to 4.01 percent in 2005-06. In comparison, the JNPT accounted for more than 69 percent of the overall growth in the container traffic between 2004-05 and 2005-06. JNPT's proportion of the total container traffic has increased from 52.5 percent in 2004-05 to 54.5 percent in 2005-06, implying that JNPT managed to attract a larger proportion of the growth than its average share of container traffic.

In order to estimate the relative efficiency of RGCT as compared to other major container ports, a simple data envelopment analysis (DEA) was carried out. Only five ports are considered for the analysis. These are JNPT, Visakhapatnam, Tuticoran, Chennai and RGCT. Two different measures of outputs, namely TEUs and Tonnage were considered for the analysis. The inputs considered were mainly related to infrastructure available at the ports such as cranes, trailers, forklifts, reefers etc. the data with respect to each of the ports is obtained from "Seaports of India (<http://www.indiaseaports.com/isp/indexie.jsp>)". Generally, an analysis like DEA is not attempted with only five items and few outputs and inputs. The very nature of the DEA techniques will normally ensure that all the items (ports in this case) are on the boundary of the data envelop when the number of alternatives (items) considered are very few, especially as compared to the number of constraints (number of outputs and inputs). This is more likely to happen in this particular case because there are only two outputs under consideration. But, the analysis showed that the relative efficiency of RGCT is only 0.667 while all the remaining four container ports are on the boundary of the envelope. This actually indicates that the relative efficiency of RGCT is significantly lower than that of the other container ports.

One of the advantages of DEA is that it indicates the ports that are nearest to RGCT in terms of efficiency. In addition, it also provides the sensitivity analysis which in turn indicates the direction and quantities required to improve the efficiency levels of RGCT. The two ports that come nearest to RGCT in terms of efficiency are Visakhapatnam and Tuticoran. In order to reach the comparable efficiency levels of these two ports, RGCT will have to increase the tonnage by about 700 thousand tons or TEUs by about 100. This is based on the present infrastructure available at RGCT, since a considerable amount of investment had already gone into improving the infrastructure,

## **Reasons for Low Levels of Efficiency**

There a number of factors which contribute to the low levels of efficiency, in spite of the significant increases in the infrastructure brought about by the Dubai Port Authority. The foremost reason is the culture of the businesses and shipping agents in Cochin. The RGCT has started operating 24 hours a day on all the 7 days of the week. This had improved the turnaround time for the vessels and also resulted in a significant increase in the number of vessels calling at the port. Unfortunately, the culture of the businesses in the Cochin area is that they operate only for 6 to 8 hours a day for 5 days a week. Consequently, there was no significant improvement in the throughput. Not only there was no significant improvement, the mismatch in vessel handling and movement of containers in and out of the storage yard has created a situation of overcrowding in the storage area.

As a part of the agreement with the Cochin Port Authority, all the employees working in the container port earlier are made to join RGCT. This is the first time it has happened where neither the employees nor the organization had any choice. There are 352 employees who are transferred to RGCT. Only after migration to the Vallarpadam terminal, these employees as well as IGT, which is the SPV for RGCT and Vallarpadam terminal, will have the right to continue or discontinue their services. At present IGT has no control over the service conditions of these employees. The work culture in Kerala is very different and the most difficult part for the RGCT is to change the work culture.

The existing hinterland of the Cochin port is not conducive to strong economic growth. The hinterland of Kerala consists of a predominantly consumer society. There is a decline in the trade of commodities such as cashew, coir, and other agricultural products. Even the neighboring districts of Tamilnadu (industrial areas such as Coimbatore and Tiruppur) prefer Tuticoran or Chennai even though the distance is longer to these ports as compared

to Cochin. The main reason is the uncertainty involved with Cochin port (Kerala state in particular) based on the work culture, militancy of the workforce etc.

Quick delivery (especially delivery outside the port) is important in the container terminal. At Cochin, even today, the delivery is being made inside the terminal premises. The delivery time in Cochin is 10 days at present as compared to 5 days in Tuticoran, one day in Chennai, ½ a day in JNPT.

## Strategies for the Future

Various strategies are being put in place to improve the efficiency and viability of RGCT. Some of them are already working. These strategies are aimed at (i) increasing the throughput at RGCT in the short run and (ii) increasing the effectiveness of Vallarpadam in the long run.

The first and most important short run strategy is the redeployment as well as re-skilling of the legacy employees who were earlier with Cochin Port was carried out. The objective is to change the work culture. Training programmes which were specially designed for this purpose were organized. A total of 6800 hours of training was given to 410 employees. The new management has largely succeeded in sending right signals that pressure tactics by the unions will not work. They managed to create an open culture where the employees are encouraged to carry a dialogue rather than resorting to strikes or go slow tactics. There had been not a single instance of loss of day's work due to industrial unrest in the past one year.

The management IGT is trying hard to send signals to the customers (clients) that things are different now. Implementation of a queue system for the clients is very important. Show that first-come-first-served will always work.

A number of initiatives are put in place in order to overcome congestion at the terminal. Some of these are:

- \* Dis-incentivizing longer stay of container inside the port.
- \* Reduce the number of "Free Days"
- \* Incentives for clearing the container in "off-peak" hours
- \* Developing holding area outside the port
- \* The Container Freight Terminal to develop additional area for holding
- \* Developing a separate Container freight Station

RGCT is in the process of creating a single window Customer Support System. The client can send the "complaints" through any route, namely, through SMS, telephone, e-mail, internet etc. It will be handled within a stipulated time with appropriate escalations to higher levels already built in. The client will be able to trace the status of the complaint through the web itself.

Steps have been initiated by IGT for ISO 27000 certification. The initial processing is completed and the award is expected in matter of few days.

RGCT has leveraged IT to improve its efficiency. It has implemented special software called "NAVIS". The software takes care of the entire container operations both on the shipside and shore-side. The data with respect to the ships calling and the cargo is uploaded directly through EDI. Similarly, the data on containers to be loaded into the ships is also uploaded into the software. The software keeps track of the containers and their destinations. The allocation on the ground is still done manually. The software helps in identifying the available slots and the destinations of the existing containers so that a better match could be made and the number of moves and shuffles could be minimized. The entire container operations are paperless completely. Only paper is what are required statutorily. It used to take 2 to 3 days for the billing to reach the client. Now it is done immediately on loading.

At present, Indian exports are transshipped mainly through Singapore or Colombo. The strategy is to take the transshipment business at the new container port at Vallarpadam. It can happen if larger vessels that go directly to US or China start calling at IGT. This will save additional handling at transshipment locations as well as time to reach the destination. IGT can also function as transshipment port for cargoes moving in the Indian Ocean shipping lines.

The low productivity and relative inefficiencies of RGCT are not unexpected. At the same time, for the success of the experiment of outsourcing the port operations in India, it is imperative that the Vallarpadam terminal

has to become commercially viable. The following factors are likely to work in favor of the new Vallarpadam terminal.

1. After the completion of the proposed container port at Vallarpadam, its proximity to international east-west sea routes and the deep draft available at the port, saving in total Origin-Destination cost of movement of containers to/from foreign destinations can be achieved in several cases if containers move through this port. The hinterland of the port may thus be said to extend to not only the southern India but also western and even northern India. This will considerably increase the potential for traffic at the Port.
2. The strategic location of the new terminal will make it an ideal transshipment port for inter-coastal movement of domestic Indian containers through coastal shipping. The volumes derived from such transshipment will augment the volumes projected based on export/import trade along.
3. It is estimated that total container traffic at this terminal may reach 3.5 to 4 million TEUs per annum. Thus it will be the largest container terminal in the country.

# Outsourcing and Global Supply Chain Management

*Kwok Hung Lau, charles.lau@rmit.edu.au  
Royal Melbourne Institute of Technology University, Australia*

## Abstract

As a result of globalisation, supply chains of many large business organizations nowadays tend to become very long and complex. The traditional simple linear supply chains are quickly replaced by extended supply chain networks comprising not only suppliers, manufacturers, distributors, and end customers, but also service providers. With the increasing use of third-party logistics (3PL) service by international firms, many global 3PL providers are forming partnerships with large corporations to take care of the latter's logistics operations in different regions. The management of global supply chains therefore involves not only the maintenance of relationships with suppliers and distributors but also third-party logistics providers. This paper investigates the role of 3PL providers in global supply chain management and proposes a framework for evaluation of 3PL providers as global logistics partners for international firms. The framework focuses on the core competencies of the 3PL provider and its abilities to achieve economies of scale for its users so as to assist them to achieve their outsourcing goals and objectives.

## Introduction

Rapid advancements in information and communication technology (ICT) in recent years, coupled with the collapse of entry-to-market and other trading barriers, have changed significantly the way organizations operate in terms of business model and operating scale [32]. Globalisation, lead-time reduction, customer orientation, and outsourcing are some major changes contributing to an increasing interest in advanced logistics services and global supply chain management [16]. Successful global logistics depends heavily on communication and transportation. Improved communication between different business partners through the use and sharing of real-time information facilitates the logistics of production and inventory over wider geographic areas. Efficient transport arrangement such as volume consolidation and cross docking makes possible the actual transactions between nodes [8]. Owing to the increased levels of resource requirement, complexity, and risk in running global logistics, many firms tend to outsource their logistics operations to third-party logistics (3PL) providers and focus on their core businesses. Successful management of global supply chains therefore requires radical changes in supply chain structure, business processes, and relationships with business partners particularly logistics service providers.

Traditionally, supply chain is relatively linear in structure (Fig.1). A typical manufacturing supply chain involves a few tiers of suppliers, the manufacturer (the focal company), a few tiers of distributors (including wholesalers and retailers), and finally the end customers. Materials mainly flow from upstream to downstream (*i.e.*, from suppliers to end customers) with a small reverse flow of returns while information tends to flow in both directions. Transportation is provided either in-house by the different parties separately or outsourced to different 3PL providers [37]. With globalisation and disintermediation as a result of advancement in ICT, the linear supply chain model and the associated uncoordinated logistics operations can no longer meet the demand of customers for higher efficiency, shorter lead time, and wider geographic coverage. The supply chain tends to become networked (Fig.2) with the focal company as the hub and a major 3PL provider looking after the logistics operations of the whole supply chain for the focal company in different regions [32, 36].

FIG.1: A TRADITIONAL LINEAR SUPPLY CHAIN MODEL

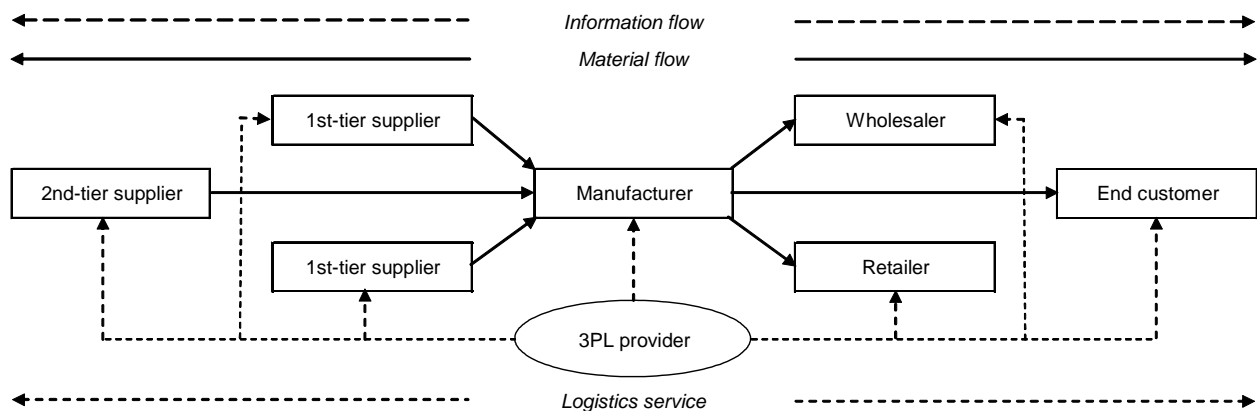

FIG.2: A NETWORKED SUPPLY CHAIN MODEL

The importance of logistics and supply chain management and the increasing use of 3PL providers are clearly indicated in the latest global third-party logistics survey conducted by Georgia Institute of Technology, Cap Gemini LLC, SAP, and DHL [22]. The 2006 survey findings show that 85% of the North American respondents, 89% of Western Europe, 88% of Asia-Pacific, and 95% of Latin America agree that “logistics represents a strategic, competitive advantage for our company” (p. 6). Across all the four regions surveyed, the most frequently outsourced services include transportation (90%), warehousing (74%), customer clearance and brokerage (70%), and forwarding (54%). The survey also reveals a growing trend for outsourcing as the spending in 3PL services (2006 against 2009-2011) is projected to increase by an average of 8% from 48 to 56% in North America, 7% from 64 to 71% in Western Europe, 6% from 63 to 69% in Asia-Pacific, and 8% from 39 to 47% in Latin America. Furthermore, there is a continuing trend of 3PL users to rationalize or reduce the number of 3PL providers they use suggesting that 3PL users are seeking integrated logistics services. This finding ties in with the frequent mergers, acquisitions, and consolidations in the 3PL sector in recent years leading to the emergence of ‘global 3PL providers’. Prominent examples include DHL and Exel; Kuehne & Nagel and USCO; UPS and Fritz and Menlo Forwarding; Deutsche Bahn and Bax Global; Uti Worldwide and Standard Corporation; and PWC Logistics and Geo-Logistics [22].

The practice of outsourcing can be explained using resource-based theory [3, 26] which proposes that a firm can achieve sustained competitive advantage if it has resources with the attributes of value, rareness, imperfect imitability and non-substitutability. Outsourcing enables a firm to focus on its core business to develop the four attributes of its resources to form the basis of its future competitiveness [17]. There are many advantages in outsourcing. The most common benefits are saving in cost, increase in capacity, and improvement in service quality. Others include time savings, cash infusion, free in-house staff, focus on core activities, talent availability, access to

specialists, business process re-engineering, greater flexibility, greater productivity, and bigger geographical coverage [12]. In theory, outsourcing should enable firms to access their 3PL providers' expertise and specialist skills. It should also bring cost savings to firms through economies of scale achieved by their 3PL providers via transaction bundling and volume consolidation [4, 6, 30]. In other words, firms are making use of their 3PL providers' core competencies and cost efficiencies to achieve outsourcing goals and objectives. This belief is supported by the study of five big European companies by Brandes *et al.* [9] on the reasons and process of outsourcing. 'Core competencies' generally refer to what a company is specialized in or good at [19, 29]. 'Economies of scale' commonly refer to efficiency gained from increasing scale of operation [10, 14, 18]. Therefore, core competencies of 3PL providers and their abilities to achieve economies of scale can be regarded as two of the major critical determinants of outsourcing success. Table 1 lists some of the major objectives of outsourcing and the outcomes expected from the activity. It can be seen that the success of the first objective depends on the 3PL provider's ability to achieve economies of scale for its user while the remaining ones rely on the expertise and capabilities of the 3PL provider. In other words, the underlying assumption for successful outsourcing is that the service provider is competent in its business. That is to say, providing the service should be the core competencies of the 3PL provider that complements its user's deficiency in this area. This is particularly significant for international firms in managing their global supply chains. Competent 3PL providers are able to pool skilled professionals and other useful resources at low costs and execute the same services repeatedly for their users over the globe. The generation of cumulative experience through scale and scope economies resulting in better, varied, and faster services at lower costs is essential to efficient global supply chain management. Such accrual of advantages would not have been possible had the clients executed the activities in their own premises [17].

TABLE 1: MAJOR OBJECTIVES OF OUTSOURCING

<b>Objective of outsourcing</b>	<b>Expected outcome</b>
To reduce costs of logistics operation	Reduction in capital investment in infrastructure, assets, human resources, and other related costs
To reduce management time and resources for logistics operation	Release of management to focus on core business; reduction of human resources and related administrative costs
To enhance reliability of delivery	Provision of on-time delivery and accurate order fulfillment to customers
To improve quality of customer service	Provision of better and higher quality of customer service than what was provided prior to outsourcing
To access best practices in logistics operation	Use of best practices and latest technologies in carrying out the outsourced activities
To enhance flexibility to changes initiated by changing customer demand and market condition	Provision of flexible service for varying scale of operation and change management capability to meet the need of customers
To achieve innovation and continuous improvement in logistics operation	Availability of IT technologies to enable coordination, synchronization and optimization of logistics operations

In view of the importance of finding a compatible 3PL provider in the management of a global supply chain, this paper aims to propose a framework that helps to evaluate the core competencies of a potential service provider in the selection process. It is admitted that a successful outsourcing contract and relationship depends on many factors, such as strategic fit and cultural compatibility, other than core competencies and economies of scale. However, a comprehensive discussion will be beyond the scope of this paper and this study will therefore focus on these two factors only. Through the analysis of a longitudinal case study of repeated outsourcing failures, this paper examines the roles of core competencies and economies of scale in outsourcing and uses the findings to help to develop a 3PL provider evaluation framework. Section 2 of the paper reviews the literature on a few areas including vertical and horizontal logistics alliances, international outsourcing partnerships, and strategic development of 3PL

providers, as well as the latest studies in the evaluation of 3PL providers. Sections 3 and 4 discuss the methodology and the implications of the case study findings. Section 5 proposes a framework that builds upon the works of previous research and the current case study. It is hoped that the proposed evaluation framework can assist 3PL users in making better outsourcing decisions through proper assessment of the core competencies of the potential 3PL providers and their abilities to achieve economies of scale. The paper concludes in Section 6 with a discussion on the limitation of the study and the direction for further research.

## Literature Review

As the 2006 global third-party logistics survey reveals, the use of 3PL providers by international firms will continue because of the ever-increasing globalisation of their businesses. As a result, most 3PL providers desire to move their customers from a conventional customer-supplier relationship to a true “partnership” [22] (p. 5). Taking the definition by the European Commission, third-party logistics is defined as “activities carried out by an external company on behalf of a shipper [or client] and [they] consist of at least the provision of management of multiple logistics services. These activities are offered in an integrated way, not on a stand-alone basis. The co-operation between shipper and the external company is an intended continuous relationship [lasting for at least one year]” [11] (p. 496). For a global supply chain, the major 3PL provider can take over the entire logistics management as well as operations from its user. These include management, analysis, and design of activities associated with transport and warehousing such as inventory management, information related activities such as tracking and tracing, as well as value-added activities such as secondary assembly of products and supply chain management [21].

As a result of globalisation, the international market for logistics and transport services becomes larger and complex. International firms rely more and more on 3PL providers for logistics solutions. According to the 2006 global third-party logistics survey, 3PL users are sometimes frustrated with apparent differences in doing business with specific 3PL providers from one region to another. The use of a “global 3PL provider” not only rids the user of the management headache but also enables the user to capture local benefits such as low labour costs so as to help reduce the net landed cost of its products [22] (p. 16). Therefore, there is a growing trend of vertical logistics alliances in which the provider and the user maintain a long-term formal or informal relationship to render all or a considerable number of logistics activities. The 3PL provider sees itself as a long-term partner in this arrangement to provide a comprehensive range of services to the user [2]. A vertical alliance includes planning and overseeing the inbound and outbound freight flows in the nodes of the logistics network. In the alliance, the 3PL provider looks for improvements to the service levels, inventories management and order processing for the user company [27].

To acquire the necessary capabilities and a global presence required for vertical alliances, many 3PL providers pursue horizontal alliances through horizontal cooperation, merges and acquisitions. Horizontal alliance can be a means to spread costs and risks and to increase the scope of services. It is attractive when costs of developing new services and solutions for complex problems facing customers in dynamic markets are too high for a single 3PL provider [11]. Horizontal cooperation is defined by the European Union [13] as concerted practices between companies operating at the same levels in the market. Short-term horizontal alliances can be formed between 3PLs, IT consultants, and software vendors. The search for higher capability of offering “global consulting” in supply chain management is seen by some as evidence of evolution from 3PL to 4PL – a term coined by Accenture to refer to “a supply chain integrator that assembles and manages the multiple resources, capabilities, and technology of its own organization with those of complementary service providers to deliver a comprehensive supply chain solution” [11] (p. 506). Permanent horizontal alliances through merges and acquisitions enable the 3PL provider to have wider geographic coverage and control of major traffic flows through the creation of efficient transport chains. The alliances also provide sufficient size to cope with high investment cost in physical infrastructure and ITC for efficient operation. Economies of scale are also permitted through business process re-engineering and entry into new market segments. Through the acquisition of specialist capabilities, especially higher value-added services, strategic and operational synergies can also be achieved [28].

With closer cooperation between 3PL provider and the user, the role of 3PL provider also changes from provision of standard logistics services to development of customer solutions. Based on the balance between general

problem solving capability (GPSC) and the degree of customer adaptation (DOCA), Hertz and Alfredsson [16] (p. 141) propose four different development strategies for 3PL providers as follows:

- *Standard 3PL provider* (relatively high GPSC and relatively high DOCA): The 3PL provider offers a highly standardized modular system to customers with relatively simple combination of standardized services such as warehousing, distribution, pick and pack, *etc.*
- *Service developer* (high GPSC and relatively high DOCA): The 3PL provider offers an advanced modular system of a large variety of services such as specific packaging, cross-docking, track and trace, and special security system, *etc.*, and a common IT-system used for all customers.
- *Customer adapter* (relatively high GPSC and high DOCA): The 3PL provider offers totally dedicated solutions involving the basic services for each customer. For example, the service provider might take over the customer's total warehouses and the logistics activities. The 3PL provider is seen as a part of the customer organization.
- *Customer developer* (high GPSC and high DOCA): The 3PL provider develops advanced customer solutions for each customer by handling the entire logistics operations. Value-adding services and enhancement of knowledge are common and the role of the 3PL provider is more like a consultant.

In vertical alliances, the role of the 3PL provider will be a customer developer involving a high integration with the user often in the form of taking over its whole logistics operations. It acts as a logistics integrator to provide integrated logistics solutions to the user and share the risk and rewards of the logistics management with the user.

Similarly, Kedia and Lahiri [17] also look at international outsourcing of service (IOS) as a form of partnership that can be classified into three different types: *tactical*, *strategic*, and *transformational*. With the increase of value proposition from low to high to highest and the involvement of provider from arm's length to deep to intense, the IOS partnership moves from tactical to strategic to transformational. Tactical IOS partnership is basically transaction oriented aiming at cost reduction. Involvement of the service provider is rule-based and contract oriented. Strategic IOS partnership emphasizes on value enhancement required to enable a company to remain locally responsive as well as globally integrative. It is usually achieved through building long-term relationships with a few best-in-class integrated service providers that possess cumulative experiences and scope of organizational learning for their users. In vertical alliances, a transformational IOS partnership is the ultimate goal. From the user's point of view, the partnership helps to share the user's risk with the provider because of reduced need for capital expenditure on infrastructure and manpower development. It also enhances the user's flexibility as the logistical competencies of the provider assists in providing faster response in a globalized business environment. Finally, transformational IOS partnership provides opportunities for the user to redefine its businesses through transformation or business process re-engineering. The success of the relationship depends on the trustworthiness of partners and the culture distance between the two parties.

As vertical alliance impacts significant on successful global supply chain management, the selection of the right 3PL provider is of utmost importance. Studies in this regard are quite abundant [4, 6, 8, 22, 23, 31, 33]. Jharkharia and Shankar [20] reviewed the literature and summarized some of the most commonly used criteria for the selection of 3PL provider as follows: compatibility with the users, cost of service, quality of service, reputation of the company, long-term relationship, performance measurement, quality of management, information sharing and mutual trust, operational performance, IT capability, size and quality of fixed assets, delivery performance, financial performance, market share, geographical spread and range of services provided, and flexibility in operations and delivery. Among these criteria, many are related to the core competencies of the provider as well as its ability to achieve economies of scale and pass the cost savings back to the user.

Despite the fact that core competencies and ability to achieve economies of scale are critical to the success of outsourcing, there are few studies in the literature focusing on what the core competencies of 3PL providers are and how they can achieve economies of scale in practice for the benefit of their users. For example, Arnold [1] proposes an outsourcing model with design alternatives for manufacturing firms combining transaction cost economics with a core competency approach. His main objective, however, is to develop a "de-materialized company" (p. 28) for optimizing outsourcing design and management. Similarly, Hafeez *et al.* [15] provide a structured framework for determining the key capabilities of a firm using the analytic hierarchy process.

Nevertheless, the framework is used mainly for identifying competency gaps within the firm with a view that the result might facilitate the making of outsourcing decisions.

Momme [24] proposes a framework for outsourcing manufacturing in which competence analysis is the first of the six phases outlined. However, the analysis focuses more on identifying the client's own core activities than that of the supplier's. It appears that there is little attempt to explore the core competencies of the supplier, which are supposed to complement the client's non-core business skills. Also, the issue of economies of scale has not been addressed in the proposed framework. It has yet to be proven that economies of scale achieved by the supplier, if any, would bring cost savings to its client. Similarly, Vaidyanathan [34] recommends a framework to establish a set of criteria for the selection of 3PL provider using IT as the focus to peruse the core functionalities of 3PL provider such as inventory management, transportation, and warehousing. Nonetheless, core competencies and economies of scale are again not the centerpiece of discussion. In view of the above inadequacy, this research aims to fulfil the existing gap by evaluating and assessing the significance of the two foregoing critical factors in their contribution to the success of the logistics service outsourcing.

## Methodology

This research is founded on a longitudinal case study of the outsourcing experiences of a global company focusing on the service providers' core competencies and abilities to achieve economies of scale. In general, case studies are less vigorous than empirical studies. Furthermore, because of the use of small sample, the case study approach also faces a limitation in generalizing the findings to reflect the situation of the whole industry. Nevertheless, the approach is suitable for exploratory and explanatory research like the one described in this paper to provide a preliminary in-depth investigation of a problem [5, 35, 38]. The intention is not to generalize the findings but to use them to better understand the crux of a problem and to propose recommendations for solution as well as directions for further research.

The case in this study is a global company providing information services to clients all over the world. As the core activity of the company is information gathering and dissemination, it relies on outsourcing to handle its non-core activities such as logistics operations. Between 1989 and 1999, the company changed three 3PL providers. Through the logistics manager of the company who oversaw the entire outsourcing process and managed the three 3PL providers during the period, detailed first-hand information about the case was collected for analysis which helps to determine if core competencies of the 3PL providers and any achievement of economies of scale existed. The information comes from the company's outsourcing analysis reports, proposals submitted by the 3PL providers for the outsourcing contracts, performance records of the 3PL providers during their respective contract periods, cost figures and other statistics provided by the 3PL providers, and performance evaluation reports at the end of the contract periods.

To facilitate analysis, an ideal situation of outsourcing, *i.e.*, the 3PL provider being a customer developer [16] and the outsourcing relationship being transformational [17], is used as a basis for comparison to gauge the performance of the three 3PL providers in the case. It is assumed that logistics functions such as transportation, inventory management; capacity planning, *etc.* should be coordinated and managed by the 3PL provider with logistical competency. Information and material flows should be streamlined and integrated by the 3PL provider to achieve economies of scale through consolidation of transactional and physical movement activities. Furthermore, the 3PL providers should be able to develop unique customer solutions and redefine business processes for its user through transformation or business process re-engineering so as to help its user to gain efficiency and cost effectiveness. Through the comparison, it can be established whether core competencies of the 3PL providers and their abilities to achieve economies of scale for user existed.

The parties involved in the case study are the user company X and its three logistics service providers (A, B, and C). For reason of commercial confidentiality, pseudonymous names are used. X is a leading international information service provider supplying news and financial information to its clients worldwide. The company installs computers and terminals at clients' premises to provide the subscribed data and information. With regional headquarters set up in Singapore, X has outsourced its logistics operations to freight forwarders since 1989. In the

1980s, outsourcing practice in Singapore was still in its infancy. Many 3PL providers were actually freight forwarding companies. The services that X outsourced include warehousing, inbound and outbound logistics, inventory management, local transportation, international freight delivery, and regional distribution of subscriber equipment.

All the three freight forwarders used by X are international freight forwarding companies with global presence and local offices in Singapore (Table 2). X awarded the logistics service contracts to the 3PL providers on a ‘2+1’-year basis, *i.e.*, two years initially with a scope for extension of one year. The contract required the 3PL provider to manage all the logistics operations of X including the provision of warehouse space, facilities, manpower, equipment and tools necessary for the activities. The service was charged at a fixed price (*i.e.*, a lump sum) and a variable price scheme according to the type of service and activity performed. X hoped that it could reduce its investment in resources and achieve flexibility through outsourcing. It expected the 3PL provider to deliver the subscriber equipment from the point of receipt to its clients in the most efficient and economic manner. In other words, X expected the 3PL provider to achieve economies of scale for its logistics operations and reduce its logistics expenditure.

TABLE 2: PROFILES OF THE 3PL PROVIDERS IN THE CASE STUDY

3PL name	Country based	Contract period	Specialization	Service provided to X
A	UK public-listed company	1989 – 1994	International airfreight forwarding and local transportation	<ul style="list-style-type: none"> <li>▪ Day-to-day management of X’s logistics activities including warehousing, inbound and outbound logistics, local transportation, international airfreight forwarding, and inventory management</li> <li>▪ Order processing and customer service</li> </ul>
B	US public-listed company	1995 – 1997	International freight forwarding and heavy weight movement	Same as above
C	Singapore-based private company	1997 – 1999	International air and sea freight forwarding	Same as above

## Case Study Findings

Analysis of the case reveals that the three 3PL providers failed to bring efficiency gains to X as expected despite of a full outsourcing of logistics operations. Problems with the 3PL providers identified in Table 3 show that they did not operate, coordinate, or manage X’s logistics activities customer developers. Their IOS relationships with X were mainly tactical. Apart from C, the other two 3PL providers did not provide complete centralized coordination and management of logistics activities for X leading to duplicated effort and wasteful operation on some occasions. The lack of logistics information systems and other IT support from the 3PL providers also prohibited them from integrating and streaming the material and information flows of X to achieve higher efficiency. These outcomes can be attributed to a few common practices. First, all the three 3PL providers did not invest adequately in resources to develop their capabilities and competencies. They did not possess their own warehouses to achieve economies of scale or logistics information and other systems to enable better planning, coordination, and management of logistics activities for X. Second, the quality of their staff was less than satisfactory (*e.g.*, untrained staff) and their management of X’s logistics operations was ineffective (*e.g.*, no quality or ISO9000 compliant process). Finally, they provided little or no IT support to manage X’s supply chain to maintain efficient information flow or to coordinate material flow.

TABLE 3: PROBLEMS WITH THE 3PL PROVIDERS IN THE CASE STUDY

Area	Problems with A	Problems with B	Problems with C
Warehousing	<ul style="list-style-type: none"> <li>▪ Did not possess own warehouse. Used leased private warehouse for X.</li> <li>▪ Cost of usage all charged to X and not shared among other customers. Did not achieve economies of scale.</li> <li>▪ Did not possess own WMS to optimize warehouse operation.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Did not possess own warehouse. Used private warehouse especially leased for X (<i>i.e.</i>, subcontracting).</li> <li>▪ X solely funded the leased warehousing and the related services. No consolidation of cargo with other customers of B or sharing of fixed cost to achieve economies of usage.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Did not possess own warehouse. Used private warehouse especially leased for X (<i>i.e.</i>, subcontracting).</li> <li>▪ Cost of usage all charged to X and not shared among other customers. Did not achieve economies of scale.</li> </ul>
Staffing	<ul style="list-style-type: none"> <li>▪ No pooling of staff from other business units to share the fixed staff cost of the Customer Service Department. No sharing of warehouse transaction cost and to achieve economies of scale.</li> <li>▪ Inexperienced warehouse operation staff. X had to train the staff of A to use its MRP II system.</li> <li>▪ Staff lacked basic logistics knowledge. X had to provide on-the-job training to the staff of A. No in-house training program in place.</li> <li>▪ High staff turnover rate (&gt;40%).</li> </ul>	<ul style="list-style-type: none"> <li>▪ B's logistics team for X comprised full-time and part-time staff with a 40% turnover that seriously affected service continuity and performance (<i>e.g.</i>, 20% variance found in annual stock take).</li> <li>▪ X had to provide training to the staff of B to use its MRP II system.</li> <li>▪ Much time was spent in re-training new comers and handing over job duties as a result of frequent staff changes.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Staff either pooled from internal units or through external recruitment. No sharing of costs.</li> <li>▪ X had to provide on-the-job trainings on inventory management and order processing to the logistics team members of C.</li> <li>▪ High staff turnover of 50% occurred mainly at the supervisor level. Poor staff stability seriously affected day-to-day operation. Unsatisfactory performance and low customer service level were reported throughout the contract period.</li> <li>▪ 10% variance was found in annual stock take.</li> </ul>
Transportation	<ul style="list-style-type: none"> <li>▪ Did not possess own vehicle fleet. Used subcontractors for delivery service. Little control and no economies of scale.</li> <li>▪ Did not possess own TMS for efficient scheduling and route planning.</li> <li>▪ Poor tracking system (used telephone only). Failed to provide high level of on-time delivery service to customers as required by X.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Used a combination of own and leased vehicle fleets. Economies of scale were achieved through consolidation of cargos for X and other customers of B. However, the benefit gained was not passed back to X as cost savings.</li> <li>▪ Did not possess own TMS for efficient scheduling and route planning.</li> <li>▪ No monitoring of performance of subcontractors to ensure</li> </ul>	<ul style="list-style-type: none"> <li>▪ Possessed own transport fleet and full-time staff to handle all transport activities with a dedicated team to serve X. However, capacity was not fully utilized and economies of scale were not achieved.</li> <li>▪ Possessed own TMS with GPS technology to track and trace its transport fleet resulting in faster turnaround time.</li> </ul>

		they worked up to the service level required by X.	
Management	<ul style="list-style-type: none"> <li>▪ No one-point solution to problem.</li> <li>▪ Vertical control in each department created unnecessary delays in communication and action.</li> <li>▪ Lack of unity of control. Fragmented management of inventory and distribution resulted in duplicated effort and wasteful operation.</li> </ul>	<ul style="list-style-type: none"> <li>▪ No major problems identified.</li> </ul>	<ul style="list-style-type: none"> <li>▪ No major problems identified.</li> </ul>
IT support	<ul style="list-style-type: none"> <li>▪ Service not provided.</li> </ul>	<ul style="list-style-type: none"> <li>▪ B possessed own team of IT professionals but failed to develop a logistics information system to integrate with X's legacy system for end-to-end management of the supply chain as stated in the proposal submitted to X.</li> <li>▪ Technical complexity, prohibitive cost, and inadequate numbers of participating customers for cost sharing were the main causes of failure.</li> </ul>	<ul style="list-style-type: none"> <li>▪ Did not possess own IT staff but hired external consultants for any IT system project.</li> <li>▪ In the outsourcing contract, C proposed to provide a low cost IT solution to replace X's own MRP II system but the project had never taken off.</li> </ul>

The lack of own warehouses and the reliance on leased facilities have limited the capabilities of the three 3PL providers to offer cost benefits to X through economies of scale. Since X spent a significant portion of its logistics cost in warehousing and related activities, its objective to reduce cost and to gain considerable savings through outsourcing was not realized basically. Apart from some bulk freight rate savings obtained through volume consolidation, the major benefit X enjoyed in outsourcing was a reduction in staff cost. However, the savings were offset by the poor and unsatisfactory service performance of the 3PL providers manifested by their high staff turnovers, incompetent management, and inefficient services.

X's case unfolds the following common issues with the three 3PL providers which suggest that they did not actually possess core competencies in all the services they provided and they were not able to achieve economies of scale as expected:

- Performance of the 3PL providers was good for international freight forwarding but only average or even poor for other logistics activities. Apart from freight forwarding, the three 3PL providers acted more like a resource provider than an integrated logistics service provider with little capability to add value to their user's supply chain. They were more like generalists providing little specialist skills or specialized equipment or systems for the outsourced services.
- Workers of the three 3PL providers were incompetent due to poor training and high turnover rate. Many of them lacked the basic knowledge or skills to perform their jobs well. The main role of the three 3PL providers in most activities was to supply manpower resources. As a result, the three 3PL providers failed to reduce the management responsibility and time of their user because of ineffective communication and lack of problem-solving and decision-making skills.
- Owing to the lump sum payment arrangement for warehousing service, there was no cost benefit arising from economies of scale through the sharing of use of facilities. In general, the services were not provided

across the whole customer bases of the 3PL providers and were charged at fixed price instead of a cost-sharing basis.

- The three 3PL providers were generally weak in IT capability to provide support to X. Their scale of operation and financial strength did not permit the provision and sharing of such service across all their users.

The above issues are all related to the amount of resources invested by the 3PL providers, the capabilities of utilizing their resources, the competencies in providing efficient logistics services, and the abilities to bring cost savings to their users through increasing scale of operation and size of customer base. They boil down to the 3PL providers' core competencies and abilities to achieve economies of scale. The findings of the case study suggest that although the 3PL providers might have the resources and capabilities to offer different logistics services, they were not necessarily competent in all the logistics activities they performed. Core competencies developed in one area as a result of long establishment, large investment, accumulated skills, and cumulative experience did not automatically translate into core competencies of other logistics services. To the 3PL providers, core activities might be the businesses they could do best or make the greatest profit. To their users, however, the 3PL providers' core competencies should be their unique expertise and experiences that could assist their users in conducting the outsourced logistics activities in the most efficient and cost effective manner. This mismatch might be the root of the disappointment and the cause of the repeated outsourcing failures in the case of X. As a logical conclusion, the analysis suggests that prior to outsourcing more careful and detailed examination of the actual core competencies of the service providers in relation to the user's expectation is important.

### **A Proposed 3PL Provider Core Competencies Evaluation Framework**

X's case presented in this paper reveals the significance of examining the core competencies of the potential 3PL providers and their abilities in achieving economies of scale before making the final decision. To a large extent, X should be responsible for its outsourcing failures. The company has an obligation to understand what core competencies of the 3PL providers are required and whether they actually possess the competencies in order to achieve the company's outsourcing objectives prior to signing the contracts. X might understand well its own logistics costs and service levels. However, evidence suggests that it has not fully examined the 3PL providers' capabilities and core competencies before requesting proposals. X selected its 3PL providers on the basis of price, range of services offered, and technical competency to provide facilities, equipment, and tools necessary for the running of its logistics operations. Using the Request for Proposal (RFP) approach, X aimed to shop for the best 3PL providers among its freight forwarders hoping that the 3PL providers could take over a wide range of its logistics functions at lower costs. However, most of the outsourcing benefits that X hoped for did not materialize because of a sharp disparity between X's expectation and the actual performance of each of the three 3PL providers.

In outsourcing its logistics functions, X did follow closely the standard procedures of outsourcing as outlined in Fig.3. The company conducted its competence analysis and mapping of activities properly (Stages 1 to 3) before requesting proposals from the 3PL providers (Stage 4). It also developed its own set of performance measures and cost parameters to evaluate the performance of the 3PL providers (Stages 5 to 7). The repeated termination of outsourcing contracts (Stage 8) therefore suggests that simply following the standard procedures might not be adequate. More detailed guidelines would be required for the most critical stage (Stage 4) in which the potential service providers are evaluated and the most compatible one is selected.

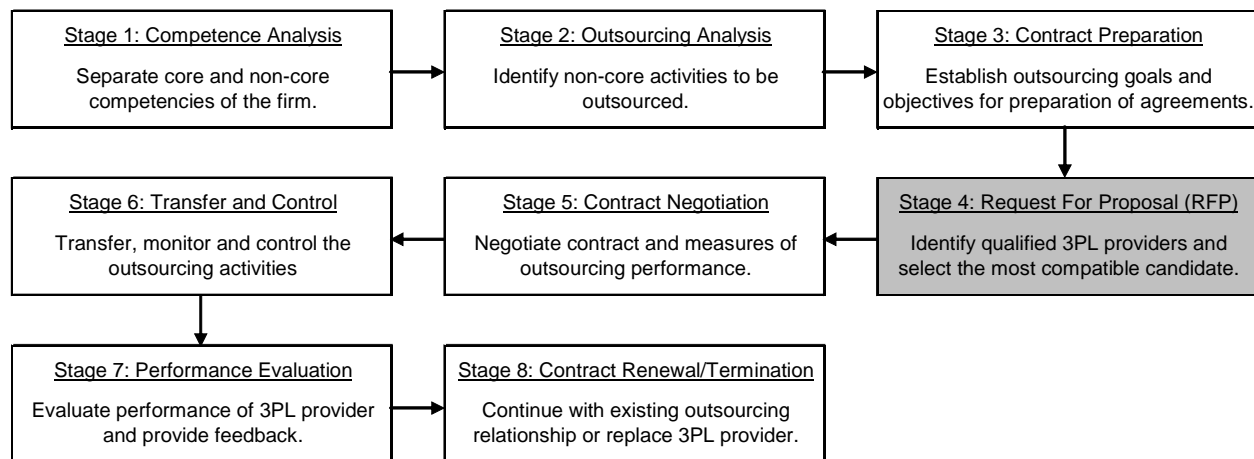

FIG.3: STANDARD PROCEDURES OF THE OUTSOURCING PROCESS

X's case reveals that resources and capabilities of the 3PL providers are essential elements of their core competencies in providing logistics services to their users. This finding is in line with the competencies hierarchy proposed by Javidan [19] in which he contends that core competencies of a firm build upon its competencies which, in turn, depend on its capabilities to utilize its resources. Javidan [19] defines the four levels of his competencies hierarchy as follows (p. 62):

- *Resources* are the inputs into the firm's value chain;
- *Capabilities* refer to the firm's ability to exploit resources;
- *Competency* is a cross-functional integration and co-ordination of capabilities; and
- *Core competencies* are skills and areas of knowledge that are shared across business units and resulted from the integration and harmonization of strategic business unit competencies.

The difficulty in rising from one level to another (*i.e.*, *Resources* to *Capabilities* to *Competencies* to *Core Competencies*) increases with the ascent but the value to the firm also inflates in increasing magnitude.

Javidan's [19] competencies hierarchy is a relatively simple and generic framework used mainly to relate a firm's core competencies to building blocks like resources, capabilities, and competencies. The framework is not especially designed for identification of core competencies by itself. Instead, it is used to show the linkages between the building blocks with the firm's strategic hierarchy comprising functional strategy, business strategy, corporate strategy, and mission statement. Nevertheless, the concept of competencies hierarchy does provide a useful reference for an evaluation framework to access the core competencies of 3PL providers. The issues identified in X's case presented in this paper help to define the dimensions of the array and supply the individual cell of the framework with ingredients.

As X's case reveals, quantity and quality of resources committed by the 3PL providers, capabilities to exploit the resources and directly control the outsourcing operations, and competencies in integrating and coordinating the logistics functions for users are critical determinants of success in renewing the outsourcing contracts. As such, some of the issues identified in the case study, such as the use of owned or leased assets, full-time to temporary employee ratio, staff turnover and stability, and the use of subcontractor and consultant, *etc.*, can in fact be translated into criteria to evaluate and assess the core competencies of the 3PL providers. Basically, a successful 3PL provider should process certain amount of resources and capabilities in order to attain core competencies in providing logistics services and to transfer cost benefits derived from economies of scale to users. These resources and capabilities include fully controlled assets such as warehouse and transport vehicle fleet, qualified personnel and well-trained staff, specialized handling equipment for service such as warehouse automated storage system, track-and-trace system, *etc.*, and a large customer base with sufficient volume of transactions to enable cost sharing.

Based on the above discussion, this paper proposes a 3PL provider core competencies evaluation framework as shown in Fig.4. The framework makes use of the findings of the case study to develop a list of evaluation items grouped under 'resources', 'capabilities' and 'processes' – the building blocks of core competencies – and use them to examine if the 3PL provider's core competencies are present. The 'processes' building block in the proposed evaluation framework is akin to the 'competency' building block in Javidan's [19] competencies hierarchy. While 'competency' in Javidan's [19] hierarchy refers to a cross-functional integration and coordination of capabilities (p. 62), the 'processes' building block in the proposed evaluation framework focuses on the availability of processes that show the presence of certain capabilities of the 3PL provider. The proposed framework is not meant to replace any existing 3PL provider evaluation models such as the ones proposed by Momme and Hvolby [25] and Vaidyanathan [34]. In making outsourcing decisions, there are many factors such as cost, quality, service, and performance to consider and different aspects such as strategic fit, compatibility of organization culture, and financial stability to look at other than core competencies and ability to achieve economies of scale [4, 34]. Therefore, the proposed framework only attempts to supplement the evaluation process upon the completion of the normal assessment procedure in the RFP stage.

In using the proposed framework to evaluate the available resources of a 3PL provider, it is recommended that staff qualification, staff turnover and stability, ratio of full-time to temporary staff, percentage of assets owned or leased, *etc.* should be examined. Similarly, to evaluate the service provider's capabilities, it is necessary to consider whether the 3PL provider has IT capabilities developed in-house or by consultants, whether logistics is truly its core business or just the main source of revenue, and whether the 3PL provider is a recognized leader in the industry, *etc.* To evaluate the 3PL provider's ability to achieve economies scale and to pass the benefits back to its users, the presence of flexible price models should be examined. Scale of operation and size of customer base usually affect a 3PL provider's ability to help its user to cut cost through economies of scale. Although cost savings can be achieved through multiple offering of services to different users, order consolidation hence volume discount, and sharing of usage of resources and assets, users will not be benefited if the costs of usage of facilities are not shared across the 3PL provider's customer base. Therefore, the availability of variable price models that permit the spreading of fixed costs across multiple users forms another evaluation criterion under the proposed framework.

It is believed that the categorical item-by-item evaluation under the proposed framework should help to identify the 3PL provider as a resource owner or a resource provider, a specialist or a generalist, and a problem solver or only a process provider. This will enable the 3PL user firm to better understand what outsourcing relationship (*i.e.*, tactical, strategic, or transformational) and what role the 3PL provider will play in the outsourced activities (*i.e.*, a standard 3PL provider, a service developer, a customer adaptor, or a customer developer). The categorization also helps to determine the strengths and weaknesses of the 3PL provider in terms of its investment in resources and innovation, proven skills and knowledge, and ability to coordinate and integrate logistics processes. This will facilitate the 3PL user firm in checking whether the 3PL provider has the capabilities and competencies to actually meet its user's outsourcing needs as well as the cumulative experience and scope for organizational learning that are necessary for forming vertical logistics alliance. Despite the fact that logistics is usually not the core business of 3PL user firms, the step-by-step approach proposed in the framework should enable the recognition of the 3PL provider's core competencies in a more systematic and objective manner. By applying the proposed evaluation framework in the RFP stage together with other evaluation processes to all the potential 3PL providers, the outsourcing firm would be able to determine which 3PL provider could help the company to achieve its outsourcing goals and objectives and provide the best scope for long-term transformational IOS partnership through vertical logistics alliance.

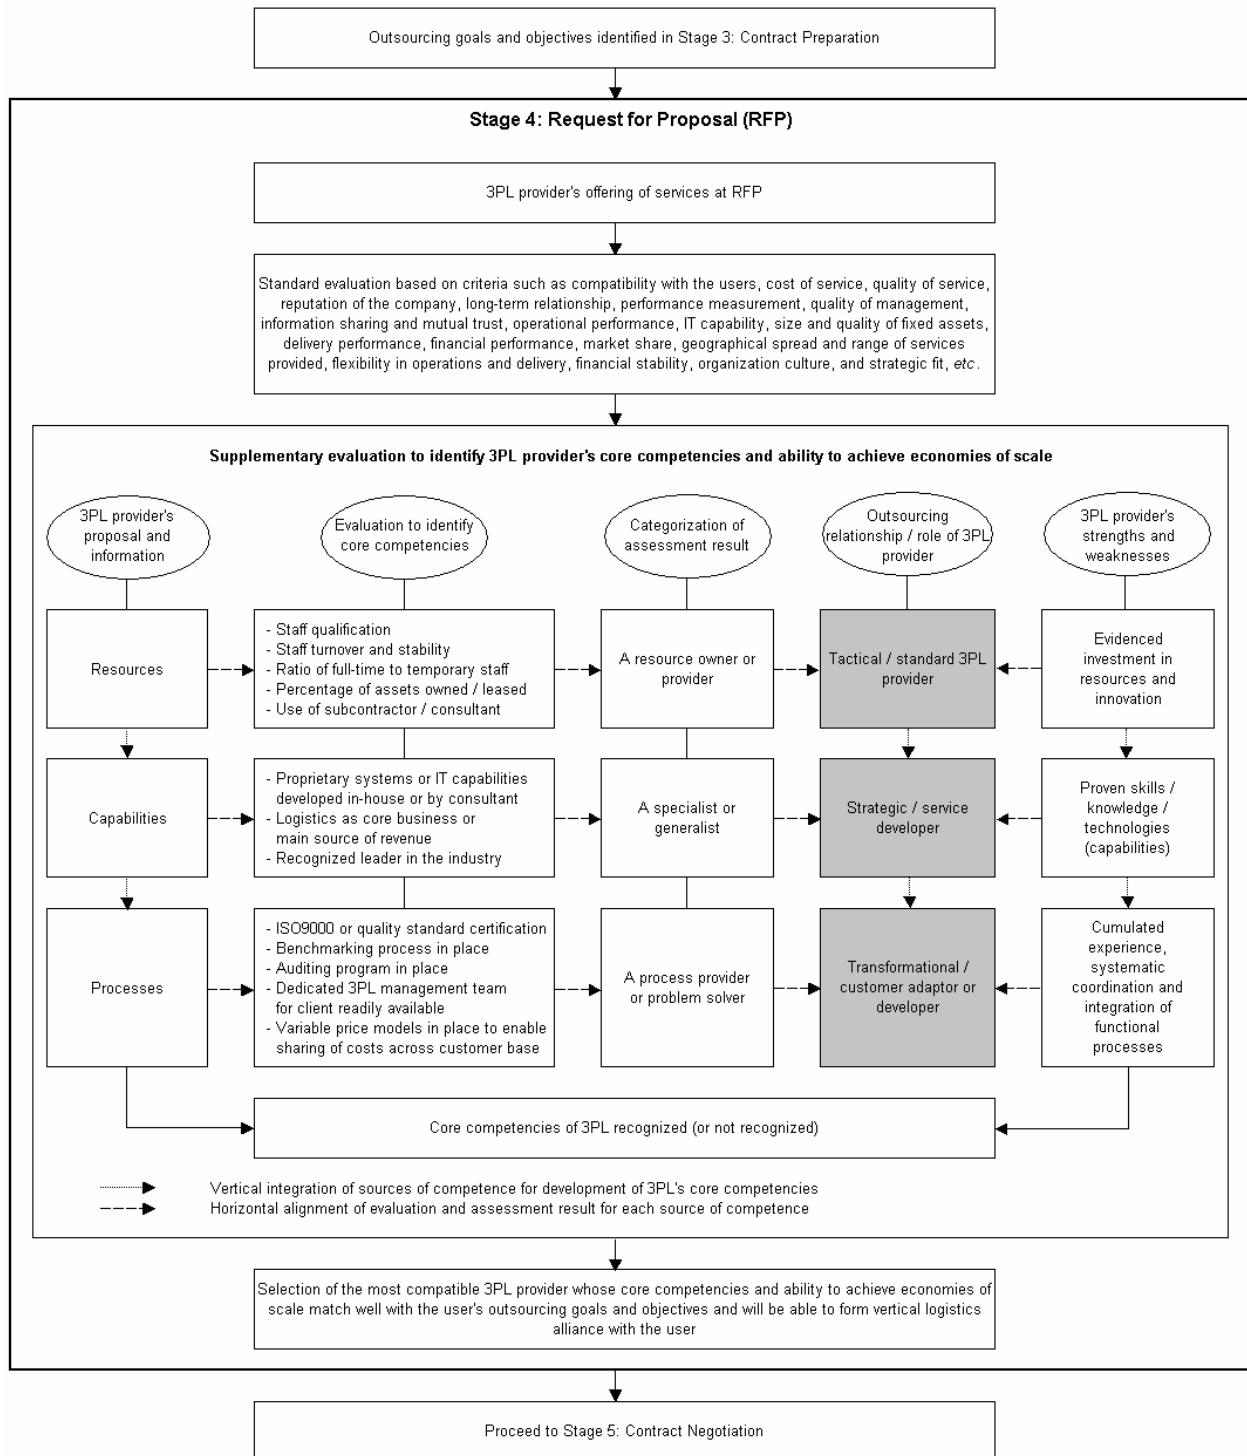

FIG.4: A PROPOSED 3PL PROVIDER CORE COMPETENCIES EVALUATION FRAMEWORK

## Conclusion

This paper argues that ‘core competencies’ and ‘economies of scale’ are two critical factors, among others, that contribute to the success or failure of outsourcing which is paramount to modern-day global supply chain management. Core competencies of a 3PL provider build on the amount of resources it possesses, its capabilities to fully exploit these resources, and its competencies in utilizing the capabilities to provide efficient and cost effective integrated logistics services to users.

The proposed evaluation framework presented in this paper can assist outsourcing firms to assess the core competencies of potential 3PL providers in the RFP stage. The framework is meant to supplement the standard evaluation process instead of replacing any procedure. It provides a systematic method to determine if core competencies of a 3PL provider are present and whether they match with the firm’s outsourcing needs. Through a categorical item-by-item evaluation process, the framework could assist outsourcing firms in determining what outsourcing relationship would be formed and what role the 3PL provider would play in the partnership. The evaluation would not only help to determine whether the 3PL provider could achieve the outsourcing goals and objectives of its user but also reveal if there is scope for vertical logistics alliance that is critical for successful global supply chain management.

As this study involves only one case with three 3PL providers, the findings might not be entirely representative although they have helped to establish parameters for the proposed evaluation framework. To fully investigate the impact of core competencies and economies of scale on outsourcing success, more studies are needed to explore the current practices of 3PL providers in different industries and regions for comparison. This might be incorporated into annual global outsourcing surveys like the one currently conducted by Georgia Institute of Technology, Cap Gemini LLC, SAP, and DHL [22]. The findings would be useful in improving the proposed evaluation framework to extend its applicability to the practitioner community.

University of New South Wales, Australia*

## Abstract

Research on international subcontracting has been policy-oriented and industry-focused. There is a lack of understanding of the phenomenon from management and organization perspectives. This paper conceptualises international subcontracting as a type of relational contract formed by buyers and suppliers from different countries, sitting between arm's length outsourcing arrangement and vertically integrated multinational enterprises (MNEs). It builds a transaction cost model for studying the choice of international subcontracting and for examining the complex nature of subcontracting relationships. The conceptual model provides an analytical framework for supply chain managers to choose strategically between outsourcing, subcontracting and vertical integration with overseas suppliers.

## Introduction

International subcontracting has been an effective means of accelerating industrial development since 1960s, fostering the specialisation among countries that reflects comparative advantages (Germidis 1980). Through such measures as the establishment of free trade zones, developing countries encourage local firms to undertake subcontracting jobs for foreign firms to earn hard currency and to accumulate technological know-how (Hamada 1974). Firms from developed countries are frequently attracted into subcontracting arrangements to exploit low labour and production costs in developing countries. The studies of international subcontracting are mainly policy-oriented (Cohen 1975, Riedel 1975, Sengenberger & Pyke, 1991) and geography or industry-focused (Lawson 1992, Kashyap 1992, Rogerson 1995). Few have examined why firms from developed countries choose to use subcontracting arrangements in the first place. Moreover, despite some classifications of international subcontracting activities according to functional or market criteria (Holmes 1986, Gereffi 1993), the nature of subcontracting relationships remains unexplored due to the lack of theoretical underpinning of international subcontracting as a form of investment. Grounded on transaction cost economics (Williamson 1975, 1979, 1985; Buckley & Casson 1976; Rugman 1981; Hennart 1982), this paper aims to provide a firm-level analytical framework for analysing the subcontracting choice and the nature of subcontracting relationships, complementing the existing literature's emphasis on studying international subcontracting as a macro-economic phenomenon.

## The Concept of International Subcontracting

There is no generally accepted definition of subcontracting in the existing literature (Hovi 1994). However, there are some essential features about the international subcontracting as a form of investment. First, international subcontracting involves two independent units located in different countries, reflecting a type of cross-border inter-firm relationship. But the fact that a firm is legally independent does not necessarily mean that it will be economically independent. The relationship between subcontracting parties is defined as 'quasi-integration', in which subcontractors from less developed countries are often dependent on principals from developed countries, where the demand of subcontracting is derived (Germidis 1980). Second, in a subcontracting arrangement, the subcontractor provides the principal with products or services on agreed terms and conditions set by the principal, where certain business activities such as marketing or product design may not be carried out by the subcontractor (Halbach 1989). The goods produced are required to conform to specifications intended for a definite principal, making it impossible or very difficult to sell them to other customers (Germidis 1980). Third, the principal usually

provides specialised physical equipment and/or ongoing technical assistance to the subcontractor to assure product specifications and quality (Sharpston 1977). The enforcement mechanisms are usually between principals and subcontractors themselves and no third party oversees the execution of the contract. The bond linking them together is thus out of market (Germidis 1980). Consequently, a significant level of transaction-specific investment has to be undertaken both by subcontractors to meet the specifications set by principals and by principals to ensure the performance of subcontractors. These basic characteristics reveal that the nature of international subcontracting conforms to Williamson's (1979, 1985) notion of a relational contract with a bilateral governance structure. Casson (1987) identified subcontracting as a distinctive type of intermediate contractual arrangement, an alternative to the vertically integrated multinational enterprises (MNEs).

## **The Choice of International Subcontracting**

The above conceptualisation allows us to examine the choice of international subcontracting as an intermediate relational contract, lying between market outsourcing arrangement and internalised MNEs.

### **Subcontracting vs. Outsourcing**

In transaction cost framework, the choice of a relational contracting form is made when transactions between buyers and suppliers are characterised by mixed asset specificity, recurrent exchange and a low degree of uncertainty (Williamson 1979, 1985). Central to the framework is the concept of asset specificity, which refers to durable human and physical investments undertaken to support particular transactions (Williamson 1985), the value of which will be lost in alternative uses. The requirement for specific assets creates potential costs in the market execution of transactions. When the asset specific feature involved in business transactions is low, buyers and suppliers keep their relationship at arm's length.

A common industrial outsourcing activity refers to market transaction of standard products or components, with both buyers and suppliers capitalising on their comparative advantages of trading and realising economies of specialization. While outsourcing may involve a long-term relationship between buyers and suppliers, it does not require the support of long-term contract. The products and components in common outsourcing activities are non-specific and there are many buyers and sellers. Some buyers and suppliers may be engaged in the trading of standard goods for a long time. But they are not bonded by contracts requirement and each side can switch to other trading parties easily due to the low asset specific investment in their trading relationship.

When products or components contain some degree of product specifications and are not 'off the shelf', they can no longer be bought on spot market. Buyers look for long-term contractual arrangements to assure the supply of the specialised inputs and products. Subcontracting is a kind of long-term contract that aims to facilitate the sourcing of products or components with buyer-specific requirements. This clarification is important because the term 'subcontracting' is often misunderstood as an exclusive portrait of buyer-supplier relationship and therefore the distinction between common outsourcing and subcontracting is blurred. As such, asset specificity is an important reason for making long-term contracts (Kay 1995), explaining the choice of subcontracting over outsourcing. To protect themselves from exposure to transaction costs arising from making asset-specific investments, both parties involved in subcontracting relations have incentives to form a long-term relational contract.

### **Subcontracting vs. Vertical Integration**

The economic rationale of international subcontracting is to realise economies of specialisation through externalising non-core production activities (Sharpston 1977) to achieve cost advantage. But firms can acquire existing low-cost suppliers in developing countries as their subsidiaries or set up plants in low-cost regions and relocate non-core activities to the new ventures. On the other hand, if the aim is to access technology expertise or other proprietary know-how held by suppliers, the buyer firm could still acquire them through equity integration with suppliers. Therefore, other than achieving production cost economies and acquiring complementary assets, there must be additional reasons for firms to choose subcontracting rather than vertical integration through acquisitions or greenfields.

Engaging vertical integration to exploit low production costs or to access complementary assets overseas would entail significant transaction and information costs, which justify the choice of subcontracting. First, the desired assets of the acquired firm are hard to disentangle from the non-desired ones, which impose a high cost on acquiring suppliers (Hennart 1988). Under this circumstance, purchasing the target overseas firm would force the buyer to enter unrelated fields or to expand suddenly in size, with the attendant management problems. This cost is particularly high for firms that rely mostly on cost rather than differentiation to survive.

Second, management costs after the acquisition make subcontracting preferable. Acquisition of a foreign supplier means the buyer also takes over an existing labor force and a well-established administrative structure. Considerable difficulties might be expected by the buyer in managing the foreign supplier firm that has cultivated its own organizational routines and corporate culture, in addition to the national culture distance. Hence, a subcontracting arrangement may be desirable as it avoids the post-acquisition management costs by leaving the management of supplier firm to the overseas subcontractor itself.

Third, information costs in assessing the value of the target firm inhibit the acquisition. Buyers may not acquire overseas suppliers for the purpose of establishing low-cost supply bases but for the potential gain from complementary assets held by suppliers. But it may be difficult to assess the true value of these complementary assets due to the intrinsic bounded rationality constraint and the expectation that overseas suppliers may opportunistically exaggerate the value of their assets. A subcontracting arrangement retains the possibility for principals to gather information on the value of overseas subcontractors' complementary assets without financial exposure in an equity relationship, and may be used as a transitional arrangement for future acquisition of the overseas supplier.

Fourth, high exit barriers in an equity relationship may jeopardize the flexibility valued by the buyer firms. In contrast, a subcontracting arrangement allows buyers to rescind the contractual relationship with suppliers at a relatively low exit cost. Finally, impediments to acquisitions arise from governmental and institutional barriers. Many developing countries discourage and restrict the foreign equity control of local companies while the pervasive anti-trust legislation in developed countries also acts against acquisitions.

When making the choice between subcontracting and building new plants (greenfield) in low-cost countries, the following factors need to be considered. First, relocating low value-added operations to newly established greenfield plants may achieve a similar level of cost reduction in labor and other production factors. But relocation to another country through greenfields requires additional knowledge in managing labor and production in an unfamiliar environment, and becoming acquainted with the specific local cultures and environment is a time-consuming process. Greenfield investments may be necessary for companies that aim to develop foreign markets for their products, but not for firms that simply seek a low cost supply base overseas.

Second, even when the buyer firm plans to develop the foreign market in the future, subcontracting may still be a preferred entry mode as it allows the firm to acquire knowledge of local market before the subcontracting arrangement is replaced by a wholly-owned subsidiary (Kogut 1988). In this case, the choice of subcontracting economises on the cost of acquiring local knowledge, allowing the prospective entrant to test the potential of the local market while exploiting the foreign country as a low cost supply base in the mean time.

## **The Nature of Subcontracting Relationship**

Transaction-specific investments bond principals and subcontractors in a relational long term supply arrangement, but it also leaves room for parties to bargain, shirk or break the relationship for short-term gains. Whether such a contractual arrangement can be preserved is primarily a matter of the nature of the subcontracting relationship concerned.

There is a whole range of international subcontracting relationships in terms of the degree of interdependence and bargaining power between principals and subcontractors. The perceived dependence and bargaining power are the function of the combination of many factors, including the degree of asset-specific investments, frequency of transactions and uncertainty between parties (Williamson 1979, 1985). Variations along

those transactional dimensions determine the degree of interdependence and bargaining power between subcontracting parties, which in turn constitute a variety of subcontracting relationships.

A loose subcontracting relationship denotes a low interdependence degree between principals and subcontractors, the switching cost for both parties is low as neither side makes significant asset-specific investments. The principal does not rely on a particular subcontractor or subcontractors for supply and the subcontractor also has a broad customer base. The principal only need to provide minimal technical assistance to the subcontractor and the subcontractor does not need sophisticated machinery and skills to perform subcontracting jobs. The frequency of orders has little impact on the relationship since both sides are loosely tied to each other and the exit costs are low for both sides when facing market demand fluctuations. Examples abound in commercial subcontracting (Gereffi 1993).

A subcontractor is more dependent when the principal has stronger bargaining power. This occurs when asset-specific investments made by the parties are asymmetric. The buyer commitments are usually confined to specific physical capital, including specific dies, moulds and tooling for the manufacture of a contracted product (Nishiguchi 1994). The subcontractor, on the other hand, has to invest in special-purpose equipment, employ skilled workers and engineers who are devoted to customer-specific operation; expand production capacity to meet the principal's requirement. The industry structure is such that many suppliers from developing countries are competing for relatively few buyers from developed countries. It is difficult for a subcontractor to diversify its customer-base and its sales revenue. However, such an unbalanced subcontracting relationship may not be unstable. Although buyers from developed countries have much leverage among many suppliers in developing countries, stable long-term relationships with their suppliers can enhance performance certainty by reducing the costs in seeking suitable overseas suppliers, in drawing up multiple contracts, and in monitoring multiple suppliers in different countries. All of these benefits would be lost in a frequent shift of suppliers. These are also the reasons why arm's length outsourcing may involve a long-term relationship. But the higher degree of asset specificity points to a more inter-locked pattern of relationship in subcontracting than in outsourcing.

The situations where a principal is more dependent on a subcontractor are less common. They happen when the overseas subcontractor holds know-how crucial to the principal's production cycle. Some once-off and occasional large purchasing orders that involve sophisticated work such as in aerospace (Esposito & Storto 1994) and shipbuilding industries (Smitka 1991) might qualify as examples, since they require highly specialized expertise and more importantly there are more buyers than suppliers in the global market. Subcontractors enjoy stronger bargaining power when they are not merely producing certain products or components, but serve as intermediates for transferring knowledge of the local market to foreign buyer firms. In this case, a local subcontractor's bargaining power stem not from the transaction characteristics, but from the foreign buyer's strategic purpose in developing the local market with the help of the local supplier. Nevertheless, the subcontractor may be unaware of the principal's strategic motive and fail to materialise its power advantage in dealing with the foreign principal firm.

When the principal and the subcontractor are mutually and heavily dependent on each other, the demand for equal collaboration is high. Subcontracting of this type requires highly specialized investments from both sides and the relationship is balanced. In such a subcontracting relationship, the principal typically contracts out the assembly of a final product. The principal commitments contain a high degree of asset specificity since complete assembly requires the highest integration of contract-specific physical facilities, including dedicated assembly lines, tooling and testing equipment (Nishiguchi 1994). Moreover, the principal will incur human asset-specific investments in the form of managerial training and technical assistance to the overseas subcontractor to attain the production specifications (Sharpston 1977). For subcontractors, end-product assembly for a particular overseas buyer will require specific investments both in human capital (e.g. employ highly skilled workers or provide special training) and in physical assets (e.g. purchase specialised machinery and equipment). Therefore, principals and subcontractors commit a similar level of asset-specific investments, which support an equal collaborative relationship characterised by common interest, mutual obligations and trust (Smitka 1991, Morris & Imrie 1992).

## Conclusion

International subcontracting is often studied as an important instrument for industrial development at the policy level. Few studies have looked at the phenomenon from a management perspective. The paper does not attempt to provide a precise definition of international subcontracting. Rather, building rigorously on the transaction cost economics, the paper conceptualises international subcontracting as a relational contract between buyers and suppliers from different countries, sitting between arm's length outsourcing arrangement and vertical integrated MNEs.

A transaction cost analytical framework is proposed for investigating the choice of international subcontracting over its market and hierarchy alternatives. The framework also allows us to examine the specific nature of a range of subcontracting relationships. Theoretically, the paper offers a conceptually coherent foundation for future research to analyse international subcontracting as a form of international business organization at the firm level. Empirically, the paper provides an analytical framework to help international firms' managers to make strategic choice between outsourcing, long term subcontracting and vertical integration with overseas suppliers for their companies' supply chain management across borders.

# Logistics and Supply Chain Management for Hungarian Mid-Size Companies: Effect on Competitiveness

Zoltan Szegedi, [szegedi.zoltan@gtk.szie.hu](mailto:szegedi.zoltan@gtk.szie.hu)

Csaba Illes B., [illes.b.csaba@gtk.szie.hu](mailto:illes.b.csaba@gtk.szie.hu)

St. Stephen University, Hungary

## Abstract

An empirical survey of 117 SMEs (examining logistics practices and the relationship of information systems such as the existence and use of an ERP - or related logistics information systems) was carried out under the leadership of the author. Our goal was to prove the relationship between the quality of the logistics processes (functionality, agility, process measures) and their effect on the position of SMEs on the market. On the basis of the survey we have received detailed information on how logistics processes and information systems affect the competitiveness of these enterprises. While large (multinational) companies are better in terms of economic competitiveness due to their size and the financial benefits they enjoy as a result of the global market, this does not work for SMEs. The path to SME-competitiveness – even when fixing and streamlining their logistics processes and installing their logistics information systems – begins with flexibility and adoptability: they must meet the unique needs of their customers by constantly improving the quality of their customer service and by adapting to customer standards. Although the paper discusses the Hungarian case, the problems can be similar in the newly joined EU member countries as well.

## Introduction

The aim of this paper is to highlight the logistics strategies and practices used by small enterprises in Hungary, with view through a “supply-chain-approach”, where it is usually a large firm as a “dominating” channel member. The need to survive and to grow forces SME-s to adapt to the rule of competition (which are changing rapidly).

We agree on the interpretation that logistics is defined as the process of controlling physical flow and connecting information flows (Colin-Fabbe-Costes, 1993). It is a major contributor to economic performance in large corporations, and it will be accepted as a tool for economic efficiency. [Kearney, (1984), Chow, G.-Heaver, T.-Henriksson. L. (1994)] The company gets efficient, if – together with its partners – it is able to reduce the costs of the logistics activities (procurement, warehousing, inventory management, transportation, distribution, etc.) and if it satisfies the customers.

Small enterprises – similarly – have and are able to implement logistics procedures to improve their performance. Despite of that, few researchers have considered logistics as a strategic tool in small firms. Researchers of this field in Hungary tend to look at SME-s as “logistics beneficiaries”, who are on the passive side, while large corporations do the majority of logistics works (within the supply chain).

We do not agree on that, because the percentage of jobs (of all competitive sectors) generated by SME-s cumulates to 51 %, and in manufacturing it is even higher (55 %).

Business interest in logistics began around 1950 and has developed since progressively. Researchers speak about stages, as the logistics functions have been integrated into the organizational structures of companies. [McGinnis, M.-Kochunny, C.M.-Ackermann, K.B. (1995); Inkalainen, A.-Vepsalainen, A. (2000)].

Figure 1 shows the development of logistics in firms by Inkalainen (2000)

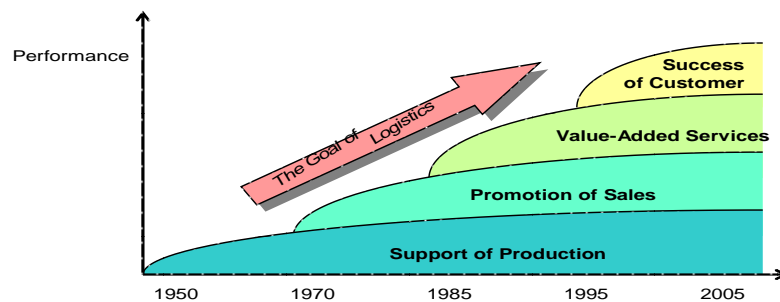

FIG. 1: CHANGING MISSION OF LOGISTICS/SCM

When having a deeper look on this development, we should be aware of the fact that researchers focussed on large enterprises. Even previous surveys usually focussed on big firms (among them subsidiaries of multinationals) with less attention paid to medium-sized ones. Nevertheless, in our opinion, the changing role of logistics affects SMEs similarly.

This paper is the result of a survey conducted at St. Stephen University, consisting of over forty in-depth-interview questions, the purpose being to survey the logistics and supply chain “situation” in Hungary. Most of the 117 companies surveyed were mid-sized manufacturing, service and commercial firms. When possible, top managers/business owners, logistics managers or logistics employees were the respondents. . In addition, this survey sought information regarding “inter-company logistics”. Information such as: To what extent inventory optimization within the supply channel is achieved, what information relationships can be found between different members of the chain, and whether a member of the chain has an overview of the whole logistics chain.

Supply chain issues have come to the forefront in developed economies. As customers demand more complex solutions, competition exists less between products, and more between management of respective supply chains. In other words competition is not between independent companies, rather groups of companies supported by their suppliers, customers and logistics service providers.<sup>1</sup> In addition to price and quality, logistics-related services play an important role in the value of a product. In order to provide quick responses to customer needs, product availability has become a strong competitive factor throughout the chain. It will come more and more true that “Relationships are not only a way to acquire resources, but also a way to develop resources” (Schary - Skjott-Larsen, 2001, p. 73). This is increasingly true in Central and Eastern Europe as well; according to several existing surveys, logistics as an independent discipline has become more accepted among Hungarian companies since the political transformations.

The main goal of the survey was to obtain information regarding the supply chain management (SCM) situation in Hungary. A summary of the findings is below. The responses generally confirmed our hypotheses of a gap existing between best and current management practices.

## Breakdown of Data

### Characteristics of the Surveyed Companies and their Place within the Channel

A breakdown of the 117 surveyed companies by scope of business is shown in Table 1. Around half of the companies have their major activities in manufacturing. A quarter belongs to sales (wholesale and retail), and roughly another quarter belong to service- and logistics service providers.

TABLE 1: BREAKDOWN OF SURVEYED COMPANIES BY SCOPE OF BUSINESS

Manufacturing	34
Manufacturing & trade	26
Service provider	20
Trade (wholesale & retail)	18
Logistics service provider	9
Wholesale (pure)	5
Retail trade (pure)	4
No data	1
Total	117

Fig. 2 shows the distribution by industries. Although the sample has been not “ideal” nevertheless it represents all areas of importance at the current state of economic development.

FIG 2: BREAKDOWN OF THE SAMPLE BY INDUSTRY

The **transport intensity** and/or **inventory intensity** of the activity was of great importance to our analysis. 78% of the interviewed companies claim they are strongly or critically transport intensive. The majority of the companies carry over 500 articles, probably the result of product diversification generated by increasing customer demand.<sup>2</sup> Every respondent in the electronics industry carried over 500 articles, while the building and food industries carried the lowest numbers.<sup>3</sup>

Breaking down the proportion of **input/manufacturing/output** logistical activities, output logistics has the most important role. This is in accordance with international trends. Output (69%) is mentioned almost twice as

often as manufacturing (34%) or input (43%) logistics in the survey responses. The breakdown by scope of business also reveals output dominance everywhere outside the manufacturing sector. This means, among other things, that **typically the selling party** undertakes the logistics services.

#### Types of Operation of the Supply Chain (Push or Pull?)

**Pull-type operations** surveyed significantly higher than expected (69%). Hungarian and foreign literature describes the pull system as on the increase, and considers the transformation of push systems into pull systems as the primary task.<sup>4</sup> The number may even be low as the survey question referred to supply chains and not companies. Input-output inventory was analysed on a company-by-company basis. If the proportion of input inventories exceeded output inventories by more than 10%, it was assumed that the company produced for stock.

### Changes in Logistics Costs

Logistics costs have increased for 85% of the respondents, by an average of 48%. A decrease, seen in 15% of the cases, is 14% on average, so **there is an average increase of 39%** over the whole sample. As the period for this survey question was five years, this proportion is not extreme as it is just above the inflation rate. Table 2 shows the changes in logistics costs. Upon examination, two things are significant. First, a higher proportion of companies performing manufacturing and trade together show an increase of costs (100%) than those performing them separately; and second, the service sector shows extreme values both in increasing and decreasing costs.

TABLE 2: DEVELOPMENT OF LOGISTICS COSTS BY SCOPE OF BUSINESS

Logistics costs	Increased	Percentage	Decreased	Percentage
Trade	85%	21,66%	15%	10,25%
Manufacturing	73%	21,69%	27%	12,14%
Manufacturing and trade	<b>100%</b>	27,20%	0%	0,00%
Services	85%	<b>157,05%</b>	15%	28,33%
Logistics service providers	88%	27,42%	13%	10,00%

We are currently in the process of analysing this data.

### Use of Logistics Service Providers (LSPs) for the Different Activities

A general **willingness to outsource** is shown in Table 4. The table shows the activity least likely to be outsourced is warehousing (78.6% using no LSP's), while forwarding is outsourced most often.

TABLE 4: USE OF LOGISTICS SERVICE PROVIDERS

	Exclusively	Partly	Do not use any	NA (or no such activity)
Transportation	23,08%	11,97%	62,39%	2,56%
Warehousing	8,55%	8,55%	78,63%	4,27%
Forwarding	29,91%	5,98%	43,59%	20,51%

These are low rates compared to Austrian and German figures<sup>5</sup> requiring deeper analysis. We believe it can be partially explained by a lack of capacities of complex logistics service providers as well as past practices of the earlier command (planned) economy where shortages created an unreliable supply chain. We expect a large increase in the use of LSP's after EU accession.

### Performance Indicators of Logistics Activities

Indicators for comparison with a survey performed five years ago were asked<sup>6</sup>. The open-ended questions resulted in a wide range of answers. In addition to the verbal and pre-printed answers, a range of answers are grouped below in Table 5:

TABLE 5: FREQUENCY OF THE DIFFERENT TYPES OF PERFORMANCE INDICATORS

Order processing time	92
Monitoring of faulty orders	83
Other order filling indicators	31
Turnover	28
Time and motion monitoring	19
Examination of inventory	14
Cost analysis	10
Capacity utilization	6
Availability	6
Monitoring customer service levels	6
Wastage	4
Supplier Performance	2

The **indicators** vary widely. Many mentioned indicators, which are connected to time (e.g. inventory turnover time), as well as lead-times of different activities for comparison. Other indicators are connected to faulty order filling, typically concerning the type or reason for the fault.

In our questionnaire we focused on a special indicator, the inventory turnover time. With this we tried to measure the speed of the economy, similar to the way “The Economist’s ‘Big Mac’ Index” is used to measure currency valuation. The results were not totally in accordance with our expectations.

### Change of Inventory Turnover Time

Surprisingly, 38% of companies reported an **increase in inventory turnover time**. This may be due to either (a) input inventories still under the production/manufacturing director; or (b) output inventories still under the supervision of the sales director, who may accumulate a large inventory of finished goods in order to guarantee quick service or balance demand. A similar imbalance can be observed in the case of changes in order processing time. While ERP systems favourably influence the proportion of increase-decrease, increases in turnover time are significantly higher among companies having an ERP system<sup>7</sup>.

It is worth noting that the manufacturing sector has performed very well in both the reduction of inventory turnover time and order processing time. ERP system use is highest in this sector, which might provide an explanation. However, it remains to be explained why growth in both order processing time and inventory turnover time (seen at companies having ERP systems) is generally higher than companies with no ERP systems, while growth is very low in the case of the manufacturing sector. The reasons for this may be; (a) it is not only the use of ERP systems which is more intense in the manufacturing sector, but their use is more efficient, or; (b) during the introduction of ERP systems, in the case of inventory turnover, companies may have suddenly noticed the negative effects of backorders due to too low inventory levels. Alternately; (c) costs may have incurred due to too high customer service levels.

### Place of Logistics and Supply Chain within the Organization, Directions of Development

Nobody in the survey responded by saying “Logistics? We don’t have that”, even though the survey conducted five years ago had several examples of it. The position of logistics within organizations is shown in Fig 3.

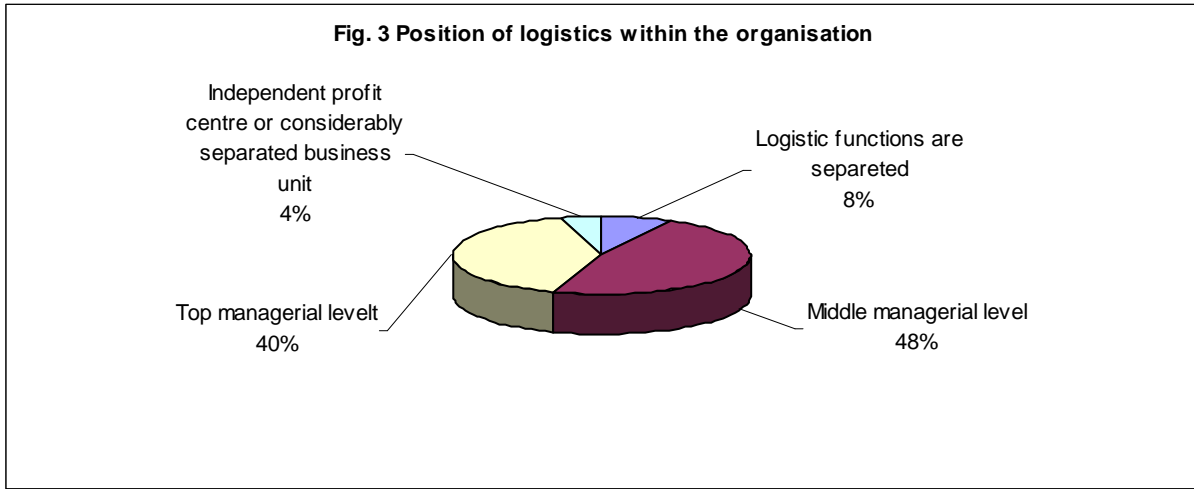

FIG. 3: POSITION OF LOGISTICS WITHIN THE ORZANIZATION

From the survey data, it appears that very few companies consider logistics functions as separate, isolated or uncoordinated activities. However, we think it preferable that more companies consider these functions at the top managerial level. The car industry, as in many other fields, has performed outstandingly in this area. The building industry - though a high proportion delegates logistics to the top managerial level - also lead in the isolated use of logistics functions. The worst situation can be observed in light industry, where only 20% perform logistics functions as separate activities, 80% at a mid-managerial level.

### Logistics Approaches

In this question we were eager to learn about using up-to-date management techniques in logistics. These techniques are not all thoroughly discussed in Hungarian logistics journals for practitioners yet. In the case of the four **logistics approaches** selected, respondents were not always fully aware of definitions of “VMI” (Vendor Managed Inventory) and/or “Postponement”. Fig 4 is below:

FIG. 4: USE OF LOGISTICS APPROACHES WITHIN THE SAMPLE

**LEGEND:** blue - yes, pink - no, white - planned. The figures show the number of companies responded.

Many of the respondents indicated the use of the JIT method, with a further ten percent planning to introduce it. However, this high number is questionable as only 28 of the 61 companies giving a “yes” answer had an ERP system and only 16 of them used EDI. We assume that if they did use a JIT system, they should have already had these tools. If any of their partners used a JIT system, communication should have been maintained through an EDI or an integrated system. A good example is the car industry where answers given to different questions fit consistently. The low number of answers given to “postponement” is surprising as its application has lower infrastructure requirements than JIT systems.

### Planned Logistics Developments

Multiple answers were possible on this question though respondents typically gave only one or two answers. Most of them considered;

- a.) the development of partner relationships, or **strategic alliances**, as most important (69%), followed by
- b.) the development of logistics information systems (55%), introducing modern logistics methods (40 %) and
- c.) the introduction of an ERP system (16%).

A 55% response for developing logistics information systems and 40% response in favour of introducing modern logistics methods we believe are very good proportions. They show that a considerable number of companies are paying attention to their logistics situation.

The proportion is 12% for logistics approaches, 25% for logistics information systems, and 19% for ERP. From these figures the question arises whether these companies have marked partner relationships because they feel themselves highly developed in other fields, or they do not feel the need to develop other fields. The latter is concluded for the following reasons:

- a) ownership of ERP is only 25% versus 43% in the whole sample in the case of companies making up a third of the sample,
- b) logistics functions are isolated in 14% of the cases, versus 8% in the sample, and
- c) 83% of them provide services only upon orders (versus 72% in the sample).

Consequently, it is an assumption from our side that companies who plan to improve only their partner relationships are less developed from a logistics point of view. A more intensive use of information networks and up-to-date logistics approaches play an important role in turning simple partner relationships into strategic alliances.

### General Use of ERP Systems

Regarding the **penetration rate of ERP systems**; the proportion within the sample is significantly higher than shown in the national statistics. Forty-three percent of the companies have ERP, 16% are planning its introduction.

The penetration of ERP systems is highest within the manufacturing sector (61%). Moreover, the difference compared to the proportion of second-placed logistics service providers is almost 38%. Service provider companies are the ones with the lowest ownership of complex company management systems, but this tendency may change in the future as 25% of the companies are planning to introduce such a system. ERP system use between different types of businesses are expected to grow wider, the manufacturing sector increasing its advantage over trade based on planned introductions.

The penetration of integrated company management systems is highest among the electronic industry (100%), as well as heavy industry (66%). The building industry and other categories need to be developed more intensively, their lack of penetration made worse by their low level of planned introductions. The **agricultural sector**, which has already been cited as a negative example, is also underrepresented in the field of ERP systems (the penetration of ERP systems is 0%, the proportion of planned introductions also 0%). With a penetration rate of 33%, both light industry and the computer industry are aiming for the most intensive development.

FIG. 5: SHOWS THE BREAKDOWN OF ERP SYSTEMS BY TYPE

The sample shows the dominance of SAP systems. MFG/PRO is the only system mentioned more than once, with its 5 industry-specific company management systems. Certainly, SAP also has industry specific systems, but they are not disclosed here. The proportion of own systems (22%) is not remarkably high and it would be interesting to know what proportion of no-name ERP systems are own developments.

### Connections within the Channels

The questionnaire had no box to signify communication via (postal) mail (Fig 6). However, in-depth interviews revealed many companies required written confirmation of customer orders.

FIG. 6: WAYS OF COMMUNICATION WITHIN SAMPLE

Communication via telephone and fax are most common, but e-mail and the Internet with 106 responses (96%) is also very high. EDI and on-line communication (with 22 and 21 answers) equalled expectations.

### Degree of Co-operation

72% of companies provide services for orders. Eight percent operate with common interfaces and 16% are connected to an integrated information system. We consider this proportion to be very low. The reasons being; a) over half of the companies have marked the use of JIT systems (in the case of own company or direct partners), though JIT systems assumes a very close strategic partner relationship, and; b) a high penetration of ERP systems would also make closer cooperation possible. Likely reasons for less close cooperation may be; a) historical - the desire in Hungarian companies to “go it alone” without partnering; b) lack of trust, perhaps more typical in the Hungarian economy than other developed economies, or; c) lower average age of the companies, strategic alliances typically being formed over many years. A comparison to similar surveys completed in other countries is being planned.

### The Dominant Member(s) in the Channel

In logistics literature, usually **OEM’s<sup>8</sup> or wholesalers are the dominant member** (which might be called the “system integrator” as well) of the supply chain. Ballou (1999) distinguishes among different types of channels: The dominant member in the channel – within members of the upstream channel it can be the OEM, within the members of the downstream channel it can be the wholesaler. The answers stated the situation in Hungary is similar to the European trend.

However, here we had some difficulties, because only 28% of the respondents gave an answer to this question. Interestingly, from the respondents the “business owners” did not typically know – or did not want to mention - the dominant member of the chain. The most answers came from the “logistics middle managers” and the “managing directors”. Apart from them, the lowest proportion of answers came from the “logistics managers” themselves. This was somewhat surprising. We should consider this for a moment:

There can be several possible explanations for this phenomenon: a) Development of the logistics-SCM strategy is performed mostly by parent companies of Hungarian subsidiaries of multinational companies; b) lack of a strategic approach by logistics managers. Hungarian companies that have by now secured a stable market position probably still handle logistics as a subsidiary activity. As a result, warehouse heads may have moved into logistics managerial positions, or; c) dealing with inventory may be a confidential activity, so in many cases a less skilled relative of the owner performs these tasks.

Based on the above we conclude that developing supply channel awareness will be a crucial task of Hungarian companies after EU accession.

## Summary of the Findings

Below are findings, which show in nutshell the logistical situation of mid-size Hungarian companies.

- **Logistics costs have mostly increased**, the rate of growth not significantly exceeding the inflation rate. The respondents mentioned **pull-type operations** to a considerably higher degree, though the survey of **inventory levels has not confirmed it** in all cases. Inventory levels are not adjusted to the system operations in all cases.
- The **dominant member** can be a **manufacturer** (e.g. car industry), or a **wholesaler/trader**. The former is typical of production chains, the latter of sales chains (e.g. FMCG sector).
- The use of logistics service providers differs mainly by industry; the scope of business not being as significant. The use of LSPs differ in fields of different logistics activities. Nearly **50%** of companies have no **connection to a logistics service provider**.
- **Turnover time has increased significantly**, the difference between industries and scopes of business being more significant than expected.
- In most cases **logistics functions are done on a mid-managerial level**. Few examples of separate management of logistics functions were found.
- A considerable shortage of **logistics approaches** can be seen compared to more developed economies. Some of the respondents presumably do not have accurate information about the exact definition and contents of different approaches.
- **Planned logistics developments** have shifted towards approaches, which, in the respondent's calculations, do not involve considerable costs.
- The **penetration of ERP systems is relatively high** leading to the conclusion that Hungary is over the first big ERP wave, the life cycle of this product having passed its peak.
- The use of **ERP systems does not necessarily result in positive changes** in indicators. Rather, it helps system optimization through a higher-level planned information processing method. The **influence of the German economy** can also be seen on the use of ERP systems as well.
- **Strategic partnerships do not constitute a considerable proportion** of co-operation at present. The process has started, though behind the level expected.

## Conclusions

Supply chain management in Hungary can currently be divided into two levels; classic logistic systems and advanced supply chain management. Classic logistics systems, which aim to minimise costs and maximise customer service levels, are gaining in importance in Hungarian companies, mainly through exposure to multinational organizations as well as modern supply chain software and methods. Much work needs to be done to upgrade systems and educate professionals, particularly Managing Directors, of the importance of supply chain management. As more products reach the marketplace and consumers become more quality and service conscious, SCM will become an ever more important component of branding a product.

The next and more challenging level will be that of integrating supply chains between companies; e.g. between manufacturing, distribution and retail outlets. This will by necessity include proprietary data being shared within companies inside the supply chain, including more information sharing, which may create some resistance from traditional Hungarian companies. While multinational companies have a considerable lead on development and maintenance of such systems, Hungarian mid-size companies have yet to realize the critical nature of such a strategy. This is in part an education process. It will be increasingly important to stress to Hungarian managers and directors the importance of strategic partnerships in distribution. If company executives fail to realize not only the advantages, but the necessity of such partnerships, they will find themselves at a considerable disadvantage when markets open following EU accession in May 2004. At that time companies may find themselves not only lagging behind but short of options for suitable supply chain partnerships.

We agree with Schary & Skjott-Larsen (2001), that competition in the future will be less between “product vs. product”, but more between “supply chain vs. supply chain”. As more products reach the marketplace, service and distribution become ever more critical to a product’s success. While some Hungarian companies are well on their way in the development of both classic logistics systems and even integrated systems, others have yet to even see the importance of such systems. Companies who fail to familiarize themselves with modern integrated supply chain systems do so at their peril.

Finally, a macro-logistics phenomena outside of the scope of this survey should be mentioned. While Hungary’s accession to the EU means considerable challenges, it also presents great opportunities. After accession, Hungary will be at the eastern (Schengen) border of the EU. Because duties paid by non-EU member companies remain in the very EU-member country that collects it, an excellent opportunity exists to create freight villages for trade flowing from both the East and the Southeast. This is a one-time opportunity for Hungary (and other Central-Eastern countries as well). Failure to take advantage of this opportunity would be a loss for the Hungarian economy.

# **A Conceptual Framework of Factors Affecting Collaborative Supply Chain Management for Agricultural Produce between Thailand and China**

*Jongkol Saengadsapaviriya, Jongkol\_s@yahoo.com  
Maejo University, Thailand  
Chamnong Jungthirapanich  
Assumption University, Thailand*

## **Abstract**

China and ASEAN countries established ASEAN – CHINA Free Trade Agreement in December 2002. After that Thailand and China established an agreement on accelerated tariff elimination under the early harvest program of the framework on comprehensive agreement in June 2003 in Beijing. And then, the two countries started an FTA program on all vegetable and fruit products on October 1, 2003. The main objectives of this studying are to present the literature reviews of fresh fruits export process, especially the current longan export of Thailand to China, and to propose the conceptual framework of factors affecting collaborative supply chain management of agricultural produce. From the report of Department of Trade Negotiation of Thailand on the international trade between Thailand and China, we found that Thailand has a surplus trade volume to China in agricultural produce from 2004 to 2006. It is increasing every year during 2004 to 2006 (38.5%, 44.14%, and 49.6%).

## **Introduction**

The world economy is gradually becoming globalized, fueled by the World Trade Organization's support on the establishment of free trade areas. As a consequence, numerous trade sanctions and constraints in taxes have been deregulated. The change of business environment affects business processes in various dimensions. This necessitates firms to adjust their business processes appropriately to the altered environment, for example, outsourcing of production, outsourcing of distribution, and transformation to high value-added economy. Collaborative alliance among businesses, such as collaborative supply chain management, represents an increasingly-important and favorable alternative for all affected by globalization.

China possesses a mega-scale market. Many countries, including Thailand, are interested in expanding their trade volumes with this country. In 2003, Thailand and China established agreements on accelerated tariff elimination in accordance with the framework on comprehensive economic cooperation. There are two main agreements as follows:

- (1) The parties shall eliminate tariffs on all vegetable and fruit produce as soon as possible, *and in any case, no later 1 October 2003.*
- (2) The parties shall apply the rules of the origin and establish a close cooperative mechanism between the concerned authorities responsible for customs administration and supervision.

As necessitated by this bilateral agreements, China and Thailand need to comply with the mutual agreements. Numerous questions on who gains or loses, what industries are favorably or adversely affected from the agreements arise. A study on collaborative supply chain management is thus conceived to shed lights on how the two nations may promote trade and collaboration in both public and private sectors. Research findings may bring about knowledge for improving the collaborative supply chain management of agricultural produce between the two countries under the FTA framework.

## **Objectives of Research**

This paper is aimed at fulfilling the following:

- 2.1 To investigate the current states situation of China and Thailand Free Trade Agreements on agricultural and fruit produce from 2003 to 2006.
- 2.2 To identify factors influencing a successful collaborative supply chain management and the conceptual model of collaborative supply chain management between Thailand and China on agricultural produce according to FTA.

## Scope of Research

The research focuses on longan, which is a kind of tropical fruits popular among Chinese consumers. It also ranks the highest in trade volumes among all agricultural produce between China and Thailand. The research is applicable to trade transactions, when FTA was reached between both countries in October 2004. Analyses were conducted on data collected between 2003 and 2006. The area scope covers northern and central provinces in Thailand and the provinces of Kunming, Guangzhou, and Hong Kong in China.

## Literature Review

### General Statistical of Trade Between Thailand and China after FTA

TABLE 1 STATISTICAL TRADE OF AGRICULTURAL PRODUCE BETWEEN THAILAND AND CHINA DURING 2004-2006 : UNIT (BAHT)

	2004	2005	2006	Change (%)	
				2005	2006
Export	13,792.31	18,203.73	22,115.67	32.25	21.30
Import	6,126.31	7,053.81	8,643.25	15.13	22.53
Trade Balance	7,666.00	11,149.92	13,472.42	45.94	20.54
Total Trade	19,910.62	25,257.54	30,758.92	26.85	21.78
(%)Trade balance /Total Trade	38.50	44.14	43.80		

Source : Information and Communication Technology center of Ministry of Commerce Thailand with cooperation of the customs department

The statistics from table 1 show that total trade of agricultural produce after FTA increase every year, it is 26.98 %,21.65 %. Next, Thailand has over trade balance to China during 2004 to 2006 , it is 38.50%,44.14%, and 43.80% respectively.

### Longans Trade Volume between China and Thailand

Statistics of international trade between Thailand to China shows an increasing trend on agricultural produce from 2004 to 2006. The report reveals high, however declining, volume of fresh longan export from 2004 to 2006. The percentages change is 288.5% and 30.4% in 2004 and 2005, respectively. The volume became negative in 2006 at -18.5%. The export of dried longans is steadily decreasing from 2003 to 2006 at -3.5%, -18.3%, and -32.9%, respectively. See Tables 2 and 3.

TABLE 2: EXPORT SALES VOLUME OF FRESH LONGANS TO CHINA

Year	Export Volume		Change ( %)	
	Quantity (Kilograms)	Value (Bahts)	Quantity	Value
2003	12,722,460	225,968,425	0	0
2004	49,426,953	803,964,791	288.5	255.8
2005	64,431,853	1,026,624,225	30.4	27.7
2006	52,522,863	925,372,873	-18.5	-9.9

TABLE 2: EXPORT SALES VOLUME OF DRIED LONGANS TO CHINA

Year	Export Volume		Change ( %)	
	Quantity (Kilograms)	Value (Bahts)	Quantity	Value
2003	56,787,976	2,268,973,098	0	0
2004	54,786,866	1,031,716,841	-3.5	-54.5
2005	44,764,049	1,000,939,145	-18.3	-3.0
2006	30,051,073	440,226,392	-32.9	-56.0

#### **Demand Chain of Export Fresh Fruits from Thailand**

Fresh fruits export from Thailand to other countries has shown a declining trend in recent years. Nevertheless, longans, durians, and mangosteens showed high export potential due to large export volumes and strong competitive positions in destination markets. Among them, longans top the export both in value (1,698 M bahts) and volume (81,924 tons)

The demand chain of the export fruits from growers to customers is described in five dimensions, including lead time, physical flow, information flow, shrinkage, and systems/ technology. Lead times from growers to packers, packers to distributors, and distributors to retailers were 3, 3, and 10 days, respectively. This results in the total lead time of 16 days from growers to retailers. The minimum lead time on shelf life of longans is 21 days, while the maximum is 35 days .

Typical threats imposed on exporters include high reliance on wet markets (local markets), growing power of supermarkets, a relatively low awareness of Thai fruits among Chinese importers and consumers, and liquidity of importers. An advantage from FTA is the reduction in import taxes, but there are still limited import licenses.

Consignment is commonly used between Chinese importers and Thai exporters to bring in Thai fruits into China for sale to other wholesalers in all key cities. Importers pay exporters after selling off the consignment. Apart from consignment, fixed-price contracts may also be adopted. Typical payment terms between Chinese importers and exporters are full sum payment in USD before shipments can be arranged.

Wholesalers play a major role in buying fruits from importers and distributing them further to retailers. The fruits demand chain in China is complex with multiple tiers of entities present. There is little integration in the supply chain. Each entity will focus on its core competency and outsource the rest of the operations to commercial transport providers.

The transportation industry in China is very fragmented. Most transport companies have competitive advantages only within certain geography. A large percentage of imported fruits come via Hong Kong. They are subsequently transported to Guangzhou, Beijing and Shanghai. Lead times from Guangzhou to Beijing and from Guangzhou to Shanghai are 4 and 3 days by highway transportation, respectively.

#### **Lastly, they propose the future state envisioning in two points:**

**Driver 1 : Supply Chain Integration** , Strong supply chain integration leads to achievement of the following strategic objectives:

- *Improving Demand-Supply Synchronization and Effective Customer Response* through the vertical integration of supply-side and demand-side partners as well as collaborative forecasting, planning and order management.

- *Increase Asset Utilization, Economics of scale & scope* by capturing synergies and optimizing resources through horizontal integration of growers and exporters at the Post Harvesting Centers and strategic sourcing of transportation services.

**Driver 2 : Quality assurance and demand chain practices**, Adoption of customer-linked quality assurance and demand chain practices lead to achievement of the following strategic objectives:

- *Minimize Shrinkage and Shorten Lead time* Through the adoption of GAP-based pre-and post-harvesting practices and technology and streamline Post harvesting operations.
- *Assure Consistent Quality and Enhance Customer Value* through customer-linked Quality Assurance accredited by international certifying bodies as well as effective plantation design.

### Current Longan Export System

The longan plantation area around Thailand, the northern area is the main area , it was 828,529 rai, and yield area was 579,627 rai, . Eastern area, in Chantraburee, it was 55,041 rai, and yield area was 32,159 rai. (Statistics in 2003:from Department of Academic, Ministry of Agricultural and Cooperative).

Next, there are many parties which involve the current export longan system (Fresh and Dried) such as government , private section. It is shown in table 4.

Tables 4 ACTIVITIES AND STAKEHOLDER OF FRESH AND DRIED LONGAN FOR EXPORTING TO CHINA

Activities	Thailand			China	
	Preparing GAP, GMP in Thailand	Pre and Post harvesting Period	Auditing for Pesticide , Phytosanitary and Transportation	Register the plan quarantine permit at AQSIQ	CIQ checking , Transportation
<b>Stakeholder</b>					
Growers	0	0			
Consolidators	0	0			
Chemical and Fertilizer Shop	0	0			
Exporters		0	0	0	0
Government' service units	0	0	0		
Logistic Providers			0		
Custom , AQSIQ				0	0
Importers				0	0
Wholesaler					0
Logistic Providers					0
Retailers				0	0

From Table 4 we found that there are four sections of stakeholders in Supply Chain of Longan , and we conclude in each sections below :

Production section : Growers, Consolidators, Packers  
 Marketing section : Consolidators, Wholesalers, Exporters  
 Transportation section : Logistic Providers , Department of Custom unit, Exporters  
 Abroad section : Exporters, Importers, Department of Custom , Wholesaler & Retailer

**Standardization of Export Longan**

Ministry of Agricultural and Cooperative is the host unit for distribution the knowledge and regulation of GAP, GMP to growers, consolidators , and exporters in 14 provinces in northern area. In 2006, the number of registration for longan ‘ growers are 90,115 persons, plantation area is 595,675.26 rai ,and the longan production is 596,502.10 tons during July to August (in season) ,and out season during January to February (active weight by potassium chlorate).

In 2005, Office of Agricultural Research and Development Region 1 set up the GAP promotion project to growers in Chiang Mai and Lamphun approximated 66,021 cases, plant area 85,637 units. The growers will received the know ledges and training program for plantation process, and post harvest. After that, during the collecting periods and transport to market, the products have to be sampling checked quality of products only 10 % of volume, and free of charge. On the other hand, the non GAP members have to be sampling checked 100% of volume, show in Fig 4.

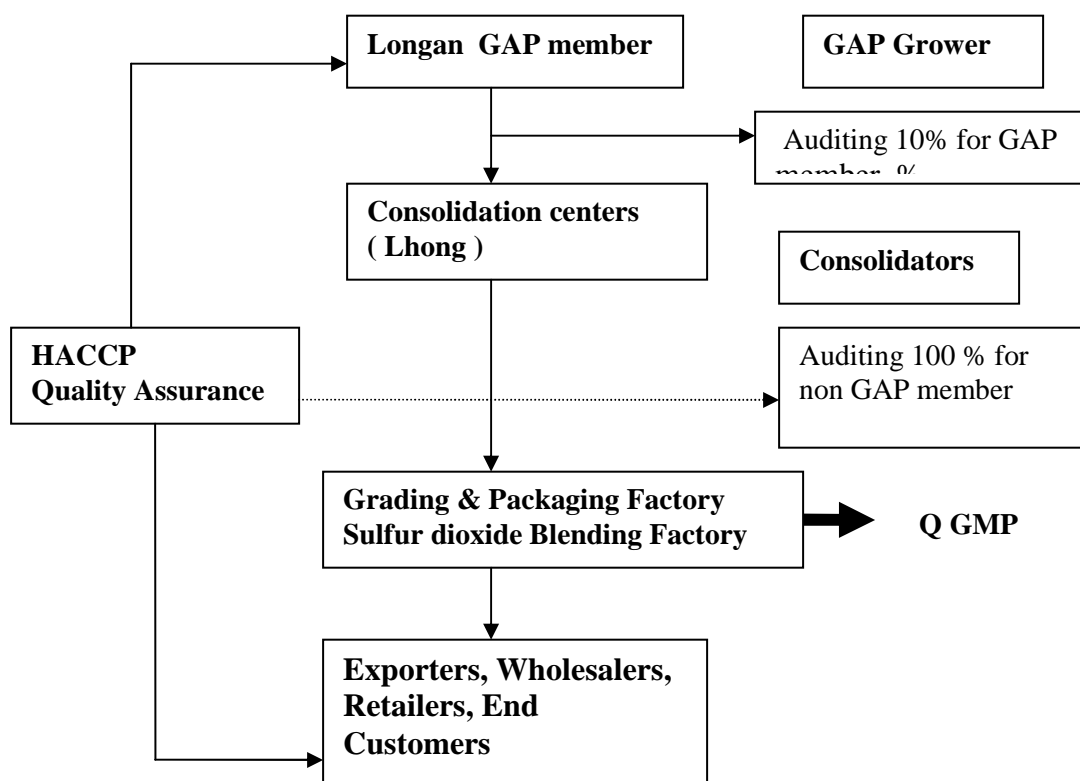

Fig 4. FLOW CHART OF PLANT QUALITY ASSURANCE  
 Source: Auditing and Quality assurance system for exporting longan  
 Office of Agricultural Research and Development Region 1

### Quality Longan Production System

Thai government has announced the Food Safety Project in 2004. The project cover food and plant in four areas such as raw material and production factors, production farming, factoring, and agricultural produces.

Fresh and Dried Longan is the economic plant which high value market, it is 5,000 Million Baht per year. In the last five year during 1999-2003, the export proportion of longan extended from 50 % to 80%. China Singapore and Canada is important export market. In 2004, There are longan produces 565,062 tons, it serve to domestic market 18.7%, export market 81.3 %. For export market, it was dried longan 72.7 %,fresh longan 25.1% , caned longan 1.9%, and free zed longan 0.3% respectively. The statistics was shown in Table 5

Table 5 CONSUMTION OF LONGAN PRODUCE IN 2004

Production Types	Volume(ton)	Fresh Longan (ton)	%
Total	565,062	565,062	100
Domestic consumption	105,605	105,605	18.7
Export consumption	459,457	459,457	81.3
<b>- Dried Longan</b>	<b>71,562</b>	<b>333,953</b>	<b>72.7</b>
- Fresh Longan	115,480	115,480	25.1
- Caned Longan	11,321	8,608	1.9
- Free zed Longan	708	1,416	0.3

Source : Northern Economic Development and Social Office

- Note :
1. fresh longan per dried longan all units proportion equal 10:3
  2. fresh longan per dried longan only flesh units proportion equal 10:1
  3. fresh longan all unit per flesh unit proportion equal 2:1
  4. proportion of dried longan all unit per dried longan only flesh unit equal 2:1

As a results, Ministry of Agricultural and Cooperative has the process direction for quality longan management system in two parts :

- (1) The quality production longan process has operated in three points.
  - Auditing and Certification Longan produces under Good Agricultural Practice (GAP) regulation
  - Auditing the chemical and pesticide products shops
  - Certificated the consolidator factory and sulfur dioxide blending factory under Good Manufacturing Practice (GMP) regulation
- (2) The certificate quality of longan for export process has operated in two points.
  - Phyto-sanitary certified process
  - Sulfur dioxide auditing and certified process

Conclusion, There are two main stages of the export longan to China

*First stage in Thailand*, it has three steps:

- (1) The exporters have to register at One Stop Service Centre at Department of Academic for longan exporting list.
- (2) The export longan produces have to be GAP, GMP certification
- (3) Passed and Approved Certificate of Pesticide Residues and Application for Phyto-sanitary Certificate by Department of Academic

*Second stage in China* , there is two main stages:

- (1) To apply the Plan Quarantine Permit at AQSIQ unit which located at sea port city such as Guangzhou , after that CIQ unit will audit five documents : Phyto-sanitary Certificate, Certificate of Pesticide Residues, Certificate of Origin, Invoice, and B/C application

- (2) CIQ will check volume and quality of products by sampling check, waiting the result from laboratory 1-4 days, but it takes time only one day in normal case. If it does not approve, it may be rechecked again or destroy pass, it depend on the regulation of each city.

### **Supply Chain Management and Collaborative Supply Chain Concepts**

Supply Chain Management (SCM) has been a major component of competitive strategy to enhance organizational productivity and profitability( A. Gunasekaran et al, 2004). Jame R Stock Douglas M. Lambert (2001) describe the meaning of SCM is the integration of key business processes from end user though suppliers that provides products, services, and information that add value for customers and other stakeholders. Next, SCM aims to increase sales, reduce costs and make full use of assets by streamlining the interaction and communication of all participants along the supply chain . And SCM solutions use networking technology to link suppliers, distributors, and business (Sarika Kulkarni and Ashok Sharma, 2005).

Supply Chain collaboration facilitate the cooperation of participating members along the supply chain to improve performance (Togar M et al,2005;Bowersox,1990). Micael Dell, and CEO of Dell Computer and Industry Week's CEO of the Year for 1998 declare " Collaboration is the new imperative". Collaborative and alliance relationships for the procurement of noncommodity items and services tend to result in the lower total costs than do transactional relationships for several reasons. Then, Stanley and Person found the three most important factors in a successful buyer-supplier relationship are (1) two-way communication, (2) the supplier's responsiveness to supply management's needs, and (3) clear product specification. Both collaborative and alliance relationships require a quality of management not common in the 1990s.(David N . Burt et al.2004)

Collaborative Supply Chain (CSC) has purposed to gain competitive advantage ,by improving overall performance through taking a holistic perspective of the supply chain. The model of CSC has six constituents: *stakeholders, processes, business strategy, enabling technology, level of collaboration, technology*. The four core supply chain processes are *plan, source, make, deliver* , their performance influences the performance of the whole collaborative supply chain. And each of the four core processes is influenced by the changes in the other constituents as well. For example better collaboration may improve information visibility and effect the core processes. Then, collaborative supply chain performance will depend on the nature of the specific CSC by selecting variables which affect in any of the six constituents such as cost, capacity utilization, customer demand customer satisfaction, time to market etc.(Berhard J. Angerhofer al et, 2005). Moreover, Ponchai(2002) find that Information technology(IT) , information sharing and trust are positive related to effective collaboration.

In addition, there are two main factors which affect to CSC, it is trust and communication. Trust is the degree to which partners perceive each other as credible and benevolent and is expected to have a positive effect on the degree of collaboration in supply chain relationships( Niklas Myhr et al.,2005;Doney and Cannon,1997;Ganesan,1994;Kumar et al.,1995). Communication between partners help boost mutual understand and trust. So , The excellent communication quality and frequent communication help improve mutual understanding , and also increase trust.And then affect to Cooperative supply chain relationships. (Yin-Pin Yeh,2005; Kumar,1996).

Finally, we present a potential conceptual framework for collaborative supply chain performance measurement by developing from the previously conceptual framework in Fig 2 and purposed conceptual framework in Fig 3.

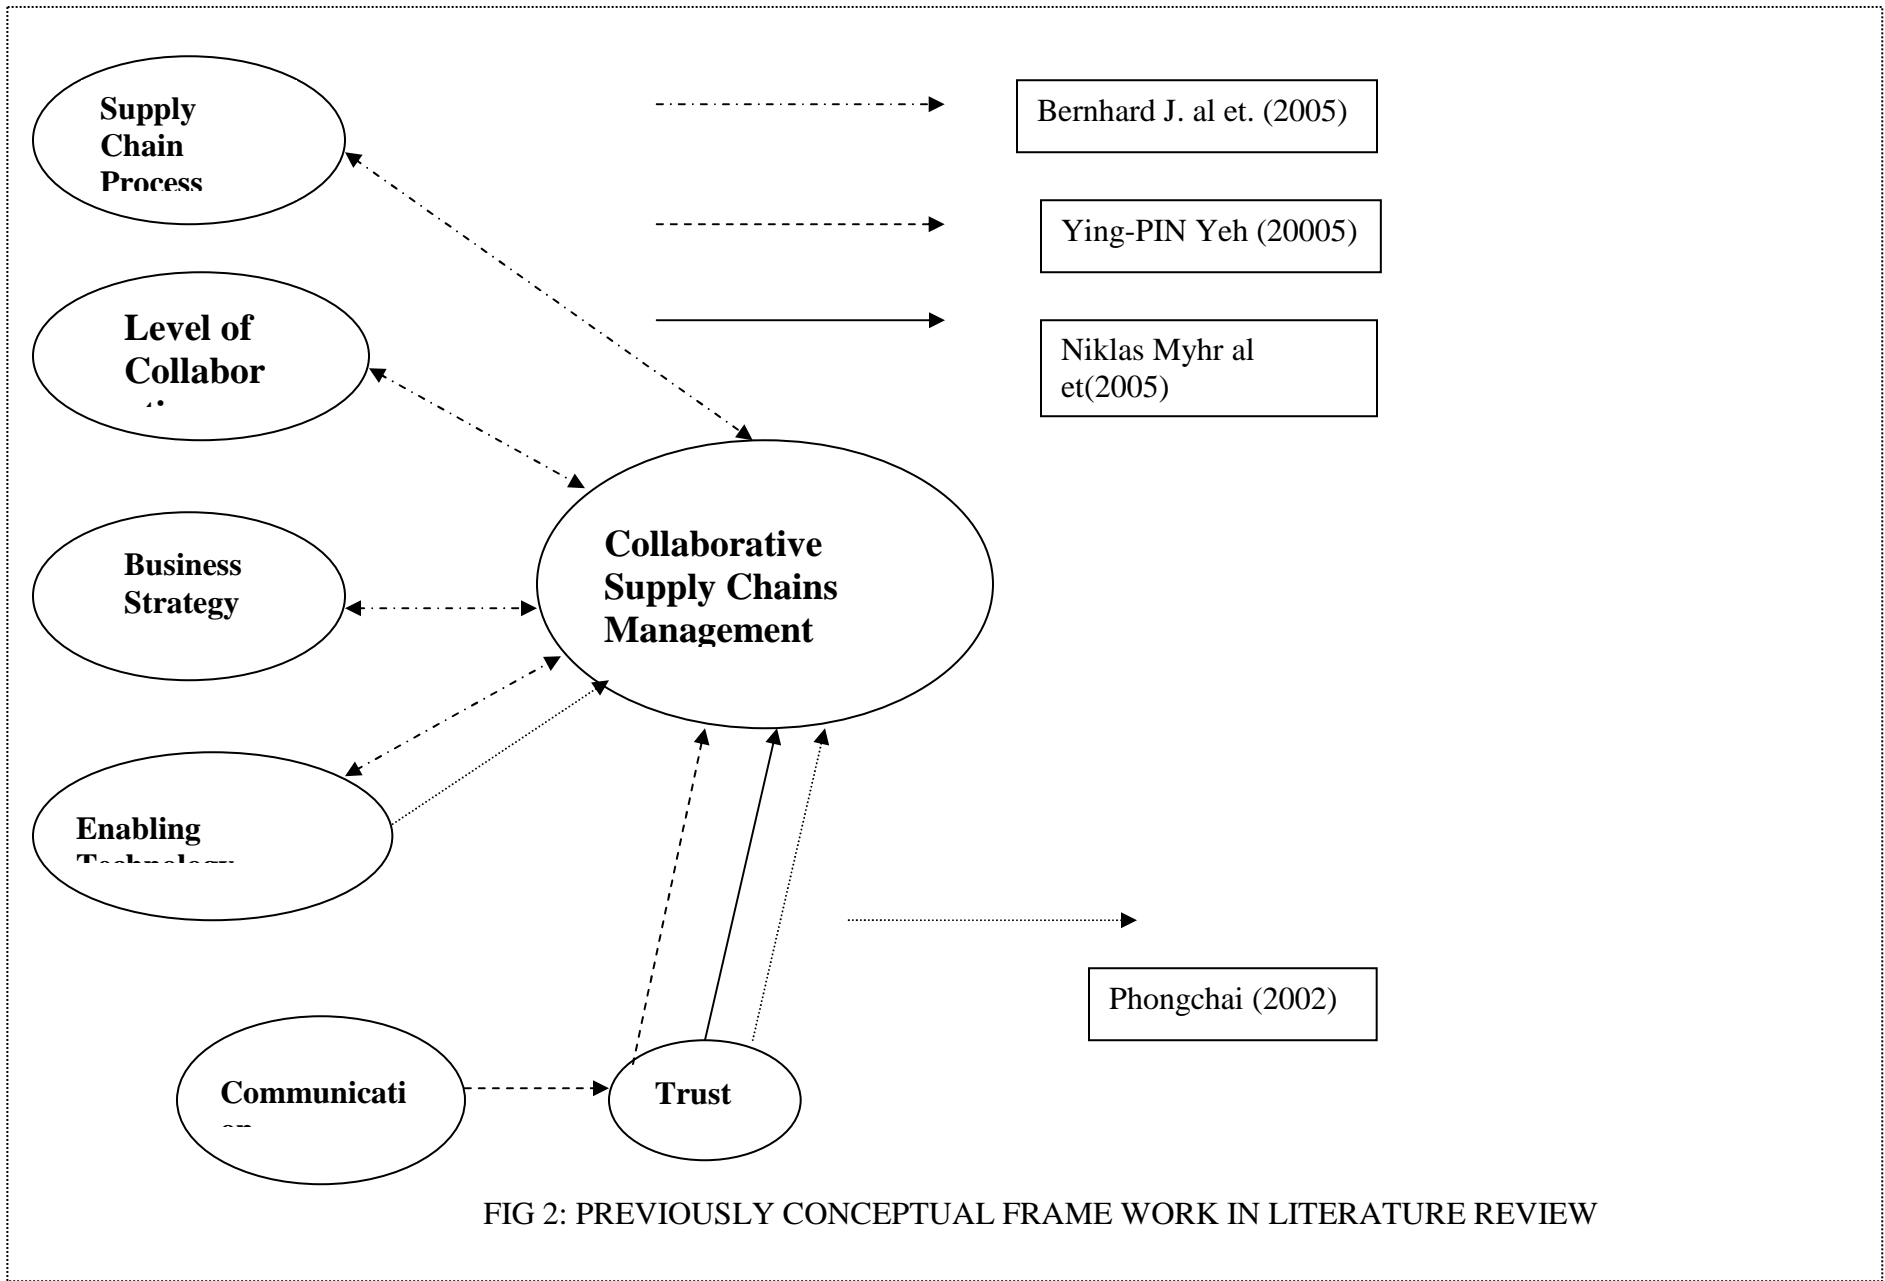

FIG 2: PREVIOUSLY CONCEPTUAL FRAME WORK IN LITERATURE REVIEW

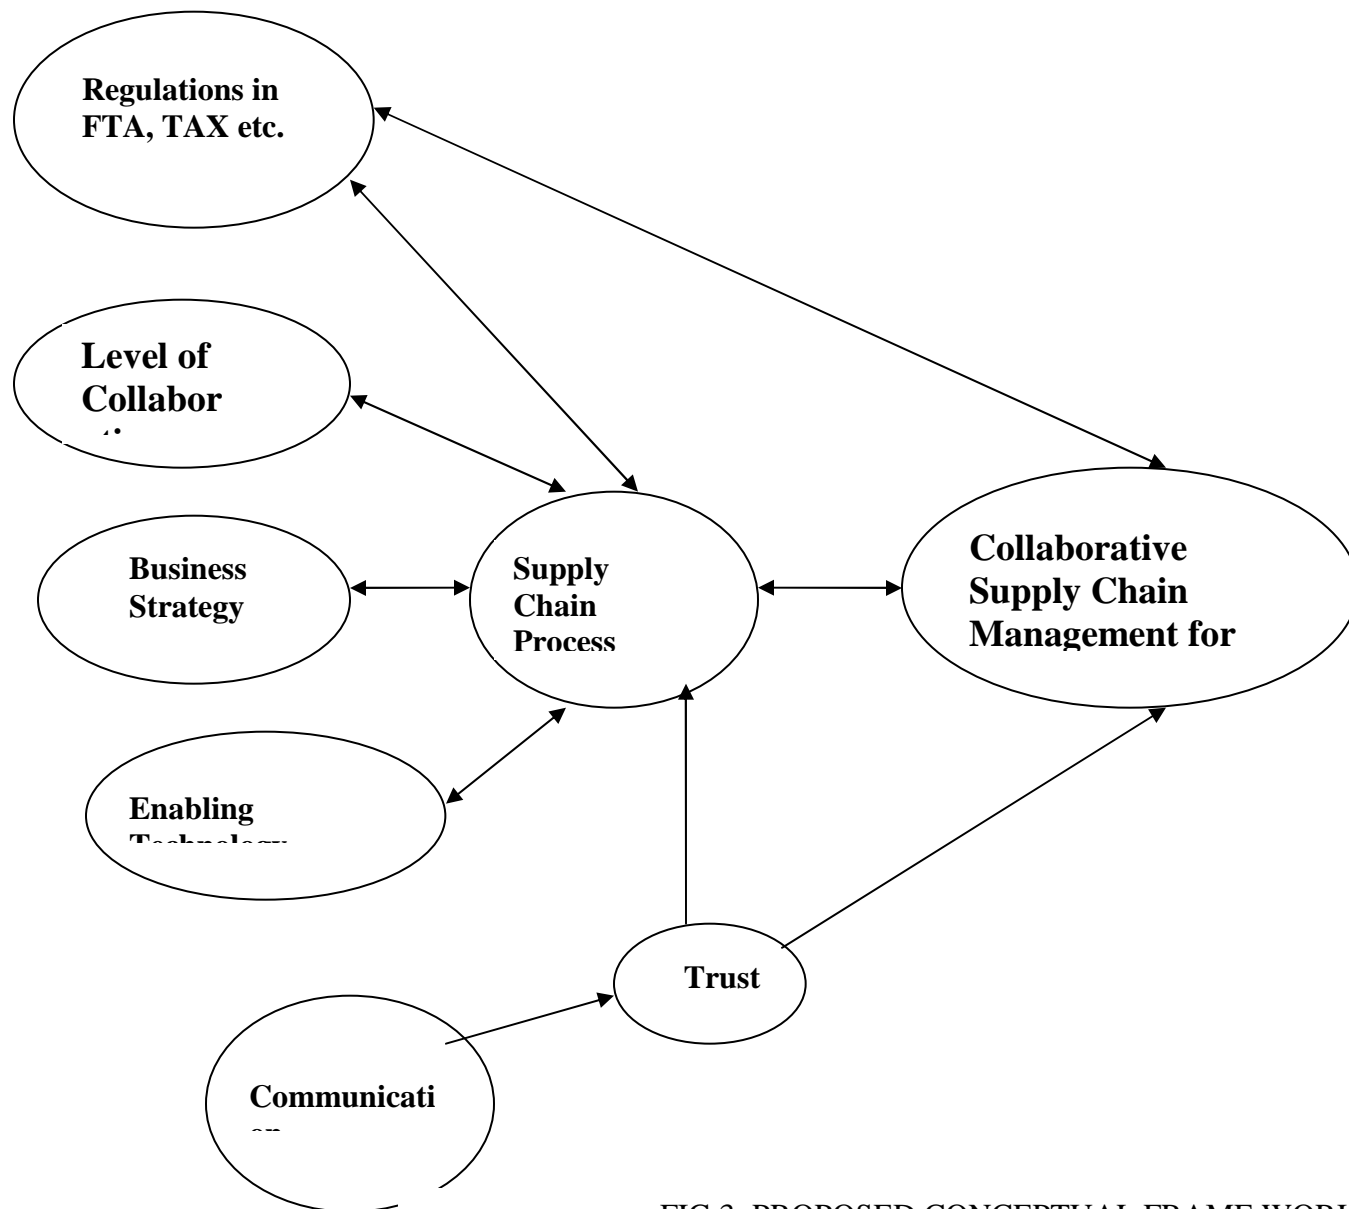

FIG 3: PROPOSED CONCEPTUAL FRAME WORK

### **Research Methodology in the future**

From literature review above , we follow the objectives of research by working on process below :

- (1) Define the target of study and searching secondary data of exporter database from private sectors, and government sectors likewise.
- (2) To analyze secondary data and set up the process flow analysis and build a model collaborative supply chain (CSC) and derive the suitable performance indicator for measurement.
- (3) Auditing the model of CSC and performance indicators with academic experts and field experts for approving the suitable model and then pretest by pilot study.
- (4) Collecting data by questionnaire survey , interview personnel from stakeholder
- (5) Analyze data and Testing model by *Structural Equation Model (SEM)*
- (6) Validation test the CSC model, conclusion, implication and reporting.

### **Expected results**

We hope that the results of study will bring the high benefits conducive for two countries in three points:

- (1) A strategy to make the collaborative supply chain work for expansion of export market and decrease the problems in each process. And also, this strategy is applicable to other products under FTA module.
- (2) To upgrade the standardization of agricultural produces of Thailand and China for competition in the world class agricultural business, such as, USA or European countries in the future.
- (3) The government organization such as Ministry of Agriculture and Cooperatives , Ministry of Commerce, Ministry of Industry, Ministry of Education, and Ministry of Transportation, etc. will use the results of studied for set up the cooperate plan , and strategy for development countries simultaneously.

### **Conclusion**

From the general information of FTA situation above, in the review literature part 4.1 to 4.4 , we find that Thailand and China have expanded the trade volume every year, approximately 20% per year . Although there are not any tariff barriers, there are still other barriers such as marketing system, transportation system, auditing product system , payment system etc. However, Thai government announced a food safety policy in 2004 , especially the food for export product. Therefore, the stakeholders of agricultural produce exporting in Thailand are interested to follow the GAP , GMP and HACCP programs . As a result, the current longan export of Thailand is qualified product for international markets , and it makes importers in China more confident. But, Thailand has to consider the cooperate plan for all stakeholder in Thailand and China by selecting optimal exporting plan and business strategy for exporting longan because longan's yield are over supply in domestic markets , 80% of longan's yield per year are export product, and China is the biggest international market. In addition, the study of demand chain of fresh fruits export from Thailand suggests the future state for development of fresh fruits export system for competition in global market in two points : supply chain integration method, and quality assurance and demand chain practices. Therefore, the supply chain technique should be applied to fit developing export systems. We find that the collaborative supply chain concept is a new business strategy in 2000s , and there are many factors which affect collaborative supply chain . In addition, from the review literatures of supply chain management practices only business sectors such as retail hyper market, and E-commerce. Therefore, we should study how to apply the technique in agricultural produce , especially the international trade under the FTA condition. We expect that the results of this study will highly benefit all stakeholders of Thailand and China, and also other countries which are in the process of similar FTA program.

# Supply Chain Collaboration in a Vendor Managed Inventory Environment

*Booi Hon Kam, booi.kam@rmit.edu.au*  
*Ramaswami Sridharan*  
*RMIT University*  
*Paul Yang*  
*Integrated Logistics Berhad*

## Abstract

Simatupang and Sridharan (2005) contend that a collaborative supply chain requires a reciprocal approach to capture five interacting features: a collaborative performance system, information sharing, decision synchronization, incentive alignment, and integrated supply chain processes. They argue that chain members need to educate each other about their needs in the joint development of a mutually beneficial collaborative process. This paper furthers that thesis by asserting that the extent to which the reciprocal approach could effectively contribute to heightening the interactions of the five key features is, in turn, dependent on the power regime in the supply chain. It will demonstrate how a reciprocal approach could be facilitated in practice in a Vendor Managed Inventory (VMI) environment by citing the case of PCM, a computer manufacturer, which utilized the services of a third party logistics service provider to successfully manage its VMI operations.

## Introduction

Vendor managed inventory (VMI) is one of many forms of strategic supply chain collaboration. Its main benefits can be generalized into reduced inventory costs and improved customer services (Yao et al., 2005). Though it has been demonstrated that VMI is beneficial for both the buying and selling parties (Dong and Xu, 2001), there are limitations to this form of supply chain collaboration. One of the most common concerns is the uneven distribution of the beneficial spin-offs resulting from inventory reduction among buyers and suppliers (Yao et al. 2000). There is also the risk that the total supply chain cost is never reduced, as the powerful buyers could have pushed the cost to the upstream parties. Dong and Xu (2001) reaffirm this risk, stating categorically that there must be lower overall inventory levels before the benefits of VMI could be dispersed to all parties involved in the arrangement.

Power plays and opportunistic behavior emerge in situations where either suppliers participate out of lack of choice, putting the VMI sponsor in a position of power in the relationship (Kumar, 1996), or material shortages occur, giving suppliers little incentive to participate in a VMI system (Wright, 2002). The former is especially prevalent in a depressed economy when demand is low and supply runs high. The latter is typically the case in a burgeoning economy. Other things being equal, the buyer or manufacturer, through its dominant position, would usually be the sole beneficiary in the short term, and all other parties involved would bear the costs (Dong and Xu, 2001).

A supply chain in which the benefits are not “equitably” distributed cannot be sustained in the long term. To ensure that a VMI arrangement could be sustained sufficiently long to disseminate its benefits to all parties involved, suppliers must be given the necessary inducement to entice them to participate in a VMI program regardless of economic outlook. Yao et al. (2005) note that in some operations extra or additional side incentives are dispensed to appease the suppliers and to garner their cooperation. In addition, some suppliers are also allowed or encouraged to leverage their inventory positions at the VMI hub to explore alternative benefits.

The limitations of a VMI program are not insurmountable. They can be mitigated if the factors underpinning supply chain collaborations are understood. For instance, suppliers do stand to benefit from a VMI program if their original holding costs are high. Because VMI requires the participation of external parties, the key challenge is to ensure that all parties derive benefits from this arrangement. The key issue is whether the VMI program sponsor has the

tenacity and the will to implement all the processes and changes necessary to bring benefits to all parties of the supply chain at the outset.

Simatupang and Sridharan (2005) contend that a collaborative supply chain requires a reciprocal approach to capture five interacting features of collaboration: collaborative performance system, information sharing, decision synchronization, incentive alignment, and integrated supply chain processes. They argue that chain members need to engage each other in a dialogue about these key collaborative features and to educate each other about their needs in the joint development of a mutually beneficial collaborative process. This paper furthers that thesis by asserting that the extent to which the reciprocal approach could effectively contribute to heightening the interactions of the five key features is, in turn, dependent on the power regime in the supply chain. It will demonstrate how a reciprocal approach could be facilitated in practice in a VMI environment by citing the case of PCM<sup>1</sup> a computer manufacturer, which utilized the services of a third party logistics service provider (3PL) to successfully manage its VMI operations.

The next section will discuss the five key features of supply chain collaboration based on the framework of Simatupang and Sridharan (2005) and why the reciprocal approach needs to be juxtaposed in the context of the supply chain power regime. This will be followed by the presentation of PCM's VMI program drawn from Yang (2006). The paper will conclude by examining the implications of supply chain collaboration in a VMI environment.

#### **Collaboration and Power Regimes in Supply Chain Operations**

Collaboration has been hailed as the driving force of effective supply chain management (Horvath, 2001). Barratt (2004) notes that supply chain collaboration can be divided into two main categories: vertical and horizontal. The former refers to collaboration with suppliers, between different internal divisions of the organization (across functions), and with customers. The latter signifies collaboration with competitors, between internal organizational divisions, and with non-competitors. Simatupang et al., (2002) provides an even simpler viewpoint, suggesting that supply chain collaboration means two or more chain members working together to accomplish some specific tasks. Since supply chain activities involve the participation of multiple parties, all supply chain operations, in a sense, would require some forms of collaboration.

The basic premise of supply chain collaboration is that chain members could effectively fulfill customer demand at less cost (Simatupang and Sridharan, 2002). To ensure the success of their collaborative efforts, collaborating chain members would typically create a common strategic objective, followed by building commitment to, and maintaining alignment of, their interface processes with the strategic objective (Simatupang and Sridharan, 2002). Invariably referred to as integrated supply chain process, this is one of the five features in the supply chain collaborative framework of Simatupang and Sridharan (2005). Business process improvement, for instance, is one key element of collaboration to deal with the bullwhip effect (Lee *et al.* 1997). Building process alignment to reduce uncertainty and variability of supply chain processes requires two closely interwoven ingredients: information sharing and joint decision making (i.e., the allocation of decision rights) in managing supply chain activities, which include demand forecasting, order batching, product rationing, and product pricing.

Information sharing, which refers to the ability to mutually access data among chain members' systems, enables the tracking of products as they pass through the supply chain (Simatupang and Sridharan, 2002). This activity, which constitutes one of the five features of the Simatupang and Sridharan's framework (2005), covers data acquisition, processing, representation, storage, and dissemination of demand conditions, end-to-end inventory status and locations, order status, cost-related data, and performance status. Data visibility, be it key performance metrics or process data, is critical to the decision process: it enables participating members to purview the bigger picture of situations to ensure that important factors could be taken into account in decision making (Simatupang and Sridharan, 2005).

Simatupang and Sridharan (2005) further argue that information sharing is glue that integrates other features into a whole. If supply chain operations are the outcomes of informed decisions, action becomes visible too when chain members understand and appreciate the underlying principles that drive performance. Information sharing thus facilitates decision synchronization, another of the five key features identified by Simatupang and Sridharan (2005), through providing relevant, timely, and accurate data for supply chain planning and execution. Relying on demand and inventory visibility to eliminate stock-outs by accurately replenishing hot products exemplifies the role of information sharing in synchronizing decisions (Fisher, 1997). Likewise, noted supply chain

initiatives, such as the Quick Response Programme (QRP), Continuous Replenishment (CR), Efficient Consumer Response (ECR), and Collaborative Planning, Forecasting and Replenishment (CPFR), are outcomes of informed joint decision making in process improvements to minimise variability, waste, and costs along the supply chain (Barratt and Oliveira, 2001; Frankel et al., 2002; Ireland and Bruce, 2000).

Like all outcomes of decision processes, the effects of supply chain collaboration require tangible appraisals. Because supply chain performance relates to intercompany, rather than individual organizational, performance (Lambert and Pohlen, 2001), collaboration in developing a common performance metric system, e.g., process metrics like perfect order, cash-to-cash cycle, and new product development which span the supply chain (Lapide, 2000), is the fourth key feature propounded in Simatupang and Sridharan's (2005) framework. Since performance metrics drive behaviour, a collaborative performance system could thus direct chain members to take actions that complement each other's role, thereby contributing to mutually beneficial outcomes.

While performance metrics may drive behaviour, an incentive mechanism is needed among chain members to reward the attainment, and punish non-conformance, of agreed-upon performance targets (Narayanan and Raman, 2004). Corbett et al. (1999) empirically illustrated that process improvement, such as inventory management and order fulfilment, has a higher probability of success when chain members become involved in aligning joint optimisation rules with logistics and commercial benefits. On the strength of these findings, Simatupang and Sridharan (2002) argue that incentive alignment, which includes cost, risk, as well as benefit sharing amongst participating members, is the fifth key element for successful collaboration. Incentive alignment motivates chain members to act in a manner consistent with their mutual strategic objectives, and to make decisions optimal for the overall supply chain.

According to Simatupang and Sridharan (2005), the above five features - a collaborative performance system, information sharing, decision synchronization, incentive alignment, and integrated supply chain processes - underpin the core of a collaborative supply chain. Each feature is an enabling factor that facilitates collaborative actions. It is the interactions of the five features that create the synergy that contribute to successful supply chain collaboration, which Simatupang and Sridharan (2002, 2005) term the reciprocal approach. For instance, monitoring and regular evaluation of collaborative performance determines what must be changed in the features of information sharing, decision synchronization, and incentive alignment in an attempt to enable chain members to continuously create or re-create integrated supply chain processes. Likewise, incentive alignment, which links collaborative performance systems to incentives, could motivate chain members to ally their actions, including the willingness to share critical information and synchronizing decisions to the mutual purpose of collaboration, further reinforcing the desired level of performance.

The merit of Simatupang and Sridharan's framework (2005), as distinct from other models of supply chain collaboration, is that it promotes reciprocal linkages among the five features, as outlined earlier. The reciprocal approach captures the interacting effects of the five elements in ways that contribute to the achievement of collaborative performance. It is the thermostat in the collaborative supply chain, identifying and regulating enablers that facilitate collaborative actions.

The reciprocal approach, unfortunately, is not an organically evolving and adapting agent. Its prowess in effectively orchestrating the interacting process required of the five features to produce the synergy needs facilitation in the first instance. This is because all supply chains, which involve the contribution of multiple team members, are underscored by specific power regimes (Cox et al., 2000; Cox et al., 2001).

Power regimes exist in supply chains because the relationships between participating members in a supply chain are not necessarily always interdependent in their business dealings. The possibility that any one member may dominate over other members as well as members may have come together merely because of a convenient arrangement could give rise to a complex web of power relationships between participating members in a multiple dyadic exchange scenario. As illustrated by Cox et al., (2001) in a dyadic exchange scenario between two members (A and B) in a supply relationship, there are four plausible regimes: A dominates over B; B dominates over A; A and B are interdependent; and A and B are independent of one another.

The structure of the power regimes existing within a supply chain dictates the ownership and control structures of the chain, carrying significant implications for its operations. This is because organizations do not participate in supply chain operations to create products and services to provide value to customers, but to make

money for themselves and for those involved in the chain through production and delivery (Cox et al., 2001). Cox et al. (2001) contend that there are three sets of value in the context of supply chain operations:

- customer's value proposition: this refers to the utility that customers derive from acquiring the products or services rendered by members of the chain;
- value-adding process: this refers to the transformation process that takes place within member organizations as they convert less valuable supply inputs and into more valuable supply outputs; and
- value appropriation: this refers to the amount of money extracted by each member organization from participating at a particular stage in the supply chain.

Inevitably, the manner in which value is appropriated among supply chain members in their attempts to add value to supply inputs to meet customer value propositions would be linked to the structure of the power regime existing within the chain. A supply relationship in which one member dominates over another is likely to lead to an inequitable distribution of benefits, or incentive misalignment as per one of the five features of Simatupang and Sridharan's framework (2005). If incentive alignment is an enabling factor that supports the promulgation of the other features (Simatupang and Sridharan, 2005), incentive misalignment would not, in all likelihood, lead to information sharing and decision synchronization. The collaboration, in short, is less likely to survive.

Understanding the extent to which the enabling effect of the reciprocal approach could be manifested would, therefore, require an appreciation of the ownership and control structures of particular supply chain resources, including the relationship between physical properties and the flow of value that occurs in the chain (Cox et al., 2001). In short, supply chain collaboration must further incorporate a holistic and inclusive understanding of the financial, in addition to physical, properties of supply chain networks based on the structure of the power regimes existing within it: how all participating members could derive sufficient benefits from their contribution to sustain their continual participation. The existence of alternative power regimes suggests that, for the five features that underpin the supply chain collaboration architecture discussed in Simatupang and Sridharan (2005) to work, a supply chain needs to be grounded within the context of its power relationship. This point will be illustrated in the case of PCM, which follows.

### **The PCM's VMI Program (based on Yang 2006)**

PCM, a leading computer manufacturer, implemented a VMI program involving over 12,000 active parts at its operations base in an economic free zone in the Peoples Republic of China in 2000. Over 220 plus suppliers were involved in the program. Though the 220 plus suppliers dealt with different parts, they assumed similar roles and responsibilities. By collectively referring them as the vendors, the VMI operations of PCM would comprise three parties: PCM (the manufacturer), the vendors (220 suppliers), and a third party logistics provider (the 3PL). One of the distinctive features of PCM's VMI program, therefore, was the presence of a 3PL, which is not usually the case in a conventional VMI model.

#### **Contractual Relationships**

The triadic relationship was bounded by three separate sets of contractual agreements. These agreements defined the objectives and responsibilities upfront of the parties involved in supporting PCM's round-the-clock production activities.

PCM had a warehouse service agreement with the 3PL governing the production space rental from the 3PL and also the picking and delivery-to-production services. The agreement between PCM and each of the 220 suppliers covered the 'Statement of Works' concerning the availability of the raw materials for production. Based on this statement, the suppliers would compute the required production and send their raw materials and parts to PCM, according to the production requirements and the rules stipulated in the statement. Inventory management was under the responsibility of the 3PL, which was to ensure the integrity of the cargo information.

Between the 3PL and the suppliers was a standard agreement for warehouse storage, handling charges and use of the warehouse management system (WMS) operated by the 3PL for inventory management and supply chain visibility. Once the suppliers signed up for the VMI operations, they would bear the logistics costs as they arose in accordance with their usage. The billing function, receiving of cargo, quality checking, repackaging (certain parts)

and remarking of cartons were done by the 3PL on behalf of the suppliers.

#### **The VMI Flow Process**

PCM's VMI program supporting its 24 hours a day, 7 days a week production line can be divided into two flow processes: operations flow and commercial flow. The former involved information flow and physical cargo movements and the latter, the financial responsibilities of the parties involved.

PCM's VMI operations flow can be explained in the following sequenced process:

1. Flow 1 – Based on the online customer demand information, PCM would compute a rolling 12-month production forecast on all its products. This production forecast would be updated and transmitted to suppliers every two days. In each production forecast released, it would confirm the 2-day forecast, and indicate that the 2-week forecast would most likely be confirmed unless notified otherwise.
2. Flow 2 – This forecast would be shared instantaneously with both local and overseas suppliers. Based on this forecast, suppliers would send the required parts to the VMI warehouse (also known as the VMI hub).
3. Flow 3 – At the commencement of the production assembly lines, PCM, through its enterprise resource planning (ERP) system, would issue a pull ticket to the VMI hub for the picking process to begin.
4. Flow 4 - Warehouse personnel would pick and pack the parts into specific product kitting boxes and would send them up to the production line via an automated conveyor system.
5. Flow 5 – The inbound and picking information of the parts would be updated instantly into the warehouse management system (WMS) run by the 3PL. Both suppliers and PCM would be alerted on all inbound and outbound parts and could check inventory levels at any time.

Lastly, suppliers would then compare production forecast with actual usage, plus existing inventory levels – to make replenishment orders into the VMI hub. Information on the physical movement of inventory would be captured by the 3PL's WMS and then updated to the PCM's ERP.

PCM's VMI commercial flow operated on a consignment stock basis. All suppliers would place their stock at the VMI hub on consignment. Only when PCM took physical receipt of the parts at the production assembly line was the ownership of the parts transferred from the suppliers to PCM. Suppliers were required to underwrite the following costs:

- VMI hub (i.e., warehouse) storage charges, which included warehouse inbound loading and handling charges;
- transportation charges from their factories to the hub; and
- all logistics costs incurred by the parts before arriving at the production or assembly line.

PCM would only pay for picking and special kiting services, plus any logistics costs incurred in the production or assembly process. The costs of the IT systems were borne jointly by the suppliers and PCM, based on a cubic meter unit rate on the parts throughput via the VMI hub.

Under the consignment stock arrangement, PCM was not obligated to pay its suppliers until the part was consumed during production. In addition, suppliers would usually extend a credit term of 30 – 45 days to PCM. Most of PCM's products were sold freight on board. Therefore at the time when PCM recognized its supplier's liability, it would have already collected money from its end customers and have a positive cash flow of 30 to 45 days before having to pay its suppliers.

#### **Information Systems**

Central to the flow of information in PCM's VMI operation were the ERP system and the WMS. The ERP system was owned and managed by PCM and was used to administer the production function. The WMS was owned and managed by the 3PL. The WMS managed the entire physical movement of the operation and also all information flows related to logistics activities. Both the ERP and WMS were connected via a set of communication protocols to ensure inventory balances were identical in both systems.

The WMS stood at the core of the VMI operation. It was the 'command center', issuing all instructions that triggered the activities in the VMI operation. The system performed three major functions: maintaining inventory visibility; issuing operation signals; and managing billing processes. By maintaining inventory visibility, the WMS ensured that the supply chain was visible to the manufacturer and all suppliers. It supplied information, such as current inventory status, receiving reports, and parts picked to all concerned parties.

The WMS also managed the pick and replenishment signals. When the PCM production line required the parts, its ERP system would issue a pull signal to the 3PL's WMS. The WMS would then issue a pick list for the warehouse staff to pick the cargo and place them into a kitting box, which was designed ergonomically to ensure that the production line could use the parts in sequence for assembly. In turn, when the inventory level in the warehouse was below the pre-determined threshold, the WMS would also transmit replenishment signals to the suppliers. As its third major function, the WMS managed the billing aspect of the VMI program, assuring all transactions to be paid according to the contractual rules set up in the triadic relationship.

In addition to the ERP and WMS housed in the same physical facility, PCM's VMI operation also used an Internet web portal provided by the 3PL to act as an information consolidator, extracting information from the WMS and offering instant visibility to all parties, facilitating communication and information sharing with the multiple suppliers.

Due to a variety of reasons, not all suppliers were able to interact with the Internet portal. This was especially true for suppliers of low value items, such as plastic cases and parts, who might not have the communications technology infrastructure but nevertheless supply quality products at low prices. There were, however, also suppliers more advanced in their technology uptake, and would require dedicated line access to the WMS and automated push-pull signaling of information. PCM allowed information connectivity with the suppliers at three levels:

- i. A premium dedicated line access interface;
- ii. Internet portal access (used by most suppliers); and
- iii. Conventional telephone line access via fax and human interface, accessible by non-critical, lower value suppliers.

#### **Centralized Production and Warehouse Facility**

Another distinctive feature of PCM's VMI program was that it did not own any physical facilities. The entire facility, comprising the warehouses and the production lines, were housed in three buildings located within the same compound provided by the 3PL. Besides warehouse storage and production line activities, the facilities were also used for modular assembling. Some minor assembly activities were required for some of the parts. The warehouse facilities also provided the space needed for some suppliers to finish their products before entering the production line. This was particularly popular among suppliers who required external parts to be attached to their products. These suppliers would arrange for the external parts to be delivered to the VMI warehouse where minor assembly or packing was done to finish the product. Examples included attaching power cables to disk drives.

Once the products were assembled at the production line, they would be routed to the quality control section on the production floor. After quality checks, they would be immediately brought to the loading bay to be loaded directly onto waiting trucks for shipment. Finished goods thus required no post-production storage at the VMI hub.

#### **Roles of the 3PL**

The 3PL was the linchpin of the entire VMI operation. At the operational level, the 3PL carried out the physical logistics activities of the VMI program. At a functional level, it managed and controlled both the information and physical flows. At the strategic level, the 3PL was responsible for overseeing the continuous supply of parts to the production line to ensure that it would not be disrupted due to unavailability of stock. This means that the 3PL was fully responsible for ensuring suppliers' participation meet all targets of customer fulfillment.

The 3PL was also tasked with managing and implementing minor assembly and quality checks, such as finishing works on computer keyboards and assembly of computer cases. For pre-production quality checking, the 3PL was tasked with ensuring the quality of memory chips, processor chips, and hard disk drives. Prior to delivery of parts to the production line, the 3PL would ascertain the quality of these parts to avoid production stoppages due to quality issues.

#### **Benefits to PCM**

The VMI program was launched to enable PCM to embrace a full postponement strategy for its manufacturing activities. Because of the VMI program, PCM would only take parts or raw material ownership when it was used for production. This allowed PCM to only commence production when it received confirmed orders. Because of the involvement of over 220 plus suppliers, assuring the receipt of quality parts on-time and in-full would be extremely

difficult, if not impossible, without the engagement of the 3PL. The engagement of a 3PL had also indirectly helped PCM to adopt a limited logistics speculation strategy (Pagh and Cooper, 1998) for its finished goods logistics activities in its distribution channels.

For PCM, after the manufacturing process, the finished goods were not stored in the VMI facility but immediately shipped out to its extensive network of product retailers and resellers. The resellers and retailers were retained mainly to serve PCM's main business servers and industrial computing division. PCM would keep its inventory at geographically dispersed reseller and retailer locations only to a level sufficient to serve as a temporary buffer for short-term availability to customers. This limited logistics speculation strategy required the support of a well-coordinated production line where the production of goods was demand-driven.

#### **Benefits to Suppliers**

One of the critical pre-requisites for a successful VMI operation is to maintain the dedicated participation of suppliers. Suppliers, which agree to put raw materials on consignment to manage inventory on behalf of the manufacturer, need to benefit from their efforts.

Under the PCM's VMI program, all storage costs were paid by the supplier themselves. This provided the suppliers with the contractual rights to utilize the VMI hub to store their goods, including the raw materials intended for other manufacturers. PCM's hub location, being located in the Free Zone where other manufacturers had also embarked on their own VMI program, also offered PCM's suppliers, who also counted on other manufacturers as their clients, to mitigate the costs that had been pushed to them. Besides costs savings, suppliers could also put more stock in the VMI hub for multiple customers, thus improving inventory availability for PCM's production.

The VMI hub might be a convenient storage place for some suppliers. Certain suppliers, primarily those supplying 'proprietary' parts such as processor chips, Liquid Crystal Display (LCD) screens, and hard disks had little or no incentive to participate. To maintain a 100% supplier participation, PCM engaged the 3PL to be a temporary buyer. The 3PL would buy from these 'proprietary' suppliers and would re-supply to PCM on a VMI basis, with commercial payment made based on the open book cost-plus model. As a result, PCM mitigated the problem of non-supplier participation and was able to be assured of 100% supplier participation in its VMI program.

## **Interpretation and Conclusion**

The PCM's VMI program has presented a case in which the power relationship is one of dominance. A big manufacturer, like PCM, typically has the leverage to persuade its suppliers into accepting the terms of its contract due to its immense purchasing power and the intense competition the suppliers face. Under situations in which one of the participating members is able to leverage on the assets of others, there is always the tacit understanding that the dependent members participating in the supply chain operations would stand to become preferential suppliers for future contracts issued by the dominant member. Suppliers in the PCM's VMI program were no different. By satisfying the requirements of PCM, PCM's suppliers were hopeful of developing a stronger relationship with PCM in the long run. This, however, would not be feasible if the current collaboration did not provide sufficient incentives for them to cultivate such plausible future relationships. As has been noted in the case of PCM's VMI program, the collaborative arrangement would not have enabled the suppliers to derive any special incentives without the 3PL involvement: providing the physical facilities to serve as the VMI hub and playing the role of a temporary buyer. In turn, PCM had been able to embark upon a postponement strategy for its manufacturing operations at very competitive terms.

In terms of reflecting the five features of Simatupang and Sridharan's (2005) supply chain collaboration framework, PCM's VMI program had shown no collaborative performance system in which the performance of all participating members could be gauged according to some mutually agreed objectives. However, the program did enjoy a high degree of information sharing through the ERP, WMS, and Internet portal communication system, which facilitated the synchronization of decisions between PCM and its 220 plus suppliers. It constituted a key element in ensuring appropriate decisions were made at the supplier locations, 3PL, and PCM. Most importantly, the case has demonstrated that incentive alignment is feasible, so long as the VMI program sponsor has the tenacity and

the will to implement all the processes and changes necessary to bring benefits to all parties of the supply chain at the outset.

Another aspect of the VMI implementation that enabled a more equitable sharing of benefits was that suppliers could use the warehousing facilities to supply to other manufacturers within the region, thereby benefiting from storage scale economies. While it is not common to see a more equitable sharing of incentives in a VMI program, this PCM case has been unique. The PCM's VMI program also ensured that suppliers and the 3PL streamlined their inventory management processes until the materials were used in production at PCM. Again, without the participation of the 3PL, this would not have been feasible.

The PCM's VMI case has revealed that the 3PL's role was pivotal in sustaining a VMI operation. It strongly supports the view that supply chain collaboration must start from an understanding of the bases of the power relationships that exists in the supply chain. This would enable the VMI sponsor to appreciate the circumstances it is in and the scope that exists for it to augment its power relative to suppliers. It also reinforces the importance of the reciprocal approach in facilitating the interactions of the features advanced by Simatupang and Sridharan (2005).

## **Abstracts**

Considering the future implications of EU environmental laws such as REACH (Registration, Evaluation, Authorization and Restriction of Chemicals) and EuP (Directive on Eco-Design of Energy-using Products) as well as RoHS (Restrictions of the Use of Certain Hazardous Substances in electrical and electronic equipment) Directive, they have been acquired to advance GSCM (Green Supply Chain Management) more and more. The aim of this paper is to introduce the construction of GSCM system that improves collaborative relationships between an EEE manufacturer and its suppliers. The study is conducted in three steps. Firstly, the four elements, which are necessities to form collaborative relationships between an EEE manufacturer and its suppliers, are described. Secondly, the condition and construction of GSCM system including the four elements is proposed. Finally, we presented the method that the GSCM system is constructed as a practicable tool in the initial stage by a case study held in Shimadzu Corporation.

## **Introduction**

The RoHS (Restrictions of the Use of Certain Hazardous Substances in electrical and electronic equipment) has driven the implementation and development of GSCM (Green Supply Chain Management) for Japanese EEE manufacturers who produce EEE products that are exported to the EU market. The EEE manufacturers have pressed their parts suppliers to participate in various activities for compliance with the directive and for meeting the demands of EU market. The three common environmental activities are; (1) obtaining certification of EMS (Environmental Management System), (2) sharing knowledge of substances presence in EEE parts, and (3) warranting RoHS substances not included in EEE parts. However, the activities are likely to have been promoted without suppliers' sufficient acknowledgement and abilities. Moreover, many Japanese parts suppliers do not directly face with EU market. It is necessary that the demands of an EEE manufacturer to its suppliers should be balanced with suppliers' capacities for an effective advancement of the GSCM. The suppliers' capacities for complying with EEE manufacturer's demand depends on their acknowledgement on RoHS directive and environmental problems, financial status, technical and human resources. Therefore, the EEE manufacturers have been faced with the fact that they must form collaborative relationships between the EEE manufacturer and the parts supplier to improve GSCM performance.

This research presents the construction of GSCM system to promote collaborative relationships between an EEE manufacturer and its parts suppliers. The GSCM system is also a standard to organize and systemically operate environmental activities. In this paper, we described the construction of the GSCM system including the four elements to form collaboration and introduced the method to apply the GSCM at the initial stage in the case study of Shimadzu Corporation.

## **The Four Elements for Forming Collaborative Relationships**

To correspond to environmental problems related to end-products, EEE manufacturers implement GSCM for the next three stages. To improve environmental problems related to the product, EEE manufacturers set the GSCM policy and purpose as the first stage. Then EEE manufacturers set the environmental requirement based on the GSCM policy and purpose as a second stage. As the third stage, EEE manufacturers promote the supplier's cooperation to cope with the environmental requirement in the GSCM implementation. Here, to promote the

cooperation of the supplier in the GSCM implementation, EEE manufacturers need to share the GSCM policy and purpose with parts suppliers in the second stage. Moreover, EEE manufacturers are requested to advance joint action with the supplier up to the second stage and the third stage. To advance sharing the GSCM policy and purpose and joint action, EEE manufacturers should share the knowledge and information with supplier. Activities for supplier support have to be implemented to effectively advance the sharing of GSCM policy and purpose, and its joint action. Therefore, we suggest four elements to form and develop collaborative relationships between an EEE manufacturer and its parts suppliers. The four elements are: (1) sharing GSCM policy and purpose, (2) joint action, (3) sharing knowledge and information, and (4) activities for supplier support.

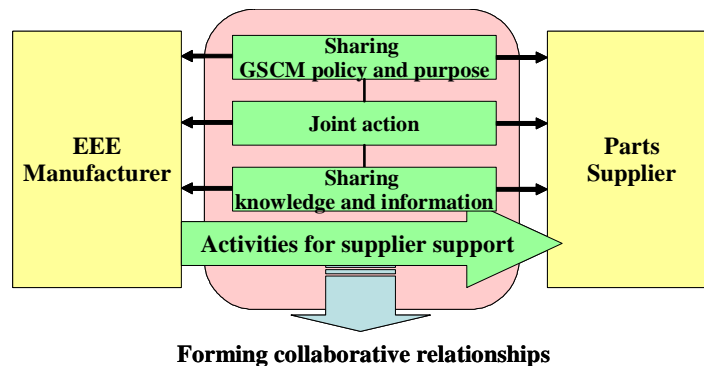

FIG.1: ELEMENTS FOR FORMING COLLABORATIVE RELATIONSHIPS

#### Sharing GSCM Policy and Purpose

B.S. Sahay (2003) described that building up mutual trust was indispensable in the collaborative relationships between the organizations. He said that the mutual trust between organizations is improved when they shared policy and purpose to advance some business activities [1]. For acquiring competing domination in the market, manufacturers who produce end-products have to promptly correspond to the trend of the market that is affected by environmental regulation. The manufacturers have to set up 'GSCM policy and purpose' to comply with the change of new environmental regulations and the market. This necessitates the sharing of the GSCM policy and purpose with their suppliers who produce parts composing end products. Parts suppliers have to be provided with information and knowledge about environmental regulations and market trends to understand the background of the GSCM policy and purpose by buyers who are end-product manufacturers. After the necessity of measures promotion consents, the supplier can accept the GSCM policy and the purpose. After the suppliers recognized the necessity for accepting the GSCM policy and purpose, the GSCM policy and purpose are included in the policy of production and environmental activity of suppliers. The suppliers will then advance their production and business activities with the ability to adapt and cope with the market demands and regulations.

#### Joint Action

The joint action is a necessity for improving collaborative relationships between a manufacturer and its suppliers in the GSCM implementation [1] [2] [3]. Danny P. Claro et al . (2006) pointed out that the GSCM implementation without joint action is likely to lead formation of adversarial relationships between a manufacturer and its suppliers.

He introduced that joint action should be consisted of joint planning and joint doing [4]. Tage Skjoett-Larsen(2000) described that joint action was operated through the process of joint planning, joint doing and joint monitoring [5]. The joint monitoring checks the status of implementing joint action. In this study, joint reviewing is included in the process of the joint action. Joint reviewing is a necessity for applying the result of joint monitoring to improve continuous performance of the whole joint action. Therefore, the joint action is implemented through a continuous cycle process of joint planning, joint doing, joint monitoring and joint reviewing.

#### **Sharing Knowledge and Information**

Louise Canning et al., (2001) identified the uncertainties on environmental aspect, the method of improving environmental performance, the capacity of resource or technology for advancing environmental activities in GSCM implementation [6]. Many suppliers have a lack of information about what kind of hazardous substances are in their products, whether such substances restricted by RoHS are in their products or not, because of uncertainty on environmental aspect. They do not have any idea how to solve or improve the environmental problem even though they understand the environmental aspect in their production and business due to the uncertainty on the method of improving environmental performance and the capacity of resource or technology for advancing environmental activities. The uncertainty between a manufacturer and its suppliers has to be lessened to improve the mutual trusts among organizations and to promote the formation of collaborative relationships between them. Sharing knowledge and information is an essential element to decrease the uncertainty between a manufacturer and its suppliers. EEE manufacturer should share knowledge and information for GSCM implementation with its suppliers to lessen various uncertainties which are obstacles in GSCM implementation.

In this research, sharing knowledge and information between an EEE manufacturer and its supplier for GSCM implementation are classified into sharing knowledge and information: (1) for sharing GSCM policy and purpose, (2) for process of joint planning, (3) process of joint doing and joint monitoring, and (4) process of joint reviewing.

#### **Activities for Supplier Support**

Many suppliers have suffered from the difficulties coping with environmental requirement from manufacturers because of lack of environmental knowledge, environmental consideration and financial or technological resources [2] [7]. The problem in these suppliers causes the supplier's cooperation in the GSCM implementation to be obstructed. In this research, therefore, activity for supporting suppliers by manufacturers who try to improve GSCM performance is classified into three; (1) providing knowledge and information on the trend of environmental regulations and the market, (2) technical assistance, and (2) providing human and financial resources.

## **The Construction of GSCM System**

#### **Requirement for Systematic Management**

Systematic management for GSCM implementation means that a manufacturer works together with its suppliers to advance the activities for GSCM on a standardized tool in this study. The standardized tool is based on the concept of PDCA cycle, which flows the four-step process of 'Plan', 'Do', 'Check' and 'Act' to improve GSCM performance continuously. The details of each process have to be documented or recorded in order to share and confirm the process and the result of GSCM implementation.

#### **Application of Environmental Management System Standard**

ISO 14001 which is the international standard of environmental management system satisfies the two requirements of systematic management operated by PDCA cycle and documentation. It has become as one of the worldwide accredited EMS certification of organizations because "it is intended to apply to all types and sizes of organization and to accommodate diverse geographical, cultural and social conditions". Table 1 and Figure 2 show the situations of the acquisition number of ISO 14001 in the world from December 2001 to December 2005. The cases of organization obtaining the certification of ISO 14001 have totaled to 111,162 in December 2005. And there is a continuous increase in acquisition counts all over the world. The widely used ISO 14001 was applied to the construction of GSCM system used by both manufacturer and supplier in this study [8].

TABLE 1: THE SITUATION OF THE ACQUISITION OF ISO 14001 IN THE WORLD

The acquisition number of ISO 14001 in the world (year)	2001	2002	2003	2004	2005
The number of acquisition	36,464	49,440	64,996	89,937	111,162
The number of countries introducing ISO 14001	112	116	113	127	138

FIG.2: THE SITUATION OF THE ACQUISITION OF ISO 14001 IN THE WORLD

**Comparison of the Requirements for GSCM System and ISO 14001 Standard**

The GSCM system includes four elements for forming collaborative relationships between a manufacturer and its suppliers, and two requirements for systematic system.

1) PDCA cycle and Documentation

ISO 14001 is a standard based on the concept of improving management performance continuously by PDCA cycle. It is described that ISO 14001 is to cycle the processes of ‘Plan’, ‘Do’, ‘Check’, and ‘Act’ in annex A.1. ‘Environmental management system requirements’ of ISO 14001 include ‘Documentation’ (4.4.4. of ISO 14001) and ‘control of documents’ (4.4.5. of ISO 14001). Organization shall report and document the main elements of the environmental management system and their interaction, and reference to related documents (4.4.4 of ISO 14001). The documents have to be controlled and maintained for implementation of environmental management system (4.4.5. of ISO 14001).

2) The four elements for forming collaborative relation

Environmental policy shall be defined by top management, and then documented, implemented and maintained within the defined scope of its environmental management system (4.2 of ISO14001; 2004). The environmental policy is communicated and shared among all members from the top management to the bottom management related to the construction and operation of EMS. The environmental policy which is described in ISO 14001 corresponds to ‘GSCM policy and purpose’. ‘Joint Action’ is a significant element for forming collaborative relationships among all person or organization related to some common activities. The processes of joint action are joint planning, joint doing, joint monitoring and joint reviewing. The four processes correspond to the processes of EMS described in ISO 14001. ‘Joint planning’, ‘joint doing’, ‘joint monitoring’ and ‘joint reviewing’ correspond to ‘planning’, ‘implementation and operation’, ‘checking’ and ‘management review’, respectively. ‘Sharing knowledge and information’ is an essential element to implement effectively the EMS. All workers for EMS implementation have to share knowledge and information to advance the environmental activities. Sharing knowledge and information is described in ‘communication’ (4.4.3 of ISO 14001:2004). “The organization shall ensure that any person performing

tasks for it or on its behalf has the potential to cause a significant environmental impact identified by the organization and is competent on the basis of appropriate education, training or experience” as described in 4.4.2 of ISO 14001. As activities of education and training are to support members in charge of EMS, and program of education and training is to support suppliers in charge of GSCM [9].

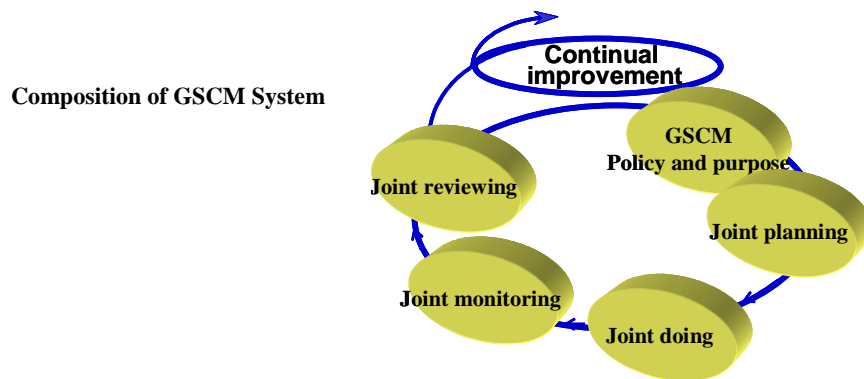

FIG.3: THE FRAMEWORK OF GSCM SYSTEM

The previous paragraphs describe the ISO 14001 standard including the four elements for forming collaborative relationships and the requirement for systematic management. Moreover, the ISO 14001 standard is the prevailing international standard of environmental management system in the world, and an applicable tool for any kind of organization. For these reasons, the contents and composition of ISO 14001 are applied to the composition of GSCM system in this study. The GSCM system shall then be an applicable tool for any suppliers. The GSCM system consists of ‘Definition’, ‘GSCM policy and purpose’, ‘scope and application object’, ‘joint planning’, ‘joint doing’, ‘joint monitoring’, and ‘joint reviewing’. Moreover, this system intends to implement and operate GSCM through the continuous cycle process of ‘joint planning’, ‘joint doing’, ‘joint monitoring’ and ‘joint reviewing’.

1) Scope and application object

For the purpose of complying with environmental regulations or market demands, and strengthening competitiveness, the GSCM system is applied as a management tool for the supply chain. ‘The cooperation for GSCM system’ means an organization in which a manufacturer and its suppliers are combined to implement GSCM. The cooperation for the GSCM system is composed of a ‘leader of GSCM system’ and the ‘cooperators of GSCM system’. The leader of GSCM system shall establish the GSCM policy and purpose and share it with the cooperators of GSCM system. In this research, an EEE manufacturer is regarded as the leader of GSCM system.

2) Joint planning

The joint planning based on GSCM policy and purpose is implemented in the processes of listing up GSCM aspects, evaluation of GSCM aspects, specifying remarkable GSCM aspects, setting up goals, and GSCM program. Firstly, a leader of GSCM system lists up GSCM aspects that seem to be related to the achievement of GSCM policy and purpose. Secondly, the leader of GSCM system evaluates whether the GSCM aspects have an important influence on the achievement of GSCM policy and purpose or not, and then specifies remarkable GSCM aspects. The remarkable GSCM aspects shall be announced to and understood by the cooperators of GSCM system.

Thirdly, the GSCM goals are set up to improve the remarkable GSCM aspects. The GSCM goals are set up for long-term achievement. The GSCM detail/ (or SPECIFIC?) goals are for short terms. These goals are expressed numerically as much as possible for the quantitative evaluation, and documented to be maintained and controlled. Furthermore, the goals shall be set up as practicable as possible through evaluating the capability of cooperators of GSCM system to achieve such goals. Finally, the GSCM program should be settled to achieve the GSCM goals and specific goals.

### **The Measurement Survey for Understanding the Situation of Cooperators**

It is significant that joint planning is practically established to achieve the GSCM goals and improve the GSCM performance. Understanding the situations such as how much capacity does cooperators have for complying with GSCM system is needed to set up GSCM goals and GSCM program in the stage of joint planning. The Measurement Survey for Understanding the Situation of cooperators (MSUS) is to be carried out in the stage of joint planning, and then the result of MSUS is to be reflected for setting the GSCM goals, GSCM specific goal and then overall GSCM program. Therefore, MSUS is presented as a method for constructing practical GSCM system in this chapter. The MSUS was conducted for Shimadzu Cooperation Assembly that is organized by Shimadzu Corporation itself and its 115 suppliers providing EEE parts to Shimadzu Cooperation from the period of August 29, 2006 to October 1, 2006. Shimadzu Corporation and 115 suppliers correspond to ‘leader of GSCM system’ and ‘cooperators of GSCM system’, respectively. The method of MSUS was through the development of questionnaire for the 115 ‘cooperators of the GSCM system’. The respondents were 63 among 115. The questionnaire aimed to grasp the conditions of GSCM policy and purpose shared with supplier, and the GSCM aspect as understood by the suppliers. Furthermore, the questionnaire also tried to estimate the practicality of the GSCM goals and to set up a practical GSCM program.

#### **The Situation of Sharing ‘GSCM Policy and Purpose’ and ‘GSCM Aspect’**

**TABLE 2: THE SITUATION OF SHARING GSCM POLICY AND PURPOSE**

The situation of sharing GSCM policy and purpose	Answered cooperators
Notified	53
Not notified	2
No memory	8
Total	63

The table 2 shows the situation of ‘GSCM policy and purpose’ expressed in number of notified ‘cooperators of the GSCM system’. (i.e., 53 among 63 companies). On the other hand, eight cooperators answered they have no experience or any sort of idea whether they have been informed about the ‘GSCM policy and purpose’. Moreover, two cooperators answered that the explanation of ‘GSCM policy and purpose’ had not been informed to them. From this result, it is clear that there are cooperators who lack understanding of the ‘GSCM policy and purpose’. The cooperators who do not understand the ‘GSCM policy and purpose’ need to be provided with information and knowledge and repeatedly done by the leader of GSCM system to achieve the GSCM goals.

**TABLE 3: THE SITUATION OF SHARING GSCM ASPECT**

The situaion of sharing GSCM aspect	Cooperators
Notified	42
Not notified	20
Total	62

Shimadzu Corporation who is the leader of GSCM system in this study has set up the ‘obtaining certification of EMS’ for its suppliers as a GSCM aspect. Table 3 shows the situation whether cooperators have recognized ‘obtaining certification of EMS’ as a GSCM aspect. Twenty cooperators have not recognized ‘obtaining certification of EMS’ as a GSCM aspect. Therefore, the leader of GSCM system needs to help the cooperators to understand the GSCM aspect by sharing information or supporting their programs.

**Estimating Practicable GSCM Goal and Detail Goal**

**FIG.4: THE SITUATION OF OBTAINING CERTIFICATION OF EMS**

Figure 4 shows the condition of the cooperators who have obtained or planned for obtaining certification of EMS. Thirty three cooperators among 62 have already got t EMS certification. The cooperators operating EMS have to be further trained and supported to advance the activities based on EMS by the leader of GSCM system. The GSCM goal and specific goal for ‘obtaining certification of EMS’ are targeting 29 cooperators who have not yet obtained the certification of EMS. Seven (7) cooperators answered that they had planned to get the certification within 1 year. A cooperator (1) answered that it has a plan to obtain the certification within 2 years. Twelve (12) cooperators have a plan to obtain the certification in the future, although they did not make sure the period for obtaining the certification. However, eight (8) cooperators answered that they did not have any plan to get the certification of EMS. From the results, we can consider the setting up the GSCM goal to be in the span of 3 years and specific goal for 1 year. Among the 29 cooperators who have not obtained the certification of EMS, 20 cooperators have positively thought about operating EMS and obtaining the certification. Although 12 cooperators have not yet determined the period of acquiring the certification of EMS, they are likely to introduce and implement

EMS to their companies within 3 years through the leader's supports. The result therefore provides the standard to set up practicable GSCM goals and GSCM program.

**Grasping the Point of Setting up GSCM Program**

MSUS aims to have understood the situation of the support service to cooperators by the leader of GSCM system for setting up practical GSCM program. GSCM program is to schedule process and selecting method for achieving GSCM goals. This paper is only limited to presenting the selection method for supporting the cooperators.

FIG.5: THE SUPPORTING METHOD FOR EMS

Figure 5 shows the supporting method that helps cooperators to understand what EMS is and how EMS is implemented or operated. The methods are 'holding seminar', 'dispatching the specialist and the person in charge' and 'guiding through mailing and e-mail'. The selection of more than one answer to these survey questions had been allowed in this case study. The answered results of 'holding seminar', 'dispatching the specialist and the person in charge' and 'guiding through mailing and e-mail' were respectively 31, 15 and 12. These results are based on the limited knowledge of the respondents. Here, it is assumed that 'holding seminar' is easily recognized as a supporting method by the cooperators. 'Holding seminar' has a merit of the leader of GSCM system being the educator and trainer and positively influences many cooperators at the same time. On the other hands, 11 cooperators answered that they have no experience or knowledge whatsoever about the need of support by leader and its continuous support from the leader of GSCM system.

**Conclusion**

The application of GSCM system was presented in this paper to improve the effectiveness of GSCM implementation and operation. The GSCM system consists of 4 elements and 2 conditions. The elements are sharing GSCM policy and purpose, joint action, sharing knowledge and information, and the activities for supplier support. All these are aim to improve the collaborative relationships between a manufacturer and its suppliers. The 2 conditions are the 'application of PDCA cycle' and the documentation to systematically advance the GSCM implementation. These identified elements and conditions must be integrated within the worldwide-applied ISO 14001 for the construction of GSCM system, since the ISO 14001 is the most applicable EMS for any organization. Here, the ISO 14001-based GSCM system is assumed to be used by any supplier. The main processes of the GSCM system are composed of the 'GSCM policy and purpose', 'joint planning', 'joint doing', 'joint monitoring', and 'joint reviewing'. Balancing the 4 elements for forming collaborative relationships and documentation operates the processes that are based on PDCA cycle. However, the GSCM system needs to be planned as a practical system in the initial stage of the construction.

Therefore, we considered the method for establishing GSCM goals and program in the process of 'joint planning'. The measurement survey for understanding the situation of cooperators (MSUS) was presented as a simple and useful method for setting up practicable GSCM goals and program. The MSUS has to be further developed and utilized for a continuous and practical operation of the GSCM in the future.

## Abstract

The purpose of this study is to identify the inter-organizational factors that influence both the supplier-buyer's EDI utilization and the business performance in domestic retail industry. In terms of successful supply chain implementation and operation, we deduced the structural factors in the context of the inter-organizational characteristics between mass merchandisers and vendors. This study therefore focused on suggesting the ways of managing the partnership in supply chain and conceptualizing the big picture of EDI development model in the scope of a retailer's IT strategy. The results implicate that it is important to leverage the level of organizational capabilities for the success of supply chain adoption and operation. In the stream of SCM initiatives from the manufacturing industry, retailers should concentrate on improving the inter-organizational environment and implementing the effective information technology for supporting business strategy.

## Introduction

These days, business environment is changed radically because of information technology development, globalization, customer needs diversification, and so on. So there are many companies that would like to promote innovation through IT tools such as SCM(Supply Chain Management) for development of business efficiency and cost reduction.

So in this study, we verify a relation model between suppliers and buyers by inter-organizational characteristics, and suggest how companies should use EDI based SCM for level-up usability and company performance by there characteristics.

## Related Researches

There are many studies about the EDI usage level and performance. The usage level is about EDI adoption effectiveness, adoption attitude, and transaction degree, and so on(Noh at al, 2001; Lee, 2001; Kim et al, 2002; Sokol, 1989; Emmelhainz, 1990; Mansseti, 1991). Researches about the performance of EDI usage analyzed cost reduction, business improvement, competitive advantage attainment, financial outcome increase, level-up system usage and satisfaction, and so on.(Kim et al, 1999; Yang et al, 2001; Sokol, 1989; Brian, 1990; Emmelhainz, 1990; Hwang, 1991; Mansseti, 1991). This study reviews the relationship between EDI usage level and effectiveness, and suggests a model which organizational characteristics affect this relationship.

### EDI usage level

Masseti(1991) and Hwang(1991) explained the relationship between EDI usage level and EDI usage effect, and classified EDI usage level into usage integration, usage diversity, usage width, and usage quantity. Usage integration meant the degree of coordination between EDI system and legacy information system. Usage diversity meant the

types of document that is transmitted with EDI, and usage width meant the ratio of EDI using business partners of whole of business partners. Usage quantity meant the ratio of transaction quantity used by EDI of total transaction quantity. Park(1998) divided EDI usage level into usage quantity and usage scope, and verified the organizational differences between high usage level groups and low groups. And Kim et al(2002) defined EDI usage width into EDI using partner companies, and measured diffusion degree of business environments.

These studies measured supplier-buyer EDI usage level based on M:M cooperation relationship. The role of EDI is different according to relation types with partner companies. Because EDI is one of enterprise information system, usage level should be measured by two-way. So this study analyzes EDI integration, usage width, usage quantity, and suggest a relationship of usage diversity and usage scope that is showed by transaction relationship with suppliers.

#### **EDI performance**

The researches about organizational performance with information technology focused in strategic, managerial, operational, and financial areas. The studies for EDI system usage performance analyzed effects through communication and information sharing in B2B transaction.

Clemons(1986) classified usage performance into order cost reduction, increasing order times, lead-time reduce, stock cost reduction, and managerial support.

Sokol(1989) analyzed performance in organizational efficiency, and the affecting factors to performance were transaction cost reduction, material and service cost reduction, ordering process shortening, customer service improvement, internal business process reformation, and so on. These studies suggested EDI performance in operational and managerial side. Brian(1990) divided EDI performance into direct and indirect factors. Direct factors were transmission efficiency improvement of electronic documents, manpower reduction, and efficient usage, and strategic factors were improvement of long-term competitiveness in long-term, long-term strategic planning, improvement relationship within partners and customer satisfaction.

This study focuses on operational and managerial performance factors such as reduction of business transaction cost and time, business process improvement, stock reduction, and strategic factors such as customer service improvement, transaction relationship improvement, competitive advantage, business innovation, etc.

#### **EDI usage level and performance**

Masseti(1996) and Noh et al(2001) classified determinant factors for EDI usage level and performance into technological organizational and managerial factors. And they studied about the effect of EDI determinant factors for EDI performance in organizational and managerial sides.

#### **Relationship characteristics**

EDI affects various inter-organizational relationships as Inter-Organizational Systems (IOS) (Noh et al, 2001). The researches about the characteristics of inter-organizational relationship were developed mainly in marketing areas, core concepts are trust, relationship absorption, relationship solidarity, open communication, cooperation, reliance, and conflict resolution (Wilson, 1995). These concepts explain the qualitative characteristic of inter-organizational relationships.

## **Research Model and Hypothesis**

This study is about use of information technology for successful SCM in retail industry of Korea. The critical factors for SCM success are information sharing and easy communication between partners.

So, we set a model to explain the relationship between inter-organizational characteristics, EDI usage level and SCM performance.

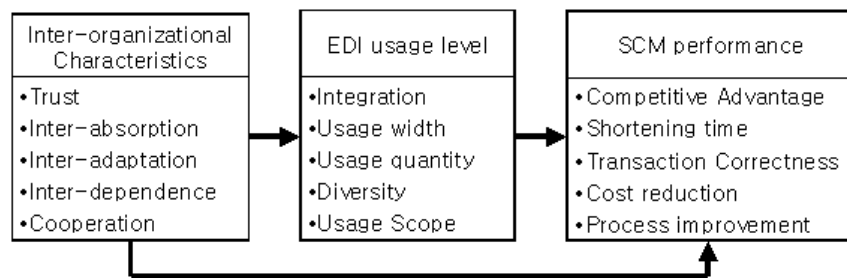

FIG. 1: RESEARCH MODEL

### Inter-organizational characteristics and EDI usage level, SCM performance

#### Trust for partners

EDI system is for promotion of interaction between supplier and buyers by inter-organizational information processing. The mutual openness and trustable relationships between partners promote efficient information sharing activity and affect usage and performance of supporting information systems (Mohr & Spekman, 1994; Winson, 1995).

And trust develops the interaction and inter-organizational performance between partners as an important tool for sustaining relationship (Schurr & Ozanne, 1985; Noh et al, 2001). So, high trust for partners affect positively EDI usage level and performance.

[H1-1] Trust among partners affects positively EDI usage level

[H2-1] Trust among partners affects positively SCM performance through level-up the EDI usage

#### Inter-absorption between partners

Absorption means constant needs for sustaining relationship between partners. The partners which have low level of relationship absorption are liable to break the partnership. There should be inter-absorption for business sharing and transaction with EDI. Partners can overcome long-term business problems through inter-absorption (Mohr & Spekman, 1994; Noh et al, 2001).

[H1-2] Inter-absorption affects positively EDI usage level

[H2-2] Inter-absorption affects positively SCM performance through level-up EDI usage level

#### adaptation to partner

Inter-adaptation means understanding of circumstance and characteristics of partners, recognizing aims exactly, and reacting to various strategic operations (Heide & John, 1992). There is no guarantee of strong relationship because of radical IT development, diversification of customer needs, and entering new competitors. So, flexible attitude for unpredictable market changes is important to organizational performance.

[H1-3] The degree of partner adaptation affects positively EDI usage level

[H2-3] The degree of partner adaptation affects positively SCM performance through level-up EDI usage

#### Inter-dependence between partners

Inter-dependence between partners is recognition process of mutual benefits through interchanges. The achievement of goal through inter-dependence in B2B transaction cannot be attained by one-side and can be presented by constant effect within partners (Mohr & Spekman, 1992).

The partners which have inter-dependence mediate through cooperation take flexible relationships.

[H1-4] Degree of inter-dependence between partners affects positively EDI usage level

[H2-4] Degree of inter-dependence between partners affects positively SCM performance through level-up EDI usage

### **Cooperation between partners**

Cooperation derives success in business relationship. In general, there are the more cooperation between partners in supply chain, the more cost efficiency and higher performance. Cooperation based on mutual trust is basis of strong partnership(Heide & John, 1992). Maltz & Srivastava(1990) suggested that cooperation between retail companies and supply companies developed performance in whole of supply chain

[H1-5] Degree of cooperation between partners affects positively EDI usage level

[H2-5] Degree of cooperation between partners affects positively SCM performance through level-up EDI usage

### **EDI usage level and SCM performance**

#### **EDI usage level**

With EDI usage level, we can cognize inter-organizational IT adoption and usage degree. ED usage and participation degree between supplier and buyer is related to EDI adoption scope. In this study, EDI usage level is measured by integration between internal information system and EDI, EDI usage width, usage quantity, diversification, usage scope, and so on.

#### **SCM performance**

IT can contribute to organizational performance improvement such business process reformation, maternal and cost reduction. And companies can have promotion of partnership, increasing exact and speedy communication, advanced organizational efficiency, improvement of trust and cooperational structures. In this study, SCM performance is measured by competitive advantage creation, transaction time reduction, information correctness increase, transaction cost reduction, and business level improvement.

[H3] Inter-organizational EDI usage level affects positively SCM performance

## **Results**

### **Data Collection**

Subjects of this study are Korean large discount store and partner companies. So we selected one discount store which developed WEB EDI system in October 2001 for collaborative with partner companies. There are about 2,000 companies which use WEB EDI system. Whole of questions are formed with 5 scales.

We gathered data by online survey after informed about this study to EDI practical staff of partner companies. Online communication tools such as CGI, etc. develop questions and answers were stored to database in real-time. We gathered 381 questionnaires and take 315 in analyze.

### **Test reliability and validity**

We use factor analysis to identify the structure of relationships among variables(Hair at al, 1995). So we take SPSS 10.0 for extract determinant factors and use Varimax rotation method and principal component analysis.

TABLE 1: FACTOR ANALYSIS OF INTER-ORGANIZATIONAL CHARACTERISTICS

	Factor 1 Trust	Factor 2 Inter-absorption	Factor 3 Interaction	Factor 4 Inter-dependence	Factor 5 Cooperation
Observance of contract	0.869				
Correct understanding of correctness of contract	0.865

B5						0.418***		0.277***		0.252***		-0.087	

- ⊗ 1. A1(trust), A2(inter-absorption), A3(inter-dependence), A4(cooperation), B1(EDI integration), B2(EDI usage quantity), B3(EDI width), B4(EDI diversity), B5(EDI scope), C1(Shortening time), C2(Improve correctness), C3(cost reduction), C4(process improvement)
- 2. Di(Direct relation), In(Indirect relation)
  - \* path coefficient is significant in 0.1 ( $p < 0.1$ )
  - \*\* path coefficient is significant in 0.05 ( $p < 0.05$ )
  - \*\*\*path coefficient is significant in 0.01 ( $p < 0.01$ )

Trust, inter-absorption, inter-dependence, cooperation affected EDI integration, usage width, usage quantity, diversity, and usage scope very much. Inter-absorption, inter-dependence and cooperation affected EDI usage level directly or indirectly and they affect SCM performance indirectly. Inter-dependency affect transaction cost reduction directly, but there is no indirect relationship through EDI usage level. And individual variables of EDI usage level affect directly to individual SCM performance variables.

EDI integration shows weak but statistically significant relation with process improvement. And EDI usage width affects positively to improve correctness but weak. EDI usage width and diversity have very significant relation with transaction time shortening, cost reduction, and process improvement. EDI usage width affects time shortening, improve correctness, cost reduction and shows very high statistical significance and path coefficient.

In the analysis result of inter-organizational characteristics, EDI usage level and SCM performance, trust, inter-absorption, inter-dependence, and cooperation affect positively EDI system integration. And inter-absorption affect EDI usage width, inter-dependence does quantity positively. In quality, the companies which show high degree of inter-dependence and cooperation handle various businesses with EDI.

The relation between inter-organizational characteristics and EDI usage level affect SCM performance partially and indirectly. And high trust relation lead time shortening, improve correctness, and cost reduction. So, [H1-1] can be adopted partially and [H2-1] adopted.

EDI integration, usage width, usage diversification, and usage scope are positive relation with inter-absorption and related to improve correctness and cost reduction. So, [H1-2] and [H2-2] can be adopted

But inter-adaptation was omitted because of low significance, and [H1-3] and [H2-3] were rejected. Inter-dependence positively affects EDI usage quantity, but there is no indirect effect path to business performance. So, [H1-4] was adopted partially but [H2-4] was rejected. Cooperation affects EDI integration, diversification, usage width positively and does time shortening, improve correctness, and cost reduction indirectly. So [H1-5] and [H2-5] could be adopted.

Whole variables of EDI usage level affected SCM performance positively. Specially, EDI usage width has strong relation with time shortening, cost reduction, and improve correctness. So the path of [H3] is suitable and [H3] can be adopted.

TABLE 6: HYPOTHESIS TEST

Path	Hypothesis	Results
Trust → EDI usage level	H1-1	Partially Adopted
Trust → EDI usage level → SCM performance	H2-1	adopted
Inter-absorption → EDI usage level	H1-2	adopted
inter-absorption → EDI usage level → SCM performance	H2-2	adopted
Inter-adaptation → EDI usage level	H1-3	rejected
Inter-adaptation → EDI usage level → SCM performance	H2-3	rejected
Inter-dependence → EDI usage level	H1-4	partially adopted
Inter-dependence → EDI usage level → SCM performance	H2-4	rejected
Cooperation → EDI usage level	H1-5	adopted
Cooperation → EDI usage level → SCM performance	H2-5	adopted
EDI usage level → EDI performance	H3	adopted

## Summary

The purpose of this study is to identify the inter-organizational factors that influence both the supplier-buyer's EDI utilization and the business performance in domestic retail industry.

In terms of successful supply chain implementation and operation, we deduced the structural factors in the context of the inter-organizational characteristics between mass merchandisers and vendors. This study therefore focused on suggesting the ways of managing the partnership in supply chain and conceptualizing the big picture of EDI development model in the scope of a retailer's IT strategy.

While applying the EDI utilization factors that have been experimented in previous researches, we explored five main inter-organizational factors to evaluate EDI utilization and SCM performance. A new modified research model was deployed and analyzed to identify the influential paths among three families of factors. The result of this study showed that the inter-organizational factors have both direct and indirect positive relations to EDI utilization and SCM performance at a significant level. Especially, a cooperation between retailers works for usage of EDI. Also the scope of EDI use has a relatively high impact on supply chain performance.

This paper implicates that it is important to leverage the level of organizational capabilities for the success of supply chain adoption and operation. In the stream of SCM initiatives from the manufacturing industry, retailers should concentrate on improving the inter-organizational environment and implementing the effective information technology for supporting business strategy.

# Offshoring of IT and IT-enabled Services: How Far Does India Benefit From Its Outsourcing Industry?

Anindya Bhattacharya, [anindyab@brooklyn.cuny.edu](mailto:anindyab@brooklyn.cuny.edu)  
Brooklyn College, City University of New York, USA

## Abstract

The literature on services offshoring typically focuses on the extent of job losses in the home country. The impact on recipient countries is rarely examined in the debate on offshore outsourcing. The purpose of this paper is to analyze the impact of offshoring in information technology (IT) and IT-enabled services (ITES), including business process outsourcing (BPO), on employment creation and technology diffusion/innovation gap in India. The paper concludes that being a service industry, the IT/ITES sector cannot be expected to solve India's massive unemployment problem. India needs to build labor-intensive, manufactured products, not just services, in order to create jobs for millions of educated but unemployed young Indians. Concerning technology diffusion/innovation gap, in spite of impressive progress achieved by Indian service providers, they continue to lag behind in high-end areas that call for creativity and innovation such as inventing innovative business products, and creating new global markets for such products.

## Introduction

A by-product of the "flattening of the earth" has been the freedom of global businesses to engage in "offshore outsourcing" – which is the business practice of relocating labor-intensive manufacturing or service functions from an internal to an external source anywhere in the world. From the business viewpoint, offshore outsourcing can provide dramatic cost savings, permit the fragmentation of the value chain, enable a company to concentrate on its core competence, and leverage resources to higher-value-added products and services in order to create sustainable competitive advantage (Brown and Wilson, 2005; Prahalad and Krishnan, 2004.) Although offshore outsourcing has been going on for a long time in countries like Ireland, Israel and Turkey, recently it has attracted a great deal of political attention recently due to the alleged "loss of domestic jobs" in the United States, Europe and elsewhere to China in the manufacturing sector and to India in the services sector.

A review of the literature reveals that a great deal has been written in the west on the economic and technological issues involved in offshore outsourcing of services, but such writings have focused exclusively on the pros and of "global labor arbitrage", the extent of job losses in the home (exporting) country, and the plight of the workers whose jobs have been 'Bangalored" (Simpson, 2004.) The development impact of offshore outsourcing of services in the host (recipient) countries is rarely examined in the ongoing western debate on outsourcing.

The purpose of this paper is to examine some of the economic and technological issues pertaining to offshore outsourcing in the IT/ITES-BPO service industry in India. Specifically, the paper examines the impact of offshore outsourcing on (a) employment creation in India, and (b) technology diffusion/innovation gap in India.

## An Overview of the IT/ITES-BPO Industry in India

India's \$30 billion plus export industry of IT/ITES-BPO has been growing at an impressive annual average rate of around 35 percent since FY 2002-03. The Tier I Indian companies (Tata Consultancy Services, Infosys, Wipro and HCL Technologies) regularly report double-digit growth in client base, sales revenue, and net profit. They rank among the top 14 largest IT companies in the world in terms of manpower, profitability, and stock market capitalization. These top four Indian companies register annual revenues of more than \$1 billion each, and together with Satyam, are also India's leading IT exporters.<sup>[1]</sup> (NASSCOM, Strategic Review 2005, and 2006.)

India ranks as the number one destination for offshore outsourcing of IT and ITES-BPO, accounting for nearly one-half of the highly competitive global outsourcing market. India is the second largest exporter of software in the world, and some 300 of Fortune 500 companies do business with Indian IT services companies. Twenty out of fifty best-managed outsourcing vendors in the world are based in India -- either captive companies of multinationals or local Indian companies.<sup>[2]</sup> In addition, India's top BPO firms generate huge revenues from foreign sources and employ a large number of people.<sup>[3]</sup> Thus, India has been able to build up valuable brand equity in this industry in global markets.

By 2010, the outsourcing industry is expected to account for seven percent of Indian GDP, attract one-third of all foreign investment in India, generate around \$60 billion in annual export revenues (35 percent of exports), and create more than one million additional jobs. In addition, this sector has fuelled the growth of a number of ancillary businesses such as transportation, real estate, hotels, catering, and so on, and has created 3 million additional jobs via indirect and induced employment. With some 1.6 million of India's vast and talented educated people currently working directly and indirectly in this sector, the outsourcing industry exercises a major influence on the Indian economy (NAASCOM, Strategic Review 2006; The McKinsey Quarterly, Special Edition 2005.)

India is the principal outsourcing destination because it combines the twin advantages of low-cost and high-quality labor. In addition, by this time the top Indian vendors have mastered multi-country service delivery capabilities, thus enhancing their usefulness. As the cliché goes, multinationals go to India for low cost (NAASCOM estimates that offshoring to India generated cost savings between 25 and 60 percent for the IT sector, and 78 percent for the ITES-BPO sector over the U.S. cost base) but stay for the high quality in software and business process services. India has the highest number of qualified engineers and the largest pool of offshore talent in the world (Paul, 2004.)

In the offshore outsourcing industry, India is the only country in the world that has the largest number (more than 400) companies possessing international quality certifications. Some 82 of these companies are assessed at Carnegie Mellon's Software Engineering Institute (SEI) Capability Maturity Model (CMM) Level 5 – the highest international standard for quality attainable in software development. India has more companies assessed at this quality level than any other country in the world. India also has numerous companies assessed at the International Standard Organization (ISO) 9000/9001-level certification standards for high-quality manufacturing. Many Indian companies have also implemented Six Sigma methodology – a corporate-wide approach for ensuring high-quality performance. In this sense, India has truly become a “quality knowledge hub – the world's leading supplier of human intelligence” (Department of Information Technology, Annual Report 2005-06, p. 2.)

## Local Employment

There is no denying that with offshore outsourcing the host country gains in terms of employment generation, but the absolute numbers in India are only superficially impressive and cannot possibly be expected to make a dent in India's overall unemployment picture.

### Static Employment Effects

Table 1 shows the growth of Indian software exports from fiscal year (FY) 2002-03 to 2006-07. As can be seen, total Indian software exports have been enjoying an annual growth rate of 35 percent, the IT component of which has been growing at 34 percent, and the ITES-BPO component at 35 percent in U.S. dollar terms.

TABLE 1: INDIAN SOFTWARE EXPORTS, FY 2002-2003 - FY 2006-2007 (US \$ BILLIONS)

Fiscal Year	IT Services & Software	ITES-BPO	Total Exports
2002-2003	7.1	2.5	9.6
2003-2004	9.2	3.6	12.8
2004-2005	12.2	5.1	17.3
2005-2006	17.1	6.3	23.4
2006-2007*	23.0	8.3	31.3

\* Estimated

Sources: Ministry of Finance, Government of India, Economic Survey, 2004-2005, pp. 147-148; NASSCOM Strategic Review 2005, and 2006, p. 28.

Table 2 shows the growth of employment in IT/ITES-BPO sector (the latter defined as customer care, finance, human resources, payment services, administration, and content development) in India from FY 2002-2003 to FY 2006-2007. As can be seen, total employment in this time-period grew at an annual average rate of 45 percent, employing some 1.6 million people in FY 2006-07.

TABLE 2: EMPLOYMENT IN IT AND ITES-BPO SECTORS IN INDIA, FY 2002-03- FY 2006-07 (THOUSANDS)

Fiscal Year	IT software exports	ITES-BPO	Total
2002-2003	205,000	180,000	385,000
2003-2004	270,000	253,000	523,000
2004-2005*	345,000	348,000	693,000
2005-06	878,000	409,000	1,287,000
2006-07*	1,085,000	545,000	1,630,000

\* Estimated

Sources: Ministry of Finance, Government of India, Economic Survey, 2004-2005, p. 148; NASSCOM Strategic Review 2005, and 2006, pp. 34, 156; NASSCOM, "Industry Trends", May 11, 2006.

Yet, in spite of these impressive statistics, the IT industry as a whole accounted for less than 5 percent of Indian GDP in FY 2005-06 and employed one million plus people in a land of more than a billion people. Of course, the outsourcing industry in India is expected to grow in the future to 7 percent of India's GDP and employ yet another 1 million people by 2008. Still, even these optimistic job numbers will still amount to barely over 1 percent of the massive Indian labor force estimated to be some 600 million people in this decade (Department of Information Technology, Government of India, 2005-06, 2003-04; The McKinsey Quarterly, Special Edition 2005.)

#### **Dynamic Employment Effects**

It is true that such static calculations do not take into account the dynamic spillover and multiplier effects of the IT/ITES-BPO industry on other tertiary industries such as transportation, construction, real estate, security, catering and hospitality, and so on. NASSCOM estimates that the outsourcing industry has created 1.3 million indirect and induced jobs in ancillary services. Undoubtedly, the outsourcing industry has generated a booming middle class of young professionals with high disposable income that is contributing to India's national income, tax revenue, and an increase in consumer spending, particularly in real estate, construction, shopping malls, hotels, airlines, and mobile phones. The industry has also brought to the international forefront India's attractiveness as an investment destination, and this "prestige" factor is hard to quantify. Lastly, it has contributed to a reversal of the "brain drain" as expatriates of Indian origin return to India for good.

In particular, the BPO sector, including its knowledge-process outsourcing (KPO) sub-sector, has enormous job-creating potential in the future in such activities as corporate planning, market research, investment valuation research, patent filing, legal and insurance claims processing, biotechnology, pharmaceuticals, healthcare, business and commercial information, distance learning, and many more. By 2007, the BPO sector in India is estimated to bring in \$16 billion in revenues, capture some 49 percent of the overall offshore BPO market, and the KPO component of this sector is expected to create 300,000 jobs by 2010 (NASSCOM, Strategic Review: 2005; Confederation of Indian Industry, 2005.)

#### **Dichotomous Development**

Taking into account both the static and dynamic factors, the outsourcing industry will probably employ some 5 percent of the Indian labor force by 2008. However, this is a highly optimistic scenario. Ironically, as the top Indian vendors move up the "food chain" from BPO/KPO, design, programming, testing, maintenance and documentation tasks to higher value-added services such as product development, customization, system integration, IT consulting, and business consulting, such higher-end services require less and less labor. Also, some of the remote work that used to be performed out of India by Indian service providers is now being done out of other low-cost, talent-rich locations like China, Vietnam, and Eastern Europe. In addition, only about 25 percent of some 400,000 engineers

graduating annually in India are suitable for offshoring jobs at multinational corporations, and the top Indian companies recruit only about 1 percent of job seekers (The McKinsey Quarterly, 2005: 3.)

India has more than 40 million people looking for work, and an additional 35 million will join the labor force by 2008. The vast majority of educated young people in India, numbering some 200 million, are outside the elite loop of outsourcing since they are not employable in the industry due to lower-quality educational institutions they graduate from. In fact, the educated youth would probably comprise more than half of India's unemployed within the next decade and could constitute a "ticking bomb" for India if the economy does not create enough jobs for them (Basu, 2004; The McKinsey Quarterly, 2005: 3.)

Creating jobs for all these millions of unemployed Indians will require more than nurturing the outsourcing service industry alone. Only labor-intensive manufacturing can provide jobs on such a scale. India may have "missed the boat" with respect to Chinese-style low-cost, labor-intensive manufacturing, but India may have some advantages over China in "discreet" manufacturing or manufacturing activities that requires engineering skills (Joshi, 2004; India Abroad, February 16, 2007.) Without this job-creating possibility, however, as the "enclave" thesis maintains, the outsourcing industry in India will probably end up by creating "pockets of affluence" in sumptuous suburban campuses, leading to a highly dichotomous development process (Asian Development Bank, 2004; Joshi, 2004.)

## **Technology Diffusion/Innovation Gap**

In spite of impressive progress made by top Indian software companies in moving up the value chain to higher-level, sophisticated services, the fact remains that so far they still operate as "low-cost/high value" service providers. They have not yet reached the stage where they are able to manufacture, commercialize, market, and export a technological final product. Hitherto, the elite Indian companies have shown few signs of causing "new market disruptions" and are quite content to be "low-end disrupters" rather than innovators. Thus, even though India has gained by way of technology diffusion from western multinational companies, the innovation gap continues to persist.

Certainly, the more advanced Indian companies today have gone far beyond the traditional "hub-and-spoke" model in which strategic functions (such as innovation, business consulting, IT consulting, defining requirements, etc.) are generally retained in the home country, while non-strategic, labor-intensive activities (such as design, programming, testing, documentation, maintenance, etc.) are typically outsourced (Simpson, 2004.) These sophisticated Indian companies have moved up the value chain by going beyond the traditional project-oriented, technology-specific outsourcing contracts to an integrated "global onshore-offshore delivery model." This model involves "cross-selling and up-selling" a broader range of complex and higher value-added, domain-focused, services and solutions (such as business portfolio analysis, change management, sales and marketing relationship management, supply chain management, defining the client's market in relation to competition, packaged applications implementation, custom application, IT consulting, R&D, product design and development, remote network management, and systems integration.)

The Indian service providers are acutely aware of the fact that in this era of globalization of the services industry (particularly financial services), an outsourcing partner must provide services on the business and process side (such as time to market, customer relationship management, operations management, and the like), not just on the technology side. Therefore, top Indian companies are delivering domain knowledge in key verticals (industry-specific) such as financial services, health care, manufacturing, retail, life sciences, telecom, media, and so on. They have developed cost-effective processes for managing large-scale projects in distributed locations combining customer-side activities with development activities (Murthy.)

The BPO industry too is moving up the value ladder from providing horizontal low value/high volume communication and data-driven activities to delivering vertical high value/low volume analytics-based, knowledge-processing services (such as clinical data management, biometrics, market research, financial research, securities processing and lending, risk management, real estate management, fund management, actuarial modeling, insurance claims processing and underwriting, medical, accounting, legal work, and so on.)

Thus, the top Indian companies have been able to put together multicultural teams consisting of IT specialists, management specialists, domain experts, and behavioral experts from multiple countries in order to deliver customer-focused consulting and technology package deals to multinational clients (NASSCOM, Strategic Review, 2005.)

Today, India has emerged as a major global design center for higher-end technological tasks that were not outsourced before. In particular, Bangalore has been able to attract several creative/planning jobs, including high-tech product development, product design, software architecture, content development and design, and R&D. Multinational companies like IBM, General Electric, Motorola, Intel, and Microsoft have opened cutting-edge R&D and technology design centers in Bangalore and elsewhere. Famous Indian companies can deliver some very advanced engineering design and development work in large-scale projects (including aerospace) in distributed locations anywhere in the world (NASSCOM, Annual Report 2004-05; NASSCOM, Strategic Review 2005.)

#### **Role of the Indian Government**

The Indian government's support of the software industry, coupled with economic liberalization measures, has certainly been conducive to the success of the Indian outsourcing industry.<sup>[4]</sup> The overall result of the government-supported free environment for the high-tech sector was to create a highly competitive environment for the Indian firms, which were forced to adopt world-class infrastructure, quality control processes, and human resource management practices. Now the Indian government needs to introduce "second-generation" reforms in the field of education by privatizing higher education institutions, enlarging the number of engineering Ph. D candidates, introducing meritocracy in the academic labor market, and increasing faculty salaries to industry level. The issue of the quality of training of workers in the outsourcing industry, particularly in managerial and marketing skills, is going to be problematic for India in view of poor faculty salaries and deteriorating physical infrastructure, even in elite universities and technical institutes (Murthy, 2004; Singh, 2004.)

#### **Looming Problems on the Horizon**

The conventional wisdom concerning India's strong fundamentals in offshore outsourcing stresses the level of government support, quality of the labor force, proficiency in English, entrepreneurial culture, project management skills, and exposure to new technologies (Department of Information Technology, Government of India, 2003-04.) Such a rosy picture explains only part of the story. The so-called Indian advantages mentioned above might dissipate over time due to a variety of reasons over which the Indian companies may not have much control.

First, offshore outsourcing is a part of the strategic planning process of a multinational company in which a host of variables (including relative labor costs, logistics costs, customer requirements, time to market, skill levels and business experience, size of the local market, infrastructure facilities, and political and currency risks) enter into management calculations concerning the choice of an outsourcing location. The "portfolio approach" to offshoring maintains that spreading outsourcing relationships across a basket of low-cost regions and countries reduces risk and increases potential reward for a multinational company. Recent trends in outsourcing show a shift away from the client's reliance on a single vendor to provide end-to-end services (or the entire spectrum of outsourcing services including IT consulting, application outsourcing, BPO, and infrastructure outsourcing) to "unbundling" requirements, and opting for "hybrid structures" or "extended organizational forms." The latter involve partnering with a network of multiple "best-of-breed" service providers in specific areas of their strengths such as application development or industry-specific expertise. These relationship-seeking, rather than transaction-focused, customers expect vendors to simultaneously bring to bear technical knowledge, industry knowledge, knowledge of competitors and market trends (Vestring, Rouse & Reinert, 2005; NASSCOM, Strategic Review: 2005.)

Secondly, India's current cost/quality advantage faces serious competition from rival locations such as China, Vietnam, the Philippines, South Africa, Russia, the Czech Republic, Hungary, Poland, and Canada. This competition will be particularly problematic if wage pressures continue to build up in India, attrition rates (currently ranging from 35 to 45 percent in call centers) in the ITES sector continue to skyrocket, and faculty shortages at the post-graduate level continue to mount. If multinationals are flocking to India now to set up captive units (they have 40 percent share of the BPO market in India), they are doing so to fill a particular gap (e.g., labor-cost gap, talent supply gap, etc.) at a particular point in time. History has taught us that one can never be sure that multinationals will remain in one particular location such as India (or any other place for that matter) over the long haul.

Already, there are signs that India's labor advantage is dwindling due to rising wages, high turnover rates, and a shortage of skilled manpower. It is estimated that demand for qualified IT professionals will outstrip supply in India soon, resulting in further wage pressures and higher attrition rates (ranging from 15 to 30 percent) in the near term. India's cost advantage may be cut in half by 2007, and the current wage differential of 35 percent for higher-end services might shrink to 9-to-18 percent. It remains to be seen whether the elite Indian educational institutions (seven Indian Institutes of Technology and six Indian Institutes of Management) will be able to produce sufficient trained professionals to meet increased demand, and even if they do, quality of training might suffer due to heightened pressure to meet this demand (NASSCOM, 2006; McKinsey, 2005 Special Edition.) Interestingly, due to acute competition for this limited pool of talent, high-prestige Indian companies like Infosys that used to recruit only from the top engineering and management colleges in India are now hiring graduates from lesser-known educational institutions and offering them lower salaries.

Concerns over heightened competition, rising labor costs, high attrition rates, and future growth prospects are reflected in the generally declining prices of stocks (American Depository Receipts) traded on Wall Street of the top Indian vendors – Wipro, Infosys, Satyam, TCS, and HCL. Further, until recently, India attracted only 5 percent of the total venture capital/private equity invested in Asia, as compared to 40 percent for China including Hong Kong. And over 90 percent of these so-called “risky” investments in India were in fact made only in existing, profitable, top Indian companies. Only now private equity capital is pouring into India in a big way.

Yet, Wall Street analysts are puzzled by the ability of these Indian companies to generate double-digit (in the range of 30-40 percent) revenue growth, deliver high profit margins (earnings before interest, tax, depreciation and amortization/revenue) of about 30 percent, maintain high price-earnings ratios at more than 20 on average for the top companies, and ensure stability in client billing rates despite rising wage pressures in the Indian labor market (Pradhan, 2003; NASSCOM, Strategic Review: 2005.)

While the concerns of Wall Street analysts about long-term growth prospects for these companies may be legitimate, it appears that in the near term (over the next 2 to 3 years) there is enough room for these world-class Indian companies to grow in attracting clients from Fortune 500 and Fortune 1,000 companies. While salaries and bonuses of IT professionals have been increasing at a rate of about 10 to 15 percent annually, billing rates vis-à-vis large clients have been remarkably stable, going up by one-half the rate of growth in salary cost. Indian vendors have managed to withstand higher cost pressures due to declining telecom and infrastructure costs, moving to higher-yield services such as consulting, package implementation, running thinner but more efficient operations, and achieving improvements in scale economies and productivity.

#### **Competition from China**

In the long run, however, of all the possible competitors to India in offshore outsourcing, it is China that poses the gravest threat. China is investing heavily in producing English-speaking engineering graduates and software professionals, and these investments are expected to bear fruit in about a decade's time. However, as of now, China's IT services industry remains highly fragmented, consisting of multiple players (some 15,000 service providers), the majority of which are small players based in one particular city or province with less than 15 employees doing basic programming and niche applications. Chinese IT firms do not yet possess the size and expertise needed to attract large international clients.<sup>[5]</sup>

The current Chinese situation is subject to dramatic change with time. With greater consolidation under government pressure, improved talent base, tax incentives, “single window” processing, and lower power costs, the fragmented IT industry in China will in all likelihood regroup fast, posing a serious threat in the future to India's dominant position in the outsourcing industry. China outbids India by at least a 5:1 factor in attracting foreign direct investment, accompanied by a great deal of technology transfer and R&D placement, some of which will most likely spill over into the IT sector. Already, clusters of excellence are emerging in northeastern China, attracting multinational companies like IBM, General Electric, and Accenture.

The major Chinese weaknesses are lack of intellectual property rights protection, and low level of innovation. In addition, India has certain highly visible weaknesses, such as deteriorating physical infrastructure, perpetual power blackouts, and the like that China does not have, at least to that extent. The so-called Indian advantage over China in the English language may not be material in the outsourcing industry, except in call centers and transaction processing. In any case, since 1992, English has replaced Russian as the main foreign language

taught in Chinese schools, and it will probably take a decade or so before the Chinese become functionally proficient in English (The McKinsey Quarterly, (1), 2005.)

Of course, the India-versus-China competitive scenario does not necessarily have to be phrased in “either-or” term. In typical eclectic Asian fashion, it can be phrased in “this-and-that” term. The size of the outsourcing pie may be large enough to accommodate both of them with different specializations for each player, i.e., offshoring work for India, and captive work for China. This is precisely what the Chinese Prime Minister had in mind when, in his last visit to India in April 2005, he invoked the “two pagodas” alliance in which China would concentrate on hardware and India on software. The technological collaborative agreements between China and India, signed in New Delhi in April 2005, open up new vistas for the outsourcing business, dominated by the Chinese in the manufacturing sector and by the Indians in the services sector.

The top-tier Indian companies have already set up software development centers in China to take advantage of lower-cost skills, and the Chinese manufacturers are in the process of entering the vast market of India. The entry into each other’s huge markets will hopefully enable both countries to become global players in a bigger way. The Indian vendors, with their diversified service portfolio, deep industry-specific expertise, and far-flung, worldwide operations, are well poised to meet the multinational clients’ needs.<sup>[6]</sup> They are also operating in other low-cost, talent-rich areas such as Vietnam, Brazil, and Eastern Europe. Thus, the leading Indian vendors have proven capability to deliver multicultural teams in distributed geographies to serve global clients efficiently in both onshore and offshore locations.

#### **Role of the Hardware Sector**

In reality, though, probably one reason why India will continue to be the preferred destination for offshore outsourcing in high-tech services is the correlation between low wages and low capacity for technological competitiveness and innovation. Studies have shown that India ranks the lowest among top countries in the world in technological capacity and competitiveness, i.e., the ability to manufacture, commercialize, market, and export a technological final product (Simpson, 2004.)

Table 3 shows that in IT/ITES-BPO exports out of India, services account for more than 96 percent of revenue generated, and the share of hardware (e.g. electronic product development) is negligible amounting to less than 4 percent. The reasons behind this poor showing of the hardware sector include lack of domestic availability of inputs, government controls on imports and capital goods, inflexible labor laws that discourage entrepreneurship, poor infrastructure, and high interest rates – all contributing to a high-cost structure for hardware exports (Paul, 2004; NAASCOM, Strategic Review 2005.)

TABLE 3: COMPOSITION OF INDIAN IT-ITES EXPORTS, FY 2003-04, 2004-05 (PERCENT)

	FY 2003-04	FY 2004-05
IT Services & Software	69.1	67.8
ITES-BPO	27.0	28.4
Hardware	3.8	3.7

Source: NAASCOM Strategic Review 2005, p. 27.

Table 4 shows that in the Asia-Pacific region India ranks only number 6 in total R&D spending on information and communication technology.

TABLE 4: TOTAL INFORMATION AND COMMUNICATION TECHNOLOGY SPENDING (\$ MILLIONS), 2004

Country	Spending
Japan	425,095
China	110,468
South Korea	61,921
Australia	37,223
Taiwan	33,966
India	28,247

---

The manufacturing of electronic hardware (such as semiconductors and other components) is characterized by high fixed costs and calls for large-scale investments in R&D and infrastructure that are not in the cards in India. Neither does India possess global product marketing skills on a big scale. Unlike East Asia, India's development policies have not supported the emergence of an export-led, world-class manufacturing industry. The "triple disconnect" in the Indian outsourcing industry between hardware and software, foreign and domestic markets, and services and products is a matter for concern (D'Costa, 2004.)

#### **Shortcomings of the Indian Service Providers**

Generally, only the leading Indian software service companies are able to offer a wide-ranging bouquet of global services ranging from IT infrastructure, and software testing to BPO, IT architecture, and IT consulting. But even they do not have the global reach of western multinationals like IBM, Accenture, and EDS

Only a few elite Indian companies such as Wipro and Satyam have engaged in "big leaps" such as "string-of-pearls acquisitions" of major western companies. Probably out of fear of depressing the high price of their stocks, other Indian companies have undertaken joint ventures, strategic alliances, and relatively small, "tuck-under acquisitions" in niche areas across geographies to broaden their capabilities in setting up "near-shoring" facilities (local centers for clients that are not ready yet to outsource to distant locations) to serve their clients in the West. The presence of Indian companies in strategic consulting (management consulting or business process re-engineering) is negligible largely due to perceived inadequate intellectual property protection laws in India.<sup>[7]</sup> (Pradhan, 2004.)

Generally, Indian software companies have a long way to go before they can arrive at the product development, commercialization, and marketing stage. They continue to remain masters of processes involved in managing distributed work across geographies in a "flat" world, usually on a point-to-point basis. Achieving global status in hardware assembly work will call for substantial investments in physical infrastructure, which are not forthcoming in view of the large fiscal deficit and public debt in India. Currently, infrastructure investment in India amounts to only 6 percent of GDP or half of the Asian average and will continue to pose a serious bottleneck problem in the future (IMF Survey, 2005.)

By far the most important challenge that Indian software companies face in becoming truly global players is changing the mindset away from sustaining their cost/quality advantage via the "average revenue realized per employee" route to becoming "disruptive innovators" or "leapfrogging the competition and dislodging the entrenched market leaders." The leading Indian software companies have succeeded in becoming "low-end disrupters" based on their low-cost/high quality business models such as the Global Delivery Model. However, in order for them to remain competitive in the global market place in the long run, they need to move into "new market disruptions" or create new markets for their patentable innovative products where no such markets currently exist.<sup>[8]</sup>

So far, even the elite Indian software companies have shown few signs of becoming new market innovators and are quite content to be order-takers rather than innovators. They have focused on global service delivery models that emphasize delivery client value via integrating "packaged software" created initially by western multinationals. These "service-only" Indian companies have done very little software product innovation and have yet to develop software products that could sell in global markets. They have indeed developed "incremental" process innovations that are tailored to delivering low-cost services to local customers, particularly in the rural areas of India. However, breakthrough "disruptive" innovations with a global impact are still missing (Pradhan, 2003.)

## **Conclusions**

India's number one priority is to create employment for its unemployed educated youth. In the short run, there is no denying that the IT/ITES-BPO industry has created an employment base in India, with all its spillover benefits, that did not exist before. However, the outsourcing industry cannot possibly be expected to be a panacea for India's massive unemployment problem. In fact, this industry is caught in a "Catch 22" situation with respect to creating employment. The employment-creation prospects are the highest at the bottom of the "food chain", that is in the

BPO/KPO segments. However, in order to satisfy client demands, as the Indian software vendors move up the value ladder to higher value-added services such as consulting, application management, networking, and the like, the need for labor in these higher-end services becomes less and less.

India needs export-led, labor-intensive manufacturing to create jobs for its vast masses of unemployed but educated people. In other words, India needs to build products, not just deliver services. The Indian strategy of “leapfrogging” into the big league of advanced nations by exporting high-tech services without first going through the manufacturing export stage is unprecedented in history. But its long-term success remains to be seen in view of acute competition stemming particularly from China, and the fact that the industry will reach its maturity stage in the not-so-distant future. So far, even the elite Indian software companies have succeeded only in becoming masters of “incremental” process innovation and “low-end disrupters” based on their low-cost/high quality business models such as the Global Delivery Model. They have not been able to become masters of product innovation or “new market innovators” in creating new global markets for innovative products.

The high-end technological work being done out of India is essentially tailored to fit the needs of distant users implying little interaction with India’s domestic economy. Still, there is no question that the organizational capabilities developed by the IT/ITES-BPO services sector can serve as a model for the rest of the Indian economy. The high-tech services sector has been less regulated and taxed than other sectors. This, coupled with liberalization and the consequent unleashing of the power of human capital, has catapulted India as one of the leading economic forces in the world, and certainly as the undisputed leader in services outsourcing. Thus, the success of the software industry has had a profound “demonstration effect” on the whole of India.

The challenge for India now is how to extend the global success of the outsourcing industry to the manufacturing, construction, real estate, retail, tourism, and infrastructure sectors of the economy, all of which are labor-intensive. In a nutshell, the challenge for India is to make high technology work for millions of unemployed yet educated Indians. Short of this, the contribution of this industry towards promoting economic development in India will remain questionable, and the industry will probably remain yet another elite enclave (with limited linkages to the rest of the domestic economy) enhancing the existing pervasive inequality in India.

## End Notes

<sup>[1]</sup>The tier-1 Indian companies include Tata Consultancy Services, Wipro, Infosys, and HCL Technologies, while the tier-2 companies include companies like Satyam. Cognizant Technology Solutions is excluded from this analysis since it is a U.S.-based company with development centers in India.

<sup>[2]</sup>These companies are: IBM Global/Daksh, Accenture, Hewlett Packard, Mphasis, Wipro Spectramind, ICICI OneSource, Sutherland Technologies, Hewitt Exult, HCL Technologies, Satyam, Northrop Grumman Information Technology, Infosys, Getronics, Spherion, i-Flex, Siemens Business Services, Datamatics, i-Gate, Perot, and Patni Computer. See Brown and Wilson, 2005, 159-163.

<sup>[3]</sup>In terms of full-time employees hired in FY 2005-06, the top 10 BPO vendors in India were: Wipro BPO, Genpact, IBM Daksh, WNS, Mphasis BPO, HCL BPO Services, ICICI OneSource, Progeon, and ExI Service Holdings. See NASSCOM, "ITES-BPO Market: Facts and Figures", June 6, 2006.

<sup>[4]</sup>The first-generation economic reforms, initiated in 1991, decentralized decision-making authority from the central government to regional and state governments, allowed software companies to raise capital through the equity market, introduced current account convertibility of the rupee, made access to foreign currencies easier (thereby promoting overseas travel, establishment of overseas sales offices, and hiring of foreign consultants), and allowed 100 percent foreign ownership of Indian subsidiaries (thus facilitating the entry into India of multinational companies.) Most software imports were brought under the Open General License Scheme, and the duty on software imports was eliminated. The corporate tax rate was reduced, and estate tax was abolished. The government also allowed Indian companies to list on foreign stock exchanges such as NASDAQ. Finally, the IT sector was exempted from labor regulations concerning working hours, and overtime pay. See Murthy, 2004.

<sup>[5]</sup>The top 10 service providers in China control only 15 percent of the regional outsourcing market, compared with 45 percent market share for India's top 10 suppliers. China does not have brand names in the outsourcing industry whereas India has several, i.e., the top-tier Indian companies. Only 6 of China's 30 largest software companies are certified at levels four or five of CMM, while all of the 30 top Indian companies are certified at these levels. India's IT and ITES-BPO exports are generally double the amount exported by China. See The McKinsey Quarterly, 2005:1.

<sup>[6]</sup>See comments made by Nandan M. Nilekani, Managing Director of Infosys, in interview with a New York Times columnist in [www.infosys.com/media/playing\\_field.asp](http://www.infosys.com/media/playing_field.asp). Satyam maintains an overseas presence in 46 countries, Wipro in 35 countries, Tata Consultancy Services in 33 countries, Infosys in 17 countries, and HCL Technologies in 15 countries. See [www.tcs.com](http://www.tcs.com), [www.wipro.com](http://www.wipro.com), [www.infosys.com](http://www.infosys.com), [www.satyam.com](http://www.satyam.com), and [www.hcltech.com](http://www.hcltech.com)

<sup>[7]</sup>Computer software is protected by the Indian Copyright Act, which did not prohibit reverse engineering, thereby causing a great deal of anxiety to the outsourcing industry concerning piracy of intellectual products. Recently, an amendment to the Indian Patent Act has been proposed to protect software product. However, neither the Indian Penal Code nor the IT Act of 2000 deals adequately with emerging cyber crimes. See NASSCOM, Strategic Review 2005, pp. 172-173, and CNET News.com, June 29, 2005.

# R&D Outsourcing, Technology Characteristics, and Corporate Performance: Evidence from Japanese Manufacturing Firms<sup>1</sup>

Akihiko Kawaura, *akawaura@mail.doshisha.ac.jp*  
Doshisha University, Japan

## Abstract

This paper is an attempt to investigate research and development (R&D) activities of Japanese manufacturing companies. Traditionally, Japanese firms conducted most of their R&D within their own organizations. In the past decade, however, their behavior shifted in the direction of greater R&D cooperation with outside organizations such as other firms, research institutes and universities.

## Introduction

Figure 1 demonstrates this trend in terms of the share of corporate R&D disbursements that fund external R&D activities.<sup>2</sup> The share remained 6-7% in the 1980s and until mid-1990s, and began to increase during the second half of the 1990s to exceed 11% in 2003 and 2004. This observation merits attention, as it may represent a more comprehensive shift in the inter-firm relationship among Japanese companies. Transactions with non-affiliated firms were basically limited to those conducted in the context of the buyer/seller of inputs such as raw materials, intermediate goods, and services.

Figure 1. External R&D Activities Share: Japanese Manufacturing Firms 1979- 2004

In the process of surviving the post-bubble recession of the 1990s, however, many Japanese companies began to seek inter-firm cooperation as a means to best utilize their resources. The rise of the R&D outsourcing is an

example of this effort, and its investigation could lead to a better understanding of the emerging alliance among Japanese companies.

This paper examines the outsourced external R&D from the perspective of its relationship with the internal R&D activities. An important issue is whether firms' inventive activities conducted outside their organizations substitute or complement their internal efforts. When they are substitutes, the choice between internal and external R&D is mainly a matter of cost minimization. Firms outsource part of their inventive activities when they judge it to be cost reducing. In case internal and external R&D efforts are complements to each other, however, an increase in internal activities will also make R&D outsourcing more productive.

This relationship between internal and external R&D could be discussed in the context of industry's technology characteristics. Products and the industry supplying them can be classified according to technological features behind them. As Clark and Fujimoto (1991) discussed, automobiles are designed with a closed system of interface among component parts that are in many cases unique to individual manufactures. On the other hand, personal computers (PCs) manufacturers build their products by assembling modules whose designs are more universally common. Under the former circumstances, outsourcing R&D activities may be difficult, as a close exchange/sharing of concepts and design information among companies is necessary for successful cooperative innovation. In the latter case, however, it should be easier to utilize external R&D resources: Integrating fruits of inventive activities from different sources is one of their technological features. These technology characteristics could dictate the extent of R&D outsourcing observed in various industries.

Following empirical analyses will identify manufacturing sectors that exhibit a greater degree of R&D outsourcing, and discuss if general perception of their technology features is consistent with the results. It will be then tested if the difference in the external R&D utilization is a factor to explain firm performance variation.

## **Determinants of External R&D Activities**

The data for quantitative analyses are from the *Basic Survey of Japanese Business Structure and Activities (Kigyo Katsudo Kihon Chosa*, in Japanese) conducted by the Ministry of Economy, Trade and Industry (METI). METI initiated this exercise in 1992, and has since 1994 made it an annual survey to collect wide-ranging information from individual companies.<sup>3</sup> The survey provides a comprehensive dataset for a large number of firms as it covers firms larger than the threshold of 50 employees or 30 million yen of paid-in capital. The sample sizes of the 2005 and 2004 survey, for example, are 28,314 and 26,634 respectively.

This research uses data from 1995-2004 surveys that report corporate data of 1994-2003 fiscal years. After elimination of data for non-manufacturing firms, the 10-year panel contains 63,571 samples from 11,665 companies. Summary statistics of sales, internal R&D/sales, and external R&D/sales are shown in Table 1, together with sample numbers in individual industries. Figure 2 demonstrates the combination of internal and external R&D size by the 16 industries that exhibit average internal R&D expenditures at least 1% of sales. The first analysis examines a firm's external R&D activities as a function of (i) sales and (ii) internal R&D activities. The industry effect is depicted through the use of industry dummy variables, which are specified for the 16 industries in Figure 2.

TABLE 1: SUMMARY STATISTICS: SALES, INTERNAL R&D/ SALES AND EXTERNAL R&D/SALES

Variable	Mean	Std. Dev.	Min	Max
Sales (million Yen)	34404.61	197516.3	55	9104792
internalR&D/Sales	.01933	.03094	0	2.04082
externalR&D/Sales	.00118	.01094	0	2.15306

(sample numbers in respective industries)

food: 6010	drink & tobacco: 1159	textile: 1632	clothing: 794
wood: 369	furniture: 889	paper & pulp: 1241	print: 927
pharmaceut: 1984	chemical: 5834	oil & coal: 353	plastic: 3131
rubber: 853	tan & fur: 210	ceramics: 2599	iron & steel: 1354
nonferrous metal: 1519		metal: 4366	general machinery: 8946
electric machinery & equipment: 5640		telecommunication: 1567	electronics: 3465
automobile: 4204		non-automobile transport: 933	
precision machinery: 2170	others: 1422		TOTAL: 63571

Figure 2. Internal/ External R&D relative to Sales by Industry: 1994- 2003

Regression results are shown in Table 2. The specification (1) includes sales, (Sales), internal R&D activities relative to sales (intrRD/Sale), its squared value (intrRD/Sale-SQ) and 16 industry dummies as explanatory variables. The sales variable enters the regression after being adjusted for inflation by the CPI index (2000 constant price). Three observations are derived from the results. First, a large firm tends to engage in more external R&D, as

implied by the positive and statistically significant coefficient of sales variable. Second, the coefficients combination of  $(\text{intRD}/\text{Sale})$  and  $(\text{intRD}/\text{Sale-SQ})$  indicates that the external R&D activities decrease until  $(\text{intRD}/\text{Sale})$  reaches 0.125, from where external R&D increases. In view of the sample average internal R&D ratio of 0.019, it means that internal and external inventive efforts are substitutes for most of the firms. Third, firms in pharmaceutical, chemical, general machinery, electric machinery & equipment, telecommunication machinery & equipment, electronics machinery & equipment, and precision machinery industries exhibit external R&D activities that are relatively larger than other industries.

The specification (2) includes dummy-interactive variables in order to investigate the size effect as well as the relationship between external and internal R&D that are specific to individual industries. An interesting finding is that statistically significant coefficients of  $(\text{intRD}/\text{Sale})$  and  $(\text{intRD}/\text{Sale-SQ})$  that enter as dummy-interactive variables reveal that internal/external R&D relationship are not uniform across industries. In Table 3 is this R&D relationship categorized for 16 industries.<sup>4</sup> In electronics industries, for example, the peak of external R&D takes place at  $(\text{intRD}/\text{Sale})$  of 0.838, while the industry average  $(\text{intRD}/\text{Sale})$  is 0.025. This implies that, for most electronics companies, external R&D rises at a decreasing rate as internal R&D activities increase. This complementarity between two types of R&D activities is also observed for the electric machinery & equipment industry. In five industries, on the other hand, external R&D is characterized by a switch from substitutes to complements to internal R&D over the  $(\text{intRD}/\text{Sale})$  range that covers three standard deviations from the industry average. They are pharmaceutical, ceramics, general machinery, telecommunications, and automobile industries.

TABLE 2: DETERMINANTS OF EXTERNAL R&D/SALES: 1994-2003 PANEL ANALYSIS

TABLE 3: RELATIONSHIP BETWEEN INTERNAL R&D AND EXTERNAL R&D

Relationship	Industry
Complements	Electric Machinery & Equipment / Electronics
Substitutes / Complements	Pharmaceutical / Ceramics / General Machinery / Telecommunication / Automobile
Substitutes	Textile / Chemicals / Oil & Coal / Plastic / Rubber / Tan & Fur / NonFerrous Metal / NonAuto Transportation / Precision Machinery

In these seven industries where internal and external R&D activities could be complementary to each other, it is important for a company to develop in-house innovative capabilities for two reasons. First, integration of fruits of outsourced R&D activities into internal innovation requires substantial technological expertise. The second factor, which is related to the first, is the “learning” aspect of the internal R&D process.<sup>5</sup> With accumulation of internal inventive efforts, a company is able to gain better assessment of various options of external R&D, and to identify the most suitable partners and projects.

Technological features of these industries demonstrate the importance of interface between internal and external innovations. Companies in electric machinery & equipment, telecommunications, and electronics industries compete in markets of high-technology products that combine frontier knowledge both in software and hardware. They allocate their own R&D resources to seek for the breakthrough core innovations while outsource inventive activities on the module part of the products. The internal R&D is important not only for its own sake, but also to create and maintain a promising pipeline of external R&D projects. The automobile industry, which is characterized by the “integral” technology, also shows complementarities between internal and external R&D, particularly for those firms with a high R&D intensity. Integrating innovative component parts to the entire automobile design system is a difficult task, which might be feasible only for companies with substantial internal technological capabilities. Once this option is available, however, new product development becomes more efficient by making use of the resources available outside. The drug industry is another industry where internal and external R&D activities are mutually enforcing. After chemical compounds are identified for the new drug, they have to be tested for clinical use. In both stages, a close R&D cooperation with universities and hospitals are crucial.

It is notable that the industries where internal and external R&D are substitutes include mature industries with a limited role of technological innovation, such as oil & coal, plastic, rubber, and tan & fur. The importance of maintaining internal inventive capacities could be lower for those industries where competition does not necessarily take place on the technological frontier. In this case, utilization of R&D outsourcing may lead to curtailment of internal innovative activities, hence substitutability between internal and external R&D.

## **External R&D and Corporate Income**

This Section will extend the analysis of two types of R&D, and investigate the performance consequences of the R&D outsourcing. The corporate performance is gauged by the operating income, as this measure reflects effects of technological innovation both on sales (through product innovation) and costs (through process innovation) while excluding influences of peripheral factors for manufacturers such as returns on securities and sales of real estates. The dependent variable is the operating income relative to sales, and explanatory variables include sales, internal R&D relative to sales, external R&D relative to sales, and product of external R&D and internal R&D. Squared values of both internal R&D relative to sales and external R&D relative to sales enter the regression as well. Industry dummy interactive variables are also added in order to isolate industry effects.

The regression results are in Table 4. The coefficients combination of internal R&D relative to sales (2.063) and its squared value (-12.145) means that income increases as a company expands its internal R&D up to the point where it reaches 0.085 (8.50%) of sales. As the sample average of this ratio is 0.019 (with the standard deviation of 0.031) from Table 1, this result implies that innovative activities are performance enhancing options for most of the firms in the sample.

Precision	1.907 (1.27)	-35.457 (1.20)	-8.371 (0.92)
Adjuted R <sup>2</sup>	18.05		
Wald-Chi	8691.37		

Note: z-statistics are in parentheses. \*\*\*Statistically significant at the 1% level.

\*\* Statistically significant at the 5% level. \*Statistically significant at the 10% level.

When industry-specific internal R&D coefficients (that are statistically significant) are incorporated, however, this relationship is reversed and internal R&D proves to be performance reducing at their industry mean internal R&D level for 13 industries.<sup>6</sup>

One interpretation of this result is that these industries with dummy variables are manufacturing sectors with relatively high R&D intensity, and companies are operating at the margin where their internal R&D efforts are designed to be profit maximizing. The regression shows that their profit decreases at their mean internal R&D, reflecting the extent that inventive activities involve risk.

The last column of Table 4 shows that the coefficients of the product of external R&D and internal R&D are positive and significant for pharmaceutical, chemicals, and electronics industries. Firms in these industries compete for technological innovation, and this result confirms the importance of utilizing internal as well as external inventive resources for corporate success in these industries.

## Concluding Remarks

This paper reports early findings of the analysis of the corporate data collected in the *Basic Survey of Japanese Business Structure and Activities*. The first regression indicates that, in sectors that are characterized by technological competition, R&D activities outsourced by manufacturers are complements to the R&D activities that these firms conduct within their organizations. This relationship may reflect the keen pressure for innovation, where

in-house R&D capabilities are crucial for companies' own innovation as well as exploiting technological expertise available in the markets. The second analysis is an attempt to identify the corporate performance consequences of R&D activities, both internal and external. While a counter-intuitive observation is derived that internal R&D is not performance enhancing in many high R&D intensity sectors, it was demonstrated that combination of internal and external R&D would contribute to better corporate performance in drug, chemicals, and electronics industries. It is necessary to refine these analyses in order to investigate the factors behind firms' decision to engage in R&D outsourcing. This would help our understanding of the link between innovation strategy, technology features and corporate strategy.

## End Notes

<sup>1</sup>This inquiry is part of a research project on "Reformed Japanese Innovation Model" organized at the Institute for Technology, Enterprises and Competitiveness (ITEC) of Doshisha University, funded under the Center of Excellence (COE) program of the Ministry of Education, Culture, Sports, Science and Technology.

<sup>2</sup> The data source is *Report on the Survey of Research and Development* (various years) prepared by Statistics Bureau, Ministry of Internal Affairs and Communications. The documents report corporate R&D expenditures disbursed to finance internal as well as external R&D that are aggregated by industry. The share in Figure 1 is calculated as percentage share of external R&D in the total (internal and external) disbursements.

<sup>3</sup> Matsuura and Kiyota (2004) provides a detailed description of the survey data. Fukao, Ito and Kwon (2005) presents a study of Japanese manufacturing firms based on the survey.

<sup>4</sup> Derivation of the industry-specific R&D characteristics is based on the industry combination of (intRD/Sale) and (intRD/Sale-SQ) coefficients. This combination is obtained by adding, to the baseline (intRD/Sale) and (intRD/Sale-SQ) coefficients, coefficients of dummy interactive (intRD/Sale) and (intRD/Sale-SQ) variables when they are statistically significant at least at the 10% level. This re-evaluation is conducted for 9 industries, i.e., textile, pharmaceutical, chemical, ceramics, general machinery, electric machinery and equipment, telecommunications, electronics, and automobile.

<sup>5</sup> Cohen and Levinthal (1989) investigate this issue, and write, "... while R&D obviously generates innovations, it also develops the firm's ability to identify, assimilate, and exploit knowledge from the environment - what we call a firm's 'learning' or 'absorptive' capacity." (page 569).

<sup>6</sup> They are textile, pharmaceutical, chemicals, plastic, rubber, ceramics, non-ferrous metals, general machinery, electric machinery & equipment, telecommunications, electronics, automobiles, and precision machinery industries.

# Neoliberal Idealism, State Building, and the Washington Consensus: A Story of Underdevelopment

*Michael Heazle, M.Heazle@griffith.edu.au*

*Griffith University, Australia*

## Abstract

The paper links some of the major events and changes in international relations thinking over the last 30 years – such as the ending of the Cold War, the growing intolerance in the West of human rights abuses and the emerging doctrine of conditional sovereignty, and the recognition of trans-national threats by states – to demonstrate i) that the Washington Consensus list of development principles originally identified by John Williamson has been co-opted into an ideological vision for reshaping and homogenizing the behavior of states (both internally and externally); and ii) that doing so has resulted in a failing attempt at “securitizing” international development, which has led the US and its allies into a security and development “dead end”.

## Introduction

Following the ascendancy of neo-liberal economic thinking during the 1980s in the UK and US, the fall of the Soviet Union further strengthened both the empirical and political arguments for what John Williamson in 1989 called “the Washington Consensus”: a blueprint for social and economic development focusing on fiscal restraint, deregulation, and free trade. But while Williamson himself has objected to the strong neo-liberal flavor his term has since assumed, it is nevertheless clear that the professional consensus on economic development he originally described has become an integral part of a much broader ideological agenda pursued by the Bush administration and like-minded governments in the UK, Australia, and elsewhere. Indeed, following the 9/11 attacks on the US, an *augmented* form of the Washington Consensus<sup>1</sup> became – in theory but not in practice – a major pillar of the grand experiment in state building undertaken by the US in response to so-called failing states and the trans-national threats they are believed to generate. But in so far that a “consensus” of the kind described by Williamson ever existed, the Washington Consensus is better characterized today by division and mounting skepticism among professional economists and theorists rather than consensus.

This paper will argue that in the time since Williamson first drew attention to the Washington Consensus brand of policy thinking, any notion of a professional consensus on its effectiveness has been seriously eroded by dissent from leading economists and theorists. Its inclusion then as a major ingredient in state building, and broader status as the basis for global integration, appears to have been based on little more than a “belief” that the kinds of neo-liberal reforms implemented by many Western governments over the last two and a half decades are i) universal in their applicability; and ii) can, therefore, be readily used to transform rogue or failing states into stable and responsible members of a more secure global community of states.

The paper will link some of the major events and changes in international relations thinking over the last 30 years – such as the ending of the Cold War, the rise of the non-interventionist “regulatory” state model, the growing intolerance in the West of human rights abuses, the emergence of “conditional sovereignty”, and the recognition of trans-national threats by states – to demonstrate i) that the suite of policies named by Williamson has been co-opted into an ideological vision for reshaping and homogenizing the behavior of states (both internally and externally); and ii) that doing so has resulted in a failing attempt at “securitizing” international development that has led the US and its allies into a security and development “dead end”. Indeed, the state-building project is a highly questionable strategy due to the lack of either an unambiguous set of criteria for identifying failed and failing states,<sup>2</sup> or any universally applicable model for kick starting development. Unlike the highly successful “State Re-Building” undertaken by the US and its allies in Europe and Japan in the early post-war years – or perhaps the highly *unsuccessful* experiment in “State Overhaul” in Iraq – “State Building”, as witnessed so far, usually involves the elimination of grinding poverty and the building from scratch of institutions and infrastructure, human capital, civil society and rule of law, and, perhaps most importantly, political legitimacy. Moreover, the unwillingness of the intervening states to make the kinds of long term commitments any successful state-building is likely to require, due to the heavy ongoing domestic political and economic costs for both the intervening and recipient state(s), makes the entire enterprise extremely dangerous, since the problems created by failed or failing interventions can sometimes be worse than the problems and threats the intervention originally set out to address.

## **The Birth and Augmentation of the Washington Consensus**

In 1989, John Williamson outlined, in the form of a ten point list, what he believed represented the consensus of the time on development’s main ingredients. According to Williamson (2004), “I made a list of ten policies that I thought more or less everyone in Washington would agree were needed more or less everywhere in Latin America, and labeled this the ‘Washington Consensus’”. When Williamson summarized and named what he saw as the non-controversial fundamentals of development at the time, he was less than a decade past a major paradigm shift in

developmental economics and the role of the state but standing also at the beginning of the end of the Cold War and the ideological battle that had helped sustain it.

The turn away from Keynesian principles to what have since become known as neo-liberal economic policies and thinking, based as they are on neo-classical and Hayekian prescriptions for free markets, free trade, privatization, and an increasingly smaller state role, began in the UK with Margaret Thatcher's election in 1979<sup>3</sup> but was already taking root in the US under the Carter administration. Domestic US policy, however, would not fully embrace the fundamentals of neo-liberalism until after Ronald Reagan's election as President in 1981. By 1982, the increasingly rapid subscription of neo-liberal economic principles among the Anglo-American economies, regardless of their government's political persuasion,<sup>4</sup> was also beginning to manifest itself in the thinking of development economists and foreign policy. Mexico's debt crisis and the apparent failure of the centrally planned economies of Europe and Asia juxtaposed against the rapid growth experienced firstly by Japan and then by East Asia's Dragon economies (Hong Kong, South Korea, Singapore, and Taiwan, and later Malaysia, Thailand, and Indonesia) each served to reinforce the need for change in development policy thinking (Lindauer and Pritchett, pp.7-8). The introduction of loan conditionality by the Bretton Woods institutions for developing countries seeking loans and debt relief at this time, in the form of Structural Adjustment Programs (SAPs) requiring the freeing up of trade and markets and fiscal restraint, marked the shift in development priorities that Williamson would later summarize as the Washington Consensus.

For most of the remainder of the twentieth century, the development strategies of the Organization for Economic Cooperation and Development (OECD), the World Bank, the International Monetary Fund (IMF), and the US Treasury rested upon a set of policy fundamentals that contradicted the major policy assumptions on development of the preceding thirty years. The policy pendulum had, by the time of Williamson's announcement of a "Washington Consensus", completed its journey from one extreme to the other. The conventional wisdom of the initial post-war period on development, influenced as it was by de-colonization and the geo-political and ideological confrontation of the Cold War, stood in stark contrast to the new, "free market good/government intervention bad" thinking of the 1980s and 1990s. In the 1960s, government was a "driving force" of development, trade and integration were largely seen as unimportant, and foreign direct investment (FDI) was to be avoided; external government borrowing was judged far more beneficial. By 1989, the "consensus" perceived by Williamson directly contradicted all but one of these assumptions; the Washington Consensus itself did not explicitly reject state controls on the market, but its prescriptions would, in effect, erode state influence and control. The clarion call for the removal of state interference in economic development, and the rent seeking activities such interference allegedly led to, would come from other, and more ideologically explicit, quarters.

Indeed, with the election of the Reagan administration came the opportunity for several fast rising political figures in Washington – in particular Paul Wolfowitz, Francis Fukuyama, and Richard Perle – to begin implementing their ideas on how to pull the US out of the malaise they believed it to be in. According to these figures, later to be identified among the vanguard of neo-conservatism, the excessive liberalism of the 1960s combined with defeat in Vietnam and years of appeasing the Soviets under détente had led to a weakening of US power with its economy now struggling under stagflation and a general sense of aimlessness pervading Washington. The solution was a reassertion of US power and its projection against communism in order to spread internationally the neo-conservative vision they embraced, based as it was on notions of democracy, marketplace freedoms, the role and nature of the state, and a strongly held belief in US power as a force for good.<sup>5</sup> The views of Wolfowitz and others sympathetic to the neo-conservative position in the administration such as Richard Armitage and Secretary of State George Schultz were often challenged by the more traditional realist elements within the administration, most notably Secretary of Defense Casper Weinberger, but they sat well with the strong anti-communist and pro-monetarist policies pursued by the UK under Margaret Thatcher. The close relationship that developed between Thatcher and Reagan was in part the product of a general conservative dominance and consensus among the Anglo-American economies during the 1980s.<sup>6</sup> Thus, by the late 1980s, economic analysis and ideological commitment had converged to produce a consensus on development and how it should occur that went beyond only economists to include policy makers and politicians as well. The pivotal moment in the ascendancy of neo-liberal economic thinking, however, came with the collapse of the Soviet economy. The ensuing dissolution of the Soviet Union in 1991 and the widespread acceptance in the West that the Soviet demise demonstrated once and for all the supremacy of liberal free market economics and democracy not only appeared to reaffirm the policies of the Anglo-American governments, but also opened up a vast set of opportunities for the export of these policies into undeveloped and still developing states. Buoyed by communism's collapse in Europe and its apparent validation of Fukuyama's politically appealing "End of History" thesis, analysts and senior officials in the US treasury and Bretton Woods institutions felt relieved of any remaining doubts they may have had over the appropriate way forward for development. Furthermore, thanks to the Soviet demise, democracy was increasingly regarded as a defining characteristic of economic and state development.<sup>7</sup>

The Washington Consensus approach to development, with its focus on market liberalization, deregulation, and privatization, remained mostly unquestioned in the US and elsewhere until the 1997 Asian financial crisis, which saw some of Asia's economic miracles grind to a halt after the sudden flight of overseas short term capital from their economies. Hardest hit were South Korea, Indonesia, and Thailand. The governments in these countries had, under pressure from the US Treasury and OECD, liberalized their capital accounts in order to facilitate greater foreign investment, a policy Williamson denies was part of the original set of Washington Consensus

recommendations (Williamson, 2000 & 2004). The ensuing closure of many otherwise profitable companies resulted in huge economic and social disruption and rapidly rising unemployment. These economies were plunged into further hardship by the IMF's insistence on raising interest rates as the best way of attracting foreign capital back into the struggling economies and shoring up their free falling exchange rates. The 1997 financial crises triggered a growing wave of criticism of the neo-liberal free market focus that Williamson's 1989 list was now increasingly seen to be prescribing, despite his protests to the contrary. Nevertheless, the US commitment to free markets, trade, and democracy as the necessary ingredients for development remained resolute, as demonstrated by the Clinton administration's 1998 National Security Strategy document, which asserted that:

The forces necessary for a healthy global economy are also those that deepen democratic liberties: the free flow of ideas and information, open borders and easy travel, the rule of law, fair and even handed enforcement, protection for consumers, a skilled and educated work force. If citizens tire of waiting for democracy and free markets to deliver a better life for them, there is a real risk that they will lose confidence in democracy and free markets. (*National Security Strategy*, 1998, p. iv)

The institutional response to the financial crisis and the failed IMF advice was to turn to the nature of the institutions in developing economies and the state itself for an explanation of what had gone wrong. What emerged was the so-called "augmented" Washington Consensus, which added a further ten points to Williamson's original list that focused on required areas of governance and institutional reform. Proponents of the augmented version, which was preceded by the World Bank's 1997 World Development Report (WDR) entitled *The State in a Changing World*, argued that market reforms alone are unable to generate sustainable economic growth. Without institutional capacity – providing corporate governance, social safety nets, financial codes and standards, protection against corruption, and targeted poverty reduction – the original Washington Consensus prescriptions for financial and trade liberalization, fiscal discipline, and privatization and deregulation can not be properly implemented. In the case of the now crippled Asian Dragons, the failure, therefore, was not with the economic principles that had, to a greater or lesser degree, been adopted by each government, but rather was the result of their failure to implement them properly. According to Beeson and Islam (2003):

Pundits – most notably the IFIs [international financial institutions] which, on the very eve of the crisis, praised the East Asian economies for their 'miraculous' achievements – now rushed to condemn them as 'failed' cases of 'crony capitalism'. What appeared to be close government-business relations that were, in the past, argued to facilitate a virtuous process of equitable growth now became 'corrupt regimes' that encouraged inefficient state intervention, bred structural deficiencies and brought about their own downfall. The solution – crafted through the so called 'Letters of Intent' that were negotiated between the IMF and the crisis-affected economies of Indonesia, Thailand and Korea – essentially called for a re-imposition of 'augmented' Washington Consensus policies.

The augmented version of the Washington Consensus was essentially an attempt by neo-liberal advocates, attracted by both the ideological underpinnings of free market economics and also the neat fit it provided for promoting liberal democracy, to salvage the original Washington Consensus principles in the face of growing

criticism. From 1997 onwards, an advancing tide of both internal and external criticism continued to erode the Bretton Woods institutions' credibility, attacking in particular the strong, pro-market ideological beliefs that many critics believed were driving policy. Within the World Bank, senior staff members such as Joseph Stiglitz, Ravi Kanbur, and Branko Milanovich, to name but a few, have all spoken out against the neo-liberal policies of the Bank and IMF and also the strong political influence exerted by the US Treasury and executive. Stiglitz and Kanbur, for example, resigned from their positions at the World Bank as a result of political pressure from the US Treasury (Wade, 2002). Other critics include Harvard economist Dani Rodrik (2002), who, writing in 2002, stated:

After more than two decades of application of neo-liberal economic policies in the developing world, we are in a position to pass unequivocal judgment on their record. The picture is not pretty.

Rodrik (2002) went on to point out that levels of growth in most of Latin America in the 1990s were lower than in the 1950-1980 period, while poverty rates and real output in many of the former socialist countries were worse than 1990 levels after more than a decade of Washington Consensus-led development in those countries; development in Sub-Saharan Africa too is "very disappointing" and in many of these countries the situation is worse today than it was in the 1970s. Moreover, the countries that achieved the best and strongest rates of growth and poverty reduction during the 1990s – China, India, and Vietnam – "violated virtually all the rules in the neoliberal guidebook even while moving in a more market-orientated direction". By 2006, Rodrik and others proclaimed that the Washington Consensus, as implemented, was dead and buried as a development blueprint, since the evidence of its failure to produce lasting (or in many cases any) economic growth and development is simply too overwhelming for even its strongest supporters to ignore. According to Rodrik (2006), "While the lessons drawn by proponents and skeptics differ, it is fair to say that nobody really believes in the Washington Consensus anymore. The question now is not whether the Washington Consensus is dead or alive; it is what will replace it". As for the augmented version's remedy to the original's apparent failures, this too offers little hope for escaping the dead end that development policy in the World Bank and IMF now appears to have reached, since it in effect requires developing or underdeveloped states to be developed – in terms of the kind of state setting the Washington Consensus principles need to work – in order for them to develop! (Lindauer and Pritchett, 2002; Rodrik, 2006)

Given the sustained criticism that the Washington Consensus has suffered, in addition to the poor results obtained from more than two decades of its implementation, what can explain the continued adherence to its principles by many in the developed world, in particular the Anglo-American governments? And how can we understand the continued emphasis on institution building, in spite of the huge and as yet unmet problems and challenges it presents, that now underpins not only development but also current security strategy thinking in the US and elsewhere? Contrary to Rodrik's claim that "nobody really believes in the Washington Consensus anymore", the conservative belief in the primacy of privatization, free trade, and fiscal discipline (US defense spending is clearly

an exception here) remains alive and well from Washington to Canberra and London to Tokyo where it is driving not only domestic economic policy but also foreign policy initiatives aimed at managing international security, in particular trans-national threats, as well. To answer these questions, we must first return to the era in which Williamson first conceived of his consensus on development, paying particular attention to how both the ideological climate and changing geo-political landscape of the time made the neo-liberal co-option of the Washington Consensus all but inevitable.

### **Ideological Imperatives, 9/11, and the Securitization of Development**

As earlier noted, Williamson presented his notion of a Washington Consensus on the eve of one of the most significant events of the last century: the ending of the Cold War and the bi-polar structure it created within the international system. The United States, for the first time in its history, was suddenly (and unexpectedly) in a position where its level of power and international influence was unchallenged. The foreign policy rhetoric from both the Bush senior and later the Clinton administrations, and even George W. Bush when he first took office, appeared to confirm a firm US commitment to maintaining a multi-lateral international environment, based on international law and co-operation through multi-lateral institutions such as the United Nations. For a short while at least, it seemed that the ultimate liberal dream of transplanting the key ingredients of domestic society – civil and legal order and civil rights, shared values and institutional arrangements – into the international realm was close enough to no longer qualify as an idealist fantasy. High on the list of features that the “new world order” would include were a strong commitment to liberal democracy, human rights, and, of course, the major tenets of neo-liberal economic thinking: free trade, deregulation, privatization, and free markets.

It is not surprising then that the “Washington Consensus” that Williamson recognized in 1989 was warmly received and generally agreed upon within most developed governments at the time (Japan was still unaffected by the neo-liberal bug at this time)<sup>8</sup>, since major economies like the US and Great Britain had already been practicing neo-liberal fundamentals for almost a decade while less influential economies, like Australia’s and New Zealand’s, followed suit. For Williamson, however, the problem is that he never subscribed to any form of neo-liberal agenda and certainly never intended his Washington Consensus list to contribute to one. He maintains that the policy prescriptions he listed were simply empirically sound economic principles that most economists could agree upon in the context of creating and maintaining economic development (Williamson, 2004). Williamson’s basic argument seems to be that had the Washington Consensus principles been implemented differently, which he has indicated to mean a more balanced and case specific approach, the development outcomes of at least the last twenty years could have been different.

But given that Williamson's "laundry list" of policy prescriptions stopped short of providing any detail or guidance on exactly how the Washington Consensus should be implemented and, importantly, under what circumstances (hence the "one-size fits all" approach adopted by the World bank and IMF discussed by Stiglitz<sup>9</sup>), his protestations over it being wrongly labeled as "neo-liberal" are unreasonable. Indeed, since it was the prevailing neo-liberal political climate surrounding the major economies at the time that provided acceptance of his consensus in the first instance, it is hardly surprising that the same neo-liberal mindset should interpret and implement the Washington principles in ways that were consistent with that mindset. Contrary to what Williamson appears to be arguing here, the "facts" do not speak for themselves; nor do they exist in any form of theoretical vacuum. As Eckaus (Lindauer and Pritchett, 2002) notes, in his commentary of Lindauer and Pritchett's 2002 overview of how post-war development theory has swung wildly from one set of assumptions to another on the basis of new "facts" emerging from the development experience,

In economics, facts are reflected through the theories we carry around, as if those theories were prisms with different indexes of refraction that separate and display the colors in the light differently. So what Lindauer and Pritchett describe as irrefutable facts of the times were actually readings of events that were generated by the theories with which they were interpreted. Lindauer and Pritchett's list of the influences on each period's perceptions of the problems and policies in developing countries should include the power of the ongoing theories. (Lindauer and Pritchett, 2002, pp.31-32)

Fast forward to the post-9/11 international environment in 2002 and we find a fundamentally different ideological and theoretical mindset taking hold among the US and its allies in the aftermath of the 9/11 attacks. The Bush administration responds to trans-national terrorism and the security threats posed by failed and failing states by asserting its ability – as the only super power and in accordance with neoconservative views on the role of US power – to act unilaterally in pursuit of an open-ended War on Terror (WOT). Unilateral military intervention to overthrow "rogue" states is clearly stated as a policy option in the 2002 *National Security Strategy* document, which also presents an unequivocal policy statement on the future course of development policy and thinking:

We will actively work to bring the hope of democracy, development, free markets, and free trade to every corner of the world. The events of September 11, 2001, taught us that weak states, like Afghanistan, can pose as great a danger to our national interest as strong states. Poverty does not make poor people into terrorists and murderers. Yet poverty, weak institutions, and corruption can make weak states vulnerable to terrorist networks and drug cartels within their borders. (*National Security Strategy*, 2002, p.v)

In addition to the 2002 National Security Strategy document's often cited announcement of the Bush administration's plans to pursue a "post-sovereignty" inspired doctrine of pre-emption, it also reaffirms the relevance of the Washington Consensus in its augmented form – despite its past failures and the mounting criticism it is attracting as a development model – by effectively *securitizing* both the ends and means of international economic development.

Put simply, failed and failing states are no longer regarded only as obstacles to development and the proliferation of human rights. They have become, since 9/11 and the al Qaeda presence in Afghanistan, the key focus of security strategy in the developed world, since failed states like Afghanistan are regarded as potential “incubators” for terrorist attacks against the West<sup>10</sup> (read free market, liberal democracies). Thus, the solution is to ensure that failed or failing states are reconstructed in a pro-liberal democratic form and are free market orientated so that the finished product will be a) pro-Western (read pro-US) in its political orientation; and b) easily and profitably integrated into a global, neo-liberal orientated global economy. The earlier notion of negative sovereignty that characterized attitudes in the developed world to developing, post-colonial states was driven by the stigma of imperial exploitation and a post-war emphasis on self-determination, as enshrined in the UN Charter, in development and modernization approaches. Widespread popular, rather than government, concern with egregious human rights abuses and development failures in many of these states emerged in the 1970s, particularly in the aftermath of the massacres in Cambodia. This trend was further augmented by South Africa’s apartheid rule, the Tiananmen Square violence in China, the perceived human rights victory that accompanied the ending of the Cold War, and then further outbreaks of genocide in the Balkans and later Rwanda. By the late 1990s, it had become clear that political pressure for some standard of “conditional sovereignty” to be enforced was mounting, both domestically and internationally, but most states still remained reluctant to become directly involved in the internal affairs of other states, particularly in the absence of any clearly defined mission and exit strategy.

Thus, the major impact of the 9/11 attacks was to give urgency to not only the need for state accountability, but also the augmented Washington Consensus argument, formed in the wake of the 1997 Asian financial crisis, that weak or corrupt governance posed serious obstacles to economic development strategies<sup>11</sup>. Completing the rationale for direct intervention post-9/11 was the widely accepted assessment of failed and failing states as “a clear and present danger” to the security of other states via a host of potential transnational threats, most disturbingly terrorism. In an abruptly altered security paradigm – one where traditional notions of sovereignty no longer apply, trans-national threats abound, and the supremacy of liberal democratic societies exists as an article of faith – the US-led “coalition of the willing” appeared to take their ability to directly implement neo-liberal economics and liberal democratic governance in failed and failing states as a given. As Wesley (State of the Art) has noted, Anglo-American states have, until recently at least, largely agreed on the attributes of a properly functioning state, despite the many ambiguities involved, and the actions required for turning failed states around since the late 1990s. This consensus is more broadly reflected by the goals of the various interventions since that time (Kosovo, East Timor, Democratic Republic of Congo, Liberia, and the Solomon Islands): a consensus based on the principles mapped out by the augmented version of the Washington Consensus and given added conviction and validity by the 9/11 attacks and subsequent War on Terror. And despite increasing public and academic opposition to this “consensus”, there has

remained a strong, bi-partisan commitment within the US and among its allies to the neo-liberal interpretation these, and past, governments have given to Williamson's original principles.

### **State Building 101: The Devil is in the Details**

The general order of play adopted for state building in failed states divides the process into three stages (Wesley, 2008). The first stage involves foreign military intervention aimed at stabilizing the domestic security situation, providing humanitarian aid, and creating an atmosphere of law and order. Stage two focuses on institution building and the introduction and development of a functional public administration and market led economy (overseen by international agencies). Following the successful and linear completion of stages one and two, conditions should then allow the further development of legal, public, and corporate infrastructures and institutions, civil society, the political legitimacy of the state (generated by the state's increasing effectiveness), further market orientated economic development and the introduction of liberal democratic style elections and political institutions. Stages two and three of this process clearly resemble the augmented Washington Consensus' dual list of things to do (and also, therefore, the 1997 WDR) as does the initial prioritization of institutional and governance development in order to lay the necessary groundwork for free market development.

The big problem with this seemingly logical progression of actions and events is of course the issue of "how?". As was the case with Washington Consensus' original set of principles, and remains the case with the governance-orientated principles tacked on by the augmented version of Williamson's now rather tattered looking consensus, they are simply too broad and underspecified to serve as any form of blueprint for state building. Furthermore, there is no guide offered, and nor does one exist, on the critically important issue of developing long term political process and legitimacy other than some rather glib expectations concerning the universal legitimacy of liberal democratic processes and norms and the ability of the state to assume legitimacy (at some point!) by favor of its good performance. But which comes first, the chicken or the egg? In his critique of the World Bank's 1997 WDR, *The State in a Changing World*, Kapur (1998) observed that:

The WDR is generally successful as a didactic device ... as a guide to policy makers on the "what": the State's role must focus on social and economic fundamentals, but should always be tailored to capabilities. It is, however, much weaker when it comes to the "how". Its recipe for reinvigorating institutional capabilities – increased competition, decentralization, and participation, and internal collective action – is neither controversial nor novel. Myriad exercises at quantification to "prove" its case, especially with regard to the importance of state "credibility, are often misplaced and analytically flawed. And by avoiding contentious issues at the heart of the state, in particular those related to politics and power, and instead genuflecting the current intellectual fashions, the report says more about the World Bank than the role of the State in LDCs.

Commenting in 2002 on the augmented Washington Consensus model, itself informed largely by the ideas in the 1997 WDR, Rodrik (2002) too focuses on the superficial character of the approach to development taken by IFIs and Western governments, and their failure to move beyond merely describing what properly functioning states should look like:

The Augmented Washington Consensus is bound to disappoint, just as its predecessor did. There are too many things wrong with it. It is an impossibly broad, undifferentiated agenda of institutional reform. It is too insensitive to local contexts and needs. It does not correspond to the empirical reality of how development really takes place. It describes what “advanced” economies look like, rather than proscribing [sic] a practical, feasible path of getting there. In short, the Augmented Washington Consensus is infeasible, inappropriate, and irrelevant.

Indeed, the military interventions aimed at creating stable states complete with free market economies and liberal democratic government over the last ten years all continue to struggle to move beyond the first stage goal of creating a stable and secure environment; conditions in some countries, Iraq and Afghanistan in particular, appear to have become less rather than more secure. The missing ingredient in the 1997 WDR and Augmented Washington Consensus schemas is the issue of political legitimacy, and the critical role its establishment, or absence, plays in determining the nature and stability of states<sup>12</sup>. During the Cold War, realist thinking put the challenge of exporting democracy to the developing world in the too hard basket precisely because of the overwhelming complexities involved, which explains in large part why US policy rhetoric on freedom and democracy was often undermined by Washington’s relations with unsavory authoritarian regimes in Central and Southern America and elsewhere. And two decades or more later, the Anglo-American commitment to democracy and freedom abroad still rings hollow. As Chandler (2006) argues<sup>13</sup>, the state building goal of creating strong, independent states is disingenuous, since all that the current attempts have actually intended to establish has little to do with political autonomy and is entirely about administrative and technocratic capability. Sovereignty, then, becomes devoid of notions of political legitimacy, and is instead identified in terms of administrative capacity; if sufficient capacity is established, legitimacy will follow since legitimacy according to this view is entirely the product of how well the state functions. In addition to being a gross misrepresentation of the complex internal factors that contribute to the creation of political and state legitimacy – notions of national identity and belonging; shared cultural heritage and values; and in particular the exercise of tangible political power and influence by local rather than external actors – what this “state as independent variable” (Wesley, 2008) based approach sets up is the perception that intervention is all about establishing and supporting sovereignty. If societies resist intervention, or fail to cooperate sufficiently, they are, therefore, undermining their own sovereignty, since sovereignty is really only about building administrative and institutional capacity. Thus, as Chandler (2006, p.36) points out, “Governments which resisted this external assistance could, in the Orwellian language of state builders, be accused of undermining their own sovereignty.”

But even if the West were able to come up with a workable blueprint for developing the economies and institutions of impoverished states, one that addressed the question of “how?” rather than simply describing the desired end product, it is obvious that such an undertaking would require a long and expensive commitment to the target state(s) involving significant sacrifices, both in resources and most likely human life, by the intervening parties. The problem here, however – as we have already seen from the ongoing interventions in Iraq, Afghanistan, and the Balkans, and will no doubt soon see in East Timor, and perhaps the Solomon Islands – is the ability and willingness of the intervening states to “stay the course” and also their willingness to make “national interest” sacrifices of benefit to the state they are attempting to stabilize and empower. On the latter point, the Howard government, for example, has been widely criticized over its refusal to give the fledgling East Timor government, created out of the UN intervention Australia led in 1999, a larger share of the huge oil and gas deposits under the Timor Sea<sup>14</sup>. On the former point, Western democracies have historically shown very little patience and virtually no long term commitment to foreign interventions and military actions that do not provide obvious or direct security or national interest benefits to the intervening state. As the US interventions in Vietnam, Africa, and more recently Iraq and Afghanistan have shown, any existing commitment dwindles rapidly in the face of mounting casualties, while domestic political concern over issues such as the financial cost and impact of overseas deployment on national security also can rapidly erode political will at home for foreign interventions. The obstacles to long term commitment to state building enterprises created by weak or limited domestic political support within the intervening states pose an interesting set of issues concerning the extent to which attempts to promote and create liberal democratic states abroad are handicapped by the apparent unwillingness of liberal democratic societies and governments to bear the long term costs and responsibility of doing so.

## **Conclusion**

Looking at the current state of existing state building exercises in 2007, and their contribution to international development, it appears that we have reached something of a dead end. Lindauer and Pritchett, for example, have suggested that the development community now has run out of the kinds of “big ideas” that drove development throughout the post-war period, since “the current nostrum of one size doesn’t fit all is not itself a big idea, but a way of expressing the absence of any big ideas” (Lindauer and Pritchett, 2002, p.13). Moreover, the largely undisputed focus on trans-national threats and issues that has helped shape the much broader security paradigm within which policy makers now operate rightly continues, but without any confident strategy or purpose. Indeed, the necessity of international cooperation and engagement in the management of trans-national issues like terrorism, global warming, wildlife management, and epidemics, to name but a few, are also generally accepted. And it would

seem reasonable to associate the need for international cooperation with a significant role for international multi-lateral institutions, treaties and conventions, and international law. The efficacy of such an approach, however, depends heavily on an international society, or at least system, of functioning states able to implement domestically what they sign and commit to internationally. Clearly, no such system exists.

The formation or application of regimes and intergovernmental organizations to deal with transnational threats, therefore, would require them to include some strategy for empowering states, which of course leads us back to the problem of state building, or at least state empowerment, which we apparently know far less about than we thought we did. The mantra of “develop institutions”, which replaced the earlier mantra of “get prices right”, is now being recognized for what it has always been: complex, inherently political, country specific, and of limited importance as a driver of growth unless one can clearly specify exactly what kind of institutions and policies will work in country specific contexts (China’s institutions, for example, appear to work far better than Russia’s, no thanks of course to Western development thinking). And even if we think we know what kinds of institutions and practices are needed, that is still a far cry from knowing how to create them, or even understanding the factors that brought them into existence in already functioning states like our own. As Rodrik (2006) points out:

Taken to its logical conclusion, the focus on institutions has potentially debilitating side effects for policy reformers. Institutions are by their very nature deeply embedded in society. If growth indeed requires major institutional transformation – in the areas of law, property rights protection, governance, and so on – how can we not be pessimistic about the prospects for growth in poor countries? After all, such institutional changes typically happen very rarely – perhaps in the aftermath of war, civil wars, revolutions, and other major political upheavals. The cleanest cases that link institutional change to growth performance occur indeed at such historical junctures: consider for example the split between East and West Germany, or of North and South Korea. But what are poor countries that do not want to go through such upheavals to do?

The current “dead end” we find ourselves in over how to promote development, not only as an end in itself but also as a means to enhancing our own security, goes some way to explaining the serious lack of policy debate in Anglo-American societies over what to do now. Indeed, foreign policy debate on development and state building, in addition to responses to pressing trans-national issues like global warming and terrorism, is generally quite shallow thanks to the lack of ideas and alternatives in mainstream politics. Thus, a pervasive form of bi-partisanship appears to exist on the fundamentals of most major policy issues, with debate being restricted to more superficial disagreements over “how much” and “how long.” Voters, in effect, are being offered any shade of black that they like! Even more worrying, though, is the conviction with which the advocates of neo-liberal and neoconservative policies, despite mounting evidence and specialist advice to the contrary, maintained their support for their own particular brand of development and state building; firstly by offering the augmented version as the explanation for why the original Washington Consensus was not working, and then, implementing it as the response needed to combat terrorism and other transnational threats. The ideological commitment to neo-liberal economics and belief in

the manifest destiny of liberal democracy that underpinned the politics of the conservative Anglo-American governments throughout the 1980s and 1990s clearly played a significant role in limiting the so-called “market place of ideas” to one that was highly “brand specific”<sup>15</sup>. But what does this suggest about the role of specialist advice in policy making and the extent to which we can expect public policy making to ever be an entirely “rational process” in the conventional usage of the term? These questions will be the focus of my future work on the Washington Consensus variants and the role they have played in the recent evolution of development policy and state-building.

<sup>6</sup> In Australian and New Zealand politics, the Labor Party, like in Great Britain, traditionally has represented left of centre political ideology and policies (although some factions within the Labor Party historically have taken extreme leftist positions). But since the late 1970s, the Australian and New Zealand Labor parties have taken a much more conservative view on a range of economic and social policies, such has been the influence of conservative economic thinking over the last two decades. In Australia, deregulation, privatization, and other "neo-liberal" economic reforms began under the Hawke Labor government in the early 1980s; similar reforms began in New Zealand during this period under a Labor government.

# **Achieving Competitive Advantages and Sustainable Growth: Developing Human Capital under Globalization Strategy**

*Hadijah Ibrahlim. ihadijah@hotmail.com  
Nagoya University, Japan*

## **Abstract**

**The purpose of this paper is to investigate how Japanese Multinational Companies (JMNCs) in Malaysia's electronic and electrical (E&E) industry, developed human capital by using an event-history analysis, in the period from 1980s to 2006s; past 26 years. Considering the status of Malaysia as the hub of global production network, it is vital to identify the globalization impact on human resources. Many past studies have proven that human management practices can help to create a source of sustained competitive advantages, especially when they are aligned with firm's competitive strategy. Thus, this study focuses on understanding the subsidiaries' human resource management in the context of organizations and its environment. Findings show that, despite the unique culture and distinct characteristics of the parent companies, the stress of successive environmental changes is inevitable. In the process of adaptation and assimilation of technology, local operations implemented continuous improvement and innovation-oriented activities. Author concluded that continuous individual self development is the essence of the subsidiaries' absorptive capacity.**

## **Introduction**

In Malaysia, as the technology factor becomes increasingly critical in sustaining global competitiveness, the shift to high-tech industries becomes an integral policy for Malaysia in realizing its vision of being a fully industrialized nation by the year 2020. The shift towards higher technology and capital-intensive activities in the manufacturing sector was indicated by: (1) greater investment in higher technology and capital intensive projects and (2) a greater proportion of skilled workers employed. As a result, higher-value added and knowledge intensive activities increase the need for knowledge and market-driven expertise. However, Malaysia has consistently faced a shortage of skilled workers (engineers, scientist, researcher, experts, specialist etc.) in specialized fields such as engineering, information and communication technology and high technologies. Mismatch between supply of and the demand for skilled workforce and the labor mobility were highlighted to be the basic reasons that lie behind the problem. This persistent shortage may hamper Malaysia's progress in the technology dimension and its ability to attract further investment by MNCs, on which the country depends for industrial development (Hobday 1996). Thus, developing innovative, creative and highly skilled human capital becomes one of the challenges in industrial development.

To overcome this shortage, MNCs play a vital role in developing human capital (Lall, 2000; OECD, 2003). Engagement of foreign experts and specialist are prevalent in the higher managerial category and specialized fields (MIDA, 2005). In 2005, there were 35,480 expatriates employed in Malaysia, with 14,406 (40.6 per cent) in the manufacturing sector. At the same time, foreign labor in Malaysia was mainly employed in the unskilled category. There were 1.8 million foreign workers, of whom 581,379 workers (32 per cent) were employed in the manufacturing sector. As a measure to reduce the dependence on foreign labor, industry initiated efforts in the automation of production processes, using labor saving technologies such as robotics and computer integrated manufacturing systems.

This research attempts to explore how MNCs subsidiaries overcome the issue of skilled workforce shortage. Reviews on theoretical and empirical research suggest that Human Resource Management (HRM) may be observed as a method of identifying the internal and external context of organizations in developing their human capital. The objective of this study is three folds. First, it intends to characterize Human Resources Management (HRM) practices of Japanese Multinational Companies (JMNCs) subsidiaries in electronic and electrical (E&E) manufacturing sector in developing the human capital (skilled workforce as core competencies), second, to investigate the extent to which Human Resources Management (HRM) practices have converged over a period of past twenty six years (1980 to 2006) from traditional personnel management to sophisticated HRM practices, and third, to understand the HRM in the context of organization and its environment. The time frame is based on the time when the sample of companies started their operation in Malaysia.

I decided to focus only on JMNCs subsidiaries in E&E manufacturing sector due to its significant contribution to Malaysia's economic competitiveness<sup>1</sup> and growth. Since JMNCs possess dominant position in Malaysia manufacturing sector<sup>2</sup>, it is essential to investigate how they had developed human capital as core competencies in achieving competitive advantages and sustainable growth at firm-level; which, later became an important catalyst in the growth and development of Malaysia manufacturing sector<sup>3</sup>.

This study is structured as follows. The second section reviews theoretical literature on human capital and HRM in the context of social and economic development. The third section explains the research methodology, followed by the fourth section addressing the HRM practices in the case studies. The fifth section discusses the degree of changes and adoption of HRM in the context of organization and its environment. The final section concluded the study.

## **Literature Review**

The resource based theory of competitive advantage focuses on the role of internal resources like employees play in developing and maintaining a firm's competitive capabilities. The resources are valuable when they enable a firm to

enact strategies that improve efficiency and effectiveness, exploit market opportunities, and/or neutralize potential threats (Barney, 1991; Wright and McMahan, 1992; Porter, 1985). Employee skills can be classified as core or peripheral assets (Barney, 1991). Core assets, in particular are vital to the competitive advantage of an organization (Porter, 1985) and often require continual internal development (Quinn, 1992), while other peripheral asset may be outsourced.

The value and uniqueness of human capital determine human capital architecture. The value of human capital can be influenced by a multitude of sources, such as firm's strategy and technologies (Arthur, 1992; Snell and Dean, 1992). Accordingly, the value of human capital is inherently dependent upon its potential to contribute to the competitive advantage or core competencies of the firm (Lepak and Snell, 1999). The transaction cost and resource theory have argued on the idiosyncratic resources (Barney, 1991; Williamson, 1981). The uniqueness of an employee's (firm-specificity) may result in variety of factors. Work organization such as team-based production and unique operational procedures such as JIT and TQM, will enhance the uniqueness of a firm's human capital. It rely on the company's decision to select and pool their capital investment in building core competencies; gaining and retaining skilled workforce that has high value and uniqueness to the company.

HRM practices can helps to create a source of sustained competitive advantages based on human capital, especially when they are aligned with firm's competitive strategy (Begin, 1991; Butler et al., 1991; Capelli and Singh, 1992; Jackson and Schuler, 1995; Porter, 1985; Schuler, 1992; Wright and McMahan, 1992). Organizations can use HRM in a variety of ways to increase their human capital (Cascio, 1991; Flamholtz and Lacey, 1981). They can "buy" human capital in market or "make" it internally. HRM practices is mainly concern about (1) getting good resources, (2) upgrading skills and knowledge and (3) retaining skilled workforce. Contextual factors affect HRM in the value creation (Jackson and Schuler, 1995). In human capital theory, contextual factors such as organization structure, strategy, technology, labor market conditions, government policies and natural characteristics of the industry can affect the cost associated with alternative approaches to using HRM to increase the value of organization's human capital and value of the anticipated returns, such as productivity gains (Russel et al, 1993) Figure 1 summarizes the research model for this study.

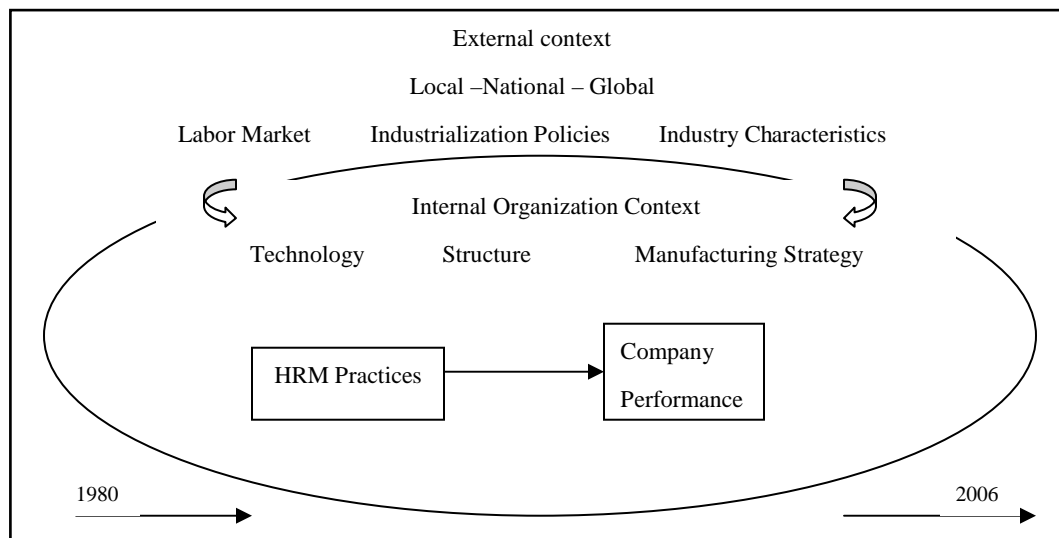

FIG. 1: FRAMEWORK FOR UNDERSTANDING HRM IN CONTEXT OF ORGANIZATIONS AND ITS ENVIRONMENT

Based on Jackson and Schuler,1995; Youndt, Snell, Dean and Lepak,1996 and altered by author for this study.

## Methodology

**Sample:** Two JMNCs subsidiaries from E&E Industry (manufacturing), were selected as subjects of observation. Companies' profiles are listed in Table 1. The outstanding achievement and recognition gained over the years has made these companies the choice of observation.

**Data:** Preliminary data is based on the field study conducted in September, 2001 and April, 2003 in Malaysia. For this purpose, seven staffs were interviewed. The staffs were chosen from Japanese expatriates group, most outstanding local staffs group and a representative from human resources department. Closed structured interview was arranged. Information on recruitment and selection was gained from human resources department. Interview questions were designed to explore the career development progress of successful local staffs that regarded as core competence to the company. Other question related to career path and promotion and appraisal system were asked to acquire specific idea on the actual process of human resource development in achieving effectiveness. Continuous observation and engagement were undertaken through emails with few interviewees for updated information after the interviews. Secondary data is based on all related historical events and information recorded from the time of establishment till 2006 provided by the company. Other related information is also collected from archives of local newspapers, companies' homepage, research papers and surveys.

## Empirical Findings

This section addresses the Human Resources Management (HRM) practices of Japanese Multinational Companies (JMNCs) subsidiaries in electronic and electrical (E&E) manufacturing sector in developing the human capital (skilled workforce as core competencies). Comparative analysis is done to distinguish general practices of the sample; to seek the extent to which Human Resources Management (HRM) practices have converged over a period of past twenty six years (1980 to 2006) from traditional personnel management to sophisticated HRM practices (gaining good resource, upgrading skills and knowledge, retaining resources). Evidences from human resources

management and development practices shows that there are changes pertaining to the environmental factors which took place over the period of 26 years of establishment.

## Getting Good Resources: Recruitment and Selection

Interviews reveal that recruitment practices vary upon type of position and skill requirement. Table 2 shows four types of practices that generally being implemented in early 1990s.

Evidences show that recruitment of fresh graduates for engineer positions are being carried out periodically, similar to fresh graduates' recruitment system in Japan; which occur during the final year of studentship for annual entrance in April. Parent Company will recruits required number of Malaysian graduated in many disciplines from universities and technical college around Japan according to the Japanese traditional hiring policies. This is taken as part of the strategic human resource management to attain competence employees with Japanese language literacy that can work better in both local and parent company. This is also referring to the aggressive transfer of new product technology which required more than Japanese expatriates could handle. Similar to Thong (1991), the environment of rapid technological change due to technology transfer in local production line is conducive to the employment practice of hiring young inexperienced workers who are more adaptable than older workers to new methods and techniques.

TABLE 2: RECRUITMENT PATTERNS AT COMPANY A AND B IN 1990S TO 2005

	<b>Periodical recruitment (large number of people)</b>	<b>Vacancy opening (very small number of people)</b>
<b>Administrative and High Operational Position</b>	Fresh graduates from Japan (after 1988) (Engineers/staffs with Japanese Language Proficiency)	Specialized/skilled engineers/staffs (including fresh graduates from other universities)
<b>Operational position</b>	Unskilled Malaysian labor (permanent employment) Unskilled foreign labors (contract basis)	Skilled labor (technician etc)

Source: Author's compilation

Periodical recruitment is also practice in the case of unskilled operators for new production line. In early 1990s, as Malaysia labor market experienced the phenomenon of labor scarcity problem and competition between manufacturers has intensified the practice of poaching staffs within the same area and industry. Both companies described how they send personnel staffs out to the remote rural villages in the east coast of Peninsular Malaysia to recruit women operators on the spot. B. Wilkinson et al (2001) similarly reported that specifically due to the recruitment problems and urgent expansion, Company B set up their second plant in rural area in 1993. In the late 1990s, further expansion of Company A has made the production became dependent on foreign labor from Indonesia. Personnel staffs went to Batam Island in the mission of sourcing required numbers of young women to fill in the positions of production operators. However, dependency on foreigners is kept at 20 to 40 percent. Interestingly, managers actually preferred foreigners because they are more or less captive for the three years or so of their contracts – legally they cannot job hop and training efforts are less likely to be wasted (B. Wilkinson et al, 2001).

In the case of real time HR needs and vacancy opening, both companies practice the 'internalization of labor market'. Firm-specific skill and close networking within department has made it difficult to recruit a 'stranger' from external labor market unless the specific skill could not be found internally. Although, at initial stage of factory establishment, a group of experts were sourced out or headhunted from local labor market, towards a more stable development stage, priority were given to selected high performers in the organization. Allocation of HR works as a mechanism to motivate close networking, accumulation of knowledge and new skills among indigenous staffs.

However, implementation has always been the hardest part. Generally, internalized labor market practice which is 'across department job rotation' is not welcomed in the indigenous Malaysian organization. This practice has driven some misperceptions among local staffs. Local staffs interviewed at both companies remarked their disagreement in the practices which claimed that it will give negative impact to their future career development (showing incompetence of personnel in holding particular position). It is a coalition of ideas of being a specialist or a generalist. In some cases, the local staffs leaved the company rather than being shifted to another department which is not related with their current job. On the other hand, findings show that those who experienced 'across department job rotation', stayed and survived over ten years have shown interesting achievement. Indigenous staffs that became general managers for both companies are the evidences. They were trusted to head a department, having high participation in the top level management and communicating directly with the parent company. In short, it is also a tool for selecting potential indigenous staff for succession planning and a way of indirectly structuring organizational capacities. For instance, the first local staff appointed as Director at Company B started his career as Production Engineer in 1980. After being transferred to various sections on the production lines, he was appointed as Sales Executive to assist Japanese expatriates in establishing the department in local factory since 1982. He developed his career in sales and currently holding the key position of coordinating sales operations for customers from all over the world. He is also the only one left from the first group of engineers recruited as pioneers.

Toward the end of 1990s and early 2000s, recruitment for immediate vacancies is being carried out with close attention. In the case of company A, the good reputation and recognition gained from Malaysian community has made up the overwhelming response for each job advertisement. Thus, selection criteria for a new staff are more complicated and high credibility on their basic knowledge, skills and work experiences is accounted. The new hiring strategy is a departure from the seniority systems in which work experience is valued before entry, and the base salary is competitive with the market rate (Chew, 2005). This is well reflected from the accumulated group of indigenous staffs with high education background (graduated from famous western universities) and expertise in various fields. Deputy General Manager of Design Department commented that;

*"In comparison to the 'pioneers' group, the young generation of indigenous staffs is well selected and equipped."*

## **Upgrading Skills and Knowledge: Training and Development**

Interviews reveal that further training and development of HR after proper appointment has changed over the past 26 years. Training and development program is no longer a simple menu of enhancing technology transfer from parent company to local production floor as it was in early stage of establishment in 1980s. Multi-purpose program to fit each level and group of employees was designed early 1990s as the production continuously expand. There are few factors that help the process of designing the program. Internally, adaptation of parent company's training and development program created the main stream of the system. External forces, such as Malaysia government policies indirectly support the establishment of few technical training centers and private consultants to help the development further. Human Resource Development Fund started in 1992 too, has encouraged the development practices (Chew, 2005). Table 3 shows the outline of the training and development menu that is multi-purpose to cater different level of staffs. Generally, training and development for management and operational level is separated. The width and depth of the skill is also regarded.

The purpose of training and development system in foreign MNCs in Malaysia is more than just meant for replacement and retraining. Survey done by Chew (2005a) shows that heavy investment in training for promotion and succession planning is prevalence. In addition to the job specific training which are provided for replacement so as to equip new recruits with basic on the job skills, comprehensive development programs are extended to high performing staff as apart of the succession planning, as well as to prepare employees for the larger responsibilities that accompany promotion. Interestingly, this study found that both companies include some other generalized development training programs to enhance not only job specific skills on individual basis, but organizational learning culture as well. These are referred as innovation-oriented activities to promote creativity amongst indigenous staffs.

TABLE 3: OUTLINE OF MULTI-PURPOSE AND MULTI-LEVEL TRAINING MENU FOR COMPANY A & B IN 2000S

Level / Group	Job Specific Training (OJT & Off-JT)	Generalized Development training (Off-JT)	Duration
All levels (skilled and unskilled)		<ul style="list-style-type: none"> <li>✓ Quality Control Training</li> <li>✓ Occupational, Safety, Health and Environmental Training</li> </ul> (In-house & external)	Continuously

Source: Author's compilation

### Job Specific Training

Mounting evidence from past studies and surveys has shown that on-the-job training is well adapted in all Japanese manufacturing companies especially in building technical capability on the production floor (B.Wilkinson, 2005, Chew 2005, Tatsuo Kimbara, 1991, Thong, 1991, Nobuo Kawabe, 1991). Japanese expatriates are assigned to a group of engineers and technician as technical coordinators, where coaching and guidance are given as the team executes their daily task. According to B. Wilkinson et al (2005), it is typical for operators in final assembly and components plants in Malaysia to spend the first few couples of weeks on induction and on-the-job training before being assigned to proper place on the production line. Even for fresh graduates employed as engineers and executives, few weeks induction process and job specific training for a period of 3 to 6 months at parent company is commonly practiced.

On the same rate, upon confirmation of appointed position, job rotation within department on the production floor and at administrative level is practiced. Some of the findings support the conventional wisdom that there are frequent transfers of staffs within Japanese firms as a training practice. The interviews reveal that a typical indigenous staffs experienced more than once inter functional transfers through out tenure. Transfer would also be used as human resource practice to select those who are less capable as engineers and more suitable for non-

technical work (T. Numagami & K.Kusunoki, 1997). Worker's capabilities in rotating between jobs and in engaging in continuous improvement activities were clearly related to this greater emphasis on skills formation.

In the early stage of production expansion of Company A, from 1990 to 1997, production staffs were sent for technical training at mother plants in Japan, for duration of 3 to 6 months periodically. However, in the 2000s, the frequency decreased as the production became more stable. But, prior to the transfer of new product engineering that is introduction of "Digital Reality Creation" incorporated in their latest products from Japan in 2002, again, overseas technical training has been carried out aggressively for all related engineers. On the other hand, the divergence of mutual interest between Company B and parent company has exhilarated the technology transfer to be completed within short period after the company established. Shift from labor-intensive to new manufacturing systems based on flexible production have been introduced by middle of 1990s (Rajah, 1988). The number of operators as reduced drastically upon importation of numerous automated machines for replacement. It is argued that such high-technology-based production is possible due to the mature and stable product's concept. Thus, further technical training is concentrated in machine maintenance and improving process for cost efficiency. Consequently, the adoption of techniques such as total quality control (TQC), just in time (JIT) and materials requisition planning (MRP) and the team concept of production introduced, giving workers greater input into decisions on the shop floor (Sarosh Kuruvilla & Ponniah Arudsothy, 1992).

In attaining higher knowledge and skill in managerial level, job specific training such as acquiring professionalism in certain administrative fields is encouraged. Company B mentioned that a substantial provision is allocated to encourage employees to further develop themselves. It is depending on individual effort to seek for such training at external institutions and approval of head of department is required to justify the importance of training to their job task. Further, Deputy Department Manager of Human Resource Department at Company B stated that:

*"Here, we encouraged self development among local staffs. We do not wait for the management to plan our career, personal efforts in seeking self improvement are supported and the company is ready to invest for such ...., I am also one of the many that had acquired specialized knowledge through some external institutions."*

## **Generalized Development Training**

Off-the-job training programs constituted by various types of management training beyond the job scope, specifically structured to support skill enhancement and preparing a personnel for particular position. Apart from that, there is also some training programs designed purposely to company needs. For example, a staff from Company A was sent to an intensive 'Six Sigma' workshops conducted by professional consultants in 2000. He was awarded 'black belt' status that allowed him to be trainer for in-house training team (training for trainers). Later, the in-house training is continuously provided for all staffs in managerial level. Some of the training contents are customized to suit the immediate requirement for organizational improvement.

It is quite surprising that parent companies of both A and B conducted some overseas management courses for their local managers. According to all managers interviewed, the course is specially designed to build up the awareness of the group of companies' position in current and future market, as well as to build up corporatism spirit among managers. The ten days intensive course at Japan headquarters is regularly organized twice a year. Participants are selected top and middle local managers from all subsidiaries around the world. Beside, basic management skill courses, every night is filled with free sessions for the managers to socialize, communicate and build up networking. Customs of meeting and building closer intra-firm relation among top management is quite familiar in Japanese business organization, but such a cross cultural or cross borders programs which include other than Japanese expatriates is rarely mentioned in previous studies and surveys.

## **Retaining Skilled Workforce: Appraisal System**

Both companies have adapted a comprehensive combination of performance appraisal system based on ability and outcome. The appraisal is conducted twice a year from April to September and October to Mac following the financial year of Japan calendar. These practices are carried out over a period of time, continuously for a long term.

In avoiding bias and getting fair evaluation outcome, values are calculated relatively to overall company performance for the particular financial year. Justification is made by finalizing the average value taken from total evaluation figure given by few evaluators.

Though, group performance is measured by similar criteria, different measurement scale for individual performance appraisal is adopted by both companies. It reflects the nature of different work organization and production systems constituted in both companies. Company A which is large in size and depends highly on parent company for expertise in engineering, emphasizes more on communication skill and discipline to keep smooth control in executing daily task. However, other achievement, job related skill and contribution to group is accounted for further promotion.

In contrast, Company B favors high-flyers with outstanding creativity, leadership and organization oriented personalities. These are related to the company's guiding spirit initiated in Japan in 1959, quoting 'sincerity', 'pioneering spirit' and 'harmony'; represent important instruments in the process of character building and attitude formation (Dore, 1971). Particularly, in the multi racial organization such as Malaysia (Japanese, Malays, Indian and Chinese), 'harmony' has always been the most highly valued. At the same time, it is also as motivation tool to initiate further innovation at local production line. In motivating creativity among local staffs, Japanese Director at Company B explained that 'Patent Award' is also extended to indigenous engineers that come up with excellent invention. However, it is yet to be awarded due to lack of support and not conducive environment for such research and development to be done in Malaysia. General Manager from Sales Department of the Company B commented;

*"There was an occasion where the local design department has come out with an improved jigs and tool that helped to modify the process of assembly and saved substantial amount of production cost. This was highly regarded by parent company and later on implemented in affiliate's production line as well."*

TABLE 4: OVERVIEW OF PERFORMANCE APPRAISAL SYSTEM DESIGNED IN 1990S

Group performance 70% (Same for Both Companies)	Individual performance (Company A) 30%	Individual performance (Company B) 30%
<b><i>Project Base</i></b> Target setting (Cost or Quality etc) Target achievement Contribution to organization	<b><i>Performance Base</i></b> Communication skill Discipline (attendance, absentees) Other ability	<b><i>Performance Base</i></b> Creativity Leadership Communication skill Personality
<b><i>Evaluators:</i></b> Department Manager and other related department	<b><i>Evaluators:</i></b> Department Manager and Human Resources personnel	<b><i>Evaluators:</i></b> Department Manager and Human resources personnel
<b><i>Duration &amp; validity:</i></b> Short term (company performance and target)	<b><i>Duration &amp; validity:</i></b> Long term and continuous (moral and personality)	<b><i>Duration &amp; validity:</i></b> Long Term and continuous (good attitude and personality building)

## Retaining Skilled Workforce: Pay and Promotion

Generally, the outcome of performance appraisal system is closely linked to pay and promotion system. According to Company A, increment in salary and bonus is very much influenced by the result of the appraisal system which classified employees into A, B and C achievers. Simultaneously, salary rate is depicted by standard range to accommodate the difference. However, when it comes to the issue of determining further promotion that gives a leap in the pay increment and implication to the whole organization, it takes a deeper thought to comprehend the

evolution of the system. A distinct feature of both companies' pay and promotion system is that it follows Japanese practices of seniority based promotion system and wages system. The system became more obvious towards the end of 1990s as both companies' structure of organization grow bigger, production lines become more stable and product concept became more mature.

The comparison between 'pioneers' career paths and those that came after 1990, explained the change. For instance, before 1990s, the position of engineers or executive is a single level. However, after 1990s the position was enlarged to 3 grades which are junior executive, executive and senior executive, before one could be able to reach the position of Assistant Manager. Thus, also means that employees who joined the company earlier has higher tendency to be promoted within short period (to much higher managerial 'level'). Whereas, those joined after middle of 1990s, promoted to a certain 'grade' or 'level' after fixed period which is every two years of tenure ship. Staffs tendency to stay at the same level is much longer than the 'pioneers'. Regardless of the young or new joined staffs' competencies, the career ladder is becoming more rigid than before. However, upward promotion to upper grade is linked to stable increment in basic pay. Some conventional wisdom explained this phenomenon as a divergence from a generalist to a specialist (Koike, 1990). Consequently, their range of experience and job scope became narrower than before. Thus, slow promotion to upper level is justified with opportunities to be specialist. Meanwhile, the increment in basic salary is compensated by seniority merit.

## Discussion

This section discusses the degree of changes and adoption of HRM in the context of organization and its environment. Finding from the fieldwork represents the actual trend happening at national level. The employment pattern in the manufacturing sector reflected the shift towards higher technology and capital intensive activities as indicated by the higher proportion of skilled and semi-skilled workers employed as in Table 5. New technologies have made the use of cheap human resources no longer attractive. Thus, particularly in the fast and rapid technological advancement industry such as E&E, cost effectiveness of cheap labor for its assembly operations is no longer feasible, which are now undertaken semi automatically. In view of this, human resources have to be re-trained in other areas, particularly in production of higher value-added items. Retraining of assembly workers is an important concern of the developing countries in the region (Nabeshima, 2000).

TABLE 5

Source: Economic Planning Unit & Department of Statistic Malaysia, 2006

Through the adaptation process to the changing environment, evidences show that it was both intentionally and unintentionally where the local organization continuously making improvement and endless effort in

maintaining effectiveness. As a result, highly competence indigenous human capital is accumulated. Their capabilities are developed in achieving managerial effectiveness.

The most obvious finding to emerge from this study is HRM practices will not succeed in isolation: firm-level industrial relations and human resources policies must be mutually reinforcing, must fit together into consistent whole. In this aspect of interrelationships between various policies requires attention (Kuruville, 1992). Dore (1973) noted that the question of transferability apart, however, consideration on cultural and institution setting of the employment systems make it clear that one cannot evaluate them in isolation. It is necessary, too to look at their interrelation with the other institutions of their respective societies. The effectiveness of HRM practices of these two companies is non comparable. In fact, the adequacy of the policy to the strategy can be evaluated by looking at the longitudinal time effects on the whole organizational performance.

TABLE 6: HRM IN CONTEXT OF ORGANIZATIONS AND ITS ENVIRONMENT

\*: Internalized labor market

## Conclusions

Returning to the questions posed at the beginning of this study, it is now possible to state that in the adaptation to environmental change, the subjects of observation have continuously experienced evolutionary process, which resulted to the establishment of distinctive capabilities (skilled workforce that became core competence of the company); which is unable to be replicated by competitors. It is also obvious that HRM plays a vital key in establishing sustainable competitive advantage in JMNCs subsidiaries of E&E manufacturing sector in Malaysia. The samples show how HRM systems were geared toward making these human resources to firm-specific competencies that are valuable, rare, imperfectly imitable, and non-substitutable. The flexibility of HRM to fit the changing strategy and work system is the heart of the story. Owing to these intangible capabilities, high value-added activities and products with cutting-edge technology are continuously being trusted to the foreign subsidiaries in Malaysia.

The limitation of this study lies in the fact that financial data was not collected to test the financial status and physical evidences on company performance. The access to the data was denied due to recording inaccuracy and some confidential matter.

## End Notes

<sup>1</sup> An investigation on the Malaysia electronics industry, found that the industrial competitiveness of Malaysia shifts away from the production of low value added products (radio and sound recorders) to that high value added (office machines and computers) ones (Okamoto, 2005). Study on the catch up process manufacturing amongst East Asian countries shows that Malaysia's home electrical appliances depicted very strong competitiveness in 1990s (Hiratsuka, 2005).

<sup>1</sup> Japan is the most influential foreign investor in Malaysia. The influx of Japanese companies into Malaysia has been remarkable since 1980s as Malaysia government launched the export-oriented industrialization program. Taking just the manufacturing industry, which is the main focus of my research, the number of operations has risen from 367 in 1991, to 533 in 1993, 596 in 1995, 722 in 1996, and 755 in 1997. A feature of Japanese industries in Malaysia is that the proportion of E&E manufacturers among them is higher than among Japanese companies operating in other Southeast Asian nations.

<sup>1</sup> The manufacturing sector continues to remain an important sector; the share of the sector to GDP increased from 29.1 per cent in 1996 to 31.4 per cent in 2005. Electric and electronic (E&E) products were the main contributor accounting for 64.1 per cent of the total exports of manufactured goods. Manufacturing sector is also the second largest source of employment, after services sector accounted for 3.1 million in 2005; electrical and electronics (E&E) industry, with 840,800 workers, or 26.8 per cent, of the total employment in the manufacturing sector.

# Making the Business Case for Corporate Sustainable Development<sup>1</sup>

Robert W. Taylor, [taylorr@mail.montclair.edu](mailto:taylorr@mail.montclair.edu)  
Montclair State University, USA

## Abstract

Can a business case for sustainable development be made? A more common approach is to rely on business ethics to make the case for sustainable development and not to rely on basic business principles – will the business make a profit and sustain itself financially? In order to move towards corporate sustainable development, it is necessary to make a business case for sustainable development. This can be done through the use of two conceptual tools: triple-bottom-line thinking and understanding the economic dimensions of eco-system services. This paper looks at the various business responses to environmental problems; analyzes the global drivers for corporate sustainable development; fits sustainable development into business strategy; and structures specific management approaches that result in both corporate sustainable development and business competitive advantage.

## Introduction

A recent report estimates that continued release of human-induced greenhouse gases that cause global warming without any policy or management changes could risk future economic damages equivalent to a reduction of up to 20% in global Gross Domestic Product (GDP) (Stern, 2006; Varian, 2006:). Table 1 shows the economic costs of extreme weather events in developed economies with only moderate climate change, while significantly greater costs are associated with higher temperatures. The Asian Development Bank states that Asian economies are losing between 2-9% of their annual GDP to environmental degradation, and the latest published report from the Chinese State Council estimates that environmental problems are costing the Chinese economy more than 200 billion US dollars a year, or about 10% of its annual GDP (ADB, 2001; Zissis (2007); Lelyveld (2006). Table 2 displays the results of China's Green National Accounting Study of 2004, a more modest assessment than other international assessments. It is these types of reports and governmental estimates that are leading corporate CEO's and business leaders into a new way of looking at the environment and its relationships to business competitive success. This new way of business thinking is referred to as corporate sustainable development and it is being promoted globally by international organizations such as the Business Council for Sustainable Development and other organizations that represent the views and policies of major multinational corporations. Companies that do not manage and mitigate their exposures to environmental risks are destined to lose shareholder value. Companies that do incorporate these risks into their business strategy will be well-positioned to generate competitive advantage over their rivals (Lash & Wellington, 2007).

TABLE 1: COSTS OF EXTREME WEATHER EVENTS IN DEVELOPED COUNTRIES WITH MODERATE CLIMATE CHANGE\*

Region	Event Type	Temperature	% of GDP	Notes
Global	Extreme Weather	2 degrees C	0.5-1.0%	Based on extrapolating and increasing current 2% rise in costs each year over and above changes in wealth.
USA	Hurricanes	3 degrees C	1.3%	Assumes a doubling of carbon dioxide leads to a 6% increase in hurricane wind-speed.
USA	Coastal Floods	1-m sea level rise	0.01-0.03%	Only costs of wetland loss and protection against permanent inundation.
UK	Floods	3-4 degrees C	0.2-0.4%	Infrastructure damage costs assuming no change in flood management to cope with rising risk.
Europe	Coastal Floods	1-m sea level rise	0.01-0.02%	Only costs of wetland loss and protection against permanent inundation.

Source: Stern Review, "The Economics of Climate Change," 2006. \*Temperatures are global relative to pre-industrial levels. If temperatures increase 4 or 5 degrees centigrade, economic costs are likely to rise much sharper than the above models based on moderate temperature increase

TABLE 2: COST ESTIMATES FROM CHINA'S GREEN NATIONAL ACCOUNTING STUDY REPORT<sup>2</sup>

Categories of Environmental Damage	Economic Costs as a % of GDP	Categories of remediation expense	Estimated remediation costs as a % of GDP
National Resource Depletion Costs* Land, Minerals, Forest, Water, Fisheries	N/A	Pollution discharge and treatment costs	8.8%
Environmental Damage Costs Environmental Pollution Ecological Damage	3.05% N/A		

Source: China's Green National Accounting Study Report, 2004, SEPA and NBS (<http://english.sepa.gov.cn>)

\*Cost estimates of environmental damages do not consider depletion costs and ecological damages which is why other sources (Zissis, 2007; Lelyveld, 2006) estimate costs as a percentage of GDP (8-12%).

When 51 of the 100 largest economies are companies and not countries, and when it is recognized that the combined sales of the world's largest 200 corporations generate one quarter of the world's GDP, it is imperative to involve the corporate community in any shift toward sustainable development (Table 3). It is the purpose of this paper to discuss the reasons why multinationals are developing new strategies of corporate sustainable development; describe how these strategies relate to the principles of business management; and analyze the various tools that exist to successfully implement corporate sustainable development.

TABLE 3: TOP TEN COMPANIES COMPARED TO GDP OF SELECTED COUNTRIES 2000

Corporation	Sales (\$Mil)	Country	GDP (\$Mil)
General Motors	176,558.00	Denmark	174,363.00
Wal-Mart	166,809.00	Poland	154,146.00
Exxon Mobil	163,881.00	Norway	145,449.00
Ford Motor	162,558.00	Indonesia	140,964.00
DaimlerChrysler	159,985.70	South Africa	131,127.00
Mitsui	118,555.20	Saudi Arabia	128,892.00
Mitsubishi	117,765.60	Finland	126,130.00
Toyota Motor	115,670.90	Greece	123,934.00
General Electric	111,630.00	Thailand	123,934.00
Itochu	109,068.90	Portugal	107,716.00

## Business Responses to Environmental Problems

There are traditionally four responses that businesses take when dealing with environmental issues and problems. Businesses that are well-positioned in the market, have a good management team in place, and understand the nature of competitive strategy, seek to look at the business challenge of environmental problems. These companies do not view regulations as business obstacles but utilize innovation and new technologies to respond to new market opportunities. These early adopters are on the cutting edge of corporate sustainable development and are the global leaders in this new way of thinking. They tend to build environmental ethics into their corporate mission.

A second type of response is made by mainstream businesses that also seek to address new customer preferences and business opportunities presented by public environmental awareness. These businesses respond more traditionally than the early adopters by developing strategies that limit costs through better engineered products, the reduction of waste and toxics in the production process, and a pro-active approach to regulatory compliance.

A third type of response is made by businesses that seek to sustain competitive advantage by ensuring that they maintain regulatory compliance. Their response is driven mainly by governmental regulations, and considers environmental problems as compliance issues. This business strategy is geared more toward environmental management than in pursuing a strategy of sustainable development. They seek to stay competitive by reducing compliance costs, and make little effort to tap into new environmental opportunities.

And lastly, a fourth type of business response is generated by companies defined as business laggards. These companies are often the least competitive businesses; are in industries or sectors that are experiencing economic decline; and whose main purpose is to continue to stay in business. These businesses are marginal and need to be closely monitored by regulatory agencies. They view environmental issues and regulatory agencies as mostly adversarial.

TABLE 4: BUSINESS RESPONSES TO ENVIRONMENTAL PROBLEMS

Type	Driver	Characteristics
Early Adopters	Market Opportunities	Utilizes innovation and new technologies to respond to new market opportunities.
Mainstreamers	Costs	Seek to address customer preferences and reduce costs in products or services.
Compliers	Regulations	Seeks to maintain regulatory compliance only.
Laggards	Declining Markets	Are in economic sectors experiencing declining markets and take an adversarial position.

## Global Drivers for Corporate Sustainable Development

There are three drivers or factors that are leading businesses to adopt sustainable development as a competitive management strategy. The first driver is governmental compliance. Businesses need to comply with the regulatory apparatus of their host countries. In countries that have strict regulatory procedures and strong enforcement, this driver constitutes a major consideration in business policy and can move companies much faster toward sustainable development. In countries that have weak enforcement systems, a greater emphasis needs to be placed on the economic gains that can be derived from adopting a sustainable development management strategy. Countries that have strict environmental standards perform better in the global marketplace as companies learn to become more efficient and adopt better technology. Also, companies that can respond quicker and more efficiently to a regulatory environment can gain a significant advantage over weak competitors who cannot comply (Porter, 2005).

A second driver is the marketplace. Businesses can sustain competitive advantage by responding to the environment preferences of their customers, suppliers, communities, investors, shareholders, and other financiers. This driver is growing more important as global financiers such as the World Bank and various not-for-profit and for-profit investment groups are demanding that companies that practice corporate sustainable development be part of their investment portfolios. And finally, companies can gain market share by responding to the need and demand for environmentally-friendly products and services. This opens up new markets for entrepreneurial business expertise.

And lastly, a third driver is the development of the globally integrated enterprise. The globally integrated enterprise is a further evolution of the multinational corporation into something new and different. While the multinational corporation tends to have a hub-and-spoke management style, the globally integrated enterprise is more decentralized, is based on the revolution in information technology, and requires new forms of collaboration between businesses in different countries. This new type of global business framework requires greater global stability and a greater reliance on new intergovernmental networks of regulators and legislators. It also requires shared professional standards and relationships in cross-national communities. This means that environmental and social problems now become business issues, as global business relies on a global peace and stability that ensures that global business networks perform efficiently and in a timely fashion (Payne & Raiborn, 2001; Dodd, 2000) (Palmisano, 2006).

### **Fitting Sustainable Development into Corporate Strategy**

For corporate sustainable development to be truly operational, it is necessary to develop two types of thinking. The first is to recognize that payment for ecosystem services is a policy that encourages sustainable development by placing an economic value on the environment. Ecosystem services are services provided by natural systems that sustain life and make it possible for humans to exist and prosper. Photosynthesis is responsible for food production and biotic productivity; proper atmosphere and climate

TABLE 5: DRIVERS OF CORPORATE SUSTAINABLE DEVELOPMENT (SD)

Driver	What the Driver Does	Problem of Driver	Possibilities of Success
Governmental Compliance	Establishes an effective country-based regulatory system.	Not all countries enforce their regulatory systems.	Increasing involvement of Civil Society leads to stronger enforcement.
Marketplace	Responds to customer demands.	Environmentally sustainable products are often more costly.	Investment screens, capital venture opportunities, and green labeling provide greater market penetration.
Globally-Integrated Enterprise	Decentralizes and equalizes corporate power globally.	Requires peace and global stability to operate.	Collaborations are fostering knowledge networks for stability.

establish the tolerance levels for human existence; and biomes such as wetlands provide services to humans such as water filtering and purification and a buffer to flooding, To replace these natural systems with man-made engineered solutions are sometimes impossible but when possible, costs much more than simple maintenance of the natural system. Thus, a policy of payment for the maintenance of ecosystems, such as watersheds and wetlands, can be viewed as a good return on investment using simple return-on-investment techniques used for any business decision. Through this type of thinking, environmental amenities can be viewed through a traditional business approach and can be dealt with in traditional business decision-making formats (Abramovitz, 1998, Potent, 2006).

A second type of thinking is to develop corporate sustainable development around the concept of the Triple-Bottom-Line (TBL) (Savitz, 2006). The Triple-Bottom-Line is based on three measures of business success. The first is economic. This measure is determined by traditional measures of business success, such as: what percentage of market share does a company have; what is the stockholder value of the company; and what are its capital assets and infrastructure capabilities. The second measure of success is social. Its business application refers to its ability to bring people into the market-place, to generate goods and services that are affordable and can expand purchasing capacity of larger numbers of people, thereby reducing poverty and expanding social opportunities. The third measure of success is environmental. This measure of success depends on the capacity of the business to lessen natural resource use, practice eco-efficiency in production units, prevent and reduce pollution, and follows policies of de-materialization and de-carbonization (Kates, 2000).

TBL constitutes the evolution of business thinking from the environment being an externality to one where social and environment issues are important components of corporate sustainable development. Businesses first viewed the environment as an externality, something which was outside normal business operations. This perspective was replaced in the 1970's in the United States by the view that new environmental public policies required that businesses respond to governmental compliance. By the 1990's this approach was supplanted by the development of policies geared toward pollution prevention. And finally, the current perspective emphasizes corporate sustainable development. This management strategy holds that competitive advantage is based on the ability of the corporation to incorporate social and environmental considerations into its business model. By doing so, the business organization will develop new markets for its products, create more effective management systems, and respond to the needs and demands of a wide-range of stakeholders.

## The Business Case for Sustainable Development

Free market economists like economist Milton Friedman do not believe that businesses should make decisions based on social and environmental criteria, but should strictly adhere to pragmatic business principles of profit and loss and return of value to the shareholders (Friedman, 1962). If sustainable development is to be an effective corporate

management style it must meet the basic principles of business decision-making. A business case rests on decisions that companies must produce goods and services for people at affordable prices. They must develop market share in their industries or business sector. A corporate sustainable management style provides the nexus of sustainable development with the principles of business.

Free market economists who believe that business has no role to play in the social and environmental realms fail to recognize the issue of timeframe. Business decisions that do not take into consideration a long-range timeframe are basically non-sustainable. If the natural capital base that generates global wealth degrades to the point that it impedes global economic growth, businesses will atrophy along with natural systems. Also, triple-bottom-line thinking, a core feature of sustainable corporate management, views the social feature as a way to grow business market share. Today, only 1.5 billion people out of a global population of 6.5 billion have enough wealth and purchasing power to drive the global economy. With triple-bottom-line thinking, reducing poverty and bringing more people into the global market will allow businesses to significantly increase market share and prosper. The key business feature of corporate sustainable development is the recognition of the benefit of long-term thinking, - that the role of business is to incorporate long-term social and environmental consequences into short-term decision-making and planning.

## **Obstacles to Corporate Sustainable Development**

One of the key ways to move the organization toward corporate sustainable development is to recognize the obstacles within the organization to this new type of thinking and to develop the appropriate tools and strategies to remove these obstacles.

Who is demanding this new type of thinking? While there has been attention given to a growing customer base for green markets, generally, customers are not major drivers for this new management style. Also, the business organizations themselves, meaning the large groups of people that make up the line and staff positions of these organizations, are often too involved in short-term decision-making to be fully engaged in corporate sustainable development. The major drivers for this new way of thinking are corporate CEO's. They tend to see the big picture and are looking at where their organizations will be in ten or twenty years. This expanded timeframe produces the perspective necessary for the adoption of corporate sustainable development.

How can organizations move to this new type of thinking? The most salient approach is to develop "knowledge systems" that convey the key concepts of corporate sustainable development internally within the organization and externally to the broader community. These "knowledge systems" are part of the concepts basic to the learning organization. They consist of multi-stakeholder collaborations, successful training programs, and customer and community dialogues. Two broad management approaches to corporate sustainability reveal the various tools and strategies that organizations need to implement in order to adopt this new way of thinking.

## **Management Approaches to Corporate Sustainable Development**

There are two basic approaches to corporate sustainability. The first approach deals exclusively with business operations. Business operations refer to the functions of the organization that deliver its products and services on a daily schedule and require short-term planning and decision-making. There are four tools available to deliver corporate sustainability: environmental management systems (EMS); environmental cost-accounting (ECA); design for environment (DFE); and eco-efficiency (EE).

The most prevalent tool for the delivery of corporate sustainable development is the ISO 14000 series, an international standard that establishes a corporate environmental management system (EMS) that integrates environmental responsibility into corporate management procedures. ISO 14000 is basically a way for the business organization to manage and measure its environmental performance. A company sets its own goals and puts in place a management system that accomplishes these goals (Tinsley & Pillai, 2006).

Environmental cost-accounting (ECA) is a financial tool that allows corporations to understand more precisely their environmental costs associated with their products. Traditionally, environmental costs have been a

part of general administrative costs in the accounting function. Through this approach, it is impossible to understand how certain products in a company's product line might be most responsible for exaggerated environmental costs. Through environmental cost-accounting (ECA), companies move toward a system of accounting based on activities where costs are measured by product. In this way, a company builds its environmental costs into each product cost analysis and is able to make a decision to eliminate products that have unusually high environmental costs.

Design for environment (DFE) is an important corporate sustainability tool that recognizes that the most important stage in product development is the design stage. DFE takes the traditional issues related to product design, namely, utility, interest, manufacturability and reparability, and adds the dimension of environmental sustainability. This tool addresses issues of environmental health and safety, preservation, and restoration processes in new product development. It considers issues such as product disposal, waste management, pollution prevention, ecology, and resource conservation. It is a tool that enhances environmental quality as well as market competitiveness ([www.best.me.berkeley.edu](http://www.best.me.berkeley.edu))

TABLE 6: ADVANTAGES OF DESIGN FOR THE ENVIRONMENT

Conserve resources and create leaner products.
Design products which can be reused or recycled.
Minimize waste, byproducts and emissions in the production process.
Increase a product's service life.
Create more efficient disposal and waste management alternatives.
Increase the safety in the product design.
Prevent or decrease pollution in the production, use, and disposal of designed products.

And lastly, eco-efficiency (EE) is a tool that seeks to minimize the use of resources by utilizing the concepts inherent in the developing science of industrial ecology. It is an approach that calls for the creation of value with fewer inputs of materials and energy. It is one of the main tools responsible for recent global trends in product development that emphasizes dematerialization and de-carbonization.

TABLE 7: BUSINESS TOOLS FOR CORPORATE SUSTAINABILITY

<b>Tool</b>	<b>Characteristics</b>
Environmental Management Systems (EMS)	Establishes a system to measure environmental performance.
Environmental Cost Accounting	A financial tool where environmental costs are associated with specific products or services.
Design for Environment	Assesses environmental sustainability through product design.
Eco-efficiency	Measures product or service value based on fewer inputs of material and energy

A second approach to corporate sustainability is stakeholder engagement. This management approach emphasizes the need to develop good information systems for business competitive advantage and effectiveness. Good information can only be attained through a system of open and available information flow that is dependent on a knowledge network of engaged stakeholders. These stakeholders can be either internal to the company, - company employees and various company offices, or external, - suppliers, customers, regulators, company shareholders, the public and the local community. Both these stakeholders, the internal and the external, are often covered in environmental management systems conceived through the ISO 14000 series. Corporate sustainable development develops information that allows the company to create product marketing that appeals to customer's environmental preferences. It engages its suppliers in a supply chain management system that ensures proper resource conservation

and environmental quality. And finally, it engages its shareholders, its financiers and investors, and members of the public through proper and timely environmental reporting.

## **Public Policy for Corporate Sustainable Development**

It is necessary to have effective public policy in place that encourages corporate sustainable development. One set of public policies must be directed at bringing the marketplace into the environmental problem-solving arena through the creation and use of market mechanisms. The use of market mechanisms to encourage corporate sustainable development is dependent on establishing the value of eco-system services both to business and society. By establishing value on these services, it is possible to utilize market-based mechanisms such as trading markets to move toward sustainability.

An example of a trading market is the greenhouse gas emissions market that has developed as a result of the Kyoto Accord. The attempts to reduce human-induced carbon dioxide, the major greenhouse gas that leads to global warming, has produced a carbon emission trading market used by national governments and corporations to trade permits in order to motivate polluters to reduce their emissions through a series of financial or business incentives. These market based incentives are not designed to replace governmental regulatory policy but to use the market to optimize the business case for sustainable development.

Public policy is also necessary as a force for guiding multi-stakeholders into the development of effective “knowledge networks” for sustainable development. There is an increasing body of research that states that corporations, local communities, regions, and nations that possess the most effective environmental policy as measured by various indicators of environmental quality also are the most innovative, possess the most advanced technology, and have the strongest economies. As a result, one measure of environmental sustainability and economic viability of cities, regions and nations is analyzing the ability of these geographic areas to develop clusters of stakeholders or “knowledge networks” that foster sustainable development.

## **Conclusion**

Can a business case for sustainable development be made? A traditional method is to rely on business ethics and not on the traditional principles of business to justify the implementation of corporate environmental sustainability. While business ethics are necessary, business decisions are generally made on the principles of the business case - will the business make money and sustain itself financially? In order to move towards corporate sustainable development, it is necessary to make a business case for sustainable development. This can be made through use of triple-bottom-line thinking and understanding the economic dimension of eco-systems services. Good environmental performance means good business performance. The growing consensus among CEO's is that if your corporation is sustainable, you will be in business a long time, and if it is not, you will soon be out of business.

### End Notes

<sup>1</sup>Special thanks to Jeffrey Potent, adjunct professor at Columbia University and official with the United States Department of Environment Protection, Division 2, for his assistance with this paper.

<sup>2</sup>There is a major discrepancy between various estimates of the GDP in China due to environmental degradation. Recently, the China National Green Accounting Report downplays the impact, while international organizations and even Chinese officials have estimated the impact to be 9-12% of GDP, depending on how extensive environmental damages are computed.

## Competitiveness of SMEs as Sustainable Enterprises

*Vojko Potocan, [vojko.potocan@uni-mb.si](mailto:vojko.potocan@uni-mb.si)*

*Matjaz Mulej, [mulej@uni-mb.si](mailto:mulej@uni-mb.si)*

*University of Maribor, Faculty of Economics and Business, Slovenia*

### Abstract

Society's functioning depends on all organizations, including small and medium-size enterprises (SMEs). SMEs are 99 % of enterprises in Europe, the others employing 48% and dictating rules of game. To survive, SMEs must be economic rather than only legal enterprises; their heads must be innovative and entrepreneurial. Market demands synergy of efficiency, quality, range, uniqueness, and sustainability. SMEs must cherish sustainable development like all enterprises. Meeting these requirements depends on influential humans, along with institutional order. Many SMEs must innovate their management style, applying ethics of interdependence using the sustainable-enterprise ethics. SMEs owners/entrepreneurs/managers might benefit from requisitely holistic/systemic behaviour. Paper discusses two theses. (1) Improving SMEs' competitiveness by becoming sustainable enterprises to requisitely holistically meet requirements in social/business environments. (2) Improving business by helping SMEs members understand/implement "sustainable-enterprise ethics". SMEs' future depends on their innovating of individual/organizational values, culture, ethics, and norms very much. It is conceptualized as a reminder to diminish oversights in SME's practice.

**Keywords:** entrepreneurship, ethics of interdependence, globalization, innovation, requisite holism, sustainable development, sustainable enterprise.

### The Selected Problem and Viewpoint

Currently, in Europe 99 % of all enterprises are small and medium-size enterprises (SMEs) employing 52 % of all employees (Rebernik et al., 2003; EU, 2006; Potocan and Mulej, 2007). This means that 1 % of all enterprises employ 48 %; among them the multinationals have the biggest and most global influence (Petzinger, 2000; EU, 2006). But the biggest number of new jobs is provided by the micro enterprises employing 23 % (Hazl, 2002; EU, 2006).

In transitional countries of Central and Eastern Europe that are only starting to become innovative societies, SMEs are a rather recent feature, but their number is coming close to EU figures. How entrepreneurial are these new SMEs? How can they become more and requisitely innovative, including sustainable development (SD)?

### Diffusion of Attributes of Economic Enterprises among SMEs

Entrepreneurship can be considered:

- A legal feature, i.e. ownership of enterprises, such as family ones (Duh, 2002; Rebernik et al., 2003),
- An economic feature, i.e. searching for, creating, and using new business opportunities to make innovations (Schumpeter, 1934; Rebernik and Mulej, 2000; Potocan et al., 2004 – 2007; Senge et al. 2004), or
- A psychological and sociological attribute of the entrepreneur as a person (Potocan, 2002; Leydesdorf, 2006).

Hence, the above figures mean that about 40 % of adults in a society must be entrepreneurial persons to make enterprises economic rather than only legal entities, called enterprises. This percentage must be achieved by innovation (as a process) of human values, which will not be a novelty yielding no benefit to its users, but an innovation (as outcome) (Potocan et al., 2004-2006; Mulej, 2006).

Figures from research on diffusion of novelties aimed at becoming innovations (Rogers, 1995; Lester and Priore, 2004; McGregor, 2006) include into rather innovative recipients of novelties only about 18 % - 30 % of all adults, while in e.g. Slovenia, as a case of the transitional countries of the Central and Eastern Europe this figure may be even only 20 %; according to public opinion survey, 80 % prefer a slow development (Rebernik and Mulej, 2000; Rebernik, Mulej and Rus, 2003; Rebernik et al., 2003). This means that new concepts such as economic

entrepreneurship replacing routine-loving behavior (including employment without subordinates' responsibility for creativity) are difficult to implement. The same findings apply to sustainable development, too (Ecimovic, Mulej and Mayur, 2000; Potocan, 2002; Potocan and Mulej, 2003; Potocan, 2004; Potocan et al., 2004 – 2007; Potocan, 2005).

On the other hand, both scientists and world top politicians found it urgent to declare SD a new invention supposed to become innovation in order for humans to solve an emergency of the entire humankind – a lack of remaining natural preconditions for humankind to survive (WCED, 1987; UN, 1992; OECD, 2000; Umpleby, 2002; Umpleby, 2003); they still fight for support, but do receive some support also in the business community (WCED, 1987; UN, 1992; OECD, 2000; BASD, 2001; BASD, 2002; Potocan et al., 2004-2006).

Both groups of change agents – those concerned with SMEs as economic enterprises and those concerned with SD – have obviously not done enough on making the emergency recognized by all influential persons and organizations; they have not considered that their scientific findings and political declarations should be considered inventions that should become innovations (Potocan et al., 2004; Mulej, 2006). This requires the invention to be considered in terms of a persuasive communication process (Potocan, 1998; Dyck and Mulej, 1999; Ecimovic, Mulej and Mayur, 2002; The Economist, 2006a; Potocan and Mulej, 2007). Figures 1 - 4 were neglected or unknown. The approach was not requisitely holistic and hence successful for humankind to have a secure future with no monopolies and unemployment (against which SMEs work) and with a healthy natural environment (for which sustainable development works).

FIG. 1: THE SELECTED LEVEL OF HOLISM AND REALISM OF CONSIDERATION OF THE SELECTED TOPIC BETWEEN THE FICTITIOUS, REQUISITE, AND TOTAL HOLISM AND REALISM

APPROACH TO DEALING WITH AN OBJECT AS A TOPIC OF THINKING ETC.	One-sidedness by a single viewpoint	Requisite holism by co-operation of all essential professionals and only them	Total holism by consideration of totally all viewpoints, insights from them and synergies of them
TYPE OF APPROACH	(Too) simple	Requisitely simple	Very entangled
TYPE OF SYSTEM	Single-viewpoint based system	Dialectical system	Total system
ATTRIBUTES OF OBJECT INCLUDED IN SYSTEM	(Very) few	All essential	All
RESULT OF APPROACH	Fictitious holism (in most cases)	Requisite holism (good in most cases)	Total holism
FOCUS MADE POSSIBLE	(Too) Narrow focus (in most cases)	Requisitely holistic focus	Lack of focus
NUMBER OF PROFESSIONS	One single	Requisitely many	Literally all
TYPE OF WORK	Individual	Mixed team of requisite and different experts	All humankind in co-operation
CONSEQUENCES	Complex due to crucial oversights, dangerous	No problem due to no crucial oversights	Simple due to no oversights
AVAILABILITY	(Too) Frequent in real life	Possible in real life	Not possible in real life

FIG. 2: LAW OF REQUISITE HOLISM (FIGURE 1) IN SOME DETAILS

One-sided attempts of perception, thinking, decision making, and action are normal with the normal specialists, if they do not want and/or know how to co-operate with other specialists who are different from them, and make therefore oversights and finish in fictitious holism causing mistakes (from e.g. bad cooking all way to world wars). Owners, entrepreneurs and managers of SMEs are often quite close to this danger: they do not have many co-workers, they have often established their own SMEs because they had no other chance to survive after losing their job as employees (Rebernik and Mulej, 2000; Rebernik, Mulej and Rus, 2003; Rebernik et al., 2003). Often, this means that they are very good in a technical profession, on which they intend to live, with full right, but less good or even completely uneducated in running a SME (Gerber, 2004; Nussbaum, 2005; Mulej, 2006). This is obviously no local problem of the transitional economies of the Central and Eastern Europe with a short tradition of SMEs that are not handicraft with a limited number of employees or intellectual services, to which SMEs used to be limited in the so called socialist era. An entrepreneur produces an enterprise rather than a product; his professionals produce the product as a part of his/her basis to produce a SME.

In the current economic circumstances, SMEs must be obviously viewed as inventions that are supposed to become innovations, not only their products. All influential stakeholders must be persuaded in a communication process for the transition from invention to innovation to happen. In a summary, everything in Figure 3 must be considered and mastered (Summarized from Rogers, 1995).

<i>Viewpoints to be considered</i>		Phases of users' decision making about a novelty				
		1 Awareness	2 Persuasion	3 Decision	4 Applica- tion	5 Reconfir- mation
<b>Novelty custo- mers (po- tential)</b>	Customers – innovators					
	Early customers					
	Early majority					
	Late majority					
	Laggards					
<b>Opinion leaders</b>						
<b>Attributes of novelty</b>	Relative advantage					
	Compatibility					
	Complexity					
	Testability					
	Visibility					
<b>Communicat- ion channels</b>	Public					
	Interpersonal					
<b>Nature of the social system of customers</b>						
<b>Decision type about novelty</b>	Optional					
	Group					
	Authority					
<b>Conseque- nces of novelty</b>	Desired					
	Undesired					
	Indirect					
	Direct					
	Anticipated					
Unanticipated						

FIG. 3: MATRIX OF ESSENTIAL ATTRIBUTES OF DIFFUSION PROCESS FROM THE VIEWPOINT OF CHANGE AGENTS (A CASE)

Legend: The darker the area, more effort of change agents is needed.

In addition, making an innovation from an invention requires the inventor trying to become an innovator to consider everything included in the dialectical system of preconditions in Fig. 4 (Mulej, 2000).

Innovation = (invention X entrepreneurship X holism X management X co-workers X innovation-friendly culture X customers X suppliers X competitors X external (socio-economic) conditions X natural environment X random factors, including good luck).

FIG. 4: DIALECTICAL SYSTEM OF PRECONDITIONS FOR INNOVATION TO SHOW UP

In order to cover well everything in Figures 1-4, the entire process in Fig. 5 must be taken care of with requisite holism (Mulej, 2000).

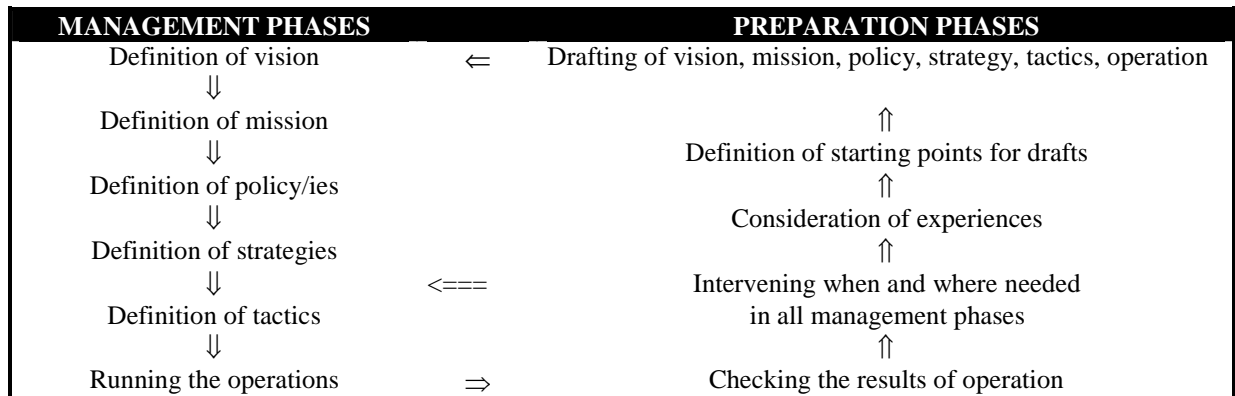

FIG.5: THE CYBERNETIC CIRCLE OF THE PREPARATION AND IMPLEMENTATION OF THE MANAGEMENT PROCESS (A SIMPLE MODEL)

For influence of sustainable enterprises (SE) and SE's ethics (SEE) on enterprise competitiveness see Figures 6 and 7 (See: Potocan and Mulej, 2003; Potocan and Mulej, 2007; completed up after: Bolwijn and Kumpe, 1990).

Decade	Market & Social Requirements	Enterprise's Ways To Meet Requirements	Type of E
1950	Meet post-war conditions	Supply anything	Supplying E
1960	Suitable price (as judged by customers)	Internal efficiency, i.e. cost management	Efficient E
1970	Suitable price X quality (as judged by customers) (X = interdependence)	Efficiency X technical & commercial quality management	Quality E
1980	Suitable price X quality X range (as judged by customers)	Efficiency X technical & commercial quality X flexibility management	Flexible E
1990	Suitable price X quality X range X uniqueness (as judged by customers)	Efficiency X technical & commercial quality X flexibility X innovativeness management	Innovative E
2000	Suitable price X quality X range X uniqueness X contribution to SD (as judged by customers)	Efficiency X technical & commercial quality X flexibility X innovativeness X SD	Sustainable E (SE)

FIG. 6: FROM AN EFFICIENT TO A SUSTAINABLE ENTERPRISE

Choices between the models from various decades in Fig. 6 are no longer available for SMEs with interest to compete successfully: they must be SEs. This is a matter of knowledge and will: the owners, entrepreneurs, and managers must form their values and diffuse them in terms of the model in Figure 7. They will attain more success,

if they follow the left column in Figure 8 rather than the right one, but the narrow specialists and routine-lovers prefer the right one – and fail.

Individual values (interdependent with knowledge)	↔	Culture = values shared by many, habits making them a round-off social group
↓		↓
Norms = prescribed values on right and wrong in a social group	↔	Ethics = prevailing values on right and wrong in a social group

FIG. 7: CIRCULAR INTERDEPENDENCE OF VALUES, CULTURE, ETHICS, AND NORMS, INCLUDING THE CASE OF SE ETHICS

Nothing in Fig. 1 – 7 may be left aside. In the contemporary circumstances both attributes – being an economic SME rather than a legal one only, and living with or even on SD – are unavoidable and interdependent for a longer-term prosperity of the enterprise including all its stakeholders and of the society at large. Therefore it is an important question: who is in charge of making it all happen in the case of SMEs? The rough framework only and nothing more is provided for by United Nations documents and with governments’ documents per countries. Enterprises can normally obey or circumvent legal rules and institutions on the basis of their own market situations, perception of trends etc., which depends on personal attributes of the decisive persons - owners, entrepreneurs, and managers and other stakeholders.

### Who and What Makes SMEs Economic and Sustainable Enterprises?

SMEs face the same natural and market conditions as all other enterprises, including the requirement for consideration of SD (Potocan, 2002, Potocan and Mulej, 2003; Potocan, 2004; Potocan, 2005). They can succeed, if they do understand (and implement in business practice) important business trends on the basis of:

- Sustainable development (SD) and prevailing of sustainable enterprise (SE),
- Appropriate business ethics, which means sustainable enterprise ethics (SEE).

This capacity is easier to attain with systems thinking – see Figure 8.

No	Systems / Systemic / Holistic Thinking	Un-systemic / Traditional Thinking
1	Interdependences, Relations, Openness, Interconnectedness, Dialectical System	Independence, Dependence, Closeness, A single viewpoint/system
2	Complexity (& Complicatedness)	Simplicity, or Complicatedness alone
3	Attractors	No influential force/s, but isolation
4	Emergence	No process of making new attributes
5	Synergy, System, Synthesis	No new attributes resulting from relations
6	Whole, Holism, Big Picture, Holon	Parts and partial attributes only
7	Networking, Interaction, Interplay	No mutual influences

FIG. 8: THE SEVEN INTERDEPENDENT BASIC SETS OF TERMS OF SYSTEMS / SYSTEMIC / HOLISTIC VS. UN-SYSTEMIC THINKING (AS A DIALECTICAL SYSTEM)

Information in Figures 1 – 8 applies both the making a SME an economic enterprise, after it has been established as a legal one, and to making it a SE. All attributes are necessary and are so in synergy.

A holistic research of all the phases of process of transition of owners’, entrepreneurs’ and managers’ (as well as their co-workers’ and other stakeholders’) ethics concerning SD and its application in the SMEs operation reaches beyond the framework of our investigation or this contribution. We shall rather discuss only the basis for SME’s owners’, entrepreneurs’ and managers’ behaviour in the framework of globalization: why is SD so important for SMEs competitiveness, how do we understand sustainable SME, why (and how) sustainable SMEs’ ethics

presents interdependence linking the selected important viewpoints of business and how SE and SEE of SME influence SMEs' competitiveness.

Since the great majority of business systems are SMEs, it is almost impossible to reach any goal in the society without engaging also the SMEs. This applies also to achieving the goals of SD (Rebernik, Mulej and Rus, 2003; Potocan, 2004; Potocan et al., 2004 – 2007; Potocan, 2006).

Like any enterprise, SMEs start as empty legal shells (with some kind of organizational structure). It is the owners, entrepreneurs, and managers (individually or in teams) that define goals and operations of their SME (as a process of finding and exploiting business opportunities) that make their SME efficient, effective and successful with help of their co-workers and other stakeholders, of course. They all must be both entrepreneurial and managerial personalities to succeed (See: Schumpeter, 1934; Bygrave, 1994; Prigogine, 1997; Affuah, 1998; Daft, 2000; Hazl, 2002; Gu and Chroust, 2006). Entrepreneurial personalities are aiming at something new all the time, managers at using the given funds optimally. Thus, they are complementary to each other. If these rather different viewpoints must be the concern of the same person, it may cause troubles, unless the person exercises Figures 1 – 8.

A SME is a product of owners, entrepreneurs and managers aimed to exploit a business opportunity and to capitalize on it. Management of SMEs is a complex process, and the owner, entrepreneur or manager who runs it has to play many different roles (Drucker, 1990; Harman and Porter, 1997; Magretta, 2000; Buijs, Meer and Fischer, 2007). There is no guarantee that the entrepreneurial efforts will be allocated in a way that follows the innovative and constructive image we usually have of the economic entrepreneurship. Not every entrepreneurship is aimed at development; it can also be unproductive or destructive (Baumol, 1990; Drucker, 1990; Baumol, 1993; Harman and Porter, 1997; Magretta, 2000; Potocan, 2002; Potocan and Mulej, 2007). Unproductive entrepreneurship refers to the performing of entrepreneurship activities that enrich the entrepreneurs, but do not increase the wealth of the society of which he or she is a part. In some cases, entrepreneurs may even play a destructive role (apart from the entrepreneurship of military dictatorships, destructive wars, etc.), especially when they obstruct the dissemination of technological knowledge and other inventions and innovations, or forget about their corporate social responsibility in other ways (Laurent, 2007; Jennings, 2005).

As we have summarised in Fig. 6, the ideal enterprise of this decade is a SE (i.e. highly ranked in efficiency, quality, range, uniqueness, and care for humankind's natural environment, all in synergy). Thus, it holds true that the existence and development of SMEs in the frame of contemporary globalization should depend increasingly on their capability to contribute to SD in their environment. Hence, the behaviour of owners, entrepreneurs and managers who are the core of SMEs is to be examined more closely, and perhaps also supported with new insights and suggestions.

In working on their SE and its SD, owners, entrepreneurs and managers encounter a number of problems. Firstly, they must understand the modern economic conditions (e.g. globalization, which tackles them indirectly, at least, even if their own business covers the local markets only: there are no totally local markets any longer, at least not in Europe and most of the other world). In the next step, owners, entrepreneurs and managers must define the starting points and characteristics of their work in the frame of globalization. And finally, they must define their own place in working on their SME's SD, and application of the idea of SD on SMEs to make them SEs with SEEs. This fact has to do both with their knowledge and their ethics (Singer, 1993; Umpleby, 2003; Senge et al., 2004; Potocan, 2006), as we can see in Figure 7 and in the fact that no person is rational only or irrational only; thinking and emotions and interdependent (Smith, 1937; Bertalanffy, 1968; Mulej, 1979; Mulej and Kajzer, 1998; Mulej, 2000; Mulej et al., 2004).

What must owners, entrepreneurs and managers of SMEs do to successfully enter the market game under modern conditions, on the basis of the above summarised findings, in practice?

## **Globalization Requires Management Innovations**

The globalization no longer allows for routine-loving owners, entrepreneurs and managers, like a long-term stability used to for millennia (Magretta, 2000; Potocan, 2002; Rebernik, Mulej and Rus, 2003; Potocan et al., 2004 - 2007). Therefore, the new bases of a modern ownership, entrepreneurship and management may include serious novelties

aimed at becoming management innovations such as:

- Owners, entrepreneurs and managers must thoroughly rethink and innovate their operation to improve their SMEs competitiveness, permanently create and sell new products and services, which must become innovations.
- Owners, entrepreneurs and managers must create operation globally, and act locally; they need direct links with their end users, to know both their market and the broader consequences of their action in time.
- Owners', entrepreneurs' and managers' transition from the commanding hierarchy to the 'process-based' specialization and interdisciplinary creative cooperation is of special importance, in order for a SME to activate capacities of every member and partner in the value-chain.
- Owners, entrepreneurs and managers must reconsider their absorption capacity for inventions and other knowledge from research organization, which are their potential and/or real partner in research and development (R&D), because most SMEs cannot afford R&D departments of their own, but need fresh knowledge and information on technology, marketing, accountancy, law, etc. (Potocan, 2004; Potocan, 2005; Potocan, 2006).
- There is a growing need for the interdisciplinary capacity of owners, entrepreneurs and managers in SMEs (e.g. systems thinking, inter-cultural capabilities and knowledge, permanent education and training, formation of personal standards of ethics of interdependence and the standards of entrepreneurship behavior, capacity of anticipation based on a broad interdisciplinary cooperation, cooperative and team work capacity).

For these reasons, owners, entrepreneurs and managers must innovate the process of their work (and perception of its role, importance and characteristics) to meet the newly emerging conditions of business operation. They must create a set (better: a dialectical systems) of new goals and new innovative behavior for their own work (Rhinesmith, 1999, Daft, 2000; Potocan and Mulej, 2003; Potocan et al., 2004 – 2007; Potocan, 2005; Potocan, 2006).

The basic tasks for a SME's owners, entrepreneurs and managers to be competitive in conditions of globalization include hence, we think, the following (See for details: Potocan, 2002; Potocan and Mulej, 2003; Potocan, 2005).

- A timely and therefore anticipatory and requisitely holistic/systemic formation of the entire concept of the SME and its competitiveness, which will be created on the basis of co-operation between all partners of a value chain – both the current and the potential ones, and institutions from the environment. Such a view can make the future operation equal-footed, cause co-operation and motivate coworkers for creativity (See also: Ulrich, 1997, Hebert and Link, 1998; EU, 2006).
- Anticipation of the changes in the industrial dynamics, and the resulting adoption and adaptation of the available and potential resources of a SME. The operation of the SME will, therefore, be oriented mainly to the innovation of the already existing operation and to the formation of new possible directions of further development. The optimization of available resources will be replaced by the efforts to accumulate and innovatively use the SMEs' (potential) resources. Additionally, it will be necessary to anticipate synergetic effects of the use of resources together with the competitors and buyers (Rebernik, 1997; Affuah, 1998, Rebernik and Mulej, 2000), and to include SD in the anticipation.
- Creation of a flexible system of operation, which will enable, on an anticipatory basis, a (re)configuration of resources to suit to new possibilities of operation of a SME - market, and other challenges. The provision of the capability for such a (re)distribution of resources is based on the fast learning, holistic understanding of 'new society and economy' (where the 'limits' and restrictions are mainly fictitious and virtual) and the formation of a learning and innovative SME behavior (See also: Kekes, 1988; Lunati, 1997, Ecimovic, Mulej and Mayur, 2002).
- Development of the capability of global operation. SMEs must create their operation globally and locally at the same time and thus establish their relations with buyers, suppliers and other partners. Their base of success can no longer leave the care for the natural environment aside, because it is less costly to consider SD and be a SE (See also: Hawken, 1994; Hawken, Lovins and Lovins, 1999; The Economist, 2006). Neither can the business be good enough if it is based on the real-time data only, the rapidly and permanently changing environment

requires a requisitely holistic anticipation of one's future to be the basis of the current business decision making and acting.

- Support by artificial intelligence tools, such as standardization of decision-making (See for details: Potocan, 1998; Potocan, 2006).

Owners, entrepreneurs and managers must in the new conditions of the economy, therefore, redefine their goals and tasks, rethink areas of their own work, and innovate the characteristics of their own operation, in order to make it a fundamental source of the potentially big enough competitiveness and consequently of profit of their SME, which is high enough now and does not cause danger to future. Their problems have to be decided upon in the phase of investment preparation already and hence in both a (requisitely) holistic and anticipatory manner.

One we have been able to link the issue of SMEs' competitiveness with invention-innovation processes and reaching the level of SE, one may ask the question what does the top international literature on innovation say about it.

Literature on innovation abounds. Still, we did not detect literature considering SMEs becoming SEs as an important factor of innovation success, although it obviously belongs to its preconditions, if it meets the Mulej/Kajzer law of requisite holism in Figures 1 and 2 (Mulej, 1979; Mulej and Kajzer, 1998).

In other words: SMEs becoming SEs might be considered an overseen step toward the innovative society. Why should SMEs incorporate sustainability into their attributes to become SEs?

## **Being a SE is Important for SMEs Competitiveness**

Why must the statement in the title of this chapter be stressed? Only a minority of SMEs intend to grow, e.g. in Slovenia (Rebernik et al., 2003; Potocan et al., 2004 - 2007).

Times, including conditions of business operations, have changed a lot over the last few centuries, and especially over the last decades. The economic development processes made the humankind split into the well-advanced 20% and the increasingly lagging 80% (Dyck and Mulej, 1999; Ecimovic, Mulej and Mayur, 2002; Potocan, 2002; Potocan, 2006).

It is the approach to innovation which causes these differences – the innovation-need paradox: the ones needing innovation the most, like it the least (Freeman, Pierce and Dodd, 1995; Rogers, 1995; Lunati, 1997), and support entrepreneurial behavior the least, too (Laurent, 2003). In addition, with a decision by its highest political body – the United Nations (UN) – humankind decided, in 1992, to accept the fact that a holistic rather than biased / one-sided care of humans for their economy and natural environment including themselves – called SD – had become a precondition of their own survival (Potocan, 2002; Bauchamp, Bowie, 2004; EU, 2006).

Foresights, decisions and actions of all human activities (especially of enterprises) must include SD. Otherwise, profit (as a goal, defined one-sidedly) kills profit (as the outcome), because oversights, neglecting nature around humans cause tremendous cost of eco-remediation and/or other renewal of preconditions of survival of humankind and other interdependent nature's subsystems (Potocan, 2002; Umpleby, 2002; Umpleby, 2002, Trevino and Nelson, 2004; Potocan, 2005; Potocan, 2006). Conditions have changed rapidly and critically as we presented in Figure 6.

SE also requires creation of new understanding of the current reality and new way of thinking of all members of the modern society. We try to suggest humans how to adapt to changes conditions for business based on past and current long-term and recent socio-economic development trends in Figures 6.

Figure 6 shows why humankind needs SEs in order to survive. How can SME become sustainable SME (SSME)? All the economic conditions mentioned above result in requiring SME to take a new, requisitely holistic and future-anticipating vision aiming at their own long-term viability (Potocan, 2004; Potocan, 2005, Potocan, 2006).

All members of modern SMEs are, hence, facing a basic question: How to define the new development and future business of their SMEs supposed to become SEs.

## Criteria for SMEs to Become SEs

In both theory and practice there is no model of business, which would provide for a harmonized and target-oriented development of SMEs toward SEs (to the best of our knowledge). But the SD concept offers a partial solution, trying to carry out common goals of humankind with a sustainable orientation of human activities at all levels of our common living and behavior.

On the basis of much theoretical cognition and our own experiences in business practice, we can define SME as a SE, most generally, as an SME that tries to work, as much as possible, to attain a synergetic whole of: economic, ecological, social, and ethical objective of its business (Potocan, 2002; Potocan and Mulej, 2003, Potocan and Mulej, 2007).

The basic direction (and objectives) of SME's being SEs working are depicted in Figure 9.

<b>Dimension</b>	<b>Focus</b>
Economic imperative	Competitiveness
Ecological imperative	Habitability
Social imperative	Community
Ethical imperative	Legitimacy
All dimension	Combined foci

FIG. 9: BASIC DIRECTIONS (AND MAIN GOALS) OF SSME

A SME as a SE tries to conceive and run its working in a way, which meets needs and requirements on levels of: enterprise, its closer natural and social environments, and its broader (i.e. global) ones.

These needs require SMEs as SE to define and use suitable criteria, too, to evaluate business in critical levels of working (See Figure 10).

<b>Criteria</b>	<b>Corporate Performance</b>	<b>Societal Performance</b>	<b>Global Performance</b>
Economic Imperative	Corporate profitability	Societal wealth	Global wealth
Ecological Imperative	Corporate eco-efficiency	Societal eco-efficiency	Global eco-efficiency
Social Imperative	Corporate reputation	Societal quality of life	Global quality of life
Ethical Imperative	Corporate values	Societal values	Human values
All dimensions	Sustainable management index	Sustainable development index	Sustainable development index

FIG.10: BASIC CRITERIONS FOR EVALUATING SSME BUSINESS

Hence: a SME as a SE attains the highest level of requisite holism and destroys the human conditions of survival the least of all enterprises. A SME as a SE does not command with the most modern and comprehensive knowledge only, but with ethics as well allowing it to do no harm, i.e. the SD ethics. We brief it in chapter 8.

A crucial innovation of the management style is unavoidable, and it is e.g. corporate governance and management and societal governance, which is able to make it happen. The entire World needs a transition of ethics along with the transition of conditions and preconditions of life, SD being a part of the process. The changing, both experienced in the West, and expectable with the other 80 % of humankind (and partly going on with them, too) now, may include change in a number of attributes of ethics.

This requires much more of ethics of interdependence, as has been the habit so far. United Nations would not need UNICEF, ILO, or IRO, otherwise. There would be no need for world-top conferences on the South-North trade, like the one in Cancun in autumn of 2003, etc. Owners, entrepreneurs, and managers must include this fact in

order to be requisitely holistic and hence successful, effective and efficient. Our understanding how these influence on SMEs competitiveness, is briefed in chapter 7.

## **SE and SE's Ethics Influence over SMEs Competitiveness**

Let us go back to Figure 4 and brief difference of SME from other types of enterprises from the viewpoint of meeting requirements for competitiveness. On the basis of different theoretical cognitions and our experiences from business practice we can define some findings about the influence of SE (and its ethics) on SME competitiveness (Potocan, 2002; Potocan, 2005; Potocan, 2006; Potocan and Mulej, 2007).

SME as SE may also be considered the most creditworthy and trustworthy of all enterprises:

- This level of reliability diminishes the need for lots of double-checking and related cost, thus increasing a SME's profit critically.
- Similar may be impact of converting innovation into total quality and attain ISO 9000 and similar certificates: they help customers trust their potential suppliers, because they do not risk much drop out of their row material etc. coming from their suppliers.
- Provision of a range of products and services helps SME approach more customers; thus the invested capacities can be utilized better, initiatives for new innovation processes can be received and accepted, etc.
- Provision of uniqueness may lead, for a period of time, to a more or less monopolistic position of a supplier, which leads to higher margins and profits.
- Provision of well-know care for natural environment provides a SME a well-accepted image, resulting in new customers, in bargaining power concerning suppliers.
- All of them together cause cost, as well, of course, but in medium period of time, this cost is outweighed by expectable benefits. The general preconditions may read: lower cost, better quality, better image must result from innovation rather than from causing unemployment etc.

## **Some Conclusions**

The current cognitions about SE (and its ethics) as well as about their impact over SME's competitiveness allow us to understand and treat:

- Links between single (kinds, types, and forms of) SMEs ethics inside a given SSME;
- Links between a SME (with a given SSME ethics) and the possible (and/or real) outcomes of working (and behavior) of this SSME;
- Links between outcomes of working of a SSME (with a given SSME ethics) and its competitiveness.

A more/requisitely holistic investigation of this topic will require a further research of further content – and methodology related issues including e.g.:

- Potential consideration of a SME and different SMEs ethics in an given SE,
- Potential consideration of SSME ethics over competitiveness, and
- Bases for a requisitely holistic approach to consideration of SSME, SSME ethics, and their impact over business of an SME.

The above mentioned questions present the basis for a further investigation of the selected basic starting points, and characteristics of SSME, its ethics and influence of SSME ethics on business competitiveness.

## Abstract

The Visegrad countries (Poland, Czech Republic, Slovakia and Hungary) have undergone remarkable economic transition since 1990, in spite of their different initial conditions, and have become the members of European Union in 2004. The economic reforms that were in line with the „business class model“ supported by the international institutions, and privatization attracted the massive inflow of foreign direct investment and know-how to these countries, helped to create the substantial SME sector, and increased the competitiveness of these countries in the international scale. In spite of the attained progress the rapidly developing globalization and transformation to the knowledge-based economy opens new challenges for Visegrad countries. In near future they will have to augment substantially support for the R&D, innovation, education, business cluster formation and transborder co-operation in order to stay competitive and help to fulfill the expectations of the European Union formulated in the Lisbon strategy.

## Introduction

Visegrad countries comprise four countries located in Central Europe: Czech Republic, Slovakia, Hungary and Poland. The countries became the EU members in 2004. After the fall of communism these countries successfully managed their transition to market economies. And today they have to cope with the similar challenges as other OECD countries. They have to take care of increasing their competitiveness in the context of fast developing global knowledge-based economy.

There are many serious problems in Visegrad countries, such as strong regional disparities resulting from uneven FDI, partial reliance on traditional industries and agriculture, which are unable to compete on the international level; asymmetries among SME sector and international investors; the problems of the development of capacities. These problems are known in the developed countries. They are however more intense in the Visegrad countries (Bohle, D., Greskovits, B Retrieved March 6 2007).

## Transition and Economic Restructuring

Transformation of the Visegrad countries was quite similar. During one decade, all these countries consolidated their democracies. They also became integrated in the global and European economy. They trade mainly with countries of the European Union (EU). The value of their foreign trade approximates or exceeds their GDP. Via substantial foreign direct investment (FDI) inflows, their assets have been incorporated into global and European systems of production, commerce, and finance. These countries' exposure to external influences has been further exacerbated by their entry to the IMF, the World Bank, OECD, WTO, and, after long preparation, the EU. The above-mentioned development was very important because traditional production factors such as land (and real estate), labor, capital, became more accessible for the entrepreneurs.<sup>1</sup>

Privatizations have been a key tool in the transition process. The different privatization methods have been used and they brought varying results for the particular countries. The transition brought on one hand the growth of individual companies' productivity, the growth of GDP (see the Table 1), but on the other hand the rise in unemployment and growing income disparities.

TABLE 1: REAL GROSS DOMESTIC PRODUCT IN VISEGRAD COUNTRIES

Annual change in %	2002	2003	2004	2005	Q3 2005	Q4 2005	Q1 2006	Q2 2006

Before 1989 the logic of industrial development was quite different in Visegrad countries and developed European countries. In EU the industrial structure was basically determined by the factors of demand and supply. Consumer demand is linked to the shifts of incomes. Supply on the other hand depends on the availability of the production factors and innovation. The innovation influences positively the productivity but it may lead to the loss of jobs, if it is not accompanied by the growth of production output. Moreover with rapidly growing productivity in production sector and slower productivity growth in the service sector, the share of services in the GDP and employment rises. These tendencies are further amplified by the globalization, which affects profoundly both the national conditions of the supply and demand. The loosening of the trade barriers leads to the new international division of labor, which exerts the pressures on the ways of organizing the production. The process is also amplified by the rapid development and implementation of ICT, that enable to reduce the transaction costs of companies supporting the processes of off shoring, outsourcing and viability of TNC. The pressures exerted from the rapidly changing conditions of supply and demand forced the Western European countries to accelerate their restructuring since the oil shocks in seventies, when the era of relatively stable development of after war „Trente glorieuse“ years have ended.

The industrial structures in Visegrad countries started to adapt to the changing global market conditions only after 1989. Before that the organization of production was controlled by socialist central governments and seriously influenced by the „international socialist division of labor“ that was coordinated by the Council of Mutual Economic Assistance (COMECON). The aims of these structures differed from the market logic, and therefore the structural development strongly deviated from that what we could observe at that time in Western European countries. The effort to keep the full employment in socialist countries had led to the support of the ineffective state enterprises. The socialist industrialization created in some regions economic monostructures, that are in the contradiction with entrepreneurial cultures and even today such regions is quite difficult to restructure. Many enterprises moreover suffered from obsolete equipment and lack of investments. The lack of economic freedom has stifled the innovation and so after the break of the Iron curtain the Visegrad countries practically did not produce top quality high tech products for the consumer markets. The problem of restructuring was further aggravated by the legacy of socialist economic management. At the epoch of communism the preference was given to the heavy industry consuming large amount of energy and raw materials, reduction of consumer goods, domination of large state owned enterprises, state control of the material supply, low mobility of the production factors, decision on localization of industry based often on military or non-economic consideration, lack of independent financial sector, prices determined by state and not by market – the distorted prices could not ever be used for the efficient calculation of the economic efficiency. The obsolete industrial structure and equipment together with slow innovation processes had moreover the negative impact on the energy saving, industrial pollution of air, water and soil (Tickle, A., Welsch, I., eds. 1998).

The institutional theory put the important stress on “path dependency”. The economic development is quite dependent on historically created business structures, culture and institutions. Transformation enabled to develop the new institutions, however they evolved in local context and therefore they may often differ from their developed

countries counterparts. Short existence of the new institutions and structures together with the frequent changes of legislation did not enable to attain the same level of experience as is common in the developed countries.

Before 1989 the industry was organized in the large state-owned conglomerates. There was the lack of management marketing skills. The goods were sold mostly to other COMECON countries, where the power of consumers on the consumer markets was rather weak. The population moreover had the low income. Lack of competition did not stimulate the innovations either.

The situation in 1989 was not identical in all Visegrad countries. Not all state-socialist countries had to start “from scratch” when building a market economy. (See the Table 2) While Czech and the Slovak Republics inherited rather unreformed state-socialist systems Hungary and Poland had small private businesses long before the fall of iron curtain, although the dependency of last two countries on Soviet economy was higher. In 1993 the former Czechoslovakia was divided to two countries that had to build their nation state and that was the really tough issue especially for the Slovak Republic. In the less affluent and ethnically more heterogeneous Slovakia nation building came into conflict with democratic state building for a period in the 1990s (Bohle, D., Greskovits, B Retrieved March 6 2007).

TABLE 2: INITIAL CONDITIONS OF VISEGRAD COUNTRIES

	<b>Czech Rep.</b>	<b>Slovakia</b>	<b>Hungary</b>	<b>Poland</b>	<b>Average <sup>1</sup></b>
<b>Population (millions)</b>	10.3	5.4	10.0	38.7	15.9

Two parallel transformations had taken place in Visegrad countries after 1990. It was necessary to change the command economies to market economies, and that mean to change the ownership structures and introduce and implement the new institutional structures and at the same time to react on the globalization challenges. With the opening of their economies the Visegrad countries were able to buy the products on the World markets, to attract the foreign direct investments etc.

This was however realized in the conditions of the fierce economic competition. The former socialist countries had thus to bridge the gap between their old structures and the prevailing structures in the World economy as well as adapting to the new pace of the structural change determined by globalization processes (Muller, B., Finka, M., Linz, G.,eds. 2005). The start of the adaptation to the globalization was late in comparison to the Western countries, which led to substantial problems in these countries in early Nineties. While in Western countries the adaptation to the changing conditions was stretched on the longer period of time and usually it did concern one or two industrial sub sectors or regions at one of them, the postponed restructuring in Visegrad countries created during transition the necessity to change quickly almost everything.

## Foreign Direct Investments

The transformation of the Visegrad countries was realized according to the "business class" model supported by key global institutions such as the World Bank, the International Monetary Fund and the World Trade Organization. This model has been supported by governmental policies focused on liberalizing markets and promoting economic efficiency aimed at the opening of economies to foreign investment, deregulation, fiscal discipline, privatization and trade liberalization. The model exerted substantial pressures on firms. They had to concentrate more on core operations, outsourcing other activities to the extent possible. The countries that have benefited from the substantial economic reforms than have acted as the conduits for the foreign direct investments. The economic freedom was at the same time the prerequisite for the development of important sector of SME (small and medium enterprises). SMEs were important source of growth of Visegrad countries because of their flexibility and adaptability, and their important contribution to reducing unemployment level.

According to a survey by Ernst & Young, the region including the Czech Republic, Hungary, Poland and Slovakia together, with Estonia, Latvia, Lithuania and Slovenia (the other four CEE states which acceded to the EU on 1 May 2004), is now regarded by international executives as the second most attractive foreign investment locale after Western Europe and is the most favored place for investment in the manufacturing industry. 40% of respondents to the survey with declared relocation projects indicated that CEE was their preferred choice, followed by only 22% for China and 7% for India. In relation to manufacturing related projects, the figures were 30% for CEE, 23% for China and only 16% for Western Europe (Ernst & Young's 2005 European Attractiveness Survey).

This view is supported by the figures produced by the OECD (see the Tables 3 and 4): between 2000 and 2004 the CEE's share of total inward European FDI increased from 17% to 31%. In fact, according to the Vienna Institute for International Economic Studies and the Economist Intelligence Unit, around 70% of exports in these four states are now accounted for by foreign-owned firms (Allen and Overy 2007).

One of the most important effects of FDI is the transfer of technologies and know-how. In many industrial sectors the new generation of equipment has been introduced, together with the new ways of the organization of industry (such as the lean production, Toyota manufacturing system). The important driver for the change of technology is the higher quality of products and export. The most of the foreign-based businesses brought to countries of Visegrad new technologies that are comparable to the equipment installed in the developed countries. This had the serious impact on domestic producers that followed the foreign examples and introduced important innovations in their technologies in order to be competitive. For the foreign firms it also typical more efficient use of the production factors. The privatized firms have been deeply restructured and their productivity has grown up.

Foreign direct investments affected the growing regional disparities in all Visegrad countries. The capital cities, and the large cities with the universities and skilled working force, the regions located on the western parts of Visegrad countries have benefited from new job opportunities and higher income level, while some other regions lagged behind. For the illustration of this phenomenon the territorial pattern of distribution of FDI stock in Czech districts in 2005 is shown in Fig. 1.

The growing export affects the strength of the local currency. For instance in Slovakia the Slovak koruna has strengthened its position to Euro by 15% in the last 12 months. Such situation exerts the pressure on the domestic producers that use the obsolete technologies and rely on the low-cost labor. They have to make their processes more efficient, they have to pay more to their workers otherwise they lose their markets or they may not be able to find enough qualified labor. For example, as the result of the entrance to the European Union it is estimated that the Eastern Europe lost more than 1 million of construction workers that moved west. Many of these workers are now missing in the booming construction sector of the Visegrad countries. Hence this affects also the competitiveness of the local companies. If they are not willing to innovate they have to go out of the market. Growing incomes of qualified workers exert additional pressure on changing the industrial equipment. It becomes more efficient to substitute the labor by machinery, when labor costs rise, and that is the important innovation driver.

The new technologies and products are not in most cases developed in the recipient countries of Visegrad. The former research and development base developed during the communist era has been substantially reduced.

The new ways of organizing the production, such as just in time systems, higher requirement on the quality of supply are the reasons why some larger producers provide the technical aid for the suppliers which then enables them to buy better supplies and reduce the costs.

The purchasers of the supplies are not the only businesses that exert the serious influence on suppliers. The investors influence suppliers also indirectly. The activities of the firms with the share of foreign capital exert the pressures on the domestic firms through the demonstration effects. As a result of it the domestic firms augment their technical and organization level. The special channel of such activity is also the mobility of the managers and workers, who transfer the experience acquired in firm with higher level of productivity to domestic firms. For the

firms with the share of the foreign capital is typical growth of production, quality and higher effectiveness – as well as the good perspective. The growths of the competitiveness on the micro level enable the growth of the competitiveness of the industry as the whole, and creates also general atmosphere of the success. It helps to ameliorate the image of the Visegrad countries in the world.

### FDI Stock in Czech districts in EURO in 2005

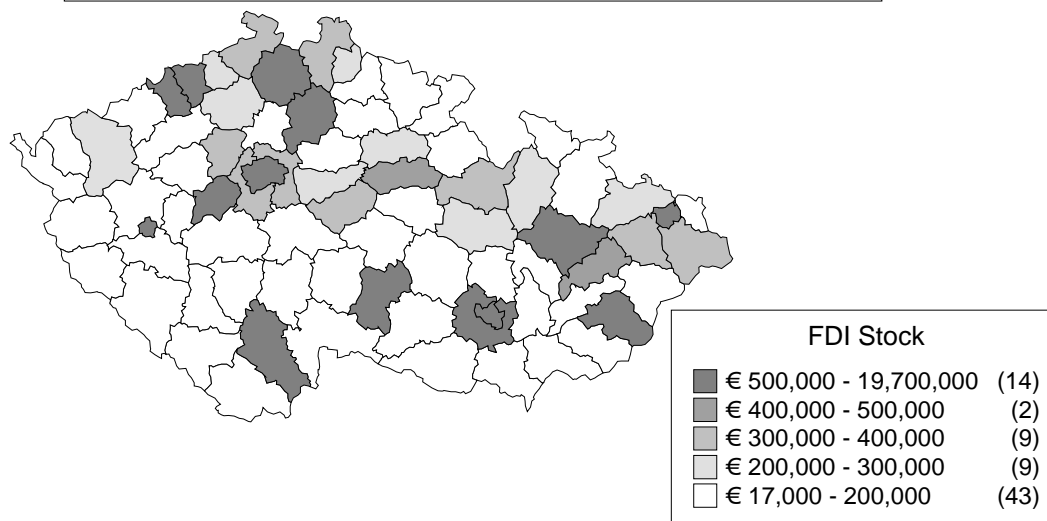

FIG. 1: FDI STOCK IN CZECH DISTRICTS IN 2005  
The map was elaborated based by authors based on data from Czechinvest

The purchasers of the supplies are not the only businesses that exert the serious influence on suppliers. The investors influence suppliers also indirectly. The activities of the firms with the share of foreign capital exert the pressures on the domestic firms through the demonstration effects. As a result of it the domestic firms augment their technical and organization level. The special channel of such activity is also the mobility of the managers and workers, who transfer the experience acquired in firms with higher level of productivity to domestic firms. For the firms with the share of the foreign capital is typical growth of production, quality and higher effectiveness – as well as the good perspective. The growths of the competitiveness on the micro level enable the growth of the competitiveness of the industry as the whole, and creates also general atmosphere of the success. It helps to ameliorate the image of the Visegrad countries in the World.

### Research and Development and the Links to Industry Sectors

In the area of research and development the Visegrad countries lag behind developed countries in the amount of funds invested (public and private) and also in the number and quality of R&D institutions and their employees. The two serious problems are a low utilization of R&D outcomes in innovation activities and insufficient support of industrial research.

The problems of Visegrad countries are quite low expenses to R&D. According to available data from OECD (see the Table 5) the percentage of R&D expenses from GDP Visegrad countries was much lower than in developed countries. The situation was especially alarming in Poland and in Slovakia. It does not seem to us that it

has radically changed in the last years. Moreover the structure of expenditures differed profoundly from developed countries, where the industry funds most of the R&D expenditures.

TABLE 5: SCIENCE AND RESEARCH TECHNOLOGY DEVELOPMENT  
(GROSS DOMESTIC EXPENDITURE ON R&D – GERD) IN 2004

Country	Gross domestic expenditure on R&D (GERD)			
	% financed by			Per capita at current USD
	% of GDP	Government	Industry	
<b>Czech Republic</b>	1,27	41.89	52.82	236
<b>Hungary</b>	0.89	51.81	37.1	142
<b>Poland</b>	0.58	65.23	26.91	72
<b>Slovak Republic</b>	0.53	57.11	38.29	72
<b>United States</b>	2.68	30.95	63.38	1,063
<b>G7</b>	2.5	29.57	62.75	841
<b>EU-15</b>	1.9	34.32	54.27	528
<b>EU</b>	1.81	35.04	53.66	459
<b>OECD total</b>	2.26	30.17	61.93	627

Source: OECD in figures 2006-2007.

It is therefore necessary to link better the local R&D capacity to local production. We often observe a worrisome disconnect between academia and industry, where businesspeople perceive academics as theoreticians and do not expect any involvement on their behalf in R&D projects. Especially alarming are the passive attitudes of industrial companies towards R&D and innovation together with limited interest in technology transfers. Fortunately there are also many positive examples.

## Development of Industrial Clusters

Clusters have become the focal point of many new policy initiatives in the last few years, in Europe as elsewhere around the globe. The clusters help to reduce the barriers to entry of the new businesses to other location, they are the factor of growing productivity, they influence the pace of innovation cooperation and as the consequence of it - the growing competitiveness of businesses.

The clusters might be considered as one of the approaches for raising the competitiveness of the European Union in the broader context of Lisbon agenda<sup>2</sup>. The implementation of clusters helps to translate the goals of macroeconomic policies into the microeconomic level, and to develop the new type of partnership between research and educational institutions and the private sector. Many private firms are also interested to take the advantage of clusters because in the globalized economy; a company's location is one of the few sources of differentiation competitors cannot easily copy (Solvell, O, Lindqvist G., Ketels, C. 2003). The development of a knowledge-based economy requires the human capital, ICT, and innovation systems have to be interlinked. Cohesive progress in these sectors impacts productivity and growth, which also depends critically on the business environment in which innovative firms must operate (Goldberg, I. 2004)

The governments of the Visegrad countries have found that if they want to attain the sustainable economic growth and balance economic development they have to raise the quality of business environment on the local level. As a result of it the last years the cluster initiatives and the strategies were expanded.

According to the cluster mapping 46 clusters has been identified on Slovak territory in 2003. Slovakia supports the sector SME, but has at present no cluster policy. In practice the clustering occurs under the influence of

FDI and the imported management approaches. One can observe especially the clustering in the automotive industries. It is recommended by OECD to apply the cluster approaches for Slovak regional policy (Local Economic and Employment Development Business Clusters 2005). Slovakia's success in attracting automotive production is linked to five factors (World Investment Report 2004):

- The three main sites located in western Slovakia are close to western Europe and in the middle of an emerging cross-border cluster of 13 car plants, 10 power train factories and hundreds of suppliers in a 500-km circle that encompasses the Czech Republic, Hungary, Poland, Slovakia and Slovenia.
- Slovakia benefits, within that cluster, from good transportation links (a highway link to Western Europe is almost complete) and free movement of goods within the enlarged EU, which facilitates the cross-border supply of components.
- The country offers a combination of labor skills and competitive labor costs. The latter are particularly competitive due to the latecomer status of the country in attracting FDI. This has kept wages lower than in CEE countries that have been the traditional magnets for FDI (the Czech Republic, Hungary, Poland) and that, as a result, have seen their wages rising.
- Thanks mostly to Volkswagen's efforts – such as the construction of two industrial parks for suppliers – the supplier capacity of Slovakia is improving, making production more cost efficient. In 1997, the production value by Slovak automotive suppliers amounted to around \$450 million. By 2003, it had increased by more than five times, to about \$2.5 billion.
- In the cases of PSA and Hyundai, the Government of Slovakia provided assistance within the limits of EU rules on State aid (up to 15% of the value of the projects): free land for the plants, construction financing, subsidies to train the labor force and tax breaks. Direct payments to Hyundai were estimated to be around \$170 million, while estimated public expenses related to the project amounted to \$50 million. PSA was expected to receive \$114 million in government assistance. In addition to its contribution to export competitiveness, FDI in Slovakia's automobile industry is a major source of new investment and jobs.

In Poland we observe the tendencies to networking from bottom-up in the traditional as well as in technological sectors. The first elements of cluster policies have been introduced in 2002 and since that time we observe the gradual development both on the regional and central level. As in other Visegrad countries there are the problems with inadequate development of the social capital, although spontaneous creation of the regional business associations closely co-operating with the regional governments has enabled to attain the certain progress.

Hungary has developed in past 15 years many initiatives on the regional level that support the local development. The clusters were established in some sectors such as automobile, logistics, and construction. Export oriented cluster is Pannon Automotive Cluster, PANAC, representing 10% of HDP is the most important cluster in Hungary. On the basis of Szechenyi plan of the Ministry of economy from the year 2000, 21 consortiums were officially labeled as the clusters, which are eligible for the state support. Later analysis has shown that only one third of all clusters can be described statistically. The growth was concentrated in the western part of the country and there are substantial differences between West and East. Creation of cluster from domestic firms continued quite slowly.

In Czech republic we may observe the establishment of clusters in older industrial regions in Moravia (metallurgy, mechanical engineering) and also for the supply networks for large international corporations, such as Volkswagen/Skoda. The Association of technology parks, the consulting agency Czech Venture Partners, Czech modernization Center and Czechinvest are the important factor for the cluster development that is moreover pushed by FDI (Local Economic and Employment Development Business Clusters 2005). All these organizations coordinate the establishment of industrial zones and are seeking the strategic investors.

In the CR the problem of clusters and their promotion is only at the outset. Nevertheless Czech Republic has developed the program KLAŠTR in 2004 and the so far attained results are very positive. Further development of the clusters is decelerated by the absence of regional strategic development plans and regional industrial and innovation policies, to which the clusters or other projects promoting innovations in regions could be connected.

However at present the substantial changes are implemented. The main differences consist of a change in the amount of state support, more independency concerning the membership of universities and optimal number of cooperating entities in clusters. Concurrently, the preparation and training of experts and managers in the area of innovative entrepreneurship is taking place partly funded from EU funds

Some of the scholars criticize the cluster concept in EU and in Czech Republic. According to Jetmar, N. and Kourilova, (J, Wokoun, R. and Mates, P., eds. 2006) the notion of clusters is not well described and in the cluster concept two approaches are mixed. The first one is linked to the development of business networks, creation of the strong relations with the regional actors that are moreover supported by the public sector interventions. The second one is linked to the enhancement of innovation potential, the strengthening of competition and putting the stress on further concentration of business. Such mixture of approaches has the corollary: the unclear goals, policies and instruments as well as the role of public sector supporting the clusters.

From our point of view the contradiction embedded in the cluster concept is in fact imaginary. In fact the contradictions represent the driving force of the cluster development. From the practical policy making view this may represent the problem, since more experience is needed for tuning up the policy measures, business structures, operations, etc.

## **Public Instruments for Enhancing the Competitiveness of the Clusters**

The desindustrialization and competitiveness are two problems that are closely linked. It is necessary to define the policies that would stop the desindustrialization processes. The European institutions act as the guardian of the competitiveness. They have the common goal that would enable their successful competition on the global markets. After 1995 the productivity growth in Europe was slowed down. The efficiency of hourly work in Europe in 2002 was on the level 86,6% calculated from the level of USA. The growth of competitiveness of labor in the period 1990-1995 was 2,5% but later decelerated to the level 1.3% (1995-2000). In the USA corresponding numbers were 1,1 % a 1,9 % (European competitiveness report 2003)

The results of the research show that the principal importance has the conditions that enable the investor the fast start of the investments, and to certain extend also the reduction of its costs. This depends both on creations of tangible conditions such as the access (existence) to the land and infrastructure and in the first place the efficiency of formal approvals. The local governments (city self-governments) can influence the investment in the first place by their responsible attitudes, the quality of provided services in the city hall and through the technical infrastructure. The very important role is played in this process the institutions and the local leaders (Domanski, B. 2001). The investor expect the amelioration of the local infrastructure – the construction of the new roads or amelioration of the surface of the existing roads, there are also requests for the amelioration of energy and water supply, refuse removal, canalization, water treatment plants, some of the firms also request the amelioration of the public transport.

The modern business clusters need better transport infrastructure, such as good access by the international airport, which is integrated with other types of transport, the high speed railways, express highways, the broadband access, etc. The clusters bring better-paid jobs and growing need for the mobility. Their operations indirectly generate the demand for the production of new housing units. In the innovation clusters the large part of jobs have the service character, hence the cluster development generates the growing demand not only for modern industrial and logistic premises but also for the modern distractive spaces, which is clearly the challenge for the developers, that are now prospering in the fast developed regions of Visegrad countries.

In some cases however the real estate development does not match the needs of industry. Unjustifiable delays in implementing the necessary land ownership reform remain the major cause of the lack of development in the housing, construction and property markets, with a direct and negative impact on the labor market, SME growth, new enterprises and financial intermediaries. This problem is also hindering the entry of domestic and foreign investors in both these and a wide range of other sectors, especially when compounded by the legal loopholes affecting property rights.

Horizontal infrastructures need to be put in place or reinforced in the internal market sector, particularly those that facilitate a good business environment and entrepreneurship. Examples of areas where there is considerable room for improvement include: market supervision, standardization, certification and industrial and intellectual property rights.

## Transborder Economic Co-operation

The regions that were once on the frontier of the „iron curtain“ dissolved after 2007 have at present the interesting development potential. The European Union tries to stimulate the transborder cooperation in these regions from the EU funds. In the short paper it is not possible to describe all initiatives that take place in Visegrad countries. For this reason we concentrate our description on the Centrope transborder region (see Fig. 2).

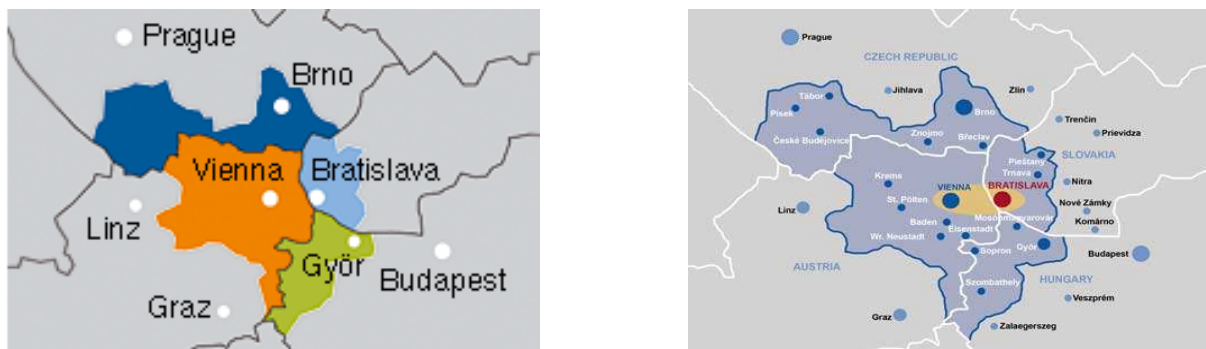

FIG. 2: CENTROPE REGION  
Maps are from Centrope web page

The Centrope region, strategically located in the heart of the “New Europe”, is one of the continent’s most dynamic economic regions. In contrast to Western Europe’s saturated markets, Eastern Europe offers enormous growth opportunities, with an economic expansion rate of up to five percent anticipated over the next few years. (4 Countries – Unique Business Opportunity, Retrieved March 2007). The Centrope region was established in October 2003 and consists of 9 bordering regions of Austria, Czech Republic, Slovakia, and Hungary. The center of the region is not in Visegrad countries but in Vienna, Austria. Investment in the Centrope region anticipates an economic expansion rate of up to 5% within the next few years, and for this reason it is expected to offer enormous growth opportunities for potential investors. Recently it focuses on biotechnology, automobile and IT and telecommunication.

The Centrope region has the potential to become the high tech region (Centrope. Central European Region 2006) We should mention especially life sciences sector (13,500 persons in Vienna, 140 enterprises in the fields of biotechnology, pharmacology, medical technology, big pharmaceutical companies Baxter, Novartis and Boehringer Ingelheim, Campus Vienna Biocenter, the research base in Lower Austria: Wiener Neustadt, Koln, Krems). Similarly we should mention the strong potential in South Moravia (Masaryk University, the Mendel University of Agriculture and Forestry, the University of Veterinary Medicine and the University of Pharmacology, The establishment of new enterprises in the field is driven by the South Moravian Innovation Center).

The important centers of the automotive industry are located in Western Slovakia (PSA Peugeot-Citroen, Hyundai-KIA, Opel, VW and Audi, top automotive brands). Slovakia produced 295,000 cars in 2005. The automotive production was mostly oriented on export (40% of national export). This year it will produce 500,000 cars, and it is expected that the production in 2005 will attain the level 800,000 cars (Stavebne noviny, 2007). At the

moment, the multifunctional science and Technology Park CEPIT (Central European Park for Innovative Technology 2007) is being constructed north of Bratislava, which should be completed within six to eight years.

The co-operation of Volkswagen and the Slovak University of Technology in Bratislava enabled to fund the University the costly measuring equipment and EDP systems. The University can then better prepare the graduates for the work in the industry and also develop the research activities that can later be applied in industry. The real potential of the co-operation and technology transfer is however still underutilized. The flexible managerial structure responsible for the transfer has still to be developed especially at the Slovak Universities. Meanwhile the demand from automotive industries is growing. More and more subcontractors of the automotive industry are coming to the country. And they need to innovate their products. So more synergy is expected to be developed with the local Universities.

The Gyor area in Hungary is also specializing in automotive industries. The vehicle manufacturer Reba started the development pole "Auto polis", the important player is also Szechenyi Istvan University of Gyor. The Hungarian state promotes the development of regional "development poles". According to these, Budapest is to become a development pole for information and communication technologies; nano and micro technologies are to be promoted in Miskolc; biotechnology and IT are to be points of emphasis for Debrecen and Szeged, and Szekesfehervar, Veszprem and Gyor will further expand the automotive sector.

The Austrian Burgenland region has assumed Europe-wide pioneering role in the field of renewable energy (production of liquid fuels, solar energy, recycling, treatment of e-waste, construction of low energy and passive houses), South Moravian region is concentrated on wastewater management.

The concept of the Centrope is the visionary concept that combines the ideas of knowledge based society, transborder co-operation, competitiveness, and integrated regional policies.

## **The Problems to be Solved**

In Raising EU R&D Intensity Report, was claimed "In most Accession countries (now already members of EU), the challenge is to find technology-based firms with sufficient resources and vision to look beyond the day-to-day struggle for survival and the courage to begin the virtuous cycle of investment in innovative activities. Building links with existing research institutions may also be complicated because traditional competence in this sector may not be aligned with the needs of firms involved in rapidly-changing technology sectors." (Raising EU R&D Intensity 2003).

An important factor limiting the transfer of R&D outcomes into practice is insufficient use of instruments securing the rights to intellectual property. As a result, the patent activity in Visegrad countries is low. The reason can be either a lack of quality R&D outcomes suitable for patenting or technical and financial demands of the patenting procedure.

Compared to other EU countries, in the area of innovations the Visegrad countries ranks below average. The Visegrad countries lag behind the developed countries notably in the intensity of enterprises' innovation activity, transfer of technologies, business spending on R&D and innovation, patent activity, cooperation between research and enterprise sector and use of venture capital. Since innovations are one of the prerequisites for business sector competitiveness, it can be assumed that promotion of innovations will impact positively on economic growth and employment.

Innovation depends mostly on the activities of private sector and its cooperation with research institutions, sufficient and available funds for innovative activities and innovation infrastructure. Apart from sufficient "inflow" of R&D outcomes suitable for innovations, the development of innovative activity also depends on the innovation infrastructure, firms and, not least, innovative human resources.

The innovation infrastructure consists of scientific and technological parks, entrepreneurs' incubators and centers for transfer of technologies. The existing infrastructure in Visegrad countries is not developed sufficiently, although the substantial progress has been achieved. There is the lack of quality entrepreneurs' incubators, which

would provide complex services for entrepreneurs. The transparent and simple legislation, have to be developed which would motivate research and education institutions to create spin-off firms financed from public budgets. To ensure further development of innovation infrastructure it is therefore necessary to focus on creating structures and mechanisms to improve the innovative environment including the business structures, which represents quite complex problem.

It is very important to promote the cooperation between employers, educational institutions and professional institutions. Such areas of co-operations as preparing new educational programs with the participation of the private sector, participation of experts on education, providing practical experience, and by promoting mobility of students and teachers via practical traineeships in enterprises, are not unknown in Visegrad countries but they are not in widespread use. The strengthening of the interconnection among universities and private sector could help to bring more funds into educational institutions.

The important moment for the development of the competitiveness is the enhancement of the social capital. The quality network of the social interconnections enable to reduce the transaction costs, stimulate the co-operation between different partners, helps to pool the scarce resources, supports the process of preparing the creative solutions and innovation. It is an important factor of monitoring costs as well. The social capital is also very important factor for building the cluster organizations, where the creation of the partnership structures is the essential ingredient of success. According to this economic rationale, Visegrad countries entrepreneurs would make the rational choice to maximize their personal profit by deciding to interact and invest in social relations.

The growing exposure of the Visegrad countries to the global economy, growing maturity of the public and private sectors together with the involvement of the specific EU policies and structural funds, as well as FDI inflows are the important catalysts of growing competitiveness. The Visegrad countries has made the serious progress during the last 16 years of the economic and social transformation, however they stand in front of the new challenges that intellectually stimulating but not easy to deal with.

## End Notes

<sup>1</sup> In fact the new challenges for economic transformation of Visegrad countries influence indirectly the social sphere and should be accompanied with measures that enable better affordability of housing for Visegrad countries' labor force in. In order to understand these problems, it is necessary to understand the new challenges of economic transformation. In this sense this paper presented represent the preparatory material for the solution of the research grant VEGA1/3781/06 European dimension of Slovak housing policy and development of housing sector in Slovakia, and it is partially funded from it, which we are grateful for.

<sup>2</sup> Lisbon European Council in 2000 formulated the idea that the Europe should become "the world's most competitive and dynamic knowledge based economy"

# **Enlarged EU-27 and the Growing Fragmentation of its Enlarged Internal Market**

Dusan Soltes, [dusan.soltes@fm.uniba.sk](mailto:dusan.soltes@fm.uniba.sk)  
*Faculty of Management, Comenius University, Slovakia*

## **Abstract**

The paper deals with some experiences as gathered from our research and lecturing in the area of internal market of the EU. The general development trend in this one of the key areas of the EU has been that the bigger is its internal market, the bigger is becoming also its fragmentation. Accordingly, the EU member states are becoming also members of various categories of members according to their role, place and functions in the functioning of the EU. The main focus of our paper is on this process as developing after the last two enlargements from the recent “old” EU-15 to the current EU-27

## **Introduction**

Just very recently, in the end of March 2007, the EU has - with its traditional pomp and sense for magnificence – celebrated the 50<sup>th</sup> anniversary of the Rome Treaties that among others have established not only two new European Communities i.e. European Atomic Energy Community (Euratom) and the European Economic Community (EEC) but also the Internal market of the European Communities or of the current European Union. According to the same basic treaties ... “the internal market shall comprise an area without internal frontiers in which the free movement of goods, persons, services and capital is ensured in accordance with the provisions of this Treaty”. Originally, the same EEC Treaty has stipulated that the particular internal market has to be established within the so-called transitional period of 12 years i.e. that till 1970 the Internal market of the EEC has to be not only existing but also to be fully functional. Unfortunately, as in many other similar cases also the history of the Internal market of the current EU has not been as simple and as straightforward as it has been originally expected and signed by the EU member states heads of states, etc.. Although originally its creation had to be completed by the year 1970, even now after more than 50 years since its inception we can state that the Internal market of the EU has not been completed as yet and it is still an open question when if ever it could be completed according to the particular Article 14 (ex Article 7a) of the basic treaties as quoted above. In the following parts of this paper we will deal in more details with some aspects and/or problems that are doing the entire process of the internal market development more complex and difficult than it has been originally anticipated.

## **Some of the Main Problems and Difficulties that have also Caused the Internal or Common (?) or Single (?) Market of the EU has not yet been completed even after more than 50 Years since its Inception**

One of the first problem areas that are related to the issues of the internal market of the EU is the problem of its name. Since its initial definition in the above Rome Treaty as an internal market there exist in the basic treaties and other official documents also another two names used for the same purpose. So in the basic documents we could find altogether three different names for the same object, viz.:

- internal market
- common market
- Single market.

Although in principle all three of them denominate the same object or entity, we could say that they at the same time have been stressing some different features of this one of the most important parts, goals and symbols of the entire European integration:

- internal market - as we have stated already above, the original definition according to the Rome Treaty on the EEC has been underlining the fact that this market is internal i.e. without any internal frontiers or borders and thus has to be existing and operating within some external borders that at the same time have also to protect this internal market against any distortions and/or an unauthorized entries from the outside of the EU. In this connection it is interesting to point out that the particular external border is not directly mentioned in the particular initial definition and legally has not been done so until year 1992
- common market – although according to the basic Treaties there is no explicit definition of the common market, there is in the Article 3 (a)-(d), (g) and (h) of the EC Treaty stated that the common market is “...a customs union in which in addition to the free movement of goods also the free movement of persons, services, capital and payments, the freedom of establishment and undistorted competition are guaranteed...”. In this respect, the common market represents an extension of the internal market from its original four basic - or as often being marked – fundamental or constitutional freedoms to some additional freedoms that specifically mean the freedom of establishment i.e. a right to apply these fundamental or constitutional freedoms anywhere within the internal market i.e. not only e.g. in own member state but universally inside the external borders of the EU together of course also without any undistorted competition or otherwise in other words without any discrimination. This aspect of non-distortion or non-discrimination is in this context very important as it is right this fundamental and/or constitutional right that is most often not respected and most widely violated depending upon the EU member states nationality of the particular subject no matter if it is a physical or a legal one
- Single market – since of its inception more than 50 years ago in 1957, the internal market of the EU has gone through various development stages, reforms, action plans, etc. In order to accelerate to make more efficient its completion and/or practical implementation. One of the most significant in this respect has been the so-called Single European Act adopted in 1986 that has amended the particular EEC Treaty and stated also the new, more realistic deadline for the completion of the internal market by 1 January 1993. Since that time also a new term of a Single market has been introduced in order to stress and underline that within the EU there has been only one single market.

However, these legal and terminological uncertainties regarding the EU internal market still do not represent the major problem in this problem area although it is fact that on the other hand they also document how it is difficult and complicated to transfer such an important part of the European integration from the texts of treaties into the daily practice of the EU. The more important fact in this respect is the problem that even after 50 years of its development; the EU internal market has still not been a fully functioning reality for various reasons. Some of the most general problems in this respect have been the following ones:

- although the year 1970 has been originally defined as a target year for the completion of the EU internal market, until 1992 i.e. adoption of the Maastricht treaty on the EU there has not been defined an external border of the EU i.e. the border that as an external border has been responsible for the protection of the EU internal market. And unfortunately even until now this external border in principle has not been existing to the full of its extent and thus in some respect it has been more dividing than protecting the EU internal market. The problem is that the so-called Schengen external borders of the EU and thus also of its internal market are not fully corresponding to the actual borders of the EU and/or its member states. For example as of today in this connection we could see several paradoxes. On the one hand, not all member states of the current EU-27 are within this external borders of the EU although formally they are also integral parts of the internal market of the EU. In fact out of current EU-27 member states only 13 old EU-15 member states i.e. without Ireland and the UK are “protected by the Schengen border. It means that most of the current EU member states i.e. 14 are outside the borders of the EU Internal market although of course they are integral parts of the EU Internal market and on their “internal” borders with other EU member states are free of any customs controls but of course not of passport controls for all passengers irrespective if they are or are not citizens of the EU-27. In order the reality of the Internal market would be even more confusing, there are

some non-members of the EU like e.g. Norway, Iceland that are parties to the Schengen agreement and thus enjoy also free movement of persons including their own citizens who although not being EU citizens can fully enjoy what EU citizens from the above 14 member states simply just can not?! And in order to make it even more complex, citizens of some overseas “territories” of some EU member states have also a kind of privileges regarding their free movement within the EU territory although they not meeting even the most fundamental precondition for European integration i.e. to be from or in Europe as stipulated the initial treaties regarding who is eligible to become a part of the initial European Communities i.e. “any European country can apply...”

- a mutual recognition (e.g. of goods for free movement within the EU Internal market) difficult in practice – although since adoption of the so-called “Cassis de Dijon” in 1979 has already elapsed more than 27 years, the problem of a mutual recognition of goods has been still one of the most frequent obstacles in the truly and fully free movement of goods. Most of the member states of the EU still do not miss any opportunity to protect their national market against any “unnecessary” imports and thus of course for various reasons protecting their own national producers e.g. especially in agriculture where they always find enough reasons for suspending free movement of goods on the grounds of BSE, a cow disease, a bird flu, etc.
- Transposition delays – it is a problem that for various reasons the member states are “unable” to adopt and implement the community legislation into their national legislative system. Among the most frequently quoted reasons are that there is too much of EU legislation adopted too quickly and with insufficient deadlines for its implementation on the national level, administrative structures especially in the new member states are not always able to absorb so much legislation in such a short time especially because of their internal institutional, administrative and other deficiencies. In many cases there is misinterpretation of the EU legislation, what in many cases means that the national administrations either underestimates the importance of the adoption of the EU legislation and/or they interpret it differently than it has been originally adopted on the EU level. So in many cases they use the EU legislation as a cover up or “objective justification” for achieving their narrow and selfish national interests and not those of the community significance. Especially in the case of the EU directives that enable a kind of national interpretation of the basic principles of the particular legal act it is quite common that the same directive has quite wide and different interpretation in different member states what again is to some extent distorting the functions of the EU internal market. Not to mention that it has to be not only an internal but also a common or even a single market as we have defined it above. Another and very often problem with the functioning of the EU internal market on the national level has been the problem of the enforcement of the already adopted and implemented EU legislation. In the next part of this paper we will illustrate at least some of these problems in connection with the current situation regarding the four basic or constitutional freedoms or free movements.

### **The Key Problems of the EU Internal Market Regarding Four Basic, Fundamental or Constitutional Freedoms or Free Movements – Goods, Services, Capital and in Particular of Persons/EU Citizens**

As we have already stated above at the beginning of this paper, since its inception more than 50 years ago by the Rome treaty, the current EU internal market has to be based on four basic freedoms that as they are defined by the basic treaties have at the same time to be interpreted as fundamental or constitutional freedoms. In this respect their functions in the EU internal market are far more important and significant than some other legislative acts as we have mentioned them in the end of the previous part. Analogically as on the national level, the constitutional rights and freedoms are always above or are superseding the “ordinary” legislation. Of course that the same principles have to be respected also on the community or the EU level. As the EU has not have still its own Constitution – as we know the particular EU Constitutional treaty has not been approved in the referendum in France and the Netherlands – then the existing basic treaties serve as a part of a rather complex and not very logically organized, but still an officially adopted and ratified kind of a “constitution”.

Unfortunately, in view of the above, the current situation in the EU has still been far from the above enquired respect for and adherence to the particular basic fundamental constitutional freedoms as enshrined in the basic treaties already for more than 50 years. If we take any of these basic freedoms, no one of them could assess as a fully functioning one.

## **Free Movement of Goods**

Some still existing problems in this respect we have already mentioned also in the previous part of this paper. In addition to those already mentioned above, we could add that there exist the whole range of various others that are not just simply consequences of the misinterpretation of the community law, or its delayed implementation or interpretation. There are existing distortions to the truly and fully existing free movement of goods that are directly sanctioned - by an evident paradox - by the community legislation i.e. the same legislation that has to be in the front-fore of protection of a fully functioning free movement of goods as enacted by the basic treaties. In this respect we cannot find a better example for illustrating this paradox situation than the CAP - Common Agricultural Policy. The largest, oldest and at the same time the most expensive common policy that during the period of fifty years since its inception has completely lost any kind of objective justification for its existence. While in time of its inception in 1950s, shortly after the 2<sup>nd</sup> World War, the CAP was a common policy that had to help member states to overcome at that time still existing shortages in food supplies, in quality of food, etc. Nowadays there has not been any justification for this kind of common policy that annually has been swallowing almost the half of the total budget of the E. Moreover, this enormous financial means have been serving to a sector that has already for long nothing to do with any of the new challenges of the contemporary EU like e.g. the Lisbon strategy on e-Europe and information society, or its newer version of i2010, or problems of energy self-sufficiency, a modern life-long education, new and better jobs instead of still existing a rather high unemployment especially among some categories of the EU citizens, etc. This enormous amount of the EU budget has been still used to serve to a still smaller part of the EU population that currently achieves not more than about 5% of the total workforce and contributing to the GDP on the union level by not more than about the same share. Moreover, in an already overproduction of all basic categories of food. With some exaggeration we could say that currently this enormous sum of community money are used directly or indirectly by the EU itself for distortion of its own internal market! All those various subsidies and direct payments to farmers for their agricultural production or on the opposite for not producing some crops, or for liquidation of the existing production capacities like currently e.g. for closures of sugar mills, destruction of wine yards, etc. have nothing to do with any market economy and not at all with any free movement of goods, etc. Moreover, in all those various kinds of subsidies there exist relatively high differences e.g. currently between old EU-15 and new member states. The latter ones have been receiving only a fraction of subsidies (25-35%) of what has been paid to farmers from the old EU-15 member states. And this differentiation between "old" and "new" members has been so strict that it has not been even allowed to equalize these differences from the national budgets of the new member states. It is then no surprise that an important segment of the EU internal market i.e. one dealing with agricultural goods has had totally anything with any elementary requirements of the free movement of particular goods. And the negative consequences are already evident especially in the new member states. The prices of basic foodstuffs are no much higher than they were before they joined the EU less than three years ago., because simply most of them are nowadays not home grown but imported from the old EU member states and thus also cheaper than they could be produced by the less subsidized domestic farmers but in general more expensive for consumers as their prices correspond more to much better paid citizens of the old EU-15 countries than consumers from the new EU member states.

Some evident distortion of the current EU internal market exists also in respect of the free movement of goods across the borders between the new and old EU member states. While there have been abolished any customs check points on these internal borders between old and new EU member states yet on 1 May 2004 when the EU has enlarged from the former 15 to then 25 member states, i.e. almost three years ago, there is still evident a kind of distortion in the free movement of goods especially from the new to old EU member states. It is enough just to travel from Austria to Slovakia or vice versa through the border crossing Berg - Bratislava and one can see those never

ending long waiting cues of loaded trucks for their “free crossing of the internal border of the EU internal, common or single market”. As we have already mentioned above there is always something what has to be checked, verified or just simply something like that in that respect on that and other similar internal borders of the EU. If it is not for infected meet, then for potential illegal emigrants or if for nothing else then for the technical conditions, weight, overloading or whatsoever similar “technical or security or any other reasons”. If we take into account that in addition to the above already mentioned distortions of the current enlarged EU internal market that the free movement of goods is further distorted by various quantitative quotas in production or storage e.g. again in agriculture products or steel and other industrial products then it is clear that the current EU internal market is definitely not anything similar to the common or single market. In fact within the current EU internal market due to its above ongoing fragmentation there exists several partial internal markets for free, less free or more free movements of goods. If we take again only the sector of agriculture as an example we could see that there exist several segments of the EU internal market as e.g. one consisting of old EU-15 member states with high subsidies, completely free movement of goods, etc. Then there exists a relatively separated segment of the EU internal market consisting of 10 NMS with less generous subsidies but various restrictive quotas that do not exist e.g. in the EU-15 as e.g. regarding production of sugar (all “redundant” production capacities in that respect have been recently eliminated in the NMS but on the other hand generously compensated from the EU funds to their foreign owners), beer, but also in the segment of energy, steel, etc. And then there is the newest segment of EU internal market consisting of the latest entrants of Bulgaria a Romania that are now in the stage of the same subsidies as previous 10 new entrants were in year 1994.

Also from this rather brief analysis of the ongoing fragmentation of the EU internal market it is quite evident that as for free movement of goods it is neither common nor at all a single but more and more fragmented internal market. Nothing in this respect could be changed by the fact that the CAP is officially exempt from the EU internal market where any unfair competition, excessive state aid, subsidies, quotas, etc. are strictly prohibited by the community legislation, etc.

## **Free Movement of Services**

In principle the same problems as we have listed them in the previous part in connection with the “free” movement of goods could be t the same extent applied also in the case of the second fundamental or constitutionally provided and/or by the basic treaties provided a free movement of services. Again as in the case of the free movement of goods there exist an ongoing process of fragmentation of the common internal market as a consequence of the ongoing and especially the latest two enlargements of the EU from the original EU-15 to EU-25 and quite recently to the current EU-27. In principle there are again at least two segments of the common EU internal market i.e. one consisting of the old EU-15 countries that in principle have in fact an existing free movement of services within all 15 member states. However, again completely different situation exists regarding services provided by the entities from the EU NMS. The most vivid and most famous case in this respect has been the enormously publicized case of a “Polish plumber” who - just because - has offered his services in plumbing promptly on the spot and for much more reasonable price than his French counterparts has become a symbol of an unacceptable danger from the East destroying labour market, taking jobs to local experts and specialists, etc. Not surprisingly he has become a symbol of the anti-campaign against the Draft of the Constitutional treaty that has finally been not approved in the referendum in France and subsequently also in the Netherlands and thus sending not only the particular treaty but also the entire EU into the deepest crisis never before existing. And the entire case is just nothing more or less than a practical example of application of one of the basic constitutional freedoms of movements and rights of citizens in practice. Nothing more than an attempt to fully utilize all the potential of the EU internal market in the free movement of services that on paper has been existing nowadays already for more than 50 years! Unfortunately, the “Case of Polish plumber” has not been the only, although the most publicized symbol of the ongoing fragmentation of the EU internal market in its segment of free movement of services. Many more other examples could be brought up regarding e.g. various restriction against service providers from the NMS in the area of truck services, taxi services (taxi drivers from the NMS are e.g. not allowed to offer their services in the old EU-15 member states even

in cases when their first leg service has been carried out from the territory of the NMS to the territory of the old EU-15 member state?! However, on the other hand, there exist some exemption also in this respect. If one happens to provide nurse services in hospitals, or for elderly, or happens to be providing certain ICT related services, then there are no restriction for providers of them in the old EU-15 member states even by nationals from the NMS. And of course, so far there are no existing any such exemptions for service providers from the countries of the latest two entrants to the EU.

In summary to this part we could again just to state that the EU internal market in its segment of free movement of services has again been fragmented into several relatively isolated parts strictly according to the three basic categories of the EU-27 member states i.e. old 15, new 10 and the newest 2. Or otherwise, the current EU-27 internal market in the area of free movement of services is not common or single or on the other hand in fact as fragmented as it suites to the needs or preferences of the old EU-15 member states! One only can wonder where in this case are all those proclaimed basic principles of the European integration on mutual respect, benefits, assistance, solidarity between EU member states of course also old and new ones!

## **Free Movement of Capital**

In principle this kind of free movement is relatively less controversial or fragmented within the current EU-27 internal market than in the case of the three other of them. But again after the last enlargements also in this respect we can witness some fragmentation tendencies of the EU internal market especially again along the lines or internal borders between the old EU-15 and NMS respectively. In principle there exist at least two tendencies towards its fragmentation and they are:

- regarding the common European currency – Euro
- in the capital flows in the form of FDI

As for the common European currency – Euro the last two enlargements have substantially changed the position of this “common” currency. While within the old EU-15 all but three member states (Denmark, widen and the UK) have switched to this new European currency, after the last two enlargements out of the total of EU-27 member states only 13 i.e. less than half of members have been using this “common” currency. It is quite evident that this problem is not only a technical one but has also many very practical adverse effects on the free flow of capital especially again between the old and new member states as of 12 new members only one (Slovenia) has already qualified to the Euro zone. And quite logically those more negatively effected in this fragmented capital movement are those NMS that have not yet met the particular Maastricht criteria as prescribed by the Maastricht treaty on the EU for eligibility of the country to become a part of the new Euro zone within the EU. As in various other areas also in this respect exist some differentiation between the old and new member states. While in the case of original old EU member states the consideration of the readiness of the country to join the Europe zone has been more than generous (except perhaps of Greece) and most of the countries even until now have never met the particular Maastricht criteria. In many cases it was enough just to show the so-called some positive development tendency in the particular criterion and the country was approved for joining the Euro zone. Thus it happened that among the first Euro countries have been approved also at least two countries that have exceeded the total debt Maastricht criterion of 60% of the GDP by more than 100% on the levels of over 120%. Until now their all the positive development tendency in meeting this one of the fundamental four criteria has improved to not more than to around 110% what has been still almost the double of the required threshold of 60% of the GDP. And since introduction of Euro almost a decade ago, many Euro zone member states are unable to meet various Maastricht criteria especially those on the budget deficit on the level of 3% of the GDP. And what was the result? The particular countries instead of being punished according to the treaties have managed that the particular articles of the Maastricht treaty have been adjusted in such a way that there has not been any punishment at all. In order the paradox with the particular criteria for introducing Euro would be even bigger, it has to be mentioned that Euro has been used also by the countries that have never had or never will have to meet any such criteria and are not even EU member states as e.g. Montenegro, Province of Kosovo, but also all various tiny neighbours of the EU like e.g. Vatican (even being allowed to mince its own Euro coins?!), San Marino, Monaco, Andorra and of course also again

various overseas departments of some EU member states. On the other hand some of NMS that have already met the particular Maastricht criteria and/or are much closer to meeting them than some of the existing Euro zone members have not yet been allowed to join the Euro Club as reputedly they are not-yet-ready to meet all the necessary criteria?! In any case the Euro common currency so far has been more dividing, further fragmenting the EU-27 internal market than making it more common or single as it has been its main objective and also undisputed potential

As for capital flows in the form of FDI, these flows are so far much more one way flows from the old EU-15 members to NMS than anything else. In principle it could be a positive trend as it is one of the ways how to more equality and cohesion among the old and the new EU member states. But again, in many cases these FDI are more dividing and fragmenting the EU internal market of the EU than unifying it. The main reason is that the foreign investors very soon discovered that for various historical but also other development trends, the cheap NMS are the best place for placing in them various productions and activities that are less sophisticated, requiring less qualified workforce, less value adding so in this respect the particular gap between old and new members of the EU has been rather widening than narrowing. While sectors and activities related to the latest ICT applications, R&D, etc. have been mostly placed and/or remained in the old EU-15 member states various laborious, hazardous or environmentally more risky productions have been placed in the new member states for the overall costs being just a fraction of the costs required in the old EU-15 countries. The typical example is a recent incident with huge explosion in a plant in Slovakia where semi-qualified workers have been dismantling obsolete ammunition for the monthly salaries on the level of only 200-300 Euro per month?! In case of more attractive productions like e.g. car industry, the foreign investors have expected such locally provided incentives that in many cases raised the total costs for creation of one job to several times multiplied expenditures than have been normally needed or offered to local employers, etc. Not to mention various other direct perks to the foreign executives, managers or even ordinary specialists like accommodation in newly built villas, free air transport, education of their children in foreign language schools, recreational facilities, etc. In some other cases as e.g. in case of privatization of banks through foreign banks has required the incoming FDI required such “preparatory” national investments into the “cleaning” process of their portfolio from bad loans (it is quite interesting that there was no much effort to find out who was behind those “bad loans” that again their final sale to foreign investors has been just a clean loss for the particular new member state and especially its citizens who have been the largest losers from all these processes of privatization, rationalization, modernization, etc. through so often over heralded FDI. They are again contributing more to the fragmentation of the EU internal market to its high tech segment in the old EU member states and its low tech portion in the NMS than to its integration towards a truly and fully common or single market of the entire EU. What is in this overall FDI flows most remarkable, it is the fact that in spite of all problems with them there is one significant development trend. The outflows of profits, dividends and various other benefits for foreign investors have been permanently growing. While for example in the case of Slovakia just ten years ago the total repatriation of dividends has been only about 10 billion Slovak Koruna (1 US\$ is currently about 25 Sk) in just finished year 2006 it has been over 70 billion Sk what is almost the same amount as the total amount of the incoming FDI into the country for the same year?! Hence, the free flow of capital between the old and new EU member states has had really some unwanted and unpleasant consequences not being in line with the principles of mutual benefits, solidarity, assistance, etc.

## **Free Movement of Persons**

All the above distortions of the EU internal market regarding its fragmentation due to problems with the free movement of goods, services and capital have negative impact on overall functioning of the EU, but this last fourth free movement being also guaranteed directly to the citizens of the EU by the basic treaties has even more damaging effect. It is simply because of its nature. Although all three previous free movements have negative effect on the overall functioning of the EU and thus finally negatively effecting also each and every citizen of the EU, but most of them are not so directly effected by some problems in the free movement of goods, services or capital as most of them neither exporters nor importers. Most of them are not providers of various services and even less they are

involved in the free movement of capital. After all, none of these free movements belongs among the fundamental human rights guaranteed by the most universal act of international law. By their substance they belong to the responsibility of various specialized UN and/or other international agencies like WTO, World Bank, IMF, UNCTAD, etc. However, the free movement of persons on the other hand belongs among the fundamental human rights i.e. something what has been guaranteed to every human being irrespective of what is his/her nationality, gender, race, social or marital status, religion, etc. as it is expressed also by their character – they are universal and as such they belong to all people without any restrictions, necessity to claim them, etc.

In view of this its universality it is then absolutely unacceptable that a part of the EU citizens has been deprived of this kind of one of fundamental human rights as it has been currently in the case of the EU citizens from the NMS.

Due to the above universality, there is no legal way that any human being could be stripped of this right. No national or international act of law, treaty, and agreement can have that effect even in case if the particular citizens would “voluntarily” agree with that. In view of this universality it is then no surprise, that the citizens of the NMS are very sensitive about any restrictions imposed over them regarding their free movement within the EU territory i.e. territory of the Union of which they are also “full fledged” citizens with otherwise all the same rights and obligations as they belong to the EU citizens from the old member states. In view of this, any restrictions imposed in this respect over them by the accession treaties that among others have introduced also the so-called transitional period in this respect with the total length up to seven years i.e. till year 201. Especially, for the citizens of the EU from the former ten socialist countries this restrictions regarding free movement of persons has been clearly seen as their totally unacceptable and unjustified discrimination. Basically they see it as a kind of the same continuing unjustified discrimination they were subjected during their former totalitarian communists regimes when right the restrictions on travelling abroad (i.e. to the West) had been seen as one of the biggest deprivations. And by the certain paradox, the same countries that for decades were encouraging citizens of the former socialist countries to get rid with their totalitarian regimes nowadays are doing the same what those undemocratic totalitarian, dictatorial regimes?! It then no surprise that in the first ever elections into the EP the turnout of electorate was in some NMS on the level of the historical lowest levels of only e.g. 16% in the Slovak Republic. That is just a result of their frustration in this respect. They have become citizens of the EU but only of the second category. The EU citizens from the NMS are now also holders of the EU passports but that passport does not help them much in their free movement as guaranteed to them not only by the basic EU treaties but also by the UN Universal human rights, by the Council of Europe etc. Basically, within the EU they do not need the EU passport as an ID card is enough – but in the most of the old EU-15 member states they can till travel only as tourists on the same grounds as citizens of various other countries from the outside of the EU. And outside the EU, their new EU passport also do not help them as their visa and other related statuses are depending upon their national passport or citizenship and definitely not on their EU passport or citizenship.

In principle we could say, that the current situation in the free movement of persons as in one of the “constitutional” freedoms has created such a situation that the citizens of the EU are nowadays divided into at least the following eight categories of citizens:

- citizens of 14 old EU member states that have a complete free movement not only within the Union but also outside
- citizens of one old EU member states, notably Greeks have some restrictions regarding travel abroad e.g. to the USA where they as only citizens of the old EU-15 countries need visas
- Citizens of the 10 NMS have limited free movement within the EU-15 member states where they fully depend upon the generosity or non-generosity of the particular EU member states. For example the UK, Ireland, Finland have opened their labour market to them without any restriction since their entry into the EU. All other old member states are opening it at their will as they like and/or need migrant workers from the East e.g. according to some professions, etc. This “pick-up” or “a la carte” system of opening their national labour market is even more discriminatory than in case that the country has not opened its labour market at all as it makes of the NMS just a source of wanted or unwanted labour! In this case the EU failed to achieve at least that little for its citizens from the NMS that no country could choose what categories of

professions they will accept or not. The minimal equality of the citizens requires a consequent principle of either all citizens or none of them as otherwise the current system is a double discrimination!

- Moreover, also in the old EU-15 countries that have opened their labour market for citizens from the NMS, the situation of these new workers is not an ideal one. Although in principle the EU rules and legislation on the equality, equal workers rights, benefits, etc. has been formally guaranteed, in practice there are various kind of hidden discrimination. These workers have e.g. an equal pay as their counterparts but mostly it is not according to their qualification but because of their initial language deficiencies they are assigned to mostly menial jobs of servants, janitorial staff, etc. so they pay is equal with semi-qualified immigrant workers from the third countries, etc. In this connection it is again a big question, what for exists the portfolio in the European Commission with responsibility for education and multi-languages, etc. If Canada or Australia are able to provide a language preparation for their immigrants for free why the EU is not able to provide the same for its own citizens within the EU itself?!
- Citizens from the last two NMS i.e. Bulgaria and Romania do not have any opened labour market in any of the old EU-15 member states
- Although the EU as also all international organization are very active in protection of national minorities, there are minorities in the current EU-27 that although formally they are eligible to be citizens of the EU as they were born on the territory of the particular member states and have permanent residence in the member state they are not eligible to become citizens of the particular member state e.g. because they do not pass test in the official language of the particular country?!. On the other hand there are citizens of other EU member states that do not speak the language of the particular member state but they are citizens of that state. Hence it would be necessary to have a common Union rules and regulations that would clarify this kind of issues and problems with citizenship, minority status, etc. There are still big differences existing also between old EU-15 member states e.g. between France and the FRG,
- Another problems with the free movement of persons exists between Schengen and non-yet Schengen member states. By a certain paradox (unfortunately not unusual in the European integration) in some case non-citizens of the EU but citizens of the Schengen have more rights for the free movement of persons and free right for establishment than it is in the case of the EU citizens from the NMS. Similarly, also in some EU member countries immigrants from their former colonies have more favourable treatment than citizens from the EU NMS, etc.

In this list of problems and weaknesses in the current free movement of persons within the EU we could continue further on but we suppose that for illustration we have brought up enough examples that call for a very fast and efficient solution in this one of the principal human rights also for the citizens of the EU irrespective if they are citizens of the old or new EU-27 member states. There should be no discrimination whatsoever and this constitutional right of the EU citizens has to be guaranteed directly by the EU institutions and not being left in the hands of the national administrations of individual member states. Otherwise, could happen again very soon that in the next elections into the EP in year 2009 the turnout of electorate will achieve another new historic record in the low level of those who will exercise their right to vote. The solution of the free movement of persons strictly according to the basic treaties could bring the EU closer to its citizens than all various existing campaigns, slogans, declarations, etc.

## **Conclusions and Recommendations**

As we have stated in the previous parts of this paper, in spite of the fact that the EU internal market has just very recently celebrated its 50<sup>th</sup> anniversary, there has still been a lot of work needed in order to bring it into line with the provisions of the basic treaties. The existing and to some extent continuing fragmentation of the EU internal market requires a more consequent approach than it has been so far. Especially it is needed to increase the role of EU institutions in the entire process of the EU internal market development in particular the European Commission has to act in the protection of the EU internal market more strictly according to the basic treaties and without taking into account if that or other group of member states has some other national priorities, etc. Otherwise, it could

happen very soon that there very soon will be no internal common and single market of the EU but only a rather inconsistent gathering of individual and fragmented national markets or their sub-regional groupings.

## Implementation of the EU Lisbon Strategy: Problems for States

Dusan Soltes, [dusan.soltes@fm.uniba.sk](mailto:dusan.soltes@fm.uniba.sk)  
*Faculty of Management, Comenius University, Slovakia*

### Abstract

The paper deals with some experiences as gathered especially from our recent EU projects that have been funded by the EU under the 6FP and its IST – Information Society Technologies Program. For more details about our particular EU funded projects please visit the web site of our e-Europe Research & Development Centre at [www.fm.uniba.sk/erdc](http://www.fm.uniba.sk/erdc). From the point of view of our experiences from these and some other similar projects we are trying to assess some problems and weaknesses of the Lisbon strategy implementation but also some innovations as prepared by the EU under the new research and development program EU/7FP/ICT to be operational for years 2007-2011. This new program by its overall orientation is more open, global and thus giving more opportunities also for participation of partners from the outside of the EU in the EU community research and thus contributing positively to the overall implementation of the Lisbon strategy until its original target year of 2010.

### Introduction

The Lisbon strategy of the EU as adopted at the Summit of the EU member states leaders in March 2000 has stipulated as its main goal by the year 2010 that the EU should become the most advanced and competitive “knowledge based” economy in the world with more and better jobs ... cheap Internet as the main backbone of the whole Lisbon strategy and the future e-Europe with ... modern public services on-line ... dynamic e-business environment, etc. [6]

However, the further development has quite quickly and clearly demonstrated that the main goals of the Lisbon strategy have probably been too ambitious for the current stage of the EU and especially for the national governments of new member states and their general development strategies. In particular it has not sufficiently taken into account that during the same period of years 2000-2010 another important process would be going on in the EU development. This other equally demanding process has been the process of the ongoing enlargement of the EU from the previous 15 member group of (mostly highly developed Western European) states to the EU of 25 member states since 1 May 2004 and subsequently to the current EU-27 when on 1st January 2007 also Romania and Bulgaria have become new EU members. Most of these new member states are former socialist and less developed countries from the Central and Eastern Europe including former USSR. The entry of these new member states has just further widened the gap between the EU and the USA that the Union has originally wanted to overtake as the most advanced knowledge based economy in the world by year 2010.

In addition to the above already mentioned problems with the ongoing process of enlargement there have also been some other and equally important problems. One of main such problems has been that there has not been any whole range and comprehensive implementation strategy for the e-Europe on the EU and especially on the national i.e. member states levels. As it has been in this connection quite evident, the whole Lisbon strategy in terms of its implementation has had some shortcomings especially regarding of its insufficient financial, institutional, legislative and other necessary support.

As it has been quite clearly stated in the W. Kok’s Mid Term Evaluation Report: of the Lisbon Strategy in November 2004 [5]:

member states have made some progress in one or more areas but none succeeded consistently across a broad front  
Halfway to year 2010 the overall picture is very mixed...

Europe needs to step up its efforts considerably in order to meet the Lisbon’s main objectives by the year 2010...

Otherwise, the Lisbon strategy will become a synonym for (an another) missed objectives and failed promises.

On the basis of these and other evaluations, the EU finally adopted a revised and somehow less challenging strategy of i2010 with the main objectives basically defined as “a European Information Society for Growth and Employment [2] i.e. strategy that has been focusing not on becoming the most advanced knowledge based society but to become by the target year 2010 an Information Society that will be able to achieve the steady and higher overall macroeconomic and socio-economic development with higher employment and thus to lower unemployment that currently in many member states of the EU and EU regions has been rather too high hovering on the high levels of 10-12% in average and in some less developed regions even over 20-25% of the total workforce.

### **A Brief Description of the Situation in Implementation of the Lisbon and/or i2010 Strategies within the Previous EU/6FP/IST i.e. in Years 2002-2006**

In addition to the insufficient support to the ICT utilization and to SMEs, another deficiencies of the EU's Lisbon strategy implementation has been that although the “knowledge based economy” has been the main goal of the EU for the whole decade 2000-2010 there has not been so far created anything like a “common policy in e-Europe” in its support similarly to the CAP i.e. common agricultural policy, common foreign and security policy, common policy in justice and home affairs, common regional policy, now intended common energy policy, etc. Most clearly this lack of support could be documented by the EU budget that has - still by an evident paradox – been destined for the old fashioned and currently already out-of-date CAP – Common Agricultural Policy and not for the development of the knowledge based economy. Almost 50% of the EU budget i.e. 45-50 billion Euro goes annually still to the CAP and its subsidies, direct payments, etc. to farmers who in general represent nowadays in the EU only a very small sector of 2-3% of the total workforce and that contributes to the EU's GDP also only with about the same share.

On the other hand the whole 6FP as the main executive program for the EU's research and development program has had totally only 17.5 billion Euro. But even that small amount in comparison with the annual 45-50 billion Euro for the CAP has not been allocated for one year but for the whole period of the 6FP i.e. for years 2002-2006!

In general, the EU policies have been well known for its support to comprehensive institutionalization of the processes of the European integration, However, by a certain contrast the Lisbon strategy has some evident deficiencies in this respect as e.g. in some member states specialized ministries of informatics have already been existing but in most of them such ministries have been missing so the coordination has been in such cases left on several other central organs of the state administration what evidently is not the best way of coordinating the most important development strategy of the EU on the national level

Although the whole Lisbon strategy is based on the knowledge i.e. education, research, development and science, in addition to the insufficient budgetary support to R&D as we have already illustrated above, there has not been any more systematic attempt to create anything like a common educational policy although such a portfolio in the current European Commissioner has already been existing since 2004. So far we cannot see any whatsoever progress in this respect e.g. regarding any systematic all EU harmonization of the curricula, coordinated mobility programs, not to mention e-education or education in ICT and foreign languages e.g. in English as the most important factors for achieving anything similar to the evident comparative advantage of the educational system in the USA that in addition to various other advantages has also one important feature i.e. it is very open for foreign students, stipend and/or fellowship holders among scientists, researchers, etc. from the entire world. That in addition to its much better technical basis is also very flexible and open to the outside world e.g. in attracting best foreign students, PhD. students, researchers to the U.S. universities, etc. Most of measures as adopted in the EU in this respect as e.g. in the introduction of the e-education are more administrative decisions than any comprehensive approach including necessary international coordination, funding, mobility, etc. We cannot just simply speak about development of the knowledge based society and economy without a real revolution in the EU's educational system that only could prepare at least young people for more and better jobs as it has been stipulated in the Lisbon strategy. Just to create a new portfolio in the EC is just not enough moreover, if by a certain paradox the entire educational systems are left as

a national and not community competence. Otherwise, it could not happen such a paradox like in Slovakia where e.g. in time when all the effort has to be devoted to expansion of the Internet based education in all schools, the religious education has been introduced as one of two elective subjects together with ethics?! And in this connection we could state even more paradoxes that something has to be wrong in the education on the community level...

One of the biggest shortcomings of the so far completed implementation of the Lisbon strategy has been that it has not offered any evident and relevant Internet services for general public. Especially many new EU member states are very slow and inefficient in offering any Internet based benefits regarding e-government, e-education, e-health, etc. so citizens of the EU do not see any justified reason why they should invest in the home based Internet connections, services, etc. Just to read newspapers or check train and bus time-tables through Internet is not an adequate benefit for still rather high costs of Internet installation, operation, utilization, etc. Moreover if some new member states with a very high unemployment, low wages of about 400 Euro in average are still not having the standard of living that would correspond to the age of information society, etc.

To some extent quite surprising there has not been existing any sufficient legislative support to the processes of informatization of the EU society is rather weak. Although in many other areas especially again in agriculture, but also in food protection, environment, etc. the EU is very active in introducing community legislation e.g. also in the recently adopted legislation on "protection of air passengers" that to some extent is even in contradiction to fundamental human rights or dignity, etc. the Lisbon strategy lacks in many cases even the most necessary legislative support as e.g. already mentioned institutionalization but also more practical oriented legislation on mandatory utilization of an (unified and cheap) electronic signature as a basic precondition for any more wider utilization of Internet for daily needs, etc.

In general especially in the new member states of the EU there is not a big respect for the SMEs as a potential backbone of the accelerated socio-economic development. The whole sector of the SMEs has been still seen more as a sector that serves as a fast track for becoming a rich businessmen as soon as possible than as one bringing the same benefits as in the USA regarding the high GDP growth, employment, etc. According to many accounts the situation of the SMEs in the new member states of the EU has not improved much since becoming a part of the EU. On the contrary their position has in many respects worsened as e.g. we have registered complaints within our above EPRI-start project. In general the situation of the SMEs including those active in the ICT sector in the new member states has not improved but has been stagnating or even worsening.

Some special problems exist also in the sector of SMEs acting or doing business in the ICT i.e. in the field that represented the operation area for the EPRI-start project. They are as follows:

The methodology and rules of the EU funded projects are too complex, complicated and in some cases even very hard understandable especially for SMEs. For example, there are no specific rules for projects to be prepared by SMEs that quite naturally cannot have the same capacities as e.g. big trans-national corporations. So most even interested SMEs are finally discouraged from a wider participation in the community research and development oriented projects

In general, all preparatory works and activities for submitting a project for funding by the EU is very much time consuming. It requires a lot of own resources, effort and the prospect for success is a rather limited especially in comparison with the big TNC, well established universities, recognized research institutions, etc. Moreover, the English language and especially the specific terminology of the EU funded projects is also an evident burden for the SMEs

too many and various agencies have been offering their (and quite expensive) services, training, consulting and advising on "how to prepare a good EU funded project" but only very few have also a practical experiences from the particular field so there is an another reason for the distrust in this respect from interested SMEs

If in an exceptional case, the project is finally accepted for being funded by the EU, then the cash flow from the Commission is very slow and its final settlement could last for several years even after the successful completion of the project. According to the existing situation, very often projects funded by the EU get during the lifespan of their operation only about 40% of the allocated funds. This especially for SMEs is a rather big problem as they usually do not have so much of own free capital to be bound for so long by the EU

SMEs would prefer rather specific concrete orders, tasks from the EU and its agencies for specific IST related solutions, projects than to apply within the particular calls for rather abstract and very generally formulated topics

like e.g. nanotechnology, safe Internet, advanced robotics, etc. In general it means that in the future 7FP there should be specific programs for SMEs as well as for their matching together with their partners from the old EU member states.

However, one of the biggest problems of the whole Lisbon strategy on any level of its implementation (education, business, government, services, etc.) has been the problem with Internet. Even after practically six years since the inception of the Lisbon strategy, Internet has not yet become anything close to what could represent a backbone of the whole strategy.

Internet especially in the new member states has still many deficiencies. Some of the most crucial in this respect are the following ones:

there still does not exist the necessary technological broadband basis for safe and high speed Internet  
Internet services as offered by the public sector and/or governments are insufficient so they do not offer any incentives and/or compensation for rather still high costs of Internet services. The government sector itself is not using Internet efficiently even for its own internal purposes, there is still missing any share system on the data collected from the citizens by individual governmental agencies. National governments are very slow in any support to Internet in general and its wider utilization e.g. Slovakia only now more than 5 years after adoption of the Lisbon strategy has launched more systematic support to Internet by an incentive of about 150 Euro but limited only to 40 thousand families and a particular client must be 15-25 year old (?) and the speed of Internet must be 512 kbit/sec. in many NMS like e.g. in Slovakia in principle general public has still not had a free and easy access to Internet through the proposed PAP – Public Access Points and definitely Internet café like services are no substitutions in this respect Similarly, there is not sufficient liberalization in the telecom services so there is a lack of competition and thus there exist conditions for the monopolistic position of the existing providers. Just for comparison while there are more than 10 telecom services providers in Denmark, there are only 4 in Slovakia, i.e. in countries of about the same size and population

in general the Internet and related services are too expensive not only for general public but also for SMEs especially if taken into account high costs, high VAT, low salaries, high unemployment, etc. Our research under the EPRI-start project has clearly documented that most of the SMEs from the sector of the ICT related services are not offering any public access to their services through Internet. For example in our sample of 348 such SMEs we have found only 101 of them with their own web site and e-mail addresses. It means that more than two thirds of SMEs registered by this project do not have/offer own web page or generally accessible e-mail address?! Just for comparison again, a company in the USA that has not had an Internet connection or e-mail is considered as a suspicious one of about the same kind like being without phone, fax, a bank account, etc.

There is growing distrust to Internet because of spasm, etc. For example our first attempts using general Internet communication as main communication tool to SMEs under this project has failed and we had to switch to more personalized ways of communications

although all schools e.g. in Slovakia are already linked to Internet the access of pupils and students is still rather limited because of location of PCs or the lack of qualified teachers. The access to Internet in schools has still not been available for parents or the public from that community as it is a common practice e.g. in all schools in the USA

There is not existing any EU program for long-life education in ICT and Internet and no whatsoever promotion for citizens in order to explain them advantages of Internet benefits for their work, education, information, etc. in many sectors it seems that a wider utilization of Internet is seen as an unnecessary intruder to the existing practices of corruption, shadow economy, various kinds of illegal payments, cash transfers, etc. as simply e-communications and e-transfers in such cases are too transparent, impersonal and too traceable and unnecessary well documented.

In view of these few but of course also many more facts it is not quite realistic to expect that Internet will become a backbone of the e-Europe very soon, at least not in some new member states of the EU.

## **Some Results of our Comparative Analysis of the Situation under the EU/6FP/IST in Years 2002-2006 with the Perspectives as Outlined by the EU/7FP/ICT for Years 2007-2011 according to the Draft EU/ICT/Work Programme for the First Two Years of 2007-8**

On the basis of our particular comparative analysis between the previous 6FP and the current 7FP [4] the results achieved could be summarized to the following main advantages of the latter one.

The 7FP is defined for seven years i.e. a longer period than it has been in the case of the 6FP with five years what due to the character of many research and development projects creates more stable and thus also more effective operational area with the clearly stated rules, funding schemas i.e. types of projects to be funded by the EU, etc. although so far it has been launched only first two years 2007-8

The funds as allocated for the 7FP from the EU budget have been substantially increased in comparison with the former 6FP. While the 6FP altogether was handling the total budget of only 17.5 billion Euro for the new 7FP the total budget allocation has been over 50 billion Euro (the exact figure has not yet been available in time of writing this paper). That means that also on the comparative annual basis there has been an increase from 3.5 billion Euro to more than double amount of over 7 billion Euro under the current 7FP. It is evident that as before not all this funding is only for the IST program and has to cover all various other research and development programs under the framework of the ERA – European Research Area. However, on the other hand the total is still substantially less than is funding allocated for the CAP but generally a positive trend and shift in favour of R&D has been clearly evident. And it creates also a good starting platform for the expected future substantial revision in the provisions for the CAP after the year 2011 when will expire the current still stand in the CAP funding. Another positive fact in funding has been regarding involvement of the SME in the EU/7FP. The funding limit for them has been increased from the previous 50% to 75% what gives more chances to this important and very dynamic sector for its active involvement into the research and development activities under the 7FP. On the other hand our experiences from the EU/6FP/IST EPRI-start have clearly demonstrated that even this remaining lower threshold of 25% could be too high especially if we realize that some SMEs with the highest research and innovation potential are really too small or rather only micro companies with less than 10 employees. Another important obstacle for their active participation in the community R&D projects could be the cash flow from the EC to members of various consortia. Our own experiences clearly demonstrate that the delays up to 2-3 years in the final payments are no exemption. In this respect it would be really very much desirable if also in the cases of payments under the 7FP a kind of decentralization i.e. principles of subsidiary would be introduced in order to minimize this kind of delayed payments that as we have mentioned above are often the main reasons for non participation of SMEs in the community R&D programs

One of the biggest advantages of the current 7FP has been its more open policy towards an active participation of subjects from the non-EU member states. In connection with the EU's intentions to become a more respected and active global player and at the same time to support inflow of the innovative know how from the outside of the EU for the support of the Lisbon and i2010 strategies, the EU has now even more wider opened door for entrants from non-EU member countries for their active participation in the 7FP especially in the IST program. There are at least two important aspects in this respect. One being that with only three partners from three different EU member states, there is practically available almost unlimited number of partners from non-EU member states. The other one being that practically the whole world has been invited to join the 7FP. Regarding this "open door" policy of the EU towards research and development partners from the non-EU member states it is important that this door is open practically for all the developing world including some of the poorest and/or smallest and most tiny nations. Most of them are hardly even known to ordinary EU tax payers, like e.g. Cook Islands, Tonga, Tuvalu, Vanuatu, Samoa, Kiribati, Nauru, Niue, Palau etc. in the Pacific Rim. It is really a commendable gesture that clearly indicates that the EU firmly believes that the knowledge, know how, entrepreneurship are not exclusive domains only of the most rich nations. In this truly global geographic context it is important also to realize another not less important factor of real liberalization, globalization of the EU sponsored community research. Among eligible countries for funding from the EU 7FP budget are also countries that are otherwise often ostracized and criticized like Cuba, Syria, Belarus, Burma/Myanmar, Iran, Venezuela, Zimbabwe, Sudan, etc. Out of those not found in the eligibility list we

could mention only e.g. P.D.R. of Korea. This most welcome “open door” policy of the 7FP is going even that far that in case of some big and very prospective countries like Russia, China, Brazil, India they are considered not only as eligible countries but also as regions so there could be more partners from these countries on the basis of their internal regions, states, etc. what is further widening their participating potential and thus also their more than welcome active contribution to the EU community R&D. Of course that the 7FP is open also for all most developed countries like the USA, Canada, Australia, New Zealand or some very rich countries like Saudi Arabia, Kuwait, Qatar, Bahrain, etc. but not under the direct funding from the EU budget. However, again for individual experts even from these countries the funding from the EU could be made available on the case to case basis.

One of the main challenges of the 7FP - in addition and/or better above the already mentioned various positive development trends - is the so-called global physical e-infrastructure for the truly and fully EU Global Research Network. Under the GEANT2 an e-Infrastructure and/or grid has been made available for practical utilization. This global network through its individual subsystems like AGEE, DEISA, EU MEDGRID, EELA, OSG, TERAGRID, SEEGRID, EUINDIAGRID, EUCHINAGRID, NAREGI, BALTAGRID, KNOWARC has created the system that is directly linking current and mainly future partners also in the community research and development into one homogenous e-working environment where the exchange of knowledge, information, results, innovations will only be a matter of fraction of time for direct on-line, real time transmissions. In this way, e-research and e-science under the 7FP will be only a matter of e-communications from/to any place of the globe as also above names of particular grids indicate e.g. regarding the USA, the Latin America (EELA), China (EUCHINAGRID), India (EUINDIAGRID), South East Europe (SEEGRID), Baltic (BALTICGRID), etc.

## **Conclusions and Recommendations**

As we have presented in the previous part devoted to the comparative analysis of the current 7FP with the previous 6FP it is evident that the EU as a whole, its EU member states and in particular the European Commission and its units responsible for the IST programme have in the preparation of the 7FP adopted a new more innovative, systematic and comprehensive “self-learning” approach i.e. learning from its own experiences as well as from the opinions and recommendations spelled out during the 6FP in years 2002-2006 by various experts including this author. Although in some cases it is still evident that some compromises with the existing situation had to be done like e.g. still just in a gradual shifting of funding from the CAP to the R&D, the 7FP and/or the ERA, etc., in general the development trend in this respect is definitely positive one as we have clearly documented in the previous part of the comparative analysis between the current 7FP with the previous 6FP.

The main features and principles as adopted in the 7FP in its ICT Work Programme are definitely creating all necessary preconditions for an accelerated approach and proceeding in the “informatization” of the society irrespective if we consider it under the original e-Europe Lisbon strategy or its “softened” version of i2010. In our opinion the formulation of i2010 has been adopted rather to hastily and prematurely. Sticking more firmly to the original Lisbon strategy would be - also from the psychological aspects - much better serving to the main strategic goals of the EU in the first decade of the 21st century i.e. get closer to the modern Information society.

In this connection, the recent two events organized by the EU in promoting also this global collaborative approach of the EU in the 7FP as e.g... The EUSEA in Singapore in June and BELIEF in New Delhi in December 2006 have clearly demonstrated that the EU and especially the EC are very serious in their effort for attracting research and development capacities from the outside world to international consortia for solving challenging tasks in the current 7FP in the IST/ICT programme. In this respect especially “Get-in-Touch” sessions at above events have also clearly demonstrated an enormous interest from the developed as well as developing countries in joining their capacities with their partners from the EU member states in solving tasks under the 7FP/IST. What is needed it is to provide for them an adequate training program for mastering the project preparation methodology of the EU funded projects. For example our e-Europe Research & Development Centre at the Faculty of Management of the Comenius University ([www.fm.uniba.sk/erdc](http://www.fm.uniba.sk/erdc)) is one of such institutions that could now already help in transferring its recently acquired “hands on” experiences from preparing good EU projects to the potential partners from the

developing countries. It is just a matter of some organizational and financial arrangements and e.g. we, - as a modern university educating regularly foreign students not only from the EU under the ERASMUS project but also those from various developing countries – are ready to launch such a hands on, on-the-job training also for our future potential partners from developing countries.

## Monetary Unification in East Asia: Economic Necessity or Political Illusion?

Mariusz K. Krawczyk\*, [mak@econ.ryukoku.ac.jp](mailto:mak@econ.ryukoku.ac.jp)  
Ryukoku University, Kyoto, Japan

### Abstract

The launch of the economic and monetary union in Europe and the 1997 financial crisis that underscored the disadvantages of currently employed exchange rate regimes raised questions about the feasibility of a similar monetary unification project for East Asia. Being one of the most dynamically growing regions in the world, East Asia has the potential for a successful implementation of a monetary union. The paper examines why, despite of substantial political emphasis being placed on the issue of monetary integration, the progress to date is slower than it could be expected. The major finding is that, although East Asia may actually benefit from establishing its monetary union in the long run, a specific political culture that prevails in the region and misconceptions about the sequencing of the process prevent the East Asian monetary union from materialising. Possible short and mid-term policy solutions follow.

### Monetary Unification in East Asia: Economic Necessity or Political Illusion?

East Asia, one of the most dynamically growing regions in the world, has long been thought to be a potential candidate for a regional monetary union. Amid the successful launch of the European monetary union the debate on the issue of regional monetary integration (or at least close monetary cooperation) in East Asia heated up in the aftermath of the financial crisis that hit the region a decade ago<sup>1</sup>.

The crisis underscored the danger of running fixed exchange rates, with independent monetary policy and opens capital accounts, and resulted in a growing awareness about the importance of regional monetary cooperation in East Asia. There is now a strong perception that, had an effective regional monetary cooperation institutional framework been implemented, the crisis itself might have been prevented or at least mitigated and that the benefits of the intra-regional cooperation could not be fully accrued without a well-established monetary cooperation framework. Accordingly, a group of East Asian countries<sup>2</sup> engaged in a series of appropriate initiatives that aimed at enhancing the region's monetary cooperation.

Yet in spite of high priority given to the issue of monetary unification at least during high-level meetings of regional bodies, East Asia's progress towards its common currency seems to be falling short of expectations. Furthermore, there is evidence showing that, after the immediate post-crisis initial switching to floating rates, the East Asian countries have gradually returned to the *de facto* dollar peg<sup>3</sup>.

Looking for answers about the reasons for slower than expected progress towards monetary unification in East Asia, the paper examines three possible explanations. First, East Asia may really not need the monetary union after all. Second, there may be the lack of political will to implement the agreed policies. Third, East Asia may be following its original path to the monetary unification that need not necessarily be identical to the approaches adopted in Europe or in the Gulf area. The remaining of the paper is organized as follows. The second section presents arguments in favour and against alternative exchange rate regimes for East Asia. Next, the following section questions the desirability of the region's monetary union using a basic optimum currency area framework. The main political initiatives towards the monetary union in East Asia are presented in fourth section. Section five argues that it is mainly the Asia's original path to the monetary unification that is to blame for the slower than expected progress. Finally, concluding section, after having answered the paper's main question, provides a set of necessary, in author's opinion, steps that may lead to achieving the monetary unification in the region.

### Alternative exchange rate regimes for East Asia

The debate whether the exchange rate should be fixed or flexible has remained unresolved ever since Milton Friedman began championing the cause for exchange rate flexibility. Advocates of both corner solutions could be found on either end of the economic theory spectrum. A Keynesian economist would argue for instance that flexible exchange rate could absorb external and internal shocks without affecting domestic price and wage levels, while his support for fixed exchange rate regime would be based on the beliefs that it provides a necessary protection from speculative attacks (that result from imperfect foreign exchange markets). On the other hand, a market economy believer would argue that flexible exchange rates are necessary condition for retaining independence of domestic monetary policies under free capital movement (that is indispensable for efficient functioning of a market). Yet fixed exchange rates could, in his reasoning, provide a nominal anchor necessary for stabilising flexible domestic prices and wages. The debate is far from being resolved and in practice a wide range of intermediate regimes has been in place.

The Asian currency crisis constitutes a milestone in the debate on the optimal exchange rate regimes for East Asia. Most of the region had adopted *de facto* dollar peg before the 1997 crisis. Undoubtedly, the fixed exchange rates helped to encourage capital inflows that contributed to the excellent performance of East Asian economies before 1997. Yet even then the vulnerabilities of the system were quite obvious; the high interest rates necessary for stabilising rapidly growing economies were encouraging more portfolio investment that in turn contributed to the overheating in the region (the impossibility to maintain fixed exchange rate, capital mobility and independent monetary policy at the same time). After 1997, while leaving the debate on two corner solutions still largely unresolved, the focus of the debate here has shifted to costs and benefits of three alternative exchange rate regimes, a return to the dollar peg, a currency basket regime and a monetary union for East Asia.

Let aside the return to the *de facto* dollar peg after the crisis, some analysts have argued in favour of explicit adoption of a dollar peg<sup>4</sup>. For reasons ranging from transaction costs, direction of trade flows to historical conditions at least some countries of East Asia could be considered as a part of a “greater dollar zone” (with Canada, Mexico and parts of Latin America being a “natural dollar zone”). As Fukuda (2006) convincingly shows, for history and expectations reasons, invoicing in dollars dominated in Thai (85.7 percent in 2001, down from 92.0 percent in 1997) and Korean (87.43 percent in 2001 down from 89.21 percent in 1997) transactions in spite of the fact that their trade with the United States amounted to only 20.3 and 20.9 percent respectively (against 49 percent of East Asia share in Thailand and 44.3 percent share of East Asia in Korea’s trade). History, lower transaction costs, and a nominal anchor for stabilisation policies constitute the main arguments in favour of a dollar peg but on the other hand the arguments on the loss of independent monetary policy and the possibility of asymmetric shocks still hold (Table 1).

TABLE 1: THE DOLLAR PEG IN EAST ASIA

Benefits	Costs
An efficient medium of exchange (lower transaction costs)	If a country does not satisfy the OCA criteria, the economy would suffer from asymmetric shocks
A nominal anchor (low inflation)	
It can be carried out unilaterally by a small economy. Regional cooperation is possible if all economies peg to the US dollar	
Currency attack would be weaker and contagion would be contained	The entire region becomes dependent on the third party (FRB) monetary policy decisions
If Japan joined (China has been already in) the entire region would be unified optimally	

Source: loosely based on Wyplosz (2002) and Ito and Park (2004)

Although being the second best solution, the *de facto* dollar peg has returned in practice as the first choice of an exchange rate regime in East Asia. But much more attention has been paid to a currency basket peg and to a currency union as optimal forms of monetary unification in the region. Many academicians would prefer the former while the policy makers in the regions apparently favour the latter one. One of main arguments in favour of a basket regime is its ability to stabilise real effective exchange rates (as such a basket would contain currencies of major trading partners). Regarding quite high trade weight with Japan and the European Union, the argument that a basket containing, apart from dollar, the euro and Japanese yen could mitigate the 1997 crisis looks fairly plausible. Another argument in favour of a currency basket peg is its moderating influence on capital flows. Comparing to a single currency peg, a basket peg contains a higher exchange rate risk and therefore has a depressing influence on capital flows. A basket peg provides an economy with some stabilising anchor (comparing to flexible exchange rate) and with more flexibility than it happens under a fixed exchange rate regime.

There are, however, also some difficulties associated with a currency basket peg. First, complicated basket calculations would certainly result in a loss of transparency. Given difficulties in immediate evaluating the actions the monetary authorities undertake, the credibility of the basket peg may be adversely affected. Needless to say, interventions within the currency basket regime may be technically much more complex than those that take place under a single currency peg. Second, since each country optimal basket is different, adopting a currency basket peg may result in difficulties in policy coordination in the region<sup>5</sup>. Table 2 summarises the main costs and benefits of a currency basket regime.

TABLE 2: A CURRENCY BASKET REGIME

Benefits	Costs
Fewer fluctuations in trade balance	No currency crisis prevention
Moderate capital flows	Loss of transparency (due to complicated basket calculations)
Some flexibility in managing external shocks	Loss of flexibility (compared to a free float)
Gives some anchor to prevent misalignment (comparing to a free float)	Loss of nominal anchor (compared to a fixed exchange rate), hence higher risk premium
Allows for joint appreciation and depreciation in the region	Policy coordination problems

Source: loosely based on Wyplosz (2002), Ito and Park (2004), and Ogawa et al. (2004)

The successful launch of the economic and monetary union in Europe has provided an additional argument for those who support a similar project in East Asia. Some, especially those involved in policy making, seem to take for granted that East Asia will have its own version of a common currency introduced in a (relatively) near future<sup>6</sup>. The advantages and drawbacks of a monetary union are relatively well known (Table 3). A monetary union arrangement provides exchange rate stability necessary for promotion of trade and investment within the region while avoiding at the same time dependency on the third party monetary policy (one of the drawbacks of the dollar peg). Here the monetary policy would be conducted by an independent (regional) central bank. A monetary union provides also a firm anchor both in monetary and institutional sense (peer pressure for meeting policy coordination goals if a framework such as the Europe's Growth and Stability Pact has been established). One can also expect that, once in place, a monetary union may deepen the economic correlation within the region. The loss of independent monetary policy for each member country has been the most pronounced cost of the monetary union. However, long before the debate on currency union emerged, the proponents of currency board arrangement had argued that the loss of an independent monetary policy resort associated with establishing a currency board was actually overstated. It happens because the growing interdependence of the world economy does not allow for completely independent monetary policy and, in addition, even the independence of monetary policy does not warrant its optimality<sup>7</sup>. Moreover, as Wyplosz (2002) argues, there is a possibility that a common monetary policy performed by a regional central bank may not vary significantly from each member country optimal monetary policy. Needless to say, in order to implement a monetary union successfully, the region needs to meet the optimum currency area criteria.

TABLE 3: A MONETARY UNION

Benefits	Costs
Exchange rate stability (trade and investment promotion)	Loss of independent monetary policy
A (regional) central bank independence	
Peer pressure for macroeconomic policy coordination	Asymmetric shocks may cause problems without sufficient capital mobility and fiscal transfers

*Source:* loosely based on Wyplosz (2002), and Ito and Park (2004)

Most of research done on the issue of monetary integration in East Asia seems to be quite in favour of establishing a monetary union in the region. Even critical papers (Chan-Lee, 2005 or Kim, 2004) predict that a monetary unification of some sort will eventually emerge in the region over a longer time horizon. Yet in spite of the favourable comments and various political initiatives the monetary integration in East Asia still seems to be decades away. The following sections will attempt to search for reasons behind the slower than expected progress.

### **Is a monetary union desirable for East Asia?**

The benefits of monetary union outweigh its costs when the union's partners are trading intensively with each other, when their economies business cycles are correlated and they suffer from symmetric shocks, when there is high degree of policy coordination in place, production factors mobility between member states is high, financial markets well developed and so on. In other words when the entire region constitutes an optimum currency area (OCA). This section attempts to address briefly this issue.

Most of empirical evidence seems to suggest that the region does indeed satisfy the OCA conditions, more or less. Trade openness indices for East Asian economies (defined as a share of total trade in country's GDP) show that, with notable exceptions of Myanmar and Japan, the economies of the region are as open as the EU-15 and more open than the EU economies were in 1990 (before the Maastricht Treaty, Table 4).

East Asian economies do similarly well on the account of the intra-regional trade. For instance Kawai and Motonishi (2005) as well as Yano and van Anh (2006) show that the intra-regional trade in East Asia has already reached the level comparable to the pre-Maastricht European Union (Fig.1). The caveat is that the ASEAN economies do not trade much between themselves; in 2003 only 24 percent of their trade were reaching other ASEAN countries. The same applies to the Asian New Industrialised Economies (NIEs; Hong Kong, Korea, Singapore and Taiwan); only 16,1 percent of their trade were directed to the region in 2003. But the trade between the ASEAN, the NIEs and China already accounted for 44.1 percent of their total trade in 2003. When the trade with Japan is included the intra-regional trade amounts to 54 percent of the region's total trade. Fig. 1 (based on Kawai and Motonishi, 2005) shows that this is more than the intra-regional trade within NAFTA and it is comparable to the intensity of the intra-regional trade in the European Union in 1990 (before the Maastricht Treaty).

TABLE 4: TRADE OPENNESS IN EAST ASIA AND THE EUROPEAN UNION  
(Total trade as a percentage of GDP)

East Asia	1990	2002	EU-15	1990	2002
Brunei	88.5	113.4 <sup>a)</sup>	Austria	56.4	69.7
China	24.2	49.1	Belgium	111.1 <sup>b)</sup>	169.1
Cambodia	17.4	101.8	Denmark	50.3	61.0
Hong Kong	218.3	248.8	Finland	39.1	59.3
Indonesia	42.2	53.6	France	37.0	43.1
Japan	19.8	21.1	Germany	50.0	55.4
(Rep. of) Korea	51.4	65.2	Greece	33.6	31.1
Laos	30.5	40.9	Ireland	93.7	114.2
Malaysia	124.1	177.2	Italy	31.9	41.8
Myanmar	3.1	1.0 <sup>a)</sup>	Luxembourg	129.4	95.4
Philippines	46.0	87.7	Netherlands	87.2	99.1

Thailand	61.4	98.1	Sweden	46.8	61.1
Vietnam	54.1	115.0	United Kingdom	41.2	39.1

<sup>a)</sup> 2001

<sup>b)</sup> 1993

Source: Kawai and Motonishi (2005).

Even more support on the OCA criteria comes from the estimated correlations of real sector macroeconomic variables (real GDP, real personal consumption, and real gross fixed capital formation) as well as financial variables (real money supply, real stock price, and real effective exchange rates) and price variables (GDP deflator, consumer price index, and wholesale price index). Kawai and Motonishi (2005) estimations for the period 1983-2000 as well as Yano and van Anh (2006) results for 1980-2002 show that East Asia economies do on this account not worse than European countries. Similar conclusion emerges from estimations of demand and supply shock correlations for East Asia, EU-15 and NAFTA. The results<sup>8</sup> show similar level of correlation for all groups of countries. Given the endogenous character of the criteria in question (i.e. once the a monetary union has been formed, economic integration will deepen and the degree of asymmetry of shocks will decline) the results support the plausibility of the East Asian monetary union.

FIG.1: INTRA-REGIONAL TRADE  
(as percent of total trade)

Some problems arise when the labour mobility criterion is tested. Although limited availability of data constitutes a serious difficulty, Yano and van Anh (2006) conclude that the labour mobility in the region is rather low. For major economies (Japan, Korea, Taiwan, and Thailand) the approximate stock of migrant workers in 2000 did not exceed 1-2 percent of labour force in spite of enormous income disparities between labour exporting and labour importing countries (PPP adjusted income per capita in Japan, Singapore, and Hong Kong is 8-9 times higher than that in Indonesia or Philippines). Only Hong Kong (5-7 percent), Malaysia (10-15 percent), and Singapore (25-27 percent) have shares of migrant workers higher than average. In the presence of high capital mobility (except for Malaysia and China) one may argue that, similarly to Europe, labour mobility has largely been replaced with trade and capital flows.

The quality of institutional framework constitutes another serious difficulty for East Asia as shown in Chan-Lee (2005). In spite of relatively high level of capital account openness, the quality of financial sector prevents the capital flows from being efficiently utilised. Table 5 (based on data from Chan-Lee, 2005) presents, apart from the capital account openness, the assessment of the quality of financial systems (scale 1 to 10) and the perception of business environment (here the reversed Price Waterhouse and Coopers' "business opacity" index). While some of the East Asian countries (Hong Kong, Japan, Singapore or Taiwan) managed to establish relatively sound financial systems, much is to be done to match the level of the EU "southern periphery" (Greece, Portugal, Spain) not to mention the United States. The problems are aggravated by phenomena common for most of emerging market economies such as insufficient property rights protection and contract enforcement, poor transparency, low level of corporate governance and widespread corruption. Except for Hong Kong and Singapore, the perception of business environment in East Asia is not encouraging. Poor condition of the region's financial markets damages the East Asia's image as an optimum currency area.

TABLE 5: QUALITY OF FINANCIAL MARKETS

	Quality of financial systems (1-10), 2003	Business environment (1-10), 2001	Capital account openness (1-4), 1999
China	2.7	1.3	1.5
Hong Kong	6.9	5.5	4.0
Indonesia	1.9	2.5	3.5
Japan	6.9	4.0	3.5
(Rep. of) Korea	5.4	2.7	3.5

n. a. – data not available

Source: adapted from Chan-Lee (2005)

To summarise, on most of accounts East Asia (or at least its parts) seems to be satisfying the OCA criteria. Even if not matching the level of the EU monetary union member countries, East Asia is close to the levels the EU member states had reached before they started the process of monetary unification (i.e. before the Maastricht Treaty). However, the disparities between the East Asian countries are much bigger than in Europe and much is to be done in the area of institution building. Nevertheless the answer to the question whether East Asia needs its monetary union seems to be largely positive (at least for parts of the region).

### **A lack of political will?**

This section attempts to address the issue whether it is the lack of political will to implement a monetary integration that is responsible for a slow progress in achieving the goal. There may be no straightforward answer to this problem. On the one hand there is abundance of political initiative towards deepening integration in the region. ASEAN+3 heads of state have met annually since 1997. Even before their first meeting took place the Manila Framework Group, a regional surveillance body had been established in November 1997. Other initiatives include bilateral swap arrangement (Chiang Mai Initiative) of May 2000, establishing intergovernmental East Asia Study Group or non-government East Asia Vision Group (both agreed at November 2000 meeting in Singapore), Asian Bond Initiative of 2003 and so on. A series of bilateral negotiations has produced a handful of bilateral free trade agreements between countries of the region.

TABLE 6: ASEAN+3 DECLARATIONS ON ECONOMIC AND MONETARY COOPERATION IN EAST ASIA

Venue and date	Agenda
Kuala Lumpur, December 1997	Exchange of views on regional currency problems amid the Asian currency crisis
Hanoi, December 1998	Deepening an economic cooperation aimed at economic recovery in the region
Manila, November 1999	The first official joint statement by the ASEAN+3 summit
Singapore, November 2000	The assessment of the Chiang Mai Initiative Agreement. Establishing the non-government East Asia Vision Group (EAVG) and its intergovernmental counterpart, the East Asian Study Group (EASG) for working-out guiding principles of economic and monetary cooperation in the region
Brunei, November 2001	Accepting the EAVG report. Korea's President Kim Dae Jung announces his country's readiness to establish an East Asian Free Trade Area
Pnom-Penh, November 2002	Accepting the EASG report on establishing a free trade area in East Asia
Bali, October 2003	Accepting a strategy for establishment of the ASEAN Community by 2020 (the Declaration of the 2 <sup>nd</sup> ASEAN Accord)
Vientiane, November 2004	Establishing an official bureau of the ASEAN+3 in the ASEAN structures (ASEAN+3 Unit)
Kuala Lumpur, December 2005	Renewed commitment towards narrowing development gap between member states
Cebu, January 2007	Commitment towards accelerating the establishment of the ASEAN Community by 2015

Source: compilation based on the ASEAN internet home page ([www.asean.org](http://www.asean.org) actual as of May 2007).

Yet in spite of being often highly publicised, many of those initiatives do not develop beyond the stage of a study group or a political statement. Even the most successful one, the Chiang Mai Initiative still seems not to be fulfilling its entire potential. Verbal support and statements of good will do not change the fact that, in contrast to Europe, East Asian governments seem to be very reluctant to delegate parts of their prerogatives to supranational institutions. Europeans' willingness to do so has been the result of their historical experience of two world wars that generated a desire to establish political and economic institutional framework able to prevent a recurrence of conflict. There is apparently lack of such consensus among East Asian nations. The lack of shared beliefs in political democracy and the presence of unresolved historical disputes result more often in emotional confrontations<sup>9</sup> rather than in a compromise based on principles of solidarity and conflict resolution. The resultant distrust translates then into a characteristic pattern of many low profile initiatives.

On the other hand, after the bitter controversy surrounding the IMF Stand-by Agreements with East Asian economies in the aftermath of the 1997 crisis no self-respecting Asian leader would ignore the issue of deepening the regional integration here. East Asia, one of the fastest growing regions of the world economy, is highly under-represented in various international bodies (the IMF, G-8, United Nations and so on). There is a growing frustration over the disparity between the region's own growing economic might and its lack of political clout. Awareness of own helplessness can be also an important driving force behind regional cooperation efforts.

Considering the number of undertaken integration initiatives, not necessarily the lack of the real political will but rather the specific political culture of distrust and lack of commonly shared cultural and political set of values contributes to slower than expected progress of the integration process. The procrastinated negotiations on the free trade agreement between Japan and the Republic of Korea may illustrate the point.

## Is East Asia following its own specific path towards monetary union?

Even if East Asia is indeed on its own path towards monetary union, the path is very different from the one the European monetary union has followed. After having achieved its original goal of establishing a customs union the European countries undertook series of attempts to stabilise the intra-European exchange rate (dating back to the pre-EMS days). Then, the leading monetary body (Germany's monetary authority) took over setting the pace of region's monetary policy and, after relaxing capital movement controls (that did not happen without difficulties) the Europe's common currency was finally established.

East Asia's path towards monetary integration differs significantly from the Europe's one. First, East Asia as a region has not pursued any formal trade liberalisation. Instead the region's trade has been regulated on the base of bilateral liberalisation agreements (notably the agreements on free trade between the largest countries of the region, Japan, Korea, Taiwan, and China have yet to be reached on). Primarily for that reason the monetary integration in East Asia stands for a *policy goal* itself, while in case of Europe it has been a mere economic *policy tool* used for further deepening of economic and political integration.

A second important difference is the fact that, contrary to the European experience, East Asian countries (with the notable exception of China) had liberalised their capital accounts even *before* their financial markets were well developed. Although the capital controls relaxation was arguably necessary for achieving high growth rate at the end of last century<sup>10</sup>, capital mobility makes it difficult to sustain a fixed exchange rate regime (let it be either dollar or currency basket peg) as a precondition for establishing a monetary union in the region.

Third, there appears to be no obvious candidate to assume the role Germany has performed in the European Union at the end of 1980s and in the 1990s. The position of Japan, once undisputed candidate for a regional leadership, has been seriously damaged by its prolonging economic depression. As for China, with its low level of economic development, internal discrepancies<sup>11</sup>, underdeveloped financial systems, not convertible currency, and capital account restrictions, it is hard to imagine it taking over a regional economic leadership in a near future.

Fourth, the East Asian political establishment seems to have taken it for granted that the economic integration goes precisely along the Balassa (1962) five-consecutive-steps pattern. It requires first establishing a free trade area (FTA) in order to reach a customs union level. The latter can later develop into a common market and a full-fledged economic union can follow. Finally, the integrating nations can establish a complete political and economic union<sup>12</sup>. Revolutionary as it was half a century ago, the theory neglects the fact that it requires a *common policy* to reach the level two of customs union while the FTA does not require any common policy at all (simple abolishing of customs should suffice the FTA to work). The European Union has *never* been a free trade association. Already in 1957 it aimed at entering the Balassa (1962) pattern at the stage two. Accordingly, given the fact it was not the European Free Trade Association (EFTA) that produced the Europe's common currency, forming the network of FTAs around the region will not eventually lead to a monetary union as that would require a *common policy*, something the FTA actually misses.

## Conclusion: What is wrong with East Asia?

The East Asia's path to monetary unification suffers from the adverse effects of its reversed order (capital account liberalisation ahead of monetary integration) that creates a conflict between monetary cooperation (understood by the region's opinion makers as a capital movement liberalisation) and exchange rate coordination (ranging between a single currency or currency basket peg and currency union altogether). Also the misconception about the sequence of economic integration (i.e. taking the Balassa, 1962 theory *prima facie*) has taken its toll on the speed of the monetary integration in the region (or may take in a near future). Together with the lack of regional leadership (the role Germany has played in European processes), specific political environment that precludes bold political initiatives, and, to put it straightforward, lack of political vision for the region's future (i.e. political union) it probably rules out for decades any monetary union in East Asia.

However it does not mean that nothing can be done in order to deepen a monetary integration in the region. In my opinion, the following measures could be helpful for establishing the monetary union in East Asia in mid- and long run. First, the political energy should switch from concluding bilateral FTA towards establishing at least a customs union in the region<sup>13</sup>. Then, building sound financial markets should follow. The character of the optimum currency area theory allows for almost discretionary interpretation of results. But, let aside the Mundell's original criteria, it is the soundness of the financial system that spells the ability to withstand the adverse shocks that are likely to accompany the monetary unification project. At their current condition the East Asian financial markets are as weak as they were at the onset of the 1997 currency crisis and probably could not withstand any similar challenge. Third, through strengthening the Chiang Mai Initiative, the joint surveillance of economic policies and coordination of exchange rate policies could ultimately lead to establishing a decision making framework (or institutions) based on the principle of the mutual consent. Only from that point one can realistically think about the East Asian monetary unification process.

Besides, there is the problem of what to do with China. If the country is going to assume the leadership in the region, then a phased opening of its capital markets has to take place at some time. But, analogously to the Russia's relations with the EU, there is a well-grounded doubt about the wisdom of creating such an unbalanced integration body.

Finally, it seems plausible to acknowledge that the monetary unification in East Asia is not a political illusion. However, it is not an immediate necessity either. As the Economic and Monetary Union in Europe has taken half a century to materialise, also here, after having addressed the problems raised in the paper, fifty years from now, East Asia may be well on its way to a monetary union.

# The Trade Liberalization Process and the Structure of Protection in Bangladesh

Muhammad Mahmood, [muhammad.mahmood@vu.edu.au](mailto:muhammad.mahmood@vu.edu.au)  
Victoria University, Australia

## Abstract

There has been a significant shift in trade policy orientation in Bangladesh over the last two decades. A dirigiste policy orientation has gradually been replaced by a more outward oriented economic policy. In line with such a policy orientation, a series of trade liberalisation measures has been introduced marked by occasional reversals in the policy direction. Tariffs still remain the main instrument of protection for import competing industries while export oriented industries are accorded various forms of subsidy. While any direct involvement of the government in trade has been reduced, there still exist significant regulatory controls and administrative discretions in influencing the flow of imports. The paper argues that a more uniform incentive structure will enable the country to adjust to the changing global economic environment and help expand its production and export base.

## Introduction

Since the early 1980s a large number of developing countries have moved towards reforming their economic policies to put in place a more open economic regime particularly in relation to their economic engagement with the rest of the world. Such a policy also entails to create a more competitive environment within the domestic market. However the reasons for economic liberalisation differ from country to country.

Bangladesh is ranked as one of the least developed countries in the world with per capita income of US\$470.00 in 2005. Almost half the population live below the poverty line. Bangladesh at its independence in 1971 followed a state interventionist economic policy. However state intervention in economic activities in the post Second World War period was not an uncommon phenomenon even in most industrialised countries which were described as “mixed economies”. In newly decolonised developing countries, too, state intervention as reflected in the philosophy of national developmentalism, was considered essential to address the issue of underdevelopment and industrialisation was considered essential for economic development. This was to be achieved through the import substituting industrialisation (ISI) strategy usually accompanied by financial repression which entails the imposition of legal restrictions preventing financial institutions to function at their full capacity. In the case of Bangladesh it was not the issue of state intervention as such but the extent to which it went resulted in the virtual state control of the economy.

The emergence of market failures in the economic literature in the early 1950s did provide a conceptual framework to determine under what circumstances state can in the interest of maintaining properly functioning of competitive markets be allowed to intervene. It simply means that when a perfectly competitive market fails under specific circumstances such as increasing returns to scale, non-rivalry in consumption and externalities, the state can intervene to promote competition, provide public goods and take remedial measures to neutralise the effects of externality. The fundamental belief in the ability of market to allocate resources most efficiently has never been under question. However even a larger issue was at stake; if market fails, what is the guarantee that state will also not fail as well. Therefore state’s ability to redress market failures has become a questionable proposition.

Bangladesh in effect followed a dirigiste policy where the visible hands of state were present in every aspects of the economy. There was a fundamental distrust of the ability of the invisible hands of market to deliver efficient and desirable economic outcomes. Dirigisme as a doctrinaire view pervaded all aspects of economic life in Bangladesh and as a result state continued to play an activist role in all aspects of economic policy formulation. A paternalistic state also suited the prevailing social order in Bangladesh based on patron-client relationship.

It is fair to say that Bangladesh inherited a system of state control at independence and the government of the time in Bangladesh further extended those controls quite extensively and to such an extent that the direct state

intervention touched nearly all aspects of economic life in Bangladesh. It was argued that all embracing economic controls were justified on the grounds of prevailing economic circumstances resulting from the war of independence. There was also an ideological commitment for state to control the economy to deliver the desired economic outcomes. Therefore a highly centralised economic system was instituted and such all pervasive economic controls severely limited the scope and functioning of private sector firms. By 1974 some 62 percent of manufacturing output was in the hands of the public sector, a share that rose to 71 percent by 1978, the highest share of any Asian country, except China at the time. Eventually the government extended its control to transportation and distributive trade (see Mellon and Stern, 1991).

Given the background outlined above, the paper intends to examine the trade liberalisation process that has been instituted in Bangladesh since the mid 1980s and also to examine the structure of protection accorded to industry that has evolved since then. Such a study will enable us to see the direction and speed of the transition process from a highly centralised economy to a more open market oriented economy with increased economic engagement with the rest of the world. The emphasis in this paper is on trade liberalisation in the context of overall economic reform measures and the corresponding structure of protection that has developed and now currently in place.

## Literature Review

In most cases the reason for trade liberalisation is to expand the production and export base, in particular for manufactures, which now almost accounts for four fifth of world trade in merchandise. A liberal trade regime, it is hypothesised, will expand the production and export base through reducing the distortions in relative prices which will enable the economy to direct its scarce resources to most productive sectors of the economy thereby stimulating growth. As Rivera-Batiz (1997) pointed out the proliferation free trade zones, trade liberalization initiatives and the successful completion of the Uruguay Round of the General Agreement on Tariffs and Trade (GATT) are testimony to rising faith in trade as an engine of growth. Krueger (1997) suggested that then and now, it was recognized that trade policy was central to the overall design of policies for economic development. Manufacturing in this context is of great importance to policy makers because a sound manufacturing base can provide the country with more flexibility in trade as trade in manufactures face far less barriers than primary goods. Agenor and Aizeuman (1995) hypothesised that trade liberalisation on its own or as part of a comprehensive restructuring might lead to new economic activity and would change the sectoral composition of output in the long run. This is to suggest that a country can trade on the basis of comparative advantage only under a free trade regime. Papagorgiou et al (1991) argue that a liberal trade regime promotes the expansion of production and export of manufactures, contributes to economic growth and help achieve the country to improve international competitiveness. Protection can impose increased costs to exporting industries as protection increases input costs. This puts exporters at a competitive disadvantage. Balassa (1982) describes this as an absolute bias against exports. The Lerner symmetry theorem also states that an import tariff will have the same effect as an export tax. Thus trade liberalisation reduces the cost of imported inputs (see Dornbush, 1992). Thomas et al (1991) suggest that exports in general and manufactures in particular tend to increase following liberalization. Countries that reformed their trade policies performed better than those did not reform. However two studies that were undertaken under the auspices of UNCTAD by Shafaeddin (1994) and Agosin (1991) found very little evidence of any link between trade liberalisation and export performance. Santos-Paulino and Thirwall (2004) found that reductions in export and import duties had significantly affected the growth of exports and imports, with the impact on import growth greater. Rodrik (2002) also suggests that while there is no conclusive relationship between trade openness and growth in many countries, there is also no evidence that trade protection is systematically associated with high economic growth.

A trade system is called neutral if it operates under perfect competition as it would in the absence of government interference. Any movement in a trade regime towards neutrality is defined as trade liberalisation, and a change which increases the deviation from neutrality is seen as reversal of liberalisation (Togan, 1996).

Therefore a liberal trade regime is not necessarily a free trade regime. There is no general consensus on what really constitutes trade liberalisation unlike free trade where there is a body of theoretical frameworks exists to

define free trade. In the absence of any clearly defined formulas, trade liberalisation can mean (i) reductions in anti export bias where a move towards equalising incentives between the exporting and import competing sectors resulting in a neutral set of relative prices (i.e. tariffs can be offset by subsidies); (ii) the level of government intervention in all forms has been reduced. This may involve removal or reductions in tariff and non-tariff barriers, subsidies etc; and (iii) replacing one more distorting instrument of intervention by a less distorting one where quotas are replaced by tariffs. Any of these measures can lead to a more open trade regime relative to a previous one with high levels of state involvement in trade. In the case of Bangladesh it appears that the model (i) above approximates the trade liberalisation process.

## **Economic Policy Reforms in Bangladesh**

By the late 1970s continued poor performance of public sector business enterprises created serious strain, as well as drain on the very limited resources of the country. At the same time the government was also under pressure from foreign aid donor countries to institute economic reforms to lift economic performance which was extremely poor by all criteria of macroeconomic performance evaluation. Economic policy failure was clearly demonstrated by poor economic performance as reflected in persistent balance of payments problems, high inflation and interest rates and the failure of public sector business enterprises to run efficiently and profitably. This has resulted in the rethink of economic policies. It was clearly evident that a centralised economic system with strong state controls over production and distribution was incapable of steering the economy towards sustained economic growth.

Mallon and Stern (1991) suggest that the emergence of three groups in the 1980s has helped to accelerate the pace of economic policy reforms; foreign aid donors, local and foreign technocrats and more enterprising local business persons. They were successful in convincing local interest groups that the economic reform process would benefit all. It was not a zero-sum game rather a positive sum game.

As a first step some limited industry policy reforms were instituted throughout the late 1970 and the early 1980s by encouraging increases in private sector investment in manufacturing. In a country with an estimated unemployment rate at 40 per cent, industrialisation is seen as a major strategy to absorb unemployed (given that the country has a high adverse person-land ratio with a population density of 1090 per square km in 2005) and to accelerate economic growth. However the process of industry policy reform has been marked by piecemeal efforts starting with the removal of investment ceilings to simplification of approval processes for the private sector. Since the early 1980s with gradual liberalisation of the economy, industry policy as revised in 1992, allowed private sector investment without any investment ceiling including joint ventures with foreign enterprises in all areas except five industries, armament, nuclear energy, forestry, security printing and air and rail transportation. Air transportation, in certain specific areas has later been opened to private investment. At the same time policies have been introduced to encourage foreign direct investment. Reductions in agricultural input subsidies and output price controls have also been undertaken. The objective of industry policy is to achieve rapid industrial growth through private sector initiatives within the framework of a relatively more open and competitive market economy.

A limited degree of reform was also introduced in the early 1980s to liberalise financial markets where private and foreign financial institutions, especially in the banking and insurance industries were allowed to operate within a given set of parameters. However a number of nationalised banks and insurance companies still remain nationalised. The very slow process of privatisation in Bangladesh can be largely attributed to what Cowan (1990) described as the lack of suitable institutions and institutional capabilities to permit the privatisation process to go forward. But the private sector banking activity increased quite substantially since early 1990s as reflected in the number of private sector banks allowed to operate. As consequences some regulatory reforms directed at the banking and the financial sector have been introduced to strengthen their operations.

Overall, while the economic liberalisation process along with trade liberalisation started in the 1980s, but this did not gain momentum until the very early 1990s. It is also clear that forces external to the government played a more decisive role in forcing economic reforms rather than the reform agenda originating within the governing system of the country. Therefore economic policy reforms lacked any firm commitments on the part of the government to see them through in the early phases of the reform process.

## Trade Policy Trends in Bangladesh

In the area of trade, the Bangladesh government at independence inherited a comprehensive set of control measures which were instituted by Pakistan. These control measures over time were further extended and strengthened. Import substitution was the policy objective and to give effect to such a policy objective require the use of high tariff barriers to protect domestic manufacturing. High tariffs were supplemented by quantitative restrictions either through import bans or by import licensing in the case of many consumer goods producing industries. The import tariff is also the government's principal source of revenue, accounting for a quarter of its total tax revenue. It was thought that import substitution in manufacturing would be synonymous with industrialization, which in turn was seen as the key to development (Krueger, 1997). Further distortions were introduced by differential tariff rates for different products. The tariff structure was designed in a way where final products faced almost prohibitive rates while intermediate and primary products faced a more favorable tariff rate. The tariff structure as applied in Bangladesh coupled with quota restrictions opened up avenues to extract high economic rents on imports creating the an anti-export bias. This anti-export bias was further reinforced by an overvalued exchange rate.

Despite such policy measures, the share of imports of manufactures continued to rise as a proportion of domestic consumption. Such an outcome is generally consistent with empirical findings of many other developing countries (see Bhagwati, 1978, Krueger, 1978 and Balassa and Associates, 1971). Santos-Paulino and Thirwall (2004a) also concluded in their paper that while the strong presumption that trade liberalisation contributes positively to economic performance exists in the literature, however for a variety of reasons, the level of proof remains a little less than one might wish but the preponderance of evidence certainly favours that conclusion.

Every country that followed such a policy option has failed to develop either a competitive manufacturing industry or has been able to solve current account deficits. The ultimate price for such protection has been borne by domestic consumers and export oriented industries. Excessive protection provided to domestic manufacturing in many developing countries including Bangladesh caused the internal terms of trade between manufacturing and agriculture to turn against agriculture more than what the corresponding terms of trade measured in world prices would have been. This definitely caused resources to move from the agriculture sector to the manufacturing sector.

An inward looking trade policy also failed to develop a sound domestic manufacturing base because of the very small size of the domestic market in Bangladesh. Such a small market can neither achieve economies of scale because the country can not specialise nor can it find its niche in the global market under a protectionist regime. A protectionist regime also gave rise to increased imports of intermediate inputs to keep protected domestic manufacturing functioning. This process was also further aided by an overvalued currency. The failure of a protectionist trade policy is reflected in the country's failure to develop a broad based manufacturing. Bangladesh still remains an agrarian economy in terms output and employment. Agriculture still accounts for 19.8 per cent of GDP, employing 51.7 per cent of total employed labour force while manufacturing contributes 15.4 per cent to GDP employing only 9.7 per cent of total employed labour force (see BBS, 2005 & WB, 2006).

Trade policy reform with a view to liberalise the trade regime in Bangladesh is possibly the most significant economic reform measure that has been undertaken in the country since its independence. The government initiated a series of trade policy reform in 1985 with a view to stimulate exports by reducing anti-export bias. The process has begun to accelerate since the early 1990s. This shift in trade policy orientation has been also augmented by significant structural adjustment programs composed of market driven programs to enhance the growth prospects of the country. Trade policy reforms so far included reductions and rationalisation of tariff and import taxes, simplification and streamlining of administrative procedures, gradual elimination of import prohibitions and import licensing and other quantitative restrictions. Shahabuddin et al (2004) suggest that the existence of considerable dispersion around average tariff rate and numerous exemptions and concessions in the tariff structure indicate that the pace of trade policy reform has slowed down since the middle of 1990s.

Trade liberalisation to work effectively also needs a flexible exchange rate regime along with other related economic reform measures. A country like Bangladesh experiencing chronic current account deficits must rely on a flexible exchange rate system to address the problem. Bangladesh does not have recourse to other sources of finance

such as borrowing overseas in foreign currency to finance current account deficits. Macroeconomic policies to maintain low inflation and a competitive exchange rate regime allow the country to trade on the basis of its comparative advantage.

Trade and exchange rate liberalisation are important steps towards creating a competitive economy to achieve faster and durable economic growth and to insulate the economy from external shocks. A liberal trade regime is neutral between production for exports and the domestic market. Export prices should reflect the combined impact of world prices and scarcity of domestic inputs.

## **Exchange Rate Policy**

The role of exchange rate policy is not only important in the context of maintaining macroeconomic stability but also extremely important for promoting trade as changes in exchange rate can impact on a country's competitiveness. In Bangladesh, there were controls also placed on foreign exchange transactions at independence. The government followed a dual exchange rate system incorporating one fixed (official) and partly market related exchange rate for a long time. The two exchange rate markets are separated mainly because of the exchange rate risk premiums, interest rate differentials (foreign and domestic) and expected rate of exchange rate depreciation (Ghatak and Siddiki, 2000). The official exchange rate (Taka/US\$) was always lower than in the secondary market. The secondary exchange rate more closely reflected the market. The expansion of the secondary market over time reduced the importance the official exchange rate and also eased the impact of direct control on imports through rationing of foreign exchange at the official exchange rate. Over time both exchange rates depreciated and continued to converge. At the beginning of 1990s, the official exchange rate was within a two percentage range of that in the secondary exchange market.

The Dual exchange rate system that existed through the 1970s to the 1980s was unified in early 1992, allowing market forces a much greater role to play in determining exchange rates. Bangladesh accepted the Article VIII obligation of the International Monetary Fund in 1994. This obligates Bangladesh to liberalise transactions on the current account. The Bangladesh taka was eventually made convertible in March 1994 with respect to current account transactions and accordingly the taka depreciated against currencies of its major trading partners, reflecting the exchange rate response to the persistent current account deficits. Restrictions still apply to capital account transactions. As a result average black market foreign exchange premium has drastically fallen (see Martin, 2003). It is now widely accepted that growth prospects for developing countries are greatly enhanced through an outer-oriented trade regime and fairly uniform incentives (primarily through exchange rate) for production across exporting and import competing goods (Krueger, 1997).

Exchange rate policy the way it existed until May 2003 had been based on making periodic adjustments to the value of the Taka through monitoring the trend in the real effective exchange rate (REER) index based on the trade weighted basket of currencies of 15 largest trading partners of Bangladesh and other macroeconomic indicators. Current developments in the regional and international fields including those in the countries that compete with Bangladesh, but not included in the REER index, are also taken into consideration (see BB, 1999 for details). The REER is useful for examining changes in the relative purchasing power of foreign currencies, especially of the major trading partners over time. The main objective of exchange rate policy during this period appears to be to maintain a stable REER. Since May, 2003, Bangladesh has introduced the freely floating exchange rate system. However, Bangladesh Bank quite often intervenes in the foreign exchange market to stabilise the rate at the target zone and uses monetary policy instruments to ease the upward pressure on the exchange rate. Despite Bangladesh Bank's intervention in the foreign exchange market, Taka has continued to depreciate. Since the floating of the Taka in 2003, it has depreciated by about 25 percent by the end of 2006. Togan (1996) suggests that the manifestation of trade liberalisation is also a move towards a system where real exchange rate and the sectoral real effective exchange rates remain relatively stable over time with no violent fluctuations.

## The Structure of Protection

Since the mid 1980s Bangladesh has embarked on liberalising its trade regime with progressive reductions in tariffs and non-tariff barriers. The proponents of protectionism still exert a considerable degree of influence in shaping the trade policy direction. While the government is committed to pursuing a liberal trade policy, the process of implementation has been marked by counterbalancing measures to provide additional protection to domestic industry. This can be seen from the structure of protection that has evolved over the last two decades and as it exists now in the country.

## Tariff Protection

Tariffs have continued to be the main instrument of protection despite continued reductions in tariffs since the mid 1980s. Tariff as an instrument of protection becomes fairly complicated as Bangladesh heavily relies on import taxation for revenue rising. One quarters of the government's tax revenue came from import taxation in 1999-2000, given that tariffs have been progressively reduced since the early 1990s. This share however declined from 33 percent in 1994-95 to 25 percent in 1999-2000 but by 2004-05 this share went up to 26 percent. If other taxes associated with imports such as consumption tax and supplementary tax are included, the share went up to 50 percent in 2004-05. It is apparent that during the first half of 1990s, tariffs were reduced at a rapid rate but since the second half of 1990s the rate has significantly slowed down (see Table 1)

Average tariffs have been reduced and made more uniform. Average tariffs have declined from 57.5 per cent in 1991-92 to 12.51 per cent in 2005-2006. Table 1 indicates a gradually declining average tariff rates. This fall in average tariff has also led to reductions in effective rates of protection with wide variations across sectors.

TABLE 1: AVERAGE (UN-WEIGHTED) TARIFF, BANGLADESH  
(percent)

Year	Average Tariff
1991-92	57.5
1992-93	47.4
1993-94	36.0
1994-95	25.9
1995-96	22.3
1996-97	21.5
1997-98	20.7
1998-99	20.3
1999-00	19.5
2000-01	18.6
2001-02	17.13
2002-03	16.51

Source: GOB (Various issues): Bangladesh Economic Review

However, tariffs (i.e. customs duties) per se provide a misleading picture of the level of protection provided to domestic industries as Bangladesh also continues to impose a number of other taxes on imports over and above customs duties (i.e. tariffs). These taxes are often described as para-tariffs because they have the same effect as tariffs on imports. These taxes can be used selectively with wide discretionary power making the system very non-transparent. These taxes include taxes on imports such as value added tax, supplementary duties, regulatory duties

and infrastructure development surcharge. Some of the para-tariffs are applied across the board on all imports while some additional para-tariffs are also applied more selectively. The main function of para-tariffs is to raise the level of protection above that accorded by tariffs. This results in tariff peaks (highest tariffs) exceeding the maximum tariff rate in Bangladesh. Bangladesh now has the highest average tariffs in South Asia and is one of the most protected economies in the world.

Very slow rate of progress in expanding the tax base, in particular income based tax which contributed 18.9 percent of total tax revenue in 2004-05 relative to 8.6 percent in 1992-93 is one of the major contributing factors to this anomaly. Also the domestic tax collection system is known for its inefficiency and is riddled with corruption and also less comprehensively covered relative to taxes on imports. It appears that without a major overhaul of the taxation system, any significant further reductions in tariffs may be difficult if not impossible.

Furthermore, the tariff regime has been further streamlined by equalising operative tariff rates with statutory tariff rates along with reductions in tariff slabs (tariff bands) from 12 in 1993-94 to 4 in 2004-05. Table 2 indicates that the government did not synchronise between operative tariff rates which are actual tariff rates applied to imports and statutory tariff rates which are the officially declared rates until 2000-01. This was primarily due to the government's use of the budgetary process to provide additional protection to specific industries. This process obviously was subject to lobbying by special interest groups and also used by the government for raising additional revenue. This ad hoc approach further added to increased opportunities for discretionary application of tariffs.

TABLE 2: OPERATIVE AND STATUTORY TARIFF RATES

Year	Operative Tariff Rates (%)	Statutory Tariff Rates (%)	Highest Tariff Rate	Tariff Slabs

GOB (2006): Bangladesh Economic Review

The highest rate of tariff was reduced from 350 per cent in 1991-92 to 25 per cent in 2004-2005. Differential rates of tariff still exist not only on the basis of broad classifications but also for a wide range of products within those broad classifications, ranging from zero tariffs for food-grains to 25 per cent for many consumer items. Table 3 summarizes differential rates of tariff by broad product type. This process is further complicated by preferential tariffs accorded to SAPTA member countries along with the application of the rules of origin contained within the agreement.

Like many other developing countries, Bangladesh also uses tariff escalation where tariffs escalate according to the degree of processing where higher the level of processing, higher the level of tariffs with final consumer goods attracting the highest rates (see Table 3). Tariff escalation always raises the effective rate of

protection above the nominal rate of protection contributing to further increases in the anti export bias. Tariff escalation also impacts on tariff peaks. WTO (2003) suggested that tariff peaks and escalation can constitute major impediments to poorer countries' development and industrialization.

TABLE 3: AVERAGE (UN-WEIGHTED) TARIFF RATES BY BROAD COMMODITY GROUP

Year	(Percent)			
	Primary products	Intermediate goods	Capital goods	Final Consumption goods
1992-93	47.7	41.6	38.7	63.6
1993-94	34.9	31.8	26.2	49.9
1994-95	31.6	23.2	13.9	38.6

Source: GOB (Various issues): Bangladesh Economic Review.

The import tariff still remains the principal instrument of trade policy in Bangladesh therefore constitutes a major impediment to competition with the consequent implications for efficient allocation of domestic resources. Since independence, the main instrument to regulate the import regime has been the Import Policy Order (IPO) which used to be issued annually until 1988, then it became two yearly and finally in 1997 it became five yearly. This was designed to provide policy continuity and certainty for a reasonable period of time and also to provide a stable business decision making environment. The IPO 1997-2002 also provided much greater ease for imports of capital goods and industrial raw materials to assist promoting exports. However the government introduced a three year IPO (2003-2006) with effect from March 2006. This new import policy appears to indicate some departures from the previous one. The new import policy clearly discourages import of nonessential goods to address the balance of payments difficulties. It also sets standards for goods which have implications for public health and the environment. In essence the new import policy (2003-2006) is more restrictive relative to the previous one (1997-2002).

### Non-tariff Protection

While the number of goods in the quantitative restrictions list including banned items has considerably been reduced, the continuation of such a policy is defended on non trade related issues such as public health and safety, environment and for religious and cultural reasons. The reason for the existence of such a list appears to be more about creating technical barriers to imports as reflected in the list being getting shorter and shorter over time. Now the list contains 63 items as outlined the Import Policy Order (IPO), 2003-06, relative to 315 items in 1989-90. However there still remains trade related restrictions applied to a number of agricultural products, packaging materials and textiles. There are also in certain cases government approvals are needed to import specific products.

This tantamount to import licensing which was abolished in the early 1990s. Furthermore, all importers are required to register with the appropriate authority. This causes the transaction costs to rise given the lengthy bureaucratic process involved.

Any direct state involvement in trade has also significantly been reduced, now limited to only defence equipment and petroleum products. But government procurement procedures in Bangladesh offering price preference margins tend to favour local producers.

## **Contingent Protection Measures**

Bangladesh does not use contingent protection measures such as anti-dumping duties (AD), countervailing duties (CD) and safeguard measures. Given the very high level of protection provided already by tariffs and para-tariffs, these measures were not considered necessary by the government to provide further protection. But following India's anti-dumping cases in recent times against some of Bangladeshi imported products, there is now growing pressure in the country to introduce contingent protection measures.

It is true that Bangladesh has made significant strides in liberalising its trade regime by reducing tariffs and eliminating many quantitative restrictions on imports. However there still remain significant regulatory controls and administrative discretion which further add to the complexity and create uncertainty. There also still exist the complicated formalities associated with import activities. Furthermore, it was pointed out that 38 signatures are required to import goods into Bangladesh relative to 2 in Singapore<sup>1</sup>. While such bureaucratic processes help to restrict imports flowing into the country, it at the same time creates problems for exporting firms by increasing transaction costs as a very large number of exporting firms rely on imported inputs.

## **Export Incentives**

Bangladesh has put strong emphasis on export-led industrialization since the mid 1980s. With that objective in mind the government has put in place a variety of export incentives and special attention has been given to certain industries which are considered to have a high export potential such as the clothing industry. The policy instruments for export promotion include an export credit guarantee scheme, concessionary interest rates, export processing zones, duty-drawbacks (i.e. direct and indirect exporters are exempt from import restrictions), bonded warehouse (i.e. firms are allowed to import and stock intermediate inputs duty free) direct subsidies (used selectively, not across the board) and tax concessions. A number of institutional arrangements have also been put in place for the implementation of various export incentive schemes. Some of these measures were designed to offset the adverse effects of relatively high tariffs and other duties which exporting firms face. This helps to neutralise anti-export bias in any restrictive trade regime but cash subsidies, in particular, in many instances constitute indirect barriers to imports. But these measures make the regime more complex. The export incentive program implementation process is complex and non-transparent reducing its effectiveness. Furthermore, Bangladesh also has set up an export promotion agency to provide market intelligence and to assist firms in their exporting activities.

### **Export Restrictions**

Bangladesh also imposes restrictions and taxes on exports of certain products such as animal hides and skins and jute textiles. In all the cases these restrictions in effect subsidise production and exports of leather and jute goods by depressing the domestic price of the raw materials and intermediate inputs. This causes input prices to remain below the world price level and this enables the manufacturers to further process the products for final consumption by end users overseas at a competitive price. Export controls are therefore, an effective tool in these instances to subsidise exports to enable exporters to gain competitiveness.

## Conclusions

Since the mid 1980s there has been a fundamental shift in Bangladesh's economic policy orientation with greater emphasis on market oriented economic outcomes. In line with such a policy shift a steadily liberalised trade regime has been put in place. Despite many structural and institutional constraints, levels of tariffs and quantitative restrictions have been reduced and a more deregulated foreign exchange and financial markets were introduced. However the pace of trade liberalization process has been slow and marked by occasional reversals in policy decisions under pressure from various interest groups as well as in response to balance of payments problems. Also there still remain significant regulatory and administrative controls which renders policy implementation complex and nontransparent.

Although tariffs have been reduced since the mid 1980s, they still remain the principal instrument of protection in Bangladesh. While export oriented industries are supported by various forms of subsidies and are allowed to operate under almost a free trade regime, import competing industries are supported by tariffs and many regulatory barriers. But it must be borne in mind that in Bangladesh tariffs are not simply an instrument of protection but also a principal source of revenue. This compounds the role tariffs play in the economy. However the new import policy as outlined the Import Policy Order (IPO) for 2003-2006 is more restrictive relative to previous one indicating some policy reversals. Such an erratic policy direction is symptomatic of intense lobbying by various interest groups and the way trade policy reforms have been crafted.

It is also suggested that on the part of the government there is no political commitment or will to economic reform measures including trade policy reform measures or any firm belief in the market mechanism to operate in an open economic system. As the forces external to the government played a more decisive role in forcing economic reforms rather than reforms originating within the governing system of the country, economic policy reforms including trade policy reform lacked any firm commitment on the part of the government. Furthermore there is considerable opposition from civil bureaucracy and organized labour to the reform process (see Mallon and Stern 1991, Karim, 1996). However since the mid 1990s a general consensus has started to emerge within the country that more open economic engagement with the rest of the world must be a key element of overall economic policy to stimulate economic growth which is now recognised as the principal means to alleviate poverty in Bangladesh as well as in other developing economies. Such a policy should be implemented progressively so as to minimise the costs of adjustment. While the influence of civil bureaucracy and organised labour appears to be declining in shaping trade policy direction but other interest groups such as import competing industries in the manufacturing sector and certain elements within the primary sector are continuing, as expected, to resist a more open economic policy. The interplay of pro and anti trade liberalisation forces will continue involving bargaining and sometimes shifting coalitions within the country and at the same time the forces of global economic integration on the other hand will also definitely impact on the future direction of trade policy.

The major challenge facing Bangladesh now is to move towards to step up trade liberalization process and carried through to create an enabling environment for industries to be internationally competitive. This also calls for a more uniform incentive structure so that industries can adjust to changing global economic environment. Such structural adjustments will help expand the production and export base.

# Negotiating a Free Trade Agreement between Australia and Japan: An Economic Assessment\*

*Mahinda Siriwardana, asiriwar@une.edu.au*  
*University of New England, Australia*

## Abstract

The Australia-Japan Free Trade Agreement (AUJA-FTA) is already in the process of negotiation by the two governments. The success of this FTA will depend on the manner in which it deals with the problem of agricultural trade between the two countries. This paper analyses the economic effects of the proposed FTA between Australia and Japan on both economies and on the trading partners, drawing lessons from simulations of two bilateral FTA scenarios. The simulations are undertaken using the Global Trade Analysis Project (GTAP) model and its version 6 database. By simulating the GTAP multi-country CGE model, the paper provides quantitative evidence concerning the welfare impact of the FTA with special reference to trade creation and trade diversion. The responses of various production sectors to the FTA show the structural changes that may take place in the two economies over the long run. The findings may shed light on the debate over the inclusion of agricultural trade into the agreement.

## Introduction

On 9 May 2002, Prime Minister Junichiro Koizumi of Japan formally announced during his official state visit to Canberra that Japan sought a Free Trade Agreement (FTA) with Australia and was willing to negotiate towards that end. Australian Prime Minister John Howard responded positively to this proposal. This initiated a complex negotiation process over the period September 2002 to June 2003 that culminated in the signing of an Australia-Japan Trade and Economic Framework Agreement on 17 July 2003 in Tokyo. The Economic Framework Agreement formally obliged both countries to “work the liberalisation of trade and investment” on a “balanced and comprehensive basis” through an ongoing Joint Consultative Committee (JCC) composed of representatives of both countries (Australian Department of Foreign Affairs and Trade, 2003, p.1). The JCC, as part of its commitments, completed its comprehensive study in April 2005. Following the report, Prime Minister Howard and Prime Minister Koizumi further agreed to carry out a joint study covering various policy options to enhance economic relations between Japan and Australia. This included a feasibility study of an FTA between the two countries.

The joint government study report was published in early December 2006. It concluded that a comprehensive WTO-consistent FTA between Australia and Japan would produce substantial benefits to both countries. The Australian Prime Minister Howard and the present Japanese Prime Minister Abe welcomed the findings in the report towards finalising an FTA. Consequently both Prime Ministers agreed on 12 December 2006 to commence negotiations on an FTA in early 2007. The first round of negotiations was to be held in Canberra from 23-24 April 2007 (DFAT, 2007).

It would thus appear that a protracted period of negotiations between the two countries will now begin in order to eventually draft a mutually satisfactory bilateral FTA. An FTA between Australia and Japan would represent part of the broader “hub-and-spokes” Growing East Asia Community strategy developed by Japan (Scollay, 2001). In this sense it would augment the existing FTAs with Singapore, Malaysia, Philippines, Mexico, and Chile. Under this strategy, Japan would cement its role as the dominant economy at the centre of Asia and strengthen its ties with surrounding nations in the Asia-Pacific region.

A critical feature of the Japanese FTAs so far is that they exclude important agricultural commodities. Japan’s FTA strategy appears to be dominated by its long-run objective of securing the steady supply of energy and natural resources that are needed by the country to maintain a steady economic growth while remaining internationally competitive. As Japan is the largest market for Australia for its agriculture, fisheries and forestry exports, the question of agricultural trade between Australia and Japan is bound to raise many difficulties, especially the problem of Australian access to the Japanese domestic market. It is the intension of Australia that the negotiation

should take place to include all the goods without exemptions. The strong farming lobby that has substantial influence on the agricultural trade policy in Japan needs to be convinced that the gains from AUJA-FTA are far above the cost to reach a reasonable solution to this issue. Given that Australia is Japan's fourth largest supplier of agricultural and food imports supplying 10 per cent of Japan's requirements, the inclusion of important agricultural goods into the FTA with Australia surely cannot be ruled out.

This paper offers some preliminary findings relating to macroeconomic and sectoral impact of the proposed FTA on both the economies of Japan and Australia. We use a computable general equilibrium (CGE) model developed at the Global Trade Analysis Project (GTAP) to examine the effects of trade liberalisation envisaged by the FTA. The analysis focuses on two different scenarios highlighting the importance of agricultural trade and potential benefits and costs of its inclusion to the FTA.

The paper is organised as follows: Section 2 provides a brief synopsis of the development of FTA activities in Australia and Japan. Section 3 outlines the Australia-Japan trade and investment relationships. Section 4 briefly explains two trade liberalisation scenarios used in the GTAP simulations: an FTA including agriculture and an FTA excluding agriculture. Section 5 analyses the results of the simulation exercises. The paper ends with some brief concluding comments on potential policy implications of an AUJA-FTA in section 6.

## **Brief Review of FTA Developments in Australia and Japan**

Australia's involvement in bilateral trade treaties goes back to 1983 when Closer Economic Relations Agreement (CERA) between Australia and New Zealand was signed. The CERA is regarded as one of the most successful FTAs and it has contributed to a phenomenal growth in bilateral trade between the two countries (see Lloyd and Maclaren, 2004). Australia has become New Zealand's number one trading partner while New Zealand is Australia's 7<sup>th</sup> important trading partner. After a period of deep involvement in multilateral arrangements, now Australia has an 'open mind' about FTAs. In recognition of the fact that the trade isolation could hinder the long-run growth prospects of the country, Australia actively began seeking opportunities for regional trade agreements (RTAs). The first successful negotiation occurred between Australia and Singapore and an FTA between the two countries was signed in February 2003 (Siriwardana and Dollery, 2003). The agreement came into effect in the second half of 2003. Australia also signed a free trade agreement with Thailand which came into effect in early 2005.

The Australia-US FTA (AUSFTA) is the fourth bilateral FTA that Australia has negotiated and it came into effect from 1<sup>st</sup> January 2005 (Siriwardana, 2007). The US is Australia's third largest single trading partner. Under this agreement, Australia and the US agreed to trade bilaterally about 86 per cent of the commodities import tax-free. By 2022, almost every bilaterally traded commodity will achieve tax-free status with the exception of sugar and dairy products (CIE, 2004).

The most recent developments in relation to RTAs in the North East Asian region indicate that Australia is unlikely to be left alone. At a meeting held in Laos on 30 November 2004, the leaders from ASEAN, Australia and New Zealand have mutually agreed to establish an ASEAN Free Trade Area (AFTA) including Australia and New Zealand. This opens up new exciting prospects for full free trade in the region and it could well be regarded as an extension of CERA beyond Australia and New Zealand. Australia has also made a significant progress on a bilateral free trade agreement with China. There have been five rounds of negotiations to exchange information that are important to both Australia and China (DFAT, 2006a, DFAT, 2006b). It is anticipated that the Australia-China FTA will be concluded within a short period.

Japan on the other hand had pursued its trade liberalization under the General Agreement on Tariffs and Trade (GATT) and the World Trade Organization (WTO) until the late 1990s. Hence Japan has been slow to enter the FTA arena. It is now widely recognized that these multilateral trade negotiations are making a slow progress and hence FTAs are emerging as an option for achieving trade liberalization. Japanese government now wants FTAs to play a significant role in promoting its economic growth by creating business opportunities for Japanese firms in FTA partner countries. The domestic agricultural sector reforms are also considered to be necessary in achieving

success through bilateral trade treaties. FTAs can promote economic stability in East Asia and they would have a positive impact on Japan (Urata, 2005).

Japan signed its first FTA with Singapore in 2002. Under this agreement Singapore has removed tariffs on all imports from Japan while Japan has removed tariffs on 94 per cent of imports from Singapore. Mexico is the second country that Japan has successfully negotiated an FTA in 2004. Japan's strong resistance to liberalise its farm products such as pork, beef, chicken products, oranges and orange juice was a major obstacle for the FTA negotiation with Mexico. Eventually Japan opened up the market for these products by increasing import quotas but not by the usual removal of tariffs. Mexico on the other hand agreed to open up its market to all imports from Japan. Japan has finally agreed to include 84 per cent of imports from Mexico into the FTA. Japan also subsequently negotiated FTAs with Malaysia, Philippines and these agreements have also excluded agricultural goods. The most recent FTA has been the one with Chile where Japan has agreed to include 94 per cent of its trade with Chile into the agreement.

### Trade Pattern between Australia and Japan

FIG. 1 depicts Australia's trade with Japan from 1986 to 2005. Over this 20-year period, trade between Australia and Japan has shown substantial growth. Furthermore, Australian exports exceed imports throughout the period showing a significant trade surplus with Japan.

FIG.1: AUSTRALIA'S TRADE WITH JAPAN, 1986-2005

Source: Based on data from IMF, Direction of Trade Statistics Yearbook (various issues)

Table 1 displays Australia's bilateral trade with Japan in 1995 and 2005 by commodity group. Over the ten-year period, the composition of exports to Japan has undergone some changes whereas the composition of imports

remained relatively stable. In 2005, 75 per cent of Australian exports to Japan were primary goods (Food & live animals, Crude martial, inedible, except fuel, and Mineral fuels, lubricants & related materials). With regard to imports from Japan, 'Machinery & transport equipment' dominated the total accounting for nearly 80 per cent. This trade pattern between the two countries provides evidence to support the view that Australia-Japan bilateral trade takes place according to the comparative advantage and it can further be strengthened by removing tariffs under the proposed FTA.

**TABLE 1: AUSTRALIA'S BILATERAL TRADE (MERCHANDISE) WITH JAPAN (US\$ MILLION)**

Commodity group	1995				2005			
	Exports to Japan	%	Imports from Japan	%	Exports to Japan	%	Imports from Japan	%
Food & live animals	2252.88	21.0	26.82	0.3	3520.19	16.3	34.39	0.3

FIG.2: BILATERAL FDI BETWEEN JAPAN AND AUSTRAL, 1996-2005

Source: Japan Ministry of Finance web site, <http://www.jetro.go.jp/en/stats/statistics/>

FIG. 2 shows the bilateral FDI (stock) between Australia and Japan from 1996 to 2005. It is clear that Japanese investment in Australia is considerably greater than the Australian investment in Japan. It is also widely recognized that the proposed FTA should be used as a vehicle for lifting FDI flows to higher levels and the liberalisation of services are hence another priority area that has attracted attention of trade policy negotiators on both sides.

## GTAP Model and the Trade Policy Simulations

The specific model used to quantify the impact of the Australia-Japan FTA is the GTAP model. It is a multi-regional CGE model of the Johansen type that has been used extensively in the literature. It has been well documented in Hertel (1997). The modelling of each region in GTAP is based on the ORANI model (Dixon et al., 1982). In this paper, we used the GTAP model with version six of the database that disaggregates the world into 87 regions and 57 sectors.

We aggregate the GTAP database into 10 regions and 20 sectors to suit our needs as (see Appendix Table A1). Since our focus is on the bilateral FTA between Australia and Japan, the regional aggregation is designed to capture the importance of other trading partners to both countries. The sectoral aggregation framework is adopted to distinguish commodities (or sectors) that are important for the present analysis, especially separating agricultural goods from others. The elasticity parameters (i.e., Armington elasticities of import-domestic substitution, primary factor substitution, and export demand elasticities) are crucial to GTAP simulations. The present study uses the parameters that are standard to the GTAP database.

Source: GTAP data base Version 6, 2005

Table 2 shows bilateral import tariffs estimated from the GTAP database version 6. In Australia, the highest import tariffs on imports from Japan are recorded for 'Motor vehicles and parts' (16.3 per cent), and 'Wearing apparels' (13.6 per cent). In Japan, the tariff level is relatively high compared with Australia. The highest import tariffs on Japanese imports from Australia are noted in 'Grains' (162.8 percent) followed by many other agricultural goods.

The elimination of tariff barriers on bilateral basis under the FTA needs to be implemented via simulations of GTAP in order to quantify the effects of the agreement. A number of changes are expected to occur in bilateral tariff with the formation of an FTA between Australia and Japan. If both economies are fully open to each other's imports, both Japan and Australia will abolish tariff barriers on imports bilaterally (shown in Table 2). It is assumed that tariffs imposed on imports from other trading partners (non-members of the FTA) will remain unchanged. The prices of both Japanese goods sold in Australia and the Australian goods sold in Japan are expected to fall by the extent of import duties shown in Table 2. In order to quantify the effects of the proposed FTA, we carry out two GTAP simulations. These two simulation scenarios may reflect the options that have been discussed by the two parties at different stages of negotiations.

Scenario 1: All bilateral tariffs between Australian and Japan are removed while the existing tariff barriers against non-FTA countries are maintained. This is called 'the full liberalization' scenario under the FTA. If this is adopted, all tariff rates that appear in Table 2 will be reduced to zero.

Scenario 2: Even though Australian is keen to liberalize everything, Japan's position is not yet certain when it comes to agricultural goods. Hence the second scenario is designed to implement the AUJA-FTA by excluding agricultural commodities. This implies that goods 1-4 in Table 2 are subject to existing import duties while the other 16 goods are imported free of duty on bilateral basis.

We adopt the standard long-run macroeconomic closure for the simulations reported in the paper. This is sometimes known as the “steady state” closure. Here the rate of return on capital is fixed exogenously and the level of capital stock is allowed to adjust in response to the policy shock. Investment occurs in each region during the period of tariff reduction with the effect that sum of the regional investment matches with the changes in the global savings. The current account is fixed by setting the trade balance fixed exogenously. The period is long enough for the capital stocks of different industries in a given region to respond to the shock. The reallocation of capital stock among sectors equilibrates rates of return across sectors restoring the rates of returns to their initial levels. Thus in the process of adjustment, industries which are favored by the trade liberalization experience their capital stock growing while those industries which are adversely affected experience their capital stock shrinking.

In the simulation of GTAP, we assume that in the long-run the aggregate employment at national level is affected by the demographic factors that are not sensitive to the implementation of the FTA. Thus it is reasonable to assume that the elimination of merchandise tariffs under the FTA has no long-run effect on aggregate employment levels both in Australia and in Japan. In the model simulation, the fixed employment level is maintained in the long-run by the endogenous adjustments in the real wage. This implies that the benefits from the FTA are seen in terms of the increase in the real wage rather than the increase in aggregate employment.

## **Simulation Results**

To assess the effectiveness of the FTA with and without agricultural goods, we report results of full liberalization and partial liberalization separately. It is important to determine whether the maintenance of high tariff barriers by Japan against agricultural goods imported from Australia make economic sense in the negotiation of the proposed FTA. From the perspective of Japanese trade negotiators and farming lobby groups, these findings will have significant policy implications. Reported in the next sections is the impact of the bilateral trade liberalization on important macroeconomic variables, trade, industry outputs and economic welfare.

### **Full Trade Liberalization**

The first panel of Table 3 shows the macroeconomic effects of full trade liberalization under the proposed FTA between Australia and Japan. The projections highlight important findings that are crucial to both parties. Japan will experience an increase in real GDP by 0.33 per cent whereas Australia is projected to have 0.22 per cent increase. Except USA and Hong Kong, all other non-member regions are showing a decline in real GDP as a consequence of the FTA. Among these losers, ASEAN(6) is reported to have the most significant negative effect in terms of real GDP. This is a reflection of their strong trade relations with Australia and Japan and the trade diversion due to the FTA has adverse impact on them.

The proposed FTA seems to have substantial effect on the trade performance of both countries. As far as exports are concerned, Japan has a better outcome (1.91 per cent) than that of Australia (0.69 per cent). However, a significant gain in the terms of trade for Australia allows it to import more than what Japan may be able to achieve in imports under the FTA. Unlike for Australia, the terms of trade for Japan deteriorate by about half a per cent, which could explain its less strong capacity to import.

The projection of the equivalent variation (EV) as reported in Table 3 is a measure of the welfare impact of the FTA. The EV is an absolute monetary measure of changes in welfare in terms of income that eventuates from the fall in import prices when tariffs are eliminated. The EV estimates follow the same pattern of changes in real GDP. These improvements in welfare are attributed to the gains from trade creation. A more meaningful way to view the welfare effects is to consider the EV as a percentage of country's GDP. The AUJA-FTA with full trade liberalization seems more favorable to Australia than to Japan according to the EV to GDP ratio. Our projections indicate that Australia has a ratio of 1.33 per cent compared to the Japanese 0.17 per cent. The change in real consumption (see column 6 of Table 3) which is regarded as an alternative measure of welfare outcomes also confirms this finding.

Conventionally, trade creation and trade diversion are two key features that govern the welfare outcomes of preferential trade agreements. In the case of AUJA-FTA, the discriminatory behavior towards non-members will

reduce global welfare via trade diversion. All non-member nations have negative EV projections. This is the impact of trade diversion. As can be seen from Table 3, there is a small welfare loss globally which amounts to US\$ 3413 million due to the AUJA-FTA.

Columns 2 and 3 of Table 4 report the sectoral output changes in response to the AUJA-FTA being implemented in its full liberalization form. Australia is projected to experience more significant structural adjustments in terms of sectoral outputs in comparison to Japan. The sectors that export agricultural and related goods from Australia emerge as key winners whereas main manufacturing sectors that may face import competition become the losers. The performance of sectors such as 'Grains', 'Meat products', and 'Sugar' are quite exceptional. Conversely, the same agricultural sectors in Japan appear to be the significant losers from the FTA. Nevertheless Japanese manufacturing sectors show a consistent positive output response to the removal of tariffs and 'Motor vehicles and parts' has the highest output growth (1.79 per cent) among them.

The factor market adjustments arising from the trade liberalization are another aspect of structural changes that occur in both countries. Table 5 (columns 2-5) reports changes in the demand for land, labour (skilled and

unskilled) and capital in production sectors of Australia and Japan. While these changes are quite complex, they closely follow the output response that was previously described. For example, while Australia's agricultural sectors will require more labor and capital to meet the new demand for its output from Japan; their Japanese counterparts will experience the opposite. However the demand for primary inputs by the Japanese manufacturing sectors will increase and the demand by Australian industries will decrease. These shifts in factor demands are quite consistent with the respective comparative advantage which is further strengthened by the FTA.

A quite robust export performance by industries in both countries can be expected under the FTA. As can be seen from Table 6, Australia will strengthen its position in trade with Japan by exporting more of the agricultural goods. The most significant winners are 'Grains', 'Sugar', and 'Meat products'. The export performance of Japanese sectors is also very encouraging. While there is an overall stimulus from the FTA to various sectors to do better, the manufacturing sectors are particularly advantaged by the removal of tariffs. For Japan, sectors such as 'Textiles', 'Wearing apparels', 'Metal products', and 'Motor vehicles and parts' promise to be the key players in exporting to Australia under free trade.

## Trade Liberalization Excluding Agricultural Goods

From the outset of the negotiations, Australia has persuaded the Japanese government to consider the FTA with the full liberalization option. Of course this appears to be the best option for Australia, though for Japan the protection of its agricultural sector has been a priority in many previous FTA treaties. Therefore its position is still unclear with the FTA with Australia. Japanese farmers have consistently opposed to the liberalization of the agricultural trade (Scollay, 2001). Surely, the role of agriculture and any associated level of protection afforded it will be a major concern in the forthcoming process of negotiations.

Source: Author's simulation of GTAP.

We have also attempted to project the potential outcome of an AUJA-FTA without liberalizing agricultural trade between the two countries. This may provide a preliminary estimate to trade policy negotiators who may be concerned with the ramifications of full free trade with Australia. Can Japan reap the full benefits by excluding agriculture from the proposed FTA? Will Japanese farmers be better off by not allowing free market access for Australian agricultural exports in Japan? Given Australia is a key supplier of agricultural goods to Japan, does it make sense to exclude such trade from the FTA? Some preliminary answers to these questions are found in the macroeconomic projections reported in the second panel in Table 3. These results are obtained by excluding commodity 1-4 in Table 2 from the FTA.

A quick glance at the GDP projections indicates that Japan's gain in GDP under full free trade is halved (from 0.33 to 0.16 per cent) if agriculture is excluded from the liberalization. Australia on the other hand improves its position (from 0.22 to 0.39 per cent). It appears that the benefits projected under the full liberalization for Japan are reduced substantially by removing agriculture from the proposal. A most noticeable change for Australia is the significantly reduced terms of trade improvement and the associated trade outcome. Australia exports more and imports slightly less than before. Overall, the welfare of both countries is reduced as measured in absolute as well as relative terms. Consistent with income changes, real consumption is also estimated to be less. Overall, the macroeconomic projections in Table 3 imply that Japan will eventually experience much reduced benefits in terms of income, trade, and welfare in the event it decided to exclude key agricultural goods from the FTA. Australia's experience is relatively less sensitive to the decision on agricultural goods.

As can be seen from Table 4, the sectoral output projections also changed substantially as a result of removing agricultural goods from the agreement. The extent of the change is a reflection of how producers respond to the policy decision on agricultural trade. In both Australia and Japan, 'Grain' sector's output performance is reversed dramatically. On examining the rest of the sectoral output responses, it is seen that different sectors in the Australian economy improve their position relative to their Japanese counterparts. This sectoral performance could perhaps explain why Australia's real GDP increases under this scenario compared to the full liberalisation. For Japan, the decision on agricultural trade is critical and it could certainly change the outcome for Japan considerably. Trade negotiators on the Japanese side need to be aware of such effects prior to concluding an FTA with Australia.

The employment projections shown in Table 5 suggest that the opposition to the FTA by the farming community in Japan does have some merit. The demand for skilled and unskilled labor in 'Grain' is reduced significantly under full liberalization but the removal of agricultural goods from the FTA may reverse the demand to be positive. But it comes at the expense of the rest of economy facing somewhat reduced employment prospects as the FTA is transformed from full to partial liberalization mode. The magnitudes of the bilateral exports volumes are also affected and the main shift again occurring in 'Grains'. Interestingly, except 'Grains', Australia's export performance shows improvement whereas as Japan's is somewhat adversely affected.

## Conclusion

This paper provides some preliminary estimates of the economic cost and benefits of the proposed AUJA-FTA which may be a significant change in the bilateral trade policy for both countries. The simulations conducted using the GTAP model examined two plausible bilateral trade policy scenarios: full trade liberalization and trade liberalization excluding agriculture. Naturally, as Australia's comparative advantage lies in the agricultural commodities and Japan's in the manufactured goods, the full liberalization option appears to be giving a balance outcome that can be regarded as superior to any other alternative. Both countries gain in welfare at a higher level and trade would occur according to their respective comparative advantage if trade is liberalised across the board. Any exceptions to this policy could lead to possibly a sub-optimal outcome to both parties.

The liberalization of trade in agricultural goods has become a politically sensitive issue in Japan since its possible negative impacts on employment. The analysis presented in this paper clearly demonstrates that Japan is likely to experience a reduction in its benefits that are possible from fully-liberalized trade with Australia if it decides to exclude key agricultural goods from the agreement. Compared to many countries that import agricultural goods, Japan's average tariffs on such imports are fairly low (12 per cent). What is special for agricultural protection

in Japan is extremely high protection given to several specific products with a complicated system that combines quotas and high tariff rates. For example, ad valorem tariffs equivalents on goods such as rice, wheat, sugar, butter, and potatoes are well above 200 per cent. As we can see from our second simulation scenario, the exclusion of commodities of this type from the FTA makes a significant difference. For Japan, it would be more beneficial to liberalize agricultural trade under the FTA and seek appropriate adjustment policies to deal with negatively impacted sectors at a subsequent stage. In the long run, it is an affordable policy option for Japan and the important positive impacts that eventuate from the free trade treaty will surely outweigh the costs. Moreover, the FTAs of this nature will ensure stable supply of food and natural resources that are paramount to the long-term growth of the Japanese economy.

# The PPP Theory of Inflation and Post Colonial Trade Relationships: The Case of Two African Countries

Glenville Rawlins, rawlinsg@mail.montclair.edu  
Montclair State University, USA

## Abstract

Using the absolute version of the Purchasing Power Parity (PPP) theory, the paper models the nominal exchange rate and the price level as integrated processes that ensure that trade between two countries will render the real exchange rate as a stationary process. After conducting a Unit Root Test on the primary price and exchange rate variables, the paper employs the Johanssen Cointegration technique, to investigate whether the current inflation differential accounts for the difference between the present and previous exchange rate levels for two pairs of countries: Cote d'Ivoire and France, and Ghana and Britain, as well as between these two developing countries and two other developed countries, Japan and the US. Given the tighter trading relationship between the former two countries we expect a priori the PPP theory to yield more robust results here than in the latter case. The result is the reverse suggesting that indeed Ghana's significantly higher average annual inflation rate is a stronger determinant of exchange rates than the two nations' trading patterns.

## Introduction

This paper examines one of the oldest and still one of the most controversial issues in economic theory and practice, namely the Purchasing Power Parity (PPP) Hypothesis, primarily using Non-Stationarity and Cointegration tests. This is accomplished through an empirical investigation of the experience of price level and nominal exchange rate fluctuations of two West African Countries, Ghana and Côte d' Ivoire, and through their interactions with four of the primary industrialized economies. The PPP concept is vital because the establishment of a stable underlying relationship between national price levels and the exchange rate facilitates the use of the PPP as an equilibrium or steady state theoretical level for the exchange rate. Deviations of the actual exchange rate from this level can then benchmark the extent of currency misalignment, see for example Edwards (1988), Machlup (1973), and can form the basis of an evaluation of economic policy intervention that may be required to restore equilibrium.

The rest of the paper is organized as follows. The next section lays out the traditional empirical formulation of the PPP Hypothesis. This is followed by a brief description of the two techniques (the cointegration and unit roots test) that will be featured as the primary empirical framework for this study. The next section presents basic data description together with a look at Ordinary Least Squares (OLS) regression analysis of the PPP for these two countries. The Non-Stationarity and Cointegration results are then presented in a section which is followed by a brief conclusion.

## A Formulation of the PPP

In the most succinct formation, the PPP theory states that the nominal exchange rate (measured as the number of domestic currency units per unit of the foreign currency) should be equated to the domestic to foreign price ratio. In equation form this is often written as:

$$S_{it} = \beta_1 (P_{it} - P_{it}^*) + \mu_t \quad (1)$$

Where,  $S_{it}$  is the nominal exchange rate

$P_{it}$  is the domestic price level

$P_{it}^*$  is the foreign price level.

Quickly taking logs of an expression such as this (or expressing it in a long linear fashion), this becomes:

$$\text{Sit} = \beta_0 + \beta_1 P_t + \beta_2 P_t^* + \mu_t \quad (2)$$

This is the absolute version of PPP accompanied by either the symmetry condition<sup>1</sup>, that  $\beta_1$  and  $\beta_2$  be equal and of opposite signs, or the proportionality condition, that  $\beta_1$  and  $\beta_2$  be 1 and minus 1 respectively. A milder version (the Relative PPP) merely requires that a nominal exchange rate adjustment provide a percentage match for any relative price adjustment. This formulation implies that deviations from parity (such as excessive inflation in one country) create potentially profitable arbitrage opportunities which when exploited would result in a nominal exchange rate change that would restore PPP. It also implies that for a country with a flexible exchange rate system, the exchange rate becomes an endogenous variable.

Many variations of Equation 2 have over the years been estimated using OLS with generally negative results for the PPP theory. Fenkel (1978) is an example of one study that formally estimated values for  $\beta_1$  and  $\beta_2$  close to plus and minus 1 respectively for countries experiencing high inflation. However, when Frenkel (1981) examined countries during a period of real economic shocks (the 1970's) he finds no evidence to support the PPP. It must be mentioned that prior to the 1980's researchers failed to examine the issues of stationarity of the residuals from a formulation as Equation 2. If it is shown that the exchange rate and price variable in that equation are non-stationary, then OLS, even with a high coefficient of determination and strong T-statistics, will nevertheless provide a spurious relationship between these variables. Engle and Granger (1987) showed that even if the nominal exchange rate and price variable are non-stationary then if a linear combination of the two (say the residual in the equation) is stationary, then they are "Co integrated" and that there is an underlying long run relationship between them. The next step is to conduct a unit Roots Test to establish whether these variables are non-stationary.

**The Unit Root Test**

Starting from an AR (1) where a variable Y is specified as:

$$Y_t = \rho Y_{t-1} + SX_t + E_t \tag{3}$$

Where  $X_t$  represents regressors such as a constant or a time trend,  $\rho$  and S represent the parameters and  $E_t$  the white noise.

The series  $Y_t$  is stationary and will fluctuate around its mean value within a constant range provided that  $|\rho| < 1$ . However if  $\rho$  takes on the value absolute 1, the series becomes non-stationary with both a mean that is constantly changing through time and a variance that will change to match changes in the chosen sample space. One way to test for a unit root is to regress  $Y_t$  on its one period lagged value.

The series is confirmed to have a unit root and thus be non-stationary if the value for P estimated from this regression is 1. This is a description of the simple Dickey-Fuller Test. A testable version of Equation 3 is found by subtracting  $Y_t$  from both sides of this equation which gives:

$$\Delta Y_t = \alpha Y_{t-1} + S x_t + E_t \tag{4}$$

Where  $\alpha = \rho - 1$  and where  $\alpha$  becomes 0 if  $\rho = 1$ . Equation 4 assumes that at higher order lags the white noise term  $E_t$  is uncorrelated. To handle higher order series lag correlation, the above Dickey-Fuller formulation is extended to add P lagged differentiated terms of the dependent variable Y to get:

$$\Delta Y_t = \alpha Y_{t-1} + \beta_1 \Delta Y_{t-2} + \dots + \beta_{p-1} \Delta Y_{t-p} + SX_t + V_t \tag{5}$$

This is the Augmented Dickey-Fuller test construct that is used in this paper to conduct the non-stationary tests.

**Cointegration Test**

As set one by Engle and Granger (1987), if two variables Y and X is shown to contain a unit root and is both I (1), then we can regress Y on X, such as:

$$Y_t = \beta_0 + \beta_1 X_t + u \tag{6}$$

Now writing out that equation with the residual as the dependent variable yields:

$$u_t = Y_t - \beta_0 - \beta_1 X_t \tag{7}$$

If a unit root test establishes that u is stationary, i.e.: I (0) and is free of stochastic trends, this allows us to state that Y and X are cointegrated, implying that there is long term relationship between them. Then regression analysis based on Equation 6 gives an economically meaningful representation of that long term relationship.

In general for the cointegration test we hypothesize that the level data ( $Y_t$ ) above have linear trends but that the cointegrating equations merely have intercepts (i.e. no linear trends). The exact cointegration technique used in this paper is the one advanced by Johansen and Juselius (1990) and Johansen (1991).

#### **Data Description**

The bi-directional trading patterns of these two African countries are reported in Table 1. A few salient points may be quickly noted. Table 1 reflects a secular decline for both Ghana and Cote d'Ivoire in the share of trade done with the developed countries, and an implied increase in South-South trade. Overall trade with the US, which had been slightly behind that between Ghana and the UK and that between Cote d'Ivoire and France, declined in tandem with the volume of trade between each former colony and the respective former colonial power. Interestingly, trade between the UK and Cote d'Ivoire and between France and Ghana, which as expected was at a low level, hardly budged over the 35 year period examined by this table. The same is true for Germany's and Japan's trade with each of these two countries (even though only the 2004 figures are shown for Germany and Japan). The absence of any startling changes in Ghana and Cote d'Ivoire's trade with the developed countries is a reflection of a powerful surge in intra regional trade within Africa that was facilitated by the growing importance of ECOWAS as a vehicle for commerce in West Africa.

While both nations experienced what would be considered above normal inflation rates over the forty year period, Table 2 makes a distinction between the two countries in this regard. At 6.9%, Cote d'Ivoire retained what has to be regarded as some degree of control over its domestic price level. At an average annual rate of 33% over a 40 year span, Ghana toiled with an inflation rate that was sure to impact macroeconomic stability and growth. What is even more alarming is that over just the last 10 years, while there has been some decline in the average annual inflation rate, Ghana's rate was still more than four times that of Cote d'Ivoire.

One can speculate as to the reasons for these vastly different outcomes. For most of the period in question, monetary policy in Ghana was determined by the authorities with few restrictions imposed by foreign commitments. Unfortunately monetary policy was shaped in an environment where there was relatively little Central Bank independence from the governments, which permitted excessive amounts of domestic credit creation<sup>2</sup>. On the other hand Cote d'Ivoire was the leading proponent of the CEFA, a currency that was tied to the French Franc and was used by a group of former French colonies in Africa. For most of the period whenever inflation threatened, the authority managing this currency responded with draconian measures such as the 50% devaluation of the CEFA carried out on December 31<sup>st</sup>. 1992.

## **Empirical Results**

#### **OLS Regression**

Table 3 presents the OLS results for Equation 2 for both Côte d' Ivoire and Ghana. For both countries the signs on the foreign and domestic price coefficients are the expected ones, (negative for the foreign and positive for the domestic) and also the T statistics for the pair are significant. In the case of Côte d' Ivoire the coefficients are somewhat but not excessively different from 1 and -1 respectively, (to honor the symmetry and the proportionality conditions of the PPP hypothesis).

In the case of Ghana, the coefficients differ noticeably from 1 (especially that on the composite foreign price variable). The two reported Durbin Watson statistics imply the likely presence of Autocorrelation, while a comparison of the size of that latter statistic with the relatively high coefficients for determination ( $R^2$ ) suggests the possibility that the estimated OLS regressions could be spurious.

#### **Unit Root Test**

Tables 4 and 5 present the results of the non-singularity test for our two countries and the developed countries, where the null hypothesis is that there is a unit root. For both sets of countries the Augmented Dickey Fuller test critical values are -3.467, -2.878 and -2.575 respectively. For the level test the null hypothesis of a unit root is accepted at the 1% critical level for almost all of our exchange rate and price variables; the sole exception being the Japanese price level in Table 5, which is narrowly rejected<sup>3</sup>.

Additionally all of the first difference results allow us to reject the possibility for a unit root here (i.e. I(2)), with the one exception being the French price level where the null hypothesis of multiple roots is rejected only at the

10% level. In as much as all of the domestic price and bilateral exchange variables of both Ghana and Côte d' Ivoire have been shown to be non-stationary series, an appropriate next step would be to employ cointegration tests to determine whether there are long term relationships between these variables.

#### **Cointegration Test**

The Cointegration tests results employing the Johansen method using the Trace and the Maximum Eigen Value techniques are reported in Tables 6 and 7. In each case the test is run using the exchange rate shown (the SDR exchange rate and each of the four bilateral exchange rates), the country's domestic price level and the foreign price level as shown in Equation 1. The first column of this table provides the number of cointegrating relations as per the null hypothesis, with the number of reported cointegrating equations shown in the column after each exchange rate variable<sup>4</sup>.

For the Trace Test, the 5 percent critical values for a null hypotheses of at most 0,1 and 2 cointegrating vectors are 29.78, 15.49, and 3.84 respectively. The corresponding values for the Maximum Eigen Value test are 21.13, 14.26 and 3.84. All tests are run with an assumed linear deterministic trend.

While the results have thus far made little distinction for the PPP hypothesis between Ghana and Côte d' Ivoire, the cointegration test points to a significant difference. In the case of Ghana the results decidedly reject the null hypothesis of no cointegration. When the log of the SDR is used as the exchange rate variable together with the Ghanaian and developed country price indices, both the Trace and the Eigen Value test reject the hypothesis of no cointegrating relations but do accept the null of at most one.

The Trace reports identical results when the test is done on the Ghanaian bilateral exchange rate between each of the US, UK, France, Japan and the Ghanaian domestic price level together with the domestic price level of each of these countries. The Eigen Value similarly rejects the null of no cointegration when using the SDR exchange rate and the bilateral exchange rates of the US and France while narrowly rejecting the presence of cointegration in the case of the UK and Japan.

In the case of Côte d' Ivoire the null hypothesis of no cointegration is accepted in virtually every case. The lone exception being when the bilateral exchange rate with Japan is used, the Trace reports the existence of three cointegrating vectors. This result is contradicted by the Maximum Eigen Value test which finds no cointegration in this case nor when any of the other exchange rate variables is used. The implication of these results is that the empirical analysis for Ghana appears to confirm that there is an underlying long term relationship between the price level and the exchange rate, while this is denied in the case of Côte d' Ivoire.

Further the strength of the trade relationships does not appear to play any consistent role in determining the existence or lack thereof of any such long term relationship. This is because there is no cointegration of the bilateral exchange rate between Côte d' Ivoire and France with the two price levels, just as that for Ghana appears weakest with Britain. Instead the cointegration and validation of the PPP Hypothesis between the exchange rate and price differentials appear to hinge on the country experience with inflation over the 40 year study period: Ghana with an average annual rate of 40% and Côte d' Ivoire with 7%.

## **Conclusion**

In this paper Unit Root and Cointegration tests were the primary analytical tools used to evaluate the PPP Hypothesis of a link between the nominal exchange rate and the price level differentials between two countries. This is accomplished using data from two African countries (Ghana and Côte d' Ivoire) which had vastly different experiences with inflation, over the 40 year study period. In addition to using the traditional SDR exchange rate with the domestic and foreign price variables, this study used, for both countries, the bilateral exchange rate with each of four developed countries.

The initial OLS test showed that while for both countries price differentials play a role in determining nominal exchange rates, it was clear that some of the variables were stationary thus calling into question the reliability of these results. After stationarity tests established that just about all variables used in the paper had a unit root, the test turned to the issue of the long term relationship between exchange rates and the foreign and domestic price levels. Although there were some minor disagreements between the two tests employed, for both the SDR and

the bilateral exchange rates with the major developed countries, there was in the case of Ghana at least one cointegrating relationship with the price differential but none in the case of Côte d' Ivoire. These results constitute support for the belief that the long run PPP hypothesis works best in countries with long histories of inflation such as Ghana, but fails to unearth a link between price levels and the nominal exchange rate for countries with low inflation such as Côte d' Ivoire over the 40 year study period. In addition there was no greater likelihood that the cointegration results would be stronger in the relationship between former colonial trading partners Côte d' Ivoire and France, and Ghana and Britain. Taken as a whole these results imply that Ghanaian (more so than Côte d' Ivoire) nominal exchange rate may be more susceptible to developments in the western industrialized countries.

**End Notes**

1. The symmetry and proportionality conditions are supposed measures of the accuracy of the empirical results from an OLS regression as provided by the coefficient on the domestic and foreign price variables  $\beta_1$  and  $\beta_2$ . The symmetry condition states that these must be both equal and of opposite sign, while the proportionality condition (the more binding of the two) requires that  $\beta_1=1$  and  $\beta_2=-1$ .
2. A detailed analysis of the consequences of this extended period of weakness of monetary management is featured in Rawlins (2001).

3. The ADF test was done using ESP which for the level Test requires that the ADF test statistic exceeds (i.e. be less negative) than the test critical values in order to refrain from rejecting the null hypothesis of the existence of a unit root. The first difference test requires that the ADF test statistic be less (i.e. have a greater negative value) than the critical values in order to reject the hypothesis that the series is I (1), implying that it has more than 1 root, i.e. that the series is stationary.
4. The values reported in Table 7 reflect the first column of the Maximum Eigen Value Cointegration test using LSDR, LPD and LPW (the composite price variable) as in Table 6. Similar results came from the Trace test for each of the four bilateral exchange rates in Tables 6 and 7 but are not reported for the sake of brevity. These are available from the author.

# Trade, Growth and Poverty Alleviation in South Asia\*

Ian Kerr, [Ian.Kerr@cbs.curtin.edu.au](mailto:Ian.Kerr@cbs.curtin.edu.au)  
Curtin University of Technology, Australia

## Abstract

This paper examines the effects of trade liberalisation on economic growth and poverty alleviation in South Asia. After an introductory section, section two of the paper provides an overview of the performance of the major South Asian economies over the last two decades, focussing on growth, trade and FDI. Trade and FDI policies in these countries are also discussed. The next section examines the level and composition of trade and investment flows in the region. Section four reviews the literature on the influences of trade liberalisation on economic development and poverty alleviation and reports on the record of poverty reduction in the major South Asian economies.

## Introduction

### Overview

This paper examines the effects of trade liberalisation on economic development and poverty alleviation in South Asia.

Section two of the paper provides an overview of the performance of the major South Asian economies, focussing on growth, trade and FDI. Trade and investment policies in these countries are also discussed. The following section examines the level and composition of FDI into South Asian countries and the level and composition of trade flows between South Asian countries. Section four examines the literature on the influences of trade and investment liberalisation on economic development and poverty alleviation, and reports on poverty reduction in South Asia.

### South Asia

There is no agreement on the definition of South Asia as a geographical region. However, in the economic development and trade literature the countries of South Asia are often taken to be those belonging to the South Asian Association of Regional Co-operation (SAARC).

The Charter for the South Asian Association of Regional Co-operation was signed in December 1985 at Dhaka in Bangladesh. The co-signatory nations were Bangladesh, Bhutan, India, the Maldives, Nepal, Pakistan, and Sri Lanka. Afghanistan was subsequently admitted as a member nation.

For the purposes of this paper, we take South Asia to consist of the original seven founding nations of SAARC. Furthermore, most of the references and analysis in this paper will be to the four largest economies in South Asia – India, Pakistan, Bangladesh and Sri Lanka.

### Trade and Investment Liberalisation and Other Reforms in South Asia

In the 1980s and 1990s, at least five of the SAARC countries (Bangladesh, India, Nepal, Pakistan and Sri Lanka) made a major departure from *dirigiste* (state-directed) economic development and adopted the “Washington Consensus” in the form of liberalisation, privatisation, marketisation and modernisation (Lama, 2005:130).

Significant reforms were implemented in the areas of trade, investment, technology, and financial and capital markets. The private sector (both foreign and domestic) started playing a vital role in areas like energy, telecommunications, banking, trade and commerce (Lama, 2005:131). As a result, most countries subsequently recorded higher economic growth, albeit with some adverse socio-economic side effects.

These reforms and the consequent growth have been accompanied by moves to further integrate the regional market, culminating in the signing of the South Asia Free Trade Area (SAFTA) agreement and opening up a market of over 1.3 billion people.

## **Economic Growth and Economic Policies in South Asia**

### **Overview of Major South Asian Economies**

The following gives a brief overview of the economic performance of the major South Asian economies over the last two decades, focussing on rates of economic growth, FDI, trade, structural change and poverty.

#### **Bangladesh**

The Bangladesh economy had a growth rate, in terms of GDP per capita, of 3.2% p.a. over the decade from 1995 to 2005. This was a significant improvement over the 1.7% p.a. growth rate throughout the previous decade. The agricultural sector contracted in relative importance, falling from 37.8% of GDP in 1985 to 20.5% in 2005. Gross capital formation as a percentage of GDP rose from 16.3% in 1985 to 24.4% in 2005, in a welcome sign of greater investment activity. Over the same period, exports of goods and services as a percentage of GDP rose from 5.6% to 16.1%, indicating a strong growth in the openness of the Bangladesh economy. The World Bank Group's latest available figures (2005) list 50% of the population below the national poverty line. FDI in Bangladesh increased from US\$6m in 1995 to \$US385m in 2004, a substantial leap. (World Bank Organisation, 2006).

#### **India**

Economic growth in India has been impressive. Between 1984 and 1994, the annual growth rate in GDP per capita was 3.3%. This rose to 4.1% p.a. in the decade from 1994-2004, with an acceleration in this growth rate towards the end of the decade. The services sector has been expanding rapidly (from 38.7% of GDP in 1984 to 51.85% in 2004), with an offsetting decline in the relative importance of agriculture. The economy has opened up, with exports of goods and services as a percent of GDP rising from 6.5% in 1984 to 16.2% in 2004. FDI into India increased from US\$983m in 1994 to \$US4020m in 2004. A recent estimate by the World Bank Group is that 29% of the population lives below the national poverty line. (World Bank Organisation, 2006).

#### **Pakistan**

Unlike India and Bangladesh, growth in the Pakistan economy slowed in the 1995-2005 decade, in comparison with the previous decade. There was a growth rate in GDP per capita of 2.6% p.a. between 1985 and 1995. This fell to 1.2% p.a. in the following decade. However, the last two years indicate a reversal of this trend, with growth in GDP per capita of 3.9% in 2004 and 5.2% in 2005. Unlike India and Bangladesh, there was only a slight change in the sectoral composition of the Pakistan economy, with the agricultural sector falling in relative importance from 28.5% of GDP in 1985 to 21.6% in 2005. Gross capital formation as a percentage of GDP actually fell from 18.3% in 1985 to 16.8% in 2005. However, over the same period, exports of goods and services/GDP rose from 10.4% to 15.3% showing an increase in the openness of the economy. Furthermore, FDI into Pakistan increased from US\$131m in 1985 to \$US1162m in 2005. Recent World Bank figures estimate that 33% of the population were living below the national poverty line. (World Bank Organisation, 2006).

#### **Sri Lanka**

Growth in the Sri Lanka economy also slowed in the 1994-2004 decade. From 1994 to 2004 GDP per capita increased by 2.8% p.a. This compared to 3.0% in the previous decade. However, the growth rate rose above 4% in both 2003 and 2004, an encouraging sign. There was an increase in GDP per capita in 2003 of 4.8%. The agricultural sector fell from 28.7% of GDP in 1984 to 17.8% in 2004. Gross capital formation as a percentage of GDP remained fairly static over the twenty year period, being 25.8% in 1984 and 25% in 2004. The ratio of exports of goods and services to GDP increased from 28.9% in 1984 to 36.4% in 2004. However, FDI into Sri Lanka only increased from US\$166m in 1994 to \$US229m in 2003. There are no figures for the percentage of the population living below the national poverty line. (World Bank Organisation, 2006).

#### **Economic Growth in the Region**

The following figure (from Deverajan and Nabi, 2006) portrays the extent of economic growth in the region over the period 2001-4.

FIG. 1: REAL GDP GROWTH IN SOUTH ASIA HAS BEEN IMPRESSIVE, ESPECIALLY SO IN THE RECENT PAST  
Source: Devarajan and Nabi (2006)

Growth has been even higher over the last two years. South Asia's GDP growth is estimated to have reached 7.8% in 2005, higher than the region's growth rate of 7.2% in 2004. The higher growth was driven by the strong performance of the Indian and Pakistan economies (ADO, 2006).

According to the *Asian Development Outlook 2006*, India's GDP increased by 8.1% in 2005, Pakistan's by 8.4% (the largest annual growth in two decades), Sri Lanka's by 5.7% (an increase on the 2004 figures) and Bhutan's by 8.8%. For the other three SAARC nations - Bangladesh, the Maldives and Nepal - GDP growth slowed or the economy contracted in 2005 (ADO, 2006). The Indian and Pakistan economies are now growing at rates not far below that of the Chinese economy in recent years.

South Asia's growth is projected to moderate to 7.3% in 2006, as a result of some slowing in India and Pakistan. Bangladesh, Bhutan and the Maldives are projected to achieve higher economic growth than the previous year. In 2007, the subregion's growth rate is forecast to rise to 7.5%, when India and Pakistan are seen as resuming their recent growth trajectory (ADO, 2006).

#### Sources and Drivers of Economic Growth

Devarajan and Nabi (2006) examine the sources and drivers of economic growth in the SAARC countries in the tables below:

TABLE A.1: DIFFERENT SECTORAL GROWTH PATTERNS IN SOUTH ASIA  
TABLE A.2: DRIVERS OF GROWTH

Table A.1: South Asia: Recent Growth Performance (Average annual percentage change, 2001-2005)

	Bangladesh	Bhutan	India	Maldives	Nepal	Pakistan	Sri Lanka
Real GDP growth	5.1 (5.4)	6.4 (5.5)	6.2 (7.7)	6.8 (8.6)	2.5 (3.8)	5.3 (6.5)	4.7 (5.6)
Growth in agriculture	2.2	3.0	3.1	6.6	3.0	3.3	0.7
Growth in manufacturing	6.3	5.3	6.4	6.2	-0.9	9.0	2.1
Growth in services	5.5	6.9	7.9	6.6	2.8	5.3	5.2
Recent reduction in poverty (last 10 years or so)	9% (1991/92)		10% (93/94)		11% (95/96)	-3% (90/91, but 12 points reduction in the 1980's)	6.1 (94-95)
Population							
GDP at market prices (latest, \$)	62 billion	725 million	672 billion	753 billion	5.5 billion	104.9 billion	20.7 billion

Table A.2: South Asia: Drivers of Growth (Average annual percentage change, 2001-2005)

	Bangladesh	Bhutan	India	Maldives	Nepal	Pakistan	Sri Lanka
Export growth (last two years)	8.9 (15.0)	10.6 (20.3)	13.8 (22.7)	15 (14.3)	-0.5 (10.4)	11.5 (13.7)	1.5 (12.2)
Growth in remittances (latest in \$)	18.54 (\$2,932.53)*	No data	No data		10.8 (687.2 mil)	33.7 (\$4150)	7.9 (\$1,355)
Private investment growth (% of GDP)	2.13 (2.36)	23.5	14.8		8.2 (11.3)	9.3 (12.8) 13.2	-0.8 (17.9)
Public investment growth (% of GDP)	0.28 (0.44)	23.5	11		4.6 (2.4)	16.1 (2.7) (25.8)	-7.9 (-4.3)
Private consumption growth (% of GDP)	6.09 (6.41)	8.3	1.8		7.4 (7.5)	12.9 (75.6) (29.2)	1.3 (-0.3)

Notes: Bangladesh Remittances\* US\$2,932 is the average period amount from FY01-05. Remittance in FY05 is US\$3,848

Pakistan: Remittances average period amount is \$2,970, the third entry for Pakistan is growth in the last two years.

Table A.1 highlights the different sectoral growth patterns in South Asia and shows India relying heavily on growth in the services sector and Pakistan experiencing strong growth in manufacturing.

Table A.2 also reveals some interesting differences between the countries in the region, with India's growth being driven by private investment and exports, Bangladesh's growth by consumption and exports, and Pakistan's by public sector investment and exports.

#### Trade and Investment Policies in the Region

Trade liberalisation and other reforms in the 1980s and 1990s have led to an increase in the openness of South Asian economies. All of the South Asian countries have made substantial reductions in tariff rates over the last two decades; although, tariffs in the region are still high by international standards. The figure below (from Berg and Krueger, 2003:16) graphically illustrates this and compares South Asian tariff reductions with those from other regions.

FIG. 2: AVERAGE UNWRIGHTED TARIFF RATES BY REGIONS

Athukorala and Sharma (2005) survey the range of foreign investment policy regimes in South Asian countries:

Only Sri Lanka protects a foreign company investing in Sri Lanka from nationalization by constitutional guarantee; both Bangladesh and Pakistan guarantee against nationalization, but not under their constitution. India gives no form of guarantee against nationalization, but the settlement of disputes is governed by the *Indian Arbitration Act 1940* and the United Nations Convention for matters arising from foreign arbitral awards. Bangladesh utilises international convention for the settlement of industrial disputes and Sri Lanka for the settlement of investment disputes. The International Commission on Settlement of Investment Disputes arbitrates disputes arising in Pakistan on foreign investment. (Athukorala and Sharma, 2005: 326-27, table 16.1).

The Pakistan government allows 100 per cent foreign equity participation, without requiring permission from the government. Bangladesh and Sri Lanka also allow 100 per cent equity (no indications of conditions). India allows 100 per cent equity in export-oriented industries, power, electronic and some technology parks, but only 24 to 51 per cent foreign equity can be held in industries that are not export-orientated.

Fiscal incentives vary between countries. No import duties or tariffs apply in Pakistan on the importation of plant, machinery or equipment for export-oriented or hi-technology industries, nor on agricultural plant and machinery. In Sri Lanka, capital gains on share transfers are exempt from income tax and a duty draw back applies to export-oriented industries (Athukorala and Sharma, 2005:326-27). There is a tax holiday for FDI in Bangladesh that varies between 5 and 7 years, depending on the location. There is also a tax exemption on capital gains on share transfers, interest on foreign loans and royalties. On the other hand, there is a 5 per cent duty on the initial importation of capital equipment and parts for the venture. In India investors in Export Processing Zones (EPZs) have a ten year tax holiday; for other investors a five year tax break applies. There is tax relief under the Avoidance of Double Taxation Agreements and access to low interest finance for investors in export-orientated industries. (Athukorala and Sharma, 2005:326-27).

Accompanying liberalisation of foreign investment policies in South Asia, there had been significant trade liberalisation in the 1980s and 1990s.

Up to the 1990 reforms, India's trade and investment regime for the previous 40 years had been based on a Soviet-style planned development programme that began with the commencement of the First Five Year Plan in 1951 (Chai & Roy, 2006: 114). The 1990s reforms, forced on India by a foreign exchange crisis, included liberalizing trade and foreign investment flows, floating the currency and virtually dismantling the industrial licensing system, except for 18 critical industries. Quantitative controls on imports of non-consumer goods have virtually disappeared, although controls on imports of consumer goods still remain. Foreign investment rules have been relaxed. The maximum nominal tariff rates for many products came down from around 400 per cent in 1990-91 to below 50% in 2000-01 (Chai & Roy, 2006: 117).

Nevertheless, India's openness to trade and investment has been marginal compared to China. The economic reform measures which would have considerably enhanced India's outward orientation have only been sought to be implemented partially, due to India's political situation. Chai and Roy believe that it is highly unlikely that this institutional impediment can be removed in the foreseeable future. Hence, FDI inflow to India will continue to increase only at a modest rate. After independence, during the regime of the 'Licence Raj', foreign investment had a limited role to play in India. But even after the dismantling of the regime, politicians continue to treat foreign capital as evil to win votes in elections (Chai & Roy, 2006: 142).

The Bangladesh economy experienced significant shifts in trade, fiscal, industrial, agricultural and financial policies over the last two decades. Bangladesh is significantly dependent on external resources and, at the behest of the World Bank and the International Monetary Fund, adopted a set of structural adjustment policies that impacted on all sectors of the economy (Alauddin, 2005:11).

The 1990s saw Bangladesh experience a more rapid growth of exports and imports than that experienced in the 1980s. Furthermore, there was significant change in the nature of the exports - by 2000, food and agricultural raw materials had fallen from a high of 31 per cent two decades earlier to only 9 per cent. At the same time manufactured goods increased from 68 per cent to 91 per cent of exports. Unfortunately, more than two thirds of these exports are accounted for by one item - ready made garments - which are exported mainly to the United States of America, the European Union and Japan.

While Bangladesh has experienced significant increase in trade overall, it has engaged in very little trade with its South Asian neighbours. True, about a sixth of Bangladesh's imports originate within the South Asian region; however, the majority of materials come from India. As for exports, even in the late 1990s Bangladeshi exports to South Asian countries were below 2 per cent of its total exports (Alauddin, 2005:16-19).

After an earlier experiment with trade liberalisation (1977-79), Sri Lanka implemented a second wave of trade and investment liberalisation in the early 1990s. There was an ambitious privatisation program, further tariff cuts and simplification of the tariff structure, removal of exchange controls on current account transactions and changes to FDI policy. Altogether Sri Lanka has become the most open economy in South Asia. Unfortunately, the reforms have not been accompanied by the rates of growth that were expected and the merits of trade liberalisation are being called into question (Athukorala and Jayasuriya, 2005:102-5).

Overall, there has been significant trade and investment liberalisation in South Asian countries over the last two decades. However, there is still need for further liberalisation.

## **FDI and Trade Flows in the Region**

### **FDI Inflows into South Asian Countries**

Foreign direct investment into South Asia still accounts for only a small fraction of global FDI and unfavourable comparisons are made with China's FDI inflows. Nevertheless, FDI into South Asia is on the rise, particularly FDI into India. The share of South Asia in global FDI flows increased from 0.23% in 1990 to 0.55% in 2001 (Lama, 2005:141).

The following table is reproduced from Lama (2005:142) and describes each country's share of the FDI coming into the region over the last two decades.

TABLE 2: SHARE OF SAARC MEMBER COUNTRIES IN THE TOTAL FOREIGN  
DIRECT INVESTMENT INFLOWS IN SOUTH ASIA:1986-2001

Year	Total FDI \$USm	B/desh %	India %	Maldives %	Nepal %	Pakistan %	S/Lanka %
1980-85	179	-0.06	34.68	-0.17	0.11	41.95	23.49
1990-95	1,185	0.51	59.33	0.59	0.51	32.83	9.28
1990	458	0.66	35.37	0.00	1.31	53.28	9.39
1995	2,753	0.07	71.34	0.25	0.18	26.12	2.03
2000	3,095	9.05	74.93	0.42	0.00	9.85	5.75
2001	4,069	1.92	83.63	0.29	0.47	9.46	4.23

Source: UNCTAD, *World Investment Report*, various issues.

Between 1980 and 1985 the total amount of FDI inflows into the SAARC countries was only US\$179 million. Of these funds Pakistan attracted 41.95 per cent, India 34.68 per cent and Sri Lanka 23.49 per cent. Although the next five year period, 1990-1995, shows a dramatic increase in the FDI inflows into the member countries to a level of US\$1,185 million, Pakistan and Sri Lanka's share fell to 32.83 per cent and 9.28 per cent respectively. For India, the share of FDI inflows increased by more than 20 percentage points, rising to 59.33 per cent, and Bangladesh moved into positive territory with FDI inflows of 0.51 per cent (Lama, 2005:142).

Although the total volume of FDI into the region has continued to rise, Sri Lanka and Pakistan have had their share eroded by growth in India's share. The Indian economy has attracted an ever increasing share of FDI, with the share doubling from 1990 to 1995.

The sections that follow summarise information on FDI projects by country (provided by Loco Monitor, 2006).

#### **Bangladesh**

In the period 2003-2006 the principal source countries investing in Bangladesh were India, the United States of America and the United Kingdom. Over this period investment by Indian companies in Bangladesh represented 27% (or 12 projects) of total FDI inflows into the country; companies from the United States invested 16% (or 7 projects), the third highest investor was the UK with 11% (or 5 projects). This investment by these three nations totalled 54% of the FDI inflows during that period and represented 24 from the total 46 projects. These investments were concentrated in the following industry clusters: Information Communication Technology (ICT) with 9 projects; Heavy Industry - 8 projects, Business & Financial Services - 7 projects. (Loco Monitor).

#### **India**

Whilst companies from the United States of America only represented 16% of FDI investment in Bangladesh, the USA was the principal source of FDI into India. In the period 2003 – 2006 investment by US companies represented 47% (or 999 projects) of total FDI inflows to India, with companies from the United Kingdom (12% or 243 projects) and Germany (6% or 131 projects) trailing a fair way behind. This investment by the top three source countries totalled 65% of the FDI inflows during that period and represented 1,373 of the total 2,474 projects. The industry clusters attracting the greatest number of investors were those in the areas of ICT - 807 projects, Electronics – 313, and Business & Financial Services - 311 projects. (Loco Monitor).

#### **Pakistan**

The principal source countries from which Pakistan attracted FDI inflows were the United States of America, the United Arab Emirates, and China. During 2003 – 2006 investment by American companies represented 21% (or 24 projects) of total FDI into Pakistan, companies from the United Arab Emirates (UAE) invested 11% (or 12 projects) and Chinese companies invested 10% (or 11 projects). The investment from these three countries represented 42% (or 47 projects) of total FDI into Pakistan. The industry clusters with the highest number of FDI projects were: Heavy Industry with 31; ICT - 22; Business & Financial Services and Transport Equipment had 16 projects each. (Loco Monitor).

#### **Sri Lanka**

In the period 2003 – 2006 the principal sources countries for FDI investment into Sri Lanka were India, the United States of America and the United Kingdom. Investment by Indian companies represented 40% (or 16 projects) of total FDI inflows, companies from the United States represented 12% (or 5 projects) and the United Kingdom invested 8% (in 3 projects). The FDI inflow by companies from these three countries totalled 60% (or 24 projects) and was spread across three industry sectors. Eleven industry sectors attracted FDI inflows (50 projects) but the industry clusters with the highest investment were: the Business & Financial Services - 11 projects, ICT - 9 projects, and Heavy Industry with 7 projects. (Loco Monitor).

**Trade Flows between South Asian Countries.**

Trade flows between South Asian countries are very low. The table below (taken from Lama, 2005: 135) gives an indication of the low volume of trade between SAARC countries, relative to their trade with the rest of the world. Intra-regional trade has been less than 5% of total trade over the two decades covered by the data in the table.

TABLE 3: SAARC TRADE

Year	<i>Intra-SAARC Trade</i> (a) (\$billion)	<i>South Asia's World Trade</i> (b) (\$billion)
1980	1.21	37.88 (3.19)
1985	1.08	43.75 (2.48)
1990	1.59	65.69 (2.42)
1995	4.25	104.16 (4.08)
2000	5.8	144.06 (4.08)
2001	6.53	143.44 (4.56)

Source: IMF, *Direction of Trade Statistics Yearbook, 2001* and previous issues.

Note: Figures in parentheses indicate (a) as a per cent of (b).

While intra-regional trade is still at low levels, intra-SAARC trade has been growing at a faster rate than trade with the rest of the world. Intra-regional trade recorded an average annual growth rate of 31.6% during the period 1991-2001, as against a very low growth rate of 3.4 % during the period 1980-90. On the other hand, South Asia's trade with countries outside the region grew at the rates of only 11.83% and 8.15%, respectively, over the same two periods (Lama, 2005:135)

The question arises: Why has intra-regional trade remained so low until now? Estimates show that trade between India and Pakistan is 70% lower than two otherwise identical economies (studies cited in Mehta and Kumar, 2005:280). The lack of trade complementarities is often cited as one of the main reasons for the lack of trade between the South Asian nations. Most of these countries export labour intensive products in which they have a better comparative advantage with the rest of the world than they have with each other. However, one area where trade complementarities do exist is in the services industry, in particular in the health and education sectors.

Another reason for historically low inter-regional trade has been the absence of trade preferences. Of course, this is changing with the introduction of SAFTA. Finally, there is a huge amount of border trade between South Asian countries which remains unrecorded, which through its informality does not pay taxes and often trades in prohibited goods. Were the informal trade to be recorded, trade statistics on intra-regional trade would be much higher (Mehta and Kumar, 2005:280-81).

For whatever reasons, the degree of integration experienced by other regional trade agreements has, in the main, been better than the SAARC countries. The intra-regional export shares within SAARC only increased from

3.2% in 1990 to 4.9% in 2001. However, over the same period, the Andean Group in Latin America experienced a rise in the intra-regional export share from 4.2% in 1990 to 11.2% in 2001. Within MERCOSUR, the export share increased from 8.9% in 1990 to 20.8% in 2001 and in southern Africa, SADC's intra-regional share rose from 3.1% in 1990 to 10.9% in 2001. On the other hand, there was little improvement in movement within the UEMOA and COMESA RTAs in Africa and ASEAN/AFTA has only increased its intra-regional export share from 19.0 to 22.4 (Mehta and Kumar 2005:282, Table 13.1). These statistics illustrate the potential increase in intra-regional trade that can result from a RTA.

Alongside the picture of low but growing intra-regional trade, there are some very significant imbalances in the bilateral trade flows between countries in the region, as evidenced in the following table (from Lama, 2005:136).

TABLE 4: INTRA-SAARC TRADE FLOWS

<i>Country</i>	<i>Exports</i>		<i>Imports</i>	
	1995	2000	1995	2000
Bangladesh	4.1	3.2	51.34	34.2
India	76.4	72.33	8.8	12.34
Maldives	0.54	1.07	2.0	4.79
Nepal	1.48	6.5	5.9	17.46
Pakistan	12.58	10.2	7.53	8.31
Sri Lanka	4.9	6.7	24.4	22.9
<b>Total Value (Million \$)</b>	<b>2021</b>	<b>2797</b>	<b>2242</b>	<b>3057</b>

*Source:* IMF, *Direction of Trade Statistics Yearbook*, 2001 and other issues.

As shown in the table, the volume of intra-regional trade between the SAARC countries increased slightly between 1995 and 2000. However, there are some substantial imbalances in the balance of trade. Indian exports to the rest of the region amounted to US\$76.4 million in 1995, but their imports from others in the region were at the relatively insignificant level of only US\$8.8 million. On the other hand, Bangladeshi exports to other countries in the region were miniscule in comparison to their imports over the same periods. The figures for Sri Lanka also reveal a significant imbalance between exports to and imports from other countries in the region.

#### **Trade Flows between South Asia and SE Asia.**

India has been a full dialogue partner of ASEAN since 1995 and the two are negotiating for a formal Comprehensive Economic Cooperation Agreement. ASEAN's trade with India has increased from US\$2.9 billion in 1993 to US\$9.9 billion in 2001, with ASEAN experiencing persistent and growing trade surpluses in its trade with India. In relative terms, ASEAN-India trade has not exceeded 2% of ASEAN's total trade, although 10% of India's imports have been sourced from ASEAN countries. (Ariff and Cheen, 2006:71).

ASEAN's exports to India are concentrated mostly in the industrial products area. For the period 1999-2001, industrial products constituted 77.7 per cent of the total trade between ASEAN and India. Lack of diversification in the ASEAN-India trade profile is clearly apparent (Ariff and Cheen, 2006:71).

## **Economic Growth and Poverty Alleviation: Influences of Trade and Investment**

### **Introduction**

During most of the twentieth century and earlier, South Asian economies suffered from low economic growth and widespread poverty. Twenty years ago a consensus had emerged that trade liberalisation strongly promoted growth and poverty reduction. The intervening period has seen a large wave of trade liberalisation in the developing world. It is important that the theoretical and empirical evidence for the beneficial effect of liberalisation on economic growth and poverty alleviation be examined.

### **The Influence of Trade on Growth**

Alan Winters (2004) reviews the evidence linking trade liberalisation to economic performance and reaches the broad conclusion that trade liberalisation and openness to trade enhance economic growth. However, he cautions

that the econometric evidence is not conclusive, due to problems encountered in cross-section studies with the definition and measurement of openness and the difficulty of establishing the direction of causality. Furthermore, he concludes that some of the benefits of trade liberalisation are dependent on a country having other supportive policies and institutions (investment, education, anti-corruption and other pro-growth policies).

Some of the sources of economic growth and the mechanisms through which international trade affects economic growth are highlighted in the following Table (UNCTAD, 2004:73).

TABLE 5: SELECTED MECHANISMS THROUGH WHICH INTERNATIONAL TRADE CAN HAVE GROWTH EFFECTS

Source of growth	Associated aspect of trade
1. Static and dynamic efficiency gains arising from specialization according to current comparative advantage	<ul style="list-style-type: none"> <li>• Openness</li> <li>• Exposure to international trade competition</li> </ul>
2. Exploitation of a "vent for surplus"	<ul style="list-style-type: none"> <li>• Export growth, particularly natural-resource-based or tourism-based</li> </ul>
3. Increased capacity utilization	<ul style="list-style-type: none"> <li>• Increased import capacity</li> </ul>
4. Increased investment	<ul style="list-style-type: none"> <li>• Economies of scale through selling to domestic and external markets</li> <li>• Reduced costs of capital goods through imports</li> <li>• Reduced costs of wage goods through imports</li> </ul>
5. Increased technology acquisition and learning	<ul style="list-style-type: none"> <li>• Buyer-seller links</li> <li>• Machinery and equipment imports embodying foreign technology</li> <li>• Exports that have great potential for learning through technology transfer</li> </ul>
6. Structural change	<ul style="list-style-type: none"> <li>• Composition of exports and imports</li> <li>• Product and market diversification</li> </ul>
7. Releasing the balance-of-payments constraint on economic growth	<ul style="list-style-type: none"> <li>• Export growth</li> <li>• Import substitution</li> <li>• Reduced income elasticity of imports</li> <li>• Increased elasticity of export growth with respect to growth of world income</li> <li>• Reduction of non-essential imports</li> </ul>

Static and dynamic efficiency gains result from international trade specialisation; technological transfer is embodied in importation of capital equipment; growth and trade are linked in a variety of ways.

#### Poverty in South Asia

There are many different measures of poverty, ranging from figures on the cumulative distribution of income, the Gini coefficient, the number or percentage of the population living below some specified minimum standard of living, the Human Poverty Index, and so on.

On most measures of poverty, there is still very substantial poverty throughout South Asia, although the percentage of the population living in poverty has decreased in most countries in recent years.

#### India

India has had some success in reducing the overall percentage of the population living in poverty. The table below (from Chai and Roy, 2006:192) reveals a steady decrease in the percentage of the population living in poverty over the period 1973/4 to 1999/2000. In India, 260 million people (26.1 per cent of the population) were living below the poverty line in 1999-2000. This represents a decrease from 321 million (54.9%) in 1973-1974.

TABLE 6: INDIA: NUMBER AND PERCENTAGE OF POPULATION BELOW THE POVERTY LINE

Year	Rural sector		Urban sector		India - Total	
	Number (millions)	Poverty ratio %	Number (millions)	Poverty ratio (%)	Number (millions)	Poverty ratio (%)
1973/74	261	56.4	60	49.0	321	54.9
1977/78	264	53.1	65	45.2	329	51.3
1983	252	45.7	71	40.8	323	44.5
1987/88	232	39.1	75	38.2	307	38.9
1993/94	244	37.3	76	32.4	320	36.0
1999/2000	193	27.1	67	24.0	260	26.1

### Pakistan

According to Anwar (2005:99) whilst the economic reform programs instituted in Pakistan over the past 15 years were aimed at increasing efficiency and/or reducing poverty, the trends in almost all dimensions of poverty indicate poverty has worsened. Recent estimates show that more than 49 million people live below the official poverty line and 3.1 million persons are unemployed. The structural adjustment demanded by the IMF and World Bank policy has been to the detriment of the Pakistan economy, through “inappropriate sequencing of policies” and implementation of financial sector reforms “before achieving macroeconomic stabilization and reduction of the fiscal deficit” (Anwar, 2005:98). External debt increased due to the continual devaluation of the rupee against the US\$ and, in order to meet these rising costs and to decrease the fiscal deficit, less funding was available for public and social services. With improved capital from overseas and a restructuring of bilateral debts Pakistan has decided to exit from the IMF program (Anwar, 2005:98-99).

By 2001-2002, both the World Bank estimates and the official Pakistan government figures, whilst differing, show poverty increased in Pakistan between 1990-1991 and 2001-2002, rising from 34 percent to 37.3 per cent (World Bank figures) or from 26.1 per cent to 32.1 per cent (Pakistan Official FEI poverty line). According to the World Bank figures, during this latter period, urban poverty decreased to 26.4 per cent, but rural poverty rose to 41.6 per cent (Devarajan, 2006).

### Other South Asian Countries

The following table (from UNDP, 2005) provides information on both the Human Poverty Index and the percentage of the population living below the poverty line.

TABLE 7: HUMAN DEVELOPMENT REPORTS

HDI rank		GDP per capita (PPP US\$) (HDI)	Human poverty index (HPI-1) Rank	Population living below the national poverty line (%)
2003				1990-2002 a
Medium Human Development				
93	Sri Lanka	3,778	42	25.0
96	Maldives	.. b,c	37	..
127	India	2,892d	58	28.6
134	Bhutan	1,969b,e	..	..

135 Pakistan	2,097	68	32.6
136 Nepal	1,420	74	42.0
139 Bangladesh	1,770	86	49.8

*Notes:*

- a. Data refer to the most recent year available during the period specified.
- b. Data refer to year other than that specified
- c. In the absence of an official estimate of GDP per capita (PPP US\$), preliminary World Bank estimates, subject to further revision, were used as follows: Maldives 4,798; and Suriname 6,552.
- d. Estimate based on regression.
- e. Aten, Bettina, Alan Heston and Robert Summers. 2002. "Penn World Tables 6.1." University of Pennsylvania, Center for International and Interarea Comparisons, Philadelphia. Data differ from the standard definition.

- column 3:* World Bank. 2005. World Development Indicators 2005. CD-ROM. Washington, DC.

Bangladesh has the greatest degree of poverty, according to both measures of poverty, followed by Nepal, Pakistan, India and Sri Lanka, in that order. The country rankings for GDP per capita are almost the reverse, as can be expected.

**Changes in Poverty**

The following figure (from Devarajan and Nabi, 2006) gives an overview of the different fortunes of India and Pakistan and looks at the changes in poverty in five South Asian countries over the last decade.

*Source:* (Data) Bangladesh: HES 1991-92, 95-96 and HIES 2000; India: NSS 50<sup>th</sup> and 55<sup>th</sup> rounds; Nepal: NLSS 1995-96 and 2003-04; Pakistan: PIHS 1990-91, 2001-02; Sri Lanka: HIES 1991, 2002.

FIG.3: POVERTY IN SOUTH ASIA

Further information is provided, in the table below (from Devarajan and Nabi, 2006), on the urban/rural distribution of poverty and changes in this over the period from 1993/4 to 2001/2.

TABLE 8: POVERTY REDUCTION IN SOUTH ASIA

	Previous			Latest		
	National	Rural	Urban	National	Rural	Urban
India 1	36 (1993-94)	37.1	32.9	26 (199-2000)	26.8	24.1
Pakistan 2	34 (1990-91)	36.9	28	37.3 (2001-02)	41.6	26.4
Pakistan 3	26.1 (1990-91)	25.2	26.6	32.1		
Bangladesh	58.8 (1991-92)	61.2	44.9			
Sri Lanka	26.1 (1990-91)	29.4	16.3	22.7 (2002)	24.7	7.9
Nepal	41.76 (1995-96)	43.27	21.55	30.85	34.62	9.55

Notes:

1. Planning Commission headcount estimates,
2. Pakistan: World Bank estimate, Basic needs Poverty Line
3. Pakistan: Official FEI poverty line

It is evident, from the table above, that poverty is relatively greater in rural areas than in urban areas. This is what one might expect, given the relationship between the industry composition of the economy and the level of poverty. Primary producing and exporting countries are more likely to suffer poverty than those countries exporting manufactured products or services (UNCTAD, 2004:132).

#### **The Influence of Trade on Poverty**

Many commentators take the view that changes in poverty are almost entirely attributable to economic growth itself, not to changes in the world income distribution or policies that aim at redistributing income. Berg and Krueger, for example, state (2003:4) “Whatever the causal relationship between growth and changes in income distribution, most variation in income of the poor must be a result of changes in average growth, not changes in income distribution, unless the changes in income distribution are of historically unprecedented magnitudes.”

Warr points out (2005:345-6) that “the literature on poverty has exhibited a divergence between one school of thought, which places primary attention on economic growth as a means of reducing poverty and another, emphasizing the social nature of many of the dimensions of poverty, broadly conceived. Two kinds of empirical findings from existing studies are relevant for this discussion.

First, changes in income poverty over time are closely associated with, but not perfectly correlated with, changes in real output (real GDP) per person. This is equivalent to the finding that changes in inequality occur slowly and are not necessarily associated with changes in national income. The fact that a strong correlation exists means that policies affecting the rate of growth should rightly be considered an important component of a poverty reduction strategy. The fact that the correlation is imperfect means that other matters – other than simply the rate of growth – are also important determinants of the rate at which (income) poverty declines.

The second empirical finding is that many of the non-income dimensions of poverty are correlated (but not perfectly correlated) with income poverty. This finding means that the “go-for-growth” and “rights-based” approaches to poverty reduction are not in such strong opposition to one another as was earlier thought. The key point is that these various components of poverty, broadly conceived, are interdependent. The direction of causation runs in both directions.”

Warr, himself, finds that both agricultural and services sector growth in India over four decades (1957-1997) reduced poverty incidence significantly, but industrial growth did not reduce poverty and may actually have increased it (Warr, 2005:366).

Reimer (2002) undertakes a very comprehensive survey of empirical studies on the poverty impacts of trade liberalisation. His survey covers cross-country regressions, partial-equilibrium/cost-of-living analyses, general-equilibrium simulations, and micro-macro syntheses. He finds a substantial variety of research findings, although the majority support a definite poverty alleviation effect of trade liberalisation and economic growth.

The linkage between poverty reduction and economic growth is used by Devarajan and Nabi to project poverty reduction associated with economic growth in South Asia. They make projections of poverty incidence to

2013, based on alternative rates of growth of the economies of South Asia. The following table (Devarajan and Nabi, 2006:19) and figure (Devarajan and Nabi, 2006:4) summarise these projections.

TABLE 9: POVERTY REDUCTION ASSOCIATED WITH ECONOMIC GROWTH IN THE COMING DECADE

	Annual average GDP growth rate of the last two years	Annual Population growth rate	Latest available poverty estimate	Poverty incidence in 2013	
				Base case: (GDP growth of 7% per annum)	High case: (GDP growth of 10% per annum)
Bangladesh	5.4% <sup>1</sup>	1.7%	49.8% (2000)	20%	12.6%
India	7.7%	1.5%	22.7% (1999-2000)	15.1%	12.5%
Nepal	3.4%	2.3%	31% (2003-04)	15.2%	9.4%
Pakistan	7.4%	2.4%	35.2% (2201-02)	13.4%	7.5%
Sri Lanka	5.7%	1.2%	22.7% (2002)	9.6%	4.3%

The following factors are critical in determining the growth impacts on poverty reduction:

1. **The relationship between household consumption and GDP:** It is not always that GDP growth rate is identical to the growth rate of household consumption. In fact, the latter tends to be lower than the former in the South Asia region. This distinction is important since the growth elasticity is computed with household consumption, not with GDP. For the above simulations, we estimate the relationship between the growth rates of household consumption and GDP from available data.
2. **Impact of inequality.** In Sri Lanka, the growth has not benefited the poor much during the last decade. Widening inequality tends to lower the growth elasticity of poverty reduction. The first table assumes there is no change in inequality, but Table 2 assumes inequality changes at the rate that is estimated from household surveys.
3. **Methodology used for estimating growth elasticity:** For Sri Lanka and Pakistan, the same method (Bourguignon (2003)) is used, while a different method was used for India and Bangladesh.

*Note:* Most recent poverty estimates are those estimated by the World Bank and in some cases may be different from those reported in Figure 2. The method used for computing growth elasticity varies among countries. Bangladesh: Wodon (2001); India: Deaton and Dreze (2002); Nepal: Datt and Ravallion (1992); Pakistan: Bourguignon (2003); Sri Lanka: Bourguignon (2003).

FIG. 4: POVERTY REDUCTION IN SOUTH ASIA ASSOCIATED WITH HIGHER GROWTH RATES

## Conclusion

This paper has presented an overview of economic growth, trade flows, FDI and poverty in South Asia. Several important issues and policy debates have been briefly addressed, making it difficult to provide an in depth, detailed analysis of all aspects of the topic and to reach definitive conclusions. Nonetheless, there is sufficient evidence presented here to support the view that trade and investment liberalisation has been broadly successful in promoting economic growth and alleviating poverty in South Asia.

The issue of whether South Asian countries should “look east” (to ASEAN, China and elsewhere) or pursue further integration within South Asia through SAFTA is a non-issue. Policies and agreements to further integrate the South Asian economies within the SAARC framework are not incompatible with efforts to increase trade with ASEAN, JACIK (Japan, ASEAN, China, India and Korea) and other groupings. All of these avenues and opportunities for further trade, growth and poverty reduction should be vigorously pursued.

### **Abstract**

**“If we stop thinking of the poor as victims of as a burden and start recognizing them as resilient and creative entrepreneurs and value –conscious consumers, a whole new world of opportunity will open up” (Pralhad, 2005). ‘Village phone’ is such a weapon of social revolution in rural Bangladesh that fights against poverty by facilitating entrepreneurship, reducing transaction costs, and substituting for slow, unreliable transport and postal systems. It is a tool to empower the nation’s rural women with earnings, information, dignity and status. The women are now acting as change agents in rural Bangladesh by serving the community as an umbrella of information to solve all the problems at the robust pace. This paper seeks to determine the factors that are influencing the growth of village phone in Bangladesh. Our findings suggest the role of personal characteristics and social factors as crucial determinants for playing the role of change agents in the society. Keywords: Grameen village phone, phone lady, Bangladesh, entrepreneurship.**

### **Introduction**

Information is power. And it is such a power that can open up the windows of opportunities for a person as well as for a nation. For Bangladesh, ‘village phone’ is such a platform which is empowering the rural villagers with up-to-date information, connecting the community under an umbrella of communication and above all creating an army of women entrepreneurs who are acting as change agents to shape the future of the country. Village phone program has turned the deprived and inactive women into ‘phone lady’, a successful entrepreneur, a person of standing in her community. The program is managed by Grameen Telecom in cooperation with Grameen Bank and Grameen Phone covering 50,000 villages through 260,000 village phone operators which is providing the rural poor with new, exciting income-generating opportunities with upgraded social status of women in the community.

### **Objectives**

This paper will explore the factors influencing the growth of ‘village phone based mobile entrepreneurship’ in Bangladesh. And our specific objectives are as follows:

- To conceptualize the village phone model activating in Bangladesh;
- To identify the role of core parties and determine the entrepreneurial factors influencing the growth of village phone model;
- To measure phone ladies’ satisfaction toward the core parties’ support and services;
- To evaluate the influence of social and entrepreneurial factors that are turning phone ladies into change agents;
- And finally, to determine the success rate of village phone model and giving guidelines for further improvement.

### **Methodology**

The study has initially focused on qualitative research to conceptualize the model and to determine the factors which

are influencing the model. And then through survey method under quantitative research, the proposed model has been tested. To conduct the study, primary data were collected through personal in home interviews of phone ladies unstructured questionnaires (Malhotra, 2005).

In this study, to evaluate the factors affecting the growth of village phone model in Bangladesh, the level of scale was interval and the technique was five point likert type scale anchored at the numeral 1 with the verbal statement 'strongly disagree' and at the numeral 5 with the verbal statement 'strongly agree'. (Elbeck, 1987; Steiber, 1989). Multiple items were used to establish appropriate measurement properties (reliability and validity) of the selected constructs. The scale was reliable as the cornbach's alpha was evidenced as .819. The questionnaire was pretested several times to ensure that the wording, format, length, and sequencing of questions were appropriate.

In designing the sampling process, the target population includes all the village phone operators of Grameen Phone. As a technique, simple random sampling (Zikmund, 2004) was applied as the samples elements were collected from pre specified list. In this case, sample units were 4 and sample size was 130 in total. A total of 124 surveys were completed. Of the total number of completed surveys, 4 were considered problematic due to excessive missing data. The data from these surveys were not included in the data set. Thus, a total of 120 surveys were analyzed.

Structured questionnaire were used using the existing village phone village phone model. The model has been developed through depth interview and focus group discussion with experts. To conduct data analysis, one sample t-test under SPSS program has been applied to measure all the dimensions of village phone model.

Simultaneously, to make this paper more informative different published text books, related journals, reports, seminar papers, magazines and research works have been consulted. Literatures were generally collected from said sources and the Internet. As a result, a through review of literatures enabled us to make a consistent presentation of the theme of study.

Thus the paper is fine tuned into the following several rhythms: The first one after the introduction and objectives focuses on the literature review to determine the factors pertinent to the model development process, the second one proposes the model on factors affecting the growth, the third one describes the hypotheses to test the model, the fourth one provides the results of the hypothesis, the fifth one measures the rate of success and finally we provides recommendations along with conclusions.

## Literature Review

"...In the developing world, things are very different. Mobile phones are increasingly recognized as powerful tools in the fight against poverty, since they reduce transaction costs, facilitate entrepreneurship and substitute for slow, unreliable transport and postal systems." (The Economist, October 1st-7th, 2005)

" Delora Begum's home office is a corrugated metal and straw hut in Bangladesh with a mud floor, no toilet and no running water., yet in this humble setting, she reigns as the 'phone lady'. A successful entrepreneur and a person of standing in her community. It's all due to a sleek Nokia cell phone. Mrs. Begum acquired the handset in 1999. Her telephone "booth" is mobile: during the day, it's the stall on the village's main dirt road; at night, callers drop by her family hut to use the cell phone. Once the phone hookup was made, incomes and quality of life improved almost immediately for many villagers. This new channel of communication allows villagers to learn the fair value of their rice and vegetables, cutting out middlemen notorious for exploiting them. They can arrange bank transfers or consult doctors in distant cities. Besides, a villager who is owner of a mobile phone earns about \$600 a year which is about twice the annual per capita income in Bangladesh."(Jordan, Wall Street Journal, June 25, 1999).

Like delora begum, Grameen phone now owns 260,000 village phone subscribers who are playing the role of a change agent in the rural parts of Bangladesh by connecting the community with their fingertips. And all these members who are mostly women have broken the vicious circle of poverty, elevated their social, economical and family status, quite well known in the locality and attained importance in the society, "Phones have helped elevate the status of the female phone operators in the village. Surveys have found that the Village Phone Operators become socially empowered as they earn an income, gaining participation in family decisions in which, in rural Bangladeshi society, women usually have no say"(WRI:2002). They are solving real problems and as a result, "the BOP

consumers get products and services at an affordable price but more important, they get recognition, respect and fair treatment”(prahalad,2005).One of the studies conducted by the TeleCommons Development Group (TDG) of Canada for the Canadian International Development Agency highlighted that "The Village Phone Program yields significant positive social and economic impacts, including relatively large consumer surplus and immeasurable quality of life benefits, The consumer surplus from a single phone call to Dhaka, a call that replaces the physical trip to the city, ranges from 264 percent to 9.8 percent of the mean monthly household income. The cost of a trip to the city ranges from 2 to 8 times the cost of a single phone call, meaning real savings for poor rural people of between BDT 132 to BDT 490 (USD 2.70 to USD 10) for individual calls," noted the TDG multi-media case study on the Village Phone Program."(www.grameenphone.com)

According to Dr. Muhammad Yunus, “Village Phone fosters meaningful, lasting change in people’s lives. It brings economic benefit to the local entrepreneurs who run the service like a public pay phone system, gives their communities greater access to government services and markets for their products, and connects them with friends and relatives living in other areas” (Keogh and Wood, 2005). This journey of such mobile entrepreneurship started in 1997 in Bangladesh and continued its dramatic growth till 2006 by connecting 60 million people and 61 zillas through it mobile entrepreneurs whom we are calling ‘phone ladies’. This unique program of Grameen phone paves the way for remote rural villagers to access into telecommunication facilities where no such services were available before. The Program enables mostly poor village women to own a Village Phone subscription and retail the phone service to her fellow villagers while providing them with a good income-earning opportunity. It is administered by Grameen Telecom in cooperation with Grameen Bank, the internationally renowned micro-credit lending institution.

#### **Village Phone and its genesis**

Village phone is the name of an information umbrella in rural Bangladesh to empower the rural community to access into telecommunication facilities and to solve their day to day problems. The business model is standing on a profitable partnership among the village Phone Company, telecommunication provider, and micro finance institute and phone users to present a win-win situation. By leapfrogging fixed infrastructure and leveraging existing wireless infrastructure, Village Phones offer a viable strategy for increasing teledensity in developing countries and helping the poor lift themselves out of poverty. (Keogh and Wood, 2005)

#### **Village phone model and its Mechanism**

In Bangladesh most of the people live in rural villages and until recently they were disconnected from urban cities and deprived of modern amenities due to lack of telecommunication facilities. With the advent of mobile communication, the situations improved a bit but telecommunication facilities remained beyond the reach of general people. In that critical situation Grameen village phone came up with a unique and solid business model to bring the village people under the communication network by facilitating entrepreneurship. To implement the model successfully, Grameen Bank (a micro finance organization) played a crucial role to interact with the customers at the bottom line, selling airtime and making financial transactions. These deep links into the community are essential for introducing new services which act as channel to market telecommunication services to the rural people. By utilizing microfinance institutions as a channel to market, Grameen phone in Bangladesh was able to tap a market that was previously inaccessible because of the prohibitively high cost of developing and maintaining a channel to this enormous market. As a member of a microfinance institution (Grameen Bank), a potential Village Phone Operator uses a loan to purchase everything needed to start their business. The Village Phone starter kit costs approximately US\$200-US\$250 and includes a mobile phone, prepaid airtime card, external Yagi antenna, charging solution, signage, marketing collateral, and other materials necessary to get started. The Starter Kit is created by the “Village Phone Company” (Grameen Telecom) which establishes relationships with microfinance institutions to bring this product to their customers. The Village Phone Company negotiates wholesale airtime rates from the Telecommunications Provider (Grameen phone) who provides access to existing telecommunications infrastructure for the Village Phone Operators. Individual villagers in rural areas can then visit their local Village Phone Operator and make an affordable phone call. With proceeds from the business, the Village Phone Operator contributes to their loan repayment and also purchases additional prepaid airtime cards. The microfinance institution earns money from the loan and also a percentage of the revenue from airtime sales. The Telecommunications Provider earns money through volume sales of airtime, and the Village Phone Company earns enough money to continue to promote and

expand the program. There are no subsidies in this model. It works because it is designed so that all parties in the partnership “win” (Keogh and wood, 2005).

**Win-win situation among the parties** (Keogh and wood, 2005)

partner	Essential service provided	Winning strategy
Telecommunication company	Communication structure coverage to the rural areas	New revenue generated from airtime sales from a previously inaccessible market.
Microfinance institution	Provide loans to village phone operators so they can purchase equipment to start a village phone business.	Income from loans and airtime sales and a new product to market to clients.
Village phone operator	Affordable telecommunications to members of their community.	Profitable business which earns a steady income.
Community members	Customer base for village phone operators.	Access to affordable telecommunication.
Village phone company	Crafts and manages relationships, facilitate supports, manage overall program.	Sustainable operation.

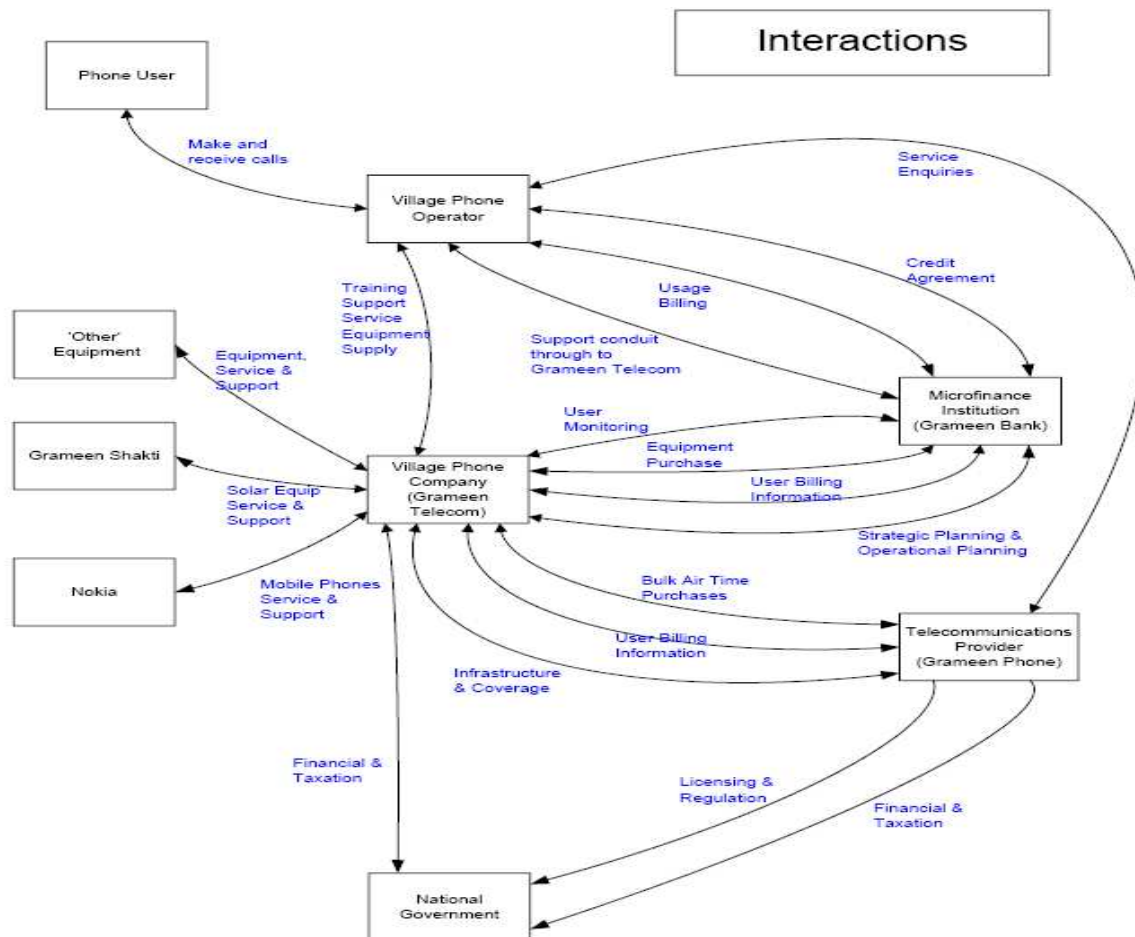

FIG1: INTERACTION AMONG THE PARTIES OF VILLAGE PHONE MODEL (KEOGH AND WOOD, 2005)

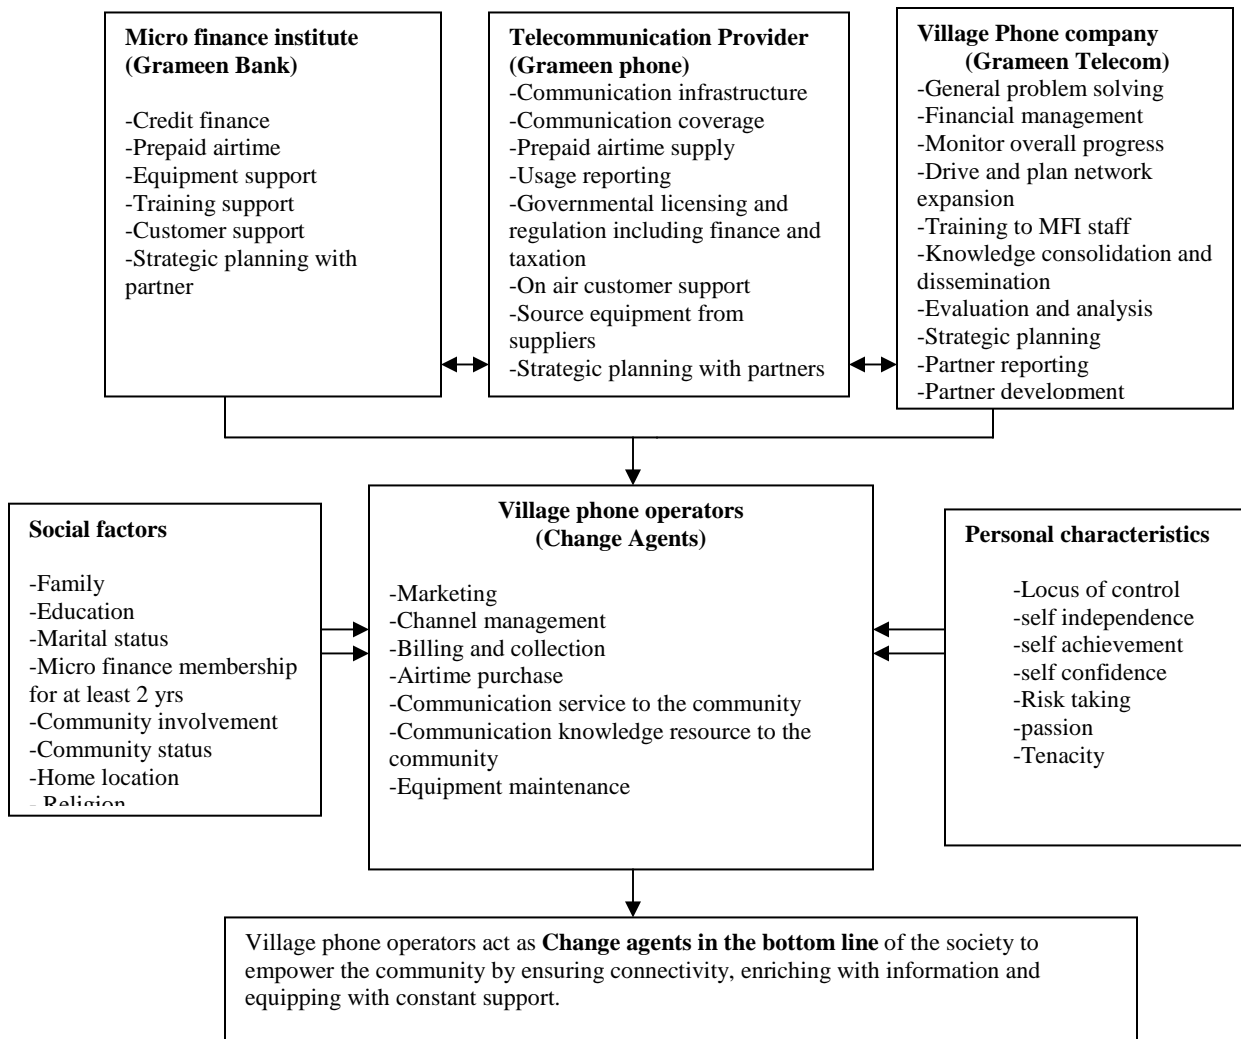

### Mobile entrepreneurs and their personal characteristics analysis

“Entrepreneurship is the pursuit of opportunity beyond the resources you currently control.” (Stevenson 1983, 1985, 1990). Examining history and culture in more than 40 countries over the last two decades, some findings (Baum and Locke, 2004) emerge as follows:

- Entrepreneurship flourishes in communities where resources are mobile;
- Entrepreneurship is greater when successful members of a community reinvest excess;
- Capital in the projects of other community members;
- Entrepreneurship flourishes in communities in which success of other community members is celebrated rather than derided;
- Entrepreneurship is greater in communities that see change as positive rather than Negative.

Personality traits, organizational factors, and environmental factors have been studied by entrepreneurship researchers as causes of new venture success; however, from 1961 to 1990, research about entrepreneurs' traits found only weak effects (Aldrich & Wiedenmayer, 1993). The weak results for traits were surprising because new venture financiers and entrepreneurs themselves pointed to entrepreneurs' personal characteristics as dominant reasons for success (Sexton, 2001; Smith & Smith, 2000). Recently, a growing cohort of psychology-based researchers has renewed interest in entrepreneurs' personal characteristics as predictors of success by moving beyond the past focus on traits to study competencies, motivation, cognition, and behavior. More complex models, better research tools, and concepts that are closer to performance in terms of causality have been used (Baron, 1998; Baum, Locke, & Smith, 2001; Busenitz & Barney, 1997; Mitchell, Smith, Seawright, & Morse, 2000). Early entrepreneurship research focused on finding general traits and motives of successful entrepreneurs (Brockhaus, 1980). Researchers hoped that personality screening could help entrepreneurs avoid personal disappointment and could help nations avoid wasted resources (McClelland, 1965). To cope with these challenges, we believed that entrepreneurs had to genuinely love their work and be tenacious about pursuing their goals given the many obstacles they would face. Thus, *passion* and *tenacity* seemed most promising in terms of leadership and entrepreneurship theoretical support (Locke, 2000; Yukl, 1989). Besides, passion and tenacity, in our case, we will analyze *locus of control* in entrepreneurship as there is a positive correlation between venture success and internality (Jennings and Zietz, 1966), *need for independence* as he has a desire to be his own boss and to do things in his own way (Hisrich and Brush, 1985), *need for achievement* refers to psychological characteristics moving toward recognition (McClelland, 1965) and *risk taking intention* is a part of entrepreneurial process whether financial, social or psychological (Hisrich and Brush, 1985). If we think about personal characteristics of women entrepreneurs, then females are motivated by the same need for money, wish to be independent, and identification of business opportunities as their male counterparts (Garritson, Beyer and Namaki, 1986). In fact, when traditional personality tests are conducted, no significant differences emerge with regard to achievement motivation, autonomy, persistence, aggression, independence, non-conformity, goal-orientation, leadership, or locus of control. On only one important factor do males and females appear to differ significantly: self-confidence (Chaganti, 1986).

## Model Development (on factors affecting the growth of mobile entrepreneurship)

It is quiet evident that the key parties which are moving the wheels of the model are microfinance organization, telecommunication provider, village phone company and village phone operators. The implementation of the model depends on successful execution of responsibilities of the key parties. Besides, village phone operators are also influenced by some social and personal factors which are influencing the growth of the business at the bottom line.

### Hypotheses development:

**H1: phone ladies' are satisfied toward the micro finance organization**

**H 1.1:** Credit finance is adequate to buy village phone

**H 1.2:** Interest rate is within the tolerance level

**H 1.3:** Training is helpful to operate the business

**H 1.4:** Customer support GB is helpful to operate the business

**H2: phone ladies' are satisfied toward the telecommunication provider**

**H 2.1:** My village phone is under the network coverage

**H 2.2:** I can connect to the network at any time

**H 2.3:** Customer support of GP is satisfactory

**H3: phone ladies' are satisfied toward the village phone company**

**H 3.1:** Mobile set is satisfactory

**H 3.2:** Antenna can capture the network

**H 3.3:** Any Problems of set is fixed up promptly

**H 3.4:** we can gain profit after paying the bills

**H4: phone ladies are possessing some specific entrepreneurial factors.**

**H 4.1:** I have control over my business

**H 4.2:** I want to be self independent

**H 4.3:** I have a desire to achieve my goal

**H 4.4:** I have confident to reach my target

**H 4.5:** I have a passion for success

**H 4.6:** I will be stick to my business in any difficulty

**H5: social factors influence the growth of village phone model**

**H 5.1:** my family is supporting me to conduct my business

**H 5.2:** my primary education is helping me to operate my business

**H 5.3:** I am not facing any religious restrictions from my community.

**H 5.4:** I have got recognition in society.

**H 5.5:** other ladies want to follow me.

**H6: overall, phone ladies are satisfied with their present venture.**

**H 6.1:** village phone operators are satisfied with their venture

**H 6.2:** village phone operators recommend others to undertake this venture.

**Results of Hypotheses Testing**

TABLE 1: PHONE LADIES' ARE SATISFIED TOWARD THE MICRO FINANCE ORGANIZATION

	Test Value = 3					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
to determine the attitude toward credit finance	17.195	119	.000	1.233	1.09	1.38
to determine the attitude toward interest rate	31.795	119	.000	1.450	1.36	1.54
to determine the attitude toward training	31.795	119	.000	1.450	1.36	1.54
to determine the attitude toward service	11.317	119	.000	.908	.75	1.07

Through this analysis we have tried to figure out the role of grameen bank in facilitating the village phone program. It is evident from the analysis that the phone ladies are very much satisfied with the support of the grameen bank because here all the hypotheses have been accepted according to our one sample t-test.

**H 1.1:** Credit finance is adequate to buy village phone

Here the hypothesis is accepted since the calculated value (.000) is less than the critical value (.05). So we can conclude that Phone ladies are satisfied with the amount of credit provided by grameen bank to be an owner of a village phone.

**H 1.2:** Interest rate is within the tolerance level

Here the hypothesis is accepted since the calculated value (.000) is less than the critical value (.05). So we can conclude that Phone ladies are satisfied with the interest rate provided by grameen bank to be an owner of a village phone.

**H 1.3:** Training is helpful to operate the business

Here the hypothesis is accepted since the calculated value (.000) is less than the critical value (.05). So we can conclude that Phone ladies are satisfied with the training provided by grameen bank to be an owner of a village phone.

**H 1.4:** Customer support GB is helpful to operate the business

Here the hypothesis is accepted since the calculated value (.000) is less than the critical value (.05). So we can conclude that Phone ladies are satisfied with the customer support provided by grameen bank to be an owner of a village phone.

**Table 2: phone ladies' are satisfied toward the telecommunication provider**

	Test Value = 3					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
to determine the attitude toward network coverage	16.353	119	.000	1.108	.97	1.24
to determine the attitude toward instant connection	16.279	119	.000	.992	.87	1.11
to determine the attitude toward customer support	13.362	119	.000	.892	.76	1.02

The above output clearly says that phone ladies are satisfied with the services of grameen phone (telecommunication provider) in terms of network coverage, instant connection and on air customer support. So this hypothesis is accepted as all the items' calculated value (.000) is less than the critical value (.05).

**H 2.1:** My village phone is under the network coverage

Phone ladies are satisfied with the network coverage set up by the grameen phone. So the hypothesis is accepted since the calculated value (.000) is less than the critical value (.05).

**H 2.2:** I can connect to the network at any time

Phone ladies can easily access into network whenever they want to meet up their clients' demand. So the hypothesis is accepted since the calculated value (.000) is less than the critical value (.05).

**H 2.3:** Customer support of GP is satisfactory

Phone ladies have expressed their satisfaction with the on air customer support of telecommunication provider (Grameen Phone). So the hypothesis is accepted since the calculated value (.000) is less than the critical value (.05).

TABLE 3: PHONE LADIES' ARE SATISFIED TOWARD THE VILLAGE PHONE COMPANY

	Test Value = 3					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
to determine the attitude toward mobile set	22.024	119	.000	1.342	1.22	1.46
to determine the attitude toward antenna	14.037	119	.000	1.117	.96	1.27
to determine the attitude toward services of grameen telecom	27.671	119	.000	1.675	1.56	1.79
to determine the attitude toward profit	31.670	119	.000	1.442	1.35	1.53

Village Phone Company, that is, Grameen Telecom assists the village phone operators with mobile set, network connecting antenna, billing on calls and overall services. Our analysis says that phone ladies are satisfied with the village phone company from all dimensions.

**H 3.1:** Mobile set is satisfactory

Phone ladies are satisfied with the mobile set provided by the village phone company which is reflected in our hypothesis testing in which the calculated value (.000) is less than the critical value (.05).

**H 3.2:** Antenna can capture the network

Network connecting antennas provided by the village phone companies working well and assisting phone ladies to connect with the network at any time. This hypothesis is accepted as the calculated value (.000) is less than the critical value (.05).

**H 3.3:** Any Problems of set is fixed up promptly

Village Phone Company serves phone ladies promptly with their sales representative who are closely connected with the customers for dealing with the credit issue. So this hypothesis is accepted as the calculated value (.000) is less than the critical value (.05).

**H 3.4:** we can gain profit after paying the bills

Village phone operators are satisfied with the profit amount after paying their bills to the village phone company. And it is reflected in our hypothesis testing as the calculated value (.000) is less than the critical value (.05).

TABLE 4: PHONE LADIES POSSESS SOME SPECIFIC ENTREPRENEURIAL CHARACTERISTICS

	Test Value = 3					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
to determine the attitude locus of control	22.809	119	.000	.992	.91	1.08
to determine the attitude toward self independence	30.860	119	.000	1.325	1.24	1.41
to determine the attitude toward self achievement	31.553	119	.000	1.433	1.34	1.52
to determine the attitude toward self confidence	16.572	119	.000	1.000	.88	1.12
to determine the attitude toward risks	31.296	119	.000	.892	.84	.95
to determine the attitude toward tenacity	30.017	119	.000	.883	.83	.94

At this phase of analysis, we have evaluated all the entrepreneurial factors which are influencing the growth of village phone based entrepreneurship in Bangladesh. Here it is clearly evident that phone ladies who have been proved as successful entrepreneurs by possessing some specific personal characteristics like locus of control, self independence, a strong desire of self achievement, self confidence, an easy mentality of taking risks and an aggressive mind to stick with the business in any difficulty.

- H 4.1:** I have control over my business  
(Hypothesis is significant as calculated value .000 is less than .05)
- H 4.2:** I want to be self independent  
(Hypothesis is significant as calculated value .000 is less than .05)
- H 4.3:** I have a desire to achieve my goal  
(Hypothesis is significant as calculated value .000 is less than .05)
- H 4.4:** I have confident to reach my target  
(Hypothesis is significant as calculated value .000 is less than .05)
- H 4.5:** I have a passion for success  
(Hypothesis is significant as calculated value .000 is less than .05)
- H 4.6:** I will be stick to my business in any difficulty  
(Hypothesis is significant as calculated value .000 is less than .05)

**H5: SOCIAL FACTORS INFLUENCE THE GROWTH OF VILLAGE PHONE MODEL**

	Test Value = 3					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
to determine the attitude toward family support	34.233	119	.000	1.558	1.47	1.65
to determine the attitude toward community support	8.792	119	.000	.558	.43	.68
to determine the attitude toward primary education	3.802	119	.000	.108	.05	.16
to determine the attitude toward religious restriction	-2.087	119	.039	-.200	-.39	-.01

In addition to entrepreneurial factors, we have also analyzed the social factors which are fostering the growth of village phone model in Bangladesh. Here in our case, we have evidenced positive support from family, community, primary education and religion which are accelerating the growth of village phone in Bangladesh.

- H 5.1:** my family is supporting me to conduct my business  
Phone ladies are satisfied with the support from the family which is reflected in our hypothesis testing in which the calculated value (.000) is less than the critical value (.05).
- H 5.2:** my primary education is helping me to operate my business  
Phone ladies are expressing their positive intention toward primary education as it is helping them to run their business successfully. And it is reflected in our hypothesis testing in which the calculated value (.000) is less than the critical value (.05).
- H 5.3:** I am not facing any religious restrictions from my community.  
Phone ladies are not facing any religious restrictions from the community to run the business as local NGOs are creating a lot of awareness programs over the issue. And it is reflected in our hypothesis testing in which the calculated value (.000) is less than the critical value (.05).
- H 5.4:** I have got recognition in society.

Phone ladies have got recognition to elevate their status in society which is reflected in the hypothesis testing as the calculated value (.000) is less than the critical value (.05)

**H 5.5:** other ladies want to follow me.

Phone ladies have become 'a role model' to others in the society and they also want to follow them. This is supported by our hypothesis testing as the calculated value (.000) is less than the critical value (.05).

TABLE 6: PHONE LADIES ARE SATISFIED WITH THEIR PRESENT VENTURE

	Test Value = 3					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
to determine the attitude toward satisfaction	24.818	119	.000	1.550	1.43	1.67
to determine the attitude toward recommendation	16.553	119	.000	1.008	.89	1.13

Finally we have determined the level of satisfaction of village phone operators toward their ventures. It is clear that village phone operators are very satisfied with their business and they are ready to recommend others to undertake this venture and become successful entrepreneur.

**H 6.1:** village phone operators are satisfied with their venture

Phone ladies have expressed their utmost satisfaction toward their venture which is reflected in our hypothesis testing as the calculated value (.000) is less than the critical value (.05).

**H 6.2:** village phone operators recommend others to undertake this venture.

Phone ladies are also ready to recommend the venture mechanism to others to follow the way of development. And it is also reflected in our hypothesis testing as the calculated value (.000) is less than the critical value (.05).

### Rate of Success in Bangladesh:

One of the greatest success stories in international development has been Grameen Village Phone program in Bangladesh. "... [Grameen Village Phone] has had considerable development benefits. It has reduced the cost of communications relative to other services such as transportation...the program has enabled the village pay phone entrepreneurs, poor by most standards but among the better-off in their villages, to turn a profit" (The World Bank Group Report: 2000) .

- The poor, disconnected and deprived people are now empowered with instant information to solve their problems. Now they don't need to make a costly physical trip to go to the city rather they can get the prompt support of phone ladies at their next doors. And in this way, the phone ladies are acting as change agents to shape the fates of their families and their neighbors.
- The typical "village phone lady" has an average income three times the national average. The most obvious benefit of the Village Phone program is the economic and social impact that this communications tool brings to the entire village.
- The local farmers are no more victims of unscrupulous middlemen, parents are no more worried about their kids' health and education and local community are no more afraid of the sudden attack of disasters, "Farmers from the villages use the phones to call the city markets to find out prices for their produce. Previously they were a little bit short-changed by their middlemen. The middlemen would say a lower price than what the actual market price was. So now they can call the market themselves to find out what the actual price of eggs or whatever their produce is. An independent study found that half the people who use the phones regularly, traders in rice or bananas for example, make more money from their business and they save 10 hours in travel time" (NPR: 2002).

- According to Prof. Iqbal Qadir(Cofounder, Grameen Phone), “If the Grameen Telecom experience is a reliable guide, then providing phone service yields powerful social and economic benefits in rural communities....Empowering poor communities by providing a wide range of digitally enabled self-help tools – via the private sector – could become a crucial part of an effective rural development strategy ... Business is a proven method of solving their [poor individuals] problems in a sustainable way.” (Keogh and wood, 2005).
- In a Canadian International Development Agency (CIDA) commissioned study, the consumer surplus for a single phone call ranges from 2.64% to 9.8% of mean monthly household income. The cost of a trip to the city ranges from two to eight times the cost of a single phone call, meaning that the real savings for poor rural people is between \$2.70 and \$10.00 for individual calls (Keogh and wood, 2005).
- The income that Village Phone Operators derive from the Village Phone is about 24% of the household income on average – in some cases it was as high as 40% of the household income. Because the phone operators are typically female and the phones are in their places of business, women who might otherwise have very limited access to a phone feel comfortable using Village Phones. Furthermore, as these phones become important for the whole village, the status of women in the communities where they work is enhanced.

### **Overall Findings and Recommendations:**

Village phone program is an integrated model of development at the bottom line to turn the inactive workforce into successful entrepreneurs with the help of microfinance organization and mobile phone operators. Through our analysis it is clear that this dynamic entrepreneurship is not a one way journey, rather it is impacted by the personal characteristics, social factors and the pertinent organizations who are paving the way for this revolution.

- Since micro finance organization initially provides the credit to be a village phone owner, so they are in charge of selecting capable phone ladies which can be justified by our entrepreneurial factors of locus of control, self independence, self achievement, self confidence, tenacity and mentality to take risks.
- Village Phone Company can create social awareness programs highlighting the success of phone ladies and positioning them as ‘role models’ for others for development. They can also handle positively all social factors like the importance of primary education, religious flexibility the support of family and community to smooth the growth of village phone.
- The village phone company can target un-served and under-served regions and provide support for acquisition of quality market appraisal knowledge and market data through market research in the field.
- The Village Phone programme appears to be the best available technical solution for rural universal access under current regulatory and commercial circumstances. The Village Phone programme is the best solution to rural telecommunication access partly necessitated by a regulatory environment that is not conducive to advancing rural telecommunication infrastructure. So regulatory bodies can reduce taxes over this venture to smooth the growth of root level development.
- Finally, since phone ladies are acting as change agents, so we can turn them into information hub by linking with contend providers to a large extent. In this way, we can create a knowledge based community for radical development of society.

# The Critical Success Factors for Six Sigma Implementation: Empirical Evidence in Malaysia

Sivabalan Sasthriyar, [shmz@usm.my](mailto:shmz@usm.my)  
Suhaiza Zailani  
Yudi Fernando  
Universiti Sains Malaysia

## Abstract

Six Sigma has grown quickly throughout the world, in terms of companies' performance, quality, cost reduction and customer satisfaction. The research examined the critical success factors of Six Sigma which gives perceived Six Sigma success to the organizations. Out of the many companies in the Sirim QAS International Directory a simple sample of 200 electronics companies chosen. The response was 60 companies, which gives a 30% of the sample. Finding revealed that there is a positive relationship between critical success factors with the perceive Six Sigma success implementation in the Malaysian companies. With this the final analysis resulted that the perceived Six Sigma successes are dependent on the critical success factors of implementation. *Key words:* Six Sigma, Success Factor, Electronic, Malaysia

## Introduction

Industries around the world need to continue to improve the quality of its products and services if it is to continue to compete effectively in both domestic and world markets. Statistical methods are an important tool in the quality improvement activities because they provide both descriptive and analytical methods for dealing with the variability in observed data. One of the most widely used tools is the Six Sigma method. Six Sigma has been around for decades many of them neglected it due to the difficulty and its discipline. Furthermore the use of computers has made this application possible where the outputs can be made to be very presentable. Industries often use this Six Sigma tool in various areas from improving the lead-time, quality and management.

Six Sigma is a powerful breakthrough improvement business strategy that enables companies to use simple and powerful statistical methods to define measure, analyze, improve and control processes for achieving and sustaining operational excellence. Today's leaders from the industries fond of Six Sigma simply because it has generated bottom-line results for all kinds of organizations in hundreds of cases. As the inventor of Six Sigma, Motorola has used Six Sigma methodology in product design, manufacturing, and services in every business unit where in one particular case Motorola have brought down manufacturing time for a product from 40 days to less than 1 hour. Six Sigma also drives strategy execution where in today's demanding business environment; organizations need reliable management systems capable of aligning strategy and delivering breakthrough results. In addition Six Sigma generates flexible and robust business processes. It can be applied to tackle a specific problem in a single department or to renew the entire business.

Six Sigma provides companies with a common vehicle and language to frame business goals focus organizational energy and drive results. Its implementation involves building human capability with common approaches and tools to address business process issues. Industries found Six Sigma as a low risk investment the financial returns that far outweigh the investments required (Pande et al, 2000). That is why a lot more companies have followed the footsteps of Motorola, for example Pentagon, Nasa, Sony, 3M, Citicorp, General Electric, Texas Instruments, Intel, Seagate, Xerox and Hewlett Packard. The outcome implications are the benefits prevailed from these critical success factors of Six Sigma to the firms. This benefit includes customer satisfaction, cost reduction, transformation of quality embracement culture and establishing an efficient organization.

The focus of this paper is to identify the most critical factors for the implementation of Six Sigma programs that will lead to success in Malaysian companies. The outcome or the findings of this paper is to understand how well implemented critical success factors contribute to the total success of Six Sigma. The rest of the paper is organized as follows. First, an overview of relevant literature review in respect to identified Six Sigma factors. After

that, the methodology and the data analysis of the results are presented. The end of this paper concludes with discussion and suggestion for further research.

## **Literature review**

Six Sigma is a rigorous, focused and highly effective implementation of proven quality principles and techniques. A company's performance is measured by the sigma level of their business processes. Traditionally companies accepted three or four sigma performance levels as the norm, despite the fact that these processes created between 6,200 and 67,000 problems per million opportunities. The Six Sigma standard of 3.4 problems per million opportunities is a response to the increasing expectations of customers and the increased complexity of modern products and processes. A higher sigma quality level value is better. A Six Sigma quality level is said to equate to a 3.4 parts per million outside specification limits. Most organizations today operate between two and three sigma, however in U.S. the manufacturing firms frequently attain four sigma quality levels, whereas service firms often operate at quality levels of one or two sigma (Montgomery & Runger, 1999).

For Motorola, the originator of Six Sigma, the answer to the question "Why Six Sigma?" was simple which is survival. Motorola came to Six Sigma because it was being consistently beaten in the competitive marketplace by foreign firms that were able to produce higher quality products at a lower cost. Today, Motorola is known worldwide as a quality leader and a profit leader. After Motorola won the Malcolm Baldrige National Quality Award in 1988 the secret of their success became public knowledge and the Six Sigma revolution was on. Initially, the concept of implementation of Six Sigma methodology at Motorola is to reduce quality costs, i.e. costs of not doing things right first time, costs of not meeting customer requirements, etc.

However, Six Sigma stresses the application of statistical and problem-solving tools and techniques in a methodical and systematic fashion to gain knowledge that leads to breakthrough improvements with dramatic impact on the bottom-line results. While the original goal of Six Sigma was to focus on manufacturing process, in the present day, marketing, purchasing, billing and invoicing functions are also embarked on Six Sigma strategies with the aim of continuously reducing defects throughout the organization's processes (Dale, 2000).

### **Infrastructure for Six Sigma**

There are previous study has shown that failure to provide this infrastructure is the number 1 reason why 80% of all TQM implementations failed in the past. Six Sigma makes improvement and change the full-time job of a small but critical percentage of the organization's personnel. The key to Six Sigma improvement success is the building up of an effective infrastructure. An effective infrastructure lays the foundation for the success of the organization in its implementation of Six Sigma. It is a known fact today that the success of Six Sigma lays on the projects selected and their link to the strategy of their organization.

The fundamental idea behind the Six Sigma philosophy is to continuously reduce variation in processes and aim at the elimination of defects or failures from every product, service and transactional process (Hoerl, 1998). Six Sigma can be defined in both statistical and business terms. In business terms, Six Sigma is a business improvement strategy used to improve profitability, to drive out waste, to reduce quality costs and improve the effectiveness and efficiency of all operations that meet or even exceed customers' needs and expectations (Antony & Banuelas, 2001). In statistical terms, Six Sigma is a term that refers to 3.4 defects per million opportunities (DPMO), where sigma is a term used to represent the variation about the process average.

There are 10 myths of Six Sigma (Snee, 1999) which needs dispelling as listed below:- (a) Works only in manufacturing (b) Ignores the customer in search of bottom-line benefits (c) Creates a parallel organization (d) Is an add-on effort (e) Requires massive training (f) Requires large teams (g) Creates bureaucracy (h) Is just another quality program (i) Requires complicated, difficult statistics (j) Is not cost-effective

### **Factors for the Success of Six Sigma**

In order to manage and optimize the process output, it is important that we identify the main factors which influence the output. The first step was to carry out an exploratory study on the topic as similar studies were performed by authors such as Pande et al. (2000) and Henderson and Evans (2000). Moreover, it is also important to learn the importance of these success factors in a ranking or prioritized order, particularly in the Malaysian companies. The

relative weightings of critical success factors (CSFs) would assist people to understand what factors are essential for making Six Sigma process successful and what factors are not important to the success. It would also assist people in organizations to gain a better understanding of the process of Six Sigma implementation. The following CSFs are identified from the literature.

#### **Management involvement and commitment**

The underlying principles of Six Sigma must be taught to senior managers within the organization. Jack Welch, the CEO of General Electric has strongly influenced and enabled the restructuring of the business organization and changed the attitude of the employees towards Six Sigma (Henderson and Evans, 2000). Without the continuous support and commitment from top management, the true importance of the initiative will be in doubt and the energy behind it will be weakened (Pande et al., 2000).

#### **Cultural change**

Six Sigma initiatives require the right mindset and attitude of people working within the organization at all levels. The people within the organization must be made known and be aware of the need for change. Companies that have been successful in managing change have identified that the best way to tackle resistance to change is through increased and sustained communication, motivation and education (Henderson & Evans, 2000). With a true cultural revolution in an organization come two basic fears on an individual level: fear of change and fear of not achieving the new standards. To overcome fear of change in any industrial environment, the people involved must understand the need for change.

#### **Organization infrastructure**

The employees in an organization practicing Six Sigma are generally highly trained, have undergone rigorous statistical training, and lead teams in identifying, executing and managing Six Sigma projects. In many multinational corporations, Six Sigma initiatives are led by the CEO or vice-president, who is considered as the Six Sigma champion. This will be followed by the formation of master black belts, black belts, green belts and other team members who are individuals who support specific projects in their area (Harry & Schroeder, 2000). The timing and readiness of the organization is also important. This is because Six Sigma effort requires a great deal of resources such as staff commitment, top management commitment, time, energy and costs, etc.

#### **Training**

It is critical to "communicate both the 'why' and the 'how' of Six Sigma as early as possible, and provide the opportunity to people to improve their comfort level through training classes" (Hendricks & Kelbaugh, 1998) before unleashing the employees into the world of Six Sigma. There is usually a hierarchy of expertise, which is identified by the "belt system". The belt system ensures that everyone in the organization is speaking the same language. This makes the setting up and execution of Six Sigma projects much easier throughout the organization. The curriculum in the belt system varies from organization to organization and consultant to consultant; however it needs to be provided by identifying the key roles of the people directly involved in applying Six Sigma.

As mentioned that training is a crucial factor in the successful introduction and development of Six Sigma program. There is usually a hierarchy of expertise, which is identified by the belt system. Within GE, the belt system is fundamentally divided into (Henderson & Evans, 2000): (a) Champions – fully trained business leaders promoting and leading the Six Sigma deployment in significant or critical areas of the business. (b) Master Black Belts (MBBs) – fully trained quality leaders responsible for Six Sigma strategy, training, mentoring, deployment and results. (c) Black Belts (BBs) – fully trained experts leading improvement teams across the business. (d) Green Belts (GBs) – individuals trained in Six Sigma supporting Six Sigma projects. (e) Team members – individuals supporting specific projects in their areas.

#### **Project management skills**

As Six Sigma is a project driven methodology, it is good practice for the team members to have project management skills to meet the various deadlines or milestones during the course of the project (Antony & Banuelas, 2001). Most of the projects on Six Sigma fail due to poor project management skills, setting and keeping ground rules, determining the meeting's roles and responsibilities.

#### **Project prioritization and selection, reviews and tracking**

There have to be proper criteria for the selection and prioritization of projects. Poorly selected and defined projects lead to delayed results and also a great deal of frustration. Pande et al. (2000) provide three generic categories of

projection selection criteria. These are:- (1) Business benefits criteria (a) impact on meeting external customer requirement; (b) financial impact; (c) impact on core competencies. (2) Feasibility criteria (a) resources required; (b) complexity; (c) expertise available, etc. (3) Organizational impact criteria (a) cross-functional benefits; (b) learning benefits, i.e. new knowledge gained about the business, customers and processes.

#### **Understanding the Six Sigma methodology, tools and techniques**

A healthy portion of the Six Sigma training involves learning the principles behind the Six Sigma methodology, i.e. DMAIC methodology. During the training, employees learn three groups of tools and techniques, which are divided into process improvement tools and techniques, leadership tools and team tools. For many Six Sigma projects, generally simple statistical tools or quality tools are more than enough to tackle the problem at hand (Hoerl, 1998). However, for greater breakthrough improvements in business processes, certain advanced statistical tools and techniques (such as design of experiments, statistical process control, regression analysis, analysis of variance, etc.) are needed. In addition, there has to be a clear set of metrics that are used to measure process performance against customer requirements. Examples of metrics include defect rate, cost of poor quality, throughput yield, rolled throughput yield, etc. Accurate data are also required for analyzing potential root causes and support the team's decisions (Harry & Schroeder, 2000).

#### **Linking Six Sigma to business strategy**

Six Sigma cannot be treated as yet another stand-alone activity. It requires adherence to a whole philosophy rather than just the usage of a few tools and techniques of quality improvement (Dale, 2000). It needs to be clear how Six Sigma projects and other activities link to customers, core processes and competitiveness (Pande et al., 2000). Since the goal of every organization is to make profits, Six Sigma projects make business processes profitable while attacking variability which leads to high scrap rate, high rework rate, low productivity, etc. In every single project, the link between the project objectives and the business strategy should be identified.

#### **Linking Six Sigma to the customer**

A key element of the success of Six Sigma program is its ability to link to the customers. Projects should begin with the determination of customer requirements (Harry & Schroeder, 2000). However Pande et al. (2000) argue that before customer needs can be met successfully, there has to be a good understanding of the organization and its linkage to various business activities. The process of linking Six Sigma to the customer can therefore be divided into two main steps:- (a) Identifying the core processes, defining the key outputs of these processes (b) defining the key customers that they serve. Identifying and defining the customer needs and requirements. An important issue here is the selection of critical-to-quality characteristics (CTQs). These CTQs must be identified quantitatively in the starting phase of the Six Sigma methodology. Quality function deployment is a powerful technique to understand the needs and expectations of customers and translate them into design or engineering requirements. In service industry, the customer requirements are often ambiguous, subjective and poorly defined.

#### **Linking Six Sigma to human resources**

Human resources-based actions need to be put into effect to promote desired behavior and results. Some studies show that 61 per cent of the top performing companies link their rewards to their business strategies, while lower performing companies create minimal linkage (Harry & Schroeder, 2000).

#### **Linking Six Sigma to suppliers**

Many organizations that implement Six Sigma find it beneficial to extend the application of Six Sigma principles to management of their supply chain. The concept that "everybody plays" created special challenges for General Electric Appliances (GEA). You cannot be a Six Sigma company without your suppliers participating in the culture change (Hendricks & Kelbaugh, 1998).

## **Methodology**

This is a correlation study; it is expected to conduct in normal condition of the organization with minimum interference by the third party or the researcher with the normal work flow or which is normally known as the field study. The population of this study comprises of all the electronics companies operating in Malaysia that is registered under SIRIM QAS International Directory of certified Products and Companies (2004). This study is using the directory as the population frame. Out of the many companies in the SIRIM QAS International Directory a

sample of 200 electronics companies chosen. The response was 60 companies, which gives a 30% of the sample population, using the rule of thumb method criterion (Sekaran, 2003). The unit of analysis in this study is the individual firm. The study used a random sampling method, which involves electronic companies in SIRIM QAS International Directory (2004). A random sampling procedure assures that each element in the *population* has an equal chance of being selected is referred to as *random sampling*.

#### **Variables and Measurement:**

##### **Independent Variables**

(a) Management involvement and commitment, there are seven items.

(b) Project prioritization and selection, reviews and tracking, there are four items.

(c) Understanding the Six Sigma methodology tools and techniques, there are four items

(d) Linking Six Sigma to business strategy, there are three items

(e) Linking Six Sigma to suppliers, there are four items

(f) Training, There are three items

(g) Company Infrastructure, There are three items

(h) Project Management Skills, There are two items

(i) Linking Six Sigma to human resources, there are four items

(j) Linking Six Sigma to customers, there are four items. All independent variable is measured on a five-point Likert-type scale ranging from 1, low level to 5, high level.

##### **Dependent Variable: Perceived Six Sigma Success**

This is measured on a five-point Likert-type scale ranging from 1, low level to 5, high level. There are four items that cover whether cost saving projects, efficient and improve culture, transformation in quality, engineering and cost in performance of the company and lastly meeting customers' requirements.

## **Results and discussion**

Majority of the companies surveyed are wholly-owned by non-Malaysian (93.3%) and 6.7% are jointly owned by Malaysian and non-Malaysian. Annual gross revenue of these companies consists of RM51- 100 million (5%) and more than RM100 million (95.0%). They were mostly operating more than 10 years (95.0%) and followed by 5 – 10 years (5.0%). The study also found that all of the companies surveyed employed more than 500 people of full time employees. Besides that, 81.7% of the respondents export their products, whereas 18.3% market their products both in domestic and export. About 45% respondents hold Six Sigma certification and 55.0% in progress of implementation. However, 50.0% of the respondents implemented Six Sigma to high extent, 35.0% at high level and 15.0% are neutral. Table 1 summarizes the respondents' companies.

TABLE 1: PROFILE OF RESPONDENTS' COMPANIES

TABLE 3: RELIABILITY OF INDEPENDENT AND DEPENDENT VARIABLES

Variables	Cronbach's Alpha
Management Involvement and Commitment	.823
Understanding the Six Methodology, tools and techniques	.774
Project prioritization and selection, reviews and tracking	.616
Linking with Business Strategy	.615
Linking with Supplier Management	.790
Linking with Human Resoucre	.727
Focus on customer satisfaction management	.592
Focus on Cultural change and new practices in organization	.517
Training	.679
Project Management skills	.606
Perceived Six Sigma Success	.531

Mean and standard deviation were obtained for all twelve variables from independent and dependent. From Table 2, it can be seen the means for all twelve variables are quite close, which is around the range of 2.87 to 4.05. The variable Cultural Change was the highest with the mean of 4.05 and lowest was 2.87, Company Infrastructure. The possible reason why cultural change is having a high mean is due to the way of life and practice in the organization. A new company culture, a way of life seems to be a key to the future.

Cronbach Alpha method is used to determine the reliability coefficient. It is to ensure that the items comprising factors produced a reliable scale. According to Sekaran (2003), reliability less than 0.60 are generally considered to be poor, those in a range of 0.70, to be acceptable, and those over 0.80 to be good. In this study, reliability test was run for the twelve factors. Cronbach's alpha for Factor 1, Management Involvement and Commitment is .82 for 7 items. For Factor 2 until Factor 10, alpha ranged from .52 to .82. It indicates greater consistency in Factor 1 compared to others.

Cronbach alpha reliability coefficient was highest 0.823 for management involvement and commitment. Meaning the Six Sigma implementation highly needs management involvement to give and set direction and executive plan. Lowest was 0.517 for focus on cultural change and new practice in organization. This perhaps the new practice will have some resistance at begin because the old culture needs to undergo some level of assimilation. Perceived Six Sigma Success shows a Cronbach alpha that is .531. This is low perhaps due to the adopted measurements of dependent variable is from an established variable which has been measured before. The statistical output for reliability is presented in Table 3.

TABLE 4: MULTIPLE REGRESSION ANALYSIS: - CRITICAL SUCCESS FACTOR FOR SIX SIGMA

*Dependent Variables: Perceived Six Sigma Success*

*Note: 2- tailed significant level at .05 (\*\*\* < .001 \*\* < .05 \* < 0.1)*

Overall, using multiple regression, it is found that all ten dimensions of critical success factors of Six Sigma (independent variable) as a group, explained 45% ( $R = .667$ ,  $R^2 = .445$ ,  $F = 3.926$ ,  $p = <.005$ ) in order to perceive Six Sigma success as shown in Table 4. Somehow, factors for Management Involvement and Commitment, and Linking with Supplier Management could not explain the relationship with Perceived Six Sigma Success at the significance level of  $p < .05$  with beta of 0.14 and 0.40. However, all other factors show significance level of  $p < .05$  with beta ranged from .040 to .424. So, hypotheses H1; Management involvement and commitment is positively related the success of Six Sigma implementation. and H5; Linking Six Sigma to supplier management is positively related to the success of Six Sigma implementation in the Malaysian companies are rejected. Besides that, H2, H3, H4, H6, H7, H8, H9 and H10 were accepted at significance level of  $p < .05$ .

Management Involvement and Commitment showed Cronbach alpha reliability coefficient was highest, but on contrary the Multiple Regression Analysis could not explain the relationship perceived Six Sigma success at the

significance level. This perhaps due to successful deployment of Six Sigma is not an end; obviously it is only the beginning. Like any business function, it requires the ongoing care and attention of those who are invested in its success. That is especially true in regards to how well the business has come to accept Six Sigma into its culture. So indeed the harder time getting management and managers to pay attention to them or to assign people to projects. There is little commitment to putting team members through any kind of training, so the Black Belts have to spend more time dealing with conflict and confusion and less time helping team members improve processes. The Black Belts also are beginning to be the butt of in-house jokes and resentment, and as a result are becoming a tight-knit group who do not welcome outsiders (Pande & Holpp, 2002).

During the earliest part of a Six Sigma implementation, the company watches closely all signs of success so the successes can be built upon, and all signs of failure so course corrections can be made. Everyone in the management chain is alert (George, 2003). But it is not unusual for organizations that have already implemented Six Sigma to let down their guard. Fortunately there are warning signals of trouble that can be acted upon. Sometimes, those signals are just gut feelings or uneasiness that employees are just paying lip service to Six Sigma. But in many cases, more concrete signals indicate that Six Sigma is beginning to become disconnected from the core business. Alert for these signs and engage the appropriate management to bolster or restore the original enthusiasm and commitment to Six Sigma. Any delay in taking corrective action could mean a lost window of opportunity for an on-going quality improvement program. Remember Six Sigma is about results, it is not about meeting training goals, counting the number of project teams working, or making presentations about what is going to be done (Montgomery & Runger, 1999). Management must insist there be a P&L financial validation to "book" the savings as real by constantly asking the right questions and specific.

The next was, *Linking with Supplier Management* showed poorly correlated, while the Cronbach alpha reliability was 0.790, show the measurements are reliable and good. The argue-mental reason could be the responsibility to make sure supplier management continues to meet customer and business needs today and into the future. Unfortunately, this role is difficult and could be overlook. A good process owner must understand about the output from the supplier, which is important to customers and to the business, and must have a thorough understanding of how his or her supplier management fits into the overall scheme of the business. This allows understanding there is other important factors which are relevant to perceived Six Sigma success. These discussions vary greatly in depth of coverage but usually include a variety of content on, Executive Engagement, Communications, Discipline and Consequences. Further more, each one of these Critical Success Factors may be broken down into sub-factors to further define the actions, measurements, roles, responsibilities and behaviors that each slice of the organization must demonstrate to assure Six Sigma successes and get significant results.

Consider the cost savings most often discussed in the annual reports of the best Six Sigma companies. They are usually discussing savings in a range of 2 - 3% of sales per year. Other organizations that have adopted Six Sigma success with far lesser amounts of financial success in the range of 0.5% to 1.0% of sales. Some discussion of critical success factors takes place greatly in depth of coverage but usually include a variety of content. Each one of these Critical Success Factors may be broken down into sub-factors to further define the actions, measurements, roles, responsibilities and behaviors that each slice of the organization must demonstrate to assure success and get significant results. These critical success factors and their sub-factors is merely a first step in the process of assuring their implementation and making them a permanent part of a company's culture and operating system.

The study also reveals that all ten dimensions of critical success factors of Six Sigma (independent variable) as a group explained 45%, in order to perceive Six Sigma success. This reveals, that there must be more these 10 independent critical success factors. So, it can be concluded that all the independent effects of critical success factors of Six Sigma were collectively predicting the perceived Six Sigma success. As a conclusion this research question is answered and indicated that the relationships of critical success factors of perceive Six Sigma success in the Malaysian companies and identifying the critical success factors for Six Sigma success in the

Malaysian companies. Impact of employee competencies on Perceived Service Quality has played an important role in service quality.

### Abstract

In this paper we analyse the reasons behind the evolution of the gender gap and wage inequality in South and East Asian and Latin American countries during the decades 1970-2000. Health human capital improvements, the exposure to free market openness and equal treatment enforcement laws seem to be the main exogenous variables affecting women's economic condition. During the second globalization era (in the years 1975-2000) different combinations of these variables in South East Asian and Latin American countries have had as a result the diminution of the gender gap. These results have further normative consequences for the measure of economic inequality. The improvement of women's condition has as a result the diminution of the dispersion of wages. Key words: wage inequality, gender gap, market openness, human capital. JEL CODES: J22, J13, J16

### The Data

It is well known that when we include women's income information in world's international comparisons the first problem we have is the lack of reliable data. In poor countries part of the work performed by women is in the informal economy, performed at home and for piece rates. The available information on this kind of work is still scattered in few datasets and not comparable across countries. The same problems arise to evaluate women's income derived from properties and other financial assets. This lack of information makes the comparison of women and men's incomes very difficult, almost impossible.

This is why we have limited our observations to urban wage earnings. As we shall see different sources report female and male wage earnings in a very systematic way, although this analysis also has some limitations. Income inequality measures are higher than earnings inequality indexes, since waged earnings show a lower dispersion than total incomes. Additionally, poor people, workers in the informal sector of the economy, employers and property owners are excluded from our analysis, which means that our data is not useful to analyse some economy-wide changes. But instead our data allows us to analyse rigorously and systematically gender differences in wage earnings, the main engines causing them and their implications for income inequality evolution.

In parts 5 and 6 of this paper we want to explain the gender gap in Asian and Latin American countries by means of regression analysis. The data come from the UN datasets. UN uses them to calculate Gender Development Index and the Gender Empowerment Index. These data are available in the Human Development Report (2005). It is important to stress here that UN data referring to female incomes and the ratio male/female incomes are different from the data we use to compute inequality. To estimate gender differences in incomes (and not earnings), the UN uses the ratio of the female non agricultural wage over the male non agricultural wage, the female and male shares of the economically active population, the total female and male population, and per capita GDP(PPP US\$).<sup>1</sup> When data on gender wages are not available, the UN assumes a rate of 75% in female/male wages outside the agriculture. This is certainly a limitation of this source. We use this data because they are the first available that make possible worldwide comparisons. But we are aware of the deficits of this data, particularly when we compare our results on the wage gender gap with the UN indicator of income gender gap. Nonetheless, we think it is worth to make use of the first evidence available on gender income differences in order to make the first comparative analysis.

To complete the variables that can be included in the econometrical analysis we have matched Asian and Latin American country level information of the Human Development Report (2005) with the variables available in Barro-Lee (1994) dataset. The resulting sample includes 180 countries. We have updated the values of human capital variables up to 2000 since in the original dataset the last variables' observations are for the year 1985. Barro-Lee dataset only includes 138 countries and this fact is a source for missing values. But there are also other important sources for missing values. A lot of variables recording women's empowerment are missing for the developing world. In poor countries of Asia and Latin America statistically significant variables on women empowerment like women officials and legislators have a lot of missing values. This may be a restriction of our analysis that for the moment cannot be improved by means of secondary sources.

In part 7 of this paper we estimate the inequality indexes and gendered inequality indexes of wage workers for a sample of six countries of Asia and Latin America: Brasil, Argentina and Uruguay (1975-1995) in Latin America and China, Korea and Singapore (1985-1995) in South East Asia.

For China, South Korea, Singapore and Brasil in 1999, the data source is the October Inquiry (OI). OI is an annual survey conducted by ILO since the mid 20<sup>th</sup> century. The Inquiry collects returns on wages by occupation in October every year as reported by the Statistical Institutes of different national governments. The number of countries and the scope of information it covers has enlarged and improved over time. Since 1983, the survey includes 140 wage categories for very thin and well-specified occupations. In some cases specific information is missing, in which case ILO fills it in by using average wages. Other problems arise from this source when you want to make the information comparable. Wages can be expressed hourly, daily, weekly or monthly with very few scattered information on the number of working hours per day or per week according to the country. All these problems are being analysed by R.Oostendrop and R. Freeman who are calibrating the data to make feasible international comparisons<sup>2</sup>.

In the countries we have chosen the wage rate information refers always to monthly earnings and the male and female earnings are specified in all the occupations. These wage rates refer to net earnings of the basic wage and do not include earnings derived from productivity plusses or extraordinary hours. Therefore the observations from our sample once standardised are homogeneous and allow for international comparisons.

To calculate the inequality indexes we have matched the gendered wage rates by occupation as specified by OI with the gender employment of the census returns according to ILO classification criteria<sup>3</sup>. Wage and employment information do not always have a single match, and our criteria has been to maximize employment and to calculate average wages per employment category. The census employment categories that do not have any match with OI wage information are ignored. Since most of the wage information refers to the economy of urban areas the final employment categories derived from this matching process belong to the industrial and services sectors and can be considered representative of the urban setting. In the case of China OI makes explicit that the wage information is urban. South Korea and Singapore are highly urbanized countries and OI gives very little information on rural agrarian wages. The main exception to this rule is the case of Brasil, 1999. In this last country the wages reported refer both to urban and rural scenarios.

Data on gender wage earnings for the cases of Argentina, Uruguay and Brasil in 1976 come from the Household Surveys of every country. These surveys are normally used to analyse household income inequality, but they also provide information on wage earnings of individual members of the household, men and women. For the Latin American case this information is increasingly available since the 1970s and can be regarded as a rich reservoir of data for the analysis of living standards and income distribution. Household Surveys inquire on the basic wage weekly or monthly. In the case of Argentina and Uruguay they are representative of urban settings, while the inquiry of Brasil covers all the national area.

## **The Methodology**

In parts 5 and 6 we present a regression analysis on the exogenous factors behind female income and the gender gap. In our dataset most of the variables used here are presented in a panel format. Nonetheless all variables on Gender Development and Gender Empowerment from UN dataset are just available for the year 2003. This is why for the

moment we present the results in a cross section multivariate regression analysis. On the other hand it is important to stress the limitations we face when applying regression analysis with variables that contain a lot of missing values. The values of N drastically diminish when we include women empowerment variables. This is crucial when we restrict our sample to the countries in which we are interested: Latin America and South East Asian countries. Our strategy has been to yield the maximum statistical significance with small values for N. As we already pointed up in many poor countries the number of professional women, women legislators or officials, are not recorded in our data source. Countries with missing gender empowerment information should also be the countries with most gendered culture. This is a threat of our analysis which must contain some sample selection bias. In terms of the internal validity of our estimates the may cause reverse causality and omitted variable effects. The incidence of women's empowerment on the gender gap should be overestimated in our sample as a result of a problem of self-selection in the recording of women empowerment in poor countries.

When measuring inequality, the Gini index is the most widely used indicator. In part 7, we have calculated the Gini index for earnings inequality in the economy as a whole as well as for inequality within men and within women. But since the Gini index for a population is not a linear function of the Gini indexes of its subgroups if these subgroups overlap in the earnings distribution, as it happens gender, we cannot decompose the relative contribution of gender inequality to inequality in the economy using Gini. The alternatives are the so-called generalized entropy measures, of which the best known are the Theil indexes. These indexes, while keeping the same properties as the Gini index, allow estimation of how much inequality is explained by inequality within groups and how much by inequality between groups. We use these indexes to decompose inequality into its gendered sources. More specifically, this paper uses the so-called Theil's L index or mean log deviation measure, the most commonly used in the literature. Its formula can be expressed as follows:

$$I_0 = \frac{1}{N} \sum_{i=1}^n \ln \frac{\bar{y}}{y_i}$$

where  $I_0$  is the inequality index, N is the total size of the population, and y is income or earnings. One of the properties of these indicators, as already said, is that they can be decomposed as a function of some subgroups characteristics. Subgroups can be defined according to occupation, age, or gender, amongst others. Let  $y_k$  be the average income of a subgroup,  $n_k$  the population in the subgroup, and  $I_0^k$  the inequality index for the subgroup, then,

$$I_0 = \sum_{k=1}^n \left( \frac{n_k}{N} \right) I_0^k + \sum_{k=1}^n \frac{n_k}{N} \ln \frac{1}{y_k / \bar{Y}}$$

The first term represents within-group inequality, and the second term between-group inequality (Mookherjee and Shorrocks, 1982). We will use this to assess how earnings inequality within and across gender contributes to inequality in the economy. Within-gender inequality refers to the diversity of male wages and female wages. If over time wages become less spread out in one of the subgroups, women for example, this would contribute to reduce inequality in the economy, other things equal. The second term, between-gender inequality, refers to inequality between subgroups, that is, it ignores the spectrum of wages within each subgroup and looks at differences in average wages across subgroups. In other words, it measures the contribution of the gender gap to overall inequality. If women's average earnings increase, for example –and taking into account that women are the lowest paid subgroup–, inequality will increase, *ceteris paribus*.

Another indicator of gender inequality is occupational segregation, that is, the tendency for men and women to be employed in different occupations. High levels of segregation have been considered to be a significant factor in the discrepancy between the wages of women and men, and generally to be at the root of gender inequalities. In order to measure segregation, the most common indicator is the dissimilarity index, which generally measures whether a particular group is distributed across occupations in the same way as another group. The formula to calculate gender occupational segregation is the following:

$$S = \frac{1}{2} \sum_i |m_i - f_i|$$

where  $m_i$  and  $f_i$  are the percentage of male and female employment in occupation  $i$ . The dissimilarity index is a measure from 0 to 1. The closer to 1 the values, the more segregated the two groups are.

## Female Human Capital in South and East Asia, and Latin America

In tables 1 and 2 we provide the world indicators on women's levels of participation and female human capital. A first result from table 1 is that participation levels are very high in East Asia, much higher than in Latin America and South Asia. This result is influenced by the very high levels of female participation attained in the most populated country of the world: China. In this country after the one child policy (and also before) women have been participating in all stages of production. The participation of Chinese women in blue collar positions (e.g. in the textiles) is particularly outstanding. In China the gender gap do not arise from economic participation but instead it can be explained by the lower education attainment and by the lower enrolment in the Chinese communist party, being the latter one of the main sources of social promotion in this country (see Gustafsson, Shi, 2001). In the other East Asian Nic's women participation levels are also very high. This fact together with the quick fertility reduction in the last few decades of the 20<sup>th</sup> century shape a different model in East Asia with respect to South Asia and Latin America (see Mason, 2001).

We think that the model for South Asia established by the literature is India and has been thoroughly analysed by Dreze and Sen (1995). In this case a combination of cultural and economic factors have shaped a subordinate position of women in the family and also in the labour market. The key factor explaining the very gendered situation in this case is the unequal access to human capital services by men and woman. In table 2 we can see that in South Asia women attain the lowest levels of adult and young literacy in the world. This fact is crucial because it restricts the capabilities potential by women and also their chances to actively participate in the economic life. In spite South Asian women's levels of economic participation are similar to those of Latin America the illiteracy rates are higher in the first case showing the situation of higher social exclusion.

The patterns of participation in Latin America are different. In this second case patterns of female participation vary a lot according to the racial composition of the population of the country and in broad terms we can say that non white women have very few chances to meet jobs with regular earnings in the formal economy.

If we measure education by means of literacy we obtain similar results in Latin America and East Asia, a bit more egalitarian in Latin America. This result is confirmed by Barro-Lee (2000) data set. In terms of years of educational enrolment the ratio women/men has improved from 82,9 in 1960 to 95.7 in 2000 in Latin America while in East Asia the figures 49.0 in 1960 and 83.5 in 2000. Nonetheless, when considering the real meaning of this result it is important to bear in mind that in absolute terms the number of years of enrolment of women are similar in both set of countries. The differences observed in the ratio women/men are explained by the longer enrolment of men in East Asia. The second remark we must make refers to the nature of education in Latin America (in contrast with East Asia). In average terms the number of years of enrolment in Latin America has doubled between 1960 (3.30 years) and 2000 (6.06 years). But the results in terms of educational attainment are very poor. Between 1960 and 2000 the situation only slightly changes and the percentage of people having completed primary school moves from 12.8 in 1960 to 13.8 in 2000. The data for completed secondary school are 4.1 per cent in 1960 and 8.6 in 2000 and tertiary education 0.9 and 4.9 respectively. The basis of the educational system at the primary level has enlarged only marginally while the achievements of the educational system affect the higher opportunities of educational attainment by the elites of Latin America.

Nonetheless the worst situation is attained in South Asia. The gender ratio of school enrolment (female average years in school/male average years) was 25.3 in 1960 and 53.1 in 2000 while the proportion of people with no access to school was 74.3 in 1960 and 45.2 in 2000. Indeed the relative differences between East Asia and South Asia can be explained by the most successful path of growth of China and the NICS with respect to India. In spite

India is also growing fast since the 1990s the levels of education were and are lower than those of China particularly those of women (see Dreze Sen, 1995). This is may be one of the most outstanding legacies of the communist political regime in terms of economic growth.

In figures 1, 2 and 3 we present the gender results on health measured by life expectancies. Notice in figures 1 and 2 that the income variable in the X axis is not per capita GDP but the UN estimation of men, women income by country.

Figures 1 and 2 clearly establish that health improvements measured by life expectancies have a positive impact on income evolution but the marginal returns of this second variable on life expectancies are diminishing both for men and women. For the overall population this was pointed out for the first time by Becker (2005) who also stated that health improvement act as a means for poor countries to converge with rich. From the figures 1 and 2 we can also see that East Asian Nics (excluding China) are on the top of the income and life expectancy levels of both regions. Latin American and South Asian countries are instead placed in the low middle ranks of poverty and life expectancies.

In figures 5 and 6 we plot the relationship of income according to gender and levels of per capita GDP as calculated by UN. We can see that both for men and women PPP income in absolute terms is a linear function of per capita GDP. But the slope is flatter for women and steeper for men fostering the increase of the gender gap with development improvements in these 3 sets of countries and according to UN methodology to measure income according to gender. From this result and in these world regions we can advance the hypotheses that culture and in general non economic factors have an important role shaping the gender gap.

Another result from a gender perspective from figures 1 and 2 is that the elasticities of health on income are much higher for men than for women in spite in both cases a life expectancy increases are crucial to achieve income improvements particularly after the threshold of 70 years of average life. But health improvements originate larger income increases for men than for women (the elasticities are for men > women ). This last fact is coherent with the incidence of GDP levels on gendered income reported in figures 5 and 6. In spite human capital is basic to improve women's condition, gender disparities increase as a result of development showing the incidence of social capital on the gender gap in Asian and Latin American countries.

The paradox just presented on the relationship of development on the gender gap is presented in figure 3 following Sen methodology. Sen recorded the world gender relations by means of the ratio attained in female life expectancy/male life expectancy and its variance with respect the biological rule achieved in Europe and North America. According to this methodology we can see in figure 3 that most of the countries here under study are over the wished threshold ratio of 1.05, with India, China and Jamaica at the threshold level and Bangladesh, Nepal and Pakistan below. But we can also see that the highest levels of relative women well being are attained in relatively poor Latin American countries. In the richest countries (Hong Kong, Japan, Australia, New Zealand) the relative well being of women is lower than in Latin America. This fact shows that human capital is only one of the ingredients to explain gender relations. Culture and social capital factors are also basic to understand gender relations and this fact is crucial in the comparative analysis of Asia and Latin America.

## **Explaining Female Real Income**

Since the classical book by Ester Boserup (1970) many authors have insisted on the importance that all factors fostering female market power have in the erosion of the gender gap. Human capital and exposure to the labour market are some of these factors. Institutional and cultural factors promoting more bargaining power by women are other elements (Field, 2003; 2005). But in several poor countries of Asia and Latin America women may have problems to develop market power. One of their main restrictions refers to available time to devote to market activities. In table 3 we present the working time balance on men and women in several countries of Latin America and Asia. This table is based on scattered data at the country level, and must be analysed with caution. But as a general remark table 3 shows that in poor countries women work more hours than men because of the loads of work in non-market activities<sup>4</sup>. With the available technologies for domestic work, in poor countries women must deploy between 5.5 and 6 hours daily to unpaid work. Part of this work is addressed to supply goods and services that in

rich countries are offered by the market. This is an important time restriction when considering the possibilities of women's market exposure in poor countries<sup>5</sup>. This situation of time collapse between alternative activities only gradually changes as a consequence of human capital investments and improvements, which increase women's capabilities and market dexterity and as a result the value of their market activities also improves (Becker, 1991).

Before considering the factors explaining the gender gap, we want to present the factors affecting the value of women's time devoted to market activities in nowadays South and East Asian and Latin American countries. In table 4 we try to reconstruct the impact of human capital on the marginal increase of women's real earnings. Table 4 presents the results for the total sample of 180 world countries while table 5 presents the results for the sample of 50 South and East Asian and Latin American countries. The regressors of human capital variables presented in the tables represent the elasticities of women's income to marginal increases in health and education. Variables promoting equal treatment and women's empowerment of the same tables are presented in absolute terms.

In table 5 we can see that in the countries here analysed female real earnings are extremely elastic with respect to health improvements. For all countries of the sample presented in table 4 female income elasticities with respect to health and education are statistically significant. On education we obtain significant results at the 1% level both for female literacy and primary school completed. The statistical significance of life expectancy varies according to the model but from our results we can state this second human capital variable is basic to explain women's income. An endogenous factor of education, fertility, has significant negative outcomes on women's income. Child bearing and child rearing, in promoting household working loads drive women efforts towards unpaid work and at the expenses of paid work and income increases. This is why the negative marginal impact of fertility on income is very high and statistically significant.

When we restrict the sample to South and East and Latin American (table 5) countries the results vary somehow. The most remarkable result refers to the value of health in these sets of countries. The value of the coefficient on life expectancy is very high in all models (much higher than for all the countries presented in table 4) and the results are statistically significant at the 1% level of error. Women's wages, therefore, are very sensitive to health improvements measured through the life expectancy at the moment of birth, which cause a sharp increase in the value of female labour productivity (see part 3 of this essay). In South East Asian and Latin American countries life expectancies have improved a great deal since 1950 as a result of the exogenous impact of the assimilation of medical scientific innovations stored by the Western World (Bloom, Williamson, 1998). However, in countries in the tropical zone survival is still hazardous. Epidemic tropical pandemics still cause high mortality amongst children and population at the working age. Aids is also causing an important number of premature deaths. Epidemic blows mainly affect the economically active population (women in the case here studied) and children, something that helps to explain why good health (the absence of pandemics) has such a big economic value in labour terms. (See the life expectancy evolution in Latin American countries in Thorp, 2000 and the East Asian results in Bloom, Williamson, 1998; see the gendered picture of life expectancies in part 3 of the paper in figure 3 ).

The role of education is more controversial than the role of health. If we measure education through literacy the elasticity is statistically significant at the 10% level in model 2. But we don't obtain significant results for education measured as the proportion of women with primary studies completed. In the Latin America case the inadequacy of part of the schooling supplies has been highlighted and can help explain this result (Reimers 2000, 2006). Education supplies are totally segmented, and while the well-off white urban population has access to good schools, the non-white poor rural population is sent to bad schools. This is how Latin American educational institutions are responsible for the aforementioned segmentation of schooling supplies (Engerman, Sokoloff, 2002, 2005).

From results of table 5 and in contrast with results of the world's sample we can assert that human capital achievement acts on the very basic levels in these set of countries. Good health and literacy are the main factors affecting women's real earnings and productivity increases.

We already stated that fertility rates are endogenous to human capital accumulation. Nowadays it is well established that the improvement of women's levels of education has a direct effect on the decrease of fertility in rich and poor countries (Galor, Weil, 1996; Hazan, Berdugo, 2004). And the impact of a marginal increase in fertility on women's real earnings is also strongly negative in Latin American and Asian countries. Childrearing and childbearing directly affect the amount of non-market work of women we have presented in table 1. This is why the

fertility rate has a very negative incidence on women's paid labour reward. We can say that the value of this coefficient may represent the opportunity cost of non-market work in a situation in which human capital is improving and fertility is diminishing more remarkably in East Asian countries.

Bloom and Williamson (1998) have stressed the positive economic impact of the demographic transitions in East Asia and in general in developing countries. The initial decrease of child and youth mortality has as a consequence the formation of larger size cohorts that after a time span of 10-15 years glut the economically active population. The subsequent diminution of fertility rates additionally diminishes the dependency ratio. From a gender perspective, the impact of this demographic shift cannot be analysed in an isolated way. The increase of female labour productivity and real earnings brought by the improvement of mortality health conditions and the diminution of fertility rates are associated factors to the demographic shift. We have proved through the elasticity analysis that the economic impact of these demographic events on women's labouring lives is enormous. Apart from the impact of fertility and mortality patterns on cohort sizes, the dependency ratio has also diminished because young and healthier married women are increasingly involved in market activities, attracted by the higher reward of their paid labour. The impact of the demographic transition (improvement of life expectancies and fertility decline) has affected before and in a more remarkable intensity to East Asian countries. This is why the levels of women economic participation in this area are also higher. According to our analysis the transition to higher levels of women's participation levels is endogenous to the demographic transition and educational improvement. The elasticity analysis of the variables affecting women's income (life expectancy, literacy and fertility) sheds light on the engines behind the changes of value of women's time and their final impact on the share of time spent in market activities.

## **Explaining the Gender Gap**

In this part of the paper, we use the UN data on female and male incomes to analyse the determinants of the gender gap. We already stressed the limitations of these data, and indeed provide in the next section (Table 9) our own calculations on the gender gap based on much more reliable data on wage earnings. We think nonetheless, that the composed index provided in the UN publication is useful to make the first comparative regression analysis. Mainly because it provides an indication of the income gender gap that not only based on the value of wage work but also on the weight of the paid work and women's participation levels in market activities.

In table 6 we present the results for the world wide sample. The first remark we can make is that Models 2 and 4 of table 6 confirm Becker's hypotheses on the factors influencing the gender gap (Becker, 1957). Market openness and the exposure to competitive forces reach significant coefficients. In model 1 we also obtain statistically significant results for the role of equal treatment enforcement laws measured here with the number of women legislators and officials. The influence of women's empowerment is lower than the effects of the exposure to the market forces but it also represents a second significant set of variables.

Instead the role of the relative achievement on human capital formation by woman is negative and statistically significant (models 2 and 4). Here we measure some of the gendered human capital elasticity factors we pointed up in section 3. Results on human capital achievement on the gender gap exposed in table 6 reflect the different income human capital elasticity according to gender. While we have seen female life expectancies are important to explain women's income, the result is different in terms of gender gap because human capital accumulation has much larger multiplying effect on men's income than on women's income. The same is true for education. In model 4 we prove that the ratio female primary school completed/male primary school completed has a negative significant impact on the gender gap. This is because the income elasticity of primary school is higher for men than for women. We must remind the reader that the gendered income elasticity calculation from the UN dataset which is on the bases of this part of our analysis is a linear function of levels of per capita GDP, levels of paid work participation a part from data on gendered non agrarian wages when available.

But in what concerns the sample of countries studied here we obtain different results. When we restrict the sample to South East Asian and Latin American countries and include the Latin American dummy in the control variables the role of the exposure to open market forces on the gender gap decreases and loses statistical

significance. Instead in the restricted sample the variables strongly improving the gender gap are female literacy and female legislators. Notice in table 8 that the value of all variables directly affecting economic competitiveness decreases when the Latin American dummy is included.

From table 8 we can infer that the variables affecting the gender gap are different in the subset of East South Asian and specially Latin American countries. Latin America changes in gender wage differentials are less sensitive to the open market globalization forces. Indeed during the 19<sup>th</sup> and a large part of the 20<sup>th</sup> centuries protectionist barriers in Latin America have been among the highest of the world (Coatsworth, Williamson, 2004). Economic adjustment and liberalization policies during the 1980s implied a severe crisis in most of the countries of the continent. Another transformation since the 1980s is the formation of an economic model based on the increasing role of the informal sector that according to some authors has increased the magnitude of economic inequality (Blumer-Thomas, 1996; Wood, 1994; Psacharopoulos, Morley, Fiszbein, Lee, Word, 1992; Prados de la Escosura, 2004, 2005). The lower exposure of Latin America to globalization may be the reason behind the lower impact of market openness on gender gap.

But in spite of the minor role of globalization in this second case other factors associated to literacy and women's empowerment have had an enormous incidence in the diminution of the gender gap. Exception for Indian and Black women, a more equal access to literacy and health services may explain a less gendered culture in Latin America with respect to East Asia. Indeed Amartya Sen (1990, 1992, 2003) has identified 100,000,000 missing women by premature death in South and East Asia and North Africa (50,000,000 in China). Women's unequal access to health services and food consumption goods in Asian countries is a clear sign of women's social exclusion. According to the same author in East Asia this particularly applies to the Chinese case. But we shall see in part 7 of this writing that in East Asia, gender discrimination also has effects on wage determination of other countries like South Korea.

## **The Implications of the Gender Gap for the Study of Economic Inequality**

The Gini and Theil results on total inequality and gendered inequality evolution for the six Asian and Latin American countries of our sample are presented in table 9. It is important to stress that these results refer to wage urban population. This makes our data difficult to compare with the standard Gini coefficients of inequality of household income or expenditure, which are generally higher and show very low tendency to change over time (Deiniger, Squire, 1996). By definition, our data does not include the inequality shares of the top (owners and employers) and the bottom (poor and employed in the informal economy) of the income distribution. With the exception of the Brazilian case our wage information doesn't capture the increasing inequality between urban and rural settings, which explains the sharp increase of inequality in countries like China. In spite of all these problems, by studying waged labour we are able to identify some of the gender inequality patterns that arise from changes in the gender gap.

In table 8 we present the evolution of the gender gap (or, to be more precise, the female/male earnings ratio) and index of dissimilarity for the six countries of our sample. The latter ranges from 0 to 1. When the dissimilarity index of occupations is close to 1 this means that occupations are more segregated according to gender than when the index is close to 0. This index quantifies the extent to which men and women can be substitutes in the labour market but it does not explain if the occupation segregation or its absence involves changes in income levels.

A first result we can stress from this table is that gender inequality has improved in all countries with the exception of China in recent decades. In all Latin American countries, including Brasil, the gender gap has eroded from 1975 to 1995.<sup>6</sup> Regarding the influence of ethnicity on economic inequality among women we have pointed out in section 6 of this paper, we must bear in mind that in the Argentinean and Uruguay cases most of the population is white (or mixed) and the proportion of Indian people is residual. In the Brazilian case 1999 we do not exclude the possibility that the source, OI, minimizes the impact of social exclusion of black women<sup>7</sup>. In fact, Argentina and Brasil are especially outstanding because in few decades women have attained nearly the same economic condition than men. Therefore from our case studies we can infer that in Latin America women's situation has improved a great deal. When we try to explain why, we must bear in mind the variables affecting the gender gap

in this continent: life expectancy and equal treatment laws. Both variables have improved in recent decades Latin America, especially life expectancy (see Camou et al, 2006). We have seen this is the most powerful variable explaining the gender gap in this case. According to the index of dissimilarity more economic equality according to gender does not imply that women perform the same jobs than men. The indexes of dissimilarity are high and imply that women are employed in different occupations than men. We can also see in tables 1 and 2 of this paper that women's participation levels are lower in Latin America than in East Asia. Indeed we have identified that Latin American working women from these 3 countries concentrate in the employment opportunities provided by liberal professions (teachers, nurses) clerical work (administrative) and services.

The gender gap information arising from the South East Asian case is very different. Except for Singapore, gender economic inequality is higher in East Asia than in Latin America. The gender gap only slightly improves in the case of South Korea and worsens in the case of China. The Chinese case deserves special attention. Before the economic reforms that began in 1978, the wage distribution in this communist country was very egalitarian and inequality has specially increased after 1991 when the scale and scope of the economic reforms intensified (see the Chinese inequality patterns in Knight, Shi, Renwei, 2001; Gustafsson, Shi, 2001; Guthrie, 2006).

We have seen for the Asian case that market openness is the main engine behind the erosion of the gender gap. On the other hand the dissimilarity index shows that in this case women's are less segregated. In this respect the Chinese example is illustrative. Urban women have very low fertility rates and they are present in the blue-collar spheres of the economy. In the case of China (like in most developing countries) real wages were very low because the productivity levels were also very low. The strategy has been to specialise in the production of export goods like textiles that make intensive use of the pool of cheap and unskilled female labour. By means of the production of labour intensive products, they could compete at the international markets. In these East Asian cases the causes of women's discrimination are found inside the household and the family human capital decision making. As a general rule men are educated in preference to women (Sen, 1990, Barro, Lee, 2000) and men also have more and better access to health services (Sen, 1990, 1992, 2003). Although in global cities like Hong Kong or Singapore the presence of women in well paid technical and liberal professions is increasingly important (see Brooks, 2006), in the other countries like China and South Korea women continue to concentrate in the unskilled ranks of employment. The gender gap has improved in most of the cases and the participation levels are higher in East Asia than in the Latin American (see part 3). But gender structural problems linked to the social capital and the historical customary role of women in this set of countries makes the magnitude of the gender gap also higher than in Latin American countries. In 1995 women's earnings (all occupations) represented 70% of men's earnings in South Korea and 74% in China, while at the same date this percentage attained levels of 91% in Argentina and 98% in Brasil.

The main consequence of the relative improvement of women's condition in our set of countries (with the exception of China) is the decrease of the levels of within-country inequality (see Table 8). Levels of total (men and women) inequality diminish. This trend is different from the result obtained using World Bank household data, which show a stagnant or slightly increasing trend in inequality in the same period (Deininger, Squire, 1996). In this respect our findings, still impressionistic, have further normative methodological consequences. Inequality at the household level hides the changing unequal situation of men and women. When we include women in the calculation of within-country inequality the result is the improvement of inequality levels. Traditionally women have concentrated in the most poorly paid and unskilled jobs being a factor that was breeding inequality. The improvement of women's condition brought by the improvement of their human capital stock, the effects of globalization forces and equal treatment enforcement laws have implied that the dispersion of wage earnings has narrowed. Therefore in these developing countries inequality has improved thanks to the improvement of women's condition and the narrowing of the gender gap.

Again the main exception is China. But levels of total inequality are lower in China than in any of the other countries. To explain this fact we must consider two factors: the egalitarian role of the communist tradition in urban wage determination<sup>8</sup> and the fact that our wage data just include the basic wage. Extraordinary payments like productivity surpluses and extraordinary hours represent an important share of the final wage in the Chinese case (see Knight, Shi, Renwei, 2001, p.139). Indeed taking into account all these factors the Gini levels and trends observed in our case are similar to those reported by the bibliography that deals with urban wage incomes of China of the post 1978 period (Khan, Griffin, Riskin, 2001; Lina, 2001; Gustafsson, Shi, 2000).

From our analysis the inherent different gender discrimination levels in Latin America and East Asian models can be explained when comparing within-gender inequality and between-gender inequality. In the Latin American case the improvement of total inequality levels from 1975 to 1995 is explained by the sharp decrease of the gender gap (between-gender inequality). We have tried to explain in parts 5 and 6 of this essay that the exogenous factors behind these trends are the improvement of women's health human capital and the establishment of equal treatment enforcement laws. In this respect Latin America is different from East Asia since human capital (health and education) is more equally distributed according to gender. The more egalitarian patterns of Latin American families in the human capital decision making of their members (enhanced by gender enforcement laws) are the main exogenous force explaining the observed diminution of inequality levels brought by the improvement of the gender gap.

The conclusions we can frame on the Asian case are more diverse and complex. In this second case we need more case studies in order to be able to frame a general model. Here the diminution inequality at the country level is mostly explained by means of the decrease of within gender inequality. The contribution of the gender gap to total inequality in China and South Korea increases. In spite of the influence of open market forces in shaping a more equal gender situation as observed in the case of Singapore (see part 6 of the paper) other cultural and historical forces counterbalance them. In the case of South Korea the parallel diminution of within-gender inequality and the slight improvement of the gender gap explain the resulting trend of the total diminution of inequality. In the case of China economic reforms have brought with them the increase of between men and women inequality. Nonetheless we must stress this case is very special. In absolute terms the inequality levels measured by the basic wage of urban workers are the lowest of the sample both for men and women<sup>9</sup>. In the point of departure, 1978, urban wages were extremely equally distributed both within and between gender groups (Lina, 2001). Economic reforms have brought with them the liberalization of the labour market and therefore the increase of inequality levels. Nonetheless the increasing magnitude of between-gender inequality (the gender gap) reveals the situation of social exclusion by women as reported by Sen and other authors.

## Conclusions

In these pages we have tried to show the reasons behind the gender gap in South and East Asian and Latin American countries and their influence in the final evolution of wage inequality. In a context in which the demographic transition is still operating, female life expectancies and fertility decline have proved to be the most powerful variable explaining women's wages and the improvement of women condition. Health human capital, but also literacy are on the basis of women's labour economic improvement. A more egalitarian gender behaviour in the access to health and school services supplies among the white population of Latin America seem to be the exogenous factor behind the important diminution of the gender gap in this set of countries. Instead in the East Asian case the erosion of the gender gap seems to be mainly explained by the Stopler-Samuelson and Becker simple model. With the exception of China, the exposure to international trade openness acts as an engine of erosion of the gender wage differences in this second set of countries. The Chinese case deserves special attention. In this last case economic reforms since 1979 seem to cause the increasing wage inequality between men and women. In our universe of countries we also obtain very statistically significant results for equal treatment enforcement laws.

The improvement of women's condition in most of the cases has further consequences for the analysis of wage inequality. Since traditionally women have been at the bottom of the wage hierarchy, their economic improvement also narrows wage dispersion and income inequality. This result is confirmed both by means of Gini and Theil coefficients. Therefore we think our results have further normative consequences for the study of income inequality. The often neglected information regarding women's economic condition has hidden the impact of their changing condition inside the household and the labour market. In the period under study, the second global era, and with the exception of China, the inclusion of women's wages in the calculation of inequality has as a consequence the diminution of the indexes of wage dispersion.

We think that in this paper we have provided the first evidence concerning the relationship between globalization and the gender gap from a comparative perspective. Our next step shall be to enlarge the sample of

countries (and continents). But we also want to further explore the features of gender inequality patterns by means of intensive research at the national level of the countries explored in this paper. Brasil or China deserve more attention and are cases that can highlight the future forthcoming patterns on the role of women in economic development.

## Acknowledgement

We want to acknowledge Jeff Williamson and Li Han from the Economics Department of Harvard University and the members of the Economic History Seminar of Universidad de la Republica de Uruguay for rich suggestions concerning ideas and bibliography. Will Nygard and Carmen Madanes, undergraduate students from Harvard have helped to build the dataset in which is based the econometrical analysis and Li Han has revised it. This paper has been written during the leave of Enriqueta Camps at Harvard University (January 2005/july 2006). It represents her first collaborative contribution using macro historical methodologies. She wants to express her gratitude to the people a part from the co-authors who have contributed to the paper. Jeff Williamson has been a real master while Jim Stock and Xavier Sala-i-Martin have provided some of the economic growth and econometrical backgrounds for the analysis. She also wants to acknowledge valuable support and suggestions by Pol Antras, Albert Bravo Biosca, John Coatsworth, Stan Engerman, Chen Ying Huang, Ana Mikoucheva and Jim Robinson. Only the authors are responsible of the possible remaining mistakes of this manuscript.

## End Notes

<sup>1</sup> The precise arithmetical formula for the calculation is specified in technical note 1, Human Development Report (2005), pg. 346.

<sup>2</sup> See Freeman, Oostendrop, 2000. The detailed series of male wages 1983-2003 are already available in Occupational Wages Around the World (OWW) Database [www.nber.org/oww/](http://www.nber.org/oww/)

<sup>3</sup> This data are available at the ILO website [www.ilo.org/public/english/bureau/stat/child/actrep/octing.htm](http://www.ilo.org/public/english/bureau/stat/child/actrep/octing.htm) the dataset Laborsta.

<sup>4</sup> This data refers to unweighted averages of time devoted by women to paid and unpaid works. It has meaning in relative terms and not in absolute terms. Time devoted to work in unpaid non-market activities (as well as to paid activities) may vary a great deal according to the social class or women's economic status. Evidence from Spain supports this assertion both in the 19<sup>th</sup> and 20<sup>th</sup> century. See Perez-Fuentes (2005); Carrasco (1991).

<sup>5</sup> With an ordinary duration of the paid day's work, 8 hours, the total time women must devote to work in a urban setting is 13,5 hours according our estimations of time necessary to perform non-market activities. It is well known that many women of poor countries perform part time, out doors work in the informal economy, more compatible with the loads of unpaid work as shown in table 1.

<sup>6</sup> The changes observed in table 7 have a meaning in terms of trend of improvement and before we can make more general conclusions we need to enlarge our sample of countries.

<sup>7</sup> By this date we can make the hypotheses that most black population work in the informal economy or are integrated in the pool of poor people and therefore are not registered in the sample of wage workers.

<sup>8</sup> Still part of the wages are determined in State owned firms.

<sup>9</sup> We must pay attention to the nature of the data when considering this result. See explanation in page 15.

# International Oil Market Regime

*Kenichi Matsui, kmatsuijr@aol.com  
Ryukoku University, Japan*

## Abstract

This paper analyzes the international oil market from the 1920's to today applying the "International Regime" theory, which was introduced and developed primarily in the U.S. since the 1970's to reflect the growing interdependence of states and growing involvement of non-state players in international politics. Stephan Krasner defines the "International Regime" as: "...sets of implicit or explicit principles, norms, rules, and decision-making procedures around which actors' expectations converge in a given area of international relations. Principles are beliefs of fact, causation, and rectitude. Norms are standards of behavior defined in terms of rights and obligations. Rules are specific prescriptions or proscriptions for action. Decision-making procedures are prevailing practices for making and implementing collective choice. (Krasner, 1983). Analysis finds that there has been an International Regime in the oil market in the form of the International Petroleum Cartel and OPEC Cartel identifies the principles, norms and rules in each regime. Factors which worked for establishing an international regime are identified.

## Background for the Regime Formation

Regime formation began with oil companies concern over the cut throat competition between Shell and Mobil in the Indian oil market which prompted discussions among top executives of the Big Three Oil companies; Standard Oil of New Jersey, Royal Dutch Shell Oil Company and Anglo-Persian Oil Company (later British Petroleum Company) at Achnacarry castle in Scotland. The subject of discussions was to find measures to eliminate the competition and ways to steadily develop the world oil market. In more concrete terms, the problem for them was to find and set a pricing system and other related rules which would allow them to earn profit while keeping the market share of each member in a market which was basically on a growing trend but fraught with danger of overproduction at any time. The situation was a dilemma of common interest. Cooperation was necessary among players to reach the best solution for all. After long and hard work, they reached an agreement and adopted a document dated September 17, 1928 which was titled simply "Pool Association". This document is more often referred to, however, as the "as is agreement of 1928" or the "Achnacarry agreement". The system based on and managed by this document was later called the "International Petroleum Cartel".

## Principles, Norms and Rules

### Principles

The big three oil companies worked out principles, norms, rules and decision-making procedures and they controlled other oil companies and hence the world oil market with this framework. Background and basic philosophy of the Pool Association is stated in "the introduction" of the document as follows:

The petroleum industry has not of late years earned a return on its investment sufficient to enable it to continue to carry in the future the burden and responsibilities placed upon it in the public's interest, and it would seem impossible that it can do so unless present conditions are changed. Recognizing this, economies must be affected, waste must be eliminated, the expensive duplication of facilities curtailed. (U.S. F.T.C., 1952)

This introduction says that the principle of this cartel is to avoid excessive competition so as to attain sufficient profit for providing an enough investment and to make possible paying off burden and debt in future which oil companies undertake for the public interest. It could be further simplified, "to supply oil steadily coping with the growth of world oil demand at a reasonable price guaranteeing a future investment by avoiding excessive competition and waste."

### Norms

And to realize this principle seven norms were developed which include the importance of cutting waste and curtailing expensive duplication of facilities and the necessity to control the industry for this purpose. The 7<sup>th</sup> and final norm says, "The best interest of the public as well as the petroleum industry will be served through the discouragement of the adoption of any measures the effect of which would be to materially increase costs with consequent reduction in consumption. (U.S. F.T.C., 1952)"

This norm says that control of the industry will also be beneficial for consumers. The US Federal Trade Commission criticized this point as saying that it gives a consumer-interest spin to the purpose of accomplishing savings and stabilizing the industry (1952). But I support the view of the oil companies', namely, the system introduced by them protected consumer interest by stabilizing the world oil market. This is evident when looking back the long history of the world oil market. The market was most stable and oil price was kept low under the regime of the "International Petroleum Cartel" in 1950's and 1960's .

#### **Rules and Decision-making Procedures:**

These were prescribed in detail in "a policy and a procedure rule" of the document (U.S. F.T.C., 1952).

According to Yoshinobu Yamamoto, there are three processes, i.e. through compulsion-rule, negotiations and autogenetic way, three factors i.e. power, profit and creed system in regime formation, and 9 types of regime formation by the combination of these three processes and three factors (1996). To apply this categorization, "International Petroleum Cartel" is a type formed by negotiations over a factor of profit by international oil companies which are non-governmental players. Here, the specific international field of international relations is the world oil market.

### **Managing the Cartel**

To prevent betrayal is crucial for a cartel and they worked out a detailed rule on actions of members for that purpose. Since the number of the members of the International Petroleum Cartel was small, just seven, and among them three companies were very big and the other four companies were related with these big three companies in one way or another. So the concern for betrayal within the members was small and the main concern for them was outsiders. They dealt with the outsiders case by case and tried to protect the cartel. And when this problem became a big issue in the cartel administration, they concluded the "Memorandum for European Market" in 1930 to be able to deal with this problem properly by such means as making a special regional agreement in areas having problems.

The most crucial issue in this regard was one of whether producers in Romania, a main oil producer in the 1930's in Europe, would obey a cartel rule or not. In 1930, the cartel concluded an agreement with Romania , but it was contested. Renegotiations were made and new Romania production agreement was concluded by introducing an arrangement that the cartel members would contribute a quota bigger than the original production quota given to the independent suppliers of Romania as a standard right in 1928.

With these efforts, the International Petroleum Cartel companies established control of almost all big production areas in the world by the middle of the 1930's. But to strengthen this dominance, cartel members gathered in London in 1934 and rebuilt the agreement with revised principles<sup>1</sup> of "status quo" and worked out the "Draft Memorandum of Principles" (U.S. F.T.C., 1952). The cartel solved many difficult problems in this way and managed the difficult task to smoothly deliver oil to the world market.

It is, however, generally believed that the cartel agreement ended during World War II, since Standard Oil of New Jersey which seemed to lead other American companies made an oral announcement of its withdrawal from the Draft Memorandum Agreement in 1943 and also from the activities that may stay afterwards.

On this point, U.S. Federal Trade Commission argued as follows. "However, the U.K. and the Dutch collaborative relationship never cooled off with the withdrawal of Standard Oil and the companies of U.S.A. cooperated to some extent in wartime and after the war. (1952)" In this way, Federal Trade Commission judged that the cartel system was maintained by tacit consent after World War II, virtually, as a business custom based on long run cooperative relations.

Tosuke Inoguchi argued also that the business tie up of Japanese oil companies with U.S. and British oil companies during the time of industrial rebuilding after W.W.II was carried considering carefully the norms of the cartel (1963).

Also, it was made clear that the basing point system for oil price, which was one of the most essential norms of the cartel, was maintained after the war by adding new basing points and also by moving the basing points (Inoguchi, 1968).

A report of the American Multinational Enterprise Committee (the so-called Church committee) reported in January, 1975 that American major oil companies controlled the world oil market with cartel market control rules over the period of 1950-72 (U.S.S. C.F.R.).

After World War II, supplying Middle Eastern oil to the world oil market without inviting confusion was a big task for not only International Oil companies but also the governments of U.S.A and United Kingdom.

The two countries concluded the International Oil Trading Agreement in August, 1944 to solve this problem. This agreement says that oil must be supplied from each production area in the world for the purpose of giving sufficient satisfaction for all people taking into account the available reserves, application of suitable technology and economic factors and interests of consuming countries and developed countries. Additionally, it stated that these principles can be promoted most effectively through an international agreement among all countries having an interest in oil trade as a producer or a consumer. The two countries agreed to the establishment of the International Oil Committee, which has a function of research and consulting.

This agreement was signed but not ratified ,however, because of possible conflicts with the US anti-trust law .

"However, this agreement was not necessary for managing ordered trade in the world oil market. Since only seven or eight International Oil companies had power to do it and actually they could manage the task for further 10 years. (Inoguchi, 1968)"

In this way the International Petroleum Cartel functioned up to World War II effectively and after the war it continued to work well in a way that the basic frame of the cartel permeated into the world oil market as an established business practice.

Thus I showed that the "International Petroleum Cartel" is an International Regime and that it has been managed tacitly and skillfully and in spite of the public announcement of abolition it permeated into the world oil market as a business custom after W.W. II and through the beginning of the 1970's.

## **Transformation of International Oil Market Regime**

The International Oil Market Regime established by the big international oil companies seemed to have collapsed in the early 1970's through the power shift from big oil companies to OPEC producers. However, looking back at the cartel behavior of OPEC, it is better understood that the regime transformed; the principles of the International Petroleum Cartel were essentially maintained despite the changes in members and changes in accompanying norms and rules.

Here, I will first discuss what changed through this power shift, and then what did not.

### **What Changed**

First, power to decide production level and price moved from the International Oil Companies to the governments of the OPEC countries.

Second, this change weakened the International Oil Market Regime in many ways:

a. Because OPEC Cartel consists of sovereign states, it became difficult to introduce a sanction clause for the violation of decisions. b. It also became more complicated to adopt common policy and measures due to differences in oil reserves and economic and political situations in the OPEC countries. c. OPEC policy tends to be influenced by the political situation in the Middle East and US policy for the area because large OPEC producers concentrate in this area. d. The OPEC Cartel has no strong leading players comparable to the Big Three oil companies in the International Petroleum Cartel, though Saudi Arabia has played a limited role as a swing producer. e. The International Petroleum Cartel had been administered secretly, but the OPEC Cartel is managed basically in

the open. This is also a weak point. f. The members of the International Petroleum Cartel preferred to commonize the interests through capital ties such as joint stock holding, establishment of joint enterprise and interposition of a neutral financial institutions; For OPEC, state sovereignty was a barrier to such a strategy (Iwasaki, 1989).

Third, rules and procedures are not set in detail in a strict way in the OPEC Cartel. OPEC lacks an adjustment and or penalty clause for violation of the decisions. Rules and procedures adopted in the Establishing Agreement of OPEC (November 6, 1962) set only administrative procedures and a large part of the rules and the operation procedures are left for the unanimous decision at the general meeting.

The most important thing for the OPEC Cartel is the setting of price and production level like other cartels. These issues are discussed and decided based on advice prepared by the long-term strategy committee of OPEC based on it's world supply and demand forecast. Total level of production is subsequently allocated for each member considering deposits, recent production as well as such factors as population and necessity of finance of each member. Defiance to the decision made at the General Meeting has not been rare in OPEC. For example, during the second oil crisis in 1979 and 1980, several OPEC members added allowance over the price decided at the General Meeting for various reasons.

#### **What Did Not Change**

Next, I will discuss the points that did not change.

The principle of the International Petroleum Cartel "to supply oil coping with the growth of world oil demand at a reasonable price guaranteeing a future investment by avoiding excessive competition and waste" is basically seen to be succeeded by the OPEC Cartel. The reasonable price for the members of the International Petroleum Cartel was a price to guarantee a future investment, and this is true also for the OPEC Cartel, though the expression might be different.

The first resolution in the establishing agreement of the OPEC on September 14, 1960 asked oil companies to consult with the OPEC members in case of price modification and second resolution expressed its principle to unify the petroleum policy of member countries and determine the best means for safeguarding the interests of member countries individually and collectively. Thus these resolutions expressed its original aims and objectives to protect profit of OPEC member countries and imply that first, oil resources belong to the country and, secondly, the oil-producing countries aim to decide production level and price by themselves and to produce oil to contribute to the development of the oil-producing countries.

To achieve this goal, oil-producing countries with small reserves prefer a high oil price policy keeping the production level low, and oil-producing countries with large reserve prefer a low oil price with large oil production. Specifically, Saudi Arabia prefers the policy to restrict development of oil alternative energy in the world by keeping the oil price low and prolonging the era of oil. This factor has disturbed the solidarity of OPEC, but it was recognized that to make decision with no consideration for the situation of other countries would cause a negative effect not only for OPEC as a whole but for the country itself. Therefore, effort was made to compromise at a certain price and production level which would guarantee the future production of OPEC and which would be beneficial for OPEC as a whole.

At the occasion of the second oil crisis, when it was possible for OPEC to have an very bullish view about future price of oil, a goal was set to gradually raise the price of oil to the price of alternative energy. This price policy is understandable because with this price, oil can be competitive and necessary capital for future production can be gained.

It is naturally important for OPEC to avoid excessive competition in achieving this goal. As for cutting waste by excluding overlapping investment, it is valid both for both the International Oil Market Regime under the International Petroleum Cartel and the regime under the OPEC Cartel.

## **Conclusion**

To conclude, principle of the International Oil Market Regime under the International Petroleum cartel was succeeded in its essence by the regime under the OPEC Cartel.

As for the norms, most important norms both for the OPEC cartel and International Petroleum cartel are for members to abide by the production and price of oil as agreed by the cartel.

Unlike the International Petroleum cartel, the OPEC Cartel does not have detailed adjustment clause nor penalty clause for violating the agreements. This is a weak point of the OPEC Cartel.

The norm of the International Petroleum Cartel to keep the market share of each member is expressed in a different way in the OPEC Cartel. Namely, OPEC aims to use oil resources in the most proper way to contribute to the development of economy of each member state. It certainly does not say to keep the market share of each member but the allocated production level for each member stayed fairly stable except for some drastic changes in a specific country at the occasion of political turmoil.

Vinod Aggarwal separates the items of rules and procedures from the items of principles and norms from the point of significance of them to the regime, calling the former the “regime side” and the latter the “meta-regime side”(1985). Stephan Krasner calls regime change in which changes occur only in the regime side as the transformation of the regime (1983). I conclude that the change of the regime from the one under International Petroleum Cartel to the one under OPEC Cartel applies this case . And this regime transformation was brought about by the shift of the power underlying the regime. Namely, this transformation was triggered by the power shift from major oil companies to the OPEC producers as a result of the Fourth Middle East War.

As for the effectiveness of International Regime, judging from the fact that after the transformation of the regime, oil price started sharp fluctuation typically shown in the time of second oil crisis and collapse of the oil price in 1986, regime under the OPEC Cartel lost effectiveness largely compared to the regime under International Petroleum cartel.

In spite of the weakness, however, OPEC contributed to the stabilization of the world oil market through setting an index price, setting total OPEC production and setting each individual OPEC members production until the mid-1980's. The collapse of oil prices in 1986 showed clearly the diminished cartel power of OPEC. The expanding wave of globalization and a growing future's oil market tends to be led by the NYMEX WTI future's price. Today, OPEC can just set the production level following the market situation with the hope of its desired price. Also, the share of the Non-OPEC producers in the world oil production has increased as well. With these factors, OPEC's market controlling power has been eroded significantly. But OPEC is only one international body in the world oil market which cooperates to control the world oil supply. Considering this, we need OPEC if it is weak. We need an international regime in the world oil market for various reasons. I argue this point to finish my paper.

## **Why International Regime in the World Oil Market**

Why has an international regime been established in the world oil market ?

First, because this is a global issue. Oil is a commodity traded around the world and is indispensable for the life and industrial activities everywhere in the world.

Secondly, oil is a natural resource unevenly distributed in the world. Supply cost is principally dependent on geological conditions. Short term price elasticity of supply as well as demand is very small.

Thirdly, oil is strongly linked with politics. Oil was a big factor in World War I and II and has been woven into the politics of the Middle East.

Fourthly, oil is surrounded by inherent uncertainty. Proven oil reserves, prospects of technology development for new and renewable energy and for oil substituting fuel, they are all uncertain.

Fifthly, there exists a dilemma among suppliers and between producers and consumers and, through collaboration, better outcomes for all players is expected in longer term.

From these reasons, a framework supplementing market mechanisms is required for stable supply of oil in the world oil market.

### Abstract

Applying Johansson's multivariate procedure and vector error correction model to historical data of 1967-2003, this study investigates the role of export in Iran economy. Results of this study showed that in the short run, causality direction is from non-oil export growth to non-oil GDP and in the long run this is expected to be reverse. Therefore, in the short run, non oil export growth has a positive influence on non oil GDP growth, whilst in the long run, non-oil GDP growth has a positive influence on non-oil export growth and not vice versa. Thus, export supporting policies are expected to lead to increased export and GDP only in the short run. Keywords: export-led growth, Johansson's procedure, short and long run causality, Iran

### Introduction

Since 1970, export growth strategies have been undertaken by many countries as one of the most efficient tools for growth and development. As stated by Abou-Stait (2005), such strategies aim to improve the capability of producing goods and services that are able to compete in the world market, to use advanced technology, and to provide foreign exchange needed to import capital goods. Analyzing the role of exports in the economic growth and the causality directions between them have been of economists' interests specifically for developing countries. According to the literature, there are several studies (e.g. Bahmani-Oskoei and Alse, 1993; and Levin and Raut, 1997) revealing that export growth promotes overall economic growth. Investigating the causality between export growth and output growth has been the focus of many studies in recent years. Combining Granger causality with Akaike's Final Prediction error (FPE), Bahmani-Oskoei, et al (1991) obtained some support for the export-led growth hypothesis. Dodaro (1993) investigated the issue of causality by employing Granger's approach to a set of 87 countries. He found a very weak support for the contention that export growth promotes GDP growth or the opposite that GDP growth promotes export growth. Bahmani-Oskoei and Alse (1993) using Engle and Granger (1987) two-step approach for co-integration and error correction modeling and employing quarterly data instead of annual data for the eight countries, find that there is a strong empirical support for two-way causality between export growths in eight out of nine countries. Love and Chandra (2005) utilized Johansson's multivariate approach and found that long and short run causality directions run from GDP growth to export growth and reverse relationship is insignificant. Motavaseli (1998) applied a Granger causality procedure to annual data of 1967-1995 and recognized two-side causality between export growth and GDP growth in Iran.

This short review refers to the fact that a unique causality direction does not exist between the variables of our interest and therefore further studies are needed to clarify dominant relationships in transition economies such as Iran. The rest of this paper is structured as follows: a background of Iran export is discussed following by methodology specifications and findings are discussed afterward. At the end, some policy implications are provided.

#### Background on Iran Exports

As the fourth largest oil producer in the world, Iran is slowly integrating into the global economy and financial markets. The Fourth Five-Year Economic Development Plan (2005-10) focuses on expanding trade interaction with the global community and pursuing an active presence in international markets. This would require to increase exports substantially.

Petroleum constitutes the bulk of Iran's exports, valued at USD 46.9 billion in 2006. However, non-oil exports play a significant role in Iranian export and enjoyed a growing share in total foreign earnings in recent years. Exports

resulted in easing the pressure on the balance of payments and creating employment opportunities. According to the Iranian Ministry of Trade, total exports of non-oil commodities were at USD 4 billion in 2001 and more than USD 4.4 billion in 2002. The figure reached USD 6 billion in 2003, surpassed USD 10.5 billion in 2005 and rose to USD 12 billion in 2006. The figure hit USD 16.3 billion in the year ending March 20, 2007, which was an increase of 47.2 percent from the previous period. The rapid growth in Iran's non-oil exports in recent years was due to a policy of non-dependence on oil income and diversification of goods and services exported.

By 2003, a quarter of Iran's non-oil exports were agricultural based. Iran's agricultural sector contributed 11 percent of the GDP in 2004 and employed 23 percent (1996) of the labor force. Since 1979 commercial farming has replaced subsistence farming as the dominant mode of agricultural production.

Agricultural products as a whole have been an important contributor to the country's non-oil exports that has been of the Iranian government interest in recent decades. However, the agricultural export potential has not been fully tapped.

The Iranian government has made significant progress in implementing trade reforms and intends to do more according to the ambitious plan outlined in the Five-Year Development Plans. Many non-tariff barriers on imports have been replaced by their tariff equivalents. During the year 2000, restrictive import licensing requirements were lifted on 895 products. At the same time, import taxes on many of these items were increased in an attempt to compensate domestic producers for loss of protection. Despite the important reforms conducted as part of the recent Government's trade liberalization agenda, important areas were additional substantial steps to use market mechanisms as means of regulating foreign trade remain.

Implementing successful non-oil trade intensification and a shift from import substitution to export-oriented activities will require a new set of policies that affect agricultural trade beyond the ratification process carried recently.

The upward trend in value of non-oil exports in recent years is consistent with the trend of development largely due to the government's policies, particularly its policy of weaning the country from its dependence on oil exports. This may be attributed to the redirection of general policy in Iran. Yet, a study is required to investigate the impacts of such policy switching to economic growth.

This study investigates relationship between non-oil exports and non-oil GDP growths, direction long and short run causality these variables are from export growth to GDP growth, reverse or two-way causality and the end exhibit commendation policy.

## Methodology

Johansen's multivariate framework and vector error correction model are used in this study to investigate short run and long run causality between non-oil exports and growth. The first step is to determine whether the variables in the model are stationary. If they are non stationary, then the issue is to what degree they are integrated. This can be addressed by Augmented Dickey-Fuller (ADF) tests. In this study Microfit 4.0 is used to perform computations.

The next step is to find out whether the variables are co-integrated. Within the Johansson's framework, an unrestricted VAR model is defined by (1):

$$x_t = \mu + \pi_1 x_{t-1} + \dots + \pi_k x_{t-k} + \varepsilon_t \quad , \quad t = 1, 2, \dots, T \quad (1)$$

Where  $\varepsilon_t$  is i.i.d (independently and identically distributed) p-dimensional Gaussian error term and white noise,  $X_t$  is a Vector of I (1) variable and  $\mu$  is a vector of constants. Since  $X_t$  is non stationary, the above equation can be expressed in first differenced error correction (2) that is expressed as a traditional first difference VAR model except the term  $\pi x_{t-k}$ :

$$\Delta x_t = \mu + \Gamma_1 \Delta x_{t-1} + \dots + \Gamma_{k-1} \Delta x_{t-k+1} + \pi x_{t-k} + \varepsilon_t \quad (2)$$

Where  $\pi = -(I - \pi_1 - \dots - \pi_k)$  ,  $i = 1, \dots, k-1$  ,  $\Gamma_i = -(I - \pi_1 - \dots - \pi_i)$ .

The coefficient matrix  $\pi$  contains information about long run relationships between the variables, and  $\pi = \alpha\beta'$ , where  $\alpha$  and  $\beta$  are  $P \times r$  matrix. The co-integrating vectors  $\beta$  have the property that  $\beta'x_t$  is stationary even though  $x_t$  itself is non stationary. In this case, equation (2) can be interpreted as an error correction model. Johansen (1988) and Johansen and Juselius (1990) derived the likelihood ratio test for the hypothesis of  $r$  cointegrating vectors or  $\pi = \alpha\beta'$ . The co-integrating rank,  $r$ , can be tested with two statistics, namely Trace and Maximal Eigen value. The likelihood ratio test statistics for the null hypothesis that are at most  $r$  cointegrating vectors against the alternative of more than  $r$  cointegrating vectors is the Trace test and is computed as:

$$\lambda_{trace} = -T \sum_{i=r+1}^P \ln(1 - \hat{\lambda}_i) \quad (3)$$

Where  $\hat{\lambda}_{r+1}, \dots, \hat{\lambda}_P$  illustrate  $P - r$  smallest estimated Eigen values. The likelihood ratio test statistic for the null hypothesis of  $r$  co-integrating vectors against the alternative  $r+1$  co-integrating vectors are the maximal Eigen value test and are given by:

$$\lambda_{max} = -T \ln(1 - \hat{\lambda}_{r+1}) \quad (4)$$

The numbers of co-integrating vectors after the model was find out by Trace and Eigen value test statistics are determinates. In this way, where the first is to test null hypothesis that there is zero cointegrating vector by use of Trace and Eigen value tests and if it is rejected, the next step, null hypothesis of one cointegrating vector is tests and stop while the first time the null hypothesis is not rejected. After having established the number of cointegrating vectors, the next step is to determine the direction of both, long and short run Granger causality. Vector error correction model for three variables can be written as:

$$\begin{aligned} \Delta LRGDP &= \alpha_1 + (\Delta LRGDP, \Delta LRX, \Delta LTOT)_{-1} + \lambda_1 e(-1) \\ \Delta LRX &= \alpha_2 + (\Delta LRGDP, \Delta LRX, \Delta LTOT)_{-1} + \lambda_2 e(-1) \\ \Delta LTOT &= \alpha_3 + (\Delta LRGDP, \Delta LRX, \Delta LTOT)_{-1} + \lambda_3 e(-1) \end{aligned} \quad (5)$$

Where LRGDP denotes log of real non-oil GDP, LRX is log of real non-oil exports, and LTOT represents log of terms of trade and  $e(-1)$  is the lagged value of the error correction term. While error correction term captures the long run relationship, short run dynamics are provided by the lagged values of different terms. This study uses historical annual data for the period 1959-2003 and applies the above described methods to non-oil real gross domestic production, non-oil real export and terms of trade in Iran.

## Results

As the first step, all three variables and their first difference were tested for stationary and the results are given in Table 1. It appears that for none of level variables is the calculated ADF statistic less than its 90% critical value and for the first differences of all variables, the ADF statistics are less than their corresponding 90% critical values and thus, all level variables are I(1) since their first differences are I(0).

TABLE 1: ADF TESTS FOR UNIT ROOTS

Variable	Test statistic		95% critical value	
	levels	First difference	levels	First difference
LRGDP (log of real non-oil GDP)	-1.847(1)	-3.424(0)	-2.937	-2.94
LRX (log of real non-oil exports)	-1.115(0)	-6.176(0)	-2.937	-2.94
LTOT (log of terms of trade)	-1.854(0)	-6.652(0)	-2.937	-2.94

TOT is defined as proportion value index of exports upon value index of imports; terms in the parenthesis show the number of augmentations or lags (k) in ADF regressions; k is chosen with the help of a model selection criterion such as Akaike information (ADF), Schwarz Bayesian Criterion and Hannan-Quinn criterion (HQC)

As shown in Table 2, the null hypothesis of zero cointegrating vector by use of Trace and Eigen value statistics is rejected and the null hypothesis of one cointegrating vector is not rejected. Thus, the number of cointegrating is one.

After having established the number of co-integrating vectors and model where intercept is presented in the cointegration relation, the restricted co-integration vector (-LRGDP+0.377LRX+1.341LTOT+1.257) is obtained after Normalization. It can be seen that both real non-oil exports and terms of trade have positive influences over real non-oil GDP.

TABLE 2: COINTEGRATION RANK SELECTION

H <sub>0</sub>	H <sub>1</sub>	Test statistic	90% critical value
$\lambda_{trace}$ :			
$r = 0$	$r \geq 1$	33.95	31.93
$r \leq 1$	$r \geq 2$	12.33	17.88
$r \leq 2$	$r = 3$	3.08	7.53
$\lambda_{trace}$ :			
$r = 0$	$r = 1$	21.61	19.86
$r \leq 1$	$r = 2$	9.25	13.81
$r \leq 2$	$r = 3$	3.08	7.53

$r$  is the cointegration rank of the cointegrating vectors

The next step is to determine both the long and short run Granger causality. The presence of one co-integrating vector allows using Engle and Granger error correction to test for Granger causality. Since the error correction model are written in the first difference form and with justification order of VAR, which is 2, the optimal lag length in them gets reduced by one. The results of the causality analysis are presented in Table 3. It can be seen that the error correction term with  $\Delta$ LRGDP as the dependent variable is insignificant at even 10% level of significance. Therefore, in the long run, non-oil export and terms of trade do not Granger causes the non-oil GDP. The error correction term with  $\Delta$ LRX as the dependent variable is significant; therefore, non-oil GDP and terms of trade Granger cause non-oil export in the long run. So, it can be concluded that there is long run one-way causality between real non-oil export and real non-oil GDP, which the direction being from real non-oil GDP to real non-oil export.

TABLE 3: RESULTS OF GRANGER CAUSALITY IN A MULTIVARIATE FRAMEWORK

Dependent variable	Coefficients of lagged $\Delta$ LRGDP	Coefficients of lagged $\Delta$ LRX	Coefficients of lagged $\Delta$ LTOT	Joint significance	Error correction term (Prob)
$\Delta$ LRGDP	—	(0.047) <sup>S</sup>	(0.01) <sup>S</sup>	(0.004) <sup>S</sup>	-.52(0.37)
$\Delta$ LRX	(0.403) <sup>NS</sup>	—	(0.001) <sup>S</sup>	(0.001) <sup>S</sup>	-1.868(0.00)
$\Delta$ LTOT	(0.275) <sup>NS</sup>	(0.473) <sup>NS</sup>	—	(0.541) <sup>NS</sup>	-0.194(0.847)

NS: not significance; S: significance

Note: (1) figures in the parenthesis are the probability values showing the exact level of significance; (2) the positive sign of the error correction term with  $\Delta$ LRGDP as the dependent variable is incorrect but the coefficient itself is insignificant.

The short run dynamics can be seen by looking at the coefficients of lagged differenced terms. Coefficients of lagged  $\Delta LRX$  and  $\Delta LTOT$  with  $\Delta LRGDP$  as the dependent variable are significant. This implies that growth of real non-oil export and terms of trade in short run does exercise a significant influence on real non-oil GDP. Coefficients lagged  $\Delta LRGDP$  and  $\Delta LTOT$  with  $\Delta LRX$  as the dependent variable, respectively are insignificant and significant, implying growth of non-oil GDP in the short run does not have a significant influence on growth of non-oil export, and growth terms of trade significantly affects the growth of non-oil export in the short run. In same way, non-oil export and non-oil GDP do not significantly influence on the terms of trade neither in the short run nor in the long run. It may also be noted that non-oil GDP on their own may exercise insignificant influence on non-oil export in short run, but conjunction with other variables they become important as the tests of joint significance show.

## Concluding Remarks

Based on the findings of this study, the direction of short run causality is from real non-oil export growth to real non-oil GDP growth in Iran whilst the long run causality direction is reversed. Furthermore, the hypothesis of export-led growth is to be existed in the short run. This result implies that support policies such as export subsidies lead to increase export and GDP only in the short run, whereas in the long run export may be increased via well-being infrastructure economic and increasing production in the country. In other words, expanding export as one of the long run purposes of macro programming in the country can be achieved through increasing capacity utilization, improving productivity, and greater product variety. This can provide the opportunity to compete in the international markets that leads to technology transfer and improvement in managerial skills. Although protection policies in foreign trade has conflict with the WTO agreements, implementing strategies that increase productivity and production are corresponding with principals of this organization. Therefore, utilizing convenient strategies that improve Iran's infra-structure of production, it is expected that joining Iran to WTO can increase its non-oil exports. Although Iran has made significant progress in implementing trade reforms and intends to do more in the future in accordance with the WTO requirements, it should be noted that, as reviewed by Gunter, et. al. (2005), any gains from trade liberalization are often associated with external effects that are dynamic in nature.

*University of International Business and Economics (UIBE), China*

## Abstract

Since midterm of 1990s the world has been experiencing a new wave of Regional Integration Agreement (RIA). This paper extends the growth model to panel data and applies this model to test the growth effect of Economic Regional Integration in the period 1981-2005 related to 106 countries. Empirical study shows that RIA partners' income levels have exerted positive effects on home country growth, and the effects on home country growth of different type of agreements are different: North-South and North-North agreements have significant growth effects; there is no clear answer for South-South agreements.

## Introduction

Regional integration refers to the process which two or more economies set up regional integration agreements to achieve economic development through the trade liberalization or more intensive economic cooperation. According to the extent to which regional integration members remove trade barriers, regional integration can be divided into various types such as free trade area, custom union, common market and economic alliance etc; according to levels of economic development of its members, regional integration can be divided into three types: regional integration among the developed countries (North-North regional integration), regional integration among developing countries (South-South regional integration) and regional integration between developing and developed countries (North-South regional integration).

Since the establishment of European Community (EC) in 1950s, regional integration experienced a speedy development. Since the mid-1980s, regional integration speeded up. According to WTO statistics, there are 214 regional trade agreement notified to WTO/GATT up to September 2006. More than half of the agreements entered into force after the Agreement Establishing the World Trade Organization went into effect. According to the World Bank statistics, about 60% of world trade took place within the regional groups.

Strengthening regional economic cooperation and promoting national economic growth have become an important trend in the world economy nowadays. However, how does the participation in regional integration affect member's economic growth? Is the growth effect of integration related to the income level of the partners among the regional integration agreement? What is the favorite type of the RIAs? Answers to these questions are helpful for China to develop regional economic cooperative strategy and select regional integration partners.

This paper is structured as follows. Section I is introduction. Section II reviews the literatures on the relationship between economic growth and regional integration, It shows that different opinions about the impact of regional integration on economic growth. Section III sets up a model to test the effect of RIA partners' income levels on home country economic growth by using the panel data in the period 1990-2005 related to 106 countries.

We introduce the absolute and relative indicators of regional integration into economic growth model. In addition, This section classified regional economic integration into three models of regional economic integration: North-North, North-South and South-South and test the effects of different type of agreements on home country growth. Section IV is the result analysis. Appendix is attached.

This paper used data from the World Development Indicators (WDI) database and the United Nations Comtrade database<sup>1</sup>. And test the growth effect of regional integration in the period 1981-2005 related to 106 countries (see Appendix).

## Literature Review

Since Tinbergen(1954)and Balassa(1961) introduced the empirical method in testing the growth effects of regional integration, a significant number of empirical studies on the impact of regional economic integration on growth have utilized various econometric approaches. These have included: time-series analysis (e.g. Landua 1995), standard growth regression analysis (e.g. Henrekson et al. 1996), static panel data models (e.g. Torstensson 1999) and dynamic panel data models (e.g. Badinger 2001).As to growth effects of regional integration with different samples, their results are different.

Henrekson et al. (1996) deals with the effects of European integration in the EC and EFTA on economic growth. Regression results suggest that EC and EFTA memberships do in fact have a positive and significant effect on economic growth, and that there is no significant difference between EC and EFTA membership. The results suggest that regional integration may not only affect resource allocation, but also long-run growth rates. Badinger (2001) uses time series data and dynamic panel data model to estimate the effect of the European Union (EU) on economic growth. The study found that regional integration has not led to sustained increase of EU members' growth, but the real GDP per capita of EU members would be 20% lower if there is no regional integration.

Torstensson (1999) conducted an analysis of a data panel consisting of 20 OECD countries and covering the period between 1976 and 1990. The result didn't support the correlation between the economic growth and the economic integration. Anyway in an indirect analysis he empirically identified two channels linking economic integration to growth through investment and knowledge transfers.

Brada and Mendez (1988) revealed that members of the regional integration have a positive impact on the rate of investment by OLS method, but they had failed to confirm the direct link between regional integration and economic growth.

The study of Landau (1995) found that there had been no statistically significant difference between the growth of EEC member and non-member countries in a sample of 17 OECD countries in the period of 1950-1990. That would suggest that there was no long-term growth effect associated with the membership in the EC. Vanhoudt (1999) utilized panel data to analysis 23 OECD countries, finding that there were no positive or negative effects for EC members in comparison to non-member OECD states.

Brodzicki(2003)utilizes a two-way panel data approach to analyze a balanced panel of data composed of a group of 20 developed countries covering eight consecutive subperiods between 1960-1999, finding that being an EU member did not effect economic growth significantly, while the size of EU affect its members' economic growth greatly. Waltz(1997a , 1997b , 1998)used dynamic general equilibrium growth models that account for regional aspects, finding that the growth rate after integration depends on several factors, such as whether the integration agreement causes trade creation or trade diversion, the comparative advantage of each member, and initial trade barriers.

Most empirical literature tried to assess whether regional integration affects growth through the use of dummy variables for a country's participation in regional integration agreement (RIA). An important disadvantage of this approach is that a simple dummy variable will not capture a country's features that may have growth effects once an integration agreement comes to true. Matias(2003)introduced a new way to measure regional integration by creating the absolute RIA and the relative RTA indicators, which not only consider whether a group of economies

have signed the RIA, but also captures the world market combined with domestic markets once the agreement takes place.

Venables and Puga (1998) have reached conclusions regarding the effects of different types of agreements on income and welfare. Specially, they investigate the effects of trade arrangements between developed and developing countries, i.e. North-North and South-South agreements, on industrial development. They concluded that unilateral liberalization is beneficial, but also that the gains from integration agreements are likely to bring greater gains from integration. Moreover, they found that the North-South agreements are more likely to bring greater gains to developing countries than South-South agreements. Liu Li (1999) argued that most developing countries take part in South-South regional integration agreements, but the South-South agreements were not successful. So the North-South agreements are more beneficial. Liu Jing (2005) took Australia, New Zealand-ASEAN FTA as an example, suggesting that establishment of the FTA will benefit the three parties. Cai Penghong (2005) argued that China should establish FTA with individual member among ASEAN while establishing China-ASEAN FTA, so as to achieve common development. Zhao Nan (2003) indicated that China should actively participate in APEC activities, pushing the establishment of 10 +3 model at the same time.

The existing literature shows that relatively little attention has been devoted to study the effect of different types of RIAs on economic growth.

## Model

### Absolute and Relative Regional Integration Agreements Indicator

We will use the Absolute and Relative RIA Indicator to test the effect of the partners' income level on the home country's growth.

The absolute RTA is an indicator as follows:

$$AbsoluteRIA_{jt} = \sum_{\substack{i=1 \\ j \neq i}}^N (D_{it}^j \cdot SWGDP_{i,2000}) \quad (1)$$

Where N is the number of countries in the world,  $D_{it}^j$  is a dummy variable that takes the value of 1 when country j has an integration agreement with country i in period t, and  $SWGDP_{i,2000}$  is the share of world GDP of the countries with which country j has signed regional integration agreements<sup>2</sup>. So the Absolute RIA Indicator in equation (1) measures the absolute size of the market after entering into an regional integration agreement.

Also the relative RIA indicator is constructed as follows:

$$RelativeRIA_{jt} = \frac{\sum_{\substack{i=1 \\ j \neq i}}^N (D_{it}^j \cdot SWGDP_{i,2000})}{SWGDP_{j,2000}} \quad (2)$$

where  $SWGDP_{j,2000}$  is the share of world GDP of the countries with which country j has signed regional integration agreements(The base year is 2000).

Comparing the two indicators, we can find that the latter conveys information regarding the size of the partners' market relative to the domestic market.

### Growth Model of regional integration

In this paper, we quote identities as follows:  $Y=C+I+G+(X-M)$ , where Y represents GDP, C represent consume, I represents investment, G represents government expenditure, X represents exports and M represents imports.

According to the purpose of this paper, we select and adjust relative variables on the basis of the above model. In particular, we add the variable indicating "be whether or not member of a regional integration organization", "Absolute and Relative Regional Integration Indicators" etc. Thus we get the following growth model:

$$GGDP = \alpha + \beta_1 GE + \beta_2 FDI + \beta_3 TS + \beta_4 NS + \beta_5 ME + \beta_6 TPG + \beta_7 Labor + \beta_8 RD + \beta_9 BTRIA + \beta_{10} AbosoluteRIA + \beta_{11} RelativeRIA + \varepsilon \quad (3)$$

Where

GGDP is growth rate of Real GDP Per Capita in constant dollars (International prices, base year 2000);

GE is general government consumption expenditure (% of GDP);

FDI is FDI net inflows as % of GDP;

TS is exports as % of GDP;

NS is the share of world GDP of all neighboring countries (%);

ME is the ratio of manufactured exports to merchandise exports (%);

TPG is the exports growth rates of top 10 trading partners (%);

Labor is annual growth rate of labor force (%);

RD is R&D expenditure as % of GDP;

BTRIA is a dummy variable which takes value 1 if country i belongs to a regional integration agreement;

*AbosoluteRIA* is absolute regional integration indicator;

*RelativeRIA* is relative regional integration indicator;

Implementing backward method to delete insignificant variables, we can get the following growth model:

$$GGDP = \alpha + \beta_1 FDIRate + \beta_2 RD + \beta_3 Labor + \beta_4 ME + \beta_5 GE + \beta_6 TS + \beta_7 BTRIA + \beta_8 AbosoluteRIA + \beta_9 RelativeRIA + \varepsilon \quad (4)$$

## Results analysis

### Effect of RIA Partners' Income Levels on Home Country Economic Growth

#### (1) Analysis of Dummy Variables Coefficient

From column (1) - (3) of Table 1 we can see that coefficient of BTRIA variable is positive but not significant. It's well known that only use of the dummy variable is not enough to explain the growth effect of regional integration and lackage of theoretic foundation exists.

#### 2) Analysis of Absolute RIA and Relative RIA variables Coefficients

In this paper, we test the impacts of Absolute and Relative variables with three methods: firstly, retaining theAbsolute RIA variable, removing theRelative RIA variable; secondly, Removing the absolute integration variable, retaining the integration variable; thirdly, retaining these two variables at the same time. Empirical results are shown in Table 1 (column 4 - 12).

Column 4 of Table 1 uses Absolute RIA variable instead of the dummy variable BTRIA. It can be seen that the coefficient of Absolute RIA variable is positive and significant while using OLS regression method, which indicating that market size of integration partners has a positive and significant impact on economic growth. If a country comes to regional integration agreement with a partner whose GDP share of world is 1%, then the growth rate of the country will increase by 1.20% in long-term.

Column 5 and 6 also show that Absolute RIA variable has a positive and significant impact on economic growth. Hausman test rejected the results of random effects estimation, suggesting that fixed effect model can explain the growth effect of regional integration better.

The regression results of fixed effect model reveal that the higher RIA partners' income levels are, the greater home country economic growth rate is.

Column 7, 8, and 9 include Relative RIA variable in the model instead of Absolute RIA variable. Results show that coefficients of Relative RIA variable are all positive and significant, indicating that RIA partners' income levels had a positive and significant impact on economic growth of home country.

Column 10, 11, and 12 include both Relative RIA variable and Absolute RIA variable in the model. OLS regression results show that coefficients of the two variables are both significant, while they are both insignificant in fixed and random effect model. One of the reasons is that there exists collinearity<sup>3</sup>.

In choosing the model we shall notice that to specific countries the constant item represents the factors not to change with time trend (also called "individual effect"). These factors may also have an impact on a country's economic growth, such as the country's social system and the current economic cycle. There are two main channels in treating of individual effects: fixed effect model and random effect model. In this paper results of fixed effect model show that being a member of RIA did not have an significant effect on economic growth, but RIA partners' income levels exert a positive and significant effect on home country economic growth rate, and RIA partners' relative income levels promote home country economic growth rate even higher.

#### **Growth Effects of Different Regional Integration Modes**

Implementing same method used above to verify growth effects of different regional integration models, that is to say, EU<sup>4</sup> (on behalf of North-North integration), NAFTA (on behalf of North-South integration), and ASEAN (on behalf of South-South integration).

General speaking, GE, TS, FDI have significant impacts on economic growth. We compare the coefficients of Absolute RIA and Relative RIA variables only. Column 1, 2, and 3 of Table 2 retain Absolute RIA variable and remove Relative RIA variable. We can conclude that North-North integration agreements have a positive effect on economic growth; North-South integration agreements have a more significant positive effect on economic growth.

Column 4, 5, and 6 include the Relative RIA variable. Again North-North agreements have a positive and significant effect on economic growth. When both variables are included in column 7, 8, and 9, the above results remain unchanged, that is to say, both North-North and North-South integration have significant growth effect. So we can come to a conclusion that North-North and North-South integration has a positive effect on economic growth, and the growth effect of South-South integration is ambiguous.

Overall, empirical results suggest that RIA partners' income levels have exerted positive effects on home country growth, and the effects for different type of agreements on home country growth are different: North-South and North-North agreements have significant growth effects; there is no clear answer for South-South agreements.

# On R&D Internationalization Decisions in Developing Countries: A Theoretical Framework

*Yoshifumi Okawa, okawa@biwako.shiga-u.ac.jp*  
*Shiga University, Japan*

## Abstract

This paper presents simple theoretical frameworks taking into account R&D internationalization decisions by TNCs. We consider three types of R&D internationalization: internationalization by advanced-country TNCs in developing countries, internationalization by developing-country TNCs in advanced countries and internationalization by developing-country TNCs in other developing countries. Our analysis leads to the following results. First, the larger the market and the greater number of rival firms a subsidiary in a developing country faces, the more attractive internationalizing R&D in the developing country becomes for advanced-country TNCs. Second, the enforcement of intellectual property rights and a general knowledge pool encourages advanced-country TNCs to internationalize R&D in a developing country. Third, when developing-country TNCs can increase their knowledge base, they internationalize R&D in an advanced country. Fourth, developing-country TNCs have an incentive to internationalize R&D in other developing countries in which advanced-country TNCs never engage in R&D because of a small general knowledge pool.

## Introduction

R&D internationalization by transnational corporations (TNCs) expanded significantly in the last two decades. UNCTAD (2005) reported that global R&D expenditure of TNCs' foreign affiliates amounted to \$30 billion in 1993 and \$67 billion in 2002. Roberts (2001) also pointed out that the average share of R&D conducted abroad in total expenditure steadily rose from 15% to 22% between 1995 and 2001. The expanding internationalization of R&D is reflected in the growing role played by foreign subsidiaries in the R&D activities of many countries. Total R&D expenditure of foreign affiliates in host countries worldwide rose from \$29 billion to \$67 billion between 1993 and 2002, and their share in global business-related R&D jumped from 10% to 16% (UNCTAD, 2005).

Growing interest in R&D internationalization has led to rapidly expanding literature on the determinants and role of R&D conducted in foreign subsidiaries (e.g., Kuemmerle 1997, 1999; Florida, 1997; von Zedtwitz & Gassmann, 2002; Le Bas & Sierra, 2002; Shimizutani & Todo, 2007). These papers are mainly concerned with R&D

internationalization between advanced countries, such as North America, Europe, and Japan. Although advanced countries remain the main host locations of foreign R&D activities by TNCs, recent studies suggest that more R&D activities of advanced-country TNCs are located in developing countries, especially Asian countries such as China, India, Singapore, etc. In developing countries, the share of foreign subsidiaries in business R&D increased from 2% to 18% between 1996 and 2002, and rose faster than in advanced countries (UNCTAD, 2005). von Zedtwitz (2005) used a database comprising the locations of 776 internationalized R&D units, and showed that 194 R&D units, constituting about 25% of all internationalized R&D, are located in developing countries and controlled by advanced-country TNCs.<sup>1</sup> Moreover, developing-country TNCs are also internationalizing R&D activities. von Zedtwitz (2005) showed that 64 R&D units, constituting about 8% of all internationalized R&D, are located in advanced countries and controlled by developing-country TNCs, and 22 R&D units, constituting about 3% of all internationalized R&D, are located in developing countries and are controlled by other developing-country TNCs.<sup>2</sup>

The main purpose of this paper is to present simple theoretical frameworks that analyze the decision of R&D internationalization by TNCs. These frameworks consider three types of R&D internationalization: a) foreign R&D by the advanced-country TNC in the developing country, b) foreign R&D by the developing-country TNC in the advanced country, and c) foreign R&D by the developing-country TNC in another developing country. In this paper, we present that there are two incentives to internationalizing TNCs' R&D activities. One is a 'home base exploiting' incentive, henceforth the HBE incentive, and the other is a 'home base augmenting' incentive, henceforth the HBA incentive. These motivates are pointed out in many empirical studies (e.g., Kuemmerle 1997, 1999; Le Bas & Sierra, 2002).<sup>3</sup> The HBE incentive is the need to enhance the competitiveness of the subsidiary by adapting technological advantages possessed by TNCs to local input conditions, demand conditions, and regulations (Hakanson & Nobel, 1993; Fors, 1997). The HBA incentive is the need to gain access to foreign local knowledge that would otherwise be unavailable in the home country (Almeida, 1996; Florida, 1997).

Although many R&D internationalization studies exist in the empirical and business literatures, there are few theoretical economic analyses of R&D location decisions by TNCs. In the foreign direct investment (FDI) literature, Siotis (1999), and Bjorvatn & Eckel (2006) show that, when FDI generates technology spillovers between TNCs and local firms, a technologically lagging firm may engage in FDI that allows for technology sourcing from a technologically advanced firm. Although such FDI is caused by the same motivation as the HBA incentive, they do not consider R&D location decisions. Franck & Owen (2003) analyze how country-specific knowledge stocks affect R&D internationalization. In their model, TNCs localize a part of their R&D activities abroad to enhance the absorbing capacities of fundamental foreign R&D, which is nonrival firms' local R&D activities and R&D conducted at public institutions. This is R&D internationalization motivated by the HBA incentive.

Our models are mainly based on Belderbos, Lykogianni, & Veugelers (2005, 2006). They consider a two-country, two-firm model of strategic R&D location decisions by TNCs, when intrafirm and interfirm knowledge spillovers are allowed. In their model, henceforth the BLV model, two TNCs based in different countries operate subsidiaries in each others' home markets. The total R&D level of both TNCs is fixed, and they decide on the share of R&D to be conducted in the foreign subsidiary. They consider the potential outgoing R&D spillovers to the rival firm, and foreign technology sourcing opportunities from the foreign rival and the general knowledge pool available in the host country. The BLV model shows that the optimal share of R&D performed abroad by TNCs depends on the degree of intrafirm international technology spillovers and local interfirm R&D spillovers, and the size of the local knowledge pool.

Two differences exist between our models and the BLV model. First, the BLV model mainly focuses on the role of the interaction of R&D spillovers between two TNCs, and does not analyze the role of the relative size of the product markets in the two countries. In our model, however, the difference in the product markets' size in the two countries is explicitly considered, and R&D internationalization motivated not only by sourcing technologies from the local knowledge pool (the HBA incentive) but also by enhancing technological efficiency of the subsidiary located in a country having a large market (the HBE incentive) is analyzed. Second, our models consciously focus on R&D internationalization between the advanced country and the developing country, or between two developing countries, while the BLV model does not.

The remainder of this paper is organized as follows. Section 2 describes the simple monopolistic firm model and examines two incentives to internationalize TNC's R&D activities. Section 3 considers R&D internationalization by the advanced-country TNC in the developing country, and section 4 considers R&D internationalization by the developing-country TNC in the advanced country and another developing country. Section 5 presents the main conclusions.

## **The Monopolistic Firm Model**

In this section, a simple model with one TNC and two countries is constructed. It is assumed that the TNC enjoys a monopolistic position and has production facilities in both countries (the home and foreign countries). The home and foreign markets are completely separated, and the TNC's parent (subsidiary) supplies its products to the home (foreign) market. Linear inverse demand functions for the home country  $h$  and for the foreign country  $f$  are given by  $p_h = a - q_h/b_h$  and  $p_f = a - q_f/b_f$ , where  $q_h$  ( $q_f$ ) denotes the TNC's sales in the home (foreign) country.<sup>4</sup> The parameters  $a$ ,  $b_h$  and  $b_f$  are positive constants and  $b_h$  ( $b_f$ ) measures the size of the home (foreign) country.

Similar to the BLV models, the TNC has fixed budgets for R&D activities, and decides what share of R&D resources to allocate to the foreign subsidiary. The R&D location decision has an impact on the effective knowledge base of the parent and subsidiary. An increase in the effective knowledge base positively affects parent's and subsidiary's profits by reducing marginal costs. Let  $K_P$  and  $K_S$  be the level of the effective knowledge base of the parent and subsidiary, and  $m_P$  and  $m_S$  be their marginal costs. The relations between marginal costs and the effective knowledge base are given by  $m_P = A - K_P$  and  $m_S = A - K_S$ , where  $A$  can be considered the initial marginal costs that prevails with no effective knowledge base.<sup>5</sup>

The effective knowledge base consists of own R&D resources in the location, international intrafirm knowledge transfer, and incoming knowledge spillovers from the locally available general knowledge pool, which represents nonrival's R&D activities and R&D conducted by public institutions. Let  $X_T$  denote the level of TNC's total R&D budgets and  $\lambda$  denote the share of TNC's R&D resources allocated to the subsidiary, with  $\lambda \in [0,1]$ .

The TNC can transfer knowledge internally from the parent to the subsidiary and vice versa. These international intrafirm knowledge transfers are imperfect, not only because of the costs associated with transferring knowledge internationally within the TNC, but also because of the need to adapt the transferred know-how to local conditions. Adaptation costs arise because the products and processes developed by the parent need to be modified to satisfy requirements in the host country. The intrafirm transfer efficiency is indicated by the parameter  $\beta$  ( $0 < \beta < 1$ ), representing the share of knowledge that survives if transferred intrafirm across countries.

Moreover, the TNC can gain knowledge spillovers originating from the local general knowledge pool.  $G_h$  ( $G_f$ ) denotes the size of the general knowledge pool available in the home (foreign) country.  $\gamma$  represents the share of knowledge that spills over from the local knowledge pool to the TNC. Incoming spillovers are enhanced by the absorptive capacity of the TNC in the country represented by the TNC's own local R&D resources. For example, in the case of the foreign subsidiary, the impact of incoming spillovers on the subsidiary's knowledge base depends on the subsidiary's absorptive capacity represented by its R&D resources, such that  $\gamma G_f \lambda X_T$  is the addition to the knowledge base of the subsidiary because of incoming spillovers.

Given the above assumptions, the effective knowledge base of the parent is given by:

$$K_P = (1 - \lambda)X_T + \gamma G_h (1 - \lambda)X_T + \beta(\lambda X_T + \gamma G_f \lambda X_T). \quad (1)$$

The effective knowledge base consists of three parts. The first term represents the internal R&D allocated to the parent. The second term represents incoming spillovers from the general knowledge pool in the home country. The third term is the internal knowledge flowing back to the parent from the subsidiary. It is the combination of the internal knowledge transfer efficiency parameter  $\beta$  and the potential knowledge base to transfer, with the latter consisting of the subsidiary's own R&D activities and incoming spillovers from the general knowledge pool in the foreign country. The effective knowledge base of the subsidiary is similarly given by:

$$K_S = \lambda X_T + \gamma G_f \lambda X_T + \beta[(1-\lambda)X_T + \gamma G_h (1-\lambda)X_T]. \quad (2)$$

The TNC's profit function is given by:

$$\Pi = \pi_P + \pi_S - \frac{\delta(\lambda X)^2}{2}, \quad (3)$$

Where  $\pi_P$  and  $\pi_S$  are profits of the parent and the subsidiary, and the third term of the right side of (3) is the costs of decentralizing R&D activities, captured by a quadratic cost function.  $\pi_P$  and  $\pi_S$  are given by:

$$\pi_P = \frac{b_h(a - A + K_P)^2}{4}, \quad (4)$$

$$\pi_S = \frac{b_f(a - A + K_S)^2}{4}. \quad (5)$$

The TNC internationalizes its R&D activities if  $\partial\Pi/\partial\lambda > 0$  at  $\lambda = 0$ . As shown in (4) and (5), profits of the parent and subsidiary depend on their level of effective knowledge bases  $K_P$  and  $K_S$ , and the knowledge bases are functions of  $\lambda$ . Then the total marginal impact on profits of a change in the R&D resources ratio  $\lambda$  is:

$$\frac{\partial\Pi}{\partial\lambda} = \frac{\partial\pi_P}{\partial K_P} \frac{\partial K_P}{\partial\lambda} + \frac{\partial\pi_S}{\partial K_S} \frac{\partial K_S}{\partial\lambda} - \delta\lambda(X_T)^2. \quad (6)$$

$\partial K_P/\partial\lambda$  and  $\partial K_S/\partial\lambda$  represent the marginal impacts of the share of R&D resources in the subsidiary on the knowledge bases of the parent and subsidiary. From (1) and (2), those are given by:

$$\frac{\partial K_P}{\partial\lambda} = -(1 + \gamma G_h) + \beta(1 + \gamma g G_h), \quad (7)$$

$$\frac{\partial K_S}{\partial\lambda} = 1 + \gamma g G_h - \beta(1 + \gamma G_h), \quad (8)$$

where  $g = G_f/G_h$  represents the ratio of the general knowledge pool between the home and foreign countries.

From (4)-(8), the following proposition is obtained.

**Proposition 1:** *When the TNC is a monopolist in the home and foreign markets, the TNC internationalizes its R&D activities iff:*

$$\frac{b_f}{b_h} > \underline{b} = \frac{\{1 + \gamma G_h - \beta(1 + \gamma g G_h)\}\{a - A + (1 + \gamma G_h)X_T\}}{\{1 + \gamma g G_h - \beta(1 + \gamma G_h)\}\{a - A + \beta(1 + \gamma G_h)X_T\}}. \quad (9)$$

$\underline{b}$  is the minimum ratio of the size of both markets, for which the TNC transfers its R&D resources to the foreign subsidiary. The line AA' in Fig.1 indicates the combination of  $\underline{b}$  and  $g$ , and the shaded area constitutes the region of parameter values for which internationalizing R&D activities is profitable for the TNC.<sup>7</sup>

Proposition 1 implies that, for the TNC to internationalize its R&D activities, the foreign country needs to have sufficiently larger markets or a more general knowledge pool than the home country. As shown in Fig.1, the

TNC never transfers its R&D resources to the foreign subsidiary when both countries are symmetric (i.e.,  $b_f/b_s = 1$  and  $g = 1$ ). When the sizes of the general knowledge pool in both countries are equal, transferring TNC's R&D resources to the subsidiary brings about an increase in the subsidiary's knowledge base, which equals a decrease in the parent's knowledge base.<sup>8</sup> However, the marginal profits of the parent's knowledge base are larger than the subsidiary's knowledge base (i.e.,  $\partial\pi_P/\partial K_P > \partial\pi_S/\partial K_S$ ), because the marginal profits are increasing for their own knowledge bases, as shown in (4) and (5), and  $K_P = X_T$  and  $K_S = \beta X_T$  at  $\lambda = 0$ . Therefore, R&D internationalization is not profitable for the TNC, because an increase in the subsidiary's profits by transferring R&D resources cannot compensate for a decrease in the parent's profits as a result of it.

FIG.1: THE CONDITION FOR INTERNATIONALIZING R&D ACTIVITIES

For  $\underline{g} < g < \bar{g}$ , the subsidiary's profits increase by internationalizing R&D activities, while the parent's profits decrease because its knowledge base declines. The larger the foreign market, the larger the marginal gains of the subsidiary. Therefore, when the foreign country has a sufficiently large market, the TNC has an incentive to internationalize R&D activities to enhance the competitiveness of the subsidiary. This means the HBE incentive. On the other hand, if the foreign country has a more general knowledge pool than the home country ( $g > 1$ ), an increase in the subsidiary's knowledge base is larger than a decrease in the parent's knowledge base. Thus, when the foreign country has a sufficiently abundant general knowledge pool, the TNC has an incentive to transfer its R&D resources to enhance an access to a rich local knowledge pool. This means the HBA incentive.

The TNC never internationalizes its R&D activities for  $g < \underline{g}$ , because internationalizing R&D activities decreases the knowledge bases of not only the parent but also the subsidiary. As shown in (8), accepting R&D resources from the parent increases the subsidiary's knowledge base at the expense of decreasing intrafirm spillovers from the parent. If the disparity in the general knowledge pool between the parent and subsidiary is sufficiently large, an increase in the subsidiary's knowledge pool by spillovers from the foreign general knowledge pool

becomes so small that it cannot compensate for a decrease in spillovers through the parent from the home general knowledge pool. On the other hand, the TNC always internationalizes its R&D activities for  $g > \bar{g}$ , regardless of the difference in market sizes between the home and foreign country. This is because the parent's knowledge base increases from spillovers from the foreign general knowledge pool through the subsidiary, when the general knowledge pool in the foreign country is sufficiently larger than the home country.

### **R&D Internationalization by the Advanced-Country TNC in the Developing Country**

In this section, we consider how the advanced-country TNC determines the transfer of R&D resources to the subsidiary in the developing country. Assume that the home country is the advanced country and the foreign country is the developing country, and that the general knowledge pool is more abundant in the home country than in the foreign country (i.e.,  $g < 1$ ). Proposition 1 implies that the advanced-country TNC transfers its R&D resources to the subsidiary in the developing country, if the developing country has a sufficiently larger market than the advanced country, and the disparity in the general knowledge pool between both countries is not as large. Because the developing country has a smaller general knowledge pool than the advanced country, the HBE incentive is the main motivation for the advanced-country TNC to transfer its R&D resources to the subsidiary in the developing country. The larger the market in the developing country, the stronger the HBE incentive of internationalizing R&D activities. However, large market is not enough for the TNC to transfer its R&D resources. If the developing country has a small general knowledge pool, transferring R&D resources to the subsidiary is not profitable for the advanced-country TNC, because the TNC cannot increase the subsidiary's profits enough to compensate for the parent's losses by transferring R&D resources to the subsidiary.

The HBE incentive is also affected by the difference in the degree of competition between the home and foreign markets. Now, we modify the model shown in the previous section. It is assumed that the TNC is still a monopolist in the home country, but the foreign subsidiary competes with other rival firm—that is, a local firm or another TNC's subsidiary. Assume that the knowledge base of the rival firm in the foreign market is  $X_R$ , so that equation (7) is replaced by:

$$\pi_S = \frac{b_f (a - A + 2K_S - X_R)^2}{9}. \quad (10)$$

From (4), (6), (7), (8), and (10), the following proposition is obtained.

**Proposition 2:** *When the TNC is a monopolist in the home market and competes with a rival firm in the foreign market, the TNC internationalizes its R&D activities iff:*

$$\frac{b_f}{b_h} > \underline{b}^* = \frac{9\{1 + \gamma G_h - \beta(1 + \gamma g G_h)\}\{a - A + (1 + \gamma G_h)X_T\}}{8\{1 + \gamma g G_h - \beta(1 + \gamma G_h)\}\{a - A + 2\beta(1 + \gamma G_h)X_T - X_R\}}. \quad (11)$$

$\underline{b}^*$  is the minimum ratio of the size of both markets, which is needed to realize R&D internationalization.

Comparing  $\underline{b}^*$  with  $\underline{b}$ , the following lemma is obtained.

$$\textbf{Lemma.1: } \underline{b}^* < \underline{b} \text{ iff: } X_T > \frac{a - A + 8X_R}{7\beta(1 + \gamma G_h)}. \quad (12)$$

Inequality (12) is satisfied when the TNC has large R&D resources, the competitor with the subsidiary does not have a large knowledge base, and the TNC's intrafirm knowledge transfer efficiency is high. If inequality (12) is satisfied, the subsidiary's marginal profits of the knowledge base ( $\partial\pi_S/\partial K_S$ ) are larger when the subsidiary competes with the rival firm than when it has a monopolistic position. This means the HBE incentive becomes stronger when the subsidiary faces more rival firms in the foreign market.

Fig.2 demonstrates that the stronger competitiveness of the TNC widens the range of parameter values of  $b_f/b_h$  and  $g$  where the TNC internationalizes its R&D activities. The line AA' is the same as the line AA' in Fig.1, and shows the border line as to whether the TNC internationalizes its R&D activities when it has a monopolistic position in both markets. If inequality (12) is satisfied, the border line is located below the line AA', such as line BB' or line CC'. For  $\beta > 1/2$ , the border line moves from line AA' to line BB' and line CC' as the TNC's total R&D resources increase or the knowledge base of the rival firm decreases. The line BB' is the border line at  $X_T = (a - A + 8X_R)/(16\beta - 9)(1 + \gamma G_h)$ , and the line CC' is the border line at  $X_T > (a - A + 8X_R)/(16\beta - 9)(1 + \gamma G_h)$ . Fig.2 implies that even if the developing country has a smaller market than the advanced country, the advanced-country TNC has the incentive to allocate its R&D resources in the developing country when the subsidiary faces more competitors than the parent and the TNC has stronger competitiveness towards its rival firms.

FIG.2: THE RELATIVE COMPETITIVENESS OF THE TNC AND R&D INTERNATIONALIZATION

Next, we consider how intellectual property rights protection in the developing country affects the decision of R&D internationalization. Now it is assumed that the TNC's subsidiary competes with a foreign local firm, which has R&D resources  $X_L$ , and the local firm can get spillovers from the general knowledge pool and the TNC's subsidiary. The size of the local firm's knowledge base  $K_L$  is given by:

$$K_L = X_L + \gamma g G_h X_L + \alpha_f \lambda X_T X_L. \quad (13)$$

The third term of the right hand side of (13) represents incoming interfirm spillovers.  $\alpha_f$  represents the share of knowledge spillovers from R&D resources, which is transferred to the subsidiary by the TNCs, and the impact of incoming spillovers depends on the local firm's absorptive capacity represented by its R&D resources  $X_L$ .  $\alpha_f$  reflects the effectiveness of intellectual property rights protection in the foreign country and declines as intellectual property rights are tightened.

When the local firm's knowledge base is affected by the subsidiary's R&D resources, the total marginal impact on profits of a change in the R&D resources ratio is given by:

$$\frac{\partial \Pi}{\partial \lambda} = \frac{\partial \pi_p}{\partial K_p} \frac{\partial K_p}{\partial \lambda} + \frac{\partial \pi_s}{\partial K_s} \frac{\partial K_s}{\partial \lambda} + \frac{\partial \pi_s}{\partial K_L} \frac{\partial K_L}{\partial \lambda} - \delta \lambda (X_T)^2. \quad (14)$$

The third term of the right side of (14) represents the marginal impact of changing local firm's knowledge base by knowledge spillovers from the subsidiary.

From (1), (2), (4), (10), (13) and (14), the following proposition is obtained.

**Proposition 3:** *When the TNC is a monopolist in the home market and competes with the local firm in the foreign market, and there are spillovers from the TNC's subsidiary to the local firm, the TNC internationalizes its R&D activities iff:*

$$\frac{b_f}{b_h} > \underline{b}^{**} = \frac{9\{1 + \gamma G_h - \beta(1 + \gamma g G_h)\}\{a - A + (1 + \gamma G_h)X_T\}}{4[2\{1 + \gamma g G_h - \beta(1 + \gamma G_h)\} - \alpha_f X_L]\{a - A + 2\beta(1 + \gamma G_h)X_T - (1 + \gamma g G_h)X_L\}}, \quad (15)$$

$$\text{and } \alpha_f < \frac{(1 - 2\beta^2)(1 + G_h) + \beta}{\beta X_L}. \quad (16)$$

Fig.3 indicates the combination of  $\underline{b}^{**}$  and  $\underline{g}^{**}$  is the same as  $\underline{g}$  when  $\alpha_f = 0$ .<sup>10</sup> Inequality (16) is the condition that  $\underline{g}^{**} < \bar{g}$ . Proposition 3 implies that the TNC never transfers its R&D resources if intellectual property rights protection is so weak in the foreign country that  $\alpha_f$  does not satisfy inequality (16). When the foreign government tightens intellectual property rights, the line that shows the combination of  $\underline{b}^{**}$  and  $\underline{g}$  moves from line DD' to line EE', as shown in Fig.3, because  $\partial \underline{b}^{**} / \partial \alpha_f > 0$  and  $\partial \underline{g}^{**} / \partial \alpha_f > 0$ . This implies that, if the developing country government enforces intellectual property rights protection, the advanced-country TNC is likely to transfer its R&D resources to the subsidiary in that country.

We summarize the determination of R&D internationalization by the advanced-country TNC in the developing country as follows. Because the developing country has a smaller general knowledge pool than the advanced country, the advanced-country TNC transfers its R&D resources to the subsidiary in the developing country if the subsidiary faces a sufficiently larger market or more rival firms than the parent. This is because the TNC has the HBE incentive to internationalize R&D activities, which is the need to allocate its R&D resources to a large market or a market where competition is intense. However, a large market and many rivals are not enough for the advanced-country TNC to allocate its R&D resources to the subsidiary in the developing country. The developing country needs to increase its own general knowledge pool and tighten intellectual property rights for the advanced-country TNC to transfer R&D resources to that country.

FIG.3: INTELLECTUAL PROPERTY RIGHTS AND R&D INTERNATIONALIZATION

### R&D Internationalization by the Developing-Country TNC

In this section, we consider how the developing-country TNC determines the transfer of R&D resources to the subsidiary in the advanced country or the other developing country. At first, we focus on R&D internationalization by the developing-country TNC in the advanced country. Proposition 1 implies that the developing-country TNC has the HBA incentive to internationalize its R&D activities in the advanced country, because the advanced country has a larger general knowledge pool than the developing country. Now, we consider the developing-country TNC that has only a production facility in the developing country and establishes the R&D center in the advanced country. The R&D center is established just to only absorb knowledge from the advanced-country TNC's parent and the abundant local general knowledge pool. It is assumed that the home (foreign) country is still the advanced (developing) country and the local firm is the developing-country TNC, which has the R&D center in the advanced country. When the advanced-country TNC has already divided  $\lambda$  of its total R&D resources in the subsidiary, the

knowledge base of the developing-country TNC, which allocates  $\lambda^*$  of its R&D resources to the R&D center in the advanced country, is given by:

$$K_L = (1 - \lambda^*)X_L + \gamma g G_h (1 - \lambda^*)X_L + \alpha_f \lambda X_T (1 - \lambda^*)X_L + \beta [\lambda^* X_L + \gamma G_h \lambda^* X_L + \alpha_A (1 - \lambda) X_T \lambda^* X_L]. \quad (17)$$

The fourth term of the right side of (17) is the intrafirm spillovers from the R&D center in the advanced country, and  $\alpha_A$  represents the share of knowledge spillovers from R&D resources of the TNC's parent to the R&D center of the developing-country TNC. The profits of the developing-country TNC depend on the knowledge base denoted by (17), and  $\partial K_L / \partial \lambda^* > 0$  is the condition under which the developing-country TNC transfers R&D resources to its R&D center in the advanced country. From (17), the following proposition is obtained.

**Proposition 4:** *When the developing-country TNC has an R&D center in the advanced country, and the advanced-country TNC has already transferred  $\lambda$  of its total R&D resources to the subsidiary in the developing country, the developing-country TNC transfers its R&D resources to the R&D center iff:*

$$g < \frac{[\beta(1 - \lambda)\alpha_A - \lambda\alpha_f]X_T + \beta(1 + G_h) - 1}{\gamma G_h}. \quad (18)$$

Proposition 4 implies that the developing-country TNC transfers its R&D resources to the R&D center in the advanced country, if the disparity in the general knowledge pool between both countries is large. Inequality (18) implies that if intellectual property rights are tighten in the developing country or the intra-firm knowledge transfer efficiency of the developing-country TNC is improved, the incentive for the developing-country TNC to internationalize its R&D activities is enhanced.

Next, we focus on R&D internationalization by the developing-country TNC in the other developing country. Now we replace the home country from the advanced country with the other developing country, which has the general knowledge pool  $G_h^+ (< G_h)$ , and the TNC is assumed to have total R&D resources  $X_T^+ (< X_T)$ . If the TNC has a monopolistic position in both markets like the model in section 2, inequality (9) changes to:

$$\frac{b_f}{b_h} > \underline{b}^+ = \frac{\left\{ [1 + \gamma g^+ G_h - \beta(1 + \gamma g G_h)] \{ a - A + (1 + \gamma g^+ G_h) X_T^+ \} \right\}}{\left\{ [1 + \gamma g G_h - \beta(1 + \gamma g^+ G_h)] \{ a - A + \beta(1 + \gamma g^+ G_h) X_T^+ \} \right\}}, \quad (19)$$

where  $g^+ = G_h^+ / G_h < 1$ . Compared with (9), it is explicitly shown that  $\underline{b} > \underline{b}^+$ . In Fig.4, the line AA' shows the combinations of  $\underline{b}$  and  $g$ , and line FF' shows the combinations of  $\underline{b}^+$  and  $g$ .<sup>11</sup> The shaded area in Fig.4 constitutes the region of parameter values for which internationalizing R&D activities is not profitable for the advanced-country TNC but is profitable for the developing-country TNC.

Fig.4 implies the developing-country TNC, which has less R&D resources than the advanced-country TNC, has the incentive to transfer its R&D resources to a country that has such a small general knowledge pool that the advanced-country TNC never transfers its R&D resources to that country. This is because the parent's losses suffered from transferring R&D resources to the subsidiary are smaller for the developing-country TNC than the

advanced-country TNC. There are two reasons for this. First, the occasional costs of losing spillover gains from the home general knowledge pool are smaller for the developing-country TNC than the advanced-country TNC, because the developing country has a smaller general knowledge pool than the advanced country. Second, the parent's marginal profits of its knowledge base are smaller for the developing-country TNC than the advanced-country TNC, because the developing-country TNC has less R&D resources than the advanced-country TNC.

FIG.4: THE COMPARISON OF ADVANCED AND DEVELOPING-COUNTRY TNC IN R&D INTERNATIONALIZATION

## Conclusions

This paper presents simple frameworks that analyze the R&D internationalization decision by TNCs and shows that there are two incentives to internationalizing R&D activities. First, the HBE incentive is the need to enhance the competitiveness of the subsidiary that faces a larger market or more rival firms than the parent. Transferring R&D resources to the foreign subsidiary causes a decrease in the parent's profits by decreasing its knowledge base unless the foreign country has an abundant general knowledge base. If the foreign subsidiary faces a larger market or more competitors than the parent, internationalizing R&D activities brings subsidiary's profit gains that are greater than the parent's losses. Second, the HBA incentive is the need to enhance the access to the abundant local knowledge pool. If the foreign country has a larger general knowledge pool than the home country, the TNC can increase its profits by transferring R&D resources to the foreign subsidiary, because an increase in the subsidiary's knowledge base by spillovers from a rich general knowledge pool overcome a decrease in the parent's knowledge base. Moreover, the TNC can increase not only the subsidiary's but also parent's knowledge base by transferring R&D resources to the foreign subsidiary, if the foreign country has such an abundant general knowledge pool that spillover gains from the foreign general knowledge pool overcome spillover losses from the home general knowledge pool.

Our frameworks analyze the determination of R&D internationalization in three cases. At first, as for the R&D internationalization by the advanced-country TNC in the developing country, our model shows the HBE incentive is a main motivation for the advanced-country TNC to transfer its R&D resources to the subsidiary in the developing country. Because the developing country has a smaller general knowledge pool than the advanced country, transferring R&D resources to the subsidiary always brings about losses to the parent. And then, for attracting R&D internationalization by the advanced-country TNC, the developing country needs to have a large market or to create an environment where many firms compete in that country. On the other hand, our model also shows that the developing country needs to enhance the general knowledge pool or to tighten intellectual property rights. As represented by Propositions 1 and 3, even if there is a large market or many firms competing in the developing country, the advanced-country TNC never transfers its R&D resources to its subsidiary when the foreign country has a small general knowledge pool or does not apply strong intellectual property rights protection.

These results explain the background of the increasing establishment of R&D units in several developing countries these days. Recently, the emergence of newly industrialized countries, represented by BRICs (Brazil, Russia, India and China), has induced FDI to these countries by advanced-country TNCs. In addition to the growing GDP, the situation in which many TNCs compete against each other in these countries increasingly stimulates the establishment of R&D units by advanced-country TNCs in these emerging countries. Moreover, our model shows that the policy of widening the local knowledge pool, such as improving the national innovation system, training scientists and engineers, and tightening intellectual property rights, are effective for attracting R&D units from the advanced countries.

Second, as for the R&D internationalization by the developing-country TNC in the advanced country, Proposition 1 shows that the developing-country TNC has the HBA incentive to internationalize its R&D activities in the advanced country. Moreover, even if the developing-country TNC does not have the production facilities and only has an R&D center in the advanced country, the developing-country TNC transfers its R&D resources to the R&D center when the gap between the general knowledge pool in both countries is so large that the developing-country TNC increases its effective knowledge base by spillovers through the R&D center from the abundant general knowledge pool in the advanced country. In addition to that, Proposition 4 shows that tightening intellectual property rights in the developing country stimulates R&D internationalization by the developing-country TNC in the advanced country. Propositions 3 and 4 imply that tightening intellectual property rights in the developing countries promotes not only R&D internationalization from advanced countries to developing countries but also vice versa.

Thirdly, as for the R&D internationalization by the developing-country TNC in the other developing country, our model shows that the incentive to transfer R&D resources to the developing country is stronger for the other developing-country TNC than the advanced-country TNC. This is because the occasional costs of transferring

R&D resources to the subsidiary, which involves parent's losses, are smaller for the developing-country TNC than the advanced-country TNC. R&D internationalization by developing-country TNCs in other developing countries is observed very recently, and the scale of this is still small. However, our model suggests that R&D internationalization between developing countries could grow rapidly in the future.

Finally, we make suggestions for future research. At first, our analysis focuses on the decision of whether or not the TNC internationalizes its R&D activities. A more complex question would be to allow for endogenous determination of the size of the R&D share allocated to the subsidiary  $\lambda$  and the total R&D budgets  $X_T$ . Second, compared with the BLV model, our models do not explicitly consider the strategic interaction between oligopolistic TNCs. In our model, TNCs strategically interact through product market competition and R&D spillovers, whereas TNCs strategically interact only through R&D spillovers in the BLV model. Therefore, it would be interesting to extend our model to analyzing the strategic interaction between TNCs.

## Abstract

Foreign Direct investment (FDI) contributes to a significant share of the domestic investment, employment generation, exports etc., in a number of economies in the world. It is, however, important to weigh the costs and the benefits of FDI to gauge whether FDI has positive impact on economic development. It is not surprising that there is a lot of hype surrounding FDI. Arguments and counter arguments about FDI and its relationship with development can take highly polarized positions. A number of studies conclude that FDI can have beneficial effects on a host economy if right policies and regulatory conditions are in place. This paper examines whether the positive impact of FDI on development in a country depends on the quality of FDI it is receiving besides the identifying the determinates of the Quality of FDI, global FDI trends and also elaborates the need of effective development strategy for quality FDI.

## Introduction

Foreign direct investment (FDI) is considered to be a major catalyst in promoting sustainable development in developing countries. FDI has the potential to generate employment, raise productivity, transfer skills and technology, increased income, enhance exports and contribute to the long-term economic development of the world's developing countries. More than ever, countries at all levels of development seek to leverage FDI for development. Liberalization policies have led to rapid growth in FDI flows in recent years. Basing on the benefits associated with FDI several developing, as well developed countries, compete fiercely for FDI. They try to attract foreign investors by providing financial and fiscal incentives, undertaking corporate restructuring and economic reforms and inviting foreign investors in the privatization of state-run units. In 2001, for example, 71 countries made 208 changes in their FDI regulatory regimes, out of which 194 were done to attract higher FDI.

FDI is one of the means of achieving the targets of higher economic growth and development. But not all countries have succeeded in attracting FDI, and for some who have, FDI has not brought the expected benefits to their economies. FDI can have negative impacts on sustainable development, such as environmental degradation, poor labour standards, crowding-out of domestic companies, and corruption. Thus recent approaches to FDI have

focused on the quality of FDI rather than the quantity. But the notion of “quality” FDI is still narrow and focuses on the economic rather than the environmental and social dimensions of sustainable development.

Merely receiving more FDI is no panacea for developing countries' problems. The challenge before several developing countries like India is to get quality FDI that fosters development. This paper discusses the main elements required for policies aimed at attracting quality FDI and how best it improves the economic development of the country besides providing supportive framework for effective foreign corporate, social and environmental responsibility.

## **Determinants of Quality FDI**

One of the factors said to be bringing about contrasting impacts of FDI on economic development in different countries is the quality of FDI they have been receiving. Quality of FDI can be determined by how much the foreign affiliates have linkages with the economy. How much a country would benefit from FDI depends on the quality and quantity of FDI and the domestic economic environment, e.g., whether and how the benefits are distributed among the people.

The quality of FDI can be determined by:

- The extent of localization of affiliates' output: how much linkage foreign affiliates have with the local economy.
- Its contribution to the development of modern industries: foreign affiliates entering into relatively technology-intensive industries, which are new to the host country, bring more benefits.
- Its extent of export-orientation: FDI in export-oriented units can have substantial balance of payments benefits and positive external effects.
- Research and development (R&D) activity of affiliates: such activities have substantial positive externalities.

## **FDI and Economic Development**

The aim of attracting FDI should fit into a country's overall development strategy. It is also necessary to encourage domestic investment, along with FDI, in a country to increase its total investment. East and South East Asian (ESEA) countries, which are said to have experienced a favourable effect of FDI on economic development, took steps to increase domestic as well as foreign investment. Further, foreign companies may be reluctant to invest in an economy, if domestic investors are reluctant. For example, it is said foreign investors prefer not to invest in South

Africa because investment by domestic investors is very low, even though domestic investors have adequate resources.

Regulation of foreign, as well as domestic, investment is another major element in the development strategy of any developing country. The motive of any company, domestic or foreign, making investment is to make profits. Countries have to make sure that the profit-making activities of the companies do not clash with their overall development strategies, by regulating both domestic and foreign investment.

FDI, however, is neither a necessary nor sufficient condition for economic growth and development: higher FDI may not imply faster economic development. A lot depends on the strategies a country adopts to attract FDI. East and South East Asian countries, for example, have utilized FDI to stimulate economic growth by taking a selective and strategic approach to FDI.

South Korea and Taiwan, for example, did not receive very high FDI, as they had imposed restrictions on entry of FDI and the degree of ownership. The two countries, however, took steps to maximize the spillover effects of FDI by encouraging FDI, accompanied with certain kinds of technology, imposing strict local content requirements and encouraging investors, such as sub-contractors, who were willing to transfer technology to domestic companies. China, Malaysia and Singapore, in contrast, had greater FDI flows but did make sure that they receive FDI in line with their national development priorities.

There are, however, other countries, which imposed local content requirements, such as Brazil, that had imposed such requirements in high technology sectors but were not much successful in benefiting from FDI. ESEA countries might have been able to benefit from FDI, by imposing local content requirements because of the accompanying high economic growth. In this context, the question is, whether FDI benefits growth or growth benefits FDI.

## **Positive Impacts of FDI on the Economies of Developing Countries**

Countries seek FDI because of its potential benefits. The most often cited benefit of FDI is that it can supplement a shortfall in domestic savings. Countries, which do not have a domestic resource crunch, may seek FDI for other potential benefits. The potential benefits of FDI can be classified into trade benefits, non-trade benefits and other benefits.

### **Trade Benefits**

Traditional theory states that FDI substitutes trade, while empirical analyses show that the former complements the latter. If a company decides to set up a unit in a country to which it used to export, FDI substitutes trade. If local affiliates of foreign companies import inputs to manufacture products for domestic and international markets, then

FDI complements trade. FDI can stimulate exports, if the motive of foreign investors is to exploit the export potential of the country. FDI usually stimulates exports in the natural resources sector. Transnational corporations (TNCs), such as mining and oil companies, play a leading role in this.

#### **Non-Trade Benefits**

Flow from the fact that TNCs possess assets such as advanced technology, managerial know-how, skills, international production networks, brand names and access to international markets, which are not easily obtainable by developing countries. These resources are not easily obtained in the market. One way to obtain them is by letting FDI enter a country. These factors help in the modernization of an economy, increase productivity and bring about high economic growth.

#### **Other Benefits**

Expand and diversify the production capacity of an economy;

Relatively stable than other forms of international capital flows as it has a longer-term perspective;

Establish backward and forward linkages with the rest of the economy;

Provide access to advanced technologies and facilitate the transfer of technologies;

Bring in improved management practices;

Transfer best practices in corporate governance and accounting practices; and

Integrate the domestic economy with the global economy and infuse competition in the domestic economy.

## **Strategies for Maximizing the Benefits of FDI for Economic Development**

### **Green Field Investment Strategy**

FDI through Greenfield investment has better chances of generating positive externalities, compared to the acquisition of a running enterprise (though, at times, acquisition can be favourable). Some countries discourage the latter.

### **Export-oriented Strategy**

Export-oriented FDI has better chances of favourable externalities compared to FDI targeting the domestic market. Export-oriented FDI minimizes the possibilities of crowding-out of domestic investment and generates favourable spillovers by creating demand for intermediate goods. Export-oriented FDIs have other externalities— information on export potential for domestic firms, and transfer of best technological practices. Therefore, a number of host countries adopt policies to channel FDI into export-oriented production.

In this context, China's record is most impressive in pushing FDI through performance requirements to develop export-oriented industries, which now account for 55% of its manufactured exports and as much as 80% of

high-tech exports. MNCs, in contrast, account for less than 10% of India's exports. Experiences of other Southeast Asian countries such as Malaysia, South Korea, and Thailand in this direction—through selective policies and export obligations imposed at the time of entry also deserve careful consideration. India's own experience with export performance requirements, direct or indirect, has been successful.

#### **Strategy for encouraging Joint Ventures**

Joint ventures improve the chances of learning by local joint venture partners, absorbing the know-how and building on it. This has been seen in several cases, including the auto industry, where local partners built their technological capability and became globally competitive. Therefore, many countries tend to limit the extent of foreign ownership to encourage joint ventures. India's vibrant domestic entrepreneurial pool actually makes the joint venture mode an interesting proposition even for the foreign entrant, who can use the resources and networks of local partners to get off the ground quickly.

#### **Encouraging Manufacturing Industry**

FDI in manufacturing generally may have more favourable spillovers, such as employment generation and backward linkages for the domestic economy than in services. For this reason governments have generally been more restrictive to FDI in services. In China, the bulk of FDI is directed to manufacturing.

The relative strengths of the costs and the benefits of FDI depend on whether the economy has a sound investment climate. An investment environment is said to be a sound one if the country have the following policies and institutions.

- A sound macroeconomic environment, which depends on monetary and fiscal policies and conditions such as stability of interest rates and status of fiscal accounts;
- Appropriate institutions, which depend on the existence of effective legal and regulatory structures, a competition authority and investment promotion and facilitation institutions; and
- Adequate basic infrastructure, which implies adequate supplies of power, water, land, transport and communications.

It can be said that these factors are the "right conditions" to ensure that FDI has beneficial effects on the economy. There is, however, no single winning formula for maximizing benefits from FDI, in that there is no single set of right conditions for all countries. For example, several countries have managed to benefit from FDI without the presence of a competition authority.

A sound investment environment is needed to establish linkage with the rest of the economy. If a country lacks basic infrastructure, linkages of FDI with the rest of the economy might not be established and the country, most likely, would not benefit from FDI. Countries such as Angola and Nigeria attract FDI in sectors such as mining and petroleum, but they lack good infrastructure. Consequently, FDI has not been bringing benefits to large

segments of population in these economies. While all the “right conditions” need not be present in countries, which open up their regimes to attract FDI, it is usually believed that some of the basic conditions should be present. It is said that a number of African countries did not benefit from FDI because they opened up their economies to foreign investors without the accompanying economic, institutional or infrastructural reforms.

### **The Following are the Some of the Important Measures Taken before to Attracting FDI**

Define the country’s development priorities first and then channelise FDI accordingly;  
Implement poverty reduction and income redistribution measures along with FDI liberalization measures;  
Put in place a regulatory structure to prevent any corporate mal-practices;  
Promote FDI with the potential of having deep linkages with the local economy;  
Develop an investment environment, which ensures that benefits of FDI outweigh costs;  
Being cautious as to not to open up the economy to allow more FDI than that it can absorb;  
Disseminate information and build the capacity of its citizens on the various aspects of FDI and development; and  
Conduct research and outline a clear country position on FDI before committing themselves to any agreement relating to investment at the WTO.

### **Negative Impacts of FDI on the Economies of Developing Countries**

When countries try to attract FDI for their own sakes, they may overlook negative effects of certain types of FDI, such as adverse environmental effects of extractive industries. In an industry such, as petroleum exploration, refining and distribution, which are highly environmentally sensitive, the major businesses are transnational companies. There are allegations that many of these companies do not follow proper environmental practices in several least developed countries and that many of these countries overlook environmental hazards posed by the companies.

FDI, which brings in environmentally harmful technologies, may do more harm than good to a country. It is alleged that similar other threats posed by foreign companies, such as displacing domestic investment or creating economic and social Inequalities are ignored by host developing countries. It is necessary for countries to adopt strategies to attract “quality” FDI and maximize benefits from it. However, it could be the other way round, domestic companies may have poorer performance than the foreign ones in social and economic terms. Therefore, countries should regulate foreign as well as domestic investment.

It is often alleged that FDI causes “mal-development” by impoverishing developing countries: it increases

poverty in the countries. The potential costs of FDI are:

- Negative impact on balance of payments (increases balance of payments deficit), if it increases imports of raw materials and inputs and remittances of royalties and dividends;
- Leads to inaccurate transfer pricing, if the products, which are imported by foreign affiliates from parent companies, are overvalued and the exports to the parent company are undervalued. This may also lead to balance of payments deficit;
- May reduce domestic investment or replace domestic monopolies by foreign companies. This leads to unemployment; and
- May transfer outdated or environmentally harmful technologies.

FDI can harm a country through the same route by which it can benefit the country. If trade effects of FDI are considered, balance of payments crisis can be caused if foreign investors import more than they export. Further, TNCs with a large size and market power may hinder proper development of domestic markets. Moreover, FDI may be costlier than other means of acquiring the factors, such as advanced technology and managerial practices. It may be cheaper for a country to develop these domestically. If a country has the potential to develop its domestic resources, then a better way of utilizing FDI could be to strategies the role FDI can play in the development of domestic resources rather than depending on FDI to acquire technology and other resources.

There is, however, no evidence to show that FDI has a negative impact on poverty reduction. It may have an indirect effect on poverty, if it leads to higher economic growth and employment. However, there is a weak link between an increase in economic growth and a reduction in economic inequality and poverty. Traditionally, it is thought that growth is important for reducing absolute poverty; though higher growth may not reduce countries in Latin America have experienced increases in FDI and economic growth and an increase in inequality at the same time. On the other, ESEA countries have experienced simultaneous increases in FDI and economic growth and decreases in economic inequality and poverty over the past two decades.

By itself, FDI is unlikely to make much of a dent in the poverty situation. Government-initiated programmes, which improve social safety nets and redistribute income and profits, complementing its policies, have proved to be more useful for this. FDI-led higher economic growth can provide funds for such programmes. FDI can also help in the provision of social services, such as delivery of water and power, especially in countries where the state has failed to provide such services adequately. Proper regulation of FDI in these sectors is usually necessary to ensure that the poor have proper access to the services. In recent times, Peru and Bolivia have had unpleasant experiences with the privatization of the water sector.

In the World Trade Organization (WTO), there have been proposals on having agreements to liberalize public services, such as water delivery, power, health care, primary education and postal services, under the General

Agreement in Trade in Services (GATS). However it is feared that if public services are liberalized, TNCs would enter these sectors in developing countries and deprive a large number of poor people from the services by charging high prices. It is important, they point out, that developing countries study the impact of the entry of foreign investors in these sectors before they make any such commitments at the WTO.

There are also concerns that FDI, mainly TNCs, drains resources from developing countries and is a new form of economic imperialism. Many in developing countries fear that FDI flows will be followed by developed countries taking over of their countries. FDI policies of several developing countries, such as India, were moulded by this belief- the “East India Company syndrome”, for a long time. India, now, officially welcomes FDI and has been taking policies and measures to attract FDI. In today’s information age, it might be difficult for a company to do a repeat of what the East India Company did in India. The global political, social and economic conditions have changed beyond recognition in the last 50 years. It might be fanciful to compare foreign capital that had entered developing countries, say, about a hundred years back with today’s FDI flows.

It is, however, important to weigh the costs and the benefits of FDI to gauge whether FDI has a positive impact on economic development.

## **Conclusion**

However, the enthusiasm shown by most developing countries today in attracting FDI is more because of ideological factors rather than ground-level changes. The propaganda of the World Bank and the IMF, among others, on the importance of FDI has been such that it is now believed that a country cannot develop without FDI. But the fact is, receiving more FDI is no panacea for developing countries.

China has maintained high GDP growth along with huge FDI flows. However, it started receiving FDI only after it got into a high growth path. Hence, large FDI flow is the effect of high growth and not the other way round. Even today, China's growth is largely driven by domestic capital formation, and FDI as a proportion of total investment is barely 10 per cent.

Very often there is talk about the South-East Asian miracle. Again, these countries have achieved high growth by mainly depending on their domestic capital accumulation rather than FDI. The experience of Brazil and Argentina, the two Latin American nations that attracted huge FDI throughout the 1990s, is even more telling. Argentina is in a deep crisis and the Brazilian economy has remained stagnant for long. It is, therefore, quite clear that huge FDI flows have not been of any real value to these countries.

FDI, reportedly, has had a more favourable effect on economic development in more advanced developing countries than poorer developing countries. It is said that economic and structural reforms undertaken in ESEA

economies have facilitated FDI. Their experience suggests that FDI depends on the availability of adequate infrastructure, appropriate labour, per capita income and economic growth of a country. It is also said that these countries were able to achieve high economic growth because of high FDI flows. FDI and development, it seems from the evidence, have a symbiotic relationship. One induces the other and vice versa. Therefore, an effective development strategy for developing countries would be to undertake measures for economic reforms and governance as well as to FDI at the same time.

A country can lose from FDI through the same routes by which it can benefit from FDI. It should take measures to improve its investment environment before liberalizing its FDI regime to allow more foreign investors. FDI would have a positive effect on development, if a country is able to make sure that it has adopted measures, which would maximize benefits from FDI. At the least, a country should adopt minimum regulatory measures to ensure that FDI or domestic investment does not harm its economy.

The challenge before developing countries is not to attract more FDI but to get quality FDI that fosters development. As it is, getting FDI is quite a challenge, and making it development-friendly is even more difficult. But there is no need to go out of the way to attract FDI. Increasing FDI inflow may be desirable but it is equally important to pay attention to quality, as it is the means for development and not an end in itself.

### **Abstract**

**In this study the causality relation between the financial development and the economical growth in Iran is studied using time series data of 1961-2004. The results of this study showed that there is not any mutual relationship between financial development and the economical growth in Iran and only the economical growth leads to financial development.**

**Therefore, the financial development will not be an effective factor to the economical growth.**

### **Introduction**

One of the most important goals of every economical development is achieving economical growth and development. One of the most important dimensions of economical developments is financial development. Because of having an advanced financial system beside other economical parts, there is the possibility of better funds and savings transition in society. It can also lead to an increase of generating investments in social and economical substructure and in human resource as well as increase the skill and expertise level of human force. In such a way it can help the economical development in society. In fact, the effect of a good financial structure on the economical structure is very important that the economical growth and development will have trouble without it. For the first time, in this direction the great economists like Schumpeter (13) explained the importance of financial system rather than the economical growth. Goldsmith (3) also indicated the positive relation between financial development, economical preferences in the case of 35 advanced and advancing countries. He also showed that the economical growth of these countries had been affected by financial development based on the increase of average finances ratio in financial institutions. Mackinnon and Shaw (9,15) believed that the government interferences in financial development system is an obstacle for the economical growth process also the financial development has an affective role on the economical growth ,and the financial systems with better operations have faster growth. King

and Levine (6) began to analyze the correctness of Schumpeter theory which was based on the importance of financial development in a study with the title “financial development and economical growth”. Their results showed that better financial development cause better economical growth. In recent years many studies had been done on the effects of financial development on the economical growth using some economical techniques. Levin and Zervos (7) showed that there is a positive and significant relationship between the components for developing the stocks and for growing the gross domestic product. Colderon and Liu (2) said at firstly, financial development leads to economical growth in general, secondly there is a mutual Granger causality between the economical growth and financial development, and thirdly financial development shared in developed countries in a causality relation is greater than in developing countries. Financial development can also lead to economical growth by forming more investment and more efficiency. Hondroyiannis, Lolos (5) showed that there is a mutual Granger causality between financial development and economical growth in Greece. Nieuwerburgh, Buelens, Cuyvers (11) showed that the increase of the market stocks led to economical growth in Belgium. Such studies had been done in Iran. Hadian and Tourkey (16) said that the theory of supply leadership had been rejected but the demand following is confirmed in Iran. Results of financial indexes also showed instability in the financial system of Iran economy. Shiva (14) declared that the economical growth in Iran had a positive relationship with financial development indexes. The relationship between economical growth and developing financial market is also one side and is from economical growth toward financial development in Iran. Nazifi (10) began to analyze effects of financial development on economical growth and he studied transferor channel for effects using granted credit indexes in private sector. Results of this model showed that during the studies, the financial development had negative effect on economical growth. Also with because of attention to importance of financial structure in economical growth process, we are trying to know if financial development leads to economical growth or economical growth leads for financial development.

## **Model Specification and Method**

In order to examine the short run and long run relationship between economic growth and financial development, the following relationship is specified:

$FD = g(Y, R)$ , where FD is an indicator of financial development, y is an indicator of economic growth and R is real interest rate (deflated by inflation). Different indicators like real interest rate, different definition of monetary aggregate and deposit ratio in gross domestic production in other countries were examined as indication of financial development. However, studies show that these indicators are not suitable factors to show degree of financial development (10). In this paper annual data of real GDP is an indicator for economic growth and data of granted

credit of banks to private sector is an indicator of financial development for 1961 to 2004 time period. Also real interest rate for above period is calculated. All of the variables in model are to show real price (1998=100) and are specified in the following form:

$LGDP$  is the natural logarithm of the real GDP,  $LBCR$  is the natural logarithm of granted credit of banks to private sector and  $R(-1)$  is the real interest rate with one lag. Two variables such as granted credit of banks to private sector and real interest rate have been one lag because their impact is not usually shown instantaneously in the same year.

In order to study causal relationship between economic growth and financial development, for the reason of using time series statistics, beginning determinants degree of integration of variables are used in this study with Augmented Dickey Fuller (ADF) test. For the next step to study a long run relationship between variables, we used Johanson method which determines a short run relationship between variables in model used from vector error correction model (VECM). Johanson's method is a framework of vector autoregressive model (VAR), which is as follows:

$$x_t = \sum_{i=1}^k A_i x_{t-i} + \varepsilon_t, \text{ where, } \varepsilon_t \text{ is a vector column of error terms and } x_t \text{ is a vector of variables.} \quad (1)$$

By adding terms  $x_{t-1}, x_{t-2}, \dots, x_{t-k}$  and  $A_1 x_{t-2}, A_2 x_{t-3}, \dots, A_{k-1} x_{t-k}$  to both sides of the above equation,

Equation (1) can be expressed in the first differenced error correction form:

$$\Delta x_t = \sum_{i=1}^{k-1} \delta_i \Delta x_{t-i} + \pi x_{t-k} + \varepsilon_t, \text{ where } \pi_{m \times n} = -(I_{n \times n} - A_1 - A_2 - \dots - A_K), I = -I + A_1 + A_2 + \dots + A_i \quad (2)$$

and  $I$  is a  $n \times n$  square matrix. In this method the coefficient matrix  $\pi$  contains information about long run relationship between the variables in the data vector. Therefore, variables can be evaluated by the number of co-integration vectors, with rank of  $\pi$  matrix. It shows that there are three forms: 1) when rank of  $\pi$  matrix is equal to number of variables in vector autoregressive model, then all variables are co-integrated; 2) when rank of  $\pi$  matrix equals zero, then  $\pi$  matrix is a null matrix and no long run relationship exists between variables in the  $x_t$  vector; 3) when the rank of  $\pi$  matrix shows that  $r$  is lower than  $n$  (number of variables in model). Usually  $r < n$  in the form of  $\pi = \alpha' \beta$  where  $\beta$  matrix is a co-integration matrix and their columns, if normalized, indicate a long run relationship between variables. Elements of  $\alpha$  indicate adjusted rate in a long run relationship. Therefore, Equation (2) produced a vector error correction model.

Johanson (1992) suggests the need to import the variables like intercept. Such trend has been tested jointly with determinate rank of matrix. These models measure if there is a relationship between trend and intercept, no relationship between trend and intercept or existence of one of the variables. Hypothesis of existence of zero co-

integration vector is tested ( $r=0$ ), with more than respective likelihood of ratio test statistics ( $\lambda_{trace}$ ) and maximal eigenvalue test ( $\lambda_{max}$ ). The likelihood ratio test statistic (trace test) is computed as follows:

$$\lambda_{trace} = -n \sum_{i=r+1}^k \ln(1 - \hat{\lambda}_i)$$

The null hypothesis that there are  $r$  co-integrating vectors against the alternative of more than  $r$  co-integrating vectors is tested and when accepted the trace statistic is lower than critical value suggested by Johanson and Juselius (1990). Other test is maximal eigenvalue test which is following:

$$\lambda_{max} = -n \ln(1 + \hat{\lambda}_{r+1}) \quad r = 0, 1, \dots, k - 1$$

This statistic tested for the null hypothesis of  $r$  co-integrating vectors against the alternative of  $r+1$  co-integrating vectors. When existence of  $r$  co-integrating vector is accepted the maximal eigenvalue statistic is lower than critical value. Then it has been suggested that the ratio test statistic and maximal eigenvalue test determine the presence or absence of the long run relationship between variables in the model. The next stage is to determine short run and long run relationship. If there is one or there are more than one co-integrating vectors between variables, one can use error correction model for testing Granger outcome. The error correction model for three variables can be written as:

$$\Delta LGDP = \alpha_1 + lag(\Delta LGDP, \Delta LBCR(-1), \Delta R(-1)) + \lambda_1 e(-1)$$

$$\Delta LBCR(-1) = \alpha_2 + lag(\Delta LGDP, \Delta LBCR(-1), \Delta R(-1)) + \lambda_2 e(-1)$$

$$\Delta R(-1) = \alpha_3 + lag(\Delta LGDP, \Delta LBCR(-1), \Delta R(-1)) + \lambda_3 e(-1)$$

Where  $e(-1)$  is the lagged value of the error correction term  $e$  and error correction term indicates that the long run relationship and short run dynamics is provided by the lagged values of the difference terms.

## Results

### Stationary

In order to study presence or absence of a long run relationship between financial development and economic growth, the Augmented Dickey-Fuller test (ADF) is used to determine co integration. Results of this study which were calculated using Microfit 4.0 are reported in table 1.

TABLE 1: ADF TEST FOR UNIT ROOTS

Variabl	With trend and no intercept		with intercept and tren	
	ADF statistic	95% critical value	ADF statistic	95% critical
LGDP	-1/94	-2/95	-2/91	-3/54
D(LGDP)	-3/31	-2/95	-3/38	-3/54
LBCR(-1)	-2/57	-2/95	-2/87	-3/54
D(LBCR(-1))	-3/37	-2/95	-3/62	-3/54
R(-1)	-1/46	-2/95	-1/34	-3/54
D(R(-1))	-6/34	-2/95	-6/43	-3/54

The results in table 1 indicate that all variables in level and the first difference are stationary at 95% level of confidence. Thus, using ADF unit root test, we conclude that all variables in this model are non stationary: I (1) since the first difference are I (0). In the next step and in order to apply Johansen’s procedure, first we must set the appropriate lag length of the VAR model to ensure that serial correlation problem does not exist in this model. Microfit 4.0 determines the number of appropriate lag length with Akaike Information Criterion (AIC) and Schwarz Bayesian Criterion (SBC). In this paper AIC is used to select VAR and a number of co-integrating vectors with trace test when the model includes intercept and no trend. These results are presented in table 2.

TABLE 2: TRACE TEST OF CO-INTEGRATION VECTORS IN VAR MODEL WITH INTERCEPT AND NO TREND

Null	Alternative	Statistic value	95% Critical value	90% Critical value
$r=0$	$r>=1$	35/18	34/87	31/93
$r<=1$	$r>=2$	17/66	20/18	17/88
$r<=2$	$r=3$	4/14	9/16	7/53

Based on the results of null hypothesis in table 2, the co-integrating vectors are rejected. In the next step we test null hypothesis that there is one or lower than one co-integrating vector. Because the test statistic is lower than the 90% and 95% critical value, the null hypothesis is not rejected. In other means we accept existence of one co-integrating vector between variables in model. Therefore, accepted model is model 2, which has no intercept and no trend in a short run. Also no trend has restricted intercept in a long run and the number of co-integrating vectors is therefore one. The result of estimated coefficient of co-integrating vector is reported in table 3.

TABLE 3: CO- INTEGRATING VECTOR ESTIMATED IN SECOND MODEL (LONG RUN RELATIONSHIP)

Variable	Coefficient of co integrating vector
LGDP	-1/3233
LBCR(-1)	0/8877
R(-1)	-0/9367
intercept	6/1559

Based on table 3, there is a normalized relationship, which is gaining from this vector for gross domestic product variable is as follows:

$$LGDP = 4 / 6520 + 0 / 6709LBCR(-1) - 0 / 07079R(-1)$$

Next step is to determine Granger relationship in the short run and the long run. The result of this causality analysis has been offered in table 4.

TABLE 4: RESULT OF MEANING ESTIMATED COEFFICIENT IN MULTIVARIATE GRANGER CAUSALITY

Dependent variable	$\tau$ static of $\Delta LGDP$	$\tau$ static of $\Delta LBCR(-1)$	$\tau$ static of $\Delta R(-1)$	F static	Error correction term(ECT)
$\Delta LGDP$		0/26(0/79)	-0/41(0/68)	1/9(0/14)	0/29(0/77)
$\Delta LBCR(-1)$	4/03(0/00)		-1/7(0/09)	24/9(0/00)	-4/2(0/00)
$\Delta R(-1)$	-1/32(0/17)	1/1(0/27)		0/24(0/86)	0/91(0/36)

Figures within parenthesis are the marginal p values. From the base result in table 4, it can be seen that error correction term with  $\Delta LGDP$  as the depended variable is insignificant at 10% level. This implies that in the long run banks granted credit to private sector and real interest rate, Granger causality of real income growth or real gross domestic product and only coefficient of error correction term in the equation that  $\Delta LBCR(-1)$  is the depended variable, is 100% significant. Therefore, real income and real interest rate are the Granger causality of growth of granted credit to private sector in the long run. This object implies onside relationship in the long run between financial development and economical growth.

In case of the short run relationship, result in table 4 shows that the short run coefficients in equation 1 are insignificant, which means that interest rate and credit in the short run do not effect real income growth alone. Because of F statistic these variables are significant. In fact, these two variables jointly influenced growth in the short run. Coefficient of variables in the short run (in the second equation) implies that both variables real income and interest rate in the short run exclusively influenced financial development or credit. Furthermore, F statistic

shows that these two variables jointly have a significant effect on credit. The variable coefficient in equation three shows that in the short run real income and credit do not influence real interest rate.

## Conclusions

Results of this paper show that in the long run financial development does not lead to economical growth, but economical growth leads to financial development. This result arises from Iran economical situation, saving distribution in society, investment level, and government intervention in private and governmental sector. Financial development in Iran would come to an end by level investment in governmental sector and by combination of benefits of oil sale and the domestic taxes from private sector. In other words, Iranian gross domestic product colluded to oil and had a positive effect on financial development. However, because Iran has a lot of problems in financial structure there was no positive effect on gross domestic product. Current financial structure in Iran is not moving in the right direction towards economical growth due to inefficiency. Thus, financial structure in Iran must change to enable savings and facilitate investment in order to improve economical growth.

## Abstract

Foreign Direct Investment capital represents an indispensable source of capital for economy. Cross border capital flows could be traced to the Middle Ages in Europe, but the current reference to Foreign Direct Investment (FDI) is based on the role of multinational enterprises to transfer capital to other nations during the Industrial Revolution and throughout the twentieth century and beyond. The growth of FDI has surpassed the growth of the world trade and has been the engine of growth for many countries, particularly in Europe and Asia. The importance of FDI in financing growth and investment in many countries is well documented. However, the evidence to determine the impact of foreign capital investment on some of the emerging countries of eastern/central Europe is lacking and somewhat mixed. The main objective of this paper is to examine the role of foreign direct investment on the growth of GDP and trade in some emerging European countries.

## Review of Literature

### Trends in FDI

In the past twenty years, the inflow of FDI has increased tremendously in the world economy. In particular, it grew from 13 to 31% of GDP on average for all developing economies (Henriot, 2003). The biggest reason for the rapid growth of direct investment in Eastern and Central Europe is the movement of these countries towards free trade accompanied by political and economic reforms. According to Henriot (2003), FDI stock in this region jumped from 2% of GDP in 1990 to 32% in 2002. Curiously, FDI tends to be concentrated in small economies. For example, it reached 57% of GDP in Czech Republic, 43% in Estonia and Slovakia, and 38% in Latvia (Henriot, 2003). According to the IMF, there has been a shift in relative shares of net private investment in different regions of the world during the past ten years. As shown in Table 1, the capital flows to emerging market economies were relatively even at around 4% of GDP in 1996. However, by 2002, while the Asian share had dropped to 1% of GDP

and the share of Latin America was only 0.5% of GDP, the share of the European accession countries had increased to 7% of their GDP. In addition, FDI seemed to stimulate trade in these countries as their exports increased more than four times between 1990 and 2000 and their imports were more than 5 times higher. Thus, FDI cannot only stimulate economic growth of the host economy but also affects other variables that favorably impact the growth of GDP.

TABLE 1: FDI FLOWS TO EMERGING MARKET ECONOMIES 1990-2003

Countries	Annual Average		1996	1997	1998	1999	2000	2001	2002	2003
	1990-1996	1997-2002								
All Countries	62.0	156.8	114.4	141.7	153.6	164.0	158.0	172.1	151.3	160.9
Africa	2.5	10.9	3.6	7.8	6.4	9.3	7.7	22.3	11.8	10.1
Asia	31.7	56.3	53.4	56.8	59.7	61.2	54.2	47.1	58.7	59.0
Middle East & Turkey	3.5	7.5	4.8	5.5	6.5	5.5	7.9	10.8	8.8	11.5
Western Hemisphere	18.2	58.7	40.3	56.1	60.1	64.1	64.7	66.9	40.4	45.6
Countries in transition	6.1	23.4	12.3	15.5	20.9	23.9	23.4	25.1	31.5	34.7

Source: IMF, World Economic Outlook, September 2003; IMF Database

FDI can take the form of greenfield investments in new facilities as well as mergers and acquisitions of existing firms. Mergers and acquisitions are more common types of FDI because they are easier to be executed and already have established customer base, production and distribution systems. In post-Soviet countries, large-scale privatization, which permits national enterprises to be acquired by private investors, outweighs greenfield investments.

Even though foreign investors have different options such as exporting, licensing, joint ventures or FDI when deciding to expand their activities abroad, many of them may choose FDI due to OLI paradigm (Dunning, 1993). The Ownership advantage occurs when the transfer of technology and management know-how permits the company to compete in the local market. The Location advantages occur when a country can provide location-specific resources such as good infrastructure or low-cost inputs. Finally, the Internalization advantage is realized if it is cheaper to invest than export to a particular country.

The governments of host countries are also interested in FDI, which positively impacts the economic development of their countries. Because of low domestic savings in the emerging and transition economies, FDI is an essential impetus to the economic growth as well as a source of finance for the host economies.

## **The Determinants and the Impact of FDI**

The most important effect of FDI on the growth of a country is to bring much needed capital to a country to overcome the pervasive investment-saving gap. Additionally, the inflow of FDI brings more efficient technology and new management techniques to a developing country. The main problem of assessing the impact of FDI on economic growth is its association with other growth-driven factors. On the one hand, FDI stimulates economic growth (Bernstein et al., 1998), while, on the other hand, high growth rate attracts FDI (Barrel and Pain, 1996). Therefore, FDI and economic growth can be interrelated. For example, Ericsson and Irandoust (2001) examined the causal relationship between FDI and economic growth for four European countries of Denmark, Finland, Norway, and Sweden. The results are controversial: the existence of causality was shown for Sweden and Denmark, being bi-directional for Sweden and unidirectional for Denmark; no causality link was detected for Finland and Norway. Lheem and Guo (2004) who tested both FDI-led growth model and growth-driven FDI model in China found that China might have experienced these two effects simultaneously. In summary, empirical studies provide mixed results finding both unidirectional and bi-directional causality.

The impact of FDI on economic growth is a controversial topic among economists. Some researchers confirm the positive impact of FDI on a host country's development (Borensztein et al., 1998, Baliamounte-Lutz, 2004, Asheghian, 2004), while others insist that its influence is ambivalent or negative (Haddad and Harrison, 1993). According to modernization hypothesis, FDI is the most critical impetus for economic growth because it brings with it advanced technology and managerial knowledge and spreads the benefits thereof throughout the economy (Tsai, 1994, Makki and Somwaru, 2004).

Other researchers argue that even if the inflow of FDI has a positive impact in the short run, it has an adverse long-term impact on economic growth, as reflected in the negative correlation between the stock of FDI and economic growth (Bornschiefer, 1980).

In addition, political, social and cultural factors are major determinants of FDI (Borensztein et al., 1998, de Mello, 1999). The location of the host country also plays an important role in the flow of FDI because it is easier to manage a subsidiary that is close to the home country. Gopinath and Echeverria (2004), however, found that distance has a negative effect on the trade-FDI ratio, which means that countries switch from trade to FDI the farther the receiving economy is from the home country. The market size can be another determinant of FDI, although Brenton and Di Mauro (1999) found no significant impact of market size on FDI in Central and Eastern European countries. According to Zhang and Song (2000), the impact of FDI varies across countries because of different stages of their development.

Another influence of FDI is on the trade balance of a country. The effect of FDI depends primarily on whether the motivation for the inflow of capital is 'market seeking' or 'efficiency seeking'. In the first case, the effect of FDI inflow on trade balance of the host country is expected to be negative (Varamini and Matty, 1998) as the product produced by the MNC is expected to be sold primarily in the host country. In this case, there is an inflow of intermediate goods to the host nation without much contribution to exports. On the other hand, if the main motivation for undertaking FDI is to seek lower cost input, it is quite likely that the net export in the host country could increase, creating a positive effect on the trade balance of the nation.

### **FDI in Central and Eastern European Countries**

Central and Eastern European countries have witnessed a considerable increase of FDI inflows since beginning of 90' and the potential to join the European Union. FDI has been an important source of financing and a catalyst for the economic development for many of these nations. Therefore, while competing for FDI, countries tried to implement structural reforms aimed at improving their investment climate. Deichmann et al. (2003) found that the level of reforms is a significant positive determinant of FDI inflows into transition economies. Since FDI in developing countries is usually export-oriented, the policies that a host country implements are also designed to facilitate trade. Thus, FDI not just stimulates the growth of the economy but also accelerates international trade, which in turn favorably affects the economic growth of the country. The leading recipients of FDI in eastern/central Europe were Poland, Czech Republic, Hungary and Slovakia. These countries were the first ones to reform their economies and they are among the first countries that joined the European Union in 2004.

Investors in Central and Eastern European countries have a variety of motives when choosing a recipient of FDI. Lankes and Venables (1996) show that FDI projects in these countries are very heterogeneous and differ in terms of their size, objectives, technology, location, ownership, and control requirements. Therefore, when assessing the impact of FDI, it is important to study it on a country-by-country basis. Brenton and Di Mauro (1999) analyzed FDI inflows to the CEEC and their results show that FDI is positively affected by GDP but market size, measured by population, does not appear to significantly influence FDI inflows. They also found that the distance coefficient was significant and negative because the cost of managing a subsidiary increases with the distance. In addition, FDI may substitute exports in distant countries. Aturupane et al. (1999) and Walkenhorst (2001, 2004) found a positive correlation between trade and FDI in transition economies, suggesting that FDI and trade are complements rather than substitutes in these countries.

In another empirical analysis of FDI inflows to the CEEC, Bevan and Estrin (2000) took the host country's credit risk into account. Their results show that FDI is determined by the host country's risk and size, labor costs

and distance. They also found the evidence that an announcement about future admission to the European Union had a direct and positive influence on FDI. Contrary to this study, Altomonte (2000) concluded that FDI appears to be influenced by GDP per capita and by population, but not by distance. In addition, in emerging and transition economies, certain sectors such as manufacturing and science-based attract FDI, mainly due to lower labor costs.

## **Comparison between Slovakia and Slovenia**

The interest for comparing Slovakia and Slovenia is based on economic as well as cultural and historic reasons. They are both Slavic countries, which are relatively small, even if Slovakia is more than twice bigger as Slovenia, (see table 2). From a cultural point of view it is interesting that they have almost the same name, which causes, sometimes (even high-level politicians) to confound them. The origin of both probably came from the old Slavonic “slovo”, meaning simply, “word”, so that Slavs would be those who know “words”, contrasted to “non speakers”, from which derives the Slavonic name for Germans, “Nemci”, meaning “deaf”. Another cultural aspect is that both populations are in majority catholic, even if historically in both also the protestant movement played a role in the past.

There are also other historical similarities: both populations awakened to national consciousness in the nineteenth century in the Habsburg Monarchy, even if Slovenes in the Austrian and Slovaks in the Hungarian part of it. After World War I, they were part of two different federate states: Czechoslovakia, the Slovaks and Yugoslavia, the Slovenes. After Second World War they both adopted the socialist system and when it collapsed in the 90's they became independent states.

The main differences, in our opinion, are connected mostly with the different policies adopted after World War II by Czechoslovakia and Yugoslavia. The first one was considered as one of the showcases of the eastern political and economic system, playing the role of a faithful satellite of the Soviet Union, if we make exception to the Prague spring period. Whereas Yugoslavia played in Tito period, an independent political role. Another important difference is that in post World War II period, Slovenia played the role of the most developed part of the federation, whereas Slovakia was the less developed part of it.

Given these premises, it is interesting to analyze some data showing the transition pattern of both countries after the collapse of the former socialist system, and the results obtained by them until now, considering also the role of FDIs for both of them.

Firstly, we can say that the transition process was pretty successful for both countries. In 2005 they got membership of EU. At the end of 2007, they both are going to enter into the Schengen area and at the beginning of the same year, Slovenia became also member of the Euro zone, as the first East European country, whereas Slovakia

forecasts the same objective in 2009. The Euro area membership is an important criterion of judgement, as it implies a very strict adherence to Maastricht criteria. There are old members of the EU, which still don't comply to Maastricht completely, but the new ones are compelled to pass a restricted gauge, probably as a consequence of the recent political problems, faced by the Union.

The elements of the strategy adopted can be deduced from the table 2.

TABLE 2: ANNUAL INDICATORS FOR SLOVAKIA (1) AND SLOVENIA (2)

Years	2002 <sup>a</sup>	2003 <sup>a</sup>	2004 <sup>a</sup>	2005 <sup>a</sup>	2006 <sup>b</sup>	2007 <sup>c</sup>	2008 <sup>c</sup>
(1) GDP (US\$ bn)	24.5	33.0	42.0	47.4	55.0

Sources: The Economist Intelligence Unit, 2007; OECD, 2006; Slovenski Statistični Letopis, 2006, World Investment Report 2006, UNCTAD. (a Actual, b EIU estimates, c Forecast, d Our elaboration on the basis of the Slovene Statistical Yearbook 2006).

Fig. 1 is showing the data of the GDP growth in the period between 2002 and 2008. The data for 2006, 2007 and 2008 are calculations and forecasts. The growth data are higher for Slovakia than for Slovenia. They are reaching an apex in 2006 for both countries, after which they bend down. Anyhow, the data are higher than the EU average, which is around 2% in the same period.

FIG. 1: REAL GDP GROWTH FOR SLOVAKIA (1) AND SLOVENIA (2)

Another interesting data we can see from Fig. 2 Both countries reduced inflation in the observed period, reaching almost 0 in 2006, but the forecast for 2007 and 2008, is about a small rising, within the Maastricht allowance. The impression is that reduced inflation was possible also because of heavy foreign investment particularly in the area of large distribution, which helped to push down domestic prices in both countries.

FIG. 2: CONSUMER INFLATION IN THE PERIOD 2002, 2008 IN SLOVAKIA (1) AND SLOVENIA (2)

Fig. 3 is showing the data of GDP per capita, which in 2002 was twice as high for Slovenia than Slovakia. The forecast is for a quick growth of it until 2008, but the distance between two lines looks as remaining at the same level and even expanding a little bit. Slovenia had a higher per capita GDP and was able to increment it, reaching a level close to the EU average, whereas Slovakia is still on a level which is below that EU average and is catching up only slowly.

FIG. 3: PER CAPITA GDP IN SLOVAKIA (1) AND SLOVENIA (2) IN THE PERIOD 2002-2008

FIG. 4: CURRENT ACCOUNT BALANCE AS % OF GDP

Another interesting picture of the two countries, is given by Fig. 4, showing the pattern of the current account balance. We see here a marked difference between the two, which is probably explaining also the differences exhibited by GDP. Slovenia has a current account, which is in the whole period much more balanced than Slovakia, the last exhibiting a wave-like pattern in the negative quadrant. The explanation can be only that Slovenia has a better trade balance, i.e.: it has companies, which are able to export to the world markets, keeping tighter the balance between imports and exports. Moreover, Slovenia has a better service sector, which is also creating financial inputs to the country, offsetting possible deficits in the trade area.

It is known that FDIs, when they arrive to a country, can create problems to the host, if they implement a huge demand for products, before provoking exports, as it might take time for an investment to be fully efficient, from a global point of view. It looks like that such a situation may have acted in Slovakia, creating the patterns shown in Fig. 4, with large deficits of the current account. Maybe also the service sector, which can help to buffer such a situation, was less effective in Slovakia than Slovenia. In order to know that, it would be necessary to make a more detailed analysis.

FIG. 5: UNEMPLOYMENT RATE IN SLOVAKIA (1) AND SLOVENIA (2)

Fig. 5 is showing another important indicator of overall economic performance: the unemployment rate. In 2002 it was higher in Slovakia, but after it is around 9%. This phenomenon may be a sign of the good Slovak policy, in order to attract FDIs to the country, also by the use of fiscal measures, like the famous flat tax rate at 19% in all areas, from VAT to profit taxation.

Fig. 6 shows the fiscal deficit of the two countries: we can observe that Slovenia again has a fiscal policy which is much more equilibrated than Slovakia, which was one of the reasons for accepting the country into the Euro area, whereas Slovakia looks like to be “fighting” with this problem. But in the last time, the fight appears to be pretty successful, closing on the target given by the Maastricht rules, which are, as known -3%.

FIG. 6: GOVERNMENT BALANCE IN % OF GDP, SLOVAKIA (1) AND SLOVENIA (2)

The Fig. 7, shows inward FDIs in both countries as percentage of GDP. Of course, there is a difference between the two countries: the FDIs in Slovakia are bigger than in Slovenia, but we can observe that, as a percentage of GDP, the difference is not so large as thought. Moreover, the forecast is showing that Slovenia might catch up in the next years. It would be a premium for the more equilibrated economic policy of the country.

Fig. 7.: FDI Inward as % of GDP, Slovakia (1), Slovenia (2)

FIG. 7: FDI INWARD AS % OF GDP, SLOVAKIA (1) AND SLOVENIA (2)

The coherence and consistency of the reforms, together with EU membership, has helped to convince large multi-national corporations that the Slovak economy is an attractive investment destination. The penetration of foreign direct investment has been high, with business investment particularly in the export-oriented manufacturing sector becoming the prime engine of capacity and output growth. FDI has brought with it new technology and better business practices, many of which have now trickled down to domestic firms who have been forced to compete in the more dynamic business environment. Indeed, productivity gains have been most notable in those sectors that have seen significant FDI inflows and in those where competition is strongest. At the same time, interest rates, inflation, and the public deficit have been converging to European Union benchmarks, further enhancing the credibility of the reform agenda and increasingly facilitating the access of smaller firms to credit. Thanks to a robust increase in potential output, strong export and domestic demand over the past two years have faced no major supply constraints and the economy has remained on a balanced growth path of around 5% per year. Looking ahead, however, the extent of excess capacity in the economy is diminishing, suggesting possible risks for inflation.

## Conclusions

The two countries Slovakia and Slovenia have some historical, cultural and economic elements in common: they were both part of socialist federal states, from which they seceded. The main difference was that Slovakia was the less developed and Slovenia the most developed part of the respective systems. Moreover, Tito's Yugoslavia introduced earlier market reforms and Slovenia had the possibility of developing its infant industry in a more open economic environment, getting used to market rules. During transition, Slovenia followed a more cautious policy, paying attention to the fiscal balance. The current account balance was kept under control also by developing service activities in the areas of tourism, transports and similar areas.

Slovakia, on the other hand, was more interested to develop at any cost, having the preoccupation of a high unemployment rate, as a result of the failure of a large number of companies of the previous socialist period.

Also in the FDI area Slovenia was more cautious, keeping in mind that in general they are beneficial to a given country, but sometimes they might have also a negative impact, especially in the short run, if they unbalance the current account of the host country.

So that an equilibrate policy might have a reward in growth, which comes not immediately, but with some delay in the medium or long period.

# **Analysis of Factors Contributing to Low FDI in the Agricultural Sector in Tanzania**

*Elibariki Msuya, mzeeba@hotmail.com*

*Kyoto University, Japan*

## **Abstract**

**In this paper impact of FDI on agriculture productivity and poverty reduction are examined. Factors that hinder FDI flow to agriculture sector in Tanzania are assessed. Specifically, the role FDI in improving agriculture firm's efficiency in Tanzania and reforms required for more effective investment promotion in agriculture are examined. The study uses literature review to draw its conclusion and policy recommendations. It is observed that FDI has positive impact on productivity especially to smallholder farmers who are linked in the integrated producer schemes. The study recommends rethinking of the smallholder institutional setup for increasing productivity and FDI flow to the agriculture sector. An important implication of the result is that, FDI to Tanzania specifically to agriculture sector has much more reaching economic and social impact than in other sectors.**

## **Introduction**

FDI has been shown to play an important part in promoting economic growth, raising a country's technological level, and creating new employment in developing countries (Blomström and Kokko, 2003; Klein, Aaron, and Hadjimichael, 2003; Borenstein, De Gregorio, and Lee, 1998). It has also been shown that FDI works as a means of integrating developing countries into the global marketplace and increasing the capital available for investment thus leading to increased economic growth needed to reduce poverty and raise living standards (Rutihinda, 2007; Dollar and Kraay, 2000; Dupasquier and Osakwe, 2005).

According to the World Bank's "World Development Report", in 2000 over 1.1 billion people were subsisting on less than US\$1 a day and around 2.1 billion people on less than US\$2 a day of whom between two-thirds to three-quarters live in rural areas. In Sub-Saharan Africa (SSA), where about 43 percent of its population is living below the international poverty line, the incidence of poverty is the highest among smallholder farmers residing in rural areas. Thus, if the war on poverty is to be won, developing countries need to place more emphasis on the agricultural sector (Mangisoni, 2006; IFAD, 2002).

Growth in agriculture and its productivity are considered essential in achieving sustainable growth and significant reduction in poverty in developing countries. Both development and agricultural economists view productivity growth in the agricultural sector as critically important if agricultural output is to increase at a sufficiently rapid rate to tackle poverty (Rao, Coelli and Alauddin, 2004). In view of the declining arable land per capita, high production costs, combined with rapid population growth and the resulting need for human settlement and rising urbanization significant improvements are required in productivity growth in agriculture in order to increase agricultural output through technological innovations and efficiency. Limited development and adoption of new production technologies essential for improving productivity by the poor are mostly due to limited income and source of credit among others. FDI play a significant role in increasing productivity by offsetting the investment and technological gap. This is shown in much literature (e.g. Chen and Démurger, 2002; FAO, 2001; and Buckley, Clegg and Wang 2006) by significant levels of TFP growth between sectors dominated by FDI and those dominated by domestic investment. Much of this productivity is a result of technological improvement through spillovers and improved efficiency (Blomström and Kokko, 2003).

In the light of the above, the evaluation of impact of FDI on the agriculture productivity in Tanzania is an essential step in studying the relationship between FDI, agriculture-sector productivity and poverty reduction. There are a small number of literatures dealing with FDI flows to Tanzania (see for example, Rutihinda, 2007; Ngowi, 2002; and Mkenda, 2005). However, the existing literature focuses on the determinants of FDI to the country, impact of FDI on local firms (spillover effect), and FDI entry modes to Tanzania, with very little discussion on the impact of FDI on agriculture productivity, and the resulting impact on poverty reduction. The present paper attempts to overcome this limitation. It examines the impact of FDI on agriculture productivity in Tanzania by reviewing empirical evidence. More specifically this paper examines the role of FDI in increasing efficiency of smallholder farmers and thus their productivity. Factors that hinder FDI flow to the agriculture sector are also highlighted. It emphasizes a new approach to the promotion of investment to the sector that is based on further integration of smallholder farmers in national, regional, and global value chain.

Flow of FDI into agriculture sector in Tanzania is important for three main reasons. The first is that, the agriculture sector plays an important role in the Tanzanian economy and possesses the potential to advance the country's objectives of growth and poverty reduction. The sector contributes the most to GDP (over 45% of the GDP) and supports livelihoods of over 80% of Tanzanians living in the rural areas. Agricultural products contributed about 21.3% in 2005 (URT, 2006a) of Tanzania's export earnings. Second, since over 80% of the population in Tanzania lives in rural areas and agriculture is the mainstay of their living, any strategies to address poverty must involve actions to improve agricultural productivity and farm incomes. As growth is the single most important factor affecting poverty reduction, FDI flow into the sector is thus central to achieving that goal. Third,

FDI to the sector has remained very small<sup>1</sup> (about 2.1% of total FDI inflow) despite the sector's impressive growth rate (5.5% in 2005; URT, 2006b); being the most efficient sector in creating employment<sup>2</sup> and given its role in addressing both urban and rural poverty.

The paper is organized as follows. Section 2 builds a conceptual framework for the impact of FDI on agriculture productivity. Section 3 presents a descriptive analysis of Tanzania's FDI flows while section 4 summarizes evidence of FDI impact on agriculture productivity and poverty reduction in Tanzania. The way forward is presented in section 5 followed by concluding remarks.

### **Literature Review**

The importance of FDI in the economic performance has been extensively discussed in the economic empirical literature. Analyses may be divided in two main categories: those looking at the determinants of FDI and those looking at the impact of FDI on the domestic economy. From the theory of determinants of FDI the major determinants include domestic market size and its growth, domestic business environment, technological capability, trade policy, investment policy, commitment to international rules and agreements, and other factors. The second group includes a growing number of empirical papers studying at various levels of aggregation, how FDI influences economic growth process. The main focus of this paper being on the impact of FDI on the agriculture productivity and poverty reduction, the following review concentrates on the literature investigating the role of FDI in the increasing productivity. Within this literature, two different approaches can be distinguished. One aims at measuring the contribution of FDI to output growth and productivity. The other assesses the performance of sectors dominated with FDI in comparison with domestic firms, in order to appreciate their potential impact on industrial structure and efficiency.

### **Theories and Empirical Studies**

According to Blomström and Kokko, (2003) and Borenzstein, De Gregorio, and Lee (1998), the contributions of FDI to the development of a country are widely recognized as filling the gap between desired investment and domestically mobilized saving, increasing the tax revenues, and improving management, technology, as well as labor skills in host countries. These could help the country to fight its way out of poverty (Borenzstein, De Gregorio, and Lee. 1998).

According to neoclassical theory, FDI influences income growth by increasing the amount of capital per person. It spurs long-run growth through such variables as research and development (R&D) and human capital. Through technology transfer to their affiliates and technological spillovers to unaffiliated firms in the host economy, MNCs can speed up the development of new intermediate product varieties, raise product quality, facilitate international collaboration on R&D, and introduce new forms of human capital (Ikara, 2003).

Empirical studies suggest that FDI is very important because it provides a source of capital and complements domestic private investment. Many studies (e.g., Blomström and Kokko, 2003; Chen and Démurger, 2002; and FAO, 2001), conclude that FDI contributes to total factor productivity and income growth in host economies, over and above what domestic investment would trigger. These studies find, further, that policies that promote indigenous technological capability, such as education, technical training, and R&D, increase the aggregate rate of technology transfer from FDI and that export promoting trade regimes are also important prerequisites for positive FDI impact.

For instance, a study by Borenzstein, De Gregorio, and Lee (1998) using data on FDI received by developing countries tested the effect of FDI on economic growth in a cross-country regression framework. They found some indications that FDI has a positive effect on economic growth, but this impact was dependent on the human capital stock in the host economy. The higher productivity of FDI holds only when the host country has a minimum threshold stock of human capital. Similarly, Sun (1998) in Chen and Démurger's (2002) work, also finds evidence on a generally higher level of productivity growth of foreign-funded firms in China as compared to domestic firms. As most of these studies use data cross-cutting different sectors it is assumed that the results and implications hold true on agriculture firms. Therefore, based on this, the first research question (R1) is: *If inflow of FDI in Tanzania agriculture sector has a positive impact on productivity. This is expected to be the case especially for smallholder farmers who are linked to FIEs through integrated producer schemes<sup>3</sup>.*

However, there is growing empirical evidence suggesting that the impact of FDI on economic growth is not automatic. For example, Borenzstein, De Gregorio, and Lee (1998) show that for FDI to contribute to economic growth, the host country must have achieved a minimum threshold level of development in education, technology, infrastructure, financial markets, and health. Thus, FDI contributes to economic growth only when a sufficient absorptive capability of the advanced technologies that it brings is available in the host economy. This suggests that most of the effect of FDI on economic growth likely derives from efficiency gains rather than an overall higher induced level of investment. In a similar perspective, Fan (1999, chapter 7) quoted in Chen and Démurger (2002), shows that "positive and significant spill-over appears only in industries which are mainly labor-intensive and have a low to moderate technology gap between Chinese and foreign firms". Therefore, based on this and the fact that agriculture production in developing countries is mainly labor-intensive the second research question (R2) is: *If agriculture firms (smallholder farmers) with strong links (through vertical integration) to FIEs are likely to be more efficient than their counter parts that are not.*

### **Conceptual Framework**

This paper is based on the concept that; achieving the MDGs requires more rapid and broad-based economic growth. An estimated rate of gross domestic product (GDP) growth of 7% a year is needed to achieve the Millennium

poverty target (IFAD, 2002). In many low-income countries, given the importance of the agriculture sector in employment and output, the best way to raise the overall rate of economic growth and promote broad-based and sustainable development is through more rapid agricultural development. FDI can play an important role through increasing efficiency and productivity.

Although growth is not a sufficient condition for poverty alleviation, there is evidence that higher incomes in developing countries benefit the poor segments of the population proportionately (Ikara, 2003). FDI is a key figure for generating growth and thus it is an important ingredient for poverty reduction. Dollar and Kraay, (2000) indicate that on average the poor do benefit from the growth as an increase in the rate of GDP per capita leads to a one for one increase in the average income of the poorest. FDI is thought to contribute to economic development (and therefore poverty reduction) through initial macroeconomic stimulus and by raising total factor productivity and efficiency of resource use in the recipient economy.

FIG. 1 below present a conceptualization of the way in which FDI can contribute to poverty reduction. In Ikara (2003) work, FDI contribute to poverty reduction by raising total factor productivity and efficiency of resource use. This leads to economic growth and ultimately poverty reduction. He points out the transmission mechanism between FDI and poverty reduction is through; direct technology transfer, technological spillovers, human capital formation, international trade integration, and competitive business environment. Most literature on FDI agrees with the above mentioned transmission mechanism (see Blomström and Kokko, (2003) for a review).

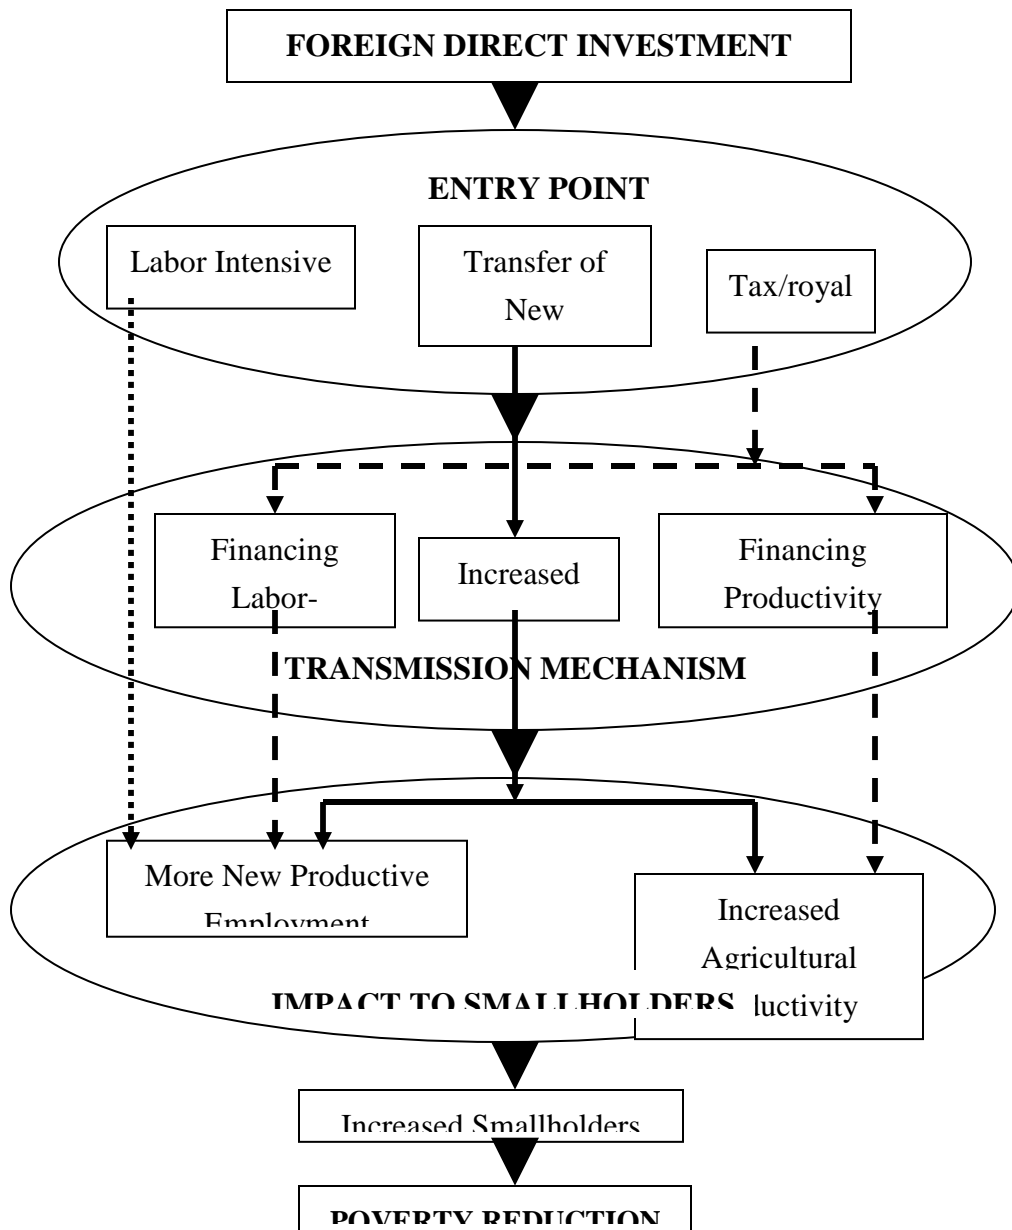

FIG. 1: FDI IMPACT ON POVERTY REDUCTION; TRANSMISSION MECHANISM

As it can be observed from FIG. 1, the pattern of inter-relationships among the economic variables impacting on poverty reduction is complex and, given time and other constraints, cannot be entirely cover in this study. However,

Tambunan (2004) shows that much contribution of FDI to poverty reduction is through widening access to employment, especially productive employment. He points out that "...in many developing countries insufficient job opportunities are the result of inadequate levels of investment, both domestic and foreign" and that "... low investment makes other forms of poverty alleviation more difficult, because lower rates of economic growth than the rate of population growth means that each year more people are added to the ranks of the poor...". In developing countries where domestic savings are very small, FDI is a potential source for capital formation. As pointed earlier the ultimate impact of FDI on economic growth in the host countries (leading to poverty reduction) depends not only on the performance of foreign firms, but also on the diffusion of new technologies, innovations, knowledge, new best practices and other intangible assets from FDI throughout the economy of the host countries (Tambunan, 2004; Borenstein, De Gregorio and Lee, 1998).

The literature reviewed shows that most previous studies on FDI impact on productivity focused on different countries and sectors of the economy although, some focused on a single country or a single branch at a time using a variety of methodologies (see Hansen, Jervelund and Olsen, 2006 for a summary). On the other hand, most researchers (both development economists and agricultural economists) have examined the sources of agricultural productivity growth over time. Most of these studies used cross-sectional data to estimate a Cobb-Douglas production technology using regression methods. The focus was generally on estimating production elasticities and investigating the roles of farm scale, education, research and presence of FIEs in explaining the determinants of productivity. A number of studies have conducted panel data analysis of agricultural sector comparisons. Rao, Coelli and Alauddin, (2004) provide a brief review of these literature.

#### **FDI Inflows in Tanzania**

Table 2 below shows selected economic and financial indicators of Tanzania. Domestic savings are about 12 percent of Gross National Disposable Income. Although this might seem to be high, one can observe that the rate of saving is somehow very small. In this small saving rate Tanzania economy needs a lot of support from outside. FDI could be a better way for injecting the much needed capital for rapid economic growth.

TABLE 2: TANZANIA ECONOMIC AND FINANCIAL INDICATORS

Indicator	Unit	2000	2001	2002	2003	2004	2005
Change in GDP at Factor Cost-- Constant 1992 Prices	Percent	4.9	5.7	6.2	5.7	6.7	6.7

Population (TZ Mainland)	Million	31.9	32.1	33.6	34.2	34.8	36.2
Total External Debt as % of GDP	Percent	80.7	78.5	75.9	83.5	77.5	77.5

Source: Bank of Tanzania

Despite a fall in FDI into Sub-Saharan Africa, Tanzanian's FDI inflows have increased impressively over the years. Flow of FDI into Tanzania has been on the increase over the past decade (Table 3). According to the World Investment Report 2006 (UNCTAD, 2006), Tanzanian's inward FDI stock in 2001 reached a record high of US\$224 million, before jumping to US\$ 6,028.8 million by the end of 2005, placing the country among the top dozen recipients of FDI in Africa, just behind oil producing countries and South Africa. This trend is partly explained by the continually improving economic performance and investment climate created by the economic and political reforms in the early 1990s.

TABLE 3: SUMMARY OF FDI FLOW AND STOCK IN TANZANIA

No.	Variable Inward Outward	Inward (Millions of dollars)
1	FDI flows, 2002-2005 (annual average)	475.0
2	FDI flows as a percentage of GFCF, 2002-2005 (annual average)	21.5
3	FDI stock, 2005	6028.8
4	FDI stock as a percentage of GDP, 2005	49.6

Source: UNCTAD, FDI/TNC database

About 85 percent of the Foreign Private Capital (FPC) stock in Tanzania is FDI. FPC such as portfolio and other foreign investment, mainly debt (short and long-term borrowings) account for the remaining 15 percent. Other types of external capital to Tanzania are bilateral and multilateral aid from the World Bank and other partner countries. Since 1993, FDI inflows into Tanzania have taken predominantly the form of Greenfield investment in spite of some participation by foreign investors in Tanzania's privatization programme and a few cases of acquisitions of foreign affiliates by foreign investors. Tanzania has been able to attract both market-seeking FDI and export-oriented FDI to different sectors of her economy (Table 4).

Survey results from a study by the Tanzania Investment Center (TIC) show that, FDI stock in Tanzania is dominated by OECD countries particularly UK, Canada, Japan and USA as observed in Table 4. As a group, OECD countries, accounted for 57.2 percent of the stock of FDI in 2001, followed by SADC (24.5 percent) and EAC (7.3 percent) (URT, 2005).

TABLE 4: SUMMARY OF TYPE OF FDI AND COUNTRY OF ORIGIN

No.	Type of FDI	Industry	Country of Origin
1	Market-seeking FDI	Brewing	South Africa
		Tobacco	Japan
		Electronic Equipments	Japan; Republic of Korea; UK;
		Cement	Norway; Zambia
		Sugar Processing	South Africa; UK
		Financial services	South Africa; UK; Saudi Arabia; US; Belgium; France; Kenya; Malaysia
2	Export-oriented FDI	Mining	UK; SA; Ghana; Canada; Australia;
		Textile	China;
3	FDI in infrastructure and utilities	Energy (electricity)	Malaysia; Canada;
		Telecommunication	German; Netherlands; US; EU;
		Port handling facilities	Philippines; UK; EU

Source; UNDP, 2007

Regional distribution of FDI in Tanzania shows that high concentration is in regions endowed with a variety of natural resources and have better social and economic infrastructure. Dar es Salaam the largest city in the country was leading with 51.7 percent of total FDI stock during 1999 – 2001, followed by Shinyanga and Mwanza (11.5% and 10.8%); Arusha – including Manyara (8.3 percent) all of which have natural resources. Others are Morogoro (5.5 percent) and Urban West – Zanzibar (2.4 percent) (URT, 2005). Development of social and economic infrastructure is thus necessary in order to increase the prospects of other regions to attract investments.

Mining, manufacturing, wholesale and retail trade (including tourism) sectors have attracted more investments since the middle of 1990s. These sectors have been dominated by TNCs, which also dominates the power generation and telecommunication industries. According to recent data from TIC (URT, 2005), between 1990 and 2003, 2288 projects with total investment of \$11.9 billion were registered. Figure 2 and 3 below show number of projects and FDI stocks distribution by sector. The surge of investments in the manufacturing sector reflects a response to the reform programme and privatization process started in 1993. Failure of the agriculture sector to attract much FDI needed to bring about rapid growth and thus help in fight against poverty is discussed further in the coming section.

FIGURE 2: DISTRIBUTION OF FDI STOCK (%) BY SECTOR, 1998-2001

Source; Tanzania Investment Center (TIC) reports

FIGURE 3: NEW (1990-2003) INVESTMENT PROJECT IN TANZANIA BY SECTOR

Source; Tanzania Investment Center (TIC) reports

Despite the fact that agriculture sector has immense investment potentials, employing about 89 percent of the total population, contributing about 47 percent of GDP, directly producing about 45 percent of total exports, and a key sector in the fight against poverty, it has attracted the smallest share of FDI to Tanzania.

#### Impact of FDI on Agriculture sector in Tanzania

The qualitative impact of FDI on the Tanzania economy has become noticeable, especially in the industries in which FDI is concentrated. FIG. 4 below, indicate that there is a strong positive relationship between FDI stocks and GDP growth rate. In mining, FDI has served as an engine of growth and has helped increase gold exports. Gold exports amounted to USD 703.7 million contributing about 42% of total exports value for the year ending September 2006 (BOT, 2006). Gold exports remain dominant in total non-traditional exports, followed by manufactured goods and fish and fish products. Increase of FDI inflows has also contributed to the modernization of the different industries. Foreign investors have restructured privatized enterprises, boosting their competitiveness, typically contributing to the transfer of technology and skills. Although the impact is strongest in the industries in which FDI is concentrated, it has limited implications for the entire economy.

FIG. 4: FDI INFLOWS/STOCK AND GDP GROWTH 1992-2005

Source: UNCTAD, FDI/TNC database; Bank of Tanzania

The scale of these impacts is still small and a number of desired impacts are not occurring (such as linkages to the local economy and thus impacting poverty reduction or the encouragement of local science and technology capacities). For example most FDI, currently has little impact on the employment situation, as it is directed toward capital-intensive sectors. Thus, after initial successes with FDI, the challenge for the Tanzania is now to push FDI to new frontiers, such as agriculture sector which is important in the fight against poverty.

### **Impact on Agriculture Productivity**

On his speech to commemorate the 16<sup>th</sup> Africa Industrialization Day the Tanzania Minister for Industry and Trade Dr Juma Ngasongwa stressed among other things that “...low productivity, inadequate physical and economic infrastructure, dependence on export of primary goods without value addition through manufacturing and low standards and standardization are key constraints adversely affecting Tanzania economic growth...,” (IPP, 2005). Dr. Ngasongwa pointed out that, the government through the Tanzania Development Vision 2025 has “...assigned the industrial sector a very central role of transforming the economy from a low productivity agriculture to semi-industrialized one led by modernized and highly productive agricultural activities which are effectively integrated and buttressed by supportive industrial and service activities...”. Given the limited financial capabilities of the government, FDI is expected to play a central role in this task.

As shown in the literature review section above, several studies have found local firm’s productivity increases with sales to multinational enterprises. Similar results have been obtained in Tanzania by Rutihinda, (2007), when exploring the impact of globalization on SMEs firms in Tanzania. In her regression model both specification coefficients for capital, raw materials, domestic sales to FIEs and joint ventures were positive and significant. This indicates that Tanzania firms like firms in other developing countries are affected equally by FDI flow. This trend is assumed to hold true in all sectors.

Tanzania agriculture is dominated with smallholder farmers cultivating an average of 0.5 ha to 2 ha. Productivity has been especially low for smallholders compared to agricultural undertakings by estates or large commercial farms, which have been able to attract considerable amount of FDI. Records from TIC show that more than 90% of FDI into the agriculture sector went to crops sub-sectors (e.g. sugarcane, barley, sisal) whose smallholder farmers have been well organized to support the foreign investments (URT, 2005). Two examples (The production of sugar cane in Mtibwa<sup>4</sup> and Kilombero<sup>5</sup>; and tea in Rungwe District through the Wakulima Tea Company<sup>6</sup>) demonstrate that FDI flow to agriculture sector is viable and beneficial to smallholders and FIEs (Box 1). These two cases are picked as they show incentives from FIEs (such as reliable markets, stable prices and technology development) can lead to high increase in smallholder productivity. Secondly they are picked due to the large number (about 30,000 smallholders) of smallholders integrated with the FIEs. Given that these smallholders normally represent households, the impact of the increased productivity is far reaching. In the sisal industry similar trends have been observed through Katani Ltd<sup>7</sup>. FDI has been proved (R&AWG, 2005; URT2006a; and Msuya and Ashimogo, 2006) to be able to stir up agriculture productivity and thus impacting on poverty reduction in Tanzania. However, more empirical studies are required to prove beyond doubt the impact of FDI on Tanzania agriculture productivity.

#### BOX 1: PRODUCTIVITY OF IMPACT FROM FDI

*In these two schemes driven by FDI, positive results have been recorded in expanded area cultivated, in increased production and productivity and in improved quality.*

##### **Tea Industry**

*In Rungwe, annual green leaf production has increased fivefold in the last four years from 3,774,912 kg (2000/01) to 15,285,451 kg (2004/05). The average yields of green leaf from smallholders have increased consistently from around 1,000 kg/hectare (2000) to around 5,000 kg/hectare (2004), while the overall quality of tea from smallholders is reported to be above the standards set by the company. Productivity performance is best for those smallholders with links to integrated producer schemes. Their average yield increased from 939 kg/hectare (2000/01) to 3,249 kg/hectare (2002/3). Although there is room for improvement when compared with tea estates' productivity that averaged 9,128 kg/hectare (2000/01–2003/4), the yields from smallholders in integrated producer schemes have improved consistently and significantly since 2000. In Rungwe the scheme is operating with 15,000 tea-producing smallholders.*

##### **Sugar Industry**

*Sugar cane recorded a much higher growth in production from 2001 after several years of stagnation. The smallholders increased production from 907,000 tonnes (1999/00) to 1,594,000 tonnes (2004/05) accounting for about 68 percent of total production of sugarcane in 2004/2005 season. This significant growth can be attributed to the privatization of sugar cane estates and the adoption of the out grower model of production which began in early 2000. Smallholders producing sugar cane are integrated through growers associations which have direct links with FIEs (MSE and KSCL). The FIEs provide extension services, transportation of cane to the factories, and direct markets. Combined the two FIEs supports about 14,000 (2006) sugarcane-producing smallholders.*

#### **Impact of FDI on Efficiency**

A number of studies in Tanzania agriculture sector have shown that smallholders with strong links to FIEs are more efficient compared to their counter parts. Msuya and Ashimogo, (2006) used cross-sectional data to estimate technical efficiency of smallholders farmers in the Tanzania sugar industry. The results obtained from the Cobb-Douglas stochastic frontier estimation, showed that the average technical efficiency of outgrowers (smallholders with links to FIEs) was higher than that of non-outgrowers. Although they found several factors (age, origin of the farmer, educational level, and farm area) affecting technical efficiency of smallholders, the integration of

smallholder with FIEs (Mtibwa Sugar Estate (MSE)) was a major factor. For example they found out those smallholders who are close to the factory were more efficient compared to those who are far. This was closely associated with high transportation cost to smallholder farmers far from the factory as the MSE provide transportation for farmers close to the factory and others forced to use private transportation.

On the other hand a work by Admassie and Matambalya (2002) shows that firms that are not integrated with FIEs are more likely to be inefficient. In their study, the level of technical efficiency of SMEs in Tanzania was examined using a Cobb-Douglas stochastic frontier production function. They found high levels of technical inefficiency characterizing the Tanzanian SMEs. They showed that the inefficiency reduced SMEs potential output levels significantly. They suggested in assisting these firms to improve their technical efficiency efforts should be put on ensuring "...adequate supply of inputs, markets, and credit facilities, and undertaking extensive infrastructural development and training...". It should also be noted that these SMEs were mostly agricultural based.

Impact of FDI on efficiency and thus poverty reduction is also shown in a work by ESRF, (2002) which focused on the impact of MSE and KSCL in economic development of Morogoro Region. In their review ESRF (2002) showed that the two factories had an impact on poverty reduction in the surrounding areas as a result of the outgrower schemes. They showed that higher prices and assured markets had led to increased productivity and efficiency of smallholder cane farmers. As pointed earlier in the introduction section, there are a few literatures discussing the impact of FDI on Tanzania agriculture firms and/or smallholder farmers. An empirical analysis linking the above observed efficiency increase to FDI will help in determining if mechanisms suggested in section 2 above hold in all crops sub-sectors.

#### **Factors Contributing to Low FDI in the Agricultural Sector in Tanzania**

Domestic policies vis-à-vis FDI falls into two broad categories; regulation and promotion, both of which have substantially been used in Tanzania. With respect to the regulation of FDI, the general trend over the past decade has been for the gradual liberalization of rules governing foreign investors and their investments. Furthermore, privatization programmes from early 1990s have expanded the opportunities for foreign investors in the country. For example in June 2003, the Finance Minister announced that the Government would introduce reforms to the 1999 Land Act. The intent of the reforms is to facilitate the use of land as collateral in bank borrowing and to spur private investment in agriculture. Investment promotion has concurrently become an important policy tool for attracting FDI. Policies aimed at attracting FDI have ranged from relatively passive and general promotion schemes to much more aggressive targeting of foreign investors combined with the use of investment incentives. Investment incentives Package in Tanzania agriculture sector includes among others: - Zero-rated duty on capital goods, all farm inputs including fertilizer, pesticides and herbicides; reduced import tariff on project capital items to 0% for investors with Tanzania Investment Centre (TIC) Certificate of Incentives; Deferment of VAT payment on project

capital goods; Zero-rated VAT on agricultural exports and for domestically produced agricultural inputs. All exports of locally produced goods from Tanzania are charged 0% of VAT; and an indefinite carry-over of business losses against future profit for income tax.

Despite these efforts and recent growth of the sector, together with observed productivity and efficiency increasing capabilities, FDI flow into the agriculture sector has remained very small in Tanzania. Fig. 4 above shows among projects approved by Tanzania Investment Centre between September 1990 and June 2004, agricultural and livestock projects accounted for only 5 percent of the total value of investment (URT, 2005). It has been shown agricultural and livestock projects are most efficient in creating employment (Figure 5), indicating that agriculture sector has what is needed (ability to create productive employment) to address both urban and rural poverty.

FIGURE 5: EMPLOYMENT OF APPROVED FOREIGN AFFILIATES BY INDUSTRY, 1990-2000

Expansion of private investment in the agricultural sector is limited by several factors. A study (Amani *et al*, 2003) has observed that Tanzania’s agricultural export is constrained more by domestic (supply-side) factors than international trade barriers. For instance, lack of adequate infrastructure has resulted into high energy and transportation cost, thus rendering Tanzania’s commodities uncompetitive. Low level of domestic entrepreneurship coupled with poor quality products have resulted into loss of market share. Limited financial capital, and unfavorable land and labor laws deter the growth of medium and large-scale agricultural production leading to export sector’s dependency on poor quality high cost products from small-scale production sector (refer Amani *et al*, (2003) for a detailed review).

On the other hand as Tanzanian agriculture sector continue to depend on smallholder producers, characteristics and institutional setup of smallholders' have impact on the performance of the sector and thus its ability to attract FDI. Tanzania smallholder farmers have limited education and experience, frequently exposed to shocks and have to deal with weak institutional arrangements for production. This has led to low increases in agricultural productivity and insufficient improvements in the quality of production (R&AWG, 2005). This has been truer when productivity of smallholders is compared to that of agricultural undertakings by estates or large commercial farms. As discussed above this difference in productivity had led to more than 90% of FDI into the agriculture sector to be directed to crops sub-sectors (e.g. sugarcane, barley, sisal) whose smallholder farmers have been well organized to support the foreign investments.

Although factors mentioned in Amani *et al.*, (2003) work are important and significant in addressing low levels of investment in the sector, institutional setup of smallholders seems to be the single major determinant of FDI inflow into the sector through increased agricultural productivity and efficiency. Therefore, to promote production and quality in an environment/economy such as Tanzania's, there is a need to reconsider the traditional approach to agriculture - based on smallholder farmers competing in liberalized markets - and to consider new approaches to promote sustained, high quality production. These justify the consideration of alternative institutional arrangements for smallholder farmers that will attract more FDI inflow and improve smallholder productivity leading to poverty reduction.

#### **The Way Forward**

In order to transform the agriculture sector into one with high productivity and high quality output, efforts are needed toward understanding and eliminating the barriers to smallholders that inhibit the growth of productivity. The structural problems facing smallholders (such as limited access to information, to inputs, and to output and financial markets) need rethinking in a different institutional arrangement that will attract more FDI to the sector. Such an arrangement would involve smallholders being better organized (in producer associations). Producer associations can improve productivity, reduce costs through supply chain linkages and improve competitiveness. They manage to do so by improving access to required and affordable inputs (technologies and credit).

Although cooperatives are the dominant form of smallholder producer association, they are faced with some challenges in addressing investment and productivity to the sector. In Tanzania restoring the confidence of smallholders toward cooperatives is a big challenge. The second challenge is to build the integration of production, transport, processing and marketing to take advantage of supply and demand value addition without complicating the institutional arrangements of the unmanaged levels. Third is to ensure the introduction of innovation and knowledge in a continuous basis without subjecting members to payment of high consultancy fee given the socio-economic conditions of smallholders (read R&AWG, 2005 for challenges of reintroducing cooperatives in Tanzania).

Integrated producer schemes on the other hand are designed to develop the capacities of smallholders through extensive provision of extension services and close monitoring of production and quality control. The model links production to investments in agro-industrial activities and markets. It has typically involved technical assistance from foreign or local private companies. This setup typically operates an integrated system that links production, extension services, transportation, processing and marketing. As the integrated producer schemes have an inbuilt supply chain system, they allow the realization of value addition for the benefit of all involved. In Tanzania, integrated producer schemes have so far been organized in sugarcane, tea, sisal, and dairy industry. These kinds of product specification tie the investors (FIEs) in processing facilities to the providers of agricultural produce and create an alliance which is of mutual benefit. Through this setup smallholder farmers can have reliable markets and foreign investors who shy away from the sector can have reliable sources of inputs to satisfy the capacity setup of their processing plants. So far in Tanzania this setup mainly exists in form of outgrower schemes, with the help of foreign investment it has been viable and beneficial to smallholders (Box 1). Given that integrated producer schemes requires a lead firm for governance, which frequently have to heavily investment in the sector in question; and given the low saving and thus investment capacity of local citizens, FIEs will remain as the major link in setting up these schemes.

## **Conclusion and recommendations**

This paper has examined impact of FDI on agriculture productivity in Tanzania, with some focus toward poverty reduction. The study suggests that there might be a positive impact of FDI on smallholder productivity and efficiency. The study found out that apart from the general determinants such as macroeconomic stability, efficient institutions, political stability and a good regulatory framework; smallholder institutional setup has positive impact on FDI flow into the sector. It has been observed that crops whose smallholders are well organized attracted more FDI. An important implication of the result is that FDI to agriculture sector is not solely driven policies and incentives to foreign investment and that institutional setup of smallholder farmers can play an important role in promoting investments to the sector. In the short and medium term, efforts to foster integration and creation of strong bonds between smallholders and investors through integrated producer schemes can increase FDI into the sector and thus increase productivity. Other determinants such as investment regulatory frameworks, policies that promote macroeconomic economic stability, and improved physical infrastructure also have a role to play both in the short and long run. In the long run, more FDI can be attained by developing good institutions in all sectors. The challenge that remains is how to setup these institutions (integrated producer scheme) in other crops which might

have different processing requirements. Further empirical studies on this area are recommended for a better understanding of the mechanism through which FDI addresses productivity of smallholders and poverty reduction.

## End Notes

<sup>1</sup> Among projects approved by Tanzania Investment Centre between September 1990 and June 2004, agricultural and livestock projects accounted for only 5 percent of the total value of investment (URT, 2005).

<sup>2</sup> To generate employment of one person in agriculture sector, it requires approximate an investment of TSh.7 million, while in the construction sector would require an investment of about TSh.115 million (URT, 2005).

<sup>3</sup> Integrated producer schemes are designed to develop the capacities of smallholders through extensive provision of extension services and close monitoring of production and quality control. The model links production to investments in agro-industrial activities and markets.

<sup>4</sup> Mtibwa Sugar Estate (MSE) was handed over to Tanzania Sugar Industries (TSI) in August, 1998 (after TSI had bought the company). Prior to this, the Government of the United Republic of Tanzania owned it. Super Doll Trailer Manufacture Company (T) Limited of Dar-es-Salaam, in the United Republic of Tanzania, on behalf of TSI now manages the Company through The Agricultural Consultancy Services (Mauritius) Limited (ACSL), of c/o Multiconsult Limited, Les Jamalacs Building, Port Louis, Mauritius.

<sup>5</sup> Kilombero Sugar Company Limited (KSCL) is owned by three shareholders — South Africa's Illovo Sugar (55 per cent), Tanzania government (25 per cent) ED&F Man Holdings Limited of Britain (20 per cent). It produces an average 150000 tons per year. This is the largest sugar producer in Tanzania.

<sup>6</sup> Wakulima Tea Company (WATCO) and the Rungwe Small Tea Growers Association (RSTGA) are partners under the roof of Tanzania Tea Packers (TATEPA). Established in 1995, TATEPA is the largest domestically owned private company in Tanzania – and the third largest on the stock exchange – with 2,000 shareholders and 200 employees. Rungwe smallholders own 25 per cent of the shares of WATCO.

<sup>7</sup> Katani Ltd. was formed after sale of government share of the former Mkongwe Group Companies in 1998. it is now owned by Highland Estates Manufacturer of sisal twine, ropes, yarn, carpet

## **Abstract**

Generally, the pattern of the food consumption is diversified when the wealth gap expands with economic growth, and it differentiated into an affluent individuals and the poorest segment of the population. Therefore, food policy is requested to play an important role in the following two parts, i.e. to ensure food security and to cope with the structural changes in food consumption. This research assumes the rice consumption in Shanghai, the P. R. China where economic growth is remarkable to be a case to clarify the changing realities of food consumption when the wealth gap expands. It also proposes an appropriate food policy corresponding to the consumer's diversification under the process of economic growth.

## **Introduction**

Generally, food policy is requested to play important roles in the following two parts, i.e. to ensure food security and to cope with the structural changes in food consumption.

Food security for a nation means that its citizens have access to an affordable and stable supply of food (Carter [3] and Barrett [2]). Therefore, to supply cheap food constantly is considered to be an important strategy of food policy for developing countries with a huge number of undernourished people.

On the other hand, economic growth converts the consumption structure of food. Because there is a difference in the income elasticity of demand for each article in food, the proportion such as grain with low income elasticity in the consumption of food decreases and the proportion such as meat and poultry with high income elasticity in the food consumption increase along with income improvement, making of food consumption high-end. Moreover, consumer's preference strongly influences the consumption of food besides income and price. The factor of preference in the factors of food consumption strengthens when income reaches at the level enough to buy

necessary food, and the diversification of food consumption advances. Therefore, food policy is requested to maintain the system of food supply corresponding to the change in such a food consumption structure. This means that the rich layer's needs for food are also requested to be satisfied while food security for the poorest segment of population is taken into account by food policy for developing countries accomplish economic growth.

However, researches on food policy up to now were mainly analyzed on the relation between an average income level and food demand with the country as a unit. Researches on the influence that wealth gap gave to the food demand along with economic growth were insufficient. Although, consumption behavior according to income bracket was analyzed based on the statistical data, the analyses of the problem that the top-tier and the poorest segment of the population are facing were also insufficient because the realities of food consumption were not able to be fully understood by the statistical data (Gale & Hunag [6]). The formation of the poorest segment relates to the issue of food security, and the formation of rich layer is related to the issue of correspondence to consumer needs. Furthermore, in the analysis of which the unit is the country, it is difficult to clarify the relation between economic growth, the food consumption and the food policy where geographical inequity exists.

Therefore, in this research, the influence that economic growth gives to the food consumption will be analyzed by taking the influence of wealth gap into consideration. China and Shanghai City are targeted in this research because China is accomplishing rapidly economic growth, both the expansions of wealth gap and the difference between regions of economic growth are generated; Shanghai which is the city that develops most economically in China. In that sense, China and Shanghai are suitable as the object of the study.

## **Analysis on Consumption Behavior in China According to Income Bracket**

In general, it is thought that the product differentiation by the difference in quality is a little if there is no wealth gap. However, a qualitative change in consumption is considered to be caused by the change in wealth gap along with the improvement of income level. The production of food is requested to correspond to the change in such consumption so that economic development may progress smoothly. That means the pattern of food supply corresponding to the pattern of different economic development is needed.

In the state of low income, the purchase price of food doesn't rise though the consumption of food rises by the income improvement. At the stage where income is a little high, both the consumption and the purchase price of food rise by the income improvement. However, at the stage where income is higher, the purchase price of food rises and the consumption of food decreases by the income improvement. TABLE 1 summarizes the per capita annual living expenditure of urban residents in China, their expenditure on grain and food consumption and according to income level.

TABLE 1: PER CAPITA ANNUAL LIVING EXPENDITURE OF URBAN RESIDENTS (2003, 1987)

Unit:Yuan

Source: Calculation based on the data of China Statistical Yearbook 2004, 1988 China Statistics Press.

First of all, the amount of per capita living expenditure has increased from 1987 to 2003, and the difference among brackets has expanded from 2.62 to 5.66 times. The difference of expenditure on food between income levels has also expanded but not as big as that of per capita living expenditure. On the other hand, the difference of the expenditure on grain among income brackets is small and it has reduced further. The proportion of the expenditure on grain in food expenditure has decreased by the rise of income improvement. The ratio decreases from 1987 to 2003 at all levels, and the ratio of the decrease is especially large in the high income group.

TABLE 2 breaks down urban residents' expenditure on grain into purchase quantity and unit purchasing price according to income bracket in China. First, if we see the relation between the income bracket and the amount of purchase, it is clear that grain was superior goods in 1987 but it has become inferior goods in 2003. Unit purchasing price of grain had only a small increase in 1987 but a large increase in 2003 along with income improvement. The unit purchasing price of the top dressing of income bracket has risen more than that of the lowest layer by as much as 56%. It is thought that the purchase ratio of high-end goods increases along with the income rise, by shifting grain consumption to rice with a high unit price.

TABLE 2: PER CAPITA ANNUAL PURCHASE AND EXPENDITURE ON GRAIN (2003, 1987)

Level of Income		I	II	III	IV	V	VI	VII	VII/I
Purchase :a (kg)	2003	84.08	82.63	82.94	78.49	78.67	77.49	69.65	0.83
	1987	128.32	130.47	131.49	130.79	134.84	141.51	149.06	1.16
Expenditure :b (yuan)	2003	170.66	178.47	188.60	190.53	202.68	213.74	220.08	1.29

Source: Calculation based on the data of China Statistical Yearbook 2004, 1988 China Statistics Press.

To clarify the relation between income and the pattern of grain consumption in China, the income elasticity of grain consumption and the income elasticity of unit purchasing price of grain were measured. As a result, the income elasticity of grain consumption was 0.151 in 1987 and -0.099 in 2003, and the income elasticity of the unit purchasing price of grain was 0.084 in 1987 and 0.253 in 2003 (See TABLE 3). That is, the unit purchasing price increased oppositely though the grain consumption decreased as the income improved in the period.

TABLE 3: INCOME ELASTICITY OF DEMAND AND PURCHASING PRICE OF GRAIN

	Demand	Purchasing Price
2003	-0.099	0.253
1987	0.151	0.084

Measurement equation

$$2003 \log D = 2.271 - 0.099 \log Y$$

$$(32.50) (5.36) \quad \text{adj-R}^2=0.822$$

$$1987 \log D = 1.687 + 0.151 \log Y$$

$$(20.41) (5.36) \quad \text{adj-R}^2=0.822$$

$$2003 \log P = -0.565 + 0.253 \log Y$$

$$(12.60) (21.36) \quad \text{adj-R}^2=0.987$$

$$1987 \log P = -0.619 + 0.084 \log Y$$

( ): t-value

Although the relation between wealth gap and consumption behavior was clarified by the analysis according to the income bracket of the statistical data, the existence of the poorest segment and top-tier population cannot be understood enough. In the next chapter, we will take Shanghai City as a case to analyze the issue of food consumption in Shanghai, especially by focusing on the high quality and safety intention in the rice consumption of rich households on one side, and the food assistance system for the poorest people on the other.

## **Problem of Food Policy in Shanghai**

### **Correspondence to High Quality and Safety Intention of Food Consumption in Urban Rich**

The consumption of rice is assumed to be a case to clarify the characteristic of the food consumption pattern of the top-tier population and the comparison analysis with other income brackets is undertaken.

First of all, the interviews to the scholars at Fudan University and to the person in charge of JETRO Shanghai office and the person in charge of Shanghai City Agriculture Committee, 'food tasting investigation' and 'group discussion' both to the teacher and the students at Shanghai University and to the housewives of the rich layer, and the 'retail price investigation' to the foreign-affiliated supermarket, the convenience stores, and the agricultural markets were undertaken at the end of July in 2004.

Continuously, at the end of March in 2005, the interview to the person in charge of Shanghai Municipal Grain Bureau, the 'group discussion' to the housewives of the rich layer, the 'questionnaire survey' to the civilian in Shanghai, and the 'retail price investigation' to the luxury department-store, the foreign-affiliated supermarket and agricultural market were undertaken. Furthermore, the above-mentioned investigations were undertaken once again in September of 2005. Therefore, the following analyses are the one that these investigation results were based on<sup>1)</sup>.

### **What is Top-Tier Population in Shanghai?**

A rich layer here has the following characteristics. Firstly, a fat income and a high academic background, a low concern for the domestic politics and the high interest in personal consumption and overseas lifestyle was shown. Secondly, because they had obtained the commodities such as 'private housing', 'private car', and 'traveling abroad', etc. for which the civilian in Shanghai is yearning, their consumption style had changed from the consumption as objective into the consumption as achieving lifestyle. Thirdly, they got tired of the information from the commercial advertisement of television and newspaper for everyone but took their own purchasing experience, personal communication between friends, and some foreign magazines etc. as the important source of information

for their consumption<sup>2</sup>). Finally, the image (probably influenced by their own experience at abroad) for Japan was not an ordinary stereotype like the civilian had but comparatively objective.

#### **Production, Circulation, and Consumption Situation of Rice in Shanghai City**

The annual grain consumption in Shanghai is about 5.7 million tons, and its rice consumption is about two million tons. However, due to the annual rice production in Shanghai is less than 100,000 tons, the demand for rice in Shanghai is supplied by other provinces such as three provinces in Northeast China (Jilin, Liaoning and Heilongjiang), Jiangsu, Anhui, etc. Although the staple food for Shanghai citizens was Indica rice before the 'economic reform', it has almost changed into Japonica rice now even including the fluid population.

First of all, when having questioned on the place where rice was eaten to the Shanghai citizens, 60 percent of those who answered was "Home", and 40 percent was "Restaurant and public dining room, etc". The advancement of 'Eating out' along with economic growth in urban area of China has been found<sup>2</sup>). Moreover, to the question about how frequently they eat rice for each day, those answered "Three times" and "Twice" were almost equal, and it fell below half the number a little. When the reason of "Twice" was asked, it was told that breakfast often ate not rice gruel but the Dian Xin (Yam Cha) because of there was no time<sup>3</sup>). In addition, although there was an individual difference about the amount in which rice was eaten every time, the men generally had 1-1.5 cups while the women had 0.5-1 cup in Shanghai.

Next, it was the order of the supermarket, the rice shop (food convenience store), and the agricultural market as for the places to purchase rice in Shanghai. The reason to buy rice in supermarkets was considered as the follows: the guarantee of quality and safety to some degree, the kinds and brands abundantly become complete in supermarkets. However, the popularity of the rice shop as the place to purchase rice came not only from its long history as a traditional purchasing place but also from its convenient location in residential area where poor people (who receive food assistance) can buy rice with a supplementary card as well. On the other hand, the purchase of rice in the agricultural market was considered to be supported by elderly people and repeaters for the reasons that vegetables, meats, and marine products were bought with rice from the same place and a delivery service was available when rice was purchased beyond 10kg.

However, the background that supermarket is becoming a main stream of the place to purchase rice could be explained as there have been a great change in the system of food circulation in China in recent years though the history of supermarket as the store to purchase rice was short<sup>4</sup>).

Moreover, as for the amount of each purchasing, the most popular was ten kilos in the supermarket while a small amount of selling by weight was a center in the agricultural market. However, housewives in a rich layer bought 5kg packaged rice in supermarket, and answered that 5kg or less packaged rice was good. Actually, it was found that 2.5kg packaged rice sold the best in the rice counter of a luxury department-store (Sogo).

In addition, the retail price of rice in Shanghai in recent years varied widely due to the different kinds, brands and stores. There was an opening price of 2.6-18.4 yuan for each kilogram; the cheapest one was the non-brand Japonica and sold by weight in the major supermarket (2.6 yuan per kilogram), and the most expensive one was the organic farming Koshihikari variety produced in Guangdong province (18.4 yuan per kilogram). According to the questionnaire survey, 80 percent of the people buy rice at a price of 2-6 yuan per kilogram.

For understanding the points mostly evaluated by consumers for rice purchase and knowing the kinds of rice chosen by consumers, group discussion and questionnaire survey to the consumers at different income level were undertaken by using six standards for rice purchase, such as price, taste, brand, producing area, milling date and cultivation method.

As for the order of the standard that mostly evaluated when rice was bought, TABLE 4 was a summary according to the income level. Although taste was mostly evaluated by any income level, the importance degree of the price decreased, and the brand (brand and producing place) and the quality (milling date) and the safety (cultivation method) increased along with the rise of income. In other words, the pattern of rice consumption in Shanghai has moved from a past, low-priced intention to the brand oriented, high quality and safety intention.

TABLE 4: ORDER OF CRITERIA IN PURCHASING RICE ( GROUPED BY INCOME LEVEL )

Income level	First	Second	Third	Fourth	Fifth	Sixth
Total ( N=301 )	Taste (4.41 )	Brand (4.31)	Price (4.22)	Area of Production (3.38)	Cultivation Method (3.15)	Date of Rice Milling ( 3.01 )
Less than 50,000 Yuan ( N=219)	Taste (4.38)	Price (4.30)	Brand (4.28)	Area of Production (3.32)	Cultivation Method (3.07)	Date of Rice Milling (2.87)
50,000-100,000 Yuan ( N=43 )	Taste (4.35)	Brand (4.20)	Price (3.88)	Area of Production (3.75)	Date of Rice Milling (3.55)	Cultivation Method (3.38)
Over 100,000 Yuan ( N=18)	Taste (4.65)	Brand (4.35)	Cultivation Method (4.18)	Date of Rice Milling (3.82)	Area of Production (3.78)	Price (3.71)

Notes: Respondents who answered “important”, “slightly important”, “have no preference”, “not so important”, “not important” are scored for 5, 4, 3, 2, 1 respectively.

However six indices about the taste of rice were used for searching the difference of the preference between income levels, they are sheen, fragrance, sweetness, glutinosity, dryness and firmness. TABLE 5 indicated the evaluation order to the taste about rice according to the income level. The consumers in any income layer of

China required fragrance, sheen, and firmness but not sweetness oppositely for rice. However, there was the tendency that the higher income of consumers the more glutinosity of rice they preferred.

TABLE 5: EVALUATION ORDER TO THE TASTE ABOUT RICE (GROUPED BY INCOME LEVEL)

Income level	First	Second	Third	Fourth	Fifth	Sixth
Total ( N=301 )	Fragrance (4.42)	Sheen (4.29)	Firmness (3.70)	Sweetness (3.63)	Glutinosity (3.63)	Dryness (3.20)
Less than 50,000 Yuan ( N=219)	Fragrance (4.40)	Sheen (4.27)	Sweetness (3.62)	Firmness (3.58)	Glutinosity (3.57)	Dryness (3.14)
50,000-100,000 Yuan ( N=43 )	Fragrance (4.49)	Sheen (4.40)	Firmness (3.98)	Sweetness, Glutinosity (3.64)		Dryness (3.51)
Over 100,000 Yuan ( N=18)	Fragrance, Firmness (4.65)		Sheen, Glutinosity (4.29)		Sweetness (3.82)	Dryness (3.53)

Notes: Fourth and Fifth Place of “50,000-100,000 Yuan”, First and Second Place, Third and Fourth Place of “Over 100,000 Yuan” has same the number of decimals.

By concluding the above-mentioned analyses, the change in the consumers’ preference towards rice consumption in Shanghai seemed to be composed by two elements: they were the change in the pattern of rice consumption and the change in the factors for brand selection as shown by Fig. 1. It was considered that consumers’ preference towards rice consumption changed from a low-priced intention to brand consciousness and the high quality and safety intention with a decrease in the amount when households income rise along with economic growth. The change in such a consumption side corresponded to the change in the composition of the rice variety in China which was pointed out by the existing researches on production and circulation<sup>5</sup>.

On the other hand, it seemed that the change in the consumers’ preference to the taste about rice was influenced by other factors such as the food culture (whether rice is made staple food for them or not), the information (personal communication, TV, and newspaper), and their purchasing experience (what kind of rice they usually eat), etc. rather than by income and lifestyles.

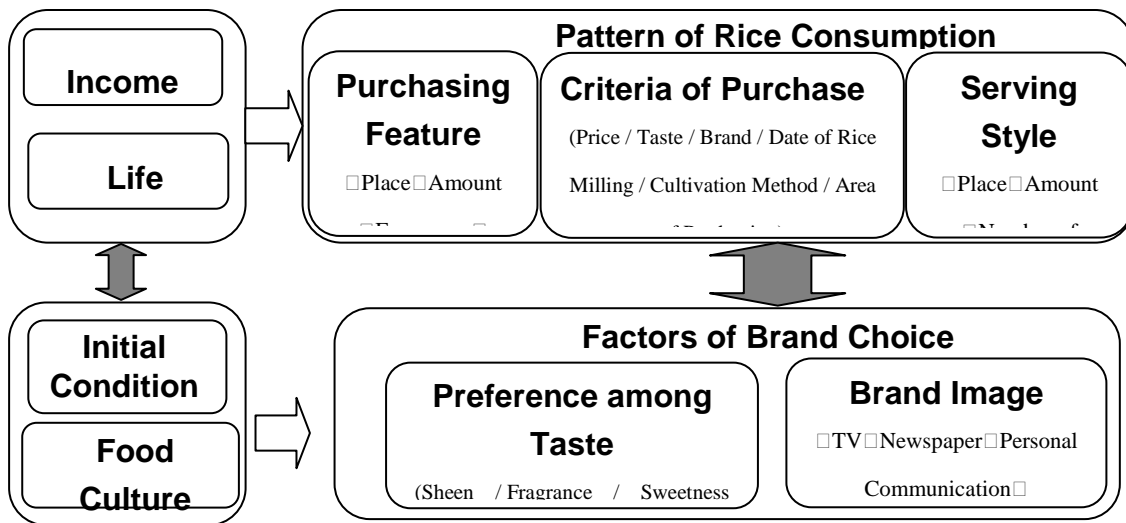

FIG. 1: CHANGE IN CONSUMERS' PREFERENCE TOWARDS RICE CONSUMPTION IN SHANGHAI

#### Rice Consumption Pattern of Top-Tier Population in Shanghai

To clarify the rice consumption pattern of top-tier population more in detail, the investigation of group discussion was undertaken. First of all, a rich layer was strong brand consciousness, and worried about current Chinese rice in respect of the reliability of the quality, safety, and the display of package. Moreover, because they valued their own purchasing experience and information from personal communication, there was a demand for the high quality and a small amount of package on rice. In addition, because they had daily access to Japanese products (including Japanese food products), the rice produced in Japan with the feeling of high quality and luxury could not only meet their needs for rice but also corresponded to their consumption as achieving lifestyle.

On the other hand, the civilian had a strong taste and price intention towards rice consumption. Their requirement for rice was to have a constant quality with appropriate price. Moreover because they were sensitive to the commercial advertisements of televisions and newspapers, it seemed that Japanese breeding rice produced in Northeast China which was considered to have a close taste only one tenth or less of the price to the imported Japanese rice corresponded to their consumption as objective.

Based on the above analyses, the attribute of rice required by different consumers was shown by Fig. 2. However, two kinds of rice (the Japanese Breed Rice produced in Northeast China and the rice produced in Japan) were included in Japanese rice here.

### Food Security for Urban Poor

Shanghai was the first city to establish a minimum living security system (June 1993). According to Shanghai Bureau of Statistics, the poverty line in 2005 is 300 yuan and 400,000 people are the object persons. However the

poverty line in 1993 was 120 yuan and only 6,500 people were the object persons (TABLE 6).

The causes of poverty in Shanghai can be classified into the following categories: the socially weak (those who are disabled, without legal guardian and the elderly), unemployed and temporarily released workers of SOEs and exiles (migrants from poor region) <sup>6)</sup>. The government is assisting to the urban residents who have the income below the security standard as shown in TABLE 7.

TABLE 6: SITUATION OF SECURITY SYSTEM FOR URBAN MINIMUM STANDARD OF LIVING

Year/Month	Minimum Standard of Living Security System in Urban Region		Beneficiaries
	Amount of Money ( Yuan )	Rate of Change (%)	(10,000 person)
1993.6	120		0.65
1994.7	135	12.5	0.70
1995.4	165	22.2	0.75
1996.4	185	12.1	0.77
1997.4	195	5.1	0.77
1998.4	205	5.1	1.30
1999.4	215	4.9	11.30
1999.7	280	30.2	11.30
2000	280	0.0	18.70

Assistance	Contents
Security Amount	300 yuan/month
Food Assistance	40 yuan/month
Side Food Assistance	8 yuan/month
School Expense Subsidies ( elementary and junior high school students )	Exemption of miscellaneous and School expense Assistance of Lunch
Issue of Certification for School Expense Subsidies (High School Students and above)	Part-time Job Loan
Rent Subsidy	
Etc.	Medical Assistance

#### Food Assistance System in Shanghai

The food reform was done in the whole country in China for the main farm products such as food (grain and cooking oils) and cotton in 1991. It became a situation that caused their life extremely difficult where the distribution of the food that had been secured up to now for the low income group stops. Then, food Assistance System which targets the city registered residents of the income bracket below a constant standard for reducing a money load to the food purchase to them was executed in Shanghai<sup>7)</sup>.

Among the object persons of Security System for Urban Minimum Standard of Living, the person of 16 years old or less and 60 years old or more becomes the object person of the Food Assistance System. The object persons of Food Assistance System are able to obtain food from 'Food Assistance Store' by using 'Food Assistance Card' which is issued by local government.

To know the difference of price between Food Assistance Store and other stores, we made price survey in September, 2005. It is seen that there is a big price difference by the shop than by the brand (See TABLE 8).

TABLE 8: RETAIL PRICE OF RICE, EDIBLE OIL AND WHEAT FLOUR IN SHANGHAI

Food	Store Category	Price(Yuan/kg)
Rice	Luxury Department-store	11.1
	Foreign-affiliated Supermarket	6.0
	Convenience Store	3.8
	Agricultural Market	3.5
	Food Assistance Store	3.4
Wheat Flour	Japanese Food Store	40.0
	Luxury Department-store	27.8
	Foreign-affiliated Supermarket	5.5
Edible Oil	Japanese Food Store	22.0
	Luxury Department-store	20.8
	General Food Store	9.6
	Convenience Store	9.2
	Foreign-affiliated Supermarket	7.1

Notes: Price of Edible Oil indicates Yuan/L term.

#### Effect and Problem of Food Assistance System

To know the realities and the execution condition of the Food Assistance System, G-town office of Hongkou district was visited and the person in charge was interviewed (See TABLE 9). Moreover, we also successively interviewed one of the recipients of the Food Assistance System. Mr. A enjoyed the good quality and cheap price of food supplied by the system, however he pointed out that there existed problems of examining the recipient of the system.

TABLE 9: ASSISTANCE SITUATION IN G TOWN OF HONGKOU DISTRICT

Unit: Yuan/Year

Safety net	Coverage	Amount of Money
Rent Subsidy	71 (households)	36,120
Student Aid	200 (Issues)	-
Socially Weak	213 (person)	76,780
Security System for Urban Minimum Standard of Living	1,128 (person)	296,800
Insurance(lay off workers)	177 (person)	-
Food Assistance Card	890 (issues)	35,680

Source: Interview Survey

To know how the other recipients were evaluating the Food Assistance System, the questionnaire survey was done to nine recipients. All members answered that Food Assistance System had improved their nutrient

condition though it did not go to the stability in their livelihood as an evaluation. On the other hand, the subsidy was few, there was sense of resistance in the card presentation in the shop, and the procedure of the system was complicated were pointed out as the problem of the Food Assistance System, (See Fig. 3).

FIG. 3: EVALUATION OF FOOD ASSISTANCE SYSTEM

Moreover, we questioned the recipients and the Shanghai citizens on the most important policy for the urban poor. Health Assistance was most answered by the recipients, and Job Assistance (including Job Gaining and Job Training) was answered by the civilian ( See Fig. 4 )

FIG. 4: MOST SIGNIFICANT POLICY FOR URBAN POOR

The following points of Food Assistance system in Shanghai were clarified based on the above-mentioned analytical result. First of all, it can be said that this system was effective in the point of the improvement of recipient's nutrient condition. Next, the system that local community takes charge of the business and finances the half of the subsidy by revenue from the township enterprises is considered an effective way to improve the consciousness towards poverty reduction at a community base.

On the other hand, a proper subsidy amount is enumerated as a problem of the Food Assistance System. The minimum wage is 690 yuan per month and Urban Minimum Standard of Living is 300 yuan per month in Shanghai. Therefore, there is a gap between the minimum wage and the minimum standard of living, and the

problem how it is necessary to deal with the citizens who' amount of income belongs to the gap remains. Moreover, the problem in the system management includes the problem how to do an accurate specification of object person and the prevention of the loophole shouldn't to be unwatched.

## **Concluding Remarks**

When the wealth gap doesn't expand under the process of economic development, the horizontal differentiation based on different preferences for food is caused and the diversification is few though the demand for high-end food advances (See Fig. 5-a). As a result, the formation of production home according to regional characteristics is caused.

On the other hand, when the wealth gap expands under the process of economic development, food demand is diversified between income hierarchies and a vertical differentiation based on different quality of food is caused at the same time with the horizontal differentiation based on the preference for food though making the demand for high-end food advances as a whole. As a result, the production home based on regional characteristics, the production home where the mass products are produced at a low-cost and the production home that produces high quality products, are formed. Moreover, when Food Assistance System is executed to urban poor caused by an enlarged income disparity under the process of economic development, it is considered that the standardization of food products as assistance goods advances (See Fig. 5-b). In addition, in the stage where the food consumption has become more mature shown in the developed countries, the emphasis of food policy for these countries should move to the correspondence to diversified consumer needs and a stable supply of food (including food importation).

Therefore, food policy for China in the current stage means to be able to provide food to the poorest segment of the population at cheap price with a constant quality and to correspond to the diversified needs of the general public for food (including high quality and safety intention of top-tier population).

### **Abstract**

Sistan province is one of more divest provinces in Iran. In this province more people employ to agriculture and livestock, but they are more problem with weather like famine, flood and ect. So this is necessary to crop area planning for improvement status of farmer in sistan. The present study dealt with the real-world problem of irrigation water management of evolving suitable cropping pattern. The Hirmand river basin system, which it is just water source in sistan, has been first simulated and analyzed. A multi-objective fuzzy linear programming (MOFLP) area allocation model has been formulated to cope with the diverse/conflicting interests of different decision makers such as the irrigation authority (government) and the individual farmers involved. Simulation output in the form of optimal monthly releases for irrigation is one of the main inputs to the MOFLP area allocation model. Over time variable irrigation demand has been incorporated into the formulated model which includes high variation in precipitation. Thus, varying cropping patterns in the command area, one for each year, have been analyzed which are based on the past 30 years of reservoir simulation. Besides this, a cropping pattern corresponding to 80% dependable releases and rainfall is also analyzed. Such analysis is extremely useful in deciding on an appropriate cropping pattern in any command area that minimizes the average crop failure risk in view of uncertain irrigation water availability, especially in dry years.

**Keywords:** Fuzzy multiple-criteria decision making; MOFLP; Crop area planning

### **Fuzzy Multiple-Criteria Decision-Making Model for Crop Area Planning**

Increasing demands for agricultural products with limited water resources lead to irrigation planning and management problems. In addition, the conflicting objectives of individual monetary benefits and social benefits, inevitability of uneconomical crops and providing employment to labor make the problems rather more complex.

For efficient and scientific solutions of these problems ground water is also to be optimally extracted and combined with surface water to meet the requirements. At the same time it is necessary that the water quality standards are not seriously affected. Even at a marginal reduction of net benefits, labor deployment with increased cropped area could be a better alternative for the society. On the other hand, uncertainty makes irrigation planning problems more complex in the form of unexpected droughts and floods, uncertainty in price of crops, uncertainty in yields, nonavailability of labor at right time, variation of inflows from year to year.

Fuzzy set theory is identified as an alternative approach to handle such vagueness of the planning objectives and imprecision involved in the parameter values since deterministic approaches are not sufficient to model such complex situations. Chang et al. (1997) explained the advantage of fuzzy multiobjective optimization over deterministic approach as 1) fuzzy uncertainties embedded in the model parameters can be directly reflected and communicated into the optimization process 2) the variation or vagueness of the decision maker's aspiration level in the model can be incorporated and there by generate a more confident solution set for decision maker 3) regardless of the orientation of decision maker's aspiration level (maximization or minimization), each objective or goal have its own independent membership function and different aspiration levels.

The present study considered above aspects in the multiobjective Fuzzy Linear Programming (FLP) framework by incorporating three objectives net benefits, crop production and labor employment for selection of the compromise irrigation plan. The present study deviates from previous studies by considering fuzziness in the objective functions, uncertainty in the inflows through stochastic programming and multiple objectives in the analysis.

Fuzzy Linear Programming (FLP) is developed for the evaluation of management strategies for a case study of Sri Ram Sagar Project, Andhra Pradesh, India. Three conflicting objectives net benefits, crop production and labor employment are considered in the irrigation planning scenario. The present paper demonstrates how vagueness and imprecision in the objective function values can be quantified by membership functions in a fuzzy multi-objective framework. Uncertainty in the inflows is considered by stochastic programming. Analysis of results indicated that net benefits, crop production and labor employment in FLP are deviated by 2.38%, 9.6% and 7.22% as compared to ideal values in the crisp Linear Programming (LP) model. Comparison of results indicated that the methodology can be extended to other similar situations. (Srinivasa & Kumar, D., ())

The task of reservoir operation and planning remains incomplete without ensuring the beneficial use of obtained releases for irrigation. It requires that cropping pattern must be readjusted with respect to possible releases available. Therefore, the second step, following reservoir management, is the problem of irrigation water management. Essentially, three decisions are required in irrigation water management, namely optimal crop selection, optimal land allocation under different selected crops, and optimal amount of water to be allocated to each

crop. Optimization techniques provide a powerful tool for analysis of problems that are formulated with single, quantifiable objectives. However, the real-world decision-making problems usually require consideration of multiple, conflicting and non-commensurable criteria. Numerous single as well as multiple-objective crop area allocation models were developed in the past and are well described in the literature (Maass et al., 1962; Hall and Dracup, 1970; Rogers and Smith, 1970; Lakshminarayana and Rajagopalan, 1977, etc.).

The decision problems like crop area planning or agricultural planning also involve multiple, conflicting and non-commensurable criteria and a 'satisfying' decision is desired. These are called multiple-criteria decision problems, where the decision maker generally follows a satisfying solution rather than the maximization of objectives. Such a problem leads to numerous evaluation schemes and to the formulation of a vector maximum problem in mathematical programming. Further, uncertainty due to the random character of natural processes can be dealt with quantitatively by various developed techniques and tools provided by probability, decision, control and information theories. The real-world decision problems can rarely be defined precisely in mathematical terms rather than in terms of the real world, which may often be imprecise, by nature (because of fuzziness). A fuzzy set is a class with not sharp boundaries, i.e. a class in which transition from membership to non-membership is gradual rather than abrupt. Fuzziness plays an essential role in human cognition because most of the classes encountered in the real world are fuzzy - some only slightly and some markedly so. It is truer in system modeling in which human aspects have to be included. A decision maker might not be able to express his goals or constraints precisely because his utility function is not defined or definable precisely, or phenomena of the decision problem might only be described in a fuzzy way. Much of water resources management takes place in an environment in which the basic input information, goals, constraints, and consequences of possible actions are not known precisely. Therefore, water resource managers and modelers are bound to deal with -imprecision mostly due to insufficient data and imperfect knowledge - which should not be equated with randomness and the consequent uncertainty. Hence, it is more realistic to consider imprecise model constraint and goals. Fuzzy goals and/or fuzzy constraints are regarded as fuzzy criteria (Bellman and Zadeh, 1970).

In the last two decades, multiple-criteria decision making (MCDM) techniques have experienced spectacular growth (Cohon, 1978; Goicoechea, 1982; Zeleny, 1982; Harboe, 1992, etc.), but not many water resource planning studies have utilized these methods throughout the entire course of the planning process. There are several reasons behind this. Some multi-criteria methods require information that is difficult to obtain in a real-world setting. Sometimes the complexity of mathematical formulations alienates the potential users. Generally, prevailing institutional arrangements are also not favorable for their application. Thus, there is a dilemma. The single criteria alone do not satisfy every sphere of society any more and, on the other hand, multi-criteria approaches are difficult to apply in real practice. In this paper a simple, yet potential, tool in fuzzy multi-objective analysis has

been explored and utilized. The fuzzy linear programming is used to formulate the multi-objective fuzzy linear programming (MOLFP) area allocation model considering various conflicting objectives involved in irrigation planning.

## **Multiobjective Fuzzy Linear Programming**

Fuzzy Linear Programming problem associates fuzzy input data by fuzzy membership functions. Fuzzy Linear Programming model assumes that objectives and constraints in an imprecise and uncertain situation can be represented by fuzzy sets. The fuzzy objective function can be maximized or minimized. In Fuzzy Linear Programming the fuzziness of available resources is characterized by the membership function over the tolerance range. In the present study objective functions are considered as fuzzy sets and inflows are considered in the form of chance constraints (Zimmermann, 1996).

In any irrigation system, two distinct groups of decision makers are generally involved, namely irrigation administration representing the government who usually control the operation of the system and the individual farmers (cultivators) who are the actual producers of agricultural commodities. Different groups of decision maker have different goals, perspectives and values. Issues of equity, risk, redistribution of national wealth, environmental quality and social welfare are as important as economic efficiency. It is clearly impossible to develop a single objective that satisfies all interests, all adversities and all political and social viewpoints. Hence, six conflicting objectives have been identified to illustrate the potential methodology. The objectives are classified into three groups, namely social, economic and socio-economic. The objectives like benefit maximization, investment minimization are economic objectives whereas maximization of calories, labor employment and total area under irrigation are social objectives. The objective like maximize crop area in order of crop ranking reflects both the social as well as economic aspects of planning.

## **Crop Selection**

Generally, the choices of crop types to be sown are based on social and agronomical considerations only. Selection of the appropriate type of crops to be sown should be made by incorporating all conflicting objectives of agricultural planning, instead of arbitrarily out of convenience or out of tradition. Some criteria among others like domestic need of a particular crop commodity, productivity, market value, regional balance and resource requirements and their availability can significantly influence the crop selection decision. Under such circumstances, crop selection is a case of a multi-attribute decision-making problem. Candidate crops should be identified and short-listed, eliminating

those that are obviously dominated. Crops that are inferior to at least one other crop, by all considered criteria, should not be considered further. A set of non-inferior crops should then be evaluated (Tabucanon, 1993). The Analytic Hierarchy Process, Multi-attribute Value Theory and Promethee are suitable techniques for crop selection problem. So following crop select for this paper.

- |          |           |            |            |               |

| 1. Wheat | 2. Barley | 3. Pasture | 4. Alfalfa | 5. watermelon |
| 6. Melon | 7. Onion  | 8. Lentil  | 9. Cumin   |               |

## Generalized Framework of Multi-Objective Crop Area Optimization Model

### Vector maximum problem

The vector maximum problem is defined as follows:

$$\text{"max"} \{Z(x) \mid x \in X\}$$

Where  $Z(x) = (Z_1(x), \dots, Z_k(x))$  is a vector-valued function of  $x \in R^n$  into  $R^k$

The set of all 'efficient solutions' (complete solution) is defined as the set of all solutions  $\bar{x} \in X$  which, with respect to the objective functions  $Z_t(x)$ , satisfy the following conditions:

$\bar{x}$  is an efficient solution if there is no  $x' \in X$  such that  $Z_t(x') \geq Z_t(\bar{x})$ ;  $t=1; \dots; k$  and  $Z_t(x') > Z_t(\bar{x})$  for at least one  $t \in \{1, \dots, k\}$

The optimal solution, whichever way it has been determined, has to be a member of the 'complete solution' (non-dominated or pareto optimal solution).

### Multi-Objective Area Allocation Model Formulation

Once the task of crop selection is over, the subsequent question is how much resource should be allocated to each type of crop such that the available resources are efficiently utilized so as to result in a most satisfactory decision to the multi-faceted and conflicting objectives. The resource availability and their requirements necessarily govern feasibility of the alternative decisions made. The multi-criteria decision-making techniques like goal programming and linear programming are particularly suited and widely recognized to such allocation problems.

### Notations

The notations used in problem formulation are listed in the nomenclature.

### The Objectives Functions and the Considered Objectives

1. Net benefit maximization: the economic objective like benefit maximization is commonly aspired to by every decision maker involved in the planning process. However, farmers are more biased to such objectives and

always prefer a cropping pattern which can provide them with more financial returns. Hence, it can be formulated as:

$$MaxZ_1 = \sum_i N_i \times A_i, \forall i. \quad (1)$$

2. Calories (energy) maximization: in many developing countries malnutrition is widespread. Therefore, the government prefers a cropping pattern which results in maximum calorie production to prevent calorie deficiency in the country or community. Such a social objective can be formulated as:

$$MaxZ_2 = \sum_i f_i \times C_i \times A_i, \forall i. \quad (2)$$

<b>Nomenclature</b>			
Subscript and superscripts:		$i = 1, 2, \dots, n$ crop type index	$j = 1, 2, \dots, 12$ month type index
<b>Variables and parameters</b>			
<b>A<sub>i</sub>:</b>	allocation of land to ith crop	<b>LB<sub>i</sub>:</b>	lower production bound of ith crops
<b>R<sub>i</sub>:</b>	overall crop ranking factor for ith crop	<b>UB<sub>i</sub>:</b>	upper production bound of ith crops
<b>L<sub>i</sub>:</b>	labor requirement per unit area for production of ith crop	<b>TAGW:</b>	maximum permissible annual ground water withdrawal
<b>P<sub>i</sub>:</b>	production (yield) per unit area of ith crop N <sub>i</sub> net return (in excess of field level costs) per unit area from production of ith crop	<b>C<sup>e</sup>:</b>	minimum quantity of cereals (maize, paddy, wheat) requirement in the planning unit
<b>I<sub>i</sub>:</b>	total per unit area investment required for cultivation (production) of ith crop	<b>P<sup>u</sup>:</b>	minimum quantity of pulses requirement in the planning unit
<b>C<sub>i</sub>:</b>	total per unit area energy (calories) available from production of ith crop	<b>O<sup>s</sup>:</b>	minimum quantity of oil seeds requirement in the planning unit
<b>W<sub>i</sub><sup>j</sup>:</b>	volume of irrigation water requirement for ith crop in jth month A total cultivable area available in planning unit	<b>β<sub>i</sub><sup>j</sup>:</b>	fraction of the total area under crop I exists on the @led during month j (0-1; describing the composite crop period)
<b>GW<sup>j</sup>:</b>	maximum permissible groundwater availability in jth month	<b>f<sub>i</sub>:</b>	fractional amount of edible food obtained from ith crop
<b>SW<sup>j</sup>:</b>	maximum surface water availability in jth month obtained from reservoir simulation study for optimal releases	<b>μ<sub>z<sub>i</sub></sub>(x):</b>	membership function of tth objective

3. Labor employment maximization: the governments of under-developed or developing countries may advocate a labor-intensified cropping pattern to minimize unemployment as well as under-employment, especially in the agricultural sector. Hence, mathematically:

$$MaxZ_3 = \sum_i L_i \times A_i, \forall i. \quad (3)$$

4. Investment minimization: the investment required to produce a particular crop also plays a significant role in crop selection, especially in a developing country like Iran where cultivators have very limited financial capacity. Usually, farmers prefer a cropping pattern which is less investment intensive, though it may fetch some smaller benefits. Thus, mathematically:

$$MinZ_4 = \sum_i I_i \times A_i, \forall i. \quad (4)$$

5. Maximize total area under irrigation: considering the government's policy of providing irrigation to as large an area as possible rather than limiting to some specific crops that yield more returns or serves individual objectives:

$$MaxZ_5 = \sum_i A_i, \forall i. \quad (5)$$

6. Maximize crop area in the order of crop ranking: at the outset all possible candidate crops suitable for sowing should be identified and ranked based on several criteria. Therefore, among others one objective of the planning could be the maximization of the area under crops in order of crop ranking. Such an objective indirectly takes care of several other conflicting criteria. Mathematically, it can be written as:

$$MaxZ_6 = \sum_i R_i \times A_i, \forall i. \quad (6)$$

#### Model Constraints

The developed model is subjected to the following constraints:

1. Cultivable area constraint: in a planning unit, area allocated to different crops is utmost equal to the total cultivable area, i.e:

$$\sum_i A_i \leq A, \forall j. \quad (7)$$

2. Water requirement constraint: in any month irrigation water demand of all the crops should not exceed the water available in that particular month, i.e:

$$\sum_i W_i^j \times A_i \leq SW^j + GW^j, \forall j. \quad (8)$$

In sisthan province groundwater is not usable for agriculture then  $GW^j = 0$

3. Annual groundwater withdrawal constraint: the total groundwater use in the command area should not exceed the annual permissible groundwater withdrawal:

$$\sum_i GW^j \leq TAGW \quad (9)$$

In this paper  $\mathbf{GW}^j=0$  , so this constraint is not use.

4. Upper and lower bound constraints: to cater the need of social, economic and regional factors of the dynamic system, upper and lower bound constraints are required to introduce into the model for better control on production of certain crops. These constraints are frequently needed for the sake of maintaining commodity prices in the region. Lower bound constraints are usually required to fulfil social obligations such as production of minimum food requirements, which is associated with food affinity or malnutrition of the society. Thus, constraints can be expressed in general form as follows:

- upper bound constraints:

$$f_i \times P_i \times A_i \leq UB_i \text{ for selected } i \quad (10)$$

- Lower bound constraints:

$$f_i \times P_i \times A_i \geq LB_i \text{ for selected } I \quad (11)$$

Food requirement constraints are lower bound constraints of the model. They are usually required to produce a minimum quantity of desired food commodities for domestic consumption. Considering the food habits of the local population as well the recommended balanced diet by the Indian Council of Medical Research, certain minimum quantities of cereals, pulses and oil seed foods are required to be produced. The suggested cropping pattern should ascertain the supply of these minimum quantities of food commodities. These can be expressed as follows:

- cereals requirement: 
$$\sum_i f_i \times P_i \times A_i \geq C_e \text{ index } i \text{ for} \quad (11a)$$

- pulses requirement: 
$$\sum_i f_i \times P_i \times A_i \geq P_u \text{ index } i \text{ for} \quad (11b)$$

- Oil seeds requirement: 
$$\sum_i f_i \times P_i \times A_i \geq O_S \text{ index } i \text{ for} \quad (11c)$$

5. Non-negativity restriction: the basic assumption underlying the model is that all decision variables must be non-negative, i.e.:

$$\forall i \ A_i \geq 0 \quad (12)$$

### Generalized Fuzzy Decision Model in Multi-Objective Analysis

For each non-redundant objective function  $Z_i(x)$  there exists a uniquely determined functional efficient optimal solution  $x_i^*$  that means:

$$\hat{\bigwedge}_{x \in X} Z_t(x) \leq Z_t(x_t^*) = Z_t^* \quad (13)$$

For the individual optimal solutions holds:  $X_i^* = X_j^*$  for  $i \neq j$  and  $i, j=1, \dots, k$ .

Furthermore, we define for  $t=1, \dots, k$ .

$$Z_t^m = \min(Z_t(X_1^*), \dots, Z_t(X_{t-1}^*), Z_t(X_{t+1}^*), \dots, Z_t(X_k^*)) \quad (14)$$

and  $d_t^* = Z_t^* - Z_t^m > 0$  (15)

### Membership Functions

Membership function acts as surrogate characterization of preference in determining the desired outcome for each of the objectives within the multi-objective framework.

Membership function, denoted by  $\mu_{z_t}(x)$  for the  $t$ th objective, should at least satisfy the following conditions:

$$\mu_{z_t}(x) = \left\{ \begin{array}{ll} 1 & \text{if } Z_t(x) \geq Z_t^* \\ 0 < \mu_{z_t}(x) < 1 & \text{if } Z_t^m < Z_t(x) < Z_t^* \\ 0 & \text{if } Z_t(x) \leq Z_t^m \end{array} \right\} \quad (16)$$

Where  $Z_t(x)$  is the outcome of the  $t$ th objective.

Several membership functions could be employed in fuzzy linear programming which we employed hyperbolic inverse membership function in this fuzzy model.

For each objective function  $Z_t(x)$ , the corresponding hyperbolic inverse membership function  $\mu_{Z_t}^{HI}(x)$  is defined as follows:

$$\mu_{Z_t}^{HI}(x) = a_t \tanh^{-1}(y) + 1/2 \quad (17)$$

Where  $y = \alpha_t \{Z_t(x) - (Z_t^m + Z_t^*) / 2\}$ ; and  $\alpha_t$  is a parameter.

### Generalized Fuzzy Linear Programming Model

The central idea behind fuzzy linear programming is that ill-defined problems are first formulated as fuzzy decision models. Crisp models can then be designed which are equivalent to the fuzzy models and could be solved by using

existing standard algorithms. This approach is particularly suitable for decision problems which have the structure of linear programming. The fuzzy programming approach to multi-objective linear programming problems was first introduced by Zimmermann (1978) and further developed by several researchers including Leberling (1981), Hannan (1981), Sakawa and Yano (1985) and Sakawa (1987). Following fuzzy decision or minimum operator proposed by Bellman and Zadeh (1970) together with linear, hyperbolic, or piecewise-linear membership functions, authors proved the existence of an equivalent linear programming problem.

The fuzzy objective function is characterized by its membership function, and so are the constraints. To satisfy (optimize) the objective functions as well as the constraints, a decision in a fuzzy environment is a defined analogy to a non-fuzzy environment as the selection of activities which simultaneously satisfy objective function(s) and constraints. The 'decision' in a fuzzy environment is the intersection of fuzzy constraints and fuzzy objective function(s). The relationship between constraints and objective functions in a fuzzy environment is therefore fully symmetric, i.e. there is no longer a difference between the former and latter (Bellman and Zadeh, 1970).

If one defines the solution with the highest degree of membership to the fuzzy 'decision set' as the maximizing decision, then the fuzzy optimization problem can be defined as follows (Zimmermann, 1978; Leberling, 1981):

$$\text{Max } Z(x) = (Z_1(x), \dots, Z_k(x))^T$$

$$\text{Such that: } \quad AX \leq b \quad \quad X \geq 0$$

Where '~' means that all objective functions are characterized by corresponding membership functions:

Objective function	Membership function
$Z_1(x)$	$\mu_{Z_1}(x)$
•	•
•	•
•	•
$Z_k(x)$	$\mu_{Z_k}(x)$

The task is then to satisfy simultaneously all objective functions via their corresponding membership functions. For a general aggregate function:

$$\mu_D(x) = \mu_D(\mu_{Z_1}(x), \dots, \mu_{Z_k}(x))$$

The general optimization problem will be:

$$\text{Max } \mu_D(x)$$

$$\text{such that: } \quad AX \leq b \quad \quad X \geq 0 \quad \quad (18)$$

Definition:  $\bar{x} \in X$  is called optimal fuzzy decision of the fuzzy linear vector optimization problem, if  $\bar{x}$  is an optimal solution of Eq. (18) that means:

$$\hat{\mu}_D(x) \leq \mu_D(\bar{x})$$

Using Zadeh's mini-operator (Zadeh, 1965) to specify the general aggregation function  $\mu_D(x)$ :

$$\hat{\mu}_D(x) = \min(\mu_{Z_t}(x)) = \min(\mu_{Z_1}(x), \dots, \mu_{Z_k}(x))$$

Eq. (18) then can be written as:

$$\max \min(\mu_{Z_t}(x))$$

$$\text{such that:} \quad AX \leq b \quad X \geq 0 \quad (19)$$

Zimmermann (1978) showed that Eq. (19) is equivalent to the following linear programming problem:

Max  $\lambda$

Such that:

$$1) \lambda \leq \mu_{Z_t}(x), \quad 1; 2; \dots; k \quad 2) AX \leq b \quad 3) X \geq 0 \quad (20)$$

## Multi-Criteria Decision Model for Crop Area Planning Using Fuzzy Linear Programming

In formulation of a fuzzy linear programming-based multi-criteria decision model for crop area allocation, it is quite reasonable to allow the member function to be of hyperbolic nature. This is particularly true to real-world problems, as marginal satisfaction of the decision maker decreases as the level of satisfaction (grade of membership) with respect to attainment of objective increases.

Assuming the following nonlinear tangent hyperbolic membership function for representing the fuzzy goals of the decision maker:

$$\mu_t^H(Z_t(x)) = \frac{(\tanh((Z_t(x) - b_t)\alpha_t) + 1)}{2}$$

Where  $\alpha_t$  is a shape parameter and  $b_t$  represents the value of  $Z_t(x)^*$  such that  $\mu_t^H(Z_t(x)) = 0.5$ . Taking worst

value and best value of tth objective function as  $Z_t^m$  and  $Z_t^*$ , respectively,  $b_t = (Z_t^m + Z_t^*)/2$ . Using the

above-mentioned hyperbolic membership function for representing the fuzzy objectives of the decision maker together with the fuzzy decision of Bellman and Zadeh (1970), the general form of the problem can be stated as

Max  $\lambda$

Such that:

$$1) \lambda \leq \mu_{Z_t}^H(x), t = 1, 2, \dots, k \quad 2) AX \leq b \quad 3) X \geq 0 \text{ and } \lambda \geq 0 \quad (21)$$

In this formulation  $\lambda \leq \mu_{Z_t}^H(x)$ , is a nonlinear function hence it is a nonlinear programming problem.

Leberling (1981) showed that such nonlinearity by introduction of nonlinear hyperbolic membership function could be equivalently converted to a conventional linear programming problem. Eq.(21) can be written as:

Max  $\lambda$

such that:

$$1) \lambda \leq \frac{(\tanh((Z_t(x) - b_t)\alpha_t) + 1)}{2}, t = 1, 2, \dots, k$$

$$2) AX \leq b \quad 3) X \geq 0 \text{ and } \lambda \geq 0 \quad (22)$$

This is equivalent to:

Max  $\lambda$

such that:

$$1) (Z_t(x) - b_t)\alpha_t \geq \tanh^{-1}(2\lambda - 1), t = 1, 2, \dots, k$$

$$2) AX \leq b \quad 3) X \geq 0 \text{ and } \lambda \geq 0 \quad (23)$$

if we define:

$$x_{n+1} = \tanh^{-1}(2\lambda - 1) \quad \text{Then} \quad \lambda = \frac{(\tanh^{-1}(x_{n+1}) + 1)}{2}$$

Since,  $\tanh^{-1}(x)$  is a strictly monotone increasing function with respect to  $x$ , the maximization of  $\lambda$  is equivalent to the maximization of  $x_{n+1}$ . Hence, fuzzy vector-valued multi-objective optimization problem can be transformed to the following crisp model:

Max  $x_{n+1}$

Subject to:

$$1) \alpha_t Z_t(x) - x_{(n+1)} \geq \alpha_t b_t, t = 1, 2, \dots, k$$

$$2) AX \leq b \qquad 3) X \geq 0 \text{ and } x_{(n+1)} \geq 0 \qquad (24)$$

Let  $(x_{(n+1)}^*, x^*)$  be an optimal solution of Eq. (24), then optimal solution of the original problem can be obtained by:

$$(\lambda^*, x^*) = \left( \frac{\tanh(x_{n+1}^*) + 1}{2}, x^* \right) \qquad (25)$$

Therefore, the multi-objective fuzzy area allocation model with hyperbolic membership function can be formulated as follows:

Maximize  $A_{(n+1)}$

Subjected to:

1. Original constraints [Eqs. (7) - (12) of multi-objective area allocation model formulated in Section 1.4.2].
2. Hyperbolic membership constraints one for each considered objective:

- Net benefit maximization:

$$-\alpha_1 \sum_{i=1}^n N_i A_i + A_{n+1} \leq -\frac{1}{2} \alpha_1 (Z_1^m + Z_1^*)$$

- Calories maximization:

$$-\alpha_2 \sum_{i=1}^n f_i C_i A_i + A_{n+1} \leq -\frac{1}{2} \alpha_2 (Z_2^m + Z_2^*)$$

- Labor employment maximization:

$$-\alpha_3 \sum_{i=1}^n L_i A_i + A_{n+1} \leq -\frac{1}{2} \alpha_3 (Z_3^m + Z_3^*)$$

- Investment minimization:

$$-\alpha_4 \sum_{i=1}^n I_i A_i + A_{n+1} \leq -\frac{1}{2} \alpha_4 (Z_4^m + Z_4^*)$$

- Maximization of total area under irrigation:

$$-\alpha_5 \sum_{i=1}^n A_i + A_{n+1} \leq -\frac{1}{2} \alpha_5 (Z_5^m + Z_5^*)$$

- Maximization of crop area in order of crop ranking:

$$-\alpha_6 \sum_{i=1}^n R_i A_i + A_{n+1} \leq -\frac{1}{2} \alpha_6 (Z_6^m + Z_6^*)$$

where:  $\alpha_t = \frac{6}{Z_t^* - Z_t^m}$  for  $t = 1, \dots, 6$

3. Non-negativity constraints:  $A_{(n+1)} \geq 0$

## Multiple-Criteria Decision Model for Crop Area Planning: Application, Results and Discussion

In order to demonstrate the applicability as well as analytical capabilities of the model developed earlier, the model was applied to sisthan (Iran). The model addresses the issue of establishment of most appropriate cropping pattern in a command area in view of surface water availability via optimal operation of the reservoirs system in the form of available optimal releases and multiple conflicting and non-commensurable objectives frame-work which are usually involved in irrigation planning. The developed model determines the type of crops to be grown, their extent and the level of water application such that all other available resources are efficiently utilized so as to result in a most satisfactory decision to the multi-faceted, conflicting, non-commensurable and imprecise objectives.

### Description of Study Area

The irrigated command area of sisthan province has been selected to illustrate the applicability of the formulated multiple-criteria decision model for crop area planning.

In Sistan province there are 12000 ha operational lands which these lands can be using for farming. Also groundwater in this province is not usable for farming and farmers use surface water which obtain from Hirmand River. Share of Iran to use water of this river is 820 billions  $m^3$  in each year ( $26 m^3$  in each second).

---

January    February    March    April    May    June

34.67	78.16	73.13	31.11	9.03	19.73
July	August	September	October	November	December
13.72	9.37	2.32	5	12.72	23.04

### Assumptions Used in Model Application

The following assumptions are made owing to the lack of reliable and sufficient information:

1. Time scale of the model is taken as a month, which is considered to be appropriate for such planning. All resource requirements and their availability have been evaluated on the same reference.
2. Overall project efficiency is applied to consider actual water available in the field.
3. All parts of the land under consideration receive the same management practices.
4. Land and soil are uniform throughout the command area; hence, suitable for all the crops under cultivation.
5. Annual availability of groundwater is considered which can be utilized at any time in a year. Further, it is also ensured that before using any groundwater in a period, all surface water available in that period should be utilized.

### Determination of Crop Ranking Factors

Nine common crops have been identified which are considered to be suitable for cultivation in the selected Sistan command area. In order to determine the crop ranking factors, multi-attribute value theory (MAVT) has been used.

#### MAVT

The preference function  $V$  is decomposed into some simpler forms if the decision maker's preference for the various combinations of the level of criteria satisfies certain conditions. A simple and most widely used form is the weighted additive form (Zeleny, 1982) which is used in the present case:

$$V(f_1, f_2, \dots, f_k) = w_1 \times v_1(f_1) + w_2 \times v_2(f_2) + \dots + w_k \times v_k(f_k)$$

Where  $w$ 's are the weights and  $v$ 's are the value function for each criterion.

#### Assessment of $v_k(f_k)$

A simple method is to use a 100-point rating scale on which 0 indicates the worst level and 100 indicates the best level. The different levels of an attribute are rated on this scale. The value of a level of a criterion is simply the rating divided by 100.

Five criteria were employed in ranking the crop alternative, namely, maximization of labor ( $f_1$ ), maximization of net benefit ( $f_2$ ), minimization of cost of cultivation ( $f_3$ ), maximization of benefit / cost ratio ( $f_4$ ) and maximization of available calorie ( $f_5$ ).

### Criteria Weights

In the absence of subjective weights all the five criteria, i.e.  $f_1 - f_5$  are assigned equal weightage (i.e.  $w_1=w_2=w_3=w_4=w_5=0.20$ ).

The overall value ( $V$ ) for each crop alternative can be computed as:

$$V = w_1 \times v_1 (f_1) + w_2 \times v_2 (f_2) + w_3 \times v_3 (f_3) + w_4 \times v_4 (f_4) + w_5 \times v_5 (f_5)$$

## Methodology

The reservoir system of the Sistan is first simulated under different operational strategies. The output of the simulation model has been taken as the input to crop area planning model (as surface water availability). Although the simulation model determines the optimal irrigation releases from a reservoir corresponding to the imposed demand which has been computed using given cropping pattern by the project authorities and assuming whole cultivable area under irrigation. In fact this is the maximum irrigation demand which can be used and desired but the system may not be in a position to fulfill such demand. The simulation model attempts to satisfy as much as possible of this imposed demand considering temporal and spatial priorities and energy generation targets in the system. Therefore, it is most likely that full crop water demand may not be satisfied by the system in all time periods of the planning horizon. Thus, the immediate problem of concern is how best to utilize these obtained irrigation releases from the reservoir? This problem can be solved by finding 'how much area should be put under irrigation and under which crops to fulfill the aspiration of decision maker in the framework of available water and land resources?' Moreover, the desirability of incorporating multiple imprecise goals of different decision maker(s) further complicates the problem. The developed crop area-planning model provides the most preferred satisfying solution to the present problem. The crop area-planning model determines the cropping pattern for each year of the considered 30 years planning horizon (1949-78). The model also computes and employs varying irrigation water requirements of crops in each year because the precipitation varies over time. In order to establish an optimal cropping pattern corresponding to some reliable irrigation releases and rainfall, different probability distributions have been fitted into the monthly series of optimal irrigation releases at Hirmand reservoir (obtained through an external simulation model) in its irrigation command area. The fitted distributions are normal, log-normal, gamma 2-parameter, pearson 3-parameter and log pearson 3-parameter. The best-fitted distribution in each month is then identified and used to calculate 80% dependable irrigation releases and rainfall.

TABLE 1: COMPUTATION OF CROP RANKING FACTORS (OVERALL VALUE) BY MULTI-ATTRIBUTE VALUE  
TECHNIQUE

Crop alternatives	Values of crop alternatives with respect to each criteria					Overall value (V)	Crop ranking
	$v_1(f_1)$	$v_2(f_2)$	$v_3(f_3)$	$v_4(f_4)$	$v_5(f_5)$		
Wheat	0.354	0.007	0.825	0.000	0.923	0.422	6
Barley	0.160	0.049	0.796	0.152	0.070	0.245	8
Pasture	0.000	0.000	1.000	0.016	0.000	0.203	9
Alfalfa	1.000	0.206	0.074	0.148	0.000	0.286	7
watermelon	0.446	0.326	0.816	0.508	1.000	0.619	1
Melon	0.446	0.394	0.813	0.616	0.345	0.523	3
Onion	0.829	1.000	0.000	0.935	0.193	0.591	2
Lentil	0.279	0.255	0.532	0.569	0.588	0.444	5
Cumin	0.427	0.613	0.222	1.000	0.000	0.452	4

Lower bound constraints on food requirement are imposed for cereals, pulses and oil seed crops. In the case of cereal food requirement constraint, since cereals include paddy, maize, and two varieties of wheat crop, a proportionality constraint has been introduced to specify minimum proportion among them which ensures minimum desired production of each type of cereal. The developed computer program is also very flexible as it can automatically readjust the lower bound food requirement constraints, if the solution becomes infeasible due to violation of these constraints. Such flexibility is essential, since models have been used for a long planning horizons period (30 years) which also contains extreme dry periods. During dry periods enough surface water (irrigation release) is not available to satisfy lower bound food requirement constraints and thus the solution may become infeasible.

## Results and Discussion

For analyzing catered data with due attention to explained methods, six linear programming models were estimated which adapted with different goal functions which had similar constraints. Firstly, it is necessary to explain that,

choosing productions is affected by shortage of water and drought in area and we choosed plant which needs few water, more over, their humidity necessity are less during dry months.

Result of estimating these five LP model plus Fuzzy multiple-criteria decision model are presented in table 2. As shown by the result, because of having water limitation especially in May, September, October and November and having Upper and lower bound constraints for main productions such as wheat and barley haven't many different in models however this variety related to productions such as watermelon and cumin.

TABLE 2: OPTIMAL CROPPING PATTERNS UNDER DIFFERENT OBJECTIVES AND FUZZY COMPROMISED SOLUTION

Crop	Area (ha) under different crops with respect to objective of . . .						Area (ha) under fuzzy compromise solution
	Benefit max.	Calories max	Labor max.	Investment min	Area max	Ranking max.	
Wheat	15000	15001	15000	15000	15000	15000	15001
Barley	4900	4900	4900	4900	4901	4900	4900
Pasture	2000	2000	2000	2000	2000	2001	2000
Alfalfa	320	320	320	320	320	320	320
watermelon	400	420	400	400	400	400	408
Melon	365	365	365	365	365	385	365
Onion	227	200	227	200	227	200	216
Lentil	6500	6500	6500	6500	6500	6500	6500
Cumin	26921	2000	26921	2000	26920	26920	26920
Annual	56633	31705	56633	31685	56633	56626	56630

As it explained, some months had more water limitation than others, this mean that water have shadow price in these especial months. On this base, in first model which its net benefit maximization, shadow price of water is 3252.7 Rials in May and 7626 Rials in November, so adding only one cubic meter water in May and November add 3252.7 and 7626 Rials to net benefit respectively from cultivating these productions.

In the next model, which is Calories (energy) maximization, the limitation is related to May and October which adding one water unit, will add achieve calory level to 2851.32 and 13107.31. On this base, adding each more water unit as limitative factor by production cultivating expansion have direct effect equivalent 2581.32 calory in May and 13107.31 calory in October.

Labor employment maximization is the aim of third model and water limitation in May and November is: adding one m<sup>3</sup> water will arise man-hours to 0.0552 and 0.1211 in these months.

Investment minimization which is the aim of next model, deals with October and finally maximizes crop area in the order of crop ranking is the aim which achieved with the last model by usual linear programming and water limitation is related to May, October and November in this model. More aver these months have the highest level of water limitation in Fuzzy multiple-criteria decision making, so this is a powerful factor which limit production cultivating in Sistan's area.

TABLE 3: PAYOFF TABLE FOR OPTIMAL CROPPING PATTERN UNDER DIFFERENT OBJECTIVES AND FUZZY COMPROMISE SOLUTION CONSIDERING SURFACE WATER

Objective	Unit	Objective function value of optimal solution corresponding to the objective of ...						Objective function value in case of fuzzy compromise solution
		Max. benefit	Max. calories	Max. labor	Min. investment	Max. area	Max. ranking

## Recommendations and Concluding Remarks

Five linear programming model and Fuzzy model show that we have shortage of water in three month in year which is about May, October and November. More aver we offered the above statement to improve efficiency and expand farmer's income in this area:

1. Production cultivating with high efficiency (means, use less water and have high economical product) such as cumin and saffron.
2. Use plant which needs no water in dry month or need less water then others, such as wheat, barley, cumin, saffron and etc.
3. Rising efficiency usage and irrigate with modern irrigation methods such as dropping or raining irrigation.
4. Define and specify Hirmand River's legal system.
5. Compensate damages of drought to prevent farmer's economical ability in next plant period.

6. Use parallel jobs such as Livestock, handing arts, starting or establishing frontier passage and ... with government support to expand family economical ability and decrease heavy drought effects.

### **Abstract**

Economic and social development in developing countries are dependent on the government's ability to make enough revenue for providing necessary programs- service programs like health, training, transportation and communication. Therefore, the relationship between government revenue and expenditure in every country is a scale for measuring the level of development and growth. Data of 1970-2002 was used. At first we use unrestricted error correction model (UECM) that has been suggested by Pesaran et al for testing cointegration between government revenue and expenditure, then we use inter-temporal budget constrain (IBC) for fiscal sustainability. The results show that government revenue is changed to government expenditure quickly, but it takes long for government expenditure to change to government revenue, although there is no fiscal sustainability in Iran.

### **Introduction**

Monetary and fiscal policies have direct and indirect important roles in government actions for spreading economic activities in unemployment periods, capacity surplus and decreasing activities when there is inflation and excess demand. When there is no regular and internal supervised monetary market in developing countries, these countries have to equip internal resources with fiscal policies. Economic and social development in developing countries are dependent on the government's ability to make enough revenue for providing necessary programs- service programs like health, training, transportation and communication.

In a developing country's economy, the government ownership share and government control are so high. Therefore, the correct use of internal saving and external resources for the projects of governmental investment and mobilizing and leading rare resources to domains that help more to reach long-run economic goals, preparing the

limited resources to ways that provide the more necessary constructional changes for a sustainable and symmetrical economic growth (17) and planning and investing on cases that they have are causes increase in productivity and producing income for government in developing countries economic are very necessary.

A lot of studies have been done on fiscal policies on the government roles for expending revenue to reaching the economic growth and development. Narayan (12) investigated evidence for cointegration and causality between government revenue and expenditure for nine Asian countries. Gupta and Verhoeven (10) assessed the efficiency of government expenditure on education and health in 37 countries in Africa in 1984-1995 with free disposal hull method (FDH). Garscia and Henin (8) have used a divariated VECM representation for the joint government revenue- government expenditure dynamics for five the main OECD countries. Santos Bravo and Silvestre (16) have tested sustainability performing an empirical analysis of co integration between public expenditure and revenue as ratios of GDP in 11 European Union members. Goyal and Khudrakam and Ray (9) have assessed the Indian fiscal trends in terms of inter-temporal budget constraint (IBC) for the central and state government separately. Abu-Bader and Abu-Bader (2) investigated the causal relationship between government expenditure and economic growth in Egypt, Israel and Syria. Folster and Henrekson (7) have studied on growth effects of government expenditure and taxation in OECD. Fetres (6) investigated the effects of the government monetary and fiscal policies on agriculture's value added, investment and export Bakhtiari and Haghi (4) have focused on the effects of increase in oil revenue on agriculture sector in Iran. Bakhshodeh (3) investigated on forecasting the elimination of government's interferences from wheat market and welfare effects of wheat liberalization in Iran.

With consideration on the point that government revenue has an important role in growth and development and the way that revenue changes to expenditure is more important, this study has focused on government revenue and expenditure relationship and finance sustainability in Iran.

## **Methodology**

In this study we focus on government revenue and expenditure relationship and finance sustainability. For this aim Iran center bank data of 1970-2002 have been used. Variables were GE is the logarithmic of government expenditures to GDP ratio and GR is the logarithmic of government revenues to GDP ratio. All equations have been estimated by Microfit 4.0 Software. All variables are changed to constant of 1997.

### **Cointegration**

Our sample is relatively small (33 observations). Therefore we use the bound testing approach to cointegration as it is suitable for small sample size (13) and were explored by Pesaran et al (13) to examine the long run relationship

between government revenue and expenditure. They suggested Unrestricted Error Correction Model (UECM) for testing co-integration between variables, and they showed this method is suitable for small sample. Pesaran et al suggested their method based on Auto Regressive Distributed Lag (ARDL), and separated it to section:

1- Co-integration test 2-estimate the long run coefficients. In first stage the relation between variables is tested and in the second stage the coefficients are estimated.

So ARDL model is changed to error correction model like below:

$$\Delta Y_t = \alpha_0 + \alpha_1 t + \sum_{j=1}^p \Phi_j \Delta Y_{t-j} + \sum_{j=0}^q \beta_j \Delta X_{t-j} + \Psi_0 Y_{t-1} + \sum_{i=1}^k \Psi_i X_{i,t-1} + \varepsilon_t \quad (1)$$

K is the number of variables.  $\Delta$  Is the difference operator,  $\alpha_0$  is drift,  $\alpha_1$  is the time's coefficient,  $\Phi$  and  $\beta$  are long run multipliers. The cointegration test hypothesis is:

$$H_0 : \Psi_i = 0 \quad i=0, 1, \dots, k$$

If the null hypotheses is rejected, then there is long-run relation between variables, but is accepted there is not any long-run relationship between variables. The F-test which has a non- standard distribution depends upon: 1- the non-stationary properties of the data 2- the number of independent variables and 3- the sample size. The critical values are available in Pesaran and Pesaran (15) for 500 observations and Pesaran et al (14) for 1000 observations, but our sample is small, then we use the critical values that estimated by Narayan (12).

Two sets of critical values are generated. One set refers to I(1) series and the other for I(0) series. here, the critical values for I(1) series are referred to as the upper bound critical values while the critical values for I(0) series are referred to as the lower bound critical values. When the calculated F-statistic is greater than the upper bound critical values the null hypotheses of “no co-integration” is rejected, and when the calculated F-statistic is lower than the lower bound critical values the null hypotheses of “no cointegration” is accepted (1). The UECM method has several advantages over alternatives such as Engle-Gerenger and Johanson- Joselios methods, like below:

- 1- The variables can be I(0) or I(1).
- 2- It is really more suitable than another method for small sample size.
- 3- It can distinguish dependent and independent variables. For instance, by taking variable  $GR_t$  as a dependent variable and  $GE_t$  as an independent variable, if one finds that based on the bounds F-test there is cointegration between the variables then it implies that  $GR_t$  is the dependent variable in this relationship (12).

In this study, while the government revenue is independent variable, model is like below:

$$\Delta GR_t = \beta_0 + \Psi_{GR} GR_{t-1} + \Psi_{GE} GE_{t-1} + \sum_{i=1}^p \theta_i \Delta GR_{t-i} + \sum_{j=0}^q \phi_j \Delta GE_{t-j} + \varepsilon_t \quad (2)$$

That GE and GR are logarithmic government expenditure and revenue to GDP ratio,  $\beta_0$  is drift,  $\Psi_{GE}$  and  $\Psi_{GR}$  are long-run coefficients,  $\theta_i$  and  $\phi_j$  are short-run coefficients.

But when government expenditure is the independent variable, the model becomes like below:

$$\Delta GE_t = \beta'_0 + \Psi'_{GE} GE_{t-1} + \Psi'_{GR} GR_{t-1} + \sum_{i=0}^p \theta'_i \Delta GR_{t-i} + \sum_{j=1}^q \phi'_j \Delta GE_{t-j} + \varepsilon'_t \quad (3)$$

$\beta'_0$  Is drift,  $\Psi'_{GE}$  and  $\Psi'_{GR}$  are long-run coefficients,  $\theta'_i$  and  $\phi'_j$  are short-run coefficients.

We don't use trend in this study because variables don't have a regular trend, and lags have been chosen by AIC. That has been selected p=2.

#### **Granger Causality**

There are a lot of methods for testing the causality between variables like Granger, Hisao and error correction methods. If variables aren't cointegrated, the Granger or Hisao are suitable. Granger proved when variables are cointegrated we can't use Granger or Hisao methods because they don't use error correction terms. Thus he formulated the causality equations in error correction models way (11). In this study we use the error correction models to distinguish the causality of variables.

#### **Finance Sustainability**

The term fiscal or debt sustainability perhaps implies a set of fiscal policies that could be continued unaltered without jeopardizing the economic policy objectives such as economic growth, price stability and external balance.

Traditionally, the ability of the government to maintain its fiscal policies are measured in terms of  $\frac{debt}{GDP}$  doesn't

grow to explosive proportions over time. There are, however, alternative approaches to test the sustainability of debt. One approach is the steady-state Domar condition in which rate of growth of income must exceed the interest rate on public debt, subject to the condition that primary balance is either positive or zero. Measuring the sustainability of deficit from the Domar condition could be naive; after all, a  $\frac{debt}{GDP}$  might be stable at 200%.

However, this may be quite unsustainable. In order to get rid of such incredible outcomes, the standard approach in the literature is measuring inter-temporal budget constrain (IBC). In IBC approach, a sustainable debt would require

(4)

not only that  $\frac{debt}{GDP}$  is stable in the future, but it must be ensured that the outstanding debt is finally repaid. Thus

the gap between government revenue and expenditure is very important. If there is no cointegration between revenue and expenditure, the result is lack of sustainability (9). IBC approach:

$$\Delta B_t = G_t - R_t - r_t B_t$$

$B_t$  is the government debt at the end of t,  $G_t$  is government expenditure interest payments,  $R_t$  is government revenue and  $r_t$  is the rate of interest payable on outstanding government debt at t. government is always faced with a similar constraint for period t+1,t+2,..., so expressing (4) as a ratio of GDP

$$\Delta b_t = e_t - T_t + \lambda b_{t-1} \quad (5)$$

Where

$$\lambda_t = \frac{(r_t - g_t)}{(1 + g_t)} \quad e_t = \frac{G_t}{Y_t} \quad \text{And} \quad T_t = \frac{R_t}{Y_t}$$

With this assume that  $\lambda_t$  is stationary around a mean  $\lambda_0$ , so equation 5 is changed to:

$$\Delta b_t = e'_t - T_t + \lambda b_{t-1} \quad (6)$$

Where

$$e'_t = e_t + (\lambda_t - \lambda_0)b_{t-1}$$

Iterating equation (6) forward yields:

$$b_t = \sum_{j=0}^{\infty} \gamma^{j+1} (T_{t+j} - e'_{t+j}) + \lim_{j \rightarrow \infty} \gamma^{j+1} b_{t+j+1} \quad (7)$$

Where  $\gamma^{j+1} = (1 + \lambda)^{-(j+1)}$

Equation below from taking expectations in (7) is resulted:

$$b_t = E_t \sum_{j=0}^{\infty} \gamma^{j+1} (T_{t+j} - e'_{t+j})$$

Eq. (5) is equal with transversal condition,  $E_t \lim_{j \rightarrow \infty} \gamma^{j+1} b_{t+j+1} = 0$ . Economic interpretation of the above condition is that for debt process to be sustainable, current debt must be equal to expected present value of future primary surplus.

So from eq. (7) we have  $\Delta b_t = e_t^R - T_t = \sum_{j=0}^{\infty} \gamma^{j+1} (\Delta T_{t+j} - \Delta e'_{t+j}) + \lim_{j \rightarrow \infty} \gamma^{j+1} b_{t+j+1}$  where

$e_t^R = e_t + \lambda b_{t-1}$  that it is government expenditure plus interest payments and  $E_t \lim_{j \rightarrow \infty} \gamma^{j+1} \Delta b_{t+j+1} = 0$ . From eq.

(7) we have for debt process to be sustainable, the current debt must be equal to the expected present value of future primary surpluses. So  $e_t^R$  and  $T_t$  can't deviate from each other over time. If  $e_t^R$  and  $T_t$  are I(1) so we must test

$\Delta b_t$  stationary.

So

$$T_t = \alpha + \beta e_t^R + \varepsilon_t \quad (9)$$

If  $e_t^R$  and  $T_t$  are I(1), but they are co-integrate, the null hypothesis for sustainability is  $\beta = 1$ . If we impose eq. (9)

to (4) we have

$$\Delta b_{t+1} = (1 - \beta) e_t^R - \alpha - \varepsilon_t \quad (10)$$

If  $e_t^R$  is I(1) and  $0 < \beta < 1$ , we can conclude that  $\Delta b_t$  is I(0), and budget deficit is sustainable weakly. If  $\beta = 1$  and government revenue and expenditure are co-integrate,  $\varepsilon_t$  is I(0). Then  $\Delta b_t$  is I(0) and budget deficit is sustainable strongly. If  $\varepsilon_t$  is not I(0) and  $\beta = 1$ , then sustainability is weak. When public debt is weakly sustainable, implying that the speed at which the inter-temporal borrowing constraint is satisfied is quite slow and is likely to result in higher growth rate of debt (16).

### Measuring the Degree of Sustainability

At first the cointegration between  $e_t^R$  and  $T_t$  must be checked. If two variables are I(1) for measuring sustainability, variables must be checked like eq.15. If variable are not co-integrate, then budget deficit is not sustainable. But when variables are co-integrate, we must test null hypothesis  $H_0 : \beta = 0$  opposite to  $H_1 : \beta < 1$ . If null hypothesis is accepted, then sustainability is strong, but if it rejects sustainability is weak. Table 1 shows the stage of sustainability:

TABLE 1: CO-INTEGRATION ANALYSIS AND DEGREE OF SUSTAINABILITY

$\beta$	Co- integration	$\Delta b_t$	Sustainability
1	Yes	I(0)	Strong
$0 < \beta < 1$	Yes	I(0)	Weak
----	No	I(1)	Unsustainable

Reference: Goyal et al (10)

## Results

### Unit Root Test

Augmented Dickey – Fuller test (ADF) was used for stationary test of variables. Variables are non-stationary in level but their differences are stationary. Table (2) shows this test results.

TABLE 2: RESULTS OF ADF TEST

GR		DGR		GE		DGE	
ADF	CV	ADF	CV	ADF	CV	ADF	CV
-2.23	-2.9706	-2.24	-2.9706	-5.31*	-2.975	-5.86*	-2.975

\*at 5% significance level

### Estimate of Unrestricted Error Correction Model

The cointegration test in this study is based on UECM approach. F-statistic for our equations is compared with the critical values that have been supposed by Narayan (12) for 33 observations. When government revenue is the

independent variable, F is 5.8, while if it is independent variable, F is 53.3. They are bigger than the critical value in 5% and 1% level. Table 3 shows the critical values that have been suggested by Narayan (12).

TABLE 3: BOUND F-TEST FOR CO-INTEGRATION

N	%1		%5		%10	
	I(0)	I(1)	I(0)	I(1)	I(0)	I(1)
33	5.7630	6.48	3.957	4.53	3.233	3.757

Reference: Narayan (12)

### Long Run Coefficient Estimation

Coefficients have been estimated by autoregressive distributed lag (ARDL). The results on long run coefficients are reported in table 4. We find that an increase in government expenditure has a statistically significant positive effect on government revenue and vice versa.

TABLE 4: LONG-RUN COEFFICIENT

Dependent variable	Long-run coefficient	t- statistics
GR	0.9577	5.8*
GE	1.42	5.38*

\* at 1% significance level

### Granger Causality Test Results

We use error correction model for causality, because GR and GE are co-integrate. ECM (-1) in table 5 is residual of long-run equation when GE is explanatory variable, and ECM (-1) in table 6 is residual of long-run equation when GR is explanatory variable. Table 5 shows GR is long-run and short-run causality. Speed of adjustment to equilibrium is significant in 1% level. Table 6 shows GE is long-run causality for government revenue but significant isn't high. On the other hand it is not true for short-run, because  $\Delta GE$  coefficient isn't significant. Speed of adjustment to equilibrium is slow, thus government expenditure in the long run changes to government revenue.

TABLE 5: GRANGER CAUSALITY TEST RESULTS FOR VARIABLE GE

	$\Delta$ GR [t]	ECM(-1) [t]
$\Delta$ GE	0.73      1.71**	-0.93      -5.1*

\* at 1% significance level

\*\* at 5% significance level

TABLE 6: GRANGER CAUSALITY TEST RESULTS FOR VARIABLE GR

	$\Delta$ GE [t]	ECM(-1) [t]
$\Delta$ GR	0.803      1.48 <sup>ns</sup>	-0.184      1.84*

\* at 5% significance level

<sup>ns</sup> not significant

### Sustainability of Finance

For testing if budget deficit is sustainable or not, at first, the cointegration between variable must be tested. In this study variables are I(1), but they are co-integrating, thus with the information in table 4 the null hypothesis  $H_0 : \beta = 0$  must be tested opposite of  $H_1 : \beta \neq 0$ . In the first row of table 4 when GR is dependent

variable, t-statistic is 5.8 and so is significant. So we test null hypothesis  $H_0 : \beta = 1$  opposite of  $H_1 : \beta < 1$ . So we

have:

$$t = \frac{\beta - 1}{s(\beta)}$$

T-statistic according to equation above is 0.26, that we can reject the null hypothesis; so  $\beta$  is between zero and one. Budget deficit in Iran has weak sustainability and deficit in one year causes the deficit for next years. Continual growth of debt could increase interest rate, which might eventually create problems for marketing or rolling over of public debt in future. In other words, while fiscal stance of government is sustainable at least in the short-run, for long-run sustainability government needs to other its fiscal policies to prevent any adverse repressions (9).

## Conclusions

The main aim of this study has been exploring on government revenue and expenditure relationship and the degree of fiscal sustainability for 1970-2002. To test the cointegration between variables, we use the UECM. The results of this model showed that variables are co-integrate in 5% significant level. After that the Granger causality was tested. The results showed that government revenue is changed so fast to government expenditure, while it takes a long time for government expenditure to change to government revenue. On the other hand fiscal sustainability in Iran is weak, thus persevering budget deficit becomes a cause of increase in interest rates, has negative effect on market mechanism, and becomes the budget deficit in the next periods. With these results, it is suggested that the government revenue must expend in subtraction sectors, because investing in subtractions causes increase in productivity and increase in government revenue. Government should decrease expenditure in consumption matters, because they don't have revenue for government. Decrease in government incumbency and decrease in government volume can decrease from massive government expenditure in matters. The results showed that there is no fiscal sustainability in Iran. Therefore, we suggest that the experts must consider to the effect of fiscal policy's results for various matters for a long period, not just for one year, because the budget deficit in one year becomes budget deficit in next years. To reach on the sustainable fiscal, fiscal policies must enact in that manner, which budget deficit in one year doesn't become the budget deficit in the next years and revenue must grow faster than expenditure, because continual debt for many years becomes cause for increasing interest rates and problems for market mechanism.

### **Abstract**

In developing countries, governments are administrators of investment in various economic sectors. In fact the share of government in economic system is very bigger than the private sector. Government policies have very deep influence on investment in the various economic sectors. With this point the study explores the role of the government monetary and fiscal policies in decrease or increase of economic duality in Iran. For this aim data of 1973-2003 was used. The study model was seemingly Unrelated Regressions (SUR). The results showed that the government monetary and fiscal policies are not the significant difference in investment between agriculture, industry and service sectors. Therefore, the government monetary and fiscal policies aren't causes of the sectoral duality, On the other hand we couldn't find the significant difference between investment in industry and service sectors with investment in agricultural sector. Thus, the government policies aren't causes of increasing in duality between rural and urban areas.

### **Introduction**

In many developing countries, there is a modern commercial industrial sector inside the traditional agriculture that produces minimum livelihood that creates the dual economic. The result of duality is asymmetry in organization of production in various sectors. In fact differences in organization and production between modern and traditional sectors are one of the most important characteristics in developing countries. If we want to find the development process relations, we should find the economic duality that there are between modern and traditional sectors, and then we should estimate the amount of fundamental changes. Duality is divided into various kinds. One of them is economic duality. Economic duality defines that there are two sectors, one of them is leader with rapid changes and technology intensive and capital intensive and this sector produces income, on the other hand the traditional sector is

labor intensive with limited changes (8). One of the important theories that were introduced about duality is Lewis theory (1954). He divided economic into two sectors, one of them is modern, and another is traditional. He said that the main wheel of development is industry, and agriculture is not important in the developing process. After Lewis, Fie-Ranis theory propounded, their theory was more perfect than Lewis theory. They emphasized that economic growth is related to agriculture sector growth. After Fie-Ranis theory, Gorgenson theory propounded. In his theory, he assumed that there might have been existence labor surplus in developing countries but marginal product of labor is positive, not zero. This is the main point of his theory. He said the most important point in the development way is technology coefficient and labor growth rate, which is related to population growth rate. He emphasized for having optimum growth, technology must be developed (5).

With this introduction we can say that the level of investment in agriculture, industry and service is a good index for recognition of the amount of duality. Nowadays a lot of study has been done about duality. Bourguignon and Morrisson (1998) suggest in many countries increase in the level of productivity in traditional agriculture may be the most effective way to reduce the inequality and poverty. Chaudhuri (2005) made an attempt to provide a possible answer to the problem of urban unemployment aggravates as the urban sector expands both in terms of output and development following an inflow of foreign capital in a two sector mobile capital HT<sup>1</sup> framework. He suggested that an inflow of foreign capital is likely to be welfare improving and may not aggravate the problem of urban unemployment in the given setup. Roy (2005) focused on the dualism that exists within the industrial sector. He developed a model of informal sector incorporating its linkage with the formal sector. The products of the two sectors are imperfect substitutes as products of informal firms are deemed to be of inferior quality compared to the formal sector product. Also the formal sector producer is the dominant producer whereas the informal producers constitute a competitive fringe. The article results showed, a policy for helping the domestic producers through a cost subsidy may not necessarily result into an increase in income for domestic producers and therefore become ineffective. The subsidies can result into positive benefits only if favorable market condition exists. Motonishi (2005) showed some limited evidence that the variable related to sectoral shifts in the economy, i.e., the agriculture - non agriculture disparity and household income, played a significant role in increasing income inequality with somewhat smaller magnitude, financial development had an effect in the opposite direction, which roughly cancels out the effect of education level disparities. Gindling and Terrell (2005) studied on wage gap between formal and informal sectors have been persistent in Costa Rica. They tested whether increases in minimum wages raise actual wages. They found they not only raise wages in large urban and rural enterprises(traditionally referred to as formal), but they also raise wages of workers covered by minimum wage legislation in what are traditionally regarded as informal sectors where the legislation is often considered not be enforced: small urban and small rural enterprises.

Eslemi (1993) determined the rural regions development degree in Iran. His study showed that conditions in all rural regions were better in 1986 than 1976. Although the rural regions have developed but regional duality increased.

## Methodology

Investment in various sectors is an important factor in society growth and development. Whatever the gap of investment between various sectors become bigger, duality increases. In this way governments have very important role for making good decision to eliminate the duality. Thus, our aim in this study is that if government monetary and fiscal policies have effects on economical and social duality. we used Iran center bank data for 1973-2003. To catch the goals of this study, investment functions in agriculture, industry and service was estimated with Seemingly Unrelated Regressions. The reason for usage of this system is that residuals in these three sectors are related with each other and (SUR) model is very suitable to estimate these related equations. In this model the coefficient for M equations are estimated. Error terms have whole classical linear regression model characters, and error terms of various equations are related with each other. These M equations create Seemingly Unrelated Regressions. Assuming there are T observations, that they are equal for each equation, although the explained variables and constant could be different. This system could show with below matrix:

$$Y_m = X_m \beta_m + u_m \quad \text{and}$$

$$E(u_m) = 0, \quad E(u_m u'_m) = \delta_m I_t$$

And error terms correlation in various equations is  $E(u_m u'_m) = \delta_{mp} I_t$ . and  $\delta_{mp}$  is error term covariance in equation m with equation p. and we can assume that it is constant for all observation Zellner (1962) offered below method for a consistence estimation of residuals in var-covar matrix. Each equation are estimated by OLS and after that residuals are calculated, then  $\delta_{mp}$  estimator is:

$$\delta_{mp} = \frac{1}{T - K_m} \sum_{t=1}^T \hat{u}_{mt} \hat{u}_{pt} \quad m, p=1,2,\dots,m$$

That  $K_m$  is numbers of parameters (11). With this short explanation our equations in this study that have been estimated with SUR model are:

$$I_A = a_{10}T + a_{11}I_A(-1) + a_{12}C_A + a_{13}Oil + a_{14}E_G + a_{15}Liq + \varepsilon_1 \quad (1)$$

(2)

$$I_I = a_{20}T + a_{21}I_I(-1) + a_{22}C_I + a_{23}Oil + a_{24}E_G + a_{25}Liq + \varepsilon_2 \quad (3)$$

$$I_S = a_{30}T + a_{31}I_S(-1) + a_{32}C_S + a_{33}Oil + a_{34}E_G + a_{35}Liq + \varepsilon_3$$

In these equations  $I_A$ ,  $I_I$  and  $I_S$  are logarithmic investment in agriculture, industry and service sectors orderly.  $I_A(-1)$ ,  $I_I(-1)$ ,  $I_S(-1)$  are logarithmic investment in agriculture, industry and service sectors with one order orderly.  $C_A$ ,  $C_I$ ,  $C_S$  are orderly logarithmic credits in agriculture, industry and service sectors,  $T$  is time trend (it is an index for technology),  $Oil$  is the logarithmic oil revenues,  $E_G$  is logarithmic government consumption expenditure (it is an index for fiscal policy),  $Liq$  is logarithmic of liquidity (it is an index of monetary policy) and  $\varepsilon_1, \varepsilon_2, \varepsilon_3$  are residuals of equations. All variables changed to constant of 76. These equations have been estimated by Microfit 4.0 Software.

## Results

### Unit Root Test

Augmented Dickey – Fuller test (ADF) was used for stationary test of variables. Variables were non-stationary in level but their differences were stationary. Table (1) shows the test results.

TABLE 1: RESULT OF ADF TEST

Variable	DF	CV	Variable	DF	CV
$I_A$	-1.48	-2.96	$DI_A$	-7.18*	-2.97
$C_A$	-1.196	-2.96	$DC_A$	-6.36*	-2.97
$I_I$	-1.57	-2.96	$DI_I$	-3.8*	-2.97
$C_I$	-0.42	-2.96	$DC_I$	-4.456*	-2.97
$I_S$	-1.37	-2.96	$DI_S$	-4.328*	-2.97
$C_S$	-1.32	-2.96	$DC_S$	-5.247*	-2.97
$Oil$	-2.438	-2.96	$DOil$	-4.328*	-2.97
$E_G$	-1.394	-2.96	$DE_G$	-5.376*	-2.97
$Liq$	-0.909	-2.96	$DLiq$	-3.56*	-2.97

\*at 1% significance level

After that co-integration between variables in equations (1), (2) and (3) were explored. If existence of co-integration between variables in each equation isn't true, there wouldn't be the long run relation between variables

in equations. So, Engle-Grenger method for co-integration was used. The residuals of each equation were stationary. Therefore there are long run relations between variables in each equation. Table (2) shows these results.

TABLE 2: RESULT OF CO-INTEGRATION TEST FOR EACH EQUATION

Residual	ADF	CV
Equation(1)	-4.98*	-2.97
Equation(2)	-3.75*	-2.97
Equation(3)	-3.84*	-2.97

\*at 1% significance level

Table (2) shows that results of each equations are state in 5% level. Therefore there is a long run relationship between variables in each equation.

#### Estimation

Table (3) shows the Seemingly Unrelated Regressions (SUR) results. For the variables are logarithmic therefore coefficient of variables are elasticity of investment in each equation.

TABLE 3: RESULT OF ESTIMATION

equation	variable	coefficient	t statistic
1	T	0.486*10 <sup>-3</sup>	0.03

\*at 1% significance level

$R^2$  in equations (1), (2) and (3) orderly are 0.6, 0.7 and 0.7. Table (3) shows that credits which are given to agricultural sector and oil revenues have positive affects on investment in agriculture. Previous investments in agriculture and government consumption expenditures effects are positive but not significant. On the other hand liquidity can decrease the amount of investment in agriculture. Table (3) shows one percent increase in liquidity can increase 3.187 percent, investment in agriculture. Table shows for industrial sector, that amount of previous investment and increase in oil revenues have positive and significant effects on industrial investment. Amount of credits that are given to industrial sector and government consumption expenditures have positive but not significant. Liquidity has negative effect on industrial investment, and it decreases investment on industry. In table (3) for one percent increase in liquidity, investment in industry decrease to 1.72 percent, in table (3) we can find all variables have positive effects on service sector investment and the effect of pervious investment on present investment is really significant. Result shows that increase in liquidity causes increase in service sector investment opposite of industrial and agricultural sectors. 1 percent increases in liquidity causes 0.57 percent increase in service investment. With the information of table (3) however effect of government consumption expenditure in investment in 3 sectors isn't significant, but elasticity investment of industry is bigger than elasticity investment in two another sector, with one percent increase in government consumption expenditure, investment in industry, agriculture and service sectors are orderly 0.56, 0.3 and 0.2, but this difference of effect on these 3 sectors is not significant. Monetary policies aren't causes increase in duality. One percent increase in liquidity causes 3.2, 1.7 decreases orderly in agriculture and industrial sectors investment, but it causes 0.57 percent increase in service sector investment. These differences aren't significant.

For our aim, that how much monetary and fiscal policies cause increase in regional duality, we used t-test. Since agriculture activities are being done in villages and industrial and services activities are being done in cities t – test for catching this aim was design like below, which  $H_0$  hypothesis for government fiscal policies is:

$$H_0: a_{14}=a_{24}+a_{34}$$

That  $a_{14}$ ,  $a_{24}$  and  $a_{34}$  are government consumption expenditures coefficients in equations (1), (2) and (3) orderly. If the government consumption expenditures coefficient for agricultural sector wouldn't had significant difference from the sum of this variable coefficient in 2 another sectors then this result is true that government fiscal policies are not causes of increasing in duality between rural and urban.

Also  $H_0$  hypothesis for government monetary policies is:

$$H_0: a_{15}=a_{25}+a_{35}$$

That  $a_{15}$ ,  $a_{25}$  and  $a_{35}$  are liquidity coefficients in equations (1), (2) and (3) orderly. If the liquidity coefficient for agricultural sector wouldn't had significant difference from the sum of this variable coefficient in 2 another sectors then this result is true that government monetary policies are not causes of increasing in duality between

rural and urban areas. The calculated  $t$  with  $H_0$  hypothesis for government fiscal policies becomes  $t=0.47$  and with  $H_0$  hypothesis for government monetary policies becomes  $t=0.26$ .  $t$  test with these hypotheses aren't significant, then we can understand that government monetary and fiscal policies aren't causes of increasing in duality between rural and urban areas in Iran.

## Conclusions

With these results that government monetary and fiscal policies aren't causes of increasing duality in Iran, we can conclude if government wants to eliminate the sectoral and regional duality, should continue present monetary and fiscal policies.

# The Kaesong Industrial Complex: The Last Exit to North Korea's Development

Jinhwan Oh, jo95@cornell.edu  
Cornell University, USA

## Abstract

**This paper applies the MSV Model to test whether a higher level of equilibrium (industrialization) can be reached in North Korea. Based on this model, the Kaesong Industrial Complex (KIC), in which some South Korean firms have just started doing business using North Korean labor, will be the main focus of this paper. It will be argued that successful launch of the KIC will bring a spillover effect to the entire country, leading to industrialization and ending its dependence on nuclear weapons as a bargaining chip.**

## Introduction

The vicious circle of poverty has been one of the core issues in Development Economics. Rosenstein – Rodan (RR) (1945) and Nurkse (1953) were early pioneers in this topic. According to their ideas, although all firms will become better off by entering markets together, an individual firm may not gain profit by entering an economy alone. Nurkse added that this kind of trap is often the cause of the persistence of poverty (Basu 2000, p.17).

More than thirty years later, Murphy, Shleifer, and Vishny (MSV)(1989) elaborated their ideas by constructing a model. Using multiplicity of equilibria, MSV tried to explain the concepts of *poverty trap*, *industrialization*, and *big push*. In a less developed economy, they assumed  $k$  sectors producing different commodities, and within each sector, there is a *fringe* firm and a *modern* (or, *industrialized*) firm. In this economy, if only one individual modern firm enters a market by itself, the profit of the firm is negative. Therefore, if others do not enter, the single firm's best response is also *not entering*. Since the Nash Equilibrium is, by definition, a combination of best responses, we have an equilibrium of *everybody not entering*. In this equilibrium, no industrialization is made and the economy is trapped in poverty. Suppose now that all modern firms decide to enter. Then, they will receive positive profit. Under this situation, each firm's best response is *entering* and in this equilibrium, the economy achieves industrialization.

This paper will use the MSV model as the main tool for describing the current poverty trap of North Korea and to suggest a possible solution to get out of the trap and move toward a higher level of equilibrium. Unlike most other researches, this paper will also discuss *why and how the country fell into such a trap* because answering this question will make it easier to find a way to get out of it.

The suggested solution in this paper for North Korea's *big push* is the economic cooperation with the South. The Kaesong Industrial Complex (KIC)<sup>1</sup>, in which some South Korean firms have just started doing business using North Korean labor, will be the main focus of this paper. From the perspective of the MSV Model, South Korean firms interested in the KIC will be assumed to be monopolists deciding whether or not enter markets. It will be argued in this paper, both theoretically and empirically, that the MSV Model's prediction is such that the KIC is the key for North Korea to reach a higher level of equilibrium. Moreover, the successful launch of the KIC project will be a stepping stone for North Korea to open its door to the outer world. Finally, the successful gain from the KIC project will bring a spillover effect to the entire country, leading to industrialization and ending its dependence on nuclear weapons as a bargaining chip.

## Poverty trap and Multiple Equilibria: The MSV Model

The idea of Nurkse and Rosenstein-Rodan was formalized in the MSV Model. The MSV Model says that an economy is trapped in poverty where no sector has an incentive to industrialize but all sectors earn positive profits if all sectors become industrialized (Basu 2000, p.23). Their model covers fundamental ideas of multiple equilibria (one is the vicious circle of poverty trap and the other is industrialization) and big push from the lower equilibrium to the upper one. From the general equilibrium approach, this paper reinterprets a simplified version of their model used by Basu (Basu 2000, pp. 23-33).

### Background

First, their model starts with following assumptions:

- (A.1.) There are  $k$  sectors in a less developed country.
- (A.2.) Each sector produces a distinct commodity.
- (A.3.) There is a representative consumer (or, many consumers with an identical preference<sup>2</sup>) with a utility function  $u(x) = x_1x_2x_3\dots x_k$  and income  $y$ .
- (A.4.)  $L$  units of labor are supplied by the consumer side, and  $l_j$  is the number of laborers employed in sector  $j$  for all  $j=1, 2, \dots, k$ , where  $l_1+l_2+\dots+l_k=L$
- (A.5.) Each sector has one fringe firm and one (potential) monopolist firm.
- (A.6.) Monopolist firms are industrialized in the sense that for a given input of labor, monopolist firms produce more output than the fringe firms do.
- (A.7.) Fringe firms have the same wage  $w$  across sectors, and monopolist firms,  $\lambda$ , across sectors. Also, from (A.6.), work loads are heavier in monopolist firms, resulting higher  $\lambda$  than  $w$ . In later analysis,  $w$  and  $\lambda$  will be normalized to 1 and  $1+v$ , respectively ( $v>0$ ).
- (A.8.) Goods are homogeneous. (A.6.) does *not* mean that monopolist firms produce a higher quality of goods than fringe firms do. Therefore, consumers will choose cheaper goods regardless of brand.
- (A.9.) Production functions of both firms are all linear; in sector  $j$ ,  $x_j=f(l_j) = l_j$  (45 degree line and no sunk cost) for the fringe firm, and  $x_j=g(l_j)=\alpha(l_j-F)$  ( $\alpha>1$  and  $F$  is a sunk cost) for the monopolist firm.
- (A.10.)  $F$  in the monopolist firm is the same across sectors. In 4.3., where this model is empirically applied to North Korea, this assumption will be released. Instead,  $F_j$  (each firm's sunk cost) will be used.
- (A.11.) While fringe firms freely enter and exit the economy with zero economic profit, monopolist firms enter the market only when they gain positive profit. Out of  $k$  sectors in total, monopolist firms enter the market in  $n$  sectors.

**General Equilibrium**

Based on this background, a general equilibrium approach can be set up as following.

1) Consumers' Utility Maximization Problem (UMP)

$$\begin{aligned} \max x_1 x_2 x_3 \dots x_k & \quad (P) \\ \text{s.t. } p_1 x_1 + \dots + p_k x_k & \leq y \end{aligned}$$

By solving for (P), we get

$$\{x_j^*\}_{demand} = \frac{y}{kp_j} \text{ for } j=1, \dots, k$$

2) Producers' Profit Maximization Problem (PMP)

For  $j=1, \dots, k$ ,

$$\pi^{fringe} = \max (p_j x_j - w l_j) = p_j \{x_j^*\}_{supply} - w \{l_j^*\}_{demand} \text{ where } x_j = l_j$$

$$\pi^{monopolist} = \max (p_j(x_j) x_j - \lambda l_j) = p_j(x_j^{*s}) \{x_j^*\}_{supply} - \lambda \{l_j^*\}_{demand} \text{ where } x_j = \alpha(l_j - F)$$

3) A competitive equilibrium in this economy is a pair of  $(p_j; x_j, l_j)$  for  $j=1, \dots, k$  such that

i)  $\{x_j^*\}_{demand}$  solves UMP    ii)  $\{x_j^*\}_{supply}$  solves PMP

iii) There are equilibrium prices  $p_j^*$  and  $w^*$  (or  $\lambda^*$ ) in which goods markets and labor markets clear<sup>3</sup>.

**Fringe Firm**

We have  $\pi = p_j x_j - w l_j = (p_j - w) l_j$  for  $j=1, \dots, k$ . If  $p_j > w$ , when  $l_j$  goes up, profit goes up as well. Therefore, demand for labor keeps increasing, thus market does not clear. If  $p_j < w$ , the optimal demand for labor is 0, so there is no incentive to produce. The only meaningful case is when  $p_j = w$  with zero profit. Actually, the technology is assumed to be linear, which is homogeneous of degree 1. Therefore, it is natural to say that profit is zero.

Since  $x_j = l_j$ , if  $p_j > w$ ,  $x_j = \infty$ , if  $p_j < w$ ,  $x_j = 0$ , and if  $p_j = w$ ,  $x_j \in [0, \infty]$ , deriving a step function of a supply curve. Also, from the UMP, we have a demand function of  $x_j = \frac{y}{kp_j}$ . Therefore, supply and demand curve in sector

j is given in FIG 1.

### Monopolist

We have  $\pi = p_j x_j - \lambda l_j = p_j \alpha (l_j - F) - \lambda l_j = (p_j \alpha - \lambda) l_j - p_j \alpha F$  for  $j=1, \dots, k$ . If  $p_j > w$ , then according to the homogeneity assumption of (A.8.), nobody will buy a good  $x_j$  from monopolist. In other words, a demand function that a monopolist faces is  $x_j = 0$ . If  $p_j < w$ , people will only buy goods made by monopolist firms, and a demand curve<sup>4</sup> that they face is the same as the demand curve of the (representative) consumer in this country, which is  $x_j = \frac{y}{k p_j}$ . Therefore,  $p_j = \frac{y}{k x_j} < w$ , deriving  $x_j > \frac{y}{k w}$ . Since  $x_j = \alpha (l_j - F)$ , it turns out that  $l_j > F + \frac{y}{k w \alpha}$  where the profit maximization problem is not solvable. The only meaningful case is when  $p_j = w$ . In this case,

$x_j \in [0, \frac{y}{k w}]$ . In other words,  $l_j \in [F, F + \frac{y}{k w \alpha}]$ . Here, the profit maximization problem becomes

$$\text{Max } (w\alpha - \lambda)l_j - w\alpha F \quad (\text{Q})$$

$$\text{s.t. } l_j \in [F, F + \frac{y}{k w \alpha}]$$

case (i)  $w\alpha < \lambda$

$$l_j^* = F \quad \therefore \pi = -wF < 0$$

case (ii)  $w\alpha = \lambda$

$$l_j^* \text{ indeterminated} \quad \therefore \pi \text{ indeterminated}$$

case (iii)  $w\alpha > \lambda$

$$l_j^* = F + \frac{y}{k w \alpha} \quad \therefore \pi = (w\alpha - \lambda)(F + \frac{y}{k w \alpha}) - w\alpha F = \frac{y}{k} (1 - \frac{\lambda}{w\alpha}) - \lambda F$$

Therefore, case (iii) is the only one that solves (Q). If  $w = \lambda$ , then, since  $\alpha > 1$ , case (iii) is obviously true. According to (A.7.), however,  $w$  is assumed to be smaller than  $\lambda$ , and under this assumption,  $w\alpha > \lambda$  is a necessary condition for profit maximization.

Now, let us normalize  $w$  and  $\lambda$  to 1 and  $1+v$ , respectively<sup>5</sup>. Then, from the case (iii), individual firm's

profit becomes  $\pi = \frac{y}{k} (1 - \frac{1+v}{\alpha}) - (1+v)F$ . Let  $1 - \frac{1+v}{\alpha} = b$ , then

$$\pi = \frac{by}{k} - (1+v)F \quad (1)$$

where  $b$  is assumed to be positive. According to (A.10.), number of firms entering the economy is  $n$ , so the total profit of this economy is

$$\bar{\pi} = n\left[\frac{by}{k} - (1+v)F\right] \quad (2)$$

According to (A.3.),  $y$  is the income of a representative consumer in this economy. In other words,  $y$  is the sum of profit of firms and wage income of workers. More specifically,

$$\begin{aligned} y &= \text{profit of fringe firms (0) + profit of monopolist firms } (\bar{\pi}) \\ &+ \text{wage income of workers hired in fringe firms} \\ &+ \text{wage income of workers hired in monopolist firms} \end{aligned} \quad (3)$$

Consider the number of workers in fringe firms and their wage income. <Figure 1> indicates that the equilibrium output  $x_j^*$  is  $\frac{y}{kw}$ , and when wage is normalized to 1, it is  $\frac{y}{k}$ , which is the same as  $l_j^*$ . Since monopolist firms enter  $n$  sectors, fringe firms are doing their business in  $k-n$  sectors. Therefore, total number of people working for fringe firms and their wage income (when  $w$  is 1) are  $(k-n)\frac{y}{k}$ .

The rest of workers are in monopolist firms. From (A.3.), total number of workers in this economy is  $L$ . Therefore,  $L - (k-n)\frac{y}{k}$  number of people works in monopolist firms. Since each person's wage is  $1+v$ , their wage income is  $(1+v)[L - (k-n)\frac{y}{k}]$ . Plugging all of these into (3),

$$\begin{aligned} y &= n\left[\frac{by}{k} - (1+v)F\right] + (k-n)\frac{y}{k} + (1+v)\left[L - (k-n)\frac{y}{k}\right] \\ \therefore y &= \frac{(1+v)(L - nF)k}{(1+v)k - n(v+b)} \end{aligned} \quad (4)$$

Plugging (4) into (1),

$$\pi = \frac{(1+v)[b(L - nF) - F(1+v)k + Fn(v+b)]}{v(k-n) + k - bn} \quad (5)$$

Since  $k > n$  and  $b = 1 - \frac{1+v}{\alpha} < 1$ , denominator is positive. Therefore, whether profit is positive or negative depends on the sign of  $b(L - nF) - F(1+v)k + Fn(v+b)$ . Following Basu's notation, Let  $\chi(n) = b(L - nF) - F(1+v)k + Fn(v+b)$  (Basu 2000, p.29). Then there exist  $b, L, F, v$ , and  $k$  such that  $\chi(1) < 0$  and  $\chi(k) > 0$ . Corresponding diagram is provided in FIG 2.

FIG. 2

Two points a and b can be viewed as Nash Equilibria. When other monopolists do not enter, the monopolist in sector j gains negative profit if it enters the market alone. This is true for every monopolist firm in the country. Therefore, when nobody enters the market, the Nash Equilibrium, or combination of best responses, is *not entering*. However, when others enter, the monopolist can have a positive profit, so it has an incentive to enter the market. Therefore, another Nash equilibrium is made when everybody enters the market. Being stuck in the former equilibrium is the so called *poverty trap*; small deviation from the equilibrium will cause the economy to go back to where it was. The latter equilibrium is synonymous with *industrialization*, and moving toward to the latter from the former is possible by *big push*.

## Poverty Trap in North Korea

### Current Situation

Before applying the MSV Model to North Korea's development, let us check the current situation of the country. Table 1 obviously reveals that this country fell into a poverty trap. But for a few recent years, the economy has grown negatively, and the per capita income of 2004 is less than it was 13 years ago.

TABLE 1 : NORTH KOREA'S POPULATION, GNI, AND GNI PER CAPITA

	1991	1993	1995	1997	1999	2001	2003
Population	20,495	21,123	21,543	21,810	22,082	22,253	22,522
GNI	22.9	20.5	22.3	17.7	15.8	15.7	18.4
GNI/capita	1,115	969	1,034	811	714	706	818

Unit: population(thousand people), GNI(billion dollars), GNI per capita(dollars)  
Source: Bank of Korea

At this situation, the country's state budget keeps decreasing. In spite of this situation, the regime continues to spend approximately 30 percent of its total budget (\$5.78 billion in 1997) on military expenses, which results in a smaller distribution of capital to its people (Ministry of Unification).

The energy problem is also serious. As is shown in Table 2, the decreasing production of coal and electrical power with the rapid curtailment of petroleum imports contributes greatly to the country's declining energy output.

TABLE 2 : THE ENERGY SUPPLY SITUATION IN NORTH KOREA

	Coal Production ( <i>million tons</i> )	Import of Crude Petroleum( <i>million tons</i> )	Electricity Production( <i>billion kWh</i> )
1990	33.15	2.52	27.7
1992	29.20	1.52	24.7
1994	25.40	0.91	23.1
1996	21.00	0.94	21.3
1998	18.60	0.37	17.0
2000	22.50	0.29	19.4
2002	21.90	0.44	19.0
2004	22.80	0.39	20.2

Source: Bank of Korea. Estimates on North Korea's economic indicators. Various issues (in Korean)

Moreover, the steel, cement, and chemical industries, which play a central role in the North Korean economy, all suffer greatly from the low stock of energy available. A South Korean who recently visited Pyongyang revealed in his essay that the most luxurious hotel in Pyongyang turned off most lights and stopped operation of elevators. (Oh 2001, pp. 2-3). FIG. 3 reflects this; unlike the bright night in South Korea, North Korea is completely dark.

FIG. 3: IMAGE OF NORTH KOREA AT NIGHT

Source: Global Security

### Falling into the Trap: Why?

One interesting fact is that North Korean economy was not this bad until the 1980s. Like all the postwar Communist states, North Korea undertook massive state investment in heavy industry and state infrastructure when it was independent of Japan. Also, unlike the South, land reform in North Korea by Kim Il Song regime was successful, and the country became rapidly stabilized under his control. As a result, North Korea was in a superior situation to

South Korea in 1950s and 60s; the conventional wisdom is that the North's per capita income exceeded the South's until 1970s.

However, North Korea's economy started to degenerate in the 1980s, and ultimately collapsed in the 90s.

FIG. 4 reflects this.

FIG. 4: GDP GROWTH RATE OF NORTH KOREA (UNIT: PERCENT)

Source: UNCTAD Handbook of Statistics On-line

One of the internal reasons for this lies in a variety of problems typical of centrally planned economies (CPEs), exacerbated by so called *Juche* ideology. This was first proclaimed by Kim Il Sung in 1957 as the fundamental principle of North Korea's state management emphasizing self-reliance. This ideology, however, resulted in an autarkic economy in North Korea, with an international trade share (exports and imports) of approximately 12 percent<sup>6</sup> of its total GDP, well below the 50 to 55 percent observed on South Korea (Noland 2000, p.66). This autarkic situation is very fragile to some internal shock in which supply of necessities is blocked. For example, there was a big flood in July and August 1995. As a result of the worst catastrophe ever, 5.4 million people were displaced, 330,000 hectares of agricultural land was destroyed, and 1.9 million tons of grains were lost (Noland 2000, p.175). The country's autarkic policies, coupled with its heavy-industry oriented policy causing fragile agriculture, turned the flood problem into a severe food problem.

However, the CPE and the *Juche* ideology were fundamental philosophies even when North Korea's economy was relatively successful in the 1950s and 1960s. Therefore, these internal reasons - CPE, *Juche*, and autarky - are not sufficient to explain the recent crisis. An examination of external reasons provides a stronger explanation for Korea's current state.

A big external shock was the crash of North Korea's principle benefactor, the Soviet Union, and the subsequent breakup of the Eastern Bloc. The trade volume between North Korea and Russia dropped sharply in 1991; the decline in imports from Russia was equal to 40 percent of North Korea's total imports. Aid from the Soviet Union, which explained a large portion of the North Korean budget, came to a stop in 1986. Since then,

strangely enough, North Korea even supported the Soviet Union for some years. The collapse of the former Soviet Union was a big shock to many third world countries. However, the shock was particularly disastrous to North Korea whose international trade pattern was extremely biased to communist countries, particularly to the Soviet Union. Being cut off from international markets, North Korea interacted very little with capitalist countries, for example, the U.S. With this bias, economic hardship of their partners transmitted directly into North Korea.

In an economic perspective, North Korea's steadiness until 1980s and collapse since then can be described as multiple equilibria. As is shown in FIG. 5, until the 1980s, North Korea's relatively stable economy was at point *a* where equilibrium is Walrasian in which the first welfare theorem is satisfied. However, the collapse of the former Soviet Union, combined with no diversification trade patterns and severe natural disasters of flood and famine, resulted in the movement of the equilibrium to *b* where resources are not efficiently utilized.<sup>7</sup>

FIG. 5

Using Nelson's terminology, requoted by Basu, this is a "low level equilibrium trap" (Basu, pp.17-8); it is stable in itself, meaning that small deviation from this point does not change the equilibrium. It is by the so called *big-push* that the economy can go back to the pareto-efficient equilibrium point.

## Escaping from the Trap: the Kaesong<sup>8</sup> Industrial Complex<sup>9</sup>

### Background

Investigating how and why North Korea fell into the trap gives an idea on how it can get out of it. Falling into the trap was largely due to the collapse of the former Soviet Union that had been the North's major trading partner and supporter. Therefore, finding another partner to substitute for the former Soviet Union is very important for North Korea; a successful finding will be a stepping stone for the big push. In this regard, economic cooperation with South Korea in the Kaesong Industrial Complex (KIC) is suggested as a solution.

FIG. 6

Source: Hyundai Asan

Opened in December, 2004, the KIC is a special administrative zone in North Korea being developed as a collaborative economic cooperation with South Korea. As is shown in FIG. 6 it is located only six miles north of the Korean Demilitarized Zone (DMZ) with direct road and rail access to South Korea with an hour's drive from Seoul and Incheon International Airport.

The combination of South Korean technologies and North Korean cheap labor is definitely a pareto improvement for both countries. North Korea's labor and human resources are of its high quality; it has an eleven year compulsory education system with 98% of the literacy rate and 96% of the age cohort enrolling in the primary and secondary educational system. This rate is far above the average of countries with similar income (GNI/capita: \$914 (year 2004)). The recent famine might have deteriorated 'hardware' of education environments, but in terms of 'software', its human resources are still highly available. Moreover, the fact that the two sides speak the same language and share the same culture and history makes the North Korean market more attractive.

Before the KIC, South Korean firms used to invest mostly in China or in Southeast Asia because of the geographical proximity and relatively low wage. However, since the KIC Project was launched, a large number of South Korean firms have shown great interests in entering North Korea, which is significantly closer than China or South East Asia and has significantly lower wage (\$57.5 per month on average in the KIC, which is 1/30 of South Korea). This is obviously encouraging news to many South Korean firms, so when this plan was first publicly announced, 1806 firms from various sectors applied to enter the KIC. Due to competition of land, however, 54 of them were approved to enter. However, it is expected that approximately 300 South Korean firms with 100,000 North Korean workers will participate in the region by 2007. The entire complex is planned to be complete in 2012, covering 25 square miles with 1000 firms employing 350,000 people (Hyundai Asan).

#### **Application of the MSV Model**

The KIC is a very good source that offers a possibility of applying the MSV Model to North Korea. It seems that the MSV Model is not a good tool to describe the multiple equilibria of the last Stalinist economy where there exist

very few leading monopolist firms. However, the reclusive country now has South Korean firms within its territory. Assuming these South Korean firms are monopolists, the MSV Model will be very useful.

First, it is known that 1806 companies are interested in the KIC and applied for the project. Therefore, it can be viewed that  $k$  is the number of sectors by which these 1806 firms are sorted. The maximum capacity of the KIC area is 80 million square yards, and the predicted maximum number of firms within this area is 2000 (Hyundai Asan). This paper assumes that 1806 is very similar to the maximum capacity of 2000.<sup>10</sup> Additionally,  $n$  is the number of sectors of South Korean firms that actually entered the KIC and  $L$  is the total number of workers in the  $k$  sectors.

Recall that the wage of the fringe firm is normalized to 1 and that of the monopolist firm, to  $1+v$ . Also recall that  $b = 1 - \frac{1+v}{\alpha}$ . It is reported that wage in the KIC is two times higher than the average wage in North Korea (approximately \$50<sup>11</sup> in the KIC and \$25 at average)(Ministry of Unification.). Then, these prices can be normalized to 2 and 1, respectively, regarding  $v$  as 1. From here,  $b = 1 - \frac{2}{\alpha} = \frac{\alpha - 2}{\alpha}$ . Since  $\alpha$  is greater than 1,  $b$  is smaller than 1. Also, in chapter 2.4.,  $b$  was assumed to be positive to guarantee positive profit. Graphically, function  $b$  has the following shape.

FIG. 7

$\frac{db}{d\alpha} > 0$  and  $\frac{\partial^2 b}{\partial \alpha^2} < 0$ , thus the function is diminishingly increasing. This graph suggests that  $\alpha$ , which refers to the productivity of monopolist firms, be the case that

$$\alpha > 2^{12} \quad (6)$$

The MSV model says that  $\chi(n) = b(L - nF) - F(1 + v)k + Fn(v + b)$  determines the sign of the profit of monopolist firms. Now,  $v$  is known to be 1. Rewriting  $\chi(n)$ ,

$$\chi(n) = bL - 2Fk + Fn \quad (7)$$

$\chi(n) > 0$  if  $n > \frac{2Fk - bL}{F} = 2k - \frac{bL}{F}$ . Since  $\frac{db}{d\alpha} > 0$ , an increase in  $\alpha$  results in increase in  $b$ , and resulting in decreasing in  $2k - \frac{bL}{F}$ . Therefore, the larger the  $\alpha$  is, the smaller the  $2k - \frac{bL}{F}$  becomes, requiring fewer

monopolist firms to enter the market to get positive profit. From FIG. 7, range of  $\alpha$  was such that  $\alpha > 2$ . This range can be narrowed down by considering the multiplicity of equilibrium. To get multiple equilibria and to be consistent with the MSV Model, it must be the case that  $\chi(1) = bL - 2Fk + F < 0$  and  $\chi(k) = bL - Fk > 0$ . Since  $b = \frac{\alpha - 2}{\alpha}$ ,

rewriting and solving for  $\alpha$ , we get

$$\frac{2L}{L - Fk} < \alpha < \frac{2L}{L + F - 2Fk} \quad (8)$$

Comparing (6) and (8),  $\frac{2L}{L - Fk} - 2 > 0$  if

$$L > Fk \quad (9)$$

Under condition (9), (8) is left finally as a range of  $\alpha$ . This result is achieved only knowing that  $v=1$ , not knowing other parameters including  $L$ ,  $F$ , and  $k$ . Further empirical research on these parameters, introduced in chapter 4.3, will make it possible to get an estimated value of  $\alpha$ <sup>15</sup>.

#### Empirical Approach: Idea and Limitation

Initially, 15 firms from different sectors entered the KIC in the demonstration area (*shibom danji*), followed by the entrance of another 23 firms in the main area (*bon danji*). Table 3 introduces the firms that entered the KIC, the former 15 firms come the first 15 rows, followed by the rest of the firms. Currently, all of the former 15 firms in the demonstration area and 3 firms in the main area are producing goods (Ministry of Unification). This table, however, has one big problem. The Ministry of Unification releases data on the total revenue of all the firms in the KIC, \$886.8 mil, as of Dec. 2006, but each firm's data are confidential (Ministry of Unification). Therefore, this paper provides limited empirical results, using this \$886.8 mil.

TABLE 3: COMPANIES IN THE KIC<sup>16</sup>

ID	Name	Goods & Sector	$F_j$		$l_j$	$x_j$
			$F_j^1$	$F_j^2$		
	Samduk Trading	shoes	5,393,390	117,004	1,469	n.a.

19	Millions	bag, toy	4,264,392*	n.a.	n.a.	n.a.
20	Rok Sec Garments	military uniform, sanitary clothes	1,279,318*	n.a.	n.a.	n.a.
21	Artrang	leather goods, mobile charger	6,396,588*	n.a.	n.a.	n.a.
22	Jason Group	DVD, PDP, phone	6,396,588*	n.a.	n.a.	n.a.
23	Ivory	sports wear	4,264,392*	n.a.	n.a.	n.a.
24	Sudo Corp	handkerchief, scarf	3,731,343*	n.a.	n.a.	n.a.
25	Bedding Land	bedding supplies	5,330,490*	n.a.	n.a.	n.a.

$F_j = F_j^1$  (cost of factory construction) +  $F_j^2$  (rent of land for 50 years, \$48/m<sup>2</sup>), measured by Korean won, converted into U.S. dollar (\$1=938 won, as of 11/17/06)

\*: predicted cost. These firms did not reveal actual cost for factory construction, so I used predicted cost that they submitted to Hyundai Asan. Since these costs are approximated ones, some firms have identical costs.

$l_j$  : number of workers  $x_j$  : output per month (for firm 1 and 17, the numbers are *pair of goods*)

This table is not directly applicable and needs to be modified because of the following reasons. First,  $F_j$  is measured by dollar and  $l_j$  is the number of people. To overcome this unit difference, this paper converts *number of people* into *wage income*. Since their wage of \$50 is normalized to 2, the modified result is achieved by simply multiplying  $l_j$  by 2. Secondly, while their wage of \$50 is what they receive each month,  $F_j$  is the one-time payment and firms do not pay this for the following 50 years. Therefore, another multiplication of  $l_j$  by 600 (12 months\*50 years) is required. Table 4 has the modified version of  $l_j$ , which is 1,200 times bigger than the original one. Thirdly,  $F_j$  is the actual amount of money, without normalization (\$25 = 1). Therefore, to be consistent with this paper,  $F_j$  needs to be scaled down. Table 4 reflects this; the  $F_j$  here is derived by dividing the original one by 25. Finally,  $x_j$  should also be measured in monetary terms. Since each firm's output is not revealed, this paper uses \$886.8 mil, the summation of total revenue of 18 firms that are currently producing goods in the KIC. With this information only, this paper assumes that  $x_j$  is the average value of \$886.8, scaled down by 25. Therefore,  $x_j$  is \$886.8 mil/18/25 = 1,970,000. Based on  $F_j$ ,  $l_j$ , and  $x_j$ ,  $\alpha$  can be estimated by the equation  $x_j = \alpha(l_j - F_j)$ .

TABLE 4: MODIFIED VERSION OF TABLE 3

ID	$F_j$	$l_j$	$l_j - F_j$	$\alpha$	ID	$F_j$	$l_j$	$l_j - F_j$	$\alpha$

\*: negative values of  $l_j - F_j$ , which are not meaningful from the perspective of the MSV Model.

For the firms that do not have  $F_j^2$ , only  $F_j^1$  is considered.

As long as the estimated  $\alpha$  is within the range of (8), these firms are expected to gain positive profits, and according to the MSV Model, the higher level of Nash Equilibrium will be achieved. Instead of (8), this paper uses (6) ( $\alpha > 2$ ) as a basis for checking each firm's profitability, since  $L$  and  $k$  are currently unavailable.

Table 4 says that 11 firms have  $\alpha$  that exceeds 2. According to the MSV Model, this is a positive sign for the KIC's profitability. Additionally, as is shown in FIG. 8, the total revenue in the KIC keeps increasing.

FIG. 8: TOTAL REVENUE IN THE KIC  
source: Ministry of Unification

This trend will continue given the survey for firms doing businesses in the KIC. The result of the survey, done by National Assembly Budget Office of South Korea, is summarized in Table 5.

TABLE 5: SURVEY RESULT FOR FIRMS IN THE KIC

Questions	answers	# of firms	total #
Is your business in the KIC getting more and more difficult?	Yes	1	12
	No	10	
	No change	1	
Are you gaining profits in the KIC?	Deficit	11	12
	Break-even	1	
Are you planning on expanding your business?	Yes	9	13
	No	4	

Source: National Assembly Budget Office

Most firms answered that they were having less and less difficulties in doing their businesses in the KIC, and many of them (9 out of 13) had plans to increase their investment in the near future.

Higher revenue will increase the value of  $\alpha$ . Then, with a higher value of  $\alpha$ , the prediction of the MSV Model is such that all of the entering firms will be more likely to gain positive profits, which enables achievement of the higher level of Nash Equilibrium.

#### **Spillover Effect: Another Maquiladora?**

Condition (8) in 4.2. is important because, with this condition, the corresponding Nash equilibrium predicts that every monopolist firm in  $k$  sectors will gain positive profit by entering the economy. As a result, industrialization of the Kaesong area will be made in this equilibrium.

However, under this condition, more important results can be achieved; Kaesong's industrialization may bring a spillover effect to the entire country, which is much bigger than the KIC. If the big push in the KIC is big enough to industrialize its  $k$  sectors,  $m$  sectors ( $m \gg k$ ) in the entire country may be industrialized as well. In this section, spillover effects will be viewed from three perspectives. After that, the Maquiladora Industry will be introduced as a possible blue print for the KIC.

#### **Gravity Perspective**

The Gravity Model from physics has been applied to economics, particularly to international trade, with empirically success. This model states that a country's trade and growth are positively related to the two countries' economic size, and inversely related to the distance between them. That is

$$T_{ij} = A (Y_i * Y_j / D_{ij}) \quad (10)$$

$T_{ij}$ : bilateral trade volume between country  $i$  and  $j$   $Y_i, Y_j$ : GDP of country  $i$  and  $j$ , respectively

$D_{ij}$ : Distance between country  $i$  and  $j$   $A$ : Constant of Proportionality

Let us divide North Korea into two parts - the KIC and other parts. Then, the above model can be a good source in explaining the spillover effect. GNI of North Korea is \$20.8 billion (<Table 1>, Bank of Korea), and the total value of production in the KIC is \$46 million<sup>17</sup> (Hyundai Asan). However, \$46 million is based on the current

production of 15 South Korean firms that started to produce goods in the KIC. If everything goes as planned, 2000 firms are supposed to enter there by the year 2012, and this value is expected to increase up to \$6.2 billion. Moreover, the KIC is within North Korea, making  $D_{ij}$  almost zero.

This close distance is particularly important, because the U.S. and Japan, which are the largest and the second largest economies in the world and which accounts for 30% of world's economic activities, are imposing economic sanctions against North Korea. According to the Gravity Model,  $D_{ij}$  jumps up to almost infinity, and the model is not applicable. This is a huge loss to the isolated country. However, the KIC is unaffected by these sanctions, and its industrialization is spread out to the entire country.

#### **Factor Movements**

Movement of labor as a factor of production is important. Currently, approximately 10,000 North Korean people are working in the KIC (Hyundai Asan). This number is expected to increase up to 350,000 by the year 2012. Their wage is more than twice as much as other North Koreans (\$57.5<sup>18</sup> and \$25, respectively). Assuming that the KIC workers interact with people outside, wage discrepancies will be more distinctive, a fact which may push the country toward wage equality. Moreover, the policy of North Korean authority for the KIC is becoming more and more decentralized<sup>19</sup>. By working for South Korean firms and interacting with South Korean people, they are experiencing a market economy system.

Movement of physical capital is also important. Unlike South Korea, North Korea has abundant natural resources including iron ore and coal. Also, it has a moderate oil refinery industry<sup>20</sup> whose capacity is approximately 4 million tons per year. Utilizing this capital is pareto improvement to both Koreas; South Korean firms can use the resources with lower transportation cost, and the industry in the North related to these fields will gain positive profit.

#### *Facilitation of Other Complexes (Rasin-Sonbong and Shinuiju)*

The KIC is not North Korea's first attempt of industrial complex. In 1993, North Korea undertook its first attempt in the Rajin-Sonbong area, a remote Northeastern part of the country where the borders of Korea, China and Russia meet. A subsequent project followed in Shinuiju in 2002 to absorb Chinese capital (See FIG. 9 for geographical explanation).

Unfortunately, these projects have not been successful. Low quality of infrastructure and a bad credit rating due to political insecurity drove risk-averse investors away. So far, its third attempt in Kaesong has had much better result than those previous ones. If the KIC becomes very successful, there may be incentive to invest in complexes in Rajin-Sonbong and Shinuiju as well. Ideal situation will be such that industrialization of all of three places has a spillover effect on the country from every direction.

FIG. 9: A MAP OF NORTH KOREA AND THREE INDUSTRIAL COMPLEXES

### The KIC as Another Maquiladora

Maquiladoras are the Mexican version of the KIC. A Maquiladora is a factory that imports materials and equipment and usually re-exports the assembled product to the originating country. With the end of the U.S. Bracero Program, which allowed Mexican immigrants to find temporary agricultural work in the United States (Wikipedia), the Mexican government was looking for substitute industries to absorb the unemployed Mexican laborers. As a solution, Maquiladora industries were established in 1961 in border cities of Mexico, located within 20 km of the U.S. border, Maquiladoras' achievement was initially unimpressive. Since then, however, Maquiladoras has grown rapidly. Active investment from the U.S., cheap Mexican labor, geographic proximity to the U.S., and strong support from the Mexican government are major factors of their success. Maquiladoras' achievement brought a spillover effect to Mexico, and its industrial area expanded accordingly from some border cities to the entire country

Considering Maquiladoras' success, the KIC is likely to have a bright future. North Korea's cheap labor, South Korean firms' active participation, and proximity from Seoul (1 hour drive) are very similar to the favorable conditions of Maquiladoras. Moreover, if the other two complexes in Rajin-Sonbong and Shinuiju are to be successful as well, North Korea will also attract investment from China. Then, with South Korean firms from the south and China from the north, the reclusive country may reap great benefit throughout the country.

### Conclusion & Policy Suggestion

The KIC project is expected to shift North Korea's equilibrium from the current poverty trap to an efficient Walrasian level in which industrialization is made. However, this benefit is attainable only when North Korea shows its maximum effort to preserve the KIC and when the international community is supportive of this project.

Regarding North Korea, it is suggested that the country lower its renting price of land. According to Table 3, the renting price of land for 50 years, which is \$48/m<sup>2</sup>, explains some portion of firms' fixed costs. Theoretically, lowering rent will increase the likelihood of the KIC's profitability; it is highly likely that condition (9),  $L > Fk$ , would be satisfied. It is understandable that receiving higher rent is one of North Korea's goals in opening its land to South Korean firms. However, North Korea must show its willingness to lower the rent and encourage further investment from the South, which will bring higher profit to the North in the long run. In addition, North Korea also needs to try as hard as it can to reduce the risks of nuclear weapons, including active participation in the six party talks.

On the other hand, other countries should support this project; the products that are made in the KIC must be referred to as those made in South Korea. Three countries, U.S., Canada, and Japan, which are imposing higher tariffs to North Korea, are reluctant to approve it. If they maintain their current hostile policies toward North Korea, the KIC goods will not be able to compete in these countries. Moreover, South Korea is in the process of discussing Free Trade Agreement (FTA) with the U.S., and will soon start to negotiate the FTA with Canada and Japan as well. Then, the country of origin - whether the KIC goods are made in North Korea or in South Korea - will be a very important issue.

TABLE 6: COUNTRIES TARIFF RATES TOWARD SOUTH & NORTH KOREAN GOODS

U.S.	S.Korea	Normal Trade Relations (NTR) Column 1 Tariff applied [clothing(0~32%); shoes(0~48%); bags(5.7~20%); toys(0%); accessories(0~11%); automobile parts(0~3%); computer parts(0%); electronic goods(0~15%)]
	N.Korea	Foreign Assets Control Regulations, Imposing economic sanctions since 1950 Column 2 Tariff applied [clothing(35~90%); shoes(20~84%); bags(40~90%); toys(70%); accessories(45~110%); automobile parts(25%); computer parts(35%); electronic goods(25~80%)]
Canada	S.Korea	General Preferential Tariff applied (0~7%)
	N.Korea	No economic sanctions, General Tariff applied (35%)
Japan	S.Korea	WTO member rate applied [clothing(9.1~10%); leather goods(3~15%);
	N.Korea	Export to North Korea prohibited, Uninsured North Korean ship not allowed to disembark Statutory rate applied [clothing(11~16%); shoes(two times higher than WTO member rate); leather goods(4~20%)]
Other Countries	No differential tariff rate to North & South Korean goods Countries examined (EU, Switzerland, Norway, Turkey, China, Taiwan, Singapore, India, Indonesia, Thailand, Philippines, Malaysia, Pakistan, Myanmar, Bangladesh, Australia, New Zealand, Brazil, Colombia, Peru, Chile, Mexico, Panama, Russia, Ukraine, UAE, Jordan, Egypt, Iran, Saudi Arabia, Nigeria, South Africa, Kuwait)	

Source: Ministry of Unification, Korea Trade Investment Promotion Agency (KOTRA)

The recent nuclear test done by North Korea made the international community become more hostile to Pyongyang. The Bush Administration is pressuring South Korea to stop the KIC project. Japan is trying to impose its highest sanctions against North Korea. However, the isolation policies can never be a solution for nuclear

problems; North Korea has no choice but to depend more on nuclear weapons. The successful achievement of the KIC is required to end this vicious circle and step toward world peace.

## End Notes

<sup>1</sup> This complex is located in North Korea, just six miles north of the border line. More detailed explanation is being provided in Chapter 4.

<sup>2</sup> Assuming homothetic preference, it can be viewed that there is one positive representative consumer in this economy.

<sup>3</sup> It is not described in detail how the labor market clears, but we have two markets and find explicitly that goods market clears ( $\{x_j^*\}_{demand} = \{x_j^*\}_{supply}$ ). Therefore, it is verified from the Walras Law that labor market also clears.

<sup>4</sup> Geometrical explanation is skipped in this paper. Graph of this demand curve, along with Marginal Revenue curve is provided by Basu (2000, p. 26). In this book, he processed his ideas by finding profit maximizing point where MR=MC. Approach in this paper is slightly different from his one, but reaches the same result.

<sup>5</sup> Unlike Basu (2000, pp.23-33), normalization was not made earlier in order to examine the relationship between  $w$  and  $\lambda$  and derive the condition of  $w\alpha > \lambda$ .

<sup>6</sup> As will be discussed soon, this 12 percent is exclusively dependent on trade with the Soviet Union and Eastern Bloc. Due to this bias, North Korea had particularly disastrous shock when its partners' economies collapsed.

<sup>7</sup> Note that PPF does not shift inward. These negative shocks are mostly external, and North Korea's resources including physical capital and human resources are not destroyed.

<sup>8</sup> The Korean characters for Kaesong are . Kaesong, Gaesong, Kaesung, Gaesung, Kaeseong, and Gaeseong all mean the same thing.

<sup>9</sup> Sometimes, it is called industrial park or industrial region.

<sup>10</sup> Note that  $k$  is not the number of sectors that already exist in the area of Kaesong City. This paper assumes that it is only South Korean firms who play a role as monopolists. Preexisting North Korean firms in the neighborhood of the KIC are assumed to be fringe.

<sup>11</sup> Strictly speaking, it is \$57.5 (Hyundai Asan). This paper uses its approximate value for convenient reason.

<sup>12</sup> This is consistent with  $w > \alpha\lambda$ , the condition of (Q), which is a profit maximization problem of a monopolist firm in 2.3.. By simply plugging in  $w=1$  and  $\lambda=2$ , exactly same result is achieved.

<sup>13</sup> Since  $k > 1$ ,  $(L+F-2Fk) - (L-Fk) = F-Fk < 0$ . Indeed, left-hand side is smaller than right-hand side.

<sup>14</sup> An empirical approach in 4.3. indicates that the current L and F do not satisfy condition (9). However, since the KIC is growing, with more employment, it is premature to say that the KIC is unprofitable.

<sup>15</sup> A rough estimation in 4.3. says that  $\alpha$  is not within this range. However, considering the current expanding pace of the KIC,  $\alpha$  will eventually be within this range.

<sup>16</sup> Among 38 firms, there are some firms that are in the same sectors. In this case, to be consistent with the MSV Model, particularly with (A.2.), only one firm per sector with bigger size or having more information is introduced.

<sup>17</sup> \$20.8 billion North Korea's GNI in the year 2004, and \$46 million is measured from August, 2005 to July 2006.

<sup>18</sup> For convenient reason, this wage is assumed to be \$50, and in this paper, it is normalized to 2.

<sup>19</sup> Currently, South Korean firms pay workers' wages in US dollars to a North Korean authority, and the workers receive ration tickets, such as food stamps, from the authority. However, it is suggested that South Korean firms directly give them wages. If it happens, a merit-based pay system will be expected to follow.

<sup>20</sup> The oil refinery industry is very important in a country's development. On top of the spillovers from the successful KIC, North Korea may gain another spillover by the development of the oil refinery industry, which has

been observed by many countries in their process of development. See Isard (2005) for relevant case studies on Puerto Rico.

# **Whistleblowing in Indian Public Sector Enterprises: The Legal Environment**

*Madhusree Mukherjee, m\_m@sxccal.edu*

*St. Xavier's College, Kolkata, India*

## **Abstract**

The present study is an attempt to explore the legal environment for whistleblowing in Indian public sector enterprises (PSE) vis-à-vis the international corporate governance arena. It looks into the legal paradigms in Indian PSE in the context of a case study drawn from a very dynamic public sector enterprise in the country. The purpose is to find out the structural support provided by the Indian legal system to encourage the whistleblowers to voice their dissents in times of need to unearth the unethical activities within and thereby become a valuable instrument of corporate governance in the country. The study highlights the absence of the right kind of necessary administrative mechanisms, supportive infrastructure and requisite protection to encourage whistleblowers in India. It, however, appreciates some upcoming changes in the scenario through judicial activism and competitive media exposures combined with public outcry for justice acting as a pressure operating in a liberalized environment in the country. **Keywords:** Whistleblowing, India, public sector enterprises, legal environment.

## **Introduction**

Whistleblowing, the mechanism by which the organization members (former or current) disclose illegal, immoral or illegitimate practices under the control of their employers, to persons or organizations that may be able to effect action (Miceli and Near 1992), can act as a very effective weapon to ensure proper governance in the Indian corporate sector. The present study is an attempt to explore the legal environment for whistleblowing in Indian public sector enterprises (PSEs) vis-à-vis the international corporate governance arena. A literature survey reveals that this area still remains unexplored. Asian countries have hardly been covered in the available studies. Moreover, the concept of whistleblowing has always remained confined in the books of business ethics rather than being treated as an essential tool for ensuring governance in the corporate sector. However, as the country is gradually emerging as one of the future powers in the global arena, this study finds an exploratory journey into the

environment of whistleblowing, as a technique of corporate governance, in a thriving economy like India extremely relevant.

A review of the international literature on Whistleblowing unravels the fact that extensive studies have been done on the whistleblowers in the developed nations in the West, particularly in the US. The reason seems to be obvious. The socio-legal paradigms offer unique opportunities for whistleblowing in the country (Johnson 2003). The cases of whistleblowing in the US have been growing in number during the last few decades. These have their reflections in the literature. So far as the developing Asian nations are concerned, however, only a few studies are available. This creates further need to explore into the world of developing nations like India to find out the level of the administrative support and encouragement available to potential whistleblowers.

Among the serious attempts available, Chiu's (2003) is an inquiry on Chinese managers to ascertain how they decide to blow the whistle in terms of their locus of control and subjective judgment. Al-Khatib, Rawwas and Vitell (2004) examine employee's self-reported work-related ethics and compare them to their perceptions of co-workers and top managements on various morally challenging situations in three developing countries' organizations – Saudi Arabia, Kuwait and Oman, known as the Gulf countries. Park, Rehg and Lee (2005) have done their study on South Korean public employees to ascertain the influence of Confucian Ethics and Collectivism on whistleblowing intentions.

Only one study has so far been made on whistleblowing in relation to India – by Keenan (2002). He compares Indian managers with American on whistleblowing. He finds no significant difference between the two with respect to both organizational propensity for whistleblowing or fear of retaliation. The only difference he observes is in the American managers having stronger personal propensity for whistleblowing than their Indian counterparts.

The study appears to be grossly inadequate in terms of its sample population as well as the depth of the investigation. It lacks critical understanding of Indian socio-legal factors which ultimately moderate people's whistleblowing behaviour. The present study therefore finds a real void in this field and feels the need to explore whether there is proper enabling environment, especially legal, for whistleblowing in Indian industries.

With this end in view, it looks into the Indian industrial scenario with particular attention to the Indian Public Sector Enterprises (PSEs). This sector has played a crucial role in the planned development of the economy since Independence (Rangarajan 1996), also poses serious threats in the areas of accountability and governance. This is especially because huge amounts of public money flow through the PSEs. However, evaluation of its performance on the basis of the balance sheet was not considered important to the Indian planners, who conceived this sector as a useful tool for achieving social objectives (Sengupta 1996). This, however, ultimately led to the dilution of commercial principles causing enormous wastage and inefficiencies, neglect of cost control measures, diversion of

resources into rent-seeking activities, operational inefficiencies and massive inflation in capital cost due to corruption (Guha, 1996).

In the post-globalize era, if the PSEs are to play a truly desirable role of meeting the social commitments of the government, they have to improve in the fronts of efficiency and productivity. This calls for proper governance of the PSEs, where whistleblowing can become a really valuable weapon in the hands of the employees and managers at every level to act as a check on the unwarranted wastage of the public resources, through “self-policing” (Near and Dworkin 1998). This study therefore attempts to explore this sector as its first step of enquiry into the Indian panorama.

The study also observes that without an effective legal system ensuring protection against retaliation, the whistleblowers in the country cannot feel encouraged to voice their dissents against corruptions. Such observation is further strengthened when we look into the Satyendra Kumar Dubey’s case (2003). It appears to be the classical example of an Indian PSE whistleblower, who acted as “the tragic hero battling the system” (Grant 2002) ultimately to be rewarded with death penalty at the hands of unscrupulous contractors. The case, as has been detailed afterwards, raises serious concern regarding the protection available to an average whistleblower in the country. This study therefore ultimately concentrates on the legal environment in the country in general and PSEs in particular in order to examine the judicial support available to Indian PSE whistleblowers in terms of encouragement as well as their protection against retaliation.

Accordingly, this paper starts with a search into the theoretical background of the study by a discussion of the Satyendra Kumar Dubey case followed by a thorough review of the contemporary legal environment in relation to whistleblowers’ protection in Indian PSEs. The paper then makes a case study on Steel Authority of India Limited (SAIL) – to make a qualitative assessment of the surveillance mechanism within a Government Company, and actual implementation of whistleblowing provisions in that organization. Finally, it ends with a discussion and analysis of the actual scenario with a mention of the limitations of the study along with the future prospects of research.

## **The Theoretical Background**

### **The Satyendra Kumar Dubey Case: A Classical Example of an Indian PSE Whistleblower**

Satyendra Kumar.Dubey, An IIT Kanpur Engineer, joined the Ministry of Surface Transport as an Indian Engineering Service (IES) officer. He was sent on deputation to work at National Highway Authority of India (NHAI) in July 2002 as Assistant Project Manager for Golden Quadrilateral Corridor Project at Koderma, Jharkhand. Sincere, simple and honest by nature, he would visit the quarry to inspect the quality of stone used and

count each equipment to ensure the contractor's commitment. Riding on his bike, he used to visit sites four to five times a week unlike the usual practice of visiting once in a month. In August 2002, he was transferred to Gaya, Bihar. He was then selected as the Deputy General Manager of NHAI ([www.skdubeyfoundation.org](http://www.skdubeyfoundation.org)).

During his tenure, he exposed mishandling of funds of five engineers and insisted that the contractor of the project, Gammon India, suspend them. Later on, he wrote to the Prime Minister's Office (PMO) detailing the financial irregularities in the Project on November 11, 2002. He highlighted several instances of what he called "loot of public money" and "poor implementation". As he knew that such a grave complaint from an ordinary citizen is not going to be accepted and investigated with due importance, he disclosed his identity, at the same time, requesting the authorities to keep his name secret.

Within the next ten days, the PMO forwarded Dubey's complaint to the Ministry of Road Transport & Highways. His request for anonymity was ignored by the PMO as his personal information was also forwarded. His letter was then sent to NHAI with a copy to the NHAI Chief Vigilance Officer. Dubey wrote to NHAI about his fear of retaliation. In return he was reprimanded for sending the letter to the PMO.

S.K.Dubey was brutally murdered on November 27, 2003 when he arrived at Gaya railway station from Varanasi at around 3 a.m. only to discover that his car had developed some mechanical problems. Neither the car nor the driver was present. He took a rickshaw to reach his destination. He was later found to have been gunned down near Gaya Circuit House. His brother, in the FIR lodged in the police station, claimed that he was killed by the people whose corrupt practices he had exposed. The case was fought in the courts. Later on it was referred to the CBI. The final CBI report dismissed the murder as a simple roadside robbery case.

Conscious people throughout the world formed the S.K. Dubey Foundation to give vent to their outrage at such a cover-up. Dubey has been posthumously awarded with the prestigious Whistleblower of the Year Award instituted by the international Magazine "Index on Censorship", published from UK, devoted to protecting and promoting free expression.

## **The Contemporary Legal Environment in Relation to Whistleblowers' Protection in Indian PSEs**

### **The Initial Attempt**

It is disconcerting to note that India till date does not have any legislation to protect whistleblowers. The *Public Interest Disclosure (Protection of Informers) Bill* drafted by a former Supreme Court judge, Justice B P Jeevan Reddy in December 2001 as the Chairman of the Law Commission of India is known to be the first-ever attempt to give any protection to the whistle-blowers in the country. The former Supreme Court Judge suggested a number of

measures to encourage and protect the whistle-blowers. The salient provisions of the Bill, which is yet to get the nod of the Parliament, are ([www.skdebeyfoundation.org/files/indianwhistleblowersact\\_179rptp2.pdf](http://www.skdebeyfoundation.org/files/indianwhistleblowersact_179rptp2.pdf)):

- A “*competent authority*” is to be set up in every government organization under the law to receive and investigate complaints of corruption and misadministration.
- *Independence of such authority* is ensured through the authority being given to an outsider selected by the Central Vigilance Commissioner.
- The entire inquiry *proceedings would be confidential*.
- *The principle of natural justice demands* that all the contents of the complaint including *the identity of the complainant should be disclosed to the accused*. The authority concerned would be expected to act accordingly.
- The law, however, makes *provisions for maintaining of confidentiality* of the whistle-blowers’ identity contingent on two conditions: i. The whistle-blower would have to *ask for keeping his identity confidential*. ii. The authority will have to be satisfied to accede to such request *in the public interest or for the safety of such a person*.
- The Bill provides *safeguards against employer’s reprisal* e.g. through punishment- posting or service records being spoiled. Such protections are available only in situations where his identity is not completely confidential.
- The competent authority is to give its report after proper inquiry based on which disciplinary action must be taken. *Criminal proceedings against the public servants* concerned and the accomplices must be taken in case of serious impropriety.
- It also makes *provision for punitive action against the unscrupulous whistle-blower* for any false, reckless or malicious disclosure which may extend to a three-year term of imprisonment.

The basic premise of the Bill as suggested by Justice Reddy is: “No corruption takes place without somebody somewhere coming to know about it. Hence are the measures to encourage and protect the whistle-blowers”([www.newindiapress.com](http://www.newindiapress.com) dated 18<sup>th</sup> April 2004). This Bill, however, is now lying in cold storage.

### **The Post-Enron Attempt: The Narayana Murthy Committee Report on Corporate Governance**

Year 2001-02 saw a number of corporate governance problems in the US including Enron and WorldCom, which shook the investors’ confidence throughout the world. The Sarbanes-Oxley Act 2002 ([Sarbanes\\_Oxley\\_Act\\_of\\_2002.pdf](#)) in the US made exhaustive provisions to bring back the credibility of the corporations in society. It gave special protection to the whistleblowers in publicly traded companies (Sec 806 of the Sarbanes-Oxley Act of 2002).

The Narayana Murthy Committee on Corporate Governance 2003 formed under the aegis of the Securities

Exchange Board of India (SEBI), followed the footsteps of the Sarbanes-Oxley Act of the US by adapting and incorporating whistle-blowing rights for the employees of listed companies of India in its recommendations. This was a revolutionary attempt wherein the Indian capital market regulator, the SEBI, through its listing agreement, has been required to empower one of the important stakeholders of the listed companies - the employees. The recommendations are as follows (Recommendation 3.11: Whistleblowers Policy: Report of the SEBI Committee on Corporate Governance, India, submitted in Feb., 2003):

- Personnel who observe an *unethical or improper practice (not necessarily a violation of law)* should be able to approach the *audit committee without necessarily informing their supervisors*.
- Companies shall take measures to ensure that this right of access is *communicated to all employees* through means of internal circulars etc. The employment and other personnel policies of the company shall *contain provisions protecting “whistle blowers” from unfair termination and other unfair prejudicial employment practices*.
- Companies shall *annually affirm that they have not denied any personal access to the audit committee of the company* (in respect of matters involving alleged misconduct) and that they have *provided protection to “whistle blowers” from unfair termination and other unfair or prejudicial employment practices*.
- Such affirmation shall form *a part of the Board Report on Corporate Governance* required to be prepared and submitted together with the annual report.

The *appointment, removal and terms of remuneration of the Chief internal auditor* must be subject to review by the *Audit Committee*.

**Corporate governance Requirement under Clause 49 of the Listing Agreement as designed by the Securities Exchange Board of India (SEBI):**

On the basis of the above Report, Clause 49 of the Listing Agreement (Corporate Governance requirements) was amended in September 2003. The amendment required all listed companies to include Clause 49 (iv) Whistle Blower Policy as mandatory information in the Report on Corporate Governance in the Annual Report of the company ([www.sebi.gov.in](http://www.sebi.gov.in)).

SEBI, the apex capital market regulator in the country, however, in a master Circular issued in October 2004 (no. SEBI/CFD/DIL/CG/1/2004/12/10 dated Oct.29, 2004), withdrew the previous announcement and offered the status of a non-mandatory clause to the Whistleblower Policy. Such a revision ([www.bseindia.com/cirbrief/notices.asp](http://www.bseindia.com/cirbrief/notices.asp)) provides that, the company may establish a mechanism for employees to report to the management concerns about unethical behaviour, actual or suspected fraud or violation of the company’s code of conduct or ethics policy. This mechanism could also provide for adequate safeguards against victimization of employees who avail of the mechanism and also provide for direct access to the chairman of the

audit committee in exceptional cases. Once established, the existence of the mechanism may be appropriately communicated within the organization.

#### **Role of the Central Vigilance Commission (CVC) in Case of PSE**

The Central Vigilance Commission Act, 2003 has been enacted under the Ministry of Law & Justice to provide for the CVC to inquire into offences alleged to have been committed under the Prevention of Corruption Act, 1988 by the public servants in PSEs including corporations established under the Central Act and Government Companies established under the Companies Act, 1956. According to the Annual Report 20004 ([www.cvc.nic.in](http://www.cvc.nic.in)), on account of the murder of Satyendra Dubey and the PIL filed in the Supreme Court, the Supreme Court directed the Government to designate a suitable machinery to act on complaints from whistleblowers till a suitable legislation is enacted. The CVC has been authorized by the Government of India to act as the 'Designated Agency' to act on complaints of whistleblowers till the Parliament passes a law (GOI Resolution on "Public Interest Disclosure & Protection of Informer" 2004). It requires the CVC to bear the responsibility of keeping the identity of the complainant secret. The above Resolution clearly states the following aspects to be complied with by the whistleblower:

- The complaint should be in a closed /secured envelope.
- The envelope should be superscribed "Complaint under 'The Public Interest Disclosure'. This is to ensure protection to the complainant under the above Resolution. The complainant should give his/her name and address in the beginning or the end of the complaint or in an attached letter.
- Anonymous/pseudonymous complaints will not be entertained by the Commission.
- The text of the complaint should not give any details or clue as to his/her identity. The details of the complaint should, however, be specific and verifiable.
- In order to protect the identity of the whistleblower, the CVC will not issue any acknowledgement and the person/persons are advised not to enter into any further correspondence with the CVC in their own interest. The CVC assures that, subject to the facts of the case being verifiable, it will take necessary actions. The CVC will be in touch with the complainant if it requires any further clarification. ([www.cvc.nic.in](http://www.cvc.nic.in))

The important features of the "Whistleblowers Resolution" also include:

- In course of further report/investigation, the CVC shall not disclose the identity of the informant and shall also request the concerned head of the organization to keep the identity of the informant a secret.
- In pursuance to the complaint received, the CVC shall have the authority to call upon the CBI or the police authorities to render all assistance to complete the investigation.

- If any whistleblower is aggrieved on the ground that he is being victimized due to the disclosure, he may ask for redressal and the CVC may give support to the complainant.
- If the CVC opines that either the complainant or the witness needs protection, it shall issue appropriate directions to the concerned government authorities.
- In the event of the identity of the whistleblower being disclosed in spite of the CVC's directions to the contrary, it is authorized to initiate appropriate actions as per regulations against the person or the agency making such disclosure.
- The CVC also enjoys the right to take action against complainants making motivated /vexatious complaint under the Resolution.

**The Right To Information Act, 2005 (RTI) – to Contain Corruption and to Hold Governments and their Instrumentalities Accountable to the Governed** ([http://commerce.nic.in/rti/rti\\_first.htm](http://commerce.nic.in/rti/rti_first.htm))

This enactment is the latest of its kind which attempts to provide for setting out the practical regime of right to information under the control of public authorities. The purpose of such an enactment is to promote transparency and accountability in the working of every public authority. The Act has led to the creation of a Central Information Commission and a State Information Commission. Under the Act, the rights to information include the rights to –

- i. inspection of work, document, records
- ii. taking notes, extracts or certified copies of documents or records
- iii. taking certified samples of materials
- iv. Obtaining information in the form of diskettes, floppies, tapes, video-cassettes or in any other electronic mode or through printouts where such information is stored in a computer or in any other device.

Every public authority is bound to provide the information sought. Moreover, no suit, prosecution or other legal proceedings shall lie against any person for any thing which is done or intended to be done in good faith.

**Steel Authority of India Limited (SAIL) – A Case Study**

The study now examines one of the most respected world class corporations in the public sector to find out the implementation aspect of the above provisions. The purpose is to see whether the company has been able to create an enabling environment within the organization, so that the whistleblowers can come forward to save the company from any impending danger in future.

SAIL is a *NAVARATNA*<sup>1</sup> company and happens to be the leader in steel industry in India in terms of quality, productivity, profitability and customer satisfaction. 85% of its shares are held by the government whereas Foreign Institutional Investors (FII) own 5.08% of its shareholding. The company has won the Global Corporate

Excellence Award (2005) given by the Centre of International Business, Amity Business School, International Business Horizon – 2005 (Annual Report: SAIL 2005-06).

The case study includes a scrutiny of the Annual Reports of the company and its website followed by interviews of three top level managers in the city office in Kolkata. The observations are as follows:

1. That the company has a strong vigilance activity is evidenced by the notice by the CVC put up on the wall of the Reception Hall, SAIL Office, Industry House, Camac Street, Kolkata: “Do not pay bribes. If anybody of this office works for bribe or if you have any information on corruption in this office or if you are victim of corruption in this office, you can complain to the following officers”.
2. The company has a Corporate Vigilance Department with Quality Management System, which is accredited with ISO 9001-2000 Certification.( [www.sail.co.in/vigi\\_main.asp](http://www.sail.co.in/vigi_main.asp)). It is headed by an IPS as the Chief Vigilance Officer. The functions of SAIL vigilance are broadly preventive in nature. The focus is “towards facilitating the environment for people to work with integrity, impartiality and transparent manner, upholding highest ethical standards for the organization”(sail website)
3. The Annual Report 2005-06 states that in line with the concept of Corporate Governance, the Internal Vigilance Department is playing a proactive role for continuous simplification of systems and procedure with greater emphasis on transparency in the system.
4. Every department has an internal officer known as Assistant Central Vigilance Officer, who holds the office on a rotational basis, so that there is no abuse of power.
5. The company already had the procedure of receiving complaints from external parties as well as employees. This has further been strengthened on the basis of the CVC’s circular 2004 on whistleblowing. Complaints are received through the website in order to bring transparency in the system and expedite the process.
6. All complaints are processed after confirming the veracity of the complainant and further action is taken according to the procedure laid down under Quality Management System.
7. No action can be taken on the anonymous /pseudonymous complaints as per the CVC guidelines. However, keeping in mind the greater interest of the company, the vigilance department takes them into account to keep better vigil.
8. Guidelines for lodging complaints include the following:
  - Complaint should be specific with relevant details like subject and date.
  - Correct name and address are mandatory for processing the complaint.

- No correspondence shall be entertained on the subject after lodging the complaint.
  - In case it is found to be false and with the purpose of harassing the officials, action may be taken against the complainant.
  - The complaints having 'vigilance angle' are only examined. It consists of misuse of official position, demand and acceptance of illegal gratification, misappropriation/forgery or cheating, gross and willful negligence, blatant violation of systems and procedures, reckless exercise of discretion, and delay in processing the cases.
9. However, interviews with the top management revealed that most of the complaints received were found to be malicious in nature, governed by the self-interest of individuals rather than greater issues like saving of public money and concern for the company. Such trivial issues vary from personal leg-pulling, deliberate obstruction of the promotion of colleagues to defaming a manager, or inter-union rivalry. A small percentage of the complaints definitely involve public and social issues, which are handled with extreme care.
  10. When asked about any such incident of whistleblowing, which has saved the company from bigger problems, the officers maintained silence. While agreeing to the fact that such incidents are there, they did not agree to divulge the facts and figures in the bigger interest of the company and its market image.
  11. SAIL depends largely on preventive measures such as surprise checks in sensitive areas like procurements, contracts, supply of material through physical verifications. Procurement is one of the most crucial areas where chances of "technical corruption" are very high. The process of procurement is scrutinized through proactive vigilance on a regular basis to prevent such incidents.
  12. Vigilance Manuals are regularly updated and distributed among personnel as guidelines to be followed. Purchase/Contract Procedure 2006 is one such important document used for this purpose.
  13. Vigilance Audit is another mechanism through which peer review of the vigilance department's activity and quality are conducted..
  14. The internal vigilance departments are also subject to Customer Satisfaction Index, wherein the customers of the vigilance department output i.e. the directors, management information system (MIS), CVO etc. can express their level of satisfaction and thereby create inter-departmental competition in terms of vigilance activities.
  15. Finally, the internal vigilance departments conduct awareness programs among the employees, so that the chances of corruption can be kept at the minimum.

16. The company, however, has no mechanism known as Whistleblower Policy which is a non-mandatory requirement under the listing agreements with the Stock Exchange. This is evident from the Corporate Governance Compliance Report and the Certificate from Auditors regarding the compliance of Corporate Governance norms. None of these reports contain any mention of such a policy.
17. The company has established mechanism to receive and reply the queries under the Right to Information Act legislated recently.
18. The company maintains absolute confidentiality about the identity of the complainants or enquirers, so that they are not unnecessarily harassed. But no such mention is made in the website through it receives complaints. This may give a wrong message to the potential whistleblowers in the organization.

## **Discussion and Conclusion**

This study explores the legal environment of India to find out whether it is friendly enough to encourage the potential whistleblowers in the country to blow the whistle without the fear of retaliation. The study concentrates on the public sector enterprises of the country where a huge amount of public money has been deployed since Independence. The significance of this sector to the entire economy lies in the fact that it has largely catered to the development of the basic and infrastructure industries in the country since the 1950s. It has still a lot of promises to keep in order to placing the country in a more respectable position in the global horizon.

Moreover, at a juncture, when the global investors are eyeing the country as their investment destination, corporate governance becomes a big issue overall. However, there is no dearth of corruption, misutilisation of resources and wastage in the PSEs as is reported in the media everyday. Under such circumstances, the country needs more public servants who are as upright and honest, sincere and committed as the late S.K. Dubey was. This is, however, possible only when they are groomed well with all sorts of encouragement and protections in a perfectly value-laden ambience. Only then, one S.K. Dubey can give rise to hundreds. However, the injustice that has been meted out to a whistleblower like him bears a clearly negative signal to the future potential whistleblowers. This is voiced in the statement made by the brother of late S.K. Dubey that, unlike his elder brother, he is not going to have his career with the Government ([www.skubeyfoundation.org](http://www.skubeyfoundation.org)).

In a country where the Prime Minister has announced his zero-tolerance for corruption, the basic judicial support system to fight corruption needs to be further developed through timely enactment of some much-awaited legislation, like the Whistleblowers Protection Act in the line of B.P.Jeevan Reddy's draft bill. More than five years

have passed since the bill was first placed before the Parliament and the silent role played by the legislators on this issue raises the question regarding the genuineness or the willingness on the part of the government.

Again, a recommendation by a high-powered committee becomes meaningless, if it is not implemented properly. This is established by the fact that whereas the Narayana Murthy Committee on Corporate Governance recommended in favour of a mandatory provision of Whistle Blowers' Policy to be established in all listed companies in the country, the SEBI, the apex regulatory body of the capital market, seemed to be in a dilemma. This is evident when this study finds the SEBI following the recommendation and issuing a circular to the effect in September 2003, and then withdrawing the same by another superseding circular in 2004. The last circular, which is still in effect, has provided only a non-mandatory status to the Whistle Blowers' Policy. This gives enough opportunities to the publicly traded companies not to create such a mechanism, thereby refusing a crucial right to one of the most vital stakeholders in an industrial organisation.

This dillydallying process indicates the lackadaisical approach of the governmental agencies towards encouraging the act of whistleblowing when the same is gaining extreme popularity in all advanced countries. As a result, whereas Narayana Murthy's own company Infosys (a private sector organization) has come up with such policy in letter and spirit ([www.infosys.co.in](http://www.infosys.co.in)), it is conspicuously absent in a public sector enterprise like SAIL (Annual Report: 2005-06).

Although this study finds a thoroughly active internal vigilance department in SAIL, the officials seem to be a bit skeptical when it comes to the issue of Whistleblowers' Policy as a whole. Firstly, they are too confident about their own vigilance activities, claiming that that nothing wrong would go undetected under the existing provisions. Secondly, they have a complaint receiving mechanism in compliance with the CVC mandate. This mechanism, which is posted in the website, however, tells nothing about the maintenance of the confidentiality of the complainant or protection against future retaliation by the affected party. As a result, the potential whistleblowers get no clear message about the availability of such protection. With reference to the nature of complaints received, the top management opined that most of these are directed towards personal gains rather than to serve a greater cause. At the same time, they could not deny the fact that there are a few genuine cases, which have saved the company from huge wastages. While the officials are not ready to divulge such strictly confidential internal information, the question remains: are the authorities trying to encourage the number of such genuine reports to grow, so that the company can make real gain out of it? There is no clear-cut answer to this.

The vigilance department in Sail holds awareness programmes for their employees, so that an ethical environment prevails within. But when it comes to empowering the employees through the establishment of a whistleblowers' policy, the top brass are found to be not very interested. The basic mindset is that it is going to be misused. This is clearly indicative of the reality situation that in a country like India, where the trade unions have

always been very active, the senior management would hardly like to further strengthen the hands of individual employee by promoting concepts like whistleblowing.

In so far as the newly enacted Right to Information Act 2005 (RTI) is concerned, it can open up the floodgate of public queries creating a real democratic environment where the government and its administrative agencies become truly accountable to the governed. But the basic issue remains the same - its implementation aspect. This is because an enactment is meaningless without it being properly utilized by those for whom it is designed. The questions obviously arise - are the average countrymen, poor and illiterate as they are, prepared to raise desirable questions in time? Moreover, are the employees in an organization in a position to use this weapon to raise their voice against the questionable practices of their bosses without fear of actual retaliation? We have yet to wait to experience such implementation effects. RTI, however, can never be a substitute for a viable legislation for whistleblowers' protection in immediate future.

The study, therefore, observes the country and its legal mosaic is still far away from creating any ambience of encouragement and protection where individuals can fearlessly raise their voice to protest against corruption and thereby become a valuable instrument of corporate governance.

In the mean time, however, some optimistic developments in the Indian judiciary are becoming visible as noticed in a very recent case, where an IIM Lucknow graduate and public servant working in the Indian Oil Corporation, Manjunath Shanmugham, was murdered for exposing a racket involved in the sale of adulterated fuel in a town in the state of Uttar Pradesh. In one of the fastest convictions ever, as reported in The Times Of India dated March 27,2007, the district court has issued a death sentence to the guilty petrol pump owner and awarded life imprisonment to seven other accomplices within sixteen months after the murder of the whistleblower. This positive development may be attributed to the nationwide campaign which was triggered by the incident. It affirms the bludgeoning role of public opinion coupled with judicial activism and competitive media exposures acting as pressure groups in bringing about justice and an ethical environment in a thriving democracy like India. This gives rise to the ultimate optimism where the study expects some positive move on the part of the legislators too to bring about a full-fledged enactment on whistleblowing in near future. Without this, the act of whistleblowing can never flourish to solve governance problems in Indian PSEs.

#### **Limitations of this Study**

This being an exploratory study on the Indian legal environment with respect to whistleblowing in PSEs in India, this attempt necessarily suffers from certain limitations. Findings on the basis of a qualitative analysis, I feel, need to be supplemented by a quantitative measurement of the perceptions of the Indian PSE employees towards the very act of whistleblowing and towards the governmental support available to the potential whistleblowers through legal backings.

Another glaring limitation of this study is that it has been done on the background of the developments in advanced western block like the UK and USA. It has failed to consider the Asian neighbouring countries' scenario, e.g. Japan, China or Singapore. The reasons are two-fold. Firstly, literature studying these economies is not much available. Secondly, Indian legislative structure is based on Anglo-Saxon legacy. This is now being supplemented by the American developments at the dictate of WTO and IMF. Hence comes the bias.

Next limitation of this study is comparatively greater dependence on secondary data, rather than on primary one. This is due to the overall conservative attitude and therefore closed door policy of the management of almost all Indian organisations. They hardly like to divulge any information which is not strictly official. Availability of primary data therefore becomes difficult. One has to depend more on published documents and the secondary data like media reports, journals and websites become major source of information.

#### **Scope for Future Study**

There seems to be enough opportunity for future research as no fundamental study has yet been done on whistleblowing in India. As has been felt in the above section, this study needs to be supplemented by a quantitative analysis of the socio-cultural perspectives of the whistleblowing behaviour of the Indian people. India, as a nation, is however too broad to be characterized as having the same cultural attributes all over the country and a monolithic assessment of its cultural environment and behaviour would suffer from an inability to take into account its incredible cultural diversity. Future studies should therefore consider this aspect first by making an intra-firm comparison of whistleblowing behaviour in an organization, which is characterized by such cultural blends. Steel Authority of India can be an excellent case for this purpose, as the company is truly national with its bases in all four regions, east and west, north and south.

Future attempts can further be directed towards cross-cultural studies where Indian situations can be compared with neighbouring Asian countries' like Japan and China. This may help finding out the cross-cultural variables leading to the similarity or otherwise among whistleblowing behaviour of people of these countries which share the common oriental culture and values. Recent publications on Asian management as has been done by Chatterjee and Nankervis (2007) can provide a basic theoretical framework to such studies.

Future research can also proceed to make further comparison between whistleblowers in India with the advanced economies like the US and UK, where whistleblowing has become a regular activity in industries. As Indian companies are becoming increasingly global, more research attention is clearly needed on studying whistleblowing across cultures and across nations. This will help the Indian multinationals to develop and manage policies and standards with respect to ethical issues and whistleblowing in an organization in a more effective manner.

### Abstract

A lake is polluted and needed to be cleaned. A certain cost is incurred to clean the lake. This cost should be allocated fairly to all upstream agents (firms, counties, or villages which are connected to the water system). To address this cost sharing problem, we extend a similar research "Sharing a Polluted River" (Games and Economic Behavior, 2007?). The problem is modeled by a tree structure in which agents are located on a tree and the root of the tree is the lake. We apply the theory of games with permission structure developed by van den Brink (Games and Economic Behavior, 12(1996)113-126) to our problem. We assume that upstream agents must get permissions from downstream agents in order to exude their pollutant to the system. Applying the two main advocated doctrines in international disputes: the theory of Absolute Territorial Sovereignty (ATS) and the theory of Unlimited Territorial Integrity (UTI), we accordingly propose two cost sharing methods: the Local Responsibility Sharing (LRS) method and the Upstream Equal Sharing (UES) method. For each method, we provide an axiomatic characterization. Interestingly, both the LRS method and the UES method coincide with the Shapley value solutions to the corresponding (cost) games that are naturally induced according to the ATS and the UTI doctrines respectively. Moreover, both the LRS solution and the UES solution are the core allocations of the corresponding games. Thus, both the LRS method and the UES method can be considered as fair or reasonable solutions to the pollution cost allocation problem. JEL classification: C71, D61, D62. Keywords: Externality, Fair allocation of pollution costs, Shapley value.

## Introduction

### A Model

Consider a water system in which there are  $N = \{1, 2, \dots, n\}$  agents located on a tree and the root of the tree is a lake denoted by  $L$ . Agents are connected through links and all lead to the lake. Each agent exudes certain amount of pollutant to the system which eventually flows to the lake. Assume that an agent needs the permission of her immediate downstream agents before exuding her pollutant into the system. The entire water system is polluted and needs to be cleaned. The overall cost of cleaning each and every water canal (link) as well as the lake must be shared among these agents.

Formally, let  $N = \{1, \dots, n\}$  be a finite set of agents. Let  $G = \{N \cup L, E\}$  be a tree structure for  $N$ . The cost function  $C : E \cup L \rightarrow \mathbb{R}^+$  has two components. The (links') costs  $C(E) : E \rightarrow \mathbb{R}^+$ , is denoted as  $C(E) = \{c_1, c_2, \dots, c_n\}$ , where  $c_i$  is the cost of the link in  $G$  that originates from agent  $i$ ,  $i = 1, 2, \dots, n$ . The lake cost is denoted as  $C(L)$ . For convenience, also denote  $C(E) = \sum_{i \in N} c_i$ , i.e., the total link costs. A pollution cost sharing problem is a triple  $(N \cup L, G, C)$ . Throughout the paper, we simply call the triple  $(N, G, C)$  a problem. A solution to a problem  $(N, G, C)$  is a vector  $x = (x_1, \dots, x_n) \in \mathbb{R}^n_+$  such that  $\sum_i x_i = C(L) + C(E)$ , where  $x_i$  is the cost share assigned to agent  $i \in N$ . A method is a mapping  $x$  that assigns to each problem  $(N, G, C)$  a solution  $x(N, G, C)$ .

Given a tree  $G$ , the upstream-downstream relation between agents is uniquely determined. Also for any agent, there is a unique path that connects a sequence of downstream agents successively to the lake.

Recall the literature on permission games (van den Brink, 1996). In certain situations some agents have to get permission from certain other agents before they can engage in cooperative activities. Specifically, a permission structure is represented by a mapping  $P : N \rightarrow 2^N$ . It is assumed that agents  $j \in P(i)$  must get the permission from agent  $i \in N$  to participate in the cooperative activities. The collection of all permission structures on  $N$  is denoted by  $\mathcal{P}$ .

structure in a natural way. Given  $(N, G, C)$ , the tree  $G$  induces the following permission structure:  $P : N \rightarrow 2^N$ ,

$$P(i) = \{j \mid \text{there is a path from } j \text{ to } L \\ \text{such that } i \text{ is } j \text{'s immediate follower (downstream agent)}\}$$

We assume that all agents  $j \in P(i)$  need the permission of agent  $i \in N$  to exude their pollutant.

Example 1.

FIG. 1: POLLUTANTS

In this example, we have the following permission structure  $P$ .

$$P(1) = \emptyset, P(2) = \{1\}, P(3) = \emptyset, P(4) = \{3\}, P(5) = \{2, 4\}$$

The transitive closure of the permission structure  $P$  is a permission structure  $\hat{P}$  such that for all  $i \in S$  we have  $i \in \hat{P}(j)$  if and only if there exists  $i_1, \dots, i_{k-1}$  in  $S$  such that  $i_1 = i$ ,  $i_{k-1} \in P(i_{k-2})$  for all  $1 \leq k-1$ , and  $i_k = j$ . The agents in  $\hat{P}(i)$  are called the subordinates of  $i$  in  $S$  and the agents in  $\hat{P}^{-1}(i) := \{j \in S \mid j \in \hat{P}(i)\}$  are called the superiors of  $i$  in  $S$ .

Define for every  $i \in S$ ,  $\hat{P}^{-1}(i) = \{j \in S \mid j \in \hat{P}(i)\}$ .

Example 1 (continued): It is easy to check that

$$\hat{P}(1) = \emptyset, \hat{P}(2) = \{1\}, \hat{P}(3) = \emptyset, \hat{P}(4) = \{3\}, \hat{P}(5) = \{1, 2, 3, 4\}$$

$$\hat{P}^{-1}(1) = \{2, 5\}, \hat{P}^{-1}(2) = \{5\}, \hat{P}^{-1}(3) = \{4, 5\}, \hat{P}^{-1}(4) = \{5\}, \hat{P}^{-1}(5) = \emptyset$$

Given a permission structure  $P$ , three different kinds of coalitions can be formed. The stand-alone part of a coalition  $S$  is itself. The sovereign part of a coalition  $S$  is the coalition  $\sigma(S) = S \cup \hat{P}^{-1}(S)$  consisting of  $S$  itself and the set  $\hat{P}^{-1}(S)$  for the reason that members in  $S$  can reduce or stop emissions of pollution themselves and their responsibilities in pollution reduction should be extended to all the downstream agents they affected. On the

other hand, the authorizing set of  $\mu$  is the coalition given by  $\rightarrow(\mu) = \mu[\hat{P}(\mu)]$ , in which the responsibilities are split between all relevant upstream agents. Note that these definitions are different from that in van den Brink (1996). Also note that in our lake pollution problem the two theories of the ATS and the UTI are not in sharp contrast to each other compared to the case in Ambec and Sprumont (2002).

Accordingly, three different games can be defined based on the above definitions of coalitions. First, we define the stand-alone (s.a.) game as follows.

**Definition 1** Let  $(\mu, \mu, \mu)$  be a lake pollution problem. Let  $\mu(\mu)$  be the permission structure induced by  $\mu$ . Define the game  $\mu(\mu)^{S.A.}$  as follows:

$$\mu^{\mu}(\mu)(\mu) = \mu(\mu), \mu^{\mu}(\mu), \quad (1)$$

where  $\mu(\mu)$  is the total cost of the links associated with  $\mu$ .

Next, based on the sovereign set concept, we define the following game.

**Definition 2** Let  $(\mu, \mu, \mu)$  be a lake pollution problem. Let  $\mu(\mu)$  be the permission structure induced by  $\mu$ . Define the game  $\mu^{\mu}(\mu)$  as follows:

$$\mu^{\mu}(\mu)(\mu) = \mu(\sigma(\mu)), \mu^{\mu}(\mu), \quad (2)$$

Corresponding to the authoring set, we have the following game.

**Definition 3** Let  $(\mu, \mu, \mu)$  be a lake pollution problem. Let  $\mu(\mu)$  be the permission structure induced by  $\mu$ . Define the game  $\mu^{\mu\mu\mu}(\mu)$  as follows:

$$\mu^{\mu\mu\mu}(\mu)(\mu) = \mu(\rightarrow(\mu)), \mu^{\mu}(\mu), \quad (3)$$

**Example 2.** The sovereign game and the authoring game generated from the problem in Example 1 can be found as follows.

**The Sovereign Game  $\mu^{\mu}(\mu)$ .**

- $\mu^{\mu}(\mu)(C)(1) = C(1, 2, 5), \mu^{\mu}(\mu)(C)(2) = C(2, 5), \mu^{\mu}(\mu)(C)(3) = C(3, 4, 5),$
- $\mu^{\mu}(\mu)(C)(4) = C(4, 5), \mu^{\mu}(\mu)(C)(5) = C(5),$
- $\mu^{\mu}(\mu)(C)(1, 2) = C(1, 2, 5), \mu^{\mu}(\mu)(C)(1, 3) = C(1, 2, 3, 4, 5),$
- $\mu^{\mu}(\mu)(C)(1, 4) = C(1, 2, 4, 5), \mu^{\mu}(\mu)(C)(1, 5) = C(1, 2, 5),$
- $\mu^{\mu}(\mu)(C)(2, 3) = C(2, 3, 4, 5), \mu^{\mu}(\mu)(C)(2, 4) = C(2, 4, 5), \mu^{\mu}(\mu)(C)(2, 5) = C(2, 5),$
- $\mu^{\mu}(\mu)(C)(3, 4) = C(3, 4, 5), \mu^{\mu}(\mu)(C)(3, 5) = C(3, 4, 5), \mu^{\mu}(\mu)(C)(4, 5) = C(4, 5),$
- $\mu^{\mu}(\mu)(C)(1, 2, 3) = C(1, 2, 3, 4, 5), \mu^{\mu}(\mu)(C)(1, 2, 4) = C(1, 2, 4, 5),$
- $\mu^{\mu}(\mu)(C)(1, 2, 5) = C(1, 2, 5), \mu^{\mu}(\mu)(C)(1, 3, 4) = C(1, 2, 3, 4, 5),$
- $\mu^{\mu}(\mu)(C)(1, 3, 5) = C(1, 2, 3, 4, 5), \mu^{\mu}(\mu)(C)(2, 3, 4) = C(2, 3, 4, 5),$
- $\mu^{\mu}(\mu)(C)(2, 3, 5) = C(2, 3, 4, 5), \mu^{\mu}(\mu)(C)(3, 4, 5) = C(3, 4, 5),$

$$\begin{aligned}
\varnothing(C)(1, 4, 5) &= C(1, 2, 4, 5), \varnothing(C)(2, 4, 5) = C(2, 4, 5), \\
\varnothing(C)(1, 2, 3, 4) &= C(1, 2, 3, 4, 5), \varnothing(C)(1, 3, 4, 5) = C(1, 2, 3, 4, 5), \\
\varnothing(C)(2, 3, 4, 5) &= C(2, 3, 4, 5), \varnothing(C)(1, 2, 4, 5) = C(1, 2, 4, 5). \\
\varnothing(C)(1, 2, 3, 5) &= C(1, 2, 3, 4, 5), \varnothing(C)(1, 2, 3, 4, 5) = C(1, 2, 3, 4, 5).
\end{aligned}$$

The Authoring Game  $\varnothing(\varnothing)$ .

$$\begin{aligned}
\varnothing(\varnothing)(1) &= C(1), \varnothing(\varnothing)(2) = C(1, 2), \varnothing(\varnothing)(3) = C(3), \\
\varnothing(\varnothing)(4) &= C(3, 4), \varnothing(\varnothing)(5) = C(1, 2, 3, 4, 5), \\
\varnothing(\varnothing)(1, 2) &= C(1, 2), \varnothing(\varnothing)(1, 3) = C(1, 3), \\
\varnothing(\varnothing)(1, 4) &= C(1, 3, 4), \varnothing(\varnothing)(1, 5) = C(1, 2, 3, 4, 5), \\
\varnothing(\varnothing)(2, 3) &= C(1, 2, 3), \varnothing(\varnothing)(2, 4) = C(1, 2, 3, 4), \\
\varnothing(\varnothing)(2, 5) &= C(1, 2, 3, 4, 5), \varnothing(\varnothing)(3, 4) = C(3, 4, 5), \\
\varnothing(\varnothing)(3, 5) &= C(1, 2, 3, 4, 5), \varnothing(\varnothing)(4, 5) = C(1, 2, 3, 4, 5), \\
\varnothing(\varnothing)(1, 2, 3) &= C(1, 2, 3), \varnothing(\varnothing)(1, 2, 4) = C(1, 2, 3, 4), \\
\varnothing(\varnothing)(1, 2, 5) &= C(1, 2, 3, 4, 5), \\
\varnothing(\varnothing)(1, 3, 4) &= C(1, 3, 4), \varnothing(\varnothing)(1, 3, 5) = C(1, 2, 3, 4, 5), \\
\varnothing(\varnothing)(2, 3, 4) &= C(2, 3, 4), \varnothing(\varnothing)(2, 3, 5) = C(1, 2, 3, 4, 5), \\
\varnothing(\varnothing)(3, 4, 5) &= C(1, 2, 3, 4, 5), \varnothing(\varnothing)(1, 4, 5) = C(1, 2, 3, 4, 5), \\
\varnothing(\varnothing)(2, 4, 5) &= C(1, 2, 3, 4, 5), \varnothing(\varnothing)(1, 2, 3, 4) = C(1, 2, 3, 4), \\
\varnothing(\varnothing)(1, 3, 4, 5) &= C(1, 2, 3, 4, 5), \varnothing(\varnothing)(2, 3, 4, 5) = C(1, 2, 3, 4, 5),
\end{aligned}$$

$$\begin{aligned}
\varnothing(\varnothing)(1, 2, 3, 5) &= C(1, 2, 3, 4, 5). \\
\varnothing(\varnothing)(1, 2, 4, 5) &= C(1, 2, 3, 4, 5). \\
\varnothing(\varnothing)(1, 2, 3, 4, 5) &= C(1, 2, 3, 4, 5).
\end{aligned}$$

A (cost) game is convex if an agent's marginal cost is non-increasing as the agent joins larger coalitions.

Formally, a game  $C(\cdot)$  is convex if

$$\varnothing(\varnothing[S]) - \varnothing(\varnothing) \geq \varnothing(\varnothing[S \cup \{i\}]) - \varnothing(\varnothing), \forall \mu \subseteq S, i \notin S.$$

We claim that all the associated games generated from a lake pollution problem are convex.

The Shapley value (Shapley, 1953) is the most important solution concept for cooperative games.

Definition 4 For any game  $\varnothing: 2^N \rightarrow \mathbb{R}$ , the Shapley value is given by

$$X_i^{Sh}(C) = \sum_{S \subseteq N, i \in S} \frac{(|S|-1)!(n-|S|)!}{(n-1)!} (\varnothing(S) - \varnothing(S \setminus \{i\})) \quad i=1, 2, \dots, n \quad (4)$$

It is well-known that for convex games the Shapley value is in the core.

The following Local Responsibility Sharing (LRS) method is the Shapley value of the stand-alone game  $L^{s.a.}(C)$ .

Definition 5 For any  $\mathbf{c} \in \mathbb{R}_+^n$ , The Local Responsibility Sharing method is given by

$$X_i^{\text{LRS}}(\mathbf{C}) = c_i, \quad i=1, 2, \dots, n$$

The Shapley value (Shapley, 1953) can be similarly applied on the games  $\Gamma^{\text{LRS}}$  and  $\Gamma^{\text{Shapley}}$  respectively.

Definition 6 For any  $(N, G, C)$ , the Shapley value Sharing method is given by

$$X_i^{\text{Sh}}(\mathbf{C}) = \sum_{S \in \mathcal{S}} \left( \frac{(n-|S|)! (|S|-1)!}{(n!)} \right) (L^{\text{sov}}(\mathbf{C})(S) - L^{\text{sov}}(\mathbf{C})(S \setminus \{i\})) \quad i=1, 2, \dots, n \quad (5)$$

And

**Definition 7**

For any  $(N, G, C)$ , the Shapley value Sharing method is given by

$$X_i^{\text{Sh}}(\mathbf{C}) = \sum_{S \in \mathcal{S}} \left( \frac{(n-|S|)! (|S|-1)!}{(n!)} \right) (L^{\text{Author}}(\mathbf{C})(S) - L^{\text{Author}}(\mathbf{C})(S \setminus \{i\})) \quad i=1, 2, \dots, n \quad (6)$$

**Characterizations of the Local Responsibility**

Method and the Shapley Value Methods

**Characterization of the Local Responsibility Method**

The characterization of the LRS method is the same as the characterization in the river case (Ni and Wang, 2006).

We state the result below.

Additivity: For any  $\mathbf{c}^1 = (c_1^1, \dots, c_n^1) \in \mathbb{R}_+^n$  and  $\mathbf{c}^2 = (c_1^2, \dots, c_n^2) \in \mathbb{R}_+^n$ , we have  $\Gamma(\mathbf{c}^1 + \mathbf{c}^2) = \Gamma(\mathbf{c}^1) + \Gamma(\mathbf{c}^2)$  for all  $\Gamma \in \mathcal{G}$ .

Additivity is a classical axiom in the cooperative game theory (Shapley, 1953) as well as in the cost sharing literature (Moulin, 2002). As a (mathematical) structural invariance axiom, Additivity itself has no normative or equity meaning. However, for our pollution cost sharing problem, we can provide the following interpretation.

Imagine that each firm  $i \in N$  has two divisions with costs,  $c_i^1, c_i^2$ , respectively and located along two different rivers. Then, Additivity says that it is the same either we allocate the overall total cost vector or we allocate the two separate cost vectors and then add them together.

No Blind Cost: For any  $\Gamma \in \mathcal{G}$  and any  $\mathbf{c} \in \mathbb{R}_+^n$ , if  $c_i = 0$ , then  $X_i(\Gamma) = 0$ .

No Blind Cost says that if an agent incurs no pollution cost (e.g., the agent does not pollute at all) the agent shouldn't bear any cost.

Efficiency:  $\sum_{j=1}^n x_j = \sum_{j=1}^n c_j$

Theorem 1 The LRS method is the only method satisfying Additivity, No Blind Cost, and Efficiency.

The LRS method clearly indicates that all firms are treated fairly in the sense that no cost is imposed on a firm which bears no local responsibility at all, and that the cost distribution is anonymous: even if a firm changes its location, its cost share does not change. These two features together with Additivity and Efficiency remind us that there would be some connections between the LRS method and the Shapley value of certain game induced from the problem. Indeed, the following proposition shows that the LRS

solution exactly coincides with the Shapley value of the game  $(N, \varphi)$  for all  $\alpha \in \mathbb{R}^n_+$ .

We have the following proposition.

**Proposition 1** For all  $\alpha \in \mathbb{R}^n_+$  and  $\varphi$  defined by (3), we have  $X_i^{LRS}(C) = \varphi_i(\alpha)$ .

Discussion.

### Characterization of the Shapley Value for Sovereign

Games

In this subsection, we first provide an axiomatic characterization of the Shapley Value method using the sovereign games generated from the problem. Then we show that the Shapley value is in the core. First we introduce the following two axioms.

**Independence of Upstream Costs:** For any  $\alpha \in \mathbb{R}^n_+$ , any  $\alpha', \alpha'' \in \mathbb{R}^n_+$

Such that  $\alpha_i = \alpha'_i = \alpha''_i$  for all  $i \in \hat{P}^j(\alpha)$ , then for all  $\alpha \in \hat{P}^j(\alpha)$ , we have  $\varphi_i(\alpha) = \varphi_i(\alpha')$ .

This axiom is based on the Downstream Responsibility principle, which in turn, extends the responsibility version of the theory of the Unlimited Territorial Integrity. It says that an agent's cost share only depends on her own pollution cost as well as all downstream costs, but not on upstream costs for which she has no control or responsibility.

**Upstream Symmetry:** For any  $\alpha \in \mathbb{R}^n_+$ , for all  $i, k \in \hat{P}^j(\alpha)$ , we have  $X_j(0, \dots, 0, c_i, 0, \dots, 0) = X_k(0, \dots, 0, c_i, 0, \dots, 0)$ .

The Upstream Symmetry requires that all upstream agents have equal responsibilities for a given downstream pollution cost. As we explained in the introduction, we treat all upstream agents equally in terms of responsibility for a given downstream cost because we assume that, first, pollution cannot be washed away easily, and secondly, it is hard to tell exactly how much each upstream agent contributes to the given downstream cost. Moreover, the axiom implies that any agent, no matter how far she is from any of her downstream agents, her responsibility extends.

Now we have the following theorem.

**Theorem 2** For any Sovereign game, the Shapley value method defined by (5) is the one and only one method satisfying Additivity, Independence of Upstream Costs, Upstream Symmetry, No Blind Cost of Irrelevant Permission, and Efficiency. And further it is in the core of the corresponding Sovereign game.

### Characterization of the Shapley Value for Authoring

Games

In this section, we first provide an axiomatic characterization of the Shapley value for the Authoring Games generated from the problem. Then we show that the Shapley value is in the core. First, we introduce the following axiom.

Downstream Equal Impact: For any  $\square \in \mathcal{P}$ , for all  $\square, \square' \in \hat{\mathcal{P}}^1(\square)$ , we have  $X_j(0, \dots, 0, c_i, 0, \dots, 0) = X_k(0, \dots, 0, c_i, 0, \dots, 0)$ .

The Downstream Equal Impact requires that all downstream agents are equally affected by a upstream agent who has to get permissions from all her downstream agents according to the permission structure. As we explained in the introduction, we treat all downstream agents equally in terms of responsibility for a given upstream cost because we assume that, first, pollution cannot be washed away easily, and secondly, it is hard to tell exactly how much a given upstream agent's pollution affects each downstream agent.

Moreover, the axiom implies that any agent, no matter how far she is from any of her upstream agents, she is equally affected. This is the implication of the Unlimited Territorial Integrity (UTI).

Now we have the following theorem.

**Theorem 3** For any authorizing game, the Shapley value method defined by (6) is the one and only one method satisfying Additivity, Independence of Downstream Costs, Downstream Equal Impact, No Blind Cost of Irrelevant Permission, and Efficiency. And further it is in the core of the corresponding authorizing game.

*Proof :* We also divide the proof into three steps which are similar to those in proof of Theorem 2.

**Step 1:** We show that the DES method defined by (10) is the one and only one method satisfying Additivity, Independence of Downstream Costs, Downstream Equal Impact, No Blind Cost of Irrelevant Permission, and Efficiency. Clearly, it is easy to check that the DES method  $\Phi_i^{\text{DES}}$  satisfies these five axioms.

Now we turn to the "if" part. Suppose that a cost sharing method  $\Phi_i$  satisfies these five axioms. Fix arbitrarily a tree consisting of  $n + 1$  nodes.

To be completed.

### **An Application**

This proposed project is a real example taken from a current Asian Development Bank (ADB) loan project in P.R.China. The lake in interest is Bai Yang Dian lake catchment, which plays a key role in preserving the ecological environment in Northern China. The lake was used to be very large historically, but due to overuse of water from inflow rivers and the lake itself, the lake was almost completely dry during 1980-87. The lake then was subject to severe dry ups later on, and the Chinese Ministry of Water Resource and State Council had to intervene, ordering the local government to discharge water from upstream reservoirs for rescue.

The following diagram shows the geographical structure of the project.

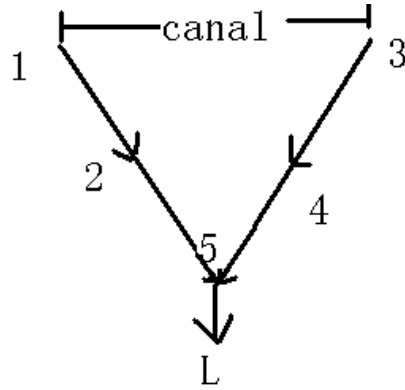

FIG. 2: PROPOSED CANAL PROJECT LINKING RESERVOIRS 1 AND 3

In this problem, we have the following permission structure  $\square$ .

$$\square(1) = ; , \square(2) = 1 , \square(3) = 1 , \square(4) = 3 , \square(5) = 2 , 4$$

The transitive closure of P is given as follows.

$$\hat{P}(1) = ; , \hat{P}(2) = \{1\} , \hat{P}(3) = \{1\} , \hat{P}(4) = \{1, 3\} , \hat{P}(5) = \{1 , 2 , 3 , 4\}$$

$$\hat{P}^1(1) = \{2 , \square , \square , 5\} , \hat{P}^1(2) = \{5\} , \hat{P}^1(3) = \{4 , 5\} , \hat{P}^1(4) = \{5\} , \hat{P}^1(5) = ;$$

The Sovereign Game  $\square^{\square\square\square}(\square)$ .

$$\square^{\square\square\square}(C)(1) = C(1, 2, 3, 4, 5), \square^{\square\square\square}(C)(2) = C(2, 5), \square^{\square\square\square}(C)(3) = C(3, 4, 5),$$

$$\square^{\square\square\square}(C)(4) = C(4, 5), \square^{\square\square\square}(C)(5) = C(5),$$

$$\square^{\square\square\square}(C)(1, 2) = C(1, 2, 3, 4, 5), \square^{\square\square\square}(C)(1, 3) = C(1, 2, 3, 4, 5),$$

$$\square^{\square\square\square}(C)(1, 4) = C(1, 2, 3, 4, 5), \square^{\square\square\square}(C)(1, 5) = C(1, 2, 3, 4, 5),$$

$$\square^{\square\square\square}(C)(2, 3) = C(2, 3, 4, 5), \square^{\square\square\square}(C)(2, 4) = C(2, 4, 5), \square^{\square\square\square}(C)(2, 5) = C(2, 5),$$

$$\square^{\square\square\square}(C)(3, 4) = C(3, 4, 5), \square^{\square\square\square}(C)(3, 5) = C(3, 4, 5), \square^{\square\square\square}(C)(4, 5) = C(4, 5),$$

$$\square^{\square\square\square}(C)(1, 2, 3) = C(1, 2, 3, 4, 5), \square^{\square\square\square}(C)(1, 2, 4) = C(1, 2, 3, 4, 5),$$

$$\square^{\square\square\square}(C)(1, 2, 5) = C(1, 2, 3, 4, 5), \square^{\square\square\square}(C)(1, 3, 4) = C(1, 2, 3, 4, 5),$$

$$\square^{\square\square\square}(C)(1, 3, 5) = C(1, 2, 3, 4, 5), \square^{\square\square\square}(C)(2, 3, 4) = C(2, 3, 4, 5),$$

$$\square^{\square\square\square}(C)(2, 3, 5) = C(2, 3, 4, 5), \square^{\square\square\square}(C)(3, 4, 5) = C(3, 4, 5),$$

$$\square^{\square\square\square}(C)(1, 4, 5) = C(1, 2, 3, 4, 5), \square^{\square\square\square}(C)(2, 4, 5) = C(2, 4, 5),$$

$$\square^{\square\square\square}(C)(1, 2, 3, 4) = C(1, 2, 3, 4, 5), \square^{\square\square\square}(C)(1, 3, 4, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Sov}}(C)(2, 3, 4, 5) = C(2, 3, 4, 5), \varphi^{\text{Sov}}(C)(1, 2, 3, 4, 5) = C(1, 2, 3, 4, 5).$$

$$\varphi^{\text{Sov}}(C)(1, 2, 3, 5) = C(1, 2, 3, 4, 5), \varphi^{\text{Sov}}(C)(1, 2, 3, 4, 5) = C(1, 2, 3, 4, 5).$$

The Authoring Game  $\varphi^{\text{Auth}}(\varphi)$ .

$$\varphi^{\text{Auth}}(C)(1) = C(1), \varphi^{\text{Auth}}(C)(2) = C(1, 2), \varphi^{\text{Auth}}(C)(3) = C(1, 3),$$

$$\varphi^{\text{Auth}}(C)(4) = C(1, 3, 4), \varphi^{\text{Auth}}(C)(5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(C)(1, 2) = C(1, 2), \varphi^{\text{Auth}}(C)(1, 3) = C(1, 3),$$

$$\varphi^{\text{Auth}}(C)(1, 4) = C(1, 3, 4), \varphi^{\text{Auth}}(C)(1, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(C)(2, 3) = C(1, 2, 3), \varphi^{\text{Auth}}(C)(2, 4) = C(1, 2, 3, 4),$$

$$\varphi^{\text{Auth}}(C)(2, 5) = C(1, 2, 3, 4, 5), \varphi^{\text{Auth}}(C)(3, 4) = C(1, 3, 4),$$

$$\varphi^{\text{Auth}}(C)(3, 5) = C(1, 2, 3, 4, 5), \varphi^{\text{Auth}}(C)(4, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(C)(1, 2, 3) = C(1, 2, 3), \varphi^{\text{Auth}}(C)(1, 2, 4) = C(1, 2, 3, 4),$$

$$\varphi^{\text{Auth}}(C)(1, 2, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(C)(1, 3, 4) = C(1, 3, 4), \varphi^{\text{Auth}}(C)(1, 3, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(C)(2, 3, 4) = C(1, 2, 3, 4), \varphi^{\text{Auth}}(C)(2, 3, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(C)(3, 4, 5) = C(1, 2, 3, 4, 5), \varphi^{\text{Auth}}(C)(1, 4, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(C)(2, 4, 5) = C(1, 2, 3, 4, 5), \varphi^{\text{Auth}}(\varphi)(1, 2, 3, 4) = C(1, 2, 3, 4),$$

$$\varphi^{\text{Auth}}(\varphi)(1, 3, 4, 5) = C(1, 2, 3, 4, 5), \varphi^{\text{Auth}}(\varphi)(2, 3, 4, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(\varphi)(1, 2, 3, 5) = C(1, 2, 3, 4, 5), \varphi^{\text{Auth}}(\varphi)(1, 2, 4, 5) = C(1, 2, 3, 4, 5),$$

$$\varphi^{\text{Auth}}(\varphi)(1, 2, 3, 4, 5) = C(1, 2, 3, 4, 5).$$

The Shapley value of the Sovereign Game can be calculated as follows.

The Shapley value of the Authoring Game can be calculated as follows.

On top of the drying up, the lake is also subject to serious contamination. With rapid economic growth in surrounding areas, particularly with the rise of leather industry, increased power generation and paper mills, almost all wastewater in surrounding counties was untreated and was directly discharged into the rivers and eventually to the lake.

In 2003, the lake was highly polluted such that fishes in the lake were dying, attracting media's attention and causing criticisms from the mass. The government then released 150 million cubic meters of water from reservoirs 1 and 2, trying to dilute the pollutant. But on the contrary, more fishes died because the water current in river path 1-2-5 pushes the stagnate sewage (in County 1 denoted by node 2) into the lake, which further polluted the lake. If they did not discharge large amount of water from reservoir in node 1, the sewage in node 2 would infiltrate into the ground, resulting local groundwater pollution, but not the lake's.

However, if only use the water from reservoir in node 3, it will not be sufficient since it is relatively small in scale and it supplies living water for Baoding municipality (node 4 in the diagraph). Furthermore, part of river 1-2-5's watercourse belongs to Shijiazhuang municipal jurisdiction and the use of the water is thus out of node 4's control.

In light of these, Baoding government (node 4) proposed the linkage project which connects the two reservoirs nodes 1 and 2 so that water holdings in reservoir node 1 can be used to dilute pollution in the lake and meet the living water demand at the same time.

This proposed project costs about 24 million US dollars. However, the benefits are unclear except that less pollution would be brought into the lake from the river path 3-4-5. Also the current water demand in Baoding at node 4 can be met by reservoir at node 3, thus the extra water from node 1 is not needed at node 4. If the canal is not to be built, an alternative is to build a wastewater treatment plant at node 2 which will stop pollutants being driven to the lake if river 1-2-5 is used as effluent channel. However, the local County at node 2 does not want to bear the entire cost of building such a wastewater treatment plant.

Our recommendation to this lake pollution cost sharing problem is as follows. The Canal project should be built and its construction costs shall be treated as pollution cost and be allocated to all parties involved. The cost share assigned to lake 1 (node 1) should be taken by government. This solution combines pollution cost sharing with water sharing.

## **Abstract**

Changing business environment continues to redefine strategic requirements for corporate survival and success. At the dawn of the five-year Kyoto Protocol era, many companies are fine-tuning their strategic posture for the new market regime and beyond. Some are even proactively seeking corporate social opportunities in their green business pursuit through innovative management thinking and practice beyond their corporate social responsibility. This study will explore challenges and opportunities associated with such a pursuit. More specifically, it presents a case study of strategic green sourcing pursuit of Japanese paper and pulp manufacturer, Oji Paper Co. and examines challenges and opportunities in the company's internal woodchip sourcing capacity-building effort through overseas afforestation under its Environmental Charter. Drawing on available information, the paper will evaluate alternative strategic options for the company's overseas plantation area expansion and devise an action plan.

## **Introduction**

Changing business environment continues to redefine strategic requirements for corporate survival and success. In addition to ever-intensifying global competition since early 1990s, multinational companies have been addressing challenges associated with growing public concern with global warming independently and/ more often collectively in their supply chain. After two decades since the establishment of Intergovernmental Panel on Climate Change, the United Nations in 1988, finally concerned countries will begin their collective journey to reverse the damage caused to our planet since industrial revolution under the so-called Kyoto Protocol which came in effect in February 2005. At the dawn of the five-year Kyoto Protocol era, many companies are fine-tuning their strategic posture for the new market regime and beyond to comply with a new set of regulations, market challenges, and corporate social responsibility. There are even some companies that have been proactively seeking corporate social opportunities in

their green business pursuit through innovative management thinking and practice beyond their corporate social responsibility. This study will explore challenges and opportunities associated with such a pursuit. More specifically, it presents a case study of strategic green sourcing pursuit of Japanese paper and pulp manufacturer, Oji Paper Co., and examines challenges and opportunities in the company's internal woodchip sourcing capacity-building effort through overseas afforestation. Drawing on available information, the paper will evaluate alternative strategic options for the company's overseas plantation area expansion and devise an action plan.

## Setting the Scene

### Albany, Western Australia

Albany is the centre of the Great Southern Region of Western Australia, Australia. It is the most southerly town in the state, about 409 km from the state's capital city (see Fig1: Albany, Western Australia). In the state, it is more commonly known for its historical heritage (i.e., the oldest British settlement site) and natural beauty (a typical Mediterranean climate and scenic coastal views). Historically the city had developed as the principal international port and later, the centre of whaling industry. Ironically these have long become something of the distant past. In 1900, the Port of Albany lost its iconic international status in the state and then, in 1978 the whaling industry was shut down under the growing public environmental concern. In recent decades, Albany gained popularity as a tourist destination for the historical and natural attractions. And more recently it has grown to the national capital of eco-conscious hardwood, or more specifically bluegum (*Eucalyptus globulus*), plantations and a likely Mecca of eco-tourists in the growingly environment-conscious world.

FIG1: ALBANY, WESTERN AUSTRALIA

Source: Bureau of Rural Sciences (2006) Figure 01: National Distribution of Plantations, p. 4

Between 1991 and 2001, the region experienced the rapid increase of the total plantation area from 6,150 to 127,500 hectares of which 93 per cent accounted for bluegum plantations; notably, 80 per cent of the bluegum plantations took place between 1996 and 2001 (Schirmer et al. 2005). According to Whittington (2002, p. 4), the region's bluegum plantations grew to cover 130,000 hectares and the scale is "by far the largest resource in Australia" with the expected annual export value of A\$120 million. A more recent government report estimates the bluegum plantations area to be 135,000 hectares with the estimated value of A\$500 million (Department of Local Government and Regional Development, 2006, p.10). Given the estimated peak of 150,000 hectares mark (Timber 2020, n.d.), there is room for some more expansion.

#### **Albany Woodchips Export Industry**

The extraordinary regional transformation was not something planned nor achieved by any single agent. It has been a product of collective engagements by and partnerships among different parties. However, the due recognition should be paid to the Department of Conservation and Land Management (CALM) of the Western Australian State Government that established the foundation for the region's later transformation. In 1988 it began bluegum plantations on cleared, run-down farm lands in Albany to combat the prevailing land degradation problem caused by salinity and water logging under sharefarming agreements with local landowners. (A sharefarming scheme enables landowners to receive a fair share of return from bluegum plantations on their lands under the concept of the farm forestry.) In 1993 Albany Plantation Forest Company of Australia Pty., Ltd (APFL) came to the scene with the objective of planting 26,000 hectares of bluegum trees in the region for the purpose of woodchip export with initial A\$100 million investment in the establishment phase (APFL 2005). Instrumental to this long-term project whose investment scope stretches over 30 years was the State Government's assurances for the company's commercial rights through the Albany Hardwood Plantation Agreement Act 1993 which also endorsed a partnership agreement with the local expert CALM South Coast Sharefarms. (For detailed discussions on their partnership, refer to Tamaki's (1999) "Green Business Alliances: the case of a Japanese/Australian joint forest plantation project".) The presence of APFL in the region as well as the Federal Government's nation-wide promotion of plantations (i.e., 'Plantations for Australia: the 2020 Vision') brought prominent Australian agribusiness investment firms (e.g., Great Southern Plantations Ltd., Timbercorp Securities Ltd., and Integrated Tree Cropping Ltd.) into bluegum plantations in the region. While creating intensified competition for bluegum plantation lands, these new comers accelerated a speed of the regional transformation as the country's centre of eco-conscious industrial plantations.

After a rather quiet initial plantation phase of some ten years, in late 2001 the region started preparing itself hastily for the emergence of a new industry when the region’s first bluegum harvesting began. Within the following six months, more than A\$ 50 million infrastructure development projects were completed including “the woodchip mill, rail connection, port and shiploading facilities” (Whittington 2002, p. 4). Fig2 depicts an overall picture of the emerged woodchips export industry value chain. Then in March 2002 the region’s first woodchips were shipped to the destination, Japan. According to Whittington (2002), this new industry is projected to produce an annual export trade of 1.5 million tonnes of woodchips worth A\$ 120 million. Of the export volume, it was reported that a sub-value chain consisting of APFL and Albany Plantation Export Company Pty., Ltd. alone would ship 700,000 tonnes of woodchip a year by the end of 2005 (Manning 2005). In July 2005, the region witnessed another development in the industry when Timbercorp Securities Ltd. and Integrated Tree Cropping Ltd., which employ the integrated woodchip production (i.e., harvesting and infield mobile chipping) system, began to ship their woodchips to Japan through their jointly operated pulpwood terminal, Albany Chip Terminal (Albany Port Authority 2005 & 2006).

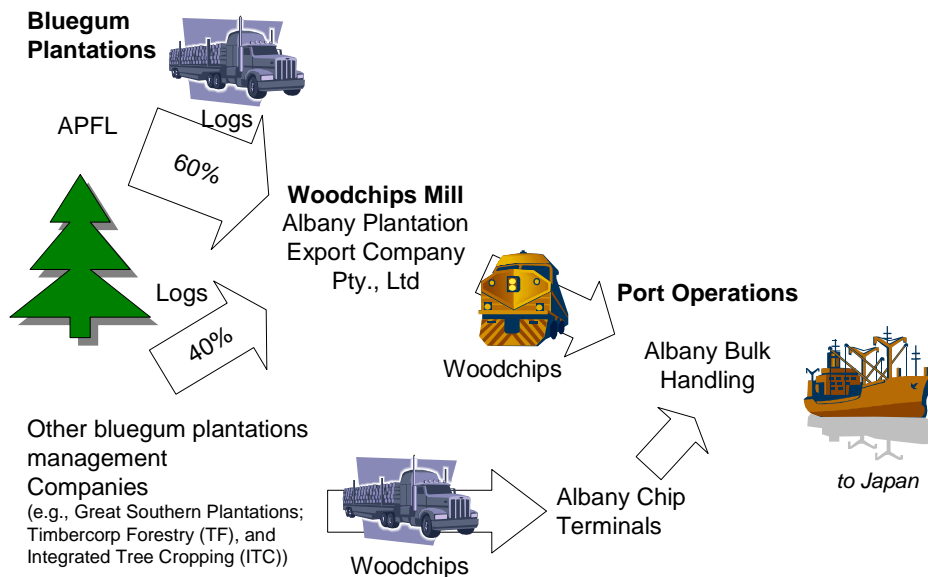

FIG 2: THE ALBANY WOODCHIPS EXPORT INDUSTRY VALUE CHAIN

Noteworthy in the value chain (Fig 2) is the involvement of Japanese business interests. In particular, three business entities deserve some detailed discussion. First the bluegum plantation company APFL is a joint venture

between leading Japanese companies. It was originally formed by Oji Paper Co., Ltd., Itochu Corp., and Senshukai Co., Ltd. The paper and pulp company held a majority share (51 per cent) of the joint venture while the trading company and the mail order company held a 30 and a 19 per cent share, respectively. This joint venture is a vertical strategic alliance formed between the paper manufacturer at the centre and its two adjacent down- and up-stream partners. The driving force of this partnership was the future strategic challenge shared: 1) ensuring a future woodchip supply through sustainable management of forests in the ever-growing demand for paper and 2) pursuing corporate excellence in greener business process, in this case, 'green sourcing' of woodchip through afforestation and forest recycling. APFL is renowned to be the first Japanese commercial plantation project in Western Australia and the second in the country to a joint venture project established in 1989 in New South Wales between Nippon Paper Industries Co., Ltd. and Itochu Corp. (Japan Overseas Plantation Centre for Pulpwood, n.d.). More recently APFL attracted two more prominent Japanese companies as a shareholder with the following share holding composition: Oji Paper Co. (48.45%), Itochu Corp. (28.37%), Senshukai Co. (13.18%), Tohoku Electric Power Co. (5%), and Nippon Yusen Kaisha Line (5%) which has been carrying the woodchips from Albany to the Oji Paper Group in Japan. Second APEC was formed in March 2000 as a joint venture between Oji Paper Co. and Itochu Corp. with the former holding 51 per cent of share of the company. As indicative from the ownership structure, the company was primarily established to process APFL's bluegum harvests for chipping and shipping to Oji Paper Co. in Japan. Lastly, Albany Bulk Handling is an international joint venture between Itochu Corp. and local company, Toll Logistics (Ports and Resources Division). Although the APFL-APEC value chain failed to meet the early plan to export 700,000 tonnes of woodchips in 2005, the export volume has been increasing progressively from 33,000 tonnes in 2001 to 642,000 tonnes in 2005, with the 2007 forecast of 840,000 tonnes (Ando 2006). Currently APFL supplies some 60 per cent of input to APEC's processing and the rest is sourced mostly from Great Southern Plantations (Ando 2006).

### **Oji Paper Co., Ltd. and the Oji Paper Group**

Oji Paper Co. is one of Japan's oldest and largest paper manufacturing companies. More recently it has transformed itself into a global and highly integrated paper and pulp manufacturer, leading the diverse corporate group consisting of 220 subsidiaries and 86 affiliates across national boundaries (Oji Paper Co., Ltd. 2006). For the 2006 fiscal year which ended March 2007, the company is reported to record a consolidated group pretax profit of 64.5 billion yen and sales of 1.27 trillion yen, leaving behind its archrival Nippon Paper Group which is said to report 46 billion yen and 1.18 trillion yen for the respective financial criteria (The Nikkei Weekly 2007a).

Since the early 1990s, the company has been challenged for its ability to better meet ever changing requirements for corporate survival in the resource- and increasingly capital-intensive business. For instance, it endured a pains-taking corporate re-engineering pursuit in the hostile environment which can be illustrated by a decade long post-bubble recession, the rising fuel and raw material costs, and ever-increasing global competition.

Earlier Tamaki (1999) described Japan's well-established place in the world as the world second largest paper and pulp producer, next to the United States of America. However, by 2001, China had grown to claim the second place (see Table 1).

TABLE 1: WORLD TOP TEN PRODUCERS OF PULP AND PAPER: 1998, 2001 & 2004

<u>1998</u>		<u>2001</u>		<u>2005</u>

(unit: 1,000 tonnes)

(Source: Pulp & Paper International Annual Review 1999, 2002 & 2006)

Statistics in Tab1 are indicative of two underlying market trends: the rapid development of China as a pulp and paper producer (i.e., a more than twofold increase over the 1998-2005 period) and a clear upward trend of pulp and paper production even by the total output of the world's nine producers excluding China (i.e., a 5.6 per cent increase over the same period).

The established logic of global-scale market competition has been accelerating market consolidation both inside and outside of Japan. Following its merger with Toyo Pulp in 1989, Oji Paper Co. has continued to pursue capacity-building for scale and integration for global competition through mergers and acquisitions. For instance, it merged with Kanzaki Paper in 1993 and with Honshu Paper in 1996 to build a further manufacturing capacity. More recently, the company shook the industry with its unprecedented hostile take-over bid against Hokuetsu Paper Mills. Though the bid was unsuccessful, blocked by its archrival, the take-over bid clearly signalled the company's great appetite for capacity-building and consolidation. This consolidation effort among pulp and paper manufacturers is not unique to the company nor the country. For instance, in 2001 Nippon Unipac Holding (holding

company of Nippon Paper Industry) and Daishowa Paper Manufacturing Co., Ltd formed to merge Nippon Paper Group, Inc. In Finland three paper and pulp companies merged to form UPM in 1995, and more recently in the U.S., Weyerhaeuser (US) took control of Willamette (US) in 2002. However, this industry-wide consolidation effort for the emerged global competition can be best illustrated by the emergence of mega company Stora Enso (Finland) through an international merger between Enso (Finland) and Stora (Sweden) in 1998. According to Pulp & Paper International Annual Review 2005 (2006), the company was ranked, by output (14.3 million tonnes), the world second largest pulp and paper manufacturer next to International Paper (USA). In the same year, Oji Paper was ranked sixth with just under 8.2 million tonnes of output whereas UPM-Kymmene (Finland) and Weyerhaeuser (US) were ranked third (10.2 million tonnes) and fifth (8.9 million tonnes), respectively.

As part of its proactive global strategy, Oji Paper Co. has been exploring market opportunities in Asia, especially in China. Since 1995, it has established six ventures in China: Shanghai Eastern Oji Packaging (1995), Qingdao Oji Packaging (1997), Oji Speciality Paper (Shanghai) (2002), Oji Paper Nepia (Suzhou) (2002), Suzho Oji Packaging (2002), and Oji Kinocloth (Shanghai) (2005), and, after three years of waiting, now the Nantong Project in Jiangsu Province, large-scale integrated pulp and paper mill, is under way (Oji Paper Co. Ltd., n.d.<sub>1</sub> & 2006b). Fig3 depicts the Oji Paper Group's overseas activities.

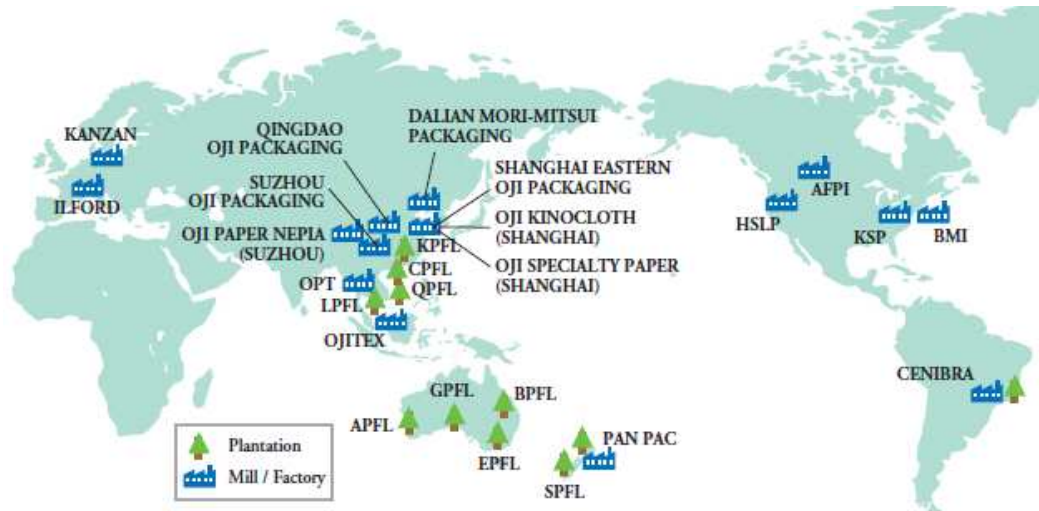

FIG3: THE OJI PAPER GROUP'S OVERSEAS ACTIVITIES

Source: Oji Paper Co., Ltd., 2006, Oji Paper in Prospective, 2006, p. 54: Overseas Activities

As seen in Fig2, Oji Paper Co. has 11 overseas plantation ventures. (Note that all the ventures are jointly funded most commonly with Japanese trading companies like the case of APFL and sometimes even involving local partners.) Of these, nine ventures are bluegum plantations. All these bluegum afforestation ventures began since the early 1990s, starting off with SPFL (1992) in New Zealand, moving into Australia (APFL in 1993, GPFL in 1997, BPFL in 1998 and EPFL in 1999) and Vietnam (QPFL in 1993), and more recently in Laos (LPFL in 1999) and China (CPFL in 2001 and KPFL in 2005) (Oji Paper Co., n.d.2). In the conventional sense, the series of aggressive overseas afforestation activities can be explained by the company's 'strategic need' to secure a stable supply of quality woodchips more from internal supply sources to better prepare the Group for a future paper market demand in global market (especially in rapidly growing Asian markets) and 'strategic intent' to pursue excellence in corporate social responsibility of protecting forests and the environment under the concept of forest recycling. Furthermore, in light of the Oji Group's vertical integration pursuit, it is logical to seek actively self-supply sources of woodchips in overseas countries that promise a superior growth rate of trees (i.e., a shorter harvest cycle). In particular, as for the 'strategic intent', the Group established 'Oji Paper Environmental Charter' and actions plan in 1997 to better address the growing public concerns with environment and climate change. The Charter's basic policy states:

*The Oji Paper Group Environmental Charter requires the Oji Paper Group to help create a truly enriched and sustainable society by developing business activities that harmonize with the environment from a global perspective. The Charter calls for the Oji Paper Group to make autonomous efforts to achieve further environmental improvement, and aggressively drive its forest recycling, paper recycling, and global warming countermeasures forward. (Oji Paper Co., 2006, p.52)*

Since its formation, the Charter has been guiding the Group's strategic posture. For instance, building on conventional Oji Paper Co.'s pursuit of recycling (i.e., paper and forest) and operational efficiency, the Group have actively sought ISO14001 accreditation. The Charter also led to the formation of the 'Oji Paper Group Partnership Procurement Policy' in 2005, and within the framework, the Group defines the 'Wood Raw Material Procurement Guidelines' which promotes, among others, sourcing of raw materials from forest plantations as opposed to natural forests, and those forest operators certified by the Forest Stewardship Council (FSC) for their sustainable forest management (Oji Paper Co., 2006). In Kolk and Pinkse's framework (2005) consisting of six green business strategic configuration types, these manifested Group policy and practice collectively define the Group's green business strategy as a combination of 'internal' and 'vertical explorer' strategic configurations. That is, a combination of "a strong internal focus, which involves a combination of targets and improvement" and "a strong focus on measures within the supply chain" (Kolk and Pinkse 2005, p. 14).

Of the numerical targets set for Year 2010 under the Charter's action plan (i.e., the Environmental Action Plan 21), noteworthy is the revised overseas afforestation area target and more specifically new strategic drivers behind it. In 2003, Oji Paper owned (to be precise 'jointly owned' as all overseas plantations are joint ventures) some 140,000 hectares of forest plantations overseas, 60,000 hectares short of the original FY 2010 target set in 1997; however, it revised the plan by more than doubling the target to 300,000 hectares (The Nikkei Weekly 2005). Given the fact that it took the aggregate of over 50 years of investments in eight afforestation projects across five countries to reach the 2003 plantation area total, the new target is an overly ambitious one. Given that, there seem new strategic agendas behind the new target.

Two of such new strategic agendas are apparent. First is the aforementioned 'Nantong Project' - a joint venture between Oji Paper Co. (90 per cent) and local paper manufacturer affiliated with the local municipal, which is the biggest project ever led by an overseas paper and pulp manufacturer in China (The Nikkei Weekly 2006a). The new plant will substantially increase the Group's appetite for raw materials, such as woodchips. Another seems to stem from the defining feature of forest lands in the environment - i.e., its ability to store carbon and sequester carbon dioxide (i.e., carbon sink). It is concerned with 'carbon credits' associated with afforestation/reforestation projects under the Kyoto Protocol Article 3.3; forest management under Article 3.4; and the Clean Development Mechanism (CMD). While the first two counter-measures for global warming are concerned with Annex I countries' domestic efforts to meet the set greenhouse gas emission targets, the third is innovative alternative to the Kyoto's 'cap-trade' mechanism which promotes joint efforts between Annex I countries and non-Annex I (i.e., developing) countries. Under the afforestation/ reforestation CMD project, an Annex I CMD project partners can receive Certified Emission Reduction credits for their greenhouse gas mitigation projects in the non-Annex I host country. As for the Group, in 2003, Oji Paper Co. undertook basic plantation research in Madagascar to explore a feasibility of a bluegum afforestation project as a carbon sink CDM (Global Environment Centre Foundation, GECF, 2003). In 2005, the Oji Paper Co. also conducted a similar feasibility study for its CDM project application concerning a future expansion of its Lao bluegum plantations led by Oji Lao Plantation Forest Co., Ltd. (Oji Paper Co. n.d.<sub>3</sub>). Building on these field feasibility studies, Oji Paper Co. has submitted a project proposal for a carbon sink CMD project through bluegum afforestation and reforestation in Madagascar to the U.N.'s CDM executive board (The Nikkei Weekly 2006b).

Table 2 summarises the Group's overseas plantations activities as of March 2006. Tab2 clearly shows the performance-aspiration gap between the 2006 plantation area total (152,344 ha) and the Y2010 target (300,000 ha). Notably, the discrepancy is still evident even with the target plantation area total (260,560 ha), and with additional some 10,000 hectares of the proposed Madagascar plantation project.

TABLE 2: THE OJI PAPER GROUP OVERSEAS PLANTATIONS ACTIVITIES

<u>Host Country</u>	<u>Company</u>	<u>Establishment</u>	<u>Target Plantation Area (ha)</u>	<u>Plantation Area (PA)</u>	<u>Oji Share (%)</u>	<u>Harvest Cycle (Year)</u>
<b><u>Chip Project</u></b>

Brazil	CENBRA	1973	43,450	49,141*	32.3%	7
<b><u>Total</u></b>			260,560 (270,560)	152,344		
<b><u>Y2010 Target</u></b>			300,000			

Note: All plantation areas are those as of March 2006, except figures with asterisk which record plantation areas as of December 2005.

(Based on Oji Paper Co., n.d., Shokurin Saizensen)

Since the historical declaration of the Kyoto Protocol in December, 1997, many progresses have been made to support implementation efforts of the international joint climate change effort. In particular as for afforestation and reforestation, the 2001 Marrakesh Accords opened the avenue for afforestation/reforestation based CMD projects, or sink CMD project. And it was again emphasised that such a CMD project needs to facilitate a sustainable local development in a host country. Then in 2003, the Milan Conference refined the carbon accounting mechanism with introduction of Certified Emission Reduction credits (i.e., tCMD and lCMD) by taking into account the 'non-permanence' nature of carbon sink projects as opposed to permanent emission reduction through technology-based CMDs. Unfortunately, these unfolding of the Kyoto Protocol seem to have been a disappointment to international paper and pulp manufacturers. As explicated in the aforementioned two Oji Paper Co.'s feasibility study reports (GECF 2003 & 2005), sink CMD projects do not seem to be an attractive venture in the conventional commercial sense, even after taking into account financial benefits associated with the carbon credits. In other words, in a sink CMD project pursuit, an organisation needs to be willing to accept a break-even or even loss-making in a sink CMD project in exchange of carbon credits equivalent to the project financial loss and contribution to the host community's sustainable development.

Though highly debatable, corporate citizenship theorists urge multinational organisations to pay more attention to their ethical responsibility and volition, promoting their active involvement with such a project with a high positive social impact and low or even negative economic return. Along this line, Grayson and Hodges (2004) event challenge organisation's innovative capability to transform 'responsibility' into 'corporate social opportunity' whereby the organisation can pursue the seemingly two incompatible goals simultaneously. In the context of the Oji Paper Group and in line with its Environmental Charter, these arguments reinforce the importance of a multi-perspective decision-making framework for selection and evaluation of its overseas afforestation and forest recycling projects. At the Group, this concept is promoted and led by President and CEO Shinoda who asserts that the Group should pursue its business based on the assumption that "(p)rotecting the environment comes at a cost" (Oji Paper Group, 2006c, p.7). Such a strategic pursuit of corporate social responsibility seems to pay dividends in the heightening domestic market competition from overseas low-cost producers (especially from China), by appealing to environment conscious domestic customers.

When trees of 300,000 hectares of overseas plantations come to maturity for harvesting, Oji Paper Co. is said to increase the internal sourcing ratio of imported woodchips to 40 per cent (Oji Paper Co. 2007). With the ever-intensifying global competition in sourcing of raw materials due to depletion of natural forests in the traditional woodchip and pulp source countries as well as the growing public pressure on corporate social responsibility, it will not be a distant future when the company's pursuit of capacity-building through overseas afforestation and forest recycling becomes simply an operational necessity. In case of woodchip supply shortage, if not prepared, a paper manufacturer will simply have to forgo market opportunities. In particular given the long-term nature of bluegum plantation (i.e. a harvest cycle of 7 to 12 years), Oji Paper Co. needs to make strategic decisions on and investment in afforestation now for the Group's woodchip demand in ten years' time. However, at present the progress of the company's afforestation project seems stalled despite its strategic importance associated.

### **APFL as the Driver of Oji Paper Co.'s Internal Woodchip Sourcing Capacity-Building**

The Oji Paper Group is currently looking for a new plantation sites in China and Africa. Earlier Tamaki (1999, p.86) reported Oji Paper Co.'s key selection criteria for a new overseas plantation venture as follows:

- stable economic, political and legislative conditions;
- suitable local partner(s) with adequate technological expertise;
- the growing conditions of a selected tree(s), and productivity performance;
- land availability for the commercial size of the project;
- economic assessment of costs and infrastructure;

- any nationwide and local environment issues; and
- total feasibility of the long-term project.

These criteria remain intact (Oji Paper Group 2006). As readily imaginable for an investment with a timeline stretching over thirty years (consisting of three rounds of plantation and harvesting), a decision for a new bluegum plantation site selection involves an extended process of data and information gathering and negotiation. For instance, a testing of the growing conditions and tree growth alone can take a year. In light of the Y2010 target, this rules out the Oji Paper Group's plantation area expansion pursuit through new plantation sites alone. Such a pursuit needs to be combined with a further expansion effort at existing plantation ventures, especially by those left far behind their set targets, such as EPFL and LPH (see Tab2). More specifically, when an expansion strategy of overseas plantations is considered along the existing ventures and based on the criteria, APFL stands out as the prime candidate as the driver of the Group's overseas plantation expansion. Since its establishment in 1993, APFL has grown to be the Group's largest overseas woodchip afforestation venture, accounting for 15.6 per cent of the Group's overseas plantations area total and some 32 per cent of the bluegum plantation area total. The following sections analyse qualitatively and discuss its overall attractiveness deductively.

#### **LPH and KPFL**

All of Oji Paper Co.'s existing overseas woodchip plantations are located in Asia and Oceania, and all Asian plantations are interestingly in former or existing communist countries. In terms of size of the currently assigned plantation area target, LPH (Laos) and KPFL (China) easily exceed APFL. These Asian plantation ventures are of significant strategic importance given their respective shorter harvest cycles (i.e., 6 or 7 years vs. 10 years) and the proximity to the company's large scale paper and pulp factory in Nantong. Notably these are not a 'greenfield' bluegum afforestation projects led by Oji Paper Co.'s initiative.

As for LPH, Oji Paper Co. came to take control of a 85 per cent share of the company in February 2005 by acquiring the New Zealand company's stake in the original joint plantation venture with the Lao Government, which was formed in 1999 (GECF 2005b). On the contrary, KPFL was established through capital injection to the local plantation company. KPFL has the following three parent companies: Oji Paper Co., Marubeni Corp. (5%) and China's Guangdong Petro-trade Development Corp. Group (65%) with which the former sourced woodchips earlier (Oji Paper Co., n.d.4). Though the involvement of the local partners in these projects can be viewed advantageous in their unique business environment, it can also be a source of business risks. For instance, as evident in Tab2, LPH's plantation progress has been extraordinarily slow. (Note that LPFL in Fig3 has been renamed to Oji Lao Plantation Holdings Limited (LPH), following the new involvement of ten additional Japanese corporate shareholders who were allotted a marginal portion of Oji Paper Co.'s original 85% of the company stake (Sato Co., 2006)). However,

this reconfiguration of the company's ownership structure unfortunately was not followed by any additional capital injection to the project. Hence, it is unlikely to act as a change driver to the standstill LPH's afforestation project.

On the contrary, KPFL has been enjoying a speedy plantation establishment. However, this is not to guarantee KPFL's continuing development in the future. Given dynamic socio-cultural developments in the countries, the venture might attract public critique on and protest against its operations locally as well as internationally unless needs and wants of the local community are addressed proactively through community consultation. This point can be best illustrated by Oji Paper Co.'s experience with the former operations in Papua New Guinea and the failed bluegum afforestation attempt in Thailand. In particular with KPFL (and another plantation project in China, CPFL), inherent political tension between China and Japan should not be taken lightly. For instance, it was suspected that there were some political motives behind the extended lead time to the government approval of the aforementioned Nantong Project (i.e., three years) (The Nikkei Weekly 2006a). Furthermore, as observed in the past, when political conflict manifests itself between the two countries, it often ignites anti-Japanese sentiment in public and leads to orchestrated public protest. Especially when market competition between local Chinese paper and pulp manufacturers and their Japanese counterparts intensifies on the Chinese soil, it is likely that the business war would trigger such a public sentiment built on nationalism and this, in turn, may grow to jeopardise business interests of the Oji Paper Group and its partners in the country.

At a micro-level, these ventures are also inherited with problem with staffing. The aforementioned site selection criteria indicate that one of determinants of the successful overseas plantation operation is the availability of suitable local partners (e.g., subcontractors) with adequate skills and competence in performing field work (i.e., plantation, maintenance and risk management (e.g., fire)). As reported in Oji Paper Co.'s feasibility study in Laos, absence of skilled field workers poses a significant challenge to a progress and profitability of the venture (GECF 2005). This problem is also shared with afforestation projects in China where modern Western plantation management thinking and practice has a rather short history. By all means, these countries are important woodchip source countries to the Oji Paper Group, and need substantial support and coaching for the successful development of a sustainable forest plantation industry. Given the resource requirement and political risks, it is more logical than individual market opportunity pursuit, for the Group to initiate an international alliance with leading Western paper and pulp manufacturers in the countries to initiate the foundation of human resource development program with education and training program for the local on horticulture and sustainable forest management, and establish a bargaining power and lobbying capacity to safeguard its long-term business interest in the countries.

#### **Australia and APFL**

As opposed to the two countries, Australia and New Zealand provide more stable and established environment to afforestation businesses (e.g., a supportive legal framework and the presence of competent forest operators or local

subcontractors instrumental to Oji Paper Co.'s overseas plantation strategy) with fewer wildcards. Especially this is the case of Australia as the Federal Government in partnership with its state counterparts has been promoting forest plantations under 'Plantations for Australia: the 2020 Vision' with the goal to treble by 2020 the size of country's plantation estate through private-public partnership. The government initiative, which was launched in 1997 and relaunched in 2004, is said to have driven forestry plantations as one of fast growing sectors in agribusiness (Great Southern Plantations Ltd., 2005). Beside, over recent years Australia has emerged as the largest woodchip source country for Japan, accounting for over 30 per cent of the country's woodchip import market (Adviser Edge 2007).

One wildcard associated with Australia is its stance to a post- Kyoto Convention. For the first round of the Kyoto Protocol (i.e., 2008-2012), the Government, together with its US counterpart, decided not to partake the international effort to combat climate change. However, a likely future development of the country's stance to the issue is that it will eventually join the international joint effort under mounting public pressure for the country's social responsibility inside and outside of the country. Yet, the critical question of its timing is still unknown. With the anticipation of the future, however, New South Wales State Government has been proactively embracing the spirit of the Convention and preparing the state for more or less in line with the Kyoto Protocol and its successive COPs rulings on operational details. However, there is a noteworthy difference between the State and the Kyoto Convention in their approach in addressing the 'non-permanence of carbon storage' issue. Taking a more literal interpretation of the concept, NSW Government has developed a carbon accounting mechanism based on a so-called 100-year rule – a notion that "removing the GHG from the atmosphere for 100 years approximates the effect of not emitting the GHG in the first place" (New South Wales Department of Primary Industries, n.d.). Under this mechanism, NSW Greenhouse Abatement Certificates can be awarded only the amount of carbon stocks that will be removed from the atmosphere over 100 years. This is more likely to treat foreign afforestation projects owners unfairly unless some flexibility is introduced to the system. Nonetheless, at present nothing is certain - whether the NSW model to be adopted as a national model without due consideration into alternative international mechanisms when the country decides to rectify a post-Kyoto convention in the future.

Among the Group's four Australia's bluegum afforestation projects, APFL has been the model case of the Oji Paper Group's overseas plantation ventures. For its CSR excellence and corporate citizenship behaviour in the local community, APFL has been a frequent recipient of local, national and international awards, such as Landcare Australia Award in 1995, The Asia Pacific Marketing Federation's 1997 Environmental Marketing Award, Agricultural Innovation Award in 2000, and Western Australia Business Community Award in 2002. Along the line with the Oji Paper Group's Partnership Procurement Policy, APFL has also obtained Forest Stewardship Council Certification for its dedication to sustainable forest management. These awards and accreditation, in turn, have helped APFL earn respect and credibility in the local community and the industry. Furthermore, APFL is the only

bluegum plantation venture which resides with the Group's local research centre, Albany Forest Research Centre. At the centre, two Japanese expatriate researchers have been working busily for continuous improvement of bluegum seedlings for high yielding plantation operations.

The only criterion on which APFL does not score well with certainty is 'land availability for the commercial size of the project'. There seem to be three strategic options which are not mutually exclusive to each other. First APFL continues its pursuit of expansion opportunity through acquisition of new plantation lands on its own. However, it should be born that such an attempt will repeat its earlier experience – i.e., market competition for plantation land. Second is through a partnership with its competitors, agribusiness investment companies. Under the partnership, APFL may initiate a new investment scheme to be managed by its partner by nominating itself as an investment partner to each individual and institutional investor, sharing costs, risks and gains. This arrangement would attract a different group of investors who do not fit the typical client profile of existing bluegum plantation investors. At the same time, APFL should also explore the acquisition option of existing plantation lands or land lease entitlements from the competitors. And finally a more decisive action is acquisition of one of competitors with the financial backed-up of the world sixth largest paper and pulp manufacturers. By no means, such merger and acquisition are not new to the industry. For instance, it is still in a recent memory when Futuris Corp. acquired Integrated Tree Cropping Ltd.

There are three major competitors in the Albany region, Great Southern Plantations Ltd., (GSP), Timbercorp Securities Ltd., and Integrated Tree Cropping Ltd. As seen in Fig2, GSP's harvested bluegum trees go through a more or less same value chain with APFL via APEC while the latter two have created another path by jointly forming and managing Albany Chip Terminal. The GSP's on-going working relationship with APFL's sister company APEC and its relative independence from the other two competitors make GSP as a primary target partner for the desired afforestation area expansion. However, this is not to rule out other two alternatives. Given the national scope of the three competitors, it should be born in mind that a business deal struck here in Albany might well roll out as a nation-wide arrangement and extend to nation-wide plantation networks between the companies. And such a national network also enables Oji Paper Co. to spread risks associated with future climate change in the country. If Oji Paper Co. is dedicated to its capacity building of internal woodchip supply as much as its recent attempt for the hostile take-over bid, it need to explore these above options earnestly and promptly.

## **Conclusion**

Changing business environment continues to redefine strategic requirements for corporate survival and success. At the dawn of the five-year Kyoto Protocol era, companies are fine-tuning their strategic posture for the new market

regime and beyond. Some are even proactively seeking corporate social opportunities in their green business pursuit through innovative management thinking and practice beyond their corporate social responsibility. This study has discussed challenges and opportunities associated with such a pursuit. More specifically, it presented a case study of strategic green sourcing pursuit of Japanese paper and pulp manufacturer, Oji Paper Co. and examined challenges and opportunities associated with its internal woodchip sourcing capacity-building through overseas afforestation under its Environmental Charter. Drawing on available information, the paper explored an action plan in light of the company's overseas plantation area expansion strategy, and proposed Australia, and more specifically its bluegum plantation venture in Albany (APFL) as the driver for its capacity-building of its internal woodchip sourcing.

# The Impact of Gender in Business Performance

Carlos Morales, [cmorales@eada.edu](mailto:cmorales@eada.edu)

*EADA International Development Centre, Spain*

## Abstract

Regarding gender and performance there is an extensive bibliography which explicitly accepts both that gender diversity has impact on team performance and it has not. The empirical evidence shows at the same time differences and similarities between male and female performance in companies. However there has been little research regarding the effects of gender has on the perception which teams have of their own performance. This research is based on the need to analyse the relationship between gender and Perception of performance in work teams. This is a comparative study in multinational companies in Spain and Peru. Research aims to describe similarities and differences in two different cultural, political and economically diverse areas which at the same time are united by a history in common. Main results show that gender does not have a predictor value on performance when performance is measurement with teamwork variables; and at the same time the perception of the gender diversity degree, moderates the relationship between gender and performance.

## Introduction

The notable increase in levels of diversity in organisations is a reality which reveals the increase in diversity in societies. Interest in diversity in organisations has also been seen in the significant quantity of empirical research on its effects on work teams. The research findings are varied, but they can clearly recognise two ways of thinking. In accordance with the existing theory, the influence of diversity can be both positive and negative. Diversity may increase the quality of decisions, encouraging creativity and a desire to change (Cox, Lobel & McCleod, 1991; Watson, Kumar & Michelsen, 1993). At the same time in diverse groups, there may also be less social integration, commitment to the team and a feeling of belonging to it. Equally, diversity may have negative effects on one's job satisfaction and satisfaction with the group itself. (Triandis, Kurowski & Gelfand 1994; Riordan & Shore, 1997)

Some researchers agree with the fact that the benefits of diversity are only seen in certain conditions (Milliken, Bartel & Kurtzberg, 2003). Therefore, studies have shown for example, that diversity has a positive impact on creativity in collective cultures (Chatman, Polzer, Barsade and Neale, 1998). It would seem that research

results do not show agreement in the positive effects of diversity on performance, but that they do coincide in that if there is one negative effect, it is on the psychological relationship between individuals and groups. (Triandis, et al. 1994; Williams and O'Reilly, 1998).

One important limitation in research on diversity is that in many cases, work is done on data compiled in US companies and that the studies tend to include only the largest companies. This linked to the fact that the quantity of research in the area of Latin America is less than that carried out in Europe, poses an interesting opportunity for researchers, which is to carry out comparative studies on two different areas whose differences can also be seen in the levels of diversity within their organisations.

Diversity alludes to the differences between individuals in any attribute, which may lead the perception that the other person is different from oneself. (Jackson, 1992). This considered, diversity is understood to refer to almost any individual characteristic. However, in research, special emphasis has been made on gender, age, race/ethnicity, mother tongue, religion, education and seniority in a company. In this paper we will only be analysing the impact of gender in performance, basically because it is one of the variables which can be compared between two organisational realities in which the research is made: Peruvian and Spanish.

The empirical comparison between gender and performance in business has produced mixed results. Fasci and Valdez (1998), Reynolds (1993); Loscocco (1991) have found that women have less financial performance than male in business. However, another group of studies has found few financial performance differences in comparisons of women and men in business (Watson 2002; Shim and Eastlick 1998).

In a close related by different area, like small business area, a lot of academic studies have focused on the role of gender regarding financial performance. Kalleberg and Leicht (1991) compared business performance on the basis of the owner's gender in companies in Indiana. They found no differences in growth of business earnings based on the gender of the owner. In a research which considers the influence of gender directly on performance by including it as one of the explanatory variables in the performance models, Collins-Dodd, Gordon and Smart (2004) have found gender had not statistically significant effect on performance measurement in financial terms too. On the other hand, there is opposite evidence in several studies regarding performance in small business. Loscocco et al. (1991) found that female-owned businesses generated both less sales volume and earned less income compared to male-owned business. Lustgarten (1995) found that self employed women-owned business had lower earnings in comparison to self employed men.

Some authors agree with women maybe less effective than men in competitive environments, even if they are able to perform similarity in non competitive environments. Gneezy, Niederle and Rustichini (2003) found in an experiment that the harder the competitiveness of the environment, the greater the increase in performance for men, but not for women. These researchers propose that discrimination in the work place, eventually responds to the fact

that women may be less effective than men in competitive environment. With this proposal, Gneezy, Niederle and Rustichini suggest an additional explanation regarding female discrimination in work place.

## **Gender Overview. Europe and Latin America**

In 2003 the GDP per capita in Europe (15 member countries) was nearly 65% of the GDP per capita of the United States (Gnere, Gómez & Lamo, 2005). There are various explanations for this, one of which is the ratio of women in the job market. 66% of the unemployed between 15 and 64 years old in Europe are now women and although the increase of women in the workplace between the mid 1970s and 2000 has varied from between 47% and 60%, there is still a gap of 12% with regard to that of women at work in the United States (Genre *et al*, 2005). According to the report on World Employment Trends (OIT, 2004), the unemployment rate for women in industrialised economies (which includes Europe with its 15 member countries) in 2001 was 6.4% and in 2003 it was 7.0%. According to this source, the unemployment rate for women in Latin America has always been greater than that of men. In spite of the fact that by comparison with 2001, the unemployment rate for women has improved by 1.2%, “... *in 2003 it was 10.1% compared to 6.7% only in the case of men*”.

There are also differences between women’s participation in the workplace with regard to age range. In a study on diversity between men and women at the workplace in Europe, Gnere, Gómez & Lamo (2005) found that the ratios of working women between 25 and 54 years old in Spain, Ireland and Italy was under 60%, while in Finland, Sweden and Denmark it was over 80%. In the same study it can be seen that within the European countries, women between 25 and 54 are more active, except for Holland where women between 15 and 24 years old have similar ratios for work to those between 25 and 54. (Gnere *et al*, 2005).

When diversity between men and women at the workplace is analysed, apart from the existing difference between the number of employed men and women, two related phenomena need to be reviewed: the quantity of women in management positions and the salary differences between men and women. Worldwide, only Sweden and Norway have introduced regulations concerning the composition of the board of directors in private companies, in an attempt for equal opportunities. In general, the proportion of women in management positions is still low in the majority of European Union countries (Smith, N.; Smith, V; Verner, 2005). In Latin America, probably the clearest measure geared at establishing parity in this area and access to power for women, has been that of the Quota System which in the last 20 years has been implemented in the political parties in a similar way in the region, although it is clear that this measure is not related to access of women to management positions in the workplace. On the other hand, the gender wage gaps continue to be a characteristic of the labour markets, in spite of having been reduced over the last 20 years (Altonji & Blank 1999). Although some are explained by the differences in human capital,

most of the salary differences between men and women can be attributed to the gender segregation in different types of work. (Amunedo-Dorantes, de la Rica, 2005).

### **Perú. Relevant information**

According to the National Institute of Statistics and Information Systems in Perú, in 2001 the population of a working age in Perú was 67.9% of the total population. Due to the similar proportion in the amount of men and women in Perú (50.3% and 49.7%, respectively in 2005), there is also a similarity in the quantity of men and women of working age (67% of the total male population and 68.8% of the total female population, respectively). However, the composition of the economically active population with occupation is not the same in the country. 57% are men and 43% are women. In Lima, in the July-September quarter of 2006, 66% of the economically inactive population were women and 33% were men. This information shows that there are fewer women than men in the workforce in Perú. The differences can also be seen in the level of Visible Underemployment (number of people of the economically active population who work less than 35 hours a week involuntarily). In Lima, for example, in 2005 there were 380,000 underemployed women and 295,000 underemployed men.

### **Spain. Relevant information**

The notable ageing of the Spanish population, the entry of the woman in the workplace, migratory movements and the increased amount of multifunctional teams, are the main factors which explain the increased diversity within Spanish organisations. Of these factors, increased immigration and the massive entry of women in the job market are the two most relevant social phenomena which have led to the current diversity levels in Spanish organisations. (Cachón, 1999; INE, 2004; Martín and Pérez de Nanclares, 2002).

The massive entry of women in the workplace has meant an important change in the distribution of the working population. Although the rate of professionally active women is lower than that of men, (approximately 45%, compared to 68%), the number of women who have entered the workplace in recent years is higher than that of men. In 2004 alone, almost 285,000 women gained employment compared to 99,500 men (INE 2004). In spite of the fact that the male-female employment gap has decreased in recent years, partly because of the greater education level among women and the reduction in fertility ratios (Arellano & Bover, 1994), Spain has one of Europe's lowest indices with regard to women in the workplace.

### **Methodology**

There are several studies related with gender and performance measurement in financial terms. However there are no studies analyzing the relationship between gender and performance measurement by teamwork variables, specifically by the perception of these teamwork variables.

This research analyses the relationship between the *perception of performance* and *gender* in three Peruvian companies and one Spanish company. It is a field study which presents vertical data on four organisations. It has an exploratory character due to the lack of research in this area up to now in comparing Spanish and Peruvian companies.

The chosen organisations share the following characteristics: a minimum workforce of 100 people, the total proportion of the workforce between men / women or women / men is a minimum of 30% for the minority group, it has work teams already set up and each team has leaders or managers.

The company in Barcelona (which we will call B-1) is a subsidiary of a multinational in the finance sector. It is a services centre which operates in Barcelona and from there it provides services to 15 countries in Europe. The language spoken by all employees is English but each employee needs to speak at least one other of the ten languages which the company considers to be *working languages*.

In Perú, the participation of more than one company was sought in order to increase the level of gender diversity in the total of the sample for Perú. Three companies took part (which we will call P-1, P-2 and P-3). P-1 is a services company in the Customs sector, it is not a multinational and it responded to 44% of the surveys in Perú. P-2 is a state company set up for defence of the free market (free competition), it belongs to the economic regulation sector and it responded to 17% of the total of those surveyed. Finally P-3 is a subsidiary of a multinational in the financial sector and it replied to 38% of the survey.

To obtain information, one instrument is used: *Perception of Performance in work teams*. It is a Likert type scale with 5 alternative replies ranging from 1 (the least points possible) to 5 (maximum points possible). Before the application in each organisation, the instruments were revised and approved by the Human Resources managers. Then the surveys aimed to adapt them to the characteristics of the company and particularly to the way in which performance of work teams is evaluated. In this scale the team members' perception of team performance was evaluated. 14 items were chosen on general areas of team functioning, following the review of various theoretical studies of working in a team. The items evaluate: Time management, Decision making, Continuous improvement objectives, Efficiency, Conflict management, Task sharing, Quality of results, Learning, Common commitment to targets, Capacity to give and receive feedback, Effectiveness, Planning processes and Team Climate. In the reliability process of the scale, no item was eliminated for the total sample or for countries. For the entire sample, the statistics of the scale were: Alpha = .852; Scale Mean = 47.844; Standard Deviation = 8.974, for the

sample of Perú: Alpha = .897; Scale Mean = 48.528; Standard Deviation = 10.071 and for Spain: Alpha = .805; Scale Mean = 47.339; Standard Deviation = 8.078.

The factorial structure of this instrument has three components in both countries. In Perú the components explain 64.269% of variance and in Spain 52.204%.

**TABLE 1: ROTATED COMPONENT MATRIX - SPAIN**

ÍTEM	COMPONENT 1	COMPONENT 2	COMPONENT 3
Task sharing	.711		
Contin. Improvement objectives	.703		
Conflict management	.700		
Feedback	.658		
Quality of Results	.624		
Learning	.541		
Team climate	.482		
Efficiency	.461		
Effectiveness		.810	
Decision making		.666	
Planning processes			.690
Time management 1			.670
Time management 2			.597
Common Commitment to targets			.482

TABLE 2: ROTATED COMPONENT MATRIX – PERÚ

ITEM	COMPONENT 1	COMPONENT 2	COMPONENT 3
Team climate	.879		
Conflict management	.789		
Learning	.724		
Contin. improvement objectives	.629		
Feedback	.625		
Quality of results	.557		
Decision making	.543		
Common Commitment to targets	.536		
Time management 2 (**)		.768	
Efficiency		.729	
Planning processes		.707	
Task sharing		.587	
Time management 1 (*)			.854
Effectiveness			.514

In both cases:

Extraction Method: Principal Components.

Rotation Method: Varimax with Kaiser normalization.

(\*) Time Management 1. In work meetings a lot of time is invested in activities which do not add value to the task which needs to be developed.

(\*\*) Time Management 2. Work meetings begin and end at the agreed times.

The instrument also incorporated three items concerning the perception of: *the degree of gender diversity within the team, the influence of gender diversity on achieving objectives, the influence of gender diversity on the team climate*. These three items were not considered in the final marking of the scale or for the analysis of reliability, but they were considered for the analysis of regression and effect of moderation.

A total of 205 people responded to the two instruments. 87 were in Perú and 118 in Spain. Information was compiled in relation to age (Spain, mean = 30.5, deviation = 6.034. Perú, mean = 34.7, deviation = 9.360), gender (Spain, women 58.5%, men 41.5%. Perú, women 27.6%; men 72.4%), time working in the company (Spain, 38.1% = up to 4 years; 21.2% = up to 3 years. Perú, 54.8% = over 4 years; 20.7% = up to one year) and the area to which they belonged in the company structure.

The scale was replied to by team members and middle managers, not by senior management members and the level of analysis carried out in the research was individual.

## Results

All the analyses are carried out separately for the Peruvian and Spanish samples. Tables 3 and 4 show the correlations between the variables.

**TABLE 3 – CORRELATION MATRIX AMONG VARIABLES - SPAIN**

	1	2	3	4
<b>Control Variables</b>				
<b>1. Sex</b> N				
<b>2. Age</b> N	,022 117			
<b>3. Tenure</b> N	,059 114	,250** 114		
<b>Scale</b>				
<b>4. Perception of Performance</b> N	,059 118	,107 117	,058 114	

Note: \*\*p < .01

**TABLE 4 – CORRELATION MATRIX AMONG VARIABLES - PERÚ**

	1	2	3	4
<b>Control Variables</b>				
<b>1. Sex</b> N				
<b>2. Age</b> N	.125 84			
<b>3. Tenure</b> N	.073 84	.689 ** 83		
<b>Scale</b>				
<b>4. Perception of Performance</b> N	.089 87	.035 84	.056 84	

Note: \*\*p < .01

To analyse the relationship between Perception of Performance with the chosen variables, regressions were made. The results in the companies in both countries are noticeably different. Gender as a predictor of the perception of performance works differently for the companies studied in each country. (Perú: Sex: beta = .089; ns.; Spain: Sex: beta = .059; ns.). For both cases, the model explains a reduced percentage of the variance of the perception of performance, however, in the case of Peru, the percentage is less. (Peru:  $R^2 = .008$ ) (Spain:  $R^2 = .003$ ).

The same occurs with the control variables chosen as probable predicting variables of the perception of performance. There are differences in the strength of association between the variables on each side but for neither of the countries are the associations significant. (Perú: Age: beta = .035; ns. Tenure: beta = .056; ns.) (Spain: Age: beta = .107; ns. Tenure: .058; ns).

An attempt was also made to analyse a possible moderating effect of the perception of degree of gender diversity on Gender to predict the Perception of Performance. We find that for both countries there is a moderating effect of perception of degree of diversity on the teams. (Peru: beta = .226;  $p < 0.1$ ;  $R^2 = .051$ ), (Spain: beta = .153;  $p < .1$ ;  $R^2 = .092$ ). As we will analyse later, this result is along the same lines as previous findings on the effect of beliefs on diversity in the replies of diverse groups.

TABLE 5 – RESULTS OF REGRESSION ANALYSIS - PERÚ

*Dependent Variable: Perception of Performance*

	R2	Beta	Sig.
Gender	.008	.089	.675
Age	.001	.035	.100
Tenure	.003	.056	.261
Moderating effect: Perception of Gender Diversity Degree on Gender - Perception of Performance	.051	.226	.030

Note:  $N = 87$ ;  $+p < .1$ ;  $*p < .05$ ;  $**p < .01$ ;  $***p < .001$

TABLE 6 – RESULTS OF REGRESSION ANALYSIS - SPAIN

	R2	Beta	Sig.
Gender	.003	.059	.406
Age	.012	.107	1.339
Tenure	.003	.058	.380
Moderating effect: Perception of Gender Diversity Degree on Gender - Perception of Performance	.024	.153	.097

Note:  $N = 117$ ;  $+p < .1$ ;  $*p < .05$ ;  $**p < .01$ ;  $***p < .001$

In the Peruvian companies, the final average of the scale is 3.466 (sd = .719). In the Spanish company the final average is 3.377 (sd = .581) and there are no statistically significant differences ( $t = 0.938$ ; ns).

When analysing separately according to sex, the final averages of the scale perception of performance do not show any significant differences in the case of Peru. For women in the Peruvian companies the final result of the scale of performance is higher than that of men: women mean = 3.569; sd = .840 and men mean = 3.427; sd = .671 respectively. In the Spanish company, the women also have higher final averages than those of men on the scale: mean women = 3.409; sd = .588 and mean men = 3.341; sd = .563. In neither of the cases do the comparisons show statistically significant differences.

The perception of gender diversity degree in work-teams is different in both countries. However the four companies perceive itself as *gender diverse companies*. In Perú 43,7% of the sample thinks gender diversity degree in their team is *medium*, and 31,0% that it is *high*. In the Spanish company 30,5% perceive the degree of gender diversity is *medium* and 42,4% is *high*.

In the Peruvian companies, the perception of influence of gender diversity on the achievement of operational objectives in the team is greater than the perception of its influence on the team climate (mean = 3.436; sd = .623 and mean = 3.367; sd = .700; respectively), although there are no statistically significant differences. The opposite happens in company B-1, where the workers perceive that gender diversity has a greater influence on the climate than on the achievement of objectives (mean = 3.805; sd = .630 and mean = 3.364; sd = .687; respectively). In this case the results show significant differences ( $t = 5.976$ ;  $p < .001$ ). In a notably diverse environment, (B-1 company), gender diversity has a greater influence on the climate than on the achievement of team objectives, at least that is the way its influence is perceived. The reason for this finding would need to be researched more thoroughly. On the other hand, in a less diverse environment (P-1, P-2 and P-3) the influence of gender diversity is perceived as greater for the achievement of objectives than for maintaining a good team climate, an aspect which also needs to be explored in greater depth. Perhaps the reason for the differences can be found in that, in this case, diversity is reflected mainly on the variable of sex, and it probably has a relationship with cultural issues and with the role women had in Peruvian market labour.

## Discussion

The relationship of performance with gender as proposed potential predictor, takes on a different pattern in the companies studied. The fact that the perception of gender diversity and the perception of the impact that gender has on the working environment and achieving objectives for each country shows not only a different *real* degree of gender diversity in each business environment, but also varying approximations, evaluations and sensitivity towards

gender as they exist in each company. This could also lead us to believe that just how gender diverse the company really is, is less important than how much awareness, sensitivity and gender perceptions there are in it.

A significant find in this study is just how the perception of the degree of gender diversity acts as a moderator in the group responses. This conclusion is related to the conclusions of van Knippenberg, Haslam and Platow (2004) concerning the role of beliefs and perceptions about diversity. The authors propose that people find value in diversity and as a consequence of this, they respond favourably to the diverse group precisely because it is seen as a diverse group (van Knippenberg, Haslam & Platow, 2004). In this study, the degree of gender diversity perceived moderates the replies concerning team performance. Even when the intensity of the relationship between perception of performance and value of moderation referred to is not high; it is still higher than the existing relationship between performance and gender. This is one of the most important similarities to be seen in companies from both countries. It is important to underline this because it stands completely apart from the real degree of gender diversity within the teams. It is perception which indeed affects the responses of people in the companies studied in Perú and Spain.

Another significant similarity is that neither gender, age nor tenure has a greater relationship with the perception of team performance. Unlike perception of gender diversity, these are three variables *of fact* which have nothing to do with personal criteria or valuations. The fact that in none of the cases is there an association between them and performance, prompts an analysis of its real degree of importance in implementing programmes of sensitivity, awareness to diversity or diversity management. Considering that the main idea behind this concept of diversity is to get the most out of the human resources provided by heterogeneous groups, which means that they are diverse in terms of sex, age, race, ethnic background, nationality etc. (Barberá, 2003), the interpretation of what diversity (in this case gender diversity) can bring to a team is made relative in terms of what the team or the company wish to achieve.

This is an exploratory study, its main aim being to propose a line of investigation for diversity so as to: widen the existing theory which has been restricted mainly to US and European companies and samples; and to propose the reality of Latin American *business gender diversity* as an object of study in organisational behaviour. Along these lines, in this research, we have tried out instruments which have been used in Spanish companies to analyse how they work and how valid they are in some Peruvian companies. Given the objectives of the study, analysing the final results has been important as we have seen that regardless of the different contexts, there are common basic trends which we can keep researching and generating applications for, which are also useful in companies in Latin América.

The results of course are not conclusive, as the study has limitations (lack of control of variables like task difficult degree, competitive level in the working environments, population centre differences or education level)

this could be repeated in organisations of similar or dissimilar characteristics with the aim of carrying out an in-depth search of efficiency predictors in diverse organisations. Other research scenarios may be considered, being related directly to the data about gender with indicators of satisfaction, efficiency, measurements of achievement of objectives or figures of evaluation of performance and we can see just what an impact a specific gender diversity management policy would have on them. This type of research could also be useful more specifically from an operational and applicative point of view in human resources management.

# Education and Productivity: A Fixed Effect Three Stage Least Squares Approach

*Tam Bang Vu, tamv@hawaii.edu*

*David Hammes, hammes@hawaii.edu*

*College of Business and Economics*

*University of Hawaii-Hilo, USA*

## Abstract

Using single equation estimations, Hojo (2003), finds that education increases productivity. Using simultaneous equation estimations for small open economies, Kumar (2003) shows that education fosters productivity growth, but this growth in turn has a negative effect on education. Both authors employ cross-sectional data. In this paper, we use panel data and fixed effect three stage least squares estimations for 65 countries worldwide. In contrast to Kumar, our results show that productivity has a positive effect on education. Concerning the effect of education on productivity, we find evidence supporting Hojo's and Kumar's results. However, education only has at best a weak effect on productivity in developed countries.

## Introduction

Economic development theory emphasizes the importance of education in fostering economic growth and labor productivity. Nonetheless, macroeconomic data analysis on education and growth is scarce and the results are conflicting. Estimating models that include life expectancy and base-period output per capita, Knowles and Owen (1995) find that the correlation between education and growth is insignificant statically. Using panel data, Caselli et al. (1996) find a negative and significant correlation between these two variables. These results contrast with the new theory of endogenous growth that includes human capital in the production function and empirical results using microeconomic data for a single country.<sup>1</sup>

Inspired by these, Hojo (2003) performs an empirical study using the country-specific residual from the regression by Caselli et al. (1996) as a proxy for productivity. Analyzing a cross-sectional data set for 97 countries and single equation estimations, he finds that education has a positive and significant impact on productivity. Since higher productivity is related to a higher output growth as shown in Islam (1995), Hojo's results imply that education

can indirectly affect economic growth through productivity. However, single equation estimations might be subjected to simultaneity bias if there is a two-way causality between education and productivity.

Kumar (2003) develops a model that addresses this two-way causality for small open economies. Using simultaneous equation estimations on cross sectional data, he finds that education fosters productivity growth, but this growth in turn has a negative effect on education. Since Hojo and Kumar both employ cross-sectional data, the remaining question is whether or not their results are robust using a combination of panel data and simultaneous equation estimation.<sup>2</sup>

In this paper we use two panel data sets for 65 countries worldwide over the time period 1984-2002 with education as a proxy for human capital. The data sets include many types of economies: large, small, developing, and developed countries. One data set provides secondary school enrollments from the United Nation Common Database (UN) and the other provides public expenditure on education from the World Development Indicators (WDI). Dissimilar to Hojo (2003) who uses a country-specific effect as a proxy for productivity and Kumar (2003) who uses total factor productivity (TFP), we use output per worker to measure productivity levels and follow a fixed effect three stage least squares (3SLS) approach. In contrast to Kumar, our results show that productivity has positive effect on education. The results are robust to several model specifications and sample sizes.

Concerning the positive effect of education on productivity, we find evidence supporting Hojo's and Kumar's results. These results are in line with development theory: there is a virtuous circle of influences, in which education increases productivity, which in turn increases human capital accumulation due to rising per capita income. However, education only has at best a weak effect on productivity in developed countries. This supports the hypothesis of diminishing returns to human capital fostered by economic development theory, especially when the public expenditure on education is used as a proxy for human capital.

### **The Model and Data**

We use an augmented Cobb-Douglas production function for the supply equation:

$$y_{it} = Ak_{it}^{\alpha} h_{it}^{\theta} \prod_{j=1}^n c_{jt}^{\gamma_j} e^{\sum_{l=1}^m \phi_l S_{it}^l},$$

where  $y$  is output per worker,  $i$  is country index and  $t$  is time index,  $k$  is capital per worker,  $h$  is human capital per worker,  $c$  is a vector of control variables such as foreign direct investment (FDI), export, import, etc., and  $S$  is institutional variables such as government stability, corruption, political risk, etc. Taking the logs of both sides and taking into account the possible two-way causality between education and productivity yields a system of equation:

$$\ln y_{it} = \ln A + \alpha \ln k_{it} + \theta \ln h_{it} + \sum_{j=1}^n \gamma_j \ln c_{jt} + \sum_{l=1}^m \phi_l S_{lt}$$

$$\ln h_{it} = \ln B + \eta \ln y_{it} + \sum_{p=1}^r \kappa_p \ln c_{jt} + \sum_{q=1}^s \omega_q S_{lt} \quad (1)$$

Following Hojo (2003) and Kumar (2003), we use education as a proxy for human capital in System (1). Data for employment is from the International Monetary Fund's (IMF's) International Financial Statistics (IFS) and the IMF's Country Reports, updated with information from economag.com. Data for the country-specific variables for 1984-2002 are from the International Country Risk Guide (ICRG). The rest are from the WDI.

The UN data set has three missing years, 1992, 1996, and 1997, so we have to eliminate these years from the data for the other variables as well. There are many missing observations for life expectancy, literacy rate, and government stability, so we use binary dummy variables to control for this problem. There are still some missing observations for other variables, so we have an unbalanced panel. Data on other variables are divided by employment data to obtain per-worker values.

#### The Methodology and Results

To eliminate business cycle effects, we calculate four-year average values of each variable and first perform regressions on this new data set. As Hojo (2003) omits an "openness" variable, we first exclude this variable from our estimation. We follow a testing-down approach to avoid omitted variables, starting with all variables that might affect productivity. After performing several Variance Inflation Factor tests (VIF) to eliminate variables with high multicollinearity,<sup>3</sup> we have eleven explanatory variables for the first equation.

A Granger-Causality test shows education depending on population, government consumption, productivity, and public expenditure on education. This test also shows that productivity depends on its past value in addition to the other eleven variables.<sup>4</sup> This leads to the structural form of our econometric model as follows:

$$\begin{aligned} PRO_{it} &= \beta_0 + \beta_1 EDU_{it} + \beta_2 PRO_{i,t-1} + \beta_3 CAP_{it} + \beta_4 FDI_{it} + \beta_5 GOV_{it} + \beta_6 CORR_{it} \\ &\quad + \beta_7 LIT_{it} + \beta_8 POLI_{it} + \beta_9 ECON_{it} + \beta_{10} LIFE_{it} + \beta_{11} FIN_{it} + \beta_{12} PCY + v_i + \varepsilon_{it} \\ EDU_{it} &= \psi_0 + \psi_1 PRO_{it} + \psi_2 PEX + \psi_3 GCON_{it} + \psi_4 POP_{it} + w_i + \Omega_{it} \end{aligned} \quad (2)$$

where *PRO* is productivity, *EDU* education, *CAP* capital, *FDI* accumulated stock of FDI, *GCON* government consumption, *POP* population, and *PCY* real GDP per capita, all expressed in log of labor intensive form. Variables in level include *GOV* as government stability, *CORR* corruption, *LIT* literacy rate, *POLI* political risk, *ECON* economic stability, *LIFE* life expectancy, and *FIN* financial stability; *v* and *w* are the country-specific disturbances,

whereas  $\varepsilon$  and  $\Omega$  are the idiosyncratic disturbances.  $PCY$  is highly correlated to  $PRO$  and so is removed from the second equation.

We then perform the Arellano-Bond GMM one step and two step procedures to investigate the involvement of the lagged dependent variables. The Arellano-Bond tests of average auto-covariance in residuals of order one and two in both equations, estimated with the White correction for heteroskedasticity, reveal no autocorrelation. These results imply that the fixed effect 3SLS estimator will be consistent. For the first equation, the Sargent test, which is performed without the White correction for heteroskedasticity, rejects the over-identifying restrictions. As a cautionary measure, we continue to use time dummies in our subsequent estimations.

There are several excluded variables from each equation, and the absence of autocorrelation problems implies that these excluded variables might be used as instrumental variables for the other equation. Hence, the order condition for the system identification is satisfied. Preliminary tests of the reduced form show that some of these exogenous variables are statistically significant, implying that the rank condition for the system identification is also satisfied.

Estimating System (2) using fixed effect 3SLS,<sup>5</sup> we gradually eliminate variables that have p-values over 0.30. The Ramsey RESET tests indicate no missing variable for each equation. Hence, our model specification is:

$$\begin{aligned}
 PRO_{it} &= \beta_o + \beta_1 EDU_{it} + \beta_2 PRO_{i,t-1} + \beta_3 CAP_{it} + \beta_4 CORR + \beta_5 LITER + \beta_6 GOV \\
 &\quad + \beta_7 FDI_{it} + \beta_8 PCY_{it} + v_i + \varepsilon_{it} \\
 EDU_{it} &= \psi_o + \psi_1 PRO_{it} + \psi_2 PEX + \psi_3 GCON_{it} + \psi_4 POP_{it} w_i + \Omega_{it}
 \end{aligned} \tag{3}$$

Table 1, Column 1, reports the results. In contrast to Kumar (2003), we find that productivity affects education positively. Similar to Hojo (2003) and Kumar (2003), we find that education affects productivity positively.

To account for the effect of economic openness as in Kumar (2003), we alternate data for the average openness, trade openness, and capital openness from the data in Edwards (2007). The first estimation shows that coefficients of trade openness, capital openness are insignificant, so we only add the average openness ( $OPEN$ ) to the model. Additionally,  $LITER$  and  $GOV$  are highly insignificant, so we eliminate  $LITER$  and substitute  $GOV$  with  $ECON$ . The robustness of our estimations is then checked by reducing the sample size from 65 to 60 countries. The results, which are reported in Columns 2 through 4, are similar to those in Column 1.

We also use the original data to estimate system (3) and examine the effect of each past value in both equations. Performing the Granger Causality test, we see that only the first lags of education and productivity are individually significant although they are jointly significant up to two lags for productivity and four lags for

education. After performing the Akaike (1973) Information Criterion (AIC) procedure to remove excessive lags and the fixed effect 3SLS to remove highly-insignificant variables, we have this system:

$$\begin{aligned}
 PRO_{it} &= \beta_o + \sum_{k=1}^3 \beta_k EDU_{i,t-k+1} + \beta_4 PRO_{i,t-1} + \beta_5 PRO_{i,t-2} + \beta_6 CAP_{it} + \beta_7 FDI_{it} \\
 &\quad + \beta_8 CORR_{it} + \beta_9 ECON_{it} + \beta_{10} PCY + v_i + \varepsilon_{it} \\
 EDU_{it} &= \psi_o + \psi_1 PRO_{it} + \psi_2 PRO_{i,t-1} + \psi_3 EDU_{i,t-1} + \psi_4 EDU_{i,t-2} + \psi_5 PEX \\
 &\quad + \psi_6 GCON_{it} + \psi_7 POP_{it} w_i + \Omega_{it}
 \end{aligned} \tag{4}$$

For the model with openness, *ECON* becomes highly insignificant, so we substitute it with *GOV*.

The Arellano-Bond tests of average auto-covariance in both equations again reveal no autocorrelation, and the Sargent tests fail to reject the over-identifying restrictions in both equations. Hence, we do not use year dummies in the subsequent estimations.

Table 2 reports the results of the benchmark variables.<sup>6</sup> Theoretically,  $EDU_{it} = EDU_{i,t-1} = EDU_{i,t-2}$  in the steady state, so we can write the results as  $\beta_1 EDU + \beta_2 EDU + \beta_3 EDU = (\beta_1 + \beta_2 + \beta_3) EDU$ . The same is true for the second equation, that is,  $\psi_1 PRO + \psi_2 PRO = (\psi_1 + \psi_2) PRO$ . From Table 2, the sums of *EDU* and *PRO* coefficients are both positive. The Chi-square statistics also reveal that these sums are statistically different from zero.

TABLE 1. SYSTEM (3): RESULTS FROM ANALYZING THE FOUR-YEAR AVERAGE DATA

Dependent Variable: Productivity

POP	.3483** (.1487)	.2508* (.1445)	.5994** (.1668)	.6448** (.2052)

Chi <sup>2</sup> (1) - value for sum of PROs	4.44	4.78	4.48	3.62
Sample size	564	452	562	498
R <sup>2</sup>	.9451	.9460	.9483	.9479

\* and \*\* indicate 10% and 5% significance level, respectively. Figures in parentheses are standard errors.

We then estimate developed and developing countries separately. Estimated results for different sample sizes and developing countries are similar. An interesting point is that the three EDU coefficients for developed countries are much smaller than those for developing countries, and the sum of the former is only significant at 10% level. This is in line with the hypothesis of diminishing returns to human capital posited by development theory.<sup>8</sup>

Since the WDI data use public expenditure on education as a proxy for education itself, we also estimate a new system with this variable as EDU. Hence the model specification is:

$$\begin{aligned}
 PRO_{it} &= \beta_o + \sum_{k=1}^3 \beta_k EDU_{i,t-k+1} + \beta_4 PRO_{i,t-1} + \beta_5 PRO_{i,t-2} + \beta_6 CAP_{it} + \beta_7 FDI_{it} \\
 &\quad + \beta_8 CORR_{it} + \beta_9 ECON_{it} + \beta_{10} PCY + v_i + \varepsilon_{it} \\
 EDU_{it} &= \psi_o + \psi_1 PRO_{it} + \psi_2 PRO_{i,t-1} + \psi_3 EDU_{i,t-1} + \psi_4 EDU_{i,t-2} \\
 &\quad + \psi_5 GCON_{it} + \psi_6 POP_{it} w_i + \Omega_{it}
 \end{aligned} \tag{5}$$

The results of the benchmark variables are reported in Table 3. From this table, the results are similar to those in Table 1.

TABLE 3. SYSTEM (5): RESULTS FROM ANALYZING DEVELOPED AND DEVELOPING COUNTRIES SE

	(.2188)	(.1889)	(.1609)	(.1621)
Chi <sup>2</sup> (1) value for sum of PROs	4.86	4.94	7.12	8.67

---

Sample size	314	328	189	327
R <sup>2</sup>	.9251	.9306	.9256	.9326

---

\* and \*\* indicate 10% and 5% significance level, respectively. Figures in parentheses are standard errors.

A small difference is the result for developed countries: this time, the sum of the three EDU coefficients is insignificant. This again supports the hypothesis of diminishing returns to human capital, especially in the case of expenditure on education.<sup>9</sup> For the second equation, we also find similar results to those in Table 1.

## Conclusion

In this paper we extend Hojo's and Kumar's empirical studies using fixed effect 3SLS estimations. In contrast to Kumar (2003), we find that productivity has a positive effect on human capital accumulation. Concerning the positive effect of education on productivity, we find evidence supporting Hojo's and Kumar's results. Thus, there is a virtuous circle of productivity growth and education in a cumulative process, in which education increases productivity, which in turn increases school enrollments as per capita income rises. The results support the economic development theory of cumulative causality. However, education only has at best a weak effect on productivity in developed countries, reflecting the hypothesis of diminishing returns to human capital fostered by economic development theory, especially when the public expenditure on education is used as a proxy for human capital.

Since our focus is on a possible two-way causality between education and productivity, the questions of a possible two-way causality between education and output growth will be left for future research.

## **Diversity Management: An African Perspective**

*Daniel Theron, [dtheron@uj.ac.za](mailto:dtheron@uj.ac.za)*

*University of Johannesburg, South Africa*

### **Abstract**

**This paper considers the nature of diversity and relates the dimensions of diversity to the African continent by assessing some of the dominant themes in the literature relating to the issues of culture and diversity management. It examines the importance of effective diversity management for organisations in general and for countries on the African continent servicing a diverse customer base and/or competing internationally. It reviews the output of literature scholars on culture, cultural diversity and the models of Human (2005); Van der Wal & Ramotsehoa (2001) on diversity management in general and the model of Rijamampianina and Carmichael (2005) on Africa in particular. The argument confirms that cultural diversity should be managed and fully integrated taking into consideration macrocultural diversities of societies and their impact on workforce diversity. This paper enhances the understanding of diversity management and addresses important aspects relating to diversity management in an African context.**

### **The Management of Cultural Diversity: An African Perspective**

Africa is the birth of mankind. Africa is the land of my ancestors... but I hardly know this place at all. *[Harris (1991)]*

### **Introduction**

The wide variations in the economic, organizational and communicative patterns by which humans live and the environment

in which international business is undertaken today, is fundamentally different to that which confronted organisations even a decade ago. While the term ‘cultural diversity’ may have become overused, the phenomenon itself is real. The consequence for almost all organisations is thus profound requiring them to be much more sensitive, flexible, innovative and collaborative. This is attested by Redding and Stening (2003:xiii) who state that “the consequences for managers of organisations are correspondingly significant in dealing with the far greater

demands of managing the increased number of cross-cultural interactions”. Managers must therefore develop new skills and awareness to handle the unique challenges of global diversity, and cross-cultural understanding

This article has the modest overall objective of reviewing some considerations pertaining to the management of cultural diversity with the view of doing business in Africa. It firstly, provides a brief discussion of definitions and the dimensions of culture as noted in the literature. It then explores the concept of cultural diversity and other diversity issues against the backdrop of an African reality. It finally reviews and compares theoretical models of diversity management as a frame of reference for managing cultural diversity in Africa.

## **Definition and Dimensions of Culture**

Scholars on culture have never been able to agree on a simple definition of culture. In an important attempt to answer the question of what culture is, the most sophisticated and most quoted reference is that of international authorities Berger and Luckman (1967). In their book *The Social Construction of Reality* the authors argue that reality itself is constructed by members of a nation or a society for their collective use, and that a society’s culture is a particular reality – a set of guides including language and behaviour - in which an individual can find accommodation in the surrounding world. Culture is furthermore learned through perceptions, which are formed by the language individuals learn and the physical and psychological stimuli that individuals encounter. Redding and Stening (2003:4) and Silove (2004:76) subscribe to this view by emphasizing culture as the total way of life of people and the social legacy of values an individual acquires from his group; a way of thinking, feeling and believing; an abstraction of learned behaviour and a mechanism for the normative regulation of behaviour; and a set of techniques for adjusting both to other individuals and the external environment. From the collective views of Hofstede (1984) and Namenwirth & Weber (1987) Redding and Stening (2003) and Silove (2004) culture can be defined as a system of values and norms that are shared among a group of people and that when taken together constitute a design for living. The set of definitions and rules for conduct of what is, what ought to be, and which become absorbed and transmitted by members of a particular society, can therefore be described as the culture fabric of society. The term society refers to a group of people who share a common set of values and norms. Values are abstract ideas about what a group believes to be good, right, and desirable and norms being the social rules, and guidelines that prescribe appropriate behaviour in particular situations.

Hofstede (1980, 1994) provided probably the best-researched values-based model for differentiating between cultures. The model comprises of four basic dimensions, namely: <sup>1)</sup>

- *Power distance*, which focuses on how society deals with the fact that people are unequal in physical and intellectual capabilities and the extent to which people in a society, community or organisation tolerate inequality;

- *Individualism versus collectivism*, which describes the relationship between the individual and his or her followers. In the former the ties between individuals are loose and individual freedom highly valued. In the latter ties are tight with people born into collectives such as extended families;
- *Uncertainty avoidance*, which measures the extent to which different cultures socializes their members. High uncertainty avoidance cultures place a premium on job security, retirement benefits and so on. They also have a strong need for rules and regulations. Lower uncertainty avoidance cultures are characterized by a greater readiness to take risks and are less emotional about change.
- *Masculinity versus femininity*, by which masculine cultures define different roles for men and woman. In masculine cultures, traditional 'masculine values', such as achievement and power determine cultural ideals. In feminine cultures, sex roles are less sharply distinguished with little differentiation between men and woman in the same job.

Hill (2007:112), however, cautions about aspects of Hofstede's research. According to the author, it firstly assumes that there is a one to one correspondence between culture and the nation state, whereas many countries have more than one culture, and secondly, that the research concentrated on European and Americans within one single industry. The author, however, admits that it does represent a starting point for managers trying to establish how cultures vary and what that might mean for management practices.

From an African perspective attempts to define the philosophy of African cultures have come from both African and non-African authors, and according to Carmichael and Rijamampianina (2006:175) there is much disagreement about what form it should or does take. Most authors, however, agree that Africa can be divided culturally and philosophically into North-Africa and sub-Saharan Africa, with their Muslim and Christian/traditional belief systems respectively (Wikipedia, 2005). Carmichael and Rijamampianina (2006:165) refers to Wortzel (undated) who mentions sub-Saharan Africa with its multiplicity of cultures and the northern countries which are

<sup>1)</sup> Human (1995: 20-21) discusses five dimensions of Hofstede's model, including the subsequent view of long-term vs short-term orientation in work ethic, predominantly Arabic. Wortzel (undated) furthermore emphasizes the important theme of regional and sub-regional Africa with some common regional characteristics that may assist potential investors in acclimatizing themselves to the local environment. Regional allocations are, however, not necessarily absolute; for example Zambia which is sometimes said to fall into Southern Africa or Central Africa. The issue of cultural diversity in Africa is therefore a controversial one.

From an organisational point of view Weisner and Millet (2000:123) perceives culture as a three-layered entity consisting of:

- basic assumptions people in an organisation hold

- which gives rise to shared feelings, beliefs and values and which manifests in symbols, processes, forms and some aspects of group behavior

Culture is therefore to the organisation what personality is to the individual. It is a hidden unifying force that provides meaning and direction (Green, 1989:72). The importance of organisational culture is summarised by Werner (2007:28) as follows:

- It creates a corporate identity that distinguishes one organization from others and thereby gives members of the organisational an identity.
- It guides employees in terms of acceptable behaviours and attitudes and creates commitment to organizational goals and objectives.
- It creates social system stability with associated emotional security and serves as a yardstick for evaluating and correcting deviant behaviours and for rewarding desired behaviors.

More recent studies indicate that organisational culture can have a significant impact on an organisation's long-term competitive advantage and financial performance and thereby the success or failure of firms.

## **Research into Cultural Diversity**

The contribution of Human (1996: 18- 53) towards the diversity debate relates to an analysis of the views of protagonists such as Blommaert (1988), Hofstede (1980; 1994), Berger (1994), Coldwell and Moerdyk (1981) and Keesing (1992). Blommaert (1988) for instance proposed a continuum ranging from a 'maximalist' (universalist) to the 'minimalist' (particularist) position. The maximalism viewpoint subscribes to the notion that a person's culture will tend to determine how a person interacts with others whilst minimalists support the view that a culture constitutes a subconscious part of a person's identity as a communicator. Human(1996:22) refers to Berger (1994:53) and Coldwell & Moerdyk (1981) as authors from pre-democratic South Africa who probably as a result of 'ideological contortionism', viewed the prospects for Africa from a maximalist position. The authors argue that 'some cultures are more open to economic development than others'; that 'some underdeveloped cultures are problematic; and that 'certain African cultural paradigms pervade the conceptualization of management processes and black managerial effectiveness'. Since the first democratic elections in South Africa, however, a shift in 'liberal thinking' by South African authors such as Lessem (1993), Koopman (1993) and Beck & Linscott (1993) reflected the trendy belief of the time that different African cultures are, in fact, 'nice'. Contemporary authors such as Luiz (2006:163) and Werner (2007: 183) adopts a more pragmatic view on the 'Rainbow Nation' of South Africa and reflects on its multitude of cultures and the implications for motivation, leadership and teamwork in organisations.

Human (1995: 24-34) critiques maximalism as ignoring cross cutting complexity of social variables such as level of modernisation, level of urbanisation, social class, level and type of education; socialization within the family; and religion and personal idiosyncrasies within national cultures or ethnic groups. The author also argues that maximalism ignores some of the similarities which may exist between individuals and cultures. According to Human (1995: 36-44) the minimalist approach of stressing commonalities and underplaying ethnicity or national culture is equally problematic. The author is of the opinion that 'in overstressing the interactive nature of intercultural relationships, minimalism can defy common-sense understanding of the world in terms of the generalisations persons hold about themselves and of others'. Horwitz (2006:138) refers to Africa in particular and warns against the making of broad generalizations about Africans and thereby ignoring the unique features in each country in Africa. These diversity features cut across many dimensions with some 2000 different ethno-cultural communities undergoing rapid socio-economic and political transformation, with many countries still struggling to establish an identity as a nation state.

The predominant religions of Africa are, as previously mentioned, Christianity and Islam with approximately 40% of the overall population following each, with the remaining 20% consisting of traditional African religions. With regard to Christianity the connection made by sociologist Weber (1958, original 1904-1905) between Protestant ethics - of hard work and wealth creation - and the emergence of modern capitalism (and entrepreneurship) is well known. Nations of Africa with Catholic or Orthodox majorities have also shown significant and sustained entrepreneurial activity and economic growth. Economic implications of Islam are evident in Africa with the Koran being very explicit on economic principles, many of which are pro-free enterprise. Islam, on the other hand, is also concerned with social justice and Muslim countries are likely to be receptive to international businesses as long as those businesses behave in a manner that is consistent with Islamic ethics. Carmichael and Rijamampianina (2006:166-168) summarize Africa's main ethnic groups, religions and predominant languages in table form. From this table it becomes evident that the main languages of Africa are non-African languages adopted through colonization, such as English, French and Arabic, with an additional estimated one thousand or more indigenous languages. A number of countries are multilingual, for example, South Africa that has no less than 11 official languages. Effective communication is, however, not always just about the language. Hall (1976:56) for instance proposes that when communicating with black Africans, it is important to know that they are highly contextual in the manner that they seek and offer knowledge, 'preferring to begin a conversation with enquiries about your health, your family and your general well-being'. Morris (1982) furthermore refers to the aspect of small interpersonal space accompanied by physical contact such as handholding that may be foreign to Westerners. Africans, furthermore, operate in male-orientated, strongly hierarchical communities. With regard to age, investors in Africa will be interacting with younger people than in other countries around the world. The life

expectancy at birth is the lowest of all world regions and can be attributed to high poverty levels and the highest prevalence of HIV/AIDS. This in turn has a major impact on primary education and skill levels in Africa.

From the above it can be concluded that cultural diversity has been characterized by the application of a large number of dimensions. Many scholars have analysed and described the notion of culture and diversity. Some scholars, as mentioned, have categorized these dimensions in terms of models. The fact is that it is today widely acknowledged that culture, organizational culture and diversity imply a complex set of factors relating to people and the interactions among them. With the mix of individuals within organizations the issues relating to diversity have become a critical component of business success or failure. With today's world of technological innovations and shifting competitive advantage the ability of an organisation to stay ahead largely depends on how the diversity, interaction and co-operation of people within the organisation are managed.

## **The Management of Cultural Diversity**

The distinction between minimalism and maximalism as mentioned before is not helpful in terms of managing diversity. In this regard Human (1995:45- 53) suggests that the two perspectives should be married according to the situation to hand. Thus the basis of managing diversity 'is the need to manage and infinite changing variety of social variables which, to varying degrees, impact on social interaction'. In a later study Human (2005:29-32) again suggests a situational adaptable approach as a solution to the management of diversity. The situational approach accepts a kaleidoscope of complicated configurations of social identities and how these identities vary according to the context at hand. A situational adaptable process can furthermore assist in gathering enough relevant information in order to avoid stereotyping, that is, to judge people too quickly. It can also avoid having too much information that can cloud irrelevant facts and the ability to act.<sup>2)</sup>

The situational adaptable approach as advocated by Human (1995; 2005) prevents prejudgments and ensures the gathering of relevant information in order to make decisions, to come to constructive solutions and to monitor the outcomes. The question is<sup>2)</sup> According to Human (2005:3) stereotypes are a form of generalizations and important tools for understanding and dealing with everyday life stating quoting for example: 'If a person walks into a bank wearing a balaclava and carrying a gun, staff members do not attempt to establish whether that person intends to conduct financial business'.

However, raised to what extent the ability to differentiate and integrate such variables by the situation at hand can be learned by managers. In this respect Human (1995:53) concludes that 'managing diversity programmes should attempt to increase cognitive complexity by providing the skills by means of which individuals can begin to understand diversity in a different way; thereby defusing maximalist stereotypes and the value judgments which

often accompany these'. Carmichael and Rijamampianina (2006:161-178) also warns against one-dimensional stereotyping as a common theme to many schools of thought around diversity in Africa. According to the author the diversity of people in Africa cannot be regarded as a single identity and that 'Africa is far more colourful and richly textured than black/white polarization versus the many possible shades of grey in between'.

Human (2005:4) claims that the management of diversity is the foundation on which all effective organizational behaviour rests. It, however, often ranks low on managers' list of priorities. As diversity relates to a wide variety of socio-economic dimensions, including the dimension of culture, the management of diversity in general and the management of cultural diversity in particular are inextricably linked. The challenge for management is therefore to manage cultural differences by embracing the concept of diversity management. In this regard Human (2005) suggests two critical axes concerning effective diversity management as illustrated in Fig. 1.

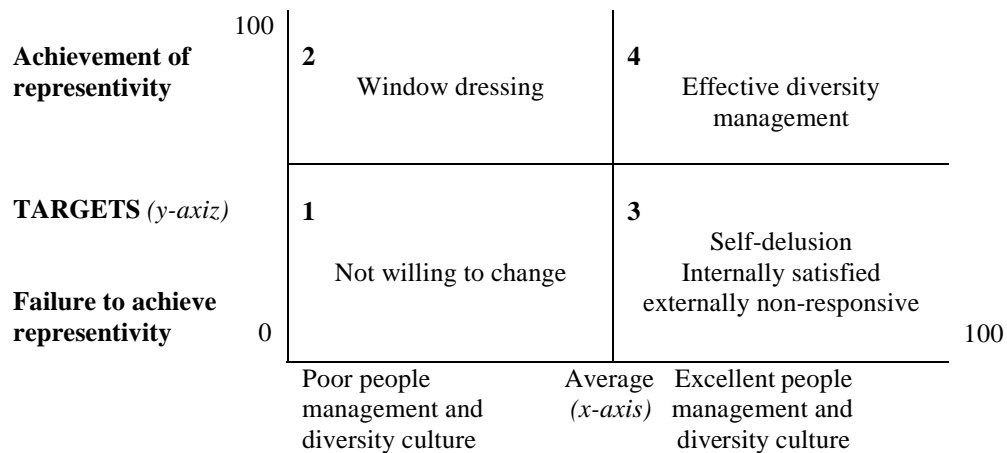

FIG. 1: AXES ILLUSTRATING ACHIEVEMENT OF REPRESENTIVITY

Source: Human, 2005

The x-axis in Fig. 1 refers to the management of people and diversity culture; while the y-axis indicates targets and the extent to which targets have been achieved. The various plots produce a continuum from low representivity, poor people management/diversity culture (*Scenario 1 – bottom left block*) to high representivity, good people management/ diversity culture (*Scenario 4 – top right block*). The latter should be the aspired vision of organisations striving to manage diversity effectively. Looking into the scenarios, illustrated in Fig. 1, from a cultural point of view the key characteristics listed by Human (2005:54-56) can be condensed to the following:

Scenario 1:

- Dominant group in power

- Dominant group feels diversity is lowering standards
- Non-dominant groups alienated and marginalised
- Stereotyping and negative expectations

Scenario 2:

- Dominant group feels reversed discrimination
- Dominant group feels diversity is lowering standards
- Non-dominant group does not feel threatened
- Some aspects of diversity ignored

Scenario 3:

- Dominant group still in power
- Culture still that of dominant group but more accommodating to diversity
- Dominant group does not feel threatened
- No genuine questioning of status quo

Scenario 4:

- No group in power/"integrated" culture
- Emphasis on job-related characteristics rather than stereotypes
- No one feels alienated or marginalized
- Respect for individuals/"culture

From a list of critical aspects for effective diversity management by Human (2005: 47-48) the following cultural aspects need mentioning: identifying diversity as a business case and communicating it throughout the organisation; diversity skills underpinning all other communication; and an integrated diversity strategy commensurate with executive management commitment and shared values. With regard to the latter, Carmichael and Rijamampianina (2006:179-180) propose that the well known McKinsey 7S model, as illustrated in Fig. 2, can provide a systems view of the principle aspects of organisational design.

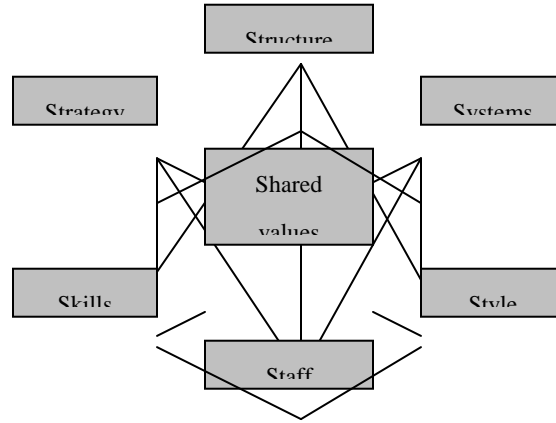

FIG. 2: THE MCKINSEY 7S MODEL

Source: Hitt, 1995

According to this model, once the organisations's vision , mission and values are in place strategy could be formulated in such a way to optimize implementation. Van der Wal and Ramotsehoa (2001:14-18) proposed a diversity model to assist South African organisations with change and development efforts. Their model with its three cornerstones is illustrated in Fig. 3.

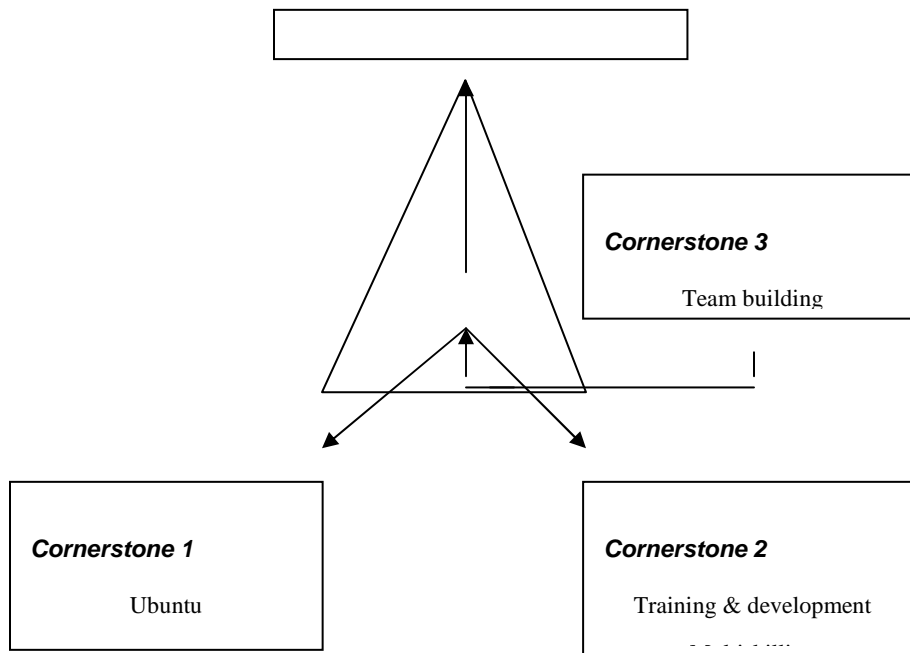

FIG. 3: A CULTURAL DIVERSITY MODEL FOR CORPORATE SOUTH AFRICA

Source: Werner, 2007

The different cornerstones are:

**Cornerstone 1** represents ubuntu - sharing, seeking consensus and interdependent helpfulness; cultural synergy – appreciation and application of diversity; and shared values – inspired by genuine appreciation of cultural diversity.

**Cornerstone 2** focuses the knowledge and skills within the organisation but also on diversity training, mentoring as a mechanism to enhance socialisation and empowerment to create an organisational culture or workforce culture where people are made responsible for the achievement of organizational goals.

**Cornerstone 3** highlights team building, networking and transformation as building blocks in the management of diversity appreciation.

From a cultural perspective the defining and managing of workforce culture (*cornerstone 1*), people development (*cornerstone 2*), and leadership value commitment (*cornerstone 3*), are important and necessary leadership competencies for managing diversities.

## Managing Cultural Diversity in Africa

This section reviews theoretical models of diversity management as cited by Human (2005:53); Van der Wal and Ramotsehoa (2001:14-18); Rijamampianina and Carmichael (2005) as cited by Carmichael and Rijamampianina (2006:182) as a frame of reference for managing cultural diversity in Africa. In Fig. 4 the model of Rijamampianina and Carmichael (2005) for managing diversity in Africa is adapted to include Helriegel's (Helriegel *et al.*, 2004:364) framework. The latter shows that an organisation's workforce diversity and cultural diversity are shaped by the higher-level macrocultures of societies and industries. *Workforce diversity* referring to demographic diversity such as age, sex, race, and national origin; *cultural diversity* pertaining to the full mix of cultures and subcultures to which members of the workforce belong; and *macrocultural diversity* pertaining to a combination of assumptions and values of both the society and the industry in which the organisation operates. This adapted model is depicted in Fig. 4:

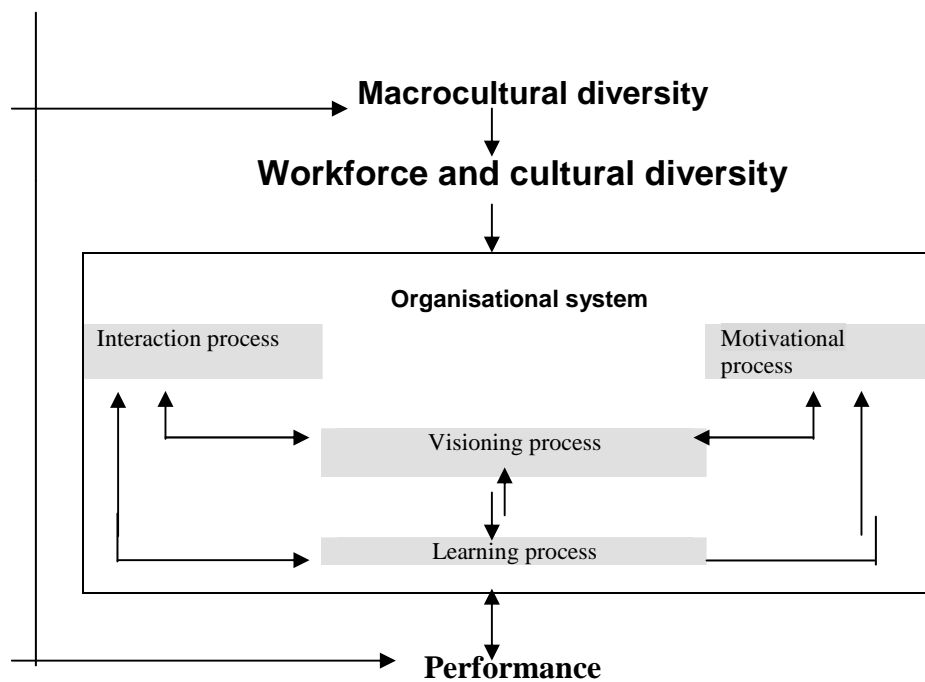

FIG. 4: A MODEL FOR MANAGING DIVERSITY IN AFRICA

Source: Adapted from Carmichael and Rijamampianina, 2006 and Helriegel *et al.*, 2004

The concepts of belonging and respect for others being of great importance to the African are integral to this model. This view is also supported by the first cornerstone of the model of Van der Wal and Ramotsehoa (2001), suggesting that it is only through the genuine appreciation of cultural diversity that shared values will be inspired.

The *interaction process* shown in the model can only take place in an environment of trust in which an individual can share his/her worldviews without being rejected or ridiculed. Cornerstone three of Van der Wal and Ramotsehoa (2001) also stresses the creation of a culture genuinely appreciative of diversity through transformation.

The *motivational process* as part of the model involves a sense of ownership into employees through the sharing of organisational outcomes. Taking the human element of *ubuntu* into account is also part of cornerstone one of the model of Van der Wal and Ramotsehoa (2001). The *ubuntu* worldview also becomes part of the visioning process and the concept of the organisation's vision, mission and shared values as depicted in the centre of McKinsey's 7S model.

The *visioning process* lying at the heart of strategic management and building a sense of ownership is important for success in a diverse environment.

The *learning process* of the model involves the sharing of competence and focuses on providing all employees with the relevant knowledge and skills. Carmichael and Rijamampianina (2006:183) are of the opinion that the learning process can positively impact on all of the other process 'leading to improved organizational performance'. Cornerstone 2 of the model of Van der Wal and Ramotsehoa (2001) supports this view through adding the concepts of mentoring and empowerment to enable employees to add value to the organisation and being valued for their contributions.

According to Van der Wal and Ramotsehoa (2001:14-18) diversity can only be appreciated if:

- everybody is given the opportunity to develop their skill and reach their full potential
- people are empowered with knowledge
- people are given opportunities to utilize their knowledge and skills

Van der Colff (2001:16) furthermore lists ten competencies required by leaders to enable them to develop an appropriate culture that embraces diversity. The competencies being compatible with the models of Rijamampianina and Carmichael (2005) and Van der Wal and Ramotsehoa (2001) are:

- modeling the way by personal value commitment of leaders
- teamwork and team development
- empowering and enabling others to act
- creating vision

- people development and empowerment
- diversity

On a global scale, taking societal or macrocultures into consideration, Hill (2007:117-118) examines the relationship between cultural diversity and national competitive advantage. The author maintains that the value systems and norms of a country could influence the costs of doing business in a country. Japan, for instance, presents an example of how a macroculture can influence competitive advantage. In this regard an emphasis on group affiliation, loyalty, reciprocal obligations, honesty and education boost the competitiveness of Japanese companies. Consequently the rise of Japan as an economic power may be in part be attributed to the economic consequences of its culture.

The philosophies and cultures of Africa may appear to make business life more complicated and less orderly than that of Japan. In Africa, workforce diversity and the macroculture of societies can be either an asset or a liability, The outcomes depend largely on how it is managed. Because diversity and culture cannot be easily separated, managing diversity must necessarily examine culture, along with all of the dimensions of diversity that make up different cultures. Hill (2007:119) contends that one danger confronting an organisation doing business with another country or continent is being ill-informed. Organisations therefore needs to employ host-country nationals, build a cadre of cosmopolitan executives, and guard against the dangers of ethnocentric behaviour. Fedderke and Luiz (2006) have shown that ethno linguistic fractionalisation is subject to marked change over time and that further fractionalization in social, political and institutional structures are often stimulated by economic change. This leads, according to the authors to social cleavages which are dependent on the movements of specific societies.

## **Discussion**

Employees do not act in a vacuum, but are subconsciously influenced by the culture and values of society which in turn impacts the organizational culture within an organisation. Management should therefore determine the cultural diversity and shared values both within organisations, as well as between organisations, society and industry. They should furthermore consciously manage the integration of these values into an organisational culture in order maintain a competitiveness in the global business environment and thereby ensure long-term business success.

The extent to which societal cultures or *macrocultures* affect the values in the workplace is important. In this regard the culture diversity of Africa that embraces a mosaic of subcultures was noted. It was also noted that the contribution of Hofstede can serve as a starting point for managers trying to establish how cultures differ and what it

might mean for management practices. However, because diversity and culture cannot be separated, managing diversity must necessarily examine culture and values along with all of the dimensions of diversity that make up different cultures. Aspects of Hofstede's values-based model are also useful for managers interested in understanding how the organisation's culture influences employees behaviour and performance and whether it enhances or hinders overall organizational excellence. The organisational culture also sometimes called the *workforce culture* was described as a system of shared assumptions held by members and which distinguishes one organisation from others.

The interaction between *workforce cultures* in organisations and *societal macrocultures* was pointed out as being meaningful. A society is regarded as a group of people that share a common set of values and norms; that is, people who are bound together by a common culture. On the other side of the coin are cultures that embrace several nations and regions. In an African context the examples of an Islamic society and culture that is shared by the citizens of mainly northern African states and Sub-Saharan states embracing mainly Christianity and traditional beliefs were mentioned. The issue of diversity characteristics and macrocultural values and norms impacting on African organisations are therefore emphasized.

From the above it is clear that there are societal cultural factors and workforce cultures and, which are important to managers operating in a global business environment. A strong organizational culture does, however, not just happen. It is cultivated by management, and learned and reinforced by employees. In a continent seeking competitive advantage, the goal of managing diversity should furthermore be to develop the capacity to accept, incorporate, and empower the diverse human talents of Africa. The solution may lie in the model of Rijamampianina and Carmichael (2005) as adapted and illustrated in Fig. 4 which assumes four major collective, organizational processes that interact with and affect one another as mentioned in the previous section. It also considers the macrocultural influence of societies on the workforce diversity in the labour force. The model also takes the factors of sharing and integration into consideration allowing for inclusion of all of the diversity factors and dimensions promoting the organizational design factors in the McKinsey model. The model furthermore provides a connection between cultural diversity and performance or competitive advantage. This model when applied in more detail could suggest which countries in Africa are likely to produce the most viable competitors. It could also have important implications for the choice of countries in Africa in which to locate production facilities and to do business with.

## **Conclusion**

With global trading on the rise, more and more organisations are striving to entrench multiculturalism into their organizational cultures. Culture is a complex whole that includes knowledge, beliefs, art, morals, law and other

capabilities acquired by people as members of society. Economic progress and globalization seem to be two important engines of cultural change. Within African societies and organisations different cultures can operate, either complementarily or contradictorily, alongside the dominant culture that has been embedded over time. While it may be argued that Africa with its cultural diversity remains one of the most misunderstood continents in the world, the fact remains that the outcomes with regard to organisations doing business in Africa depend largely on how diversity is managed within organisations with due consideration of the macrocultural societal assumptions that in turn influence organizational cultures. In this regard this article has attempted to paint a picture of culture and cultural diversity in Africa in broad strokes. It also referred to cornerstones that can assist African organisations with change and development efforts and listed some competencies needed by leaders in order to manage diversity effectively. It furthermore compared generic models for managing diversity and concluded by suggesting an adapted model for managing diversity in Africa taking into consideration the macrocultural influences of societies on workforce diversity. It is suggested that it is through this adaptation that the management of cultural diversity could be mastered in the business environment in Africa.

## **Social Responsibility: Driver of International Competitiveness\***

*Maria V. Ciasullo, mciasullo@unisa.it*

*Giulia Monetta, gmonetta@unisa.it*

*University of Salerno, Italy*

### **Abstract**

The aim of this work is to study to what extent the principles of Global Compact are diffused among those Italian organisations that are carrying out internationalisation processes. In order to satisfy this aim, this study, after having carried out a preliminary theoretical-conceptual analysis of the social responsibility of those organisations undergoing internationalisation, will then publish the results of a field study. The second part of the study will initially establish an observation group by selecting a sample of organisations that represent the context. It will subsequently investigate the diffusion and application of the Global Compact principles through the analysis of the strategic *performance* communication tools (social budget, budget reports, press releases, etc). This will be followed by trying to verify their influence in determining the competitive capacity of the organisation within an international context.

### **Aim and Structure of the Study**

The United Nations proposed a noteworthy initiative with the aim of contributing to the consolidation of those social pillars upon which all the markets, including the global ones, must be based, should they want to survive and develop healthily. Global Compact aims at promoting socially responsible behaviour, starting with the organisation through the sharing and application of a series of basic fundamental principles including human rights, labour standards as well as protecting the environment. The organisations that decide to adhere to the initiative undertake to contrast any form of corruption (e.g. extortion, bribery etc).

On the basis of the aforementioned concepts, Global Compact has not been conceived as a verification tool. It is limited to merely collecting the requests to adhere to the initiative made by the organisations, with it neither controlling nor certifying whether they respect and/or apply the relative principles. In addition, with the aim of studying in further detail the work started by the United Nations, this study aims at verifying whether the organisations adhering to this initiative have given the relative amount of importance not only to the economic

activity it carries out but also to the social and environmental too. This will be done by analysing the reports and any other public documents they publish.

In order to satisfy this aim, this paper is divided into two parts, dealing with the theoretical analysis and empirical research, respectively. In fact, the research will be carried out with a cyclic approach, starting with the theory, followed by the collection and analysis of data, subsequently returning to the theory (Bryman, 1988; Lazarsfeld and Rosenberg, 1955).

The first part is a preliminary theoretical-conceptual analysis of the various studies that deal with the theme of social responsibility, concentrating on the particularities that characterise those organisations orientated towards international markets. From a purely theoretical perspective, the theme of social responsibility of internationalised organisations has been studied through the procedures of reasoning, critical as well as detailed analysis of the studies carried out by both Italian and international researchers.

In the second part, in order to carry out the empirical analysis, a specific research problem based on the theme of the study was defined. It is worth noting that it was based on a cognitive problem in relation to a more general problematic situation (Dewey, 1938), a “section” was selected on the basis of the possibility to observe as well as further understanding. It was subsequently decided to study the diffusion and application of the Global Compact principles as well as analyse the behaviour, more or less coherent, of those organisations that have chosen to adhere to it, as well as take into consideration, positive or negative, competitiveness within an international context. This was carried out based on opportune logical-procedural criteria as well as with concrete operative tools which will be subsequently described in detail.

## **Social Responsibility of Internationalised Organisations**

The concept of the organisation as a “tool” without any form of ethics or social responsibility has been criticised due to the need to integrate the criteria of economic interests with social objectives. The strategies and values that inspire the organisation should therefore be defined, including the indication of the ethical and social responsibilities that the organisation should assume. Consequently, the behaviour of the organisation should be orientated towards improving performance, not only in economic terms but also in terms of excellence within the social context too. In other words, the organisation should be constantly trying to improve its performance through dynamic behaviour, with the results being subsequently expressed not only in economical terms but also as ones of social excellence. The drive to produce acceptable profit levels notwithstanding competitive pressure, must be combined with a respect for the “basic moral” obligations (Barry, 1998). *Business* ethics set out how to conduct any form of

economical activity, while respecting the principals, regulations and standards established by society (Trevino and Nelson, 1999).

In the United States, the study of social responsibility of the organisation has been developed up to the point of considering several relevant practical problems. During the 1950's, the theme of *Corporate Social Responsibility* was developed, with the aim of analysing the specific consequences of production on social and environmental conditions. The contribution of the studies carried out by the *Harvard Business School*, subsequently set out a new theme, *Corporate Social Responsiveness*, that not only developed the analysis of the social consequences of production but also examined the different set ups adopted by organisations in dealing with the various impact problems that they create. For further details, it worth noting Epstein (1987). While in Europe, the ethics approach received a strong input from the German economic-organisational doctrine that gives particular attention to the need to associate the actions of the organisation to the demands of equity and balance of the collectivity of which the same entity contributes expression (Zanoni, 1984). In Italy, this vision was developed through the contributions of experts in Organisational Economics<sup>1</sup>, including Fazzi (1951) and Paces (1974) who recognised within the organisation the co-existence of economic interests along with other types of responsibilities. In the Eighties, a theme known as "*Business Ethics*" was developed on an international level, which united the experiences of social responsibility of the organisation in different countries and the belief according to which "in order to govern the organisation it is not sufficient the reaching of economic objectives, necessary, but it also requires that they are reached in an appropriate manner, in other words not limited to the mere respect of constraints set by guidelines and regulations but also characterised by the adhesion to a system of shared ethical, cultural and social values" (Carrus, 2000).

Development of the ethical dimension is also considered as a far-sighted policy in obtaining a positive economic result, in that its introduction creating positive results for the organisation. In particular, the variable ethic tends to produce advantages both relative to the relationship established with interlocutors as well as the long term survival of the organisation. Even if in the short term, this would lead to a sacrifice to sustain that in economic terms would have the aim of improving, in the long term, the same economic result (Ciasullo, 2004). In this case, ethical behaviour would assume a clear instrumental value, accompanied by a calculation that the management makes in relation to the main results that could be obtained from such a vision. In an opposite extreme, respect of the main ethical principles would derive from the morality of individuals who govern the organisation and induce obtaining economic results as one of the aims to reach even if order in comparison to others (Di Toro, 1993; Donaldson and Dunfee, 1999; Drucher, 1981; Sciarelli, 1996; 2002 and Sen, 2000).

The double, economic and social, role assumed by organisations due to the process of globalisation has now become even more important within a business context that is confronted with international realities. Every trans-

national organisation should try to reconcile its own standards of ethics with those of the country in which it is present. Possibilities include the perspectives put forward by several studies, including: a business behaviour that adapts to the moral codes of a specific nation (ethical relativism) (Sinclair, 1993) as well as a moral standard that is recognised and accepted by all cultures with the aim of obtaining a global organisation ethics concept (moral universalism) (Bowie, 1987).

The considerations above, highlight a clear and evident difficulty in attributing an unambiguous and global meaning to ethics and social responsibility of the organisation. However, it is also not possible not to take into account the following considerations.

In relation to the micro aspects, it is worth considering the size of the organisation. For many years, the social responsibility of the of the organisation was considered to be a context of activity only for large organisations and in particular, multinationals. It can represent a useful concept in describing the way in which the internationalised organisation forcefully acts on the conditions of balanced development of the territory and people that are within it. In 1984 Mintzberg had already written: “There is a need to reverse the long-term trend toward impersonalism and utilitarianism in our organization. (...). Social responsibility our best hope, perhaps our real hope, for arresting and revising that trend” (Mintzberg, 1984). This highlights the attention the organisation gives towards the balance between the objective of economic and competitive development and the effects of the objectives and the needs of the environment with which it is directly connected. It is doubtful that the organisations operating over trans-national borders result characterised by evident responsibilities in their different social contexts. It is also not possible that they result being judged by various and numerous clients and it is for this reason that they are capable of managing social projects that are more structured and detailed than those modest sized organisations, operating in local and national contests. It is also true that any organisation, regardless of its size, qualitatively grows and develops when the clients as well as the collectivity recognise reliability, credibility and correct behaviour. It is also worth noting that internationalization and the free circulation of products do not constitute fields precluded to modest sized businesses. The latter, through the creation of institutional networks<sup>2</sup> as well as with the help of Institutions, have progressively overcome the economic and cultural barrier that operate beyond the national borders. In considering the size of the organisation, it is worth taking into account the differences and specifications in order to understand which facilitate both the valorisation of the possible supplies as well as the assumption of the relative criticality. In fact, organisational activity within a specific territory is not exclusively linked to either respecting legal obligations or carrying out philanthropic activity but it should be permeated by a common and shared sense of responsibility as well as respect towards all the stakeholders (Caroli, 2000).

The main characteristics of the Small-Medium Businesses (SMB) should be taken into consideration and analysed with the aim of the social responsibility of the organisation. These characteristics seem to be placed in a

particularly advantageous position within the social responsibility scale due to the collectivity constituting the *milieu* in which they are created and live. The SMB can be found all over the world and are widespread over the territory. They can be easily recognised and reached by the client. They are managed in a familiar, formal way, including the labour relations. Their products respect and reflect the local culture. They do not devour natural resources and distribute the assisted in order to improve their understanding of the social role that they have, thus introjecting more effectively and less spontaneously the means and technical-operative tools of CSR, designed over recent years. Their promising potential is not sufficient, with many of them often ignoring the compulsory obligations and imperative ethics causing human, social and environmental problems and inconveniences in the name of competition. Ad hoc training programmes based on assisted evaluation and the improvement of one or more aspects (environment, labour, human and institutional rights etc) can highlight and consolidate virtuous procedures generated by daily activity and the individual sensitivity of the businessman. Light monitoring systems, carried out by external agencies (trade unions, local authorities, environmentalists, consumers etc), codified but neither bureaucratic nor expensive can validate the efforts made by the small business, highlighting how commitments and intentions can become reality.

Further micro aspects are the macro-economic factors of a country and include history, religion, cultural diversity and politics. An interesting study (Raltson, 1997) has highlighted how the management of an organisation in a socialist country results less inclined to justifying non ethical behaviour, while on the contrary managers in capitalist countries seem to tolerate more non ethical conduct.

Further micro aspects are the macro-economic factors of a country and include history, religion, cultural diversity and politics. An interesting study (Raltson, 1997) has highlighted how the management of an organisation in a socialist country results less inclined to justifying non ethical behaviour, while on the contrary managers in capitalist countries seem to tolerate more non ethical conduct.

In extreme synthesis, what seems to emerge from internationalised organisations is the need to find a common interpretation upon which “ethical behaviour” can be based,. There is therefore, a need to create a common base of values, or in other words a common denominator. The term International Business Ethics refers to the ethical behaviour of organisations that is expressed within the context of the relations with individuals as well as on a global context (Mintz, 2005) It is for this reason that the second part of this study, reference will be made to the main principles and universally recognised of Global Compact<sup>3</sup>.

## **Global Compact**

The international debate, which currently involves noteworthy representatives of the economical, political and academic worlds, with it being mainly based on a voluntary approach, looks for and proposes solutions and indicators capable of conferring a credible reality to the manifestations of social responsibility of the organisations. The most mentioned indications and explanations of accredited internationalisation, result being: “The tripartite declaration of principles of the multinational organisations and social policies” of the International Organisation of Labour (IOL) as well as the guidelines of the International Agency for the Economic Cooperation and Development (IACD). Both agencies are intended for multinational organisations but the principles indicated can also be adapted to small and medium sized businesses that are orientated towards international markets.

Among all the agencies of the United Nations, the IOL is naturally the most obvious for promoting the culture of social responsibility of organisations, with it being significant, even though not exhaustive, in respecting the fundamental rights and principles of work. The agencies that constitute it (governments, businessmen, trade unions) facilitate the reinforcing of social dialogue through a wider involvement of all those stakeholders interested in developing social responsibility. On the basis of the introduction, the General Secretary of the United Nations, upon proposing the famous Global Compact to the organisations considered four fundamental inherent categories, among the main reference principles. They were respecting human rights and labour standards, protecting the environment as well as anti-corruption (TABLE 1).

TABLE 1: THE TEN PRINCIPLES

<p><b>Human Rights:</b></p> <p>Principle 1, Businesses should support and respect the protection of internationally proclaimed human rights;</p> <p>Principle 2, make sure that they are not complicit in human rights abuses.</p> <p><b>Labour Standards:</b></p> <p>Principle 3, Businesses should uphold the freedom of association and the effective recognition of the right to collective bargaining;</p> <p>Principle 4, The elimination of all forms of forced and compulsory labour;</p> <p>Principle 5, The effective abolition of child labour; and</p> <p>Principle 6, The elimination of discrimination in respect of employment and occupation.</p> <p><b>Environment:</b></p> <p>Principle 7, Businesses should support a precautionary approach to environmental challenges;</p> <p>Principle 8, undertake initiatives to promote greater environmental responsibility;</p> <p>Principle 9, encourage the development and diffusion of environmentally friendly technologies.</p> <p><b>Anti-Corruption:</b></p> <p>Principle 10, Businesses should work against all forms of corruption, including extortion and bribery.</p>
--

The main idea of the Global Compact consists of favouring the collaboration between organisations with the aim of promoting the culture of basic fundamental rights, above all where there seem to be hardly any, in other words, the developing companies.

In order to carry out a “sustainable” globalisation (more balanced and with a greater social dimension), apart from correct policies of public governance, a greater commitment is needed by those richer countries towards the poorer ones. The main priority of the Global Compact is not only to ask organisations to respect the rights (human, labour, environmental) within those industrial countries where they seem to be widely accepted and protected by national legislation but also to demand coherence of the interventions and business behaviour in situations where organisations have production/distribution subsidiaries situated in poorer countries, where legislation is lacking in relation to social responsibility.

The organisations are trans-national as well as active in developing countries can give a significant contribution by transferring, facilitating and diffusing a climate of understanding as well as safeguarding those rights considered to be typical of an industrialised nation.

Essentially, this is the initiative promoted by the United Nations, sustained by the IOL and currently being adopted in Italy. In fact, the intent is to encourage adhesion to the Global Compact by those organisations interested. The project that has been started in Italy is similar to the one carried out by the ex-Ministry of Welfare in relation to the strategy of Corporate Social Responsibility (CSR), with it being considered an integral part of it<sup>4</sup>. In fact, those organisations that have accepted and are sharing the elements of credibility of their social commitment in Italy, through CSR, have the possibility to carry out the internationalisation process, as requested by the UN. It does not necessarily imply having to be organised in order to carry out social labels capable of bringing about advantageous opportunities. The progressive involvement of the organisations (in whatever dimension it is assumed), along with the “voluntaristic” philosophy constitute favourable conditions for carrying out a business strategy that is reinforced through integrative processes and international projections.

It, subsequently, results accredited in doctrine and empirically verifiable that the social performance of an organisation is surely destined to increase the economic performance regardless of whatever form of certified formalism. It represents the logical basis of the project of social responsibility in Italy, while at the same time being the meaning of the request of the UN. It does not promise labels but further possibilities and continues with the aim of carrying out a constant and progressive valorisation of social responsibility, as well as increasing prestige that is only a consequence thanks to a solid commitment, visible through actions and behaviour.

Global Compact is therefore a flexible, universal tool that highlights the practical processes rather than the formalism of the procedures. From a procedural point of view, the organisations that intend on adhering to it, should periodically, if not annually, make a public declaration as well as a letter to the General Secretary of the United Nations, reporting on the progress made. Without a doubt, participation leads to an increase in visibility and prestige for those organisations that are orientated towards international markets as well as facilitates a liberal and free comparison. Visibility represents a powerful tool of transparency, in whatever form, as well as for monitoring the performance, with acts and documents, projects and experiences, criticisms and solutions and reports all attracting the attention of the international community, therefore becoming a patrimony of experiences and improving knowledge. Progressive benchmarking can also increase the level of responsibility. The comparison is made possible due to telematic platforms, set up on the Internet by the UN agencies. These deal with specific problems through concrete examples that include highlighting new marketing strategy options as well as different ways of conceiving the relations with the context. They also invite organisations to share the problems that they may have in common as well as adopt original approaches developed through best practice methods. Specific and personalised measures are also identified, especially within the context of the small business, in order to deal with collective problems within a greater perspective.

As previously mentioned, the Global Compact Office in New York files all the letters of participation received and inserts the names of the organisations into a database. This does not mean that the United Nations Agency recognises or certifies the application of the Global Compact principles by the organisations participating. In fact, it was not conceived as a static verification agency, only working when receiving a declaration from the organisation wanting to follow its principles. It has a divulgence and advisory role, through the analysis and diffusion of the relations that the participating organisations present each year. In other words, through the press releases reporting on the organisations activities. The reports on the application of the Global Compact principles contribute to the constant promotion of the transformation process not only of the organisations that have chosen to follow them but also all the stakeholders as well as the public opinion.

It is worth highlighting that the voluntaristic approach of the project represents, on the one hand, a point of strength, while on the other, the risk of losing integrity and credibility should the organisation adhering to the initiative not be capable of demonstrating the progress made. For this reason, all the participants are asked to draw up and publish a COP (Communication on Progress), reporting on the commitments made by the organisation upon adhering to the initiative. The COP represents the Annual Communication through which the organisations give a detailed description of the activities carried out in relation to the 10 Global Compact principles. The aforementioned Annual Communication has been the object of new directives set out by the United Nations Agency in New York since January 2004. On the basis of these directives, the participating organisations have to annually communicate the activity carried out in relation to the Global Compact principles through annual sustainability reports as well as other communication tools. All the tools listed should be transmitted to the Global Compact Office and made public through the opportune channels of communication (websites etc). The guidelines for drawing up and publishing the Annual Communication represent a reference model not only for those organisations that already publish annual sustainability reports but also for those organisations that have never published this type of report before, even though it is from a social perspective.

Global compact asks those organisations which decide to participate that their principles become an integral part of organisational strategy in order to constantly orientate all business activity. Participation to the initiative represents for several organisations, the starting point of the aforementioned process, while for others, it contributes to increasing the efforts already made in trying to integrate the economics objectives with social ones. This, however, is a long and continual process that consists of introducing, diffusing and sharing the inspirational principles of human rights, labour as well as environmental priorities with all the interlocutors of the organisation, both internal, and in particular with the human resources that participate to the business project, as well as external, including suppliers, clients and any other collective in general.

## **Empirical Research**

### **Theoretical and Hypothetical Assumptions Subject to Falsification**

Empirical research is based on the following theoretical assumption: the Global Compact principles set out on an international level represent a fundamental reference not only for those organisations orientated towards international and European markets but also those operating within developing countries. There are currently 4000 large organisations that have adhered to Global Compact. Notwithstanding the fact that they operate within different sectors and geographic areas, they have the common ambition of wanting to increase their respective global responsibility, which takes into consideration the interests of a wide range of interlocutors including employees, investors, clients, partners, consumer associations and local communities.

Empirical research will try to verify whether Global Compact not only represents a reference for those organisations operating in foreign markets but also if it can become a tool capable of facilitating the construction and maintenance of competitive advantages on an international level. In other words, whether adherence to Global Compact facilitates competitive sustainability within an international context.

The theoretical analysis has defined the assertion that implies the relationship between two or more variables. They are collocated on an inferior level of abstraction and generality in relation to the theory due to translating it into empirically detectable and controllable terms. The empirical research was based on the initiative of Global Compact, fully aware that the principles, methodology, regulations as well as the indicators that an organisation can adopt to measure its own economic, social and environmental contribution can be different.

After having collected and analysed the quantitative data and qualitative information, the following general hypotheses emerged<sup>5</sup> subject to falsification<sup>6</sup>: given a specific time period (2004-2006), it is possible to highlight the relationship between the increase – tendency and growth, decrease and stability – of the annual income on an international level of the organisations observed and the behaviour they assume in relation to the Global Compact principles. The hypothesis intends on subjecting to falsification whether, within a specific time period, there is a correlation<sup>7</sup> between the following of a specific and economically measurable parameter (amount of income) and the implementation of determined actions and activity aimed at qualifying a more or less convinced behaviour of the organisation in relation to the Global Compact principles.

It is worth noting that the correlation terms used are not similar to those of the statistical analysis due to them referring to the analysis of the relations between cardinal variables. In this case, the study, given the nature of the data compared, proposes a correlation of casual relations, eventually recoverable, in the study of the observed phenomena<sup>8</sup>. In fact, the comparison takes into consideration numerical data as well as descriptive information,

dealing with, in the first case, the development of the quantitative data observed (amount of income) and in the second, the carrying out of activity capable of influencing the quantitative variable.

Three specific hypotheses subsequently allow for the more general hypothesis to be validated:

- a) the organisations that, during the period considered, have registered an increase in income result being the same that have dedicated particular attention to the activity of communication as well as have shared their experiences and promoted adhesion to the initiative to other organisations. In other words, the hypothesis validates whether the coherent actions of sensitization to the Global Compact principles, with activity aimed at communicating and sharing the aforementioned actions positively influence the economic performance of the organisation.
- b) the organisations with an annual income that remained more or less the same over the three year period, even though they respected and shared the Global Compact principles, can be characterised not for having communicated the progress made upon adhering to the initiative and the efforts made to continually improve.
- c) the organisations that have registered a reduction in their annual income are those organisations that adhered to the Global Compact initiative, purely for its “face-value” but result inactive and show no particular sensitization or sharing of the themes of social responsibility of the organisation. In other words, the hypothesis validates whether the amount of international income is reduced for those organisations that have not carried out any coherent activity in relation to the Global Compact principles.

In order to carry the process of falsification, any further reasons that may have influenced the trend are also taken into consideration, with these causing any possible distortions therefore creating an illogical correlation. They may not result being particularly significant as it not always to have a positive trend of the parameter considered, even though in this case, the organisations interviewed paid particular attention to the principles of social responsibility as well as having a high degree of agreement with the Global Compact principles. Another aim was to highlight any other variables that influenced the income increase as well as take them into consideration.

#### **Variables and Phases of the Process**

In Italy, the start of the Global Compact Project dates back to 2002, with 105 organisations adhering. These organisations constituted the universe of the study.

Various types of organisations adhere to Global Compact, with the United Nations Agency dividing them into the following: Associations (businesses, banking and no-profit), Banks, Consortiums, Cooperatives, Foundations, Public Agencies, Companies, Research Institutes and Trade Unions.

A non probabilistic sampling method was preferred for the field study, due to both the evident need to analyse a reduced number of organisations in relation to the universe as well as the cognitive objectives of the analysis of the data and its relative demands (Chisnall, 1994; Marbach, 1996; Agnoli, 2006).

The organisations chosen to be part of the sample, with information being collected and subsequently analysed, were selected on the basis of:

- the approach adopted towards foreign markets and were therefore, Italian companies that carry out internationalisation processes through export, collaboration and direct foreign investment strategies (Sicca, 1998). Multinationals with operative offices in Italy were not considered;
- being in relation to the referred business core, and were therefore companies operating within the secondary sector, in other words, industrial. However, excluding the service and public utilities sectors (tertiary). The reason that excludes the service sector is the not very significant number of them in relation to the industrial companies, given the minor transactional presence of the first in relation to the latter. It was also considered opportune not to take into account the tertiary companies in that the attention they give to the themes of social responsibility are often the result of an autonomous and fully aware choice, as well as the fact that the study is dealing with companies that, due to their mission, manage activities of public interest.

It is also worth noting that companies operating within the primary sector (agriculture) were also not taken into account, due to them not resulting among those organisations adhering to Global Compact.

The sample was made up of 42 organisations, chosen on the basis of selection criteria of the aforementioned units of analysis.

In order to satisfy the informative needs, collection of the information was articulated over two time periods, even though they were carried out simultaneously. The information obtained directly from the filed study was compared and integrated with other information that had been previously obtained from other sources. The use of a research methodology based on the analysis of data obtained from both primary as well as secondary sources can be considered valid in that having as much data as possible, gives a more accurate and detailed analysis of the phenomenon. It also makes the results of the empirical research more reliable as well as complete.

It is well known that secondary data includes those published and collected regardless of the aims of the study being carried out. The sources of this type of data are both internal as well as external (Marbach, 1996; Metallo and Barile, 2002). In the first case, it is data that can be easily consulted, with it either being published on the company website or made available by the company<sup>9</sup>. While, in the second, the data was published and supplied by the Italian Global Compact Organisation website. It is worth noting that the secondary data has given qualitative information. This phase was useful in identifying those organisations that besides having adhered to the principles of

Global Compact, had also demonstrated to have assumed a responsible behaviour, through constant communication with both the United Nations Organisation as well as with its interlocutors, through the publication of reports and progress press releases.

It was considered necessary to collect further data/information from the field in order to carry out the objectives of the study, considering the type and characteristics of the data available, as well as satisfy the informative needs.

The primary data was collected using a questionnaire, considered to be a indispensable support when acquiring general information, as well as necessary and useful. It was considered opportune to structure the questionnaire with both closed and semi-open questions. The first were used in order to obtain quantitative data on both the national and international revenue, as well as understand how much attention the company gave to the themes of social responsibility. They also gave information on how the manager perceived the benefits associate to adhering to Global Compact. The qualitative information was obtained through the analysis of secondary sources, allowing a comparison between the actual communication tools used by the organisations and those claimed to be used during the field study interviews.

On the whole, the questionnaire resulted being, in its definitive final version, the most essential possible with the aim of both obtaining the most number of valid answers as well as facilitating the interviewee in filling it in. It was administered electronically, being sent to the Administrative Offices as well as the Press Office, when present on the company organization chart.

The last phase of the research was dedicated to the organisation of the statistical data as well as the qualitative information in order to not only to give a detailed analysis of the phenomenon investigated but also to falsify the declared hypothesis. The first step of this activity had a well defined aim, even though descriptive, of realising a taxonomy of the organisations that have adhered to Global Compact as well as their classification based on the different types of behaviour they assume in relation to the principles of social responsibility. The notion of paradigm, as “a conceptual structure through which scientists watch the world” (Kuhn, 1969), makes reference to the recognisable vision of intepretism (Weberian Theory) according to which reality can not be simply observed, but is interpreted (Weber, 1958). The method, therefore, was that of understanding through the use of instruments and tools considered to suitable in analysing the reasons that have inspired the observed business behaviour.

The description of the different types of behaviour assumed by the organisations, the research and any eventual signs of sensitivity as well as the attention given to social responsibility have contributed in satisfying the informative needs of the second phase of the study. It was also verified, through the process of falsification, whether a more or less responsible behaviour of the organisations studied can be considered one of the determining factors in acquiring international competitiveness. This was carried out through the analysis of the historical trend<sup>10</sup> in relation to the foreign market revenue. The identification of the quantitative parameter (revenue) made it possible to make a

distinction between the organisations interviewed on the basis of its progress (increase, decrease, stable), highlighting the different particularities<sup>11</sup>, as well as verifying whether the two phenomena studied – the quantitative data and the qualitative information – result being connected by a casual relation. In other words, this part of the study also tried to clarify the capacity that determined business behaviour can have in influencing, either positively or negatively, determined results in quantitative terms. In terms of cause-effect, the case was taken into account in which a certain event was the sufficient condition, but not necessary, in order to verify a determined result. It was not the case of exclusively identifying the existence of a constant association between two phenomena but the cause and effect created (Bunge, 1959).

In order to test the general hypothesis, as well as hypothesise on a theoretical level a casual relationship, it was considered necessary to verify the events and the relative observable consequences empirically (Blalock, 1961) and subsequently create further research proposals. The falsification process of the general hypothesis resulted in taking into account any other variables that could have determined variations in revenue. A more detailed study of the questions in the questionnaire allowed for the possibility that the general correlation, progress (increase or decrease) of the observed parameter could have been influenced by other factors or elements.

Table 2 summarises the various activities carried out during the field study.

### Results Obtained

The considerations that follow highlight the results obtained from the field study, first dealing in detail with the information relating to the qualitative aspects and then the quantitative data.

As previously highlighted, the information relating to the qualitative aspects of the field study was collected mainly from secondary sources, including documents, publications, websites relating to the organisation investigated as well as the Italian Agency of the United Nations and only in part to the questionnaire administered directly to all of the organisations that constituted the sample.

On the basis of the information obtained, followed by an accurate interpretation and analysis of the communication tools used by the organisations as well as the different types of behaviour in terms of agreement/disagreement with the principles of Global Compact, the organisations studied can be divided into the following:

- “resonant organisations”, constitute approx 13% of the sample. In respecting the principles set out by Global Compact, they periodically communicate the initiatives taken. In accordance to the commitments made upon adhesion, these organisations annually draw up and publish the Communication On Progress (COP) on the United Nations Agency website. They are also concerned with making public their annual sustainability reports as well as any other information regarding the action taken by the organisation including the implementation process used in order to integrate the 10 Global Compact principles within the daily management of the organisation. This is done not only through their own website but also through other channels of communication. Most of the organisations defined “resonant” have realised and applied an ethical code that includes amongst its principles, those universally recognised and sanctioned by the United Nations Agency;
- “immoderate organisations”, constitute approx 28,5% of the sample. These organisations, like those belonging to the first group, periodically publish the Annual Communication but on the contrary to the “resonant” organisations, the reports published and diffused on their website do not include details about the actions taken by the organisation in relation to the 10 Global Compact principles. This category of organisations, even though have adhered to the initiative of the United Nation and result apparently active and participative in upholding the relative principles, are not however particularly concerned with including within the management of their organisation, either defending human rights, labour relations or protecting the environment;
- “idle organisations”, constitute approx. 24,5% of the sample. This type of organisation, after having adhered to Global Compact with a public declaration and a letter to the General Secretary of the United Nations, have not annually communicated with a COP what they have done in relation to the Global Compact principles. Nevertheless, the signs of attention and sensitivity that tend to highlight how important it is, even for these organisations, to integrate the criteria of economic interest with social objectives can be gathered from the websites of the organisations as well as secondary sources (annual sustainability reports, social balance);
- “dissonant organisations”, constitute approx 14% of the sample. The dissonant organisations, like the “idle organisations, upon having adhered to Global Compact have not published any form of annual Communication. However, this category of organisations is different from the others in that they give no attention what so ever to the themes of social responsibility, as highlighted by the analysis carried out. This is sustained by the information published on their websites as well as through the analysis of alternative sources (data collected form bulletins published by the associations that deal with organisational ethics and sustainable development, annual statistics, in journals and magazines etc). There was also no use of

business tools (social balance, sustainability reports etc) to communicate an active and responsible involvement of this type of context within the context in which they operate.

The comparison between the primary and secondary data, or in other words between what the organisations declared through communication channels and the information obtained from the interviews carried out during the field study, has not highlighted any noteworthy differences or disagreements. In particular, on the margin of the proposed taxonomy and with the aim of giving the proposed classification greater credibility, it is worth highlighting that among the benefits of Global Compact indicated through the collection of the primary data, in most of the cases, the interviewees coherently collocated in the second and third groups indicated: the possibility to obtain greater visibility and prestige on foreign markets; the opportunity to take advantage of contacts with social organizations as well as other players involved in the Global Compact initiative; the opportunity to realise projects in collaboration with the United Nation Agencies as well as other socially active institutions, therefore benefiting from the technical assistance of multilateral organisations. On the contrary, the interviewees whose organisations were collocated in the first group, believed that Global Compact was among other things, a global platform capable of uniting universally valid and shared principles as well as being a responsible business behaviour with the aim of converging towards a sustainable globalization.

Figure 1 shows the “positioning matrix” based on the considerations discussed up until now. It classifies the organisations studied on the following parameters:

- “activism” inherent the major or minor communication and sharing capacity, through the COP, of the actions taken by the organisations, from the moment of adhesion to the initiative, of the sanctioned Global Compact principles;
- “coherence” among the universally recognised and sanctioned principles of Global Compact and how they are accounted for by the organisation through the communication channels of social responsibility.

		<b>COHERENCE</b>	
		High	Low
<b>ACTIVISM</b>	High	<b>IMMODERATE</b> (12 organisations, of which 5 replied to the questionnaire)	<b>RESONANT</b> (14 organisations, of which 8 replied to the questionnaire)
	Low	<b>DISSONANT</b> (6 organisations, of which 4 replied to the questionnaire)	<b>IDLE</b> (n. 10 organisations, of which 8 replied to the questionnaire)

FIG. 1: POSITION MATRIX OF THE ORGANISATIONS ADHERING TO GLOBAL COMPACT

The quantitative data was collected exclusively through the questionnaires administered to all the organisations constituting the sample. In reality, the main reference principle was the volume of annual revenue relative to sales that the organisations had carried out in foreign markets over the last three years. It is worth noting that the primary data, which is analysed and discussed, is limited to those organisations which returned a completed questionnaire. Approximately 61% of the 42 organisations constituting the sample answered the questionnaire. It is worth highlighting this in order to define the taxonomy of the different types of behaviour of the organisations adhering to Global Compact, with reference being made to the entire sample. The general hypothesis (para. 4.1 lett. a) should have been verified, had the development of the revenue (Y) of the organisations studied, varied in relation to the different type of business behaviour assumed (X). The falsification process of the previously declared hypothesis was carried out on a limited number of the organisations sampled, only 25, in that the questionnaires in which the organisations highlighted specific and particular reasons (e.g. end of a type of activity, contingent factors etc) for having determined either an increase or a decrease in the observed parameter were not taken into account.

Analysis of the development of the volume of international revenue for the three year period, 2004-2006, lead to the following considerations relating to the organisations studied. In particular, 56% of them had an increase in international income, 12% had no variation whereas the remaining 32% suffered a decrease in foreign market sales.

On the basis of the proposed positioning matrix (FIG.1), those organisations that highlighted a positive trend in revenue resulted belonging to the group of “resonant organisations” (with 7 having a positive variation),

while the rest, to the group of “immoderate organisations (with 4 having a positive variation). The few organisations that registered no form of significant variation of revenue for the three year period were mainly allocated in the group of “dissonant organisations” (with 2 having no variation at all) and marginally in the group of “idle organisations” (with only 1 having no variation). The latter group contains those organisations that declared a decrease in their revenue (5 organisations).

The most significant element that emerges from the considerations made, results the high number of resonant and immoderate organisations which result particularly active and annually renew their adhesion to the United Nations initiative as well as having declared an increase in revenue from foreign markets. It is also worth noting that there are only sporadic cases where dissonant and idle organisations have had an increase in the observed parameter.

The analysis has also highlighted that in order to increase revenue, it is not particularly necessary to maintain a high degree of coherence between the universally recognised and sanctioned Global Compact principles and what is declared by the organisation through communication channels in relation to social responsibility. The results obtained from the falsification process of the declared hypothesis could be illustrated (TABLE 3) using symbols that clearly represent the correlation between the quantitative data and the qualitative information.

TABLE 3: THE FALSIFICATION PROCESS

<b>H<sub>p</sub></b>	<b>Y</b>	<b>f (x)</b>	<b>Result</b>
I	Revenue	Business Behaviour	Survival of the organisation over time
a)	$\Delta +$	Adhesion, Periodic Communication and Sharing of the Global Compact Principles	“Resonant” Organisations “Immoderate” Organisations
b)	=	Ineffectiveness of social communication	“Idle” Organisations “Dissonant” Organisations
c)	$\Delta -$	Absence of social communication	“Idle” Organisations
<p><b>Y:</b> dependant variable: the variation that effects the trend in varying business behaviour.  <b>f (X):</b> logical operator, not mathematical, being the independent variable (X) qualitative observed, not expressible in quantitative terms.  <b>Result:</b> informative output (expressed in relative terms) obtained through close examination of the results deriving from empirical research.</p>			

## **Final Considerations and Further Research Proposals**

Even though it may not be exhaustive, the field analysis has verified the influence that different types of business behaviour can have on improving, as well as worsen, the international competitive capacity of an organisation.

Analysis of the effectiveness of the communication and sharing activities taken by the organisation in relation to the Global Compact principles and the degree of coherence between the two as well as what is declared by the organisation through communication channels in relation to social responsibility, were the parameters used to carry out the empirical study.

It is worth noting that the competitive capacity of the organisations studied in an international context, was measured through the variation of revenue from foreign markets. Only one parameter, in quantitative terms, was therefore considered not to constitute the only element upon which to adapt the performance on global markets. The study could therefore be carried out in greater detail by considering further reference parameters upon which to correlate performance. They could have both a quantitative value, e.g. market share, as well as a qualitative one, e.g. social image and prestige.

The results of the inductive analysis can represent, in our opinion, not a final destination but rather a starting point, giving suggestions for ulterior considerations as well as further studies. In the first case, the results obtained from the empirical research highlight how the active organisations – and in several cases, proactive – respect the all the requirements formulated by the United Nations Agency, taking fully advantage of all the benefits associated to a socially responsible behaviour. These benefits subsequently reflect on the overall performance. A business behaviour that is careful to communicate, involve and sensitize all its interlocutors to the principles relating to human rights, labour relations and protecting the environment, as well as the exclusion of corruption, being universally recognised principles, will allow the organisation to improve performance not only in terms of social prestige but also in quantifiable economic results.

In the second case, a possible consideration for subsequent studies could be to identify through the validation of a hypothesis derived from the general one, in order to study further motivations capable of determining variations in the volume of revenue from foreign markets. A example would be to study the management's capacity to identify the particulars present in different territorial contexts as well as coherently contextualise their relations with relative interlocutors. This would not only have a positive effect on the social credibility of the organisation but also on the constant interactions with the local interlocutors thus representing a form of external monitoring.

## End Notes

\* Even if both authors share responsibility for the entire work, par. 1, 2, 4.3 may be attributed to Maria V. Ciasullo, whereas par. 3, 4.1, 4.2 to G. Monetta; while par. 5 may be attributed both authors.

[<sup>1</sup>] As observed by Velo (2003) who discusses the ethics and social responsibility of the organisation, with it having to question the contribution of those studying the organisation and whether they can give a structure to a more advanced society and economy, just as the experts already studying it have done.

[<sup>2</sup>] The organisation of the value chain on a trans-national base makes for a dynamic management of the localisation of the organisation's own activity, supplying, production and sales. These allow the organisation to rapidly react to the economic and geo-politic conditions of the different parts of the world (Varaldo, 1997).

[<sup>3</sup>] Global Compact represents a type of "code of behaviour". In general "codes of behaviour" established by international agencies indicate a series of behaviour criteria to which the international organisations, even though they are not obliged by the law, are invited to follow. On the one hand, they determine a homogenous reference for all those competitors present on the international market. While on the other, they constitute a force of moral suasion that drives the organisation to uniform its behaviour in accordance to the set standards. For further details: Caroli, M.G. (2000). *Globalizzazione e localizzazione dell'impresa internazionalizzata*. Milano: Franco Angeli.

[<sup>4</sup>] The "Multistakeholders" Forum" on social responsibility started on an initiative taken by the ex-Minister for Welfare, Maroni, leading to several considerations on further strengthening of the prospects of the social responsibility of organisations in Italy, and the demonstrate definition in considering the theme as an absolute priority for Europe. In fact, even Sweden, Holland and Germany have already tested an approach that along with the strengthening of a CSR culture within their countries, also promotes it through Global Compact in developing countries. In Italy, a similar cultural process could and should be found in the associations between the strategy of management and Global Compact orientated towards the poorer countries cooperating with Italy.

[<sup>5</sup>] The hypothesis is a provisory affirmation that still has to be proved, deriving from the theory but needs to be empirically verified in order to be confirmed (Corbetta, 2003a).

[<sup>6</sup>] It is generally agreed upon that the term verify should be banned from scientific language, substituting it with the term falsification/validation in that science can never definitively prove anything but can only give confutations of alternative theories (Popper, 1970; 1985).

[<sup>7</sup>] In merit to the study on the relations between two characteristics, see: Corbetta, P. (2003b). *La ricerca sociale: metodologia e tecniche. L'analisi dei dati*. Vol. IV. Bologna: Il Mulino; Marradi, A. (1997). *Linee guida per l'analisi bivariata dei dati nelle scienze sociali*. Milano: FrancoAngeli.

[<sup>8</sup>] For further details on the concept of the correlation see: Pisati, M. (2003). *L'analisi dei dati*. Il Mulino: Bologna.

[<sup>9</sup>] “The answers to most problems can often be found among the archives of an organisation, containing material published, internal registers, statistics etc” (Chisnall, 1994).

[<sup>10</sup>] The study carried out in this phase can be considered longitudinal in that it refers to observations repeated over time (Lazarsfeld, 1967; Cannavò, 1999).

[<sup>11</sup>] It is not by chance that, “a similar procedure is used in the quantitative study of organisational phenomena(...) in order to obtain useful knowledge that can in managing the problems of the organisation, judgements concerning their behaviour as well as very action that is to be made regarding its behaviour, in given environmental conditions” (Onida, 1951).

## **Privatization and Corruption in the Kyrgyz Republic**

*Jyldyz Aknazarova, akjyldyz@mail.ru*

Osh State University, Kyrgyz Republic

### ***Abstract***

**This paper seeks to demonstrate that privatization, if well implemented, will have a positive impact on economic development and democracy. In transition, corruption in the Kyrgyz Republic is blooming. Privatization, sometimes, was conducted in a bureaucratic, corrupted and ‘broadly-giving-away-for-nothing’ way. Bribery and corruption needs to be discouraged by universal employment with sufficient wages and salaries, adequate public services, cultural values, and prosecution by the courts. The practice and culture of bribery and family/tribal loyalty need to be replaced by rule of law and honesty as the norm for economic, political and social relations. Corruption, which affects state institutions, needs to be addressed at all levels from bribery in government to corrupt practices in businesses. Without attention to corporate governance and increased corruption, privatized enterprises could miss opportunities, expose their reputations to greater risks, and find themselves at a competitive disadvantage. Ultimately they will become less attractive to foreign partners and investors.**

### **Introduction**

After the collapse of the Soviet Union in 1991, the Kyrgyz Republic declared its independence. The collapse of the Soviet Union gave rise to different political circumstances as well as to the new economic conditions for this country. Kyrgyzstan has decided to establish a competitive market economy by accepting privatization as a key element. For most analysts (see e.g. Lipton and Sachs (1990), Hinds (1990), Fischer and Gelb (1991), establishing the market economy in transitional economies mainly depends on four interrelated policies on the micro-economic side: price liberalization, integration into the world economy, reducing barriers for SMEs, and privatization. These policies also suggested by the International Monetary Fund (IMF) and the World Bank in transitional economies: stabilization-liberalization and privatization (Canning and Hare, 1996, 13). It was hoped that these policies taken together would motivate a supply response at the industry level, which would alter the structure of national

production, the pattern of sales, both domestically and internationally, the quality and variety of output and enterprise productivity (Estrin, 1996, 6).

## **Privatization Program and its Realization**

One of the main trends of the economic and social reforms conducted in the Kyrgyz Republic (KR) is formation of effective market relations in the economy. The main source of the creation of a competitive private sector is privatization of the state property and reduction of the state control over the economy.

In Kyrgyzstan, privatization process started at the end of 1991, virtually immediately after gaining of independence. Currently the seventh privatization program is being implemented. Every privatization program was developed for the period of 2 years and later for the period of 3 years and had to include the following:

- Tasks and goals of the state policy in the sphere of privatization for the current period.
- Definition of the objects involved into the program.
- Methods and means of privatization of the state property.
- Forecast of revenues.
- Forecast of the volume of investments related to privatization.
- A list of the groups of objects exempt from privatization due to the reasons of defense, state security and social development.
- Questions related to the environmental protection and public health, as well as retaining state monopoly in some sectors.
- Procedures of evaluation of the state property being privatized.

The core of the KR privatization legislation is the Civil Code and the Act on Privatization of the State Property in the Kyrgyz Republic. The privatization act of March 2, 2002 is in force. The law defines the contents of the program of the state property privatization, participants of privatization, methods of privatization, methods of transforming state-owned enterprises into joint-stock companies, procedures of privatization of the state owned enterprises that has been transformed into joint-stock companies, procedures of calculation of starting price, managing privatization income and its redistribution.

Mechanisms that ensure implementation of norms of the legislation are defined in the following regulations:

- on general conditions and the order of the state property privatization;
- on the procedures of the state property privatization by management contracts with an option for buy-out, on auctions, tenders, by leasing buy-out, by direct sale;

- on the procedures of case-by-case privatization and in methodic recommendations;
- on the evaluation of the property and objects of privatization;
- on the evaluation of land lots owned by state.

The law envisages that in the process of evaluation of the state property not only balance methods should be used, but also the methods of market valuation. This greatly broadened the list of by-laws directly or indirectly influencing on privatization processes.

Realization of each privatization program led to improvement of the legislation, more precise definitions, overcoming of misunderstandings and contradictions. The quality of the legal regulations was very doubtful – privatization programs and legal acts were in some respects too ideological and very contradicted each other and other laws. For instance, in privatization programs there were some terms and instruments absent in the act on privatization. Provisions of the law were often limited and changed in by-law acts prepared by the executive power.

### **Privatization Process and Corruption in the Kyrgyz Republic.**

The policy of privatization is based on the idea that activities of enterprises being implemented under free market economy with equal competition and commercial approach are more effective than those within administration limitations and instructions. The market is considered to be the source of social economic progress, the level of which depends on how competition is encouraged to increase production and consumer services.

Notwithstanding the depth and scales of revolution in the area of privatization, it remains an obscure notion to the majority of population. Actually, privatization includes many different approaches, goals and results. Some authors point out a necessity of good reasoned and consistent steps on the way to privatization, which would match a carefully developed conception<sup>1</sup>. The authors emphasize that “low effectiveness of production and inevitability of privatization are obvious”<sup>2</sup>. Further, analyzing the role of privatization in implementation of economic reforms, the authors write that “denationalization and privatization are, for sure, powerful mechanisms, which can enable the country to obtain in a new image, transform into a new quality of social and economic organization”<sup>3</sup>.

The problem of privatization is presented in discussions of its advisability. While such discussions take place, it is pointed out that consequences of privatization often appear to be negative in terms of the nation’s wellbeing and social justice. In other words, privatization results in unreasonable enrichment of a narrow circle of the population and pauperization of the majority of the society. Actually, it is true, but in a short term aspect. If privatization is considered not as a quick action, but as a long term and very complex process of changes, over a long period of time, its final aim is creation of an effective economic public system.

In 1992, the Kyrgyz Republic embarked a broad program of stabilization and structural reform, including price liberalization, mass privatization and liberalization of the trade regime. Most prices were liberalized with the removal of all direct and indirect price controls, and as for trade policy, all non-tariff barriers to exports and imports were removed. A mass privatization program has placed approximately 1000 primarily medium-sized and large enterprises and several thousand small businesses under private control.

In Kyrgyzstan, the mass privatization was conducted in the following way: the whole adult population was given privatization coupons on a free and equal base, with further rights to purchase apartments or exchange them for shares of state owned enterprises. The coupons were easy to trade. But the market prices of the coupons were very low. The price of 100 coupons was 1.22-1.35 soms, one coupon being approximately 0.0008 US\$. Thus the distributed coupons equaled 0.625 US\$ per capita in the Kyrgyz Republic. As a result, the coupons were not considered seriously by their owners. The mass privatization without clear legal boundaries in the early 1990s resulted in mass corruption in which high-ranking officials and influential politicians (including the opposition) snatched up the most lucrative properties and businesses<sup>4</sup>.

This method was widely used in the Czech Republic, Romania, Poland, Russia and Byelorussia. Unlike other ways, it does not require financing, and it does not gain budget revenues. The main peculiarity of this method is that the privatization process is quick and socially acceptable by the population. But the weak point of it should be admitted: that is the fact that the real situation of enterprises after privatization remains the same with all its related problems: difficult financial situations, low profitability, out-dated technology, and insolvency.

According to our viewpoint, the difficult situation of the industrial sector is due to the following reasons:

- First, lack of joint tax, financial, capital-credit and currency policy with the NIS;
- Second, differences of law regulations which affect cooperation and direct relations of enterprises;
- Third, lack of a common price and customs policy;
- Fourth, low effectiveness of the management system resulting in slow and poor decision making, inadequate control of decision making and irresponsibility of managers;
- Fifth, permanent increase of price of energy, raw materials, materials, and spare parts, which have worsened the problem of the payment of balance;
- Sixth, underassessment of the necessity of state regulation in order to study the conditions of the effective functioning of the economy.

For the period of January 1, 1991 to 1994, in the Kyrgyz Republic, 5,168 enterprises were privatized: in the industrial sector – 324 units, in the agricultural sector – 319 units, in the construction sector – 307 units, in the transportation sector – 102 units, in the trade and public catering – 1,756 units, in the public service – 1,878 units, in the non-production sector – 218 units. But since 1994 (the second phase of privatization) the correlation of

privatized enterprises has changed in terms of the ways of privatization. Transformation into joint stock companies was most common, which reached 40 percent. As for purchase by employees, it was only 3.7 percent, and purchase by private business – 16.2 percent. This correlation of ways of privatization is due to the fact that by 1994 big plants, factories and enterprises remained non-privatized, and later on were transformed into joint stock companies. The table below provides a breakdown of the privatized enterprises in the Kyrgyz Republic:

TABLE 1: PRIVATIZED ENTERPRISES IN THE KYRGYZ REPUBLIC, 1993-1995

	1993	1994	1995
Industry	259	324	462

Total	4,428	5,168	5,895

SOURCE: KYRGYZ STATE STATISTICS COMMITTEE, 1996.

In 1996 the private sector in the Kyrgyz Republic was 50 percent of GDP. As for other Central Asian countries, it was 20 percent in Tajikistan, 30 percent in Uzbekistan, 30 percent in Turkmenistan and 30 percent in Kazakhstan.

The market oriented reform policies implemented by the government over the past years have promoted multiple sources for competition in the Kyrgyz Republic. The demonopolization of specific sectors ( such as transportation and agro-processing), including the dismemberment of formerly vertically and horizontally integrated state companies, has allowed for the creation of competing markets and the liquidation of non-viable firms. The lowering of tariffs to a flat 10 percent and the elimination of quotas and other non-tariff barriers have made imports an important element of priced discipline to domestic producers. Finally, the liberalization of major restrictions to internal trade and foreign investment have created incentives for private entry, and, therefore, to expand and develop new markets.

Despite these reform efforts, the private sector growth has been hampered by a number of factors. Markets are small and dispersed, the cost structure is high and the number of risk-takers is small. There are important sectors, still run by state owned monopolies, where competition could be an important source of private sector development. Little restructuring has taken place at most privatized enterprises, which remain largely under the control of the same managers that directed them as state-owned entities. Foreign investors, who could offer new technologies, modern management methods, and access to world markets, are presented in only a handful of companies, and the securities markets lack sufficient liquidity to facilitate ownership change. Many new commercial laws have been adopted, but the judicial system is weak and court decisions are often unenforceable, and licensing requirements are often excessive. The system of corporate taxation lacks many of the incentives necessary to stimulate growth. Coupled with managers' fear of outsiders and loss of control, these factors have contributed to the general lack of investment and growth in Kyrgyz firms. John Nellis emphasizes that ironically privatization's present reputation in many transition countries as a prime cause of increased corruption<sup>5</sup>. Privatization, sometimes, was conducted in a bureaucratic, corrupted and 'broadly-giving-away-for-nothing' way. According to the Institute of Statistic Researchers, share of black economy was 3.2 percent in 1993, 6.0 percent in 1994, 10.3 percent in 1997, 11.9 percent in 1998 and 12.3 percent in 1999<sup>6</sup>. An independent center for public opinion studies in Bishkek announced on 21 February 2006 the results of its survey on corruption in Kyrgyzstan. 15.5 percent of the 2,100 people surveyed said that economic reforms have had little success due to widespread corruption in the country<sup>7</sup>.

In 1997, the financial situation of industrial enterprises remained unimproved. This, in its turn, has been due to low quality of management of enterprises, lack of really market management of enterprises. Many managers have no idea how to plan activities in market economy. They had "neither the ability to modernize the enterprise nor the market experience to cope in a competitive environment, nor the drive and vision to guide the radical restructuring often required improving enterprise performance"<sup>8</sup>. Nothing has been done to renew the main production funds. No measures have been undertaken to improve financial situation of enterprises. All these result in low profits, big losses and financial problems.

## **Stages of Privatization**

The privatization process in the Kyrgyz Republic can be divided into four distinct stages, which are 1991-1993, 1994-1995, 1996-1997, and 1998-2001. For each period, the number of privatized firms can be seen in Table 2 with respect to the sectors of Kyrgyz economy.

TABLE 2: PRIVATIZATION OF STATE OWNED ENTERPRISES IN KYRGYZSTAN: 1991-2001

Sectors	1990	1991	%	1995	%	1998	%	1991	%
	*	1994		1997		2001		2001

(\*) SHOWS THE NUMBER OF STATE ENTERPRISES STARTS BEFORE PRIVATIZATION PROCESS

SOURCE: STATE PROPERTY FUND, BISHKEK, KYRGYZSTAN, 2002

The first stage of privatization was characterized by implementation of two privatization programs for 1991-1992 and 1992-1993. On this phase the legal background for privatization and attraction of investments was created, as well as relevant organizational infrastructure. In other words, this phase focused on establishing the legal framework and institutional infrastructure required to enable ownership of private property (other than land) and private enterprise. Land reform began with 17,000 peasant farms and new agricultural cooperatives being formed from a number of state and collective farms.

This period also saw two principal approaches to the privatization of companies:

- (1) A small-scale privatization program. By the end of 1993 more than 3,400 small-scale enterprises in retail trade, catering and consumer services had been sold via cash auctions. In other words, small and medium-sized enterprises were sold to their employees. Large enterprises were commercialized after that up to 75% of their shares was sold to their employees at a reduced price. The remaining shares were intended to be sold on the coupon auctions later.

At the same time, the process of privatization was burdened by the sins of bureaucracy and subjectivism.

Plans of privatization were created by local administrations without taking into account the real situation of enterprises.

- (2) A mass privatization program (MPP). The Kyrgyz mass privatization program was designed to encourage ownership by outside investors in order to stimulate rent restructuring of enterprises. Enterprise managers have, however, not only effectively maintained control of the majority of privatized firms, but have been able to

increase their holdings since privatization. This is the result of the purchase of majority positions by enterprise managers directly from the state during the privatization process or from other investors during the several years following privatization.

Special payments were issued, the amount each citizen received depending on employment records. The vouchers could be used to buy public housing or partial payment for the privatization of medium-scale or large enterprises. The percentage of equity of such enterprises reserved for sale of vouchers was determined on an individual basis, but could not be less than 24%.

Negative aspects of this phase:

This voucher program turned out to be an inefficient and restrictive instrument of mass privatization because:

- (1) vouchers were not tradable and therefore had no market value
- (2) vouchers distributed only a small percentage of the equity of individual enterprises and offered no opportunity for change in control and management
- (3) vouchers were time-limited and most of them were not even used

Positive aspects of this phase of privatization:

- (1) destroyed state monopoly in retail and services
- (2) introduced competition
- (3) eliminated deficit

Despite these positive aspects, they did not bring any decisive changes in ownership and control structures within the economy.

The second stage of privatization began with the adaptation of a new privatization strategy, which brought about important changes. With some key exceptions, all medium and large scale enterprises (MLE) became immediately available for privatization. Private investors, Kyrgyz or foreign, were allowed to own up to 100% of the equity of the MLE.

The MPP vouchers, most of them still unused, were replaced by privatization coupons. Coupons could be used to purchase equity in state enterprises at coupon auctions where typically up to 25% of an enterprise's equity was offered. Coupons could also be used to buy the stated-owned dwelling in which the coupon holder lived. Coupons were transferable, and both Kyrgyz nationals and foreigners – including institutional investors – could trade freely in them.

In addition to the coupon auctions, individual privatization, cash auctions (which typically took place following an enterprise's coupon auction) and investment projects were the main methods of privatization used during this stage. Phase 2 also saw the creation of the Enterprise Restructuring and Resolution Agency (ERRA) in

May 1994 under the World Bank- supported Privatization and Enterprise Sector Adjustment Credit (PESAC) to deal with 29 large loss-making enterprises. This group of companies needed either radical restructuring or liquidation. Diagnostic studies were conducted on each of the enterprises, and liquidation was begun in those determined to be unsalvageable. The ERRA shut down production at these enterprises, instituted “care and maintenance programs”, and placed the bulk of their employees on paid leave. Within the group judged to be salvageable, there was restructuring to relieve the companies from the burden of old debts and non-core assets. Some received rehabilitation assistance in the form of loans from the PESAC program and have successfully resumed operations. One completely resuscitated after controlling blocks of shares were offered for sale by tender to strategic investors.

All told, phase 2 encompassed the complete or partial privatization of an additional 1,000 enterprises. Disposition of the 4.4 billion privatization coupons which were printed during this period has been as follows: 41.26% were used at auctions by individuals and companies; 9.82% were used at auctions by investment funds; 0.20% were used to purchase apartments; 0.72% were used to purchase property; 27.55% were distributed but remain uninvested; and 20.45% have yet to be distributed (as October 10, 1996).

The main objective of this stage of privatization was transformation of medium size and large enterprises in industry, transportation and construction. They were privatized in the following manner:

- 5% of the equity distributed to the employees
- 25% sold for coupons in auctions
- 70 % sold to individuals or corporate investors at cash auctions.

All these figures demonstrate there is a serious problem of “coupon overhang”, which can be attributed to the following reasons:

- (1) The MPP vouchers were time-limited and a proportion of the population lost their entitlement to convert them into coupons because they did not do so prior to their expiration date.
- (2) The general population had little confidence in the values of the privatization coupons. At a current market price of 1.22 – 1.35 soms for a bill comprising 100 coupons, each coupon is worth approximately 0.0008 US\$ making the distributed coupons equal to only 0.625 US\$ per person in the Kyrgyz Republic.
- (3) While the Government’s motives for retaining a portion of the coupon issued are not known to the author, it is known that the government has periodically sold small groups of coupons into the market. At their current market price, 20% of the coupons which remain in Government hands are worth approximately \$0.75million. However, each time a group of coupons is sold; the market price has fallen and effectively

diluted the value of the outstanding coupons held by Kyrgyz citizens. This auction effectively transferred part of the value of the Kyrgyz Republic's assets back into the hands of the State.

- (4) A significant amount of the coupons in circulation remain uninvested. Thus, portions of those companies to be sold in phase 3 of the privatization program (see below) must be offered to the general public in exchange for the outstanding coupons; otherwise the uninvested coupons will be useless.

The third stage of privatization focused on restructuring large objects of monopolized sectors of the economy, privatizing non productive spheres, and restructuring and rehabilitation work with heavily indebted enterprises by units of the State Property Fund. Phase 3 is distinguished from phase 2 by the nature of the companies involved, which are predominantly large scale enterprises in mining, construction, transport and tourism, public utilities and infrastructure. Also 100 MLE that had been partially privatized, but in which the government continues to retain significant share holdings.

In 1998, the fourth stage of privatization started. On the framework of this phase, two programs of privatization: 1998-2001 and 2002-2003 were implemented. The privatization program of 2004-2006 is being carried out. The current stage of privatization lays emphasis on restructuring monopolies in the basic and strategic sectors of the economy – telecommunications, civil aviation, printing and publishing, electricity generation and distribution, coal mining, natural gas import and distribution, engineering, antimony production, natural gas import and distribution. Because of the size and diversity of these largest properties, there will be specific arrangements in every case. Each of the entities will be subject to thorough feasibility study.

Despite a high rate of privatization in the SMEs sector, the State still retains important stakes in number sizeable industrial enterprises, often characterized by high levels of indebtedness, lack of working capital and inadequate management and marketing skills. Good corporate governance is still to be developed, and its role fully comprehended.

Privatization of the Large State monopolies (Kyrgyz Air, Kyrgyz Telecom, four distribution companies established as a result of the break-up of Kyrgyz Energo, the State –owned energy company, and Kyrgyz Gas) which has been on the agenda for the last few years, is deemed critical for the success of the medium term program of the Government. These enterprises account for a relatively large share of economic activity, and their poor performance places a significant drag on potential output growth. Moreover, the sale of these assets would make an important contribution to external debt reduction. Successful privatization of these enterprises will be essential to boost investor confidence in Kyrgyzstan.

Thus, the Center of International Private Entrepreneurship conducted the research on economic reforms in 32 countries, including all the main developing countries, as well as the former socialist countries of Central and Eastern Europe. The research has shown that those countries which successfully implemented privatization programs – Thailand, Malaysia, Singapore, Mexico, Argentina and Jamaica, have succeeded much in their reforms. But successful implementation of privatization programs does not necessarily result in successful economic reforms. The main point here is that successful privatization creates an environment for stabilization and structural reforms.

Although some degree of macroeconomic stability has been achieved by the government, the macroeconomic reality of the Kyrgyz Republic has yet to be improved to the levels necessary so that privatization and restructuring would be considered as a positive impact on the economic reforms.

## **Privatization and Economic Reforms**

Privatization can improve the economy and create favorable conditions for local and foreign investors which are obligatory conditions of economic reforms at present. In other words, privatization is profitable for state and private sectors and consumers, not only for those enterprises being privatized.

Privatization will be successful if accompanied by reforms targeted to create more open and competitive markets. Despite economic difficulties, which are temporary, privatization is a huge step toward economic growth and lasting prosperity.

To draw foreign investment, notwithstanding the fact that in the direct perspective, privatization and implementation of economic reforms have a destabilizing impact, effective privatization programs can stabilize the monetary situation and economy of a country in the long perspective.

Macroeconomic stability, better tax administration, a substantially improved financial system and much less interference of the bureaucracy in the affairs of the private sector are a key factor in drawing foreign investments, which bring many advantages to countries receiving investments, that is sharing technology, increasing employment and developing exports. These three aims are crucial for the economic growth and development.

The climate for foreign investments in the Kyrgyz Republic at the enterprise level is not ideal. Despite the adaptation of a foreign investment law that guarantees the rights of the foreign investor, enterprises have limited experience and interest in investment by foreigners. Owners frequently overestimate the value of their companies,

not understanding the relatively high level of investment risk perceived by foreigners and the investment alternatives available to them in other markets, particularly as the “global market place” continues its expansion. Local managers and owners fear a loss of control and are reluctant to disclose enterprise information essential for investor analysis. They are also unwilling to undertake the restructuring methods set by foreigners as conditions for investment. There has been an important decline in foreign direct investment inflows to Kyrgyzstan over 1993-2001 periods (see table 3).

TABLE 3: FDI INFLOWS (NET) KYRGYZSTAN

COUNTRY	1993-2001		2001		Percentage of
	Total million US Dollars	Per capita	Total million US Dollars	Per capita

Canadian companies are the main investors in Kyrgyzstan comprising 38.1 per cent of the total cumulative investment during 1995-2001. The second largest foreign investor is the United States, with about 14 per cent of the cumulative investment (see table 4), followed by Turkey with 12 per cent of the total cumulative investment. The United Kingdom, Germany, Republic of Korea, Switzerland, Russian Federation, Netherlands, and Italy are other large investors in the country.

TABLE 4: KYRGYZSTAN: SOURCES OF FDI, 1995-2001

Region/Country	FDI inflows
Canada	38.1
United States	14.1
Turkey	12.0
United Kingdom	9.3

Investment in manufacturing, transport and telecommunication, and the construction sectors continues to be low with a substantial invested in the trade and services sector.

Foreign investors and local managers alike bemoan the loss of tax holidays available under the old foreign investment law. Without the inclusion of compensatory investment incentives in the Tax Code, government

officials continue to grant tax concessions and privileges in an effort to remain competitive in attracting foreign investment vis-à-vis neighboring countries. The comprehensive Tax Code enacted in 1996 was updated in 1999. Amendments provide a uniform tax system, including income, profits, excise, customs, land and vehicular tariffs. However, tax system is burdensome, sometimes involving complex and time consuming accounting. Payroll taxes such as social fund payments, which are used for the national pension system, among other things, are also complex.

The tax administration system is corrupt and abusive. On the one hand, it is observed that legitimate businesses have little incentive to offer bribes, tax inspectors have a reputation of deliberately finding and sometimes creating problems so that they can negotiate financial payments for not revealing what they have discovered. On other hand, it is believed that many businesses do not pay taxes – hiding income and exaggerating expenses – but the corruption of the tax inspectors means that it is possible for these illegitimate businesses to pay less in bribes than they should in taxes.

Although the Kyrgyz Republic has entered into international trade agreements with its neighbors, enterprises report various difficulties in transporting goods across borders. Vehicles face frequent and extensive delays at border crossings and Custom Union countries often do not recognize duty-free entry of machinery and equipment in transit to the Kyrgyz Republic through their countries, or they require payment of VAT before goods are released. Companies complain of arbitrary enforcement and interpretation of rules at borders and claims of improper documentation. Transparent complaints and appeals procedures are lacking.

Weaknesses in the legal and judicial systems also hamper investment. Foreign investors as well as domestic investors demand control of enterprises in part due to the difficulties in adjudicating claims in the Kyrgyz Republic. While most major pieces of commercial legislation are now in place, enforcement of judges' decisions is difficult and a workable system of appeals non-existent. Courts suffer from a lack of transparency, poor procedural processes and the absence of qualified judges and other legal professionals. In other words, the court system is weak and corrupt, the courts do not enforce legal rights, and inconsistent interpretation of laws is not unusual. Despite the legal provisions, there no effective means of guaranteeing property and contractual rights. This is the result of poor training and low compensation. An honest court system is essential for encouraging and supporting the restructuring of enterprises, as the legal protection of the rights of creditors and other collateral holders, the enforcement of liquidation and bankruptcy rules and the guarantee of property rights are strong incentives for managers to put their houses in order.

Despite the adaptation of a licensing law in 1997, the system of enterprise licensing, in particular the lack of appropriate procedures for exacting penalties for violations or of a transparent appeals process, remains a source of harassment for firms. Clearly, Kyrgyzstan presents a difficult business environment. Major administrative

obstacles to investment are inconsistent implementation and interpretation of laws and regulations, excessive intervention of control agencies, unnecessary licenses and permits, corruption and unofficial payments, and insufficient institutional capacity of governmental agencies. Abuses in the administration of licenses, frequent changes in government practice and criteria, and the recent proliferation of licensing requirements can provide significant power to officials to thwart the rational flow of business.

The securities markets in the Kyrgyz Republic have played a limited role in fostering ownership change. Trading on the stock exchange is strictly regulated, but almost all trading takes place “off-market”, in an unregulated environment fraught with potential risk, and the largest infrastructure companies most likely to attract investor interest have yet to be privatized. As a result, exchange liquidity is particularly low. For most people who became shareholders during the mass privatization program, opportunities to sell securities are limited.

Why has privatization implementation appeared to be difficult and contradictory?

Here four groups of reasons could be pointed out, which slow down the process of privatization:

- (1) First, the policy of the opposition, which resists the process of privatization, presents a non-homogeneous environment, not supporting the policy of the government;
- (2) Second, the private sector is not strong. Therefore, an inadequate level of financial markets, and laws, as well as on finance and poor credit and securities mechanisms badly affect privatization of large enterprises, the main way of which is share sales;
- (3) Third, technical difficulties and large material expenses of privatization are common in developing former socialist countries, including the Kyrgyz Republic, with lack of both finance and highly qualified specialists to fulfill targeted projects;
- (4) Fourth, conflicts in the aims and conditions of privatization itself.

For instance, in the Czech Republic, privatization received more support than in Poland and Hungary (where the process was considered as an encouragement of foreign investments). In other words, the Czech public was much more interested in privatization than was the public in Poland, since people had the choice of how to use their vouchers<sup>9</sup>. Privatization in the Kyrgyz Republic showed, that bureaucracy, which comprises heads of former state owned enterprises, have too much impact by adopting forms of privatization to their own interests, or, as commonly said, they turn privatization into ‘personal privatization’ – “prihvatization”.

The experience of privatization in the developing countries, for instance, in Thailand, Indonesia, Singapore, enables us to make a number of general conclusions concerning privatization:

- introduction of competition in sectors, being monopolized by state owned enterprises in the past, enables large enterprises to be more effective and provide better quality services;

- private pension funds will assist in easing privatization processes since they strengthen capital market and enable individual share holders to manage their shares and participate in programs. Elements of this experience were used in the Czech Republic and Poland;
- privatization programs are implemented faster if the state does not make attempts to reconstruct enterprises before putting them on sale. Private investors, as a rule, can take more effective measures of reconstruction. Delay of privatization causes doubts towards the government and decreases public support of privatization.
- delay of privatization is costly for the state as well, which can cause or prolong imbalance on a macroeconomic level.

## Conclusions

The result of this research enables making the following conclusions:

The world experience of privatization has shown that privatization, if well implemented, will have a positive impact on economic development and democracy.

Privatization program could have been stronger. The degree of nepotism involved in the sale of companies needs to be reduced. The pace of privatization could be quickened and the quality improved if:

- (1) Defined prices for international securities are at more realistic levels and time frames are longer.
- (2) Government sells more companies on an "as-is" basis, and the object of restructuring (state debts, financial statements of enterprises) is prepared according to international standards, and the legal status of enterprises is clarified.
- (3) Created rule of law and culture of honesty.

Weaknesses in public policy, poor legislation, lack of transparency and consistency in their implementation resulting in unfavorable business conditions are identified as significant weaknesses. The unpredictability of the business environment; wide discretionary power given to police, law enforcement agencies, and tax and customs authorities; difficulties in enforcement of legal rights and lack of confidence in the court system, and widespread corruption all result in increased costs of doing business. In particular, current contradictions in the law must be removed and the hierarchy of legal acts must be restored in the day-to-day practice.

- (4) Corruption is reduced.

Bribery and corruption needs to be discouraged by universal employment at living wages, adequate public services, cultural values, and prosecution by the courts. The practice and culture of bribery and family/tribal loyalty need to be replaced by rule of law and honesty as the norm for economic, political and social relations. Corruption,

which affects state institutions, needs to be addressed at all levels from bribery in government to corrupt practices in businesses.

Corruption is a complex issue in Kyrgyzstan. In 2003, Transparency International ranked Kyrgyzstan 118<sup>th</sup> out of 133 countries surveyed in its annual Corruption Perceptions index. Anecdotal evidence suggests that while corruption is rampant, people often tolerate it because of their high dependence on state bureaucracy for basic needs, their perception of the importance of political loyalties, and their general mistrust of the justice system<sup>10</sup>. Many individual citizens and businessmen complained that they were forced to pay bribes for basic services, and kickbacks were extorted at every level of government. Despite the public outcry, few governments were prosecuted, and Kyrgyzstan was ranked among the most corrupt nations in the former Soviet Union countries. Kyrgyzstan's rating for corruption remains unchanged at 6.00.

(5) The policy of privatization is clearly defined and procedures followed more strictly and transparently.

(6) Created an adequate institutional framework that would include strong mechanisms of corporate governance, including rules to protect minority shareholders, rules against insider deals and conflicts of interest, and adequate accounting, auditing, and disclosure standards.

The real corporate relations are still dysfunctional due to a lack of division of functions, problems with creation of effective owner, the appearance of the new, unfamiliar environment as market economy where owners and managers have no idea how to govern the privatized company using the available set of laws and regulations. Limited efficiency of the corporate governance has the following main reasons:

First, this is the mental heritage of the Soviet era – corporate governance develops mainly on basis of privatized SOEs and bears the burden ineffective formal and informal structures and habits formed in the past.

Secondly, reforms have not been finished yet: the retaining state-controlled sector is still quite large and institutional and legal environment is highly distorted. Currently a lot of companies are quickly adapting in order to survive and develop, but they are adapting to that environment that exists now and that is very different from the one in developed countries. Besides, the choice of adaptation methods is limited by the experience, mental outlook, and skills of the main corporate players.

Third, the Kyrgyz Republic lacks sufficient sources of knowledge and models of behavior in the field of corporate governance. Under the conditions of prevailing dishonestly privatized ownership and very low level of foreign investments, the external sources of market mentality and knowledge are virtually absent. The majority of owners and managers have to learn mainly by their own mistakes.

Without attention to corporate governance, privatized enterprises could miss opportunities, expose their reputations to greater risk, and find themselves at a competitive disadvantage. Ultimately they will become less attractive to foreign partners and investors.

Over the longer term, there is a clear need to assist the Kyrgyz Republic to ensure that the privatized enterprises have the opportunity to remain viable and to grow, and to respond to their shareholders. Programs to assist in restructuring newly private enterprises, developing capital markets and financial institutions, raising capital from foreign investors, and developing effective corporate governance will be the major components of that assistance.

A well organized manner should be set in order for privatization to be successful, the main of which must be improvement of economic condition of privatized enterprises. This can be achieved by giving property to more effective owners, who are not only the source of investment, but also would lead to improvements in corporate governance and would be able to provide access to new technologies, markets etc. Attraction of effective owners should be done by:

- improvement on the overall investment and business climate;
- granting equal rights to potential domestic and foreign participants of privatization;
- active looking for foreign investors – successful and trustworthy foreign and international corporations.

Privatization, if implemented effectively and in well balanced goals, evokes trust towards the government among potential capital investors inside and outside the country. This, in its turn, will foster further privatization and will impact successfully on the economic reforms as a whole.

# **Corruption, Socioeconomic Factors, and Economic Growth: Does Regional Heterogeneity Matters?**

*Yuan-Ho Hsu, [yhhsu@mail.ncku.edu.tw](mailto:yhsu@mail.ncku.edu.tw)*

*National Cheng Kung University, Taiwan*

## **Abstract**

**This paper focuses on the macro-aspect of corruption. The research question is whether regional economic or political heterogeneity matters in determining the impact of corruption on economic growth in that region. The model was estimated using a balanced panel for 104 countries over three-year time periods from 2003 to 2005. The data come from Transparency International, the World Development Indicators (WDI), and the Heritage Foundation. The fixed effect panel estimation results show that corruption is detrimental to economic growth. Dividing the countries into five geographic groups and running separate panel regression for each region, the results also indicate that corruption impairs economic growth, though the impacts of corruption on economic growth are markedly different between regions.**

## **Introduction**

The term “corruption” is defined as the use or abuse of public power for private gains. Corruption is most likely to occur where public officials have a direct responsibility for the provision of a public service or application of specific regulations (Bardhan, 1997; Rose-Ackerman, 1997). Corruption is universally observable and has its root in a country’s social and cultural history, in political and economic development process, and in bureaucratic traditions. The causes and consequences of corruption had been widely discussed.<sup>1</sup> A rich body of knowledge on corruption was acquired in the 1970s through the research of Krueger (1974) and Rose-Ackerman (1978). A principle theoretical component is that corruption can occur wherever economic rents exist.<sup>2</sup> Typically, economic rents are the results of government regulation and public officials have discretion in allocating them. For empirical research on the impact corruption on the economy, Mauro (1995) is the first to use cross-country data to investigate the consequences of corruption. Since then, numerous empirical researches followed to investigate empirically the causes and consequences of corruption. Early empirical works, for example, Keefer and Knack (1996), rely on classical linear regression (CLR) model and most recently empirical works rely heavily on panel data techniques developed in the past decade.

The current research focuses on the macro-aspect of corruption. Given that corruption is universally observed phenomena, the research question is whether regional economic or political heterogeneity matters in determining the impact of corruption on recent economic growth in the world. A panel data set of 104 countries covering most recent years is used to investigate the impact of corruption on economic growth. Following World Bank's country classification, this paper divides the 104 countries into five geographic groups of Asia, Latin America and the Caribbean, Middle East and North Africa, Europe and Central Asia, and Sub-Saharan Africa.<sup>3</sup>

The paper is organized as follows. Section two reviews literature on the impact of corruption on economic growth. Section three presents the econometric model and some methodological issues in panel data estimation. Section four discusses the data that will be used to estimate our model. Section five presents the econometric results. Section six concludes.

## **Corruption and Economic Growth**

There are two opposing views regarding whether corruption is harmful to the economy: The advocating view maintains that corruption can be socially advantageous and hence can enhance the efficiency of the economy. For example, Huntington (1968) and Leff (1964) suggested that when inappropriate economic policies are in place, corruption can be welfare enhancing since it reduces the inefficiency of the policies. The opposing views maintain that corruption slows down the operation of the economy and hence is detrimental to economic growth and overall welfare. Mauro (1995, 1998) shows that corruption is positively correlated to lower levels of investment and that corruption plagued countries tend to under invest in human capital by reducing government expenditure in health and education. Ades and Tella (1997) theorizes that the availability of corrupt gains is an incentive to a country's aggressive industrial development policy and concludes that the positive effects of the industrial development are cut in half by the negative effects of corruption in discouraging investments. Tanzi and Davoodi (1997) focused on the effects of corruption on public finances and concluded that corruption benefits public expenditures at the expense of private investments. In addition, they provide evidence to show that corrupted government officials direct public investment towards large projects, possibly at the cost of basis expenditures of education and health care.

Lambsdorff (1999) provides a very comprehensive list of empirical and theoretical researches on the causes and consequences of corruption. For the consequences of corruption, it surveys researches on the impact of corruption on investment, GDP, institutional quality, government expenditure, poverty and international flows of capital, goods and aid. For the causes of corruption, it reviews researches that exploring factors contributed to corruption. Various contributing factors to corruption are the absence of competition, policy distortions, political

systems, public salaries, colonialism, gender and other cultural dimensional characteristics.

Various empirical researches investigating the impact of corruption on economic activities are conducted based on micro-level data. Kaufmann and Wei (1999) uses data from three firm-level surveys and finds that red tape is not exogenous but dependent on both the firms' ability to pay and the discretionary powers of rent-seeking bureaucrats. They conclude that corruption may well enhance red tape, not circumvent it. Another recent research using micro-level data can be found in Mocan (2004). Mocan utilizes micro-level data set from 49 countries to address three issues of corruption: the determinants of corruption at the individual level, the determinants of perceived extent of corruption in the country, and the impact of corruption on growth when the quality of the institutions is controlled for. The empirical results show that both personal and country characteristics determine the risk of exposure to bribery. After controlling for the quality of the institutions, Mocan concludes that corruption does not have a direct impact on growth.

Some empirical researches on corruption are conducted based on macro-level data. Pellegrini and Gerlagh (2004) investigate corruption's effect on growth and its direct and indirect transmission channels. They regress the dependence of investment, schooling, trade policy, and political stability on corruption, and then estimate the contribution of the various channels to the overall negative effect of corruption on growth. They conclude that the transmission channels together explain 81 per cent of the effect of corruption on growth. Gyimah-Brempong and Munoz de Camacho (2006) use panel data from 61 countries over 20-year period to investigate regional differences in the effect of corruption on economic growth and income distribution. The paper finds that there are statistically significant regional differences in the growth and distributional impacts of corruption. The largest growth impact of corruption is found in African countries while OECD and Asian countries have the lowest growth impact, while the largest distributional impact of corruption was found in Latin America. Akcay (2006) explores the relationship between corruption and human development in a sample of 63 countries. This paper investigates the impact of corruption on three human development indices of life expectancy, educational attainment, and standard of living and access to resources. The results reveal that there is a statistically significant negative relationship between corruption indexes and human development; more corrupt countries tend to have lower levels of human development.

## **The Econometric Model**

Early empirical research on corruption uses ordinary least square (OLS) regression to estimate pooled cross-country data.<sup>4</sup> OLS using pooled cross-sectional data treats all data as if there was only a single index. The model is given by

$$y_{it} = \alpha + \beta x_{it} + \varepsilon_{it} \quad (1)$$

Model prescribed by equation (1) does not capture any possible differences in individual characteristics; nor does it pickup any particular common time series effects. Since corruption has its roots on cultural and institutional grounds and we are expecting that different society has different cultural and institutional characteristics. Treating cross-country data as homogenous one results in bias caused by unobserved heterogeneity. Most recent empirical study using cross-country data employs panel data methods to avoid this kind of unobserved heterogeneity bias.<sup>5</sup>

An alternative specification to equation (1) is to assume that the model has an intercept term  $\alpha$  that is different for different countries. The model can then be written as:

$$y_{it} = \alpha_i + \beta x_{it} + \varepsilon_{it} \tag{2}$$

The “unobserved heterogeneity” is captured by the varying constant term  $\alpha_i$ ’s across countries.

Panel data model specified in equation (2) captures the differences in individual countries, and the estimation techniques focus on making use of the available information about differences in behavior. The task in empirical work is to identify the nature of heterogeneity and to specify the model based on available statistical tests. The model can then be estimated and inference can be made thereafter.

Suppose that there is a panel data set contains information regarding a time dimension  $t$  ( $t = 1, 2, \dots, T$ ) and a unit dimension  $i$ , e.g. firm, individual, group, country, etc. ( $i = 1, 2, \dots, n$ ). The model has  $K$  variables or regressors. Consider a model where the intercept changes for individuals but it is constant over time and the slope is constant for individuals and over time:

$$Y_{it} = \alpha_i + \sum_{k=1}^K \beta_k X_{kit} + \varepsilon_{it} \tag{3}$$

To estimate the model we can make assumptions about the intercept:

$$\alpha_i = \tau + v_i \tag{4}$$

This means that there is a constant portion in the intercept for all individuals (  $\tau$  ) and a portion that changes for each group ( $v_i$ ). Based on (4), two kinds of model can then be discussed: the fixed effect model and the random effect model. In a fixed effects model,  $v_i$  is a fixed parameter and that  $X_{kit}$  and  $v_i$  are correlated. Whereas in a random effects model,  $v_i$  is a random variable and that  $X_{kit}$  and  $v_i$  are uncorrelated. Fixed effect models can be estimated by least squares dummy variable (LSDV) regression, the within effect model, and the between effect model. Random effect models are estimated by the generalized least squares (GLS) and the feasible generalization least squares (FGLS). When the variance structure is known, GLS is used. If unknown, FGLS is used (Greene, 2002, pp. 287-

302).

This paper uses panel data to investigate the impact of corruption on economic growth and tries to find whether unobserved heterogeneity explain growth differential in countries and regions. For the empirical work, the regression model is specified as:

$$G_i = \alpha_i + \beta_{1i}C_i + \beta_{2i}Z_i + \varepsilon_i \quad (5)$$

where C is the corruption index, Z is a set of variables acting as proxies of unobserved heterogeneity, and  $G_i$  is the average growth rate per year defined as

$$G_i = [\ln(Y_{it}/Y_{i0})]/t \quad (6)$$

In equation (6),  $Y_{i0}$  is income in the initial period for country  $i$ ,  $Y_{it}$  is income in time  $t$  for country  $i$  and  $t$  is time interval to the initial period. This paper concerns the growth rate over the past decade and thus set 1995 as the base year for growth rate comparison. Variables to be considered in the set of Z are labor force growth, productivity growth, political stability, and economic freedom. The empirical model to be estimated would be

$$G_{it} = \alpha_{it} + \beta_{1i}C_{it} + \beta_{2i}LF_{it} + \beta_{3i}PRD_{it} + \beta_{4i}POL_{it} + \beta_{5i}ECF_{it} + \varepsilon_{it} \quad (7)$$

?        +        +        +        +

In Equation (7), LF is the growth rate of labor force, PRD is productivity growth per labor, POL is political stability index, and ECF is the index of economic freedom. The expected signs for the regressors are shown below the  $\beta$ 's in equation (7). Whether corruption deters or promotes economic growth is the issue we want to investigate in this paper, thus the sign for  $\beta_1$  is unknown. Following existing economic literatures, we assume that labor force growth and productivity growth contributes to high economic growth and therefore the signs for  $\beta_2$  and  $\beta_3$  are expected to be positive. We also expect the sign of  $\beta_5$  to be positive, since economic freedom and economic efficiency are positively correlated and economic efficiency promotes output growth. As for political stability, we assume that violent changes in government will not only create economic disturbance but also jeopardize policy continuity and hence yield adverse impact on economic growth. Therefore, we expect that higher political stability promotes higher economic growth.

## Description of the Data

The economic data and labor force statistics used in this research was adopted from the *2006 World Development Indicator (WDI)*, with some necessary transformation to turn it into growth rate. This research also uses three proxy variables to represent socioeconomic and political characteristics of the countries studied. For the three proxy variables of economic freedom, political stability, and corruption, this study relies on perceptions-based, subjective measures published by various international institutions and agencies.

The measures of corruption is adopted from the *2006 Corruption Perceptions Index (CPI)* published by Transparency International (TI).<sup>6</sup> The CPI scores range from ten to zero, with scores 0 indicate the most corrupted society. A score of 5.0 is the borderline figure that the Transparency International distinguishes countries for being having or not having a serious corruption problem. The political stability index measures the likelihood that the government in power will possibly be destabilized or overthrown by violent or unconstitutional means. Higher or positive values indicate greater political stability. The index used in this research is the index of “Political Stability and Absence of Violence” taken from *Worldwide Governance Indicators: 1996-2005*, published by World Bank.<sup>7</sup> The proxy for economic freedom is taking from the *2007 Index of Economic Freedom* published by the Heritage Foundation. The index of economic freedom is a weighted index of 10 factors signifying the economic or policy environments. The scores of this index range from 0 to 100, with score 0 representing the most oppressed and 100 the most freely economies.<sup>8</sup>

The data set in this study consists of a balanced panel of 104 countries for three years (2003-2005). Five geographical regions are considered: Asia and Pacific (ASIA, 14 countries), Latin America and Caribbean (LATINO, 20 countries), Europe and the Central Asia (EUROASIA, 39 countries), Middle East and North Africa (MDLEAST, 11 countries), and Sub-Saharan Africa (SUBSAHARA, 20 countries).<sup>9</sup> Table 1 summarizes the data.

Average output growth rate of the whole country set in this study is 3.30% per annual. Regional and overall maximum output growth is observed in the transitional economies. Azerbaijan has the highest growth rate (8.84% in 2005) of all countries in this study. The second high growth rate is found in China (7.872% in 2005). The third highest growth rate, which is the highest in the sub-Saharan African region, is observed in Mozambique in 2005 (7.356%). For the 104 countries in this study, labor force grows at a mean rate of 1.756 and MDELEAST region has the highest average labor growth (3.592%). Average productivity growth for all countries in this study is 3.19% and there is large gap in productivity growth. The highest productivity growth has been observed in Azerbaijan in 2005 (22.865%) and the lowest rate in Venezuela in 2003 (-11.49%), the gap is 33.355%. We observe that there are wide intra- and inter-region difference in the three economic variables used in this research.

There are also noticeable intra- and inter-region variations in the three perceptions-based socioeconomic indexes. To our surprise, the average corruption perception indices (CPI) for the whole 104 countries and for each region are all below the TI’s critical value for “corruption-free” society. The mean value of CPI is 4.061 for the whole country set. The regional highest average CPI is found in EUROASIA (4.951) and the lowest in the sub-Saharan Africa (2.893). The other socioeconomic measure, political stability index, also shows diversity in distribution. The mean score for the whole country set is 43.379. Of the five regional groups, EUROASIA has the highest mean political stability index (55.939), MDLEAST has the lowest (31.972) and ASIAN has the highest standard deviation in distribution (s.d.=29.274). The last perceptions-based index is economic freedom. The mean

value of this index for all countries is 58.938; EUROASIA region enjoys the highest mean economic freedom (61.536) while MDLEAST is the region with the least economic freedom. Based on the preliminary investigation of the data statistics, we are expecting the presence of inter-regional and cross-sectional heterogeneity in the data.

TABLE 1: DESCRIPTIVE STATISTICS

Variable and Regions	Mean	Std. Dev.	Min.	Max.	Observations
<b>CPI: Overall</b>	4.061	2.123	1.30	9.70	N = 312, n=104, T=3

## Estimation Results

This section discusses the estimation results. In empirical estimation of panel data, we are concerned with the possible heterogeneity arising from time-series dimension and cross-sectional dimension. If there is no significant temporal or cross-sectional heterogeneity in the data then we could pool all the data together and estimate the model with ordinary least square method. Wald test is used for this purpose (Greene, 2002, pp. 294-295). The hypothesis testing pooled against temporal heterogeneity has F-statistics  $F(3,304) = 2.00$  (p-value: 0.1134), so the null hypothesis of no time-dimension heterogeneity is not rejected at the 5% significance level. The hypothesis testing pooled model against cross-sectional heterogeneity has F-statistics  $F(5,302) = 6.95$  (p-value: 0.00), so the null hypothesis of no cross-sectional heterogeneity is rejected. A cross-sectional fixed effect model is preferred than then the pooled model. Further, Hausman test is used to test between fixed effects and random effects models and the null for this test is that the cross-sectional effects are uncorrected with other regressors in the model. The Hausman test statistics is  $\chi^2(5) = 11.31$  (p-value: 0.008). Thus, the null hypothesis is rejected and we use fixed effect for the analysis. Since unknown heterogeneity may be present in the fixed effects model, White cross-section robust standard errors correction is used (Greene, 2002, pp. 578-80). Finally, we want to test whether there is serial correlation in the fixed effect residuals. Since the data set in this research is a short panel, we only test for AR (1) serial correlation. Under the null hypothesis that the original idiosyncratic errors are uncorrelated, the coefficient of the lagged residuals should have an autocorrelation coefficient of -0.5. A formal Wald hypothesis reports Chi-square

statistics  $\chi^2(1) = 0.812$  (p-value: 0.368). The test fails to reject the null of no serial correlation of the errors. In order to get as much information as possible, we ran all possible regression specifications. Table 2 reports the estimation results.

The output of fixed effect model is reported in column 2 of Table 2. The  $R^2$  of the fixed effect model is 0.984. The results indicate that both increase in productivity (PRD) and growth in labor force (LF) contribute positively to economic growth. This confirms the assumption made in equation (7). A 1% growth in labor force contributes to 0.056% of real GDP growth. A 1% increase in productivity growth contributes to 0.06% of real GDP growth.

TABLE 2: ESTIMATION RESULTS

	Pooled	Fixed Effect	Random Effect	Asia	Mdleast	Latino	Euroasia	Subsahara
Constant	0.805 (0.474)	1.854 (0.954)	2.447 (0.532)	3.140 (1.373)	4.828 (1.062)	0.601 (1.567)	-3.503 (1.187)	0.825 (0.961)

POL	0.017 (0.004)	-0.007 (0.004)	-0.004 (0.004)	-0.005 (0.006)	0.010 * (0.007)	0.021 * (0.007)	0.017 * (0.011)	0.030 * (0.008)
ECF	0.017 (0.009)	0.010 (0.014)	0.010 (0.010)	-0.042 * (0.016)	-0.035 * (0.016)	0.002 (0.020)	0.051 * (0.019)	0.002 (0.012)
$R^2$	0.391	0.984	0.191	0.975	0.961	0.947	0.923	0.961
Adjusted $R^2$	0.381	0.975	0.178	0.966	0.940	0.928	0.898	0.947
Cross-section random (SD)	---	---	1.749	---	---	---	---	---
Idiosyncratic random (SD)	---	---	0.460	---	---	---	---	---

Note: \* denotes the coefficient is significant at 90% confidence interval.

The coefficient of CPI is positive and significant. Since high CPI score indicates less corruption, the empirical result shows that high CPI score is correlated with high economic growth. This implies that reducing corruption promotes economic growth. The coefficient of economic freedom (ECF) has a positive sign, which implies that economic freedom elevates efficiency and hence promotes economic growth. However, the contribution of economic freedom to economic growth is inconclusive in this model since the coefficient is insignificant.

In the fixed effect model, the coefficient for political stability (POL) is negatively small but significant. Though the coefficient is small, a negative coefficient implies that political stability is negatively correlated with

economic growth. It seems that this empirical result does not support our assumption that political stability promotes economic growth. Recalling the high diversity in political stability in various geographic regions, we suspect that this might be caused by some unobserved regional heterogeneity. Thus, a further estimation is made for each geographical group. The results are also reported on Table 2, column 4 through column 9.

The regional models tell a different story than the overall model. The  $R^2$  values for all five regional models range from 0.92 to 0.98. These high  $R^2$  values indicate the models can explain more than 92% of all variability in the data. A unanimous inference that can be drawn from the models is that productivity growth contributes to economic growth, though the extent of contribution differs region by region. A 1% increase in productivity growth contributes 0.153% output growth in ASIA, while a same 1% productivity growth contributes only 0.052% output growth in SUBSAHARA.

For all these five regional models, the signs on CPI and LF are all positive. They conform to the signs of the overall model. However, CPI is not a significant explanatory variable in the MDLEAST model and LF is not significant in the SUBSAHARA model. For those models with significant coefficients on CPI and LF, the contributions of these two variables to economic growth also vary region by region. Disturbance to CPI and LF would produce most significant impact on ASIA than on other regions. The regional models also show that political stability would promote economic growth in MDLEAST, LATINO, EUROASIA, and SUBSAHARA, but not in ASIA. The coefficient of POL in ASIA is negative and not significant.

To summarize, there are statistically significant regional differences in the growth impacts of corruption. The largest growth impact of corruption is found in Asian countries and the least impact is found in Latino countries. For the other two perceptions-based measures, economic freedom is not a significant explanatory variable of economic growth in LATINO and SUBSAHARA models and political stability is not significant in ASIA model.

## **Conclusion**

Corruption lies in the delegation of power. The foundation of power has its root on custom, cultural background, socioeconomic and political environment. Thus, the causes and consequences of corruption are heterogeneous for different countries. This paper focused on the effects of corruption on economic growth amongst countries and modeled economic growth as a function of corruption, some economic variables used in growth literature, and other factors measuring socioeconomic characteristics. We used Transparency International's corruption perception index (CPI) as proxy of corruption. We included two economic variables of labor growth and productivity growth as explanatory variables. We also used two perceptions-based measures as proxies for economic freedom and political stability. The model was estimated using a balanced panel for 104 countries over three-year time periods from 2003

to 2005. The data come from different sources such as Transparency International, the World Development Indicators (WDI), and the Heritage Foundation. The empirical work finds that the coefficient on the interaction term between CPI and economic growth is positive and significant for the whole country set. This implies that corruption is detrimental to economic growth. We also ran separate regressions based on same model specification for five geographical models. The results from geographical model also show that corruption impairs economic growth, though the impacts of corruption on economic growth are markedly different between regions.

## **Abstracts**

Despite the growing awareness of the importance of corporate governance in many studies of organisational performance, the works which have been presented to date have predominantly been based upon archival data, and performed in one-tier board systems. The objective of this study is to develop a measure of internal corporate governance based on the fulfilment of duties by company's governance structures and then relate this to perceived organisational performance. It is hypothesised that internal corporate governance relates positively to organisational performance. Reporting the responses of a sample of 496 managers and executives of companies in Indonesia, this study shows that the impact of internal corporate governance on organisational performance is weak, implying corporate governance practices are hardly observed by companies. Future studies need to take a longitudinal approach, and cluster their sample to validate the results. This is particularly so in Indonesia, as unique governance structures exist in Indonesian companies.

## **Introduction**

Is internal corporate governance related to organisational performance? Despite internal corporate governance being a key for safeguarding the interest of shareholders (Walsh & Seward, 1990), few researchers have examined this topic in an Indonesian context (Lukviarman, 2004; Nam & Nam, 2004). Interestingly, when they have there have been mixed results, as Lukviarman claimed that controlling shareholders – one form of governance structure in Indonesia – did not improve shareholders' value, while Nam and Nam concluded that board effectiveness was significantly associated with performance. In particular, Lukviarman acknowledged his study's limitations in terms of data, methodology, and measurement. In regard to this, the Chairman of The Audit Board of The Republic of Indonesia – referring to a World Bank report – stated that the Indonesian Accounting System had contributed to the

monetary crises of this country, due to its inability to produce reliable, transparent, and accountable reports (Nasution, 2003). As reliable and valid data are essential in research measurement, and as there are limited publications on this topic, further research is called for to better cross-validate findings. In addition, to improve organisational performance effectively, companies need to understand the factors that influence their performance. In this regard, Baysinger and Butler (1985) were among the first to conclude that internal corporate governance was associated with shareholders' wealth. In a more recent work, Florackis (2005) also argued that there is a positive link between internal governance structure and performance.

In regard to the conceptualisation of internal corporate governance, past research has focused on a well-performing board and executive compensation, the latter of which brings interests of managers and shareholders into congruence (Walsh & Seward, 1990). It has also focused on ownership which has led to active monitoring. To operationalise this concept in research, researchers have utilised secondary data. For example, Coughlan and Schmidt (1985), and Demsetz and Lehn (1985), measured internal corporate governance using executive compensation and ownership concentration, respectively. Similarly, Hermalin and Weisbach (2003), utilised the composition of the board – again archival data – in their research of internal corporate governance.

It must be noted that most studies of internal corporate governance were carried out in developed countries in which the validity of archival data was not subject to debate and capital markets were functioning more efficiently than those of developing countries. Particularly in developing markets, the existence of doubtful quality of secondary data (Baird, 2000) leads to the situation of the suboptimal functioning of capital markets. That is, market mechanisms of corporate governance in the form of tender offers, going-private transactions such as LBOs and MBOs, merger, and hostile tender offers can not be fulfilled (Walsh & Seward, 1990). To make matters worse, the debate relating to the cause of poorly governed and poorly performing firms has been analysed from either the strategic choice or the environment perspective (Astley & Van de Ven, 1983; Helfat & Peteraf, 2003; Porter, 1980) in which disentangling the effect from either one is always difficult. To overcome such a dilemma, Yoshimori (2005) proposed the internal corporate governance mechanism, within which the duties of all company governance structures could be assessed.

This study proposes an alternative way of advancing research in corporate governance by incorporating primary data about the duties of companies' governance structures, and relating this to perceived organisational performance. This approach is taken since "empirical dogmatism" in the form of negligence of alternative paradigms is the greatest barrier to advancing the field of corporate governance.

## **Theoretical Perspective on Internal Corporate Governance**

To date, the publications of corporate governance mechanisms are well documented. The most frequently cited references in the study of corporate governance are Berle and Means (1932), Jensen Meckling (1976), Alchian and Demsetz (1972), Fama (1980), and Williamson (1975). They argued that there were means of aligning the incentives of management with the incentives of shareholders through compensation contracts, debt covenants, boards of directors, auditing, labour markets, and capital markets. However, the study of the internal mechanisms of corporate governance, defined as the fulfilment of the duties of a company's governance structures has lagged behind.

Bank (2004) specially defined internal corporate governance in terms of the duties that are performed by a company's governance structures or organs including its board of directors, executive management, and independent control functions. He argued that in any national system, there are standards to be followed by boards of directors and executive management in running corporations. Theoretically, if these 'rules of the game' are sustained, the shareholders' interest will securely be maintained. Obviously, having thus defined the internal mechanism of corporate governance demands primary data that should be gathered from boards of directors and executives. In this regard, companies are largely unwilling to provide such information, and this barrier further inhibits the development of research in corporate governance. Nonetheless, research on corporate governance using primary data does exist. Pearce II and Zahra (1991), Zahra (1996), Zahra, Neubaum and Huse (2000), and Gill, Flynn, and Reissing (2005) to some extent used primary data in their studies of corporate governance. Daily, Dalton and Cannella (2003) believe that such data will enhance the understanding of the effectiveness of corporate governance, and they call it 'process-oriented data'. The potential value of this data has also been recognised by Forbes and Milliken, who stated that process-oriented data 'will enable researchers to better explain inconsistencies in past research on boards, to disentangle the contributions that multiple theoretical perspectives have to offer in explaining board dynamics, and to clarify the tradeoffs inherent in board design' (1999, p. 502).

In developing an internal corporate governance construct the dimension of duties of companies' organ developed by Banks (2004) was used as a starting point. As the work of Banks was derived from the context of corporate governance systems in western countries, which are based on one-tier system, adjustments were made in order to better portray the duties of companies' organs in the Indonesian two-tier system. These adjustments were based on interviews<sup>1</sup> and literature reviews of the Indonesian corporate governance system. According to the Indonesian Company Law, Law No. 1 of 1995, Indonesian company law adopts a two-tier management structure comprising a board of directors and a board of commissioners. Boards of directors are tasked with the management of the company, and their role is similar to that of executive management in western management structures. Boards

of commissioners are tasked with supervising and advising the directors, and are similar to boards of directors in western management structures.

The internal corporate governance construct consisted of 6 dimensions – namely the *Board of Commissioners (BOC)*, *Independent Commissioners (IC)*, *Audit Committee (AC)*, *Board of Directors (BOD)*, *Internal Control Group (ICG)*, and *Codes of Conduct (COC)*. In accordance with the dimensions used in this study, extant literature lent support to utilising these dimensions in researching internal corporate governance. The dimension of the *Board of Commissioners (BOC)* was selected because it represented the interests of shareholders and stakeholders by overseeing the fulfilment of the duties of boards of directors and by implementing internal controls. This dimension was applied by Bhagat and Black (1999), Hermalin and Weisbach (2003), Mak and Li (2001), and Gill et al. (2005), among many others. Related to the second dimension, the independency of commissioners is shown by the selection of criteria which stated that the members of *Independent Commissioners (IC)* are those that have no affiliation with the company, other commissioners, the board of directors, or controlling shareholders of the company and do not have a business relationship with the company's ultimate business. Examples of previous studies which support the use of this dimension are Bhagat and Black (2002), and Rosenstein and Wyatt (1997). The duties of auditing and controlling the process of financial disclosure and reporting, and internal control, are the responsibility of the *Audit Committee (AC)* (Daniri, 2005; NCCG, 2001, 2004). This dimension has been considered as one aspect of internal corporate governance by many in the past (Kurniawan & Indriantoro, 2000; Olson, 1999). The *Board of Directors (BOD)* dimension was selected since it represented the tone of the board of directors in advancing the company, protecting interested parties, being accountable for the company's decisions, and providing full and accurate information. Among many others, the works of Rechner and Dalton (1989), Gomez-Mejia and Barkema, (1998), and Desai, Kroll and Wright (2003) have considered the importance of this dimension. Further, unless the *Internal Control Group (ICG)* is in place, it will be very difficult for the board of commissioners and board of directors to perform effectively. This group of technical experts provides review, assessment, and control of a company's operations. In this regard, the internal control group plays a significant role in bridging the daily business activities of the company and the policies launched by higher levels of the corporate structure. Derived from the conceptual work of Daniri (2005) and the guidance of the National Committee for Corporate Governance (2001), this research utilised this dimension. In regard to the last dimension, the *Codes of Conduct (COC)* can be seen as 'the standards for behaviour and action when dealing with those inside and outside of the firm' (Banks, 2004 p. 47).

## **Theoretical Perspective on Organisational Performance**

As business organisations are becoming complex webs of relationship among various interest claimants (Atkinson, Waterhouse, & Wells, 1997) and multiple and partly conflicting goals exist within them, financial performance alone is no longer suitable as a performance measurement. It is for these reasons that multidimensional performance approaches, including nonfinancial or operational and perceptual performance indicators, have emerged (Venkatraman & Ramanujam, 1986; Wilderom, Glunk, & Maslowski, 2000).

This study employed the perceived organisational performance construct to measure the performance of organisation. This construct was adopted from the study of Wilderom and Van den Berg (1998). They asked about eight performance criteria that an organisation needed to improve. These criteria were *efficiency*, *customer satisfaction*, *managerial behaviour*, *professional behaviour*, *service quality*, *contact with clients*, *position in the market*, and *firm reputation*. Since improvement is the language of most managers, utilising this method was considered appropriate. Supporting this approach, Wilderom, Glunk and Maslowski (2000) and Petty *et al.* (1995) stressed that the multidimensionality of an organisation's functioning can be better measured with a multidimensional performance approach. Additionally, having stated in the previous section that the quality of secondary data was in doubt, relying upon financial performance measures could hardly have been suitable.

## **Relationship between Internal Corporate Governance and Organisational Performance**

Since the beginning of the 1930s, experts have realized that the separation of ownership from control creates a divergence in interests between owners (principals) and managers (agents) (Berle & Means, 1932). As most companies are no longer owned by equity holders, there should be controls by which the interests of managers are brought into line with the interests of the owners. Jensen and Meckling (1976) provide one solution by asserting that losses to the principal resulting from interest divergence may be restricted by enforcing control structures upon the agent. Further, Walsh and Seward (1990) argued that internal or organisationally-based mechanisms and external or market-based mechanisms will bring the interests of agents and principals into congruence. However, external control is less preferable to shareholders since acquisitions, divestitures, and ownership amendments are more expensive for owners to bear.

Internal control, thus, was investigated comprehensively and then related to organisational performance. For example, utilising M-structure as a proxy of internal control or internal corporate governance, Hill (1985) was among the first who found a relationship between internal corporate governance and performance. In regard to the first dimension of internal corporate governance, it was observed that those who monitor the management of the

company were in fact exercising behavioural control. This duty was fulfilled by the *Board of Commissioners* – one of the company's organs. Saffold III (1988) was among the first scholars who believed that behaviour control positively affected company performance. More specifically, boards of commissioners, who are tasked to 'scrutinize the highest decision makers' (Mizruchi, 1983, p. 433) or to be 'the ultimate control' (Hill & Snell, 1988), safeguard shareholders returns. In another study, the *Independent Commissioner (IC)* dimension was investigated by Hoskisson, Johnson and Moesel (1994), who stated that the presence of non-board blockholders, the proportion of board outsiders, board outsider equity, and board insider equity had a relationship with organisational performance. In more recent studies, the positive link between the presence of an *Independent Commissioner (IC)* and organisational outcome has also been validated (Florackis, 2005; Matolcsy, Stokes, & Wright, 2004). The dimensions of *Audit Committee (AC)* and *Internal Control Groups (ICG)* were also documented as important organs of internal corporate governance. Banks (2004) and the National Code for Good Corporate Governance (NCCG, 2004) have argued that an *Audit Committee* and *Internal Control Group* safeguard companies through their fulfilment of their duties. In regard to *Boards of Directors*, these are selected and paid by companies to run organisations on a daily basis. They are obliged to provide satisfactory returns to the owners of the firms through the strategy they defined, and its implementation. The contribution of this organ to organisational performance has been examined by Coughan and Schmidt (1985) and Murphy (1985), who concluded that there was a positive relationship between a *Board of Directors* and organisational performance. In more recent studies, Florackis (2005) has revealed the positive affect of compensation of boards of directors on performance. This was also the case with the *Codes of Conduct (COC)*, as its existence guards the interests of shareholders through promotion of proper behaviour (Banks, 2004).

## **Research Model**

Based on the previous section, a research model was build and this is shown in Figure 1. The second-order internal corporate governance construct consisted of 6 first-order constructs — namely *Board of Commissioners (BOC)*, *Independent Commissioners (IC)*, *Audit Committee (AC)*, *Board of Directors (BOD)*, *Internal Control Group (ICG)*, and *Codes of Conduct (COC)*. Each of these constructs is reflected by several observed variables. The *Organisational Performance (OP)* construct is reflected by eight dimensions.

FIG. 1: RESEARCH MODEL: INTERNAL CORPORATE GOVERNANCE – ORGANISATIONAL PERFORMANCE

### Hypothesis Development

Having discussed the relationship between internal corporate governance and organisational performance, and having constructed a research model, the following hypothesis was developed:

*Hypotheses 1: Internal corporate governance, which is measured by the fulfilment of the duties of board of commissioners, independent committee, audit committee, board of directors, internal control group, and the reinforcement of codes of conduct, is related positively to organisational performance.*

### Research Method

Two stages of analysis were performed: the first was factor analysis using SPSS 14, and the second was the full Structural Equation Modelling (SEM) analysis using LISREL 8.8. Factor analysis was applied as the ‘data reduction technique used to reduce a large number of variables to a smaller set of underlying factors that summarise the essential information contained in the variables’ (Coakes & Steed, 1999, p. 147). Full SEM consists of examining the measurement part and the structural part. The one-factor congeneric measurement model of Holmes-Smith (2001) was applied. In doing so, a robust construct was sought through the tests of construct reliability ( $\rho > 0.50$ ), convergent validity (parameter  $t$ -value  $> 1.96$ ), and discriminant validity. As internal corporate governance is a second-order construct, a subsequent test of measurement was also carried out. These test procedures produced parsimonious constructs with reasonable fit indicators such as Root Mean Square Error of Approximation (RMSR), Goodness of Fit Index (GFI), Comparative Fit Index (CFI), and Satorra-Bentler (S-B) $\chi^2$ , among many others. In the structural part, the path between internal corporate governance and organisational performance was examined. With

the objective that the path being analysed is plausible, given the sample data, the structural path was subject to fit indices tests – S-B $\chi^2$ ,  $p$ -values, GFI, CFI, and RMSEA, among many others.

### **Sample and Procedure**

The subject of the study implicitly demanded that respondents should be familiar with the topic of internal corporate governance and performance. Choosing managers as respondents in research relating to organisational phenomena has been common in several previous studies (as an example see Heuer, Cummings, & Hutabarat, 1999). This technique is known as purposive sampling and ‘is characterized by the use of judgment and a deliberate effort to obtain representative samples by including presumably typical areas or groups in the sample’ (Kerlinger & Lee, 2000, p. 179). Managers who were taking educational programs and/or training session in three big cities were approached.

### **Pilot Studies**

Two pilot studies were carried out prior to the main survey. In the first pilot study questionnaires were distributed to 30 surrogate respondents of managers of one of the State Owned Company. The reliability test showed that all but one construct had a Cronbach’s alpha higher than 0.7. This was *Audit Committee (AC)*, with a score of .389. ‘A poorly worded item’ (Hulland, 1999, p. 198) may produce low loading; therefore, rather than deleting these items, refining them was the final choice for this study. Pilot Test 2 was carried out in three classes of the Magister Management Program at Gadjah Mada University. The reliability test showed that the Cronbach’s Alpha coefficient of all constructs surpassed the point of reference of .07. The conclusion of these findings was the research instrument was sufficient to be used for final survey.

### **Main Study**

One thousand questionnaires were distributed to the managers and executives of companies. These respondents were enrolled in educational degrees and/or training programs in three different cities (Jakarta, Surabaya, and Yogyakarta) run by the Magister Management Program of Gadjah Mada University. Students who were in the same course with managers/executives but had no job experience were excluded from the study. The method applied here was similar to those of Denison (1984, p. 8), who used the individual respondent in his study of organisational phenomenon (the culture of an organisation). Similarly, Denison and Mishra (1995) and Carmeli and Tishler (2004) used individual perception to measure organisational culture in their research. Supporting such an approach were Schein, and Van Aken and Strikwerda, cited in De Witte and Van Muijen (1999), who argued that as they were the enablers and the makers of organisations, asking individuals about their perception of organisational phenomena was natural. Individual responses, although applied in many organisational studies, are not immune from deficiency, as acknowledged by Calori and Sarnin (1991 p. 61). Nonetheless, they deemed this approach is appropriate, stating ‘there is bias in asking individuals to respond to questions concerning the whole company. However, it seemed to be

a better solution than aggregating specific work group practices and values, mainly because the surveys do not cover the whole population of the company'. Pointing to the aggregation technique, Hofmann (1997) claimed that the shortcoming of this approach is that potentially meaningful individual level variance in the items or constructs is neglected.

The response rate of the main study was 66.9 per cent. Among the responses, 496 useable questionnaires were tabulated for statistical analysis. A demographic profile of respondents was presented in the Table 1 below.

TABLE 1: DEMOGRAPHIC CHARACTERISTICS OF RESPONDENTS

Demographic Characteristics		Frequency	Percentage
Gender:	- Female	108	21.8%
	- Male	388	78.2%
Age Group:	a) Under 30	68	13.7%
	b) 30+ to 40	234	47.2%
	c) 40+ to 50	139	28.0%
	d) 50+ to 60	53	10.7%
	e) 60+	2	0.4%
Tenure:	- Less than 1 year	10	2.0%
	- 1 to 5 years	90	18.1%
	- 5+ to 10 years	141	28.4%
	- 10+ to 15 years	120	24.2%
	- 15+ to 20 years	60	12.1%
	- More than 20 years	75	15.1%
Type of Business	- Service Business	353	71.2%
	- Manufacturing Business	61	12.3%
	- Others	82	16.5%
Department:	- Finance/Accounting	88	17.7%
	- Marketing	64	12.9%
	- Production/Operation	104	21.0%
	- Human Resource Management	36	7.3%
	- Others (corporate secretary, internal auditors, communication, and general managers)	204	41.1%

### Measures

The dimensions of internal corporate governance developed by Banks (2004) were used as a starting point. Additional dimensions derived from interviews and literature reviews of Indonesian Company Law and Indonesian corporate governance systems were included to capture the domain. In regard to the *Board of Commissioners* dimension, items summarised from Indonesian Company Law 1995 and the Code for Good Corporate Governance (NCCG, 2001) were added; the *Independent Commissioners* dimension was improved by adding items derived from the Code for Good Corporate Governance (NCCG, 2004), and the Jakarta Stock Exchange Directors' decree No.

Kep-315/Bursa Efek Jakarta/06-2000; the *Audit Committee* dimension was improved with items obtained from the Code for Good Corporate Governance (NCCG, 2004), The Stock Exchange Supervisory Body circular letter No. SE-03/PM/2000, and the Jakarta Stock Exchange Directors' decree No. Kep-315/Bursa Efek Jakarta/06-2000; the *Board of Directors* dimension was improved with items drawn from Indonesian Company Law 1995 and the Code for Good Corporate Governance (NCCG, 2001); the *Internal Control Group* dimension was improved with items summarised from the work of Daniri (2005) and material from the Code for Good Corporate Governance (NCCG, 2001); and the *Codes of Conduct* dimension was improved with items developed by the Code for Good Corporate Governance (NCCG, 2004). Synthesising these processes, the internal corporate governance second-order construct contained six dimensions and 64 observed variables. Organisational performance was measured using eight indicators developed by Wilderom and Van den Berg (2000; 1998). The questionnaire was translated into Bahasa Indonesia as the study was carried out in Indonesia.

In regard to the scale of internal corporate governance, the study asked participants to express the extent of their agreement or disagreement using a six-point Likert scale, namely: (1) Strongly Disagree, (2) Disagree, (3) Somewhat Disagree, (4) Somewhat Agree, (5) Agree, and (6) Strongly Agree. For the organisational performance construct the study asked participants to express their opinion of the degree their organisation needed to improve in the eight indicators. Here, the six-point Likert scale ranged from (1) Very Little, (2) Little, (3) Somewhat Little, (4) Somewhat Much, (5) Much, to (6) Very Much. By circling (1) Very Little, respondents confirmed that only modest improvement was needed in their company for that particular indicator, which in turn indicated that on this indicator their company had already achieved good performance.

The utilisation of a six-point scale instead of a five- or seven-point scale was based on the argument advanced by Trompenaars and Hampden-Turner (1997), who provided empirical evidence that some Asian countries, including Indonesia, rank high in the neutrality dimension. Consequently, the middle choice of response — namely 'neutral' and 'neither agree or disagree' — was excluded. It was believed that such responses would have contributed to the central tendency error (Cooper & Schindler, 2003).

#### **Data Examination**

Little's MCAR test of .035 indicated that the missing values could be considered to be missing completely at random (Little & Rubin, 2002). As such, any method of replacement was acceptable. Since series means replacement is most widely used, the study used this method. Kolmogorov-Smirnov's normality test showed there were distribution anomalies in all indicators, but skewness and kurtosis values fell within the acceptable range ( $\pm 2$ ). With 496 cases, the requirement of minimal sample size of 200 cases for SEM was fulfilled (Hair, Anderson, Tatham, & Black, 1998).

## Results

### Factor Analysis

The large number of variables could have been a disadvantage of the study, as 'increasing the number of variables also increases the possibility that the variables are not all uncorrelated and representative of distinct concepts' (Hair et al., 1998p. 91). Results of factor analysis showed that there were 20 observed variables for the internal corporate governance construct and 4 indicators of the organisational performance construct. The result of factor analysis is not shown here, but will be made available on request.

### Assessment of Measurement Properties

#### *Assessment of Unidimensionality, Convergent Validity, and Discriminant Validity*

Each construct was subject to a one-factor congeneric measurement model. Model re-specification was carried out to improve the model fit. In doing so, deletion of non-significant estimated parameters and freeing parameters that shared large error variance was applied. This process was stopped when model fit was accomplished and there were neither theoretical nor statistical justifications for further modifications. The result of the parameter estimates for final one-factor congeneric model are attached in Appendix 1.

Initially, there were 28 observed variables in the models. Following one-factor congeneric model assessment, the observed variables were reduced to 27 items. The item that was dropped belonged to *Board of Commissioners' duties*. *BOC1* was dropped since it shared significant error variance with *BOC4*, and it had lower loading than *BOC4*. *BOC1* measured the extent to which BOCs supervise the action of BODs; this theoretically overlapped with *BOC4*, which gauged the extent to which BOCs ensure that BODs comply with regulations having the force of law. Therefore, for the sake of parsimony *BOC1* was dropped.

Convergent validity measures the magnitude of the direct structural relationship between an observed variable and a latent construct. It is achieved when this relationship (factor loading) is significant from zero (Holmes-Smith, 2001). At 5 per cent significance level the *t*-value of the parameter should be higher than 1.96. The convergent validity requirement was fully satisfied as no *t*-values were less than  $\pm 1.96$ .

Another measure of validity is discriminant validity (Venkatraman, 1989). This represents the extent to which the constructs in a model are different. Constructs are supposed to not be highly correlated, as they are measuring different concepts. Therefore, a correlation between constructs that is greater than .80 or .90 represents a lack of discriminant validity (Holmes-Smith, 2001). Fornel and Larcker (1981) recommend that discriminant validity is fulfilled if the average variance extracted for two constructs is greater than the square of the correlation between the two constructs. Results shown in Appendix 2 and 3 indicated that the discriminant validity was satisfied.

### **Assessment of Reliability**

The indicator reliability was measured using squared multiple correlation. It was observed that all indicators satisfied the threshold of .500 (Holmes-Smith, 2001), and their *t*-values were significant (greater than  $\pm 1.96$  at 5 per cent significance level), therefore all were maintained (Sethi & King, 1994).

Meanwhile, in assessing the reliability of multiple measures for an individual construct, the internal consistency measure developed by Fornell and Larcker (1981) was applied. A commonly used threshold value for acceptable reliability is .50, which roughly corresponds to a standardised loading of .7 (Hair et al., 1998; Holmes-Smith, 2001). Another measure is variance extracted estimate (Fornell & Larcker, 1981). Higher variance extracted values occur when the indicators are truly representative of the latent construct. Guidelines suggest that the variance extracted value should exceed .50 for a construct (Hair et al., 1998; Holmes-Smith, 2001). The variance extracted measure is a complementary measure to the construct reliability.

Results of this study indicated that all constructs had good construct reliability ( $>.50$ ), and good variance extracted estimate ( $>.50$ ). The assessment of reliability test is shown in Appendix 4.

### **Second-order Analysis of Internal Corporate Governance Construct**

Internal corporate governance was a second-order construct; therefore, its properties needed to be assessed prior to structural analysis. Model re-specification was again carried out to improve the model fit. This process was stopped when model fit was accomplished and there were neither theoretical nor statistical justifications for further modifications. This assessment was recommended by Gerbing, Hamilton and Freeman (1994) as it has the advantage of evaluating construct validity with goodness-of-fit indices, and it also provides the conceptual advantage of providing a definite definition of the domains of content that operationalise the construct of interest.

First of all, to properly specify a second-order construct it is important to ensure that all first-order constructs are unidimensional (Kotha, Vadlamani, & Nair, 1997), as was the case with this study. To evaluate the fit of the second-order construct, researchers recommend using CFI along with other fit indices (Gerbing et al., 1994). Although the common fit indices such as chi-square, GFI, AGFI, and RMSEA/RMR are in practice applied in many studies of second-order constructs (e.g., Farmer, Maslyn, Fedor, & Goodman, 1997; Kaplan & Elliott, 1997), for the sake of completeness of good-fit indices, the CFI is called for. This index was applied in the not so recent study of Goldman, Greenbaum and Darkes (1997), and in more recent studies (Hagger & Chatzisarantis, 2005; Laroche, Kim, Tomiuk, & Bélisle, 2005). Marsh (1994) applied the RNI (Relative Non-centrality Index), which is essentially the same as the CFI, in his study of confirmatory factor analysis on a second-order construct. After five iterations, the fit indices satisfied the thresholds, as shown in the Table 2 below.

TABLE 2: MODEL RE-SPECIFICATION OF INTERNAL CORPORATE GOVERNANCE CONSTRUCTS

Fit Index	S-B $\chi^2$ (df)	<i>p</i> -value	RMSEA	RMR	GFI	AGFI	CFI
Results	155.958 (129)	0.0532	0.0205	0.160	0.909	0.880	0.999

The ratio of S-B $\chi^2$ /df was within the acceptable range of 1-2 (=155.958/129=1.209); the *p*-value was bigger than benchmark (=0.0532); RMSEA was satisfactory (=0.0205); GFI was acceptable (=0.909); and CFI's value was excellent (=0.999). The RMR score was not as good as the recommended benchmark of less than or equal to .05. However, since the RMSEA index was excellent, and RMSEA is superior to RMR in term of its characteristic of being least affected by sample size (Fan, Thompson, & Wang, 1999), the study considered that good fit indices were still satisfactory. Further, Byrne (1998) claimed that interpreting RMR is difficult since the residual values derived from the fitting of the variance-covariance matrix for the hypothesised model to those of the matrix of sample data are relative to the sizes of the observed variance and covariance. In regard to AGFI, it was acknowledged that this index was less than the restrictive threshold of .9, but exceeded the threshold of .80 (Gefen, Straub, & Boudreau, 2000). GFI and AGFI in the .80 to .89 range were also believed to represent a reasonable fit (Doll, Xia, & Torzkadeh, 1994). Moreover, Kotha, Vadlamani & Nair (1997) argued that such an AGFI index was still appropriate as long as other indices performed well, as was the case in this study. In sum, the overall fit indices were fulfilled in this study.

#### Assessment of the Structural Model

As stated by Gefen, Straub and Boudreau (Anderson & Gerbing, 1988), the objective of covariance-based SEM is:

to show that the null hypotheses – the assumed research model with all its paths – is *insignificant*, meaning that the complete set of paths as specified in the model that is being analysed is plausible, given the sample data. Moreover, its goodness of fit tests, such as  $\chi^2$  test the restrictions implied by a model. In other words, the objective of covariance-based SEM is to show that the operationalization of the theory being examined is corroborated and not disconfirmed by the data.

This objective can be met by, for example, *insignificant*  $\chi^2$  with *p*-value above .05 or GFI above .90, among many other satisfactory criteria. If needed, model re-specification can be performed to improve the structural relation between constructs or latent variables. Results showed that the full model did not need any model re-specification as all fit indices met the benchmark, as shown in Table 3 below.

TABLE 3: MODEL SPECIFICATION OF FULL MODEL

Fit Index	S-B $\chi^2$ (df)	<i>p</i> -value	RMSEA	RMR	GFI	AGFI	CFI
Results	227.748 (202)	0.103	0.0160	0.142	0.900	0.875	0.999

All but RMR and AGFI were not as good as the recommended benchmark of 0.05 and 0.90 respectively. However, considering the argument advanced by Fan, Thompson, and Wang (1999), Doll, Xia, and Torkzadeh (1994) and Kotha, Vadlamani, and Nair (1997) above, the study considered that overall fit indices were satisfactory.

The path between the organisational culture construct and organisational performance was measured by Gamma ( $\gamma$ ) coefficients. In assessing the structural paths the *t*-value was applied. The path was to be considered statistically significant if the *t*-value was greater than  $\pm 1.96$  at 5 per cent significance level (greater than  $\pm 1.645$  at 10 per cent significance level and  $\pm 2.575$  at 1 per cent significance level). With Gamma ( $\gamma$ ) coefficients of 0.076, the relationship was not significant at 5 per cent significance level (*t*-values=1.316), as shown in Table 4.

TABLE 4: ASSESSMENT OF STRUCTURAL MODEL-FINAL MODEL

Structural Path	Hypothesis	Gamma ( $\gamma$ ) coefficients	<i>t</i> -values
Internal Corporate Governance to Organisational Performance	H <sub>1</sub>	0.076	1.316 (0.057)#

# not significant at 5 per cent significant level.

## Discussion, Limitations, and Prospects for the Study

The research procedures in terms of factor analysis and two-step structural equation modelling (Anderson & Gerbing, 1988) were performed to achieve a robust and parsimonious model. One-factor congeneric model assessment was applied for each construct. Results indicated that all constructs fulfilled the benchmark set up for SEM analysis. The same results were derived from discriminant validity analysis. As internal corporate governance was a second-order construct, an assessment of its domain was again applied. After five iterations overall fit indices were achieved indicating that this construct was well conceptualised and operationalised.

The structural part of SEM showed that the hypothesis of the relationship between internal corporate governance and organisational performance, although in the right direction, was not supported by the data. The positive relationship implied that a higher presence of internal corporate governance led to higher organisational

performance. The non-significant *t*-values indicated that among the managers and executives, internal corporate governance was not considered an important determinant of organisational performance. As a consequence, relying too much on internal corporate governance to improve organisational performance can not be justified.

The reasons for the non-significant effect of internal corporate governance on organisational performance are worth discussing. The study's result may surprise scholars of corporate governance, as most previous empirical studies (e.g. Florackis, 2005; Himmelberg, Hubbard, & Palia, 1999; Hoskisson, Harrison, & Dubofsky, 1991; Thomsen & Pedersen, 2000) have claimed a positive and significant impact of internal corporate governance on organisational performance.

There is the possibility that internal corporate governance can produce stronger outcomes when it is maintained. To some extent, the behavioural systems analysis of Redmon and Mason (2001) lends support to this notion. The snapshot approach of this study was not able to figure out whether the internal corporate governance was maintained or not in the respondents' companies. This maintenance is particularly important if the environment surrounding the company is a dynamic one that demands the organisation's response – including internal corporate governance practices – to protect its survival. Accordingly, a longitudinal perspective may be applied in future research. In addition, the impact of internal corporate governance on organisational performance may materialize later in time. Here, investment in internal corporate governance requires longer time span to be expressed in better organisational performance. At the beginning, appointment of company demands costs, but then at a later stage their fulfilment of duties improves companies' positions' as no further improvements are needed in organisational performance dimensions. As such, cross-sectional data employed in this study needs to be lengthened to capture the notion of time. Additionally, the cross-sectional nature of this study could nullify all the effects, thereby, contributing to the non-significance of the model. That is, the good performance of one company's organs was counterbalanced by the poor performance of those in other companies. This effect seems right as the study did not make any attempt to deliberately choose 'good' companies, and overlook 'poor' ones. There was also possibility that the non-significant relationship was due to the tenure of respondents. That is, the new managers who attended the educational courses and/or training programs may not have had enough exposure in order to gauge their internal corporate governance practices and their organisation's performance. However, looking at the demographic characteristics of the sample only 2.0 per cent of respondent had tenure less than 1 year this possibility could hardly be justified.

In terms of regulations, in Indonesian *Company Law 1995*, there is neither limitation nor prohibition of individuals from holding multiple board positions simultaneously. This may also contribute to underperforming firms. That is, the internal corporate governance mechanisms within one company are rarely fully fulfilled if the members of the *Board of Commissioners* and *Directors* also serve the same position in other companies. This is

especially the case for directorships, as they are normally full-time employees of the company. Further, there is the other possibility that the *Independent Commissioners* are independent, but ignorant about what is happening in a company. Their ignorance may result from the fact that their appointment was not based on expertise, but rather from other considerations, such as political or government-related reasons.

Compared to other works, this research is not the only study that provides evidence of a non-significant relationship between internal corporate governance and organisational performance. For example, in their study of Australian listed companies, Lawrence and Stapledon (1999) revealed no evidence of a significant relationship. Similarly, studies carried out in Singapore (Mak & Li, 2001) and the UK (Faccio & Lasfer, 1999) have produced the same results. Two studies performed by Bhagat and Black (1999; 2002) using US data have also revealed the non-correlation between internal corporate governance and firm performance. Seeking the reason for this, Bhagat and Black (1999) pointed to the role of *Independent Commissioners*, stating that they often turn out to be lapdogs rather than watchdogs. The independency of *Independent Commissioners* in Indonesian companies was also questioned by Tabalujan (2002). The Code for Good Corporate Governance stipulates that at least 20 per cent of commissioners must be independent of the directors and controlling shareholders and must hold no interest which may impair their ability to perform duties impartially. However, as the adoption of this code is not yet mandatory, the query of Tabalujan may be justified.

This study believes that internal corporate governance is a necessary but not sufficient requirement to improve companies' performance. There are many factors that contribute to a company's performance (Bhagat & Black, 1998; Lawrence & Stapledon, 1999). Among these many factors, transactional and transformational leadership (Bass, Avolio, Jung, & Berson, 2003), industry-specific factors (Porter, 1980), and strategy (Lewis & Thomas, 1990) can contribute to performance. Bass et al. (2003), in particular, have highlighted the importance of transformational leadership given the pace of change confronting companies today. Such rapid change has taken place in Indonesia as a consequence of monetary crises, reformation, privatisation, and adjustments to so many 'new rules of the game' in the Indonesian business environment. As a result, so-called 'adaptive and flexible leadership' is called for. Admired, respected, trusted, motivated, caring, and stimulating leaders are believed to be able to provide a 'soft bumper' to make sense of the challenges employees confront and to help followers to respond appropriately to those challenges (Bass et al., 2003). It is, therefore, always possible that some additional constructs or variables, left out of the model, can provide reasons answer for the poor performance of firms. This is the important avenue for future research.

As suggested, the impact of internal corporate governance on performance may take a long time. At this point in time, this study may not tell the whole story about the relationship of both constructs. Thus, longitudinal research on these relationships would likely provide fresh evidence. The use of a cross-sectional approach, and the

equal treatment of 'good' and 'poor' companies in choosing the sample, may have contributed to the non-significant model. Clustering the sample and applying longitudinal research is suggested in future research to better examine the relationship of organisational culture and organisational performance.

## Concluding Remarks

Findings about the effect of internal corporate governance on company performance have been conflicting, and thus applying these results to the country where the system of corporate governance is significantly different is difficult. Without the courage to search for other paradigms, research on corporate governance will rarely be fruitful. This study proposed a reliable and valid measure of the domain of internal corporate governance, and related this to organisational performance. Although the relationship was in the right direction, the data did not support a significant result. As no single study can confirm the relationship between two constructs, future research is needed to provide more evidence. This is particularly so, due to the unique governance structure in Indonesian companies.

### End Notes

<sup>1</sup> In this study, interviewees' expertise was acknowledged due to the qualifications they hold. The first two persons graduated from doctoral degree of foreign universities, are researchers, and supervise research of PhD students in Indonesia. One of these two persons is independent commissioner of two companies in Indonesia. The third person is one of director of Capital Market Supervisory Agency Minister of Finance The Republic of Indonesia, and member of the National Committee on Governance. The fourth person is researcher of Non-Government Organisation focusing on the practices of corporate governance of Indonesia. The fifth person is author of book on

good corporate governance in Indonesia, a vice-director of one of biggest electronic company in Indonesia, member of the National Committee on Governance, and was former director of Jakarta Stock Exchange. The sixth person is PhD graduate of foreign university, an academic staff, and researcher in the area of organisational behaviour.

# **Corporate Governance Mechanisms: Matters of Relevance or Irrelevance?**

*Patchareewan Boriboonsate, p.boriboonsate@postgrad.curtin.edu.au*

*Curtin University of Technology, Perth, Western Australia*

## **Abstract**

**Following the economic crises in countries across the globe and the failures of major, high profile corporations in various nations around the world, corporate governance mechanisms have been targeted as a significant indicator of corporate well-beings; and a focus for remedial processes to overcome the negative effects of the past and ensure future sustainability. Thus, governments, shareholders, corporations and the public have increased their attendance to the initiation and implementation of appropriate mechanisms of governance. Academics, on the other hand, have sought to identify, develop and promote examples of the best practices in corporate governance mechanisms (CGMs). The current paper focuses on the recent CGM literature, including empirical evidence on the internal mechanisms of corporate governance: the roles of the board of directors and the ownership structure applied to corporations. Studies suggest that the findings are contradictory as to whether or not the mechanisms actually are relevant to the success of the corporations.**

## **Background and Context of the Study**

Following the economic crises in countries across the globe and the failures of major, high profile corporations in various nations around the world, corporate governance mechanisms have been targeted as a significant indicator of corporate well-being, as a focus for remedial processes to overcome the negative effects of the past and to ensure future sustainability. The corporate governance mechanisms imposed on organisations, therefore, are an accountability measure for organisational success and survival in the economy. According to the current studies on corporate governance in the academic literature, and in the practical applications adopted among real-world corporations, two relevant and critical mechanisms are those related to the board of directors and the structure of the ownership.

The board of directors can be viewed as the common apex of the decision control systems of organisations, large or small (Fama and Jensen 2004, p. 69). In addition, the board members “use past experience as a predictor of future behaviour” (Simpson 2007, p. 17) in exercising their skills to protect and to promote the interests of the

shareholders. The underpinning principle of having diversity on boards is to ensure that the interests of managers (agents) are aligned with the interests of shareholders (principals) as predicted by the agency theory: the fundamental theory of corporate governance put forward from the market-based system countries such as Australia, Canada, the United Kingdom and the United States. Although, in general, agency theory is considered to be valid, Eisenhardt (2004, p. 90) argues that “it only presents a partial view of the world; the theory ignores a good bit of the complexity of organisations. Additional perspectives can help capture the greater complexity”. Furthermore, on the global level, Davis (2005, p. 158) argues strongly that “nations vary widely in their constellations of governance institutions, even among the wealthiest economies. Both post-socialist and emerging market economies have had quite divergent experiences with public corporations and financial markets, and much work remains to be done in explaining this diversity”. Also, the argument is in line with the view of Cadbury (2004, p. ix) that “there is a diversity of governance systems and processes around the world. Forms of corporate governance are shaped nationally by their economic, political and legal backgrounds, by their sources of finance, and by the history and culture of the countries concerned”. Hence, it is not surprising that empirical evidence on the scope of the roles of boards varies accordingly to the complexity of organisational systems within, and without, a country and embedded in the context specific to each nation.

Around the world, differences also apply to the structures of ownership patterns of corporations, whereby the nature of ownership can be concentrated or dispersed depending on the market development, the evolution, and sources of finance available for corporations in each country. Moreover, the level of the owners’ involvement in the corporation also varies. Thus, so far the body of knowledge on corporate governance and mechanisms, with a focus on the roles of boards and the structures of ownership, has grown to encounter the multi-faceted aspects of domestic and worldwide corporations in the contemporary era of the global economy. Consequently, the current paper addresses two significant features of internal corporate governance mechanisms and the context of their relationship to the for-profit corporations’ performances, including the provision of empirical evidence as to their relevance or otherwise in selected countries. The paper is divided into four sections. The first section is concerned with the background and the context of the paper. The second section provides a review of corporate governance and its two mechanisms. The third focuses on empirical evidence, as to corporate governance performance, and the fourth provide a conclusion and some limitations of the paper.

## **What is Corporate Governance and Why is It so Significant?**

Despite the fact that boards are taking the issue of diversity seriously and the selection of board members has reached a new level of professionalism, previous literature defines corporate governance in specific terms related to the context of particular organisations. A generally accepted meaning of corporate governance can range from the basic definitions given by Sir Adrian Cadbury in 1992 and 2002 and the OECD (Organisation for Economic Cooperation and Development) in 1999, to a more detailed identification of a set of mechanisms that help maximise the value of the companies for their owners (Davies 2006; Denis and McConnell 2003; Luo 2007; Werder and Talaulicar 2006). Primarily, there is agreement that corporate governance is concerned with directing and controlling of large business organisations.

However, the rationale behind the wide variety of definitions that continue to exist today has depended largely upon the perspectives of the investigative researchers; i.e., it depends on whether or not corporate governance issues are viewed from a similar, or unrelated, lens. Furthermore, it depends also upon the 'theories' applied by those investigators. Turnbull (1997, p. 180 and p. 181) asserts that in order to encompass most perspectives, an inclusive definition of corporate governance should be described as all the influences affecting the institutional processes, including those for appointing the controllers and/or regulators, involved in organising the production and sale of goods and services.

Why is corporate governance so significant? The answer lies in the profit-making ability and growth of corporations. Corporate governance is perceived to be essential if a firm is to be sustainable in the longer term (Mallin 2006); in turn, the wealth of a nation impacts upon the sustainability of its corporations. The opposite is also true! The failure of domestic corporations can be followed readily by the downfall of the nation's economy, thereby triggering the domino effect on economies of other countries with strong international connections: e.g., the economic crises during 1990s and the failures of major corporations worldwide in the early 2000s. It has been noted that the corporate governance system is to be blamed for sundry scandals and collapses of corporations and economies (Phan, Lee, and Lau 2003; Clarke 2004, p. 14; Melis 2006). Not only does a collapse affect the particular corporation, but the negative impact also is felt by the citizens of the nation at the micro-level of society.

One proposed framework for determining the scope and relationships among key players in the concept of corporate governance suggests a complex set of responsibilities among shareholders, managers, the board of directors and other parties such as customers, alliances, banks, creditors, employees, government, auditors, the local community and the wider society (Fig. 1).

There are three substantial, leading theories underpinning the idea of having corporate governance mechanisms: agency theory, stewardship theory and stakeholder theory. Each theory of corporate governance and

its mechanisms can be understood by utilising the framework proposed in Figure 1. Although the components can be customised or tailored accordingly to the concept underpinning each theory, each corporate player cannot be erased completely from the whole picture.

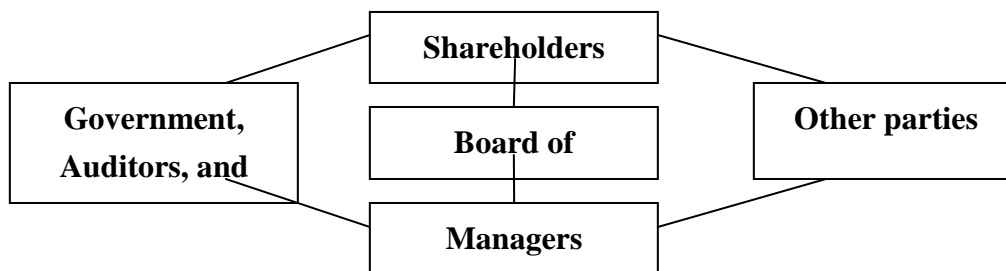

FIG 1: CORPORATE GOVERNANCE

Source: Adapted from: Intrawichai, S. (2005).

From an agency perspective, the corporate governance deals with the ways in which suppliers of finance to corporations assure themselves of getting a return on their investment (Shleifer and Vishny 1997, p. 737). Therefore, control mechanisms such as laws/regulations, markets, incentives/compensation, and independent directors are required by corporations to ensure that managers do not behave according to their personal interests (i.e. management opportunism), but in line with the best interests of financial suppliers (See Gillan 2006 for a review on recent developments of US corporate governance, and Denis and McConnell 2003 for an international perspective). Doubts about the efficacy of the agency theory have increased since the collapse of Enron in 2001. It is noted that not only does the theory prove to have its limitations, but so does the concept of the underpinning function of the monitoring system by the boards; therefore, it has been argued by Deakin and Konzelmann (2004) that the concept of boards representing financial suppliers should be replaced by the concept of stewardship. Nonetheless, before applying the stewardship theory, the question is to what extent the managers can be trusted to run the companies without the control mechanisms imposed by the boards or boards' roles. Control mechanisms in corporations remain precisely because the lack of mechanisms, and undue reliance on managers, were major reasons why corporations such as Enron failed.

According to the stewardship theory, the issue of trust has been placed upon the managers and their ability to run the companies. They are required to make their own interests that are assumed to be pure, collective and cooperative with those of the shareholders. In other words, the managers are expected to perform their strategic tasks in the best interests of corporations they are running and, by doing so, achieving the best result for themselves at the same time. Certain corporate mechanisms such as use of independent directors or having boards impose tight

control mechanisms are irrelevant to this theory. However, remuneration strategies of executives may be used to promote the concept of the alignment of personal and corporate interests.

As for the stakeholder theory, the corporate governance mechanisms are put in place by taking into account the involvement of all parties: i.e., of all stakeholders. Stakeholders include contractual stakeholders such as shareholders, employees, customers and suppliers as well as community stakeholders such as regulators, government, pressure groups, and local communities (Clarke, 2004).

The recent development in finding the best mechanisms for corporate governance has begun to incorporate the third theory, based on returns to stakeholders and to the society-at-large as part of helping develop the long-term sustainability of the corporations. It is argued (Lo and Sheu 2007, p. 346) that those companies that actively maintain sustainable development are more likely to be rewarded by investors, because they have a highly developed 'valuation' in the financial market.

Thus, the corporate governance theories have relevance to the corporation and its role in the wider society, but it is important also to understand the types of corporate governance mechanisms; in particular, the roles played by boards and the ownership structure.

## **Theories on Roles of the Board of Directors**

Regardless of different perspectives in the concept of corporate governance and its mechanisms, e.g., internal vs. external or market-based vs. non-market-based, the corporate leaders are still the 'board of directors'. As put by Siebens (2002, p. 110), the real highest level of leadership is the board, where the directors have to "run the show."

During an international seminar on Corporate Governance and Direction, it was insisted that "Boards should not and cannot run the company, assuming the board is not composed of all inside directors. They do not have the time, knowledge or skills (Clarke 1998, p. 64)". A realistic view of the role of the board, as mentioned by Professor Lorsch, was to perform a strategic role for the companies, to evaluate and reward the CEO, to monitor legal and ethical conduct, to act as change agents, to deal with company crises and to manage the company's development and succession.

Over the past decade, the academic community has discussed, investigated and proposed ideas about the 'best practices' of boards of directors. Up to date, there have been eight major theories supporting the above-mentioned views on the roles of boards. The fundamental ideas can be categorised as agency, stewardship, resource dependence, institution, network, stakeholder, managerial hegemony and class hegemony theories.

In line with an agency viewpoint, the assumption of the duty of directors is that directors are accountable to shareholders only, with a duty to protect shareholders' interests and to provide adequate return on their investment

(Lorsch and MacIver 2004, p. 112). Thus, according to agency theory, the role of the board is to ensure that top management teams are working in the best interests of shareholders or financial suppliers.

The stewardship theory assumes that the agents' interests are already aligned with those of owners of corporations (Davis, Schoorman, and Donaldson 2004); in other words, there are no conflicts of the interest between two parties in the first place. Managers are interested in cooperative behaviour with shareholders in order to achieve the goals of organisations. Metaphorically, stewards (managers) attempt their best with their full capacities to serve owners (principals). Therefore, the stewardship perspective views the roles of the boards as to oversee and to comply with, not to develop policies or strategies; i.e., managers are assumed to undertake those roles already (Hilmer and Donaldson 1996).

Three theories that take the external environment and its pressures into account are resource dependency, institution, and network theories. Pfeffer and Salancik (2003) argue that an organisation's survival and success depend on its co-optation strategies to tap resources critical to the organisation while dealing with environmental uncertainties. By having boards of directors, it is argued that boards serve for that particular purpose among different entities or interest groups such as creditors, customers, suppliers or competitors who are important for the organisations. Hillman et al. (2004, p. 139) assert that the increasing number and scope of environmental dependencies prompt the firms to alter their board structures to better align them with new dependencies, since the board members can bring in their expertise, connections, information and valuable resources into the firms and help reduce the transaction costs. The roles of boards are assumed to help reduce uncertainty and to provide linkages to the external environment within the organisational boundary.

The institutional perspective is a relatively deterministic theoretical framework that places great emphasis on environmental norms and the weight of a company's history as explanations of organisational norms and actions (Judge Jr and Zeithaml 2004, p. 151). Therefore, the roles of boards are to comply with formal and informal constraints such as laws, regulations, and accepted norms in the society and to build legitimacy within the organisational environment over time.

The definition of network governance proposed by Jones et al. (2004, p. 160) involves a select, persistent and structured set of autonomous companies (as well as non-profit agencies) engaged in creating products or services based on implicit and open-ended contracts to adapt to environmental contingencies and to coordinate and safeguard exchanges. The similarity between resource-based and network governance theories is that both can help reduce transaction costs. However, the role of boards in the two theories is quite dissimilar. Resource dependence theory puts emphasis on the critical resources received from connected parties, but the network governance theory highlights connections important for the corporations.

In contrast to the agency theory, the role of boards in stakeholder theory is to ensure that the management teams' interests match those of the stakeholders. In other words, even though it is said that the boards are accountable to shareholders, the boards are responsible also for stakeholders. In countries such as Germany and Japan, stakeholder theory has long been established in their corporate governance systems. Also, it has been noted that stakeholders have the ability to monitor company performance (Clarke 2004).

Managerial hegemony is a concept developed in the work of Mace (2004) who reported that, in 1971 American boards were to advise and to counsel, to discipline management teams and to serve as decision-makers during crisis situations such as the sudden death of a Chief Executive Officers or the resignation from the company of a President; actions which are in contradiction to the more modern business literature which supports the ideas that the boards should establish corporate objectives, strategies, policies, ask discerning questions and select the Chief Executive Officers. In managerial hegemony, there is no connection between the nominated roles of the board and actual board activity. The role of the board is perceived to be simply a rubber stamp for management actions and initiatives.

Similarly, in case of class hegemony, it is predicted that the roles of the board are to perpetuate elite and class power rather than to provide genuinely diverse resources and insights (Corbetta and Salvato 2004, p. 129).

In effect, the majority of previous literature<sup>1</sup> has focussed often on two theories in explaining the roles of boards. However, by relying alone upon one or two perspectives the actual roles of boards cannot be completely captured, nor is it possible to articulate clearly the meanings of having the board as the corporate leaders. In his pioneering work, Hung (1998) describes the ideal board of directors as designing, linking, coordinating and controlling roles related to strategic, maintenance and support corporate behaviours, reflecting the roles of the board of directors from the thoughts based on resource dependency theory, stakeholder theory, agency theory, stewardship theory, institutional theory and managerial hegemony.

## **Theories on Ownership Structure**

Associated with agency theory is the basic concept of the separation of ownership and control. The structures of ownership that fit this perspective are noted in those corporations with diffused ownership as exemplified by the majority of the corporations such as in Australia, the United Kingdom (U.K.) and the United States (U.S.). The theory of the corporate ownership structure arising from the agency perspective explores the prevalent diffusion of corporate ownership; early concepts were developed by Jensen and Meckling (1976). They suggested the optimal structure of ownership takes into account the debt and equity of the company to be held by different groups of people. The stocks and bonds can be issued to the CEO (inside equity), to anyone outside of the company (outside

equity), and also to anyone outside of the company (debt equity) in order to mitigate the agency problems arising from the conflict of interests between agents and principals.

It is simple for the Anglo-Saxon economies to apply the theory of ownership structure to the majority of public-held companies whereby the owners of the companies can be separated completely from the controlling part of the companies. In other words, by providing the stocks or options based on the performance of managers in order to ensure that interests of managers can be aligned with those of shareholders is effortless unless there is a need to find the optimal level of ownership in the companies. However, the same concept cannot be applied to different structures such as that of family businesses whereby the owners of the companies are the same group of people who control the corporations; for instance, in Thailand where family businesses still exist and mostly have control over public-held companies (Natenapha 2006).

In addition, while the form of dispersed or diffused ownership structures prevail in Australia, the U.K. and the U.S., other countries such as in Europe and in Asia have different forms (Faccio and Lang 2002; Claessens, Djankov and Lang 2000). In Japan, for example, the majority of shares of a listed company are owned by banks, business corporations, individual shareholders and insurance companies, respectively (Cooke and Sawa 1998). These shareholders, furthermore, are noted as not taking part in governing corporations, which is quite different from Anglo-Saxon economies.

Moreover, Guillèn (2000) argues that institutional investors are not increasingly adopted in many countries such as Japan, Turkey and South Korea while they are growing in other countries such as Australia, the U.K and the U.S. The underpinning cause is the difference in each country's legal tradition.

## **Relevant or Irrelevant Issues to Corporate Performances**

Contemporary literature reports that the roles of boards in relation to the corporate performance are to monitor the company and the performance of management; to make major decisions with regard to compensation plan, CEO succession, capital structure/expenditures and about mergers and acquisitions, including diversifications; and to offer advice and counsel to management, especially to the CEO. To achieve all those ends, it is argued that the board needs to be independent (Carter and Lorsch 2004) regardless of whichever theory or theories underpin the roles of the board, whatever the contexts of the studies and whichever types of board structure (the inside/outside directors ratio and CEO/Chairman duality). The independent board means that the decisions and the recommendations from each board member are not to be influenced by other board members unless the consensus is reached for the best of the future of the corporation embedded in the interests of shareholders and of other external stakeholders. Each board member is entitled to his/her views, leading the company to become successful in the current and future

economy. However, previous findings in the United States with regards to the board independency and firm performance do not uniformly support this view (Johnson, Daily and Ellstrand 1996, p. 420). The evidence concerning the independency of the board, such as that in Japan, reports that increasing of the ratio of outside directors to the board in order to create board independency does not also relate to firm performance (Yoshikawa and Phan 2003).

In their comprehensive literature review on ownership structure research in the U.S. and around the world, Denis and McConnell (2003) conclude that the evidence in the U.S. regarding the effects of ownership structure on firm value is mixed and as for the evidence around the world, the relation between ownership structure and firm performance appears to be varied. However, concentrated ownership has been reported to have a positive effect on firm value. Nonetheless, the conflicting evidence found in Hong Kong shows that there is no positive relationship between family ownership and firm performance (Chen, Cheung, Stouraitis and Wong 2005). Further, an additional view supporting the U.S. evidence found from the studies in Japan among firms whose financial resources are not from banks suggests higher levels of equity ownership by managers and the corporations are more profitable than for bank-affiliated firms (Kang and Shivdasani 1999).

Recent evidence combining the concept of independent boards and the theory of ownership structure shows that with more independent boards and greater insider ownership, the companies are less likely to be delisted from the Stock Exchange (Charitou, Louca, and Vafeas 2007). Nevertheless, the opposite result can be found from a study in Europe arguing that there is no relationship between the number of insider directors or the level of managerial ownership and corporate profitability among European firms (Krivogorsky 2006).

## **Conclusion and Limitations**

Regardless of divergent theories or convergent ideas underpinning the roles of boards and the dissimilar structures of ownership around the world, it is argued that maximisation of profits is the prime driving force of corporations now, as it always has been the case of business (Berle, 1965: 49). Also, equally important are shareholders of the companies because they vest their interests and capital in the firms. However, Blair (1995) argues that corporations do not exist to serve shareholders only, but they do exist to serve the society-at-large. If that is the case, the roles of boards will be changed accordingly to the views of those to whom the boards are accountable: the shareholders alone, or the stakeholders or groups such as employees, customers and suppliers. Is there an obvious link between stakeholders and corporate sustainability if this theory is going to prevail in the next century? The classic concern is about who has the absolute rights to maintain and control the corporation. If the owners cannot, the answers must lie in the roles of boards who act in between the managers and the (real) owners of the corporations. The question,

then, is one of who actually own the corporation? The definite answer is the shareholders or those who invest in the corporation. Also, it may be asked to whom the corporation shall be responsible in order to create long-term sustainability? The society-at-large provides the scope of an answer, as the single, major purpose of the corporation is to maximise the corporate profitability in the society.

However, as observed by Clarke (1998), the corporate governance field still lacks an integrated theory. This is not to mention about its mechanisms that have been developed in corresponding to various theories and put into practice by real-world corporations around the globe with respect to different cultures, norms, laws, local economy and knowledge of people. The gap between the theories and empirical evidence remains contradictory. Due to differences in the contexts of various studies mentioned, the supporting evidence for corporate governance and its mechanisms still seems too far from ideal practice. Nonetheless, the effectiveness of having boards controlling and directing corporations is linked to that the very essence of governance; that is to be able to govern, one must have the power to make decisions and to enforce their execution (Lorsch and MacIver, 1989: 112).

This paper has limited reference to the profit of publicly traded corporations; therefore, it is possible to exclude the real sample of populations of other types of corporations such as non-profit organisations (NGOs) and privately-held firms, which also adopt the corporate governance mechanisms.

### **End Notes**

<sup>1</sup> The exception is made by the studies of Zahra and Pearce in 1989, of Johnson, Daily, and Ellstrand (1996) and of Dallas (1996), whereby researchers combined more than two theories and explained the roles of boards.

# **Looking Afresh into the Business and Management Principles -Quran and Sunnah a Source of Research**

*Shaukat Amer, shaukat\_amer@comsats.edu.pk  
COMSATS Institute of Information Technology, Pakistan*

## **Abstract**

There is a belief among the critics of companies that the giant companies are engaged in a “silent takeover” of the world. (Micklethwait & Wooldridge, 2003) The relationship of management with the investors has aggravated the situation. Further more to meet the challenges of doing business in the modern world, management and accounting education must undergo a transformation. (Waddock, May 2005) So there is desperate need to look afresh into the principles of business and management. The Quran and Sunah is a main source of research to explore these principles. In this paper we have made an attempt to see that what these principles are.

## **Introduction**

There is no doubt that the corporate form of business organization has brought a revolution in the business world which is un-presented in the human history. This was also the need of hour in view of industrial revolution. The limited liability and separation of management from the ownership are two (2) distinct features of corporate form of organization. The concept of limited liability was introduced two hundred years ago in order to enable the large scale investment necessary for the Industrial Revolution to take place (Crowther, March 2006). However, the limited liability concept easily bails out the management for his wrong doings which may result in billion of losses either to creditors or to the share holders (Amer, 2007). The investors are considered poor monitors of managers (Carney, 1999). This is may be the logic behind separation of management from the ownership. It is true to say that the shareholders have lost control over their own wealth and the officers have gained control of the wealth which they do not personally own.

A book by title “In Defense of the Corporation” has been written by Robert Hessen in response to Ralph Nader (a US legislature) attack on Corporations. While criticizing Nader, the writer says:

“Nader maintains that shareholders are inactive because they have been denied access to information about corporate activities. But there is another explanation for their inactivity; it is a deliberate decision for most

shareholders. They are attracted to corporate shares precisely because they will not be required to participate in managerial decision making. What they seek is a sideline investment, an opportunity to entrust some of their savings to managerial specialists in return for share of the resulting profit. Critics frequently denounce the separation of ownership and control in giant corporations; yet it merely represents avoiding specialization of function or division of labor.”

In my opinion the critics are not denouncing separation and control to avoid specialization of function or division of labor but actually they are against the exploitation being done by the professional managers of the companies (Amer, 2007).

In order to address these issues there is desperate need to look afresh to the problems created by these two (2) distinct features of corporate form of organization and possible remedies. The Islamic concept of “Mudarabha” can rightly check the exploitation being made by the management. Mufti Muhammad Taqi Usmani (May 2000) while stating Islamic rules of business of Mudarabha states:

“In musharakah all the partners share the loss to the extent of the ratio of their investment while in mudarabha the loss, if any, is suffered by the rabb-ul-mal only, because the mudarib does not invest anything. His loss is restricted to the fact that his labor has gone in vain and his work has not brought any fruit to him.”

However, this principle is subject to a condition that mudarib has worked with due diligence which is normally required for the business of that type. If he has worked with negligence or has committed dishonesty, he shall be liable for the loss caused by his negligence or misconduct.”

The Islamic concept regarding limited liability is also very different from the present concept of corporate form of organization. In Islam even the death of debtors can not write off the right of repayment of debt to the creditors. The meaning of a Hadith is that:

“In response to a Sahaabi who asked about forgiveness for the sins of a Saheed (Martyr), Rasulullah (Sallallahu alayhi wasallam) said: “Yes, (i.e. His sins are forgiven) if you are firm, sincere and facing (the enemy in the battlefield) not turning your back (in fight), except debt. Verily, Jibraeel said this to me!”  
(Tirmizi)

The accounting testifies the correctness and fairness of business transactions to the parties to whom these are related. Unfortunately even with in the framework of GAAP or International Accounting and Reporting Standards the management with the help of Accountants often manipulates accounting information to deceive other stake holders to meet its dishonest objectives. As the author suggested in his papers “Development of Islamic Accounting Theory— Principle of Amanah And Accountant As Ameen” (2007) and Development of Islamic Accounting Theory— Principle of Shahadat (Testimony) - 2nd Principle (2007) the best solution to the problems

inherited in conventional accounting is to lay down a foundation for a new accounting theory, based on Divine Guidance i.e. teachings of Qur'an and Sunnah of Prophet (Salla Allahu'alaihi wa sallam). Similarly present financial system which is based on interest has created worst example of exploitation of resources by a few nations. This is one of main causes of poorness of people of third world countries. Likewise instead of giving more attention to quality of the product the consumer is being exploited through various means. In developed countries the investors are being negated by their due share through agency problem and on the other hand the employees are being oppressed. Further more there are a number of behavioral issues being faced presently by the business world which are to be addressed. Finally we should look for a society which produce "Unbroken Men and Women" against to whom Sandra Waddock (May 2005) called "Hollow Men and Women".

She rightly says:

"To meet the challenges of doing business in the modern world, management and accounting education must undergo a transformation. Courses on analysis must also consider implications of corporate and individual actions. Corporate-centric courses must become society-centric or even nature-centric. Passive knowledge transfer must give way to active engagement in learning. Disciplinary specializations must be approached within the context of an integrated perspective on business's role in society. The values-neutral posture must shift to one that recognizes the inherent values-based nature of management itself and the numerous value judgments that go into any financial report. A narrow focus on shareholder wealth and blind faith in market forces must broaden to more nuanced and intelligent focus that encompasses many stakeholders, including the natural world. We must strive for a world in balance- for a world in which society takes precedence over economy"

The Book of Allah "The Holy Quran." is the main source of knowledge. In Quran Allah has said:

"This is the Book (the Qur'an), whereof there is no doubt, a guidance to those who are Al-Muttaqun [the pious and righteous persons who fear Allah much (abstain from all kinds of sins and evil deeds which He has forbidden) and love Allah much (perform all kinds of good deeds which He has ordained)]." (Verse 2, Surah Al-Baqarah- The Holy Qur'an)

In addition to "Holy Books" Allah has sent his messengers to guide humanity. Hazrat Mohammad (SallAllaho Alaihay wa Sallam) is the last messenger of Allah. In Quran Allah has informed the mankind that:

"Similarly (to complete My Blessings on you) We have sent among you a Messenger (Muhammad SAW) of your own, reciting to you Our Verses (the Qur'an) and sanctifying you, and teaching you the Book (the Qur'an) and the Hikmah(i.e. Sunnah, Islamic laws and Fiqh - jurisprudence), and teaching you that which you used not to know." (Verse 151, Surah Al-Baqarah- The Holy Qur'an)

Now there is a desperate need to search Quran and Sunah to look at the principles and theories of management to overcome to the problems which the business and management is facing today. In Surah Luqman, Verse 2 (The Holy Qur'an) it is said "These are Verses of the Wise Book (the Qur'an)"

## **Literature Review**

Basic management techniques have been traced to the city of Ur (Iraq) in 3000 BC where Sumerian priests were the first to keep written records as a means of recording business transactions (Pindur, Rogers & Kim, 1995). The management theories can be divided into Classical Management Movement, Behavioral, Management Movement, Quantitative Management Movement and the Modern management movement.

The present management approach is to integrate these theories. Pindur, Rogers & Kim in their article "The history of management: a global perspective" states:

"The "modern management movement" continues to evolve by integrating theories. The approaches to modern management include the process approach, the systems approach, the contingency approach, the strategic management approach, the Japanese style management approach, and the excellence approach. It is a synergistic product. The classical, behavioral and quantitative movements, along with systems and contingency management theory, become integrated to form the framework of the modern management movement."

Now what is missing even in this approach is the governance aspect. Despite of historical journey of management theories we have not stopped the cases like Enron. The Enron disgrace is not alone of its kind. Giroux (2004) in his book "Detecting Earnings Management" has taken an impressive historical review of such corporate troubles. Unfortunately the accountability concept in the management definition is still missing. So for these definitions failed to protect the interests of stake holders like creditors and shareholders.

The worst part of this scenario is failure of management theories to prevent corporations in its bid to rule the world. Korten (2001) in his book "When Corporations Rule the World" rightly states:

"Corporations have emerged as the dominant governance institutions on the planet, with the largest among them reaching into virtually every country of the world and exceeding most government in size and power. Increasingly, it is the corporate interest rather than the human interest that defines the policy agendas of states and international bodies."

Similarly it has become physically impossible, and economically impractical, for central government to monitor the dynamic complexity of modern business to ensure the protection of its citizens from financial loss (Turnbull, 2002). "Net work governance" (Turnbull, 2002) is a good idea to overcome the problem. The idea is not

bad but however, it is itself very complex and hence can not comprehensively change the present scenario of rule of corporations over world. Although the un-presented technology development since industrial revolution has increase the role of machine in business and management but can't undermine the central position of human. The inspiration of humanity comes from the religion. Unfortunately our process of technological advancement had ignored this reality. Korten (2001) has written a marvelous book titled by "When Corporations Rule the World" In the book he rightly states:

"The Copernican Revolution divorced science from religion and focused our attention on mastering the secrets of the physical world. This opened the way to extraordinary technical accomplishments. We, humanity, have paid a heavy price, however, for our collective alienation from the deeper spiritual reality from which all life and consciousness flow."

Unfortunately this was the main negligence on our part. Fear of Allah ta ala is an essential step towards all spiritual advancements. The meaning of a saying of Hazrat Muhammad (SallAllaho Alaihay wa Sallam) is that "Fear of Allah taala is the root of all wisdom" (Kandhalwi). Regrettably the present body of knowledge of business and management is without this wisdom.

The Holy Quran is The Book that tells the humanity how to spend life to get success in this world and hereafter. The Quran does not promote simply a religion but it is a complete code of life. Therefore, Islam is a "deen" and not simply a religion. Regarding Quran Allah has said:

"This is the Book (the Qur'an), whereof there is no doubt, a guidance to those who are Al-Muttaqun [the pious and righteous persons who fear Allah much (abstain from all kinds of sins and evil deeds which He has forbidden) and love Allah much (perform all kinds of good deeds which He has ordained)]." (Verse 2, Surah Al-Baqarah- The Holy Qur'an)

Similarly in order to guide mankind in addition to "Holy Books" Allah has sent His messengers. Hazrat Mohammad (SallAllaho Alaihay wa Sallam) is the last messenger of Allah. In Quran Allah has informed the mankind that:

"Similarly (to complete My Blessings on you) We have sent among you a Messenger (Muhammad SAW) of your own, reciting to you Our Verses (the Qur'an) and sanctifying you, and teaching you the Book (the Qur'an) and the Hikmah (i.e. Sunnah, Islamic laws and Fiqh - jurisprudence), and teaching you that which you used not to know." (Verse 151, Surah Al-Baqarah- The Holy Qur'an)

Our future now depends on graduating to a co-evolutionary perspective that recognize the integral relationship between the spiritual and material aspects of our being and thereby allows us to recreate ourselves as whole persons, communities, and societies Korten(2000).We must strive for a world in balance- for a world in which society takes precedence over economy (Waddock, May 2005).In the era of Shaba-Radi Allaho Anhuma

(companions of Hazrat Muhammad -SallAllaho Alaihay wa Sallam) we have such type of societies. The foundation of these societies was built on The Quran and Sunah.

Such societies can not be built without revolutionary changes. This inter-alia includes radical transformation in the business and management disciplines too. The Quran and Sunah is a main source of research to look into this to put back the humanity on right track.

## **Findings**

### **Fear of Allah- The Foundation of Management**

Allah has created the whole universe. He is the creator of this world and human. So He is the only Authority Who knows the human rightly and its requirements. Dr.Naik in his article “Concept of God in Major Religions” states:

“A common feature of all major religions is the belief in a Universal God or Supreme Divine Authority that is Omnipotent and Omniscient. Followers of all major religions believe that the God they worship is the same God for them as well as for others.”

We the Muslims believe in One God. In Quran Allah advise:

“Say (O Muhammad (Peace be upon him)): "He is Allah, (the) One. Allah-us-Samad (The Self-Sufficient Master, Whom all creatures need, He neither eats nor drinks). He begets not, nor was He begotten; And there is none co-equal or comparable unto Him." (Verse 112, Surah Al-Ikhlâs: Absoluteness- The Holy Qur'an)

In nut shell we can say that the majority of humanity believe in Allah as Supreme Divine Authority. The present world of men and women desperately need an authority to guide them in their social, economic, business and political pursuits. Dr.Saleh as Saleh in his book “The Search for the Truth” describe:

“Today many people realize that all of the materialistic and secular progress which has taken place in society has produced a spiritual vacuum, which in turn has led to social, economic, political and psychological problems.”

In the Holy Quran Allah has informed the mankind:

“O mankind! Be dutiful to your Lord, Who created you from a single person (Adam), and from him (Adam) He created his wife [Hawwa (Eve)], and from them both He created many men and women and FEAR Allah through Whom you demand your mutual (rights), and (do not cut the relations of) the wombs (kinship). Surely, Allah is Ever an All Watcher over you.” (Verse 1, Surah An-Nisâ- The Holy Qur'an)

The underlying principle of success of humanity is fear of Allah. The teaching of Allah and Hazrat Mohammad (Salla Allahu'alaihi wa sallam) is that we should adopt the Deen in totality. By adopting and practicing

Islam completely, a strong spiritual will and power is created (Amer, 2007) This spiritual will and power can be turned into a bidding force. The force so created can influence positively our social, economic, business and political decisions. And thus this can help the humanity to transform management and accounting education to meet the challenges of present business world.

The fear of Allah is not only is a mechanism which will regulate this bidding force but a starting point for laying a solid foundation for business and management education. For example the present corporate practices comprehensively lack the concept of accountability. If corporate insiders are unaccountable, or accountable only to some powerful stakeholders (e.g. a large creditor or a blockholder), they will have the incentive to disclose only the information that is functional to those specific interests (Melis, 2004). Secondly, an aspect of corporate governance which has given rise to great concern is the dominant personality phenomenon (Forker, 1992).

The power of the most powerful corporate stakeholder can only be balanced if the other strategic stakeholders have the information they need to exercise their influence and hold the former accountable. Therefore, it seems correct to argue that the effectiveness of the systems of financial reporting and corporate governance is highly correlated, with any improvement in either system having a positive influence on the other, and vice versa. (Melis, 2004).

The Islamic concept of accountability which is based on fear of Allah can be effective for both the system of financial reporting and corporate governance. There are a number of Qur'anic versions and Hadith which peruse the concept of accountability in business. The meaning of a Hadith of Hazrat Muhammad (SallAllaho Alaihay wa Sallam) is that:

“The man who has these three habits is a hypocrite even if he observes fast, offers prayers, performs umra (pilgrimage), and calls himself a Muslim: when he talks he speaks untruth, when he makes a promise he does not keep it, and when he is given something in trust, he commits dishonesty.” (Muslim)

The meaning of another Hadith is that:

"There are four habits, in whosoever they are found, he will be a complete hypocrite. If any one of these habits is found in a man, he will have one habit of disruption till he gives it up, when something is given to him in trust he commits dishonesty, when he talks he tells lies, when he makes a contract he deceives, and when he quarrels he starts abusing.” (Bukhari -Muslims)

The Shaba (Radi Allaho Anhuma) were true believers and followers of Hazrat Muhammad (SallAllaho Alaihay wa Sallam): Now I present an example that how they have practiced the concept of accountability.

Once musk (fragrance) was presented to Hazrat Omer (Radi Allaho Anhu) from Bahrain. He (Radi Allaho Anhu) searched some one to measure it so that he could distribute it among the Muslims. His (Radi Allaho Anhu) wife Hazrat Aaika (Radi Allaho Anha) thrice presented her name to measure it but she was not authorized to do so. On

this occasion the words (when Hazrat Aaika -Radi Allaho Anha requested the third (3) time to Hazrat Omer -Radi Allaho Anhu) to her wife are worthwhile to be noted:

“I don’t like that you put it with your own hands in the scale and then you contact your hands with your body and so I get this much excess.”

Similarly once during measurement of mushk (fragrance) Hazrat Omer bin Abdul Aziz (Rahmat tuLah) held his breath and said:

“The benefit of mushk (fragrance) is to smell fragrance.”

In this direction the following business model is presented for further deliberation and discussion among the scholars:

FIG. 1: DECISION MAKING

One of the keys to successful management is the ability to understand and apply modern management principles and techniques effectively (Pindur, Rogers& Kim, 1995).Unfortunately one thing which is missing in these methods and techniques is the persuasion to look after the interest of all the stakeholders. Fear of Allah at the top of this decision making can fill this gap. Further as we have discussed it is root of all wisdom and therefore, should be the top most principle of business and management. Now there is a need of proper education and training of modern managers to embrace and practice this principle on the analogy of Shaba (Radi Allaho Anhuma) companions of Prophet Muhammad (SallAllaho Alaihay wa Sallam).

In the Holy Quran Allah has informed the mankind:

“O people of the Scripture (Jews and Christians)! Now has come to you Our Messenger (Muhammad SAW) explaining to you much of that which you used to hide from the Scripture and passing over (i.e. leaving out without explaining) much. Indeed, there has come to you from Allah a light (Prophet Muhammad SAW) and a plain Book (this Qur'an).Wherewith Allah guides all those who seek His Good Pleasure to ways of peace, and He brings them out of darkness by His Will unto light and guides them to a Straight Way (Islamic Monotheism.” (Verse 15 & 16, Surah Al-Mâ'idah: The Feast - The Holy Qur'an)

If you think of the human being as a machine, it is indeed a complex creation of Allah (SWT). Our Lord and Creator Allah (SWT) need not come in the form of a human being to know what is good or bad for the human being. He only has to reveal the instruction manual to mankind. The Holy Quran is the instruction manual for human being. Moreover, Allah will call this creation to account on the Day of Judgment. It therefore stands to reason, that the Creator informs us about the dos and don'ts of life (Naik).

Allah has informed the mankind in the Holy Quran:

“This is the Book (the Qur'an), whereof there is no doubt, a guidance to those who are Al-Muttaqun [the pious and righteous persons who fear Allah much (abstain from all kinds of sins and evil deeds which He has forbidden) and love Allah much (perform all kinds of good deeds which He has ordained)].” (Verse 2, Surah Al-Baqarah.- The Holy Qur'an)

Allah is the sole authority. So all the authority and power in the universe rest with Allah. In the Holy Quran Allah has informed the mankind:

“He it is Who created for you all that is on earth. Then He Istawa (rose over) towards the heaven and made them seven heavens and He is the All-Knower of everything.” (Verse 29, Surah Al-Baqarah. - The Holy Qur'an)

Allah has further informed in the Holy Quran:

“And to Allah belongs the dominion of the heavens and the earth, and Allah has power over all things” (Verse 189 - Al-Imrân. - The Holy Qur'an)

Allah is the real Owner of this universe including the earth and the Only Source Authority. The mankind can only use the resources on the earth as a trustee as ordered by Allah. These orders dictate following principles.

- Trusteeship of Resources- not ownership, which rest with Allah.
- Care for Other- use of resources not for satisfaction of the individual alone.
- Moderation in Consumption- Not wastage of resources.
- Productive Economic Activity- Ultimate aim to please Allah.
- Mutual consultation in Economic Activity- Key for success ( brings blessing of Allah)
- Wealth as a Mean-Not an aim.

On the basis discussion so far we may define management as:

“To manage the resources of the organization efficiently and effectively to meet the set objectives with having override objective of pleasing Allah the Sole Authority”

This definition dictates the following two (2) basic principles of management:

- Pleasing Allah.
- Allah is the Sole Authority.

I think this is a start in the right direction and may become the turning point in the history of the business and management. Now it is the duty of scholars to deliberate the definition further to improve it in the light of Quran and Sunnah. We can derive a number of concepts out of these two (2) principles. These may be:

- Halal Business.
- Interest Free Financial System
- Humanity a Stakeholder
- Accountability of all Stakeholders
- Maximization of Resources for Mankind instead of Maximization of Wealth of Owners

#### **Looking for a New Form of Business Organization**

Besides laying foundation of body of knowledge of business and management on fear of Allah some drastic changes are required in the present principles and theories of Management. The immediate task in front of scholars is to either look for a new form or revamp present corporate form of organization. Sacconi (2004) in his article “Corporate Social Responsibility (Csr) As a Model of “Extended” Corporate Governance. An Explanation Based on the Economic Theories of Social Contract, Reputation and Reciprocal Conformism” states:

“For a long time corporate ethical and social responsibility has been a subject of analysis and concern for highly active and committed but not exactly majority groups of business ethics scholars, NGO’s activists, and firms with forward-looking managers. More recently, on the contrary, it seems that there is no trade or business association, local or national public authority, firm or university throughout Europe giving up the opportunity of organizing a conference or a meeting on the theme. Since the end of the last century, a variety of initiatives throughout Europe and the US have sought to formulate standards for management systems devoted to implementing corporate social responsibility (henceforth CSR) within corporations. These are initiatives which have sprung from joint projects amongst research centers and universities, business firms and the professions; and they involve cooperatives, non-governmental and non-profit organizations, representatives of interest organizations, stakeholders associations and sometimes local and government authorities as well.”

However, we have to look beyond the above context. The present features of limited liability and separation of management from the ownership of corporate form of organization lead to denial of huqooq (rights) which lead to Zulm (oppression) of stake holders. If we see the situation in the context of Islamic concept of Mudarabha the limited liability principle can not bail out the management for his wrong doings. Further in Islam the debts can not be written off unless it is paid or forgiven willingly. So we have to revamp this concept completely.

The management of a corporate form of organization should remember the following saying of Allah’s Messenger (SallAllaho Alaihay wa Sallam)

“Abdullah (Radi Allahu ‘Anhu) reported that Allah’s Messenger (SallAllaho Alaihay wa Sallam) said: Every one of you is a guardian and he is accountable for his charge. Thus, the Amir is a guardian of the people and he is accountable for them. And a man is a guardian of his household and he is accountable for them; and a woman is an in charge of the house of her husband and his children and she is accountable for them; and a slave is a guardian of his master’s property and he is accountable for it. Beware, every one of you is a guardian and every one of you is accountable for his subjects." (Sahih Bukhari)

Further there is a need to strengthen the rights and role of shareholders in the management of the company. But the monitoring environment for shareholders can be improved through their active and effective participation in policy making and material decision making. This should be much beyond the limit of simply selection of board members, appointment of auditors, approval of accounts and amendments in the charter etc. Now even there is a cry that the investors should have say in setting accounting standards (Amer, 2007). In the context of corporate governance even in the Europe there is a cry that the shareholders should have say in fixing remuneration of chief executive of the company. However, there is no legal bidding upon the management to do this.

The “Rizq-e- Halal” concept of Islam can comprehensively check the present practice of earning management. This will naturally help to lay down a sound foundation for corporate governance. Allah has warned the mankind in the Holy Quran:

“And eat up not one another's property unjustly (in any illegal way e.g. stealing, robbing, deceiving, etc.), nor give bribery to the rulers (judges before presenting your cases) that you may knowingly eat up a part of the property of others sinfully.” (Verse 188, Surah- Al-Baqarah- The Holy Qur'an)

The tafseer (commentary) of this Aya is that one should not try to grab the properties of others through illegal means or by bribing the judges. It may also be possible that the judge may decide in favor of the transgressor because of someone being more persuasive in presenting the argument, but it does not change the fact that the property unjustly earned by the transgressor remains unlawful for him. It is reported in the Two Sahihs (Bukhari and Muslim) that Umm Salamah narrated that Allah’s Messenger (SAW) said:” I am only human! You people present your cases to me, and as some of you may be more eloquent and persuasive in presenting his argument, I might issue a judgment in his benefit. So, if I give a Muslim’s right to another, I am really giving him a piece of fire; so he should not take it.” A judge is only a human and he may make a mistake but the unjust person will still be accountable on the Day of Judgment for acquiring others properties unlawfully and the judgment of the authorities in any case does not change the reality of the true position. (Bayan-ul-Quran)

However, unfortunately the agenda of companies are beyond its frame of work of business. It is true to say that it is in struggle in silent takeover of the world. The companies are trying to be superior to the human. Its rule is beyond the rule of governments which is even true in the case of United States of America.

Now there is a dire need to cut it into size. And if we are unable to do this we should strive to introduce a new form of business organization in the light of Islamic principles of business and trade. In this respect we should remember that both the features of limited liability and separation of management of ownership has created this monster. And if the humanity can not make it faithful, there is no need of its existence. In nutshell the circumstances are compelling the humanity the look for another form of business organization.

#### **Need of a New Accounting Theory Based of Islamic Principles.**

The present accounting profession is under criticism since long. However, there is a tremendous increase in it in recent years. In my opinion the accounting profession has failed to maintain its main role in presenting fair and true view of business. Reliability is an essential characteristic for accounting information to be useful for decision making (Maines & Wahlen, 2006). Unfortunately this role too has been weakened. Actually the accounting profession lacks its main attribute of accountability. Evidence is found that the enforcement of the “true and fair view” principle is intrinsically flawed when the accountability and the overall corporate governance systems do not work properly (Melis, 2005). Our current problem is that accountability has been neglected for 25 years or more, and those that prefer its neglect dismiss it as irrelevant to valuation. They’re wrong (Colson, 2005)

Accounting should be more fundamentally about accountability than valuation (Colson, 2005). Again Colson in his article “Accountability and Valuation” (2005) states:

“While during the 1970s there were many reasons (many still valid) why accounting was not adequately oriented to asset and liability valuation changes, today there are growing indications that Americans are becoming more interested in accountability issues, especially as they relate to the managements of powerful social institutions, whether in the government, business, or nonprofit sector.”

In Quran in Surah Al-Mu'minûn Allah declared that “Successful indeed are the believers”

“Those who are faithfully true to their Amanat (all the duties which Allah has ordained, honesty, moral responsibility and trusts etc.) and to their covenants;” (Verse 8 Surah Al-Mu'minûn - The Holy Qur'an)

Testifying the correctness and fairness of business transactions is the actual and true spirit at the backdrop of financial reporting. At the heart of this series of certification requirements is CEO/CFO personal oversight and responsibility for the content and quality of financial information, and increased involvement with internal control (Geiger & Taylor,2003).

Presently the accounting profession is for behind of its duties of accountability and correct Testimony. In Islam the accountability has a very special meaning. Here “Amanah” is the essence of accountability. Hazrat Abdul Qadir Gilani (Rasheed, 1994) defined Amanah as:

“What is Amanah? To keep in custody other’s belongings by sacrificing own wants. No wants in the universe or if have than staying firm on the same. The human wants are in conflict with Ahkams on the

subject. Keeping custody of other belongings in lines with hukamh against owns want require a lot of energy. This result that those denied should be taken to task and those who embraced may be forgiven. Now it is still valid that if some one deliberately destroys belongings in his custody, he should repair the loss and if not deliberately, he should be spared.”

The following definition of Amanah (Aslam) is very comprehensive:

“Amanah is not only what we perceive rather every thing is Amanah which is subject to someone’s right and its safe custody and repayment is mandatory.”

Testifying the correctness and fairness of business transactions is the actual and true spirit at the backdrop of financial reporting. This concept too has a very unique meaning in Islam. This is called “Shahadat” (Testimony).The meaning of Shahadat is testifying, absolute information, on the face of it and open (Rasheed, 1994). The person who acts on Shahadat is called shaheed. The shaheed may be a testifier, an observer, guardian and verifier (Rasheed, 1994). The criterion that you must adhere to is that of truth, even if you must stand alone (Aziz).

The inclusion of ethics in the accounting education curriculum or code of ethics of professional bodies is not the exact answer as its lack a binding force (Amer, 2007).There is a need to develop a new accounting theory based on Devine guidance. The Islamic principles of “Amanah” (2007) and “Shahadat” (Amer, 2007) can lay a sound foundation for development of a new accounting theory. This is will not only take care of technical issues arising out of these principles but automatically address the ethical issues.

International Accounting Standards are more principles based rather than rules based. Principles –based standards focus on establishing general principles derived from an underlying conceptual framework, reflecting the recognition, measurement and reporting requirements for the transactions covered by the standards (Alfredson, Leo, Picker, Pacter, Radford and Wise, 2007). Similarly on the basis of principles like “Amanah” and “Shahadat” accounting and reporting standards can be formulated.

#### **Need of a New Financial System Based on Islamic Principles.**

In the present global emerging situation the multinationals are being merged, the privatization process is being enhanced and revolutionary changes are being taken place in computer technologies & institutional regulations. All these have been resulted in globalization of business and the world has become a “Global Financial Village”.

The present trend of the economy in the world has made the future of mankind very dark. Now what is emerging in the world would be equally harmful for other communities and not for Muslims only. The world is heading toward a situation where a few hands will hold the whole world economy through effective, efficient and advanced scientific and financial mechanisms of control.

From Asia, Latin America, Western and Eastern Europe, Africa, and North America reports are all much the same. Civilization is being dismantled as a trade barrier and commons is for sale to the highest bidders (Korten,

2001). Every thing seems to be on the auction block- from water, air, information indigenous knowledge, prisons, seeds and genetic codes, to social security, health care, and schools- turning public services available to every one into private services available to those who can pay and common heritages resources in private property (Korten, 2001).

Unfortunately in addition to corporations, the present world financial system which is based on interest has the major role in the above scenario. So there is a need to look simultaneously for a new form of business organization and a new financial system.

Islam strongly prohibits interest. On the other hand encourage business or economic activity based on profit and loss. In the Holy Quran it is stated:

“Those who eat Riba (usury) will not stand (on the Day of Resurrection) except like the standing of a person beaten by Shaitan (Satan) leading him to insanity. That is because they say: "Trading is only like Riba (usury)," whereas Allah has permitted trading and forbidden Riba (usury). So whosoever receives an admonition from his Lord and stops eating Riba (usury) shall not be punished for the past; his case is for Allah (to judge); but whoever returns [to Riba (usury)], such are the dwellers of the Fire - they will abide therein.” (Verse 275, Al-Baqarah- The Holy Qur'an.)

It is further stated in the Holy Quran:

“And their taking of Riba (usury) though they were forbidden from taking it and their devouring of men's substance wrongfully (bribery, etc.). And We have prepared for the disbelievers among them a painful torment.” (Verse 161, Surah An-Nisâ. - The Holy Qur'an)

We have discussed that the sole authority and owner of the universe and so of business and management is Allah. He has declared war against those who take interest. In the Quran Allah has warned the humanity:

“O you who believe! Be afraid of Allah and give up what remains (due to you) from Riba (usury) (from now onward), if you are (really) believers. And if you do not do it, then take a notice of war from Allah and His Messenger but if you repent, you shall have your capital sums. Deal not unjustly (by asking more than your capital sums), and you shall not be dealt with unjustly (by receiving less than your capital sums).” (Verse 278 & 279, Surah-Al-Baqarah. - The Holy Qur'an)

The following Hadith (Saying of Messenger of Allah- SallAllaho Alaihay wa Sallam) institutionalize the prohibition of interest:

“Abdullah (b. Mas'ud) (Allah be pleased with him) said that Allah's Messenger (may peace be upon him) cursed the one who accepted interest and the one who paid it I asked about the one who recorded it, and two witnesses to it. He (the narrator) said: We narrate what we have heard.” (Muslim)

“Jabir said that Allah's Messenger (may peace be upon him) cursed the acceptor of interest and its payer, and one who records it, and the two witnesses, and he said: They are all equal.” (Muslim)

As we have seen Islam encourages business or economic activity based on profit and loss. It persuades to do and finance the business. The real and ideal instruments of financing in Shariah are musharakah and Mudarabha (Usmani, 2000). The origin of concept of mudarabah can be traced back to beginning of Islam in Makkah when Messenger of Allah (SallAllaho Alaihay wa Sallam) himself get into the trade as Mudarib for Hazrat Khadijah (Radi Allaho Anha). The great Muslim scholar of present age Taqi Usmani (2000) has defined these two concepts in the following words:

“Mudarabah is a special kind of partnership where one partner gives money to another for investing it in a commercial enterprise. The investment comes from the first partner who is called “rabb-ul-mal, while the management and work is an exclusive responsibility of the other, who is called mudarib.”

“Musharakah” is a word of Arabic origin which literally means sharing. In the context of business and trade it means a joint enterprise in which all the partners share the profit or loss of the joint venture. It is an ideal alternative for the interest-based financing with far reaching effects on both production and distribution.”

The importance of Islamic finance in the modern world can be judged from the fact that concept of venture capital is based on Its concept of Mudarabah. We are well aware that one of the main causes of USA industrial development is venture capital. However, unfortunately so far the Muslim world has almost ignored it. The Mudarabah and Musharakah are two (2) main mode of Islamic finance which can replace the present financial system. Now there is a dire need that we should develop new financial institutions on these concepts which can replace present financial institution based on interest which creates money instead of value.

“The modern banking system manufactures money out of nothing. The process is perhaps the most astounding piece of sleight of hand that was ever invented. If you want to be slaves of the bankers, and pay the costs of your own slavery, then let the banks create money (Stamp, 1937).

The present financial system is indulged in creation of money instead of value. Korten (2001) rightly says:

“There are two common ways to create money without creating value. One is by creating debt. Another is by bidding up assets values. The global financial system is adept at using both of these devices to create money delinked from the creation of value.”

From \$1.5 to \$ 2 trillion dollars now change hands daily in the world's foreign exchange markets. Only some 2 percent is related to trade in real goods and services (Korten, 2001). I think this is cause that the majority of the world population still unable to get their basic needs like food, shelter, education and health. One of the most importance characteristics of Islamic financing is that it is an asset-based financing (Usmani, 2000). If we want financial institutions to create value we should shift to Islamic financial system.

## Conclusion

We should not let the companies to overrule the humanity. There is a need to either we comprehensively overhaul the concepts of limited liability and separation of ownership from the management or look for a new form of business organization. More over we have to move to a financial system which create real goods and services instead of money creating bubbles. As presently the accounting profession has failed to play its true role of accountability and certification there is a need to look for new principles of accounting which may lay a solid foundation for development of a new theory. The author in his earlier papers “Development of Islamic Accounting Theory— Principle of Amanah and Accountant as Ameen” and Development of Islamic Accounting Theory: Principle of Shahadat (Testimony) - 2nd Principle (2007) has discussed these principles in detail.

Most importantly we should also revamp the present business and management theories and principles. The best way is that we rejoin our served relationship with Allah. We should remember that as Creator the real owner of the universe is Allah and so he is the Sole Authority. There is a dire need that we submit our selves to Allah. The fear of Allah, foundation of wisdom, should be the base for all these theories and principles. This will not only address the governance issues but new and new ideas for achieving organization goals in the “Sirat-ul-Mustaqeem) right direction would be emerged. Quran and Sunnah will certainly help us to explore these opportunities.

We should remember that our ultimate objective is:

“(It will be said to the pious): "O (you) the one in (complete) rest and satisfaction!" Come back to your Lord, Well-pleased (yourself) and well-pleasing unto Him! (Verse- 27 & 28, Surah Al-Fajr - The Holy Qur'an)

In tafseer (commentary) to these verses it is given:

But ah! thou soul at peace) which is safe from Allah's chastisement, true in its profession of Allah's divine Oneness, grateful for the blessings Allah bestowed upon it, patient with the trials of Allah, pleased with things decreed by Allah, and content with that which Allah gives! Return unto thy Lord) return to that which Allah has prepared for you in the Garden; and it is also said this means: return to your master: the body, (content) with Allah's reward (in His good pleasure) because of its belief in Allah's divine Oneness! (Tafsir)

## Aspects a Single Currency System in Asia Region: An Overview

*Katsuji Okachi, [okachi@econ.ryukoku.ac.jp](mailto:okachi@econ.ryukoku.ac.jp)  
Ryukoku University, Kyoto, Japan*

### Abstract

Awareness of the importance of monetary stability in the region of Asia has become realistic in a political and economic dimension with the aim of ensuring the economic prosperity as well as world peace not only in the region of Asia but also in the world. There has been a common understanding among people that the combination of the single market and the single currency would improve the political and economic stability in the Asian region, especially in the East Asian community of which basic idea has come from the introduction of Euro in Europe. In a single market, there would be the free movement of goods and services, capital, and labor crossing the borders. In the single market, it is supposed that a single currency should be prevailed for promoting the greater stability in terms of monetary transaction. For establishing this purpose the idea of optimum currency area should be also considered to introduce into the East Asian Region.

## An Investigation of the Pattern of Foreign Investment by Japanese Electronics Firms

Mário Henrique Ogasavara, [marioga@nus.edu.sg](mailto:marioga@nus.edu.sg)  
National University of Singapore, Singapore

### Abstract

Japan has been traditionally a major player in the global electronics industry. With the rapid process of globalization and as a response to increasing market competition, many Japanese electronics firms have expanded their manufacturing operation to different countries and regions. This paper examines the pattern of foreign direct investment by Japanese electronics multinational firms. Particularly, this research focused on the evolution of international entry strategies made by nine large Japanese electronics firms around sixty five countries. This study intends to investigate the pattern of entry mode selection, such as wholly-owned subsidiaries, international joint-ventures, and alliances among home-country partners (e.g. *sogo shosha*, *keiretsu* firms, and non-affiliated firms). It also explores the evolution of subsidiary ownership structure and examines whether or not the accumulated experience of the parent firm in a host country/region contributes to the entry mode selection of subsequent investments. Further, this paper analyzes whether or not these firms tend to imitate the market entry decision of other Japanese firms entering the same market. This study is based on collected data from *Toyo Keizai Inc. Databank – Japanese Overseas Investment: Listed by Firms*, resulting in a sample of over 1,500 subsidiaries established by these Japanese multinational firms.

## **Role of Foreign Portfolio Investment in Developing Securities Markets: Blessing or Curse for a Pre-emerging Economy?**

*S M Solaiman, sheikh@uow.edu.au*

*University of Wollongong, Australia*

### **Abstract**

In the aftermath of the dramatic fall of socialist economies in the 1980s, the market economy has emerged as almost a single philosophy in which the securities market is regarded as being the most useful vehicle for achieving national economic growth. Establishing a vibrant capital market has thus become a major concern in many countries around the world. Arguably, foreign portfolio investment (FPI) significantly contributes to developing a securities market. However, foreign investors are not always seen to be friends of their host countries, sometimes they turn out to be foes as well. They are therefore often branded as 'opportunists' as they like to invest a large amount of money when an opportunity to make quick profits exists. They often run away by withdrawing their investment 'at the first sight of gathering strong clouds' as happened in Mexico, Asia and Russia in 1994, 1997 and 1998 respectively. Foreign investment was withdrawn from Czechoslovakia in 1995 when the short-lived 'bubble began to burst' in the securities market. This withdrawal caused erosion of investor confidence, and the market collapse is argued to have occurred due to inadequacies in the legal regime required for the efficient regulation of securities markets. Likewise, Bangladesh in 1996 witnessed the role of those opportunists who are largely blamed for 'the slaughter of innocents', as termed by international commentators. An optimal use of FPI therefore entails a comprehensive legal and regulatory framework preventing foreigners from being overly opportunistic, and at the same time, protecting them from systemic risks. This article concerns the present dismal state of FPI and the existing mechanisms for investor protection in Bangladesh. It aims to critically examine the legal and regulatory measures governing FPI, and to provide suggestions for reforms fostering such investment in Bangladesh.

## **Rude Awakenings: The Behavior of Volatility at the Open and Across the Trading Day**

Baruch College, CUNY, USA*

### **Abstract**

Using three different measures of market quality, we investigate the level of trading frictions for individual stocks that trade on the New York Stock Exchange, Nasdaq Stock Market, and the London Stock Exchange. We pay particular attention to the most stressful period of the day, the opening, and compare how individual stocks perform during the opening as contrasted to the other periods during the trading day. Our contributions are threefold: 1) we find consistent evidence at all three market centers that the market quality of trading at the open for large cap stocks is worse than the opening price behavior of small and medium cap stocks, 2) large cap stock prices at the open are more likely to exhibit short-term “momentum” trading patterns where prices move up or down sharply in a persistent manner, and 3) we apply the time-series market model  $R^2$  statistic in a novel way as a measure of market quality by computing this measure using intraday returns.

## **Investor Protection by Securities Regulators in the Primary Share Markets in Bangladesh and Australia**

*S M Solaiman, sheikh@uow.edu.au  
University of Wollongong, Australia*

### **Abstract**

Investor protection is central to vibrant securities markets. Hence, one of the prime objectives of securities regulation worldwide is to provide legal protection to investors from the culpability of other players in the market. Investors in emerging markets require greater protection compared to those in developed economies simply because the former are predominantly unsophisticated. Therefore, regulators in emerging markets should be well equipped with investor protection mechanism. But this is not always the case. The Securities and Exchange Commission (SEC) in Bangladesh is ill-equipped with outdated laws and less experienced people in comparison with its Australian counterpart, Australian Securities and Investment Commission (ASIC). The practice of corporate governance, on the other hand, is poorer in Bangladesh than that of Australia. As a result, the investors in Bangladesh remain market-shy rendering the market moribund even after its operation of more than half a century. This study aims to critically examine laws regarding primary share markets with an objective of providing suggestions for further development of Bangladeshi securities laws and regulatory regime by reference to those in Australia.

## Measurement & Reporting of Financial Derivatives under the American GAAP versus the International Accounting Standards

*Agatha E. Jeffers, jeffersa@mail.montclair.edu  
Montclair State University, USA*

### Abstract

Despite considerable work towards measurement and reporting convergence, there is still a huge divide between the current and the desired harmonized standards between the U.S. and the international accounting standards. One area that has presented a severe challenge and stands in the way of harmonization is the measurement and reporting of derivatives and other financial instruments. To address this issue, FASB has taken various steps aimed at converging U.S. Generally Accepted Accounting Principles (GAAP) and International Financial Reporting Standards (IFRS) for financial instruments. This has resulted in joint FASB-IASB deliberations on business-combination accounting and other initiatives aimed at eliminating the complexities resulting from the measurement and reporting as well as the use of derivatives and other financial instruments by companies. The paper examines the current developments in the convergence between U.S. GAAP and International GAAP as well as the implications associated with these initiatives

The paper provides update to date information on the progress that has been made towards convergence and outlines the various accounting standards that have been enacted along with other measures aimed at achieving convergence. Additionally, the paper provides a discussion on the challenges and opportunities as well as the implications of the various measures. The paper is extremely useful in that it presents information that provides valuable information to preparers, auditors and others involved in the financial reporting process as they attempt to keep abreast of the complex changes in domestic and international accounting standard setting. Furthermore, the paper enables financial statement preparers and reporters to be aware of the implications of the relevant regulatory decisions on financial measurement and reporting and enhances their understanding of fair value measurements. In addition, the paper enables users of financial statements to be more informed of the relevant issues associated with the preparation and use of international financial accounting and reporting of derivatives as well as other financial instruments. The paper finds that despite the considerable efforts to achieve the harmonization objective, there are still significant troublesome differences between the U.S. GAAP and the IASB GAAP. Furthermore, it is apparent that the challenges posed by the enactment of convergent standards for the measurement and reporting of derivatives as well as other financial transactions will continue to exist and will undoubtedly present considerable challenges as well as opportunities for regulators, managers, preparers as well as users of financial statements of both domestic and multinational enterprises.

## Vietnam's Economic Development in the Post-WTO Environment

*Binh Tran-Nam*  
*University of New South Wales*  
*Australia*

### Abstract

Vietnam has enjoyed remarkable economic successes since its emergence as a 'market' economy in 1989, although the process of economic renovation was supposed to commence with the official launch of *Doi Moi* by the Vietnamese Communist party in its 1986 Sixth Congress. After an economic slow down due to the Asian financial crisis in the late 1990s, Vietnam has again made good progress in achieving the average target of 7.5% annual growth rate in real GDP for the 2001–10 period. Vietnam recently became the 150<sup>th</sup> member of the WTO on 11 January 2007. Its integration to the global economy via the WTO presents both tremendous opportunities and challenges. This paper argues that Vietnam's WTO membership acts as a *Doi Moi* mark II, but this new stimulation will be, unlike the *Doi Moi* mark I in 1986, externally driven by global economic forces. The paper also examines Vietnam's preparation for the WTO and its economic growth prospects in the post-WTO environment. Since Vietnam's growth has been primarily derived from domestic market building and international trade, this paper will focus on two specific areas of greatest significance to Vietnam's economic development, namely, the privatization (called equitization in Vietnam) of state owned enterprises in Vietnam and the inflow of FDI to Vietnam, especially those originating from Northeast Asian countries. Finally, the paper critically discusses a long-term issue which has been attracting much public attention in Vietnam, namely, education reform and the policy of "socialization" of education recently adopted by the Vietnamese Government.

# Research and Development Performed by Foreign MNEs: Central and Eastern Europe Countries

*Julia Manea, julia.manea@mbs.ac.uk  
Manchester Business School, United Kingdom*

## Abstract

In this paper we examine the extent and nature of MNE's research and development (R&D) activities in Eastern Europe. As it is widely recognized, MNEs are the main vehicle for the development and dissemination of technology across borders and thus it is important for CEE host-country's technological progress to be able integrate with the internationalising R&D networks of MNEs by attracting investment in research and development and technology-related activities. The key conceptual argument in this paper is that the former communist countries of Eastern Europe possess an unbalanced and incomplete system of innovation which is strong at the production of scientific knowledge (due to substantial investments in science and education during the period of central planning) but weak at the commercial application of this new knowledge in production (due to the nature of economic organisation in communist systems). To understand this paradox, the first section of the paper provides an analysis of the special configuration of competences of CEECs which are seen to be both a resource and a constraint for the transformation and development of these economies. Explanations of this 'unique' configuration of resources and the deficiencies of the national systems of innovation in the communist societies is then discussed, suggesting that these problems have also been inherited by the transition economies which in turn affected the ability to transform their S&T capital in a basis for rapid economic recovery and growth. The next part of the paper asks and provide tentative answers to a number of important questions such as 'What do CEECs need in order to benefit from their scientific and technological assets and in general high local human capital in the medium-term?' and 'Can foreign MNEs assist with these problems in the medium-term by activating local S&T resources in their CEE activities and therefore help to save, develop and integrate these strategic resources within the CEE countries systems of production and thus closing this damaging gap in their national system of innovation?' In order to examine the possibility of attracting the R&D activities of MNEs in transition economies, the following section of this paper provides a overview of the strategic developments in the multinational enterprise that have influenced the internationalisation of R&D in MNEs' operations. The final parts of the chapter focus on the empirical investigation of MNEs' research and development in CEECs using a questionnaire survey. The data is analysed against the two key conceptual arguments: 1) the specific S&T setting in transition economies and 2) the model of internationalisation of R&D in the global dynamics of MNEs' activities. The conclusions explain the differences in the factors that determine the location and nature of R&D activities in transition economies with the rest of the world and discusses possible consequences of these differences for the CEE economies.

## Oligopolies with Capacity Constraints and Thresholds

*Ferenc Szidarovszky, University of Arizona, USA*

### Abstract

Extended oligopoly models will be introduced and examined in which the firms might face capacity limits, thresholds for minimal and maximal moves, and antitrust thresholds in the case of partial cooperation. Similar situation occurs when there is an additional cost of output adjustment, which is discontinuous at zero due to set-up costs. In these cases the payoff functions of the firms are nondifferentiable and in some cases even discontinuous. Under the usual concavity assumptions Cournot oligopolies have monotonic response functions and a unique Cournot-Nash equilibrium. However the introduction of these more realistic additions into the oligopoly models creates a fundamentally new situation: the existence of no equilibrium or the presence of multiple, in some cases even infinitely many, equilibria. It also results in a very different asymptotic behavior of the dynamic extensions. The lecture gives a brief survey of the relevant models, derives the response functions of the firms, and examines the existence and the number of equilibria. In the case of infinitely many equilibrium the equilibrium-set will be also determined and characterized. The lecture will finally show some initial results on the asymptotics of the associated dynamic systems.

## External Factors Affecting the Decline of the American Automotive Industry

*Richard A. Lord*  
*Montclair State University, USA*  
*Yoshie Saito*  
*Georgia College & State University, USA*

### Abstract

In this study we examine the effect of gasoline prices and the yen-for-dollar exchange rate on Japanese automotive imports into the United States in the period between 1970 and 2004. Over this time-frame Japanese vehicle imports have fluctuated considerably. One of the most important features of the market for Japanese vehicle imports during this period were the Voluntary Restraint Agreements (VRA) placed on Japanese vehicles between 1981 and 1988. Therefore, we study these relationships before, during and after the VRA. Many argue that demand for Japanese vehicles is driven by their fuel-efficiency. Our first hypothesis is to test this claim by testing for a positive relationship between real annual gasoline prices and Japanese imports. The second hypothesis is to examine the effect of the exchange rate on Japanese automotive imports into the United States. A weakening of the currency is widely cited as a reason for an increase in imports. However, the effect of exchange rate on imported products is complex due to simultaneous price and quantity mechanism. To incorporate this price and quantity mechanism, we propose that the relationship between the exchange rates and Japanese imports should vary across our study horizon. Because of well-known market share focus of Japanese firms, in the period before the VRA (1970-1980) the push for American market share by Japanese automotive manufactures would help to strengthen the yen, thus resulting in a negative relationship between the yen-for-dollar exchange rate and Japanese vehicle imports. But, the VRA restrictions would curtail the strategy of market share expansion. Therefore, after 1980 we hypothesize a positive relationship between the yen-for-dollar exchange rate and Japanese imports. We control the simultaneous relationship between imports and the strength of the currency by employing a two-stage instrumental variables approach in our analysis. We also control for the general demand for motor vehicles in the United States and the number of vehicles sold under Japanese nameplates manufactured domestically. We confirm our first hypothesis. There is considerable evidence that Japanese vehicle imports are positively correlated with gasoline prices. Not surprisingly, we observe this effect before the VRA period (1970-1980). However, it also holds after the VRA period (1989-2004), when Japanese models were larger and had more powerful engines, though they were still more efficient than most competing models. We do not observe any significant relationship during the VRA period (1981-1988). As expected, in the period before the VRA we find a strong negative relationship between the yen-for-dollar exchange rate and vehicle imports from Japan. We argue that the push for market share by Japanese firms increased demand for their cars. Strong demand for Japanese goods, eventually led to a markedly stronger yen. Contrary to our expectations, this negative relationship seems to have persisted throughout the period of the VRA (1981-1988). In the period after the VRA (1989-2004) we find the hypothesized positive relationship. So, after the VRA, demand for Japanese vehicles is not driving the exchange so strongly. Perhaps this is because most of the imports from Japan are now luxury models, while the less expensive, more popular vehicles selling under Japanese nameplates are mostly manufactured domestically.

## **Economic Reforms, Foreign Direct Investment and its Economic Effects in India**

*Chandana Chakraborty, chakrabortyc@mail.montclair.edu  
Montclair State University, U.S.A*

*Peter Nunnenkamp, peter.nunnenkamp@ifw-kiel.de  
Kiel Institute for the World Economy, Germany*

### **Abstract**

Foreign direct investment (FDI) has boomed in post-reform India. Moreover, the composition and type of FDI has changed considerably since India has opened up to world markets. This has fuelled high expectations that FDI may serve as a catalyst to higher economic growth. We assess the growth implications of FDI in India by subjecting industry-specific FDI and output data to Granger causality tests within a panel cointegration framework. It turns out that the growth effects of FDI vary widely across sectors. FDI stocks and output are mutually reinforcing in the manufacturing sector. In sharp contrast, any causal relationship is absent in the primary sector. Most strikingly, we find only transitory effects of FDI on output in the services sector, which attracted the bulk of FDI in the post-reform era. These differences in the FDI-growth relationship suggest that FDI is unlikely to work wonders in India if only remaining regulations were relaxed and still more industries opened up to FDI.

## Delayed Dynamics in Heterogenous Competition with Product Differentiation

Akio Matsumoto, [akiom@tamacc.chuo-u.ac.jp](mailto:akiom@tamacc.chuo-u.ac.jp)  
Chuo University

### Abstract

Heterogeneous duopolies with product differentiation and isoelastic price functions are examined in which one firm is quantity setter and the other is price setter. The reaction functions and the Cournot-Bertrand (CB) equilibrium are first determined. It is shown that the best response dynamics with continuous time scales and without time delays is always locally asymptotically stable. This stability can be however lost in the presence of time delays. Both fixed and continuously distributed time delays are examined, stability conditions derived and the stability regions determined and illustrated. The results are compared to Cournot-Cournot (CC) and Bertrand-Bertrand (BB) dynamics. It turns out that continuously distributed lags have smaller instabilizing effect on the equilibria than fixed lags, and both homogeneous (CC&BB) competitions are more stable than the heterogeneous competitions.

# The Relationship among Knowledge Sharing, Value Network, and Competitive Advantage

*Yung-Kuei Liang, Tatung University, Taiwan*

## Abstract

“How to create value?” is the key for enterprises to survive. The key business question in the knowledge economy is; however, “How is value created?” The traditional answer to that question is – “through the value chain.” But value chain thinking is rooted in an industrial age production line model that has gradually been superseded by the new business model of the value network or value web. The major strategic challenge today is reconfiguring a business from value chain organization to the more fluid structure of the value network. Allee (2000) suggested that a value network is a web of relationships that generates economic value and other benefits through complex dynamic exchanges between two or more individuals, groups or organizations. Brandenburger and Nalebuff (1996) highlighted that firm interaction may be positive as well as negative. They introduced the concept of the “value net”, which consists of supplier, customers, competitors, and complementors. Dyer and Singh (1998) also suggested that a firm’s critical resources may span firm boundaries and may be embedded in inter-firm routines and processes. Because of ruthless competition in the environment, enterprises have to identify and explore new source of critical capabilities. As evidenced, knowledge sharing between firms has become an important source of competitive advantages. This study examines how firms utilize network as a channel to sharing their knowledge resources and its affects on firms’ competitive advantage. Specifically, we discuss at length the following research questions through a comparative case study. We chose Ho-Tai Motors, Tong-Tai Machine & Tool Co., Ltd., Tatung Company, ECS, and Chi-Mei Electronics as case companies in Taiwan. Those companies all hold a leading position in their industry, with a complete value network and maintain long-lasting good relationship with their partners. That is, the five focal firms can provide a complete overview of firms leveraging their value network and sharing knowledge with their partners. We adopt multiple-case studies, using widely collected secondary data and in-depth interviews, focusing on the knowledge sharing between focal firms and its partners. First, we focus on the knowledge sharing among organizations affecting focal firms’ competitive advantage in manufacturing industries through a multi-case study. Therefore, future research would conduct a similar one reflecting the unique features (i.e., tangibility, inseparability, heterogeneity, perishability) of service industries and their impacts upon a focal firm’s value creation and competitive advantage within a value network on a large-scale basis. Second, like other social science models, ours excludes some potentially important factors. We only consider the characteristics of knowledge sharing in the value network as the factor affecting firms’ competitive advantages. To prevent the analysis from being overwhelmingly complex, we did not include other factors affecting competitive advantages. Thus, we suggest that future researchers should consider other factors affecting competitive advantages, such as innovation capability, marketing skills, or an introduction of new management skills. Third, from the comparative case study, we also find many examples of failure in constructing value networks. Because of limitation of research scope, we did not deliberately discuss the causes of those failures. Hence, we suggest that future researchers could explore the reasons behind in-depth. Fourth, the members of value networks studied in this research are all local in Taiwan. While pursuing internationalization, firms would not only collaborate with local partners but probably foreign ones in overseas market, and this is also an interesting topic to study. We suggest that the future researchers can make conduct an in-depth survey about the international value network.

## **Errors and Misinterpretations In Cross Cultural Management Publications**

*Alexander D. Portnyagin, aportnyagin@jwu.edu  
Johnson & Wales University, USA*

### **Abstract**

An increasing number of studies have emerged recently describing cross cultural diversity and adjustment in global economy and business. Along with this, an avalanche of errors and misinterpretations of cultural differences persists in many publications. The weaknesses of these papers seem to be so consistent that they lead a reader to believe that their causes are very common. They may vary from politics to patriotism. The objective of this paper is to identify errors and false interpretations of cultural differences, made intentionally or unintentionally, and to alert businesses and academia to be critical and cautious while using such readings for practical purposes. Samples for conducting comparative and cross-cultural management research are the students from the classes that the author of this paper runs. The fact is that it was the foreign graduate students studying in the U.S. who are very often upset about the way their cultures are being incorrectly represented in the textbooks and publications. Three classes with 91 students from 20 countries are involved in the first round of research participation. The average students' age is 30 years. The geography of countries embraces Europe, Asia, the Middle East, Central America, Central Asia, North Africa, and the U.S. The majority of inaccuracies and misinterpretations about their countries are traced by the students from India, Saudi Arabia, China, Turkey, and Morocco. It is interesting that some U.S. students do not agree with American studies that inaccurately describe current cross cultural trends in business and management. Having students from more than ten countries in one class every trimester the author assumes that the results of the research would truly reflect a real world situation and cross cultural management would significantly benefit from this research in practical managerial terms. The author intends to significantly enlarge the sample and continue the research.

## **Perceived Human Resource Management Practices and Intention to Leave of Employee: The Mediating Role of Organizational Citizenship Behavior**

*Ziguang Chen, mgzgchen@cityu.edu.hk*

*City University of Hong Kong*

*Wing Lam, mswing@polyu.edu.hk*

*The Hong Kong Polytechnic University*

*Norihiko Takeuchi, ntake@ms.kuki.tus.ac.jp*

*Tokyo University of Science, Japan*

### **Abstract**

Previous studies have shown that the use of “high-performance human resource management (HRM) practices” decreases employees’ intention to leave the organization. However, we argue that the effects of HRM practices on intention to leave (the universalistic proposition) might not be so simple, which means that there might be some behavioral interventions mediating the relationship. Based on the universalistic proposition, this study investigates how employees’ organizational citizenship behavior (OCB) mediates the relationships of perceived HRM practices on employees’ intention to leave. In particular, this study has three main purposes: (1) to explore how HRM practices affect the OCB of employees; (2) to examine how OCB negatively relates to intention to leave; and (3) to further investigate whether or not OCB acts as a mediator of the relationship between HRM practices and intention to leave, and if it is indeed a mediator, how such mediation takes place. Using a sample of 152 respondents from a Japan-Sino automotive joint venture located in Guangzhou, the province of Guangdong in mainland China, we find that retention-oriented compensation and formalized training are positively related to the engagement of OCB. However, these two HRM practices are also negatively associated with intention to leave the organization. In addition, we also find that OCB mediates the effects of retention-oriented compensation and formalized training on intention to leave. Implications and future research direction are also discussed.

## **Public vs. Private Land Ownership and Urban Economy**

*Xiao-Ping Zheng*  
*Ritsumeikan University, Japan*

### **Abstract**

**In Japan, some existing inefficiency in urban land use is related with the land ownership issue, while in China, the succeeded economic reforms have not yet reached the field of the public land ownership. With regard to these problems of land ownership in the real world, most urban economic theories seem still at an early stage, which consider land ownership only in a very simple way. In this paper, I attempt to investigate the land ownership problem in more detail using a few of microeconomic principles, and to compare the public and private land ownerships from the viewpoint of urban residents' welfare.**

## Digital Branding 2.0

*Mark J. Kay, kaym@mail.montclair.edu  
Montclair State University, USA*

### Abstract

Internet brands are unlike product, service, and corporate brands which are often critically dependent upon promotional spending to become widely known. The web, as a promotional vehicle, is much less controllable than other media. As the internet has grown and as web promotional tools have changed, managers need to reconsider many traditional brand management practices.

Internet brands are different since user browsing destinations are much more actively determined. This is partially a consequence of the web's basic "linking" architecture that call for much higher levels of engagement than other media. Branding functions differently on the internet; effective brands are much more dependent on user choices and activity levels.

This is especially important as the use of the internet is rapidly becoming embedded into every occupation, economic class, company, and region. User initiated and user-influenced branding is especially significant as the web grows. The internet has spawned a new and rapidly evolving culture of digital participation. Brands in the digital world are fueled by consumer creativity.

High levels of creativity are apparent in the rapid development of user initiated content that now populates much of the web. User creativity fuels blogs and energizes popular websites such as MySpace. This creativity is especially apparent among younger age groups. Creative, user-generated activity is related to the rapid rise of some of most powerful internet brands, namely Google, Wikipedia, and YouTube.

The growing ease of content creation has brought about a plethora of new digital activities. These have altered communication, affected social relationships, and have influenced storytelling and other artistic media. Digital brands themselves are now being reconsidered in light of the growing significance what has become known as the "web 2.0" perspective.

The Web 2.0 perspective has been promoted by O'Reilly Media, which has been of the business of publishing books, developing online services, and sponsoring conferences since 1978. While skeptics may see Web 2.0 as little more than a buzzword, this paper argues that the debate in the web programming community is particularly salient. The "behavioral" or "user" bases to the web 2.0 perspective, and its implications for branding, are examined in this paper.

As software development moves away from "stand alone" desktop computer products, it is clear that new enterprises are providing many new tools to assist content creation and empower users. A variety of new formats have emerged on the web –these include podcasts, video-blogs, and RSS feeds. These formats have increased the reach (or distribution) of content, and furthers the reach of users. These developments have important implications for branding.

Digital brands relate more to "users" than they do to companies. Digital brands tend to supplant traditional notions of brands as company "property" –instead they are common property. Being the result of participation, digital brands are increasingly viewed in an "open source" or collective context. Strong digital brands such as Google pay attention to the fact that the web "enables" users, and their power draws from their collective utility. Sites like digg.com, as a means to collect and rate new stories, are motivated by a spirit of a shared understanding and collective enterprise.

In examining the development of the digital branding 2.0 concept, it is clear that marketers need to better respond to web user participation processes. Branding is still a key marketing concern, but new approaches are necessary to keep users engaged. Marketers need to be able to better strategize and change practices in fast response to users' efforts and changing activities.

## Is Detailing Effective for Mature Prescription Drugs? A Dynamic Model of Physician Learning

*Hui-ming (Deanna) Wang, wangh@sfsu.edu  
San Francisco State University, USA  
M. Tolga Akçura, munir.akcura@liu.edu  
Long Island University, USA  
Manohar U. Kalwani, kalwani@purdue.edu  
Purdue University, USA*

### Abstract

Our aim in this paper is to investigate the impact of detailing on physician learning and prescription behavior for mature drugs. To this end, we develop a dynamic model of physician learning behavior in which a physician's perception of the efficacy of a drug is assumed to evolve over time based on the knowledge gathered from clinical experience, presentations by drug company sales representatives (detailing), and sampling. We use the Kalman filter framework coupled with a hierarchical Bayesian approach to track the changes in a physician's drug efficacy perception, and to separate the effects of detailing and sampling from clinical experience on physician learning. We also incorporate unobserved heterogeneity in physicians' patient profiles and access to different information sources. We estimate the model using individual physician-level data of new prescriptions for two mature drugs in two different categories. Our empirical results reveal that detailing as well as sampling contributes to physician learning for both drugs even though they have been on the market for several years. Further, we observe that clinical experience is an important source of physician learning for both drugs. We also find that physicians differ considerably in their reliance on clinical experience versus detailing and sampling in updating their knowledge of a drug's efficacy. We show that drug firms can exploit information on the differences in physicians' learning behavior to design optimal customized marketing programs. For example, our simulation results indicate that detailing productivity can be substantially improved by redirecting sales effort on the basis of physicians' long-term responsiveness to detailing effort.

## **Study on the Effects of Permeable Pavements on the Improvement of Living Environment**

*Minoru Wada, wada-m86pv@kkr.mlit.go.jp*

*Yuzou Ohnishi*

*Satoshi Nishiyama*

*Takao Yano*

*Kyoto University, School of Urban and Environmental Engineering, Japan*

### **Abstracts**

The impervious surface structures of normal asphalt pavements do not deplete ground water, but also cause flood flow by an increase of rainfall outflow into of rivers and sewers. The properties of permeable pavements are expected to control flood run-off and improve the environment in urban cities as cool pavements. We tested the functions of pavements that are built on a roadway. The results of temperature measurements at surface layers and the rainfall storage and infiltration functions of the pavements proved the effects on prevention of heat island phenomenon and flood run-off control. But the work cost of permeable pavement is much higher than that of normal pavement instead. This paper makes clear the durability, availability of a permeable pavement with much traffic volume of a heavy vehicle from the results of follow-up survey for 11 years and six month, and still more benefit/cost (B/C) analysis of it.

## Outsourcing and Adaptive Strategies of OEM/ODM Vendors in an Emerging Market

*Tung-lung Steven Chang, tchang@liu.edu  
Long Island University, C.W. Post Campus, USA*

### Abstract

Taiwanese OEM/ODM vendors have helped to connect the vast marketplaces and renowned multinationals with the enormous manufacturing centers of China and Southeast Asia. Estimates of 40% to 80% of China's exports in information and communications products were made in Taiwanese-owned factories (BW, 2005). Competent OEM/ODM (Original Equipment/Design Manufacturing) vendors can help develop distinct value delivery systems for renowned multinationals. In a highly collaborative design process, the ODM vendors translate OEM specifications into reality, lending specialized expertise to refine the designs, cut overall costs, and meet special market requirements. Such strategic partnership can reduce manufacturing costs, stimulate innovation, increase flexibility, and expedite product development for the improvement of overall customer value (Park and Krishnan, 2001; Simchi-Levi, Kaminsky and Simchi-Levi, 2000). In order to secure long-term business relationships with renowned multinationals, Taiwanese OEM/ODM vendors must strengthen their core capabilities in manufacturing, engineering design and R&D. Offshore sourcing that helps create substantial leverage resulting from economies of scale and process expertise has become an imperative strategic move for such Taiwanese firms in the global configuration of their business operations (Bendor-Samual, 1998; Gottfredson, Puryear and Phillips, 2005; Karmarkar, 2004). By using case study, this paper investigates Taiwanese OEM/ODM vendors that own outsourced businesses in China. The findings reveal that sample firms effectively manage their outsourced relationships and have conducted backward and forward vertical integrations to secure source of supplies and market access in China. They share with their upstream strategic partners in China the details concerning materials, design, product development, delivery and marketing information to reduce costs and improve product quality, while develop lock-in relationships with downstream name brand multinationals, such as Apple, Motorola and Nike, to expand sales into North America and European market. These firms have also cultivated their technology and marketing strengths to penetrate the China market via their own brands.

# On the Stability Conditions of the Harris and Todaro Model with Natural Environment

*Makoto Tawada,  
Nagoya University, Japan*

## Abstract

In the well-known Harris and Todaro mode, we incorporate the natural environmental factors and discuss stability conditions under various adjustment processes. Our main findings are as follows: (1) In the short-run aspect where capital is fixed to each sector and environmental quality is unchanged, equilibrium is stable under the labor adjustment process. (2) In the medium-run aspect where the environmental quality is unchanged but capital and labor are adjusted slowly, the equilibrium is stable under the condition that the urban area is capital-intensive. (3) In the long-run aspect where factors and the environment adjust sluggishly, the condition that the urban area is capital-intensive is necessary for the stability. (4) In the long-run aspect where factors instantaneously adjust but the environment adjust gradually over time, the equilibrium is stable under the condition that the rural area is capital-intensive.

## **Is Emission Standard Superior than Emission Tax?**

*Tsuyoshi Shinozaki*  
*Nagoya University, Japan*  
*Minoru Kunizaki, mk1@vega.aichi-u.ac.jp*  
*Aichi University, Japan*

### **Abstract**

**We examine the effects of an emission standard and an emission tax, and consider the comparison between two environmental policy tools. This paper examines those analyses under international country duopoly model. In this setting, we introduce unilateral and bilateral environment policies. In the case of unilateral policy, home country prefer to introducing emission standard rather than the emission tax. In the case of bilateral policy, however, the emission tax is welfare superior to the emission standard for foreign country.**

**We also consider those policy comparisons in three country model. In the case of unilateral policy in an export country, the emission standard may be welfare superior to the emission tax for all countries. In the case of bilateral policy, however, the emission tax becomes more preferable to the emission standard for both export countries.**

## Management Fraud and Audit Failure –Cases of China Listed Companies

Jinyu Zhu, [zjy1967@sina.com](mailto:zjy1967@sina.com)

Yunnan University of Finance & Economics, Kunming, P.R. China

Simon S. Gao, [s.gao@napier.ac.uk](mailto:s.gao@napier.ac.uk)

Napier University Business School, Edinburgh, U.K.

### Abstract

A management fraud has been a major concern in the business community and the accounting profession across the world. Like many other countries, China is presently facing the challenge of fighting frauds and financial irregularities. This paper provides an empirical investigation of management frauds in China through an analysis of the types and methods of management frauds by Chinese listed companies based on the sample of 74 cases over the five-year period from 2002 – 2006. This paper finds that a majority of the management frauds in the sample companies involved the manipulation, alteration and falsification of reported financial information. Fraud schemes often involve more than one technique to misstate financial statements, typically through overstating revenues and assets and understating liabilities and expenses. Most of the sample companies committed several frauds, *inter alia*, false profits and insufficient or false disclosure at the same time. Also, fraud Chinese listed companies engaged in a variety of ways to deceive profits and revenues, such as recording fictitious revenue, under-recording expense, lowering the allowance for asset impairment and recording fictitious investment profit. In addition, this study finds that most of management frauds in Chinese listed companies lasted more than two years with the longest one being nine years, and intervals between an initial fraud and punishment were usually more than three years with the longest one being 11 years.

### **Section 13: Late Submissions**

# **The Globalisation of Medicine: The Emerging Market of Medical Tourists – Estimates, Challenges and Prospects**

*Jeff Pope, [popej@cbs.curtin.edu.au](mailto:popej@cbs.curtin.edu.au)*

*Curtin University of Technology, Perth, Australia*

## **Abstract**

Travelling overseas for medical treatment is a practice generally known as (international) medical tourism. This paper seeks to analyse estimates of its current size and future growth prospects, the economic and business ‘drivers’ of this market, the major participants (in generating and host countries, with examples of specific businesses, including hospitals in selected host countries), its constraints, risks and challenges, and its overall future prospects. Estimates of the economic magnitude of medical tourism are extremely limited, and reliable data is difficult to obtain, although information from suppliers is abundant. Leading host regions worldwide comprise South America, Eastern Europe and Asia. Within Asia, in terms of market share, Thailand, Malaysia, Singapore, India and China are the leading countries, particularly for invasive surgeries. This paper analyses the newly emerging (mass) market of international medical tourism from an economic and business (customers, agents/third parties, medical service providers) perspective.

## **Introduction**

Medical tourism or medical travel is essentially the act of travelling to another country for some form of medical treatment, including cosmetic procedures and dentistry. It can be traced back thousands of years, at least to the Greek Empire when pilgrims from throughout the Mediterranean travelled to Epidaurus in search of the healing powers of their god Asklepios (Hancock, 2006, pvii). The Roman City of Bath attracted, and still does, many tourists seeking its ‘restorative waters’. Medical tourism has developed over the centuries throughout the world, although probably until fairly recently it was predominantly the prerogative of members of the richest, ruling classes and possibly religious orders and traders. One author considers the current growth in medical tourism to be the ‘second wave’, the first being in the 18<sup>th</sup> and 19<sup>th</sup> Centuries, particularly from Britain (Abdullah, 2006, p1). Within some Asian countries, the so-called Asian economic crisis of 1997-98 also played a significant role in its development as hospitals sought overseas patients to maintain revenue arising from the shortfall in local patients.

Currently the international trade in health services is estimated to be worth around US\$30 billion globally (WHO estimate, cited in TIAC, 2004, p4). It has four main components: services such as telemedicine; foreign-owned hospitals and services; individuals supplying services abroad eg short term employment of nurses; and

individuals travelling abroad for treatment (irrespective of whether the individual, insurer, employer or government pays). The latter is known as medical tourism and the focus of this paper.

Whilst medical tourism is a rapidly developing industry and currently thriving in many parts of the world, academic research on it is very limited. This may be because in a sense it 'falls between two stools', namely the medical profession on the one hand and the international tourism industry on the other. Moreover, whilst there is a great deal of information on suppliers, whether individual hospitals or third party businesses that organise visits, there is very little overall economic data on the sector. National governments, especially health authorities, and international agencies are struggling with health accounting data, part of the much wider issue of gathering statistics on the international trade in services. This is not to say that medical tourism data does not exist; rather, that estimates are made or published almost in passing and are generally part of much wider analysis, marketing or publicity. This paper should probably therefore be seen as work-in-progress and a pioneering attempt to investigate this hitherto neglected sector within global business. The data and estimates cited here should be seen as illustrative rather than comprehensive; the latter would require a very large study beyond the author's current resources and/or improved statistical collection and analysis by international agencies.

The paper is organised as follows. Following this brief introduction, the definition of medical tourism, various associated terms and the main medical procedures involved are discussed. The third section discusses the theoretical benefits and costs of medical tourism from both macro-economic and micro-economic perspectives. The fourth and fifth sections then discuss types of treatment, prices and main locations, and supply, and their related factors, respectively. Supply factors include both the hospitals or treatment centres and third party businesses that organise visits, as well as, in some countries, government or related agencies that oversee and/or promote medical tourism within their country. The sixth section analyses selected estimates of economic magnitude, in terms of visitor numbers, revenue, and other criteria, whether by country or supplier (eg hospital). The final section makes some concluding remarks, including comments on the likely future challenges and prospects for the sector, and suggestions for further research.

## **Definitions, Terms and Medical Procedures**

A tourist may be defined as '... a person who visits another place other than his/her normal place of residence for a period of more than 24 hours and less than one year.' (Pope, 2006, p2). An international tourist is someone who visits another country within the same time period as stated in the definition. The word 'medical' is defined as 'of or relating to the science of medicine in general' (Concise Oxford Dictionary, 1990). Sometimes medical is taken to exclude surgical treatment but in the context here it should be used in its wider sense.

Thus a medical tourist may be defined as 'a person who visits another place other than his/her normal place of residence for a period of more than 24 hours and less than one year for the primary purpose of medical treatment'. 'Medical tourism' is thus 'the sector or industry providing medical services to people who visit another place other

than their normal place of residence for a period of more than 24 hours and less than one year'. Strictly speaking medical tourism may be domestic ie within one country, or international ie involve an overseas visit. Current accepted use of the term medical tourism is understood to mean 'international medical tourism'.

Some commentators, generally affiliated with the tourism medical profession or elsewhere within the sector, dispute or dislike the term 'medical tourism' and prefer to use the term 'medical travel' (eg Yap, 2007). The reason for their objection seems to be that by implication a medical tourist is undertaking medical treatment as an incidental reason during a 'tour' of a country and medical treatment is not the primary purpose. From an academic perspective, the definition of tourism makes no mention of purpose, and indeed many or possibly nearly all international tourists undertake multi-purpose trips. Critics draw an analogy with business tourists, arguing that the term 'business travel' is used in preference to 'business tourism'. For those within the travel and tourism industry both terms are generally used interchangeably. From a semantic viewpoint, business travel may include business trips of only one day duration whereas business tourism must involve at least one overnight stay.

For the purpose of this paper suffice it to say that the terms medical tourism and medical tourist are used. For most medical treatments by people overseas it is likely that the vast majority of visits would be where the primary purpose is health care. However, three other situations should be recognised:

- incidental, where there is an unexpected illness or injury when the primary purpose is an overseas business or leisure trip;
- emergency, whether a pre-existing condition eg coronary, man-made eg road accident or arising from a natural disaster eg tsunami;
- expatriate workers who are treated in their country of residence rather than returning to their home country. Strictly speaking they are generally not tourists as they are resident for more than one year. Such expatriates should properly be excluded from medical tourism statistics although they are probably included in hospital supplier treatment data. Where their stay is for less than one year, then they may be properly categorised as medical tourists when treated.

From a statistical point of view, '[s]urprisingly little is known about the value and magnitude of global trade in health services' and '[w]ith no reliable, internationally comparable data to go on, there is no way of verifying the true significance of this trade.' (TIAC, 2004, p3). The main reason for this given by the World Health Organisation (WHO) is that this trade is still relatively small by global standards. Leading international agencies (UN, EC, IMF, OECD and UNCTAD) have published a Manual on Statistics of International Trade in Services that includes sector disaggregation. This includes a new Extended Balance of Payments Services (EBOPS) classification that identifies 'health-related travel expenditure', and 'health services' within the larger 'personal, cultural and recreational services' component of other private services. Various models and rules affecting the global trade in health services come under the auspices of the General Agreement on Trade in Services (GATS) (TIAC, 2004, p4). The World Health Organisation has also recognised the difficulty of medical tourism accounting (WHO, 2007). These technical aspects are recognised but not considered further.

In terms of procedures and care, medical tourism comprises medical, surgical or dental treatments. A 'grey area' is that of preventative care, for example, consultations over the use of Chinese medicine. Moreover, many would cite treatments such as massage, reflexology and acupuncture as healthcare, whether as treatment or preventative care. The so-called 'spa' industry, mainly massage and beauty treatment, is rapidly growing in various countries throughout the world and could arguably be included under some definitions.

For the purposes of this paper the narrower use of the term medical tourism, namely comprising medical, surgical or dental treatments, is used. Nonetheless, the different terms and possibly different definitions by various authors or researchers should be noted. When interpreting estimates care must be exercised, especially where comparisons are made.

Some of the main medical procedures in the field of medical tourism include (in alphabetical order): cardiac surgery; cosmetic surgery; dental surgery; eye surgery; fertility treatment; gender realignment; general surgery; orthopaedic surgery; scans and health checks; transplant surgery (Hancock, 2006, pxiii).

## **Theoretical Analysis of the Benefits and Costs of Medical Tourism**

The benefits and costs of medical tourism may be considered from a macro-economic and micro-economic perspective in traditional economic terms, with the latter further sub-divided into demand and supply characteristics. Externality effects, namely the effects on third parties outside of buyers and sellers, also need to be taken into account. This aspect is not considered further in this paper.

The main macro-economic benefits within the host country include higher expenditure on medical and related goods and services eg pharmaceutical products, and (longer-term) investment, higher expenditure on travel, accommodation and tourism services and investment and ensuing economic multiplier effects on the economy, and higher export earnings (all assuming all medical tourists are international tourists). The generating country (where medical tourists come from) benefit in terms of a higher standard of health care for parts of their population than would otherwise be the case, and ensuing longer life longevity and labour productivity, although both are probably very difficult to quantify.

The main micro-economic benefits within the host country include better quality hospital and medical services, better and often internationally, qualified doctors, practitioners, nurses and health care workers, and so on, than otherwise would be the case, as many suppliers seek to emphasise quality and parity with medical services in the richest countries in the world, particularly the USA. Arguably, these doctors and health care workers would be higher paid than otherwise would be the case. Co-ordinated services between the medical suppliers and travel and particularly accommodation services would also be introduced or enhanced, and may include government tourism organisations and bodies, to cater for this niche market.

The main micro-economic benefits for the generating country include persons obtaining required medical services at a much lower price, even after all non-medical expenses are taken account of, and/or much faster than

would be available in the generating country (in either the private or public sector). Some may achieve better 'value for money', and possibly even more highly qualified surgeons than otherwise. Other benefits include tourism benefits for any accompanying persons, probably family members, and, depending upon the medical treatment, tourism benefits for the medical tourist him/herself. There would also be less pressure on waiting lists in public hospitals and thus benefits within the generating country to the health authorities and ultimately government.

The costs of medical tourism are largely risk-related, as in any medical treatment in any country worldwide. The problem and ensuing costs become particularly important and complex where difficulties emerge after the medical tourist has returned to his/her home country. They have the choice of either returning to the hospital as a medical tourist once again or using the medical services within their home country, generally at higher expense or longer waiting times if under their public health system. Indeed, the treatment of delayed problems and failed procedures of medical tourists is likely to be of some interest to government health authority management and possibly the legal profession. Anecdotal evidence and media reports by Australian medical tourists have already cited failed treatments in some lesser known hospitals and treatment centres in Thailand, particularly in the field of cosmetic surgery eg breast enlargement. The issue of insurance for medical tourists is an important one but beyond the scope of this paper.

Other costs to medical tourists include the usual business risks of poor value for money for services incurred, misleading advertising and difficulties with third parties eg medical tour operators (rather than the hospitals themselves). The overall lack of regulations to protect medical tourists should be noted, so the maxim *caveat emptor* (let the buyer beware) becomes that much more important in this area. Needless to say, the larger the savings in the host country compared with the generating country, then generally the higher the overall risks and ensuing costs, where treatment fails.

Some argue that there is a cost incurred by the local, host population, particularly its poorer members, because their best surgeons and doctors, and the top hospitals generally, serve overseas patients exclusively or near exclusively because the rewards are far higher. Against that, members of the medical profession and hospital management argue that a high percentage of overseas medical patients improves standards and allows best worldwide health practice and equipment to be made available to the local population that would otherwise be beyond their means, either in monetary terms, as in India (apart from the rich elite), or because of a relatively small population and insufficient demand for some medical procedures, as in Singapore.

To sum up this section, the theoretical benefits to all parties generally far outweigh the direct monetary costs and longer-term risks, although for a small minority of medical tourists the cost could be great, and possibly include their loss of life in a 'worst-case' scenario. Hence the rapid growth in medical tourism worldwide, as later sections of this paper show.

## **Types of Treatment, Prices and Main Locations**

As noted earlier, medical tourism comprises medical, surgical or dental treatments. The 'grey area' of preventative care is generally disregarded in the following analysis. The main medical procedures in the field of medical tourism include (in alphabetical order): cardiac surgery; cosmetic surgery; dental surgery; eye surgery; fertility treatment; gender reassignment; general surgery; orthopaedic surgery; scans and health checks; transplant surgery (Hancock, 2006, pxiii). The main ones are now discussed, with a focus on prices and main host countries specialising in such treatments (*ibid.*).

The focus in this section is on medical tourism from the UK to a wide range of countries throughout the world, simply because more comprehensive research is available in that country. The UK provides a good insight into medical tourism, but the principles apply to many other richer countries throughout the world, particularly the USA, as well as countries in parts of western Europe, the Middle East, Asia, and Australia and New Zealand. The most popular procedures for medical tourists from the UK are orthopaedic operations, cosmetic surgery and dental treatment, with much of the latter to eastern European countries.

#### **Cardiac Surgery**

In the UK alone coronary heart disease accounted for around 230,000 deaths in 2003 (British Heart Foundation figures; *ibid.*), and the largest killer in the country. Heart bypass treatment costs around 12,000 pounds to 15,000 pounds in the UK yet only 6,400 pounds in Bangalore, India operated by the Taj Medical Group, a British company. The latter price includes all theatre, surgeon and anaesthetist's costs, nursing and medical care, drugs and dressings, and private accommodation (applies to other host country costs below unless otherwise stated). The economy class airfare from the UK to India would be around 500 pounds. Thus overall savings of at least 40 per cent are possible for UK medical tourists seeking heart bypass treatment. Other countries offering specialist cardiac services include Belgium, Germany, Malaysia and South Africa.

#### **Cosmetic Surgery**

Cosmetic surgery includes ear particularly for 18 years old and younger, breast enlargement for women aged 19-35, and eyelid surgery or facelifts for the over-50's. Males as well as females seek treatment within this category, both with the main aim of looking younger than their real age or becoming more attractive to the opposite sex. Breast enlargement costs between around 4,000 pounds and 4,700 pounds in the UK. In Koh Samui, Thailand it costs only around 1,300 pounds (including prosthesis). With economy class flight costs of between 500 and 800 pounds depending on the carriers from UK to Koh Samui, savings of at least half are possible. For UK medical tourists wishing to purchase an 'all-in' treatment and package holiday to Krakow, Poland, prices would typically be around 2,500 pounds for 6 days and 2,900 pounds for 11 days. The price includes an escort from Gatwick Airport to Krakow thus avoiding higher costs for accompanying family or friends for those who prefer.

#### **Dental Surgery**

Dental surgery includes root canal treatment, porcelain tooth crowns, veneers and implants. Although dental surgery is generally cheaper than other types of surgery, a tooth implant in the UK costs between 1,500 pounds and 2,000 pounds per tooth. In Rovinj, Croatia, a coastal town, one tooth implant costs around 734 pounds (1,100 euros), a

saving of around 50 per cent before travel and accommodation costs. The former are around 200 pounds from the UK to Croatia, and cheaper by budget airline. Package tour operators in the UK such as Thomson offer half-board visits including airfare, using some four-star hotels, starting at 300 pounds in low season for seven nights.

#### **Eye Surgery**

Treatment for cataracts costs between 1,800 pounds and 2,900 pounds (per eye); in South Africa similar treatment costs around 1,600 pounds per eye. Although savings are possibly not so high, a visit to South Africa would often include an 'add-on' safari holiday. A wide range of other countries specialise in offering eye treatment for medical tourists, including Argentina, Cyprus, Tunisia and India, and European countries such as Belgium, France and Germany.

#### **Gender Realignment**

Popularly known as a sex change, this involves a number of complicated psychological and physical treatments over a period of time that are not considered here. Suffice it to say that the treatment in the UK costs from 30,000 pounds. The main country specialising in gender realignment is Thailand. At the Aesthetic Surgery Center in Bangkok the surgical treatment costs around 16,000 pounds. Accommodation can be arranged for as little as 14 pounds a night, with flights from the UK to Bangkok starting at around 400 pounds.

#### **General Surgery**

General surgery covers a wide range of treatments by medical tourists, including gallbladder and gallstone operations, hernia, male prostrate treatment and tonsillectomy. Treatment in countries such as Belgium, Hungary, India and South Africa offer savings on UK prices.

#### **Orthopaedic Surgery**

Orthopaedic surgery includes hip replacement (UK cost around 8,000 pounds), knee replacement (around 9,500 pounds) and shoulder replacement (around 12,500 pounds). In India the UK-based Medical Tourist Company offers hip replacement for 4,500 pounds and knee replacement for 5,000 pounds, whilst another UK-based company Med De Tour (to Bangalore) is even cheaper at 3,700 pounds and from 3,200 pounds respectively. Prices exclude travel and insurance but are otherwise inclusive for the UK medical tourist. For a US-based company the cost to a medical tourist of a hip replacement in the Punjab in India is around US\$13,000, including airfare and 20-day hotel accommodation, compared with a cost in the USA of around US\$40,000 (Business 2.0, p26).

#### **Transplant Surgery**

Of all the medical procedures available to the medical tourist, transplant surgery is probably the most controversial as it raises the question of who is the donor and under what circumstances was the organ obtained. Transplant surgery is also by far the most expensive. For example, in the UK a kidney transplant costs at least 25,000 pounds plus annual drugs of 5,000 pounds, a heart transplant is at least 70,000 pounds, a liver transplant costs from 75,000 pounds and a heart and lung transplant from 100,000 pounds. The main countries listed by Hancock (2006, pp 93-100) are India, Israel and South Africa, and Costa Rica for certain procedures, although he is unable to provide cost data in these countries for these complex, costly operations.

The Republic of China (not listed by Hancock) is known to specialise in transplant operations in military hospitals using organs from condemned prisoners who are said to sign for their organs to be used voluntarily (*The West Australian*, 2006). The practice has been dubbed 'transplant tourism' by the media. Very occasionally there are media reports of poor people in developing countries being killed or kidnapped for their organs, or poor people having no choice but to sell their bodily parts. Whether there is any truth in such rumours and reports cannot be assessed in this paper. Nonetheless, the possibility of this 'darker aspect' to medical tourism, however remote, needs to be borne in mind.

To sum up this section, based on the cost of UK medical treatment, the UK medical tourist can generally obtain prices of between half and one-third lower than in the UK before travel and insurance costs are included. With low economy class fares, particularly on budget airlines, available to many destinations in the world, significant cost savings of at least a quarter are typically achievable from the UK. Similar savings are available to medical tourists in many other richer countries in the world, particularly those from Canada and the USA. In the USA savings of between 30 per cent and 80 per cent on overseas medical treatment have been cited (Business 2.0, 2006, p25). For some, there is also the benefit of visiting another country and extending the visit to include a holiday.

### **Selected Main Hospitals and Other Suppliers**

From a business supply perspective, there are hundreds and possibly thousands of hospitals and associated businesses that cater for international medical tourists. Hancock (2006, pp 109-110) lists 23 host or destination countries in his analysis, and within each country at least several are named. For India eighteen specialist medical tour firms or business groups are identified (*ibid*, pp189-202) and nearly 50 hospital enterprises with world-class facilities alone are named (*ibid*, pp202-206), including Apollo Hospital Enterprises, now with 37 hospitals and around 7,000 beds (*ibid*, px). The Indian medical tourism industry has been classed as an export industry by the Indian government, with ensuing tax breaks and incentives that should help the industry develop still further.

In Thailand, Bumrungrad Hospital, Bangkok, is the country's leading hospital for international medical tourists. It is a publicly listed company trading on the Stock Exchange of Thailand, with the Bangkok Bank and the Sophonpanich family the majority shareholders. It started in 1980, opened its main hospital facility in 1997, around the time of the so-called Asian recession, and now claims to be the largest private hospital in South-East Asia with one million square feet of floorspace and 554 in-patient beds. It has an American-led management team, over 2,600 employees, over 900 physicians and dentists, most with international training and certification, and over 700 nurses. Bumrungrad Hospital was the first hospital in Asia, and still is Thailand's only hospital, to be accredited by the US-based Joint Commission on International Accreditation (JCIA). It also has other international accreditations and certifications (Bumrungrad International, 2006).

Bumrungrad Hospital treated over one million patients (out-patient and in-patient) in 2005, with a turnover of US\$170 million. Medical tourists accounted for just under 40 per cent of its patients, with nearly 400,000 from over 190 different countries. It has a social responsibility programme that helps the underprivileged in Thailand, and claims to have treated over 100,000 Thais with free medical treatment. It has international representative offices in Australia, Bangladesh, Cambodia, Ethiopia, Hong Kong, Macau, Maldives, Myanmar, Nepal, Oman, Sri Lanka, Taiwan and Vietnam (*ibid.*). This gives some indication of the sources of Bumrungrad Hospital's client base. Interestingly, some of these are relatively poor countries that must have rich elites who use medical tourism services.

In Singapore, a city/island state with a population of around 4 million, the government and its industry partners created SingaporeMedicine in 2003. Its objectives are to develop and maintain Singapore as an international medical hub for medical tourists (the term medical traveller is preferred in Singapore) and for clinical research and development, medical conventions and exhibitions, training and education, and regional and international headquarters and operations (Yap, 2006). This is yet another 'string to Singapore's bow' in the field of tourism (for its size, Singapore is one of the world's leading countries for business events, conventions and meetings) and Singapore's overall economic development, with many international companies making it their regional headquarters.

SingaporeMedicine is an inter-agency initiative established by the Singapore Economic Development Board (promoting inbound investment), the International Enterprise Singapore (promoting the internationalisation of Singaporean companies) and the Singapore Tourism Board (here especially responsible for international marketing and branding and people-orientated services). Industry partners include hospitals, health care providers and medical travel and tourism agencies. Singapore Medicine is supervised by the Ministry of Trade & Industry and Ministry of Health (*ibid.*). One of Singapore's leading integrated suppliers is Pacific Healthcare, with over 90 medical specialists and an extensive network of facilities. Its operations include regional operations in India and Hong Kong (Economic Development Board, Singapore, 2007). Singapore's commitment to this industry is shown by overall investment in its healthcare industry fixed assets of S\$22 million in 2006 and S\$31 million in 2005 (*ibid.*).

As well as being a growing export industry, medical tourism in Singapore also helps maintain 'robust health care services with sufficient volume to support more than just one or two doctors in the rarer but critical services eg liver transplants.' (Yap, 2006, p026). In Singapore medical tourism is thus seen as a 'win-win' situation for both international visitors and the local population in terms of quality health care.

In Malaysia medical tourism has been developed by hospital groups such as PenangHealth. The highly regarded Adventist Hospital in Penang has an annual turnover of US\$32 million, with medical tourists accounting for 30 per cent of its patients, up from less than 5 per cent ten years ago (Business 2.0, p26). The Sunway Medical Centre (240 beds), Petaling Jaya, Selangor and Mahkota Medical Centre (238 beds), Melaka, are also well established hospitals in Malaysia catering for international visitors (Hancock, 2006, pp226-229). By contrast, countries such as South Korea and Taiwan have national policies in the field of medical tourism led by their

respective tourism authorities (Yap, 2006). In these countries the travel and tour aspects of medical tourism may be relatively more important, as well as the medical treatment itself.

In the Philippines, with its medical tourism industry arguably lagging behind some its better-off neighbouring countries such as Singapore and Malaysia, there is greater debate on inadequate health services for the majority of the population and whether Filipino hospitals should be encouraged by the government to cater for overseas patients (Olarde, 2006).

Europe is arguably one of the leading world regions in developing medical tourism overall, taking into account the need for co-ordination between agents, airlines, hotels and medical providers, although particular hospitals in Asia, especially the Bumrungrad Hospital in Thailand, have certainly pioneered the treatment of overseas patients. An example of the former is that Polish dentists advertise in in-flight magazines and budget airlines such as Ryanair promote trips to countries that specialise in medical tourism such as Poland and Hungary. Advertisements for eastern European dental treatment are now starting to appear in local and national English newspapers.

Perhaps surprisingly, the USA appears to have lagged behind western Europe in its generation of medical tourists and especially the setting up and development of specialist third party providers or medical tour agencies. Now it is in the process of catching up (Business 2.0, p26). For example, MedRetreat, based in Odenton, Md. is two years old and sent 320 patients overseas in 2006, mostly for cosmetic surgery to partner hospitals in Brazil, Thailand and Turkey. They receive a commission for hotel bookings and a 20 per cent discount on treatment fees from their partner hospitals. Annual turnover is approaching US\$1 million. One US entrepreneur considers medical tourism as ‘...the perfect arbitrage situation. Buy below market and sell below market.’ (*ibid.*).

Other recent US medical tourism start-up companies include GlobalChoice Healthcare (Albuquerque, New Mexico, with hospital providers in Costa Rica, India, Panama and Singapore) and PlanetHospital (Los Angeles, specialising in dealing with US employers and health insurers). Indeed, in the USA the corporate health market is ‘the big fish’, and a possible US\$500 million gold mine according to another entrepreneur (*ibid.*). However, it is too early days yet for the corporate sector overall. The vast majority of businesses and their insurers would like to see a well established, mature market first before committing. Indeed, in the USA more than anywhere else, they are critically aware that just a few surgical mishaps and ensuing costly law suits could damage the medical tourism industry severely, as well as probably bankrupting the medical tour provider. In short, in the USA at least, the generation of its citizens for medical treatment overseas is likely to be a ‘high risk, high reward’ business.

Thus, from a national leadership and organisational perspective, there are contrasting approaches to medical tourism, based on the selected Asian countries discussed above.

## **Estimates of Economic Importance**

This section attempts to synthesise some of the main estimates of the economic importance of medical tourism throughout the world. It must be emphasised that data of any kind let alone the usually quoted ‘reliable data’ is very difficult to obtain, essentially because medical tourism is a rapidly emerging industry and little data collection and research has been undertaken. Usually comparative and/or international studies follow a reasonable number of national studies within a particular sector eg business events tourism. Even within one country gathering data from disparate sources within medical tourism is no easy task!

A useful starting point is the global estimate by WHO of US\$30 billion for total health services trade in 2003 (TIAC, 2004, p4). From this and other information, TIAC estimate that this estimate of US\$30 billion is roughly composed of US\$15 billion in health-related exports and US\$15 billion in health-related travel expenditure and insurance. Unfortunately no estimates by world region let alone by leading countries have been made by WHO or TIAC.

The main economic measures used here are (medical tourist) visitor numbers and their expenditure. Other data such as their contribution to host country exports would be very valuable but is generally not available. The available data (to this author’s knowledge) giving an illustration of the economic importance of medical tourism to host countries ie inbound is shown in Table 1, and for generating countries ie outbound in Table 2. It should be emphasised that some countries eg South Korea, and also various OECD countries such as the UK and USA, can feature as both host and generating countries. This reflects both inflows and outflows, similar to international tourism flows generally.

TABLE 1: ESTIMATES OF THE ECONOMIC IMPORTANCE OF INTERNATIONAL MEDICAL TOURISM TO HOST COUNTRIES

Country/Year	Number of Patients (Inbound)	Expenditure (Inbound)
India, 2004	150,000	-
Malaysia, 2004	179,000	US\$8 million <sup>a</sup>
Singapore, 2005	374,000	-
Thailand, 2002 <sup>b</sup>	600,000	US\$550 million
Thailand, 2004 <sup>c</sup>	1.1 million	-
Thailand, 2005	520,000	-
<i>S. Korea, 2010 forecast<sup>d</sup></i>	<i>100,000</i>	-
<i>India, 2012 forecast</i>	-	<i>US\$2 billion</i>
<i>Singapore, 2012 forecast<sup>e</sup></i>	<i>1 million</i>	<i>US\$3 billion</i>
<i>Asia, 2012 forecast</i>	-	<i>US\$4.4 billion<sup>e</sup></i>

Sources: Yap (2006), unless otherwise stated: <sup>a</sup> M\$28 million cited by Hancock (2007, p225) and converted at an exchange rate of M\$3.4 = 1US\$. This figure seems extremely low and requires verification. <sup>b</sup> A\$680 million cited by TIAC (2004, p2) and converted at an exchange rate of A\$0.8 = 1US\$; <sup>c</sup> Dogra (2005); <sup>d</sup> Tour Korea (2007).

Note: <sup>e</sup> Likely to be an underestimate based on overall evidence (this author).

TABLE 2: ECONOMIC IMPORTANCE OF INTERNATIONAL MEDICAL TOURISM FROM GENERATING COUNTRIES

Country/Year	Number of Patients (Outbound)	Expenditure (Outbound)
South Korea, 2006	-	US\$20 million
USA, 2006	500,000 plus	-
USA, 2010 forecast	-	US\$40 billion

Sources: Business 2.0 (2006); *The Straits Times* (2007).

There is hardly any data on average spending per medical tourist. The Thai 2002 data from Table 1 suggests around US\$916 per overseas patient, and the Malaysian data for 2004 (US\$45), from separate sources, seems very unreliable, especially the aggregate expenditure figure. One forecast figure from Singapore is around S\$15,000 per overseas patient for a typical stay of two weeks (*The Straits Times*, 2006). Even if the current average figure for any Asian country is much lower at, say, US\$2,500 per overseas patient, any country with around 400,000 medical tourists pa would currently generate some US\$1 billion in expenditure. Both rough estimates are feasible, and arguably conservative, given available data on treatment prices from the earlier section and a rounded average of current medical tourist numbers to Thailand, Singapore and Malaysia (from Table 1).

For South Koreans, international medical tourism grew rapidly from US\$8 million in 2005 to US\$20 million in 2006, with the highest amount, around 40 per cent, being spent in the Republic of China. The leading treatments were organ transplants and Oriental medicine (*The Straits Times*, 2007).

The United Arab Emirates (UAE) sends many of its citizen abroad for medical treatment funded by its government. The leading host (destination) countries in 2004 were: Germany (46%), India (23%, up from 9% in 2001), UK (21%), USA (3%, and interestingly down from 17% in 2001), with China, Malaysia and Thailand all noted as growing in importance for UAE nationals (Al Muhairi, 2007, p6; visitor number and expenditure data unfortunately not available). The USA has thus lost market share from not only the UAE but reportedly from other rich Arab countries because of its very stringent immigration requirements following the September 2001 terrorist attacks in the USA.

The potentially huge growth in the industry may be seen from some fundamental US medical data: Americans spend around US\$570 billion at US hospitals annually; 61 million adult Americans are currently either uninsured or underinsured for medical treatment (Business 2.0, 2006, p25). In Thailand it is worth noting that just one early entrant and leading hospital, Bumrungrad, accounts for around 77 per cent of that country's international medical patients. In India international medical tourism is forecast to grow at around 30 per cent pa, and should be worth around US\$2 billion by 2012 (Hancock, 2006, px).

It is unfortunate that the available data is so scant. Nonetheless, the picture is emerging of what has hitherto been rather a 'hidden' global business that seems set for rapid expansion and growth in many host countries throughout the world including those in Asia from where much of the current data is being derived.

It is worth noting that, whilst these figures for medical tourism are impressive for a newly emerging global industry, worldwide tourism was worth around US\$6,200 billion in 2005, or 10.6 per cent of world GDP (WTTC, 2005). Moreover, expenditure on health services in many OECD countries is typically around 7 per cent to 10 per

cent of GDP (TIAC, 2004, pp 2-3) and is a multi-billion dollar industry worldwide even excluding all patients from overseas countries. In other words, in the context of both tourism and domestic medical industries worldwide, medical tourism is, at present, minimal. Medical tourism does not yet feature in the World Tourism Organisation's 'top ten' of sub-groups. For some rough comparison, in Australia alone in 1996-97 international business delegates spent just under US\$1 billion (BTR, 1999). In Thailand in 2002 medical tourism may have been conservatively worth around half of this figure. The forecast for medical tourism in India in 2012 is US\$2 billion, and for the Asian region US\$4.4 billion, probably a conservative estimate (see Table 1). Indeed, arguably the implications for domestic health systems and government health policy are more important and profound than for the tourism industry.

## **Concluding Remarks and Future Research**

This paper is an initial attempt at exploring some of the many economic and business issues in the rapidly emerging field of (international) medical tourism. Even the term itself is open to some debate, with one eminent Singaporean commentator preferring the term medical travellers. One of the disappointing constraints of this paper is the great dearth of literature and especially data on the topic.

Overall, it has been suggested that medical tourism is likely to be a rapidly growing industry that, in years to come, will be economically noteworthy (but probably not significant, at least in terms of overall international tourism numbers and expenditure). As with any study of international tourism flows, the analysis here has identified the richer generating (outbound patient flow) countries, particularly the UK and USA, and also South Korea in Asia, and the much wider range of host (inbound patient flow) countries that specialise in medical treatment for overseas visitors. The latter are generally but not exclusively poorer, developing countries. It is worth noting that many poorer countries often generate a small number of very wealthy medical tourists from their rich elites, as shown by patients to the Bumrungrad Hospital in Thailand.

Whilst recognising the data limitations and possible selection bias of the research here, leading host countries in Asia include China (although little data was found to support this proposition), Thailand, Singapore, Malaysia and India. In Europe leading host countries are mainly former eastern bloc countries such as the Czech Republic, Poland, Hungary and Latvia. In the Americas there is a fairly wide range, including Brazil, Argentina, Mexico and Costa Rica. Other parts of the world are also represented, including Tunisia, South Africa and Israel. Middle-Eastern countries, such as the United Arab Emirates, may also enter the market in a significant way in the years ahead, although hitherto they are mainly generating countries.

Currently medical tourist numbers to (selected) host countries in Asia are roughly between 150,000 and 600,000 each annually, and possibly around 1 million pa in the case of Thailand. The Thailand market alone is probably worth at least US\$0.6 billion pa, although all the data cited should be treated very cautiously. The Asian medical tourism market may be growing annually at up to 30 per cent. From an outbound perspective, the USA

generates over a half a million medical tourists every year, and the South Koreans spent US\$20 billion on medical tourism in 2006, mostly in the Republic of China. The main risks to forecast growth include widespread bad publicity in generating countries arising from deaths or serious problems; curbs to travel from world regional health outbreaks such as SARS; and terrorism or war. Currently these seem to be of low or extremely low probability.

The driver of this growth in medical tourism is primarily price, with estimated typical net savings of 25 per cent to 50 per cent for UK medical tourists and between 30 per cent and 80 per cent for those from the US. The latter probably reflects the higher costs of medical treatment in the USA, much of it deriving from higher litigation and insurance costs and the organisation and ownership of the domestic medical industry. Another driver for some medical tourist patients is the higher quality of treatment and care overseas, particularly those who may have to use an over-loaded public health care system, as in the UK, or for the rich elite patients whose home country does not have the appropriate medical facilities and physicians.

For countries with over-loaded public health care systems, such as the UK, the development of medical tourism, including offers from overseas groups eg from India, to treat public sector (National Health System) patients on a contract basis, raises significant health policy issues.

From a research perspective, many avenues are possible. Primarily there is the need for more comprehensive and reliable data and ensuing analysis from as many countries worldwide as possible, both generating and host countries. Further research could focus either more heavily on the medical issues or the tourism issues. For the former, for example, the effects upon a country's domestic health care system, irrespective of whether it is more publicly orientated (as in the UK, for example) or a more private enterprise system (as in the USA) is likely to emerge as a critical government policy issue. This applies to both generating and host countries. A critical, mainly longer-term, issue may be remedial care and treatment, and related liability and enforcement issues, where overseas treatment fails or leads to further health problems.

Research opportunities from a tourism perspective include the varying organisational approaches to medical tourism in different countries, and the economic benefits and costs to the various components of medical tourism eg tour operators, airlines, hotels, hospitals. The role of marketing is also a potentially rewarding research area.

Overall, the prognosis for the rapidly emerging area of medical tourism as a global business is currently excellent. In many ways it is a 'high reward and high risk' international business, although comparatively resilient to recession. As with any new market, there are likely to be both winners and losers, with intense international competition and discounting in some sub-sectors, until the market matures. The balance between private and public health care provision, now in an international trade context, will become increasingly prominent in the years ahead.

## Abstract

This paper examines the determinants of managers' perceptions of national and corporate culture differences, using data obtained from Chinese international strategic alliances. These determinants we identify as culture-related management impediments, cultural management policies, and cultural sensitivity. We find that the extent to which the Chinese managers have experienced culture-related management impediments is positively related with their perceptions of national and corporate culture differences. We find that the adoption of cultural management policies is negatively related to the perceived national culture difference, and that it moderates the expected positive relationship between the experience of culture-related problems and the perception of corporate culture difference. We find that the expected positive relationship between the experience of culture-related problems and the perceptions of national and corporate differences is moderated by the degree of cultural sensitivity of Chinese firms. We also report the effects of alliance age, alliance form, prior business relationships and cultural distance on the perceived cultural differences.

## Introduction

International strategic alliances (ISAs) are capable of creating an array of competitive advantages for the firms involved, if national and corporate differences between partners are effectively managed (Glaister and Buckley, 1996). The extant literature has advanced our understanding of the importance of culture on alliances. This literature has examined the impact of national culture distance on alliance partners across a wide range of issues, including control, trust, conflict resolution, learning and alliance performance (Kogut and Singh, 1988; Child and Markoczy, 1993; Hennart and Zeng, 2002). Given the problematic nature of national cultural distance at the conceptualisation and measurement levels (Shenkar, 2001), however, studies that have examined national cultural distance between alliance partners may have failed to capture the impact of managers' perceptions of national culture differences on the issues of concern. Furthermore, many studies in ISA research have not examined the effect of corporate culture differences, consequently the effect attributed to national culture distance may be exaggerated (Sirmon and Lane, 2004). We report data obtained from Chinese ISA parent firms in order to elaborate Chinese managers' perception of national and

corporate culture differences. We also examine the antecedents of national and corporate culture differences from the perspective of the Chinese managers. In so doing, we contribute to the understanding of how firms and managers in transition economies such as China tend to perceive national and corporate culture differences in their ISAs with foreign counterparts, something which has been given scant attention in the prior literature (Peng, 2000; Luo, 2002). We thereby redress the emphasis to date on European and US firms in cross-culture management research in China, by adding the perspective of local Chinese firms.

## **Literature Review and Hypothesis Development**

Differences in culture between ISA partners may pose cooperation barriers or management impediments (Hennart and Zeng, 2002). While the effect of culture differences is well explored in the prior literature, this is less so with respect to the influence of culture-related management impediments encountered by managers on their perception of culture differences between alliance partners. The prior literature has given scant attention to this question. In fact, reviewing a large body of literature treating cross-cultural differences as given by Hofstede's (1980) cultural indices and/or measured aggregately by Kogut and Singh's (1988) computational formula, Kirkman, Lowe and Gibson (2006) urge future studies to collect primary data in order to measure cross-cultural differences as perceived by managers. We seek to examine whether managers' perceptions of culture differences are influenced by their experience of culture-related management impediments.

In Sino-foreign ISAs, the prior literature suggests that culture-related management impediments arise from differences in four of the five dimensions of national culture (Hofstede, 2001). For instance, difficulties in the management of ISA may also arise where foreign firms manage according to individualistic values whereas their Chinese partners emphasize collectivistic principles (Reading, 1990; Fang, 1999). Moreover, differences in the orientation towards time, partly reflected in the importance and timescale attached to the development of commitment and mutual trust for the alliance to achieve its performance goals, can result in confusion and conflicts in Sino-foreign ISAs (Yan and Gray, 1994).

In Sino-foreign ISAs, culture-related management impediments may also arise due to differences in alliance partners' corporate cultures. It has been argued that as Chinese ISA firms are predominantly state-owned, the character of the state-owned enterprises and the system under which they operate have a bearing on the management of the Sino-foreign ISAs (Peng, 2000; Luo, 2002). Moreover, attitudinal differences with respect to assuming responsibilities, sharing information and communication, and making decisions may impede the management of these Sino-foreign ISAs (Boisot and Child, 1988). Additionally, issues of human resource management, such as selection, training, compensation, appraisal, retention, may also be problematic due to corporate culture differences between Chinese and foreign partners (Child, 1994).

When cross-cultural interaction between the alliance partners is marked by friction and frustration, stereotypes may indeed be reinforced, and conflicts can become entrenched, thus impeding adjustment (Schneider and

Barsoux, 2003). In turn it may exacerbate what the transaction costs economics is concerned with. If culture-related management impediments are widespread, they may raise the question as regards to whether the focal firm's national and corporate cultures are compatible with the partner's. The learning intentions and efforts of the firm to access or acquire the knowledge embodied in the partner's distinctive cultures may also be impeded. In a nutshell, different theoretical lenses reinforce the view that greater culture-related management impediments increase a sense of difference between alliance partners in the perception of managers.

*H1a: The greater the extent to which the Chinese managers have experienced culture-related management impediments the greater the Chinese managers' perception of national culture differences.*

*H1b: The greater the extent to which the Chinese managers have experienced culture-related management impediments the greater the Chinese managers' perception of corporate culture differences.*

Culture differences can create problems of mutual comprehension, indicating the need for considerable adaptation for the partners in ISAs. We propose a framework of seven cultural management policies, which consists of management initiatives conducted ex-ante, ex-post, and during the operation of the alliance. We argue that adoption of these cultural management policies represents one proactive use of coping mechanisms that the firm can use to mitigate the negative impact of, and simultaneously increase the benefit of, cultural diversity on alliance outcomes.

Specifically, the depth of cultural analysis undertaken prior to the formation of the alliance informs would-be partners of the differences in their strategic motives, capabilities, national and corporate cultures, which in turn prepares managers for cross-cultural interactions and enhances cultural understanding in the alliance. Cross-cultural training, as a means of facilitating interaction, enhances managers' psychological well-being and self-confidence, develops their interaction skills, and promotes a correct perception of other cultures (Black and Mendenhall, 1990). As culturally sensitive managers are likely to exhibit more cultural awareness of the norms and values held by other nationals, and to show more flexibility in cross-cultural interactions (Child and Faulkner, 1998), the selection of culturally sensitive (alternatively, the removal of culturally insensitive) managers to work in the alliance is likely to bring a sense of cultural affinity between alliance partners. By reviewing the cultural barriers experienced by alliance managers, as well as their coping strategies, managerial effort can then be better devoted to reconcile or build upon culture differences between alliance partners (Jun, Gentry and Hyun, 2001). This in turn leads to informed adjustment of procedures or practices that are culturally incompatible between alliance partners, for example the adaptation of Western-based training programmes to the context of China as reported in Bjorkman and Lu (1999). All these cultural management policies require investment of resources and commitment of top management time and effort. It is anticipated that the adoption of these cultural management policies is likely to reduce the perception of national and corporate culture differences between alliance partners.

*H2a: The greater the extent to which the Chinese firms have adopted cultural management policies the less the Chinese managers' perception of national culture differences.*

*H2b: The greater the extent to which the Chinese firms have adopted cultural management policies the less the Chinese managers' perception of corporate culture differences.*

It has been argued that managers with little cultural sensitivity are more likely to experience culture shock, denigrate other cultures, and impose their own national and/or corporate culture (Johnson, Cullen, Sakano and Takenouchi, 1996). By contrast, culturally sensitive managers tend to have greater cross-cultural experience and communication skills. Additionally, culturally sensitive managers are more likely to pay attention to cultivating relations and building trust with their counterparts. Where conflicts arise in an alliance culturally sensitive managers can use their cross-cultural knowledge to effectively resolve partner disagreements. Conversely, due to their inability to facilitate communication and understanding among parties to an alliance and to deal effectively with different expectations of parent firms, culturally insensitive managers are likely to experience more role conflicts (Shenkar and Zeira, 1992), and are more likely to malfunction in a multicultural context. The level of cultural sensitivity by Chinese managers suggests the extent to which they appreciate the foreign partner's culture and adjust accordingly, which in turn facilitates effective interaction and conflict resolution.

*H3a: The greater the extent to which the Chinese managers' parent firms are culturally sensitive towards the foreign partner firms the less the Chinese managers' perception of national culture difference.*

*H3b: The greater the extent to which the Chinese managers' parent firms are culturally sensitive towards the foreign partner firms the less the Chinese managers' perception of corporate culture difference.*

The extent to which managers encounter culture-related management impediments necessitates the adoption of culture management policies by one or both alliance partners. However, the prior literature has barely considered the extent to which the adoption of culture management policies impact on the relationship between culture-related management impediments and the perception of culture differences.

Although national cultures are deeply embedded and resistant of change, many people working in ISAs may be able and willing to adapt their national cultural dispositions under conditions which motivate them to do so (Child and Faulkner, 1998). Artefacts of corporate culture converge to a certain extent between ISA partner firms in China, particularly in the practice of human resource management. For example, performance appraisal management systems similar to Western practices were introduced in half of Bjorkman and Lu's (1999) sample. They also found that in recruitment and selection, foreign managers take formal responsibility for the selection decision based on the applicants' professional qualifications and competences, which is effective in curbing nepotism or relationship-based selection. We argue the positive relationship between culture-related management impediments and the perception of culture differences will be weaker when there is a greater level of adoption of cultural management policies.

*H4a: Adoption of culture management policies will weaken the relationship between the extent to which the Chinese managers have experienced culture-related management impediments and the Chinese managers' perception of national culture difference.*

*H4b: Adoption of culture management policies will weaken the relationship between the extent to which the Chinese managers have experienced culture-related management impediments and the Chinese managers' perception of corporate culture difference.*

Chinese firms see their foreign partners as reservoirs of both technical know-how and managerial

knowledge, and probably as a source of both explicit and tacit knowledge (Child and Markoczy, 1993). The tacit nature of organisation-based knowledge implies a bargaining power imbalance in favour of the foreign partners. This is in line with the evidence that the growth rate of wholly-owned subsidiaries has surpassed that of equity joint ventures in China since 1997 (Child and Tse, 2001). It also suggests that being responsive to the nitty-gritty of complex Chinese cultures may prove to be something of a tall order for foreign investors in China (Vanhonacker, 1997). Consequently, cultural integration may loom large in the culture management strategies of foreign firms investing in China. By contrast, we argue that Chinese firms may be constrained by the nature of their resources (which may be both imitable and substitutable), so that they may have little choice but to be more culturally responsive to their foreign partners. Moreover, the importance accorded to maintaining harmonious business relationships may tilt the Chinese firms' favoured culture management practices towards being more responsive rather than imposing culture.

The imbalance of culture management strategies argued above, with Chinese firms being more responsive and foreigner firms more imposing creates a game theoretical scenario where competitive moves harm the non-zero sum gains the cooperation aims to achieve. Where the ISA is imbued with culture-related management impediments, the cultural sensitivity on the part of the Chinese firms may signal a lack of cultural sensitivity on the part of the foreign partners, as evidenced by the ineffectiveness of adopting Western-centric training and language-teaching programmes (Bjorkman and Lu, 1999). The lack of responsiveness on the part of foreign firms may be interpreted as the lack of reciprocity, which has a deleterious effect on the cooperation (Fang, 2001). In proposing Hypothesis 1, we argued there is a positive relationship between the degree of culture-related management impediments and the Chinese managers' perception of national and corporate culture differences. Here we further argue that the magnitude of this positive relationship is likely to depend on the degree of cultural sensitivity by the Chinese managers. In other words, cultural sensitivity is a moderator of this relationship.

*H5a: The more culturally sensitive are Chinese firms the stronger the relationship between the extent to which the Chinese managers have experienced culture-related management impediments and the Chinese managers' perception of national culture difference.*

*H5b: The more culturally sensitive are Chinese firms the stronger the relationship between the extent to which the Chinese managers have experienced culture-related management impediments and the Chinese managers' perception of corporate culture difference.*

## **Research Methods**

Using a structured questionnaire and the key informant approach, we obtained 238 responses from Chinese parent firms of the ISAs. The initial English language version of the questionnaire was subjected to a back-translation process, being first translated into Chinese and then three Chinese bi-lingual researchers in the field blind-translated it back into English. The translation and back-translation process continued until the Chinese and English language

versions substantially agreed with each other. The Chinese language questionnaire draft was pre-tested for instrument validity with 12 Chinese ISA parent firms located in Zhejiang province.

In order to assess the perceived national culture difference, Chinese respondents were asked the extent to which the national cultures differed between the foreign parent's home country and China, measured on a five-point scale (1= very small difference; 5 = very great difference). In a similar vein, we also measured the perceived corporate culture difference between the Chinese respondent's parent firm and the foreign partner's parent firm. We measured the extent to which the respondents have experienced culture-related management impediments using seven items, each rated on a five-point scale (1 = no problem; 5 = major problem). Exploratory factor analysis (EFA) showed a strong single-factor solution for this measure, with a total of 54 percent variance explained by this factor and all factor loadings were at or above .64. This index has an alpha coefficient of .85. We developed seven items to measure whether or not the Chinese partner firms have adopted cultural management policies, each measured as a dummy (1= adopted; 0 = not adopted). The alpha coefficient for this index is .69. Based on Johnson, Cullen, Sakano and Takenouchi (1996), we measured cultural sensitivity of Chinese partner firms towards foreign partner firms, on a five-point scale (1 = strongly disagree; 5 = strongly agree).

We controlled alliance age, alliance form, prior business relationship, and national cultural distance between alliance partners. The alliance age was operationalised as the number of years since the reported formation of the ISA by the time of data collection in 2004. To control for the alliance form, this variable was entered as a dummy, coded 0 for non-equity-based ISAs and 1 for equity-based ISAs. Respondents were asked whether or not the Chinese parent firm and the foreign partner had had any prior business relationship, in a list of eight potential business relationship forms ranging from technology transfer agreements to joint ventures. We measured prior relationship as a dummy variable, coded 1 if both firms had previously worked with each other and 0 otherwise. The alpha coefficient for this index is .66. We also included cultural distance as a control variable. Indices of individual cultural dimensions were taken from Hofstede (2001: 500-502). Following the computational formula of cultural distance specified in Morosini, Shane and Singh (1998), we calculate aggregate cultural distance as the square root of the sum of the square of the distance of each of Hofstede's five cultural dimensions given the home country of the foreign partner.

## Results

Table 1 reports the means, standard deviations, and zero-order correlations between variables. We used hierarchical multiple regression to examine the hypotheses. Table 2 reports the regression results. The main effects variables were mean-centred to alleviate multicollinearity concerns before the creation of the interaction terms. Examination of the variance inflation factors (VIFs) associated with each regression coefficient showed a range from 1.00 to 1.40, suggesting no serious problems of multicollinearity.

[Insert Table 1 Here]

[Insert Table 2 Here]

It was expected that the extent to which the Chinese managers have experienced culture-related management impediments is positively related with their perception of national culture difference (H1a) and of corporate culture difference (H1b). Table 2 shows that H1a (model 3,  $p < .01$ ) and H1b (model 6,  $p < .01$ ) are both supported.

It was hypothesised that the extent to which the Chinese partner firms have adopted cultural management policies is negatively related with the perception of national culture difference (H2a) and of corporate culture difference (H2b). Table 2 shows that H2a (model 3,  $p < .01$ ) is supported, but H2b (model 6,  $p > .1$ ) is not supported. It was posited there will be a negative relationship between the Chinese firms' cultural sensitivity towards the foreign partners and the Chinese managers' perception of national culture difference (H3a) and of corporate culture difference (H3b). The results show that H3a (model 3,  $p > .1$ ) and H3b (model 6,  $p > .1$ ) are not supported.

It was posited that the positive relationship between the extent to which the Chinese managers have experienced the culture-related management impediments and their perception of national culture difference (H4a) and of corporate culture differences (H4b) will be negatively moderated by the extent to which the Chinese firms have adopted culture management policies. Table 2 shows H4a (model 3,  $p > .1$ ) is rejected, but H4b (model 6,  $p < .01$ ) is strongly supported.

It was predicted that the positive relationship between the extent to which the Chinese managers have experienced culture-related management impediments and their perception of national culture difference (H5a) and of corporate culture difference (H5b) will be moderated by the degree of cultural sensitivity of Chinese firms. Table 2 shows that H5a (model 3,  $p < .01$ ) and H5b (model 6,  $p < .01$ ) are supported.

## **Discussion**

After reviewing a large body of empirical work that has employed Hofstede's (1980) cultural value framework and Kogut and Singh's (1988) cultural indices, Kirkman, Lowe and Gibson (2006) urge future studies to examine managers' perception of culture differences in an attempt to reconcile conflicting findings noted in the prior studies. Whilst this is likely to be a fruitful research direction, the present study goes a step further by examining the antecedents of managers' perceived culture differences. In response to the call to differentiate national culture differences from corporate culture differences in ISAs (Sirmon and Lane, 2004), this study incorporates both cultural constructs and examines the perception of national and corporate culture differences respectively.

This study elaborates on the experience of Chinese ISA partner managers. We find that the more the Chinese managers encounter culture-related management impediments the greater their perception of national and corporate culture differences between partners.

We propose a framework of culture management policies and argue that these policies may be adopted to proactively manage culture differences. The finding that the adoption of culture management policies is conducive to reducing the perception of national culture differences lends support to Child and Faulkner (1998), who argue that

managers are able to change national cultural dispositions under conditions which motivate them to do so.

There is a wealth of literature reporting the importance of selecting culturally sensitive managers to work in alliances, but the implication of managers' cultural sensitivity for their perception of culture differences is largely neglected. Cultural sensitivity necessitates a process of accommodation, adjustment, substantive internalisation and application of the values and mores in the other party's cultures, in order to achieve efficiency and effectiveness in cross-cultural interactions. However, if the formation of culture is path-dependent, and the knowledge embodied in culture is tacit, it raises the question as to the efficacy of actually learning a culture. Hence, there may be a pair of contrasting outcomes associated with cultural sensitivity: on one hand, cultural sensitivity reduces managers' perception of culture differences and cultural effects, as extensively reported in the international human resource management literature; on the other hand, cultural sensitivity may increase perceptual differences.

Kirkman, Lowe and Gibson (2006) note that only a fraction of previous cross-cultural studies have used culture-related constructs as moderators. In the present study, we investigate two (cultural management policies and cultural sensitivity) such constructs, both as predictors and as moderators.

As a predictor, the adoption of culture management policies reduces the Chinese managers' perception of national culture differences, rather than that of corporate culture differences. By contrast, as a moderator on the positive relationship between culture-related management impediments and the perception of culture differences, the adoption of culture management policies reduces the perception of corporate culture differences, rather than that of national culture differences.

Cultural sensitivity is not a predictor of the perception of culture differences (no support for hypothesis 3), but it is a moderator on the relationship between culture-related management impediments and the perception of culture differences (support for hypothesis 5). The support for hypothesis 5 suggests the need to consider culture-related constructs, such as cultural sensitivity, as moderators in future studies.
