## **Abstract**

Japan, the leading Asian economy and the second most powerful economy in the world, is currently recovering from a long and harrowing period of recession. In order to maintain the current positive momentum, and to have any chance of maintaining relativities with rapidly developing China and India, numerous commentators have suggested that fundamental changes to the Japanese business system are urgently required. The common wisdom is that changes towards a more US style, market driven economy would be beneficial. To better understand the dynamics and logics surrounding such claims, an appropriate departure point would be a structured analysis of Japan's contemporary business system. Within this context, the fundamental objective of this paper is to present an introductory, but necessarily brief descriptive overview and analysis of the current Japanese system. For this purpose, an adaptation of Redding's (2005) comparative business systems model will be utilised.

## **Introduction**

Japan has been on an economic roller coaster ride since the Meiji Administration began its modernization drive in the last third of the nineteenth century - although this engaging story is well known, and does not require retelling in detail here, a very brief overview will be useful. Japan, under pressure from Western colonialist powers from the mid-1800s, began an industrialization program which in less than 50 years saw it transformed from an essentially agrarian to an advanced economy, and supplier of manufactured war materials to Great Britain in World War One. Territorial and imperial ambition followed rapid economic expansion, and, tragically, in time this led Japan into conflict with the West. After just four years of the Pacific War (1942-45), Japan's advanced industrial economy was reduced to the baseline, and massive reconstruction was required. With the support of the

allied occupiers of Japan, and a unique collaboration of government, bureaucracy, the corporate sector and ultimately a compliant union movement, the Japanese people responded magnificently with the result that Japan was on the verge of dominating the world economic scene by the beginning of the 1980s. This did not eventuate. Instead, a snowballing asset collapse beginning in late 1980s threw Japan into a prolonged economic recession and a crisis of self-confidence, from which it is only now emerging.

Whilst Japan's most recent economic drama has been played out, the global and regional economic environment has moved on. In particular, the United States has re-established its global economic leadership with strong economic growth since the early 1990s, and China and India, both closed to the world economy in past decades, are now established as major global market players. Importantly, the US economic and business model, philosophically based on open markets, free trade, small government, low taxation and an emphasis on the creation of 'shareholder value' has attained widespread acceptance around the world. It stands in considerable contrast to the long-term communitarian ideas of the once successful 'Japanese Management Model'. The Japanese model is no longer considered a major threat by the West, but economic history suggests that the Japanese approach to economics and business should not be dismissed lightly, and that better understanding of the status quo in Japan might well pay dividends in the longer term.

This paper utilises an adapted and simplified version of a highly sophisticated comparative business systems model developed by Redding (2005) based on the idea that business systems are best understood in terms of their unique societal circumstances. The adapted model (see Figure 1 below), which has previously been utilised in an earlier conference paper by Grainger and Chatterjee (2007) to compare and contrast the business systems of China and India, relies upon Whitley's (cited in Redding, 2005) interpretation that socio-cultural factors underpin relevant institutions, and that the dynamic interrelationship between the resultant institutional framework and the business system itself is critical. Specifically, the adapted model will be used to describe the Japanese business system in terms of its global and regional context, key historical influences, culture, role of the state and institutional framework.

Following Redding, the institutional framework is conceived of as the institutions affecting financial, human and social capital, where social capital is conceived of as the legacy of formal or informal institutions which provide certainty, or trust, in the conduct of business in a national context. The business system itself is conceptualised as the interaction of enterprise ownership (also taking into

account the concept of corporate governance), corporate networks and alliances, and enterprise level management, focusing on the coordination and control of financial, technological and human resources. The model is to be understood in a holistic way (from Ragin, cited in Redding, 2005), and ultimately relies on understanding through detailed or 'thick' description (following Geertz, cited in Redding, 2005). Although the current exercise is necessarily limited within the constraints of this relatively short paper, the principal objective is towards a better understanding of the Japanese business system, and in particular, to see if there are indications of a convergence towards the currently triumphant US free market model, or if Japan's traditional communitarian approach might survive, in one form or another.

FIG. 1: COMPARATIVE BUSINESS MODEL (ADAPTED FROM REDDING, 2005)

## Modelling the Japanese Business System

### Global and Regional Context

During post-war reconstruction, the Japanese bureaucracy and private sector worked closely together (Chen, 2004) to take advantage of unique conditions which were highly favourable for Japanese economic expansion, export growth and the maintenance of stability and order in domestic markets. As Noland (2001) noted, Japan was a major, perhaps the greatest, beneficiary of the post - war liberal international economic order established by the victorious allied nations. For example, the GATT and its successor, the WTO, orchestrated reductions in international trade barriers which considerably benefited Japanese industry and enabled increased living standards, and in the earlier stages of Japan's postwar reconstruction the IMF and the World Bank financed major infrastructure projects. Beeson (2007) also saw the benefits that Japan reaped from direct assistance from the US, coupled with access

to developing American markets, suggesting that although Japan emerged as the main engine of economic development and Asian regional integration after WW2, this was because of special and possibly non-repeatable historical circumstances.

The Japanese post war boom reached its zenith in the late 1980s, with real estate prices reaching their highest levels in 1988, and stock market prices peaking in 1989. These markets crashed in early 1991, and by 1992 the Nikkei stock index had fallen by more than 40% of the 1989 level. The central problem of the 1990s recession which followed was the large number of non-performing loans made by banks and other financial institutions. It is also believed that even more loans were extended to defaulters in order to give the appearance that they were meeting their payment responsibilities. Further, as the banks began to lose profitability, they started to restrict lending, which led to an increased cycle of bankruptcies, and the downward spiral had started. Firms failed, and unemployment began to rise. Corruption scandals began to emerge in the press, and public confidence in corporate Japan was rapidly eroded (Hamada, 2005). In combination with this domestic chaos, externally generated competitive pressures resulting from economic globalization, created an environment in which industry restructuring and different approaches to economic policy were seen as imperatives. In particular, intense competition from East Asian nations in industries the Japanese once dominated, and the globalization of production in major industries such as automobiles and IT hardware, further exacerbated the situation. At the same time, Japan has been inevitably propelled towards economic liberalization and the opening of markets by the increasing influence of multilateralism in the international political economy, where both the scope and enforceability of multilateral agreements has increased significantly since the peak of Japanese economic prosperity in the 1980s (Schaede and Grimes, 2003).

The rapid appreciation as a result of the 1985 Plaza Accord provided considerable encouragement for many large and small Japanese manufacturers to at least partially re-locate offshore (Beeson, 2007). Considerable funds were invested by Japanese corporations in low wage high skill economies in East and South East Asia, while at the same time, producers in Korea and Taiwan enjoyed productivity gains combined with a devaluation of their currencies against the yen, which further placed Japan's domestically based lower technology and assembling industries under pressure. In the high technology area, US and European IT and bio-technology firms were outperforming Japanese companies. Conditions in this new environment did not favour Japan's strengths in quality assured, mass production of consumer durables and industry policies which had fostered such industries were unsuited in facilitating the newer knowledge based industries. In sum, at the close of the twentieth century, the

industrial base that Japan had so successfully established in the post war reconstruction period and beyond, was under threat from global and regional competitors, and was being moved offshore or 'hollowed-out'. An entirely new industrial platform, together with appropriate economic and currency policies was urgently required (Schaede and Grimes, 2003).

On the world political stage, Japan's performance throughout this period was also a cause for concern. Despite the fact that Japan was the second largest economy in the world, its influence on global economic policy through international economic institutions such as the WTO, or other forums was far less than was generally expected. Broadly speaking, Japan's attempts to exert greater influence on such institutions and through them the world trading environment, has been limited by a general reluctance to oppose the US, the world's sole superpower, regional antipathy towards Japan following the Pacific War, and the primacy of domestic political interests (Noland, 2001). In its own region, Japan has really failed to wield significant political influence, or to establish itself as a political leader, although in economic terms, Japanese engagement with East Asia has certainly been substantial. Through collaboration with the private sector, the Japanese government has been able to encourage the regional relocation of domestically declining industries, as well as to orchestrate effective control of important resources in offshore locations through the use of official development assistance (ODA) and technical, advisory, insurance and financial support of Japanese businesses. Despite this, outward investment flows from Japan towards East Asia have actually declined by about 80% since the mid 1990s (coincidental with the Asian Financial Crisis), but FDI towards the US has continued to grow. Importantly, this indicates that Japan's most important economic and political relationships lie outside the region (Beeson, 2007).

Internally, the official Japanese response to the various pressures surrounding globalization has been '*kokusaika*' (internationalization). Prime Minister Nakasone made internationalization public policy at the declaration of '*kokusaika kokka*' Nihon (Japan, an international nation) in the Diet in February 1984. In terms of economics, *kokusaika* referred to a general deregulation and liberalization of the Japanese way of doing business. Politically, internationalization meant making reforms that would make the Japanese system more representative, for example by removing or reducing the rural gerrymander, and acting on political corruption. Social *kokusaika* meant opening Japanese society to foreigners, and eliminating all forms of discrimination, and external *kokusaika* meant that Japan would make an appreciable contribution to the international community (Itoh, 1998).

According to Clammer (2001), two fundamental Japanese cultural phenomena, so-called

*'Nihonjinron'* (theories of Japaneseness), which centre on Japanese uniqueness and difference to others, in terms of culture, language, psyche and physical make-up, and what is seen as the right to be different from externally imposed norms and constraints, have resulted in an insular, conservative society, which is, for example, generally resistant to immigration, and is unwilling to moderate the negative effects Japanese foreign aid, especially on the ecologies of various South East Asian nations. In particular, it has resulted in the trivialization of *kokusaika*, which has been reduced to a fashion for learning English, adding foreign words to advertising, consuming small quantities of foreign foods or other goods, and going overseas for holidays. Itoh (1998), concluded that a *'sakoku'* (secluded nation) mentality is at the core of Japanese resistance to trade liberalization and economic deregulation, suggesting that the Japanese proclivity to isolation was rooted in the cultural effects of geographic isolation as an island state, and the Tokugawa regime policy of isolationism from 1639 - 1868.

### **Key Historical Influences**

The purpose of the following table is to identify, with maximum efficiency in terms of space, those events or influences from Japan's recorded history, which have had the most significant impact upon the contemporary Japanese business system. It is necessarily a subjective process and does not purport to be a history of Japan. It will inevitably draw criticism from some because, in their view, some important factors have been omitted, and from others because, from their perspective, it has included factors which ought not to be included. Reference will be made to various historical events in the following discussion.

TABLE 1: SELECTIVE CHRONOLOGY OF EVENTS IN JAPANESE HISTORY

EVENT / PERIOD	IMPACT
<b>Unification</b> (Yamato 300 - 701)	Emergence of unified state under powerful clan. Origins of contemporary imperial dynasty. Prince Shotoku (574 - 622) promotes adoption of Chinese social and administrative ideas and adopts Buddhism. Chinese written characters are introduced. Taika Reforms and Taiho Code undertaken.
<b>Nara and Heian</b> (710 - 1185)	Imperial cities built on Chinese models at Nara and later Kyoto. Buddhism adopted as a state religion. Invention of kana (Japanese script adapted from Chinese characters).
<b>Kamakura</b> (1185 - 1333)	Military government established at Kamakura in Eastern Japan., while Emperor remains in Kyoto. Influential Buddhist sects founded.
<b>Ashikaga</b> (1333 - 1573)	Muromachi district of Kyoto becomes headquarters for Ashikaga shogunate. Prolonged civil unrest - the Onin War 1467 - 1477. Pacification and reunification of Japan begins with Oda Nobunaga, and completed by Toyotomi Hideyoshi in 1600.
<b>Edo (Tokugawa)</b> (1600 - 1868)	250 years of stability under Tokugawa shogunate, assured by centralist political controls, state sanctioned social hierarchical relations and isolation. Emperor remains in Kyoto. Japan closed to outside world. US Commodore Perry arrives in 1853, and Treaty of Kanagawa signed, establishing trade relations with US.
<b>Meiji</b> (1868 - 1912)	Daimyo system collapses, with restoration of emperor to real power in Tokyo; rapid modernization: Western style political institutions, industrial technologies and military. Sino-Japanese and Russo-Japanese wars.
<b>Imperialism</b> (1912 - 1945)	Japan aggressively expands in East Asia in military and economic terms; emergence of zaibatsu industrial groups; Japan invades China, attacks Pearl Harbour and subsequent catastrophic defeat by Allied Powers.
<b>Postwar Era</b> (1945 - 1983)	Spectacular economic reconstruction of Japan utilising cohesive relationships between the Japanese state, bureaucracy and emergent keiretsu industrial conglomerates. Oil crisis 1973.

Sources: Beasley, (1973); Hane (1986); Reischauer (1988) and Whitehill (1991).

## Culture

As can be seen from Table 1, Japan has been a major beneficiary of imported cultures and technologies, despite that fact that it has been officially closed to the outside world for long periods in its history. Over the past one hundred years or so, Japan has been at times the focus of international attention, most famously on the basis of its rapid industrialization following the Meiji restoration, its infamous regional international relations activities and aggression in the early to middle twentieth century, and economic reconstruction and return to first world status and the world community following the end of the Pacific War. Largely because of this history, knowledge about the country and culture was enthusiastically sought and developed by both Japanese and Western scholars. Among classic authorities in the field are Nitobe, (1905), Reischauer (1977, 1988), and Hane (1986) for socio-

cultural insights, and Dore (1987) and Morishima (1982) for socio-economic accounts. These authors collectively outline the behavioural characteristics and manifestations of Japanese culture, which are built on the *Yamato Damashii*, the spirit of the land of Japanese, or *Bushido* values, which can be summarised as strong group loyalties based on selfless service, orderliness, self-discipline, and pragmatism.

Despite these foundations, certainty is diminishing with respect to Japanese cultural values and national psyche in the face of the recent and dynamic changes to both external and internal environments. In short, the nation is in transition, and some would say facing cultural and identity crises. The asset collapse of the early 1990s which ushered in a decade of recession resulted in bankruptcies, job losses on an unprecedented scale, and a high unemployment rate. These drastic changes in the socio-economic environment coupled with the drastic domestic demographic changes, especially aging of the population and workforce, as well as the tidal wave of global influences and digitisation have accelerated the otherwise gradual process of cultural evolution in the country, resulting in a paradigm shift.

Major generational change in corporate Japan is also highly relevant to this discussion. According to Grainger and Miyamoto (2007), there were three significant cohorts in post-WWII corporate Japan: 1) the so-called 'corporate warriors' who grew up and live with the traditional *Bushido* values and work ethos and constituted the backbone of Japan's post-WWII socio-economic developments; 2) 'company men' as represented by the Japanese first 'baby boomers' (born between 1947 and 49) who were raised at home with the traditional Japanese values but at (at least elementary) school under the reformed education paradigm built on the liberal American values (i.e., independence - individual freedom and right); and 3) 'pseudo-career men' represented by the second-Baby Boomers (born between 1971 and 1974) who grew up with the Western ideology both at home and school, but who seemed to lack both mental and professional discipline. From the 1990s onwards, an increasing number of the self-disciplined, loyal corporate warriors began to leave the workplace to be replaced by the new generational Japanese who reputedly have a much lower regard for the traditional virtues of selfless service and painstaking pursuit of self-enrichment. Unfortunately for Japan, this dynamic socio-cultural and demographic change took place just as the country began to face a myriad of complex global and domestic challenges.

Morishima (1982) noted that there have been a number of major crises in Japan's history, although without exception, the country has demonstrated its ability to successfully reinvent itself

through innovative and conscientious 'indigenisation' of advanced foreign cultures and technologies. To be more specific, on those occasions, Japanese leaders pursued the country's institutional renewal utilising the so-called *Yamato* spirit and *Bushido* values (Morishima, 1982; Grainger and Miyamoto, 2007). In the early 21st century, however, the reform and renewal logic in both public and private sectors has been dominated not by traditional cultural principles and values, but by the Western logic of economic and market efficiency. Reform efforts by contemporary political and corporate leaders have been radically redefining the parameters of the country's institutions. This is particularly evident in corporate Japan, where there is evidence that a growing number of Japanese companies have been experimenting with Western management and human resource management logics and models in their reform efforts (Grainger and Miyamoto, 2007).

From 2007 onwards, the first baby-boomers will begin to retire, and they will inevitably pass their managerial level decision-making authority to the next generation. Given the considerations in the previous paragraph, it seems possible that the Japanese would experience quite a dramatic culture swing away from the traditional and values. However, close observation of Japanese society in the recent past suggests such logic might be premature. The recent resurgence of popularity of Nitobe's *Bushidō* and strong interest in Fujiwara's (2005) book '*Kotsuka-no-Hinkaku*' (Dignity of the State), which have both emphasised traditionalist and conservative values, is noteworthy. Both seem, on face value, out-of-place in the era of globalisation and in the context of Japanese institutional and corporate renewal driven by the Western logic. Some idea of the popularity of these works can be gained when it is understood that Suchi's (2006) version of Nitobe has been reprinted 18 times since 1998 by 2006 and Naramoto's (2004) interpretation has been reprinted even 36 times between 1997 and 2004. Fujiwara's book, which prescribes the precepts of the Japanese in the 21 century on the basis of the *Yamato* spirit and *Bushidō* values, sold over 2.5 million copies and earned the title of 'best selling book' for 2006. These phenomena indicate strong grass-roots interest by contemporary Japanese in traditional principles and values. A reasonable assessment of the cultural status quo might be that the Japanese are re-examining the reform process in the light of traditional Japanese principles and values, and at the same time the relevance, significance and applicability of those principles and values in the emergent globalisation of their society, economy and political situation.

## **Role of the State**

Traditionally Japanese state leaders have promoted the idea of big government, in which their general approach to policy planning and implementation has been 'economy first and social security second'. As a late modernising state following the Meiji Restoration, and later a post-WWII state under reconstruction, both sets of leaders desperately needed to prioritise economic development and prosperity as a means of restoring the full sovereignty and social and economic stability. They did the job superbly well, and the economics literature commonly attributes the resource-poor island nation's economic success to the active intervention of the state, and the development of political and bureaucratic partnerships with the private sector (Nakamura, 1981).

As for social security, the state has mainly left the matter to society itself, calling for the country's cultural heritage of collective identity, mutual help and self-reliance. These ideas have been traditionally embedded in Japanese communities and families, and are more or less equivalent to the recently popularised concept of 'social capital', or Abramovitz's (1986) 'social capability' concept. In fact, the Japanese state has always remained reactive and somewhat reluctant to engage in comprehensive social welfare programs, both in the pre-war era as suggested by Taira (1967), and also in the post-war era. Although the US-led Allied Occupation Force introduced and prompted modernisation of the state's social welfare system, the post-war Japanese government, in absence of sufficient economic infrastructure, simply could not afford a new approach. Against this background, companies were left to assume responsibility for meeting the social welfare needs of workers (Shinkawa, 2003).

Public spending in Japan has been increasingly financed through the issuance of government bonds. State leaders began to issue government bonds to raise capital in 1965 and have gradually grown more reliant upon this financial tool. More recently, in a desperate effort to revive the post-bubble economy and implement structural reforms, the government began to issue new bonds at quite a concerning rate. According to one estimate, the Japanese government had outstanding bond payments liabilities of 541,798 *billion yen* as of the end of 2006, which was 1.05 times more than Japan's GDP (Ministry of Finance of Japan). Given the rapidly aging population, a declining workforce, and the future need for greater social welfare for the aged, the geared state financing has placed a shadow over Japan's future. It is increasingly evident that the state can no longer continue its conventional

management approach, in the context of the changing domestic environment, and the growing intensity of globalisation fuelled by neo-liberal economic logic.

## **Institutional Framework**

### **Financial Capital**

After the end of the Second World War, Japan's economy was decimated and required a very large amount of capital investment. This required the Japanese government to provide sponsored financial services to augment the existing commercial banking system. The Bank of Japan (BOJ) guaranteed and allowed commercial banks to make large, long term loans to corporate clients, where ongoing capital injections without demands for immediate repayment were required to facilitate reconstruction. Effectively, Japan's banks became corporate investors, and this was most commonly achieved through a 'main' bank, which was part of an industrial group (Turetsky and Tudor, 1996). This became known as the 'main bank system', or MBS.

Financial regulation was also used as a means of encouraging economic growth. Artificially low interest rates and strategic allocation of capital, determined as a matter of government policy, were important in this context. During this high growth era, low cost investment funds were made available, and priority was given to the iron, steel and shipbuilding industries. The bond market was constrained as part of the low interest rate policy, and firms were therefore obliged to utilize the banking system to raise funds. The Japanese financial authorities utilized a so-called 'convoy system' (in this analogy, the convoy could only proceed at the pace of its 'slowest' member) to protect weaker banks. The system restricted the entry of new banks, expansion of existing banks, development of new products and set deposit rates to manage profitability and minimize or mitigate bank failures. When member banks experienced financial difficulties, stronger banks provided 'rescue' loans, or absorbed failed banks into their own operations (Nabeshima, 2000).

The full significance of these financial arrangements is best understood in the context of the so-called 'keiretsu' system, which are 'groups of closely affiliated corporations and lending institutions that own a large proportion of one another's common stock and share common Directors of their Board' (Constand and Freitas in Turetsky and Tudor, 1996). In the Japanese postwar financial system, the power of shareholders was limited, and interlocking shareholdings amongst firms protected corporate management from non-firm shareholder influence or takeover. During this high growth era, the main

bank system monitored the performance of corporate management on behalf of shareholders. "In short, the financial mode of regulation in post-war Japan may be characterized by the disciplining of the corporate management by the MBS and the socialization of risks by the government and the BOJ (Nabeshima, 2000: 109)".

This was a highly successful system from the beginning of Japan's postwar economic recovery until the mid-1970's, or just after the 'oil-shock' of 1973, when the OPEC nations dramatically increased the price of crude oil, causing great consternation in the developed world, but particularly in Japan, which was totally dependent upon imported petroleum products. As noted by Tohyama (2000) (2000), relative economic stagnation from the mid-1970s (annual sales growth rate from 1965-73 was approx. 16% and from 1974-80 was approx. 12%) saw a decline in the demand for capital from larger firms, and pressure on the price of capital. That is, less capital at lower prices was needed. As it happened, capital already accumulated by firms in the 1970s and 1980s meant that they were able to increasingly utilize internal funding sources. This change is reflected in the fact that between 1965 and 1973 internal financing accounted for almost 32% and external financing around 42%, and between 1981-93, approx. 57% was raised internally and 34.8% externally. Where external funding was sought, firms began to look beyond the Japanese banking system such that bank borrowings declined from almost 39% in the 1960s to approx. 9% in the 1980s. Raising money via the issue of shares in foreign markets became popular, leveraging the deregulation of domestic financial markets in response to US pressure after the 1980s. Firms became investors to increase their earnings, and the established mediating role of the banks was reduced, as non - bank money flowed into stock markets and real estate speculation.

Nabeshima (2000) observed that in the late 1980s, corporate financial deficits began to increase, as companies facilitated by deregulation, increasingly borrowed using equity related financing methods, in order to invest and take advantage of an economic boom. The disciplinary or monitoring function the main banks was compromised as a result of these changes in financial arrangements, and by the late 1980s there was excessive investment by firms. Banks, which were under pressure to find new business, commonly entered into high risk investments which they would have previously avoided. The end result of this was abnormally high rates of expansion, and ultimately, the bursting of the asset price bubble in the late 1980s. Clearly the financial system which had been developed in the post war era had become dysfunctional. As Katz (1998), put it, when capital markets allocate money efficiently, the economy was likely to be healthy, and this was no longer the case in Japan. The Hashimoto government introduced a package of reforms (so-called 'Big Bang') which it hoped would transform the over

regulated financial system into a more efficient and competitive system. However, there was substantial resistance and many banks, securities firms and insurance companies resisted the changes because it meant each of these types of financial firms would be able to enter each other's previously quarantined business area, with the competitive pressures potentially resulting in large numbers of each of these kinds of firms exiting the financial services industry.

### **Human Capital**

The 1989 asset price collapse had a savage effect on Japanese employment rates. The ensuing corporate restructuring sharply increased Japan's unemployment rate to 5% by the first years of the twenty first century, which was a shock to a Japan which was accustomed to having the lowest levels of unemployment amongst developed nations ("Business: Working Harder: Employment Agencies in Japan," 2004). The recession, which lasted for a decade, was an unsettling period and the self - confidence of the nation was challenged.

After a very difficult ten years or so, Bank of Japan (BOJ) has quite recently noted ongoing and healthy exports and business investments, as well as rising household incomes and consumption patterns. ("Asia: Depends on Where You Are: Japan's Economic Recovery", 2006). In the year 2006 to April, the numbers of those actually working or seeking work rose by 150,000, taking the total to more than 66.5 million. There were more jobs on offer in Japan than applicants, albeit that not all such jobs were permanent, and nor were they necessarily conveniently located. There was, in fact, a strong regional bias to Japan's employment profile. In the 480 km stretch from Tokyo to Osaka and beyond Kobe, job prospects were very positive. For example, in Aichi prefecture there were 1.8 jobs on offer for every applicant - in Tokyo, the ratio was 1.6:1. At the remote extremities of Japan, however, the picture was quite different. In Okinawa and Hokkaido, for example, unemployment figures remained stubbornly high. Regional variations such as these were repeated all over Japan (ibid).

Now that Japan has seemingly returned to a period of economic expansion, it raises the issue of appropriate human resources or capital, to staff the upturn and there are some major challenges. The first of these lies in the demographic profile of Japan. In June 2006, it was announced by the Japanese government that fertility rates (the average number of children a Japanese woman bears in her lifetime) had fallen to a record low of 1.25 in the previous year. Based on these figures, the government predicted that the Japanese population would fall to 100 million (down from 128 million) by the middle of the 21st century ("Ageing Japan," 2006). Another major challenge is the aging of Japan's population. Japan's proportion of elderly persons is forecast to reach 30% by 2025, and a very large group of Japanese, the

baby boomers, will begin to retire from 2007. Accompanying this trend, will be a fall in the population of youngest workers - currently, there are 16 million Japanese in their mid - 20s, but this will fall by 3 million over the next 10 years. Ultimately, fewer workers will support more retirees, and commentators suggest that this will lead to a decline in living and education standards, and government under extreme financial pressure because of obligations to retirees. Solutions may lie in making it possible for people to work longer - today, 90% of companies have a mandatory retirement age which is most often 60, the legal minimum. Other ways of alleviating the situation would be by more radically lifting the minimum age for pensions to 67 or 70, ending age discrimination in employment, and ending the seniority based payment system, which often makes it unattractive to maintain older people in employment ("The Downturn: Greying Japan," 2006).

Japanese corporate sector response to these trends has been less than comprehensive. In order to provide more flexibility in quite difficult circumstances, corporate Japan is making a transition from the formerly pervasive 'lifetime employment' and seniority based wages and promotions systems, towards a system where only a carefully screened inner core of staff would be guaranteed ongoing employment, and where there was much more emphasis on merit or performance based remuneration. Benson and Debroux (2004) were quite critical of the experimental nature of the response, noting that changes appeared to be creating a hybrid HRM system, which had internal contradictions. These contradictions had their origins in the fact that job-based payment and performance criteria for rewards and promotions fundamentally clashed with the traditional Japanese idea of belonging to a company with long-term accrual of benefits, such as a high standard of retirement allowances and conditions. They argued that it was difficult to see how seniority could be eliminated as a criterion for salary increases or promotion while companies continued to use certain levels of seniority as a pre-requisite for promotion, and skills acquisition was still dependent upon on-the-job training. Overall, there were fundamental incompatibilities between the Japanese and Western approaches to HRM, which made a hybrid system problematic.

### **Social Capital**

Fukuyama (1995a) posited that institutional differences around the developed world have narrowed after end of the cold war and the triumph of democratic institutions and capitalist economics. What is left to differentiate such societies in the modern world has its basis in social and cultural phenomena. "In the post Cold War World, the most important distinctions between nations are no longer institutional but cultural: it is the character of their civil societies, the social and moral habits that underlie institutions

that differentiate them (1995a:103)". Further, Fukuyama argued that it was differences in social and cultural phenomena which set economic or business systems apart, since economic activity between and within organizations depend upon social cooperation. The nature and pervasiveness of this cooperation, otherwise know as social capital, is an important determinant for the form and relative success of business and economic systems.

According to Fukuyama, the two most distinctive features of the successful Japanese business system have been the keiretsu network organization, and the lifetime employment system. The keiretsu system encouraged the formation of very large groupings of companies (the six largest horizontally organized keiretsu groups had an average of 31 companies each), preferential trading amongst group members, high levels of internal information exchange which has facilitated highly competitive financial support from member banks, and long term, intimate relationships with supplier companies which has enabled costing flexibility in difficult economic times. Essentially, the lifetime employment system has enabled long term HR strategy and planned professional development, mutual commitment to the success of the corporation between management and workers, and has been highly compatible with the enterprise based union system which has been a feature of the Japanese industrial relations scene in the post war era. Both the networked organizational system and lifetime employment have been voluntary systems not mandated by laws or binding regulations, but based on the high levels of trust amongst persons brought together in the course of Japanese economic life. In other words, a well-stocked inventory of social capital has facilitated the rise of the Japanese keiretsu groups and the concomitant rise of the Japanese economy in the post war era.

There are challenges to this system, however. The first of these was the bursting of the economic bubble in the late 1980s and subsequent prolonged recession that has put the high cost lifetime employment system under pressure. As noted by Fukuyama (1995), Japanese corporate employers have tried every tactic to avoid a wholesale dismantlement of the system. They have shifted employees to other areas of the business, moved them to smaller, second-tier companies in the group, slashed bonuses, forced early retirements, kept workers on the payroll more or less without work, and sharply reduced the employment of new graduates. Although some large corporations resorted to lay-offs, the established lifetime employment system has restrained Japanese corporations from wholesale staff retrenchments. A second major challenge to the high levels of cooperation and trust in the Japanese workplace is the effect of changing work values in Japanese younger workers, already noted above in the 'human capital' section of this paper. It seems likely that the diminution of reciprocal obligation bonds between employers and

employees which is a result of these changing work values, might have the effect of running down Japans' social capital inventories.

## **Japan's Business System**

Japan's business system, as per Redding's (2005) conceptualization, consists of the dynamic interaction of ownership arrangements and corporate governance, networks and alliances, and the operational management of corporations, especially financial, technology and human resources management. As outlined earlier in this paper, the Japanese business system exists in a context which is shaped and limited by its global and regional context, key historical influences, national culture, the role of the state, and the institutional framework. The key point of interest for the Japanese variety of capitalism is really its differences from Anglo-American approaches, and whether or not these differences will persist in the face of contemporary global and domestic economic and socio-cultural pressures.

According to Okabe (2002), there are two distinctive features of the ownership of Japanese corporations. The first is that they (both financial and non-financial firms) have a strong tendency to have their equity owned by the corporations with which they do business, and oppositely, own equity in those counterpart organizations. As at the end of March 2000, financial institutions (commercial banks, trust banks and insurance companies) held 36.1% and non-financial firms held 23.7% of the market value of all the stocks issued and traded publicly, and the proportion owned by corporations was around 60% (Council of Japanese Stock Exchanges, cited in Okabe, 2002). Although these figures do not necessarily indicate the cross shareholding arrangements of particular firms, they do indicate the prevalence of corporate cross shareholding in Japan. The second notable feature, is that shares held by corporations are not generally held for short term income gain, but for the longer term for the purposes of maintaining stability in business relationships - so-called 'stable share holdings' (antei kabunishi).

These unique cross shareholding arrangements have significant historical origins. After the Meiji industrial re-organization of the final third of the nineteenth century, so-called 'zaibatsu' conglomerates as the engines driving industrial Japan. By 1941 they controlled 32% of heavy industry and half of Japan's banking resources, and the four most prominent companies were Mitsubishi, Mitsui, Sumitomo and Yasuda (Clark, cited in Charkham, 2005). The basic structure was a holding company controlled by a founding family, where the holding company controlled a dozen or more companies including a bank, an insurance company, an international trading company and other subsidiaries,

affiliates and associated companies. After World War Two, the zaibatsu were disbanded by the occupying authorities, and subsequently replaced by so-called 'keiretsu' conglomerates, where cross shareholdings between group companies were substituted for family ownership and holding companies. They are arranged vertically (eg. Toyota) or in diversified horizontally arranged company groups - Mitsubishi, Mitsui and Sumitomo are examples (Charkham, 2005).

Okabe (2002) suggested that the benefits of cross shareholding included the maintenance of long term economic relationships with clients, and the prevention of hostile takeovers. The disadvantages include increases in corporate risk, inefficient allocation of capital and that corporate monitoring may not be sufficiently vigorously maintained between companies which mutually hold shares, a situation which is exacerbated by the fact that the majority of managers of Japanese corporations have been appointed from within, and they are generally biased towards the rights of employees, as opposed to the creation of shareholder value. Overall, there is consensus that cross shareholding arrangements in Japan are in decline, but remain important in holding conglomerates together, and preventing hostile takeover bids (Charkham, 2005; Okabe, 2002). Abegglen (2001), for example, noted that the Nissei Kiso Kenkyujo (1998) analysis of 2,426 companies suggested that stable shareholders (banks, insurance companies and keiretsu members) steadily declined from around 48% to 41% between 1987 and 1998. Over the same period, cross shareholdings declined from 21% to 16%.

These persistent but declining cross shareholding arrangements are significant in a debate surrounding corporate governance in Japan which arose after the collapse of Japan's economy in early 1990s and the onset of recession. As Abegglen (2001) observed, there are major differences between Japan and the West in the conceptualization and understanding roles and purposes of corporations. The Anglo - American world has accepted the idea that shareholders have an undisputed claim to corporate property, which implies that the value of a corporation is exclusively a function of capital investment, with other stakeholders having no significant role. This view generally accepts the position that the principal objective of a corporation is the generation of long-term capital gain to increase 'shareholder value'. The acceptance of the objective of corporate governance as the maintenance and development of shareholder value has no general equivalent in Japan, where it is most commonly understood to mean the maintenance and development of the company for the purpose of protecting the long term interests of employees and other, non-shareholder interest groups. Profit making is regarded as important, but is essentially secondary. Abegglen noted: "The consensus view is rather clear. The shareholder is one of the several stakeholders in the company, and management must take a long view in dealing with all the

stakeholders. Relations with employees, and honoring obligations to employees and their careers, remain the central focus. The Anglo-American focus on the shareholders' interest as the purpose of the corporation is quite clearly rejected (p179)".

Charkham (2005) observed that the idea of family has affected the development of the Japanese market economy. In fact, the Japanese economic system has been described as having its basis on 'community logic', where corporations have an important social welfare role to play and where the government really only becomes involved where unavoidable change or restructuring occurs. The concept of family has been extended to the work organization, and corporate life tends to be all encompassing, demanding the allegiance of all employees in return for paternalistic concern from one's superiors. Consensus within these kinds of family style relationships is an important ideal state in Japan, and is highly valued, just as conflict, is held in low esteem. In line with this ethos, Japanese unions are commonly based on the enterprise and direct confrontation between unions and management is now unusual. Japanese managers generally work diligently to ensure that workers understand policies, and on their part, unions try to understand what company requirements. Generally, Japanese companies are reluctant to 'downsize', placing a high value on the maintaining the employment of their staff. All of this is clearly different in the US and the UK, where markets are allowed to operate more or less freely, and the state has the final responsibility for social welfare.

As noted by Ahmadjian (2003), especially in the US in the 1980s, corporate governance and investor activism became the mantra of institutional investors. Maximisation of shareholder value was the vaunted objective, and appropriate corporate governance was seen as being achieved through strong, independent boards of directors, and adequately compensated managers. These investors began to demand these standards of non-US corporations, and subsequently brought these attitudes and beliefs with them to Japan. The 1990s economic recession combined with a number of corporate scandals (eg. concealing of stock trading losses at Daiwa Bank, product liability claims at Mitsubishi Motors, and sales of tainted milk by Snow Brand) had raised additional concerns about the corporate accountability so that within Japan there was popular acceptance of the need to improve corporate governance. Following this, there were various reforms in the 1980s towards this end: the issue of stock options became legal in 1997, and quickly spread; boards of directors were downsized, and many companies introduced the position of 'shikkou yakuin' (corporate executive officer) to try to separate the supervisory responsibilities of directors from the operational responsibilities of senior managers.

Despite legislative initiatives and a great deal of rhetoric, there has in fact been little substantial

change to Japanese corporate governance arrangements. Cosmetic changes (stock options and corporate executive officers to replace some managers with board representation) were readily taken up, but greater board independence which would challenge managerial autonomy was more elusive. Perhaps the major reason for the slow progress was that the changes required to have made boards more independent, would have needed to have come from boards which were dominated by senior managers. It is true that Japanese firms with high levels of foreign ownership and a truly global orientation (such as Sony and Orix), have made real governance reforms in Japan, but more domestically oriented firm have been much less proactive (Ahmadjian, 2003).

After the bursting of the asset bubble in the late 1980s, and the recession of the 1990s, macro level challenges to Japan's business system were matched by micro level criticisms of what had become famously known as the 'Japanese management model'. As summarized by McCormick (2004), this model has been useful to embrace a number of distinctive facets of Japanese business and management, and it has its origins factory level studies of the 1950s, in which particular emphasis was placed upon the employment system for 'regular male workers' (Abegglen cited in McCormick, 2004). Japan's spectacular economic successes of the 1970s and 1980s meant that by the 1990s, the components of the Japanese business and management model had been expanded to include consideration of the special characteristics of Japanese culture (group orientation, hierarchical and relationships based upon obligations), government business relations (administrative guidance), the education system (discipline and high standards to produce a capable and conscientious workforce), labor markets (secure employment, seniority system and enterprise unionism), corporate governance systems (main bank system, bank financing and cross shareholdings), factory level arrangements (quality control systems, non-specialized approach to job specifications, JIT) and the keiretsu system (long term alliances within a group of related companies).

In particular, as post bubble criticisms of Japan's long term employment arrangements began to mount, it was increasingly suggested that the existing system limited the flexibility of companies to react to changing global circumstances, and did not adequately reward initiative, risk taking and entrepreneurship amongst managers and workers. Major concerns were the capacity of Japanese industry to pay for an increasing number of older workers, a lack of incentives for younger workers, inflexibility for employers, inadequate opportunities for working mothers, and insufficient training to cope with a fast changing economic environment (McCormick, 2004). Sato (cited in McCormick, 2004) noted that 'lifetime employment' was increasingly interpreted as secure employment with a group of companies, as

opposed to in one company. Despite this, Japanese males still are relatively secure in their jobs, although there has been an increase in management initiated retirements amongst older workers, younger workers have faced difficulties entering the labor market, and there have been revisions to the seniority based salary system, where there has been a trend towards performance based pay, and larger individual differences in salaries according to capability and performance. The resultant picture in relation to human resources management reflects adaptation and incremental change (McCormick, 2004; Holzhausen cited in McCormick, 2004; Rebeck, cited in McCormick, 2004).

## **Conclusion**

Japan's unique business system, arising from a combination of historically and socio-culturally determined circumstances, appears to be on the cusp of major change. This is evidenced by a number of factors. For example, the influence of the cross shareholding system has declined, as has the main bank system, with major companies currently more prepared to seek finance outside the banking system. Further, pressure from external and domestic sources, has resulted in major changes in legal arrangements for corporate governance, although only a relatively small number of Japanese companies have taken up the available options. The Japanese management model, especially those aspects which emphasize the social welfare role of corporate Japan, in terms of security of employment and seniority based remuneration systems, are in a process of adaptation towards market and performance orientation. The institutional framework underpinning the business system, is in the midst of change - foreign players have entered Japan's financial markets and board rooms, and an aging, declining population, and changing attitudes to work amongst those who will replace the 'baby boomer' generation will ensure that the systems which underpin the Japanese business system of the first decades of the 21st century are not the same as those which currently exist, or which have existed in recent times. Even Japanese culture, based as it is on the historical legacy of communitarian consensus and mutual obligation, and respect for established hierarchy, is under strain from within and without - the social capital and trust which has been hard won by the mutually cooperative efforts of Japanese employers, enterprise based unions and workers, is at risk, as major corporations struggle to maintain established systems of secure employment arrangements in conditions of heightened competitiveness.

In sum, if we could use a simple analogy, the Japanese business system could be likened to a pedestrian who knows that he (or she) must cross a very busy highway, and must therefore take

considerable risks in reaching the other side. We could say that at this time the notional pedestrian is looking very carefully both right and left at the heavy traffic, and making the occasional foray into the road, but so far always coming back to the safety of the original curbside, or at least staying close enough to the curb to make an emergency return. In reality, there seems to be a lot of common sense in such caution, as an ill-considered rush into unknown circumstances might well have disastrous consequences. Japan's very considerable industrial successes in the course of its economic history have always been carefully constructed upon solid cultural and social foundations - to abandon this strategy in favor of alien philosophies or approaches without careful consideration would seem to be risky and ill-advised. Indeed, dramatic events in Japan's economic history indicate that conditions can change without much warning, and today's omnipotent economics and business philosophies might be regarded as worthless tomorrow. Change is inevitable, but tailoring responses to unique societal circumstances seems entirely appropriate, even if that process is difficult and time consuming.

# **Restructuring of Japanese Manufacturers Amidst Global Competition**

*Kishita Tetsuhiro, kishita@biz.ryukoku.ac.jp*

*Kyoto, Japan*

## **Abstract**

**This paper is to analyze how Japanese manufacturers changed cost structures in their business to cope with intensifying global competition. The primary framework for analysis depends on the contingency theory, which claims that firms have to adapt themselves to the environment around them in order to survive or acquire competitive edge. The paper first clarifies what globalization is and what impact it has given on Japanese manufacturers. In this context two hypotheses are proposed and tested regarding their cost control strategy. H1: In the industry in which market fluctuates in its size, firms convert fixed cost into variable cost in order to hedge such risk. H2: In the market with slowing growth where economies of scale are strategically achievable, firms reduce the rate of variable cost in order to reduce the average cost. H3: In the market where demands for the product fluctuate and technology continuously changes, firms convert fixed cost into variable cost in order to hedge such risk.**

## **Introduction**

The Japanese economy has been internationalized since the late 1980s with sharp appreciation of the yen as a turning point. Chinese manufacturers as well as Koreans began to enter into the Japanese domestic product markets in the beginning of 1990s, and European or American firms also began to take over Japanese manufactures in the late 1990s. It is an undisputable fact that the globalization in economic competition has given great impact on Japanese manufactures and such impact was amplified by the endogenous factor in Japanese domestic economy: the collapse of bubble economy in the beginning of 1990s. The purpose of this paper is to analyze how Japanese manufactures changed cost structures to cope with intensifying global competition. The primary framework for analysis depends on the contingency theory that claims that firms have to adapt themselves to the environment around them in order to survive or acquire competitive edge. The paper first clarifies what globalization is and

what impact it has given on Japanese manufacturers. In this context two hypotheses are proposed on their cost control strategy. These hypotheses are tested by the data of 238 companies' financial statement. The results of the analysis gave us enough evidence to support the hypotheses. Another detail analysis on automobile companies showed that their cost strategies were different in effect and pattern though most companies in the industry take the same cost strategy based on the second hypothesis.

## **Theoretical Background & Hypothesis**

### **Theoretical Background**

The primary framework to analyze in this paper depends on the contingency theory, which insists that firms have to adapt themselves to the business environment surrounding them to survive. Based on this theoretical framework, the proposition will be proposed; what cost control strategy Japanese manufacturers designed and how they implemented (or have being implementing) it, in order to cope with intensifying global competition. We first consider what impacts the development of globalization has made on Japanese manufacturers. Then we propose hypotheses about compatibility between conditions of competition and cost control strategy.

Before we discuss this issue, however, we must define what globalization is. Needless to say, globalization is a phenomenon affecting all the aspects of our lives, for example, politics, economics and culture. In the economic field, the International Monetary Found defines globalization as “the growing economic interdependence of countries worldwide through increasing volume and variety of cross-border transactions in goods and services, freer international capital flows, and more rapid and widespread diffusion of technology” (IMF, World Economic Outlook, May, 1997). In the business field, globalization has intensified international competition. Increasing volume and a variety of cross-border transactions in goods and services has pushed down market profitability. Freer international capital flows have helped foreign investors to become stake holders of domestic companies and claim more returns. More rapid and widespread diffusion of technology helped the companies in developing countries to enter into incumbent markets. In a word, globalization in business field means that constant entries of new competitors intensify the competition in the incumbent markets. The effects of globalization on Japanese manufacturers have been amplified by the macro-economy problem in Japanese domestic markets: the collapse of the bubble economy (assets inflated economy in the late

1980s up to the early 1990s). The globalization of the Japanese economy has developed intensively since the late 1980s. Japanese manufacturers exported many products abroad and earned a lot of foreign currency despite of the sharp appreciation of the yen. The foreign currency that Japanese manufacturers earned flowed into the domestic real estate market and the domestic stock market. All the assets in Japan, to say nothing of stock, were inflated. Many manufacturing firms were able to finance much low-cost money by making the most of their appreciated stock prices in the market. With the money financed like this, some of them employed more people and invested a huge amount of money to extend their business; others bought real estate or stock for speculative profit. As a result, all kinds of assets in Japan were more than ever inflated. Eventually such a bubble economy, however, collapsed in the early 1990s. The Japanese manufacturers had redundant capacity in production facilities and redundant human resources. In other words, they became too big to make profit in the shrunken market. The Japanese economy in the 1990s fell into a deflationary spiral. The prices of stocks and the value of land had been consecutively declining for several years. The decade of the 1990s in the Japanese economy was called “a lost decade.” However, under such circumstances various deregulations were implemented and entries of foreign firms into the Japanese market increased. As a result, product markets have gotten to be in a state of excess-supply, where market participants have been engaged in cutthroat price competition.

In a nutshell, at the same time Japanese manufacturers have had to compete with foreign companies as well as those domestic, they have had to restructure and reengineer their businesses. We should consider their cost control strategy to cope with global competition in this context. Therefore, we may propose the following proposition based on this theoretical framework.

Proposition: Under global competitive pressure, the surviving firms must have change patterns of cost behavior successfully to ensure profits.

## **Hypotheses**

Considering the wide scope of Japanese manufacturing industries, however, we can guess that their cost control strategies have variety. We may, however, propose two different types of hypotheses based on the condition of competition in industries, because firms change their cost strategy according to the change of market's conditions. We can find a change of market's conditions in market's size trend after Japanese manufactures got involved in global competition. Japanese companies enjoyed

consistent growth in sales amount until the beginning of 1990s, namely before they were involved in global competition. They, however, faced with both downward pressure of product's price and fluctuation of sales amount after the development of global competition. As a result, some markets began to show fluctuation in sales amount and other began to show sluggish growth.

Electric equipment industry, for example, is an industry in which market size began to fluctuate after globalization because many competitors continuously provide new products with innovation and consumers' need is diversified. Manufactures in the industry cannot have product-lines that have big sales amount with a long life-cycle in such a market. They have to produce many kinds of products with small amount because expected amount of sales in each product is uncertain and is not so large. They have to produce each goods as much as consumers want otherwise they are exposed to the risk of holding dead-stocks. In such an industry with uncertain consumer demands and continuous innovation, manufacturers have to reduce break-even-point down in order to hedge such risk. Improvement in break-even-point requires them to reduce fixed cost or the rate of variable cost (marginal cost). Since it is, however, difficult for them to reduce both fixed cost and the rate of variable cost at the same time, they try to reduce fixed cost instead of the rate of variable cost. In other words they convert fixed cost into variable cost.

For example, let us indicate fixed cost, the rate of variable cost ( $< 1$ ) and the sales amount of break-even-point by  $F$ ,  $v$  and  $BEP$  respectively. Then we can define  $BEP$  as  $F/(1-v)$ . Here  $(1-v)$  is referred to as marginal profit. Supposing that fixed cost decrease from  $F$  down to  $F'$  and the rate of variable cost increase from  $v$  up to  $v'$ . New break-even-point moves to  $F'/(1-v')$ . New break-even-point become smaller than the old one as long as the rate of new fixed cost to old one is less than that of new marginal profit to old marginal profit. We can induce the first hypothesis from this context. ( $\square F'/(1-v') < F/(1-v)$   $\square$   $F'/F < (1-v')/(1-v)$ )

H1: In the industry in which market fluctuates in its size, firms convert fixed cost into variable cost in order to hedge such risk.

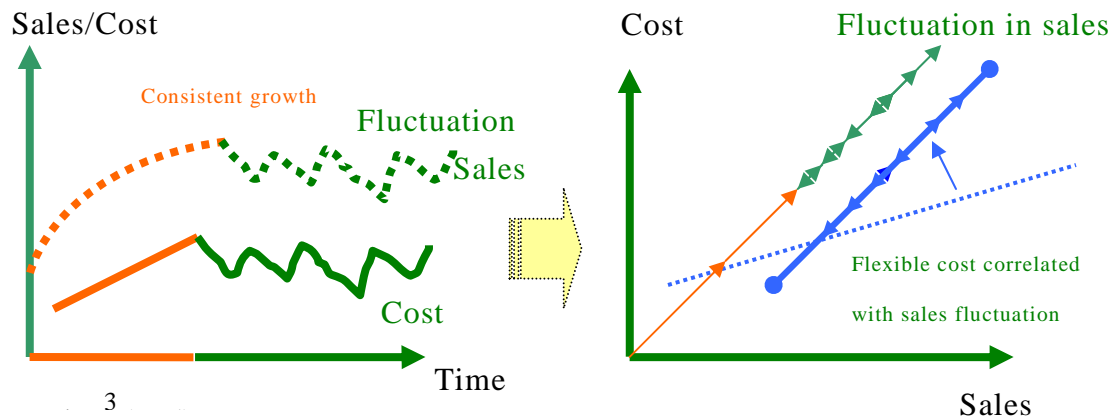

FIG.1: COST STRUCTURE CHANGE; PATTERN-'A'

On the other hand automobile industry is an industry that still grows in its market size though its growth rate slowed. A limited number of competitors (11 companies) dominate market and achieve economies of scale. Although firms in this kind of industry have to invest huge amount of money to install facilities for production, they usually enjoy a low rate of variable cost. When markets continue to expand each incumbent firm in the markets can turn a profit. They, however, have difficulties in striking a profit when the market stops to expand and new entrants come into the market, because the market share given for each firm reduces. Since a large volume of production is most important in economies of scale, they try to achieve a large share of market in a shrinking market. In such a case, they try to reduce the rate of variable cost instead of reducing fixed cost in order to reduce of average cost, which prescribes the strategic (the lowest) price with which each company can compete. Some firms merge each other and other firms take over another firm in the industry in order to acquire a large share of the market. We can induce the second hypothesis from this context.

H2: In the market with slowing growth where economies of scale are strategically achievable, firms reduce the rate of variable cost in order to reduce the average cost. (See FIG.2).

FIG.2: COST STRUCTURE CHANGE: PATTERN-'B'

## Data and Method

### Data

Unconsolidated-basis accounting data of 238 public companies in electric equipment industry, automobiles and auto parts & accessories industry were collected for 12 years (1994 fiscal year to 2005 fiscal year) from the database of Development Bank of Japan. Unconsolidated-basis accounting data of 11 automobiles maker were also collected for 26 years (1980 fiscal year to 2005 fiscal year) from the database of NIKKEY Financial Data for another detailed analysis. Electric equipment industry, automobiles and auto-parts & accessories industries are one of Japanese leading industries. The firms in these industries have been confronting with fierce global competitions. The reason why unconsolidated-basis accounting data were used is that the core companies (or parent companies) in these industries are corporate giants that have variety of subsidiaries in peripheral industries. Therefore if we try to analyze the core business of these companies, we should put focus on the unconsolidated-basis data.

### Method

Comparing two cost-lines estimated respectively for both pre-adaptive period and post adaptive period tests the hypotheses. Pre-adaptive period is the period in which firms had not yet taken any measures to change their cost structure in order to cope with the change of the market. Post-adaptive period is

the period in which firms had taken some measures and changed the cost structure. A ramification point between the pre-adaptive and the post-adaptive was defined as the point at which a time-series cost trend changed remarkably on the scatter graph of sales amount (X axis) and cost (Y axis).

Two cost lines were estimated, respectively for the two periods: the pre-adaptive period and the post-adaptive period. A cost line consists of two terms; fixed cost and the rate of variable cost. Fixed cost is the cost that does not change according to the activity (sales amount). The rate of variable cost is the percentage with which cost changes based on the activity (sales amount). Therefore a cost line equation can be described as

$$\text{Cost} = \text{Fixed Cost} + \text{the Rate of Variable Cost} \times \text{Sales Amount}$$

Cost in the above equation is total cost in business operation that means the sum of cost of goods sold and selling & general administrative cost. Fixed cost for each period was estimated by the average of selling & general administrative costs in each period. The rate of variable cost for each period was estimated as  $\beta_1$  in the following linear regression model.

$$C_t = \beta_0 + \beta_1 S_t + \varepsilon_t$$

$C_t$  = cost of goods sold  
 $S_t$  = sales revenue

If firms can successfully cope with fluctuation of markets, they will shift the cost line upward, which means that the fixed cost estimated for the post-adaptive period should be reduced less than the fixed cost estimated for the pre-adaptive period, and which, at the same time, means that the rate of variable cost estimated for the post-adaptive period should be bigger than that estimated for the pre-adaptive period.

On the other hand if firms can successfully cope with the markets with slowing growth, they will shift cost lines downward, which means that the rate of variable cost estimated for the post-adaptive period should be reduced less than that estimated for the pre-adaptive period, and which, at the same time, means that the fixed cost estimated for the post-adaptive period should be bigger than that estimated for the pre-adaptive period.

We should note that the method to analyze changes of cost structure above mentioned is not statistically rigorous, because of the arbitrariness of determination of a ramification point, and because of inadequacy in numbers of time series data. However this method can tell us a rough trend of cost structure changes.

## Results & Discussion

The results of the analyses for 238 companies were summarized in Table 1. The companies in the three industries: computers & electric equipment industry, communications equipment industry and household electric appliances industry seem to have changed their cost lines according to the pattern-A in the first hypothesis. They seem to have shifted cost lines upward and reduced the fixed cost in accordance with the fluctuating markets.

The companies in other three industries: electric equipment & component industry, other electric equipment industry and automobiles industry seem to have changed their cost lines according to the pattern-B in the second hypothesis. They seem to have shifted cost lines downward by reducing the rate of variable cost, but by increasing the fixed cost, in the markets that have been still growing.

On the other hand, the companies in electric measuring instrument industry and auto parts & accessories industry seem to have shifted their cost lines upward with the increases in both the rate of variable cost and the fixed cost. The companies in these two industries can enjoy still growing markets. They may have invested more according to the growth of the markets.

The companies in industrial electric equipment industry, however, seem to have shifted their cost lines downward with the reductions of both the rate of variable cost and the fixed cost. The effect of reduction in the rate of variable cost seems to be more remarkable than that of reduction in the fixed cost. The companies in this industry seem to have to cope with a shrinking market size. This pattern of cost behavior change may tell us that the companies in a fast-shrinking market give a first step to the reduction in the rate of variable cost instead of the reduction in fixed cost.

Let's take a look at the results of another analysis on the automobiles industry. In this analysis the data were collected in company-basis for 26 years. The purpose of collecting data for such a long time was that the emphasis of analysis was put on comparing the two cost lines between pre-globalization period and post-adaptive period. Pre-globalization was defined as the period until 1980 to the beginning of the 1990s in which the companies had not yet been exposed to the global competition.

Automobiles industry in Japan consists of eleven companies: Nissan, Isuzu, Toyota, Hino, Nissan Diesel, Mitsubishi, Mazda, Daihatsu, Honda, Suzuki, and Fuji Heavy Industry. Nissan, Toyota, Mitsubishi, Mazda, Honda, and Fuji Heavy Industry produce almost all the types of passenger vehicles. Hino and Nissan Diesel are specialized in producing trucks. Daihatsu and Suzuki have been making

only light cars with a less than one liter engine. Honda and Suzuki also have been producing motorcycles for more than half a century.

The results of the analysis in the table 2-1 and 2-2 show that nine companies except Nissan Motor Corporation and Mitsubishi Motors Corporation among eleven companies in automobiles industry seem to have shifted the cost lines downward with the remarkable reduction in the rate of variable cost, but with the increase in the fixed cost. The results obtained were in accordance with the second hypothesis that supposes that firms reduce the rate of variable cost at the expense of increase in fixed costs in the market with slowing growth where economies of scale are strategically achievable.

Nissan Motor Corporation and Mitsubishi Motors Corporation faced with sluggish sales around turn of the century, though nine companies among eleven automobiles-makers have been still expanding their sales amount. Actually both Nissan and Mitsubishi had the great trouble in their business from the late of last century to the beginning of this century. Nissan had hold excessive production capacity because of the sluggish sales, and the company had reduced those redundant resources by what they called “Nissan Revival Plan” under the command of new president, Carlos Ghosn.

On the other hand Toyota Motor Corporation and Honda Motor Corporation have remarkably reduced the rate of the variable cost. The cases of both companies were graphically represented in the Figure 3. They successfully have reduced the average cost by reducing the rate of variable cost, but by increasing the fixed cost.

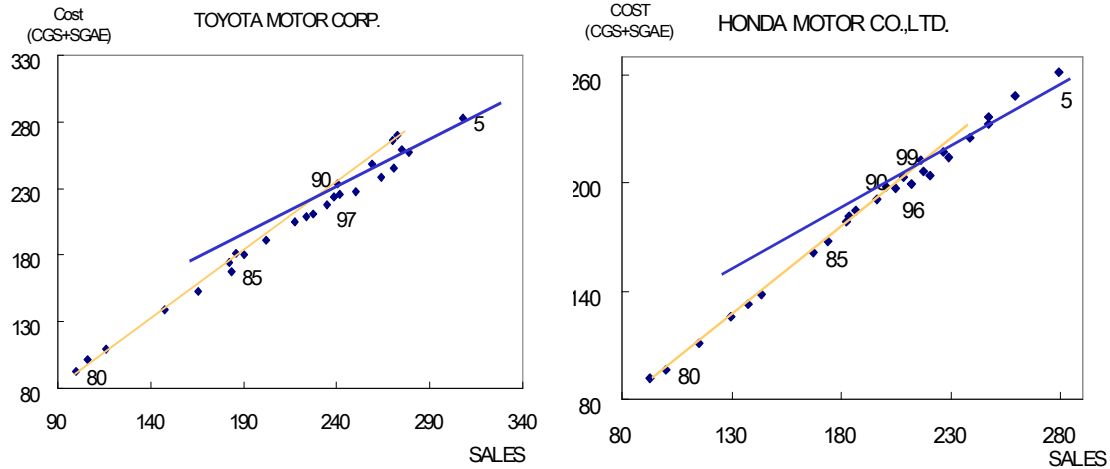

FIG.3

## Conclusion

This paper aimed to explore how Japanese manufactures have shifted their cost structures under the influence of intensifying global competition. The contingency theory claims that firms have to adapt themselves to the altering environment around them in order to survive or acquire competitive edge. The globalization in business environment has been having a great impact on Japanese manufacturers. Intensifying global competition has put pressure on manufacturers to change their strategy, organization and management process. In these interactions with a rapid changing environment Japanese manufacturers changed their cost structure to cope with the uncertain market situation. With this context in mind we proposed the following proposition:

Under global competitive pressure, the surviving firms must have changed patterns of cost behavior successfully to ensure profits. Based on this proposition two hypotheses were proposed and examined.

H1: In the industry in which market fluctuates in its size, firms convert fixed cost into variable cost in order to hedge such risk.

H2: In the market with slowing growth where economies of scale are strategically achievable, firms reduce the rate of variable cost.

With the financial data of 238 public companies in electric equipment industry, automobiles and auto parts & accessories industry, the hypotheses were examined by comparing two cost lines estimated respectively for the pre-adaptive period and the post-adaptive period. We confirmed that most companies in these industries shifted cost lines effectively to cope with the change of the markets according to the hypotheses. We should note, however, that our findings are not statistically rigorous because of the arbitrariness of determination of a ramification point and because of inadequacy in numbers of time-series data. In order to secure the statistical rigorousness or theoretical universality, a further extended study should be required with enough panel data of all manufacturing industries.

## The Paradox of Korea's Globalization

*You-il Lee, [You-il.Lee@unisa.edu.au](mailto:You-il.Lee@unisa.edu.au)*

*University of South Australia, Australia*

### Abstract

The paper argues that Korea's prevailing strong belief in self-sufficiency and the legacy of the state-led and overly regulated external policies which dominated prior to the 1997 financial crisis had become an obstacle to Korea's pursuit of market-driven globalization strategy. Although the momentum of globalization ignited during the financial crisis has become a blessing in disguise, enabling Korea to undertake speedier market opening and draconian structural reforms, if not done by Korean themselves, there has been no fundamental turnaround yet in the mindset of the Korean people, the ultimate measure of globalization. The paper critically evaluates the Korean government's inbound FDI policies since the 1997 financial crisis and realistically appraises apparently inconsistent behaviour of the FDI regime through, in part, the eyes of foreign investors in Korea.

### Introduction

Since the opening of its market to the outside, international capital flows into Korea rose from a meager US\$27.4 million in 1987 to more than \$32 billion in 1996 (Economist Intelligence Unit, 2002: 8). Beginning in the early 1990s, the affiliates of more than 16,000 foreign multinational corporations (MNCs) have established operations in fields ranging from consumer products to high-tech industries operating in Korea. In addition to International Monetary Fund (IMF) -mandated structural reforms, a lower value of the currency (won), declining status of the *chaebol*, or a group of mostly family-owned and managed conglomerates in Korea, and the government's strong push for investment liberalization measures, there was an upsurge of FDI inflows into Korea (Shin, 2005; Kwon, 2006; Harris, 2002; Noland, 2005; Kim and Rowley, 2001; Weiss and Hobson, 1988; Chang, 1988). For instance, during the four-year period after the financial crisis from 1998 to 2001, Korea attracted about US\$52 billion in foreign direct investment (FDI), which is almost more than double the entire amount of the previous four decades (Kim and Choo, 2002: 30). More recently, while the amount of total inward FDI during

the period from 1962 to 1997 was minimal, total FDI during the eight-year period from 1998 to 2005 alone tallied about US\$91 billion on a notification basis, which is nearly quadruple the US\$25 billion posted during the previous 35 years, or about 79 per cent of the US\$115 billion aggregate FDI figure recorded from 1962 to 2005 (Ministry of Commerce, Industry and Energy, 2006). Managing and exploiting the influx of FDI requires a new approach to incoming foreign investment and major adaptations to MNC business practices within Korea. The highly-successful export-driven policies as well as state-centred approach of the past may no longer be a guide to future economic success, at least as far as welcoming, integrating and upgrading foreign business activities within Korea is concerned.

In one important respect, the momentum of globalization gathered during the financial crisis of 1997 was, however, a blessing in disguise. Severe as they were, the IMF-mandated reform programs enabled Korean policy makers to tackle head-on some of the practices that had hobbled the Korean economy for several decades – restrictions to trade and investment, the rigidities of the labour market, excessive regulatory regime, and *chaebol*-led industrial structure. Indeed, Korea's unprecedented liberalization drive in the wake of the financial crisis was *par excellence* in comparison with some other countries that had been similarly inflicted. As a result, given a forward-looking leadership, Korea could end up becoming one of the most open, market-driven economies in the world, rivaling such countries like Singapore, Netherlands, and Ireland. Yet, many Koreans have tended to believe that their government was forced to adopt liberalization measures under external pressure, rather than viewing them being truly beneficial to themselves and to their own economy.

In other words, there has been no fundamental turnaround in the closed mindset of the Korean people in general and some policy makers in particular, being commensurate with their shining achievements in trade and investment liberalization. As soon as a full recovery from the crisis was believed to be in sight, Koreans' innate suspicion of liberalization efforts and their deeply-rooted nationalism have resurfaced, caricaturing foreign capital as ominous vultures that suck out precious national wealth. For example, there have been a host of foreign business grievance cases that cast serious doubts on the Roh government's announced commitment to FDI liberalization and its adherence to the globalization path. Likewise, in view of the recent upsurge in Korea of sentiment opposed to foreign capital due to the growing presence of foreign-controlled banks and to the entry of foreign equity funds, one wonders if we are reverting to the Korea of old – a country once dictated by isolationism, myopia, autarky, and the closed mindset of the people. There are many reasons why such negative perceptions continue to prevail within the foreign business community in Korea. This study shows that a combination of frequent policy changes, lacklustre efforts in policy implementation, excessive regulations, anti-foreign business sentiment within and outside government, and militant labour unions each play significant roles. Equally

important is the Roh government's failure to shift its economic growth paradigm from a mercantilist developmental state to a truly open, market-driven, dynamic economy, thus forever shedding the labels of autarkic "Land of the Morning Calm" and "Hermit Kingdom." This study also identifies that Korean bureaucrats' and policymakers' misperceptions of a basic but fundamental neo-liberal principle of globalization or the IMF bailout packages – minimal state intervention in market and social affairs (Y.H. Kim, 2000) - should not be ignored as a detrimental factor in facilitating Korea's FDI-led globalization.

A major lesson one can draw from the way the government has dealt with the financial crisis and its aftermath is that without a sure turnaround in the closed mindset at the grass-roots level, policy and institutional reforms are doomed to be short-lived. For the government to push the momentum of globalization drive kindled during the financial crisis, Korea must show its strong leadership in demonstrating the benefits of open economy and educating and enlightening the public so that they may develop a more globalized mindset.

### **Research Question: Paradigm Shift?**

Korea's a state-led developmental economic growth model (Jones and Sakong, 1980; Kuznets, 1985; Cheng and Haggard, 1987; Moon, 1988; Wade, 1988; Chu, 1989; Amsden, 1989; Haggard and Moon, 1990; Woo, 1991; Wade, 1992), which has been embedded in strong nationalistic and mercantilistic leadership faced the challenges of the IMF, an unavoidable globalization force. This is true especially if globalization would imply the realization of market democratization and minimization of state involvement. But it was a result of being forced to do that by a crisis. Major structural reforms mandated by the IMF consisted of restructuring troubled financial institutions, improving corporate governance, and enhancing labour market flexibility. The liberalization of Korea's investment regime, however, is a key external reform area for which the substantial efforts of the new government were forced to make. One of the top economic policy priorities of the new administration under President Kim Dae-jung (1998-2002) centred on attracting FDI to Korea with the aim of overcoming the currency crisis and strengthening the competitiveness of Korean industry. Further, the Korean government officially unveiled, in July 2002, a detailed plan to transform Korea into a world-class logistics centre, a knowledge-based economy, as well as an international business and financial hub of Northeast Asia; by rivaling Hong Kong, Singapore, and Shanghai within five years (Lamers, 2002; Kim, 2002a; Kim, 2002b; Raubach, 2002; Seitz, 2002). This was a totally contradictory economic

choice from the previous decades of Korea's export-led industrialization policy whereby the government drew foreign loans as an alternative to FDI (Shin, 2005:387) and pervasive government intervention, combined with large-scale technological development and foreign capital borrowings, were necessary to produce the nation's dynamic comparative advantage (Amsden, 1987; Amsden, 1992; Amsden, 1994). One conspicuous result of the financial crisis-driven reforms was a massive influx of foreign capital, which jumped from US\$6.97 billion in 1997 to \$8.85 billion in 1998 (Graham, 2003; 111). Eventual disintegration of the state from the market and its declining capacity seemed inevitable.

However the prevailing psyche within Korea is that it is perceived by foreign investors to be anti-foreign. And the government still classifies the FDI as a nationalist goal (Shin, 2003). To witness, there has been a host of international business grievance cases that cast serious doubt on the government's announced commitment to FDI liberalization and its adherence to a globalization path. For example, the recent rise in Korea of sentiment opposed to foreign capital due to the growing presence of foreign-controlled banks and to the entry of foreign equity funds (Norland, 2005; Faircolough, 2005), questions whether Korea is reverting to its old tradition. This contradicts statements from the Korean government, which believes and argues that there has been a total transformation in terms of the Korean business environment from a mercantalistic (before 1997 financial crisis) to free-market driven economy (Ministry of Finance and Economy, 2006). The following comment made from a foreign company operating in Korea reflects some insight into the popular attitudes toward globalization:

The Korean government on the one hand wants desperately to encourage foreign investment while there are still other parts of the Government and other parts of society that really don't want to see foreigners become too dominant in Korea. You can't have your cake and eat it too. They (government) have either got to be open like they claim to be and they really got to listen to the needs of foreign investors and accommodate what those people want and be more flexible....

Not surprisingly, as shown in Table 1, our interviewed data shows that 85 per cent (or 40 interviewees) out of 47 foreign CEOs viewed Korea's strong nationalism as the most challenging constraint to the success of the Korea's globalization drive.

TABLE 1: MNCS' PERCEPTIONS ON CONSTRAINTS TO KOREA'S FDI-LED GLOBALIZATION

Areas	Negative factor (number of respondents)	Per cent (%)
Feasibility to become a business centre in the Northeast Asian region (eg finance, logistics)	43	91%
Nationalism/xenophobia/anti-foreign sentiment among bureaucrats and the public	40	85%
Labour inflexibility	36	77%
Lack of Globalization mindset among bureaucrats and the public	30	64%
Inconsistency/unpredictability/ambiguity of policies/regulations	21	45%
Policy implementation	15	32%
Regulatory controls	15	32%
Korean business culture (strong relationship)	9	19%
<i>Chaebol's</i> dominance in domestic markets	8	17%
Lack of leadership	4	9%
Communication (language)	3	6%
North Korea factor	2	4%
Corruption	2	4%

Korea's rather meandering path to globalization, that oscillates between insularity and openness, motivated often by national ethos of self-sufficiency and sovereign obsession as a policy priority may not be a phenomenon only unique to Korea. Indeed it could quite commonly surface in countries with strong traditional values and racial cohesiveness that are at a transitional stage, planning a shift towards a more mature country. But it is clear that the Korean government's ambitions to transform the country into an attractive, adaptable, and responsible world-class country will depend largely upon its dealings with the legacy of its decades of old nationalistic and excessive state interventionist economic growth model with the wide-range of impacts stemming from globalization, which require the principles of market economics.

## Methodology

In-depth interviews have been used as the primary method for data collection. In particular, this research is in part based on findings from recently completed field work carried out between September and November of 2005 and April in 2006, in which 47 face-to-face interviews were conducted with senior executive officers (CEOs) of foreign companies and various foreign chambers of commerce in Korea. Companies interviewed in this study reflected a variety of sources of ownership:

American (United States), Australian, British, Canadian, Dutch, French, German, Irish, Japanese, Korean, New Zealander, Norwegian, Swedish, etc, as did the nationality of the interviewees. Although sample of the firms was small and not fully representative, MNCs were selected based on a wide range of sectors, length of stay in Korea, nationalities of firms, individuals and firm sizes. Sectors include agro-industrial products, automobile products, industrial products, consumer products, petrochemicals, distribution, insurance, finance, advertising, logistics consultancy, lawyers and foreign chambers of commerce etc. The sample covered wholly-owned subsidiaries of MNCs, joint ventures and recent takeovers, both hostile and non-hostile. In all cases of joint ventures, the MNC was the dominant partner. The length of stay in Korea ranged from more than 30 years to recent start ups, with five or six beginning since the financial crisis in 1997. Market structures included oligopolistic, monopolistic, competitive and duopolistic. Some firms were working in a 'sellers market' (e.g. high technology capital goods and raw materials), while others were operating in highly competitive 'buyers' markets' (e.g. final consumer products, including brown and white goods and automobiles). Manufacturers (hardware and software), distributors, and value added retailers were all represented in the sample. The sample was therefore constructed to allow for possible contrasts according to nationality, the nature of the market, the type of business activity and size of firm. The advantage of this approach is that face-to-face interviews are able to delve into important business processes, strategies, interpretations and perceptions which, though extremely important, are very hard to identify using conventional quantitative, survey and macro assessment methods.

Given the highly sensitive nature of the data collected, confidentiality was guaranteed and the views of individual firms are not given in the article, although anonymous quotations are used to make some of the points directly. A list of questions for in-depth interviews and un-structured open-ended format was developed based on the research framework and the findings from the pilot interviews. Interviews were taped, transcribed, and subsequently interrogated, then deconstructed. In this way, according to the principles of grounded theory, the findings and any theory emerge from the data rather than having been forced from some prior hypotheses (Glaser and Strauss, 1967; Bailey, 1987). Qualitative software, Nvivo, is used for data analysis to identify the patterns, themes and causal-effects relationships (Yin, 1994). This entails categorizing respondents' comments according to their subject matter. The programme can then arrange for all comments on related issues, or concerning particular themes, to be viewed together. These comments are cross-referenced with the interview context so that, for example, it will be apparent whether the speakers were from western or Asian firms, with which industries they might be involved and so forth. Interviewees were invited to give their comments on the following subjects:

- The Korean government's FDI policies and institutions such as Ministry of Commerce, Industry and Energy (MOCIE), Ministry of Finance and Economy (MOFE) and Korea Trade-Investment Promotion Agency (KOTRA), and local governments;
- Perceptions and realities of the Korea's FDI policies;
- Does the Roh government have a serious intention to accelerate an effort to make the nation integrate into global economy? Why is Korea's FDI regime, particularly under the Roh administration, viewed as moving backward to the pre-1997 financial crisis? Why is the government attitude towards FDI viewed as nationalistic, neo-mercantilistic and parochial? How is the concept of globalization viewed by the government and the people in general?
- Korean market and its political economy in a broad spectrum and its critical and strategic implications for the better and strengthened future of Korea's effort to induce FDI and integrate into global economy; and
- Korea's current efforts to become a Northeast Asian business centre (eg., logistics, finance, multinational Headquarters (HQs), corporate Research and Development (R&D)) and identify and develop strategies on how the Korean government strengthens its ways of inducing inflow of foreign capital (eg sectors, industries, countries) and maintaining (reinvestment, aftercare services) existing foreign investment.

However, it should be said that one of the weaknesses of this approach is that the sample was relatively small and the responses were therefore indicative of general perceptions, rather than conclusive. Also, the interviews did not focus on all possible issues, but only those raised by MNC directors as critical to Korea's FDI-led globalization.

## **Data Analysis**

As shown in Table 2, two thirds of interviewed company managers saw in Korea strong nationalism; different concept on globalization or xenophobic attitude towards FDI, transparency and inconsistent regulations, bureaucratic red-tape and regulatory bodies, as major challenges and impediments for Korea's moving into a mature economy. Most interestingly, over 91 per cent of the interviewees (43 out of 47) do not believe in realization of Korea's ambition to become a business centre in the Northeast Asian region;

The overwhelming majority of interviewees said they would encourage other foreign companies to invest in Korea. The major reason for the encouragement was the market (48 million people) and the size of the Korean economy coupled with its potential.

TABLE 2: MNCS' PERCEPTIONS ON CONSTRAINTS TO KOREA'S FDI-LED GLOBALIZATION

Areas	Negative factor (number of respondents)	Per cent (%)
Feasibility to become a business centre in the Northeast Asian region (eg finance, logistics)	43	91%
Nationalism/xenophobia/anti-foreign sentiment among bureaucrats and the public	40	85%
Labour inflexibility	36	77%
Lack of Globalization mindset among bureaucrats and the public	30	64%
Inconsistency/unpredictability/ambiguity of policies/regulations	21	45%
Policy implementation	15	32%
Regulatory controls	15	33%
Korean business culture (strong relationship)	9	37%
<i>Chaebol's</i> dominance in domestic markets	8	17%
Lack of leadership	4	9%
Communication (language)	3	6%
North Korea factor	2	4%
Corruption	2	4%

Each interviewee was asked to comment on major areas to be improved in the Korea's transition to a mature economy. Interestingly, contrary to the Korean government's strong belief (Ministry of Finance of Economy, 2006), over 95 per cent out of 47 interviewees believed several factors would delay FDI-driven industrialization. These factors include strong Korean nationalism, unawareness of the principles of market economics, labour inflexibility, inconsistency and unpredictability of government regulations, bureaucratic red-tape and excessive regulatory bodies.

## Discussion

The impressive and positive portrayal of Korea's openness to FDI, particularly since the financial crisis of 1997, is not meant to mislead readers or disguise the fact that reform has not proceeded in an entirely trouble-free fashion. It is now public knowledge that Korea has been slow in implementing its

financial, corporate, labour, and government sector restructuring due to the painful and difficult decisions that must be made along the road towards conforming to international standards and becoming more competitive on the global stage. As inefficient businesses and public enterprises are allowed to go bankrupt or are restructured or privatized, widespread layoffs and unemployment cannot be avoided. Such inevitable fallouts from reform have led trade unions to vehemently oppose the ongoing restructuring process and labour unrest continues to be a sore topic for foreign-invested companies. In 2006, IMD's *World Competitiveness Yearbook*, Korea ranked as the world's 38<sup>th</sup> most competitive nation out of 61 nations, 9 steps below last year's achievement. What is much more embarrassing is, however, Korea was placed 61<sup>st</sup> among the total number of countries surveyed, the lowest rank, in terms of the labour/management stability, one of the core factors that has not only hindered foreign companies from investing in Korea but also dragged down Korea's international competitiveness (Maeil Economic Daily, 2006). The following is a detailed account on the major obstacles encountered by foreign investors and most frequently mentioned during interviews.

#### **Anti-Globalization Forces in Korea**

The perceptions of Korea as being insular and parochial and as a country that is only lukewarm in implementing its liberalization policies can be explained by examining Korea's historical background and its concept of apparent racial cohesiveness and homogenous culture (Shin, 2003). Although a source of national pride for many Koreans, it has also served as a debilitating obstacle for Koreans and their capacity to understand and accept foreign ideals and cultures (Noland, 2005). This narrow and self-destructive mentality is the key variable that has haunted Korea for centuries and explains its tendency to isolate itself from international society. One would expect that with its past history of being subject to numerous invasions Korea would be more inclined to assimilate foreign cultures, but, in fact, such pressure from the outside has made Koreans even more reluctant to accept foreign influences. So, it is not at all surprising that in February 2006, the Swiss Institute for Business Cycle Research ranked Korea 63<sup>rd</sup> among 123 countries surveyed in the area of economic globalization, which is calculated chiefly by trade volume, FDI and equity investment as a proportion of gross domestic product (GDP) (Swiss Institute for Business Cycle Research, 2006).

As was also pointed out earlier in terms of the United Nations Conferences for Trade and Development's (UNCTAD) transnationality index as well as performance index, Korea's globalization indicators remain low among the world's major economies. Korean mentality, which is still ridden at times with a ludicrous form of nationalism, embarrassingly bucks the irreversible tide of globalization.

The following comment from the executive, who is the head of a foreign consulting company and has been in Korea more than a decade, well reflects the above:

Businesswise it has improved a lot and you see a lot of the big companies like POSCO, for example, who are truly global. And Samsung is truly global. I mean, they think global. I think LG have done a tremendous job promoting their name and the logo LG is global. Whoever the marketing man is there is first-class. There is a lot though. I mean if you go back to Samsung again, although they are globalized, they are still pulling everything back to Korea. As far as the people go, not they are not globalized. I mean everyone wants to go to Australia to play golf or send their kids to America or Australia or Canada to study but I don't think they, in the older age groups that I deal with, you know middle-aged and older senior business people, they are very insular or very Korean focused and don't understand the Western cultures are breaking free or won't accept them. And I'm the first to admit that I'm a guest in their country so I have to go more than 50 per cent here and I think I've got a pretty good understanding of Korean culture and what I should and should not do here. But Koreans, I mean I've taken Koreans to Australia for a road show, taking 10 down to Sydney this year actually and the first night out I organized at a seafood restaurant, one of the best seafood restaurants and they said no we want to go Korean. Down in the bottom half of the world and they want to try their own, they won't try the Aussie culture and then they organized a Korean man to take them around on nights when there was nothing on. I went to a seminar at the University of Washington, Seattle a few years ago and there were 12 men from Korean banks there. There were 50 people and the 12 Koreans stuck together the whole time.

A brief depiction of the national ethos exuded during Korea's economic development over four decades substantiates the above view. As pointed out earlier, during the 1960s when the Korean economy was about to take off, the inflow of foreign capital supplemented the shortage of domestic savings. Despite the relatively negligible amount of inward FDI, however, it was either closed or restricted in order to protect flagging domestic industries. Likewise, though inward FDI played a vital role in helping to resuscitating the ailing Korean economy following the financial crisis of 1997, a suspicion that foreign capital is really means for foreigners to subjugate Korean industries under their control stays quite alive even today. Instead of mutually benefiting from the inevitability of increased interdependence, growing presence in Korea of foreign entities has been regarded as a threat to national sovereignty. Such behaviour is an all-out disregard for global standards and is unacceptable for a mature and responsible country entering the new century. In short, the *weltanschauung* held by many Koreans remains parochial and myopic yet. There is no fundamental turnaround in the closed

mindset of the Korean people. This view is well reflected in our interviews. Except for a couple of companies involved in the Korean government's high-priority inward FDI areas such as high and biotechnology, the majority of respondents felt there was anti-foreign sentiment from the government. The following comment made by one of the interviewees on the government's recent tax audit on foreign companies well reflects this view:

The tax audits came out of the blue, totally out of the blue and it was because the companies were too successful. And in the end, I believe that those companies will be fairly assessed which means that if they have not broken any laws they are not going to be hit with any taxes. But the reality is that Korea's reputation globally as a good place, a friendly place to do business, suffered. At the end of the day the Korean government will say these companies did great. They made all this money legally. We have tax treaties. They followed those tax treaties, they did everything right and there is no tax to do. So I think in the end those companies will be allowed to do what they are doing. But the amount of legal fees generated and the audits ... the way the media reports if the auditors haven't found anything wrong so we have to extend the audit. So it is almost like the foreigner can not win and we are going to keep looking until we find something.

#### **The Outflow of National Wealth Syndrome**

As a result of Korea's unprecedented liberalization drive in the wake of the financial crisis of 1997, foreigners owned about 40 per cent of the shares of the companies listed on Korea's stock exchanges in terms of market capitalization at the end of December 2005, higher than the U.S. (10 per cent), Japan (18 per cent), Taiwan (23 per cent), and Thailand (33 per cent). On the other side of the coin, due to growing foreign ownership in Korea's leading manufacturing firms as well as in the domestic banking sector (22 per cent in 2004), there is a disturbing revival of economic nationalism in the name of the outflow of national wealth. As in the case of the U.S. during the 1980s, the wave of foreign investment raised the fears of "giving away America's future" (Martin and Tolchin, 1988: 274).

In Korea, too, there are views that the government is "selling out" to foreign enterprises and "practically giving away" Korea's hard-earned assets at fire sale prices and that FDI only accelerates foreign dependence of domestic industries. Such anti-foreign capital sentiments have given rise to the spurious controversy surrounding the outflow of national wealth, sparked chiefly by the media, business circles, the Bank of Korea and indirectly by the Financial Supervisory Commission and the tax authority. In his reaction to Korea's poor performance in economic globalization, according to the Swiss survey referred to earlier, the Minister of Finance and Economy views not only the general

public and the news media but also the National Assembly as far too nationalistic when it comes to foreign capital (Korea Herald, 15 February 2006). Take the well-publicized case of the sale of Korea First Bank to Newbridge Capital in December 1999 referred to earlier. The mass media carried blown-up news that the final sale price of Korea First Bank was practically a “give away.” But they failed to see the enormous social cost and massive fiscal burden that could have impinged on the economy if a transaction of such significance was delayed. They also failed to see how the disposition of the then debt-ridden, distressed Korea First Bank contributed to improved foreign investor confidence in Korea, the benefits of which inevitably spread to other Korean financial institutions in the form of lower borrowing costs from abroad. In short, M&As indeed proved to be a powerful mechanism by which inefficient management could be disciplined. Speaking of the Korean media, the following comments have been shared by many of the interviewees for this study:

The mass media here for the most part ignores foreign content of anything. I don't think that is healthy. And I think that attributes to the protectionist and this cultural isolationism that exists. I think we need to get away from this Korean-centric approach and we need to get to more of a success-centred approach. You know and it can be a success for a foreign company and a Korean company at the same time and the news needs to be reported objectively in that fashion. So there seems to be, there is a foreign press here and there is a Korean press and I can't digest a lot of the Korean press but based on the English translations of it that I see, the Korean Times, the Herald and some of the translations in the business magazines, even the ones that are done in English are very Korea-centric. I mean you'll see Korean labels on foreign designs, you'll see Korean business announcements to the exclusion of any foreign partnership or content and I don't think that is a healthy situation because I don't think it supports this success-based scenario rather than a Korea-based situation. So I think that is unhealthy.

The KFTC reform measure referred to earlier has also generated a flurry of objections by the *chaebol* in Korea. They are adamant in indicating that it unduly discriminates against domestic companies in favor of foreign enterprises since they are now vulnerable to hostile M&As by foreign investors and their managerial rights are in danger due to the ceiling imposed on the total amount of shareholding of other domestic companies or affiliates. In fact, a recent surge in foreign ownership of some of Korea's high-profile firms suggests that the *chaebol* could become either friendly or hostile takeover targets.

In this age of increasing interdependence among nations, can Korea afford to return to the old days when foreign investments were screened rigorously according to political priorities and non-economic considerations? Enhancing accountability and effectiveness of business management is probably the best defense against the encroachment on managerial rights by outside corporate hunters. M&As can play a useful role in Korea as stressed earlier, since they are a powerful mechanism by which inefficient management can be disciplined, thus producing healthy competition and strengthening transparency and accountable business management. This helps Korean companies recover credibility in the eyes of overseas investors by improving their corporate structures, introducing new management techniques, and obtaining state-of-the art technology. One interviewee, who has been in Korea for decades, argues:

Probably because of the perception or the pressure that they are under, but I think; 'Yeah, that is right' and I think where there is a bit of an issue there for Korea is that. you know, the thing that really will turn off foreign companies is just getting a feeling that there is an environment of constant investigation and constant auditing. Because if you are going to locate your business somewhere in Asia why are you going to do it in a country where you feel that you are going to be investigated and audited without, you know, potentially without a logical basis for that. There is no logical basis ... that is the issue. Now there could be a logical basis, but my perception is that is ... just a spark on the fire and generally there is nothing to it. So you know the environment, the culture and the feeling is all being affected and why now? You know strangely, ironically it is sort of a reaction to them wanting to send a message that this is a global standard of economy and a global environment. It is sort of ironical that their way of dealing with wanting to create that perception is one of countless bureaucrats doing enquiries on countless companies based often on rumour.

The prejudice against foreign-invested companies in general and foreign private equity funds in particular, as well as the associated fears of imperialism, constitute Korea's main bottleneck in maximizing economic gains and stability through FDI-led globalization. The trepidation that raising the ceiling on foreigners' equity ownership would invite hostile takeovers of Korean companies has proven to be unfounded, as not only have friendly M&As been the mainstream but also foreign shareholders have been shown to play a positive role in improving the corporate governance and managerial transparency of Korean firms through their strict monitoring function, thereby contributing to increased firm value and decreasing possibility of hostile takeovers (Jang, Lee and Park, 2006: 2-13).

Belatedly, financial authorities have come forward with constructive ways to salvage the domestic banking sector from falling into the hands of overseas investment fund managers. Recently, the government enacted a law on home-grown private equity funds that allows businesses, banks and individuals to participate in the restructuring of distressed companies, which in essence amounts to an effort by the government to counter the presence of foreign private equity funds (AltAssets, 2005).

Also, the government should seriously consider activating its pension funds, which are currently minor players in the equity market. While they manage about 124 trillion won (about US\$104 billion) less than 5 per cent of the total was invested in domestic stocks, compared with pension funds in advanced countries where about 50 per cent of their assets are in equities (Korea Herald, 2 June 2004; Han, 2003: 4-8).

Furthermore, though an ownership ceiling of four per cent may be justified to discourage *chaebol* from trying to take control of banks in an effort to secure easy loans; this could lead to unfair competition between Korean and foreign players. In fact, the *chaebol* groups argue that reverse discrimination against domestic investors, vis-à-vis foreign counterparts who are free from ownership, would result in the domestic banking sector falling into the hands of foreign private equity funds. As long as ownership is separated from management, the government should lift a range of regulations on the ownership of commercial banks by local industrial groups. Furthermore, such measures could quiet down the nationalistic outcry that financial liberalization has done more harm than good.

#### **Labour Unrest and Korean Industrial Relations**

Having languished in the National Assembly for 15 months without action since being proposed in November 2004, the labour reform bills were finally approved by the National Assembly's plenary session on 30 November 2006 following a long-standing deadlock. The three passed bills are the Act on the Protection of Fixed Term and Part-time Employees, amendment of the Act on the Protection of Dispatched Employees, and Labour Relations Commission Act, despite strong objections from labour unions. To the government's dismay, however, while management holds the view that the bills are largely in favour of labour, making the labour market more rigid, the trade unions deny the government's stance on all labour measures, claiming the legislation would only increase the number of non-regular workers and make their employment status unstable. Speaking of labour inflexibility, the following comments from an interviewee reflect the perception among the foreign community in Korea:

Well, one of the biggest things I hear from others is the labour inflexibility. Now as I say, my company does not have that issue so I typically don't have a huge participation in those dialogues, but I hear that and I see that a lot from people that have larger local presences and especially from those that have unionized labour forces. Labour here tends to be much more militant, much more inflexible and I would say the work regulations here are, how would I characterize them? The labour regulations in Korea I would characterize as being the least flexible of any place that we do business.

Although, in theory, the labour reform bills oblige a company to grant regular status to its non-regular workers who have been employed for more than two years, the new measures neither seem likely to contribute much to creating flexibility in the labour market nor offer greater job security to non-regular workers, contrary to the government's intention. An attempt to remove the current wage discrimination against non-regular workers by raising their current wage level would probably result in a steep rise in labour costs, which management would counter by laying off non-regular workers within the first two years of employment. In other words, it is unlikely that non-regular workers could serve as a safety valve for those businesses that are already confronted with rising labour costs and militant trade unions. In order to address the issues related to non-regular workers on the one hand and to entice FDI into Korea on the other, the rigid procedural restrictions on layoff measures imposed on management and excessive protection given to regular workers must first be ameliorated.

The problem is because of these labour issues even the domestic companies like Hyundai and the others, some general groups try to move out and Hyundai Motors is already going to America to set up their own factories. And they are simply the labour complex so how can we explain this environment as the foreign friendly market environment? How do we encourage foreigners to come in?

Labour-management discord at foreign-invested companies due to labour unions' combative and unyielding posture during wage negotiations was the most disparaging economy-related issue in 2003, as evidenced by the well-publicized strikes at companies such as Owens Corning Korea, KGI Securities, Tetra Pak and Nestle Korea, among others. Although Korea's unionization rate of 11 per cent is significantly lower than that of many OECD economies, the labour unions could exploit 89 per cent of less privileged employees. In 2003, there were 32 labour disputes reported at foreign-invested companies, exceeding the annual total of 26 cases a year earlier (OIO, 2004). The Korean labour unions are militant and tend to pursue their aims in a merciless way. A failure to understand the nature and style of the process will be, at the very least, demoralizing for an expatriate manager. Perceptions of rational negotiations are quickly dispelled. Interviewees voiced unanimously that when they try to

initiate what they considered from management's point of view to be sensible negotiations – showing them the books and trying to tell the negotiators what shape the company was in – there was disinterest on the negotiators' behalf. These attitudes have their antecedents. During the boom years labour negotiators were conditioned to the process of being bought off with unjustifiable wage increases. This was true of Korean companies in general and particularly true in the case of the *chaebol*. This practice is now haunting all companies present in Korea. It is especially true of foreign companies as they are considered softer targets. In particular, foreign companies are perceived by the average Korean as being short-term oriented and in the market for the 'fast buck'. For foreign companies to make serious progress, this is a perception that must be dispelled.

Well if you wanted trade barriers from overall you start with the unions for instance. Everybody will tell you that the unions here are not looking for solutions but for compensation. I find it as a big hazard in attracting FDI. The unions in Korea have not at any time changed. They act almost like traditionalist. At the moment they have almost started their annual pilgrimage, you know their strikes and there is no need. There is no, should I say sensibility. If you want to be really and truly working for the workers you should be coming up with deals that you can finally make. Everybody will tell you that the unions here are not looking for solutions but for compensation. I find it as a big hazard in attracting FDI. The unions in Korea have not at any time changed. They act almost like traditionalist. At the moment they have almost started their annual pilgrimage, you know their strikes and there is no need.... There is no, should I say sensibility. If you want to be really and truly working for the workers you should be coming up with deals that you can finally make.

Some interviewed companies admitted to making mistakes by trying to rush changes. Some attribute their bad experiences to being insensitive to the reactions of people to many centuries of foreign domination. Of course, the vast majority of foreign-invested firms have never experienced labour-management conflicts, particularly in the high-tech and capital-intensive industries (Park and Hyun, 2004; Blaszczyk, 2003). But it is critical to understand the prevailing mindset and the behaviours of the unions in Korea which dictates that employees are entitled to a return without actually committing to productivity gains. As such, there is not a productivity-orientated culture in Korea and that is a problem that most of the MNCs face in Korea today. The following comment from our interviewee well substantiates the view:

For some of the big companies like Hyundai and Kia, you know the unions are militant, if you will. They have been broken down in financial services to a large degree so they are far more cooperative when they

work but the reality is their reach is not that far because most people work for small businesses and self-proprietors that are not part of the union. But it seems true in many cases that where the unions do exist, their viewpoint is unrealistic. For example, there is news today that the X union wants X to be sold to minority investors. They don't want it to be sold to a foreign investor. Now that is ridiculous. In any other country the union would accept they were not shareholders and therefore don't have a say in who buys this company. But in Korea they believe that because they are employees, they have a stake in this.

Other than union militancy, rising labour costs have been seen as one of the major reasons for the slowdown of FDI into Korea as multinationals relocate their manufacturing operations to cheaper countries. According to the US Bureau of Labour Statistics, average hourly compensation costs for Korean production workers in manufacturing increased by 17.3 per cent in 2003 to US\$9.16, representing the second sharpest increase behind Norway among the 29 economies sampled. Furthermore, Korea's average wage costs were higher than those in competing economies such as Hong Kong (US\$5.83), Singapore (US\$7.27), Taiwan (US\$5.41) and Mexico (US\$2.38). In terms of labour unit costs, defined as the cost of labour compensation per unit of output, the figure for Korea rose by 6.6 per cent between 2001 and 2002 because wage costs grew faster than labour productivity (12 per cent versus 4.3 per cent) (US Department of Labour, 2003; Korean Ministry of Labour, 2003).

If wages continue to rise at the current pace while labour persists with its incessant demands for job security, it can only be expected that more and more foreign firms, particularly in the manufacturing sector, will relocate production facilities to countries such as China and Vietnam, leaving behind mere branch sales offices. Although labour unions strive to protect the job security of workers, the migration of foreign companies to countries that offer more favorable conditions cannot be halted. Not only is the outflow of foreign capital and jobs becoming a serious problem, but Korea is also losing potential new investments.

It is no wonder that Korea's labour-management relations have been criticized as a major impediment to achieving increased productivity and prosperity. In fact, the Organization for Economic Co-operation and Development's (OECD) *Annual Economic Surveys: Korea* (2004) stated that Korea needed to increase labour market flexibility and reduce protection for regular workers. In a 2003 InvestKOREA survey of CEOs of foreign-invested firms that have experienced labour-management discord, all the respondents praised Korea for its talented and highly-educated workforce. Apart from manpower considerations, Korea boasts an advanced infrastructure such as roads and electrical supply, a world-leading IT communications network and geographical proximity to the large markets of

Northeast Asia. But for the past several years, rising production costs due to sharp wage increases far exceeding productivity gains resulted in severe cost pressure compared to other investment destinations. In addition, labour unions' combative nature and unyielding posture during negotiations reached a level that foreign management finds too hard to endure, thus shrouding the aforementioned merits of Korea as a friendly investment location in a cloud of uncertainty (InvestKOREA, 2003).

By 2004, however, there were indications that industrial relations practices were beginning to mature and that confrontational labour-management relations could soon evolve into a labour culture marked by compromise and negotiation. This was vindicated by the successful resolution of both the LG Caltex and the subway strikes in which the firm stance held by management and government led workers to call off the action themselves.

#### **Unpredictable Tax Environment**

Korea's tax environment is another poorly evaluated area in comparison with its neighboring competitors for world FDI flows. In 2005, although Korea's highest corporate tax rate of 27.5 per cent, which also reflects the local tax burden of 2.5 per cent, was lower than that of any G-7 country, it was certainly higher than that of Hong Kong (17.5 per cent), Taiwan (25 per cent), and Singapore (22 per cent). In the case of China, its highest corporate tax rate of 33 per cent is greater than that of Korea, but a relatively low corporate tax rate of 15 per cent is imposed on most foreign-invested firms. In addition to the corporate tax liability, Korea also levies a corporate dividend income tax of 15 per cent, whereas Singapore does not have such a dividend income taxation scheme (KPMG, 2004; China Daily, 18 January 2006; Ministry of Finance and Economy, 2004; International Tax Division, 2006).

Since a large share of corporate firms are, in reality, entitled to a variety of tax preferences under FIPA and the RPTA in the form of liberal capital depreciation charges, investment credit allowances, tax-free reserves, and tax holidays offered to foreign-invested firms, what is critically important is the level of effective marginal tax rates. In 2001, with its effective marginal tax rate of 15.5 per cent, Korea was found to have a low tax burden among the leading 17 OECD countries. However, a recent OECD report indicates that Korea's tax burden compared with other member countries, in terms of the tax wedge (the difference between the net take home pay of workers and their gross income pay), has seen the sharpest rise from 13.87 per cent in 1988 to 15.76 per cent in 2004 due to increased taxes and social security contributions (Digital Chosun Ilbo, 8 February 2006). Another hypothetical study in which a U.S. firm invests in East Asian countries, taking into account corporate tax burdens both in the source and host countries, shows that Korea has the least advantageous tax

environment for foreign investors compared with China, Hong Kong, Singapore and Malaysia (Park, 2004: 52-78).

Although governments in general do not usually initiate tax reform just because the top marginal rates of personal and corporate income taxes happen to be a bit high in comparison with competing countries, reduction of tax rates and offering of tax incentives may be necessary as a welcoming sign to foreign investors. This may be particularly true in the case of Korea. The importance of granting fiscal incentives to foreign investors in order to entice FDI is well illustrated by the dramatic increase of Japanese investment in 2004, which rose by more than four times to US\$2.26 billion from US\$541 million in 2003, triggered partly by a tax reduction period from 10 years to seven starting at the beginning of 2005. In short, in the case of Korea, which is in the midst of intense competition for world FDI flows, attractive fiscal incentives are a must if it is to overcome its unfavorable tax regime for foreign investors.

Equally important as the level of tax rates and various tax incentives is the need to radically reform Korea's unpredictable tax administration that is based on arbitrary interpretation of tax laws and that has shown little concern for international taxation norms and practices. Korea's non-competitive and unpredictable tax environment is further exacerbated by the rise of prejudiced sentiments toward foreign private equity funds operating in Korea, to which the drop in FDI inflows to Korea in 2005 may be attributable. When the media announced that the U.S. private equity fund Newbridge Capital agreed in early January 2005 to sell its 48.6 per cent stake (worth about US\$3.36 billion) in Korea First Bank to British Standard Chartered Bank after nearly five years of ownership, reaping more than US\$990 million in profit, there was public outrage at the huge, perhaps tax-exempt, gains to be taken out of the country (Korea Herald, 30 September 2005; Korea Times, 9 October 2005; Tax-News.Com, 25 April 2006). While the National Tax Service speedily reacted by launching a tax audit of Newbridge Capital, the investor under fire invoked a Malaysia-Korea tax treaty to legally avoid Korean taxes on its capital gains. With Newbridge Capital having invested in Korea First Bank via Labuan, a tax haven in Malaysia, the tax authority needs to demonstrate that the US investor's subsidiary is indeed a bogus company. But this is merely a cosmetic, makeshift attempt only aimed at pleasing the uninformed public since neither the Korean tax treaty with Malaysia nor Korean law contains any anti-treaty shopping or anti-abuse provisions on the basis of which the tax authorities could assess domestic taxes on Newbridge. Furthermore, Korea's discrimination between "treaty" and "non-treaty" investors to tax "non-treaty" investors in the context of foreign private equity funds

would be unwise. Such discrimination would make Korea uncompetitive with other countries seeking to attract FDI which make no such distinction and it will be very burdensome for fund managers raising administration costs and limiting the audience of potential investors. The National Tax Service is unilaterally relying on vague substance-over-form provisions under domestic law to challenge a foreign investor's entitlement to tax treaty relief in respect of capital gains (Thompson, 2003). In the meantime, nationalistic backlash was sparked by the media, which portrayed foreign private equity funds as vultures that suck out wealth from Korea (Graham, 2005). A well-known international consultant, who has been in Korea more than 10 years:

I think where there is a bit of an issue there for Korea is that, you know, the thing that really will turn off foreign companies is just getting a feeling that there is an environment of constant investigation and constant auditing. Because if you are going to locate your business somewhere in Asia why are you going to do it in a country where you feel that you are going to be investigated and audited without, you know, potentially without a logical basis for that.

The government authorities are also to be blamed for adding fuel to the rise of corporate xenophobia triggered by the media. On 29 September 2005, the National Tax Service announced it would impose about US\$220 million in deferred taxes on five foreign private equity funds; Lone Star, Carlyle Group, Goldman Sachs, Westbrook and AIG, which the tax authority claimed had abused tax treaty codes by under-reporting cash transfers to their respective headquarters overseas and inflating transaction costs for possible tax evasion (Korea Herald, 30 September 2005).

In particular, the Dallas-based Lone Star Funds, which bought a 50.53 per cent stake in Korea Exchange Bank, the fifth largest bank in Korea, in October 2003 at a knockdown price (about US\$1.2 billion), but which is now valued at about US\$5.2 billion, has come under close legal scrutiny by Korean government authorities on two accounts. First, on 30 March 2006, Lone Star was raided by prosecution investigators over allegations that it evaded US\$146 million in taxes on the proceeds of property sales in Seoul in 2005, committed fraud in acquiring its majority stake in Korea Exchange Bank in October 2003, breached foreign exchange rules governing international transactions by illegally transferring US\$8.6 million overseas and committed other irregularities in financial dealings. Second, contentious issues surround the sale of Lone Star's 50.53 per cent stake in Korea Exchange Bank to Kookmin Bank and when the deal goes through, the seller reportedly stands to reap more than US\$4 billion in capital gains in less than three years (Reuters, 22 March 2006; Bloomberg, 30 March 2006; MK English News, 30 March 2006).

It is indeed a sovereign right of all countries to investigate earned income to see if legitimate taxes have been paid and the processes involved have followed all relevant laws and obligations. But what is completely lost in the media coverage is the acknowledgement that through the provision of needed funds and restructuring know-how, foreign private equity funds rescued a good number of distressed Korean manufacturing firms and financial institutions to which neither domestic financial firms nor the government were ready to offer any assistance. The punitive actions taken by Korean financial regulators led a number of foreign investors to wonder if they have been victims of the current whirlwind of nationalistic outrage against foreign capital. Should foreign private equity funds reaping huge capital gains, which conform to the relevant tax treaty provisions and are seemingly justifiable returns on risky ventures, be penalized in a capitalist economy?

So yeah, ... there is still to this day government intervention at the micro-economic level that affects individual firms. Taxes, they affect everybody. Two issues on taxes, the fundamental one is that they are not transparent. Just last week I was talking to a Korean businessman and he said that he ran his business very, very transparently and his books were valid. And he got audited, he gets audited every three years, everybody gets audited about once every three to five years, he got audited and the auditor looked through his books and President Kim, yes it was President Kim, said to the auditor if my books are transparent and the man from the tax office says I cannot go back to my office without generating additional tax from every country I visit. My job is not to make sure you pay fair tax, my job is to extract more taxes out of every company that I audit. That is what he said. That was, I heard it last week and he was talking about something that happened in the most recent tax year. Now it is not personal experience but I have heard the same thing from many people. I have an American friend who had a business here and he had the same issue. He was an entrepreneur who started his own company, this was about 10 years ago, but the same thing, he did his books honestly and the tax man came and he said; 'No I don't err in taxes' and he took it to court and he won. But they wanted him to pay extra in taxes and it cost him double that to defend. But it cost him double that in the courts to win the court case, the tax case. So the tax man's attitude is; 'Everybody cheats and it is my job to squeeze money out of them'. Korea is a long way from a pro-business environment. Not only for foreigners, but for Koreans too. It is the same for Mr X (Korean) who was explaining to me why he had established a factory in the United States and one of the reasons he said was that the tax man in the United States is fair, unlike the one in Korea. He said it is a headache to run a small business in Korea. It is much easier in America, so he moved his facility from Korea, 80 per cent of his business was in America, so he moved his factory from Korea, shut it down and moved to the United

States. So the things we are talking about here is not just making a good environment for foreign firms and that is a very important issue.

Similar to the case of Newbridge Capital, which claims it is entitled to the benefits of the Malaysia-Korea tax treaty (that is, an exemption from capital gains tax), the National Tax Office is trying to find ways to tax Lone Star Funds, which could also resort to the benefit provisions in both the Korea-U.S. as well as Korea-Belgium tax treaties that provide exemption from domestic taxes on capital gains, since Lone Star's stake in Korea Exchange Bank is held by its Belgian subsidiary, LSF-KEB Holdings. Unless the National Tax Office demonstrates that Lone Star had business representatives and did business in Korea, thereby designating Lone Star as a "permanent establishment," it may not be able to impose capital gains taxes on Lone Star Funds (JoongAng Ilbo, 15 March 2006; Korea Times, 24 March 2006; Korea Times, 4 May 2006).

The general practice around the world has been to recognize foreign private equity funds such as Newbridge and Lone Star as being essentially a distinct form of portfolio investment and, accordingly, to provide an exemption from the capital gains tax imposed by the host country. Therefore, it seems that neither the National Tax Office's enforcement of retroactive taxation of capital gains, nor its unilateral attempt to exercise fiscal sovereignty rights on the basis of disputable domestic substance-over-form legal principles to justify levying taxes on capital gains, are in accordance with global standards and practices. Such corporate xenophobia by the media and the one-sided punitive actions taken by government authorities only damage the country's efforts to reinvigorate FDI and impair Korea's image and credibility as a favorable destination for becoming a financial hub in Northeast Asia.

Xenophobia for sure ... interestingly, in general Koreans look at a foreigner and they say; 'Well when are you going home?' The expectation is that you will be temporary and I don't know, countless, countless times people have said it to me when they hear me speaking in Korean. .... And opening up requires a much greater change and I think people felt very threatened by that. I think in government particularly they felt very threatened that all of a sudden they were going to have all these foreigners and foreign products being inundated. And so they were very resistant to change and it wasn't about foreign policy, it was about how you interact on a working level with the Korean government and even today, there is still ... that still exists to a great extent.

The time is certainly ripe for Korea to revise its taxation system for international transactions in light of the country's virtual recovery from the aftermath of the financial crisis of 1997, the growing

global stature of the economy in both increasing inward and outward capital flows and the changes in international taxation norms and practices. Yet the actions taken by the Korean government in revising its international tax laws in general and with regards to the tax haven abuses in which Newbridge Capital, Lone Star Funds, and Sovereign Asset Management are implicated, are certainly ill-timed. The countermeasures dealing with the illegal use of tax havens have been conceived in the xenophobic atmosphere of the country, where the media is unequivocally skewed toward exaggerating tax haven abuses and the perceived profiteering by tax-delinquent foreign private equity funds. The only internationally acceptable way for Korea to remove the conflicting provisions is to renegotiate appropriate amendments to its tax treaties.

#### **Korea as a Northeast Asian Business Hub**

Korea is waking up to the fact that it may have no other choice but to chart a radically different new course for the Korean economy in the 21st century in order to adjust to the changing economic dynamics of Northeast Asia and to prosper despite limited natural resources. It was against this background that the Kim Dae-jung government (1998-2003) officially unveiled, in July 2002, a detailed strategic plan to transform the nation into a world-class logistics centre, a knowledge-based economy, and an international business and financial hub (Lamers, 2002; Kim, 2002a; Kim, 2002b; Raubach, 2002; Seitz, 2002).

Indeed, Korea does possess some advantageous factors that could make its regional hub ambitions feasible. For example, the country's pivotal geo-economic location at the heart of Northeast Asia and its well-equipped infrastructure poise it to become a base for logistics activities of countries wishing to do business in the region. Its talented and well-educated workforce ensures competitive staffing for both manufacturing and service industries. And Korea's global position as an IT powerhouse, coupled with its strong traditional as well as cutting-edge industries, provides a diverse industrial structure that holds many unlocked opportunities.

However, as shown in Table 3, the interviews revealed differing views over the potential for Korea to become a business hub of any kind. Not surprisingly, over 90 per cent believes Korea's ambition to become a Northeast Asian business hub was unrealistic. Speaking of the 'financial hub', the following comments represent the overall view of the interviewees:

I'm not a banker but I have the feeling that financial hub in Korea is not going to be the way it goes okay. This is just lip service to be very blunt. Lip service because what I read regarding the latest acquisitions or things by foreign firms shows that they are not very welcome. They want to make money and they complain of them and whereas when they

were coming in everybody was their heart and soul. All of this is not very sound and not very long term ...It is a nice word that doesn't follow. It doesn't mean that the Government doesn't have this kind of willingness but we see as well that there is a big discrepancy between the willingness of the Government and mid level administration. We need to be consistent below the line....

TABLE 3: MNCS' PERCEPTIONS AMONG INTERVIEWED FOREIGN COMPANIES ON KOREA'S HUB VISION

Ambiguous motivation?	Yes
Attention seeking?	Yes
Realistic?	No
Korea: Centre of Business activities or interests?	No
Vision = Long-termism?	No
Ambitious?	Yes
Consensus?	No
Opportunity?	Yes
Potential?	Yes
Fed up?	Yes

Interviewees were, however, overwhelmingly positive about the prospects for their businesses in Korea. The sheer scale of the market opportunity coupled with the ongoing and progressive process of deregulation combines to create a major upside. More than 70 per cent of the interviewees had clearly developed visions for their businesses in Korea. More than 90 per cent of those held positive views about the Korean market and were bullish about the position they aimed to develop. The vast majority are seeking aspirational positions. Despite these positive aspects of the market image, there are many fundamental challenges for Korea to overcome before it can hope to transform the nation into a home for international business. The McKinsey Report, released on July 2003, revealed that Seoul (Korea) must overcome many significant barriers to becoming a business centre in Northeast Asia, including its restrictive and anti-market regulatory legal practices, lack of English language abilities and disruptive unions (FIAC, 2003:57).

The following comments from an experienced foreign CEO in Korea reflect the view from the majority:

I think potential they (Korea) have got the opportunity to do it but they (Korea) have got to become more open. There is a lot of hard work that they need to open themselves up into the global environment. They need to get some consistency in the rules and regulations and rather than saying they need that, but I mean

in terms of infrastructure potentially here is very good because you know it is one of the most highly boarded economies in the world. You have all these new satellites that are better so bringing ICT but they still have those barriers and there are too many investors think they have been playing by the rules and then unfairly dealt with, they will try and move out or they will look at other regions to occupy. At least they have got an advantage over China at the moment but China is catching up at a rapid rate in terms of the hub. I think Korea is better placed at the moment to do it. But for how long, I don't know.

If not a logistics hub or a financial hub by reasons of impeding factors as elaborated above, Korea is well positioned to become a destination for technology-driven research centres of multinational entities. In July 2003, the Korean government unveiled a plan to transform itself into a knowledge-based economy and since then has been searching in earnest for foreign corporate R&D investments as an integral component of Korea's technological catch-up process. Prior to that, there was neither a need to measure the technology intensity of FDI at the firm level nor the R&D intensity of foreign subsidiaries. Instead, technology-licensing agreements, capital goods imports, technological collaboration and manufacturing on an OEM basis had been the principal conduits of technology acquisition.

Particularly, in its attempt to gain close access to core technologies, Korean firms relied heavily on imported technologies or entered extensive strategic alliances with multinationals, rather than emphasizing equity-based FDI as chief means to acquire needed technologies or to facilitate their diffusion. Samsung Semiconductor's 64K DRAM technology, for instance, was licensed in 1983 from the U.S. firm Micron Technologies. Though non-equity cooperative agreements were known to be less efficient and more expensive methods of obtaining technology than FDI, which generally benefits host economies through a variety of positive spillovers, Koreans' obsession with the loss of managerial control dictated policymakers to be rather restrictive toward FDI inducement. Therefore, the focus of FDI was placed on promoting the country as a manufacturing platform to serve the domestic markets to achieve certain immediate objectives, such as improving the trade balance, creating employment, enhancing the industrial structure and building foreign reserves. This is clearly shown by the fact that the ratio of technology imports to private R&D spending was about 34 per cent in 2002 and that Korea's royalty payments for foreign technology licensing reached US\$2.7 billion in 1999, exceeding the amount for foreign corporate R&D spending by about 13 times. It was only after the financial crisis of 1997 that equity-based collaborations became a viable option to Korean firms wishing to acquire frontier technology from abroad.

Likewise, foreign investors were only interested in increasing their market shares in Korea, and in general chose to form non-equity-based agreements with Korean firms for technology cooperation solely in order to sustain their market penetration objectives. Hence, of the foreign corporate R&D spending in Korea in 2002, 71 per cent was allotted to the development of new products in the manufacturing sector catering to local needs; and only 8.6 per cent was devoted to the development of core technologies and basic research. In short, if they possessed offshore R&D centres, foreign investors' major interest in Korea was in product development, in line with their localization strategy for the Korean market (Invest Korea, 2004:2-30; Korea Times, 25 March 2004).

However, there have been several developments that have strongly pushed the Korean government to orchestrate programs to achieve an advanced level of technological sophistication by attracting multinationals' R and D centres, to which the government has given its top priority, rather than non-corporate, profit-making, high-technology R and D institutions, and by emphasizing the promotion of new technology-based venture firms in Korea. First, as multinationals operating in Korea have seen a continuous and sharp rise in profits, they have taken a new look at Korea as a springboard to advance into other countries through their participation in Korea's R&D efforts. As in the case of 3M's Asia Display Technical Centre that opened in Korea in October 2002, a growing number of foreign-invested companies are using Korea as an R&D hub for their operations for Asia and the rest of the world.

Second, with the rapid growth in information and communications technology, the government has made significant efforts to move away from traditional, production-oriented industrial structures of the past and focus instead on the commercialization of state-of-the-art technologies. With these developments in mind, the Korean government has formulated policies to enable Korea to become a regional centre of research excellence – or, in other words, an R&D hub for Northeast Asia. This is an inevitable direction for Korea to follow to ensure its economic competitiveness in light of the hollowing out of Korea's traditional core industries as more and more Korean firms cross the Yellow Sea to take advantage of China's cheaper labour supply.

Third, realizing that venture firms will play a key role in shifting the Korean economy from a mature industrial economy to a knowledge-based centre, the Korean government has taken major initiatives aimed at creating and supporting venture capital companies as a way of fostering small technology-based firms.

The government's efforts have begun to bear some results. As of September 2005, total number of foreign R and D centres reached 901, including 137 corporate R and D centres that are wholly owned by foreign investors; some of them are Microsoft, Motorola, IBM, Dupont, 3M, Oracle, Siemens, Bosch, Fuji Xerox, LG Philips, Fairchild, Sumitomo and Merck. In 2004 alone, Intel, HP and National Semiconductor launched research centres in Seoul, while the Paris-based Institute Pasteur opened a branch engaging in research ranging from genetic studies to innovative drug development. In 2005, Fraunhofer-Gesellschaft, Europe's leading institute for technical and organizational innovation, set up an R&D centre, whereas Bell laboratories, the R&D arm of U.S. telecommunications company Lucent Technologies, planned to build an R&D centre at the Seoul Digital Media Centre by October 2006. The lab is expected to invest about 5 billion won (US\$5.2 million) annually. In 2005 Korea lured 30 foreign research centres and aimed to attract 41 in 2006 (Invest Korea Journal, January-February 2006: 8-14; MK English News, 4 December 2005).

The primary roles of these R&D centres in general include a variety of research activities related to new product development and support given to local operations. But as Korea is rapidly becoming a global leader in information technology (IT), a number of world-class companies that are leaders in high value-added industries have started operating their R&D centres in Korea in preparation for developing next-generation market-leading core technologies and for gaining a technological advantage in the Northeast Asian market. An excellent case in point is the Dutch company Philips, a world-class LCD producer, which established an LCD production complex in February 2003 through a joint venture with Korea's LG Group. When the 408-acre, US\$10 billion complex goes into full operation in June 2006, the 5,000 employees will turn out products worth about US\$2.9 billion in domestic sales and nearly US\$2.7 billion in annual exports. The complex will produce incomparably high added-value seventh and eighth generation display screens for large televisions (Invest Korea Journal, January-February 2006: 10-4).

Another illuminating case is that of Honeywell, the first U.S. firm to move its global R&D centre to Korea (from Minneapolis to Cheonan City). Established in 1984 and reorganized in 1999, Honeywell Korea made a significant technological breakthrough in December 2000 by developing a 25x-zoom model for closed circuit TV and an automobile electrical equipment sensor. As a result of these innovative achievements, Honeywell Korea was selected as a centre of excellence by its head office and its R&D quality is on par with that of the firm's headquarters in Minneapolis (Park 2005:online).

But can Korea be a serious consideration as a high-profile host country for multinationals' offshore R&D facilities? Does Korea possess the industrial conditions or environmental factors that may lead to the deepening of the offshore R&D activities of multinationals? The answer to both questions is qualified "Yes".

## **Conclusion**

The impressive and positive portrayal of Korea's openness to FDI in the aftermath of the financial crisis should not mislead readers by disguising the fact that post-crisis reforms have often not proceeded in an entirely trouble-free fashion. It is now public knowledge that Korea has been slow in implementing its financial, corporate, labour, and government sector restructuring due to the painful and difficult decisions that must be made along the road towards conforming to international standards and becoming more competitive on the global stage.

Of the main obstacles to inducing FDI into Korea, such as militant labour unions, unpredictable tax administration, excessive regulatory regime, and inconvenient living environment, it is the prejudice against foreign companies and the associated fears of imperialism that are most daunting. Although the negative attitude toward FDI held by many Koreans has slowly altered with growing recognition that FDI has, in fact, played a vital role in helping to revitalize the Korean economy following the financial crisis of 1997, the Korean people's deep-rooted pro-indigenous and anti-foreign sentiments have lain dormant, only waiting to erupt as soon as they believe anything foreign becomes too prominent within their society. If Korea really intends to maintain the continued globalization of its economy, as we emphasize once again, there should be a major overhaul of our outmoded educational system characterized by curricula and teachers that infuse anti-market, anti-globalization and chauvinistic ideals inimical to entrepreneurship, innovation, investment and growth. It is also our firm belief that the leadership has a major responsibility to educate and enlighten the public so that they may develop a more globalized mindset as well as the ability to cope with the emerging challenges and opportunities of today's era of increased interconnectedness and rapid globalization.

Korea's regulatory regime needs to continue to be reviewed and streamlined to ensure that the rules are consistent with the principles set forth in the Korean Constitution and improved in line with global best practice. There are many laws which need considerable review as they restrict market

competition, fail to reflect real-life, and too broad and vague, and often conflict with regulations among various government agencies at all levels. Such revision calls for a more far-sighted, forward-looking and global mindset and requires the government to design appropriate and consistent policies that promote efficiency, innovation, and entrepreneurship. Senior Korean policy makers and leaders must understand the impact of inward FDI on the country's integration into global economy and be open to fresh ideas and criticism aimed at cultivating the country as a more open, transparent, competitive, globalized and culturally dynamic society. Based on the research, the following are recommendations for Korea should it wish to implement globalization strategies:

- Create a sense of security and stability among foreign investors to encourage them to upgrade their investments step by step;
- Establish a 'control tower' for the policy implementations with clear and senior responsibility within government. For instance, the government must adhere to laws and principles in dealing with labour disputes in order to counter radical and illegal acts by labour unions. It is also applicable to the case of the tax authority that seeks overzealously its revenue objective. Instead, all related government agencies together should weigh the small gains of tapping tax revenues through the overly rigorous tax audits of foreign firms against the high cost of choking off FDI inflows;
- Publish (both in Korean and English) widely the government's clear and transparent strategic visions to communicate the approach both within government and across the business (both local and foreign) sector;
- Focus on the implementation of strategic priorities. For instance, if Korea's hub strategy to build a world-class R & D centre is a top priority, improve its R & D environment at home in order to counter against the massive flight of high quality human capital;
- Educational reform at the middle and high school levels takes priority over the college issue; it should be geared toward fostering both an open mindset and the basic skills needed to prosper in the globalized and information-based era of the 21<sup>st</sup> century;
- Ensure that barriers to policy implementation, especially within the government administration itself, are removed with speed and decisiveness; and
- Remain open to fresh thinking and criticisms.

By way of conclusion, it should be noted that various findings resulting from this study cannot be taken as conclusive but must be seen as tentative and exploratory. This is largely due to data

limitations, the newness of the trends and the scarcity of prior research on this subject. Rather, these results imply that further research on the challenges of Korea's FDI-led globalization is justified. It should also be said that the research conducted here should be treated as part of a continuing effort to reformulate new information and insight as it becomes available.

Overall, despite the above and other limitations of this study, it is hoped that the research conducted here has gone far beyond anything previously attempted in examining Korea's newly-adopted globalization strategy. It is also hoped this study can contribute to a rich discussion on contemporary issues in the international political economy that include the debate on structural adjustment, the role of the state, class formation and capital accumulation and the changing nature of economic or industrial policies in the course of capitalist industrialization.

## **Abstracts**

Globalisation has forced governments in many developed countries to redefine their roles. The emerged trend is a governing paradigm shift from large, centralised to small, decentralised government. Over the recent decades, resultant curtailment of public spending and increasingly privatisation and marketisation of public services have entailed a growing vacuum in society. Against this background, ‘civil society’ and ‘third sector’ have regained popularity in public discourse. Japan is no exception. Although the country lags behind their Western counterparts, it has begun to chart its course of civil society and third sector development. This paper discusses the issues drawing from the country’s recent experience with a multi-faceted nation-wide road safety program, Michi-no-Eki (Road Station). Focusing on the innate versatile property of the program from a community perspective, this paper explores a potential of the program as a vehicle of a bottom-up, community organising and building movement based on cross-sectoral partnership for the development of vibrant and self-reliant community and civil society.

## **Introduction**

Since the early 1990s globalisation has been reshaping the world, creating both growth opportunities and development challenges. The phenomenon (i.e., a blurring boundary of national economy, legal framework, culture, and society) has promoted a divergence in values in society and a convergence in political, socioeconomic institutional arrangements, shaking the foundation of nation’s sovereignty. In response to the emerged globalisation trend, governments in developed countries have been forced to redefine their role as the state. The popular approach has been to curb its political influence through a pursuit of smaller government and power redistribution to local so as to meet the country’s

developmental challenges more cost effectively. Although the power redistribution has offered better opportunities to locals in meeting their unique needs and wants, resultant curtailment of public spending and increasingly privatisation and marketisation of public services have entailed a growing vacuum in society. Against this background, ‘sustainability’ and ‘civil society’ have been popularised in development policy and political debate, respectively.

Current development debate as well as past experiences of developed countries suggests that a pursuit of sustainable development triple-bottom lines be more productive when public, private and communal sectors work together. The underlying logic is simple – i.e., synergy. For instance, in the case of a sustainable local development pursuit, public policy makers and corporate philanthropists are too often ill-equipped with local knowledge whereas communal grassroots movements lack necessary financial resources and management expertise. Yet, when their respective values, skills and resources are pooled and synergised effectively through their partnership, many challenging development goals become attainable. The renewed interest in civil society over the recent decades seems to stem from the increased importance of communal sector or public sphere, in national, regional and local development. Now communal sector is expected to expand its sphere of influence based on its vibrancy and through associational participation. And this realisation has also been fuelling an interest in the third sector - i.e., “a mix of non-profit and cooperative economic organizations and their activities” (Gunn 2004, p. 2).

Japan is no exception. Though lagged behind their Western European and U.S. counterparts, it has been charting its course of civil society renewal and a development of third sector more vigorously than ever, following the infamous burst of bubble economy. As can be expected, the country’s journey is uniquely different from the Western counterparts. Recently Kerlin (2006) contrasts experiences of Western European countries and the U.S. as for the development of social enterprises and their conceptualisation. She attributes observed differences to a unique development trajectory of the two regions, or their idiosyncratic social, cultural, economic, political, regulatory, and technological experiences (c.f., Redding 2005). As for Japan, such notion has been supported by Chambers and Kymlicka (2002) and Pekkanen (2006) as well as Osborne (2003) for a development of civil society and third-sector, respectively. For instance, the available literature on civil society highlights two unique features of Japan’s civil society development: the traditional state dominance in the civil society development and highly interdependent, partner-like relationship between the state and civil society (Schwartz 2003; Pekkanen 2006).

This paper aims to add some new insights into the literature from the Japanese perspective, drawing on the country's recent experience with a multi-faceted nation-wide road safety program. The paper focuses on the innate versatile property of the program from a community perspective. It explores the program's potential as a vehicle of a bottom-up, community development pursuit of vibrant and self-reliant community (i.e., civil society) through a cross-sectoral partnership. The road safety program is known as Michi-no-Eki (MnE) in the country. Since its introduction in 1993 it has enjoyed phenomenal popularity and (economic and social) market success. In Japan it has earned recognition as an enabler of a community-driven, local development. And for the national success, the program has been actively promoted outside the country by the Japan Bank of International Cooperation (JBIC) and the World Bank in their respective efforts to promote community-driven local developments in less developed countries.

### **Michi-no-Eki (MnE) Program**

Michi-no-Eki (MnE) can be translated in English as a 'road station'. The original concept was born at one of regional development symposiums in 1990 with the following remark of one of participants – 'Why do not we have stations along major roads like train stations?' (The Road Management Technology Centre, RMTC, 1993). Reflected in the remark is the frustration of local communities which have long been deprived of social and economic development opportunities available only to those communities which host railway stations. The concept captured an interest of the Road Bureau of the former Ministry of Construction, which was exploring an implementation strategy of its new policy focusing on road travel service infrastructure developments in response to diversifying motorist demands in the highly motorised society. Following a social experiment of the concept in three regions, the Road Bureau organised successive advisory committee meetings to explore a MnE potential, discuss its feasibility, and finalise a MnE model as part of its nation-wide road safety program. In 1993, the MnE program was officially launched as part of the ministry's 11<sup>th</sup> 5-Year Road Maintenance Plan in 1993 (RMTC 1993).

The MnE registration guidance operationalises the basic concept of MnE model along the following three parameters - 1) location: easily accessible and appropriately distanced from the neighbouring MnEs; 2) infrastructure and facilities: a) a sufficient free parking space, clean toilets, and barrier-free access to MnE service facilities and b) an information kiosk powered with IT for road and

traffic information as well as host community information; 3) services offered: a) 24-hour accessibility to free car park, clean toilet and public telephone and b) face-to-face interaction at the information kiosk (RMTC 1993). As for the MnE service facilities, each MnE is required to facilitate and promote visitor-community interactions unique to a MnE host community (i.e., economic, social and/or cultural). Detailed features of each MnE are widely made public via official MnE websites of the RMTC and the Road Bureau as well as MnE user club websites. In public, a MnE has come to be more commonly known as a ‘place’ where visitors can: 1) expect a free, safe, comfortable and convenient resting place; 2) obtain real-time traffic information as well as local information (i.e., emergency medical centre and tourist attractions); and 3) buy locally produced goods (e.g., fresh agricultural produces, processed local produces, traditional craft works, etc.) and/or social and cultural experience-based services unique to the host community. Some MnEs have even grown to become a popular tourism destination themselves from a mere stop-over place for road travellers. As of March, 2007 after the 23rd registration, there are 858 MnEs across Japan (The Road Bureau-b n.d.). Table 1 presents two sets of time-series data on the MnE growth indicators (i.e., numbers of the total MnEs registered and new MnE registration for each year) since its Year 1 in 1993.

FIGURE 1: A MNE GROWTH

\* In 2004, one MnE was de-registered.

As evident in Table 1, every year in its history the MnE program has been joined by new MnEs. However, in terms of new MnE registration over the 15-year history, Table 1 highlights two points. First, after reaching its peak in 1999 with 81 new registrations, the number of new registrations has remained low. In particular, remarkable is a substantial drop in the new registration over the recent two years. However, this should not be interpreted as a downfall of the MnE program. Given its sustained popularity, it should be understood as the end of the MnE development rush and the beginning of another chapter of the MnE program development.

### **The Michi-no-Eki (MnE) Development Model**

The MnE program is not the conventional state-guided Japanese model of civil society as commonly documented in the literature (c.f., Pharr 2003). The program is sponsored, but not guided. For its registration, certain requirements need to be met as presented earlier. However, beyond the requirements for registration, everything is left to the hand of each MnE administrative organisation. The Road Bureau takes no intervention and guiding policy on the MnE management (Kayano and Kondo 2006). There seem to be several reasons for this: a simple fact that the MnE management issues fall outside the bureau's administrative terrain; a respect to the community spirit behind the original conception of MnE; the manifestation of the recent paradigm shift in the state policy from central control to local autonomy; or a combination of these. As will be explored in the subsequent sections, the true potential of the MnE program is its flexibility to facilitate different types of partnership within its host community and capacity to function as a vehicle of community organising - "a process in which local people, united by concern for renewing their own small territory, plan and act together from an organizational base that they control" (Murphy and Cunningham 2003, p. 79) and community building.

For a MnE development, there first must be a local initiative and enduring commitment to the MnE concept, which eventually evolves into the establishment of a MnE administrative organisation (AO). The Road Bureau's MnE guidance (RMTC 1993) requires a MnE administrative organisation for registration and defines it as one of the following: 1) a municipal government, 2) a prefecture government, 3) a corporation established through joint investment of public and private or third sector (e.g., communal or agricultural cooperatives) where a municipal government holds more than a third of

the share, or 4) a *Koeki Hoji* (i.e., public interest corporation, such as an incorporated foundation and chamber of commerce) recommended by a municipal government.

The establishment of a MnE AO alone is necessary but sufficient. Initial investment necessary for construction of the required MnE infrastructure far exceeds a financial capacity of a single municipality. The establishment of a MnE commonly involves financial supports from all of the three levels of government administration of the country – i.e., central (i.e., state), regional (i.e., prefecture) and local (i.e., a municipality at a city, town, or village level) (see Figure 2). A MnE hosting municipality seeks external funds available from its respective prefecture government as well as central government to overcome its budgetary constraint, such as subsidies, grants, and/or loans tied to a development of facility for community development/promotion. The Road Bureau, the MnE program sponsor, is one of the funding sources. It offers a subsidy for car parking, IT-powered information kiosk, and toilet facilities development when such a support is justifiable from a road safety promotion perspective (RMTC 1993). Of the aforementioned 858 MnE currently in operation, more than 40 per cent of them received the subsidy (MILTa,b,c.). However, owing to this highly selective nature and specialised purpose of the subsidy, even fortunate MnE AOs find themselves in short of funds. To make their MnE vision and dream reality, a prospective MnE hosting community takes advantage of community-focused project subsidies, grants and/or loans available from its respective prefecture and other central government agencies. For instance, according to RMTC (1993), MnE Shishigashuku in Miyagi Prefecture funded its infrastructure development through the following funding mix: Road Bureau subsidy (8% or 30 million yen), National Land Agency subsidy (1% or 4 million yen), local bond issuance (80% or 313 million yen), and the municipal government budget (11% or 42 million yen); in contrast, Pascal Kiyomi in Gifu Prefecture funded the investment without the Road Bureau subsidy but the following contribution: the Ministry of Agriculture, Forestry and Fisheries subsidy (50% or 130 million yen), Gifu Prefecture subsidy (4.5% or 11.7 million yen) and the municipal government budget (44.5% or 118.3 million yen).

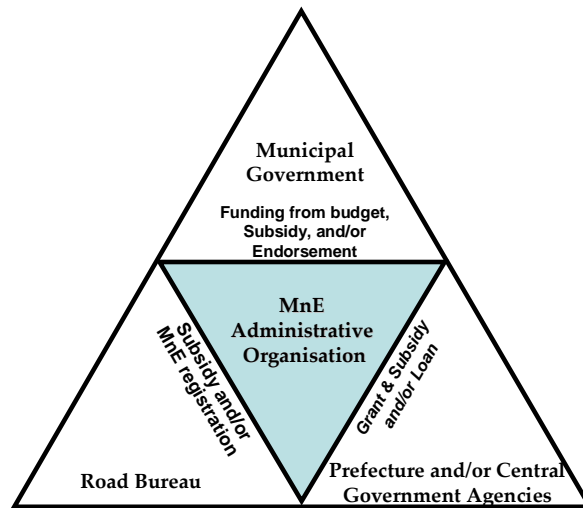

FIGURE 2: THE MICHI-NO-EKI INFRASTRUCTURE DEVELOPMENT MODEL

### The MnE Business Model

Once a MnE AO acquires the entitlement to operate under the MnE national brand, the MnE AO takes a full responsibility for the management of the established community asset (i.e., MnE service infrastructure). Here it is worthy to note the discrepancy in priority of the three MnE functions between Road Bureau and MnE AOs. From the Road Bureau’s perspective, the MnE program is a nation-wide road safety program. Thus, the bureau places more emphasis on rest and (traffic) information service functions over unique visitor-community interface services. From a MnE AO’s perspective, on the contrary, the ranking is reversed completely. A MnE AO views it as a local development program. In particular, when a MnE AO has financed its infrastructure based largely from those subsidies, grants and loans tied to promotion of local economic, cultural, and/or social developments, it bears an extra incentive and pressure to pursue such cause.

For a MnE to be sustainable, a MnE AO needs to ensure its MnE financial viability. The MnE registration guidance, though abstract and vague, stipulates basic requirements of the MnE maintenance, such as clean, comfortable, safe and 24-hour accessibility. Compliance to the registration guidance will incur a MnE costs. Such costs include expenses of utility, waste management, and labour for maintenance of safe parking and clean toilet facilities. Some cost items

might be covered by local volunteers. For instance, they may take or share responsibility for cleaning a more or less standard-number of 10 or more toilets periodically during the opening hours. However, if the MnE AO keeps failing to reward their goodwill in the form of tangible or discernable community promotion outcomes through the operations, it is most likely that their volunteer spirit will wither eventually. In such a case, the host community will soon or later find their MnE as a drainer of community capital, rather than as an enabler of community and local development. In fact, there was one such case in 2004 whereby a MnE AO and host community found the managing of MnE services a burden and requested its de-registration. From a perspective of MnE sustainability, this underscores the importance of a MnE AO to be financially self-reliant with some capacity to generate operational profits. Taking this one step further from a perspective of sustainable community development, a MnE AO in rural areas where income generation opportunities are largely limited are prompted to promote the MnE as a driver of such job and income opportunity creation. Furthermore, if the MnE infrastructure development involved loan financing, pressure for economic gains in the MnE management is more substantial. It is this need for economic gains that underscore the criticality of management discipline of private sector (i.e., marketing, entrepreneurship, and innovation among others) for the management of a MnE and its survival.

The MnE registration guidance accommodates this latent MnE AO need. It leaves the option of infusion of the commercial discipline into the MnE management. As noted earlier, the registration guidance allows the involvement of private sector in the formation of a MnE AO through an establishment of a corporation where a respective municipal government holds more than a third of the share. MnE Fujikawa Rakuza in Shizuoka Prefecture is renowned for its success under this type of a MnE organisational arrangement. Furthermore, the guidance also leaves the MnE AO another public-private partnering option - outsourcing of the MnE management function to a private organisation. MnE Hari Terrace in Nara Prefecture represents this type of arrangement. The MnE has come to be renowned not only as the first of this kind of MnE whereby a private corporation was involved as a contracted MnE managing organisation from its initial design and planning phase, also as a popular tourist destination and commercially successful MnE for its attractive services mix (Kensetus Keiei Service 2004).

Figure 3 presents the MnE business model. The model defines three key players in the MnE business model. They are a MnE host community; community agents (i.e., social, public, private actors, and their partnerships); and visitors (intra- and trans-community). From the perspective of

MnE as a vehicle of community promotion and renewal in line with the MnE registration guidance, the model places in the centre a MnE's visitor-host community interface (i.e., economic exchange and social and/or cultural interaction). For a MnE to be sustainable, the managing organisation must be able to offer something of value to its visitors. And instrumental to such a value creation is idiosyncratic host community capital (i.e., social, human, physical, financial, cultural, historical and environmental) and community-spirited entrepreneurship which transforms the former into unique and attractive value. Here the latter concept is defined, drawing on a definition of social entrepreneurship (Mair and Marti cited in Perrini 2006, p. 10) but with the focus on community needs, as the innovative application of resources so as to maximise opportunities that serve community needs in a sustainable manner.

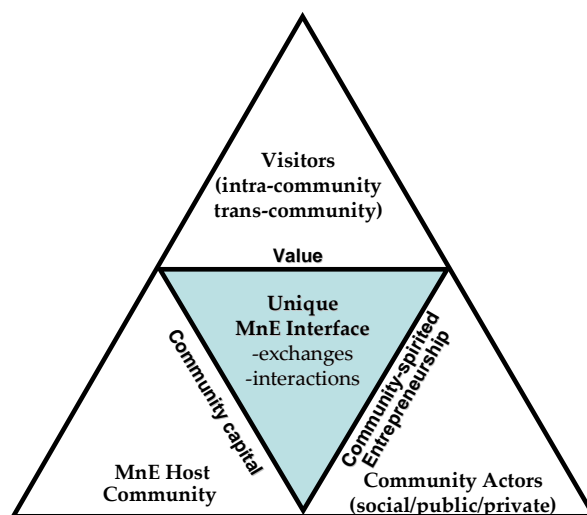

FIGURE 3: THE MICHINO-EKI BUSINESS MODEL

For the visitor-host community interface, a typical MnE is equipped with a restaurant and a selling floor or space. The former commonly serves unique dishes based on seasonal, fresh local produces whereas the latter sells fresh local produces which individual local farmers bring in every morning and/or processed local produces. Each unit of fresh produces (oftentimes local agricultural products) and processed produces is labelled with the name of its grower, so that growers can be rewarded in accordance with the actual sale of their produces. Interestingly, this operational necessity has also evolved to mean a brand name in the minds of intra- and trans-community visitors or

customers. It should also be noted that here is another opportunity for a public-private partnership or outsourcing. Many MnEs invite capable, community-spirited local businesses as a tenant at the premise. This arrangement has at least three benefits. First it ensures a source of fixed incomes to a MnE managing organisation. Second it enables each MnE to showcase its local commercial talents. And lastly, it provides a better or additional business opportunity to local businesses. On the other hand, it is also true that there are some MnE managing organisations insisting to remain distanced from this MnE commercialism. Among them is MnE Obah-chan Ichi Yamaoka in Gifu Prefecture. According to its managing director Ms Goto (2006), the MnE is a spin-off from their conventional social activity among local farm housewives who used to organise regular social gatherings for mutual teaching and learning of handcraft and cooking which eventually evolved to organise a flea market for their products; hence, the MnE still preserves its original communal spirit and is proud of its merchandise - local handcrafts, traditional processed foods and agricultural goods produced by the local farm housewives.

### **The MNE Value Creation: Current and Future Challenges**

Earlier Miyamoto, Grainger and Iwasaki (2005) envisaged two trends in a future MnE development: an increase of MnEs with a greater profitability drive and changing rules of MnE market competition. As noted earlier, the Road Bureau's subsidy to a MnE development needs to be justified from a perspective of the bureau's road travel service infrastructure development and particularly road safety. When a prospective MnE host community plans to establish its MnE in addition to the already established road safety network nodes (i.e., existing neighbouring MnEs along the main national/prefectural road), literally it has no chance of securing the bureau's subsidy. The option left to the community is, then, to look for top-up funds more heavily from other sources (subsidies, grants, and loans) with a bearing of innate profit-making pressure. The arrival of this type of MnE not only intensifies (market) competition for visitors in the region, but also alters the very nature of the competition. Simply stated, a mere offering of unique MnE local attractions are increasingly losing their relevance in the competition for visitors unless such attractions are found more valuable to prospective visitors. In this intensifying MnE market competition and under the new rule of competition, a MnE managing organisation, regardless of their establishment backgrounds, will most likely follow one of the following three paths: Rise (i.e., to dominate the region for visitor traffic), Sustain (i.e., to coexist through collaboration with the

neighbouring MnEs to compete more effectively with the neighbouring regions, and Fall (i.e., to be forced to minimise its service functions to the MnE basic – rest and road information, or even de-registration).

One of a few available MnE research reports, the MnE Study Group (MLIT 2001), earlier underscored the need for a more disciplined approach to the design and management of the MnE visitor-host community interface service facilities. In particular, the report was indicative of a lack of innovation and poor management of market intelligence (i.e., generation, dissemination and application of market intelligence) in the management of MnE. The report highlights the need for unique service offerings based on each MnE idiosyncratic community capital and community-spirited entrepreneurship, and urges MnE managing organisation to go beyond the conventional practice of the mere promotion of fresh and processed local produces. Unfortunately this message has failed to find a large audience according to a recent survey by a MnE seminar organiser who found that more than a third of 108 seminar participants indicated their strong interest, as a desired seminar topic, in the conventional local produce-driven marketing and MnE promotion (Itochu Corp. n.d.).

To understand this rather obsolete mindset of many MnE managing organisations and its context, it is appropriate here to review briefly the country's recent tradition in rural community development and renewal effort. That is, the 'One Village One Product' (OVOP) movement. A government policy report (Central Cabinet Office 2005) traces its origin back to a prefecture governor who in the 1970s began to promote a community-driven initiative for and a development of a self-reliant, proud rural community. He operationalised his OVOP vision along the following three dimensions: 1) a development of a local good or service which has global appeals at each village; 2) a self-reliant and creative community pursuit; and 3) human resource development (Oita OVOP 21 Promotion Committee, 2000). This local bottom-up effort and its unprecedented success soon found followers outside the prefecture. Accordingly to the Japan Center for Regional Development's report, in 1988 there were over 70 per cent of municipalities across the country were involved with some sort of the OVOP movement (Aso 2003). However, later the nation-wide passion for the OVOP movement soon began to wane outside the prefecture, following the introduction of the state government's overly generous grant program for regional (economic) developments (Central Cabinet Office 2005). Given that the community spirit enriched through their earlier OVOP movement is not something that disappears easily, it is not at all a far fetched argument that the community spirit is driving collective effort behind many MnE managing organisations. The OVOP movement has also provides a useful bass model for a

branding pursuit of community assets by MnE managing organisations. However, they need to be aware of one important shortcoming in the convention of the OVOP movement. The aforementioned central cabinet report (2005) underscores a strong tangible product focus in the past OVOP movement. Unfortunately, this traditional mind-set appears to be still intact in the marketing and brand development pursuit of many MnE managing organisations.

A growing importance of services to business and economy is now shared widely. In private sector, it has been understood as 'servitisation' of business (Vandermerwe and Rada 1988) to underscore the growing importance of services in a business. Some progressive MnE managing organisations have been exploring different MnE servitisation opportunities in their MnE visitor-host community interface. For instance, at MnE Tamba Markeds in Shiga Prefecture, local farmers attend, in turn, a sales floor of fresh and processed local produces and readily engage in personalized social interactions with MnE visitors to disseminate product, cooking, and local knowledge. On the other hand, the aforementioned MnE Fujikawa Rakuza organises a variety of participative, experience-based services in collaboration with its neighbouring local farmers, such as planting and harvesting of local agricultural produces. Similarly the MnE Toki Minoyaki Kaido offers interested visitors an opportunity to experience the whole making process of the nationally renowned local ceramic art. One of front runners in this race of MnE servitisation seems to be MnE Kunma Suisha-no-Sato in Shizuoka Prefecture. It has been successfully drawing over-night family visitors from urban cities, appealing to their nostalgic sentiment for the country's traditions preserved in the mountain-side natural environment (Shizuoka Chamber of Commerce, 2004). In a word, the MnE is staging 'a memorable experience' (Pine and Gilmore, 1999) for its family visitors from urban cities. However, even to these progressive MnE managing organisations, their journey of MnE servitisation is far from over.

According to Miyamoto (2005), any pursuit of servitisation of businesses involves a varying degree of relationship building and customisation. Furthermore, for effective customisation, he asserts that such effort needs to be driven by identification and manipulation of 'determinant attributes' (Hansotia, Shaikh and Sheth 1985 cited in Hutt and Speh 1998, p. 305) of the focal product - i.e., both important and differentiating product attributes in the eyes of customers. And instrumental to this servitisation pursuit is the effective management of marketing intelligence for effective relationship building through service customisation. As evidence suggests, many MnE managing organisations are not familiar with the practice of marketing intelligence management. Instrumental to a further development of the MnE program is a paradigm shift in strategic thinking and practice at each MnE

managing organisation in the visitor-host community interface management – a shift from a good to service focus, from a transactional quantity to relational quality focus, and from what service to how of service delivery focus. The importance of this proposed paradigm shift is more evident in the context where neighbouring MnEs compete with each other in their more or less homogeneous host community geographical, cultural and environmental settings.

In the eyes of the Road Bureau, the MnE program is a highly successful nation-wide road safety program. The bureau now has built enough confidence in the program and even seems to be eagerly exploring more MnE service functions like a crisis management centre in case of natural disasters. However, from a community organising and building perspective, many MnE managing organisations do not seem to have established a solid root in the host community yet. For instance, the aforementioned short-comings of many MnE managing organisations can be partially accounted for their lack of wider host community involvement or ‘communitisation’ of the MnE program. This point can be illustrated by the success enjoyed by the aforementioned front runner of the MnE servitisation pursuit, MnE Kunma Shusha-no-Koya. The MnE managing organisation differs remarkably from others in that it is owned, managed, and governed by a community cooperative composed of all community households. This unique inclusive and engaging approach, which nurture a community-wide sense of shared ownership, leadership and accountability, as the enabler of their successful management of marketing intelligence, innovation and, thus, superior community-visitor interface service offerings. This MnE managing organization can be labeled as a ‘community-based enterprise’ which Peredo and Chrisman (2006, p. 310) define as “a community acting corporately as both entrepreneur and enterprise in pursuit of the common good”.

Furthermore, from a sustainable community development perspective, it remains highly questionable to what extent each MnE managing organisation is strategically addressing challenges and opportunities associated with their pursuit of short-term gains against its long-term implications to the host community. There is no evidence on the current practices of such ‘ambidextrous’ management. Reality is that any MnE decision and action made today has long-term implications on a well-being of the host community capital. For instance, there were, in fact, some unfortunate cases where natural beauty was utterly ruined by an eccentric MnE building design. What about untapped cultural wisdom embedded within those aging locals? What about a future or sustainability of those MnEs in rural areas where the country’s aging problem is the long established reality? These are just a few of many present and future issues concerning the management of MnE host community capital. In addition to the

aforementioned paradigm shift into MnE servitisation, a MnE managing organisation also needs to adopt a more holistic strategic approach to its planning and practice. Under this holistic strategic paradigm, a MnE managing organisation needs to take willingly a leadership role in the pursuit of community organising and building. By addressing its opportunities and challenges in light of sustainable community development agenda to its host community, the MnE managing organisation should be able to generate a community-wide interest in its latent interdependent relationship with the host community as well as collective concern with a future well-being of the community. In a word, the MnE managing organisation can initiate the so-called 'community visioning' (Murphy and Cunningham 2003) and take a lead in the process of 'community organising'. Building on information generated and shared from the broader community stakeholders, new contacts and relationships will emerge (or enhanced 'civic value' and 'social capital' within the community) as well as a collective future vision. Then the MnE managing organisation will finally find itself in a position to be able to communitise the MnE, and transform the MnE into a true vehicle of community organising and building. And importantly, this potentially highly political process would be better facilitated if prominent community actors representing communal, public, and private sectors work together under the shared community future vision. As discussed earlier, the MnE program is equipped with the capacity to accommodate different types of cross-sectoral partnership. Figure 4 depicts four possible partnership arrangements across communal, public, and private sectors, such as CP1 denoting a partnership between communal and public sector. In particular, when the tripartite cross-sectoral partnership (CP1P2) constitutes the driver of MnE management, representatives of each sector can see their future through the lens of the MnE managing organisation and along its development. Only then, a MnE managing organisation can develop unique, resourceful, and attractive interface service offerings to its intra- and trans-community visitors whilst paving the way for the community to its sustainable future.

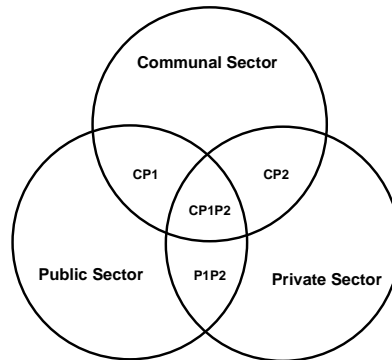

FIGURE 4: THE MICHI-NO-EKI PARTNERING MODEL

### **Internationalisation of the MnE Program: A Case of Thailand**

When measured by its popularity in public and participating municipality number, the MnE program without doubt has been a highly successful nation-wide program. The principle and philosophy of this successful program as a road safety as well as community-driven community development program has also caught attention and interest of the Japan Bank of International Cooperation (JBIC) and the World Bank. The former has been promoting the program in addition to its loans to finance infrastructure development (e.g., road construction) in less developed countries (JBIC 2001) whereas the latter has adopted the program as a model for promotion of bottom-up, community-driven, local developments in less developed countries (World Bank 2004). The following section reviews the background context prior to the introduction of the MnE program in Thailand and how the program has been integrated into the country’s industrial policy and programs to promote rural economic developments.

The Industrial Villages Project initiated by the Department of Industrial Promotion (DIP), Thailand was approved by the Cabinet on 24 May 1993 (Department of Industrial Promotion, 1999a). The project corresponded with the Ministry of Industry’s policy on the development of rural areas, and the distribution of income in order to help lessen the gap between the wealthy and the poor within the nation. The project was also designed to support the 7<sup>th</sup> National Economic and Societal Development Plan with an emphasis on the establishment of the industries throughout all regions in the country, including increasing the efficiency of production and business systems (Department of Industrial Promotion, 1997). The general goals of the Industrial Villages Project were (1) to establish industrial

villages whereby there is a well-designed business system on goods production, management, marketing, as well as administration; (2) to generate and to increase the income of villagers, including to help better the standards of their living, reducing the number of labour movement among villages; and (3) to improve the self-sufficiency of villagers (Department of Industrial Promotion, 1996). The specific aim was to improve the overall well-being of these citizens. To summarise the essence of the initiative, the underpinning idea for launching the Industrial Villages Project was to create a long-term growth and sustainable development of the nation by firstly focusing on creating jobs and generating income for citizens in rural areas. The plan was to be achieved by effectively utilising natural resources and improving skills of villagers.

At the outset of the Project in 1994, Industrial Villages were defined as the villages whereby the number of villagers maintained their vocations in producing handicrafts for a number of years such as from five to 15 years or more. Industrial Villages were, moreover, defined as potential villages that received continuous support from the government in helping develop vocations in producing handicrafts until villagers could plan, implement, execute, and manage all the pertinent activities by themselves (Department of Industrial Promotion, 1996).

The first phase of the project was implemented from 1994 until 1996 with a budget of 43 million baht. The key concept to help realise the objectives of the Project was achieved by adapting the incubation model to prospective industrial villages, which were divided into three stages over three years. The first year or at the preparation stage was to create villages' profiles, to synthesise the empirical evidence, and to select target villages. The second year, or during the executing stage, was to provide necessary activities supporting the development of industrial villages such as financial support, advising services, and the establishment of vocation units. During the last stage or the third year, was for the government to evaluate and follow-up on those incubated villages. The expected numbers of industrial villages were at first 58 villages; however, at the end of the project year, there were 117 industrial villages throughout the country. The products from each village were made from local, natural resources found in those villages, such as coconut shells, cotton, clay, java weed, pandan leaves, and bamboo. In 1996, among those 117 industrial villages, there were 22 villages selected to be champions in producing high quality handicraft products (Department of Industrial Promotion, 1996).

The success of the first phase prompted the Department of Industrial Promotion to further strengthen the development of the existing industrial villages and establish new ones through the

implementation of the second phase from 1997 until 1999 under Prime Minister Leekpai. The second Project also corresponded to the 8<sup>th</sup> National Economic and Societal Development Plan on increasing the skills of national human resources (Chiang Mai University, 1998). The objectives of the second phase were modified to be as follows: (1) to strengthen the self-sufficiency of the business units in the villages; (2) to increase the skills, knowledge, efficiency, and performance of the villagers, including leaders of villages; (3) to create positive attitudes among the villagers towards industrial vocations; and (4) to continue improving the capabilities of each village. With a budget of 65 million baht (Department of Industrial Promotion, 1997), the number of activities such as seminars/workshops educating villagers, public relation for the Project, and management support were added. At the end of 1999, the number of industrial villages was increased from 117 to 153 villages throughout the country. There were 36 champion villages selected in 1999 (Department of Industrial Promotion, 1999b).

According to the 8<sup>th</sup> National Economic and Societal Development Plan, the tourism industry in Thailand was also supported (“Sustainable Tourism,” 2002). The implication was to help improve the living conditions of citizens in rural areas. Therefore, in 1999, the Tourism Authority of Thailand teamed up with the Ministry of Industry to implement the Industrial Villages Development for Tourism Project with a financial support of 54.6 million baht from the Japan Bank of International Cooperation (JBIC), including a budget contributed by the Department of Industrial Promotion. Based upon the performance of the village and its leader, including the readiness of the villagers, 20 villages from 19 provinces were selected to take part in the Project from 1999 to 2003. Out of which, six villages were in the North, four villages were in the Northeast, five villages in Central Thailand, and five villages were in the Southern part of Thailand. Following the MnE model, the aim of the Project was to establish community centres in those villages as a vehicle of community-building and organising. Each selected village should establish own community centre for providing information on attractions of its own and nearby provinces to tourists, selling food and local handicrafts and products, providing services such as a guided tours, car/van rental, and home stay accommodations, and serving as a showcase for local handicrafts and their production (Department of Industrial Promotion 2003). To further promote the concept of community-driven local development, JBIC has organised grass-roots learning and knowledge transfer of Japanese MnE experience through workshops and staff study tour to Japan (Miyao 2005). More recently, Industrial Villages and Industrial Villages for tourism were incorporated and renamed into the Thai versions of the aforementioned ‘One Village One Product’ - “One Tambon (District) One Product (OTOP)” and “OTOP Tourism Villages” Projects - introduced by

the then-Thaksin administration in 2001 and 2004, respectively (“Big Project,” 2004). It may take many years for the principle and philosophy of the MnE program to be fully rooted in the local context. Nonetheless, the program has helped the locals institutionalise a model of bottom-up, community organising and building.

## **Conclusion**

In the recent decades, Japan has been exploring various avenues to re-engineer itself to be a sustainable state in a mature, slow economic and social growth era through promotion of stronger communal sector. This paper presented the recent experience with the nation-wide road safety program, MnE program. More specifically, it defines the MnE program as the vehicle of a bottom-up, community organising and building movement for a sustainable local development, and explores the potential. The program has enjoyed a nation-wide success and been enlightening life of those involved in the MnE program. However, it should be stressed that a full development of the MnE program is not realised. As discussed in this paper, the program can offer and return more to its host community. In order to realise its full potential, this paper advise a MnE managing organisation to pursue a communitisation of its operations actively by spearheading collective efforts of community visioning, building and organising for a sustainable development of the host community. Notably, the past economic, social and political experiences of developed economies are not at all irrelevant to less developed countries. For instance, those economies which currently enjoy a rapid growth mode of economy will also one day become a mature economy, which inevitably necessitates some sorts of re-configuration of the state systems. It seems that the creation of vibrant, self-reliant local communities and civil society constitutes one of critical ingredients for a successful state transformation. As examined in the context of recent Thai’s experience with the MnE program, the program seems to have a capacity to transcend national boundaries as the bottom-up, community development model.

# Economic Growth and Convergence of Asian NIEs: The Empirical Analysis Based on the Panel Unit Root Tests

Takashi Matsuki, [matsuki@utc.osaka-gu.ac.jp](mailto:matsuki@utc.osaka-gu.ac.jp)

Ryoichi Usami, [r-usami@utc.osaka-gu.ac.jp](mailto:r-usami@utc.osaka-gu.ac.jp)

Osaka Gakuin University, Japan

## Abstract

This study examines the growth patterns of per capita real output across the Newly Industrializing Economies in Asia (Asian NIEs): Hong Kong, Singapore, South Korea, and Taiwan. First, some concepts of convergence that are frequently referred in literature on economic growth have been arranged. Then, using panel data from 1960 to 2004, the unit root tests are applied to check whether convergence of per capita output can be found across the economies or not. By setting the models fit for the graphical features of data, the economies are significantly grouped into two different types in terms of growth experiences.

## The Model

$y_{it}$  denotes the logarithm of output or income per capita of economy  $i$  at period  $t$ . This study assumes that a series  $\tilde{y}_{it}$  ( $\equiv y_{it} - y_{jt}$ ) is generated by the following data generating process (DGP).

$$\text{Under Null} \quad \tilde{y}_{it} = \alpha_i + \tilde{y}_{it-1} + \varepsilon_{it} \quad (1)$$

$$\text{Under Alternative} \quad \tilde{y}_{it} = \alpha_i + \beta_i t + \rho_i \tilde{y}_{it-1} + \sum_{h=1}^2 \delta_{hi} D_{hit} + \varepsilon_{it}, \quad |\rho_i| < 1 \quad (2)$$

$$i = 1, \dots, N, \quad t = 1, \dots, T$$

Where  $\varepsilon_{it}$  is independently and identically distributed across  $i$  and  $t$  with a zero mean and a finite variance. Under the stationarity alternative hypothesis (2), the DGP has up to two-time shifts in the level or the slope in the trend function.  $\delta_{hi}$  denotes the size of the  $h$ th break ( $h = 1, 2$ );  $D_{hit}$  is the dummy variable which represents the  $h$ th break.  $D_{hit} = DU_{hit}$  for the shift in the level and  $D_{hit} = DT_{hit}$

for the shift in the slope.  $DU_{hit} = 1$  for  $t > TB_{hi}$  or zero otherwise, and  $DT_{hit} = t - TB_{hi}$  for  $t > TB_{hi}$  or zero otherwise, where  $TB_{hi}$  is the date of the  $h$ th break.

The regression model in this study nests the DGPs (1) and (2):

$$\Delta\tilde{y}_{it} = \hat{\alpha}_i + \hat{\beta}_i t + \hat{\phi}_i \tilde{y}_{it-1} + \sum_{h=1}^2 \hat{\delta}_{hi} D_{hit} + \sum_{l=1}^{\bar{l}_i} \hat{a}_{il} \Delta\tilde{y}_{it-l} + u_{it} \quad (3)$$

$$i = 1, \dots, N, \quad t = 1, \dots, T$$

Where  $\Delta\tilde{y}_{it} = \tilde{y}_{it} - \tilde{y}_{it-1}$ ,  $\hat{\phi}_i = \hat{\rho}_i - 1$ , and  $u_{it}$  is a serially uncorrelated error.  $\bar{l}_i$  is a lag order parameter and is specified by following the ‘general-to-specific’ procedure described in Perron (1989) and suggested in Ng and Perron (1995).

Let  $t_i$  be the  $t$ -statistic testing the null hypothesis  $\hat{\phi}_i = 0$  and  $\hat{\delta}_{1i} = \hat{\delta}_{2i} = 0$  against the alternative hypothesis  $\hat{\phi}_i \neq 0$  and  $\hat{\delta}_{1i} \neq 0$ ,  $\hat{\delta}_{2i} \neq 0$  in model (3) for each  $i$ . As carried out in Zivot and Andrews (1992) and Lumsdaine and Papell (1997), the break dates  $\{TB_{1i}, TB_{2i}\}$  are endogenously determined to be where the one-sided  $t_i$  is minimized in sequential estimations over all possible break dates. Refer to that  $t_i$  as the minimum  $t_i$ . The limiting distribution of the minimum  $t_i$  as  $T \rightarrow \infty$  for fixed  $i$  is given by Zivot and Andrews (1992) and Lumsdaine and Papell (1997) for the case of one time break and two times breaks, respectively. For the case that  $\hat{\beta}_i = 0$ , which holds for the level-shift breaks, it is shown by Matsuki and Usami (2007).

## The Criteria for Convergence

This analysis grasps convergence in terms of the historical features of the series, taking the definition shown in Oxley and Greasley (1995) and Lim and McAleer (2004). The convergence means that the output gap between any two countries is stationary, and is divided into two types or phases.

The first is catching-up. For the series of the difference in the logarithm of per capita real output between country  $i$  and  $j$ ,  $\tilde{y}_{it}$ , if  $\tilde{y}_{it}$  is stationary, that is,  $\hat{\phi}_i \neq 0$ , and  $\hat{\beta}_i \neq 0$  in model (3), it is said that one country is catching up to the other. Catching-up implies that the per capita output difference between two countries is narrowing over the period, i.e. two countries are on their way to converging. The second is long-run convergence. For  $\tilde{y}_{it}$ , if  $\hat{\phi}_i \neq 0$  and  $\hat{\beta}_i = 0$  in model (3), it is said that two countries are on long-run convergence. Long-run convergence implies that the converging process has completed. If  $\tilde{y}_{it}$  is nonstationary, that is,  $\hat{\phi}_i = 0$ , in model (3), per capita outputs for countries  $i$  and  $j$  diverge over time.

The growth patterns of per capita real outputs among the economies, catching-up, long-run convergence, or divergence, will be concluded based on the panel unit root tests, described in the next section, assuming  $\hat{\beta}_i \neq 0$  or  $\hat{\beta}_i = 0$  for model (3). Hereafter, refer to the former assumption in which model (3) has a (deterministic) time trend term and the latter in which it does not as the trend model and the no trend model, respectively.

## Test Procedure

The tests for the hypotheses are principally based on the *Fisher\_B* test statistic presented in Matsuki and Usami (2007). It is the revised Fisher statistic for the panel unit root test to allow multiple breaks, and is defined as follows:

$$Fisher\_B = -2 \sum_{i=1}^N \log p_i \quad (4)$$

Where  $p_i$  is a  $p$ -value from the minimum  $t_i$ . The *Fisher\_B* statistic has the chi-square distribution with  $2N$  degrees of freedom.

The following three reasons lead to adopt the *Fisher\_B* statistic. Firstly, the panel tests work well for the panel data. Specifically, the panel tests generally have high power relative to testing individually for each possible pair of cross-sectional units, because some pieces of the set of tests in the latter could indicate the contrary results to the true relationship in terms of probability. Secondly, among the panel tests, ones based on Fisher's  $p$ -value combination approach are just the right feature for the panel data here. They do not require a large cross-sectional dimension, and their accuracy is not affected by cross-sectional dependence among the data. Thirdly, the *Fisher\_B* test can receive flexibly modeling. It permits the regression equations to be allotted the trend model or the no trend unit by unit, where the slope-shift break in the trend model is compatible with the level-shift in the no trend, and each equation to have different break points.

In order to calculate  $p_i$ , we skillfully (and approximately) materialize the theoretical formula for the limiting distribution of the minimum  $t_i$  under the small sample size by Monte Carlo simulations. On the simulations, this study takes up the following two models as the DGP representing the unit root null hypothesis:

$$\tilde{y}_{it} = \tilde{y}_{it-1} + \varepsilon_{it} \quad (5)$$

$$\Delta \tilde{y}_{it}^* = \hat{\alpha}_i + \sum_{k=1}^{\bar{k}_i} \hat{\gamma}_{ik} \Delta \tilde{y}_{it-k}^* + \varepsilon_{it}^* \quad (6)$$

In model (5),  $\tilde{y}_{it}$  is generated for each  $i$  by a driftless random walk, where  $\varepsilon_{it}$  is an *i.i.d.*  $N(0,1)$  error across  $i$  and  $t$ . In model (6),  $\Delta \tilde{y}_{it}^*$  is the bootstrap sample for  $\Delta \tilde{y}_{it}$ ;  $\varepsilon_{it}^*$  reflects a serially uncorrelated but possibly cross-sectionally correlated error, and  $\hat{\alpha}_i$  is set at 0 when the regression model (3) does not contain a time trend. To make the bootstrap sample out of the actual data, we follow a sequence of procedure shown in Maddala and Wu (1999) and Wu and Wu (2001), and also adopt Berkowitz and Kilian's (1996) block resampling method for the artifice of the lagged augmentation samples  $\tilde{y}_{it-1}^*, \dots, \tilde{y}_{it-\bar{k}}^*$ .

For each  $i$ , Monte Carlo simulation with 5000 replications is conducted under each of DGP models (5) and (6), which provides the empirical distribution of the minimum  $t_i$ . That distribution, in turn, provides  $p_i$  for the *Fisher\_B* statistic. The simulations are, in particular, useful when data have correlation among cross-section as assumed in model (6), because, in that case, it is difficult to make theoretically clear the limiting distribution of the minimum  $t_i$ .

We will also refer to the results obtain from the common panel unit root tests to compare with ones from the *Fisher\_B* test. They are the tests proposed in Levin, Lin and Chu (2002), Im, Pesaran, and Shin (2003), and Maddala and Wu (1999), what is called the LLC test, the IPS test or  $z$ -bar test, and the MW test, respectively, which allow for no structural break in the historical series.

## Data

The data source is the Penn World Table (PWT) 6.2. It has calculated some kinds of the real outputs per capita for the countries in the world. In this empirical analysis, real GDP per capita adjusted for terms of trade changes (RGDPPT) is employed as the data for Asian NIEs from 1960 to 2004, since the economic relations with foreign countries have played as vital roles for these economies as for the ASEAN-5 countries analyzed in Lim and McAleer (2004). RGDPPT is the 1996 international price value of domestic absorption of a country in a given year plus current exports minus current imports deflated by the deflator and the 1996 PPP of domestic absorption (Data Appendix for a Space-Time System of National Accounts: Penn World Table 6.1, p. 12). All the series used in this study are taken in natural logarithms.

## Empirical Results

In the first place, let us mention the results from the LLC test and the IPS test briefly. Both of these tests reject the unit root null hypothesis, where significance level is 1 % for the LLC and 10% for the IPS, in the case of regression with time trend, while neither rejects in the case without time trend. The results seem to imply that Asian NIEs show the way of economic growth that the followers are catching up toward the leading economies among them. There is, however, reservation about reliability of those tests here. When structural breaks in the series and dependence among the cross-sectional units are likely to exist, the LLC test and the IPS test ignoring them are pointed out to tend to mistakenly reject the null ().

The Fisher statistic can free us from the above question. The results are given in Table 1. The third column presents the estimates of the MW statistic, which indicate no rejection of the null in either regression model. In particular, why the test on the first row is in favor of the null differently from the LLC and the IPS would be because the Fisher statistic does not have such a tendency toward over-rejection of the null as subsist in the LLC and the IPS. The fourth and fifth column of Table 1 presents the estimates of the *Fishier\_B* statistic taking account of one time level-shift break and two times, respectively. The *Fishier\_B* tests just partly suggest convergence. This result may have arisen from restraint that the identical form of regression equation, whether the trend model or the no trend, was applied to all of six pairs of economies.

Therefore, in order to capture the changes of the data more faithfully, each pair is separately matched with the trend or no trend model, and level or slope shift as a type of structural break in the case of the trend model. For that, in total, there are 727 ways of combination excluding extreme two cases in just the previous paragraph where refer to the case of the trend model and the no trend model with level-shift break for every pair as Case A and Case B, respectively, for convenience for comparing with Cases presented just below. Among those 727 ways, simple 10 are taken up for the Fisher tests here, and are put in order in Table 2.

The results of the tests are given in Table 3. Rivet our attention to the estimates of the *Fishier\_B* statistics in the fourth and the fifth column which is computed on the supposition that structural break has happened once, One Break, and twice, Two Breaks, in the series, respectively. The null hypothesis is, on the whole, likely to be rejected in One Break rather than in Two Breaks. It would be one reason for this that test power in the latter has become weak relative to that in the

former due to decrease in the degrees of freedom. When model (5) is used as the null GDP on the simulation, all Cases in One Break significantly reject the null, whereas only four Cases do in Two Breaks. These results may be roughly interpreted as follow: each of Asian NIEs has experienced such a change as to cause discontinuity in the time series of per capita output, but has been on some convergence process to each other since 1960. Then which type in the world should some convergence be, catching-up or long-run convergence?

The lower half of the fourth column of Table 3 ushers us to the answer to the last question. Since model (6) used for the simulation there contains more reasonable supposition than model (5), the *Fishier\_B* test becomes unlikely to reject the null hypothesis. In that situation, Case 7, Case 8, and Case 10 survive as possibility of convergence. What should be stated concerning the possibility is extracted from Table 2. According to it, among Case 7, 8, and 10, the trend model has been commonly assumed for pairs of Hong Kong and Korea, and Hong Kong and Taiwan, and the no trend model for pairs of Hong Kong and Singapore, and Korea and Taiwan in regression. All things considered, we can reach the conclusion that Hong-Kong and Singapore have been on long-run convergence as the economic leaders in Asian NIEs, while Korea and Taiwan have been catching up to them, especially Hong Kong, as the followers.

## **Conclusion**

This research has inspected the convergence hypothesis of per capita real output in Asian NIEs based on more realistic conditions and more flexible methods than those in usual analysis. As a result, the panel unit root tests have indicated evidence favoring convergence though somewhat weakly. In addition, a closer study has cleared up the growth patterns of Asian NIEs as follows: per capita real output gap between Hong Kong and Singapore has been more or less small and steady since 1960. That between Hong Kong and Korea or Taiwan has been narrowing over the period. Consequently, Hong Kong and Singapore are considered the leaders, and Korea and Taiwan the followers among four economies still at present, however, unless any catastrophic event will happen, they will grow up into a group of developed economies of Asian type in future.

### End Notes

<sup>1</sup>Asymptotically, to be technically more correct, the fraction of the  $h$  th break is defined as  $\tau_{hi} = TB_{hi}/T$  ( $h = 1, 2$ ) for all  $T$ , in which  $0 < \tau_{1i} < \tau_{2i} < 1$ . Then,  $DU_{hit} = 1$  for  $t > \tau_{hi}T$  or zero otherwise, and  $DT_{hit} = t - \tau_{hi}T$  for  $t > \tau_{hi}T$  or zero otherwise.

<sup>2</sup>Starting in  $\bar{l}_i = 8$ , as Smyth and Inder (2004), the (whole number) value of  $\bar{l}_i$  is reduced one by one until  $\hat{a}_{i\bar{l}_i}$  is estimated to be different from zero at the 10% level of significance. For the details of the procedure, see Matsuki and Usami (2007).

<sup>3</sup>The details are described in Matsuki and Usami (2007).

<sup>4</sup>About the merits and demerits of these common tests, see Maddala and Wu (1999).

<sup>5</sup>Formally, Alan Heston, Robert Summers and Bettina Aten, Penn World Table Version 6.2, Center for International Comparisons of Production, Income and Prices at the University of Pennsylvania, September 2006.

<sup>6</sup> According to the PWT 6.2, the total trade, exports plus imports, as a percentage of GDP in 2003 is 325.4, 85.8, 419.1, and 106.6 for Hong Kong, Korea, Singapore, and Taiwan, respectively, and 70.6, 208.0, 116.0, and 126.0 for Indonesia, Malaysia, Philippine, and Thailand, respectively, while its world average is 92.7. The latter four countries plus Singapore are called the ASEAN-5.

<sup>7</sup> Their estimates are not shown here, but available on request.

<sup>8</sup> The MW statistic is the Fisher statistic considering no structural break in the series. Notice that the MW static is irrelevant to either type of break in Cases given subsequently.

## Abstract

In the recent recession in Japan, U/V analysis was used as a method of the measurement of structural unemployment. Controversies on a validity of the analysis have begun. Does U/V analysis hold effective for the measurement of structural unemployment? The validity chiefly depends on structural factors in the estimated equation of time-series data. The presentation is mainly the estimation of structural factors and indicates some characters of U/V analysis.

## Introduction

### Economical Environment

The labor market in Japan has mainly consisted of the three systems, the “lifetime employment (Shusin-koyo)” system, the “seniority ranking wage and promotion (Nenko-joyoetsu-chingin)” system and the “spring labor offensive (Shunto)” system. Employees are guaranteed employment until retirement age, their wages each year and promotions are determined by their age or the length of service to the company. Many industry-based labor unions coordinate demands for wage increases and benefits in the spring. The systems played important roles at the time of Japan’s high economic growth periods. But, as Japan after 90s went through economic depression and restructuring, these systems have changed gradually. Companies are putting more emphasis on contingent work, fixed wage and merit-based promotion system. The deep and long economic depression after the middle of 90s brought forth lots of unemployment through closures and bankruptcies of companies. And the unemployment rate suddenly increased from about 2% to 5% over. By a correspondence with the situation, the government wrote in the “White Papers”<sup>1)</sup> that the structural unemployment rate was about 4% (3/4 of the actual rate), and the under-demand unemployment rate was about 1% (1/4). Most of economists felt some difference with the results by the analysis and the actual unemployment phenomenon. The reconstruction of u/v model and the controversies of the structural unemployment were derived from the circumstances.

### Controversies and Previous Studies

The results of White Papers derived from the simple model that unemployment rate is a function of only vacancy rate without any shift variable. Therefore, the structural unemployment rate (involved the frictional unemployment rate) was too high. Main points of controversies after then were three. The first is the limitation of structural factors. The factors that have influence on the structural unemployment is very difficult to select. The results derived from the selected factors are very different each other. And then, the selected factors have each cyclical pattern, only the part that influenced on the structural unemployment can’t separate from the whole. The sets of unemployment rate and vacancy one have a clock-wise cyclical pattern on u/v curve. The phenomenon mainly depends on the specialties of the preceding movement of vacancy and the delayed movement of unemployment on the labor adjustments. The second is the ways that divides the clock-wise movement from trade cycle and the shifts of u/v curve. The third is about the effects of the deflation. The adjustments mechanism of labor market was distorted by deflation, the set of u/v rates in deflation keeps still on the upper-left side in the figure. Some ways that induce plainly the price factors in the u/v model were an object of controversies. As most of previous studies of the u/v analysis in the recent Japan wrote in Japanese, it writes down main two papers here. The same objects of this paper are analyzed in Kitaura and et al.(1). By using the quarter-year data, they explain the lower rate of structural unemployment, and the stable conditions of u/v curve without clock-wise patterns. The other is the paper of Otake and Ota (3), this is characteristic of the using of plural structural factors in u/v analysis.

### Contrivances and Aims

The following u/v analysis adopts a simple time-series model used by annual data, and it counts the structural unemployment rate and the changed one. There assumes in the following that the actual unemployment equals the under-demand unemployment plus the structural one. It is on the assumption that the frictional unemployment involves in the structural one (or its rate is zero). The structural unemployment rate in u/v analysis trend to higher, but main object as an estimation of the above structural unemployment rate finds out some important reason of the shift of u/v curve. This is the same with the recognition of the determination on u/v theory. The contrivances of this paper consist on three parts, (1) the actual data adjustments of vacancy rate, (2) the estimation of the structural unemployment rate and the limitation of the shift variables of u/v curve, (3) the estimation of the structural unemployment rate in the market equilibrium; 4) Determinants of Unemployment

**Unemployment Rate**

The data of unemployment are used one of “Labor Force Survey”<sup>2)</sup> of the Ministry of Internal Affairs and Communication. The statistics presents the number of persons who was unemployed but sought employment during the survey term, and the statistics is unemployment or unemployment rate of workers basis. The unemployment rate in the following takes use of employee’s basis in common with the vacancy rate. And, by the same reason, unemployment rates are annual data in June every year. The structural unemployment rate estimates by employees basis, and after then, the rate translates into the original workers basis. The employment adjustments of Japanese companies, in general, are imperfect or partial to the regulation of the optimal size in each period. This fact mainly derives the rigidity of unemployment rate and a clock-wise pattern.

**Main Determinants**

The unemployment rate function of u/v analysis explains determinants of it. The determinants of the rate may divide three. The first is the shape factors of u/v curve. Those include vacancy rate and unemployment rate with time lag. The unemployment rate with time lag of one period is very effective in the model with remarkable clock-wise pattern on u/v curve. The data of vacancy or its rate use annual one of “Employment Tendency Survey”<sup>3)</sup> of the Ministry of Health, Labor and Welfare. The statistics covers the vacancy of offices and factories with 5 employees or more. So the vacancy with 4 employees or less has to estimate. The estimated data (1) are as follows.

TABLE 1: ESTIMATED DATA

	multiplicand	multiplier
1975-1983	E	vacancy rate of simple work in manufacturing
1984-1991	E	vacancy rate of 29-5 employees
1992-2005	E	vacancy rate of services industry
1975-2005	E	vacancy rate of 29-5 employees

Multiplicand E: aggregated employees of 4 or less the estimated data (2) are, the estimation data are the “Survey” numbers plus the above vacancy numbers. The estimation (1) is a statistics that involves in the changes of industrial or workers structure. The estimation (2) is a statistics that extends the vacancy rate of small workshops and shops. The both vacancy rate is in the following. And then, two figures of u/v curves that used by both estimations are also in the following.

FIG. 1: UV ESTIMATE

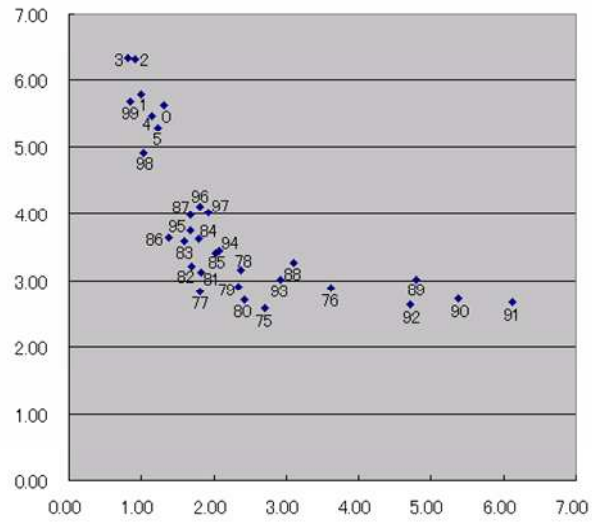

FIG. 2: UV ESTIMATE

FIG.3: UV ESTIMATE

### Wage Determinants

The second is wage factors that have a potent influence in unemployment rate. It's possible to surmise some wage factors, example real wage per labor hour, unit labor costs, and social contribution rate of employer or wage distribution ratio and so on. The wage distribution ratio was the best in the following analysis. The three indices of the wage distribution rate are prepared on the analysis. These are the ratios of wage costs/total costs of companies, wage and welfare costs/total costs of companies and total personnel expenses/national income. The former two are used by the correlation of the unemployment rate in the following.

### Structural Determinants

The third is some structural factors that cause a shift of u/v curve. It counts up a lot of factors, mismatching index of labor, quits ratio, workers ratio of service or tertiary industry, recipient's rate of employment insurance, participation rate of female and so on. But two factors of the workers rate of service industry and the workers rate of older ages were significant in the analysis. The actual combination of unemployment rate and vacancy rate have a clock-wise movement, it has to involve the structural factors in the model. But the time-series data of above factors take in the affections of trade cycle. The increase of quits ratio or recipients rate of employment insurance may have the trade cycle affections rather than the affections of labor supply. The validity of these factors depends on the characters of labor market or the difference of market adjustment processes.

## Model and Estimated Equations

### Model Expressions

The unemployment rate of the public statistics is written by workers basis, and the vacancy rate does by employee's basis. Therefore, it's necessary for the former to be transferred to employee's basis. By a consideration of the cyclical movements on u/v curve, the unemployment rate (u) is a function of vacancy rate (v), unemployment rate with one time lag (u<sub>-1</sub>), wage distribution ratio(Ws) and structural factors(St). Now the available function is,

$$\ln(u) = \alpha + \beta \ln(v) + \gamma \ln(u_{-1}) + \delta * Ws + \epsilon * St \quad (1)$$

The structural unemployment rate (u<sub>s</sub>) of employees basis is calculated by a intersection point of the above and the straight line of 45 degrees (ln(u)=ln(v)=ln(u<sub>-1</sub>)). The expression is,

$$\ln(u_s) = (\delta * Ws + \epsilon * St) / (1 - \alpha - \beta - \gamma) \quad (2)$$

The estimated equations in the following table are obtained from the above expression.

TABLE 2: ESTIMATED EQUATIONS

		$\alpha$	$\beta$	$\gamma$	$\delta$	$\varepsilon$		adjR2			
					Ws(1)	Ws(2)	St(1)	St(2)	St(3)

		-4.924	-2.839	2.932	6.078				4.542		
		-1.896	-0.140	0.363	0.037			0.023			0.9603
		-4.902	-2.648	2.373	5.441			3.853			
		-1.391	-0.148	0.382		0.030			0.031		0.9652
		-4.622	-3.241	2.941		6.081			3.354		
-1.564		-0.158	0.345		0.030	0.018				0.9644	
V(2)	V	-5.182	3.230	2.388		6.003	3.233				
		-1.372	-0.157	0.322		0.027	0.019				0.9658
		-4.325	-3.457	2.265		5.242	3.382				
	V <sub>-1</sub>	-1.434	-0.159	0.280	0.033				0.047		0.9688
		-3.731	-3.461	2.059	5.063				5.089		
		-1.669	-0.137	0.354	0.033		0.022				0.9602
		-3.879	-2.634	2.256	4.466		3.832				
		-1.372	-0.157	0.322		0.027	0.019			0.9658	
		-4.325	-3.457	2.265		5.242	3.382				

Upper: the constants lower: t ratio

Ws: wage distribution ratio

St(1): workers rate of services industry, St(2): workers rate of old ages

St(3): participation rate of female

From the estimated equations, the data of vacancy rate (1) is more effectual than the data (2). And the vacancy rate with time lag of one period is also significant. The fact is caused by the reasons why Japanese companies in depression trend to persist their employees by a activation of the internal labor market, or a period when derives unemployment is different in some situations of trade cycle and some rates of economic growth.

#### Some Results

The two data are selected as a significant one of the structural factors. Those were the workers ratio of services industry and the older age's workers ratio in all workers. The other factors were not significant. The vacancy rate with time lag was derived more stable results. The structural unemployment rates in 2003 that are calculated by the estimated ten equations were 3.29~ 3.70% and the average rate was 3.44%. The results may be no different from the previous studies. It provided that the actual unemployment rate consists of the structural unemployment rate and the under-demand one, those unemployment rates are like the following table.

TABLE 3: UNEMPLOYMENT RATES

	1987	1992	1997	2003
actual unemployment rate	2.80	2.20	3.40	5.30
structural unemployment rate	2.35	2.57	3.15	3.44
under-demand unemployment rate	0.45	-0.37	0.25	1.86

The change rate of the structural unemployment was about 1% from before and after 1990 to 2003, and one of the under-demand unemployment was about 1.8% in the same period.

### **An Amendment: Determinations of the UV Analysis**

In the u/v analysis, an equilibrium that is explained as an intersection point of u/v curve and the straight line of 45 degrees means the equation of inflow and outflow from the whole employment. The equilibrium concept is not equal to one of labor market. The emergence of unemployment at present will be a consequence of labor adjustments in past. And also, the emergence of a vacancy at present will be a consequence of company's production plan in future. The emergences of unemployment or vacancy are not the changes of labor demand or supply at present.

The difficulty of the application of u/v theory is caused by the fact that is hard to get the data of job offers. In some vacancies counted as data, there will be found some offers that the applicants can't accept the working conditions, or that can't arouse their interests. It is a possibility that the difference of data basis about unemployment and vacancy make feeble the validity of u/v analysis. The validity of the u/v theory exists in the confirmation of structural change in labor market, doesn't be in the confirmation of equilibrium in labor market.

### **Further Results**

The structural unemployment rate was calculated by u/v analysis trends to be high. The ratio is maximum one of it. The fact partly depends on the narrowness of equilibrium concept. The sets of unemployment rate and vacancy rate on the equilibrium of labor market are different with the sets of u/v analysis. Those sets on the market equilibrium are gotten by the other market analysis, like an excess-employees analysis. So the equilibrium rate of structural unemployment is calculated by an intersection point of the u/v curve and the straight line passed the equilibrium point in u/v figure. It was recognized the fact that the market equilibrium in recent Japan realized in 1992 from the other analysis. The straight line passed the equilibrium point is gentler slope than 45 degrees line. Therefore, the market equilibrium rate of structural unemployment is lower than the results of u/v analysis. The equilibrium rate in 2003 is about 2.8~ 3.1%, it explains in the following figure.

FIG. 4: EQUILIBRIUM RATE

## Summary

There are no doubts about the difficulties that obtain the vacancy rate data. The used data were statistics which were gotten by company's questionnaire; those had the movements in response to the actual economic changes. The adjusted vacancy rate has a higher correlation coefficient with the unemployment rate, and it effectuates roles as a main factor in the model. By response to idem (1) or idem (2) of the contrivances in the rate adjustments of the vacancy and the estimations of structural unemployment had relatively suitable results, and explained the limitation of structure changing factors. The structural unemployment rate of market equilibrium is an estimation of the actual rate, it is an amendment of  $u/v$  theory. The estimation was in idem (3) of the contrivances.

## End Notes

- 1) The White Papers in Japan is an annual report of the administrative organs to the Cabinet. This Papers is the "White Papers of Labor Economy", (5) 2002, and the same expressions were written in (5) 2003 or 2004.
- 2) The Survey elucidates the current states of employment and unemployment by questionnaires, and the actual enumeration takes place every month on a sample basis. The statistics records the working states of person who resided in about 40,000 households selected from about 2900 districts.
- 3) The Survey elucidates the mobility of labor forces and the current information on entering or leaving labor forces. The statistics records the labor mobility among workers in the about 14,000 establishments (with 5 employees or more) by random selection in principal industries.

## Shift of Comparative Advantages: China and India Case Studies

Tri Widodo, ui55t003@pcnet.hue.ac.jp  
Hiroshima University of Economics (HUE), Japan

### Abstract

This paper aims to scrutinize shifts in comparative advantages of China's and India's exported products which are defined in 3-digit level of the Standard International Trade Classification (SITC) Revision 2, for 1988-2003. This paper applies Revealed Symmetric Comparative Advantages (RSCA) index, Trade Balance index, econometric model and correlation analysis. Some conclusions are withdrawn. *First*, China's biggest changes in comparative advantages and export-specialization were in 1988-1993, meanwhile India's ones were in 1998-2003. *Second*, during periods of observation China and India performed despecialization process. China's changes in comparative advantages were more dynamic than India's ones. *Third*, India is the follower (if it is not being said 'competitor') of China in term of the pattern of comparative advantages. It is predicted that the time lag of the pattern is about ten years. However, it seems that the time lag is becoming shorter.

### Introduction

Both China and India applied a tight controlled system of trade until the late 1970s. India more specifically implemented this control system with very strict licensing. China had more a longer story about controlled system. Starting in the beginning 1950s, the Chinese government controlled the trade flow through a centralized planning system under the Ministry of Foreign Trade (MFT). Very limited number of Foreign Trade Corporations (FTCs) under MFT managed along product lines (such as Iron and steel; Textiles and clothing). For 1956-1977, China only recorded foreign trade not more than 4 percent of national income (Hsu, 1989). In the 1980s, China and India had different ways of liberalization. China took the form of 'decentralization' of trade which gave expansion of entities with independent right to export and import. In 1979, India established a system which classified products not domestically produced into three categories, i.e. Open General Licensing (OGL), Banned and Restriction items. Products which are not in the OGL list were placed into Banned or Restriction items. China and India performed greater liberalization during the 1990s and beyond. India has conducted massive deregulation, especially related with international trade, since mid-1991, under the leadership of Minister of Finance Manmohan Singh (Hsu, 1989). India eliminated import licensing on inputs and capital goods in 1991 though retaining it on consumer goods imports. India cut the highest tariff rate from 355 percent in 1990-91 to 85 percent in 1993-94 and to 50 percent in 1995-96. In 2001, India also abolished licensing on consumer goods imports. In short, India is virtually licensing free and relatively liberal in industrial products. With some exception, the highest industrial tariff in India has now come decreased to 12.5 percent, which is not far from the average tariff of 9 percent in China. Panagariya (2006) argues that overall the trade regime was more open in China than in India during the 1980s. India's default regime for any product was licensing, meanwhile China took the form of 'decentralization' of trade which gave expansion of entities, especially FTCs, with independent right to export and import. However, India is steadily catching up especially after launching the massive deregulations.

China and India have performed significant roles in international trade and integrated with the world economy. An indicator measuring the integration level of a specific country is the share of exports and import of goods and services in Gross Domestic Product (GDP). China's and India's shares of exports and imports of goods and services in GDP had been roundly doubled for 1994-2004. China's share of exports of goods and services in GDP increased from 18% in 1994 to 34% in 2004, meanwhile, the India's share increased from 7% in 1983 to 19% in 2004. China's share of imports of goods and services in GDP increased from 16% in 1994 to 31% in 2004, and the India's share increased from 9% in 1994 to 23% in 2004 (World Bank, 2006). China and India are geographically large and neighboring emerging-market economies (EMEs), which are increasingly being distinguished as two-up-and-coming economic powers (Das, 2006). World Trade Organization (2005) notes that

China's share in world merchandise exports and import increased dramatically from 1.2% and 1.1% in 1983 to 6.7% and 6.1% in 2003, respectively. Meanwhile, India's share in world merchandise exports and import increased modestly from 0.5% and 0.7% in 1983 to 0.8% and 1.1% in 2003, respectively. China's integration with the world economy has increased much further than the India's integration, even allowing the fact that China stated the process of integration at least a decade earlier (Srinivasan, 2006).

Parallel with the integration process of China and India in the world market, a critical issue about the countries-specific specialization and dynamic shifts in comparative advantage pattern is raising. Wörz (2005) mentions four possible relationships between trade specialization and trade-pattern convergence i.e. more-specialized together with diverging trade patterns; less-specialized together with diverging trade patterns; more-specialized together with converging trade patterns; and less-specialized together with diverging trade pattern. This paper is addressed to answer some questions. *First*, what sorts of exported products do China and India have comparative advantages in? *Second*, how have comparative advantages of China and India dynamically shifted? In other words, do they become less specialized or more specialized? *Third*, does India's pattern of comparative advantages follow a sequence change in similar to that of China? This paper is organized as follows. In the next part, a brief discussion about methodology including data, Revealed Symmetric Comparative Advantage and Trade Balance indexes, econometric model and correlation. The following part exhibits result and analysis. Finally, some conclusions are presented in the last part.

## Methodology

### Data

This paper uses data on trade published by the United Nations (UN), namely International Trade Statistics Yearbook (ITSY) and United Nations Commodity Trade Statistics Database (UN-COMTRADE). Internationally traded products are classified according to Standard International Trade Classification (SITC). This paper uses 3-digit SITC Revision 2. For comparison purposes, this paper focuses on 231 groups of products 3-digit SITCs which are all covered in International Trade Statistics Yearbook (ITSY) 2003 (see Appendix for the list of SITCs). There are still nine groups of products (SITC) which are not covered in ITSY 2003 due to poor reports and insufficient explanation of estimates (UN, 2004). The nine excluded groups of products consist of Jute, raw or semi-processed (SITC 264); Ores and concentrates of uranium and thorium (SITC 286); Electric current (SITC 351); Hoops and strip, of iron or steel, hot-rolled or cold rolled (SITC 675); Uranium depleted in U235 and thorium (including waste) and their alloys and articles thereof (SITC 688); Postal packages not classified according to kind (SITC 911); Postal packages not classified according to kind (SITC 961); Coins (other than gold coin), not being legal tender (SITC 961); and Gold, non-monetary excluding gold ores and concentrates (SITC 971). Data on total world exports and imports is obtained from ITSY 1988, 1993, 1998 and 2003. Meanwhile, data on China's and India's exports and imports is taken from UN-COMTRADE.

### Comparative Advantage and Trade Balance Indexes: Products Mapping

In order to examine pattern of comparative advantages, a measure of Revealed of Comparative Advantage (RCA) is used. The RCA index calculates the relative representation of a country's export in one industry compared to the average representation of that industry in total world trade (Balassa, 1965). The index is formulated as follows:

$$RCA_j^i = \frac{\left( \frac{x_j^i}{x_n^i} \right)}{\left( \frac{x_j^r}{x_n^r} \right)} \quad (1)$$

Where  $RCA_j^i$  denotes revealed comparative of country  $i$  for product (SITC)  $j$ .  $x_j^i$  symbolizes total exports of country  $i$  in product (SITC)  $j$ . Subscript  $r$  denotes all countries without country  $i$ , and subscript  $n$  refers all products (SITC) except product  $j$ . The index represents a comparison of national export structure (the numerator) with the world export structure (the denominator). By excluding the country and commodity under consideration, double counting is avoided and the nature of trade, which is always a bilateral exchange of goods between two countries, is

nicely represented (Wörz, 2005; Vollrath, 1991). The values of the index range from 0 to infinity ( $0 \leq RCA_j^i \leq \infty$ ).  $RCA_j^i$  greater than 1 implies that country  $i$  has comparative advantage in good  $j$ . In contrast,  $RCA_j^i$  less than 1 means that country  $i$  has comparative disadvantage in product  $j$ . Since the  $RCA_j^i$  turns out to produce values which can not be compared on both sides of 1, the index is made to be a symmetric index. The new index is called Revealed Symmetric Comparative Advantaged (RSCA) which is formulated as (Laursen, 1998):

$$RSCA_j^i = \frac{RCA_j^i - 1}{RCA_j^i + 1} \quad (2)$$

The  $RSCA_j^i$  index ranges from -1 to 1 (or  $-1 \leq RSCA_j^i \leq 1$ ). The interpretation of RSCA is similar with that of RCA.  $RSCA_j^i$  greater than 0 implies that country  $i$  has comparative advantage in good  $j$ . In contrast,  $RSCA_j^i$  less than 0 implies that country  $i$  has comparative disadvantage in product  $j$ .

It might be possible that a country not only exports but also imports simultaneously the same product (SITC). Trade Balance Index (TBI) is applied to analyze whether a country has specialization in export (as net-exporter) or import (as net-importer) for a specific product (SITC). TBI is formulated as follows:

$$TBI_j^i = \frac{x_j^i - m_j^i}{x_j^i + m_j^i}$$

(3)

Where  $TBI_j^i$  denotes trade balance index of country  $i$  for good (SITC)  $j$ ;  $x_j^i$  and  $m_j^i$  represents exports and imports of good  $j$  by country  $i$ , respectively. This index ranges from -1 to 1. Extremely, TBI equals to -1 if a country only imports, in contrast, TBI equals to 1 if a country only exports. Indeed, the index is not defined when a country neither exports nor imports. In this case, we give index with 0 since it shows potentially to be exported or imported. Any values within -1 and 1 implies that the country exports and imports good  $j$  simultaneously, “net-importer” (if TBI negative) or “net-exporter” (if TBI positive). TBI index can also reflect the originality or local-contains of a product (SITC). If a country has TBI equal to 1 for specific product; it implies that the product is originally from the country. In contrast, if a country has TBI equal to -1 for specific product; it implies that the product is only imported by the country.

Symmetric Advantage Index	$RSCA > 0$	<b>Group B:</b> Have Comparative Advantage No Export-Specialization (net-importer) (RSCA > 0 and TBI < 0)	<b>Group A:</b> Have Comparative Advantage Have Export-Specialization (net-exporter) (RSCA > 0 and TBI > 0)
	$RSCA < 0$	<b>Group D:</b> No Comparative Advantage No Export-Specialization (net-importer) (RSCA < 0 and TBI < 0)	<b>Group C:</b> No Comparative Advantage Have Export-Specialization (net-exporter) (RSCA < 0 and TBI > 0)
Revealed Comparative Advantage (RSCA)		TBI < 0	TBI > 0
		Trade Balance Index (TBI)	

FIG.1: PRODUCT CLASSIFICATIONS

This paper combines RSCA and TBI to examine the comparative advantages and export specialization for China’s and India’s products (SITC). What kinds of products (SITC) China and India have comparative advantage and specialize in? Products (SITC) can be categorized into four groups A, B, C and D as described in FIG. 1. Group A consists of products which have both comparative advantage and export-specialization; Group B consists of products which have comparative advantage but no export-specialization; Group C consists of products which have

export-specialization but no comparative advantage; and Group D consists of products which have neither comparative advantages nor export-specialization.

**Econometric Model: Specialization or Despecialization?**

RSCA index can be used to detect the existence of dynamic change in comparative advantage when it is compared over time or across countries. The following simple regression model

$$RSCA_{j,T}^i = \alpha + \beta RSCA_{j,0}^i + \varepsilon_j^i \quad (4)$$

is estimated separately for China and India. The coefficient  $\beta$  indicates whether existing comparative advantage or specialization patterns have been reinforced or not during the observation.

For illustration, FIG.2 represents RSCAs for SITC 001 and SITC 002 for 1988 on horizontal axis and for 2003 on vertical axis. If  $\beta$  is not significantly different from one ( $\beta=1$ ), there is no change in the overall degree of specialization. The difference between  $RSCA_{001,1988}$  and  $RSCA_{002,1988}$  (AB) equals to difference between  $RSCA_{001,2003}$  and  $RSCA_{002,2003}$  (DE).  $\beta > 1$  indicates increased specialization of the respective country. The difference between  $RSCA_{001,1988}$  and  $RSCA_{002,1988}$  (AB) is smaller than difference between  $RSCA_{001,2003}$  and  $RSCA_{002,2003}$  (EF). Finally,  $0 < \beta < 1$  indicates despecialization – that is, a country has gained comparative advantage in industries where it did not specialize and has lost competitiveness in those industries where it was initially heavily specialized. However, this is a necessary but not sufficient condition for despecialization and corresponds to the concept of ‘ $\beta$ -convergence’ in the growth literature. In order for despecialization in the sense of less intensive specialization to be present, a reduction in variance must take place. This is the case if the correlation coefficient ( $r$ ) between the comparative advantage in the two years ( $RSCA_{j,T}$  and  $RSCA_{j,0}$ ) exceeds  $\beta$ , that is, if  $\beta \leq r < 1$  (Laursen 1998; Wörz, 2005). In the event of  $\beta \leq 0$ , no reliable conclusion can be drawn on purely statistical grounds; the specialization pattern is either random, or it has been reversed.

FIG.2: DYNAMIC CHANGES OF COMPARATIVE ADVANTAGES

**Correlation: Convergent or Divergent?**

If it is believed that India’s pattern of comparative advantages follows that of China, how many years is the time lag? This paper applies statistical hypothesis test procedure of correlation on Revealed Symmetric Comparative Advantage (RSCA) in scrutinizing the time lag of pattern of comparative advantage. The degree of association between two series of RSCA can be compared by the Spearman’s Rank Correlation Coefficient which is given as follows (Gujarati, 1995:372):

$$\rho_{s,Ct_a,It_b} = 1 - 6 \left[ \frac{\sum_{j=1}^n d_{R_{jt}}^2}{n(n^2 - 1)} \right] \quad (5)$$

Where:

$\rho_{s,Ct_a,It_b}$  = the Spearman's Rank Correlation Coefficient between China's RSCA at time  $t_a$  (symbol:  $Ct_a$ ) and India's RSCA at time  $t_b$  (symbol:  $It_b$ );

$$d_{R_{jt}}^2 = (R_{RSCA_{jC,t_a}} - R_{RSCA_{jI,t_b}})^2$$

$(R_{RSCA_{jC,t_a}})$  = the squared difference between the rank of China's RSCA of product  $j$  at time  $t_a$ ;

$(R_{RSCA_{jI,t_b}})$  = the rank of India's RSCA of product  $j$  at time  $t_b$ ;

$t_a$  and  $t_b$  is time (1988, 1993, 1998 or 2003).

The values of Spearman's rank correlation coefficients range from  $-1$  (a perfect negative relationship) and  $+1$  (a perfect positive relationship). A value of  $0$  indicates no linear relationship. Higher Spearman's correlation coefficient indicates stronger competition between two countries in the export market. High Spearman's rank correlation coefficient also represents that the follower catches up quickly resulting in faster shift in comparative advantage. More negative Spearman's rank coefficient implies stronger complementary of these two countries in supplying products to the export market. We make a hypothesis that India's comparative advantages follow China's ones. In other words, India is the follower of China's pattern of comparative advantages.

## Results and Analysis

### Products Mapping

As previously described, exported products (SITCs) of China and India are classified into four groups i.e. A (have both comparative advantage and export-specialization); B (have comparative advantage but no export-specialization); C (have export-specialization but no comparative advantage) and D (neither have comparative advantage nor export-specialization). Table 1 represents the percentages of number of products (out of 231 SITCs) lying in each group for China's and India's export for 1988, 1993, 1998 and 2003 (see Appendix for detail results of classification). In 1988, China had 29.9 percent (out of 231 SITC) in Group A, 3.5 percent in Group B, 17.3 percent in Group C, and 49.4 percent in Group D. This composition became 36.4 percent; 2.6 percent; 16.9 percent and 44.2 percent in each Group A, B, C and D in 2003, respectively. Meanwhile, in 1988 China had 20.8 percent in Group A, 2.6 percent in Group B, 23.4 percent in Group C, and 53.2 percent in Group D, in 1988. It became 36.4 percent; 2.6 percent; 16.9 percent and 44.2 percent in each Group A, B, C and D in 2003, respectively.

Since export-specialization (which is shown by positive value of TBI) can also reflect the originality level of product, our finding shows that higher revealed comparative advantage in international market has been more significantly supported by the 'originality' level of products. Higher level of originality, higher level of comparative advantage will most probably be. In the simple worlds, China and India have comparative advantage on the products which are 'more originally' from China and India. It is shown by the higher percentage of products in Group A than in Group B. In contrast lower level of originality, lower comparative advantage will be. The higher percentage of products in Group D is greater than in Group C. This finding strongly supports to the theory of comparative advantage saying that a country will have export specialization on products with higher comparative advantages.

TABLE 1: PERCENTAGE OF NUMBER OF SITCs IN GROUPS, 1988-2003

Country	1988		1993		1998		2003	
China	B:	A:	B:	A:	B:	A:	B:	A:
	3.5%	29.9%	3.9%	36.4%	3.0%	36.8%	2.6%	36.4%
China	D:	C:	D:	C:	D:	C:	D:	C:
	49.4%	17.3%	45.5%	14.3%	40.7%	19.5%	44.2%	16.9%
India	B:	A:	B:	A:	B:	A:	B:	A:
	2.6%	20.8%	0.9%	25.1%	3.5%	23.4%	6.5%	29.9%
India	D:	C:	D:	C:	D:	C:	D:	C:
	53.2%	23.4%	48.5%	25.5%	54.5%	18.6%	39.8%	23.8%

Source: International Trade Statistics Yearbook and UN-COMTRADE, *Author's calculation.*

In the case of China, the number of products in Group A increased significantly from 29.9 percent in 1988 to 36.4 percent in 2003. In contrast, the number of products in Groups A, B and C decreased for the same periods. Biggest structural changing in comparative advantages and export specialization happened for 1988-1993. A dramatic change in the number of products in Group A happened from 1988 (29.9 percent) to 1993 (36.4 percent). However, it remained relatively constant afterwards. Products which moved to Group A for period 1988-1993 were Fish, dried, salted or in brine, smoked fish (SITC 035 from D to A); Crustaceans and molluscs, prepared or preserved (SITC 037, from C to A); Sugar and honey (SITC 061, from Group D to A); Tobacco, unmanufactured, tobacco refuse (SITC 121, from D to A); Tobacco, manufactured (SITC 122, from D to A); Fuel wood and wood charcoal (SITC 245, from D to A); Pulpwood (including ships and wood waste) (SITC 246, from D to A), Ores & concentrates of precious metal, waste, scrap (SITC 289, from C to A); Other inorganic chemicals, compounds of precious metals (SITC 523, from B to A); Other artificial resins and plastic materials (SITC 585, from C to A); Cotton fabrics, woven (not including narrow or special fabrics) (SITC 652, from B to A); Lime, cement and fabricated construction materials (SITC 661, from D to A); Iron steel casting, forging and stamping, in rough state, nes (SITC 679, from C to A); Lead (SITC 685, from C to A); Zinc (SITC 686, from D to A); Wire products (excluding insulated electrical wire), fencing grills (SITC 693, from D to A); Manufactures of base metal, nes (SITC 699, from C to A); Office machine (SITC 751, from D to A); Household type equipment (SITC 775, from D to A); Cycle, scooter, motorized or not, invalid carriages (SITC 785, from C to A); Trailer, and other vehicles, not motorized, nes (SITC 786, from C to A); Sanitary, plumbing, heating, lighting fixtures and fitting, nes (SITC 812, from C to A); Furniture and part thereof (SITC 821, from C to A); Photographic apparatus and equipment, nes (SITC 881, from D to A); Articles, nes of plastic materials (SITC 893, from D to A); Gold, silver ware, jewelry and articles of precious materials, nes (SITC 897, from C to A); and Animal, live, nes (including zoo animals, pets, insects, etc)(SITC 941, from B to A). The changes had been dominated by SITC 6,7 and 8. It is very interesting to compare the structure between periods 1988-1993 and 1998-2003. What happened during period 1998-2003 contradicts with what happened during period 1988-1993. Increased number of products in Group A (followed by decreased number of products in Group B, C and D) happened during 1988-1993; in contrast, increased number of products in Group D (followed by decreased number of products in Groups A, B and C) happened during period 1998-2003.

In the case of India, rapid structural changes in comparative advantage and export-specialization happened in 1998-2003. The number of product in Group D decreased from 54.5 percent in 1998 to 39.8 percent. It was lower than that of China during the same period. In contrast, significant increases in the number of product were in Group A, B and C. Products which moved to Group A for 1998-2003 were Wheat and meslin, unmilled (SITC 041, from D to A); Meal and flour of wheat and flour of meslin (SITC 046, from D to A); Other cereal meals and flour (SITC 047, from D to A); Sugar and honey (SITC 061, from D to A); Natural rubber, latex, rubber and gums

(SITC 232, from D to A); Vegetable textile fibers, excluding cotton, jute, and waste (SITC 265, from D to A); Synthetic fibers suitable for spinning, and waste (SITC 266, from D to A); Petroleum products, refined (SITC 334, from D to A); Articles of rubber, nes (SITC 628, from B to A); Ingot and other primary forms, of iron or steel (SITC 672, from D to A); Iron and steel bars, rods, shaped and sections (SITC 673, from C to A); Universals, plates, and sheets, of iron or steel (SITC 674, from D to A); Tube, pipes and fittings, of iron or steel (SITC 678; from D to A); Copper (SITC 682, from D to A); Nails, screws, nuts, bolts, rivets, etc, of iron, steel or copper (SITC 694, from C to A); Tools for use in the hand or in machines (SITC 695, from D to A); Steam boilers and auxiliary plant, and parts thereof, nes (SITC 711, from D to A); Office and stationary supplies, nes (SITC 895, from C to A). It is clear that products which moved to Group A in 2003 are mainly from products in Group D in 1998. They were dominated by SITC 6. Significant increase in Group B is interesting phenomenon. It implies that the number of 're-exported' products with high comparative advantages. Products which moved to Group A for 1998-2003 were Vegetables, fresh or simply preserve, roots and tubers, nes (SITC 054, from D to B), Cotton (SITC 263, from D to B); Other crude mineral (SITC 278, from D to B); Ores and concentrate of base metal, nes (SITC 287, from D to B); Residual petroleum products, nes and related minerals (SITC 335, from D to B); Hydrocarbons, nes and derivatives (SITC 512, from D to B); Carboxylic acids and their derivatives (SITC 513, from D to B); Other inorganic chemicals, compounds of precious metals (SITC 523, from D to B); Metalworking machinery (other than machine-tools), and parts, nes (SITC 737, from D to B); Electro-medical and radiological equipment, nes (SITC 774, from D to B).

#### Dynamic Change in Comparative Advantage

As emerging countries, it is intuitively guessed that China and India will try to raise their comparative advantages and to specialize on products with higher comparative advantages. There is a crucial question related with the increasing integration and liberalization process which virtually encourages international trade flows: do China and India become more specialized or de-specialized in trade? If China and India become more specialized, the comparative advantage of products in which China and India specializes will increase relatively larger than that of other products. Table 2 represents the estimation result of equation (4) for period 1988-1993, 1993-1998, 1998-2003 and 1988-2003. The test results using equation (4) confirm that export patterns have generally become less specialized over the period 1988-2003, since estimated coefficient  $\beta$  lies within 0 and 1 ( $0 < \beta < 1$ ). The second last row of Appendix also supports this despecialization process that is shown by decreased standard deviation of RSCA in both China and India.

TABLE 2: ESTIMATION RESULT

RSCA	China				India			
	Coefficient ( $\beta$ )	Correlation (r)	( $\beta/r$ )	Conclusion	Coefficient ( $\beta$ )	Correlation (r)	( $\beta/r$ )	Conclusion
1993 against 1988	0.742*	0.776	0.956	despecialization	0.894*	0.893	1.001	Despecialization
1998 against 1993	0.845*	0.858	0.985	despecialization	0.938**	0.933	1.005	Despecialization
2003 against 1998	0.875*	0.886	0.987	despecialization	0.828*	0.871	0.951	Despecialization
2003 against 1988	0.485*	0.522	0.930	despecialization	0.704*	0.736	0.957	Despecialization

Notes: Wald Test<sup>2</sup> is conducted to test null hypothesis  $H_0: \beta=1$ ; and alternative hypothesis  $H_1: \beta \neq 1$ . By using 1% (\*) and 5% (\*\*) level of significance, we reject hypothesis  $H_0$ .

Source: International Trade Statistics Yearbook and UN-COMTRADE. *Author's calculation.*

For period 1988-2003, China has smaller estimated coefficient  $\beta=0.485$  than that of India (0.704). It implies that changing of China's comparative advantages was more dynamic than that of India. In other words, China's despecialization process was faster than India's one. In the case of China, the most dynamic change in

comparative advantage; which is shown by lowest estimated coefficient,  $\beta$ ; happened in 1993-1988. In the case of India, it was in 1998-2003. In this period, India's despecialization process little bit more dynamic than China's one which is shown by estimated coefficient  $\beta$ , 0.828 and 0.875 in the case of India and China, respectively.

#### Catching Up

China and India started their liberalization in the almost the same period in the beginning 1980s. Different approaches of liberalization have been implemented in both countries China and India. In the beginning of liberalization, China was more progressive than India. Therefore, some researchers believe that India's comparative advantages have been left behind compared to China's comparative advantages. The third last row of the Appendix shows averages of RSCA of India and China. It is clearly shown that China has higher averages of RSCA than India's ones for 1988-2003. This sub-part answer the question about how many years the time lag between India's pattern of comparative advantage and China's one. Table 3 represent the Spearman rank correlation coefficient between China's comparative advantages and India's comparative advantages over 1988-2003. Higher the coefficient means higher association of China's and India's comparative advantages. Positive coefficient implies that India is the follower (if it is not being said competitor) of China.

To determine the time-lag, we can follow the arrow sign. *First*, comparing the coefficient within the same column, we can find that China's comparative advantages in 1988 had the highest coefficient (the arrow sign 1). It indicates that China's comparative advantages in 1988 had most probable similarities with India's comparative advantages. *Second*, across 1988, 1993, 1998 and 2003; India's comparative advantages in 1998 had the highest coefficient with China's comparative advantages (the arrow sign 2). Therefore, we can obviously say that the time-lag between India's and China's comparative advantages is 10 years (1998-1988=10 years). Interestingly, if it is the case then the China's comparative advantage in 1993 should have highest coefficient with India's comparative advantages in 2003. However it is not the case, the China's comparative advantages in 1993 have highest coefficient with India's comparative advantages in 1988 (the arrow sign 3). The time-lag becomes smaller from 10 years to 5 years. It is very consistent with previous explanation that the shift of China's comparative advantages was quick for 1988-1993 but it was slow for 1993-2003. In contrast, the shift of India's comparative advantages was slow during 1988-1998 and quick during 1998-2003. Therefore, it might be roughly estimated that the pattern of comparative advantages of both China and India could be the same in near future, *ceteris paribus*.

TABLE 3: SPEARMAN CORRELATION: CHINA'S AND INDIA'S COMPARATIVE ADVANTAGES

		India's Comparative Advantages			
		1988	1993	1998	2003
China's Comparative Advantages	1988	.426*	.407*	.437*	.360*
	1993	.346*	.345*	.309*	.320*
	1998	.308*	.308*	.358*	.284*
	2003	.316*	.278*	.311*	.221*

## Conclusions

Some conclusions are withdrawn. *First*, the products-mapping analysis which is based of Revealed Symmetric Comparative Advantage and Trade Balance Indexes shows that the China's biggest change in comparative advantage and trade-specialization happened in 1988-1993, meanwhile the India's one happened in 1998-2003. China's change in comparative advantages was dominated by SITC 6,7,8 and India's one was dominated by SITC 6. The analysis on China and India also strongly supports the comparative advantage theory saying that a country will have export specialization on products which the country has comparative advantage. *Second*, for 1988-2003, econometric analysis finds that China and India performed despecialization process. China's change in comparative

advantages was more dynamic than India's one. The China's biggest change in comparative advantage happened during 1988-1993, meanwhile that of India happened in 1998-2003. *Third*, India is the follower (if it is not being said 'competitor') of China in term of the pattern of comparative advantages. The time-lag between India's and China's pattern of comparative advantage patterns was about 10 year. However, it is predicted that the lag might become smaller in recent years.

## End Notes

<sup>1</sup>Pearson correlation test on RSCA and TBI is also conducted. The result shows that there are significant and positive linear relationships between RSCA and TBI. China has RSCA-TBI Pearson correlation coefficients 0.789, 0.807, 0.785 and 0.737 for 1988, 1993, 1998 and 2003, respectively. Meanwhile, India has RSCA-TBI Pearson correlation coefficients 0.586, 0.608, 0.625 and 634 for 1988, 1993, 1998 and 2003, respectively.

<sup>2</sup> See Gujarati (2000) for detail explanation about Wald coefficient restrictions test. Basically, the Wald test calculates the test statistic by estimating the unrestricted regression and the restricted regression- without and with imposing the coefficient restrictions specified by the null hypothesis,  $H_0$ . The Wald statistic measures how close the unrestricted estimates come to satisfying the restriction under the null hypothesis. If the restrictions are in fact true, then the unrestricted estimates should come close to satisfying the restrictions.

# An Evolutionary Interpretation of Ethnic Networks: the Chinese Example

Patrizia Tiberi Vipraio, [patrizia.tiberi@uniud.it](mailto:patrizia.tiberi@uniud.it)

Rubens Pauluzzo, [rubens.pauluzzo@uniud.it](mailto:rubens.pauluzzo@uniud.it)

University of Udine, Italy

## Abstract

Ethnic networks are made of interpersonal ties run by a separate set of rules that allow - among other things - to overcome formal and informal barriers and help create inner markets for more competitive exports. After reviewing recent literature, this paper considers the possible evolution of ethnic networks in different stages, which, eventually, include international production. Focusing on Chinese networks, the paper investigates their evolution, by considering the role of Embeddedness and the creation of Social capital as start-up devices. Later on, the necessity to qualify Embeddedness in accordance with global markets requirements and to govern the appropriation of Social capital, expose ethnic networks to different alternative paths, which may eventually link back to the motherland to create further synergies. To help the networks evolve towards stronger competitive advantages - rather than let them revolve into mere defensive strategies - some policies are envisaged in the conclusions.

## Introduction

In this paper we shall analyze ethnic networks, in particular those created by overseas Chinese, to better understand the nature and the dynamics of their competitive advantages. Ethnic networks will be discussed by using two main core concepts, namely *Embeddedness* and *Social capital*. These two strands of analysis provide a logical framework to underline the role of ethnic networks both for competitiveness and growth. We argue that Embeddedness provides a form of allocation efficiency that is neither supplied by the Market, through arm's length transactions, nor by the Plan of a larger organization. We also argue that the *Social capital* that ethnic networks are able to generate is a strategic evolutionary condition, both for preventing *Embeddedness* from slowing down competition, and for creating new competitive advantages. The discussion allows us to conclude with a few policy considerations, aimed at promoting the development of various synergies created by the opening up of the networks.

The paper is divided in seven sections. The first section provides a general framework of analysis, in terms of the two core concepts of *Embeddedness* and *Social capital*, according to the main results of the most recent studies on networks in general, and local networks in particular. The following sessions discuss how competitive advantages are first created and then developed when *Embeddedness* and *Social capital* interact - in ethnic networks - along an evolutionary path that gradually turns from 'close' to 'open'. In particular, by focusing on immigration issues, section two considers *Embeddedness* as a fundamental incubator of labour and skill formation, as it helps to overcome the start-up costs that often represent a barrier to entry in the labour markets. Section three considers how *Embeddedness* is also able to prompt the development of new forms of micro-entrepreneurship. In this phase, it is the reduction of the sunk costs associated with a new micro-enterprise, together with external economies created by the ethnic network that allows for a temporary low level of 'normal' profits in brand new activities. Section four discusses how new incremental value is generated, beyond the start-up phases, by better relationships based on kinship and trust. *Social capital* adds here to 'private capital' by facilitating the exploitation of more conventional economies, such as economies of scale and scope, better finance, technology and market information. Taken together, more trust and more efficiency enhance competitive advantages by reducing the risk associated with internal (intra-network) transactions, throwing a dynamic safety net towards the next phase of market enlargement. Section five considers the interaction between all the economies created in the previous phase and the risk posed by openness, namely the possibility of opportunistic behaviour, as some information may be privately appropriated by internal incumbents or external competitors. Some policies are here envisaged to help avoid these risks and better qualify the network to compete globally. Section six briefly discusses *Embeddedness* and *Social capital* as a pool of

intangible resources that may be critical for the creation of ‘redundancy’, a feature that many consider conducive to higher prospects of growth. Finally, section seven offers some conclusions.

## **Embeddedness and Social Capital**

Ethnic networks may be considered as clusters of interpersonal linkages, acting as bridges that help to overcome formal and informal economic barriers, by means of kinship, friendship and same-origin ties. Despite a long tradition of ethnic connections in almost all experiences of secular migration, especially to the Americas, their role has gained new attention, in globalisation times, as a source of links that help overcoming many barriers in entering new economic environments. Initially, they seem to favour migration processes *per se*, by supplying first aid in new settlements and essential mentorship for entering new jobs. Later on, they also represent an essential resource of product diversification. In fact ethnic workers not only create additional supply of goods and services in the country of destination; they also create additional demand for products sourced in the country of origin. As such, they soon become a valuable incubator of intelligence for market penetration of the motherland. Finally, in a more advanced phase, ethnic networks can become a valuable interface for information gathering between distant markets in general, which might indeed extend beyond the initial countries of origin and destination.

### **Embeddedness**

*Embeddedness* defines a situation in which the behaviour of individuals of a social group is characterised by a high degree of cohesiveness. Whilst applying in general to different situations, *Embeddedness* is a common tool of analysis both for the study of industrial districts, where it assumes a territorial dimension, and for the study of ethnic networks, where it assumes a cultural dimension. Ethnic groups are in fact mostly made of individuals who voluntarily endorse unwritten rules and conform to behavioural codes that are widely accepted by that community as a distinctive feature, in comparison with rules and behaviours that are otherwise established. Every economic decision, although taken, in principle, in conformity with a set of individual preferences, is eventually socially determined. It is also socially monitored and - in case of infringement - socially punished, by ostracism or even the expulsion from the community: a deterrent that might be superior to strict economic penalties. As a result, as with the studies of industrial districts, one can hardly refer to the simple atomized actors of textbook economics, or entirely rely on individual motivations based on independent utility functions or profit maximisation.

Originally, *Embeddedness* was considered a ‘particular solution’ aimed at overcoming *market failures*, which notoriously appear when the Market is unable to deliver an efficient allocation of resources for a series of imperfections and/or the existence of particular goods (for example when information is not symmetric and/or freely available to all agents). Later on, *Embeddedness* was also proposed in relation to other ‘complications’. It is in fact conceivable that individuals not only ‘do not’ take decisions independently from one another, when some assets are not available for free, but that they also respond differently to different contexts. Indeed many ‘contexts’ may emerge in this regard (Rullani, 1993; Tiberi Vipraio and Hodgkinson, 2000). But probably *Embeddedness* based on *history* and *geography* ranks among the most important organisational differences between certain ethnic networks, and the other two main forms of organisations: namely the Market, which allocates resources by the price system, and the Firm, which allocates resources through managerial planning.

To be sure, the concept of *Embeddedness* helped to overcome these difficulties, by gradually integrating individual choices with socially co-determined results: a sort of compromise between individualism in its classical form (the pursuit of pure egoism, which miraculously delivers what is needed by all) and a higher form of egoism, which feeds on other people’s fortune, dependence, gratitude, admiration or trust (what is sometimes called ‘altruism’ and/or ‘irrational’ behaviour, depending on the circumstances and/or the ideologies of the interpreters).

Expressing these concepts in a more conventional way, ethnic networks may help to prevent or, at least to reduce, some transaction costs, information asymmetry and organisational failures that derive from cultural differences in institutional settings. Yet, by endorsing *Embeddedness* as a mere remedy for market failures, we don’t go very far. As fundamentally static, *Embeddedness* does not deal with a better allocation of resources in the long run, especially in cases of fast growth<sup>1</sup>. In what follows we shall sustain that *Embeddedness* is very useful for interpreting the advantages of ethnic networks in some initial stage of development, when there are barriers to entry

in some markets, or where there is scope for widening the area of potential opportunities of a 'society' in an holistic sense, something that represents more than the sum of a number of individuals. Yet, by limiting the analysis to this feature only, we seem to be missing the most important aspects of contemporary competitiveness: the dynamics of socio-economic systems. To help overcome this difficulty we propose to add the concept of *Social capital to Embeddedness*.

### **Social Capital**

*Social capital* has been mainly discussed in studying the transfer of other factors of production (i.e. capital property, new technologies). In what follows we argue that it also constitutes the dynamic facet of resources coming from ethnic networks, to the extent that it is made available for individuals in order to better pursue their own goals within a distinct community. Social capital is thus interpreted as an additional intangible asset generated by the individual involvement in ethnic networks. This new factor of production creates the opportunity to benefit, without additional costs<sup>2</sup>, from the abundance and the reproduction capacities of resources generated by two main phenomena: namely Networking and Knowledge Sharing.

### **Social Capital from Networking**

Generally focusing on capital, rather than labour mobility, the discussion on Networking revolves around the idea that today producers can be better integrated with users in deciding what to produce and how to do it, thanks to the widespread availability of information and communication technologies (ICT). In particular, the dynamics of a better match between supply and demand (primarily in qualitative terms) tend to shift the usual cost cutting and value-adding efforts from producers to users and sub-suppliers. Not only can producers deliver cheaper and more sought after products. Thanks to ICT, new use-values emerge from *contaminations, dialogs, and experiences*. So, not only it is possible to reduce production costs and enhance value for users. It is also feasible to cut transaction costs, according to conventional transaction cost theory, by reducing uncertainty, idiosyncrasy (sunk costs) and those inefficiencies that are derived from small numbers transactions, as essential information may be available close to zero cost (Williamson, 1975; 1983).

In other words, transactions become more efficient, thanks to networking, not only because they are *cheaper* and *faster*, but also because they *widen* economic space. The initial virtues of Marshallian districts can be extended beyond local boundaries and substitute 'short' local networks with 'long' global networks based on ICT. In either case the relations can be defined as *powerful* and *meaningful*. As Evans and Wurster (1999) put it, ICT favours transactions with a high content of complexity because they enhance both the *richness* and the *reachness* of relational circuits. Neither local districts, with their *economies of proximity*, nor vertically integrated firms, with their *economies of planning*, monopolise complexity any longer<sup>3</sup>.

This view bears important consequences, as networking can turn the need to *own* something, into a much simpler *access condition* (Rifkin, 2000). In terms of transaction cost theory, one can of course avoid, this way, the specificity of the initial investment (both for consumption and production). But specificity counts here not because transactions are too few to justify the correspondent immobilisation of resources (which would lead to a simple market transaction) but rather because a more difficult match between supply and demand (created by higher complexity) would need a very strong point of reference. This might be difficult to organise under the former rules of exchange based on ownership and exclusion to others. So, when access conditions win over exclusive ownership, a radical change in the relation between demand and supply takes place.

Except for luxury goods and those goods that are physically used up by an act of consumption, access conditions do not need to be associated with anything that is functionally destroyed or privately appropriated. The former *economy of needs* can be gradually substituted, at least to some extent, by a new *economy of wishes*, whose benefits are enhanced if shared with others in a *certain* community. The definitions of new rules (institutions) soon became strategic for avoiding opportunism and the return of exclusive appropriations. Industrial districts have been studied extensively as *loci* for such developments. In what follows we shall try to develop an extension of that debate to the case of ethnic networks.

Summing up, Networking Economies arise from a flexible, decentralised, and coordinated system of production that can satisfy a sophisticated demand with a reasonable variance of goods and services. Suppliers are able to produce cheaper products and services, thanks to a vast array of economies of scale and economies of scope that cut across institutional barriers and create sub-systems of rules, which are partially protected from external

threats, operating by Markets (through prices) and by Hierarchies (through quantities and qualities). In addition, they can also use available information for multiple applications, thus deepening *and* widening their own market opportunities. So, a new Networking Economy is able to *enrich* (in varieties and variability) a large class of consumers at very low prices for the *service*. All we need is a reasonable coupling of technical possibilities of variance with a sensible spanning of human wishes. A new factor of production has emerged. We suggest calling this factor *Social capital from networking*.

#### **Social Capital from Knowledge Sharing**

Networking is also able to change the regime of production of knowledge and its use. Being replicable at very low costs, knowledge is in itself a re-productive resource. If a piece of knowledge is utilised many times, its *use-value* can be very high. A new value-multiplier can be considered as the result of all the possible *utilisations* of a certain idea. So, in the end, the faster and the larger the diffusion of knowledge, the greater the *use-value* generated for a society (or a community). If agents can extract, at least in part, some exchange value from every piece of knowledge that they produce; they can benefit from the process themselves. But if they want to extract the entire use-value of knowledge, they may find it difficult, as the ways knowledge can be used are often in the users' mind.

In fact, it is well known that knowledge producing firms are usually caught between two perils: they cannot avoid sharing their information, for this is how the *use-value* of information is enhanced and the *exchange-value* of information could be maximised. At the same time, they do not want to diffuse their knowledge too rapidly, risking to loose control over it. This is why the Market is not generally efficient for the exchange of knowledge: under competitive conditions, its equilibrium price would tend to its marginal cost of re-production, i.e. it would be closed to zero (Arrow, 1962). The well-known market failures for knowledge will make it better privatised when the market is characterised by a low degree of competitions among suppliers. Vertical integration, plus secrecy, has long been an efficient mean to reach this goal by the fordist paradigm. But when investment rigidities in R&D turned into higher sunk costs (or when economies of scale *alone* were not enough to maintain a competitive edge on competitors) evidence suggests that systems evolve by retreating into a segment of competence, and by enlarging the circuits of shared knowledge beyond the border of vertically integrated firms.

Summing up, knowledge economies emerge when the use-value of a piece of information is enhanced by its utilisation by different agents, who are able to apply and adapt free knowledge to a very large number of problems. As a result, solutions will be found according to the different forms under which knowledge is acquired and multiplied. Individual firms, being interested in the private appropriation of the results, will tend to invest more in R&D, especially in sophisticated technologies, i.e. in knowledge more feasible to be protected with patents or secrecy. Consumers will probably invest more in skills, education and culture, to be able to get the most out of their access to goods and services. But networks will need to struggle, if they want to survive; they will need to find an acceptable compromise between use-values, available to all members of that particular network (taking care of the reproduction conditions of the network), and exchange-values, privately appropriable for individual needs (taking care of efficiency, under conditions of scarcity). Again, as in the former case, a new factor of production has emerged, when use-values are introduced. We suggest calling this factor *Social capital from knowledge sharing*.

In what follows we shall apply these concepts to ethnic networks. In doing so, we shall try to envisage a possible evolutionary path of competitive advantages that goes through five main stages. The first two stages relay on *Embeddedness* as start-up conditions for labour deployment and entrepreneurship incubators. The following three stages depend on how *Social capital* is managed for the growth of the networks and its extension towards external competitive markets.

### **Embeddedness as an Incubator of Labour (stage 1)**

Ethnic networks and their strict relationship with migratory flows have been considered quite extensively since the end of nineteenth century. Ravenstein (1888) for example, stressed their significance by formulating a wide range of 'migration laws' geared at sustaining the development of chain migrations towards trade and industrial centres. The study of ethnic networks was also a point of reference in explaining the processes of factor accumulation of national groups and their specialization in some industries, usually characterised by lower financial, normative and

technological barriers, such as catering, construction sub-suppliers, or by a certain degree of 'weakness', such as small businesses in general. In all these studies, ethnic networks are said to represent fundamental bridges to support migratory processes. Through them, people can easily find all the information necessary to choose a suitable destination, obtain visas, raise seed money for the journey, activate the first contacts to find a job, and enjoy a certain degree of protection in the new environment.

Ethnic networks also allow for a better allocation of the world labour in general. Ethnic links are in fact very efficient in creating a net of information that is *wide* and that is based on *knowledge and trust*. Being *wide* allows for the best available match between demand and supply of labour, with the right skills. Being based on *knowledge and trust* is instead vital for the relationship between employer and employee at its initial stage, when neither knows each other, and therefore they must rely upon the available institutions. Yet, neither the Market nor the Hierarchy can always supply such institutions (generally accepted rules) free of charge. Finally, ethnic networks are also helpful in overcoming the problem of information asymmetries in an agency relationship (Ambrosini, 2006) by supplying single members of the network with easily accessible information that suddenly become a public good.

## **Embeddedness as an Incubator of New Enterprises (stage 2)**

Being of the same origin and sharing a common language is of course of great importance to prompt the generation of inner labour markets. This may happen both in positive and in negative terms. We have discussed the positive side in the previous section. The negative side is that, being less able to speak the local language, it is in general more difficult to find a job in the country of destination. So lower wages are generally accepted to avoid unemployment. This situation generates an incentive for ethnic firms to hire ethnic workers; it also creates favourable barriers to exit, which strengthen business opportunities.

This kind of phenomenon is very frequent in the Chinese experience. Chinese networks are often considered very little affected by external conditions. The separation of the Chinese networks from the institutions of the destination country is enhanced by its own linguistic mixture. The difference between Mandarin and Cantonese, and the vast arrays of local languages and dialects spoken in inner China, create a broad range of sub-communities, with an even greater feeling of separation from the host country. This internal fragmentation of languages and cultures is thus able to produce new sub-hierarchies, but also new horizontal connections. Such internal stratification is nevertheless able to resume at a higher level of efficiency and/or opportunities. Whilst feeding on sub-ethnic segmentations for cost-cutting activities, managers and middle person are in fact strongly related, at similar levels of responsibilities, by class ties that cut across sub-ethnic differences. It is thus possible to enrich connections, and therefore enlarge the pool of knowledge, by way of specialisation and a *mutual* exchange of information: a framework that may resemble a sort of *barter* economy.

Witness of such developments is a large piece of scholarship. Gould (1994) and Rauch and Casella (1998) for example, argue that this kind of networks promote the development of bilateral trade, by supplying market information and an easy way to compare the quality of services, in order to find the most suitable distributors. By endorsing evidence from the analysis of dispersed ethnic groups, Kotkin (1992) confirms that the wide geographical dissemination of Chinese entrepreneurs represents a core element in the process of building mutual business opportunities. Weidenbaum and Hughes (1996) suggest that 'The members of the bamboo network operate in the interstices of the trading world. They make components, manufacture for others, and perform subassembly work. The leading businessmen know each other personally and do deals together, with information spreading through an informal network rather than through more conventional channels'.

*Embeddedness* seems also be functioning as a formidable economic environment to translate an initial abundance of cheap labour into new entrepreneurship. For labourers, it acts as an incentive to work in difficult conditions, in the presence of exit barriers to the external labour markets. For firms, it acts by reducing or eliminating the sunk costs associated with the search of suitable skills. For both workers and firms external economies are created and subsequently internalised and/or put at the disposal of the community for further utilisation. It is even possible that, in this kind of environment, profits are temporarily kept below normal levels, for

new enterprises, in the prospects of future growth. This is certainly a strong incentive that lowers entry barriers in existing markets for new enterprises.

All such factors also help create strong ties between employers and employees, particularly in terms of career paths. Particularly so when employers provide employees with several advantages and fringe benefits, mostly in terms of services that span from lodging to hiring relatives and providing for them. To be sure, these links also represent the main roots for obtaining more flexibility in the labour market and thus compete on more favourable terms. So whilst on the one hand a higher value added is often created, compared with what feasible under strict market conditions, on the other hand more flexible labour relations can conduct to *excesses* in the use of the labour force, to the point of un-acceptable exploitation. An institutional compromise is therefore necessary, at this point, to distinguish between ‘ties that bind’ and ‘and ties that blind’ (Grabher, 1993).

To put it somewhat differently, the gradual intensification of trust relationships within an ethnic network may strengthen its insulation and build up barriers of entry that may become detrimental for further competing with the outside world. This represents a danger for growth. To be able to survive and possibly extend its scope, a community needs in fact to re-distribute its benefits to itself, at least to some extent. In other words, *Social capital* must be made available, so that ethnic networks will finally start to *deliver* for the future.

As an application of this way of reasoning, recent studies of the district of Prato, in Italy, although confirming the importance of such elements for growth, also underline the difficulties of this critical passage. A large immigration of Chinese people into the district took place, indeed, all along the 1990’s. This proved vital both for the district itself (where ‘networking with trust and reciprocity’ was of course governed by the *local*, rather than the *ethnic* community): the district was in fact experiencing a new wave of cost competition and a certain shortage of lower-skill labour. But it was important for the new Chinese community as well, which was made of first generation immigrants. Initially, by employing these immigrants, local firms from Prato took advantage of ethnicity as a form of labour incubator, which provided supporting activities such as knowledge and inclusion (Mistri, 2001; Ambrosini, 2003). Later on, some workers acquired enough competence to set up external activities and work as sub-suppliers, transferring local technologies and organisation structures into the Chinese community and metabolising them with Chinese norms (Ceccagno, 2003). The new entrepreneurship was indeed facilitated by the clan structures and the family ties of the Chinese community (Ungaro, 1993). But in any case, a solid collaboration with the local community has been developed.

Yet, many elements of separation remain, as ethnic firms still hire Chinese workers only, and prefer to deal with Chinese firms as sub-suppliers. This is why some refer to this situation as a ‘parallel district’ inside Prato (Rastrelli, 2003), which reproduces the initial district conditions but needs to evolve from ‘embeddedness only’ into ‘connectedness for growth’ by enhancing social capital and perhaps finding a terrain for sharing social norms. A thorough analysis of such dynamics has been recently proposed (Mistri, 2006) but a stage model encompassing all the possible phases of this particular configuration/stratification is still under way.

### **Social Capital and Economies of Growth (stage 3)**

Let’s now consider how new incremental value is generated, beyond the start-up phases, by better relationships based on networking, plus trust. It is well known that, in general, networks do facilitate access to more conventional economies, such as economies of scale and scope, better finance, new technology and market information. All such economies are indeed provided from growing connections and therefore the ‘size’ of the network. In principle, although a certain element of trust should be associated with the working of networks, there is no reason to believe that transactions could not be organised by (Market) prices and/or (Hierarchy) planning, at least to some extent. But if we add trust as a new asset that complement prices and planning signals to the point of changing the final results, further competitive advantages can be created, in ethnic networks, by reducing the risk associated with intra-network transactions. This is the equivalent, in other words, of throwing a sort of (dynamic) safety net inside segmented markets.

The state of affairs described in the previous section may also turn business opportunities into another form of *Social capital* that builds upon internal segmentations, but also feeds on cultural varieties and different use-

value, provided some horizontal connections can be created on the base of reciprocity and trust. The result is that, by enlarging the overall pool of information available for firms, new opportunities are generated for business oriented people, as a result of new applications, or new developments, of existing economic ideas (in terms of products, processes, services, product characteristics, applications, and so forth) (Pine and Gilmore, 1999). Drawing from what discussed above, in sub-section 1.2, instead of relaying on the passage from the *economies of needs* to the *economies of wishes*, we are now able to consider possible *economies of variety*: an articulation of the idea that many different applications and variations of existing economic ideas can be envisaged, provided that a certain degree of cultural diversity is preserved, and knowledge can be shared for enhancing its reproductive capacity, rather than being privately appropriated with the exclusion of others.

Finally, the existence of trust *with* reciprocity for accessing information not only allows for the formation of a first pool of *Social capital* (emerging both from networking and knowledge). It also helps to enlarge the spheres where to reach more conventional networking economies (scale, scope etc.) and to enrich the complexity of the architecture of the network (Lorenzoni, 1990). So in the end, the structure of ties (networking), and its institutional settings (based on prices, plans and trust), may provide, in ethnic networks, sufficient momentum for the expansion of economic activities beyond ethnic ties.

## **Opening the Networks to External Markets (stage 4)**

### **Opportunities and Risks**

Even if ethnic networks keep a strict relationship with a particular economic and socio-cultural background, we should not minimize the importance of the degree of its openness. On the one hand, a closed network is deemed to progressive weakness, if it is not contaminated with innovations and ideas coming from outside (Tiberi Vipraio, 1997; Maggioni and Bramante, 1995). On the other hand, an open network represents a fundamental resource for a wider and deeper exchange of information with external markets, in terms of technologies, product innovations, organisation, business connections and the like. In other words, the members of an open network can better exploit all the relationships considered in the previous phases, and generate new economies of scale and scope both in direct production and financing.

As in the above mentioned Agency case, by increasing its contractual weight, the network can create additional advantages that cannot be easily achieved by single members of it. In particular, to the extent that these advantages are not privately appropriated, they can be conferred to the network in forms that enhance - this time - the *reachness* of the network itself, by easier penetration in near markets, extensions towards more distant markets and finally, return to the motherland (see next section). In order to do so, networks need of course directions. Recent evidence suggests that network extensions are generally organised in various patterns. In Italy some underlined the importance of firms which act as Meta-organisers s, i.e. firm that are able to interface the local excellence with external markets and complementary competitive advantages (Grandinetti and Tiberi Vipraio, 2001).

There are of course drawbacks of such evolutionary patterns. The most obvious is that some external agents (and even some 'internal' agents, for that matter) can build privileged relationships with the network during its opening process, but also allow for a certain degree of Market rules to enter the network organisation. In principle, every member of the network is able to benefit from the information and knowledge created by the ethnic community, and trades it in the external markets. However, social monitoring and the community ostracism often represented a good enough deterrent against rule infringements. Greif (1989) argues, for example, that ethnic networks can provide a very efficient set of sanctions against opportunistic behaviours. This is also confirmed by Weidenbaum and Hughes (1996) as for the Chinese networks: when an agreement is not honoured, the entire Chinese community would not do any business with the rule breaker.

Such attitude applies much less if agents are either 'external' to the network or let themselves be gradually inspired by external rules, which are normally more prone to market prices than to membership, affinity of kinship. This is to say that, with the gradual openness of the network, some information may be privately appropriated by external competitors and/or be dissipated through market rules. The pool of information generated by the network gradually turns from *Social capital* into a more conventional form of *Private capital* and eventually benefits the final consumers, if market rules apply strictly. So, whilst lowering some previous entry barriers, at the same time

'opening' may create a conflict of rules that may end up with the collapse, or at least some instability, of the previous ones. The quality of the network openness, i.e. the degree of sharing vs./appropriability of knowledge, is therefore crucial for its success, and eventually for its survival.

A second problem arises from considering competition in itself. Whilst one would expect competition to rise in general after 'opening', as new partners are added to the network and new markets are now accessible, in practice we are not sure whether competition is enhanced or reduced. In fact, a network is not opened to the market in general, but specifically to certain 'selected partners' (i.e. regions, sub-ethnic communities, etc). So one must first address the issue of how much value is added during information sharing, and how much of it is shared in the form of *Social capital* or rather privately appropriated by the 'selected' partners.

This suggests that an ethnic network must solve two subsequent problems, during this phase. Firstly it must consider how much competition is left after the interaction of all the economies of scale and scope described in the previous phases. As by opening firms tend to grow, and as economies of scale and scope are more likely to present complementarity's rather than substitution effects, we are inclined to think that lower, rather than higher, competition will be initially associated with opening. Secondly, the ethnic network should also consider how many advantages (and which ones) can be kept in the network and how many (and which ones) will be left to market forces (or private appropriation). This is of course a matter that is dependent on many parameters, mostly emerging from the industrial characteristics of the network, its architecture, its relationship thread.

Unfortunately, the discussion of such issues is beyond the scope of this paper. Yet one is tempted to conclude that, to the extent that a certain degree of information redundancy is maintained, in the network, a certain pool of *Social capital* can be preserved, not only as a stock available to all, but particularly as a source of inspiration for the formation of new *Social capital*, derived from all the possible application and multiplication that are in users' minds.

#### **Policies**

Finally, moving from the positive to the normative, and following Rullani (2001), we would suggest that at least four specific functions (agents) could be identified (and promoted) to assist the survival of the ethnic network in this phase, all aimed at preserving a certain degree of mutual trust, and therefore *Social capital*, with a certain degree of market contamination and openness:

1. System managers, who help overcome internal segmentations, and allow for a better exchange of knowledge and information;
2. Interpreters, who help create cognitive bridges between different actors, building trust relationships and a certain sharing of knowledge;
3. Connectors, who supply the entire network with instruments, systems and services able to support the connective foundations of the network (communication, logistic, warranty);
4. Meta-organizers, who rule the behaviour of the members of the ethnic network by defining and controlling the general function conditions of the network.

By allowing ethnic networks to be part of the global economy without losing their ethnic identity, such functions create a sort of flexible integration between global and local circuits of knowledge (Becattini and Rullani, 1993) and a fundamental resource for the network, by matching network knowledge and global competitive advantages (Grandinetti, 1999).

Yet, besides promoting functions (agents), we also need Policies addressing bottlenecks, or obstacles, when networks tend to close up and revolve into building up defensive barriers, rather than evolve towards global advantages. Here are some suggestions:

1. Supporting education policies. Human resources represent of course a fundamental asset for competitive advantage. As for ethnic networks and their degree of openness, the implications are widespread. The educational system within the network suffers from a high degree of rigidity, due to its ethnic connotations. Whilst a source of advantages in the first two stages, this feature leads to a gradual lack of human resources in stage three and four, when the network needs to face external competition and manage the risk of possible opportunistic behaviours. In order to solve these problems, ethnic enterprises should bear the costs of a wider educational system. Yet these costs can be extremely high for small firms. So the network needs to build up a meta-educational system to survive. On the one hand, it must help create brand new competencies and professional features to up-grade its ethnic labour

market. On the other hand, it must also respond to the educational aspirations of entrepreneurs, managers and all the human resources that are already hatched in the ethnic enterprises. Trying to help the demand and supply of skills to meet is already a hard task. Even harder is to provide for the right mix of skills that is necessary to compete under a various combination of norms and institutions, emerging from internal and external contexts. But the network will eventually up-grade to the next stage only if it will be able to create a wider range of human resources, i.e. men that able to cope both with ethnic remains and with the new opportunities and threats offered by the external markets.

2. Supporting selected entrepreneurial projects. As we stated above, one of the main problems concerning the openness of an ethnic network is related to the small contractual power of most ethnic enterprises, in comparison with the external environment. As an opening process means that the advantages of the networks can be easily appropriated by private agents, because social capital is exposed to opportunism and/or easily turned into a private factor, networks should try to support business projects that are less exposed to this risk. There are at least two main ways to do so: 1) providing for financial resources aimed at overcoming the diseconomies of small scale of ethnic firms, and 2) using them in collective projects, whose main objective is to support the evolutionary competitiveness of ethnic business in general, rather than that of single enterprises. This means that some competence must be created and actions organised above firms' level, to select and develop only those activities that present a higher probability of collective success. It also means that new rules must be added to the previous ones, as this new level of competence must bear responsibility and accountability, to avoid new forms of opportunism and/or conflicts of interests.

3. Interfacing ethnic with global networks. Other risks of opportunism, for ethnic networks, don't emerge from small-scale weakness but rather from the creation of a new large-scale opportunities that the process of opening up is able to deliver. If that is the case, ethnic community should try to enter and garrison the wider value chain thus activated; in particular they should create, develop and/or manage at least some information knots (interfaces) between local competence and global markets opportunities. The possibility that additional advantages might be appropriated by others could thus be reduced, and financial resources better employed in the development of the new advantages for the penetration of external markets.

4. Incubator for knowledge and information dissemination. As we said above, the advantages of ethnic networks are strictly connected with the amount of knowledge and information that they are able to create and disseminate. The availability of these resources depends on the number of relationships and connections that are created within the network. As a result, a low level of connectedness means that a waste of useful resources is taking place. In this case there is a wide scope for policies, aimed at creating a wider informative system, both for the member of the network that need simple up-dates in technologies and organisation, and for those interested in new products and processes, or simply in doing external business. Furthermore, an incubator for knowledge and information allows for a periodic monitoring of the competitive position of firms and for an evaluation of the degree of success in the strategies used in entering global markets.

## **Opportunities with the Motherland (stage 5)**

In this section we suggest that *redundancy* - i.e. an overabundant pool of information from where to derive a large variety of original solutions and applications to economic problems - should be considered an evolutionary resource in itself. A high volume of knowledge produces, in fact, not only a general availability of abundant information, but also the possibility to operate a sort of *natural selection* that allows for a large process of trial and error. Whilst recording a number of failures, the process is indeed able to perform successfully, precisely for its dimension: no matter how many will fail, a long lasting repetition of different applications of abundant knowledge is sufficient to produce, eventually, some positive results. This is indeed how evolution operates in biology. In particular, let's consider how this process opens up a wide range of economic opportunities for ethnic network in relation with the motherland. The Chinese example is probably the most striking case in point.

There are approximately 60 million *overseas Chinese*, mostly living in Southeast Asia where they make up a majority of the population of Singapore and a significant minority in Malaysia, Thailand, the Philippines, Indonesia and Vietnam. As many others ethnic groups living outside their country of origin, *overseas Chinese* have

developed several associations, both formal and informal, traditionally based on kinship, linguistic ties and same-origin bounds. Originally, they were born for helping and assisting the community, in particular the neo-immigrants. Later on, these networks gradually evolved into basic information and knowledge centres.

In the last decades, thanks to the *Guanxi*<sup>4</sup> medium, the Chinese network has developed in a more formalized way. This has somehow eased up the possibility - for some of its members - to return to their motherland, in connection with the gradual opening up of China to the market economy. Yet the country has a world-wide reputation of having a weak legal system and a narrow circulation of market information through official channels. This represents a barrier for non-Chinese Foreign Direct Investments (FDI's). Even if the Chinese legal system had progressively strengthened its foundations, especially since the recent admission of PRC to the World Trade Organization and the consequent openness to international business, property rights and contract laws still remain insufficient for many foreign investors. So, in our theoretical framework, we could say that there are a number of market failures, in the case of China, that would suggest the feasibility of a pattern of FDI's that drives through the Chinese networks overseas. The argument runs as follows.

On the one hand, with its informal channels and connections and with its huge amount of information and knowledge, the Chinese networks are able to operate both on the market proper (by supplying competitive products and by using and transferring efficient technologies) and in the interstices of the market (by supplying 'ethnic' and 'sub-ethnic' products). On the other hand, coming from different countries, and therefore being contaminated by different uses and applications of existing products and technologies, they are also able to offer a variety of solutions and applications of knowledge, having historically adapted them to the local environment in a variety of ways.

Although further evidence is needed to support this general view, this pattern seems to be confirmed by the high shares of FDI's towards China that come from countries with a larger Chinese community. Gao (2000) considers, for example, how ethnic Chinese networks influence realized FDI inflows into the People's Republic of China (PRC) by looking at the total FDI inflows from 68 countries during the period 1985-1997. Using a standard OLS regression, with the logged value of FDI stock as dependent variable, he finds that the ethnic Chinese population share in the source country has a statistically significant positive relationship to FDI's in the PRC. His results suggest that a one percentage point increase in the ethnic Chinese population share leads to an increase of at least 3.7 percent in cumulative FDI in PRC. Although Gao believes that the FDI stock better represents the activity of foreign firms in China than FDI flows, he also regresses annual FDI inflows for 1994 to 1997 against his measure of Chinese networks. This leads to a significant positive relationship of the level of a 4.0 percent (1995) to 7.4 percent (1996) increase in FDI inflows for a one percent increase in the Chinese population share in the source country.

## Conclusions

In reviewing current literature on ethnic network, with particular attention to the Chinese networks, we have suggested that they tend to grow along an evolutionary path that first relies upon *Embeddedness* to overcome start up cost for labour and new entrepreneurship, and later on builds upon a particular form of *Social capital*: a new resource available to ethnic participants of the network for different uses and application. Economies of scale and economies of scope are thus created at negligible transaction costs. Both exchange-values and use-values are also generated by a multiple use of redundant information. In a subsequent stage, ethnic networks tend to open up to external market and connect with the rest of the world. Critical seem to be, at this point, the degree of appropriability of the available information and the degree of competition that networks tend to deliver, at the end of the day, as a result of different local and competitive conditions, industry structures, institutions and sets of behaviours. At this stage networks run the risk of disappearing, bending to market forces; but they can also strengthen up, if the right mix of competition and cooperation can be singled out and adequate policies envisaged - an attempt made in this paper - to help networks to survive and prosper. This process will require a continuous generation of new *Social capital*, but at the same time, it will create the possibility, for some agents, to use up some piece of information and/or put it under private utilisation. Eventually, if some market failures still persist in the motherland, the competitive advantages, thus created and implemented, are able to easily turn into backward investments and further

articulate the competitive advantage of both the network and the initial country of origin. Further policies to help the process deliver growth, rather than collapse or surrender to external forces, can be easily derived by a thorough analysis of the critical parameters that allow the network to better compete in each phase.

## End Notes

As in the case of Chinese ethnic networks.

<sup>2</sup> This approach departs to a certain extent from conventional neo-classical economics, when it mainly focuses on the allocative efficiency of scarce resources, and rather connects to the classical views of system dynamics, reproduction capacities, and the role of culture and territory to determine competitive (absolute) advantages. It is therefore drawing from that part of the marshallian tradition that has been recently re-considered as one the most

modern piece of economics we can rely upon for interpreting current problems in industrial economics. See Tiberi Vipraio 1999, among others.

<sup>3</sup> See Tiberi Vipraio, 1997 for a discussion.

<sup>4</sup> *Guanxi* (Traditional Chinese: 關係; Simplified Chinese: 关系; Pinyin: gūanxi ), describes the basic dynamic in personalized networks of influence. The Pinyin Romanization of this Chinese word is becoming more widely used instead of the two common translations - 'connections' and 'relationships'- as neither of those terms sufficiently reflect the wide cultural implications that *guanxi* describes. Closely related to *ganqing*, a measure which reflects the depth of feeling within an interpersonal relationship, *renqing*, the moral obligation to maintain the relationship, and the idea of 'face', meaning social status, propriety and prestige, *guanxi* is more realistically a combination of all three. *Guanxi* is a central concept in Chinese society and describes, in part, a personal connection between two people in which one is able to prevail upon another to perform a favour or service, or be prevailed upon. The two people need not be of equal social status. It could also be a network of contacts, which an individual can call upon when something needs to be done, and through which he or she can exert influence on behalf of another. It can also describe a state of general understanding between two people. This means that *guanxi* obligations can sometimes be described in terms of an extended family and the relationships formed by *guanxi* are personal and not transferable. Sociologists have linked *guanxi* with the concept of social capital and it has been exhaustively described in studies of Chinese economic and political behaviour. When a *guanxi* network violates bureaucratic norms, it can lead to corruption, and *guanxi* can also form the basis of patron-client relations.

## Value Creation Effect of Technology Alliance: Cases of Japanese-U.S. Firms

### Abstract

**Do international strategic alliances create or destroy firm value? Past research has suggested that such alliances can be a two-edged sword. On one hand, alliances can contribute to bigger, stronger, and more flexible companies. On the other hand, alliances may also serve to weaken, dilute, and fragment companies' strategic position and organizational capability. This issue is particularly ripe for rigorous empirical explanation in the context of partnerships between the two largest economies in the world, the United States and Japan. In this study, we examined stock market reactions to announcements of interfirm cooperation between U.S. and Japanese firms in 228 alliances formed in high-tech industries during the period of 1995-2000. The results showed that U.S. firms did not lose firm value following announcement of alliances with Japanese partners, contradictory to prior work warning of potential erosion of competitiveness through alliances with Japanese firms. We also found that absorptive capacity significantly influenced firm valuation effects of Japanese firms, while technological overlap with partners generated positive returns for U.S. firms.**

### Value Creation Effect of Technology Alliance: Cases of Japanese-U.S. Firms

International technology alliances have proliferated (Hitt et al., 2000) and been touted as a new source of competitive advantage and extensively used as a means to gain access to information, resources, markets, and technologies and to gain advantages of learning and economies of scale and scope. They also have enabled firms to achieve strategic objectives such as sharing risks and outsourcing value-chain activities and organizational functions (Contractor and Lorange, 1988). Along with the substantial increase of Japanese presence in various industries such as autos, electronics, and semiconductors, U.S.-Japanese strategic alliances have heightened interests among academicians and managers (Hennart, Roehl, and Zietlow, 1999; Reich and Mankin, 1986; Swan and Ettl, 1997). As cooperative activities between U.S. and Japanese firms have expanded, some authors (Reich and Mankin, 1986) have expressed a concern that Japanese firms may behave in ways that are not aligned with their partners' interests. Researchers have argued that Japanese firms are good at learning from their U.S. partners and tend to exploit cooperative relationships for their own gain, while U.S. firms fail to achieve their intended goals or lose their long-term competitiveness (Hamel, 1991). In contrast, Hennart et al. (1999) suggested that Japanese firms in joint ventures with U.S. firms do not take actions against their U.S. partners to pursue only their economic gains.

Despite these inconclusive arguments advanced by prior works, no extensive empirical study has been conducted to directly test whether strategic alliances with Japanese firms are detrimental to the competitiveness of U.S. firms. Therefore, our study examines the untested negative effects of U.S.-Japanese strategic alliances by measuring and comparing changes in U.S. and Japanese firms' market value using event study methodology. Contrary to the previous research that lacks explicit theoretical foundation, we take the organizational learning perspective in order to identify factors influencing firm value creation and destruction through interfirm cooperation.

In this study, the term "international technology alliance" is used to refer to a cooperative agreement formed by a U.S. firm and its Japanese partner firm with a strategic purpose of knowledge development and transfer. This cooperative agreement does not involve the creation of an independent business entity, as in joint ventures, but it allocates resources, operational responsibilities, and financial risks and rewards to each partnering firm. The technology alliances encompass interfirm cooperative agreements that aim at mutual knowledge transfer and new knowledge creation. Therefore, alliances that do not involve activities of knowledge development and exchange are not considered in this study.

As in several previous studies on firm valuation effects of interfirm cooperation, this study also employs the event study methodology. Given the fact that alliances require combining resources of two or more firms to achieve common objectives under the joint involvement of the parents firms, it is almost impossible to disentangle the value creation effects attributable to a particular alliance from those generated by the firms' other operations. The event study methodology overcomes this problem in that it captures only the value created from an alliance formation on its announcement day, relying on the efficiency of stock market mechanisms. In addition to its methodological uniqueness, this study advances strategy research by being the first empirical research that captures dyadic properties of interfirm cooperation in the international context.

## Theory and Hypotheses

### Firm Value Creation through Strategic Alliances

In industries where technologies rapidly change and product life cycles shrink, very few firms would be able to, or willing to independently carry the risks of accelerating research and development costs (Hagedoorn and Schakenraad, 1990). Therefore, a firm may consider developing a nexus of cooperative relationships with other firms in order to keep up with many emerging technologies, while concentrating internally on its specialty area. Powell (1990: p.315) noted that "firms pursue cooperative agreements in order to gain fast access to new technologies or new markets, to benefit from economies of scale in joint research and/or production, to tap into resources of know-how located outside the boundaries of the firms, and to share the risks for activities that are beyond the scope of the capabilities of a single organization." Madhok and Tallman (1998) also posited that firms enter into collaborative relationships because firms expect to yield superior value through the relationships relative to other forms of organizational economic activities and that collaborative relationships *per se* tend to offer potential opportunities for synergistic combinations of complementary resources and capabilities and could be considered to be productive resources for value creation and realization.

An extensive body of empirical studies using event study methodology has been conducted to examine stock market reaction to the formation of strategic alliances. The extant research based on theories from finance, economics, international business, and strategic management, provides researchers with a solid understanding of the sources of firm value creation. When firms announce formation of an alliance, previous studies found either a positive return (e.g., Koh and Venkatraman, 1991) or a negative return (e.g., Chung, Koford and Lee, 1993), or in some cases, an insignificant return (e.g., Das, Sen and Sengupta, 1998). Despite the inconsistent findings of the extant studies, it is proposed that firms entering strategic technology alliances are expected to experience substantially positive firm value gains by integrating complementary knowledge and know-how (i.e., the synergy effect).

*Hypothesis 1A: The formation of international technology alliances will create positive firm value for both U.S. and Japanese partnering firms.*

In cooperative relationships between U.S. and Japanese firms, however, it is alleged that these expected benefits from forming strategic alliances may be true for only Japanese firms. For instance, Reich and Mankin (1986) argued that:

The current situation has severe drawbacks for U.S. companies over the next five years. Over the long term, U.S. companies that enter joint ventures with Japan cannot maintain high profitability by providing services, such as assembly and distribution, which add very little value to the product being sold. The resulting interplay, while superficially promising, could really be just an extended dance of death (1986: 85).

Based on the above argument that a large number of U.S. firms involved in strategic alliances are likely to be characterized with insufficient financial resources and lack of managerial capabilities, they are exposed to a high risk of giving away to their Japanese partners their competencies in research and new product development. Loss of U.S. firms' core competencies will undermine the foundation of their long-term competitiveness (Reich and Mankin,

1986). The stock markets will also consider these potential dangers of U.S. firms' losing competencies and firm value when strategic alliances between U.S. and Japanese firms in high tech industries are announced. Accordingly, we expect that the Japanese firms create more firm value than U.S. firms by announcing cross-border technology alliances.

*Hypothesis 1B: The stock markets will react more favorably to Japanese firms than to U.S. firms when they announce technology alliances.*

#### **Past Alliance Experience**

According to the organizational learning theory, a firm's experience of engaging in particular activities and practices assists in detecting and correcting errors (Argyris and Schön, 1978) and helps to improve future actions through better knowledge and understanding (Fiol and Lyles, 1985). A large body of literature in the alliance field similarly addresses the importance of learning to successfully manage various interorganizational collaborative arrangements. One stream of research argued that past alliance experiences generate trust and commitment through the process of building reputation (Park and Russo, 1996; Gulati, 1995). In a similar vein, another stream of research reported that firms with more alliance experiences benefited more from subsequent alliances than firms with fewer experiences (Barkema et al., 1997; Powell et al., 1996). Lyles (1988) documented well how joint venturing experiences have increased the competitive edge of the parenting firms. Kale and Singh (1999) suggested that firms with more alliance experiences exhibit greater alliance success. Anand and Khanna's (2000) study on alliance capabilities was the only and first attempt that measured the effect of accumulated cooperative experiences on the value of the firms involved in alliances. However, their study was limited in that it merely aimed to demonstrate the positive relationship between experience and learning effects in the multiple forms of alliances, not taking into account firm- and partnership-specific characteristics. In this more limited context, they found empirical support for the view that past alliance experience increases firm value.

*Hypothesis 2: Firm value created by U.S.-Japanese strategic alliances will be positively related to the level of the firm's past alliance experience.*

#### **Absorptive Capacity**

Cohen and Levinthal (1990) suggested the importance of an existing competence base, termed "absorptive capacity", with which firms are capable of detecting, assimilating, and utilizing external knowledge. The key component of this notion is R&D expenditures. They suggested that a firm's R&D investments contribute to not only the generation of new knowledge but to the firm's absorptive capacity. When a firm uses an alliance to internalize new technology-based capabilities from a partner, the demands of the technology absorption process are such that the technology-acquiring firm must have considerable in-house technical expertise that complements the technology development activities of the alliance. Hence, the accumulation of R&D resources within a firm enhances the firm's ability to acquire external technology and combine it with existing internal development activities for the commercialization of the learning object, technology.

The relationship between R&D expenditures and firm innovativeness has been extensively researched in the strategy literature (e.g., Mowery, Oxley and Silverman, 1996). The level of a firm's R&D investments tends to determine the ability of the firm to assimilate new technological capabilities of other partner firms in alliances. Knowledge absorption depends on the firm's ability to add new knowledge to existing knowledge. The accumulated R&D investments may be an indicator of the firm's willingness and readiness to absorb new knowledge through alliances.

*Hypothesis 3: Firm value created by U.S.-Japanese strategic alliances will be positively related to the level of the partnering firm's R&D investment.*

#### **Technological Overlap**

Motives for establishing alliances differ among firms, and these different motives may affect both the choice of partner firms and the effect of partner choice on the capabilities of participating firms. Firms jointly pursuing collaborative development of a technology or product within an alliance are likely to require some level of technological overlap to facilitate knowledge exchange and development. Cantwell and Barrera (1996) argued that

“firms with dissimilar profiles of technological effort will be likely to have less incentive to exchange knowledge,” (p.2). Hence, firms participating in a technology alliance should possess ex ante technology-based capabilities that are similar in scale and scope at the time the alliance is formed.

Mowery et al. (1996) proposed that firms with high technological overlap tend to combine their complementary knowledge resources more effectively than firms with low technological overlap, and found that the extent of a firm’s absorption of technological capabilities from its alliance partner is positively related to its pre-alliance level of technological overlap with partner firms. As a result, firms establishing technology alliances with partners that have similar technological bases will benefit more from the alliances than firms of which partners in technology alliances have dissimilar technology bases.

*Hypothesis 4: Firm value created by U.S.-Japanese technology alliances will be positively related to the level of pre-alliance technological overlap between the partnering firms.*

## Methods

### Sample

The primary source for the data on international technology alliances is the Securities Data Company (SDC) database of Joint Ventures and Alliances. The SDC database contains information on various types of alliances and is compiled from publicly available sources, including SEC filings, trade publications and international counterparts, and news and wire sources. The database is among the most comprehensive sources of information on alliances and is one of the only sources available for large-scale empirical studies on alliance activity.

The data in this study consist of technology alliances formed between one U.S. and one Japanese firm during the period of January 1995 - November 2000. The sample period was set to include the most recent alliances for which data were available. Considering the nature of technology alliances, alliance samples consist of interfirm collaborations involving R&D, manufacturing and licensing activities. Alliances involving cooperation in the marketing area are not included. To effectively manifest the strategic roles of technology alliances, this study includes alliance activities of firms in high technology industries. The definition of high technology industries has been equivocal. In this study, we followed the study of Hadluc, Hecker and Gannon (1991), which reported 31 high tech industries based on an industry’s percentage of R&D employment. In this study, we focused on non-equity alliances in which partnering firms neither share equity control as in a minority equity investment nor create a new organizational entity as in a joint venture, but simply agree to pool resources. Following these criteria, the final sample data is composed of 228 alliance cases in the 31 high technology industries during the sample period of 1995-2000.

### Analytical Methodology

We employed the event study method to measure the impact of technology alliance formation on a partnering firm’s market value. McWilliams and Siegel (1997) discussed theoretical and empirical issues associated with the use of the event study method in the management field, and listed the appropriate procedures for an event study. The standard approach in event studies is based on estimating a market model for each firm and then calculating abnormal returns.

$$R_{it} = \alpha_i + \beta_i * R_{mt} + \varepsilon_{it}$$

where

$R_{it}$  = the rate of return on the share price of firm i on day t,

$R_{mt}$  = the rate of return on a market portfolio of stocks on day t,

$\alpha_i$  = the intercept term,

$\beta_i$  = the systematic risk of stock i,

$\varepsilon_{it}$  = the error term for stock i on day t  $\sim N(0, \sigma_{\varepsilon_i}^2)$

The deviation of the actual return from the expectation (abnormal return, AR) is computed for firm *i* on the day *t* as

$$AR_{it} = R_{it} - (a_i + b_i R_{mt})$$

where  $a_i$  and  $b_i$  are the firm-specific ordinary least squares (OLS) parameter estimates obtained from the regression of  $R_{it}$  on  $R_{mt}$  over a certain estimation period preceding an event, the announcement of an alliance. The estimation periods for the equation in previous studies that examined the impact of alliance announcement on stock prices ranged from as short as 45 days (Madhavan and Prescott, 1995) to as long as 250 days (Park and Kim, 1997). Based on the methodological tradeoff and previous alliance research, the estimation period in this study is 150 days from  $t = -170$  to  $t = -21$ , where  $t = 0$  corresponds to the date of an alliance announcement. We also set up 20 trading days before and after an alliance announcement date. During these pre- and post-alliance periods, the abnormal return of each day is measured. The abnormal return represents changes in the stock price of firms whose participation in alliances is publicly announced and the changes signify the stock market expectations about the firms' value generation through the alliances.

Since the stock market reactions to an announcement can span multiple days, due to the timing of information disclosure, the firm valuation effect is measured by summing the abnormal returns between two days  $t = t1$  and  $t = t2$  within the event window.

$$CAR_i = \sum_{t=t1}^{t2} AR_{it}$$

Alliance event studies have accumulated abnormal returns for intervals up to six days in length (e.g., Das et al., 1998). However, for regression analyses it is suggested that CARs over a short interval are preferable in order to reduce the amount of noise in the dependent variable. Since this study considers stock markets in both U.S. and Japan and different time zones, it is impossible to measure the reactions of different securities markets in the two countries to public announcement of an alliance formation on the same day. Hence, the impact of the announcement on the stock price is captured with cumulative abnormal returns of the two-day trading period consisting of  $t = 0$  and  $t = +1$ . The two-day event window meets the methodological suggestions that an event window should be short enough to control for confounding effects as well as that the  $\alpha$  and  $\beta$  terms should remain constant during the event window (McWilliams and Siegel, 1997).

Special attention is given to the accuracy of the date on which alliance formations were announced because identifying the exact date on which the alliances were consummated is extremely crucial for assessing value creation effects in event studies. In this study, the accuracy of SDC data on the dates of the alliance announcements was verified by tracking every mention of the alliances in the Dow Jones Interactive which covers various sources of news and wire reports, newspapers, magazines, and trade publications. The date on which the initial news describing an alliance formation appeared on news wires is numbered event day  $t = 0$ . If the identified announcement date is not a trading date due to weekend or holiday, the next available trading date is chosen as  $t=0$ .

The last analysis conducted in this study was to account for the variation in the abnormal returns identified by the above procedures. After identifying the statistical significance of the cumulative abnormal returns (CARs), we explained the cross-sectional variation in the returns across the firms in the alliances sample. This process requires the ordinary least square (OLS) regression of the abnormal returns on the three different types of the attributes developed in the theoretical model. Using OLS regression may cause a problem because the abnormal returns used as the dependent variable in the OLS regression are essentially residuals that may be heteroscedastic and be correlated with the independent variables. However, Karafiath (1994) suggested that the OLS estimation generates no substantial methodological problem, in comparison to more complex estimation procedures (McWilliams and Siegel, 1997). The regression tests the statistical significance of the attributes derived from the underlying theory.

## **Variable Operationalization and Data Sources**

### *Dependent Variable*

The dependent variable of this study is captured by the standard event study method that measures the abnormal returns of partnering firms on the day of alliance announcement. For the U.S. partnering firms, daily stock prices during the data collection period were drawn from the CRSP database. The stock prices of the foreign partners were obtained from the Datastream database.

### *Independent Variables*

#### 1. Prior Alliance Experience

Previous alliance experience of the firms was measured with strategic alliance data drawn from the database of Securities Data Company (SDC) and the Dow Jones Interactive. For each alliance, we counted the number of alliances each partnering firm had formed for the last 10-year period prior to an alliance announcement date.

#### 2. Absorptive Capacity

A firm's absorptive capacity is operationalized as accumulated R&D expenditures, adjusted by the sales of each firm. It is not clear from prior research on how many years of R&D expenditures should be included. Pakes and Griliches (1984) suggested that R&D lags of order 6 and higher have a significant effect on patenting. Because R&D data for Japanese firms were available from the data sources since 1991, however, we constructed a 3-year depreciated R&D investment with a 15 percent annual depreciation rate, which is recommended by Griliches and Mairesse (1984). The measure is as follows:

$$R \& D(Investments)_{it} = \sum_{n=t-1}^{t-4} (1 - 0.15)^{t-n-1} (R \& D)_{in}$$

where  $R\&D_{in}$  is firm  $i$ 's sales-adjusted R&D expenditures in year  $n$ .

The data for R&D expenditures were collected from COMPUSTAT and Bloomberg.

#### 3. Technological Overlap

Technological overlap is measured by the patent cross-citation rate between two partnering firms. The measure was developed by Mowery et al. (1996). The cross-citation rate for firm  $i$  and firm  $j$  is defined as follows:

$$\text{Cross-Citation Rate}(\text{firm}_i, \text{firm}_j) = \text{CitationRate}(\text{firm}_i, \text{firm}_j) + \text{CitationRate}(\text{firm}_j, \text{firm}_i)$$

$$\text{where Citation Rate}(\text{firm}_i, \text{firm}_j) = \frac{\text{Citations to firm}_j \text{ patents in firm}_i \text{'s patents}}{\text{Total citations in firm}_i \text{'s patents}}$$

All U.S. patent citation data were gathered from the U.S. Patent and Trademark Office database, which contains all information recorded on the front page of every patent granted in the United States since 1975. To measure a level of technological overlap, we calculated the cross-citation rate of two partnering firms for the one-year period prior to an alliance announcement date.

#### Firm Size

##### *Control Variable*

##### Firm size

Firm size variable is included to control the effect of the relative size hypothesis that suggests that value creation for large firms will be lower than that created for small firms (Chan, et al., 1997; Das et al., 1998). Firm size is operationalized as the natural logarithm of a firm's sales. A logarithmic scale is required to reduce the variance in firms' sales.

## Results

Descriptive statistics and correlation matrix for the study variables are provided in Table 1. The average change in firm value for two trading days on and after alliance announcement day was 1.3 %, which implies that, on average, firms gained 1.3 % of their firm value for two trading days by entering an international technology alliance in the high technology industries. The sampled firms had, on average, about 144 cases of alliance formation experiences during the last 10-year period prior to forming a new alliance. The mean value of 28.6% of 3-year R&D investments was consistent with high R&D intensity in high tech industries. The average degree of technology overlap between partners was 2.2%. The correlation coefficient between alliance experience and the natural logarithm of size is 0.614. This high correlation may create a multicollinearity problem. To prevent a potential collinearity problem, a centering procedure was performed, subtracting the mean from each of the two variables (Aiken and West, 1991). This procedure did not significantly change the values of the regression coefficients. The mean centered variables were used for the rest of the statistical analyses. Except for the correlation between experience and size variable, overall, the correlation values were relatively low.

Note. N=456 abnormal returns drawn from 228 U.S.-Japanese technology alliances  
Event day 0 indicates alliance announcement day.

Z-statistic: † p<.10, \* p<.05, \*\* p<.01, \*\*\* p<.001 (2-tailed)

Hypothesis 1A proposed that the formation of international technology alliances would create positive firm value for both U.S. and Japanese firms. To test this hypothesis, we first calculated the abnormal returns on individual event days to examine firm valuation effects of international technology alliances. Table 2 reports 456 average abnormal returns generated from 228 international technology alliances from day -20 to day +20. The average daily abnormal return on the alliance announcement day was +0.7% and statistically significant ( $p < 0.001$ ), supporting Hypothesis 1A. Even one day after alliance announcements, firm value was increased by 0.5% ( $p < 0.001$ ). This significant positive abnormal return realized one day after announcement can be possibly attributed to the fact that when the news of an alliance formation between U.S. and non-U.S. firms is released to the public through worldwide financial wireless services (e.g., Bloomberg) on a day ( $t = 0$ ), the day is corresponding to  $t = +1$  in Japan because of the time difference between the two countries. That means that when an alliance is announced to the U.S. on  $t = 0$ , the Japanese stock markets receive the information one day after and thus start to react to it on  $t = +1$ .

Table 2 also shows average cumulative abnormal returns over different event periods. All the cumulative returns over various time periods are positive and statistically significant. Because the shortest event period is preferred in the event study method in order to minimize any potential confounding effects (McWilliams and Siegel, 1997), we selected the average cumulative abnormal returns over two trading days of  $t = 0$  and  $t = +1$  as the dependent variable. The results suggested that firms in the sample, on average, realized 1.3% of the excess returns relative to the market for the two-day period.

Note. N=456 abnormal returns drawn from 228 U.S.-Japanese technology alliances  
Event day 0 indicates alliance announcement day.  
Z-statistic: † p<.10, \* p<.05, \*\* p<.01, \*\*\* p<.001 (2-tailed)

In order to test Hypothesis 1B, we calculated 2-day cumulative abnormal returns for Japanese and U.S. firms, respectively, and then tested whether there is a significant difference between the means of 2-day cumulative returns of firms in both countries. The mean of 2-day cumulative abnormal returns for Japanese firms was 0.2%, while the mean for U.S. firms was 2.3%. The U.S. firms realized significantly higher abnormal returns ( $p<0.001$ ), which could be a contradictory finding to the concern raised by Reich and Mankin (1986). Hence, Hypothesis 1B was not supported. As shown in Table 3, the size of U.S. firms is much smaller than that of Japanese firms and U.S. firms have much intensively engaged in R&D activities than their Japanese partner. However, there was not found a significant difference in the level of alliance experience between U.S. and Japanese firms.

TABLE 3: COMPARISON OF MEANS OF U.S. AND JAPANESE FIRMS IN SIZE, ALLIANCE EXPERIENCE, R&D INVESTMENT AND CUMULATIVE ABNORMAL RETURNS

Note. Z-statistic: † p<.10, \* p<.05, \*\* p<.01, \*\*\* p<.001 (2-tailed)

As a further analysis, we grouped the cumulative returns by country and their signs. The results are presented in Table 4. Interesting is that Japanese firms failed to create their firm value in more than 50% of the alliances (117/228). In contrast, U.S. firms significantly increased their firm value in 60% of their alliance formations (135/228).

<i>Total</i>		135	93	228

Note: Z-statistic: † p<.10, \* p<.05, \*\* p<.01, \*\*\* p<.001 (2-tailed)

Since about 60% of the U.S. firms in the sample alliances did generate positive firm value by entering alliances, whereas about 50% of the Japanese firms failed to create firm value, we need to examine what factors possibly account for this difference in the potential economic benefits of international technology alliances. For this

purpose, a multiple regression analysis was conducted. Table 5 presents the regression results to test Hypotheses 2-4. One control variable, size, was entered first and then a group of explanatory variables were entered. Model 6 was specified as the full testing model. Model 6 displays a satisfactory fit ( $p < 0.000$ ) and explains about 12% of the variance of two-day cumulative abnormal returns.

As the first step of the multiple regression, Model 1 presented in Table 5 tested whether any of the control variables significantly influenced firm valuation effects of Japanese firms in international technology alliances. The firm size variable was not statistically significant. Next, we tested whether the organization learning-related variables - previous alliance experience, absorptive capacity and technological overlap - are related to firm value creation. According to Model 2 in Table 5, only the relationship between absorptive capacity and firm value was found to be marginally significant ( $p < 0.10$ ), although the relationship was opposite to the hypothesized positive relationship. Hence, none of the hypotheses was supported with the Japanese firm samples. We ran the same multiple regression model for the U.S. firms as well. As in Model 4 in Table 5, firm size was found to be significant, indicating that the smaller firms gained higher abnormal returns. As proposed in Hypothesis 3, the level of technological overlap between the partnering firms was positively related to firm value creation for the U.S. firms. As a final analysis, the regression model was executed again with the whole sample firms. Similar to the results of the U.S. firm cases, firm size and technological overlap were found to be significant in creating firm value. The results imply that smaller firms benefited more from the cross-border alliances and alliances with firms with similar technological base yielded higher returns for the sample firms. Supported was only Hypothesis 4 that proposed a positive relationship between the similarity of technological bases of the partnering firms and firm value creation through international technology alliances. Table 6 presents summarized results of the multiple regressions.

TABLE 6: SUMMARY OF EMPIRICAL RESULTS

HYPOTHESIS				<i>Conclusion</i>
H1A	Formation of International Technology alliance	→ +	Shareholder Value for the Partnering Firm	Support
H1B	U.S. FIRMS COLLABORATING WITH JAPANESE FIRMS	→ -	Shareholder Value for the Partnering Firm	No Support (Significant, but positive relationship)
H2	Past Alliance Experience	→ +	Shareholder Value for the Partnering Firm	No Support
H3	Absorptive Capacity (Accumulated R&D Investments)	→ +	Shareholder Value for the Partnering Firm	No Support
H4	Technology Overlap between Partnering Firms	→ +	Shareholder Value for the Partnering Firm	Support

#### *Robustness of Tests*

There was a possibility that unobservable heterogeneity in firm-specific capabilities affected the firm value creation effects of international technology alliances. Hence, we ran a multiple regression with firm fixed effects and found that there were no differences in organizational capabilities across firms. We also ran similar multiple regressions with fixed effects of year, alliance mode and industry to test whether the firm valuation effects varied across years, three different alliance modes and high tech industries, respectively. No significant differences in stock market reactions to alliance announcements were found. The statistical results are available from the authors upon request.

#### **Discussion**

This paper sought to assess firm value changes of both U.S. and Japanese firms engaged in strategic alliances in the high tech industries. Past studies addressed potential dangers associated with forming partnerships with Japanese firms (e.g., Reich and Mankin, 1986). The potential, but untested concern for the Japanese firms' exploitive behavior in international alliances was echoed by one of U.S. managers involved in alliances with Japanese firms:

We established them [alliances] in their core business. They learned the business from us, mastered our process technology, enjoyed terrific margins at home, where we did not compete in parallel, and today challenge us outside of Japan (Hamel, 1991: 86).

As the first large-scale empirical study, this paper extends and challenges previous research in that it explicitly demonstrates substantial increases in market value of U.S. firms as opposed to the minor increases in Japanese firms' value. Also, this result conveys similar implications to those of the Hennart et al.'s (1999) study that examined changes in ownership structures of 58 U.S.-Japanese manufacturing alliances and reported no evidence of Japanese firms' exploitive behavior against the interests of their U.S. partners. Hennart et al's

conclusion is based on an assumption that Japanese firms tend to buy out their U.S. partner to cultivate new skills learned in their alliances. However, a direct linkage between Japanese firms' superior ability to capture the contribution of their partner and their decisions on alliance ownership status should be elicited cautiously, as the authors suggested. One possible explanation on this intriguing empirical result contrasting to past research (Hamel, 1991; Reich and Mankin, 1986) might lie in the difference in the alliance modes considered in past research and this study. Previous research focused solely on joint ventures, whereas this study considered non-equity interfirm cooperation. As Inkpen (2000) suggested, the explanatory power of any theory of alliances will be limited unless the theory explicitly considers various alliance forms (p. 778). It is obvious that the outcomes of equity joint ventures are quite different from those of non-equity contract-based alliances.

For further analyses to identify factors affecting firm value changes, this paper drew on the organizational learning perspective as the perspective emphasizes strategic value of an organization's learning capability and potential contribution to firm's long-term competitiveness. Inconsistent with learning effects suggested in previous studies (Anand and Khanna, 2000), alliance experiences did not contribute to significant increases in firm value through strategic alliances. However, the learning capability should be developed continuously and transformed into a strategic asset when firms need to institutionalize alliance experiences into organizational capabilities and leverage them for future alliances.

The negative relationship between individual firm's R&D investment and firm value creation for Japanese firms may be attributable to the nature of the alliances formed by U.S. and Japanese firms. Table 3 indicates that U.S. firms in the sample are smaller sized, R&D intensive firms relative to their Japanese partner. It is inferred that a primary motive for the Japanese firms resides in the absorption of new knowledge from their U.S. partner. Considering their relatively large firm size, they may already possess a minimally required absorptive capacity, and thus the stock markets may not view favorably the alliances where R&D intensive Japanese firms enter international technology alliances with U.S. firms because research intensive firms do not have reasons to establish cross-border interfirm collaboration, and in many cases, internal development process may be cheaper and easily protective of their proprietary knowledge. In addition, the present empirical analysis reveals that U.S. firms can be better off by assimilating their technology base with that of their Japanese counterpart. Investors tend to perceive that alliances involving two firms with similar knowledge backgrounds will generate the greater returns from the alliances.

## **Conclusion, Limitations and Future Research Directions**

This study has direct and practical relevance for U.S. firms planning for collaborative technology ventures with Japanese partners. First, firms must carefully weigh the soundness of their rationale for forming international technology alliances. Though firms that formed cross-border technology alliances, on average, were found to have increased their firm value, this does not imply that all firms equally benefit from alliances. Particularly, managers in relatively large size firms should be careful not to ride on a "bandwagon" of participating in technology alliances, seduced by the potential economic benefits presumably to be expected from interfirm cooperation. Many other factors may also affect the differentials of firm value creation through technology alliances in direct or indirect ways.

U.S. managers should recognize the contribution to firm value creation of their firm's technological overlap with their partner, because the similarity of technology base was favorably viewed by the stock markets. Managers should strive for continuous endeavors to assimilate their knowledge acquisition base with that of their partner when they attempt to increase their firm value by forming international technology alliances.

The first limitation of this study is that empirical findings about the value-creating role of international technology alliances are limited by a narrow view of value creation- the increase in shareholder wealth. Such increases reflect economic value only for the firms' shareholders, and need not be valuable to other organizational stakeholders. Indeed, the notion of firm value creation in this study is confined to the stock markets' (investors') expectations about the performance of international technology alliances. These expectations do not represent actual or realized economic performance outcomes for each participating firm. They are *ex ante* point estimates of the alliance performance when firms announce their alliance formations. Coupled with the fact that investors have a

limited information processing capacity in a short-time period (Madhavan and Prescott, 1995), the expected performance measure may have compounded the challenge of examining its relationship with the relevant explanatory variables proposed in this study.

The second limitation results from the problems of data collection for the variables used in this study. This study used archival sources of data to measure the firm valuation effects of international technology alliances. Due to the data availability of the dependent and independent variables, the sample firms were confined to public firms and large enough to be included in multiple databases. This problem was exacerbated by collecting data for Japanese firms because Japanese firms are not required to disclose accounting information and report major changes in their strategic activity as comprehensively as U.S. firms.

Lastly, the operationalization of some explanatory variables warrants further analyses. For instance, previous alliance experience on firm value creation was assumed to be linearly related to firm value creation. However, as inferred from the learning theory, there may be a minimum number of alliance experience at which alliance experience starts to take effective. On the other hand, there may be an upper limit on the number of effective alliance experience, beyond which additional alliance experience has an insignificant marginal effect.

Notwithstanding these limitations, this study is one of the first attempts that examined the possible detrimental effect of U.S firms' alliance activities with Japanese firms. This study helps to extend our perspective on how to maximize alliance payoff without losing long-term competitiveness. Arguments of past research relying on anecdotal evidence may not be as comprehensive and rigorous as those in this empirical study. In the future, continuous improvements in data availability for Japanese firms will produce more meaningful empirical results and facilitate a deeper understanding of the underlying dynamics in cross-border alliance management. Further developments of fine-grained measures of alliance performance and its contribution to parent firms will enhance the explanatory power of the model in this study. The relationship between firm value creation and international technology alliance formations will be delineated better with those new performance measures beyond the use of stock market reactions as a performance indicator. Considering the dynamic nature of strategic alliances, however, further investigations including field study or survey are warranted.

# **Japanese Multinationals and Theoretical Approaches to the Transfer of Organisational Practices**

*Jos Gamble, j.gamble@rhul.ac.uk  
Royal Holloway, University of London, United Kingdom*

## **Abstract**

The theoretical assumption has been made that, in comparison to firms in global industries, the overseas subsidiaries of firms in multidomestic industries will be more inclined to adapt their organisational practices to fit with host country environments. Based upon detailed case study research conducted at multinational retail firms in Japan and their subsidiaries in China, this paper suggests that the distinction between global industries and multidomestic industries is a poor predictor with respect to the transfer of organizational practices. Instead, key factors that have an impact upon transfer include the relative economic development of firms' parent country and the host country; the location of firms in the international division of labour; firm level perceptions of their source of competitive advantage; and the nature of local labour markets.

## **Introduction**

Extensive research has been undertaken on the transfer of organisational practices by multinational firms. An overt or implicit theoretical assumption in much of this literature is that the distinction between global industries and multidomestic sector industries has important consequences for the transfer of organisational practices (Rosenzweig and Nohria, 1994; Taylor et al., 1996; Ferner, 1997; Ghoshal and Bartlett, 1998; Edwards et al., 1999; Whitley, 2001). The usual expectation is that compared to firms in global industries the overseas subsidiaries of firms in multidomestic industries will be more inclined to adapt their organisational practices to fit with host country environments.

Few studies have sought explicitly to elucidate the extent to which industry sector is, indeed, a key variable. Some research does suggest that the overseas subsidiaries of firms in multidomestic industries do tend to adapt their organisational practices to fit with host country environments (Aaker, 1990; Beechler and Yang, 1994). However, this work is limited in extent and has also focussed solely on Western contexts. Through detailed study of multinationals in the under-studied retail sector, a major multidomestic industry, this paper assesses the importance of industry sector for the transfer of organizational practices.

The paper is organised in the following way. A literature review highlights contrasts that have been drawn between global industries and multidomestic industries. Attention then turns to the factors that might influence the transfer of organisational practices by Japanese retail sector multinationals. The empirical data is preceded by an explanation of the methodology. Case studies on the transfer of firms' organizational practices focus upon key elements of their HRM practices and their approach to customer service. The ensuing discussion and conclusion assess the theoretical implications of the case studies.

## **Literature review**

In the extensive transfer literature the theoretical assumption is made, either overtly or implicitly, that the distinction between global industries and multidomestic industries has important consequences for the transfer of organisational practices. This distinction, popularised by Porter (1990), has frequently been referred to in the general literature on multinational business and in the transfer literature in particular. Porter (1990) contrasts global industries, in which 'a firm's competitive position in one nation significantly affects (and is affected by) its position in other nations' (p.53), with multidomestic industries, in which 'competition takes place on a country-by-country basis' (p.53). Porter observes that multidomestic industries are usually owned locally and that foreign ownership, where it does

occur, 'will tend to be largely passive and involve only modest control from central headquarters' (p.54). Multinationals involved in such industries will 'have largely autonomous subsidiaries in each nation and manage them like a portfolio' (p.55). Examples of global industries are stated to include automobiles, television sets and semiconductors while multidomestic industries include life insurance and many types of retailing and consumer food products.

Ghoshal and Bartlett (1998, p.23-27) draw a similar distinction between multinational industries, in which responsiveness to local conditions is key, and global industries where scale economies are paramount and little account is taken of national differences. Similarly, Edwards et al. (1999) suggest that multinational firms are more likely to diffuse their HRM practices when there is a high degree of production integration across countries. In such instances, the headquarters will seek greater control over employment practices in subsidiaries, not least since stoppages in one place can affect others. Conversely, it is argued that firms which operate in the service sector are more likely to adapt to local HRM. In addition, Edwards et al. observe that, 'Significant differences in consumer tastes between countries limit the extent to which MNCs can integrate their activities internationally, and enhance the autonomy of national subsidiaries' (p.294-5).

There are good reasons to expect that the differences between global industries and multidomestic industries will have a significant upon their subsidiary firms' organizational practices. Service sector multinationals differ from their manufacturing counterparts in significant ways. First, their motivation to invest overseas is not impelled by a search for low-cost labour. Second, they are not located in an international division of labour, but operate as businesses that parallel those in the home country. In this sense, the overseas business and its workforce are not peripheral. Third, they deal directly with host country customers on a daily basis. Transferring parent country business practices in retail firms may, then, be more problematic than in the manufacturing sector since they must deal not only with local employees, but also the differing expectations and cultural values of customers. While staff are selectable, can be trained and subject to sanctions, customers are essentially 'unmanageable' (Gabriel and Lang, 2006). Whereas in global industries, subsidiary firms must meet the expectations of local employees, in multidomestic industries firms must also meet the normative expectations of and seek legitimacy among local customers. It could be anticipated that, as a consequence, isomorphic pressures on multinationals' subsidiaries to adhere to host country organizational practices will be substantially greater in this sector. It is also particularly important in such firms that the 'voice' of the customer is conveyed speedily and accurately to businesses' managers, so that they can react promptly to market trends and fluctuations. This might imply a greater reliance upon local employees rather than expatriates.

The importance of the distinction between global industries and multidomestic industries with respect to the transfer of organisational practices by multinational firms often appears to have acquired a taken-for-granted status. Few studies have sought explicitly to elucidate the extent to which industry sector is, indeed, a key variable that affects the nature and extent of transfer. Research that has been conducted has produced rather mixed results. In one of the few studies to contrast directly global and multidomestic firms, Beechler and Yang (1994) compare five Japanese manufacturing plants located in Tennessee with five Japanese service companies in New York City. They focus on the management practices that these firms transferred or adopted for use with an American workforce. In the manufacturing firms, a favourable local environment in terms of a loose labour market and supportive local government policies provided opportunities for the plants to develop Japanese-style HRM practices. In the service firms, by contrast, local labour market characteristics, industry features and economic conditions discouraged firms from transferring Japanese-style HRM. Consequently, in spite of wishing to do so, the firms were unable to implement their parent company practices overseas and forced to adapt to an American-style HRM system.

Beechler and Yang are careful to emphasise that a complex range of internal and external contingencies shape the HRM practices transferred to Japanese subsidiaries in the US. However, they feel confident to suggest that firms in global industries are more likely to implement Japanese style HRM practices in their subsidiaries than those in multidomestic industries. On the basis of a study of Japanese retail service affiliates in the US, Aaker (1990) reaches a similar conclusion: the application of Japanese methods is more difficult in the service sector than the manufacturing sector.

Where Aaker and Beechler and Yang both find significant differences between adaptation to local practice on the part of multidomestic industries compared to global industries, Rosenzweig and Nohria (1994) reach a

different conclusion. On the basis of a survey of HRM practices in 249 US affiliates of foreign based multinational firms, they conclude that the distinction between global or multidomestic industries revealed no obvious impact on affiliates' HRM practices. Instead, among firms in all industries, they report an 'overwhelming tendency of affiliate HRM practices to resemble local practices' (Rosenzweig and Nohria, 1994, p.244). However, they also report that whereas HRM practices and, to a lesser extent, marketing and manufacturing practices were strongly influenced by local isomorphism, other functions such as financial control adhered more closely to parent practices.

Studies focussed on Japanese manufacturing transplants indicate a mixed picture. In a study on Japanese automotive plants in the US, Florida and Kenney (1991) report that 'the automotive transplants have not tried to significantly alter or modify the core elements of Japanese work and production organisation to fit the US environment' (p.193). However, while these elements were transferred successfully, dimensions such as wage policies, personnel practices and union relations were most subject to modification. In two studies on Japanese manufacturing plants in China, Taylor (1999, 2001) reports considerable Japanese control over production issues but a localization of personnel management. He concludes that 'personnel management practices were generally not transferred from Japan to the plants in China' (2001, p.601).

Japanese retail firms operations in China are likely to face competing isomorphic pressures. As labour intensive multidomestic businesses oriented to local consumer markets, retail firms have an imperative to embed themselves in host countries and to meet the demands and expectations of both local workers and customers. The expectation might be that this would incline them to pursue host country organizational practices. The specific historical context in China might also encourage Japanese firms to adopt a low profile by adapting to local practices. Set against this, Japan is a major advanced economy and, typically, its firms are strongly embedded in their parent country. Additionally, in their overseas subsidiaries Japanese firms have been noted for their degree of central control and heavy reliance upon expatriates (Legewie, 2002). These are all factors likely to encourage Japanese multinationals to transfer their parent country organizational practices. The literature does, though, also indicate divergence in the extent to which different management functions are transferred as well as differences between specific elements of individual functions (Rosenzweig and Nohria, 1994). Within HRM, for instance, issues such as pay rates and industrial relations have been found to be under more pressure to match local norms than policies on management development or pay systems (Ferner et al., 2004).

## **Methodology**

The paper adopts a case study approach, primarily with qualitative data. This allowed exploration of a range of questions such as: To what extent do Japanese retailers attempt to transfer their home country practices to China? Which elements are most and least likely to be transferred? What factors facilitate or inhibit this transfer? This paper examines three matched pairs of Japanese multinationals retail firms in both Japan and China. By holding sector and firm constant, these aspects can largely be discounted in the analysis, thereby exposing not only cross-national but also intra-country and intra-sectoral divergences. A qualitative case study approach that includes three firms from the same industrial sector allows account to be taken of the agency of both firms and individuals within them. While national features are significant each firm has its own 'administrative heritage' (Ghoshal and Bartlett, 1998), a dimension Beechler and Yang (1994) found significant in their study.

In 2001, 2002 and 2003, research in Japan included study visits to stores owned by the three multinationals and interviews at their head offices. In China, during 2002, 2003, 2004, 2005 and 2006 research was undertaken at a total of six eight stores (JapCo1 – 4, JapCo2 – 1, JapCo3 – 3) in six different cities. A total of 146 semi-structured interviews were conducted in China with a cross section of local employees (120) and expatriate managers (26). In China, interviews with local employees were conducted on a one-to-one basis in Chinese. Reference is also made to a questionnaire based survey conducted at JapCo1 and JapCo2 stores in China and Japan, a JapCo3 store in China and a comparable state owned store.

## **Firms' China operations**

The MNC retailers all stated that their intention was to replicate their parent country operation, including store layout and procedures, employment relations and customer service. This approach was facilitated by operating on 'greenfield' sites with no established workforce and by the Japanese side of joint ventures having full operational control. The following aspects are characteristic or significant for the firms concerned and are explored in the Chinese context: expatriates' role, patriarchal management, selection and recruitment, lifetime employment and internal labour markets, pay systems and customer service.

### **Expatriates' Role**

The firms made greater use of expatriates than comparable European and American firms. They also relied upon a personalistic form of integration and coordination; communication with head offices in Japan, by phone, fax, e-mails and visits was intensive. Both these features are indicative of the influence of the national business system. Senior positions were held by Japanese staff including all store manager roles. At JapCo1, 10 to 15 Japanese employees were posted to manage the first China store, this compared with two at a UK-invested retail firm (Gamble, 2003b). Expatriate numbers have reduced gradually; the fourth and fifth stores each had just one expatriate, as store manager. Postings to China averaged three years, although some staff remained for up to seven years. Unlike JapCo3, where posting to China was treated as comparable to domestic job rotation, JapCo1 sought volunteers for transfer. JapCo2 adopted a rather different approach to expatriation; there were fewer senior expatriates, instead five young Japanese trainees were assigned to the store.

### **Patriarchal Management**

A dimension not replicated in China was the firms' male dominated nature in Japan. In China, for instance, over 50 percent of JapCo1's supervisors were female compared to just 5 percent in Japan. The firm's China operations president recalled that initially men had been selected mainly for this post, but that female staff had 'done the job better'. Similarly, while most of JapCo2's managers in Japan were male, in China over half were female. In Japan, the norm is for women to leave full time employment once they marry or have their first child, a practice supported by the tax system. In China, full-time employment for women has been promoted since the early days of the People's Republic and is supported by widespread provision of nurseries.

### **Selection and Recruitment**

JapCo3 attempted to replicate its parent country graduate recruitment scheme. When one store opened in 1993, a cadre of university graduates was recruited as middle managers with the intention to groom them to become senior managers. By 2002, however, they had all left the firm. Similarly, in 1999, the firm scoured local universities for potential recruits and selected sixteen recruits. Each recruit received twelve days' initial training, before spending one month on each of the store's five floors, with one week in each section of each dept. By 2003, just two of these recruits remained. A personal manager at JapCo1 recounted a similar situation at her store: 'in the past we've selected some good people with a university background, but they've gone to Wal-Mart.' An expatriate at JapCo3 described job-hopping as 'the biggest difference between China and Japan'.

### **Lifetime Employment and Internal Labour Markets**

A concomitant of China's economic transition has been a rise of job insecurity and many workers interviewed in this study cited security of employment as a motive to seek employment at their firms. Although none transferred lifetime employment as such, the MNCs stressed that they offered secure employment and wished to retain staff on a long-term basis. In the survey, workers were asked to what extent they agreed with the statement, 'I feel secure in my job at this company', with responses on a five point scale from 'not secure at all', to 'very secure'. The results indicate that workers felt greater employment security at the Japanese firms than at both a comparable state owned enterprise and parent company stores. Promotion at the Japanese subsidiaries was slower than in a comparable UK-invested retail firm in China (Gamble, 2003b), but faster than in Japan itself. The multinationals' stress upon internal labour markets parallels their parent country practice, but appears to contrast with emerging patterns in China (Ding and Akhtar, 2001).

### **Pay Systems**

In China, the firms stressed monetary incentives and sanctions more than they did in Japan. At JapCo2 in Japan, for instance, cashiers' salary was fixed, but in China extra payments were made for number of customers served and accuracy, with employees expected to personally make good any shortfall. In China, JapCo3 paid a bonus dependent on sales; it did not pay such a bonus in Japan. These differentials accord with emergent practice in China. Pay systems in China have shifted from previous egalitarian norms, with a trend to introduce performance related pay. This tendency also mirrors trends in Japan, although its more widespread use in China might be linked to the comparative weakness of trade unions. This may be an instance where firms introduced policies in China they might wish to implement more extensively in Japan, but were constrained from doing. In a particularly interesting measure JapCo2 introduced seniority pay in China, just as the firm curtailed such payments in Japan itself. In theory, a customer assistant, who began on 1,000 yuan pcm, could overtake a deputy supervisor's starting pay (1,900 yuan), while a deputy supervisor could overtake a supervisor's pay (2,800 yuan). The intention was to limit labour turnover and help retain staff. By contrast JapCo1, which retains seniority pay in Japan, paid Chinese employees only a negligible amount for each additional year of employment.

### **Customer Service**

The multinationals all sought to implement their parent country style customer service in their Chinese subsidiaries; they considered this a key source of differentiation from competitors. JapCo1's chief executive in China described 'politeness to customers' (*daike de limao*) as essential to attract and retain customers. Despite high customer volumes, employees were expected to bow and welcome each one. According to a JapCo1 checkout assistant, previously employed at a state owned store 'at the state store we didn't emphasise customer service, here it's what we stress most. Here customer service is number one. People there were lazy, we often ignored customers'.

The multinationals' approach to customer service interactions was prescriptive and detailed and formed a central element in training (see also Gamble, 2006a, 2006b). The firms all introduced Japanese style greeting and farewell ceremonies for the day's first and last customers. Customers' initial reactions had been similar at the different locations. At JapCo3 a floor manager recalled that initially customers considered this aspect of customer service 'strange', with some so embarrassed that they took the lift directly to the sixth floor to avoid it. A sales manager added, 'we were the first store in [...] to bow and say "*huanying guanglin*" (welcome to the store). Then, the customers were a bit afraid.' This form of customer service was provided even though customers were, initially, rather startled by it and despite the fact that its performance could provoke latent anti-Japanese sentiment.

Strict discipline and careful training were integral features that enabled the transfer of Japanese style customer service. The firms codified and stipulated the behaviour required in detailed training manuals and employee handbooks, with fines imposed for transgressions. This is a significant departure in China where, before the reform era, discipline in state owned enterprises was often lax and 'written organisational rules were rarely part of the work environment' (Guthrie, 1999, p.45). JapCo1's employee handbook contained approximately three times more rules than that used in Japan. JapCo3's deputy GM explained:

'We give workers a manual, the same as at MacDonald's. Without a manual it would be a big mess. New employees can see the manual and know what to do. So in China work 'know-how' is in the manual. In Japan, work 'know-how' is in people, not the manual.' The attempt, then, was to disembodify and codify knowledge that was largely tacit in Japan and to re-materialise it in the Chinese context. This transfer was especially problematic since it involved not only business practices, but also ways of being and behaving; the intention was to inculcate a 'Japanese' approach to work among/in Chinese employees.

Despite its unpromising early reception, the imported approach to customer service rapidly achieved legitimacy in China's retail market. The JapCo3 sales manager quoted above who remarked on customers being 'a bit afraid', observed that 'now they expect this customer service and enjoy it.' JapCo3's employees knew that surrounding stores were now attempting to copy their form of customer service and proud they could not match them. Employees' performance of this imported form of customer service appeared to go beyond 'ceremonial adoption' (Kostova and Roth, 2002). Employees' displayed pride in providing high quality service, even if the activity itself could be a source of exhaustion and, on occasion, provoke abuse.

## Discussion

Even though the Japanese subsidiaries analysed in this paper operate in a multidomestic industry, contrary to expectations, in significant respects they do not follow host country practice. Conversely, while the research indicates some country of origin effects, there is also evidence of adaptation in these new contexts. The multinationals' practices comprised a collage of strategic, tactical and reactive elements. Some features matched current trends in the host country, such as the introduction of performance related pay. Although the same trend was evident in Japan itself, the absence of a constraining union voice probably permitted its more rapid and thoroughgoing adoption in the Chinese subsidiaries. In some cases firms faced coercive isomorphic pressures, such as statutory limits on the working hours of part time staff. Occasionally the transfer process was analogous to the photocopying of a copy. This was evident in the way firms transferred a diluted commitment to long-term employment. In China, this feature meshed with recent historical practice, but is contrary to emergent norms. Firms also engaged in practices that were relatively novel for them, such as the extensive promotion of female employees to management positions. This was not a conscious strategy on firms' part but, rather, followed local labour market and social norms. Although reactive, it was also an approach that some of the firms, at least, considered desirable in Japan.

Some transferred practices were innovative in the Chinese context, such as the Japanese style approach to customer service. There were rather unsuccessful attempts to replicate Japan's internal labour markets based upon the recruitment of graduates for lifetime employment. In one instance, a firm reverted to previous practice in Japan, with the introduction of seniority pay. It has sometimes been regarded as evidence of the difficulties involved in transferring HRM practices that Japanese firms rarely transfer their seniority pay systems to overseas subsidiaries (Gill and Wong, 1998). This overlooks the fact that within Japan itself many enterprises consider seniority pay outmoded. JapCo2's introduction of seniority pay in China, despite forestalling the practice in Japan, needs to be understood in the context of the specific regional labour market. It indicates the extent to which 'Japanese' HRM practices do not stem simply from traditional social values, but were rational responses to labour market conditions at a certain stage of Japan's capitalist development and as such are amenable to transfer given analogous contexts elsewhere (Florida and Kenney, 1991). Additionally, this adoption indicates the way in which, in their overseas operations, firms can select from a repertoire of employment policies and practices that have proved themselves in the parent country.

The findings demonstrate the necessity to take account of actors' agency (Lane, 2001; Morgan, 2001). Setting up in a new location can offer firms and individuals within them space to experiment with innovative modes of operating. Posting to China presented Japanese managers with greater latitude than in their home country roles, where hierarchies were dense and multi-layered. Some expatriates relished this increased responsibility and autonomy. At JapCo3, for instance, one store manager grasped the opportunity provided by this greater creative space to design and implement a series of monthly 'campaigns' to improve customer service. The company's introduction of red and yellow cards was another instance of such agency.

The findings indicate that whereas it is possible to transfer culturally innovative practices any that run counter to institutional features, such as the nature of local labour markets, are much harder to implement. Thus firms were able to transfer a culturally influenced practice such as Japanese style customer service; even though bowing in particular was antithetical to local norms and its performance could arouse latent resentment against Japan. It was also a practice staff found stressful and exhausting. By contrast, an uncontroversial practice, JapCo3's hiring of graduates to train as a new management cadre, flourished on China's different institutional soil.

When seeking to assess the importance of any one variable in the transfer of organizational practices, a major difficulty is that, inevitably, a range of variables is involved. These can also interact in differing ways in each context, with each dimension of organizational practice likely to be differentially affected (Rosenzweig and Nohria, 1994). The specific concatenation of variables in any given environment will differ and produce diverse outcomes, organisational forms that neither replicate those in the parent country nor mimic those in the host. This underscores the necessity to trace and analyse each practice separately, rather than as a discrete whole (Lu and Björkman, 1997).

Accordingly, the remainder of this discussion focuses upon and traces the factors that underlay two specific dimensions: the role of expatriates and the transfer of Japanese style customer service.

The findings in this paper contrast, sometimes in unexpected ways, with those in recent studies on Japanese manufacturing firms in China. Taylor (1999) concludes that Japanese manufacturing plants in China did not rely upon expatriates to ensure the transfer of Japanese management style. By contrast, the retail multinationals depended on expatriates to facilitate the transfer of specific ownership advantages abroad, although as in Taylor's study, HR departments were headed by local employees. The retailers also appeared at least as committed to transfer their parent country practices as the manufacturing firms. Indeed, with respect to HRM, the retailers' commitment appeared notably stronger. In many respects, both sets of findings contradict and are the inverse of what might be anticipated given predictions made about global and multidomestic industries.

Generally, Japanese firms have been noted for their degree of central control and reliance upon expatriates. The persistence of this feature at the retailers suggests that the national business system norm outweighs the predicted pattern for the multidomestic industry sector. The apparent divergence from this pattern in Taylor's (2001) study might be due to the different investment motives of the firms concerned. He makes it clear that the manufacturers' primary objective for setting up operations in China was to take advantage of lower labour costs, whereas the retailers' motive was domestic marketing seeking. Thus while the Chinese location was incidental for the manufacturers, it was critical and of central importance to the retailers. An international division of labour perspective, which conceives of HRM practices as likely to be influenced by firms' relative position in this division (Wilkinson et al., 2001), is helpful to explicate these findings. From this approach, the manufacturing plants can be construed as peripheral, while the retail subsidiaries are core interests that parallel parent company investments and in which, accordingly, attention to and investment in human potential are more important.

Extensive expatriate use is consistent with the nature of the Japanese business system. In the case of these retail multinationals, this parent country effect influences the pace and scale of expansion. A long term perspective is consistent with the business model of 'patient capital' in Japan. The aim to inculcate in Chinese staff a 'Japanese' approach is equally redolent of long termism. There was, though, evidence of differences based upon firms' particular administrative heritage. JapCo2's rather different approach to expatriate use might stem from the firm's parent country organisational history. Where JapCo1 and JapCo3 both developed through gradual endogenous growth, JapCo2 has grown rapidly through acquisitions. This divergence underscores the necessity to delineate and trace actual firms' experience and administrative heritage in their home country. It also illustrates the way in which specific patterns of rivalry at home have an impact on the prospects for international success (Porter 1990, p.107). Such firm level differences cut across both the formulations of national business systems as well as the multidomestic-global business dichotomy.

The three MNCs introduced Japanese style customer service even though aspects involved, frequent bowing in particular, were contrary to local norms. This introduction needs to be assessed both from the perspective of firms' motivation and its reception in the host country. Two main interrelated factors account for the motivation to transfer this approach. Firstly, it formed part of the multinationals' stock of knowledge, their 'administrative heritage'; it was a tried and trusted recipe for conducting business and a taken-for-granted 'default' mode of operating. Secondly, the firms considered that provision of this customer service would constitute a source of competitive advantage in the Chinese marketplace. This is analogous to the Japanese manufacturing firms in the US described by Beechler and Yang, where top management displayed a strong commitment to product quality and zero defects and considered their transfer 'both possible and advantageous in reaching organizational objectives' (1994, p.475).

The successful transfer of Japanese style customer service to overseas subsidiaries outlined in this paper contrasts markedly with the situation described by Aaker (1990) and Beechler and Yang (1994) at Japanese service sector affiliates in America. Given that industry sector does not appear to play a major role in inhibiting the transfer of organizational practices to China, it is necessary to determine the salient differences between the US and Chinese contexts. It can be argued that two aspects are particularly relevant: the relative economic status and institutional structures of the countries involved and the nature of local labour markets.

In the Chinese context, the imported style of customer service was relatively novel. It was perceived as superior to prevailing domestic practices and thus to possess competitive advantage. Workers' adoption of this new

approach was facilitated by their perception that it constituted a level of customer service superior to that of competitors. Again, this parallels Japanese automotive transplants effective implantation of Japanese production organization in the US. A key factor which facilitated this is the fact that 'the 'Japanese model' has emerged as an international best-practice standard for manufacturing work and production organization' (Florida and Kenney, 1991, p.193). The imported practice also meshed with broader changes in China's retail economy that have transformed it from a sellers' market characterised by lack of choice and shortages, to a buyers' market with oversupply of many products and fierce competition between retailers.

The findings lend some support to Whitley's (1999, 2001) argument that the relative nature and degree of organisation in parent and host environments will affect the extent of transfer of firms' parent country practices. On this basis, host country influence on Japanese firms in the less developed and cohesive Chinese context is likely to be relatively weak. This insight is helpful to explain why Japanese service sector firms' affiliates in the US adapted their HRM orientation to host country norms, while those in China made fewer adaptations. National institutional differences appear to outweigh industry sector differences in the context of multinationals' investments in developing economies.

While valuable, this approach diverts attention from the crucial importance of labour markets. In both the US studies and this study, local labour markets played a critical role in shaping firms' ability to transfer practices. As in other contexts (e.g. Florida and Kenney 1991), a key factor which enabled the Japanese firms to transplant successfully their approach to customer service was the ability to carefully select workers amenable to Japanese practice. Although Beechler and Yang's (1994) study contrasts manufacturing and service sector firms, the contrast is also one between subsidiaries in very different parts of America whose labour markets differed substantially. As they observe, host country local labour market conditions can constrain the degree to which a multinational can transfer its HRM practices. In Japan, labour markets are relatively underdeveloped, but in major metropolitan areas of America labour is highly mobile. By contrast, turnover rates in Tennessee were low, making it feasible for the Japanese manufacturing companies to develop Japanese-style HRM practices such as careful selection and on-the-job training. In many Chinese locations, as in the firms in New York, high levels of employee turnover could preclude the transfer of Japanese-style HRM to subsidiaries.

The successful dissemination of Japanese style customer service outlined in this paper was underpinned by a range of HRM practices including selection and recruitment of those with customer-orientated values, training and socialisation, disciplinary measures, surveillance and incentive strategies. A critical enabling feature that underpinned these dimensions was the availability of an abundant labour supply. As with Japanese manufacturing plants in America (Florida and Kenney, 1991; Beechler and Yang, 1994), the potential to effectively implant Japanese methods relied heavily upon the ability to carefully select workers. Labour costs are an additional dimension. Aaker (1990, p.59) points out that Japan's service sector is highly labour intensive, with high levels of service obtained in part by using more people. This factor militates against the transfer of Japanese style customer service to the US with its high labour costs. In China, by contrast, labour costs are low and this allowed the firms to maintain relatively high staffing levels.

Finally, Rosenzweig and Nohria (1994) suggest that affiliates might increasingly come to resemble the local environment. The findings in this paper demonstrate that the local environment might also come to resemble the affiliate. This was evident with respect to customer service, as local firms sought to mimic the practices that appeared to lay behind Japanese firms' success in the marketplace. Kostova and Roth (2002) remark that foreign multinationals subsidiaries are not necessarily expected to be completely isomorphic with other local organisations. Indeed, in the Chinese context, this would defeat the state's objectives; foreign investment has been encouraged, in part at least, to introduce role models for local firms and to encourage them to upgrade. At subsidiary stores in second tier cities in particular, the firms linked themselves closely with China's modernisation project. A JapCo3 store manager described the local city as a one of the firm's stakeholders and the intention for his store to be 'a role model of a modern retailer'.

As with Japanese manufacturing firms' overseas transplants (Munday et al., 1995), the presence of foreign retailers provided 'demonstration effects' and spurred local stores to upgrade. This process is facilitated by the fact that as working environments, unlike most factories, retailers are peculiarly open to scrutiny by both customers and competitors and their practices and procedures readily observed and copied. As outlined above, evidence of mimetic

isomorphism was particularly obvious as local firms sought to model their approach to customers on the practices that appeared central to the Japanese retailers' success. Competitor firms regularly despatched employees to monitor their procedures and retail offer and also absorbed skills developed in the multinationals through recruitment of their employees. Both local employees and expatriate managers remarked upon domestic competitors' improved customer service. At JapCo1, a senior expatriate recalled that when his firm's first store opened in 1997 it easily provided the best customer service in the city, but now had to struggle to retain this status. Indeed, the context has changed so rapidly that, in 2006, interviewees at JapCo3's latest store, opened in a second tier city the previous year, described how some local firms had so successfully upgraded their customer service that they faced a challenge to catch up with these competitors.

## **Conclusion**

In marked contrast to theoretical predictions that multidomestic firms are more likely to adopt host country practices while global firms pursue a standardised global approach, this study has indicated a more complex pattern. The Japanese multidomestic retail firms in China appeared at least as inclined as their manufacturing counterparts to transfer their parent country management approach. . The argument has been made that this reflects differences in the firms' relative place in an international division of labour. In addition, business sector does seem important but in a different sense to the predictions made. For manufacturing firms, and especially those that are considered peripheral, the central focus is upon cost control. For service sector firms meanwhile, employees' interactions with customers are crucial to their business and their successful handling likely to be perceived as a core competence to be nurtured and developed, with according attention to and investment in HRM.

### **Abstract**

This paper provides some evidence on communication style that serves as the contact tool and its related external economies to knowledge-intensive production and innovation within the emerging high-technology based industrial clusters in metropolitan areas of China and Korea. Our unique data-set from questionnaire survey enables us to examine the firms' behavior of communication regarding the choice of communication mode, how often, with whom, and for what purpose. Such analysis provides insights about actual relationships among business partners of industry-academia-government in each cluster of Zhongguancun Area (Beijing), Seoul Digital Complex and Daedeok Valley (Daejeon). Our studies demonstrate that 1) with suppliers firms contact with high frequency but with less face-to-face meeting opportunities, 2) with customers and banks/investors but more with face-to-face contact, as common characteristic, 3) and that firms' long-term experience in the market is helpful to construct such meaningful communication network in Seoul Digital Complex.

### **Introduction**

This paper tries to provide some evidence on communication style that serves as the contact tool and its related external economies to knowledge-intensive production and innovation within the emerging high-tech industrial clusters in metropolitan areas in Korea and China. After decades-long extraordinary export-led growth, Korea has found its place as an exporter of technology intensive goods in the world comparative advantage ladder. At the same time, it became one of major policy goals in the post- 1997 economic crisis structural reform to foster non-conglomerate, high-technology, small and medium business, which are more agile, flexible, and entrepreneurial. China, in turn, has shown remarkable economic development taking full advantage of labor intensive manufacturing exports driven by foreign direct investment. As long-term strategy, however, the need for strengthening "own technology" based progress is recognized.

Observing the location pattern of such new business, it is notable that firms are being created in large metropolitan areas. If we recall that assembling factories had sprawled out toward the countryside searching for cheaper labor, this is a new trend. The locational advantages of urban centers can be considered as the following: the existence of larger market for new technology products both for selling own products and purchasing inputs; availability of highly educated workforce; and access to the scientific knowledge created in best universities. Of course, such advantages of market, talent, and knowledge are, in principle, accessible from other areas, by paying more transport cost. Suppose, however, there is "bonus" information attached to these transactions, including some hints about the products of the next generation, introduction to friends of friends, and rumors about unpublished research results. They are naturally very important in an industry where technology standard change with rapidly. Then, assume the quality of such information tend to decay quite badly distance, number of intermediary people, and time. Given such conditions, it is natural for firms to want to be located in metropolitan centers which enable face-to-face communication with key persons. For example, some businessmen of the telecommunication equipment sector in Beijing replied to our interview: "It's only in Beijing that we can meet informally with high-rank officials and university scientists. All the technological standard of the next generation is decided here. We try to take any information which might help us to determine our firm's strategy." Then, a certain type of tacit knowledge like this information would lead many firms to gather in a specific region like Beijing. This is exactly like "bonus" from

information.

Following the recent studies such as Charlot and Duanton (2004, 2005) and Arita, Fujita and Kameyama (2005), our analysis uses the unique data-set obtained from questionnaire survey. Our data-set was collected in Zhongguancun Area (Beijing), Seoul Digital Complex and Daedeok Valley (Daejeon) about firms' behavior of communication: how often, with whom, and for what purpose. It intends to identify what kind of communication externalities can explain the formation of the successful IT clusters in China and Korea. This data-set allows us to examine the existence of actual interaction at firm level and to study the actual effects of communication externalities. In the survey, we put special focus on information technology related firms. Part of this is attributable to the modern telecommunication technology, the Internet in particular, which reduced substantially the necessity of face-to-face communication in knowledge-creating activities. The emergence of IT industry clusters in developing countries such as Zhongguancun, Bangalore (India), Penang (Malaysia), and Singapore have grown on the basis of vertical integration (subcontracting and outsourcing) with the US firms, especially of Silicon Valley. The cost-advantage-seeking objective of the spread of IT industry is rather straightforward. Still, it is interesting to note that the spread has occurred only to a few limited numbers of places in the world where local agglomeration economies are in motion. Like the US IT clusters, in Zhongguancun and Bangalore local government, universities and research institutes played a pivotal role in providing technological environment to create information about technology and human resource network. Thus, while direct access to the most advanced innovation center was essential to explain the spread of IT industry toward developing countries, the intensity of local communication should have high explanatory power to answer the question where such industry have landed.

## **Theoretical Background**

It is widely accepted by economists that firms benefit from knowledge spillover which gives rise to aggregate increasing returns to scale due to non-excludability and non-rivalry of knowledge. Provided that the benefit of knowledge spillover is sensitive to distance, especially when the knowledge is tacit in nature, it can be seen as a source of agglomeration economies. Yet, the stylized models of new economic geography (Fujita, Krugman and Venables, 1999) have deliberately avoided incorporation of knowledge spillover because knowledge flows "are invisible; they leave no paper trail by which they may be measured and tracked, and there is nothing to prevent the theorist from assuming anything about them that she likes (Krugman, 1991, p.53)." It is recognized as a challenge for anybody seeking any relevant spatial economic model of knowledge spillover to be able to address: "not only that knowledge spills over but also why those spillovers decay as they move across geographic space (Audretsch and Feldman, 2004)."

In this regard, a pioneer study by Jaffe, Trajtenberg and Henderson (1993) considered patent citations as a visible paper trail of knowledge flows and found that patent citation is 5 to 10 times more likely to occur within the same city suggesting the effect of distance. Recently, the literature such as Audretsch and Feldman (1996) and Varga (1998) investigated the geography of innovation focusing on the role of university and R&D institutions. Audretsch and Feldman (1996) found evidence that even after controlling the degree of geographical concentration of production, knowledge created by university research results in greater innovation in firms. The results of their estimation also suggest that the propensity of innovative activities to cluster is more attributable to knowledge spillovers than mere locational advantage in production. Varga (1998) identified that channels of the university knowledge transfer are: R&D cooperation between academia and industry; university seminars; scholarly journal publications; faculty consulting; industrial associates programs; industrial parks; spin-offs (faculty and students); technology licensing; the local labor market of scientists and engineers; and local professional associations of scientists.

However, as Fujita and Thisse (2001) correctly observed, existing knowledge spillover model has the weakness of leaving vague the sources of external economies, and the underlying mechanism of the local interaction is not clearly defined. Those previous studies have not considered explicitly what kind of interaction of firms and people can generate the externalities of communication and technological exchange. They usually assume that the increase in the number of locally participating agents may increase interaction, keeping the actual interaction in the

black box. Although there are excellent descriptive works such as Saxenian (1994), considerable work of theoretical nature remains to be done incorporating geographical proximity and innovation. One promising direction was shown by Aydogan and Lyon (2004). Their paper argues that technological complementarities will increase the benefit of cooperation in R&D. Exchange of ideas can be done conveniently at a central place meeting such as academic congress but the fear of being cheated, by someone who just attend the meeting without contributing with his own idea, makes bilateral traveling preferable. In such a case, agglomeration of technologically complementary firms will be beneficial in order to save on traveling cost.

The empirical studies in this vein should face the difficulty of lack of data and ambiguous concepts of measurement of “innovation”, “knowledge”, and “proximity”. As done by Jaffe, Trajtenberg and Henderson (1993), it is common to consider that output of innovation is represented by patent, which is also convenient because patent data is relatively easily accessible. Yet patent may not be perfectly good proxy of innovation, because all innovative output are not necessarily patented, and all patent will not lead to innovation. Alternatively, Charlot and Duranton (2004) prefer to measure the effect of communication externalities by earned wage, while Anselin, Varga, and Acs (2000) use the U.S. small Business Administration Innovation Database (BAID), which measures innovation by the number of new product announcements in trade and technical journals. In turn, knowledge is treated as a sort of firm capital stock to produce innovation. Its measurement is also a subject of debate in constructing a meaningful index synthesizing R&D investment, employment of knowledgeable talent and evaluation of stock reflecting a depreciation of the past accumulation. Regarding the proximity, we should take into account the concept of distance, traveling time, and the use of telecommunication (because face-to-face communication and telecommunication is sometimes complementary with each other, rather than substitute).

Since almost all of the previous studies use census data to investigate the evidence of external economies without taking actual relationships among firms and/or industries, we can hardly expect that any usable data-set is readily available. In general, when we measure the effects of spillovers or externalities from industrial agglomeration we assume implicitly existence of spillovers or externalities even if an actual interaction exists or it doesn't exist. For this reason, it is unavoidable to conduct questionnaire sample survey to investigate actual relationships about firms' behavior of communication: how often, with whom, and for what purpose. In fact, recent studies such as Charlot and Duanton (2004, 2005) and Arita, Fujita and Kameyama (2006) have examined the effects of communication externalities using questionnaire survey after specifying the existence of actual interaction.

### **The Development of Industrial Clusters in Metropolitan Areas; Beijing, Seoul and Daejeon Zhongguancun Science Park (ZSP)**

The city of Beijing has increased its layers of urban area as the outer loop turnpikes were constructed further from the city center for rapidly increasing through traffic. While the 3<sup>rd</sup> Ring Road completed in 1994 has 48 km total length, the newest 6<sup>th</sup> Ring Road finished ten years later has 130 km. The core area of ZSP, the “Silicon Valley of China”, occupies the layers between 3<sup>rd</sup> and 5<sup>th</sup> Ring in the city's northwest corner Haidian-qu (district). This area was largely agricultural until early 1980s but already included most prestigious Chinese universities such as Tsinghua University and Peking University as well as the Chinese Academy of Science (CAS), which actually is a conglomerate of 99 research institutes across China, among which 37 are located in Beijing (see Figure 1).

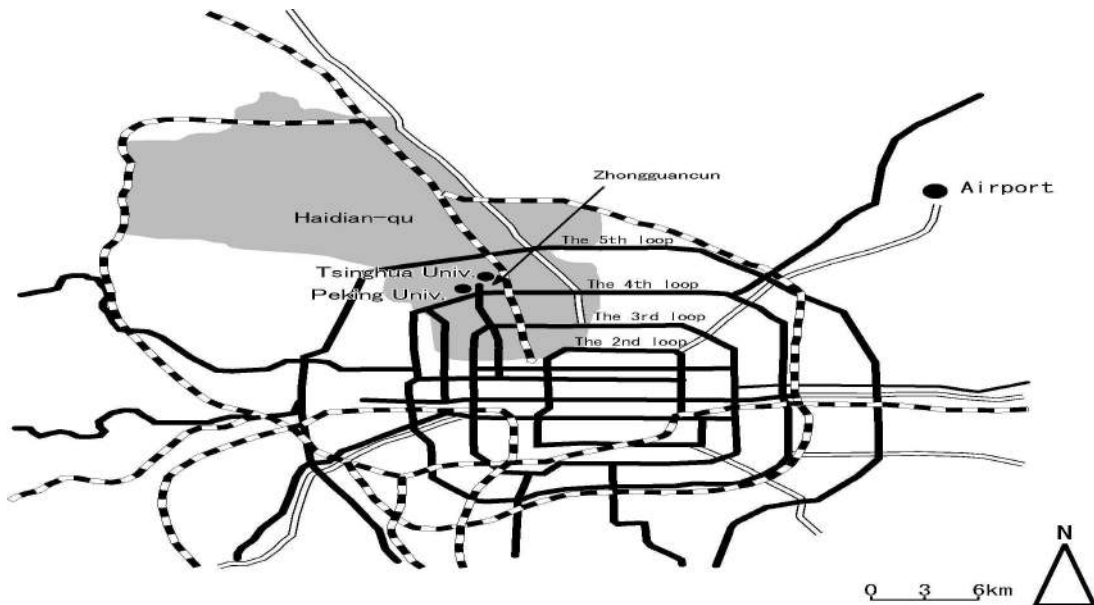

FIG 1: MAP OF BEIJING

In the 1980s, Zhongguancun came to be known as an “electronics street” appreciated by shoppers who seek cheap clone computers and parts. Various authors reported that about 40 companies were already established by 1984. Many of them were spin-offs of engineers from academic institutions in the area. Some of these early startups later grew into big business groups such as Lenovo (established in 1984) and Stone (established in 1984) from the CAS, Founder (established in 1986) from Peking University, Tsinghua Unisplendour (established in 1988) from Tsinghua University. The first systematic survey of ZSP conducted in 1987 identified 400 high-tech firms. Since late 1980s when the first experimental science park was setup, thousands of firms mushroomed through application of scientific outcomes originating in these academic institutions into business. Encouraged by strong potential of growth, Beijing Municipal Government established Beijing Experimental Zone for New Technology Industries in the Haidian district and issued Beijing Municipal Government Temporal Rule. Among other benefits are: (1) Income tax reduction to 10-15%, depending on the company’s export performance; (2) preferential tariff rate on imported materials and machineries; (3) finance from the city’s Technology Innovation Fund; (4) university professors and research institute scientists were allowed to have part time job; (5) eligible workers were granted the resident card of Beijing. National government also joined force by constructing the first incubator system, Shangdi Information Industry Base, to the north of the Haidian district in 1991, followed by science parks in Fengtai and Changpin in 1992, the Oversea Students Pioneer Park in 1997. These industrial parks were integrated into a single entity Zhongguancun Science Park in 1999.

Today, ZSP has expanded to other districts such as Fengtai, Changping, the Electronic City Zone and Yizhuang (a part of the Beijing Economic and Technological Development Zone), Desheng, and Jianxiang. The planned area amounts to almost 400 square kilometers which covers about 2% of the gross area of Beijing. Those 58 universities in the area educate 36% of the graduate students of the entire nation. The number of employees doubled in each three consecutive years of 1991-93 (<http://www.ZSP.gov.cn>). There was a period of relatively slow growth until 1998; the growth accelerated afterwards. Recall that ZSP geographically expanded during 1991-93 by the construction of several science and technology industrial parks, especially by the creation of Shangdi Information Industry Base in which the incubator system was inaugurated. Oversea Students Pioneer Park was created in 1997 which helped spurring of returning students’ opening of businesses. Multinational enterprises started to establish their R&D in ZSP by 1997-98 which also partly explains the later high growth of ZSP. Although the total number of firms in ZSP is not reported since 2000, it is largely believed that it has already reached to 7000. ZSP became highly

specialized in electronics and information technology. According to accessible data (C-Press, 2002), 915 out of 1582 surveyed Chinese-owned firms and 250 out of 392 foreign firms in ZSP are related to IT. The industry related to this technological field in China was a sellers' market, because of the large population and the market protection with quite limited number of suppliers. Beijing offered ideal locational advantage. There was a huge demand for informatization in the government sector. Because Beijing is the center of all kinds of political decision, information regarding the next generation technological standard is always in the air. The accessibility to the central government was crucial in the rapidly progressing industry. Yan (2004) explains that the early success of ZSP enterprises owed little to either their managing capability or technological strength but it was largely due to early comer's benefit which allowed nearly monopolizing the market. Zhou and Xin (2003) echoes that the success of Legend (i.e. Lenovo) can be credited to its market strategies of massive distribution and service networks across China. In fact, Zhou and Xin (2003) illustrated that the largest proportion of firms in ZSP is engaged in software and system integration. Manufacturing is also quite active in computer, IC chips, and telecommunication equipment. ZSP firms are predominantly small in size. More than 60 percent of firms have less than 20 employees. Firms with employment greater than 500 represent less than 1% of total but they are quite big with 1659 employment on average. Average size of software firms is relatively small.

In the Chinese context, it is peculiar that universities remain as the large shareholder of spin-off enterprises. This is because universities' objective is to utilize the profit to finance the operation cost. The annual turnover of the Founder group of the Beijing University, the largest of the university-owned enterprises in China, amounted to 22 billion yuan (US\$ 2.8 billion) in 2003 and covered more than 10% of the university annual budget (Waseda Business School Review, 2005). Tsinghua University established Tsinghua Holdings in 2003 which controls 39 enterprises and has minority stakes in several others. The annual turnover of the group amounts to 15 billion yuan (US\$ 1.8 billion). The presence of multinational enterprises is increasing in ZSP. It is no mystery why many multinational firms are also attracted to ZSP to establish R&D facilities. Such firms include IBM, Sun, Nokia, Matsushita, Fujitsu, Microsoft, P&G, Novo Nordisk, Lucent, Nortel, Motorola, Intel, HP, GE, Oracle, and Symantec. The multinational research-intensive R&D units tend to locate in Beijing mainly because of the academic infrastructure and quicker access to information from standard-setting and decision-shaping government bodies (von Zedtwitz, 2004).

#### **Seoul Digital Industrial Complex**

It is worth remembering that Korean IT related venture companies first mushroomed in southeastern part of Seoul, especially in the area around Teheran Street of Gangnam-gu (district) which came to be known as Teheran Valley as a symbol of the new industrialization in Seoul (Shin and Byeon, 2001). It is said that the Teheran Valley was a self-organized organic creature gathering skilled workers who lost their jobs in conglomerate business groups (chaebols) during the financial crisis of 1997. This even led to the phenomena of KOSDAQ market IT venture capital boom. The area also started to offer wide varieties of restaurants and shopping amenities. Such unorganized growth, however, provoked congestions and office rental price hike in recent years.

Seoul Digital Industrial Complex and Daedeok Valley emerged as alternative for companies seeking lower cost location and for new startups seeking government support program. The Seoul Digital Industrial Complex is located at the southwestern part of Seoul Metropolitan City, Guro-gu (district). It was planned as the revitalization of the Guro Industrial Complex which, since the 1960s, had been regarded as the national symbol of Korea's export industry specializing in traditional manufacturing such as textile and apparel. Having lost its competitiveness to countries with cheaper-labor cost, the area was reformed into high rise buildings by a government body Korea Industrial Complex Corporation (KICOX) to accommodate high technology based venture companies and was renamed in 2000. As of December 2003, the Seoul Digital Industrial Complex is a home to 2,206 firms, among which 1,834 are already in operational phase, generating employment for 41,580 workers (see Figure 2).

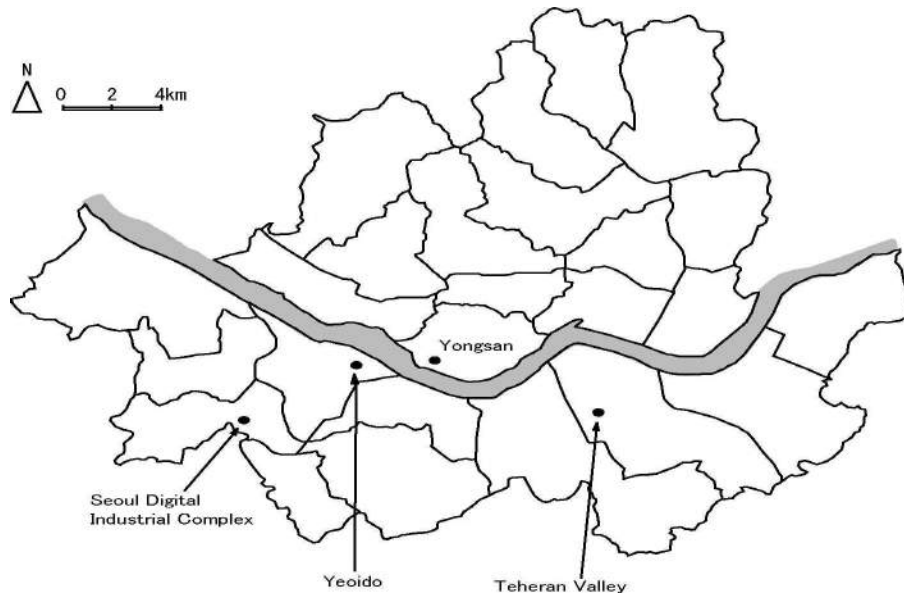

FIG. 2: SEOUL: ESTABLISHMENT OF INDUSTRY LOCATIONS

#### Daedeok Valley

Daedeok Valley is in Yusong-gu (district), Daejeon Metropolitan City. The core of Daedeok Valley is Daedeok Science Park (DSP). DSP was established in 1973 modeled after Japan's Tsukuba Science Town. Daejeon was chosen for DSP because of availability of ample cheap land and its convenient location at the geographic center, which is geographical gravity point and have the role of hub point of transportation system reachable from Seoul in about one hour and from Busan and Kwangju in about two hours using Korean high speed express train (KTX: Korea Train Express). Currently, there are 15,899 researchers in DSP: including 6,473 in 18 government-sponsored institutions; 3,297 in 27 private corporate R&D laboratories; 2,452 in public enterprise R&D laboratories; 2,319 in 4 higher education institution; 899 in 44 venture companies; 422 in 9 public institutions; and 37 in 4 supporting institutions. Among them 4,455 hold Ph.D. degree (see Figure 3).

DSP can count on two most prestigious government-owned scientific institutions: Electronics and Telecommunication Research Institute (ETRI) and Korean Advanced Institute of Science and Technology (KAIST). ETRI's most notable scientific harvest includes CDMA mobile telecommunication technology that was adapted into Korean cellular phone manufacturing to make international success. On the other hand, KAIST's major function is the higher education. There is 394 faculty staff, 2,978 students in the Bachelor of Science program, 1,971 students in Master of Science program, and 2,357 students in the Ph.D. program. According to the record of the 2004 graduates, more than a half of the undergraduate degree earners chose to study in the internal graduate program. In case of the MS degree earners, about one-third of them continue advancing to the Ph.D. Program (mostly internally), and another one-third chose to work in companies or research units affiliated to chaebols. Regarding the Ph.D. program graduates, about one-third is employed by chaebol groups and another one-third usually choose to work for government-sponsored research institutes or educational institutions. We can observe strong orientation of the graduate students to seek job in big companies and government-sponsored research institutions. Yet, it is notable that more than 10% of the Ph.D. students work in venture companies.

FIG. 3: MAP OF DAEDEOK VALLEY

In the initial phase of construction of DSP, the government transferred government sponsored research institutes and higher education from Seoul. Any productive activities were not allowed to locate in the science park because it was expected that the pollution-free and quite atmosphere would attract knowledgeable people. However, private research institutes affiliated with conglomerate business groups (chaebols) were reluctant to move to DSP because the location was considered as countryside where decent educational, cultural, or commercial infrastructure was not yet available (Shin, 2001). It took a while such obstacles were mitigated, owing partly to the Daejeon Science Expo in 1993. It is expected that DSP research resource should be utilized more in business. The government announced the plan to transform the area surrounding DSP to a high-tech venture cluster named as Daedeok Valley. The plan is being carried out as a part the post-1997 crisis structural reform to reduce the dominance by the conglomerates through the promotion of small and medium enterprises, and at the same time enhancing the consolidation of Korea's comparative advantage structure based on scientific knowledge intensive activities.

## Data Description

### Data Collection

Our data-set is constructed from Survey *Questionnaires* on International Comparison of Industrial Clusters in East Asia, conducted in March-April 2005 as a part of the research project on *the Urban and Industrial Agglomeration in East Asia*, organized by The International Centre for the Study of East Asian Development (ICSEAD). For the purpose of comparison, we restricted the respondents to firms related to information technology and asked them the same questions in Zhongguancun Science Park in China; Seoul Digital Complex and Daedeok Valley in Korea; Kitakyushu, Sendai and Nagano in Japan. The questionnaire was designed to figure out in what form, on what purpose, and how often firms make contact with business partners such as suppliers, customers, research institutes and universities, local supporting agencies, and financial institutions (investors and banks), and how geographical distance affects such interactions. With regard to Zhongguancun in China, we selected firms registered by Zhongguancun Science Park and asked the questions either by telephone or on direct visits (Note 3). The number of effective replies is 207. In Korea, the questionnaire survey was conducted for the firms registered in the Korea Industrial Complex Corporation (KICOX) and Daedeok Valley Venture Association (DDVA). The number of

effective replies is 50 in Seoul Digital Complex and 50 in Daedeok Valley. Thus, the total number of samples in Korea is 100.

#### Description of the Data

According to our data, the main industries of Zhongguancun are “electronic parts and devices” as manufacturing, and “package software” and “information processing” as services, and those of Seoul Digital Complex and Daedeok Valley are machinery & equipment as manufacturing and “information processing” and “producer services” as services. Among the latter, firms in Seoul Digital Complex specialize relatively in service industry and those in Daedeok Valley specialize relatively in manufacturing. The summary statistics are shown in Table 1 about “year of establishment”, “sales value”, “R&D share relative to sales”, “number of patent” and so on.

TABLE 1: SUMMARY STATISTICS FOR AVERAGE FIRM

						Obs.=199
	Measure	Mean	STDDV	C.V.	Maximum	Minimum
Firm Age1	Year	5.62	6.55	1.17	49.00	0.00

# of Production Item		11.21	41.33	3.69	290.00	0.00

The average age of firms in three industrial clusters is almost the same, a little more than six years. It reflects a boom of venture enterprises in China and Korea in the late 1990s and the early 2000. It is also common to all three clusters that firm sales revenue grew 2 to 3 percent on annual average during 2001-2004. These are still small enterprises in terms of the average employment, with a size of about 58 in Zhongguancun, 23 in Seoul Digital Complex, and 30 in Daedeok Valley. The firm size in Zhongguancun is the largest among the three clusters. They appeared to be highly R&D oriented as shown by 40% of the total employee being the research staff engaged in R&D. The lower proportion of R&D expenditure against the total sales revenue in Zhongguancun (13 percent in 2001 and 26 percent in 2004) may indicate the labor-intensiveness of R&D in China compared to those figures in Seoul Digital Complex and Daedeok Valley. The number of patent right is 4 in Zhongguancun, 8 in Seoul Digital Complex and 11 in Daedeok Valley. The number of product items, serving as a proxy for the level of product differentiation and responsiveness to the market, is 12 in Zhongguancun, 23 in Seoul Digital Complex and 11 in Daedeok Valley. Larger product variety per firm in Seoul Digital Complex compared to Daedeok Valley is an indication of its closeness to the market. Daedeok Valley is characterized by the proximity to fundamental research.

#### **The Nature of Alliance in Each Metropolitan Area**

Table 2 shows the overview of alliance with major business partners on R&D stage in Zhongguancun, Seoul Digital Complex and Daedeok Valley. Not surprisingly, it is commonly observed for three clusters that most firms contact with their suppliers and customers with a frequency of more than once per month and even more than once per week, especially in Seoul Digital Complex. Similarly, contact with banks (and other kind of financial institutions) is frequent in three clusters. With regard to the contact with research institutes, firms in Zhongguancun maintain more frequent contact than the Korean counterparts, although more Daedeok Valley firms confirmed more than once per month contact with research institutions than those of the Seoul Digital Complex. This shows that firms in Seoul Digital Complex are relatively more market-oriented and those in Daedeok Valley are more research based. Contacts with the source of human capital (which refers to job search assistance offices of educational institutions) and local supporting agencies are relatively scarce in Korea and more frequent in Zhongguancun.

TABLE 2: THE FREQUENCY (%) OF CONTACT WITH BUSINESS PARTNER

	Supplier	Customer	Research Institute	Source of Human Capital	Industrial Support Agency	Bank or Investor
Several times a year	13.86	7.77	16.41	39.80	27.71	36.71
1-3 times a month	46.53	49.51	46.09	37.76	51.81	34.18
Once a week or more	39.60	42.72	37.50	22.45	20.48	29.11
	Supplier	Customer	Research Institute	Source of Human Capital	Industrial Support Agency	Bank or Investor
Several times a year	12.20	6.52	48.00	80.00	55.17	34.21
1-3 times a month	36.59	34.78	44.00	20.00	37.93	26.32
Once a week or more	51.22	58.70	8.00	0.00	6.90	39.47
	Supplier	Customer	Research Institute	Source of Human Capital	Industrial Support Agency	Bank or Investor
Several times a year	10.64	6.12	30.95	84.21	68.18	40.00
1-3 times a month	48.94	38.78	57.14	15.79	31.82	37.78
Once a week or more	40.43	55.10	11.90	0.00	0.00	22.22

In Table 3, we can observe the preferred mode of communication with business partners in each cluster. In general, we consider that by preferring the use of face-to-face communication, firms are exchanging more tacit, intangible, and complicated information with their partners. In three clusters, such relationship is more relevant in their contact with industrial support agencies and financial institutions. This should be because their talks should involve subsidies and credit. Taking the information that firms in Zhongguancun have a relatively higher incidence of contact with supporting agencies suggests a strong influence of incentives offered by public policies in the region. Firms in the Korean clusters value face-to-face contact in relation with customers as well. It is also notable that Daedeok Valley firms engage in more face-to-face contact with research institutions. Although we saw in Table 6 that firms in three regions maintain frequent contact with customers and suppliers equally, Table 7 shows that the relation with suppliers relies less on face-to-face communication than in the case with customers. This may suggest that the relationship with suppliers is market-based, guided mainly by price, but human relationship is more important in sales.

TABLE 3: THE WAY OF COMMUNICATION (%) WITH BUSINESS PARTNER

	Supplier	Customer	Research Institute	Source of Human Capital	Industrial Support Agency	Bank or Investor
Face to face communication	27.84	37.00	34.17	37.36	57.14	57.53
Telecommunication	72.16	63.00	65.83	62.64	42.86	42.47
	Supplier	Customer	Research Institute	Source of Human Capital	Industrial Support Agency	Bank or Investor
Face to face communication	36.59	48.89	24.00	20.00	60.71	92.31
Telecommunication	63.41	51.11	76.00	80.00	39.29	7.69
	Supplier	Customer	Research Institute	Source of Human Capital	Industrial Support Agency	Bank or Investor
Face to face communication	29.79	51.02	54.76	27.03	52.38	77.27
Telecommunication	70.21	48.98	45.24	72.97	47.62	22.73

In table 4, we can observe what mode of transportation is used for visiting business partners in each industrial cluster. We regard “walk”, “drive”, and “subway” as intra-regional trip, and “long-distance train” and “air” as inter-regional transportation system. The intra-regional trip, especially driving a car, is the most frequently used option in each region. For firms in Zhongguancun “research institute”, “source of human capital”, “supporting

agencies”, and “banks/investors” are more likely found within the same region while there is greater chance to travel to other regions for contacting with customers and suppliers. For firms in Seoul Digital Complex and in Daedeok Valley almost anything can be settled within the same region, either by driving a car or by foot (in relation with financial institutions in Seoul Digital Complex), although some firms responded that their main suppliers or customers are outside the region.

TABLE 4: THE USE OF TRANSPORTATION (%) TO MEET BUSINESS PARTNER

	Supplier	Customer	Research Institute	Source of Human Capital	Industrial Support Agency	Bank or Investor
Walk	0	0	1	0	2	18
Drive	32	36	24	11	23	20
Subway	1	1	0	1	0	0
Long-distance train	1	3	0	0	1	0
Air	5	4	0	0	0	0

	Supplier	Customer	Research Institute	Source of Human Capital	Industrial Support Agency	Bank or Investor
Walk	1	0	2	1	1	3

To sum up, characteristics of information technology related firms in the three clusters according to their use of communication can be illustrated as follows. In terms of the frequency of contacts, we found relatively high intensity with customers, suppliers, and banks in all three regions. Contact with research institutes is the most frequently done in Zhongguancun, followed by Daedeok Valley. Zhongguancun firms contact supporting industries more frequently. Contact with suppliers does not generally involve face-to-face meeting, but to meet face-to-face is considered more effective for communication with customers in Korean two clusters. With local supporting institutions and financial institutions, face-to-face communication is more valued in all three clusters. Communication with local research institutions is mostly held by face-to-face meeting in Daedeok Valley, but Zhongguancun firms use more telecommunication because of the higher frequency. When direct contact is necessary, it is done mostly within the same region, but Zhongguancun firms are more likely to find their suppliers and customers outside the cluster.

## Communication Externalities on the Knowledge-based Firms

### Methodology

Jaffe (1989) provides one of first attempts to model the effect of university research spillover on firms’ innovation. His so-called knowledge production function is an analogue of ordinary Cobb-Douglas production function. It stipulates that firm’s innovative output is a function of inputs like firm’s own R&D investment, university research adjusted by proximity, generally represented as  $INN_{ijt} = g(\bullet) + \mu_{ijt}$ , where  $INN_{ijt}$  is innovative output of an

industry  $i$  in region  $j$  at time  $t$ ,  $g(\bullet)$  is a function of innovative input with the disturbance term  $\mu_t$ . Subsequent studies, like Jaffe, Trajtenberg and Henderson (1993), Feldman and Florida (1994), Audretsch and Feldman (1996b) and Fischer and Varga (2003) proposed other knowledge production inputs such as presence of related industry and specialized producer services and the population size in the same region. In contrast to these studies, which worked with the industry level data, we can take advantage of the availability of the firm level data. In this paper, we modify Jaffe's model for the firm level data and use the number of patents as an innovative output. The basic model form is:

$$\ln \frac{Patent_i}{Emp_i} = \alpha_0 + \alpha_1 \ln \frac{R \& D_i}{Emp_i} + \mu_i \quad (1)$$

Where  $Patent_i$  the number of patents is created by firm  $i$ ,  $R \& D_i$  represents the firm's R&D expenditure, and  $\mu_i$  is the disturbance. To control the firm size effect on patent, we divide the both side by the firm employment size  $Emp_i$ . Notice that, since our data includes only one time period and the analysis with respect to each region is done separately, the subscripts  $j$  and  $t$  are omitted from Jaffe's original model. Because the aim of the present study is to investigate the importance of communication externalities and geographical proximity on the knowledge creation, we shall include the dummy variable  $DM_i$  to which we assign 1 when the respondent answered that his firm attaches more importance on face-to-face communication than telecommunication in contacting with business partners, and 0 otherwise. We also consider the effect of the firm age  $Age$  (experience in the market) on innovation. Next, we divide the communication dummy variable for the case of contact with suppliers ( $DM_1$ ), customers ( $DM_2$ ), universities ( $DM_3$ ), and banks ( $DM_4$ ). We also add cross-terms multiplying the communication dummies and the firm age to pick up the effect of inclination to face-to-face communication boosted by longer experience in the market. The cross-terms allow us to investigate the hypothesis of firm's experience enhancing local communication network. Finally, we obtain the following model.

$$\begin{aligned} \ln \frac{Patent_i}{EMP_i} = & \alpha_0 + \alpha_1 \ln \frac{R \& D_i}{EMP_i} + \alpha_2 Age_i + \alpha_3 DM_{1i} + \alpha_4 DM_{2i} + \alpha_5 DM_{3i} + \alpha_6 DM_{4i} \\ & + \alpha_7 Age_i * DM_{1i} + \alpha_8 Age_i * DM_{2i} + \alpha_9 Age_i * DM_{3i} + \alpha_{10} Age_i * DM_{4i} + \mu_i \end{aligned} \quad (2)$$

We estimate this specification using OLS regression. We expect positive signs for all  $\alpha_1$  through  $\alpha_{10}$ . We run the regression with respect to answers for Question 3 of the questionnaire, shown in Appendix A. In this question, respondents are asked to answer the same query for the three business stages respectively: basic research and development; product development; and marketing/commercialization. For this paper we use only one part of our data-set regarding the basic research and development stage.

#### The Estimation Results

We estimate the equation (3) by using the data on the interaction during the research and development stage from our data-set. This stage should be considered as the phase in which basic idea of the product are created before making concrete design of the product to enter the market. Table 8 shows the estimation results. Based on the value of R-square, we can see that the model has reasonable explanatory power for Seoul Digital Complex while it fits poorly for Zhongguancun. In the left panel of the table we used the years since establishment of the firm,  $Age1$ , as the firm age variable, and the years operating in the present location,  $Age2$ , as the firm age variable in the side panel. The distinction of the two firm age variables may be of interest for the case of Seoul Digital Complex to which many firms relocated from other place. For Zhongguancun and Daedeok Valley, this distinction may have little meaning because firms in these regions are mostly new startups.

First, we observe the estimation results for Zhongguancun in Table 5. It shows that only firms' own R&D expenditure has statistically significant effect on innovation. Sign for dummy variables is negative, contrary to our expectation, except for the one related to banks. It is puzzling that face-to-face contact during the research and development stage does not show any effect on patent creation. Whether or not the result indicates that Zhongguancun firms poorly take advantage of agglomeration economies of innovation should be further investigated. Second, we observe the estimation results for Seoul Digital Complex in Table 5. Surprisingly, firms'

interaction with suppliers utilizing face-to-face communication revealed negative effect on innovation. However, the cross term of the face-to-face dummy with suppliers and firm age since establishment shows positive significant sign, in contrast to the statistically insignificant result for the cross term of face-to-face dummy with suppliers and firms' operating age in the present location as shown in the right side panel. This suggests that firms relocated to newly established Seoul Digital Complex have not established meaningful relationship with suppliers within the complex but firms with longer experiences before coming to the complex were able to establish beneficial face-to-face relationship with suppliers. Finally, we observe the estimation results for Daedeok Valley in Table 5. As was in the case of Zhongguancun, except the effects of R&D expenditure for each firm, there are hardly any significant effects of using the face-to-face communication and having long relation.

These results indicate that face-to-face communications cannot be considered as a source of innovation in the three regions of this study. However, according to our estimation result for the Seoul Digital Complex, the long-term matured relationship with partners may certainly enhance the effects of face-to-face communication and eventually contribute for innovation. This suggests that it may be myopic for policy planners to think that creating a cluster through tax incentives and credit facilities will provide a condition for creative production to take place. It

may take long time until such chemistry takes holds.

We could not obtain strong evidence of industry-university-government cooperation in each cluster, especially expected for the case of Zhongguancun and Daedeok Valley. It is likely that they have not arrived at the stage when the effects of industry-university-government cooperation can be clearly seen. As mentioned by Saxenian (1994) for the case of Silicon Valley, in order to foster sustainable development of industrial clusters, local, horizontal and flexible inter-personal communication and exchange of ideas are generally more important than institutional arrangements. This statement suggests the need for investigation into interaction among technologically talented people in creation of new knowledge, and not into the relation among firms and universities.

## Concluding Remarks

In this paper, we use a unique Chinese and Korean data-set obtained from questionnaire survey, including qualitative data on contents and channels of regional cooperation, and some quantitative data gathered in 2005. We examined the importance of communication externalities and geographical proximity on the knowledge-based production as formation factors of such industrial clusters as Zhongguancun, Seoul Digital Complex and Daedeok Valley. We focus on how frequency and the method (face-to-face communication or telecommunication) of contact affect the firm's knowledge-based production.

Some common characteristics were seen for the three clusters. With suppliers firms, contact was with high frequency but with less face-to-face meeting opportunities. Contact with customers and banks/investors is done through more face-to-face meeting. Zhongguancun's firms have unique characteristics of frequent direct meeting with local supporting agencies, and their contact with research institutions are the most frequent among the three. However they rely on telecommunication. This is consistent with the finding of Charlot and Duranton (2005) that industrial cluster fosters communication network and the use of telecommunication, suggesting that the direct meeting and the use of telecommunication is self-reinforcing. Firms in the scientific park environment of Daedeok Valley contact rather less with researchers, but they use face-to-face communication more.

We could identify partial evidence that firms' long-term experience in the market is helpful for construction of such meaningful communication network. This result has a policy implication that the making of innovation-enhancing clusters requires long-term support to facilitate the internal mutual exchanges. Interaction can be enhanced by various opportunities outside of corporate activities, such as: social/cultural amenities; joint activities in basic research, exchanges with different business areas, and with other clusters including of foreign countries. This leads to the discussion of how to induce the inflow or return of knowledgeable workers in developing countries that have been exporters of the precious talent.

## Abstract

The contribution of this article is both theoretical and practical. It has been suggested that some international trade concepts may need some adaptation when used to formulate strategies for marketing products in developing countries (Ekeledo and Firoz 2007). This study shades light on the issue of applying theories and concepts developed for firms from developed countries to firms from developing countries. Our study identifies variables critical to successful international market entry for firms from emerging economies of Asia. It provides a framework that firms from emerging markets could use to analyze and formulate entry strategies in today's protein business environment. As Alderson (1957) notes, adequate theory should facilitate the accumulation and integration of a body of knowledge and allow what is learned in coping with one set of problems to be brought to bear on other problems. Because inappropriate entry mode can lead to costly failure in a foreign market, the insight provided by this study will help managers avoid repeating costly mistakes made by some companies in the past. Managers charged with formulating and implementing international market entry strategies and plans will learn how to leverage firm-specific resources in a new foreign market to ensure a sustainable market presence. Although the information presented in this article is qualitative and descriptive, suggestions are made regarding future empirical testing of propositions presented in this report.

## Introduction

Any firm contemplating foreign market entry must deal with the issue of selecting appropriate entry mode. An entry mode is an institutional arrangement, such as exporting, licensing, franchising, management contract, joint venture, or wholly owned venture, that a firm may use to produce and sell its product (good or service) in a foreign market. Inappropriate entry mode can block opportunities in a market and substantially limit the range of strategic options available to management (Alderson 1957; Ekeledo and Sivakumar 2004). Indeed, an inappropriate entry mode can result in substantial financial loss and force the firm to prematurely exit the foreign market (Mathe and Perras 1994). Each entry mode is associated with a certain level of resource commitment, market involvement and control of the foreign enterprise. Also each entry mode comes with a certain amount of business risk. Therefore, it is important that managers of Asian firms, just like their non-Asian counterparts, be aware of the advantages and disadvantages of each entry mode, understand theories and practices that underlie selection of appropriate entry mode for their product, and be able to use this understanding to choose appropriate entry mode.

Much of our understanding of foreign market entry strategies is based on the experiences and practices of firms from developed nations, such as Japan, the United States, Canada, and countries of Western Europe. An important research and managerial question is the extent to which theories and practices of entry mode strategies developed for companies from developed economies apply to firms from emerging economies of Asia. Because manufacturing firms and service firms do not always approach foreign market entry the same way (Ekeledo and Sivakumar 2004), this article also highlights differences in the ways manufacturing firms and service firms from Asia approach selection of appropriate entry mode.

## Theories of Entry Mode Choice

Often, a firm's survival in the marketplace depends on its adoption of efficient marketing practices. Efficient marketing practices, on the other hand, are rooted in sound theoretical foundations (Anderson and Gatignon 1986; Dunning 1977). We begin with a brief discussion of the theories that underlie the conceptual framework and

propositions that are presented in this paper. Some of the theories of international market entry employed in previous research studies include the *internalization* theory (transaction costs analysis), *eclectic theory*, and *resource-based theory* (e.g., Agarwal and Ramaswami 1992; Ekeledo and Sivakumar 2004; Erramilli and Rao 1993; Hill, Hwang, and Kim 1990).

The *Internalization theory* posits that a firm would adopt a mode of operation that minimizes production and transaction costs (Williamson 1985) because transaction costs increase international market inefficiencies and the possibility of opportunistic behavior on both buyer and seller. To minimize cross-border transaction costs and reduce the impact of market inefficiencies, a profit maximizing firm will undertake those activities it finds cheaper to administer within the firm (Klein, Crawford and Alchian 1978). The internalization theory views low level modes of entry, such as licensing, turnkey project, supply agreement or management contract, as the default entry form; that is, a low level entry form is preferable (Anderson and Gatignon 1986). Like other industrial organization-based theories of the firm, the internalization theory “assumes perfect competition, homogeneous firms and mobility of resources among firms, including perfect transferability of know-how between a parent company and its foreign subsidiary” (Ekeledo and Sivakumar 2004, p. 71).

However, the internalization theory does not adequately explain entry mode choice in today’s business environment. The theory is concerned with conditions that lead to market failure, which in turn lead to foreign direct investment (Hennart 1989). Barriers to free flow of products between countries reduce the profitability of exporting, while obstacles to the sale of know-how enhance the attractiveness of foreign direct investment (FDI). Although internalization theory provides some rationale for choosing FDI as an entry form, it does not explain the impacts of firm-specific resources and location advantages of a target country on entry mode choice. Besides, the internalization theory is not concerned with exporting as an entry option.

The *eclectic theory* combines a number of theories that help to explain entry mode choice. Dunning’s (1977, 1980, and 1988) eclectic framework is well known and has been widely used in international business research. (e.g., Agarwal and Ramaswami 1992). Dunning’s model identifies ownership and internalization advantages of a firm together with location advantages of the target foreign market as key determinants of entry mode choice. Ownership advantages of a firm refer to competitive or monopolistic advantages of a firm that allows the firm to compete with other firms in a foreign location. These advantages include those that come from large firm size, international business experience, and a differentiated product. Location advantages include market potential and low investment risks that make it profitable to do business in a particular country. Internalization advantages, as noted previously, refer to contractual risks that make FDI more beneficial than licensing as an entry form.

However, extant eclectic models do not provide a unified perspective in the explanation and prediction of entry mode choice (Tallman 1991). The model fails to explain why firms in the same line of business and with similar ownership, internalization, and location advantages adopt different entry modes. A dynamic interpretation of internalization advantages covers ownership advantages (Buckley 1988). Furthermore, it is difficult to empirically separate ownership advantages as they relate to intangible assets (Denekamp 1995).

The *resource-based theory* views the firm as the source of competitive advantage (Capron and Hullah 1999). Resources are tangible and intangible possessions that underlie a firm’s choice and implementation of business strategies. Resources provide a basis for a firm’s competitive advantage (Barney 1991; Peteraf 1993; Teece, Pisano, and Shuen 1997). The theory assumes that resources are both heterogeneous across firms and imperfectly mobile (Barney 1991; Hunt and Morgan 1995). Heterogeneity of resources across firms implies that firms of all sizes and shapes can co-exist in the same industry. The resource-based theory explains not only the differences in entry mode choice observed across firms in an industry, but also why all firms in the industry do not and cannot pursue strategies that offer maximum returns on investment. Instead, each firm adopts entry strategies that its resources can support, which means that the differential endowment of resources among firms affects each firm’s strategic choices. (Grant 1991).

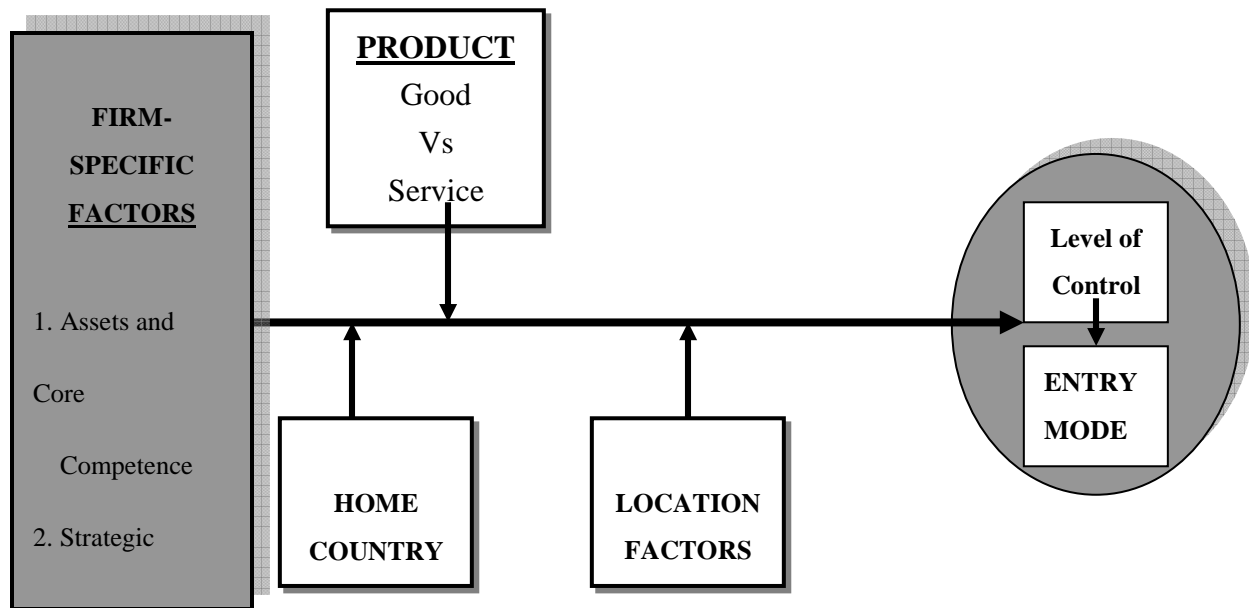

FIG. 1: ELEMENTS OF INTERNATIONAL MARKET ENTRY

The resource-based approach views wholly owned operation as the default entry mode; it is the ideal entry form. This fundamental assumption of the resource-based theory is in sharp contrast with that of the internalization approach. Even then, the resource-based theory needs to be complemented with moderating factors, such as home country factors, host country factors (location advantages) and the nature of the product (a good versus a service). The conceptual model, Figure 1, incorporates these key moderating factors. The model highlights the interrelationships among the various factors that influence choice of entry mode. The model also recognizes the impact of a firm's home country on the firm's international market entry strategies. Because there is a link between an entry mode and the amount of control over an affiliate the entry mode confers on a firm, we present a brief discussion of control and how it might affect choice of entry mode.

### Level of Control and Entry Mode Choice

Control is the amount of authority a firm has over the activities of its foreign affiliate. In general, there is a direct relationship between a firm's equity share in the foreign enterprise and the amount of control the firm can exercise over the enterprise (Anderson and Gatignon 1986). The entity with the largest equity in a venture often has the most

power to control the day-to-day activities of the affiliate. Therefore it goes without saying that the partner with the most equity also assumes most of the affiliate's business risks. As a result, the greater the equity the firm has in the business venture, the greater the firm's involvement in the day-to-day operations of the affiliate.

In addition, each entry mode is associated with a certain amount of control (Douglas and Craig 1995). Low control is generally associated with a mode of entry that involves small commitment of resources, while full control is associated with a mode that requires large commitment of resource. Thus, there is a mapping from entry mode to the level of control the entry mode affords the firm (Anderson and Gatignon 1986). Entry modes can be divided into two broad categories—equity entry modes versus non-equity entry modes. Table 1 lists common entry modes and their characteristics. These characteristics include control, start-up investment capital requirement, dissemination risks (dangers of exposing critical company know-how to a potential future competitor),

TABLE 1: CHARACTERISTICS OF ENTRY MODES

Entry Mode	Control	Investment	Dissemination	Equity/non-equity
		Capital	Risks	
Licensing	Low	Low	High	Non-equity
Franchising	Moderate	Low	High	Non-equity
Management Contract	Low	Low	Low	Non-equity
Contract Manufacturing	Low	Low	High	Non-equity
Turnkey Project	Low	Low	Low	Non-equity
Export: direct to distributor	Low	Low	Low	Non-equity
Export: indirect	Low	Low	Low	Non-equity
Export: direct to own organization	High	Moderate	Low	Equity
Joint Venture	Moderate	Moderate	High	Equity
Wholly Owned Subsidiary	High	High	Low	Equity

and equity/non-equity classification of the entry mode. Licensing is a contractual agreement in which the owner of a protected asset (the licensor) grants another entity (the licensee), for royalty or some other form of consideration, the right to use the asset in producing or distributing a good or service (Root 1994). The licensed asset may be tangible or intangible, such as a trademark, patent, trade secret, or production process. Franchising is a form of licensing. It is a mode of operation in which a company that owns a protected trademark (the franchisor) grants another company (the franchisee) the right to do business under the trademark in exchange for a consideration, such as royalties, fees, or profit sharing. In other words, the franchisee rents the franchisor's brand name. In a management contract a company manages the day-to-day operations of another company in a foreign country for a fee. This mode of operation is common in service businesses such as hotels, civil aviation, retailing, or real estate management (Palmer and Cole 1995). Contract manufacturing involves sourcing a product from an independent manufacturer in a foreign country. This arrangement is a cross between licensing and FDI (Root 1994). A turnkey project is like a standard

construction contract. The contractor brings the foreign project to the point of operation and turns it over to the owner. Construction of railroads, dams, power stations, and manufacturing plants in developing countries by Chinese firms are examples of turnkey projects. Exporting involves supplying the product to the foreign market from a domestic base or from a base located outside the target foreign market. Exporting can be direct to the foreign market through a foreign distributor or the exporter's own sales organization in the foreign market. Exporting can also be indirect. Indirect exporting uses a middleman, such as a trading company, the sales office of a foreign organization located in the firm's domestic market, or a domestic export agent to make the product available in a foreign market. A joint venture involves shared ownership of the foreign affiliate. Two or more independent organizations provide financial and other resources to support the foreign operation. The amount of control each partner exercises in the venture often depends on partner's equity share in the enterprise. Wholly owned subsidiary refers to sole proprietorship. A wholly owned subsidiary can be through acquiring an existing company or building a new company from scratch—greenfield operation.

#### **Firm-specific Factors**

Firm-specific resources (assets and core competencies) are the basis of a firm's competitive advantage (Wernerfelt 1984). A firm's assets and core competence drive its foreign market entry strategies. Assets are tangible or intangible things the firm owns that contribute to its competitive position in the marketplace. They include patents, trademarks, copyrights, plants and equipment, trade secrets, financial capital, databases, and so on. Core competence refers to the firm's ability to combine its assets and deploy them to perform a task advantageously (Day 1994; Grant 1991). To be a competitive advantage, a core competence has to be one that the firm's competitors cannot match or imitate. A core competence could reside in any of a firm's value creation activities, including a functional area such as finance, human resources, operations management, marketing, or research and development. Battat and Aykut (2005) have identified a number of assets and competencies of firms from China, India, and Malaysia that serve these firms well in other emerging markets, including markets in neighboring countries. These competencies include products and production processes designed for developing economies, ability to deal with regulatory and infrastructure environments in emerging markets, familiarity with cultures and markets in neighboring countries, and low cost production facilities. As explained later, these resources influence entry mode choices of these firms in each emerging market. To protect a competitive advantage (core competence), a firm will adopt a mode of operation, such as wholly owned operation or exporting, that gives it full control of the foreign affiliate. For example, if a firm's core competence is based on control of its proprietary technological know-how, the firm should not adopt licensing or joint venture (Hill 2007).

As noted earlier, a firm's resources limit the strategic options open to the firm. Therefore, strategic considerations may be the main reason that a firm adopts a mode other than the default (full control) mode; for

example, a firm may adopt a joint venture or another collaborative mode to gain access to technology (Huber 1991). Among strategic reasons for foreign market entry for firms from China and India are access to resources, access to markets, and technology transfer (Battat and Aykut 2005). Firms from these two countries use a mode of entry that will help them achieve their specific business objective given the constraints in the target market.

*Proposition 1:* *A firm from a developing Asian country that wants control over its proprietary technological know-how will favor a wholly owned subsidiary or exporting.*

#### **Nature of the Product**

The type of product—good or service—may determine the range of entry mode options available to a company. Products have both macro and micro characteristics. At the micro level, services differ from goods in terms of perishability, tangibility, separability, and heterogeneity (Zeithaml, Parasuraman, and Berry 1985). At the macro level, composition, weight/value ratio, packaging, brand name or image, and technology are some attributes that separate goods or services from one another. Both macro and micro characteristics of a product influence choice of appropriate entry mode (Ekeledo and Sivakumar 1998).

Services can be further divided into two groups: those that require production and consumption to take place at the same time and those that allow separation of production and consumption. Exporting is not an entry option for services that require simultaneity of production and consumption. For example, lodging services require proximity between the service platform and the consumer while consumption takes place; therefore, the production platform for this type of service has to be located in the foreign market close to potential customers. Similarly, the production platform for some manufactured goods must be located close to customers because of high weight/value ratio. For example, high transportation costs make export of beverages in bottles or can expensive, which in turn raises the price of the product in the destination country. As a result, bottling plants are often located in the target market close to customers. This is an example of the impact of micro attributes of a product on entry mode choice. Another factor that may influence entry mode choice for a service is investment capital requirement for a new production platform. The costs of opening a new insurance office may be limited to rental fees and cost of office furniture, whereas the costs of a new manufacturing plant would require a much larger financial outlay. Thus the cost of a new manufacturing facility could be the main reason for a firm to adopt a collaborative mode of entry such as joint venture.

Services that do not require proximity between the consumer and the service provider during consumption of the service may be able to use exporting. Advances in information technology (IT) have created more of this type of service; that is, a service that can be delivered from a distance. Hence exporting is a common entry mode for IT related services. Trade in computer software and IT-enabled services are the fastest growing areas of international business today. Asian firms, especially those with home in India, are key international players in IT services. Prior

to 2003, Indian firms favored exporting, but increasing government relaxation of restrictions on cash outflow from the country now allows more use of acquisitions or greenfield operations by Indian firms (Gopinath 2007). Because technologies that drive a service firm's competitive advantage tend to reside in the firm's trade secrets (Grosse 1991), service firms tend to favor a full control mode such as sole proprietorship or exporting. Service firms from Asia are no exceptions in this regard. However, service firms from Asia may be favoring exporting because of low production costs at home. When the motive for entering a market in a developed country is access to the market, Indian firms appear to use an export subsidiary. For example, pharmaceutical firms from India with USFDA approved facilities use acquisition to enter the U.S. market, but the bulk of manufacturing activities is still in India in order to take advantage of low manufacturing costs. In other developing countries where there are very few firms to acquire, Asian firms appear to favor exporting exclusively.

*Proposition 2: Firms from emerging economies of Asia favor exporting combined with acquisition in developed countries, but favor just exporting in less developed economies.*

#### **Home Country Factors**

The broad foundation of a firm's competitive advantage is the firm's home country. According to Porter (1990), factor endowments, demand conditions, related and supporting industries, and firm strategy, structure and rivalry influence industrial development and the ability of individual firms to establish competitive advantage. Firms from countries with large, demanding and sophisticated markets tend to be both innovative and competitive. Firms often begin international competition in industries where their domestic market experience provides a unique competitive advantage (Porter 1990). For example, the size, resources, and infrastructure of the Japanese market, together with the policies of the Japanese government regarding its domestic economy, have bestowed special competitive advantages on firms from Japan. Hence home country factors may explain why Japan is the home of world leaders in consumer electronics and automobiles. Clearly, a firm's country of origin has a significant impact on both the firm's competitive advantage in the international marketplace and the firm's choice of competitive strategy (Collis 1991; Fahy 1996). Therefore, it should not come as a surprise that firms from Japan and South Korea favor greenfield FDI in order to protect their brand name advantage.

However, Porter's determinants of national advantage do not completely explain the competitive advantages of firms from emerging economies of Asia; For example, firms from India have managed to establish competitive advantage in the world marketplace without the benefits of a demanding and sophisticated domestic consumers. Instead these companies have relied on the demands of consumers in their target developed countries to drive the quality of their products. Until 2003, as discussed earlier, firms from India had to deal with home government restrictions on cash outflows from the country. As a result, many of the pre-2003 foreign market entries were through exporting (Gopinath 2007). The reduction of cash outflow restrictions after 2003 has enabled firms

from India to take advantage of acquisition or greenfield as entry modes. Currently, Indian firms appear to use a combination of exporting and acquisition in developed economies, and exporting or greenfield operations in emerging economies.

Acquisition of strategic assets appears to drive current international expansion of firms from China. Compared to other Asian firms, firms from China appear to make more effort to acquire companies with well-known brand names (Battat and Aykut 2005). Lenovo and TCL of China have acquired Tompson, RCA, and IBM brands to take advantage of the distribution channels for these brands. In contrast, firms from Japan and South Korea went abroad with their own brand names in the early days of their international market entries. An objective such as technology transfer influences choice of entry too. Indian and Chinese firms have entered developed countries for reasons of technology transfer through R&D investments. These investments often take the form of acquisition or joint venture. Major investments of firms from China and India, particularly in developing countries, have been in extractive and infrastructure projects (Battat and Aykut 2007). Such resource seeking and infrastructure building projects often involve joint ventures.

*Proposition 3: A firm's home country restrictions on outward FDI will lead a firm to use exports or a collaborative arrangement as mode entry.*

#### **Host Country Factors**

Likewise a host country can significantly influence choice of entry mode. Host country factors that affect choice of entry mode include market characteristics, political and sociocultural factors, and economic infrastructure. As determinant of entry mode strategy, host country factors may strengthen or weaken the main effect of firm-specific resources on entry mode choice. Market characteristics include demand potential and market structure for the product. In general, a market with low demand potential or uncertainty attracts little FDI (Agarwal 1994). Uncertainty about future demand will make a foreign firm less willing to invest substantial managerial and financial resources in a target market, and make exporting through a foreign distributor, licensing, or management contract (for a service) the preferred entry mode. Perhaps Asian firms favor exporting in less developed countries for this reason.

Market structure affects choice of entry mode too. The structure for a market could be competitive with many non-dominant firms, oligopolistic or monopolistic. A foreign firm is likely to favor exporting or licensing in a very competitive market (Kim and Hwang 1992). According to Root (1994), to compete with the dominant firms in an oligopolistic market, the new entrant will have to use a wholly owned mode of operation (greenfield or acquisition). We expect firms from Asia to employ similar logic in selecting entry mode in similar circumstances.

*Proposition 4: Firms from emerging economies of Asia adopt exporting in less developed economies or markets with very competitive structure, and adopt wholly owned operation in oligopolistic markets.*

In general, firms are reluctant to commit significant managerial and financial resources to a country with a high level of political instability. Political instability leads to frequent change of government, military coups, riots, insurrections, or worker strikes against the central government (Green and Cunningham 1975). A firm will avoid a mode that requires a substantial investment in plants and equipment in a country with high political instability (Douglas and Craig 1995). Political instability and social unrest are likely to encourage low involvement modes such as exporting (through a foreign distributor) and licensing.

Cultural distance between a firm's home country and the host country may influence entry mode choice. It has been suggested that dissimilarities increase the probability that a firm will use joint venture in a foreign market (Kogut and Sing 1988). Firms from Asia tend to enter neighboring countries that share economic, or ethnic and cultural ties with their home country. This observation may explain the large presence of East Asian firms in South Korea, Australia and other Asian neighbors. Often mergers and acquisitions (M&A) are the preferred modes by these firms. Haier, a Chinese white goods manufacturer, has manufacturing plants in both India and Thailand. Taiwan, Thailand and the Philippines are the main recipients of FDI from Indian manufacturing firms and IT firms (Subramanian and Sunderaraman 2005). To break into the Chinese IT market, Tata Consultancy Services (TCS) of India has just concluded a joint venture arrangement with three Chinese partners (Aiyar 2007). This joint venture will allow TCS to participate in lucrative business with state-owned enterprises; joint ventures with Chinese partners are encouraged by the Chinese government. TCS' existing wholly owned subsidiary in China will become part of this joint venture arrangement. This example illustrates how a host country's preferences can influence a firm's choice of mode of operation in a target market.

*Proposition 5a: Political stability in a country and ethnic and cultural links between a firm's home country and the foreign market encourage FDI entry modes such as wholly owned subsidiary or joint venture.*

*Proposition 5b: The investment preferences of a host country may make a firm choose a collaborative arrangement such as joint venture as entry mode.*

## **Empirical Validation of Proposition**

The aim of this section is to provide some guidelines for future empirical testing of the propositions presented in the article. The unit of analysis is the foreign market entry mode choices of individual firms from Asia. The challenge in this undertaking is gathering data from a diverse group of companies not only from the same country, but also from the different countries covered by this study in order to enhance the generalizability of findings. Another problem is being able to have adequate cell sizes for each entry mode classification to ensure the power of statistical tests. Besides, cross-border business research requires a great amount of time, patience, effort and financial resources.

Survey method will be appropriate for data collection and has been used in previous research on entry mode strategies (e.g., Erramilli and Rao 1993; Ekeledo and Sivakumar 2004). Information regarding the nature of the product will be gathered from questionnaire responses as was done in similar studies in the past. Data on home country factors and host country factors can be collected from both secondary data and respondents. Following the approach in Ekeledo and Sivakumar (2004), the effect of firm-specific factors and strategic considerations will be ascertained first, followed by determination of the impacts of moderating factors, such as nature of the product, home country factors, and host country factors, as they interact with the main effect and with one another. Because this is a conceptual and descriptive paper, we have deliberately left out the specific variables that make up home country factors and host country factors. These variables will have to be supplied in the empirical testing, using variables validated in previous studies. For example, the variables for location (host country) construct are likely to include demand potential, government restrictions, cultural distance, level of economic development, and so on. The use of these variables to operationalize the broader constructs will require development of additional hypotheses and associated supporting discussion.

## **Managerial Implication**

Although yet to be tested empirically, the conceptual framework we have proposed offers some guidance to international business managers. The model highlights important factors to consider while selecting appropriate entry mode. Managers must consider the nature of the product candidate for entry and not assume that what applies to, say, a manufactured good automatically applies to a service. Managers need to carefully evaluate the strengths and weaknesses of their firm, and employ strategies that leverage the strength of their firm and minimize the exposure of their firm's weaknesses. Using this framework to guide the formulation of entry mode strategy will ensure that all important variables that have impact on appropriate entry mode choice are considered.

Our conceptual framework is broad enough to accommodate different products (goods and services). Indeed, the model could be adapted to fit a specific manufacturing or service industry. For example, computer software firms could apply this framework to their special international expansion decisions with some minor adjustments to reflect the nature of their products. Because it takes about three to five years to completely enter a foreign market (Root 1994), managers must remember that the initial entry mode may be optimal in the short term. The initial entry arrangement may be a merger and later become an acquisition. Therefore, the initial entry mode should be one that is flexible enough to allow smooth transition to another mode as future market conditions and corporate goals require.

The perspective of our research is that of a firm entering a single product into a foreign market. This is a realistic approach in that managers must plan the entry of each individual product in a foreign market even if the company has more than one product candidate for a particular foreign market. It is not unusual for a company to produce one product in a market and export another to the same market. It is also important for managers to know that successful entry of a product may not replicate in other foreign markets for the reasons that our conceptual model have highlighted.

## **Conclusion**

As stated in the early paragraphs of this article, the purpose of this study is to shade light on the internationalization of Asian firms. Although the information revealed by this research study focuses on emerging economies of Asia, firms from other emerging economies can draw some lessons from the study. Levels of industrialization among Asian countries differ: some countries, such as Japan, are highly industrialized, some are in the ranks of newly industrializing countries (NICs), and some are less developed countries (LDCs). Level of industrialization of the country of origin of a firm is likely to influence the firm's entry mode strategies. This study reveals how a country's level of economic development might influence the entry strategies of firms from that country. For example, weak home demand condition is supposed to have negative effect on domestic firms developing national advantage in a particular industry. This observation appears not to be true about the Asian firms cited in this article. Indian IT firms are key players in IT related industries in the global marketplace, but did not have sophisticated and demanding consumers at home when they made their mark in the international market scene. Firms from other emerging economies should not let inadequate home market structure deter them from venturing outside their national borders in search of customers. Current reductions in barriers to international trade and advances in information technology have created opportunities for companies all over the world, especially companies from emerging economies. Companies from developing countries should take advantage of these new opportunities, especially in other less developed economies where their experience in managing operations in less developed economies can be leveraged.

# **Strategies for Internationalization of Thai and Vietnamese Enterprises: A Comperative Study**

*Pham Thi Kim Ngoc, ngocptk@yahoo.com*

*Hanoi University of Technology, Vietnam*

*Doctoral Student, University of Fribourg, Switzerland*

## **Abstract**

Integrating into the international market, the enterprises are not only getting opportunities but also facing new environmental challenges and particularly new competitive pressures. This paper presents a conceptual framework that has been developed to investigate the level of success of entering foreign markets with the help of internationalization competencies and the internationalization strategies of the enterprises in high-tech and low-tech industries in Vietnam and in Thailand. Some initial findings of business profiles, competencies, market entry modes, etc., which are resulted from a survey of 112 enterprises in both high-tech and low-tech industries in Vietnam, and 58 enterprises in Thailand are also presented in this paper. **Keywords:** Internationalization, strategy for internationalization, internationalization competencies, internationalization performance, high-tech and low-tech industries, Vietnam, Thailand

## **Introduction**

Internationalization creates the opportunities and as well as the challenges for any country and its economic actors, the enterprises. Positively, the economic miracles of India and China in 1990s are good examples of country's economic achievements of the globalization. As new global economic actors, the impressive appearances of Chinese Lenovo Group or Indian Mittal Steel Company show how good the opportunities for enterprises on the way entering into international market. In contrast, the risks and challenges are also waiting in the global economy. The East Asia crisis in 1997, the collapse of Argentina's economy and the stable minus growth rate of many African economies are strong warning signals for globalization's challenges.

Located in the South East Asia region, Thailand and Vietnam have different situations of participating in the internationalization process. Thailand was early joined in global economic integration through joining international economic organizations, for example Thailand was one of the founders of the World Trade Organization (WTO) in 1995. It was later than Thailand, but Vietnam is emergently integrating in the world

economy with the goal becoming an industrialized country in 2020. So far, the country holds the official membership of international Monetary Fund (IMF) and World Bank (WB) (since 1992), ASEAN (1995), APEC (1998) and it signed a Bilateral Trade Agreement with the United States of America in 2000. Vietnam officially to be a member of the WTO on 11 January 2007.

Accessing to the international market through bilateral and multilateral trade agreements or participating in globalization creates competitive pressures for enterprises in Vietnam and Thailand, especially for the export companies. In order to be successful in high competitive markets, it is required these enterprises have to have their own competitive advantages and strategies to survive and prosper in the market.

Thailand and Vietnam have export advantages for agricultural and resource-based products such as rice, fishery, garment, footwear or low-tech products. High tech products such as electronics, computer parts are decreasing. For example, in 2002 the growth export rate of Vietnamese agricultural and fishery products increased 13.2%, garment and textile increased 33.8%. The growth rate of electronics and computer parts was negative of 17.3%. However, in Thailand, export volume grew of electronics at 13% and about at 17.9% in 2002. These was a negative growth in export volume of agricultural and fishery products (-1.1% in 2002). The export of high tech products is fallen and reached a negative growth rate of 7.1% in 2004. Is internationalization becomes the main cause of this problem? Why has the export growth rate of high tech products fallen or negative? Do the low-tech enterprises have a strategy to enter the international market?

Being successful in the international market is very difficult. It is requires every enterprise to develop a strategy through identifying its competitive advantages, and having clear ideas about the market entry options. The companies need to analyze the business environment, the foreign countries, the customer groups and the potential products or services. In the international market, every enterprise has to follow the common market law. How to survive and develop in the international market? How to avoid to be merged or to be bankrupt? What kind of internationalization strategies should be applied? These questions should be asked by the enterprises themselves.

## **Objectives**

The main purpose of this research is to describe and explain the internationalization of high tech companies and low-tech companies in Thailand and in Vietnam. Therefore the following objectives are given:

To investigate the level of internationalization of the enterprises in high tech and low tech industries in Vietnam and in Thailand by using firms' competencies and of firms' internationalization strategies as independent variables;

The influence of the country and the industry's environment on the international success is investigated indirectly;

To make conclusion at the level of companies as well as at the level of governments.

## **Literature Review and Research Model**

### **Competencies Related to Internationalization**

Firm's competencies can be divided into different competencies such as core competencies and distinctive competencies (Wheelen & Hunger, 2002). According to Swierczek (2004), the firm's competencies related internationalization was gauged by using three measures: global knowledge management competencies, strategic or entrepreneurial competencies, and managerial or management competencies source.

Prahalad and Hamel (1990) defined core competencies as the collective learning in the organization, especially how to coordinate diverse production skills and integrate multiple streams of technology, or a competence that provides potential access to a wide variety of markets, makes a significant contribution to the perceived customer benefits of the end product and difficult to imitate.

Strategic competencies are considered as a special type of core competencies. Strategic competencies were defined by Croteau, Taymond (2004) in their research on performance outcomes of strategic and IT competencies alignment. They found strategic competencies as a shared vision, cooperation, empowerment and innovation. Strategic competencies are part of the business strategy and help organization to gain competitive advantages. These competitive advantages refer to knowledge, know-how, skills that translate into distinctive capabilities for organization, help or in responding quickly to changes in the business environment.

Another special type of core competencies is managerial competencies. According to Henderson (2005), organizations have always been concerned about the competence of their managers. He identified managerial competencies as the 'micro-skills' of managers, and as a part of the capabilities or assets of the firm. It is these skills which allow the organization to transform its range of various other assets into organizational competence and then improve performance.

A second type of competencies is distinctive competencies. Leonard-Barton (1992) defined distinctive competencies as sets of differentiated skills and routines that provide the bases for sustainable competitive advantage.

Global knowledge competencies are considered as a special type of distinctive competencies. In recent research on the role of global market knowledge competencies, Yenyurt et al. (2005) concluded that the globalization forces engender companies to develop a new set of competencies that would enable the generation of better returns in the global marketplace. Related to this, knowledge management competencies consist of global customer, competitor and supplier knowledge management, inter-functional coordination and value chain coordination.

### **Internationalization Strategies**

Internationalization strategy is defined as plan to enter different foreign markets (Benjamin Levi, 2006). In this research, the internationalization strategic term is adopted from Swierczek (2004) and is considered as strategies companies use to go international. Exporting is the first step towards increased international sales, assets, employees and operations that leads to more outward globalization.

### **Internationalization Performance**

Traditionally, the performance of a firm was measured by comparing with previous measures from the same organization at the different time. According to the Benchmarking method, there are four types to measure the performance such as internal (comparing within a firm), competitive (comparing performance or processes with competitors), functional (comparing similar processes within an industry) and generic (comparing with unrelated industries). Generally, the term performance is considered as any recognized accomplishment. According to the marketing perspective, performance of a firm can be defined when the firm achieves its goals (valuebasedmanagement.net).

In this research, a firm's performance is defined as the accomplishments of firm's objectives in the business activities. These accomplishments can be revenue, sales, profitability, return on assets, return on equity, return on investment and so on.

### **Levels of Technology**

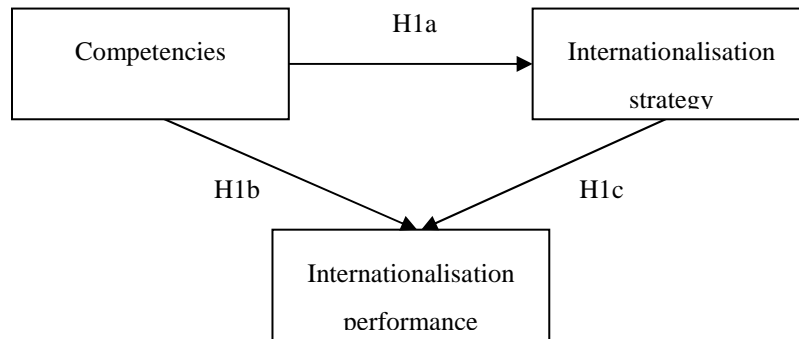

In this research, a high tech enterprise refers to an enterprise that operates in electronics and computer parts industry (E&C industry) and a low tech enterprise refers to an enterprise that operates in garment and textiles industry (G&T industry).

### **Research Model and Hypothesis**

There are several empirical researches focusing on the relationship between internationalization and firm's performance (Hawawini et al., 2004; Fillis, 2001), between firm's competencies and firm's performance (Regan et al., 2004; King et al., 2001), between firm's strategy and firm's performance (Parnell et al., 2005; Ibeh, 2003). However, there are some gaps in research and limited emphasis on the competencies, strategies and performance of the firm going to international. This study develops a conceptual framework for analyzing the impacts of the firm's environment (country and industry's scale), the firms' competencies, and the firm's strategy on the firm's performance in the context of internationalization.

Based on the objectives of this study, this research is conducted in an advanced research model with integration of the basic and the enlarged research model. The basic research framework is focused on the

relationships between firms' competencies, firms' internationalization strategies and internationalization performance. The first framework is illustrated in FIG 1.

Note: → Dependence

FIG 1: A BASIC RESEARCH MODEL

In order to express more detail the relationship between firms' competencies, firms' internationalization strategies and firms' internationalization performance in the country and in the industry contexts, the basic research model was enlarged. This enlargement is based on the descriptive models seen in Schamlensee (1985), Rumelt (1991), McGahan and Porter (1997), Hawawini et al. (2004). The firm performance is affected by the characteristics of an industry and a country environment. Therefore, the second model focuses on the comparison between two countries of Vietnam and Thailand, and between two types of industries: garment/textiles (high tech) and electronics/computer parts (low tech) industry (see FIG 2).

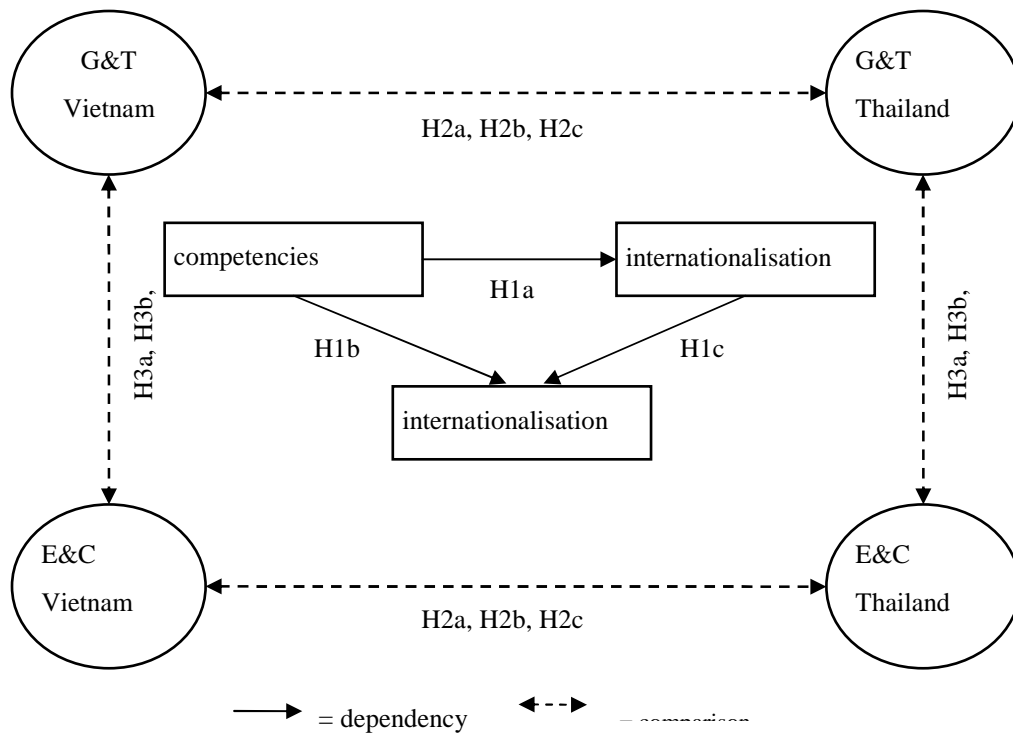

FIG 2: A RESEARCH MODEL FOR COMPARATIVE STUDY

The relationship between competencies and strategies in the context of internationalization has attracted many researchers. Hill and Jones (2001) has conducted case studies on some big companies in US such as Walt Disney, 3M, Honda, Xerron, etc.. They found the competencies and internationalization strategies have a positive link together. The same result is also confirmed by Fleury et al. (2003) in their research in SMEs and large companies in all industry in Brazil. The positive relationship between competencies on internationalization strategy and internationalization performance of the small and medium sized firms in the manufacturing sector in UK is confirmed by Regan, O. N. and Ghobadian A. (2004). No research on competencies and internationalization strategy was done in the South East Asian country. Therefore the following hypothesis is given

Hypothesis 1a: There is a positive relationship between firms' competencies with firms' internationalization strategies

The successful development of competencies on a global customer knowledge management process has a positive impact on the performance of the company (Kohli & Jaworski, 1990; Narver & Slater, 1990). The development of competencies in firms has been shown to have a positive effect upon various facets of performance

(Lyles & Salk, 1996). Although empirical research on different resources and capabilities has not yet reached maturity, there are many studies showing a positive relation between core competencies (knowledge and expertise in different functional competencies) and international growth (Cavusgil & Zou, 1994; Kogut & Zander, 1993). Recently, the positive relationship between competencies and strategies in the context of internationalization was tested in US, in UK, Canada and Finland by Cavusgil et al. (2004), Regan et al. (2004), Nummela et al. (2004) and Yenyurt et al. (2005) respectively. The above literature review shows that there is a lack research on this relationship in the South East Asia. Therefore, the next hypothesis is given:

Hypothesis 1b: The firms' competencies has a positive relation with the firms' internationalization performance

Most of empirical studies focused on the relationships between firm's degree of internationalization and its performance (Barney, 1991; Chandler and Hanks, 1994; and Wernerfelt, 1984; Grant, 1997). While most recent findings indicated that the link between internationalization strategy and performance may exhibit a non-linear form, some researchers disagree on the exact shape of the statistical curve (Ruigrok, Wagner, 2003). Some of researchers proposed that internationalization and performance have been mixed, both monotonic and curvilinear relationships (Hsu, Boggs, 2003). According to the literature review, the relationship between internationalization strategy and performance is mostly done in US, Canada, Germany, Sweden and Switzerland. Therefore, the following hypothesis is proposed to be tested in the context of Thailand and Vietnam:

Hypothesis 1c: The firms' internationalization strategies is significantly and positively related to the firms' internationalization performance

The influence of the country on the firm's capabilities or competencies is also studied by many researchers. The resource-based view argued that the internal environment is a key driver for firm's competitive advantages. Moreover the competencies and resources controlled by the parent firm in the home country can influence how firms attempt to enter and compete in foreign markets (Thomas et al., 1999). In the research on international and performance of 84 German manufacturing companies, Ruigrok et al. (2003) has confirmed the positive influence of country on the managerial competencies. Through using a secondary data, Toni et al. (2003) and Yenyurt et al. (2005) also confirmed the significant influence of county on internationalization competencies. However, there are a major gap in literature on the relationship between competencies required for a successful international strategy implementation and the outcomes associated with such competencies in the South East Asia. This study assumes that there are differences in environment, competencies, internationalization strategies, internationalization performance between two countries Thailand and Vietnam. Based on these discussions and the literature review, a set of three hypotheses are stated.

Hypothesis 2a: There are significant differences in competencies between Thai and Vietnamese companies

Hill, Hwang and Kim (1990) suggested that the foreign entry mode options are a trade off between preferences for control and resource commitments, based on environment variables. The important influence of country business environment on internationalization strategic decision is also confirmed by Koch (2001) and Beamish et al. (2001) in their study of 164 Japanese SMEs going international. No comparative study on the internationalization strategies of the firm going to international in Thailand and in Vietnam. Therefore, the following hypothesis is stated

Hypothesis 2b: There are significant differences in internationalization strategies between Thai and Vietnamese companies

Many researches on the impact of country factors to the firm performance in the context of internationalization have been done such as Dhanaja et al. (2003), Hawawini et al. (2004), Kuivalainen et al. (2004) and Rasheed (2005). The results of their study shown the positive effects of country to the firm's performance. However, these researches have been done in US, Canada and Europe only. There is no research on this issue that has been done in Thailand and Vietnam. Therefore the next hypothesis is given

Hypothesis 2c: There are significant differences in the internationalization performance between Thai and Vietnamese companies

Firms are more successful if firm achieves a "fit" or balance between the firm's internal environment and its external operating environment (Volberda, 1996; Ruigrok W., Wagner H., 2003). Textile companies and electronic and computer parts companies are operating in different industry environment in terms of technology level, labor skills, and management styles. These differences can create variety in competencies, internationalization strategy and internationalization performance.

The influence of industry on the firm's competencies is confirmed by King et al. (2001) through their research of 17 organizations from textiles and hospitals in US. The positive impact of industry on competencies is also indicated in the conceptualization research of Yenyurt et al. (2005). There is a major gap in the research on the influence of industry on firm's competencies in the context of internationalization between textiles/garment and electronics/computer parts in Thailand and in Vietnam. As a result, the following hypothesis is stated

Hypothesis 3a: There are significant differences in competencies between textile and electronic and computer parts companies

The influence of the firm's industry environment and internationalization strategy has been studied by some famous researchers such as Kogut (1988), Fillis (2001), Koch (2001), Ali (2004) and Rasheed (2005) in US, UK, Australia and US respectively. There is no research on this impact that has been done in Asia, especially in Thailand and in Vietnam. Therefore, the following hypothesis is given out to make a comparison between textile and electronic and computer parts companies

Hypothesis 3b: There are significant differences in internationalization strategies between textile and electronic and computer parts companies

The influence of industry on the performance of the firm going to international is confirmed by Gruenig et al. (2006) through their case studies in Switzerland. There is a gap for doing the comparative study on internationalization between the companies between textiles/garment and electronics/computer parts industry. Therefore the next hypothesis is stated

Hypothesis 3c: There are significant differences in the internationalization performance between textile and electronic and computer parts companies

## **Primary Findings**

In order to assess the current situation of two industries in Vietnam and in Thailand as well as to test the given hypotheses, the questionnaires have been sent to 450 companies in related industries in Vietnam and 1150 companies in Thailand. The companies are selected randomly from the list of Directory of Vietnamese Ministry of Industry, Vietnam Chamber of Commerce and Industry and from the Manager Company in Thailand and Thai Government manufacturers association. The valid respondents are only 112 in Vietnam and 58 in Thailand (see TABLE 1).

TABLE 1: RESPONDENTS PROFILE

Characteristics		Vietnam		Thailand	
		G&T (%)	E&C (%)	G&T (%)	E&C (%)
<b>1. Business activities</b>	Manufacturing	82.5	8.1	75.7	47.6
	Trading	7	64.5	21.6	28.6
	Services	3.5	12.9	2.7	23.8
	Others	7	14.5	0	0
<b>2. Legal forms</b>	State-owned company	33.9	9.7	8.1	0
	Private company	30.4	74.2	73	42.9
	100% foreign- owned company	10.7	3.2	8.1	38.1
	Joint venture company	25	12.9	8.1	14.3
	Others	0	0	2.7	4.8
<b>3. Size of firm (total of legal capital)</b>	SME	26.9	56.5	43.2	38.1
	Large	73.1	43.5	56.8	61.9
<b>4. Experience in doing international business</b>	<1 year	8.6	43.5	10.8	19
	1-5 years	27.6	29	8.1	28.6
	>5 years	63.8	27.5	81.1	52.4

*Note:* G&T = Garment and Textile; E&C= Electronic and Computer parts

Manufacturing is the main business activity of the firms, except for E&C group in Vietnam involved in trading activities. Private sector owned most the firms, except the G&T group in Vietnam. Most of firms are in large size, except the Vietnamese E&C group, that included 56,5 % SME. E&C companies are much less experienced in international operations than the others.

**International Competencies**

In this research, competencies related to internationalization are measured by three dimensions: global knowledge management competencies, strategic competencies and managerial competencies. These measures were self-reported scores of the firms on a seven-point Likert scale from very limited to outstanding.

The difference of competencies between firms in two industries in Vietnam and in Thailand is shown in the FIG 3.

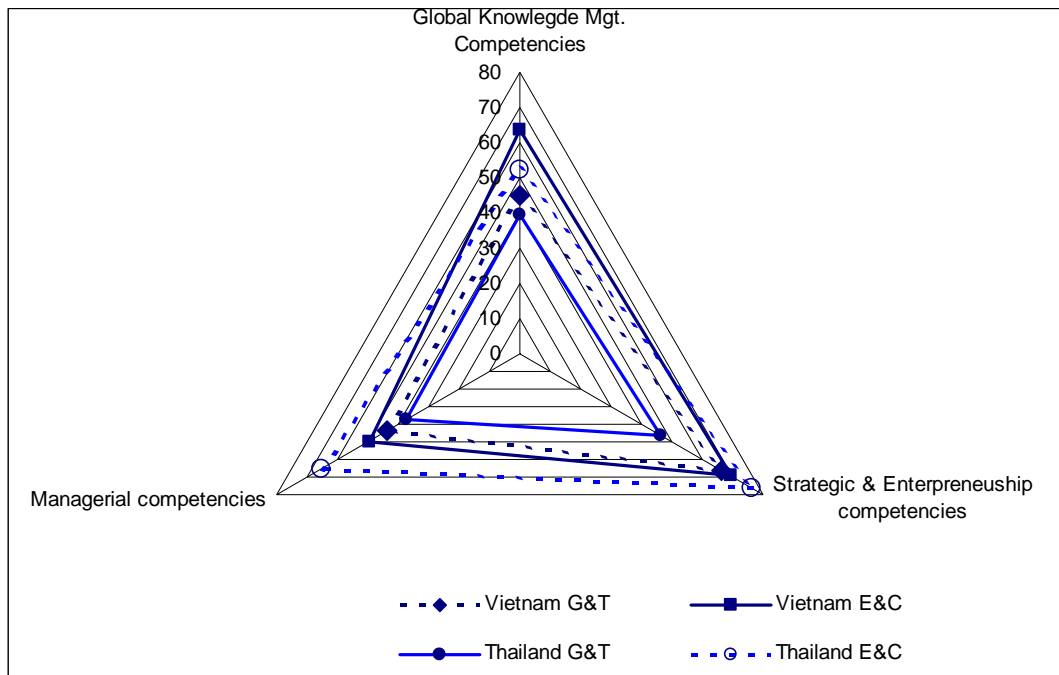

FIG 3: COMPARING COMPETENCIES OF FIRMS IN TWO INDUSTRIES IN VIETNAM AND IN THAILAND

The data shows that E&C firms have better global knowledge competencies than the others. E&C firms in Thailand have better core competencies and strategic competencies than the other firms. FIG 4 and FIG 5 present the different level of competencies in G&T and E&C firms in Thailand and in Vietnam respectively. The results show that G&T firms in Vietnam have better competencies as compared with Thai companies overall.

FIG 4: COMPARING FIRM'S COMPETENCIES IN G&T INDUSTRIES IN VIETNAM AND IN THAILAND

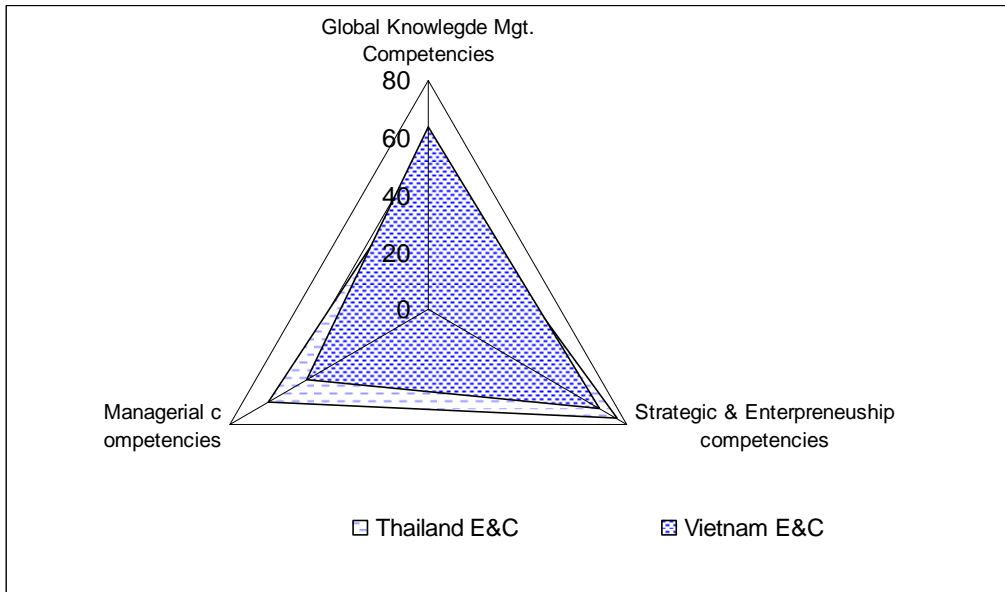

FIG 5: COMPARING FIRM'S COMPETENCIES IN E&C INDUSTRIES IN VIETNAM AND IN THAILAND

By contrast, E&C firms in Thailand have better competencies than E&C ones in Vietnam in terms of strategic and management competencies.

#### Foreign Entry Mode or Internationalization Strategy Comparison

Almost of firms selected the exporting as the entry mode to enter the foreign markets (>70% of all respondents). However, there are various forms of combination between these foreign modes (see TABLE 2). The joint ventures and export combination is the most popular for Vietnamese firms in both industries, while Thai firms used various combinations.

TABLE 2: FOREIGN ENTRY MODE SELECTED

Foreign entry mode	Vietnam		Thailand	
	G&T	E&C	G&T	E&C
Export & Licensing	1	0	4	2
Franchising & Export	1	0	1	0
Franchising & Export & Licensing	1	0	1	5
JV & Export	11	12	4	2
Franchising & Export	0	0	1	0
JV, exporting and Licensing	2	7	0	1
JV-Licensing	2	1	0	0
JV-Franchising	0	5	0	0

*Note:* G&T = Garment and Textile; E&C= Electronic and Computer parts

#### Internationalization Performance

Performance of internationalizing firms is gauged by the level of achievement its objectives in last three years. In this research, firm internationalization performance and success was evaluated by using four measures: internationalization growth rate, internationalization intensity, comparative market share and generic subject indicator. These measures were self-reported scores of the firms on a seven-point Likert scale from very much less to very much bigger.

Most of firms achieved their objectives less or much less compared with its plan, significantly the E&C companies in Thailand. More than 60% of the total E&C companies achieved the performance very much less than their plan. However, more than 50% of G&T companies in Vietnam achieved the bigger performance as compared to given objective (see FIG 6). These results show the big difference between the performance of high-tech and low-tech companies in Thailand and in Vietnam.

FIG 6: COMPARING COMPETENCIES OF FIRMS IN G&T INDUSTRIES IN VIETNAM AND IN THAILAND

## Discussion

As discussed at the beginning, the internationalization is unavoidable for every economy around the world. In market economies, the internationalization is done mainly by the companies. The popularities of the WINDOWS operation system or IBM computers are presenting the success of internationalization of Microsoft and IBM. There are many reasons of the world reunion Swiss banking services, or the reduction of Russian aircraft in the world sky. Many experts believe that the competencies and internationalization strategies are the biggest reasons. This study focuses mainly on investigating the success of entering foreign markets with the help of firm's competencies and to identify the internationalization strategies of the companies that operated in Vietnam and in Thailand, using different examples in different industries.

The primary findings of this research indicated that there are differences on the internationalization competencies between the enterprises in high-tech (E&C) and in low tech (G&T) industry. E&C companies possess better global knowledge competencies while G&T companies have better competencies in terms of strategic and management ones. The internationalization strategy that firms used to going international are also various between two types of selected industry. There are also differences on the competencies, internationalization strategy and

performance between the enterprises in two selected industries in Vietnam and in Thailand. These primary results will be a good base for further empirical tests of the given hypotheses through using the ANOVA and regression techniques to confirm relationship between competencies, strategy and performance and the influence of industry and country factors on these elements.

As the homeland of the author, the selection of Vietnam as the first country in the research is simple to understand. The selection of Thailand as the second country in this research has several reasons. The most important reason is the similarities between Thailand and Vietnam in terms of geographical, social and cultural conditions. The membership of Association of Southeast Asian Nations provides these two countries the same regional economic business environment. The difference between levels of economic development between two countries is a base for learning by Vietnamese companies.

According to many studies, the technological factor has been a significant variable indicating the internationalization of a firm. Technology is an important factor in a firm's product mobility across national boundaries. In this study, the companies are categorized in term of production technology in order to see the technological impacts and success on internationalization process. Representing the low-tech industries, the garment and textile companies are selected, while the electronics and computer parts sector is chosen as the representative of high-tech industries. Both selected industries exist with a sufficient number of companies in Thailand and Vietnam.

## **Conclusion**

There are differences between the competencies, strategies and performance of internationalizing firms in two selected industries in Vietnam and in Thailand. These differences should be tested step by step based on the proposal framework through ANOVA. The proposal hypotheses will be tested by using a REGRESSION method. This article presents only preliminarily characteristics of respondents and the basic difference on competencies, foreign entry modes and performance of internationalizing firms in G&T and E&C industry in Vietnam and in Thailand. Further findings of this study will be presented in the next publications.

# **Internationalization of Japanese Eyeglass Industry**

*Masaru Nambo, nambo@fpu.ac.jp*

*Fukui Prefectural University, Japan*

## **Abstract**

**One of the present tasks in individual industries is “internationalization,” which includes establishment of overseas bases for low-cost production to maintain superior competitiveness, and cultivation of overseas markets.**

**In this report, we put a focus on the eyeglass industry, in which more active movements of internationalization have been observed in recent years compared to other Japanese industries, to examine its actual businesses and future direction of internationalization, taking into consideration the relation of interdependence among the world big three production sites of eyeglasses, Japan, Italy and China. In this report, in accordance with the definition of P. Dicken, we discuss the actual internationalization of the eyeglass industry from a viewpoint of extensive expansion of economic activity to prospect the future direction of the industry.**

## **Introduction**

The internationalizing of local regional industry is a topic demanding serious attention. Spurred by the need to maintain competitiveness, internationalization is the moving of manufacturing centers overseas in order to lower costs and the entering of foreign markets to open new sales channels.

This paper looks at the internationalization of recent years of industries based in Fukui Prefecture by looking at one particular industry, namely the eyewear industry, which has shown remarkable movement in this direction. Along with ascertaining and accessing the current state of internationalization in the Fukui eyewear industry, we also want to investigate the future course of internationalization with an emphasis on the mutual interdependence that exists between the eyewear industries of Japan, Italy, and China - considered the world's three major eyewear manufacturing countries. According to Peter Dicken<sup>1</sup> (2004), however, the use of the term “globalization” has become established as a term similar in meaning to “internationalization” but with the following distinction. Put succinctly, “internationalization” is defined as a process in which “the simple act of expansion pushes economic activity across national boundaries. As such, it is essentially a quantitative process, one that causes economic activity to expand in a geographical pattern.” In contrast, “globalization” is a process “qualitatively

distinct from internationalization in that economic activity does not simply extend across national borders by geographic expansion but more crucially is a function integration of various economic activities going on all over the world.” Here, we will adopt Dicken’s definitions and conduct our study of the eyewear industry from the perspective of *internationalization* in its sense of economic activity expanding across national borders.

Moreover, economic internationalization has been posited as, first, the trade of goods along with the trade of services and, second, the international movement of production factors. Production factors are land, capital, and labor. Land lacks mobility and, in the case of Japan, the international movement of capital is much more common than that of labor. Therefore, when observing the internationalization phenomenon, the international movement of capital is vital<sup>2</sup>. Consequently, rather than internationalization in the broad sense of “the international flow of the various elements that make up a society, such as people, things, money, and information,”<sup>3</sup> we will take up internationalization in the narrow sense of those economic activities carried out by enterprises, with special attention paid to the overseas investment activities (direct foreign investment)<sup>4</sup> that accompany capital movement, and will not address the increasing internationalization in recent years of factors such as finance, information, culture, and human interaction.

Based on these criteria, we begin with an analysis of trade trends that represent what we will call a “prologue to internationalization” of the eyewear industry. This is followed by an assessment of the current state of eyewear industry internationalization, making reference to its characteristics and of the factors that brought them about. We also include an assessment of the course of eyewear industry internationalization with this analysis. Finally, we conclude with a few additional remarks about the eyewear industry and the internationalization it has fostered-what shape will internationalization assume in the future? And how should we approach issues bound up with it in order to achieve further development? And so on.

## **The Trade History of Sabae Eyewear Industry**

### **The start of export trade for the Sabae Eyewear Industry**

The history of the Sabae region eyewear industry export trade goes back to 1907. In that year, regional industrial giant Masunaga Kojo began exporting via Osaka wholesaler’s eyeglass frames to Russia as a general store item. By the 1910s, exporting had expanded to mainland China and in the 1930s Yumatsu Murai began doing direct trade with India<sup>5</sup>. But exporting of regional output did not begin in earnest until the 1960s with the sharp increase in exports to North America. According to the Fukui Branch of the Export Inspection Association (est. 1964) 1965 export inspection statistics, total eyewear exports for Fukui Prefecture including the Sabae region in unit base terms

grew from an initial 37,000 dozen to 240,000 dozen, a more than six fold increase. In monetary terms, the region exported 4.3 billion yen in frames and 8.279 billion yen in sunglasses, reading glasses, and other eyewear. Moreover, export destinations were worldwide, including Taiwan, Hong Kong, Vietnam, Cambodia, North America, Africa, and Oceania. What needs to be noted about this data, however, and as the monetary breakdown by item shows, is that unlike today sunglasses – a technologically uncomplicated product and therefore easy to export to overseas markets - were the primary export item. But as the quality of local output increased the focus gradually shifted from sunglasses to frames<sup>6</sup>, and this development, coupled with aggressive PR promoting regional industry, went on to foster robust export revenue growth.

#### **Recent Trading Trends: Overview of the Fukui Prefecture (Sabae) Eyewear Trade**

A look at Fukui region manufactured eyewear frames shows combined 2004 frame and eyewear<sup>7</sup> exports of 28.3 billion yen and imports of 30.7 billion yen. Moreover, with the rise in the yen following the 1985 Plaza Accord, exports peaked in 1992 at 50.6 billion yen followed by a sharp decline. This is attributed to the rising yen from 1993 along with an increase in direct trade as local manufacturing shifted to China and the subsequent side effects this generated, such as exports from China based manufacturers to Japan. While this resulted in imports greatly exceeding exports on a monetary base, a 2002 decrease in the import total showed a reversing of this broader import-export trend.

The aforementioned import data covers all of Japan so it is necessary to calculate export data for the Fukui manufacturing region alone. According to our own basic calculations, in 1996 the ratio of exports in monetary terms for the primary production item of frames (including parts) was 37.2% of 28.459 billion yen and in 2004 34.4% of 19.426 billion yen. While, as mentioned above, the trend for both export totals and the ratio has been downward in recent years, this is attributed to the shift of manufacturing to China and the subsequent growth of direct imports from overseas, China especially.

On the other hand, imports, which exceeded exports in monetary base terms, held steady since 1996 and from 1995 through 1996 increased more than 30% compared to the previous year. The peaking of reverse imports due to the increase in regional enterprises shifting manufacturing overseas in the 1990s is attributed as the main cause for this trend. The subsequent three straight years of decline starting in 1997 is attributed to uncertain demand due to poor economic conditions in Japan during that period and the subsequent reduced need for local enterprises to manufacture overseas, which in turn reduced reverse imports. The renewed rise in imports from 2000 is considered more the result of an increase in Chinese enterprises entering the Japanese market than of Japanese enterprises shifting manufacturing to China and reverse importing.

#### **Trading Trends by Destination and Item**

A look at trading trends by destination and item for eyewear goods show the following characteristics. Turning first

to export destination, in 1998 52.0% of exports were bound for North America, 29.8% to Europe, and 17.1% to Asia. After 1998, the percentage of exports to North America slowly declined down to 43.9% by 2004. Over the same period, exports to Europe slightly increased from 29.8% to 31.8% and exports to Asia increased robustly from 17.1% to 23.2%. In 1998, 70-80% of Japan's exports were bound for North America and Europe but the picture is somewhat different for more recent years. The export share of the United States, the main recipient of North America bound exports, declined sharply from 49.8% in 1998 to 35.4% in 2004. In contrast, the export of eyewear parts to East Asia, China especially, has increased robustly spurred by the growth in the domestic manufacture of eyewear frames in this region, a trend that we will look at below in terms of the change in trade volume (increasing exports and imports) with China.

Turning to imports, shows that in 2004 51.8% of imports came from Asia, a slight decrease, and 42.5% from Europe, which, in contrast to Asia, is a slight increase and thus no significant change overall. Imported goods from China, however, have increased significantly and, when excluding Italy, have been the biggest source of imports since 1997. This is due to the development of the eyewear industry in China as a result of Fukui based enterprises moving to that country. Trends by item show in the 1990s the proportion of frames exported declined from the 80% level to the 70% level while eyewear such as reading glasses and sunglasses somewhat increased. The breakdown shows that more than 80% of frame exports were metal frames and around 10% were parts exports bound for manufacturing bases set up overseas. For eyewear that comprises the remaining 30%, less than 90% were sunglasses. On the other hand, for imports 60% overall were eyewear and 40% frames, with the bulk of imports consisting of metal frames and sunglasses, both of which comprised just under 80% for their respective categories.

#### **The Emergence of China as a Trade Partner**

The general picture for Fukui Prefecture eyewear trade provided by the above data shows that the shift of manufacturing to overseas in recent years is a significant factor in changing import-export trends. In particular, the ongoing impact on the industry in China by enterprises shifting production to that country cannot be overlooked. As a further reference, import-export data for China only shows that along with the sharp increase in metal frame and sunglasses imports of the last several years exports from Japan have been robust, especially of parts. Moreover, for imports overall, imports from China comprise 88.3% for plastic frames, 87.4% for metal frames, and 84.2% for sunglasses.

This phenomenon can be attributed to the supplying of parts to Fukui enterprises that have moved manufacturing to China and the subsequent increase in imports from those same enterprises, suggesting the exertion of an export stimulation effect and a reverse import effect on local industry. If this phenomenon progresses further, in the future the Fukui eyewear industry will see the emergence of an import substitution effect<sup>8</sup> with local industry producing less of the low- and mid-end product that is China's specialty and a subsequent contraction of local

industry.

## **Internationalization of the Eyewear Industry: Current Conditions and Future Direction**

### **The Continuing Internationalization of the Eyewear Industry**

The previous chapter summarizing trading trends for the Fukui Prefecture eyewear industry shows that the dramatic increase in recent years in the pace of internationalization of local industry (meaning the shifting of manufacturing overseas) has had a significant effect on both export and imports. So just how internationalized is the Fukui Prefecture eyewear industry? This chapter closely examines this question.

Internationalization of the Fukui Prefecture eyewear industry started in the 1980s and became particularly evident after the 1985 Plaza Accord. Internationalization can be separated into two broad periods – the 1980s and the 1990s – because the shifts overseas during these two periods had different underlying factors. The moves overseas in the 1980s were done to strengthen sales in foreign markets and thus focused on setting up sales centers by setting up fully owned subsidiaries in local markets. Therefore, movement was toward Europe and North America where the demand outlook was considered most favorable. According to the 2004 List of Internationalized Enterprises compiled by The Fukui Chamber of Commerce and Industry, of the six overseas regions with a Prefectural business presence at the time, three were in the US, and the remaining three were in Germany, Brazil, and China. Moreover, five of these were sales centers and the only example among them of an overseas manufacturing base was a business that had set up operations in China.

The second period that began in the 1990s saw the beginning in earnest of moving overseas with the aim of manufacturing locally. Specifically, companies had already established an overseas presence in the form of sales subsidiaries in 34 regions and had set up overseas manufacturing center in 15 of these regions. Of this total, 22 regions, or 64.7%, were in China. The factors stimulating overseas manufacturing on the part of the eyewear industry include the 1992 peak and subsequent decline of exports along with the sharp decline in the ability to compete by price in the international market as a result of a sharply rising yen. Moreover, it is indisputable that the fall off in domestic demand brought by the collapse of the financial bubble in Japan compelled local industry to seek new opportunities outside of Japan. At the same time, however, the aforementioned sales centers established since the 1980s in the US, Europe, and other sought after consumer markets created new demand, and a manufacturing infrastructure capable of delivering the price competitiveness and the mass production for meeting the massive demand of these markets was essential.

But if we were to point to the biggest factor for the internationalization of the eyewear industry, it would have to be the unique features of the industry in the Sabae region. That is, in contrast to the intra-company integrated

production systems found in European countries such as Italy and Germany, production in the Sabae region industry is organized around the division of labor. Namely, in addition to the manufacturer of the finished good, the manufacturing process includes a number of related businesses, including subcontractors that do intermediate processing, parts manufacturers, sellers of manufacturing materials, and wholesalers within the region. The system consists of a complicated division of labor distributed among numerous small, family owned businesses performing more than 200 processes. The region's extremely labor intensive division of labor manufacturing system and the need to further reduce production costs due to intensifying competition with overseas eyewear manufacturers made it essential to change how the manufacturing process was organized. And here was the primary benefit of moving overseas. Moreover, German eyewear manufacturers had already moved manufacturing overseas, and as their experience showed, compared to other industries the eyewear industry does not require an especially significant contribution of technology to the overseas site (meaning, the technology the manufacturing site needs to get up and running), and thus an eyewear manufacturing enterprise is relatively more able position to leave planning, development, and the other non-physical, brain oriented divisions of the company in the home country and focus on shifting only the manufacturing component overseas.

#### **Current Status of Eyewear Industry Internationalization**

The above examination of the circumstances underlying the shift of the eyewear industry overseas notes the large number of manufacturing centers established in China. This is attributed to the fact that China has been the country with the lowest labor costs, a requirement given the primacy of price in the international market. Another factor is the development of a favorable environment in China for foreign investment (the establishing of special economic zones, the opening of 14 coastal cities to foreign investment, and so on). Other contributing factors include the future potential of the China market and the benefits of close proximity to the markets of neighboring countries. Given the fact that all these factors make China an inviting investment target and have spurred the eyewear industry to move manufacturing to that country, what was the overall strategy governing the choice of location and the establishing of manufacturing centers for enterprises making the move? The following examines the specific strategies of enterprises that have moved to manufacturing to China.

When looking at how enterprises that have recently moved to Asia have allocated their division of labor for their manufacturing operations, besides moving the labor intensive uniform production lines characteristic of intermediate manufacturing processes, manufacturing is becoming increasingly differentiated by segmentation along the lines of design, quality, and price. As a market strategy, moving overseas has the primary benefit of reducing costs, and includes cases where the aim is to increase international competitiveness in a third-country market by exporting to those countries while also exporting to Japan as well as cases in which production is intended to grow along with local markets as Asian economies grow. When assessing the shift overseas of the eyewear industry within

this context, the shift can be categorized as one of three main types.

In the first type, the labor intensive portion is done in China while technologically demanding final finishing processes are done in Japan. This makes it possible to sell the finished product as a made in Japan brand. Being able to manufacture a high value-added product at low cost in this way has the benefit of delivering a cost competitive product to both domestic and overseas markets. For this reason, a comparatively high number of enterprises moving overseas adopt this manufacturing approach. Moreover, in this case, another factory in the same region may also use the already existing sales network in China to supply product bearing the company brand under an integrated production system (supplying everything from manufacturing molds to parts and final finishing) as part of a manufacturing to sale market strategy focusing on the vast China market. This company, which is based in Shanghai, boasts a very high market share for its product. (Table IV-2-4)

The second type is characterized by the region's largest manufacturer and seller of eyewear frames. Goods formerly produced in Japan for overseas markets are now produced in China. By dividing production between China and Japan in this way, the company has adopted a strategy wherein the China manufacturing center produces goods for the world market. Specifically, using the company's already established sales network for the international market as its base, the China factory's integrated production system produces mid-line product for overseas markets and then exports it directly from the factory. Moreover, the company segments along product lines: goods produced in China for foreign markets turn out different brands from those manufactured and sold in Japan, each with their own design, quality, price, and other characteristics geared for particular markets around the world. Currently, the company's China factory employs around 2000 people and produces several million eyewear frames annually, making it an operation substantially greater in scope than the company's primary factory in Japan. (Table IV-2-5)

Companies conforming to the third type, unlike the aforementioned manufacturers of finished goods, shift only a part of their manufacturing processes abroad in the form of parts and plating factories overseas. Currently, the few companies that have taken this approach do so to lower production costs and for other reasons such as diversifying their revenue sources beyond those companies in Japan by anticipating demand from enterprises overseas. Another factor that cannot be overlooked is that besides the appeal to overseas customers of a high-value product at a low price is the value added of the final product made possible by using the technology of Japanese firms in the final manufacturing phase.

In addition to these three types, some companies continue production in Japan and focus on getting into the world market by fully globalizing their network of sales centers. Such companies generally avoid engaging in price competition in favor of focusing on promoting a topflight brand with high-valued added.

#### **Other Internationalization Activities**

The above section described how the eyewear industry has internationalized mainly by specializing manufacturing

processes. But in addition to moving manufacturing overseas in recent years, leading local companies have formed partnerships with Italian and other foreign brand name manufacturers with the aim of increasing their sales strength in the international market by acquiring a topflight brand. This trend has especially picked up momentum since mid-1997, when local industry giant Charmant formed a partnership with the major Italian eyewear firm Luxottica and established a large-scale distribution center in Sabae to put in place a framework for more effectively utilizing Luxottica Lux brand strength. Likewise, Sunreeve, which manufactures and sells eyewear, merged with the major Italian eyewear company Zafiro, establishing a sales subsidiary in Tokyo and formulating guidelines for selling Zafiro licensed brands in Japan. In addition, companies from other industries have entered the market. In October 1998, for example, the Ono Group, whose major holding is textile machinery manufacturer and seller Nippon Meyer, formed a partnership with German optical equipment manufacturer Carl Zeiss. The two sides agreed to establish a jointly owned company to sell Carl Zeiss brand eyewear frames. The objective of these partnerships was to jointly use the technological expertise of Japanese manufacturers and the brand strength of Italian and German manufacturers to achieve dominating a sales share in the world market. These partnerships and mergers represent a kind of international partnership for maintaining a cooperative working relationship between enterprises and their emergence can be seen as efforts to combine and maximize the economic efficiencies<sup>9</sup> of the parties involved.

#### **The Future Course of Internationalization for the World's Three Major Producing Countries**

The above section organized the main features that characterize the internationalization of the eyewear industry. The section noted that the strategy involves setting up manufacturing centers in foreign countries, of which one type focuses on setting up centers specializing in a particular manufacturing process, another type establishes overseas manufacturing as a way to serve the world market, and yet another type shifts manufacturing overseas in order to assume some of the manufacturing processes of overseas enterprises. In addition to this strategy, in recent years companies have increasingly entered into business partnerships in order to share Japanese technical expertise and the brand power of companies based in Italy and elsewhere. This development means that companies are moving from their past strategy centered on maximizing the cost advantages stemming from economic efficiency to one that emphasizes management expertise based on a company's ability to develop a successful business strategy<sup>10</sup>, a development that shows that the internationalization of the eyewear industry has reached a very advanced stage.

When we talk about the world's eyewear producing regions, we are referring to the powerful name brand eyewear produced by Italy, to the mainly low cost, mass produced, and OEM supply product of China, and to Japan's Sabae region, which specializes in cutting-edge technology and a wide variety of product produced in low volume. These three regions needless to say continue to monopolize the world eyewear market. While the industry in China had once centered around state owned large-scale eyewear manufacturers based in Shanghai, Dalian, and other major cities, these poorly automated, inflexible state-owned giants were incapable of quickly adapting to

design trends, new materials, and other developments that were essential to successfully competing in the eyewear industry, and as China's market economy developed they surrendered their dominance to local eyewear manufacturers based in the six major cities of Wenzhou, Danyang, Xiamen Guanzhou, Shenzhen, and Shanghai. These newer entrants steadily improved their technology to the point of even being able to locally produce technologically challenging titanium frames. Thus having added rising technological standards to its low costs and abundant labor, in the future China will unquestionably pose a major challenge to eyewear manufacturers in Japan, Italy, and elsewhere. Indeed, these three primary regions are already engaged in fierce competition with one another. Seeking low cost production, Italy has begun to enter China, while China in turn seeks to preserve its OEM clients among Italian brands. Meanwhile, Italian brand name suppliers and Japanese enterprises dealing in technologically sophisticated goods have deepened their mutual dependence on one another. Moreover, Japanese enterprises enter China in search of low cost production while Chinese firms seek to acquire Japanese technology, a development that is inevitably linked to transfer of technology to China.

When looking at the future course of internationalization (meaning, moving overseas) of the Fukui Prefecture eyewear industry within the context of this triangular structure and the battle for survival of the three primary producing regions taking place within it, the following scenario is inevitable. If Italy and Japan enter China in pursuit of the economic efficiencies of low cost production, Italy, Japan, and China cannot all be expected to maintain their competitiveness. Consequently, those eyewear enterprises in China pursuing the most low cost business model will, in the near future, be compelled to revise the course of their strategy for foreign markets. That means enterprises shifting to a model for entering the China market or those aiming for low cost production have to turn to regions that offer the best opportunities for maintaining their competitiveness given the strategy they have chosen. Moreover, enterprises that already have an international sales network, and along with the formation of regional blocs in the world economy, in order to supply goods that meet the needs of markets in Europe, the US, and elsewhere, have to shift from a framework dependent on the network of already existing sales centers and embark on building manufacturing centers in regions close to the markets where goods are sold. Moreover, what form the trend for corporate partnerships (international partnerships) undertaken by Italian, French, and German enterprises on the one hand and Japanese enterprises on the other with the aim of sharing brand and technological expertise takes needs to be followed closely.

## **Conclusion**

We have discussed above the state of internationalization as a component of the broader trade trends of the eyewear industry, and should eyewear industry internationalization progress any further than it already has, it will

unquestionably have a wide range of affects on the industry in Fukui Prefecture. One of these factors is the aforementioned change in the volume of trade with China (meaning the increase in parts sent to China and the increase in the import of finished goods to Japan). This increase has negatively affected regional industries and if it continues will bring about export substitution effects, causing the industry to lose out in the area of the low- and mid-end product that are China's strength and ultimately bring about a hollowing out of local industry.

The transfer overseas of eyewear manufacturing technology is another major problem linked to this trend. Until recently, the typical pattern for local industry has been to move all production through the frame stage overseas and then bring the output back to Japan for final plating and finishing. In recent years, however, enterprises are increasingly setting up integrated production systems in or moving their plating and processing divisions to China to such an extent in fact that it is no longer an overstatement to say that all regional manufacturing processes have shifted to China. The implication of this trend is that the cutting-edge technology that drives the eyewear industry is being transferred to China with the result that eyewear manufacturers in China are learning how to use better technology.

The development accompanying these changes that needs special attention is the subtle changes occurring as a result of the aforementioned international partnerships. Since the 1980s, the strategy of adding value-added to their own product by paying expensive licensing fees to acquire famous brands and thereby enhance sales strength has been a standard business practice of regional enterprises. As noted above, over time this practice has assumed the form of partnerships between major local enterprises and overseas brand name manufacturers and brand holders. But, along with the ongoing realigning of the industry in recent years by the accelerating pace of mergers and acquisitions on the part of topflight European brands, more recently cracks in the brand oriented partnership framework between regional enterprises and overseas brand manufacturers and brand holders are starting to appear, such as parties declining to renew licensing agreements and the pulling out of sales subsidiaries formed through mergers with Fukui enterprises. This trend poses a grave threat for Fukui enterprises in that they can be expected to enter the overseas market for name brand manufacturer and brand holders eyewear in the future and yet could possibly lose control of well known brands. The implication of this development is that the era of eyewear manufacturers selecting the brands they want is giving way to an era in which overseas brand manufacturers and brand holders select the eyewear manufacturers they want, overseas enterprises included.

The hollowing out of regional industry and transfer of technology abroad engendered by internationalization along with the strains in brand oriented partnerships clearly pose major challenges for the future of the Sabae eyewear industry. The future shape of the industry as it moves forward within this context, for both major enterprises and medium and small manufacturers is considered to be moving in the direction as described below. Turning first to major regional enterprises, and including those that have already internationalized by moving

overseas, we see that these enterprises have been compelled to pursue the aforementioned low cost production as a way to address intensifying competition with Italy and China. In recent years, along with DC brands and developments relating to them thus far, the major enterprises are working to brand all sorts of functions and features by bringing the functionality of their product to the forefront, but for these mass producing major enterprises relying on this alone as a way to expand output is undoubtedly a difficult proposition. Going forward, if the major enterprises make every effort to seek out partnerships and develop strategy with rgw overseas brand manufacturers and brand holders that possess unique sales strengths in the international market it is essential that relative to them they pursue dominance in the area of cost by adding value through technology, design, planning, and other factors.

On the other hand, the medium and small manufacturers that are the driving force of local industry (small finished goods manufacturers, intermediate processors, parts manufacturers, and so on) must preserve the past risk avoidance strategy of maintaining a large number of accounts while also building an ordering system endowed with a sufficient degree of specialization for meeting the needs of their customers. That requires not only building factory delivery and lot systems but coordinating closely with the planning division in order to meet the material, quality, design, brand, and other requirements of their customers.

Moreover, all manufacturers regardless of size will have to consider developing the house brands that have become the focus of so much attention in recent years. So far, regional industry has concentrated on DC brand licensing as a way to cultivate company brand, and sales channels as well are mainly primary and secondary distributors by way of major eyewear mass retailers that stress price more than design. In contrast, a house brand is a unique company product planned and developed by the company that aims to simplify distribution by selling directly to concept shops and other small retailers or by adopting a direct sale framework, has a design with a keen fashion sense, and is appropriately priced. A house brand aims to develop niche markets and, if one had to say, such a strategy might be best suited to the sales strategies of small and medium sized manufacturers.

The final issue concerning the future of the industry we need to address concerns those related fields in which the eyewear industry has put its technology to use. This is because as medical technology advances eyewear frames may lose their crucial role as a medical instrument. Therefore, in the short- and medium-term the industry needs to pursue low cost, high-valued added and fashionable product development while pursuing in the long-term further enhancing the technological standards of the industry to ensure that eyewear technology remains an indispensable resource to other fields.

One of the core technologies of the Fukui eyewear industry is its technology for working with extremely difficult to process materials such as titanium and super-elastic NT metal alloys. The extraordinary potential of this technology is a well known fact. If this technology for processing difficult materials were to become an established high-precision technology used in conjunction with precision casting and super-plastic processing<sup>11</sup>, it would be

possible to develop titanium and shape memory alloy core applications for precision machinery, laser, medical, and other uses. Moreover, building on the advances of precision casting the possibility of developing high alloy metals, stainless steel, and other hard to process materials for use as machine parts - a market potentially worth trillions of yen – is not at all farfetched. Further developing the potential of the industry’s precision technology in this way will stimulate existing markets and related fields, present opportunities for entering different fields, and recast the industry into a new form.

The Fukui Prefecture eyewear industry has overcome numerous challenges to reach its status as the world’s premier eyewear industry region centered in the city of Sabae. But now the same materials, functionality, and planning and development prowess in the area of design of the region’s enterprises that have made this past success possible must now turn to the internationalization that has been the subject of this paper. At the same time, the hollowing out that underlies internationalization is on the verge of emerging as a full blown problem. In addition, the breaking down of brand oriented partnerships will certainly have a severe negative impact on the local eyewear industry in the future. Nonetheless, we must not forget the fortunate circumstance that finds Sabae eyewear manufacturers located in the world's second highest value-added consumer market, following that of the US. By quickly ascertaining the vast as well as the uniquely Japanese needs of this market, the Sabae eyewear industry will continue in its role as a region developing and supplying eyewear products.

<sup>8</sup> METI 1998 *White Paper*, 1998, Ministry of Finance Printing Office, 254.

The effect of moving overseas on trade and manufacturing has produced the following three general outcomes: Stimulation of domestic output due to supplying capital and machine parts to overseas affiliates (export inducing effect); Increased imports to Japan due to importing output of overseas subsidiaries (reverse import effect); The substitution of Japanese exports and output by foreign output (import-export substitution effect). Moreover, METI formulates a table showing the relation between the export inducing and import substitution effects for output as part of its annual survey of Overseas Business Activities. In 1995, the table showed for the first time since its inception a net minus effect.

## Abstract

**In the semiconductor industry, there is constant pressure to make products faster, better and cheaper all the time. In such a highly competitive environment, many semiconductor foreign-owned MNCs have chosen to set up semiconductor design centers in India. Based on an exploratory study of fifteen subsidiaries in semiconductor design representing approximately sixty six percent of MNC presence in that industry space, the authors studied the rationale behind setting up semiconductor design centers in India and the contribution made by Indian subsidiaries in terms of value added services to the parent MNC, its other subsidiaries and the industry ecosystem. The aim was also to investigate the extent to which these subsidiaries function as centers of excellence within those MNCs.**

## Introduction

Network based MNC models are widely discussed in literature, the argument being that MNCs offer varied roles to their subsidiaries to foster adaptation, aggregation and arbitrage<sup>0</sup> or to promote competitive advantage through integration, local responsiveness and learning<sup>0</sup>**Error! Reference source not found.** MNCs are also conceptualized as networks of knowledge flow between the subsidiary and other parts of the corporation<sup>0</sup>. These discussions bring into focus an interesting element that it is not just financial measures that are relevant in measuring the success of subsidiaries but also the information and knowledge flow they contribute in strengthening the competitiveness of the MNCs. There is another way of looking at the contributions that subsidiaries make in the context of “business networks” consisting of actors, resources and activities involved in creating and delivering value<sup>0</sup>. Bringing these perspectives, together we could consider subsidiaries in terms of their contributions to the information and knowledge network within the MNC and in alignment with the overall strategy of the headquarters**Error! Reference source not found.** While on the other hand, we could consider subsidiaries as business entities in those specific countries where they are located, and that they are active participants in a business

network that includes other business actors such as suppliers and customers, conceptualized as external embeddedness<sup>0</sup>. In a study of 408 external relationships with customers and suppliers in 98 subsidiaries of Swedish MNCs Andersson and Forsgren found the more adapted the subsidiary was to its external counterparts the higher its importance was within the corporation, at least with respect to the technology function. Thus it was established that the role of the subsidiary in the network connecting other subsidiaries as well as headquarters evolves while interacting with customers and suppliers in product development work. What is more interesting is the role that subsidiaries can perform as linking pins between external and internal business network. They could also create value in terms of bringing together the activities and resources of external and corporate members of the network<sup>0</sup>. They would then be identified as center of excellence. It has been argued in the literature relating to MNC-subsidiary relationship that a comprehensive analysis of the determinants of centre of excellence must include the local business network to which the subsidiary belongs, in other words “external embeddedness”, and its relationship with the rest of the MNC which is also understood as corporate embeddedness<sup>00</sup> and the exchange of R&D (research and development) with other corporate units<sup>0</sup>.

The purpose of this paper is to study the subsidiaries of multinational semiconductor design companies<sup>1</sup> in India and the categorizations of the Indian subsidiaries based on the literature relating to the network based MNC. The aim is to understand the rationale behind setting up semiconductor design centers in India and the contribution made in terms of value added services by the Indian subsidiaries. Also data about subsidiaries in India was analyzed to investigate the extent to which subsidiaries of the semiconductor firms function as centers of excellence.

## **The Setting**

The study examined the Indian subsidiaries of foreign-owned semiconductor MNCs (henceforth referred to as just MNC). The reasons for selecting subsidiaries in India of MNCs in semiconductor design are highlighted by the following factors.

The semiconductor industry is a large (USD 228 billion in 2005<sup>Error! Bookmark not defined.</sup>) and complex ecosystem within an even larger and electronics industry (>USD 1 Trillion in 2005). The relationships and linkages within the semiconductor and between the semiconductor and electronics ecosystem are many-to-many making for very intricate and interesting relationships. The semiconductor industry is also a very R&D and capital intensive industry with nearly a third of the revenue being ploughed back (approximately 14% to R&D and 19% on capital expenditure items)<sup>2</sup>. A simplified view of semiconductor industry is shown in Fig. 1 below.

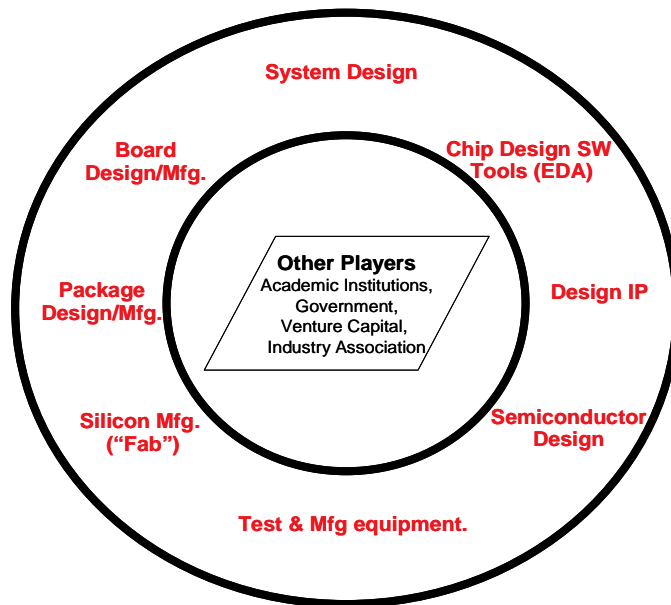

FIG. 1: SIMPLIFIED VIEW OF SEMICONDUCTOR ECOSYSTEM

The overall Indian semiconductor industry was estimated at US\$ 3.2 Billion in 2005 and expected to grow to US\$ 43 Billion by 2015 growing at a compounded annual growth rate of 29.8%[3], which is much higher compared to the global semiconductor industry growth rate of approx 9-10%. In terms of manpower, it is estimated that this industry employed 97,300 people in 2006<sup>3</sup>. The Indian subsidiaries are estimated to form approximately 60% of the overall Indian semiconductor industry today<sup>4</sup>.

Within the Indian semiconductor design companies, there are different types, such as, fully owned subsidiaries of MNCs, domestic/local companies, Indian MNC (Indian owned/based company with global subsidiaries). Almost all Indian subsidiaries of global MNCs are fully captive, working on design & development for products that will be sold globally by the MNC. Within the domestic companies, it may be further sub-divided into captive and non-captive companies. Captive domestic companies perform design related tasks associated with products created in India (such as electronics/consumer products, defense applications, etc). Non-captive companies are comprised of ‘design service’ companies (offering semiconductor design and/or related services to other companies), ‘IP’ companies (providing specific functionality complex semiconductor building blocks), etc. Based on the above breakdown, we have estimated that the headcount in Indian subsidiaries of semiconductor MNCs is 17% of the total 2006 Indian semiconductor industry workforce<sup>5</sup> Fig. 2 illustrates a generic view of the various

relationships between the Indian subsidiaries and other players. The dotted line signifies that there may or may not be a relationship while a solid line indicates an existing relationship.

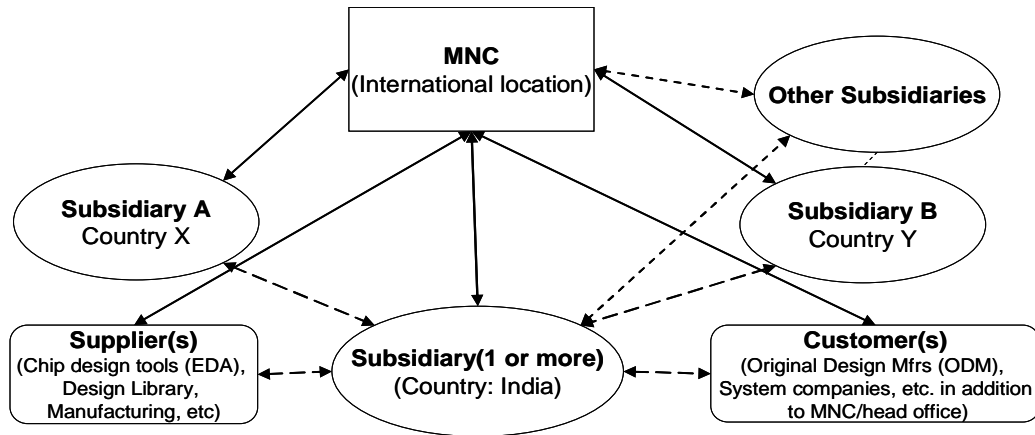

FIG. 2: SUBSIDIARY RELATIONSHIPS

## Method

### Data Collection

To control for industry effects, the study examined subsidiaries in the semiconductor design industry. Fifteen multinational subsidiaries were selected for a series of semi-structured interviews. These subsidiaries represented 66%<sup>3</sup> of the semiconductor design work of MNCs in India. Four of the Indian subsidiaries belonged to global semiconductor companies that were part of the top 10 fabless<sup>6</sup> companies in the world **Error! Reference source not found.** while 10 of them were featured in the top 25 semiconductor companies in the world **Error! Reference source not found.**

Separate interviews were conducted with senior managers of the subsidiaries in order to obtain various perspectives on the subsidiaries and their management role. The interviews were taped and subsequently transcribed. One of the authors also added insights from the interviews and the questionnaire responses that were not reflected or were not readily apparent from the transcription (he has spent 15 years of his working life in the semiconductor design industry). He was able to complement the structured questions with additional probing that helped to throw more light on the subsidiary related issues in the MNC context.

The questions for the structured part of the interview were gathered by examining the MNC headquarters-subsidary relationship literature<sup>00000</sup>. This study focused on the subsidiaries of global semiconductor MNCs and did not include semiconductor manufacturing companies as they are currently not present in India (although two

international consortiums have expressed their interest in setting up semiconductor manufacturing in India). Even though the MNCs did not have any semiconductor manufacturing facilities in India, many of the companies in the study did have manufacturing facilities elsewhere in the world.

#### **Analysis**

Eleven of the 15 companies had head offices in United States while the rest had head offices in Europe. Among the 15 foreign owned semiconductor design subsidiaries in India, 10 were Greenfield investments, where as 5 were acquisitions. Table 1 shows some other characteristics of the subsidiaries in India at the time of study.

TABLE 1: CHARACTERISTICS OF INDIAN SUBSIDIARIES OF SEMICONDUCTOR MNC

Characteristics (As of 2006)	Mean	Standard Deviation
Average Transfer Price or “revenue” <sup>7</sup> (USD, Millions)	\$39.56	\$28.71
Average number of employees in India	714	515
Average Engineers (as share of total employees in India)	85%	0.18
Average R & D staff (as share of total employees in India)	72%	0.26

The subsidiaries had relatively large number of engineers as a percentage of the total India subsidiary headcount (85%). The vast majority of the engineers in the subsidiaries were working directly related to R & D (72%). The authors found that engineers predominantly worked in the R & D function while some of them worked in non-R&D role such as customer support, application engineering (customizing or optimizing a product for a specific customer) and internal IT (information technology) organization. In this paper, the usage of the term “R&D” collectively refers to product development and/or design implementation (such as, design verification, design testing, etc.) and advanced research for future products as R&D. All the subsidiaries studied were captive design centers, implying that all of the work done in India constituted intra MNC exports (100% internal transfer).

#### **Rationale for Setting up Subsidiaries in India**

From the interviews, the authors gleaned the following factors as being the drivers for global MNCs to setup subsidiaries in India.

The top reason that emerged behind setting up the subsidiary in India was to take advantage of the technical competency supported by sizeable technical talent pool in India. The respondents also commented on the quality of the available talent to take on cutting-edge semiconductor design work to produce best-in-class products. Innovation as an attribute was also mentioned in the interview. In the context of semiconductor design, one respondent

described innovation as the ability to solve complex technical challenges related to demanding product design requirements. In many instances, the Indian subsidiary had complete product design ownership. The responses were as follows:

*“There is no product design effort duplication”. “It (presence of India subsidiary) is related to the technical competency about what can be achieved in the R&D center and this is not related to cost”. “A lot more innovation is happening in front-end of design process in India be they big or small. It enables us to work with them to understand their unique needs and expectations and to design and deliver solutions to their problems. This creates unique value for the [MNC] company from the India market perspective or globally”* (This comment was made by a subsidiary engaged in semiconductor chip design software). *“In terms of size, the India operation is the second biggest R&D operation outside of the US”*.

Some of the respondents also indicated that while talent availability was a big advantage, there were some challenges with respect to hiring engineering professionals given the strong competition for talent across the industry (MNC and non-MNC).

The second reason was the burgeoning Indian market. This drove the setting up of design center(s) to satisfy the objective of being in India and to service the fast growing domestic electronics market (compound annual growth rate of 30%0) and also be close to some of the fastest growing markets (Asia-Pacific semiconductor consumption was twice that of combined sales in US and Japan in 2005)<sup>8</sup>. Another interesting aspect raised in the interview was taking advantage of good command over English language to support both domestic customers as well as be part of a chain of subsidiaries providing global technical support for advanced semiconductor and electronic design tools. The respondents observed –

*“If you make a new concept and bring it to the design stage, you need to be closer to the market”. “It is important to have the ability to service the customers in the new geographies. A lot of our customers are technology intensive. They need a high level of technical engagement. To that extent our Indian operations is the largest outside of our headquarters”. “What we do is – in the English speaking regions, we support the customers (semiconductor and electronic designers) directly. For non English speaking areas, we become a second level of support. Likewise in Europe, in English speaking parts, we engage with customers directly”*.

The next key reason stated was about cost advantage of skilled engineering talent pool. While this was mentioned as a key reason, many of the respondents made it clear that cost advantage was not the only or the biggest driver behind setting up the R&D center. Following are some related quotes from interview: *“There is a cost advantage but contrary to the common belief, cost advantage is not a compelling driver”. “Cost is an advantage but it is not the primary driver”*.

The above factors mentioned in the study relate well with facts and figures related to the growth of the semiconductor industry in India – the electronics consumption in India was pegged at USD 28.2 Billion in 2005 with a projection for USD 126.7 Billion and USD 363 Billion in 2010 and 2015 respectively<sup>0</sup>. This is estimated to drive the India semiconductor revenue from USD 3.2 Billion in 2005 to USD 43.1 in 2015, growing at compound annual growth rate of approximately 30%<sup>0</sup>. As for talent supply, India has a large base of total engineering pool and talent specific to semiconductor space. In a recent study, India ranked second only to US with respect to the total number of engineers in semiconductor design area and stood third in overall engineering talent pool (after US and China)[5]. In a recent study conducted by India Semiconductor Association, cost advantage was listed 5<sup>th</sup> on a list of ten factors<sup>0</sup>.

### **Role of Indian Subsidiaries**

From the interviews, it was apparent that the primary role of Indian subsidiaries of global semiconductor MNCs was product development. All the responding companies stated that they were involved in some aspect of product development. The Indian subsidiaries reported that they were working on products targeted for the global market and the authors did not find any subsidiary that was developing products specifically targeted for India.

Within the realm of product development, the subsidiary's activity fell in roughly in one of these three categories -- implementing portion(s) of the product, engaged in certain type of design activity (such as verification, front-end design, back-end or physical design, embedded software, testing, etc.) and finally, implementing the entire product from specification to the finished design (referred to as "tapeout" or mask generation for semiconductor chip manufacturing). One of the interviewees observed the following: *"We have the capability to define, conceive and develop products"*.

In the case of partial product development or offering a set of design activities, the Indian subsidiary worked closely with the MNC headquarters and/or other global subsidiaries of the MNC. Some of the Indian subsidiaries were also involved in varying degrees of R&D for possible use in future products.

Other functions taken on by the Indian subsidiary ranged from Marketing, Sales, Customer Support to Applications Engineering. The primary focus of above activities was to tap the local market opportunity and help expand the sales foot print of the parent MNC. In one instance, the authors found that the Indian subsidiary was part of a network of global customer support centers providing 24x7 advanced technical product support to global customers.

### **Contribution of Indian Subsidiaries to Parent MNC**

The key contribution by the Indian subsidiaries appeared to relate to either partial or complete product development at a cost advantage delivering best in class products for the global markets. In addition, as stated above, some of the subsidiaries were involved in R&D for future products. In some cases the subsidiaries contributed to embedded software (software that works very closely with hardware to deliver certain system functionality) and complemented

the MNC in terms of type of design. One study respondent quoted the following statement made by CEO of his MNC: *“There is not a single product that the company is releasing now which is not touched by India”*.

In 2 out of the 15 respondent companies, the Indian subsidiaries were testing the ground for conceiving products that were specifically relevant to India or other similar emerging markets or geographies. The specificity was either with respect to use models (such as operate in harsh environment, community/multi-use, etc.) or products aimed at very attractive price point. It is important to note that for the respondent companies, there were no India specific products to date. On the other hand, all the subsidiaries studied were actively engaged in expanding the market potential in India through marketing and sales related activities.

Finally, a very important aspect of the Indian subsidiaries contribution was the development of Intellectual Property (IP) related to integrated circuit (IC) technology, with the key measure of IP being patents. The total semiconductor related patent applications and total patents granted (not just for MNCs) was 2145 and 621 respectively for 2001-2005 in India<sup>0</sup>. The authors assume that most of these patents were filed by Indian subsidiaries of global semiconductor MNCs due to the fact that they represent more than 60% of total semiconductor companies in India, as well as the fact that in the past, semiconductor MNCs have had a strong record of creating (and protecting) patent portfolio. While in terms of absolute numbers the number of overall patents filed may not be high as compared to other countries, this marks the beginning of establishing a strong foundation for creation of IP as an important deliverable by the subsidiary.

### **Classification of Semiconductor Design Subsidiaries**

Classification of subsidiaries can be done according to literature<sup>000</sup> based on two variables: export intensity and R&D intensity, giving us a simple two variable matrix. A high export intensity should reflect the fact that the subsidiary has some kind of international competitive advantage, while a high R&D intensity indicates that the subsidiary is undertaking its own product development. Together, these two measures express the extent to which the firm has some kind of self-created international strength and responsibility, and thus reflects the autonomy dimension. See Table 2 for classification of Indian subsidiaries of MNC semiconductor companies.

TABLE 2: CLASSIFICATION OF INDIAN SUBSIDIARIES OF MNC SEMICONDUCTOR COMPANIES WITH RESPECT TO R&D INTENSITY (BASED ON MATS FORSGREN AND TORBEN PEDERSEN FRAMEWORK, 1998)

		R&D (Research and Development)	
		Low	High
Export (Internal / External)	Low	<b>0</b>	<b>0</b>
	High	<b>5</b>	<b>10</b>

It is evident from Table 2 that a majority of the companies were in the “product mandate” quadrant (high export, high R&D) while the rest were in the “International supplier” quadrant (high export, low R&D). For the “Export” variable, both internal and external exports were considered. All the respondents were found to be “captive” design centers implying that the entire work done in the Indian subsidiary would be done for the MNC head office, thereby resulting in 100% export. For R&D, “high” meant that the subsidiary was performing cutting edge product implementation (e.g. products that would be built on latest semiconductor manufacturing process) or had assumed ownership of end-to-end development of product from specification to final design step (called “tapeout”) or had built a deep-level of expertise in specific areas of VLSI (Very Large Scale Integrated Circuits) and/or embedded software design which the rest of the companies leveraged.

A follow-up to the questionnaire was done to understand the scoring for low and high categories of R&D. The high scores were largely from subsidiaries that had been established in India for more than 5 years and exhibited the attributes listed above. Four out of the five companies that scored a low on R&D were relatively newer in terms of number of years of operation in India (less than 5 years) while the fifth company had been in India for longer than 5 years and had pockets of high R&D but the subsidiary as a whole did not conduct high level of R&D.

#### **Coordination and Exchange of R&D between Indian Subsidiary and MNC**

One of the first signs of centre of excellence emerging in a country location is degree of corporate embeddedness as reflected in the coordination and two way flow of knowledge between the subsidiary and other corporate units suggesting the emergence of a strategic role for the subsidiary in the over all scheme of the MNC. In order to measure the degree of corporate embeddedness with respect to R&D the Indian subsidiary managers were asked to indicate the level and importance of R&D coordination (with MNC head office and other global subsidiaries).

The frequency of the current level and importance attached to R&D coordination between the Indian subsidiary and MNC head office is shown in Table 3 and Table 4 respectively. The frequency of the extent and importance of relationship between Indian subsidiaries and other global subsidiaries of the same MNC is shown in Tables 5 and 6 respectively. Both the current level as well as the importance attached to the R&D coordination / relationship was considered from the perspective of the subsidiary.

TABLE 3: CURRENT LEVEL OF R&D COORDINATION BETWEEN INDIAN SUBSIDIARY AND MNC HEAD OFFICE

Value	Frequency	%
0 (Very loosely coupled)	0	0%
1	0	0%
2	1	7%
3	0	0%
4	5	33%
5 (Very tightly coupled)	9	60%

TABLE 4: IMPORTANCE OF R&D COORDINATION BETWEEN INDIAN SUBSIDIARY AND MNC HEAD OFFICE

0 (Not important at all)	0	0%
1	0	0%
2	0	0%
3	0	0%
4	4	27%
5 (Very important)	11	73%

The highly complex and challenging nature of work carried out by the subsidiary is reflected in the response on the importance of the relationship between the subsidiary and MNC head office being ranked very high (all of the responses were marked 4 or higher) in Table 4. There was also a very good correlation between the importance attached to the relationship and the actual extent of relationship between the subsidiary and the MNC head office as shown in Table 3 (all but one response were marked 4 or higher).

TABLE 5: CURRENT LEVEL OF RELATIONSHIP BETWEEN INDIAN SUBSIDIARY AND OTHER SUBSIDIARIES

Value	Frequency	%
0 (Very few engagements)	0	0%
1	2	13%
2	2	13%
3	2	13%
4	7	47%

TABLE 6: IMPORTANCE ATTACHED BY INDIAN SUBSIDIARY TO RELATIONSHIP WITH OTHER SUBSIDIARIES

Value	Frequency	%
0 (Not important at all)	0	0%
1	1	7%
2	1	7%
3	1	7%

4	4	27%
5 (Very important)	7	47%

There was good correlation between current level of relationship between the Indian subsidiary and other subsidiaries of the same MNC vs. the importance attached to this relationship – 60% and 74% of the response was marked 4 or higher for Table 5 and Table 6 respectively. However one respondent did not respond to Table 6 (frequency doesn't add up to total number of respondents). Going into the next level of detail, while 47% gave the highest rating (5) for importance attached to this relationship. Many semiconductor designs are done in a distributed fashion and require tight partnership across multiple design centers and/or geographies and involve extensive collaboration with other subsidiaries (in addition to MNC head office). The multi-site or cross-geography development for a given product is driven by the MNC desire to utilize the best teams and their domain expertise in solving specific design challenges while helping increase the cost efficiency of the overall product design. Having multiple teams also helps in accelerating time-to-market (TTM). This is best embodied in a quote from the study: *“It (cross-site/multi-site design of a product) is about lowering the cost of the development and/or increasing the speed of development”*. Only 13% attached the highest rating for the current level of this relationship although 60% rated high (4 or better). The key point that was reiterated by many respondents was that during the initial years of the Indian design center, most if not all interactions was with MNC head office with a relatively low level of engagements with other subsidiaries inside the MNC. As the India design center evolved and matured, working on one or more complex products or design aspects required interactions with other subsidiaries in addition to MNC head office. Also, while most of them acknowledged the challenges of interactions with sites across the globe (time zone differences, cultural differences, majority of interactions being non face-to-face, etc), nobody raised this as a limiter for future engagements.

**External Embeddedness**

External embeddedness coupled with corporate embeddedness contributes to the development of a centre of excellence. The senior managers of Indian subsidiaries were asked to indicate the importance and current level of relationship between the subsidiary and external customers and suppliers based on the assumption, as in theories about business networks, that such relationships were crucial for technology development<sup>00</sup>. These indicators were used as a rough estimation of the degree of external embeddedness of the degree of the external embeddedness of the subsidiaries. Table 7 and Table 8 indicate the current level and importance of relationship between the Indian subsidiary and external customers respectively. Table 9 and Table 10 show the response for current level and importance of relationship between the Indian subsidiary and external suppliers respectively.

TABLE 7: CURRENT LEVEL OF RELATIONSHIP BETWEEN INDIAN SUBSIDIARY AND EXTERNAL CUSTOMERS

5 (Very heavy engagements)	1	7%

TABLE 8: IMPORTANCE ATTACHED (BY INDIAN SUBSIDIARY) TO RELATIONSHIP BETWEEN INDIAN SUBSIDIARY AND EXTERNAL CUSTOMERS

Value	Frequency	%
0 (Not important at all)	0	0%
1	0	0%
2	3	20%
3	3	20%
4	3	20%
5 (Very important)	6	40%

A majority of the responses attached high importance to the relationship between the subsidiary and external customers (60% marked 4 or higher). This was in line with one of the goals of setting up the subsidiary which was to expand the sales footprint of the MNC by identifying and tapping domestic market opportunities. However the actual extent to which this relationship occurred was much less than the importance attached to this type of relationship (only 14% marked 4 or higher). While both R&D work and expanding sales/market footprint were important objectives for the subsidiary, R&D focus had a relatively higher priority compared to domestic sales/market opportunity and/or domestic business development. This was also supported by the relatively high percentage (85%) of resources in the design center that belonged to the engineering function. It is possible that as the Indian semiconductor market matures (with the entry of semiconductor manufacturing/fab, assembly, test, packaging, etc.) and MNCs look for increased domestic market opportunity, it may reflect in higher ratings for level of engagements between the subsidiary and external customers in the future.

The authors looked at some examples of external suppliers before analyzing the above data. Some examples of external suppliers were chip design automation software (also called Electronics Design Automation or EDA) vendors, semiconductor cell library vendors, Intellectual Property (IP) vendors (who create complex design entities that can be reused by one or more companies) etc. Table 9 shows the current level of the relationship between the subsidiary and external suppliers – 27% gave a score of 4 or higher with a majority (33%) of the respondents giving a score of 2 indicating a low level of current engagement with external suppliers. This may be explained by the fact that the Indian subsidiary, to a large extent, was typically not involved with external suppliers in terms of purchase. In the semiconductor design industry, these relationships were found to be extremely crucial from the perspective of creating competitive products with tight schedule and quality constraints. Therefore, in order to ensure consistency in design flow across multiple design centers as well as to take streamline vendor management and drive cost efficiencies, most of these relationships were cemented on a company wide or project wide basis at the MNC head office leaving somewhat of a lesser scope for subsidiaries to have vendor engagement. This was not to say that external vendor engagements did not occur at all. Examples of present external vendor engagements in the design centers most commonly were found in the areas of training (technical and non-technical), infrastructure related engagements, etc.

In Table 10, it is interesting to note that 47% of the respondents gave a score of 4 or higher on importance attached to the relationship between the subsidiary and external vendors. The fact that the current relationship (between subsidiary and external suppliers) was less than the importance attached seemed to suggest that there was a need or a desire for greater interaction. This may be due to potential increase in engagements with suppliers (such as with semiconductor IP companies, etc.) that may be driven by more complex or complete product(s) development at the subsidiary. Also, this may be a leading indicator of important engagements with other players in the Indian semiconductor ecosystem as it grows to include new capabilities such as Assembly Test and Manufacture (ATM), packaging, semiconductor manufacturing (“fabs”), etc. Fig.3 summarizes the internal and external embeddedness

ratings found in the study by plotting the frequency of scores 4 and higher for current level and importance attached to respective relationships.

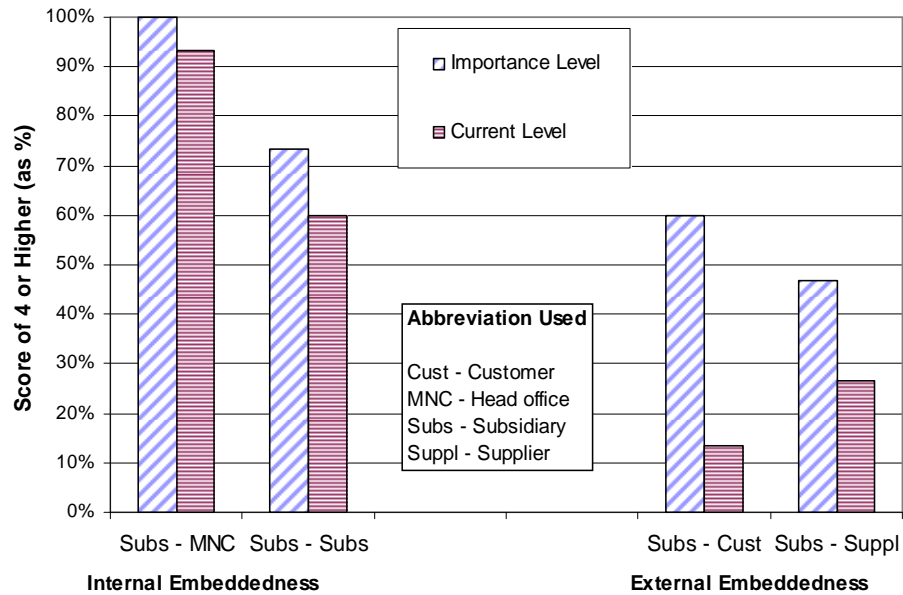

FIG. 3: PERCENTAGE OF HIGH SCORES (4 OR HIGHER) FOR INTERNAL AND EXTERNAL EMBEDDEDNESS

## Conclusion

An attempt has been made in this paper to understand as why these semiconductor MNCs established design subsidiaries in India, the contribution of the Indian subsidiaries with respect to value-added services and the characterization of the subsidiary and its relationship with MNC/head office, customers, external suppliers and other subsidiaries

The basic rationale driving semiconductor MNCs to setup subsidiaries in India was to access and utilize the technical competency and technical talent pool. The next important factor was the presence and rapid growth of the domestic electronics market and finally the cost advantage with respect to talent. In fact, the subsidiaries were setup to perform 100% internal export back to MNC and/or other global subsidiaries of the same MNC. The average number of years of operation of the subsidiaries in the study was 7 years, with 2/3<sup>rd</sup> of the respondent companies operating for more than 5 years. Two-thirds of the sample reported doing “high” R&D work (indicative of complete development work related to a given product, deep expertise on one of more critical areas of semiconductor design

or performing product development for challenging cutting-edge semiconductor process geometries (e.g. sub-100 nanometer design).

In terms of contribution of Indian subsidiaries of MNCs, it became clear that there were several examples of companies doing complete development of a given product in India while there are other companies that contribute to specific types or portions of semiconductor design activities. This indicated a strong emphasis for product mandate in the subsidiaries. In addition, the subsidiaries were also involved in creating intellectual property (IP) and contributing to the patent portfolio of MNCs. The authors did find a very small subset of the subsidiaries exploring conceiving and designing products for India or other emerging markets.

Based on the study, it is apparent that the subsidiaries attached a very high degree of importance to the relationship with MNC or head office and followed it up with strong working engagement with the head office. The Indian subsidiaries also gave high importance for relationship/interactions with other subsidiaries of the MNC and again there was good correlation between intent and actual practice.

With respect to external embeddedness, data collected indicates that the subsidiaries marked the highest value regarding the importance attached to relationship with external customers. In practice, the vast majority of the subsidiaries exhibited moderate to high engagements with external customers. This indicated that the subsidiaries are primarily engaged in the business of creating value for the MNC head office via product development as opposed to market creation/tapping of domestic opportunities. A similar trend was seen with respect to the relationship between the Indian subsidiary and external suppliers where the importance attached to this type of a relationship was fairly high but in actual practice the current engagements seemed to be weighted towards the lower end of the scale. Given that the semiconductor industry ecosystem will mature (in terms of entry and/or proliferation of semiconductor manufacturing, assembly and test, packaging, etc.) there is a strong possibility of these subsidiaries evolving as centers of excellence with a growing emphasis on external customer and supplier engagements in addition to R&D.

Some of the limitations of the study are that this was India subsidiary centric study with no corroboration on the closeness of the relationships from the MNC head office or other global subsidiaries. Similarly there was no corroboration from external suppliers and customers and their relationship with the Indian subsidiary.

## **Acknowledgments**

The authors would like to thank all the members of senior management of the subsidiaries for contributing their valuable time in providing insights on topics related to this research. We would also like to thank the India

Semiconductor Association (ISA) for their help in clarifying data related to the semiconductor industry. Any errors are the responsibility of the authors.

## End Notes

The Indian semiconductor design industry is broadly composed of VLSI design, board design and embedded software companies. This industry in India is broadly representative of the global semiconductor design industry in terms of handling design complexity (e.g. end to end design of Application Specific Standard Product (ASSP), System-on-Chip(SoC), System-in-Package (SiP), etc), types of designs (e.g. digital, analog, mixed-signal, etc.) and markets addressed (wireless, networking, consumer, etc)

<sup>2</sup> Industry Fact Sheet, Semiconductor Industry Association ([http://www.sia-online.org/pre\\_facts.cfm](http://www.sia-online.org/pre_facts.cfm))

<sup>3</sup> We have assumed a 30% growth of headcount in 2006 over 2005 as against the *projected* (not actual) growth of 36% in Reference [18]. This is more in line with some data points on *actual* increase in 2006 vs. 2005 headcount.

<sup>4</sup> Based on the count of Indian subsidiaries of foreign MNCs as a percentage of total membership of India Semiconductor Association (ISA)

<sup>5</sup> Following is the method for estimation of total headcount (regular employees, excluding contractors or outsourced staff) in Indian subsidiaries of MNC semiconductor companies in 2006. Note that all figures used are from Reference [18] except as noted. We start with the total 2006 headcount of 97,300 (see end note 3). This is split three ways as VLSI Design (15%), Hardware/Board design (4%) and Embedded Software (81%). Further, each of these portions is divided into captive and non-captive (e.g. design services companies, IP companies, etc). The captive portion of VLSI Design, Hardware/Board Design and Embedded Software are 62%, 29% and 29% respectively. The captive portion is comprised of Indian subsidiaries of MNCs and domestic/local captive companies and is about 33,000 based on above calculation. A conservative estimate of headcount in domestic/local captive companies taking into account a few large players is 17,000. We arrive at headcount of Indian subsidiaries of semiconductor MNCs by calculating the difference of overall captive portion of the Indian semiconductor market and the headcount of domestic/local captive companies.

<sup>6</sup> A Fabless semiconductor company is engaged in the design and sale of integrated circuits or “semiconductor chips” with the manufacturing outsourced to external semiconductor manufacturing companies commonly known as semiconductor foundry or “fab”.

<sup>7</sup> The arrangement under which the Indian subsidiary charges back the MNC/parent company is commonly known as “cost-plus” model. Essentially, the Indian subsidiary recognizes “revenue” for R&D work done by charging a margin on top of the cost. This “revenue” is also sometimes called “transfer price”. Note that the margin under the “cost plus” model need not be disclosed publicly and is therefore not available. We used the same method to arrive

at the subsidiary “revenue” as used by a widely used reference for the Indian semiconductor industry 0. In this method the “revenue” is arrived at by multiplying the number of engineering professionals in the subsidiary and the average headcount cost for the industry for a given year (in this case it is 2006).

# Foreign-Invested Enterprises and Chinese Trade Surplus

*Liu Xiaohui, liuxiaohui@uibe.edu.cn*

*University of International Business and Economics, China*

## Abstract

Recently, there's always huge and persistent active trade balance in china. This paper first introduces the importance of FIEs in China's international trade, that is, the active trade balance of foreign-invested enterprises ( FIEs) counts for more than half of the total number. Through deep analysis of the FIEs' behavior, the conclusions can be drawn as follows: in china FIEs' performance on trade is closely related to their industry transfer strategy seeking for cost advantage.

## Introduction

As the fast development of the economy and rapid expansion of foreign trade in China, more and more people's attention is focusing on the ever-increasing trade surplus of China. The reasons are analyzed from different perspectives, like lack of domestic demands, cheap labor force, government policy encouraging exports and the limitation of high-tech products import in developed countries etc. (Chen Min, 2001; Zhang Pin 1997). In addition, the exchange rate change on China's trade surplus is concerned by many economists. Some people show evidence that a real exchange rate appreciation reduces China's trade balance (Dees, 2001; Yue and Hua, 2002); others find no significant impact on the trade surplus (Lau, Mo and Li, 2004).

In this paper, the role of FIEs in China's foreign trade is examined (including wholly foreign-owned companies, joint venture and Sino-foreign cooperative enterprises), the conclusions can be drawn as following: MNC's transfer strategy, which is seeking to lower the cost, is one of the important reasons of the huge trade surplus in China, and the export of FIEs is less sensitive to the change of real effective exchange rate than that of Chinese-invested enterprises.

The paper continues as follows. Part two shows the trends of FDI inflows to China. Part three examines the role of FIEs in China's foreign, such as the trade structure and the export destinations of FIEs. Part four empirically analyzes the impacts of the changes of real effective exchange rate of RMB on the export and import by FIEs, and part five is the conclusion..

## Trends of FDI Inflows to China

Since 80's of the last century, there're various policies been applied to attract foreign investments, which lead to more and more FIEs setting up in China and rapid growth of the actual use of foreign investments (Fig.1), except for a slightly dip under the influence of financial crisis in South-east Asia in 1999 and 2000.

FIG.1: CHINA'S ACTUAL USE OF FOREIGN INVESTMENTS (UNIT: BILLION USD)<sup>1</sup>

At present, large part of the investment comes from Japan and other rising industrialized countries and zones. Fig.2 shows that by the end of 2005, the foreign capital coming from Hong Kong, Japan, Korea and Singapore accounts for 65.16% of the total foreign investments. While the economic takeoff of these countries, large productions of labor-intensive products are mainly exported to the developed countries, like US and European markets.

FIG.2: TOP 7 INVESTORS BY COUNTRIES/REGIONS BY 2005(SHARE IN THE TOTAL %)

According to the theories of foreign direct investment, the motive for a firm's entry into international operations may be that firms are seekers of resources, factor advantage, etc (Czinkota, Ronkainen, & Moffet, 2000). MNC usually allocates its resources globally according to the comparative advantage of different countries. As the development of local economy and increasing labor cost, developed country has begun to transfer labor-intensive industry to China, taking the advantage of Chinese cheap labor force to strength its competitive advantages in the global markets and also extent the product life cycle (Vernon, 1966, 1979). At present, manufacturing industry is a quite hot choice for FIEs. In 2005, there're 28928 projects occurred, account for 65.74% of the total projects, attracted 42.5 billion USD at the same time, which means that 70.37% of foreign capital is actually invested in this industry. By the end of 2005, there're 179,949 FIEs in this industry, and the total investments amount to 895.5 billion USD. Over the same period, the electronics and telecommunication industry has utilized the most of foreign investment, and the textile get the second rank (Fig. 3).

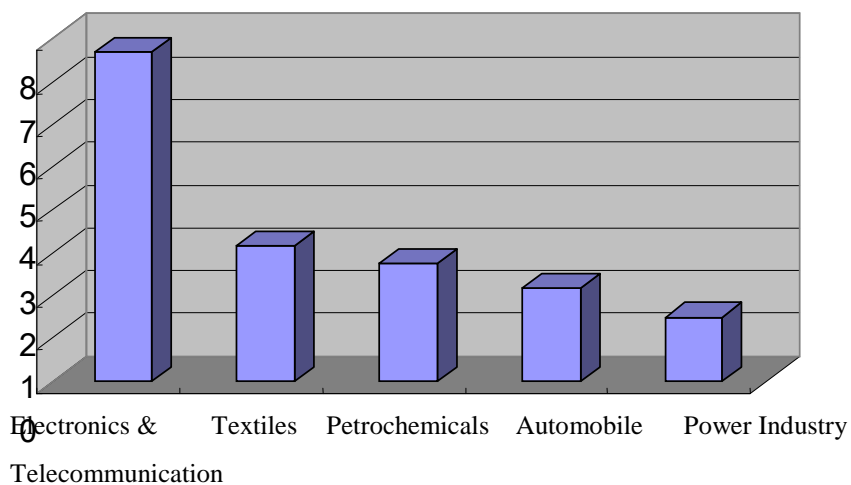

FIG.3: THE ACTUAL USE OF FDI BY SELECTED SECTORS, BY THE END OF 2005 (IN BILLIONS US\$)

## The Role of FIEs in China's Foreign Trade

### Trends and Patterns of Foreign Trade in China

Since the open policy was applied in 1978, the economic co operations between China and other countries are increasing rapidly. Chinese total trade volume expanded from 509.768 billion USD in 2001 to 17606.9 billion USD in 2005, at the same time, the trade surplus extended from 22.541 billion to 177.41 billion since China joined the WTO in 2001(Fig.4).

FIG.4: CHINESE EXPORT, IMPORT, AND TRADE BALANCE OF 2001-2006 (UNIT: BILLION USD)<sup>1</sup>

Since 90's of 20<sup>th</sup> century, processing trade is the primary means of foreign trade. The export of processing trade usually takes the proportion around 50%, 10% higher than the import, which means that the trade surplus mainly comes from the processing trade. In 2006, the trade surplus coming from processing trade is even bigger than the total trade surplus( Fig.5).

FIG.5: TOTAL TRADE VOLUME, PROCESSING TRADE VOLUME IN 2006 (UNIT: BILLION USD)

As the development of Chinese foreign trade, FIEs' position is changing at the same time. In 1980's state-owned trade companies still take more than 90% of the total trade, leaving 10% to FIEs. But after 1990, more and more FIEs enter into Chinese market, with the proportion of the export amount increased to 40%. By 2001, FIEs' export and import amount both take more than half of the total amount. At the same time, the proportion of trade surplus contributed by FIEs is also increasing to 50% plus since 2005 (Fig.6).

FIG.6: FIEs TRADE VOLUME BY THE TOTAL VOLUME (%)

As for the manners of trade, processing trade is the most important way for FIEs. In the last two years, FIEs' export value of processing trade is close to 70% in its total export value, with the proportion of import close to 80%. In china, processing trade is absolutely taking the lead. In 2006, these two numbers both increased to more than 85%, seen from Table 1.

TABLE 1: PROPORTION OF PROCESSING TRADE BOTH IN FIEs AND THE TOTAL

	Percentage of Total FIEs Trade Volume %		Percentage of Total Chinese Processing Trade Volume%	
	2005	2006	2005	2006
Export and Import of Processing Trade	69.48	68.07	83.69	84.91
Export of Processing Trade	78.03	76.47	83.23	84.48
Import of Processing Trade	59.67	58.06	84.39	85.59

It is believed that the performance of FIEs in China is closely related to its industry transfer strategy seeking for comparative cost advantages. FIEs' interests in processing trade is partly because of the encouraging policy applied by Chinese government, but more important is the cheap labor force. While FIEs is transferring the labor-intensive industry to China, it also transferred the active trade balance to China at the same time. The above point is discussed as below:

#### **Trade Structure of FIEs**

FIEs export products are mainly comprised of labor-intensive industrial manufactured products. Some are realized by processing trade. During the development of processing trade, electromechanical machine takes the largest part both in export and import. FIEs imported major parts from abroad, and exported them out after processing and packaging in the China. It can be seen from Table 2 and Table 3 that in 2005 eight kinds of major parts of electromechanical machines are on the top ten import list, and six kinds of electromechanical machines are on the top export list. In the same year, the amount of FIEs' import on electromechanical machines sums up to 266.63 billion USD, counts for 68.8%, the amount of import sums up to 317.185 billion USD, counts for 71.4%.

TABLE 2: TOP TEN IMPORTED PRODUCTS by FIEs IN 2005 (UNIT: BILLION USD)

Integrated Circuit & Microelectronic Package	72 . 126
Parts and Components for TV Sets, Radio Receivers	14.512
Parts for Automatic Data Processing Equipment	13.912
Steel	13.511
Plastics in Primary Forms	13.275
Automatic Data Processing Equipment and Components	13.229
On-Off System & Protective Circuit Equipment and Components	8.139
Diode and Similar Semiconductor Devices	6.745
Printed Circuits	6.026
Instruments and Apparatus of Measure , Inspection	5.796

TABLE 3: TOP TEN EXPORTED PRODUCTS BY FIEs IN 2005 (UNIT: BILLION USD )

Automatic Data Processing Equipment and Components	70.457
Parts for Automatic Data Processing Equipment	26.409
Cloths and Accessory	25.750
Wireless Telephone, Handset or Vehicle Mounted	19.691
Parts and Components for TV Sets, Radio Receivers	16.488
Textile Tarn and Products	13.722
Integrated Circuit & Microelectronic Package	13.562
Furniture and Components	8.285
Footwear	7.883
TV Sets	6.516

Besides that, clothes, shoes, hats, textiles, furniture and other labor-intensive products are also important for FIEs' exports, listed among the top ten of export products.

### The Import and Export Markets of FIEs

During the development of processing trade, FIEs usually import raw materials, intermediate products, manufacturing equipments and essential accessories from home countries, process them in China, and export final products to their home countries and other developed countries and regions. Such kind of vertical specialization leads to the highly concentrated import and export markets of FIEs.

As for the FIEs' import markets, more than 50% products are imported from Hong Kong, Taiwan, Japan, the EU and the US. Japan and Taiwan are the biggest importation origins. About 20% importation is from Japan and 15% from Taiwan ( Fig.7). FIEs import a great amount of electromechanical equipment accessories from these countries and regions in order to meet the needs of processing trade.

FIG 7: FIE IMPORTS BY COUNTRY/REGION 2000-2005 (SHARE IN THE TOTAL %)

The biggest five export markets of FIEs are the US, Hong Kong, the EU, Japan and Taiwan. These countries and regions absorb about 80% exportation of FIEs. The US is the most important export market and accounts for 24%. The scale of markets in the EU, Japan and Hong Kong is similar. They take 17%, 12% and 20% respectively ( Fig.8).

FIG.8: FIEs EXPORTS BY COUNTRY/REGION 2000-2005(SHARE IN THE TOTAL %)

Before the export processing FIEs transfer to China, they mainly export to the US, Japan and the EU. As such labor-intensive enterprises transfer to China, the huge trade surplus against the US partly transfers to the mainland of China. Take automatic data processing equipment (SITC 752) for example, in 1990s Japan, Singapore, Taiwan and Korea kept great trade surplus against the US. After the Asian financial crisis in 1998, more and more enterprises in such countries and regions transfer to the mainland of China. And their trade surplus against the US decreased correspondingly. Meanwhile China's trade surplus against the US increased to a large extent ( Fig.9).

FIG.9: THE US BALANCE OF SITC 752 IN BILLION (USD)<sup>2</sup>

## The effect of change of exchange rate on the trade surplus of FIEs

From June 1995 until July 2005, China pegged the value of its currency at 8.27 yuan per U.S. dollar. On July 21, 2005, China adopted a new policy, and pegged the value of its currency to a currency basket. Actually, the real exchange rate of China's currency has been changing, no matter under the old policy or the new one.. In this section, we undertake regression analysis on China's export and import functions to test for the impacts of exchange rate changes on trade volume. We try to investigate whether the exchange rate on trade volume is weaker for the FIEs than for Chinese-invested enterprises.

We use monthly trade volume as a dependent variable. The sample period is from January 2005 to March 2007. Data on China's domestic demand which is substituted by the value-added of industry were obtained from China's Statistics Bureau<sup>3</sup>. Foreign demand is substituted by OECD's composite leading indicator (CLI), since the trade value with OECD countries makes up a large majority of China's total trade value, and the data on it were obtained from the website of OECD. Data on the real effective exchange rate were obtained from the website of International Settle Bank, and an increase in REER implies real appreciation of the RMB. Data on the import and export were from China's Commerce Ministry.

Both Equation 1 and 2 displays regression results of export function by FIEs and Chinese-invested enterprises.

$$\text{LOG}(EX_F) = -26.76526 - 1.313779\text{LOG}(\text{REER}_{-5}) + 8.309706\text{LOG}(Y_F) + [\text{AR}(1) = 0.160914, \text{AR}(2) = -0.488253] \quad (1)$$

$$(-5.989562) \quad (-2.036655) \quad (8.076503) \quad (0.731336) \quad (-2.236040)$$

$$\text{R-squared} = 0.739218 \quad \text{Adjusted R-squared} = 0.669676 \quad \text{D-W} = 2.096709$$

$$\text{LOG}(EX_H) = -30.16447 - 1.639539\text{LOG}(\text{REER}_{-3}) + 9.278914\text{LOG}(Y_F) + [\text{AR}(1) = -0.063687, \text{AR}(2) = -0.309832] \quad (2)$$

$$(-5.742503) \quad (-2.249054) \quad (8.390836) \quad (-0.240494) \quad (-1.124305)$$

$$\text{R-squared} = 0.698629 \quad \text{Adjusted R-square} = 0.627718 \quad \text{D-W} = 1.919979$$

Where  $EX_F$  is the export by FIEs and  $EX_H$  is the export by the Chinese-invested enterprises. REER is real effective exchange rate of RMB, and  $Y_F$  is foreign demand.

According to the regression results, the real depreciation of the RMB will leads to an increase in the export by both FIEs and Chinese-invested enterprises. However, the export of the FIEs has a two-month longer time lag than that of the Chinese-invested enterprises has a time lag of three months.

Both Equation 3 and 4 displays regression results of import function by FIEs and Chinese-invested enterprises.

$$\text{LOG(IM}_F\text{)}=-17.40423 +2.552881\text{LOG(REER}_{-9}\text{)}+8.309706\text{LOG(Y}_{H-12}\text{)}+[\text{AR}(1)=1.080707,\text{AR}(2)=-0.532521] \quad (3)$$

$$(-4.389059) \quad (-3.428198) \quad (6.730136) \quad (5.027018) \quad (-2.541370)$$

$$\text{R-squared}= 0.844483 \quad \text{Adjusted R-squared}=0.720069 \quad \text{D-W}=1.884922$$

$$\text{LOG(IM}_H\text{)}=-5.845314+1.819151\text{LOG(REER}_{-4}\text{)}+0.360540\text{LOG(Y}_H\text{)} \quad (4)$$

$$(-1.908962) \quad (-2.541427) \quad (2.380175)$$

$$\text{R-squared}= 0.516015 \quad \text{Adjusted R-square}=0.459070 \quad \text{D-W}=1.921489$$

Where  $\text{IM}_F$  is the import by FIEs and  $\text{EX}_H$  is the import by the Chinese-invested enterprises, and  $\text{Y}_H$  is domestic demand.

According to the regression results, the real depreciation of the RMB will leads to a decrease in the import by both FIEs and Chinese-invested enterprises. However, the import of the FIEs has a time lag of nine months, while the import of the Chinese-invested enterprises has a time lag of four months.

An interesting result from the above equations is that the trade of FIEs is less sensitive to the change of REER than that of Chinese-invested enterprises. The possible reason for this is that many FIEs has more stable export destinations.

## Conclusion

This paper examines the role of FIEs in China's foreign trade, and explores the impacts of real effective exchange rate of RMB on the export and import by FIEs. The conclusions are as follows:

Firstly, as the main participants in China's processing trade, FIEs take an important role in China's foreign trade and bring great trade surplus.

Secondly, China's trade surplus is a win-win result for China and developed countries.

On the one hand as labor-intensive industry is transferred to China, FIEs reduce producing cost and get more profit through using cheap labor in China, on the other hand it also helps the industrial upgrading in their home countries. Objectively it's also good for the employment and growth of production in China to some extent.

Thirdly, according to the empirical analysis, the trade surplus by FIEs might be reduced with appreciation of real effective exchange rate, but the analysis is not very significant.

Finally, in terms of policy implications the results shows that the policy of tax combination carried out by Chinese government could decrease its trade surplus to some degree and relieve the economic conflicts between China and its partners.

In order to promote export and attract more investments, Chinese government gives export-oriented foreign companies preferential treatment in tax, land-using and finance. For example, the income tax rate for domestic

companies in China is 33%, but that for FIEs is 15%. With the growth of export in labor-intensive products and increase in trade surplus, there are more and more trade conflicts between China and its partners. In order to ease the trade conflicts and make domestic companies compete with foreign companies fairly, Chinese government implements the tax combination policy and takes the income tax for all companies at the rate of 25%. It can be foreseen that such policy would increase the cost of foreign companies to a certain extent, and decrease the export of processing trade, which finally would result in a decrease of Chinese trade surplus.

# Strategy Typology and Performance: Korean Exporting Companies

*Jihwan Yum*

*Hanyang Cyber University, Seoul, Korea*

## Abstract

The study investigates the relationship between strategy typology and organizational performance in Korean leading exporters. We investigated which factor is a significant predictor of higher performance: higher level of product competitiveness, strong marketing strategy, high level of human resource, and different strategy typology. The result shows that the different strategy affects the organizational performance more than other factors such as product competitiveness, marketing strategy, and human resources.

## Introduction

The long controversy has arrived at the temporal stable status thanks to globalization of modern economy. Globalization of economy enforces organizations into two mutually exclusive directions. One way leads organizations being the same by adopting global standard in organizational management and production processes. The other way leads to be different pursuing organization specific competitive advantages. Researchers recognized the tension between the need for a firm to be different and the need for a firm to be the same almost in the same time and same market. Porac, Thomas, and Baden-Fuller (1989) suggested that strategists needed to balance on a competitive edge between simultaneous pressures to conform and to differentiate. Abrahamson and Hegeman (1994) observed that strategic conformity reduces both competitive risk and opportunities for competitive advantage. Chen and Hambrick (1995) noted that theory and research on competitive conformity – its cause and effects – should be a high priority for the field of strategy.

Korean companies have demonstrated phenomenal achievement in economic and technical performance for last two decades. Almost of all of well known Korean companies have less than 40 year experiences in the market. Most companies' strategies were export oriented partly because of the relatively small domestic market size. From the beginning of the industrialization, export oriented strategy was one of the main theme for market dominants in Korea. Export orientation strategy with lower cost structure was a dominant logic for most Korean managers.

However, the phenomenal growth of industrial organizations faced serious threat in late 1990s. Asian

financial crisis attacked and destabilized industrial backbone named as Chaebol, major conglomerates of Korea. For the relatively short period of time, Korean industries were forced to restructure and reshape by external forces such as International Monetary Fund. Considering the national specific situation, we need to evaluate the change of organizational strategy and structure both qualitatively and quantitatively. We will examine the implications that force organizations to react to the change of environment in different ways where past institutional power still exists to be the same. We adopt strategy typology as a reaction to the environment. Where stronger institutional forces exist, the difference in typology will not be related with the performance. In other words, the different strategy may not work for different performance. On the other hand, if the difference in typology is related with the performance difference, the heterogeneous strategy may be responsible to the performance gap.

### **Miles and Snow's strategy typology**

The Miles and Snow (1978) strategic typology – defenders, prospectors, analyzers, and reactors – has generated a comparatively large amount of interest, investigation and support (Hambrick, 1979; Meyer, 1982; McDaniel and Kolari, 1987). Although these studies have contributed significantly to the body of knowledge on strategic archetypes, there is nevertheless a need for further research. For instance, a review of strategy literature reveals an increasing level of in operationalization and measurement of strategy constructs (Bourgeois, 1981; Ginsberg, 1984).

A firm following a prospector strategy frequently adds to and changes its products and services, consistently attempting to be first in the market. Such a firm tends to stress innovation and flexibility in order to be able to respond quickly to changing market conditions.

An analyzer's strategy is to maintain a relatively stable base of products and services while selectively moving into new areas with demonstrated promise. An analyzer tends to emphasize formal planning processes and tries to balance cost containment and efficiency with risk taking and innovation.

A defender's strategy is to offer a relatively stable set of services to defined markets, concerning on doing the best job possible in its area of expertise. It emphasizes tight control and continually looks for operating efficiencies to lower costs.

A reactor essentially lacks a consistent strategy. Its strategy has characteristics of each of the other type's strategies at different times and thus is difficult to categorize clearly.

Researches on the typology study lie in a wide variety of organizations and industries. Snow and Hrebiniak (1980) found that prospectors, analyzers, and defenders outperformed reactors in competitive but not highly regulated industries. Hambrick's (1983) data indicated that defenders consistently outperformed prospectors in profitability and cash flow but that prospectors outperformed defenders in market share gains in innovative

industries. Zajac and Shortell (1989) discovered that prospector and analyzer hospitals outperformed defender hospitals in the rapidly changing health-care environment, results that Shortell, Morrison, and Friedman (1990) subsequently confirmed. The typology has also been used to differentiate tobacco firm's responses to environmental threats (Miles & Caneon, 1982).

Most studies of strategy typology are pursued in relatively similar industries. The most strategic behavior researches control the industrial differences in order to maximize organizational performance differences while minimize other noise factors. However, the barrier of industrial membership has been weakened by development of technology, especially information and communication technology. Many researchers call this phenomenon as "digital convergence" (Yun, 2006). We believe that the strategy typology research should get into inter-industrial perspective in order to integrate the concept of digital convergence. Moreover, the concept of digital convergence may bring significant effect for interpreting strategy typology in the information age.

## **Research Design and Methodology**

Recent attempts have been made to operationalize and measure Miles and Snow's strategic types using multi-item scales and multiple approaches. Although many researchers have advocated the use of multiple approaches to operationalize and measure key operational constructs, few studies have employed multiple approaches to operationalize and measure Miles and Snow strategic typology. Furthermore, most previous research has tended to exclude the reactor type from the scope of analysis. The need for multidimensional construct of strategic behavior is gaining a strong support for assessing organizational strategy. Furthermore, the relationships with overall performance have not gained strong references yet.

We decided to employ integrative measurement using self typing, objective indicators, and investigator inference. Self typing is used for the questionnaire responses. Objective indicators are used to measure respondents' strategic behavior such as market orientation, process definitions, and foreign business strategies and so on. However, the final judgment for organizations' strategic typology is based on the factor analysis which made composite components into a single strategy typology.

The advantage of this process lies in two folds. First, this process does not generate any bias for the respondents to be only one strategy typology. Responding various strategic process questions, the respondent's strategy typology is naturally declared. Second, the concept of strategy typology can employ some other distinguishing factors to differentiate strategy typology. For example, the global economy emphasizes the strategy for internationalization whether the organization is big or small. International business for the organization is not an option any more. Bringing respondents from the relatively homogeneous pool, Korean companies, we could

generate international strategy as another aspect for strategy typology.

The questionnaire items were developed for strategy and market orientation of organization. The sample was selected from top 2,000 leading exporters located near Seoul, Korea. The respondents were mostly high level managers who understand statistical figures and organizational strategy. We interviewed top managers who are in charge of the department or business unit in person. However, some companies were interviewed with middle managers when the top level managers were not available. The response rate was 22.5% (458 respondents).

Table 1 presents descriptive statistics for the research variables.

TABLE 1: DESCRIPTION OF VARIABLE AND CONSTRUCT USED IN THE ANALYSIS

	N	Minimum	Maximum	Mean	Std. Deviation
Sales	428	0.01	280	1.68	14.95
Profit	430	1	7	4.25	1.22
Future_sales	429	0	7	4.00	1.47
Product_diversity	427	1	7	5.00	1.46
New_product_introduction	425	1	7	4.65	1.53
Adaptability	427	1	5	2.22	1.17
Autonomy	383	1	7	5.13	1.60
Ln_Cpital	406	-2.3	10.74	2.78	2.23
Ln_Employees	429	0.69	10.82	4.43	1.86
Market_development	423	0	1	0.66	0.48
Price_ratio	426	30	150	82.39	14.42
Own_brand_equity	427	0	100	58.36	44.01
Quality	427	14.3	250	85.53	17.59
Product_competency	429	1	7	6.42	0.93
Price_competency	430	2	7	6.32	0.92
Promotion_competency	429	1	7	4.52	1.55
Place_competency	427	1	7	4.94	1.61
HR_language_Know	430	1	7	4.53	1.38
<b>Defender</b>	378	0	1	0.31	0.46
<b>Prospectors</b>	378	0	1	0.32	0.47
<b>Reactors</b>	378	0	1	0.17	0.38
<b>Analyzers</b>	378	0	1	0.19	0.39
Valid N (listwise)	344				

We developed and modified questionnaire items in order to differentiate strategic typology. Based on the Miles and Snow's theory and multiple components from the responses, we applied cluster analysis in order to

classify organizational strategy typology. Our study generated four clusters that are significantly different each other and four clusters successfully categorized four strategy typology. Table 2 shows the result of cluster analysis.

TABLE 2: TYPOLOGY OF STRATEGY OF FIRMS BY CLUSTER ANALYSIS

	Cluster			
	Defender (n=118)	Prospector (n=122)	Reactor (n=66)	Analyzer (n=72)
Product_diversity	4.13	6.25	3.64	5.68
New_product_introduction	3.62	5.95	3.18	5.50
Adapt	2.24	1.65	3.05	2.39
Autonomy	6.03	6.19	3.24	3.68

The cluster analysis shows four distinguished aspects for each strategy typology. The aspects are product diversity, new product introduction, adaptation, and autonomy. Product diversity refers that the organization's strategic intent to provide various versions of the product. New product introduction means the organization's ability to introduce new product in a short period of time. Adaptability denotes the organization's effort to modify the product for the various markets. Autonomy indicates the level of decentralized decision making structure.

Table 3 shows frequencies of strategy typology from the data. The number of responses shows that defender and prospector are similar and reactor and analyzer are also similar.

TABLE 3: PERCENTAGE OF EACH STRATEGIC TYPOLOGY OF KOREAN EXPORTING COMPANIES

	Valid Frequency	Cumulative Percent	
Defender	118	31.2	31.2
Prospector	122	32.3	63.5
Reactor	66	17.5	81.0
Analyzer	72	19.0	100.0
Total	378	100.0	

We developed the rationale that the relationship between organizational strategy typology and organizational performance should be somewhat interrelated. As most strategy typology researches have not concluded, using relatively homogeneous sample (Korean leading exporters) is expected to generate significant result.

First, we utilized ANOVA in order to investigate the performance relationship with strategy typology. We devised three components for performance, such as profit, sales and future sales expectation. The rationales to

regard this way are two folds. First, the sample is relatively homogeneous. The leading exporters in Korea are relatively stable in their market position and their strategy has not been changed very much. Second, compared to domestic business oriented organizations, exporters need to concentrate their strategy for increasing sale and improving profit in relatively in short period of time. The government policy and incentives lead relatively narrow scope for foreign business

Table 4 presents the relationships among dependent variables and strategy typologies. The analysis shows only profit demonstrates significant relationship with strategy typology.

TABLE 4: ANALYSIS OF VARIANCE

		Sum of Squares	df	Mean Square	F	Sig.
sales	Between Groups	955.34	3.00	318.45	1.26	.289
	Within Groups	94350.47	372.00	253.63		
	Total	95305.81	375.00			
profit	Between Groups	26.34	3.00	8.78	5.89	.001
	Within Groups	557.21	374.00	1.49		
	Total	583.55	377.00			
Future sales	Between Groups	16.00	3.00	5.33	2.45	.063
	Within Groups	811.83	373.00	2.18		
	Total	827.83	376.00			
	Within Groups	700368.93	371.00	1887.79		
	Total	716958.25	374.00			

Based on the ANOVA result, we decided to investigate the most contributing factor with organizational performance, in other words the relationships with profit.

The export market has been defined as product competitiveness (Porter, 1986). The price competitiveness or quality advantage may lead to the superior performance. Considering strategy typology, product competitiveness may be independent if we consider relatively short period of time. If we consider longitudinal standpoint, strategy typology and product competitiveness may be strongly correlated. Based on this short term perspective, we developed hypothesis 1 below:

H1: Organizations that have higher level of product competitiveness will have higher rate of profit. As we investigated middle managers, their time frame could not be long enough. In the cross sectional research, but not in the longitudinal research, organizational profit is strongly related with marketing strategy. Rigorous marketing strategy tends to improve short term profit. However, strong marketing strategy without improving competitive edge

eventually erodes the initial advantage. We considered marketing strategy as a significant factor related with profit. Based on this argument, hypothesis 2 was developed:

H2: Organizations that have strong marketing strategy will have higher rate of profit. In the global business, the most important factor for competitiveness has been considered as human resources (Peng & Luo, 2000). Where technical resources or institutional advantages can be easily eroded, human resources are hard to imitate and to substitute. Organizational human resource is the only source of sustainable competitive advantage. Based on this argument, we developed hypothesis 3:

H3: Organizations that have higher level of human resource will have higher rate of profit. The argument of strategy typology is sometimes criticized as ex post description. This means the rather than managerial decisions and actions, organizations' decision making habits are articulated afterward. In order to minimize this critic, we evaluated the strategy typology based on respondents' questionnaire items so called 'integrative measurement using self typing, objective indicators, and investigator inference.' We believe that strategy typology and organizational performance may have somewhat stringent relationship. Based on this argument, we developed hypothesis 4:

H4: Organizations that have different strategy typology will have different rate of profit.

## Results

The basic model includes the size of the organization such as capital range and number of employees and target market. Capital and number of employees were recoded with natural log because the value is high. Target market is distinguished by the main foreign market is either less developed countries or developed countries. The strategic orientation may vary by the target market with organizational demographic variables. If the organization emphasizes developed countries for its target market, the strategy should be different from the organizations for less developed

countries. The strategic orientation for different level of countries will also end different level of profitability by dealing with more value added products. The basic model results show that target market orientation has a significant relationship with the profitability. Other factors that reflect the size of the organization such as capital and number of employees did not show significant relationship.

The second model, adding variables concerning product competitiveness factors show that only quality is the significant predictor for profitability. R square change was .029. Price ratio and brand equity did not have significant relationship with organizational profitability.

The third model added marketing strategy resulted that no significant relationship with the level of profitability. R square change was .014.

The fourth model adding organizational human resource also resulted in no significant relation with performance. R square change was .008. Human resource in this study measured organizational members' foreign language capability.

The final model adding strategic typology resulted in significant relationship with organizational performance. Prospector strategy is significantly outperformed other strategy organizations. We based prospector as a reference group to investigate significant relationship. Many strategy typology researches concluded that prospector strategy demonstrated significantly higher level of performance (Conant et. al., 1990; Shortell and Zajac, 1990). Based on the past research results, we based prospector as a reference strategy. R square change was .034 and R square was .011.

## **Conclusion**

The study employed Miles and Snow's strategy typology for evaluating organizational performance of Korean leading exporters. The results demonstrated that prospectors outperformed other strategies.

This study contributed to the academia and practitioners in three perspectives. First, strategy typology study has pushed respondents to be only one set of strategic behavior. Other options were not available. In the information age, fast changing and very turbulent environment urges organizations to be fast adaptors. Strategy typology research should adopt this phenomenon. Based on organizations' various strategic behavior, researchers could apply triangulation to assign organizations' representative strategic behavior.

Second, not many studies are done for Korean exporter recently. Entering into information age, the Korean exporters showed structural change from utilizing cheap labor to creating new technology and market such as MP3 players and multi functional cellular phones. In the transitory environment, this study will light a way that organizations should follow.

Finally, this study shed a light to both academia and industry analysis practitioners. Two strategic options in global environment, being the same or being different, have not met any conclusive remark. Still some researcher and practitioners emphasize organization specific factors as the only source of sustainable advantage. Others start to consider revitalized institutional power considering fast spreading technology and standard setting environment. Keeping organization specific advantage might lose whole market abruptly as Sony's Beta max video cassette disappeared. Our study shed a clue for strategic options such a turbulent digital business arena. Organizations need to use bold competitive position with maximum flexibility. Traditional marketing strategy may not appropriate. Emphasizing quality in the arena, bold prospectors will survive in the global marketing arena.

## **Determinants of Canned Fruit Exports in Thailand**

*Teay Shawyun, [teay@au.edu](mailto:teay@au.edu)*

*Virapol Siriwattanatum*

*Assumption University of Thailand , Thailand*

### **Abstract**

With the strengthening of the Baht in 2007 and the looming AFTA and FTA and canned fruits export representing the 12<sup>th</sup> biggest Thai exports with a 2005 value of 2.5 billion USD, Thai canned fruit manufacturers need to identify critical success factors that could help them to develop certain competencies to weather the ups and downs of the economy. Literature identified 15 factors that were synthesized into 6 used in this research: Firm competencies, Management attitude, Business Strategies, Channel adaptation, Product Quality and Trade barriers. The objective of the research is to determine the relationship and the predictability of these CSF with export performance. 52 medium sized and 76 big manufacturers were selected and 770 questionnaires were distributed with a response rate of 39%. The results of this research indicated that there were four critical factors that had an effect on export performance of Thai canned fruit manufacturers, which were product quality, trade barrier, business strategy and firm competencies. The other two critical factors, management attitude and channel adaptation appeared to have no effect on export performance of Thai canned fruit manufacturers in this research.

### **Introduction**

International trade is a crucial issue for governments in many countries as it affects their trade balance and balance of payment. Governments are persuading and enhancing export and import activities amongst themselves through trade blocs NAFTA, AFTA or bi-lateral FTA agreements. In Thailand, the latest of such bi-lateral partnerships between Thailand and Japan was signed in April 2007. The export value in Thailand for 2004-2005 had grown around 22 % annually; Japan was around 15 %, China was up by 35 % and other Asian countries increasing at the rate of 15-20 % ([www.dep.thai.go.th](http://www.dep.thai.go.th)). Thailand had several types of export products, which had been changing from agricultural raw material to industrial and electronic appliances. Canned fruit that was listed as the 12<sup>th</sup> highest export product with export values value between 2004-2005 dramatically increased by 11.2 % as a result of lower tax and tariff in importing countries. The ratio of exported canned fruit and canned vegetable was 80: 20 because

Thailand was able to harvest fruits all over the year, which included tropical fruits and warm season fruits. Canned pineapple was the leading product with 36 % of overall canned fruit export volume, followed by canned pineapple juice of 15 %. This showed that pineapple covered more than 50 % of Thai canned fruit export. Other canned fruit product included Lynchee, rambutan, longan, mangoesteen and jack fruit, which made up 40 % of the total export volume in this industry and the product of canned mixed fruit juices, was 9 % of export canned fruit of Thailand ([www.thaitrade.com](http://www.thaitrade.com), fact sheet of canned fruit January 2006). The main markets of canned fruit from the last 5 consecutive years remained the same with United States as the highest value purchaser with more than 50 % of the total export value of Thailand followed by Holland and Japan, where the import values were almost equal ([www.thaitrade.com](http://www.thaitrade.com), General international export of Thailand 2006). During 2005- 2007, the export value to Japan will increase as a result from the reduction in import tax after the FTA (0% within 5 years). Other export markets consisted of Germany, Russia, UK, Canada, and Australia respectively. The Thai Commercial department identified Russia with a growth rate averaging 200 % during the 3 consecutive years of 2003-2005 that was strongly growing in the import of electronic and canned products and this new market might be a potential importer with high purchasing power in near future.

In the highly competitive world, companies are trying to increase their performance in terms of internal operation, working performance, customer satisfaction including, external factor such as opportunities to expand their markets. In other words, exporters in international market seek ways for improvement to compete in an intensive market environment. The companies cannot avoid the improvement of their organization; they need to understand the factors that affect their performance. Companies are trying to cope with how to improve company's sales, what companies should consider as their important survival means, or what appropriate strategies should be used to increase export performance.

Thai exporters of canned fruit faced controllable and uncontrollable problems that are related to both internal and external factors, which may reduce its degree of competitiveness. Some of the problems were: (1) The fluctuation in climate which will be a problem for production planning and raw material management; (2) Increases in cost of raw materials in this industry, 20% for steel in 2004-2005, 67 % for sugar mix in 2006, 15% for transportation in 2004-2006 (Thai trade facts sheet, Issue3 March, 2006); (3) Fluctuation in exchange rate with the Baht having appreciated more than 16 % that affected profits reduction from sales revenue (Bank of Thailand literature, April, 2006); (4) Trade barriers imposed by import countries like JETRO (2006) "prohibit ingredients and food additive", FDA in EU and HACCP USA, (2005) that caused higher cost of production and quality control adding to the non-competitiveness of canned fruit; (5) Competition from China (30% to 43% in 2003-2005, Philippines (15% to 17%), and some countries in South America (17% in 2005) were gaining more market share especially in pineapple product.

Two of the main internal factors are: (1) Management attitudes toward export market as they still maintain the family business mindset; (2) Quality control of Thai canned fruit does not reach international standard (sterilization standards – 20%, short shelf life – 40%, dented tin – 25%, and production defect – 10%). Based on the above premises, this research aims to identify the factors and their importance that have an effect(s) on export performance focused on Thai canned fruit manufacturers, who export their product internationally.

The main contribution of the research was to identify the determinants that were critical to the export performance of Thai canned fruits products so that the manufacturers could better plan and manage these factors especially the internal factors affecting their competencies within their direct internal control towards a more successful export of their canned fruits products. This research was also applicable to other canned food products as they faced similar issues that need to be managed with special attention to the internal factors that affected their capability and competencies that directly affect their international market performance rather subject themselves to the ever changing external factors beyond their control.

## **Literature Related to the Determinants of Export Performance**

### **Export Performance**

In the increasingly trend towards globalization, Crinkota et. al., (1999) stated that companies need to globalize their international strategies to take advantage of underlying market, cost, environment, and competitive factors, and export is the most common form of international business activity. Griffin & Pustay, (1996) pointed out that the export performance indicated the firm's success in the international business which was the main issue that every firm should consider through not only its internal competency of the firm but also in its surrounding condition. Lages (2000) stated that the export performance is defined as the firms' outcomes achieved in international sales whereas, Griffin and Pustay, 1996 considered export performance as a complex task for sustaining and assessing the export performance with two sets of financial and non-financial measures. Most of the researchers (Cavusgil and Zou, 1994; Matthyssens and Pauwel, 1996, Cooper and Kleinschmidt, 1985; Kolter, 1993; Lages, 2000; Bolton and Lehmann, 2004; Moini, 1995 and Bijmolt and Zwalt, 1994) agreed that the 3 factors of: (1) Export sales, (2) Export profits and (3) Export growth, could be used as a measure of export performance.

### **Critical Factors of Export Performance**

Evidence related to the factors affecting export performance was fragmented and often contradictory (Aaby and Slater 1989; Cavusgil and Zou 1994; Zou and Stan 1998) giving rise to a rather diverse set of literature as to the approach and methodology. Barney and Collis (1999) summarized the determinants of export performance into a 2x2 table based on two dimensions: internal vs. external and controllable vs. uncontrollable. Proponents of the

internal determinants were justified by the resource-based theory (Barney, 1991; Daft, 1999; Wernerfelt, 1984) and external determinants were supported by the Industry organizational theory (Scherer and Ross, 1990) as discussed below:

- The resource-based theory (Barney, 1991; Daft, 1999; Wernerfelt, 1984) conceived a firm as a unique bundle of tangible and intangible “resources” (assets, capabilities, processes, managerial attributes, information and knowledge), that were controlled by firm and that enable it to conceive and implement strategies aimed at improving its efficiency and effectiveness. It contended that the principle determinants of firms’ export performance and strategy were the internal organization resources (Barney, 1999; Collis, 1999), which helped to generate the firm’s success resulting from the internal strength that firm could control or that could be called, “firm’s competency”
- In the Industrial organization theory, Scherer and Ross, 1990 pointed out that the industrial organization (IO) theory argued that the external factors determined the firm’s strategy, which in turn determined its economic performance. The external environment imposed pressures and a firm must adapt in order to survive and prosper (Collis, 1999) which were the primary determinants of export performance.

Based on a review of the existing literature Zou and Stan (1998) created a matrix of the factors identifying the major factors of: Export market strategy and Management Attitudes and Perception (Internal and controllable); Management Characteristics and Firm’s characteristic & Competencies (Internal and uncontrollable); Industry Characteristics, Foreign market characteristics and Domestic market Characteristics (External and uncontrollable) affecting the 3 measures of export performance: Financial Measures, Non-Financial Measures and Composite scales. Chetty and Hamilton (1993) added their comment to Zou and Stan (1998)’s matrix that the particular independent factors have 3 types of effects on export performance, a significant positive effect, a significant negative effect, or a non significant effect.

The basic aspects of the matrix as proposed by Madsen (1987), Aaby and Slater (1989), and Chetty and Hamilton (1993), argued that the single most important set of determinants of export performance falls into the cell of internal-controllable factors. The prevalence of controllable factors suggested that most researchers held the view that export performance was under the control of the firm and its management. Thus, not only better export performance could be attributed to management’s superior work, but poor export performance should be blamed upon the management as well. In addition, Aaby and Slater, (1989) and Da Rocha and Christensen, (1994) classified the factors, which had crucial effects on export performance as:

- **Export Marketing Strategy:** As noted by Hofer & Schendel (1978); Porter (1980) and Ledesma (2002), the capacity to produce different varieties of goods and the quality of the product are crucial factors explaining export performance. Hofer & Schendel (1978) and Aaby and Slater (1989) stated that

differentiation through marketing mix employed in respective export markets was a key that led to sustainable goals. Burton and Schlegelmilch (1987) and Weerachai and Patriya (2002) confirmed a significant relationship between unique product attributes, through differentiation strategy and export performance and Poh-Lin and Jeong (1995) explained that the export firms are able to differentiate their level of firm's orientation by being innovative, more pro-active and were risk takers. Generally, price adaptation seemed to positively influence export sales, export profits and export growth in the study by Chetty and Hamilton (1993) but was insignificant in others (White, 2000, Bredahl and Zaibet, 1995). In channel adaptation, dealer/ distributor support, motivation, and involvement, emerged as a key determinant of export sales, export profits and export growth (Cooper, 1985; Poh-Lin and Jeong, 1995). The research by Cavusgil and Zou (1994), and Kirpalani and MacIntosh (1980) mentioned that the channel adaptation and promotion had direct effects on export performance in term of flexibility and maintaining the target markets.

- **Managers' Attitudes and Perceptions:** The Management's attitudes and perception on export performance referred to the management's point of views, opinions and how they perceived the export activities in terms of strategies, marketing, positioning, and other attributes, along with the perception in barriers, advantages and situation in the international export markets (Narver, 1993; Pitt 1996; Da Rocha and Christensen, 1994) that had been frequently cited as important determinants of export performance. Cavusgil and Zou (1994); Axinn (1998) and Cavusgil and Kirpalani, (1993) concluded that high management commitment allowed a firm to aggressively go after the export market opportunities and pursue export marketing strategies that improved export performance. Cavusgil and Zou (1994) and Leonidou and Katsikeas (1996) found that international orientation of the manager was a very consistent predictor of good export performance, measured in financial terms or as composite. In addition, Cavusgil and Zou (1994) stated that the management's perceived export advantage and how the management people and teams perceived the international export had benefits and could generate profits, growth and sales to firms was a relevant predictor.
- **Managers' Characteristics:** Da Rocha and Christensen (1994) and Axinn (1998) found that this had a positive effect on export sales, profits and growth while another study (Cooper and Kleinschmidt, 1985) found that it had an insignificant effect, and a few others (Chartien, 1993 and Christien (1988) reported a negative effect. Overall it could be concluded that firm's export performance did not benefit from having educated and internationally experienced managers.
- **Firm Characteristics and Competencies:** Kaynak and Kuan (1993), Bodur (1994) Das (1994) and Louter et.al., (1991) reported a negative impact of the firm's number of years in exporting on export profitability

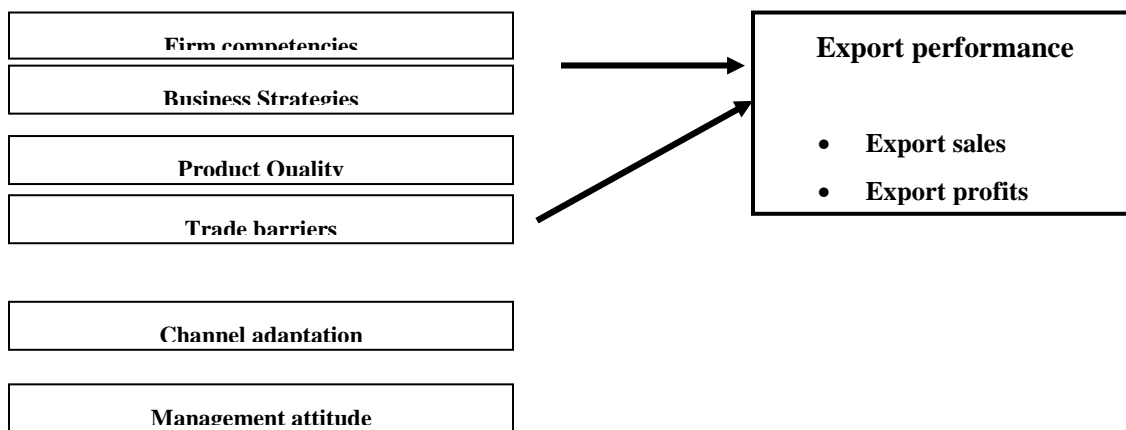

and sales but Aaby and Slater, (1989) stated that there was no relationship between years of exporting experiences with the export performance, since the number of years engaged in export activities did not indicate the success of export sales, profits and growths, but it helped to gain only reputation and reliability. They pointed out that although firm had a strong connection and several years in the industry, it could not achieve better profits and sales if they did not adapt themselves to the competitive environments. Reid (1986) Aaby and Slater (1989), and Chetty and Hamilton (1993) found that there was positive relationship between R&D/technology and innovation and export performance, since the R&D created the product innovation and new technology improvement, therefore, the firm was able to utilize these factors in other to gain customer's preference and build competitive advantages.

- **Industry:** Cavusgil and Zou (1994), Holzmuller and Kasper (1991) and Holzmuller and Stottinger (1996) argued that the industry's technological intensity or "Manufacturing complexity" had a positive influence on export performance. Cavusgil and Zou, (1994) found a significant indirect effect of export market competitiveness on export performance while Kaynak and Kuan (1993), and Madsen (1987) reported a negative effect of export market barriers (trade barrier, physical and psychological distance), which were not significant predictor of export performance. Kirpalani and MacIntosh (1980), Griffin & Pustay (1996) and Xuto (2003), found that trade barriers had direct influences on export performance, in terms of sales, profits and growths. Griffin and Pustay (1996) and Grimwade (1992) noted that non-tariff barrier or non-quantitative NTBs were the ways in which imports might be reduced.
- **Foreign and Domestic Market Characteristics:** Katsikeas (1997) reported a positive effect on export performance for the national export policy, but a non-significant effect for domestic market pressure and domestic currency devaluation. Seringhaus, (1998), Aaby and Slater (1989), Abalaka (1999), and Diamantopoulos and Schlegelmilch (1994) concluded that there were direct relationship between market information, market knowledge and export performance and that the level of export performance would be greater if information acquisition enabled market opportunities identification and threats to decision-makers. Narver (1993); Pitt (1996) and Aaby and Slater (1989) explained that there was increasing evidence that the marketing orientation of firms impacted positively on business performance, which mainly focused on the customer's satisfaction and preferences. The researchers agreed that satisfaction was the most important factor for every business. The environment could be conceptualized as attributes (e.g. hostility, uncertainty, dynamic) or as objects (e.g. general and task environment) and Cateora (1996) and Scherer & Ross (1990) pointed out that socio-cultural environment had a significant impact on export performance through the import countries' rules and regulations.

## Research Framework

The above literature came up with 15 main determinants of: Management and attitude; Research and development and firm competencies (e.g. technology); Business strategy; Channel adaptation; Trade barrier; Product quality; Firm size; Product adaptation; Product Information; Low cost strategy; Socio- cultural; Price adaptation; Market orientation; Promotion; and Management' international experience and 3 representation of successful export performance as: Export sales; Export profits; and Sales growth. Of the 15 main determinants, the 6 most significant were 5 main internal variables and 1 main external variable as shown in the research framework as shown in Figure 1.

### Internal Controllable Variable

### External Uncontrollable Variable

FIG 1: RESEARCH CONCEPTUAL FRAMEWORK

Based on the research framework above, the 2 main sets of hypothesis developed for this research were:

**H<sub>0</sub>1 to H<sub>0</sub>6** : There is no relationship between the determinants of firm competencies, management attitude, business strategies, channel adaptation, product quality and export performance of Thai canned fruit manufacturers.

**Ha1 to Ha6** : There is a relationship between the determinants of firm competencies, management attitude, business strategies, channel adaptation, product quality and export performance of Thai canned fruit manufacturers.

- H<sub>07</sub>** : There is no effect of determinants of firm competencies, management attitude, business strategies, channel adaptation, product quality on export performance of Thai canned fruit manufacturers.
- Ha7** : There is an effect of determinants of firm competencies, management attitude, business strategies, channel adaptation, product quality on export performance of Thai canned fruit manufacturers.

## Research Design

A self-administered survey instrument designed to identify the determinants of export performance of Thai canned fruit manufacturers was used in this study. In this study, the target populations were the canned fruit manufacturer in Thailand that exported to overseas markets with an export volume of more than 10 TEU (twenty footer container) per year since these medium and big size firms generated 80 % of sales revenue and had been operating more than 5 years. Altogether, there were 257 canned fruit manufacturers as listed in Thailand Export Promotion Department in 2005 and the sample size needed was 154 companies. Firstly, the 257 companies were listed and were assigned an ordered number. The ratio of medium firms (with total employees of 51 – 200) and big firms (more than 201 employees) was 40:60 (www.thaitrade.com/, fact sheet of canned fruit January 2006). The number 1 – 103 was assigned to medium companies and 104 – 257 to big companies respectively. Then, the sample units were selected by picking up odd numbers from 1 – 257 to get 128 companies (with 52 medium and 76 big firms) as the sampling units. The target respondents were persons who were engaged in export business such as export management people: Director, export manager or assistant export manager. A total of 770 sets of questionnaires were sent with each firm being allocated 5 sets. The overall response rate was 39%

TABLE 1: CRONBACH'S ALPHA OF PRE-TEST OF INSTRUMENT

Questionnaire components	No of items	Cronbach' s Alpha
Trade Barrier	8	0.8821
Business strategy	3	0.7325
Management attitudes	5	0.7268
R&D and technology	4	0.7187
Product quality	4	0.8767
Channel adaptation	5	0.8160
<b>Export performance</b>	<b>3</b>	<b>0.8178</b>

The pre-test of the reliability of the research instrument came back with the following Cronbach's Alpha as shown above in Table 1:

## Research Findings and Discussion

### Profile of Sampling Unit

Of the 300 respondents, 50% had been operating in the canned food business for more than 7 to 10 years, 30% between 5 to 7 years, and 20% more than 10 years with the majority of the group (45%) having more than 200 employees, followed by firms having employees between 51 to 100 (27%), 101- 150 (15%) and 151- 200 (13%) respectively and with export volume of canned fruit to foreign countries of more than 20 TEU (36.7%), more than 15 to 20 TEU (34%) and between 10 -15 TEU (29.3%) respectively. 46 % of the respondents had been engaged in the canned fruit export business between 7 to 10 years, followed by 5 to 10 years (40 %) and more than 10 years (14%) respectively.

### Level of Concern for the Determinants

TABLE 2: SUMMARY OF LEVEL OF CONCERNS OF DETERMINANTS OF EXPORT PERFORMANCE

<b>Concern Factors</b>	<b>Overall Mean Average</b>	<b>SD</b>	<b>Qualitative Rating</b>	<b>Rank order</b>
<b>Trade barrier</b>	4.079	1.055	Neutral	<b>5</b>
<b>Business strategy</b>	4.9	1.167	Quite High	<b>3</b>
<b>Management Attitudes</b>	4.306	0.9532	Neutral	<b>4</b>
<b>Firm competencies</b>	4.95	1.044	Quite High	<b>2</b>
<b>Product Quality</b>	5.6725	0.884	High	<b>1</b>
<b>Channel Adaptation</b>	3.982	1.028	Neutral	<b>6</b>

Table 2 showed the level of concern of each of the determinants of the 6 determinants of export performance. 3 of the factors, management attitudes (mean scores of 3.97 to 4.73 and overall mean average of 4.306), trade barrier (mean scores of 3.2 to 4.56 and overall mean average of 4.079), Channel adaptation (mean scores of 3.33 to 4.52 and overall mean average of 3.982) were in “neutral level of concern”. Business strategy (mean score of 4.65 to 5.10 and overall mean average of 4.90) and Firm competencies (mean scores of 4.44 to 5.43 and overall mean average of 4.95) fell into the “quite high level of concern”. The only factor with a “high level of concern” was Product quality (mean scores of 5.29 to 6.23 and overall mean average of 5.6725). The details of each of the factors were discussed in Appendix 1.

Based on this study, it was explicit that the key to success in the export was in line with the main stream literature that the internal controllable factors product quality, the firm’s business strategy and its R&D that led to a

firm's competence were more important than the external factors of the trade barrier and channel adaptation. What the management attitudes were would be rather irrelevant.

### Hypothesis Testing

TABLE 3: SUMMARY OF HYPOTHESIS TESTING OF DETERMINANTS OF EXPORT PERFORMANCE

Hypothesis of H <sub>0</sub> 1 to H <sub>0</sub> 6	Hypothesis testing technique	Level of significance	Correlation Coefficient	Result
H <sub>0</sub> 1: There is no relationship between R&D/ technology and export performance of Thai canned fruit manufacturers	Pearson's Correlation	.000	.57	Reject Ho
H <sub>0</sub> 2: There is no relationship between management attitudes and export performance of Thai canned fruit manufacturers	Pearson's Correlation	.54	.863	Fail to Reject Ho
H <sub>0</sub> 3: There is no relationship between business strategy and export performance of Thai canned fruit manufacturers	Pearson's Correlation	.000	.32	Reject Ho
H <sub>0</sub> 4: There is no relationship between Channel adaptation and export performance of Thai canned fruit manufacturers	Pearson's Correlation	.781	-.037	Fail to reject Ho
H <sub>0</sub> 5: There is no relationship between Trade barrier and export performance of Thai canned fruit manufacturers	Pearson's Correlation	.000	-.643	Reject Ho
H <sub>0</sub> 6: There is no relationship between product quality and export performance of Thai canned fruit manufacturer	Pearson's Correlation	.000	.783	Reject Ho

In the testing of 6 hypothesis (H<sub>0</sub>1 to H<sub>0</sub>6) of the relationships between the 6 determinants of firm competencies, management attitude, business strategies, channel adaptation, product quality and export performance of Thai canned fruit manufacturers as shown in Table 3, it appeared that all the determinants were significant with the exception of management attitudes and channel adaptation which might be construed that these 2 factors were not crucial or directly related to the export performance. In a sense, this might be interpreted that it was what the management or the firm did in terms of its product quality through its firm competencies and how the firm actually differentiated its product offer through its value proposition in terms of its quality created and delivered through its firm competencies' efforts that contributed to its differentiation from its competitor, all of which were within the internal control of the firm that it could choose to do or not to do, or improve on.

TABLE 4: SUMMARY OF REGRESSION TEST OF EXPORT PERFORMANCE PREDICTORS

**Coefficients<sup>a</sup>**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-2.254	.558		-4.042	.001
	TRADE BARRIERS	-.754	.106	-.726	-5.810	.009
	DIFFERENTIATION STRATEGY	.518	.120	.427	5.810	.000
	MANAGEMENT ATTITUDE	.160	.127	.133	1.261	.220
	R&D/TECHNOLOGY	.622	.106	.542	.794	.008
	PRODUCT QUALITY	1.129	.136	.870	8.309	.000
	CHANNEL ADAPTATION	-.117	.098	-.106	-1.199	.243

a. Dependent Variable: EXPORT PERFORMANCE

In the testing of the hypothesis 7 ( $H_07$ ) of the effect of the determinants of firm competencies, management attitude, business strategies, channel adaptation, product quality on export performance, the regression Table 4 (R square of 0.973) showed that the channel adaptation and management attitude were not significant as predictors of export performance. Of the remaining that were significant, the internal factors of product quality (0.870), R&D or the firm's competencies (0.542) and business strategy or its differentiation strategy (0.427) were significantly important in predicting the export performance of which product quality and firm competencies were imperatives that the firm must excel in order to improve its export performance. The only external factor of trade barrier showed a significant inverse prediction of performance, meaning that if the trade barrier is high, and its export performance will decrease significantly.

### Discussion of Findings

The key findings of the research were in line with the main-stream literature of the importance and imperatives of these determinants as discussed in this section. It must be noted that these determinants of the product quality, business strategy and firm competencies were mainly internal and controllable factors of the internal capabilities and competencies. The trade barrier was the only main external determinants within the control of the trading countries and under the direct influence of the importing country government. This could be construed to the fact that the degree of success in export performance was dependant on the degree of success in managing these internal capabilities to achieve a staked out position in the industry.

Abalaka (1999) stated that exporters must consider product quality as their core competency rather than low cost strategy and his studies showed that the product quality affecting customer satisfaction and creating brand loyalty was the most important factor that influenced export performance and had strong relationship with export performance as also evidenced in this study. Good quality coming from raw material, processing and final

production including effective quality control system showed the significance of product quality with export sales and export growth, which would bring about higher export profits.

The studies of Kirpalani and MacIntosh (1980) showed that trade barriers had direct influences on export performance with strong relationship to sales, profits and growths. They suggested that the exporter should consider the government rules and regulations of import countries such as the tax and tariff systems, price policies and the restriction of foreign products. It was recommended that the exporter should prioritize their export activities to the low export barriers countries open to international trade as business logic to reducing risks and uncertainties in competitive environments. The research from Xuto (2003), as supported by this study, on problems of Thai canned Tuna exported to EU market indicated that the tariff barrier was a crucial factor that directly affected the export performance and had a strong relationship as it found out that the import tariff of those markets was up to 24 %, which was much higher than some developing countries. The research suggested that the Thai government should use the WTO right to secure more equitable treatment from the developed countries trading partners.

Chetty and Hamilton (1993) reported a positive effect of firm technology on export performance since a high technology firm was able to innovate on their production process, and overall management procedures bringing about lower costs of production and management, thereby generating more profits and lower costs. Maneerungsee (2000) who conducted an in-depth study of the Thai food exporters also concluded that to gain more competitiveness and foreign investment capital, Thai factories should implement and enhance the technology in production process, which could result in higher productivity and export performance. In this research, the firms' competencies in terms of R & D and Technology which is the firm competencies was also found to be a major determinant of export performance as achieving competitive advantage was based on the firm's internal capabilities and capacity that all contributed to the firm's competencies critical to achievement.

Hofer & Schendel (1978) stated that business strategy using differentiation had direct and significant influence with the level of export performance since the firm was able to differentiate their products and services to gain the competitive advantage over the intense competition as also evidenced in this study of the firm's differentiation strategies that was a key that led to sustainable goals. Along with the research paper from Ledesma (2002), which stated that the capacity to produce different varieties of goods and the quality of the product were crucial and significant factors affecting export performance. In other words, product differentiation and increases in quality had been widely recognized as crucial factors determining the export performance of the countries and export sectors. Further more, firms that wanted to have superior performance over other competitors, generally focused on innovative and highly differentiated products.

### **Managerial Implications**

In this study, the determinants or the critical success factor were “the minimum key factors that the Thai canned fruit manufacturers must implement for the successful export performance”; therefore, the Thai canned fruit manufacturers must pay special attention and emphasis on those four determinants, which showed significant relationship with export performance. The Thai canned fruit manufacturers can apply these determinants for their development and improvement of export performance and use them as a basis to formulate plans for implementation.

- **Product quality:** To improve product quality, both private and government sectors have specific roles. Since product quality is the bridge that connects the improvement process with priorities that support the organization’s long term success, in term of quality control and certification of the quality consistency, the government has an important role to verify the quality checking system in order to improve the product reliability among nations. The related departments should improve and issue more quality regulation and systems in order to comply with the International Food and Drug association standards (JETRO, FDA, EU standard). Private sectors also have the duty to improve the product quality in term of process and production by: (1) Improving the packing through stronger cans to avoid the damages during the transportation; (2) proper and adequate wrapping up of the product with strong pallets and roping the front row of container; (3) adjusting the label by adding specific information and explanation like nutrition facts and better designs as required by importing nations.
- **Trade barrier:** The Government was not only a regulator of the sector by developing the sector in the right way the use and implementation of internationally accepted standards, but also as a negotiator for a more favorable balance of trading with other countries in order to achieve competitive advantage in the canned fruit export environment. Tax and tariffs imposed by importing countries are one of the important factors that exporters were unable to control but the Thai government had to raise these issues and discuss them with other nations in order to build up the local competitiveness especially in the EU.
- **Firm Competencies:** Product innovation and the technology improvement in production and processes are mandatory as these represent the core competency inherent in the firm’s internal competitiveness. These are the internal processes capacity and capability that creates and delivers on the value that the customers seek in the purchase and consumption of the product and service offers. These cover the ingredients affecting health consciousness; can disposal practices that affect the environment and the overall value that the customer derived in the consumption of the product or service offer through the customer value (Gale, 1994) defined as:

$$\text{Customer Value} = f(\text{Product Quality, Service Quality, Relationship, Image})/\text{Cost}$$

- **Business strategy:** The components of the business strategy capitalize on the value addition to customers and the features that most of the competitors can not duplicate. In the canned fruit industry, manufacturers are able to offer value added product to consumers by both increasing special features like Vitamin C added in syrup, select only L-sized fruit in cans, or use only super refined sugar for mixing syrup. Another value added that manufacturers can contribute to consumers related to the ease of use is by offering convenience to consumers such as, attached spoon on the top of the cap, easy to open can (without use of opener) and the diced fruit (cubic shape and easy to eat), which is the new production technique from Japan. Value addition can also be in the form of lower cost that can generate higher company's profit, which leads to better export performance. Economies of scale, scope and speed and knowledge of the customers, competitors, organization and its technology utilization are the main ways to achieve lower cost that ultimately converts to a lower cost to the customers in the form of higher value. The firm's internal systems and logistics which contribute to 20% of the cost can also be re-designed through better management systems or outsource of the logistics.

## **Conclusion**

The above implications as had been evidenced in this research had shown that the success of the firm and its exports performance was within the controllable and internal firm's direct management. In conclusion, the above research highlighted the imperative that the success of the export performance of the Thai canned fruit exporters lie in the key internal factors within the control of the firm in order to improve its competitiveness in the international arena through its own competence that it must develop. Its success and future success in the export market would be based on its capacity and capability that are human based. If not managed carefully, its foundation of success would be weak. Its organization success lies in its management of the intangible assets of its human capital, information capital and organization capital (Kaplan and Norton, 2004). It cannot just wait for the external factors to happen, as building up the competence needs time and efforts that must start immediately and that ultimately represents the firm's competence to create and deliver value that will ultimately affect its export performance that finally affects the bottom-line financial performance.

FIG 3: MEAN AND INTERPRETATION OF BUSINESS STRATEGY

Figure 3 showed that the three items in business strategy factor had a mean score ranging from 4.65 to 5.10 falling into the “quite high level” with an overall mean average of 4.90 rated as “quite high level”. This could mean that Thai canned fruit manufacturers had quite a high level of concern in implementing this factor, the highest level is the “company was considered as more innovative than others in the industry”, mean score 5.10, followed by the “canned fruit of the company has unique features, which others cannot duplicate”, and the “company’s product offers the high value added (e.g. Higher nutrients, refined sugar added) to customer as compared with those of competitors” with mean scores of 4.95 and 4.65 respectively.

FIG 4: MEAN AND INTERPRETATION OF MANAGEMENT ATTITUDE

Figure 4 showed that the five items of management attitudes mean scores ranged from 3.97 to 4.73. The overall mean average was 4.306, rated as “Neutral” which could mean that the Thai canned fruit manufacturers for its attitude was neutral with the exception of the 4<sup>th</sup> item; management had a clear direction of export business e.g. Policies and strategy which was the highest level among five items in this factor with a mean score of 4.73. The remaining items were in a “neutral level” with mean scores between 3.97 to 4.42.

FIG 5: MEAN AND INTERPRETATION OF FIRM COMPETENCIES (R&D/ TECHNOLOGY)

Figure 5 showed that the four items of the firms' competencies (R&D/ technology) factor had mean scores ranging from 4.44 to 5.43 with most of the items falling into "quite high level" with the exception of R&D development that was rated a "high level". The overall mean average was 4.95 rated as "quite high level" showing the concern of the Thai canned fruit manufacturers for this factor. The Thai canned fruit manufacturers' highest concern was the company had training and enhancement of R&D/development with a mean score of 5.43 followed by the items 1, 3 and 4, which had mean scores of 5.19, 4.73 and 4.44 respectively.

FIG 6: MEAN AND INTERPRETATION OF PRODUCT QUALITY

Figure 6 showed that the four items of Product quality factor had mean scores ranging from 5.29 to 6.23 falling into the “high level” range with overall mean average of 5.6725, which showed a “high level” of concern by Thai canned fruit manufacturers for this factor. The highest concern was effective Quality control system (defect rate less than industrial standard = 1.5%) with a mean score of 6.23. The second, third, and fourth items that Thai canned fruit manufacturers had concerns were that the raw materials and packaging were reliable (in term of freshness and cleanness), products were durable enough to meet the degree of customer requirements (without claims), and the design of product was attractive, with mean scores of 5.73, 5.44, and 5.29 respectively.

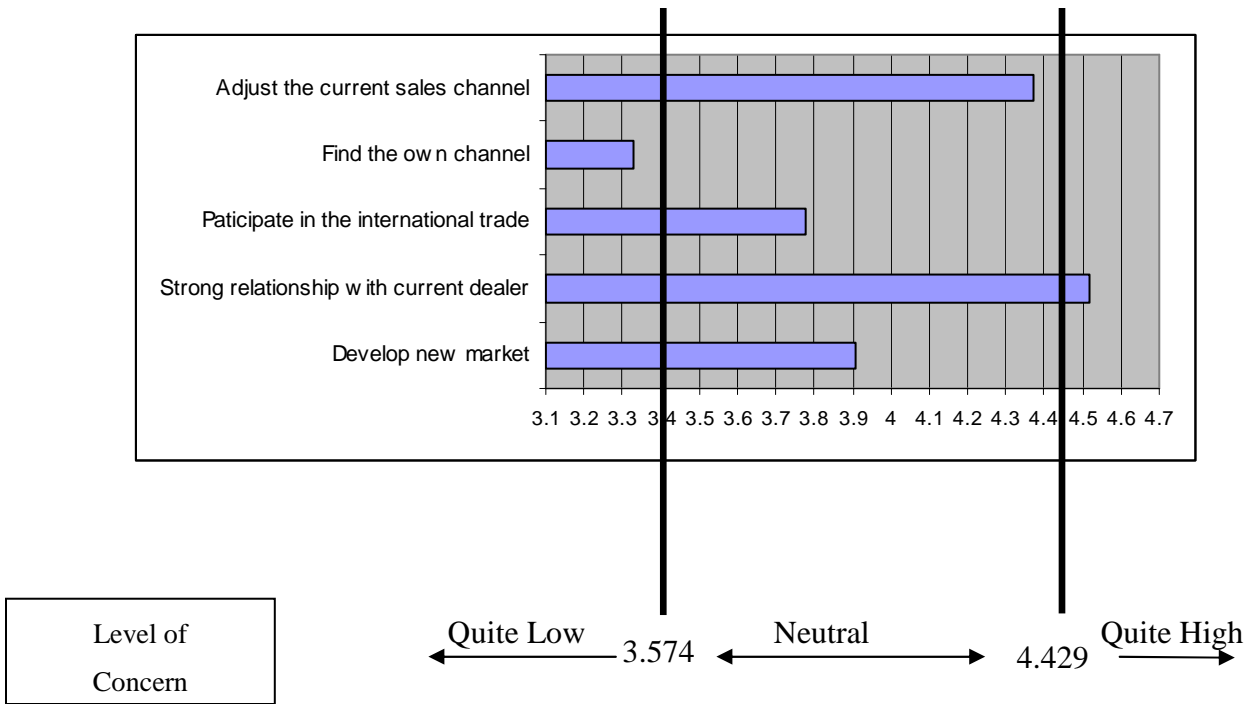

FIG 7: MEAN AND INTERPRETATION OF CHANNEL ADAPTATION

Figure 7 showed that the five items in the Channel adaptation factor had mean scores ranging from 3.33 to 4.52 were in “neutral level”, with the exception of the second item falling into “Quite low level” and the fourth item in the “Quite high level”. The overall mean average was 3.982 interpreted as “neutral level” could mean that the Thai canned fruit manufacturers were in the neutral level in their concern for this factor. Thai canned fruit manufacturers placed highest concern in Channel adaptation as the company had strong relationship with current dealers, which helped the company to adjust the sales channel to be more flexible with a mean score of 4.52. Other items, 1, 3, 4 and 5 were not considered as crucial concerns for the Channel adaptation factor, since the mean scores were considered as “neutral and quite low level”, therefore, the Channel adaptation factor had rarely received attention from Thai canned fruit manufacturers.

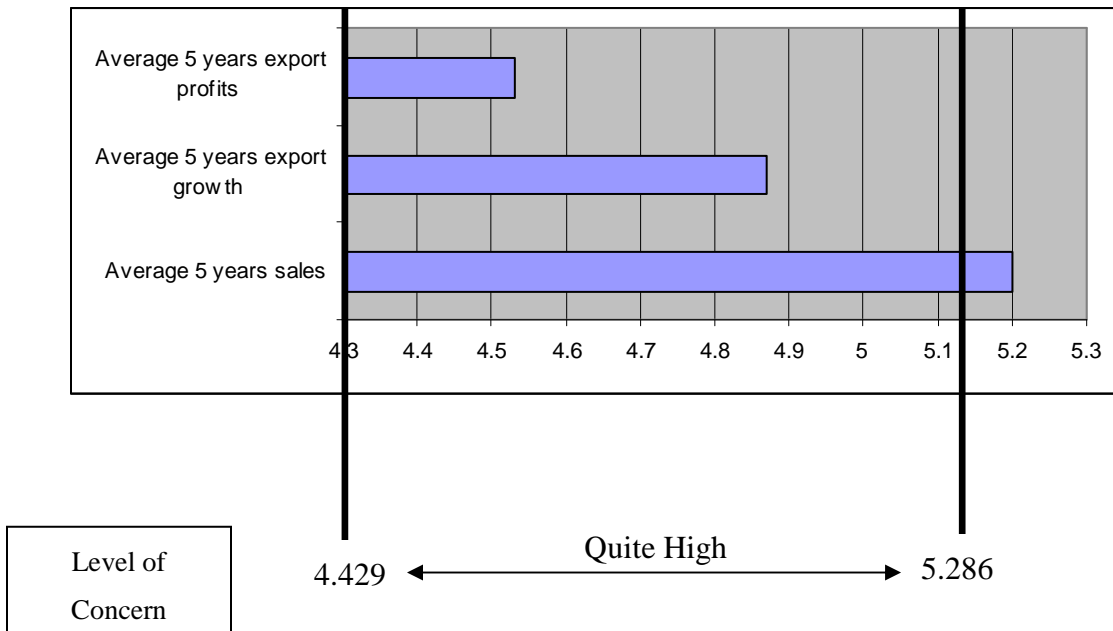

FIG 8: MEAN AND INTERPRETATION OF SUCCESS RESULTS OF EXPORT PERFORMANCE

Figure 8 showed that the 3 items of success results of export performance with mean scores ranging from 4.87 to 5.20 was considered as “quite high level” with export sales, export growth and export profit having mean scores of 5.20, 4.87, and 4.53 respectively. This could be interpreted that most of the respondents agreed that the export sales of the company had been growing in the last five years, which meant that the export sales in value (Baht) had increased and that had gained more revenue in export sales (without considering any costs). The sales growth was also growing in the same direction but not in the same percentage. Since sales growth was measured by volume (TEU), therefore, there might be some external factors such as Baht currency exchange, tax and tariff in import countries or the degree of competitions that affected the export growth. Similar to the export profits, since the higher export sales might require more investment in product and marketing, this would result in higher cost which pulled down the profits. Therefore, the increase in export sales might not necessarily affect the increase in export profits in the same level. Moreover, like export growth, export profits might be affected by the currency fluctuation (in case of Baht appreciation) and also through the increase in the logistic cost.

# **The Japanese Experience of Labour Export Policy and its Impact**

*Rie Kage, [rie.kage@gmail.com](mailto:rie.kage@gmail.com)*

*Saga University, Japan*

## **Abstract**

It was witnessed in capitalist development process that labour export policy has been remained as one of the major strategies of economic development, not only in developing countries but also in most of the developed countries. This was not an exceptional to Japan. The commencement of modernisation or so-called industrialisation of Japan since Meiji Restoration (1868) had been employed this policy as one of the major development policies to overcome its capital needs required by the development process. This had continued until 1993. This policy was contributed to expand its industrial activities while supplying major relief to both macro- and micro-level of socioeconomic problems caused by the process of industrialization based capitalistic theory. This paper mainly aims to examine the policy aspects as well as practical experience of this policy in the process of industrialisation with special reference to Japan's experience since its embarking on modernisation in 1868.

## **Introduction**

Today, the developing countries in the world commonly use labour exporting policy as one of major development strategies in their development process. However, this is not a new phenomenon in the development sphere of the world. Historically, presently developed countries, especially Japan and European countries, have had an experience of international labour migration for a relatively long period at the first stages of their modernisation, or so-called industrialisation which commenced since the 19 century. Industrialisation has involved structural change effecting on both macro and micro level of socioeconomic environment, particularly transferring of the surplus labour force from traditional sector to modern sector. However the process of this transfer had not been occurred in smooth manner. This was resulted to employment of the labour export policy during the time of initial stage of economic development. However, development economists in recent years have argued that migration is having a strong relation with economic development in developing countries. For example, Castles and Miller (2003, p.156) noted that the migration transition as a result of all the changes through economic development and demographic transition. In this respect, Japan can be extracted as strange evidence that it used this policy at the very beginning of

her modernization. The present study attempts to examine the relationship of labour export policy with the development process of Japan during the period 1868-1993.

## **Labour Export Policy in Japan: An Overview**

According to historical evidence, the labour export policy in Japan can be described under three major periods: first, before Meiji Restoration; second, prior to WWII; and third post-WWII period. **Before Meiji Restoration:** During the feudal age, Japan was not having any socioeconomic pressures from foreign countries. This was continued for over 200 years. During this period, Japan did not have trade and other economic relations with overseas except a small island in Nagasaki<sup>1</sup>. The feudal policy strictly prohibited overseas visit of the Japanese people as well as the Japanese go abroad. However in 1866, the feudal government changed its national isolation policy and started foreign trade with some restrictions under agreements with foreign countries. Although trade relations were commenced under various restrictions, the labour export was prohibited because the feudal government was worried about slave trade and the conditions of Chinese and Indian coolies. Along with the abolition of the slave trade in most labour importing countries in the world, they started to use other strategies to acquire of labour force to fulfil their labour demand. Although the feudal government was not allowed to send Japanese labour force to abroad, the middlemen who were immersed in various forms were resulted to send 153 Japanese labourers to Hawaii, 42 to Guam and 40 to California during the emergence of new government after Meiji Restoration in 1868. This is the first mass labour migration from Japan<sup>2</sup>. However, the new Meiji government had also kept a conservative attitude towards the labour export policy for a long period.

### **Prior to World WWII**

In 1869, the Meiji government prohibited inflow of labour force from Japan to Hawaii as a result of worsening condition of working and living of already migrated Japanese people. However, rapid increase of requests of the Japanese people who want to work in overseas has caused signing a bilateral agreement of labour export from Japan to Hawaii with the Hawaiian government in 1886 (Arimoto, 1993, p.58). The conditions of the agreement were as follows: the employees have to send under rules and regulations of the agreement; employment contract limited to three years; the provision of security to all Japanese labourers by the Hawaiian government.

Enomoto Takeaki (1836-1908) is also a main promoter of Japanese labour export and settlement policy. In 1890, he submitted the Opinion Paper on Migration to the Cabinet, which insisted that the government should send farmers and make them settle in the new land overseas. After his assuming as the Foreign Minister of Japan in 1891, he established a Division of Migration in the Ministry of Foreign Affairs. He procured a land in Mexico, and sent around 30 migrants there. Although this project was failed to achieve successful results as expected, it contributed

to make a strong legal base for the Japanese migration policy (*ChunanbeiIjyuukyoku*, 1965, p.1). It also helped to diversify the destinations of Japanese migration.

According to various research findings, most Japanese migrant workers were subjected to be maltreated like slaves at the destination countries in the earlier time: most of them were died in illness, overwork and accidents, under the unaccustomed climate (Wakatsuki and Suzuki, 1975, pp.57, 73). The contract migrants under the Japan-Hawaii agreement resulted in relatively better conditions compared to other destinations because they had tried to improve the working conditions through diplomatic negotiations, but the migrants of other destinations were faced serious difficulties and hard situations. Except Hawaii, the Japanese government did not have any legal contacts with other countries which used by Japanese migrants as major destinations for their overseas works. As a result, problems relating to working and living of migrant workers were deteriorated during this period. In addition, the increase of private companies and brokers, which were worked as agents of migrant workers, resulted to further deterioration of the workers' socioeconomic condition in foreign countries. This was occurred because the migrant agents exploited the people who decided to work in foreign countries (Ishikawa, 1972; 1970, p.90). In April 1894, the government issued the Regulation of Protection for Migrants (*Iminhogokisoku* in Japanese) to protect the migrants and to crack down on a dishonesty services employed by migrant agents. Under this Act, it not only protected migrant agencies, but also rights of migrant workers. In 1896, the regulation was upgraded to legislation of Protection of Migrants. Since 1898, the government started to keep data under the following categories: *Imin* and non-*Imin*. The first group, *Imin*, was regarded as labour migrants, and the second one consisted public servants, business persons, students, and tourists. The all acts which enacted on this subject mainly aimed to protect the rights of the migrant workers. The government had revised the legislation of migration for three times until 1907. This legislation was the only one chief regulation concerning for international migration.

Migrant agencies had played a major role in labour exporting policy in Japan. However, labour importing countries had gradually imposed restrictions towards foreign labour force. For example, the anti-Japanese movement was increased along with the annexed of Hawaii by the United States in 1898. As a result, the US gradually imposed various restrictions on accepting foreign labourers, particularly Japanese immigrants. Similar situations had been also seen in Australia and Canada. This made further difficulty to increase of Japanese migration. Since then, the Japanese government started to find other labour importing countries, which had less anti-Japanese movements. As a result, Japanese migrants started to move to the Latin American countries as well as Southeast Asia and pacific islands after 1903. Thus, the destination of Japanese migrants became more diversified mainly because of the restriction of immigration policy in advanced countries.

From the Taishou era (1912-1926) downward, an advance of Japanese migrants to abroad became more brisk up, and the government began to introduce more encouraging policy towards migration (Ishikawa, 1972). For

example, the government established an association for promoting migration to abroad in each prefecture after 1915 while integrating six migration agencies into a new enterprise called *Kaigaikougyou* in 1917. In 1921, the government subsidized the new migration agencies and bought a land in Brazil. Moreover, after the Great Kanto Earthquake in 1923, the government provided the expense needs for migrants who were victims of the earthquake. The later this subsidy system was expanded to the other general applicants too. At the same time, the government abolished the applicant's payment duty paid as service charge of the formalities for going abroad to migration agencies. In addition, the government was compensated the same amount of that to the enterprise charged (Ishikawa, 1972, p.133). Through the clear vision of economic development policies, the government promoted export, and supported international migration and settlement and foreign investment (Matsuno, 1997).

In 1927, the government introduced much more reinforcement towards migration policy with enactment of the Act of International Migration Union in order to support an enterprise on its labour sending business. After the following year, the government placed an accommodation for pre-migrants' temporal stay near the Kobe port, and established the "Latin America & Amazon corporations" to send migrants to these specific destinations. When the Great Depression broke out in 1929, *Takumu-Shou* (the Ministry of Migration and Settlement) was established to control Japanese migrants and migration projects as a main migration institution<sup>3</sup>. However, the Brazilian government revised its immigration policy in 1934 that aimed to limit Japanese migrants. These restriction laws imposed in these countries resulted to decline of Japanese except Japanese territories and colonies<sup>4</sup>.

#### **Post-WWII Period**

Along with the defeated of Japan in the war in 1945, it lost its territories and colonies mainly in Asian region. The war also destroyed most of the economic structures and industrial bases, resulting to face serious socioeconomic difficulties<sup>5</sup>. Moreover, having been ruled by the Allied Forces between 1945 and 1951, Japan had been isolated from the world, and had not been allowed to hold its own diplomatic initiatives (Wakatsuki and Suzuki, 1975, p.79). During this period, Japan was not having its own policy of international migration. However in May 1948, the plenary session of the House of Representatives adopted the following three resolutions aiming to solve Japanese population problem: an industrial development; a birth control; and an international migration (The Diet minutes search engine web site).

Soon after the signing of San Francisco Peace Treaty in 1951, the Japanese government took an initiative to introduce some policies towards international migration, mainly permanent migrants. In the same year of the Peace Treaty, the Brazilian government agreed to accept 5,000 Japanese migrant families as permanent migrants. Along with the positive outcomes, the Japanese government made several plans to send Japanese permanent migrants to Brazil. The Ministry of Foreign Affairs of Japan also expanded the migration institution from an office into a division level of international migration. At the same time, the Ministry established the Federation of Japan

Overseas Association as a central organisation, and the Regional Association of International Migration in each prefecture as a subordinate organisation in order for them to take charge of a practical migration service (Wakatsuki, 2001, p.15). In 1954, the Ministry of Foreign Affairs did further expansion of the institution as International Migration Affairs Bureau. Moreover, when Prime Minister Shigeru Yoshida visited the United States in 1954, he officially received US\$ 15 million loan from three American banks, and decided to utilise those financial assistance on development of Japanese international migration scheme such as establishing the Council of International Migration and Japan Emigration Promotion, Co., Ltd. (*Chunanbeijyuukyoku*, 1965, pp.84-89; Consul of Department of International Migration, 1971, p.307). This new migration corporation was aimed to finance Japanese permanent migrants and the companies in the destinations which employed Japanese workers. The Japanese government subsidised to cover all overhead expenses of the new migration corporation (Wakatsuki, 2001, p.54). The Ministry of Foreign Affairs had eagerly sought wherever countries to accept as destinations for Japanese permanent migrants. The following countries were accepted as major countries to send Japanese migrants: Paraguay, Argentine, Bolivia, Peru, and Dominica. Since then, the Japanese government had promoted mass permanent migration policy focusing on Latin America and Caribbean countries. In this respect, the Ministry of Foreign Affairs had been the main actor of the international migration, which used about 83 per cent of the total budget for necessary expenses needed for the permanent migration service during the period 1952-1968. It could be also noted that the Ministry of Transport, the Ministry of Agriculture, Forestry and Fisheries, and the Ministry of Construction were also involved in Japanese international migration services but not that much like the Ministry of Foreign Affairs.

In addition to sending permanent migrants to Latin American countries, there were also labour export policy with the United States and West Germany. Japanese government made an agreement with some related associations in California in 1956 and decided to send young Japanese labourers to farms under three-year contract. This was expected train Japanese workers and help to Japanese people to save some money to invest after return to Japan (Suzuki, 1992, p.358). Moreover, the Ministry of Labour of Japan made an agreement with the West German in 1957 to send Japanese labourers to meet the shortage of coal miners there (Suzuki, 1992, p.260).

However, along with the decline of Japanese applicants for overseas migration in the beginning of 1960s, the Japanese government ceased the labour export policy to the United States and West Germany. The major reason for this can be recognized as not only the various immigration restrictions imposed by the US, but also the rapid economic growth in Japan made high demand for the labour domestically. In December 1962, the meeting of the Council of International Migration took these internal and international circumstances into consideration, and made a philosophy of international migration policy (*Chunanbeijyuukyoku*, 1965, p.116). According to this definition, the philosophy of Japanese international migration policy for the future should be regarded as the mobility of human

resources with talents and skills for development of both internal and international societies, not just any old type of a mobility of labour. From 1963, the Ministry of Foreign Affairs had reconsidered the policy of international migration, and planned to rationalise the permanent migration services. In this respect, Japan Emigration Service (JEMIS) was established through unifying the Japan Emigration Promotion, Co., Ltd. and the Federation of Japan Overseas Association, as a semi-government agency affiliated with the Ministry of Foreign Affairs. This new institution rolled as major agency of recruiting and sending of Japanese migrants. In the regional level, municipal governments worked as major institutions to promote Japanese international migration. One year later of the liberalisation of Japanese overseas travel in 1965, the Japanese government intensified the promotion of international permanent migration, and subsidised a fare of going abroad by ship instead of loan system through JEMIS (Yamada, 1998, p.225). Although JEMIS had supported a fare of ship of permanent migrants, the number of migration had never increased. As a result, JEMIS finally stopped this supporting system and sending of migrants by ship in February 1973 (Yamada, 1998, p.227). However, JEMIS had continued financing the Japanese settlers in South America with low interest. In 1974, JEMIS was taken over by Japan International Cooperation Agency (JICA) and continued the financing programme for the Japanese settlers. In 1978, JICA started sending Japanese professionals and skilled permanent migrants to Australia<sup>6</sup>.

In 1979, the Brazilian government asked the Japanese government to close a local corporation of JICA, as its response, the local corporation of JICA retreated from Brazil in 1981. In the internal situation, the training centre for Japanese pre-emigrants ceased to exist. In 1993, the government closed recruiting and sending of Japanese migrants but, there still had kept the related budget of the Ministry of Foreign Affairs. In 1974 there were four units of affairs relating to the Japanese international permanent migration service in JICA, but they were integrated into one division. In October 2003, the institutions related to Japanese permanent emigration functioned under the government were completely abolished. This was occurred when the JICA reformed from a special public institution to an independent administrative institution in 2003. As a result, the policy of international out-going-migration of Japan has come to an end.

## **Impact of Labour Export Policy on the Economy of Japan**

### **Trends of Japanese Labour Migration**

There is a distinctive difference in the trend of Japanese migration before and after WWII (FIG. 1). It can be recognized that diverse socioeconomic factors were caused the changing pattern of the Japanese out-going – migration. In particular, pushing factors of supply side in Japan and pulling factors of demanding side in overseas relating to migrant labourers have been largely affected to changing pattern of the Japanese migration. Prior to

WWII, particularly before 1930, people in Japan could move and stay relatively freely following market forces in the frontier or labour host countries without facing a strict immigration control. However the situation had been gradually changed after the Great Depression in 1929, the host countries started to impose various restrictions to limit the inflow of foreign labour. This impact was clearly seen the change of trend of the destination. For example, the share of labour migrants toward the United States and Hawaii declined and disappeared after the 1930s (FIG. 2). However the situation changed dramatically after WWII. The most obvious different points were the size of international migration and the trends of destinations. The number of Japanese international migrants had drastically decreased especially after the 1960s. However the share moving to the North America as permanent status had been constantly high, especially between the latter part of 1960s and

FIG. 1: OUTFLOW OF JAPANESE INTERNATIONAL MIGRANTS 1878-1993

"Senzen no Nihonjiniminnshi nikansuru Tyousa/kenkyu no Seirihoukou nitsuite: Roudouidou no Shiten wo Chuushin nishite", *Bulletin of Niigata Sangyo University, Faculty of Economics*, 17, 7-42; JICA (1994). "Kaigai Ijyu Toukei", pp.116-119; Consular and Migration Policy Division, the Ministry of Foreign Affairs (2006); Suzuki, Joji. (1992). "Nihonjin Dekasegi Imin", pp.258-260, Heibonsha.

FIG 2: TRENDS OF THE DESTINATIONS 1868-1989

Source: JICA (1994). Kaigai Ijyuu Toukei, JICA.

Every year of during the 1950s, over 50 per cent permanent migrants had moved to Latin America and the Caribbean under the government (JICA after 1974) support to settle as farmers. According to Table 1, this total number of migrants<sup>7</sup> before WWII increased slowly and met a peak during the 1910s, but started to decrease after the 1920s. After WWII, however, it has grown rapidly after the 1970s, and the share of Japanese going abroad as the total population become over 10 per cent after the 1990s. While the outflow of Japanese labour before WWII showed constantly high trend, and its share kept roughly around 50 per cent of the total Japanese going abroad. After the 1930s, Japanese migrants started to move into Manchuria as rural settlers, and its number was massive. However after WWII the number of labour migrants going abroad dropped and disappeared from the Japanese international migration statistics. The available data of labour migration after WWII reported that there were 4,767 Japanese migrants, which was only 0.6 per cent of total Japanese going abroad, between 1956 and 1965. The number of permanent migrants has also decreased and the share of Japanese permanent migrants as a total Japanese going abroad became very small, especially after the 1960s. On the other hand, both periods of the number of Japanese resident in overseas are of increase trend, but dropped dramatically during war period.

TABLE 1: JAPANESE MIGRANTS AND RESIDENTS SINCE 1881

Period or Year	Migrants with Japanese Passport						Migrants Toward Manchuria	Resident of the Japanese in Overseas		
	Total	Labour Migrants (Imin)		Permanent Migrants				Total	Total	year
		total	(%)	Total	(%)	Permanent Migrants (JICA support) total

## Impact of Labour Migration on the Economy

### Remittances and Balance of Payments

Private transfers consists in one of Transfers items in the Balance of Payments of which Japanese labour migrants had contributed to make up a large share of the private transfers. This has been recognized as private remittances. According to Table 2, the private remittances had increased during the former part of the twenty century, even though other components showed deficit trends. The increase rate until the 1920 was significantly high. Remittances differ from other sources of foreign exchange. In the case of balance of trade, it is regarded as one of foreign incomes, but it is easily fluctuated by the conditions of external market such as recession in trade partner, emergence of competitors, and drop of the international commodity price, especially when the country belong to the earlier stage of industrialisation. Even under these economic conditions, remittances enable to keep stable trend, as well as increase its value as the number of labour migration expands. This is also seen through the experience of Japanese economy prior to WWII.

Prior to the first half of 1920s, most Japanese labour migrants preferred to move to the United States and Canada, because they were the frontiers of immigrants from all over the world. Moreover, in those days, the United States became the most industrialised country with high technology and good wage rates, and had enjoyed the economic boom, and needed labour force especially in construction, agriculture and mining sectors to fulfil the shortage problem in the labour market. The remittances from these two countries in 1918 and 1926 accounted for about 143,692,000 Yen (per capita remittance is approximately 1,075 yen) and 49,552,000 Yen (per capita remittance is approximately 818 Yen ) respectively. The total remittances from the world during this period (1918-1926) amounted to 234,174,000 Yen (Suzuki, 1992, p.254).

During the war period between 1941 and 1945, Japan lost its profitable trade partner like the United States, so the remittances as a proportion of merchandise exports became quite large at 17.55, and the value as a proportion of the GDP grew at 0.71 from about 0.5 percent before that period (Table 3). After the war, the value of remittances as a percent of GDP had been at the same level as it was in the pre-war time, but its proportion has dropped dramatically after the 1960s. Since around 1960, the Japanese economy recovered from the war, and entered a high growth period, and finally the position of remittances became negligible afterwards. This reveals that the private remittances from workers abroad could support the time of early stage of economic condition.

### **Labour Export and Socioeconomic Problems: Surplus Labour**

It was commonly known fact that the agricultural sector remains as a dominant sector of the economy at the very beginning of the development process of in any country. This sector is also holding surplus labour force with simple and low technology. These characteristics are not an exceptional to Japan before its embarkation of modernization in the Meiji Era. However, agricultural sector is having vital contribution to accelerate the accumulation of capital through efficient usage of land, labour and tax system.

In the case of Japanese modernisation, there was no strict monetary tax system under the feudal era, so the new government allowed private property rights, and converted the feudal land tax in kind into an annual money tax (Ogura, 1982, p.374). This is the first step of accumulating capital in Japan. However this tax system made the other socioeconomic problems such as increase of tenant farmers, expansion of the gap of income and wealth or so-called inequality, increase of rural poverty and unemployment. It could be noted that the heavy burden of the tax was the main reason for all these problems. In addition, the industrial sector, which was required mainly female labour force because of its domination of light industries rather than technologically sophisticated heavy industries. As a result, absorbing of surplus labour from agricultural sector to industrial sector had been very slow. Therefore, it can be argued that this surplus labour problem became a main push factor of the labour export policy until the mid of 1910s. Since WWI period, industrial sector with heavy industries were gradually developed, absorbing male workers in the rural sector. Even though the Japanese industrialisation was advanced on that time, the potential to

absorb surplus labour was remained at slow and lower level. For example in 1923, there were nearly 1,000,000 dismissals of factory workers in Japan, in which about 30 per cent of them returned to farming. This returning farmers increased to 43 per cent (650,000 dismissals) in 1931 (Kondo, November 1978, p.12). These figures simply reveal how unemployment problem was remained as a serious issue during those periods. Moreover, since mid-1920s, population explosion became a serious issue in Japan, making grave consciousness on food security and land scarce problems. There was only 20 per cent of arable land available in Japan (Kondo, November 1978, p.13). In 1930, some foreign researchers reported their apprehensive for Japanese commencement of war with pointing out the Japanese facing social problems of excessively high population expansion, but there was no place to send Japanese surplus population to relief the pressure (Kondo, November 1978, p.13).

However, it sounds a contradiction that labour shortage in the rural sector became a serious problem during the WWII period. In those days, the military authorities mustered young males, and the number increased as the war became severely. However after the war, the situation changed, there were much returnee and veterans returned from abroad to Japan that created serious shortage of food during the latter of 1940s and the 1950s. Consequently, the government enforced international migration policy again, focusing on permanent or settlement to acquire land abroad in order indirectly to secure foods for Japan. This was continued until the early 1990s.

## Conclusion

This paper overviewed the Japanese international migration policy since the Meiji Restoration. The study learned that the government introduced this policy to overcome some major socioeconomic problems like scarce of land, increase of surplus labour especially in rural area, expansion of inequality, increase of unemployment faced by Japan along with its development process. The migration largely aimed to find an immediate solution to the above problems while finding new markets and lands in other countries needed to achieve a sustainable industrial development at home. All these reveal that Japan's intention to use this policy as one of the most effective strategy to implement the modernization without social unrest while using this policy to improve the capital accumulation in some level.

However, it should be noted that the international migration or labour export policy, which employed Japan as a government-sponsored policy cannot be recognized as major contributory factor of the Japanese economic development. It can be considered that Japanese migrants prior to WWII could contribute to stabilise balance of payments in some level through inflow of remittances of workers.

Japan met a migration transition in the 1960s ceasing labour export policy as a result of shortage of labour in the domestic labour market. Today Japan became labour importing country. Thus, ending up the labour export policy seems to be a beginning of new stage of economic development.

### End Notes

The small island called, *Dejima*, and the place was only allowed to trade with Dutch. In actual situation, during the Tokugawa era, there were some other areas to facilitate trade with foreign countries, like Korea, Ryukyu (Okinawa), Ainu (Hokkaido).

<sup>2</sup> In 1868, E. M. Van Reed, an American businessperson, sent a group of Japanese migrants to work sugar plantations, and this unauthorised recruitment of labours is known as *Gannenmono*.

<sup>3</sup> The Great Depression started in 1929 until 1936 when world trade, partly through protection and the cautious fiscal policies of national economies, suppressed the level of economic activities (Rutherford, Donald 2002, Routledge Dictionary of Economics, 2<sup>nd</sup> edition, London: Routledge, p.239).

<sup>4</sup> In 1931, Japan attacked Manchuria, and the government started a project of Japanese migration and settlement in the region since the following year as a national project. The Ministry of Migration drew out the Outline of Scheme of Farmer Migration in Manchuria, and planned to subsidize all the related expenses for the agricultural migrants. In 1935, the government established Corporation of Manchuria Migration to procure land and to finance. Furthermore, the government, especially the military authorities, send armament migrants to the region and recruited young Japanese boys. The number of Japanese migrants to Manchuria had dramatically increased after Japan lost other destinations in the world.

<sup>5</sup> As of September 1949, there were 11,797,000 increased Japanese population, including 6,249,000 veterans and refugees from overseas, and 6,377,000 natural increased by birth, regardless of the deducted number of foreigners (Consul of Department of International Migration, 1971: p.8).

<sup>6</sup> Back in 1965, the emigration of Japanese professionals and skilled workers started in Canada (<http://www.janm.org/projects/inrp/english/overview.htm>).

<sup>7</sup> The total number of Japanese migrants according to passports includes all types of migrant status; permanent and temporary, and their purposes like travel, business, working, studying and official.

## A Non-linear Approach to the Japanese Business Cycles

### Abstract

Since non-linear dynamic approach to economics had started, considerable interest has been taken in empirical tests of finding chaos in the business cycles. Amongst the several empirical works on macro-economic time series, Frank, Gencay and Stengos (1988) found the strong non-linearity in the Japanese data. This paper attempts to give a mathematically precise version of empirical tests on Japanese time series for presence of low dimensional deterministic chaos. 'The Residual diagnostics' which is first presented by Brock(1986), is conducted on the Japanese macro-economic quarterly time series including the periods of 'rapid growth', 'twice oil crises' and 'bubble economy and after bubble depression'(from 1955 to 2000). For the tests of low dimensional deterministic chaos, correlation integral, correlation dimension and BDS statistics are examined. Empirical results show that the correlation dimension grew linearly with the embedding dimension and did not saturate at a certain value. Distribution of the BDS statistics has a large peak near 0. Based on these results, evidence for chaos in Japanese quarterly macro-economic time series is weak, and fluctuations are mainly explained by 'random noise'. J. E. L. classification number *C19, C32, E32*. This research is supported by the Grant-in-Aid (No. 16653021), Ministry of Education, Science, Sports, and Culture, Japan.

### Introduction

In the field of business cycle theory, much attempt to model the basic underlying dynamics of an economy have been taken. The Samuelson-Hicks type multiplier and accelerator mechanism, for example, isolated the regular forces in oscillating time series and explained them with appropriate assumptions concerning the structures of the economy. Although they had succeeded in modeling the business cycles generated from the internal dynamics of economy, they could not succeed in describing entire fluctuations of actual business cycles. As actual time series are characterized by much more irregular behavior not only with respect to the monotonicity of cycle but also with respect to the amplitude and frequency of the cycle, stochastic exogenous influence had been thought to be included in the theoretically expressed linear systems.

Rational expectation theory on business cycles constitutes a stochastic business cycle models which describe actual cycles by including stochastic exogenous influences in addition to the implicit regularity with the linear difference and difference systems. Typical examples of such models are Lucas (1975) and Prescott (1986). Non-linear economic dynamics, on the contrary, attempts to explain seemingly irregular actual fluctuations in actual time series by using the simple deterministic non-linear difference equations. Theoretical approaches to the non-linear macroeconomic dynamics have been started by Stutlar (1980), Benhabib and Day (1982) and Day (1982, 1983). Since then theoretical interest of economists has increasingly enhanced: see, for example, Grandmont (1985) and Lorentz (1993) for the literature.

Concurrently with the progress of non-linear macroeconomic dynamics, the empirical interest concerning the evidence of chaos in the actual economic time series has been taken. Brock (1986) and Brock and Sayers (1988) examined several American time series. They found significant evidence of non-linearity in the labor market and in investment data. Frank and Stengos (1988) examined several Canadian macroeconomic time series and found no evidence for low dimensional deterministic chaos. Amongst the several empirical contributions, Frank, Gencay and Stengos(1988) found the strong non-linearity in the Japanese data. This paper attempts to give a mathematically precise version of empirical tests on Japanese time series for presence of low dimensional deterministic chaos.

This research differs from Frank, Gencay and Stengos (1988) in two respects. In terms of statistical procedure, in order to avoid trend-reversions, Frank, Gencay and Stengos (1988) took ‘first differences’ of the time series to induce data stationarity. We use two types of time trends, linear and moving average time trend, in this research for excluding this problem. The second difference is concerning the period of data. Though Frank, Gencay and Stengos (1988) used the Japanese quarterly GDP time series from 1965 to 1986, we use longer time series dated from 1955 to 2000, which includes the periods of ‘rapid growth’, ‘twice oil crises’ and ‘bubble economy and after bubble depression’.

For the tests of low dimensional deterministic chaos, correlation integral, correlation dimension and BDS statistics are examined. Empirical results show that the correlation dimension grew linearly with the embedding dimension and did not saturate at a certain value. Distribution of the BDS statistics has a large peak near 0. Based on these results, evidence for chaos in Japanese quarterly macro-economic time series is weak, and fluctuations are mainly explained by ‘random noise’.

The remaining part of this paper is organized as follows. Section 2 presents the back ground knowledge of the non-linear macroeconomic dynamics. Section 3 defines and discusses the testing procedure which is used in this paper. Our empirical results are reported in section 4. Section 5 concludes the paper.

## Theoretical back ground

In 1975 T. Y. Li and J. A. Yorke discovered the emergence of chaotic trajectories from logistic map:  $N_{t+1} = bN_t(1 - N_t)$  which is the differential-difference equation of the logistic equation:  $dN/dt = aN(1 - N)$  and established the sufficient conditions for chaotic trajectories. Their theorem was introduced into economics by Benhabib and Day (1980) and Day (1982, 83). They indicated the conditions for chaos in the neo-classical economic growth model. In the field of endogenous business cycle, Benhabib and Nishimura (1985) showed the conditions for emergence of chaos by using the optimal growth model. For the references of this field, see Brock and Dechert (1991) and Lorenz (1993).

To review the main issues of deterministic chaos, consider the simple difference equation which is known as ‘the logistic equation’:

$$x_{t+1} = \mu x_t(1 - x_t) \equiv f(x_t). \quad (1)$$

Equation (1) is the real-valued continuous map from interval  $[0, 1]$  into itself. Here the value of  $\mu$  is crucial to the nature of dynamics. If we set  $0 < \mu \leq 3.57$ , the trajectory is approaching to the fixed point  $1 - 1/\mu$  either asymptotically or oscillatory. However, for  $3.57 < \mu < 4$ , there emerges infinite number of cycles with differing periodicity as well as an infinite number of stationary points. Any two time paths of  $x_t$  never coincide each other and two nearby trajectory locally diverge exponentially. This type of behavior is called ‘chaos’. The Li and Yorke theorem indicated, more generally, that if a continuous map from an interval to itself has a periodic point of period 3, then the map also has periodic points of all other periods.

To implementing the time series test for the presence of non-linear dynamics, the definition of deterministic chaotic explanation by Brock and Sayers (1988) and Sayers (1991) is instructive.

*Deterministic chaotic explanation:*

The series  $\{a_t\}, t = 1 \cdots T$ , has a deterministic explanation if there exists a system  $\{h, F, X_0\}$  such that  $a_t = h(X_t)$  for all  $t, X_t = F(X_{t-1}), X_0$  given. Where  $\{a_t\}$  is observed univariate time series. The function  $h$  is ‘observation function’ which maps  $\{X_t\}$  onto  $\{a_t\}$  and may scrambled the signal from  $\{X_t\}$  as it is mapped onto  $\{a_t\}$ .  $F$  denotes the deterministic law of motion which is unknown to researchers.  $X_0$  is unknown initial condition. The time series is, then, said to be chaotic, if it satisfies the above stated ‘deterministic conditions’ and if nearby trajectories diverge from one other exponentially. Such trajectories demonstrate ‘instability’ and ‘sensitive dependence upon initial conditions’.

## Testing procedures

This section attempts to give a mathematical procedures of empirical tests on Japanese quarterly Gross Domestic Product (GDP) time series  $GDP_t$  ( $t=1, \dots, N$ ) including the periods of ‘rapid growth’, ‘twice oil crises’ and ‘bubble economy and after bubble depression’ (from 1955 to 2000) for presence of low dimensional deterministic chaos.

A trend of the logarithmic GDP  $g_t = \log_{10} GDP_t$  ( $t=1, \dots, N$ ) is removed. The simplest trend is the linear function of time  $At + B$ . The de-trended logarithmic GDP time series  $x_t$  are written for the linear trend:

$$x_t = g_t - (At + B). \quad (2)$$

If the logarithmic GDP has complex time structure, the suitable trend function will be a moving average  $(g_{t+1} + g_t + g_{t-1})/3$ . Then the de-trended logarithmic GDP time series  $x_t$  are written for the moving average trend:

$$x_t = g_t - (g_{t+1} + g_t + g_{t-1})/3. \quad (3)$$

The de-trended logarithmic GDP time series  $x_t$  are tested using the procedure of the nonlinear time series analysis described below.

A fundamental concept of the nonlinear time series analysis is reconstructing an attractor of the system. Embedding vectors  $X_n(m)$  ( $n=1, \dots, N$ ) are obtained from the de-trended logarithmic GDP time series  $x_t$ :

$$X_n(m) = (x_n, x_{n-\tau}, \dots, x_{n-(m-1)\tau}). \quad (4)$$

The definition of the embedding vector  $X_n(m)$  is schematically explained in Fig. 1. Estimation of lag  $\tau$  will be given later.

FIG.1 DEFINITION OF THE EMBEDDING VECTOR  $X_n(m)$ .

The next step is to measure the spatial correlations among points  $X_n(m)$  on the attractor. To do this one calculates the correlation integral,

$$C_m(\varepsilon) = \frac{2}{N(N-1)} \sum_{n=1}^N \sum_{n'=n+1}^N \Theta(\varepsilon - \|X_n(m) - X_{n'}(m)\|). \quad (5)$$

Here  $\Theta(z)$  is the Heaviside's step function, and  $\|\cdot\|$  denotes the distance induced by the selected norm:

$$\Theta(z) = \begin{cases} 1 & (z > 0) \\ 0 & (z \leq 0) \end{cases}, \quad (6)$$

$$\|X_n(m) - X_{n'}(m)\| = \left[ \sum_{j=1}^m (x_{n-(j-1)\tau} - x_{n'-(j-1)\tau})^2 \right]^{\frac{1}{2}}. \quad (7)$$

For small values of  $\varepsilon$ , one can demonstrate that  $C_m(\varepsilon) \approx \varepsilon^D$  so that  $D(m)$  is the system's dimension, which is called the correlation dimension, (Ref: Grassberger and Procaccia, 1983)

$$D(m) = \lim_{\varepsilon \rightarrow 0} \frac{\log C_m(\varepsilon)}{\log \varepsilon}. \quad (8)$$

Dimensionality measures complexity of an object. A chaotic time series has positive but finite dimensionally. A random process is infinite dimensionally. Thus, for random noise, the correlation dimension  $D(m)$  grows linearly with the embedding dimension and dose not saturate at a certain value. If the system dose not saturate then the system is regarded as 'high dimensional' or stochastic.

For estimation of the lag  $\tau$ , one calculates the mutual information,

$$I(\tau) = \sum_{x_n, x_{n-\tau}} P(x_n, x_{n-\tau}) \log_2 \frac{P(x_n, x_{n-\tau})}{P(x_n)P(x_{n-\tau})}. \quad (9)$$

The definition of  $x_n$  and  $x_{n-\tau}$  is schematically explained in Fig. 2.

FIG. 2 DEFINITION of  $x_n$  and  $x_{n-\tau}$ .

The plane  $(x_n, x_{n-\tau})$  is divided by small elements  $(\Delta x_n, \Delta x_{n-\tau})$ , then the number of data passing the small element  $P(x_n, x_{n-\tau})$  is counted. The first minimum of the average mutual information  $I(\tau)$  is the lag  $\tau$ , and is corresponding to the maximum mutual information.

In order to check for the presence of deterministic chaos, two different empirical tests were conducted on the time series. The first test is the residual test, which is first presented in Brock (1986), is briefly explained. The de-trended logarithmic GDP  $x_t$  is modeled by the  $L^{\text{th}}$  order auto regression model AR(L):

$$x_t^{(p)} = a_1 x_{t-1} + a_2 x_{t-2} + \dots + a_L x_{t-L} \quad (t=1, \dots, N). \quad (10)$$

Then the residual time series  $r_t = x_t - x_t^{(p)}$  ( $t=1, \dots, N$ ) is obtained. If time series is chaotic, the correlation dimension will be unaffected by the linear transformation. A random noise will be drastically affected. This procedure is referred as the residual test. Thus, if the de-trended logarithmic GDP  $x_t$  is chaotic, the correlation dimension estimated for  $x_t$  will be same to one for the residual time series  $r_t$ .

The second test is the BDS test, which is first proposed in Brock, Dechert, and Scheinkman (1991). They proposed a hypothesis testing based on the correlation dimension  $D(m)$ . Under the hypothesis of independently distributed data (iid), the correlation integral at embedding dimension  $m$   $C_m(\varepsilon)$  will equal the correlation integral at embedding dimension one  $C_1(\varepsilon)$  raised to the power  $m$ . The BDS statistics is defined by

$$BDS(m, \varepsilon) = \sqrt{N} [C_m(\varepsilon) - C_1(\varepsilon)^m] / \sigma_m(\varepsilon), \quad (11)$$

$$\sigma_m(\varepsilon)^2 = 4 \left[ K_m(\varepsilon)^m + 2 \sum_{i=1}^{m-1} K_m(\varepsilon)^{m-i} C_m(\varepsilon)^{2i} + (m-1)^2 C_m(\varepsilon)^{2m} - m^2 K_m(\varepsilon) C_m(\varepsilon)^{2m-2} \right] \quad (12)$$

$$K_m(\varepsilon) = \frac{6 \sum_{t=1}^N \sum_{s=t+1}^N \sum_{r=s+1}^N \Theta(\varepsilon - \|X_t(m) - X_s(m)\|) \Theta(\varepsilon - \|X_s(m) - X_r(m)\|)}{(N-m+1)(N-m)(N-m-1)}. \quad (13)$$

If the BDS statistics  $BDS(m, \varepsilon)$  is near zero, the time series essentially consists of random noise.

## Empirical Results

The analyzed GDP time series of Japan is the nominal seasonally adjusted quarterly data from the 1Q of JFY 1955 to the 4Q of 2000 (Former SNA68 series). The number of GDP time series is 184 and unit of GDP is JPY  $10^9$ . A trend of the logarithmic GDP  $g_t$  was removed using two different trends, a linear function and a moving average. The de-trended logarithmic GDPs  $x_t$  were modeled by the 2<sup>nd</sup> order auto regression model AR(2):

$$x_t^{(p)} = ax_{t-1} + bx_{t-2} \quad (t=1, \dots, N). \quad (14)$$

Results of AR(2) for  $x_t$  (linear function) and for  $x_t$  (moving average) are shown in Table I and II, respectively. The obtained residual time series for a linear function was  $r_t$  (linear function) and time series for a moving average function was  $r_t$  (moving average).

**Table I AR(2) for  $x_t$  (linear function)**

	Value	Std.Error	t-value	Pr(> t )
<i>a</i>	1.4188	0.0669	21.2168	0.0000
<i>b</i>	-0.4155	0.0674	-6.1634	0.0000
<b>Multiple R-Squared: 0.9974</b>				

**Table II AR(2) for  $x_t$  (moving average)**

	Value	Std.Error	t-value	Pr(> t )
<i>a</i>	-0.7010	0.0727	-9.6369	0.0000
<i>b</i>	-0.2129	0.0695	-3.0637	0.0025
<b>Multiple R-Squared: 0.3666</b>				

The lag  $\tau$  was estimated by calculating the mutual information  $I(\tau)$ . The calculated mutual information  $I(\tau)$  is shown in Fig.3. Although Fig.3 (a) decays slowly as time increase, Fig.3 (b) to (d) decay quickly. It was estimated that the lag  $\tau=1$  for  $x_t$  (moving average),  $r_t$  (linear function), and  $r_t$  (moving average) from Fig.3 (b) to (d). For  $x_t$  (linear function), an appropriate lag was not estimated from Fig.3 (a), due to the slow decay. We adopted the lag  $\tau=1$  for all time series to construct the embedding vector  $X_n(m)$ . This choice of the lag is consistent with previous researches (references).

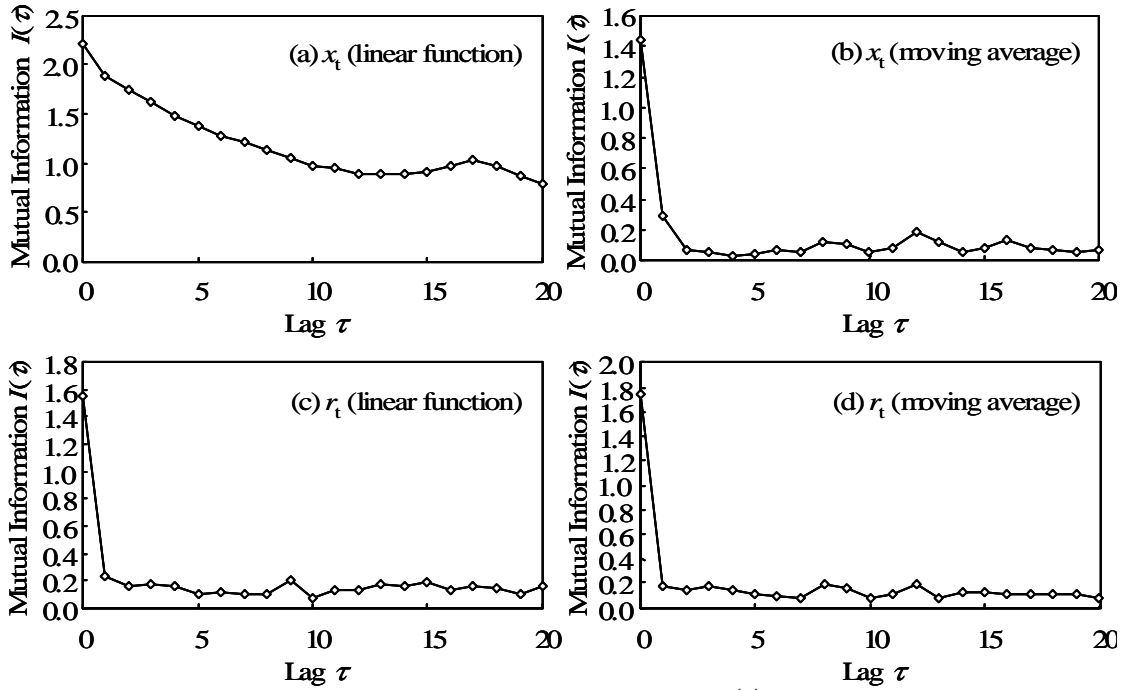

FIG.3 MUTUAL INFORMATION  $I(\tau)$ .

The correlation integral  $C_m(\varepsilon)$  at embedding dimension  $m$  was calculated using Eqs. (5) to (7) for various  $m$  and  $\varepsilon$ . As an example, the correlation integral  $C_5(\varepsilon)$  at embedding dimension  $m = 5$  was shown as a function of  $\varepsilon$  in Fig. 4.

FIG. 4 THE CORRELATION INTEGRAL AT EMBEDDING DIMENSION  $m$ .

Then the correlation dimensions  $D(m)$  were estimated using Eq. (8) in the region of small  $\varepsilon$ . For  $x_t$  (linear function) and  $r_t$  (linear function), the correlation dimensions  $D(m)$  are shown as a function of  $m$  in Fig.

5. The correlation dimension  $D(m)$  for  $r_t$  (linear function) grows linearly as  $m$  increases. This dependence of  $D(m)$  on  $m$  suggests that the system is regarded as ‘high dimensional’ or stochastic. The correlation dimension  $D(m)$  was drastically affected by the linear transformation. Thus, time series could not be regarded as chaos.

FIG 5 THE RESIDUAL TEST FOR TIME SERIES DE-TRENDED USING A LINEAR TREND.

For  $x_t$  (moving average) and  $r_t$  (moving average), the correlation dimensions  $D(m)$  are shown as a function of  $m$  in Fig. 6. This dependence of  $D(m)$  on  $m$  suggests that the system is regarded as ‘high dimensional’ or stochastic. Although it seems that  $D(m)$  was not affected by the linear transformation up to  $m = 6$ ,  $D(m)$  was drastically affected for  $m > 6$ . Thus, time series could not be regarded as chaos, again.

FIG. 6 THE RESIDUAL TEST FOR TIME SERIES DE-TRENDED USING A MOVING AVERAGE TREND.

FIG. 7 RESULTS OF THE BDS TEST

Finally, the BDS statistics  $BDS(m, \varepsilon)$  were estimated for  $m=8$  using Eqs. (11) to (13), and shown in Fig. 7.  $BDS(m, \varepsilon)$  asymptotically converge to zero as  $\varepsilon$  increase. Thus, the time series are essentially regarded as random noise.

Based on these results, evidence for chaos in Japanese quarterly macro-economic time series is weak, and fluctuations are mainly explained by ‘random noise’. This implies that prediction of future GDP is possible using a liner model.

## Conclusions

In this paper, we attempted to give a mathematically precise version of empirical tests on Japanese time series for presence of low dimensional deterministic chaos. ‘The Residual diagnostics’ is conducted on the Japanese macro-economic quarterly time series including the periods of ‘rapid growth’, ‘twice oil crises’ and ‘bubble economy and after bubble depression’(from 1955 to 2000). For the tests of low dimensional deterministic chaos, correlation integral, correlation dimension and BDS statistics are examined. Empirical results show that the correlation dimension grew linearly with the embedding dimension and did not saturate at a certain value. Distribution of the BDS statistics has a large peak near 0. Based on these results, evidence for chaos in Japanese quarterly macro-economic time series is weak, and fluctuations are mainly explained by ‘random noise’.

## Abstract

Chinese record GDP growth speed cannot go unnoticed, especially in context with the low level of inflation, stable foreign exchange rate, and a significant trade and budget surplus balance. This dynamically growing economy is having the ever-growing needs in each industry sector. One of those sectors is a plastic industry with its products in every part of the economy. To measure the plastic industry growth potential in context with the enormous Chinese economy growth is this article goal. Those questions are answered by defining Chinese plastic industry growth efficiency, sector employment figures, fixed capital growth and manufacturing capacities effectiveness, compared with the other sectors.

## Introduction

From 1949, the New China Era beginning and reforms introduction, China has changed a lot. From the economy point of view the most important changes were from 1978 to 2000, when GDP growth was from 147.3 billion USD to 1.6494 trillion USD and foreign trade from 20.6 billion USD to 1.1548 trillion USD. [6] China thus became the global economic power, more and more influencing the world economy.

Plastic industry is a fast-growing sector of Chinese economy. Outputs can be seen everywhere, from the food industry as packaging, to construction, automotive industry, agriculture, health sector etc.

This industry is one of the fastest growing sectors with the yearly growth around 11 %. China is thus a real power in the world plastic industry sector.

Chinese economical power is growing dynamically, forming up to 1/3 of the global economy growth during the last 3 years. From 1999 yearly GDP growth is reaching more than 7 % (in 2003 even over 11 %) with the growth estimates for 2007 - 2010 around 8 % per year. [6]

According to the Chinese Customs Office statistics the foreign trade turnover growth was 23 % higher for a 2005 fiscal year compared with the previous, up to 1.42 billion USD. It was No.3 in the world for that year, nearly triple, compared with 2001. Export growth is bigger than that of import causing a big trade surplus for China. Biggest trade partners are European Union, USA, Japan and South Korea. EU is with trade volume of 217.3 billion USD for 2005 (22.6 % growth compared with 2004) the biggest partner, China being the second one for EU. [10]

Plastic industry products export is stronger and stronger. According to the statistics for 2003 this export was 8.8 million tons of plastic materials, 22 % more than during the previous year. Total export value was 9.74 billion USD, 8.4 % of a total Chinese export. Plastic products exports were mostly low-tech and low production-requirement items, but with some sophisticated and high value-added products as well. [12]

Plastic industry, even with its growing importance in the world economy and with the new technological approach, is nevertheless, according to the qualitative characteristics classification of its products discerning on the product scale, but low on the technological level or the operating skills. [9]

## Research Aim

This research aim is to draw the attention to the growing plastic industry strength in China and advancing and increasing sector development, with the possible negative impact and even the bankruptcy of some of the industry corporations within the developed economies.

## Research Methodology

Economy growth is mostly represented by product growth, together with the sufficient production factors growth. It is the determinant and economy growth conditions analysis in regards to the goods and services production. In such growth models the indicators are used such as capital intensity, labour coefficient, labour intensity, capital gain, capital coefficient, efficiency etc. Such models can be divided into Keynesian models of growth or neoclassical ones. The rise and development of such theories are related with the names such as T. R. Malthus, A. Smith, D. Ricardo, J. Schumpeter and others. Keynesian models are based on theories of Roy F. Harrod, E. D. Domar, M. Kalecki, N. Kandor, J. Robinson and other economists. Shares of the practical analysis of the economy growth determinants are from CH. W. Coob, P. H. Douglas, R. M. Solow, J. Tobin, T. Swan, S. Kuznets, A. Maddison, P. Romer, R. Lukas and many others. [5, p.318]

The sources of the potential product growth are in the production factors as well as in the level of the technology used. Growth accounting theory was developed by professor R. M. Solow, the growth of the potential product is according to his theory the difference between the capital growths, and labour input growth and technology growth. Often used is there Coob-Douglas production procedure.

New growth theory is based mostly on P.Romera and R.Lukas (1988) works, their goal being to define the explicit paradigm, where long-term growth is determined using endogenous models, with a state policy having an important role. Another section of the new growth theory is based on sing the explicit research and development and imperfect competition within a model framework. The models of research and development can be divided into two groups, first being the technological advance defined as the number of new products and semi products (P. Romer) and second defining the products quality ( Grossmann, G. a Helpman). [11]

### Research Questions

The following research questions were thus postulated:

- What is the plastic industry position in a Chinese industry?
- Does the growth of this industry sector correspond with the overall Chinese economy growth?
- Is the growth extensive or intensive?

### Hypotheses

H1: The plastic industry growth in 1998 - 2004 periods is bigger then of the China economy growth during this time.  
H2: Dynamic development of the plastic industry in China is caused by the input intensity rather than the extensive growth.

### Statistical Characteristics Used

Analyzing the plastic industry in China the official statistics of NBSCh, .National Bureau of Statistics of China were used:

1. To define each of the indicators in time frame the following statistical characteristics formula was used:

→ growth rate

$$G = \frac{X_t - X_{t-1}}{X_{t-1}} \cdot 100 \quad (1)$$

2. To define the average growth rate per year the median geometrical average growth rate was used for a certain number of years:

→ median geometrical average growth rate

$$Gr = \sqrt[t]{\frac{X_t}{X_0}} - 1 \quad (2)$$

3. To define the capital involved in the production process was this equation used:

→ capital coefficient

$$\lambda = \frac{K}{Y} \quad (3)$$

Where K is fixed capital, Y is a production volume

4. Defining the amount of capital used for one worker and given output this formula was used:

→ capital intensity coefficient

$$v = \frac{K}{L} \quad (4)$$

Where K is fixed capital, L is number of workers

## Research Study Outcome

### Plastic Industry Position in Chinese Industry

As can be seen on tab.1, even with the growing industrial output in China, the plastic industry is still keeping its 11 position in the volume output scale. Actually 2.4 % was a plastic industry share on a total industrial output in 1998; in 2004 it was a small increase to 2.6 %. The most important industrial sectors in China are electronics and optics, with their total share of 15.5 % and in 2004 even 17.9 %. Second was in 2004 from the sixth position metalworking and machinery industry with 12.3 %. The other important sector is transportation machinery, where its output was between 1998 and 2004 from ninth position to the fourth.

TABLE 1: OUTPUT SHARE PERCENTAGE FROM TOTAL

Industry	% share		Rank	
	1998	2004	1998	2004

As of the number of corporations, you can see according to tab. 2, there is a growth in the plastic industry, their share growing as well. Biggest number of registered corporations is in the textile, clothing and leather industry, with 2004 as their biggest number. Comparing the results from tab.1 and tab.2, this sector is playing smaller and smaller role in China, but the number of registered corporations is growing. It is because the investment capital and labour investment is there low.

TABLE 2: NUMBER OF REGISTERED CORPORATIONS BY SECTOR - PERCENTAGE ON INDUSTRY TOTAL

Industry	Registered			
	% share		Rank

<b>TOTAL</b>	100.0	100.0	X	X

Source: NBSCh .National Bureau of Statistics of China

During 2003 number of registered corporations in a plastic industry sector in China was 8 240, 10 % being big and average size, the greatest number of them was small size by output. During the first half of 2004 this number was 700 higher. Compared with 2003 in 2005 there was 3 160 more plastic industry units, total number now is 11 400, wit the 465 billion RMB sales and 19 billion RMB profit. Total plastic industry output was 22 % higher than in 2004, 21 million tons. [12]

As can be seen on tab.3, plastic industry is making an average profit. Its 18 % from the area in red numbers, which corresponds with the total industry figure. The most losers (20 %) are in the industry of electronics and optics, where their output is the biggest in industry.

TABLE 3: PROFIT AND LOSS CORPORATIONS 2004 (UNITS)

### Production Growth 1998 - 2004

Total production growth during those seven years in China was nearly 300 %, from 6 279 389 million Yuan to 18 722 070 million Yuan. A similar growth was in the plastic industry sector, by 330 %. One of the biggest growths for the industrial sector during this period was in the metallurgy and metalworking, with the five-fold increase.

As can be seen in tab.4, using median geometrical average growth rate the yearly average of production growth, number of registered corporations and number of employees for the 1998 - 2004 period, by sector was calculated. The average industrial growth rate is 20% and number of employees increase 15.6 %. Biggest average yearly increase was in the general manufacturing sector and than metallurgy and metalworking. Plastic industry sector with 22 % average yearly growth was among the better growing sectors than the industry average. Comparing this growth with the number of employee's growth percentage (5.5 %) it is obvious, that the production increase during the mentioned period was caused by the extensive growth increase of productivity, not the labour intensity. Biggest level of productivity growth can be observed in the transportation machinery production growth, paper and printing, and rubber sectors as well. Average increase of the industrial corporations number was for this period by 32.9 %, plastic industry sector only increase was 57.5 %.

TABLE 4: MEDIAN GEOMETRICAL AVERAGE GROWTH RATE BY INDUSTRIAL SECTORS IN CHINA 1998 - 2004

Industry	Median geometrical average Growth Rate (Gr)		
	Production volume	Corp. number	Number of employees

### Level of Labour and Capital Factors

The sources of the economic growth in China, its production volume are the inputs such as production factors, labour and capital investment. Their level of increase is influencing the production volume directly.

The following tab.5 is explaining the employment level in each sector. In the textile, clothing and leather industry a biggest employment exists. During the 1998-2004 periods the number of workers increased. In the plastic industry a decrease was noted, from 4.3 % in 1998 to 2.5 % in 2004.

TABLE 5: EMPLOYMENT LEVEL IN % OF TOTAL, BY INDUSTRY

Industry	Number of employees			
	Number of employees %		Rank	
	1998	2004	1998	2004
<b>Food and tobacco</b>	2,3	6,7	14	8

The labour productivity means the production volume for one employee and is explaining the share of labour on the output. If the productivity is growing, the growth is intensive. As it can be seen in tab. 6, productivity was growing in the industry during the given period.

A biggest productivity growth was in the rubber industry sector, and paper and printing as well. Plastic industry, with the average yearly increase 15.7 % was among those sectors with the bigger growth in the industry overall.

TABLE 6: MEDIAN GEOMETRICAL AVERAGE GROWTH RATE (GR) BY CHINA INDUSTRIAL SECTORS DURING 1998 - 2004

Capital coefficient is explaining the share of fixed capital for a unit of production. As is can be seen in tab. 7, the share of fixed capital on total production was during 1998 just 0.695, it was lower during the next period to only 0,394 in 2004. In the plastic sector during this period this figure was decreasing, from 0.435 to 0.394. This situation means the production capital requirement. Average pace of this trend was around 9 % for the plastic industry sector (see tab. 6)

TABLE 7 CAPITAL COEFFICIENT

Industry	Capital coefficient (K/Y)						
	1998	1999	2000	2001	2002	2003	2004

Capital intensity means how much fixed capital is needed for one employee. Tab. 8 is explaining that during 1998 this intensity in plastic sector was significantly lower than in other industries. During the time a certain

leveling took place, but even in 2004 this indicator is lower than the industrial average. Positive is that, the rate of growth in the plastic sector, in contrast with the lowering figure in the industry as a whole. (see tab. 6)

TABLE 8: CAPITAL INTENSITY

## Conclusion

Plastic industry in China is not the one with the decisive role in forming the GDP; nevertheless it is the important one. These sector products are more and more important part of any production process or used by the other sectors. Plastic sector share in the country industrial output during 2004 was 2.6 % and share on the employment level 2.5 %. As of the number of corporations it was the industry with their highest number (4.6 % of total in 2004) since practically nonexistent strong barriers for entry to this sector. During 1998-2004 periods there was a significant increase in the production and employment as well.

Since the GDP median geometrical average Growth rate (Gr) in China during 1998 - 2004 was 0.1003, which is lower than in plastic industry, (0.2206), it is possible to conclude that this sector is capable to fulfill the growing needs in the overall economy.

The great increase of production volume was not because the extensive growth, that is by higher number of employees, and capital volume, but because of capital intensity, amount of capital per each worker.

Plastic industrial sector in China in its development is not lacking behind the overall dynamic growth of the nation economy and is in the future capable to supply this economy needs. Plastic sector growth is mostly intensive one. This sector in China is not only able to keep-up with the overall growth, but with this trend even to endanger many plastic industry corporation existences in developed countries.

# The Role of Institutions in Effectiveness of Foreign Aid: The Experience of Japanese Aid in Sri Lanka

*Hansamali Pitigala, 07632205@edu.cc.saga-u.ac.jp*  
*Piyadasa Ratnayake<sup>1</sup>*  
*Saga University, Japan*

## Abstract

Use of foreign aid in development in recipient countries overwhelmingly depends on the existence of efficient institutions of the country. In order to evaluate the effects of Japanese aid in the local institutional setting the “Walawe Left Bank Upgrading and Extension Project”, was selected. The project aims to upgrade existing irrigation facilities and to develop new area for cultivation and settlements. The irrigation system has operated effectively in the existing areas but with improvements in irrigation efficiency much below design. Water demand at the upstream is similar to pre project levels, due to lack of integrated implementation practices among the responsible organizations; unanticipated events such as encroachment of lands, that were not promptly addressed; and unrealistic expectations of farmers on water availability and officials on water use efficiencies. The development of the extension area seemed unwarranted until the institutional set up is strengthened to address the needs of the locale.

## Introduction

In recent years, the role of institutions for development has received considerable attention from development researchers, policy makers and practitioners. Institutions are generally defined as “constraints that human beings impose on themselves” (North, 1990:3). Other scholars include organizational entities, procedural devices, and regulatory frameworks in their definition of institutions (Williamson, 2000: 595). Therefore for this study institutions will be defined as **“a set of rules, norms and constraints including their enforcement arrangements, which guide behavior, intentions, norms and beliefs through human incentives in pursuing a goal”**. Following this definition, institutions prohibit, permit or require specific type of action, i.e. political, economic or social, that are important for reducing transaction costs, for improving information flows and for defining and enforcing property rights. In most of the recent articles, institutions are defined in a broader sense, linking various different measures of institutional quality to development outcomes from various angles and disciplines.

In reviewing existing literature on the impact of institutions on development outcomes, although a consensus that institutions “matter” has now emerged, influence between the institutional setup and development outcomes is not well comprehended. Correlations between institutional variables and growth suggest a relationship but not the direction of effect. It can run in both directions, good institutions resulting better growth and improved growth resulting better institutions. Most of the reviewed studies find a strong positive correlation between the quality and performance of institutions on development outcomes. However, due to various methodological draw backs and conceptual problems, it is difficult to assess of the impact of institutions on developing economies at macro level.

The present study focuses on the role of formal local institutions in irrigation resource endowments through Japanese aid, in Sri Lanka. Viewing development, as a mere set of technical engineering endeavors, is impractical as irrigation management is an important a social issue. The outcomes of the project are governed by the evolution of the behavior and choices of the different actors concerned, in which their interests, mindsets and strategies are embedded. It is important to pays attention to how changes in resource endowments change behavior within a given institutional context. Such a focus is particularly relevant when thinking about institutions in low income countries, since development, by definition, is about change

## Background of the Project: Project Area, Analytical Framework and Institutions

### The JBIC Funded WLBP and Project Area

The project<sup>2</sup> titled, “Walawe Left Bank Upgrading and Extension Project (WLBP)” was launched in 1997 with loan assistance from Japan Bank for International Cooperation (JBIC), to further expand and upgrade the irrigation infrastructure in the Walawe River Basin (FIG. 1).

The rehabilitation and extension project anticipates to achieve the following objectives; i) to increase food self-sufficiency by increasing rice production and increase production of other field crops (OFCs), ii) to increase employment opportunities, iii) to mitigate environmental degradation, iv) to boost regional economic development, and v) to alleviate poverty. The project was designed in two phases; rehabilitate and upgrade the existing irrigation areas under Phase I, and further development of additional 5,200 ha of the down stream of Left Bank in Phase II which is identified by the project as the “Extension Area”.

Phase I of this project has been completed, providing new irrigation facilities to an additional 1,600 ha of land and improved irrigation facilities (concrete lining of all canals) to about 2,400 ha of existing irrigated areas in the Kriibbanwewa and Sooriyawewa blocks (see FIG. 1). At present, LBMC irrigates a total of 6,000 ha of land. The Extension area to be developed under Phase II of the project is presently rain fed or under traditional slash and burn cultivation, which is called ‘chena’ cultivation. With the completion of the project, the total area under irrigation would increase to 11,200 ha in the WLB.

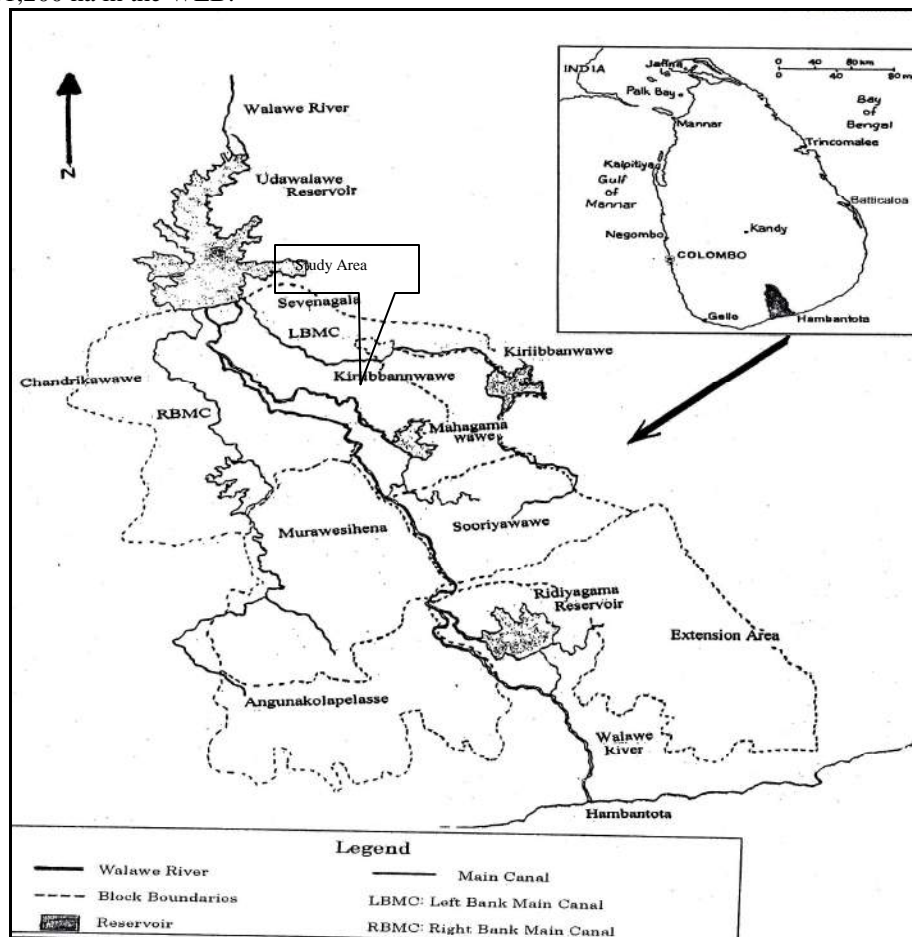

FIG. 1: UDAWALAWE IRRIGATION AREA

The estimated cost for completion of the project was US\$143.5 million (1995 prices), which included US\$33.5 million for the rehabilitation and upgrading of the Existing Area and US\$110 million for the development of the Extension Area. It had been concluded that the project was “technically feasible and economically sound, and the adverse environmental impacts could be minimized by mitigation measures” (Nippon Koei and MASL 1995: S-6). The financial details of the loan agreement for WLBP by JBIC are summarized in Table 1.

TABLE 1: FINANCIAL DETAILS OF THE LOAN AGREEMENT FOR WLBP BY JBIC

Project Phase		Feasibility Study	Phase I	Phase II
Date of approval		1994-07-04	1995-08-31	1996-10-23
Amount of approval (Yen, million)		379	2572	9393

The scope of the project suggested changes in cropping patterns, rural infrastructure development and implementation schedule. The whole design and planning process unfolded with cropping patterns predetermined. The plan assumed that all aspects of the project could be engineered according to the blueprint. For example, it was assumed that all irrigated land would be double cropped annually, that the area under each crop would be fixed, that farmers will apply the recommended inputs, and that the squatters who had moved into the area in hopes of securing land, would be removed. The very feasibility of the project itself depended, among other things, on efficient production of other field crops<sup>3</sup> on the Reddish Brown Earth (RBE) soils. Failure to achieve this objective would endanger the economic, environmental and social outcomes of the project. But viewing development as a mere set of technical engineering endeavors, is impractical as irrigation management is an important a social issue, which is highly interrelated with the daily life style of the villagers.

Table 2 shows the expected and actual irrigated land development in the project area. The second phase of the project is yet to be completed at the time of the study. However, different studies based on different scenarios do not agree yet whether there will be enough water to irrigate the whole area (IWMI, 2002:28).

#### Analytical Framework and Institutions

The conceptual framework of the analysis of the study is demonstrated in FIG. 2. The project aims, planned to achieve at the planning and implantation stages of the project is identified as “Expected Benefits”. The benefits achieves at the completion of the project were identified as the “Realized Benefits”. In the process of transforming the expected benefits into realized benefits, behavior of various institutions, in this case different organizational

setups as well as rules and regulations play a major part. How these institutions act or perform their duties would eventually decide how far the project aims are to be achieved. The institutions involved in the implantation process of this JBIC funded project have described as follows:

**Japanese Bank for International Cooperation (JBIC):** Japan Bank for international cooperation (JBIC) has provided a concessional loan in financing the Walawe Left Bank Upgrading and Rehabilitation Project. Thus the agency acts as a main stakeholder of the project.

**Mahaweli authority of Sri Lanka (MASL):** Apart from the responsibilities on project planning and implementation activities, MASL is responsible for water releases from the Udawalawe reservoir and administration of the land under the irrigation scheme. Accordingly, performance of MASL affects the project success.

**Block Offices:** On block level activities are coordinated by the block offices. The block offices take care of the adjustment of the structures in the branch, distributary and field canals. The field officers are daily in the field to adjust the structures or for maintenance, also report problems in the field to the block offices. Therefore their performance of duties at the field level and timely feedbacks from the block officers to higher hierarchy officers will affect the project in achieving its objectives.

**Consultancy Company:** The consultancy company, in this case, the Nippon Koei Engineering Consultancies (PVT) Ltd. was hired as the consultancy company by the MASL. They are responsible on overseeing planning, and implementation activities. Their perceptions of the project objectives, understanding about the village and its culture, accurate interpretation of the feed backs from local officials will help in better project planning and thereby success of the project.

**Farmer Organizations:** Farmers are organized in farmer organizations, organized per distributary canal. The farmer organizations manage the field canal system and represent the farmers towards the MASL. They coordinate irrigation water turns and maintenance and settle disputes within the organization. Therefore involvement of farmer organizational can improve the water and land use efficiencies of the member farmers and reduce resource related conflicts among farmers.

These formal institutions hold responsibility on planning, implementing and managing the project. Thus their performance, motivation and perseverance to the project objective will play a major role in project performance.

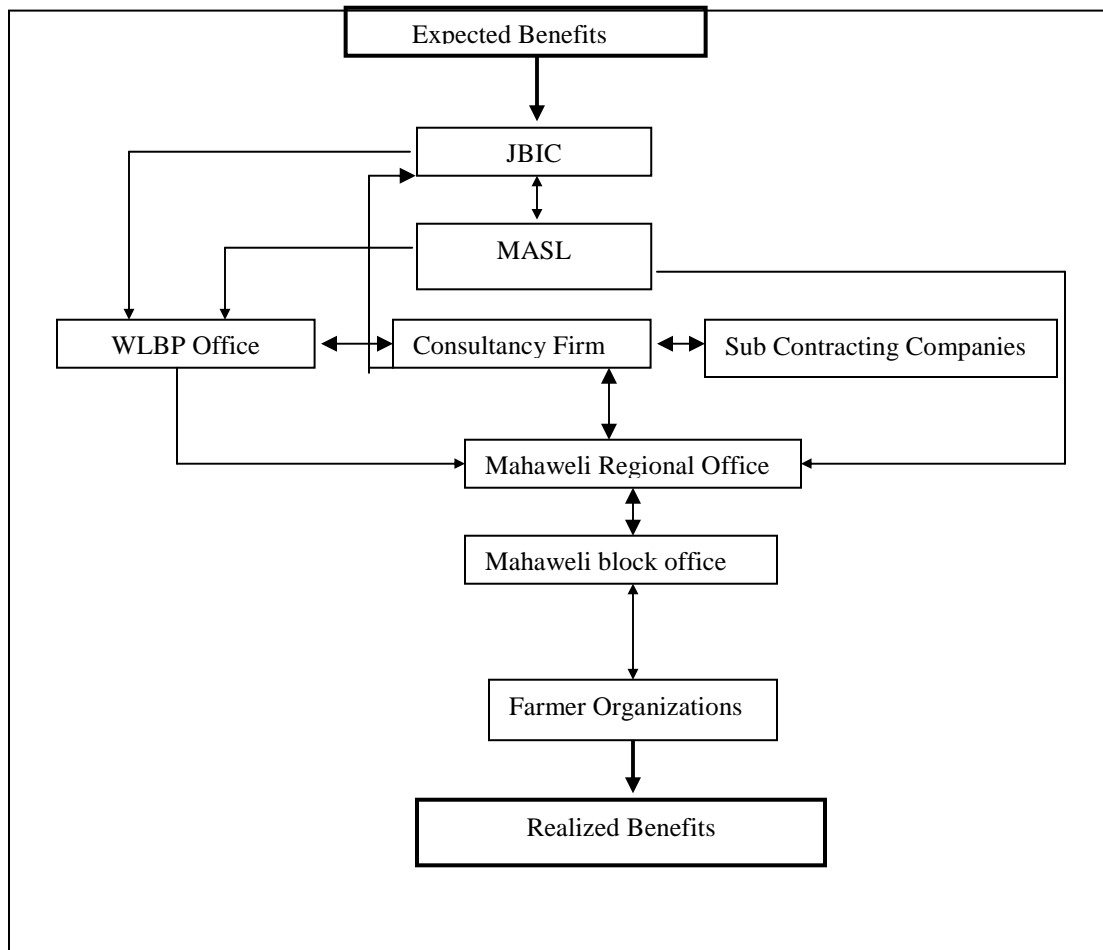

FIG. 2: CONCEPTUAL FRAMEWORK

To assess the impact of the project, the Kiriibbanwawe Unit<sup>4</sup> was selected as the study area, as its rehabilitation work has been completed by 2001 and had adequate time to realize impacts of the project, at the time of the survey. A sample of 106 settlers was selected for the case study and interviews were carried out using a structured questionnaire. Apart from that MASL, JBIC, and Nippon Koei Consultancy Company were identified as the main organizations involved in the project, and the officers' in-charge were interviewed to get relevant information about the project.

The construction work in the Kiriibbanwawe unit under the project has involved heightening of the banks of the canals and repairing and replacing various structures such as gates, valves and measuring equipments required to efficient water distribution (Table 3). A total length of 55.2 km long canal was rehabilitated and 49.2 km was constructed under this project. A total length of 105 km was developed as a drainage canal. More than 12,000 various structures required for water distribution in these canals were either replaced or newly placed. An area of 850 ha was developed as new agricultural land.

## The Role of Institutions in the Aid Delivery Process

**Mahaweli Authority of Sri Lanka (MASL)**<sup>5</sup> has been responsible for the administrations of irrigation and land development in the Walawe basin, thus responsible for the administration of WLBP as well. The internal structure within the MASL is highly hierarchic. All employees perform a task as a small part of a long chain and often have limited insight into their contribution to the eventual goal (Buysse, M., 2002:6). Similar to all irrigation projects administered by the Mahaweli Authority, a regional Mahaweli office is responsible for the Walawe area<sup>6</sup>, headed by a Residential Project Manager(RPM). A separate office<sup>7</sup> for the administration and implementation of WLBP, headed by the Project Manager for Walawe Left Bank Irrigation Upgrading and Extension Project' from here on wards identified as the project manager.

**The Residential Project Manager (RPM)** and the project manager are integrated in the organizational structure as a collateral relationship. Therefore rather than one person being accountable for the other, their official relationship involves only correspondence of the activities of each other. The project manager is directly accountable to the director general of the MEA, as same as the RPM. This arrangement has created a gap within the coordination of construction stages and implementation stages of the project, as the project manager is responsible for the coordination at the construction stage, whereas the RPM is responsible for the coordination at the implementation stage. RPM assumes little responsibilities in the construction stage and vice versa. An error of either one stage can cause problems in the other and thereby for the success of the project achievement. But in the current arrangement problems at the implementation stage are often unaccounted for.

**The consultancy company** is accountable to the project manager and their correspondence to higher levels of the organizational hierarchy is officially through him. With this environment, the block office and lower level officials who are directly involved in activities at the grass root level, do not have a direct influence at the planning stages of the project. This could lead to a vast loss of important information to both parties. It is important for the

consultancy firm to have a good background information source about the field conditions, especially as it is alien to the region. And also it is similarly important for the block officers to clearly identify the project objectives and reasons for some activities in order to maximize the resource use efficiency at the implementation stage. This opportunity is lost for both parties because of lack of direct communication linkages.

The project success is also threatened by the ignorance of the farmers about the actual effects of the project. Although there had been discussions between officials in charge and farmers prior to commencement of the project, understanding of the overall affect, and perception of the project benefits is a matter of debate. Farmer perceptions about the project benefits are summarized in Table 4. Almost all the farmers (97 percent) anticipated better and timely availability of irrigation water, while 62 percent of the farmers expected a better water distribution in the distributary and field canals. Although only 12 percent of the farmers expected to increase the cultivable land, many of them (67 percent) expected an increase of productivity. Thus it is clear that farmers' expectations are mainly on improvement of water availability, and distribution within the existing system.

TABLE 4: FARMER PERCEPTIONS ON PROJECT BENEFITS

Perception	Percentage
Better availability of irrigation water	97
Timely availability of irrigation water	97
Increase of cultivable land	12
Better water distribution	62
Reduce maintenance cost (currency, labour, etc.)	54
Less time involvement for canal maintenance	45
Reduction in farmer conflicts over water issues	62
Increase in crop yield per land plot	67
Increase in cropping intensity	9

Farmers' perception has been that after rehabilitations and upgrading of the existing resources, the availability of the irrigation water would be improved, as oppose to limited. Yet, in order to achieve project objectives, the efficiency of irrigation water usage in the system must be improved. The same quantity of irrigation water that has been utilized so far only by the existing areas, must be used by both existing and extension areas after the completion of the project. Thus the farmers in the existing cultivation areas, who have experience abundant irrigation water until now, must entail limitations in water use. Although the farmers in the area were aware of the extension of the projects, Table 4 depicts that none of them were aware or expected a limitation of available irrigation water in order to supply water to the extended areas. Since the project implementation agency and the consultancy agency had a very sparse relationship with farmer organization and farmers as individuals, the farmer attitude towards efficient water utilization, which is the key to the success of the project, has been overlooked.

## Problems and Prospect

Encroachment is one of the major problems in the project area. When MASL took over in 1982<sup>8</sup>, there were only about 7000 legal settlers and since up to date about 25000 encroachers have been regularized by the MEA (MASL & Nippon Koei, 1995:A5-2). This shows the severity of the problem and due to this, many constrains are been faced in selecting suitable farmers for settlements. Mainly, two groups of land encroachers can be identified. One is the group of farmers practicing encroached farming because they do not have access to other legal land. The other group of farmers practice encroached farming, in order to increase their land extent, in addition to their legally received land. As shown in Table 5, land encroachments of paddy lands are greater than upland, and most of them (68 percent) are land less farmers.

TABLE 5: DISTRIBUTIONS OF ENCROACHED LANDS (Percentage)

Category	Paddy land	Upland
Encroachers with own land	10	3
Encroachers without own land	68	7
Encroached land leased out	3	3
Encroached land leased in	3	3
Total encroached	84	16

The primary cause of encroachment was the delay in placing legal settlers in possession of allotments (Table 6). It was further aggravated by the lack of allotment surveys and land marks and the failure to issue land permits timely to legal settlers. The encroachers have generally occupied the land with permeable soil conditions. These lands are categorized as unsuitable for paddy cultivation. But, most of these encroachers are not willing to change their encroached lands even they are given land in some other suitable place. Because of this reason it has been difficult in blocking out the land to a proper plan. In addition, cultivating paddy in unsuitable land has increased the water requirement for irrigation in the area than anticipated.

The Mahaweli has been so far accommodated them by giving land permits for the lands they have been cultivated, thus regularizing the encroachers, but this adhoc and lax approach has confused the consultancy firm in adhering to a specific land blocking system in the area. Although this policy has been employed as a way to settle the encroachment problem, it is motivating the encroachers, giving them a prospect that if they cultivate for a long enough time, they have a high possibility to get the land permit for that land. Further more, the land encroachers who are not officially registered as land holders at any official agency are entitled for the government social welfare, whereas other farmers with official allotments are not. This sometimes act as a positive incentive for the encroacher to remain as encroachers, where they are in a position to reap the benefits of the land as well as social welfare benefits.

TABLE 6: LAND DISTRIBUTION AND ISSUE OF LAND RIGHTS IN KIRIIBBANWAVE IRRIGATION UNIT (ha)

	Irrigated land	Upland	Other	Total
Total distributed land	477	712	341	1,530
Land rights issued	454	495	326	1,275
Percentage of land plots without land rights	4.8	30.5	4.4	39.7

Encroachment also has caused disputes among settlers regarding rights to water use. The illegal status of the encroacher prevented their access to irrigation water, institutional credit and other agricultural support services. As a result, water theft becomes a common practice. Some encroachers restored to use of force and often damaged the irrigation structures in the process. They also disrupted attempts to introduce more effective water management systems and agricultural development in the project area. Although the MASL has given a high priority to regularize the encroacher problem, work progress is slow because of numerous legal and administrative problems.

As a result of these institutional weaknesses, the realized benefits of the project in the locale have been limited. Table 7 illustrates the changes in cultivable land area before and after the rehabilitation of irrigation infrastructure under WLBP. The extent of homesteads has not been changed after rehabilitation, signifying no new settlers afterwards within the households. The area of paddy cultivation has increased marginally by about one percent and two percent in *Yala* and *Maha*<sup>9</sup> seasons respectively.

The survey also found out that the decline of the chena cultivation and upland cultivation, particularly in the *Yala* season. The most significant point in this land utilization pattern is that *chena* cultivations, which usually had been practiced only in *Maha* season, where rain water is freely available, had decreased drastically after the rehabilitations. But it is important to note that although the upland cultivation in *Maha* season has increased by 2.5 percent, it has been decreased by nearly 8 percent in the *Yala* season. This change directly relates to the rehabilitation work in the irrigation canals, under WLBP. The traditional water supply for upland had been

percolation and seepage water from the earthen canals. Before the rehabilitations, the canals were not lined with concrete, but were earthen. As a result, percolations and seeping of water freely took place. This had been the main source of irrigation for upland. But the rehabilitation works carried out under the project, which mainly attempted to line all the canal surfaces with concrete, has impeded the percolations and seepage of the water as usual, purging the natural irrigation source for uplands. As a result, farmers had to face an unexpected water scarcity for their uplands after the upgrading and rehabilitation of the irrigation infrastructures of their village. At present, farmers have to pump water from the canals for the cultivation of uplands, which are the only alternative and the expectation of the project activities. But, farmers with uplands far from the canals or faces difficulties in mobilizing the required resource such as water pumps, longer pipes etc., have resigned to cultivate grains or vegetables and only in 'Maha' season where water can be supplied through rains, abandoned their upland cultivations.

TABLE 7: CHANGES IN CULTIVABLE LAND AREA BEFORE AND AFTER THE REHABILITATION OF IRRIGATION INFRASTRUCTURE UNDER WLBP

Land category	Before rehabilitations		After rehabilitation		Difference (percentage)	
	Yala (ac)	Maha(ac)	Yala (ac)	Maha (ac)	Yala	Maha
Upland	121	121	111	124	-8.3	2.5
Paddy land	280	282	283	287	1.1	1.8
Homestead	29	29	33	33	0	0
Chena	0	48	0	34	0	-29.2

Another reason exist for some farmers to have expressed difficulties in getting sufficient water for their irrigated lands, especially the farmers, who have land in the tail ends of the canals (Table 8). In the rehabilitation and upgrading of the irrigation canals, some canals had been extended in length while some canals has been widened or narrowed. With this effort the positions of some of the outlets<sup>10</sup> has been changed. Along with these changes some demarcations of land boundary have also been changed. But the farmers are still using the old land boundary demarcations, which also attributes, to the reduction of the extent cultivated as well as the water scarcity they faces. An outlet placed to irrigate a land of new land demarcations may not optimally be placed to irrigated the land area demarcated by old land boundaries still been used by the farmers.

TABLE 8: CHANGES IN ADEQUACY OF IRRIGATION WATER BY THE PROJECT (Percentage)

Adequacy of Water Receipts	Head reach	Middle	Tail end
Adequate water before and after the project	32	23	4
Inadequate water before and after the project	0	4	11
Adequate before project, but inadequate after project	0	6	10
Inadequate before project, adequate after project	0	8	3

The source of water utilization of the villagers, (refer Table 9), has changed in the recent years. The water issue from the Udawalawe reservoir focuses mainly water requirements for irrigation on each cropping season. Water uses for other activities are also dependent on water release for farming, mainly paddy. The water release from the reservoir to the distributary canals is rotational. With the introduction of perennial crops in the area, there has been a year round irrigation, increasing water availability to non irrigation purposes, but still the rotational period increases in the off seasons. According to SAPI study (2000:18), about 6 percent of the total water releases from the Udawalawe reservoir is for non irrigation purposes, but no adaptation to the irrigation schedule is made to accommodate water for non irrigation purposes.

The source of water for bathing and laundry activities for some villagers changed even within an irrigation season, depending on the water availability in the irrigation canals. At the times the water is not issued, the people in the study area use the reservoir for their bathing; while once the water is issued in the canals they go to the canals.

Thus the source of water use for daily life of the people changed according to the water rotation calendar. However, for drinking and cooking in general, preference is given to water from shallow wells, constructed by the people themselves. But, the survey found out that there is a decline in the water levels in these villages along with the rehabilitation works of the project. This is due to the reduction in the shallow water tables in the region because of the impediment of percolation and seepage water into the ground water table. Thus the percentages of households of which use own wells for cooking, bathing, laundry and cultivation in the study area has declined by 1.9 percent, 5.2 percent, 5.2 percent and 2.1 percent respectively. The reduction is 5.2 percent and 3.8 percent for cooking and bathing in common wells respectively. Although there is an increase in use of tube wells for cooking and drinking purposes, according to Buysse, M. (2002:12) more than 60 percent of the region has poor quality deep ground water. He further noted that this type of water is not good for human consumption, because it contaminated with salinity, fluoride and iron as main polluters.

TABLE 9: CURRENT SOURCE OF WATER FOR DAILY ACTIVITIES AND AGRICULTURAL ACTIVITIES  
(Percentage of households)

Purpose	Reservoir	Canal	Own well	Common well	Tube well	Own Tap
Cooking/drinking	0	0.9	14.2 (-1.9)	21.7 (-5.2)	19.9 (+2.8)	43.3 (+8.1)
Bathing	31.2	53.7	6.6 (-5.2)	1.9 (-3.8)	1.9 (-3.8)	4.7 (+8.1)
Laundry	33.2	59.3	5.7 (-5.2)	-	-	1.9 (+0.8)
Cultivation	-	98.1	1.9 (-2.1)	-	-	-

Note: Values within brackets represent the percentage changes of utilizers of each source before and after rehabilitations of the canals with the sign showing a reduction or increase

Reservoir and canal water uses highly varies even within an irrigation season and show no significant difference in the changes before and after rehabilitation of the canal. Therefore the changes in the percentage of uses of reservoir and canals before and after rehabilitations were ignored to minimize the error.

## Summary and Conclusions

The impact of WLBP on existing populations has been limited, since the study area was an already settled study area, cultivating using the Udawalawe reservoir water. In general, it can be emphasized that the success of the project relies on the efficient water use in the existing irrigation areas (including the study area), in order to provide water to the extension area. The farmers in the existing area considered irrigation water released to the left bank of the reservoir, as an abundant resource so far, mainly due to the limited command area. But with the commencement of the phase II of the project, the same amount of water released to the left bank, has to be used economically in order to irrigate a larger extent. Thus the farmers in the existing irrigation area experience a water limitation for their irrigated land because now some of the water earlier irrigated their land, has to be sent down the canal to irrigate the extension area. Therefore, if the farmers in the existing area is not prepared adequately to economize their water usage, not only the farmers in the extension area, but also some of the farmers in the existing area, especially the tail enders of an irrigation canal are bound to experience a water scarcity. This possible externality can be overcome through farmers' understanding and participation. Otherwise the whole project may face a failure due to lack of adequate irrigation water.

Another aspect of water scarcity was experienced in upland cultivations. The farmers were not forewarned and unprepared for the impediment of percolation and seepage water that had been irrigated their uplands before the project. But according to the project design, the uplands were not to be directly irrigated through canal water. At the earlier stages of the project, water requirements of the area were calculated only for the paddy land. But realizing the

failure of the calculations, an additional day of water is released to the canals for the irrigation of uplands. Without the natural seepage and percolation, the farmers are left with the only choice of pumping the water for their uplands. Not all farmers possess water pumps and some fields far from the canal, which require a longer pipe length. As the farmers were not prepared to endure this shadow cost of irrigating the land, upland cultivation has somewhat stagnated in the area. But if OFCs and other crop species, which has a low water requirement, are to be promoted in the region as planned by Mahaweli, farmers has to face this shadow cost of irrigating uplands. To overcome the problem, Mahaweli is now promoting new irrigation systems such as drip irrigation to increase the water use efficiency. But these methods still require pumping the water from the canals to the upland.

The institutional environment in the area, has not been fully compatible with the assumptions of the project design. Inefficiencies and relaxations of institutions have driven encroachment of land resources in the area. The farmers who has encroached lands illegally, are not prepared to release their holdings, as well as peer farmers are not willing to exclude them out from the system.

The development of the extension area seemed unwarranted by the very high amount of water used in the existing area. The second phase of the project was implemented before management was brought in line with acceptable standards to manage the land encroachments and to meet the needs of the area. The new project did not depart much, in its style from top-down, engineer-oriented projects with the design, settlement processes and economic feasibility dependent upon assumptions of cropping patterns, practices and productivity that had been ad hoc and unrealistic in the past, threatening the success and sustainability of the project.

The limitations of available data have constrained an in depth assessment of formal institutions, in this study. Incentives available within the organizational setting for the actors; i.e. officers-in-charge, effect their motivation for carrying out their responsibilities to such extent witch facilitates the achievement project objectives. But the incentives and motivational factors of the personnel involved in the organizations in the locale were not taken into consider for this analysis. This limits the comprehension on the effect of formal institutions, in effective utilization of foreign aid in the development process. This warrants further studies to concentrate on the incentives and motivational factors of formal institutions involved in the foreign aid delivery process, on achieving project objectives.

## End Notes

<sup>1</sup>This paper is written by Hansamali Pitigala under my supervision.

<sup>2</sup> Development of the Walawe basin, a large-scale irrigation, resettlement and rural development project was initiated in the 1950s as some of the first in the wave of agrarian settlements of the post-World War II period in Sri Lanka. The project was conducted in several stages, where the Asian Development Bank funded the initial phase.

<sup>3</sup> Other field crops include crops cultivated in low lands other than paddy; mainly chilli and onions.

<sup>4</sup> Udawalawe reservoir water is conveyed to two irrigation canals: the Right bank main canal (RB) and the Left bank main canal (LB). It is divided in five major blocks demarcated for the convenience of administration by the Mahaweli authority: Chandrikawewa, Murawasihena and Angunakolapelessa on the Right Bank and Kiriibbanwawe and Sooriyawaweon the Left Bank. Kiriibbanwawe Irrigation Block, which is located in the middle of the LB, has four irrigation units. They are Habaraluwawe, Kiriibbanwawe, Habaralugala and Mahagama. Kiriibbanwawe irrigation unit was selected for this field survey. The sample survey was conducted during 2005 March/April.

<sup>5</sup> The Mahaweli Authority of Sri Lanka (MASL), was inaugurated in 1979, in order to accelerated the 'Mahaweli Ganga Development Programme', the largest integrated rural development multi-purpose programme ever undertaken in Sri Lanka based on water resources of Mahaweli and allied six river basins. With the introduction of reforms to the public sector institutions and with the devolution of powers through the 13th amendment to the constitution, Mahaweli areas developed under the accelerated programme were provided with additional layers of institutional structures by installing Divisional Secretariats, Pradeshiya Sabhas (local authorities), and some align agencies such as Department of Agrarian Services. But in the Walawe basin, this has not yet been fully implemented, and MASL remains the sole authority for the Walawe area, therefore the WLBIU project area concerned in this study.

<sup>6</sup> A Residential Project Manager (RPM) is heading the organization and he is directly accountable to the MEA through a director general (DG). The RPM is assisted by four Deputy Residential Project Managers (DRPM), who are responsible for land, irrigation, institutional development and general affairs.

<sup>7</sup> The person in charge of the project office is designated as 'the, and all the employees working in the project office are employees under the Mahaweli Authority.

<sup>8</sup> Encroachment problems were not been addressed until 1982, when the management of the project was transferred from RVDB to the Mahaweli Authority. By the time some encroachers had been on the land for more than 15 years.

<sup>9</sup> This annual rainfall pattern defines the two cultivation periods, namely the *Maha* Season lasting from September to March of the following year, and the *Yala* Season from April to September. The latter season is comparatively dry.

<sup>10</sup> Drip irrigation system refers to a structure of a pipe, which connects the canal to the field and creates an opening in the canal to flow the water in to the field.

## Food Consumption and its Constraints – Evidence from Household Survey in Rural China

### Abstract

This paper explores the effect of household characteristics and financial asset constraint on household demand using a large household data set from Jilin Province, China. In addition to income and price factors, household size, labour's education level, and financial assets are found to have significant impacts on Chinese consumer behaviour. Based on the assumption of multi-stage budgeting procedure and weak separability, the Almost Ideal Demand System (AIDS) is used to estimate a complete demand system. In the first stage household spends all its expenditures on consumption goods and service by nine different groups in kind; while in the second stage, only food group in detailed is studied. The model with household characteristics and financial constraints results in better parameter estimates as compared to those without. The estimated elasticities of income, price and household characteristics and financial constraints are presented and these findings can provide decision-makers and business agents with important policy and market insights for understanding Chinese consumer behaviour.

### Introduction

As a fast developing country with about one-fifth of the world's population, China's food consumption and demand market is one of the greatest interesting focuses in the world. China had been struggling for its food supply-shortage with rationing for a long time. This situation has not been changed until its pursuing economic reform starting from the rural area in 1978 and the nature of the reforms led inevitably to a research agenda that tended to concentrate on the impact on farm household production and consumption. Even though China has had a high economic growth rate of around 10% per year for about 20 years, its consumption growth has not been as high as expected. According to China's Statistical Yearbook, China's final consumption rate is about 60 per cent for the last decade, which is about 20 per cent lower than the average level of the world. Because the fact that China is on course to become the world's second-largest consumer market, its consumption stagnate problem and huge potential market pressure have led the researches in China to a urgent need to provide the market-demand information on the Chinese food consumer.

The goal of this article is to explore rural household food consumption behaviour using a large data set from Jilin Province in Northern China. It particularly describes consumption expenditure patterns and estimates expenditure and price elasticities of various food groups. Jilin Province has a population of about 26 million and occupies a "middle" position in nationwide rural development indices. Its consumption patterns may well reflect the whole country's consumption behaviour in general. It is recognised as a predominantly agricultural province and is one of the main grain producing areas in China. This article focuses in particular on the understanding of how household characteristics and financial constraints affect the behaviour of Chinese rural households. The interesting question is that whether there are any differences in food consumption patterns among consumers who have the same income and face the same prices but have varying degrees of access to financial markets? As there are few published papers present this topic, this study can fill a gap in the literature. Using a high quality household sample survey data set for Jilin rural households and a rigorous and theoretically plausible modelling framework, this study, comparing to previous studies, may provide a reliable estimate of Chinese consumer's consumption demand structure and behaviour in informing policy design and business strategy.

## Methods

The Almost Ideal Demand System (AIDS) model, introduced by Deaton and Muellbauer (1980b), is a popular framework for estimating price and income elasticities when expenditure or budget data are available. As a flexible complete demand system, the AIDS model is consistent with economic theory without requiring additivity of the utility function. It is derived from the indirect AIDS cost or expenditure function, so it poses a function form consistent with household budget data. In a basic specification, the budget share equations of the model assume the form:

$$w_i = \alpha_i + \beta_i \log\left(\frac{Y}{P}\right) + \sum_j \gamma_{ij} \log P_j \quad (1)$$

Where,

$w_i$  is the household budget share on the  $i$ th commodity;

$\alpha_i, \beta_i, \gamma_{ij}$  are parameters of the system; and

$$\gamma_{ij} = \frac{1}{2} (\gamma_{ij}^* + \gamma_{ji}^*)$$

$Y$  is total household income or expenditure;

$p_j$  is the price of the  $j$ th commodity;

$Y/P$  is “real expenditure”; and

$P$  is overall price index.

In most empirical work using the AIDS, the overall price index  $P$  is approximated by the Stone price index. Green and Alston compared the traditional AIDS and the LA-AIDS with Stone’s price index and found similar elasticity results. So, this study uses the LA-AIDS form by substituting the overall price index  $P$  with Stone price index  $P^*$  ( $\log P^* = \sum_i w_i \log P_i$ ).

The demographic translating method (Pollak and Wales 1978) is adopted for the incorporation of household characteristics and financial variables because of its flexibility and simplicity. Now we have an enhanced LA-AIDS model incorporating household characteristics and financial variables:

$$w_i = \rho_{i0} + \sum_s^d \rho_{is} H_s + \beta_i \log\left(\frac{Y}{P^*}\right) + \sum_j \gamma_{ij} \log P_j + \mu_i$$

(2)

Where,  $H_s$  are household characteristics and/or financial variables.

$\mu_i$  is an independently distributed error term assumed to be normally distributed with zero mean and constant variance  $\sigma^2$ .

According to Alston *et al.* (1994), the uncompensated own-price, cross-price, and expenditure elasticities for this system are as follows:

$$\epsilon_{ii} = -1 + (\gamma_{ii}/w_i) - \beta_i$$

(3)

$$\epsilon_{ij} = (\gamma_{ij}/w_i) - \beta_i (w_j/w_i)$$

(4)

$$\eta_i = 1 + \beta_i/w_i$$

(5)

and the household variable elasticities are:

$$\delta_{is} = H_{is} \rho_{is} / w_i$$

(6)

As household variables can influence the value and sign of the  $\beta_i$ , they can, therefore, influence the elasticity values.

The Seemingly Unrelated Regression (SUR) procedure, developed by Zellner (1962), with adding-up, homogeneity, and symmetry restrictions imposed is adopted with LIMDEP software for model estimation.

## The Data

The rural household consumption expenditure sample survey data in 2004 were provided by the Jilin Provincial Statistical Bureau. The data covers 19 counties 1600 households in Jilin. Sampling is conducted in a multi-stage systematic way with a random start. The Provincial Statistical Bureau selects sample counties, then sample villages and finally sample households within the selected villages. The sampling method at each stage is controlled and is identical. Households maintain logbooks that separately record cash transactions—in value and volume terms—and own consumption/goods in kind exchanges. Table 3 provides a statistical summary of the basic features of the sampled households and quantities of food consumed. In budget terms food was by far the largest item, accounting on average for 50.66 per cent of household expenditure in 2004, followed by transportation, education and housing costs of 10 per cent, 9.57 per cent and 9.14 per cent respectively. Comparing to the index 10 years ago in 1995, food consumption dropped, transportation and education increased and clothing dropped the most. This is why the students' number and household labours' education level were selected as new variables adding to the model estimation. Within the food category grain consumption was by far the largest item accounting for 26 per cent of the total food budget (while it was 45 per cent in 1995) followed by meat and meat products at 24.4 per cent (while it was 14 per cent in 1995) and vegetables at 14.8 per cent (while it was about 10 per cent in 1995).

The data set is extremely large and in order to make the analysis feasible it is necessary to assume that households adopt a two-stage budgeting procedure. In Stage I Food is treated as a separate budgeting category from other principal categories such as Clothing, Residence, Household appliance, Transportation and communication, Cultural educational and recreation, Medical, Others goods and service. In Stage II within the Food category households are assumed to budget separately for nine categories: Grains, Potato, Soybean and its products, Oil, Vegetables, Meat poultry eggs milk, Aquatic Products, Cigar and liquor, and Others Foods. In treating the data in this way it needs to assume weak separability of preferences (Deaton and Muellbauer, 1980a). A utility function is weakly separable if and only if the goods can be partitioned into subsets in such a way that every marginal rate of substitution involving two goods from the same subset depends only on the goods in that subset. This means, for example, that the demand for a particular food group—say grains—can be expressed as a function of the prices of the items in that group and total expenditure on those items. Expenditure on and the prices of goods outside the food group enter the demand functions for food only through their effect on total expenditure on food.

Three household characteristics and two financial variable are selected for the estimation, based on the empirical analysis on Chinese rural households behaviour and the information available in the data set: (a) number of people in the household; (b) number of middle school and high school students; (c) number of labour with education level higher than middle school; (d) ratio of financial asset to disposable income; and (e) ratio of financial debt to disposable income.

## Model Results

We estimated the models with and without the household characteristics and financial variables constraints imposed. Using the log-likelihood ratio test we examined the impact of including household characteristics in the models. Chi-square tests suggested significant differences between the log-likelihood ratios at least at the 5 per cent level for the models including the characteristics compared to those without. This suggested that the AIDS model incorporating household characteristics should produce superior results. With the SUR method in LIMDEP (7.0), the AIDS model equations were estimated without using OLS method, therefore, the R-squared was not bounded in [0,1] and could not provided the goodness of fit information. But all the  $F$  values for Model Test for all food groups are statistically significant. Most of the  $t$ -values are statistically significant at 95% level. The reason to choose

LIMDEP econometric software package is because it is very suitable for econometric analysis with cross-sectional data.

Table 1 presents the estimated conditional and total expenditure elasticities for the selected food groups. A conditional value refers to the elasticity of that food group (e.g. grains) with respect to the expenditure on the whole food groups (food consumption in total) only, the latter amount having been determined a higher stage which includes food and other household consumptions under the assumption of weak separability. The total (or real) expenditure value is the expenditure elasticity of a particular group (e.g. grains) with respect to total household expenditure. If no saving behaviour involving, then the total expenditure elasticity is the same as the income elasticity. The total elasticity value, of course, is the more relevant measure when considering possible future changes in demand and also for policy analysis purposes.

The inclusion of household characteristics and financial variables increased a little household elasticity values for Grains, Soybean and its products, Meat poultry eggs milk groups, and decreased household elasticity values for Potato, Oil, Vegetable, Aquatic products, Cigar and liquor groups. They had the same direction effect on both conditional expenditure elasticities and total expenditure elasticities. It is worth noticing that the grain and soybeans are Chinese peoples' staple foods and meat poultry eggs milk group is the typical Northern Chinese family's animal product food. These food groups conditional and total elasticities became bigger when household characteristics and financial variables were added into the model. The total expenditure elasticity for Grains group ranged from 0.22 to 0.25, this was lower than the previous estimate results, from 0.64 to 0.67, ten years ago in 1995 (Jiang 2001) for the same households in Jilin, China. In comparison, for example, Wan (1996) using an Engel function on provincial rural household data in 1995, estimated an elasticity value of 0.4. Halbrendt *et al.* (1994), however, using an AIDS model estimated a value for rural Guangdong Province in 1990 of 0.58. The highest conditional elasticity and total elasticity values were for Grains, Soybean and its products, and Meat poultry eggs milk groups, with each conditional value of around 1.50 and each total value of about 0.25 among them. This was similar to the estimate of Zhang *et al.* (2001) for 5group food consumption of urban and rural households in Henan province, China with data from 1985 to 1999. Their results indicated that the largest conditional expenditure elasticities (from 1.4 to 1.8) were for grain, and cigarette and liquor groups. Other related estimate results were Halbrendt *et al.* (1994) of 1.09, Fan *et al.* (1995) of 0.9. For a fuller review of elasticity estimates from previous studies see Jiang (2001). There seems likely to be four main reasons for the differences between the various elasticity estimates: (a) the most obvious is differences in coverage between urban, rural, region etc. and the inherent quality and suitability of the data sets; (b) the majority of previous studies excluded own-price effects which tended to lead to underestimates of the expenditure (income) elasticity; (c) unlike some previous work this study explicitly takes account of the demand interdependencies of food items within a rigorous framework; and (d) studies before the mid 1980s tended to encounter the effects of central planning, particularly inadequate variation in price and income data. It is worthy to mention that China had not totally abolished the food rationing coupon until 1993. In this study, however, we have used a theoretically plausible AIDS model on high quality pooled household data from a relatively developed market situation, and thus we feel confident that our results are less susceptible to the above sources of error.

In addition to the expenditure elasticity estimation, which indicated a significant change in local households' food consumption behaviour and may supply useful information for decision-making policies, another main finding in this article is that the effect of household characteristics and financial variables on household food consumption. These are the only elasticity estimates that we are aware of in the literature for the incorporation of financial constraints into the AIDS model. We calculated the elasticity of household demand with respect to the three measured household characteristics and two financial constraint variables in Table 2. We found that the household size coefficient was significant for all food groups; labour's education level was significant for grains, oil, meat etc., aquatic products, and cigar and liquor groups; and financial variables were significant for oil, vegetables, and cigar and liquor groups. This means that these variables have some effects on a certain food groups but not for others. The absolute values of the elasticities, however, were relatively small except for labour's education level elasticity for cigar and liquor group consumption, which was 1.66. As expected, household size elasticity was among the highest, ranged from -0.2 to 0.3, and had effect on almost all food groups except for oil (-0.07) and potato (0.05). The financial variables had very little effect on all the food groups. This likely implies that all the food

groups are necessities for rural households and mainly response to current income instead of permanent income. The biggest financial variable elasticity was for cigar and liquor group, but its value was only -0.01.

Table 3 presented the estimated price elasticities. It is expected that all own-price elasticities will be negative for all goods except Giffen goods according to consumer demand theory. When household characteristics were imposed, it did not change the signs of the estimated elasticities. Most own-price elasticities in this study had the expected negative sign, implying that the results were conform to the demand theory, except for soybean and aquatic products group. Most own-price elasticities' absolute values were less than one, implying that they were own price inelastic, except for grains, potato, and vegetables groups. These three groups were the most price-elastic commodities with values of -1.5671, -2.3134 and -1.3596 indicating that a uniform percentage decrease in prices of all commodities would elicit a greater demand for grains, potato and vegetables than for others foods. The own-price elasticity for meat poultry eggs milk group was almost equal to 1 and decreased a little when household variables added. This means that it was nearly unitary price-elastic commodity.

The above results are consistent with the occupational groups and roles of the more educated rural households in Jilin. Their members tend to be the cadres, rural teachers and village enterprise managers who frequently have important public relations roles to perform including the entertaining of guests and visitors. Based on the estimation of the fact that grains and meat groups had high conditional expenditure elasticities and high own-price elasticities, it was very sensitive to current income and price changes. As food consumption takes account of 50.66 per cent of rural household total consumption expenditure. It seems likely that rural Chinese households are still in a lower stage of food consumption stage, and their food, especially grain and meat consumptions should keep rising rapidly when their income increases.

## Summary and Conclusions

In this paper we have followed a two-stage budgeting procedure, assuming weak separability of preferences, to allocate households' total expenditure within a complete consumption system. In the first stage we allocated total expenditure to Food at home, Food away from home, Clothing, Residence, Household appliance, Transportation and communication, Cultural educational and recreation, Medical, Others goods and service. In the second stage, food expenditure was allocated to nine food groups of Grains, Potato, Soybean and its products, Oil, Vegetables, Meat poultry eggs milk, Aquatic Products, Cigar and liquor, and Others Foods. In this way a complete demand system for food was estimated--in a theoretically and econometrically plausible way--using the LA-AIDS modelling framework. We also incorporated three household characteristics and two financial constraints variables in our specification. We used a high quality, highly disaggregated, household data set obtained from the Rural Jilin Provincial Statistical Bureau—a branch of the State Statistical Bureau. And, of course, the results apply only to this particular rural region. However, the "middle" position of Jilin in relation to nationwide rural development indices means that, arguably, the results provide a closer approximation to the national rural position than previous studies on, for example, Guangdong and Jiangshu Provinces or Beijing City.

The relatively high positive expenditure elasticity for Grain confirms that it was a normal good during the period studied. Substantial growth in household demand, therefore, can be anticipated, particularly for fine grains such as rice and wheat, as per capita incomes continue to grow in rural areas. In the circumstances it is likely that the internal demand pressures in China will continue to keep the Grain "self-sufficiency" goal high on the list of policy priorities.

At the same time, rural households have been shifting their consumption from coarse grains in particular towards animal products. We found that grains and meat groups had the highest expenditure and price elasticities of all the groups studied. Our results suggest that we can anticipate a relatively high increase in demand for fine grain and meat as household incomes grow. Of course this will result in considerable growth in indirect demand for Grain as a key input in animal production. Thus the composition of domestic demand for Grain will change but the added pressures from animal production will also serve to keep grain policy high on the political agenda. And of course it would be informative to analyse demand within the Meat category in more detail for further work if sufficiently disaggregated data were available.

# Managing Water – A Crucial Resource for Development: A Case Study of India

*Harbans Singh, singhh@mail.montclair.edu  
Montclair State University, USA*

## Abstract

Demand for water has been rising and is expected to rise further in the 21<sup>st</sup> Century in the developing countries due to increases in population, urbanization and agricultural and industrial development. This paper analyzes the availability, demand and uses of water as well as water policy and management of this crucial resource in a sustainable way to meet the increasing demand in the coming decades. India is the focus of this research. Insights gained from water management policies of the United States are analyzed for their applicability to the Indian context. The role of the ecological principles and climatic factors that have a bearing on the quantity and quality of water is also analyzed. The analysis shows that there has been an acute and persistent shortage of water in all major metropolitan centers in India. The critical question now facing the policymakers, especially the politicians, is the transfer of water from irrigation to meet urban demand without raising the ire of the farmers who form the majority in the countryside. Growing human population in concert with an effort to have economic growth will require additional water supply and a wiser policy of water management. This paper explores the water issues, in all its complexity, in the context of India.

## Population and Economic Growth

India's population of 1,121 million people in 2006 is expected to increase to 1,363 million by 2025 and ultimately to 1,628 million by the middle of this century, 2050 (PRB, 2006). The magnitude of population that would be added by mid-century is staggeringly large, half a billion people (Figure 1). The urban population, currently estimated as 29 percent in 2006, is projected to grow to above 50 percent by mid-century. These statistics translate into an urban population of 325 million in 2006 and 800 million by 2050. Another important facet of Indian urbanization is that only "class one" cities have increased their share of population since 1950. All other class cities' share has remained the same or declined. Class one cities are cities above 100,000 in population. This trend is interpreted to mean that more and more people are attracted to larger metropolitan centers (Figure 2). This is a global urban trend and is expected to accelerate. The expected increase in the number of mega cities, cities over 10 million people, is another trend that will be pronounced throughout the developing world as well as in India (Brockerhoff, 2000). These demographic trends foretell the challenge India faces to meet its demand for water. Two recent United Nations publications concur with the urgency of dealing with the looming water crisis. (UNDP, 2006, UN, 2006).

## Water Availability

The principles of hydrology, hydrological cycle and climate are the keys to understanding water availability. The total amount of water on the earth as estimated by the U.S. Geological Survey to be  $1.36 \times 10^{21}$  liters, or  $1.36 \times 10^9$  (1,360,000,000) cubic kilometers. Most of it (97.2 percent) makes up the oceans and is saline. The remaining 2.8 per cent resides on the continents. The largest share (76.78%) of the continents' water is in ice caps and glaciers. This water is mostly confined in the Antarctic and Greenland ice caps and is not accessible for human consumption. Mountain glaciers are an important source of water for rivers, make rivers perennial, therefore, a reliable source of fresh water supply. Groundwater available in large quantity is also an important source of fresh water supply. In comparison to other sources, the share of water flowing in rivers and streams is very small but of utmost importance as a source of freshwater supply (Table 1).

The annual global hydrologic cycle controls the overall supply of water and its understanding is critical for water management. Simply defined, the hydrologic cycle is a flow of water that evaporates from oceans and is carried by winds towards land. It results in precipitation over the land. As a result, precipitation recharges groundwater and water flows in streams and rivers which empty into the oceans. The amount of water which forms

the annual global hydrologic cycle is fairly constant at 500,000 cubic kilometers. The water that evaporates from oceans is 430,000 cubic km or 86 percent. The evapotranspiration from land contributes 70,000 cubic kilometers or 14 percent of the hydrologic cycle. Land surface, because of geography and mountains, receives a higher amount of precipitation, 110,000 cubic kilometers. Oceans receive 390,000 cubic km. Annually, land receives 40,000 cubic km of water as a surplus that makes up the surface flow of rivers and streams. The flood state accounts for 70 percent of this surplus water. To increase water supplies, it is necessary to capture the flood state water (Ambroggi, 1980). The global pattern of water availability and the hydrologic cycle provides a rough estimate of the water availability to nation states.

The linkage between climate and water availability cannot be overstressed. Climate is a determining factor for the hydrologic cycle. In agriculture, climate determines the water demand for irrigation – a predominant user of water in India. Among the elements that make up the climate, precipitation is central for this analysis. Furthermore it is the amount, geographic distribution as well as monthly variations of precipitation that are of utmost importance.

India's climate is characterized by its seasonal precipitation mainly during summer months over much of the country. This climate is commonly known as tropical monsoon. Only the Western Ghats, Northeastern India and lower Ganges Valley have abundant rainfall (Figure 3). The monsoons arrive in the middle of June at the Western Ghats initiating the rainy season. The monsoons reach Northeastern India a few days later. The Northwest section of the country experiences monsoon rainfall in the first week of July. The rainy season ends at the beginning of October. Upwards of 90 percent of rainfall occurs during this period (Figure 4). There is some precipitation in Northern India and the adjoining Himalayas associated with the temperate low pressure systems coming from the west. There is winter precipitation in Southeastern Tamil Nadu from the Northeastern trade winds. This rainfall is orographic in nature.

Seasonal precipitation causes river flows to fluctuate widely from flood state during monsoon rains to a trickle in dry months. Rivers having headwaters in the inner Himalayas are perennial. Their flow is augmented from snowmelt in Spring and early Summer. The rivers of Punjab, as well as Brahmaputra, Yamuna and Ganges and some of their tributaries fall into this "perennial" category. In the South, the Kavery is the only perennial river because its basin gets rainfall from the monsoons during summer and orographic rainfall from the Northeasterly

trade winds during winter months. The Kavery is the southernmost river originating in Karnataka and then flowing in Tamil Nadu. Water sharing of the perennial rivers between states and between countries has been a politically contentious issue.

Pollution of the rivers is another pressing factor limiting the availability of water. The water pollution problem is so dire that during the sacred Melha in the winter of 2006-2007, the Sadhus (holy men) protested and refused to take ritual baths in the Ganges at Allahabad. During the low flow in the dry season, there is not enough water to dilute pollution and urban sewage discharges. The rivers become flowing cesspools. The river downstream from the point where river water is diverted into irrigation canals, experiences similar degradation. Also, polluted channels contaminate groundwater.

Overall, water resources of India are meager. India has 2.45 percent of the land surface of the world but its share of world's water resources is lower (1.58 to 1.67 percent). In terms of population, water resources become very meager and acute because India has 17 percent of the world population (Tables 2, 3).

## Water Use

Harnessing of water resources goes far back to the origin and development of the Indus Valley civilization 4500 years ago on the Indian sub-continent. This cultural achievement that the river valleys provide resulted in achieving food surplus which was necessary for the development of cities and centers of civilization that first took hold and flourished in Mesopotamia and then diffused eastward to the Indus Valley (Sjoberg, 1965). From its core urban centers of Mohenjo-Daro and Harappa, the Indus Valley civilization reached from the lower Indus Valley to the river valleys upstream north to Punjab. Much later, this complex human organization spread eastward to the Ganges Valley with major religious centers of Hinduism along its banks.

Since antiquity, irrigation has been the major user of river water in India. Rulers built canals but these were seasonal and carried water when the river was in flood stage. Rulers also constructed tanks in every settlement

to store water. The British were the first to build large perennial canals. The flow to the canal was controlled by a permanent weir across the river. In 1861, the upper Bari Doab Canal was the first major irrigation project completed in Punjab (Buck, 1906). It happened 14 years after the British annexation of the Sikh Empire in Punjab. The Bari Canal irrigated the heartland of the Sikh Empire in present day districts of Gurdaspur, Anmritsar and Lahore. With this, a new era dawned for major canal construction. The rivers of Punjab and adjoining Uttar Pradesh were diverted into canals for irrigation. Canal irrigation ushered in a period of regional growth and prosperity for the farmers. Above all, it cemented and enhanced the authority of British rule in India. Because the British were in a position to give land grants to their supporters in canal colonies, they won further popular support with the construction of new irrigation projects. Also, there developed a market for the agricultural products from irrigated lands, especially cotton. Cotton was especially lucrative because the American Civil War disrupted supplies to British mills. Canal irrigation was a major undertaking by British rule. Even today, these canals are functioning very well.

TABLE 2: MEAGER WATER RESOURCES IN INDIA

Water: A Shared Responsibility, 2006, New York

After independence in 1947, India followed the Soviet model of development with five-year plans. The first five-year plan was launched in 1950-51 with an emphasis on the construction of dams for hydroelectric energy and irrigation. These major projects were called multi-purpose projects. They were 26 in number. The Bhakra

Nangal Project on River Sutlej at Bhakra was the biggest multi-purpose project with a dam 226 meters high and 518 meters long. Mr. Jawaharlal Nehru, the first Prime Minister of India, used to reverently call these projects “The Temples of Modern India.”

Irrigation has been a high priority. Within the first two decades of independence, more than 600 major and medium projects were planned and initiated and 380 of these projects were completed (India, 1975). As a result of the expansion of irrigation, river flows are totally consumed except during the floods.

In addition to using river water, the major expansion in irrigation has also been made possible by tapping ground water. Tube wells are a ubiquitous feature of the agricultural landscape. The groundwater is pulled out at a faster rate than the hydrologic cycle can replenish it. As a result water tables are declining and pumping the water from a greater depth becomes costly. When the water table is higher than the floor of the river channel, groundwater fills the channel and contributes to the steady flow of a river. The water flow in this state is of high purity because it has gone through the natural filtration process. This pure water is transported free of cost to localities downstream. When the water table declines below the river channel, the river is no longer fed by groundwater. The amount of river flow decreases. If there are pollution discharges flowing in the river, they seep through the bottom of the river channel and have the likelihood to contaminate groundwater. Groundwater is under great threat from over withdrawal and pernicious pollution.

## Meeting Demand

Community wells used to be the source of water for basic human needs in villages and small to medium urban centers for drinking, bathing, washing and sanitation. Larger cities had a centralized system of water supply. This pattern of water supply has undergone a revolutionary change. Currently an overwhelming majority of people in villages and all houses in small to medium urban centers have motorized private pumps that supply household water needs (Table 4). As noted earlier, India’s population will increase to 1.6 billion people by 2050. By then, the majority of the people will live in towns and cities. Large cities and mega cities will attract a much larger share of the population. Vast and rapid changes have to be made to meet the human demand for water. Plans must be formulated to meet the industrial and commercial demand for water of the metropolitan economy. Case studies from the more developed countries suggest that the large flow of surface water is the economical way to meet the water demand in years to come in India (Schneiderman, 2000).

## Water Management

The large diversion of canal water from irrigation to the metropolitan economy is fraught with the danger of conflict and civil strife. Such a diversion can reduce food production and jeopardize food security. Therefore, the likelihood of such a transfer of water is remote. Conservation is often suggested as a desirable way to reduce wasteful use and free the water for other uses. This option is partly impractical because there is already a shortage of water for urban use. With new irrigation technology, efficiency of water use can be improved. But large diversion of water away from agricultural use is politically not feasible in the foreseeable future. The only alternative that will increase water supply is to aggressively intervene in the hydrologic cycle to capture more of the water during the flood flow. The

water can be captured from the flood flow by recharging the groundwater aquifer. A second possibility to capture the flood water is to build additional reservoirs by damming rivers and their tributaries. The third possibility is to transfer water from surplus areas to deficit areas. All or a combination of these possibilities have to be pursued to meet new water demand.

The Intergovernmental Panel on Climate Change (IPCC) in its drafts of climate change report, issued in 2007, predicts a severe water shortage in Asia and Africa. The hardest hit regions are those with seasonal rainfall with most of the rain falling during summer. Most of India falls in this category. The IPCC also predicts that the intensity of rainfall will increase but its frequency will decrease in countries such as India. This means the flood will be of higher magnitude and droughts will be more severe (Goswami, et al, 2006). In such conditions, to meet the water demand, water has to be captured during the flood flow.

From the perspective of water management, an important contentious issue is large versus small dams and reservoirs. Large reservoirs are created by the construction of high dams across rivers. All multipurpose projects created large reservoirs storing huge volumes of water. The construction of large dams is criticized because it dislocates larger numbers of people who happen to live in the submerged area. The dams gravely injure or destroy the fauna and flora and thus do irreversible damage to the ecological services the river provides. The Sardar Sarover Dam over the Narmada River in Gujrat recently attracted as much controversy as The Three Gorges Dam over the Yangtze River in China.

The alternative to large dams and their resultant large reservoirs is to construct a large number of smaller reservoirs on tributaries with minimum displacement of people. There may not be much saving in terms of protecting the agricultural land from submersion. The historical experience in the Northeastern United States suggests that small reservoirs can be an important source of water. However, this region is endowed with a precipitation that is fairly distributed throughout the year. The Indian situation, in terms of policy for water management, resembles to that of the dry western United States where large dams and large reservoirs are the norm (Archibold and Johnson, 2007). An additional benefit of the high dams with large reservoirs is the generation of green, carbon emission-free electricity. Currently the hydroelectric share of total electric production is 14 percent in India. Large dams can help generate additional electricity with zero carbon emission. Carbon dioxide is a major greenhouse gas, causing global warming. Any reduction of carbon emission is a step in the right direction for the health of the planet.

Temperature is one of the indicators of water quality. Cold water absorbs more oxygen and thus increases the purity and quality of water. Oxygen rich water supports a diversity of organisms. As water temperature increases the water is rendered oxygen poor and that, in turn, degrades the quality of water. Oxygen-poor water loses its natural ability to self-clean by biodegrading the pollutants. As a result, oxygen-poor water remains polluted. Fish and other organisms are unable to survive in oxygen-poor water. Water that supports life is considered of high quality. In this regard, large dams and their reservoirs have the advantage of maintaining cooler water temperature because of greater depth. Smaller reservoirs are shallower and the water is liable to become warmer. The smaller reservoirs can become dry due to evaporation after a long, dry season and therefore become less reliable as a source of water supply. The dry period coincides with the extremely high summer temperatures before the onset of the monsoons. Cold water is refreshing during the oppressive heat of summer months when noon temperature daily climbs to above 100°F for months.

Water pollution is a severe problem in India. Natural ecological principles can be brought to bear to increase the purity and quality of water. One such important principle is the creation of wetlands and maintaining the already existing wetlands. Wetlands filter pollution, especially organic pollution, as water slowly flows through them. Maintaining a vegetation buffer along the banks of the waterways is another time-tested technique for the restoration of streams to enhance water quality (NRC, 1992). Water shed protection, though improbable, in a densely populated country like India, is desirable. The people can be made aware that whatever you throw anywhere ultimately ends up in your water. Economic forces have a profound impact on the allocation of crucial resource such as water. The U.S experience suggests that it is the public investment that provided abundant water to the metropolitan areas and their economy. Water supply systems in major cities such as New York are still managed as public utilities. As the experience of Bolivia in the privatization of the water supply, indicates private companies are disappointed by meager returns on their investment. Private companies can distribute water and collect charges

more efficiently after the vital infrastructure of dams, reservoirs, and aqueducts are already in place. The pricing of water done in the right way can lead to efficient use of water resources.

As India becomes urbanized with large numbers of big and mega cities with robust economy it will require large amounts of water. This additional water can only be met by aggressively capturing the flood flow of rivers. All options in concert have to be pursued to secure water (Gleick, 2003). There is a role for small as well as large reservoirs in the nation's water management. Large reservoirs are more suitable to meet the large demand of the mega cities and their economy. Ground water will remain a desirable source for users who are dispersed over a large area such as the residents of rural and small towns and the agricultural sector.

## Bank Distress in Malaysia Using Bank Level Data

*Faoziah Idris, faoziah@uum.edu.my*

*University Utara, Malaysia*

*Abdul Rahman Othman*

*University Sains Malaysia, Malaysia*

*Cheah Kooi Guan*

*Wawasan Open University, Malaysia*

### Abstract

This paper examines the financial distress in commercial banks and finance companies in Malaysia using logistic regression (LR). A comparison between these two groups of the financial institutions was made using the bank level data. This study covers the period from 1988 to 1999 with a sample of 30 commercial banks and 36 financial companies. The findings indicated that the rate of distress status using LR is 93% for commercial banks and 95% for financial companies. On the other hand, seven variables were found significant in finance companies, they are DEPIB (ratio of deposit and placement of bank), LIQ (liquid asset-liquid liabilities to shareholder funds) PSIZE( log of total asset), RREM( ratio of total director remuneration to total assets), NIITL(ratio of net interest income to total loan, LOANCON (ratio of loan concentration, real estate constructions, purchase securities, credit consumption and purchase of landed property to total loan) and LLPNPL (loan loss provision to NPL).Among the portfolio of financial ratios used, DFLA (ratio of liquid funds to total assets), EARNING (ratio of interest income to earning assets minus interest expenses on interest bearing liabilities) and NPLDPTL (NPL to ratio of deposit to total loan) were found to be significant in commercial banks. Key words: bank distress, logit analysis, too-Big-to-fail (TBTF) doctrine

### Introduction

The financial health of the banking industry plays a vital role for the economic stability and growth. Hence, the assessment of a bank's financial condition is a fundamental goal for the regulators in banking supervision. This assessment includes the prediction of bank distress and the provision of valuable information about troubled banks with sufficient lead time for the regulators and management to take preventive or remedial action at problem banks. In the past two decades, many countries have experienced significant distress in the financial sector. The Malaysian banking sector was not spared from this phenomenon and suffered from the financial crisis in 1997-98. As a result, in 2000, Bank Negara Malaysia, the central bank of Malaysia, intervened on behalf of the government by putting the financial sector consolidation as an important agenda for improving the soundness of the financial system through strengthening preemptive and prudential regulations.

This study attempts to derive an estimate for the probability of a bank with a given set of characteristics falling into distress or non-distress. Logistic regression (LR) was used following similar studies that used logit regressions in distinguishing "good" and "bad" banks (Dimitras, Zanakis & Zopounidis, 1996; Lane, 1986; and Martin, 1977).

Secondly, the study sought to understand the common fundamentals and characteristics that govern bank distress and non-distress. Lastly, we investigated the causes of bank distress using selected financial ratios. We also investigated the relationships of these ratios with the size of the bank since it was commonly postulated that larger-sized banks would be less likely to fail. This perception is based upon the higher possibility of a government bailout or rescue to a bigger bank that was in distress rather than a smaller-sized counterpart.

## Related Studies

Many factors contribute to the causes of bank distress. Among them were factors such as business cycles, firm-specific or sector-specific events pertaining to the market structure (see Berger & DeYoung, 1997; Fisher, Gueyie & Ortiz, 2000; Galloway, Lee & Roden, 1997; Neal, 1996). However, as to date, there is no distress theory used in the previous studies that elaborated and focused specifically on the causes of bank distress. Apparently, most studies on the banking distress are much related to the theory of financial intermediation and the frameworks of public theory “Too Big to Fail” by Kane (1988). The financial intermediation theory was seen as are much related function in the study of bank distress, because it mobilized the domestic financial resources through a variety of instruments, such as the facilitation of credit to productive activities, and as the depository of the nation’s savings.

There are several reasons that contribute to the interest in the prediction of bank distress or corporate distress or “business failure”. Firstly, bank distress could involve business failure at various levels and large bail-out or bank nationalization (Demirguc-Kunt & Detragiache, 1977) or a large non-performing loan problem. Consequently, the distress of one bank will lead to a downward spiral for the whole economy of a country via the “contagion-effects” where the cost of failure of a bank with a large network of related companies may also cause the financial system distress. As such, early and accurate bank distress predictions will enable preventive and corrective actions to be taken in to prevent failure. Secondly, the stronger competition among banks has made the government to impose regulation in many countries to overcome bankruptcy or increasing failure rates. Finally, The New Basel Capital Accord, which replaced the original Capital Accord of 1988, effective in most countries in 2005 allowed banks to use their own internal systems in order to determine their adequate risk equity coverage. Hence, the New Capital Accord creates a great incentive for banks to develop their own internal risk assessment models including prediction of bank distress.

The study of the bank-level fundamentals begins with the investigation of management quality that had played a big role in determining the future direction of the bank. Theoretically, the management quality of a bank is strongly related to its asset quality. The management has an overview of a bank’s operations, manages the quality of loans and has to ensure that the bank is profitable. In doing so, the management sets the profitability objectives and the risk levels to be undertaken by the bank’s supervision. For example, a factor that distress banks seem to have in common is the problems that they have in their loan portfolio. Therefore, these types of banks have inadequate control systems in monitoring and spotting problem loans. Perhaps another reason to this is the management may be too aggressive in expanding the bank’s loans by over lending and does not follow their loan policies strictly and stringently. At the same time, the management seems unable to screen and monitor borrowers through numerous credit exception rules on loan portfolio. This would likely result banks to have more risky loan exposure. The first study that adopted the ratio of earning assets to total assets as a proxy for measuring management efficiency in relation to net interest margins was by (Angbazo, 1997). The study indicated that the high exposure of risk taking in credit risk and interest rate by the management led to lower net interest margin that affected the growth of revenue and profitability of the bank.

We define adequately capitalized banks as those banks with at least 5.5 percent primary (tier 1) capital to total assets ratio for the whole sample period. This capital threshold is consistent with regulatory standards for adequate capitalization (Jagtiani, J., Kalori, C. Lemieux, and H. Shin, 2003). It is an advantage to use the threshold for adequate capital, since capital deficiency could be a core fundamental in identifying and providing an early signal of bank distress. Furthermore, it allows for the possibility that two banks with an equally risk would be in a different standing if one has a set aside reserve to cover for a significant amount of the problem loans, or if it has a higher level of adequate capital. (See Appendix 3)

## Description of the Data

The bank level data used for this study comprised of selected balance sheet, and profit and loss item of financial institutions in Malaysia. The external data represented statistics on banking industry and selected macroeconomic variables. The financial items were extracted from the annual reports of 30 commercial banks and 36 finance

companies operating in 1988-1999. They were then computed into relevant ratios. These amounted to twenty five ratio variables. All were considered in the setting up of the distress prediction models. (See Appendix 1)

## Methodology

The logit is one of the most commonly employed parameter in detecting potential failure risk. The logit model assumes that there is an underlying response variable  $Z_i$  defined by the regression relationship. This model was adopted from Ohlson (1980) and Gujarati (1995, p.554). It formulated a multiple regression model consisting of a combination of variables, which best distinguished distress and the non-distress banks using the formula:

$$P_i = E(Y = 1 | X_{1i}, X_{2i}, \dots, X_{ki}) = \frac{1}{1 + e^{-Z_i}} \quad (1)$$

Where  $Z_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \dots + \beta_k X_{ki}$ ,  $Y = 1$  representing distressed banks,  $P_i$  then represents the probability of distressed banks,  $X_{hi}$  = financial ratio  $h$  of firm  $I$ ,  $h = 1, \dots, k$ .  $Z_i$  ranges from  $-\infty$  to  $\infty$ . Equation (1) is known as the cumulative logistic distribution function.

This study estimated two logit models using maximum likelihood. Each sample bank was assigned a dummy value,  $Y = 0$  (non-distress) using the ratio of primary capital to total assets greater than or equal to 5.5 percent, and  $Y = 1$  (distress) otherwise.

Both models estimated the probabilities of distress institutions from a sample of 30 commercial banks, and 36 finance companies, respectively. Here we wanted to investigate and highlight which variables were common to distressed commercial banks and distressed finance companies. By doing so, we could identify the characteristics that were valuable in determining distressed in both types of institutions, regardless to their function and specialization.

## Results

### The Descriptive Statistics

Table 1.1 present the descriptive results for both financial institutions using twenty-five independent variables from the various attributes to capture variation in bank risk (such as liquidity risk, market risk, credit risk) and external factor of economic variables (such as GDP and CPI). The descriptive result shows both commercial banks and finance companies exhibit the same variables that score the highest means. Both institutions consistently capture P-size as the highest mean score of 22.49(CB) and respectively follow by 20.99(FC) and NPLDPTL of 20.87 (CB), 19.42(FC), INTCO 0.943(CB) and 0.964(FC). Apparently, among the highest mean score of the independent variables are from bank specific characteristics variables such as P-size, NPLDPTL and INTCO. Out of the twenty-five variables only two external variable of CPI represent the macroeconomic attributes and BTLDGP. As such, the descriptive results suggest that bank distress could be determined by P-size, NPLDPTL, INTCO, CPI and BTLDGP. As a whole, the result shows the bank specific characteristics variables and external variables are important variables to develop lojit models of bank distress.

#### The Descriptive Statistics of Variables Used to Estimate logit Model

Table 1.2 and table 1.3 reports mean score value results for (FC) distress vs. (FC) non-distress and (CB) distress vs non-distress (CB) which includes the twenty five variables of the same bank-level fundamental to explain bank distress. Again, the results explain almost the same variables as compare to Table 1.1. Similarly, both descriptive statistics show P-size as the highest mean score of distress and non-distress finance companies and Commercial bank. For example, P-size distress (FC) is (20.99) and non-distress P-size (FC) (19.90). On the other hand P-size distress (CB) is (22.495) and non-distress (CB) P-size is (21.997). The second highest mean distress (FC) is NPLDT (19.417) and non-distress (FC) is (17.39), non-distress (CB) is (19.388), and distress (CB) is (20.877) and follows by distress (FC) is CPI (4.388) and (4.416), and non-distress (CB) is (4.399).and distress (CB) is 94.367). The result again consistently shows P-size, NPLDT and CPI as important variables that could be explained finance companies and commercial bank distress.

Table 1.4 shows the results of the significant variables used in the study. Most of the financial variables used are related to the liquidity risk and credit risk. The results indicate three variables are found significant in the commercial bank. They are DFLA, EARNING and NPLDTL. DFLA represent of (Ratio of liquid funds (cash and short term to total assets) is the overall measure of liquidity risk that would give a signal of the healthy bank. This implies that liquid funds are significant important in order to reduce bank exposure to liquidity risk. One possible reason identified in the theoretical literature is that the bank is motivated to hold liquid assets (particularly cash and securities) to protect against unexpected withdrawal by depositors or draw downs by the borrowers (Saidenberg and Strahnan, 1999), which could to bank run. Commonly, bank distress is often characterized by runs on banks, where depositors withdraw a large of amount of funds from a large number of intermediaries (Beng and Ying, 2001). On the other hand, EARNING has a significant and negative impact on the non-distress bank. It represent the ratio of interest income to earning asset minus interest expense on interest bearing liabilities indicates on average about 0.038 and 0.034 of the total assets in the commercial bank is earning interest. NPLDTL represent of Non-performing loans to ratio of deposits to total loans and the average mean are 19.570 to 19.390. the results indicates that the higher ratios of non-performing loans are associated with a higher probability of bank distress

Table 1.5 shows that the significant variables of finance company are different form the significant variables found in the commercial bank. They are seven variables found to be significant in the sample they are P-SIZE, LIQ, LOANCON, DEPIB, RREM, and NIITL AND LLPNPL. Among the highest score mean are, P-SIZE (20.00) and (21.447), LIQ (1.902) and (1.70), LOANCON (0.334) and (0.334). The results supports and consider bank sizes are important variable. Generally, banks are divided into different sizes base on assets size and average capital ratio and bank would significantly affect to the growth rate of total loans. As larger bank are better and able to diversify their loan portfolios, thus reducing their assets risk (Calomiris and Mason, 2000). A study of comparative analysis bank failures and fundamental by (Arena, 2005) also used bank size as a measure of total assets as a bank-level fundamental and found that foreign banks are perceived as more stables and safer than domestic banks, because they may be able to resort to upstream financing from the mother institutions, which could contribute to stabilize the supply of credit, in particular during bad times, and they behave a much more stable deposits base. She found that no big bank in term of size failed in the banking crises in East Asia and Latin America during the nineties. As such, banks with smallest assets and lowest capital leverage ratio are most affected by financial distress. Hence, it indicate that P-SIZE as important dimensions of bank activity and as a proxy for too big to fail where a large banks may be less likely to fail, given the expected relative advantage of large banks of diversifying risk taking .The log of bank assets, which represents the size of bank, is almost similar on average, for distress bank and for non distress banks throughout the sample period. Therefore, we expect that large banks may be less likely to fail, given the expected relative advantage of large banks, such as, in raising new capital, alleviating illiquidity, and diversifying risk. For example, commercial banks with higher levels of assets would be in a more secure financial position, even if they have the same high level of non-performance loan.

The second highest score mean and significant variable is LIQ (liquid asset minus liquid liabilities to total shareholder's fund) which indicates that finance companies are not exposed into high fractions of liquid assets and exposure to liquidity risk is high and will increase the probability of distress. The finance companies LLP/NPL (Loan loss provision to Non-performing loans) represent of ratio loan loss provision and mostly been allocated to non-performing loans. Therefore a higher ratio of LLP/NPL in particular is associated with a higher probability of distress. The LOANCON indicates loan concentration, real estate, construction, purchase of securities, credit consumption and purchase of landed property) to total loans. The LOANCON results are associated with a higher probability of distress, that real estate loans were quite risky. The study suggests that credit risk was a problem in the finance companies.

The LLP/NPL (loan loss provision to Non-performing loans) considered a traditional proxy to measure of assets quality. LLP/NPL is expected to be positively related to risk of bank distress as such a higher means of ratio non-performing loan to total asset also have a positive impact on bank distress. The study, estimate that loans were classified as a bad loans only if they had been in arrears for six month or more, and banks would frequently restructure such loans to reduce the size of reported portfolio problems (Lindgren et al.1999) and (Arena, 2005), (Ahmad, 2003).

The result in (Table 1.6) indicates that the logit models are highly significant and the model shows a good predictive power and able to correctly predict 98.9% of the distress commercial bank and 44.4% of the non-distress commercial bank in the sample. Overall the model could predict 94.9 of the sample.

TABLE 1.6: CLASSIFICATION TABLE (THE CUT –OFF IS 0.05) COMMERCIAL BANK

	Observed	Predicted		Percentage Correct (%)
		Non distress	Distress	
Step 3	Non distress	70	1	98.6
	Distress	5	4	44.4
	Overall Percentage			92.5

TABLE 1.7: CLASSIFICATION TABLE (THE CUT –OFF IS 0.05) FINANCE COMPANIES

	Observed	Predicted		Percentage Correct (%)
		Non distress	Distress	
Step 7	Non distress	33	2	94.3
	Distress	2	42	95.5
	Overall Percentage			94.9

Table 1.7 indicates the model is able to correctly predict 95.5% of distress finance companies and 94.3% of the non-distress companies in the sample. Overall the model could correctly predict 94.9 of the sample. Note that table 1.6 and Table 1.7 are based on the observations of commercial bank and finance companies for the period (1988 to 1999). The total number of institutions in the model did not match with the number mentioned earlier. For example, we studied 35 finance companies and 30 commercial bank, but modeled 81 and 85 commercial bank. Both finance companies and commercial bank were consolidated and merged and eventually prior to merging there were 81 of (FC) and 80 (CB)

## Conclusions

This study provides a test of distress prediction models in Malaysia. The result indicates that finance companies which are smaller size in assets are more distress than commercial bank that is considered larger-sized. The results are contrary to the finding studied by (Bongini, 2000) on the sample of financial intermediaries in Korea where, the percentage of distressed institution was smaller among smaller-sized than the larger-sized institutions.

The results support the hypothesis that the “Too –Big-to- Fail” Doctrine applied by the central bank in Malaysia when they believe that some event will result in severe economic distress. As such, the adopted of a doctrine too-big-to-fail was successfully safeguards the big banks from distress. Specifically, estimating a logit model proves that the probability of distress is systematically smaller for the institutions that have larger-sizes in assets. As a result, those institutions that have larger-sized in assets stands a better chance to survive in the financial intermediaries. It is proved that smaller institutions find it harder to compensate a deposit drain by promptly collecting funds in the wholesaler financial market. In the event of systemic crisis, smaller-sized financial institutions are more likely to experience liquidity problem and to be unable to solve problem either in the market or with the help of the authorities. These findings are consistent with (Kasyap and Stein, 1997) which provide that monetary restriction hurt smaller banks more than larger one.

All in all, the finding indicate that the internal factors contributing the most factors to bank distress and finds that the macroeconomic variables does not explain the likelihood of distress. Changing in bank specific factors is found to add to bank distress of both commercial banks and finance companies. Thus, the bank-level fundamental is significantly affected the likelihood of bank distress. The study supports the view that the distress banks in the systematic banking crisis fundamental weakness in their assets quality, liquidity and capital structures prior to the on set of the crises.

### Variables and definitions

Variables	Definition
<b>Market Risk:</b>	
CA	Ratio of total shareholder’s fund to total assets
LFLOANS	Ratio of loans deposit and placement with financial institutions to total loans
<b>Credit risk/ default risk:</b>	
LAS	Ratio of gross loans to total assets
INTCO	Ratio of interest income to interest expense
EARNINGS	Ratio of interest income to earning asset minus interest expense on interest bearing liabilities
<b>Liquidity risk:</b>	
DEPPUB	Ratio of deposits from the customer (public) to total assets
DEPIB	Ratio of deposits and placement of bank and other financial institutions to total assets (inter-bank deposits)
DINTDEP	Ratio of interest expenses to total deposits
DLFA	Ratio of liquid funds (cash and short term) to total assets
<b>Macroeconomic variables:</b>	
CPI	Yearly quarter percentage change in the consumer price index
INTRS	Short-term real interest rate
<b>Other bank variables</b>	
PSIZE	Logarithm of total assets
POPA	Ratio of total operating profit to total assets
PIDI	Ratio of interest expense on deposits to total operating income
PTOI	Ratio of total interest income to total operating income
PMGT	Ratio of earning assets to total assets
RREM	Ratio of total director remuneration to total assets
<b>Structural variables:</b>	
(Banking sector)	
BTLGDP	Ratio of total banking system loans to total GDP
NIITL	Ratio of net interest income to total loan

IMPLICIT	Non interest expense minus non interest revenue to earning assets

### Abstract

This paper mainly focused on the effect that China's entry into WTO had on the volatility of the yield in China's stock market. China entered into the WTO on December 11, 2001 and we divided the time series into two periods—before and after the day. AR-EGARCH-M model was used to test the two periods and some meaningful conclusions were drawn from the analysis. Some conclusions we got were that (1) the speculation was decreasing and investors were becoming more and more rational; (2) China's stock market possessed the characteristic of 'Policy Market', but the effect was diminishing; (3) similar to developed country's stock market, the volatility in China's stock market also showed the characteristics of asymmetry and longer persistence.

### Introduction

Volatility of yield plays a very important role not only in the theory of finance but also in the actual practices. The volatility of underlying asset is used in the process of option pricing. And volatility is supposed to be constant in the Black-Scholes option pricing model. However, Mandelbrot (1963) found that "large changes tend to be followed by large changes, of either sign, and small changes tend to be followed by small changes." This phenomenon is called volatility clustering<sup>1</sup>. To capture volatility clustering phenomenon and break through the constraint of constant volatility assumption, Engel (1982) set up Autoregressive Conditional Heteroskedasticity (ARCH) Model. From then on, Bollerslev (1986) and Nelson (1991) brought forward GARCH and EGARCH model and other ARCH models were also introduced. Since then, the study and application of volatility have flourished all over the world.

Watanabe (2003) compared GARCH model, GJR model and EGARCH model's ability in option pricing under different distributions and different risk hypotheses. Meanwhile, Watanabe also empirically tested the models with Nikkei 225 index and option price based on Nikkei 225 index. Watanabe and Sasaki (2006) used ARCH models and ARFIMAX model to make forecast of volatility and test the describing ability of VaR model. Engle and Mustafa (1992), Sabbatini and Linton (1998) and Duan and Zhang (2001) used ARCH models to price options.

There are many literatures on China's stock market volatility. Chen Langnan and Huang Jiekun (2002) applied GJR-M model to test the effect of asymmetry of volatility on China's stock market with different fluctuating periods divided by ICSS rule. The data they used were daily Shenzhen Component Index from January 3, 1993 to October 28, 2001. Wang Yuyong and Pan Hongyu (2003) compared the ARCH models' ability on capturing the characteristics of volatility.

Compared with other studies, this paper contributes to the volatility literature in the following aspects.

First, existed literatures are wild about comparing different country's volatility, comparing different model's ability on capturing volatility and the application of VaR model or option pricing. This paper supports the opinion that due to the changes of emerging market's system arrangement, models based on sub-samples should be introduced separately (Chen Langnan and Huang Jiekun, 2000). From this viewpoint, this paper divided the time series into two periods—before and after December 11, 2001, the day on which China entered into the WTO. Volatility models are introduced to test the changes between the two periods.

Second, when existed literatures introduce volatility models, the process of choosing lag length is subjective. As we know, the posteffects from omitted variable are more serious than the ones from redundant variable. Therefore, as to autoregressive model, the choice of lag length should be careful. Otherwise, parameters

estimated will not obtain the characteristics of unbiasedness and consistency. Up to now, there is no accurate procedure to choose the lag length of ARCH models. However, this paper employ more precise methods to choose the lag length.

The arrangements of the rest of the paper are as follows. Section II will describe the variables and the data utilized in this study, the statistic characteristics of yield series and the result of unit root test. Section III describes the Models utilized in this paper and the methods used to choose lag length. Section IV presents the empirical results. Finally, Section V of the paper concludes with a discussion about the possible explanations of the findings.

## Data

### Data and Descriptive Statistics

In this paper, we choose the data of Shanghai Securities Exchange Composite Index (henceforth SH) and Shenzhen Securities Exchange Composite Index (henceforth SZ) as sample data. Securities Law of the People's Republic of China was implemented as of January 1, 1999. The promulgation of the Securities Law indicated China's securities market was becoming mature. Therefore, the testing period is from July 1, 1999 to December 11, 2006. The number of the observations from the sample is 1793 in total. To illustrate different performance of the stock market before and after China's entry into WTO, the sample was divided into two sub-samples, from July 1, 1999 to December 10, 2001 and December 11, 2001 to December 10, 2006. The Data used in this paper come from Bloomberg.

$R_t$  is the daily return of stock index, and the formula of  $R_t$  is  $R_t = [\ln(P_t) - \ln(P_{t-1})] \times 100\%$ , where  $P_t$  is the closed price at  $t$  and  $P_{t-1}$  the closed price at  $t-1$ . To catch the basic characteristics of daily yield series, we conduct descriptive analysis on  $R_t$  series in Shanghai and Shenzhen Securities Exchange. The result is shown in Table 1.

As shown in Table 1, both of the two series' kurtosis values are above 3. This indicates that the yield series possesses the characteristic of excess kurtosis. In addition, the mean values of SH and SZ' yield series are distinctly different with zero under 10% significant level. The paper carries out Lagrange multiplier test (LM test) on mean equations (Equation (1) in the 3rd section) in different periods. The result shows that LM(q) (q=1,2,3...7) of series SH and SZ are significant at 1% level of significance except that LM(q) of series SH in the 2nd period is significant at 5% level of significance. This also indicates that the yield series of Shanghai and Shenzhen securities market have high order ARCH effect. The value of LM(7) is also shown in the table.

Observations	1792	588	1203	1792	588	1203

NOTES: \* and \*\* denote the null hypothesis that ARCH effect is not existed at 1% and 5% significant level, respectively.

### Unit Root Test

In describing real economic activities, variables such as stock index are showing characteristics of time series. If regressions are performed with these variables directly, it is easy to fall in the trap of "pseudo-regression". Therefore, we perform Augmented Dickey-Fuller test to examine the stationarity of the series.

The Table 2 exhibits the results of unit root test on series SH and SZ. As shown in Table 2, we do not reject the null hypothesis that the two series have unit roots. The result from the test indicates that series SH and SZ are nonstationary. On the contrast, the null hypothesis is rejected. The rejection indicates that the yield series are stationary. From the test, we find that series SH and SZ are integrated of order one, I(1). Therefore, these variable's yield series can be used in volatility model directly.

## Methodology

### Volatility Model

EGARCH model introduced by Nelson (1991) is one of the best tools to describe the asymmetry of volatility. In addition, to capture the tradeoff relationship between yield and risk in China's stock market, the variable of conditional standard error is introduced into mean equations (Engle, Lilien and Robins (1987)). Finally, AR (k)-EGARCH (p, q)-M is introduced as follows:

$$R_t = c + \sum_{h=1}^k j_h R_{t-h} + \sum_{l=1}^4 \delta_l D_l + \varphi \sigma_{t-1} + \varepsilon_t \quad (1)$$

$$\varepsilon_t = \sigma_t z_t, \quad \sigma_t > 0, \quad z_t \sim i.i.d., \quad E(z_t) = 0, \quad Var(z_t) = 1 \quad (2)$$

$$\ln(\sigma_t^2) = \omega + \sum_{i=1}^p \beta_i \ln(\sigma_{t-i}^2) + \sum_{j=1}^q \alpha_j \left[ \theta z_{t-j} + \gamma (|z_{t-j}| - E(|z_{t-j}|)) \right] \quad (3)$$

Equation (1) is mean equation.  $R_t$  denotes daily yield of stock index in the two stock markets.  $\sigma_{t-1}$  denotes conditional standard error at  $t-1$ .  $D_l$  denotes Dummy variable of  $l$  in a week. For example, when  $l$  equals 3 and if the yield observed is Wednesday's, then  $D_3=1$ ; otherwise,  $D_3=0$ . Dummy variable is introduced into the model to get rid of the problems originated by day-of-the-week effect. Feng Lichen (2000) studied day-of-the-week effect in China's stock market. Daily data of Shanghai Composite Index and Shenzhen Component Index are utilized in the analysis. The analysis found that there was significant minus 'Tuesday effect' and significant positive 'Friday effect' in Shanghai stock market<sup>3</sup>. Day-of-the-week<sup>2</sup> effect may result in serious autocorrelation. The dummy variable introduced into the model can effectively reduce residuals' correlation.

$\phi$  denotes the tradeoff relationship between yield and risk. In another word,  $\phi$  denotes investor's relative risk aversion. If investors are risk averters, then there is positive correlation between risk premium and conditional variance.

Equation (3) is EGARCH model introduced by Nelson (1991). The existence of the item  $E(|z_{t-j}|)$  on the righthand side of the equation depends on different distribution of  $z_t$ . If  $z_t$  follows normal distribution, then  $E(|z_{t-j}|)$  equals  $\sqrt{2/\pi}$ . Because  $z_t$  in equation (2) is supposed to follow normal distribution, equation (3) can be transformed to the following one:

$$\ln(\sigma_t^2) = \omega + \sum_{i=1}^p \beta_i \ln(\sigma_{t-i}^2) + \sum_{j=1}^q (\alpha_j |z_{t-j}| + \gamma_j z_{t-j}) \quad (4)$$

Where  $z_{t-j}$  is standardized variable, i.e.,  $z_{t-j} = \varepsilon_{t-j} / \sigma_{t-i}$ . Good news ( $z_{t-1} > 0$ ) and bad news' ( $z_{t-1} < 0$ ) effects on stock market are asymmetry. Parameter  $\gamma$  in the model reflects the effect of the asymmetry. When  $\gamma = 0$ , good news and bad news' effect on stock market is symmetry; when  $\gamma > 0$ , good news' effects on stock market is bigger than bad news'; when  $\gamma < 0$ , bad news' effects on stock market is bigger than good news'. The existing literature found most of  $\gamma$  was minus, i.e. bad news' effect on stock market was bigger than good news'.

In EGARCH model,  $\beta$  measures the effects shocks made on the persistence of volatility.  $E(\ln(\sigma_t^2) | I_{t-1})$  is the conditional mean of  $\ln(\sigma_t^2)$  based on the information set  $I_{t-1}$ :

$$E(\ln(\sigma_t^2) | I_{t-1}) = \omega + \beta \ln(\sigma_{t-1}^2) \quad (5)$$

When this indicator is approximate to 1, it means stock market has very high persistence. In another word, if stock yield is shocked and fluctuates abnormally, it's hard to get rid of the fluctuation.

#### Methods to Choose Lag Length of EGARCH Model

Up to now, there is no accurate procedure to choose the lag length of ARCH models. The following methods are used to choose the lag length of AR ( $k$ )-EGARCH ( $p, q$ ) model.

First, AR ( $k$ ) model is estimated and from lag length 1 to 17, the length of the model  $k^*$  is the one making the value of SC minimized.

Second, AR ( $k$ )-EGARCH ( $p, q$ ) model is examined with ( $p, q$ ) equals (1,1), (1,2), (2,1) and (2,1) respectively and the one making the value of SC minimized is chosen as the length of the model, ( $p^*, q^*$ ).

Third, Ljung-Box test is performed on the standardized residuals and the square of standardized residuals got from AR ( $k^*$ )-EGARCH ( $p^*, q^*$ ) model. If the standardized residuals and the square of standardized residuals are not rejected, then  $k^*, p^*, q^*$  are affirmed. No matter which one of the standardized residuals and the square of standardized residuals is rejected, test in second step will be continued with lag length  $k^* + 1$  until none of them is rejected and  $k^*, p^*, q^*$  are affirmed.

## Empirical Results

According to the methods mentioned in the previous section, we compare different lag length with each other and get the proper one,  $k^*, p^*, q^*$ . The result is shown in Table 3. Based on the result, the paper uses maximum likelihood estimation method to estimate parameters in EGARCH model<sup>4</sup> and detailed results are shown in Table 4. The terms  $Q(20)$  and  $Q^2(20)$  denote the statistic of the standardized residuals and the square of standardized residuals at lag length 20, respectively. For each  $m$  equals 1, 2 ... and 20, series  $Q(m)$  and  $Q^2(m)$  can not reject null hypothesis at 5% significant level. Therefore, there is no autocorrelation in residual series and the lag length of AR-EGARCH-M model in this paper is proper<sup>5</sup>. Ljung-Box statistic only at lag length 20 is shown in the table.

TABLE 3: ESTIMATED SC OF EGARCH MODLES

Period	$k$	SH ( $p, q$ )				$k$	SZ ( $p, q$ )

$Q(20)$	24.923	27.139	23.773	22.062	26.503	18.574
$Q^2(20)$	9.3238	21.346	22.535	10.145	10.501	21.342

NOTES: 1) \*, \*\* and \*\*\* denote 1%, 5% and 10%, respectively.

2) Standard errors are in [ ].

Parameter  $\phi$  denotes the tradeoff relationship between yield and risk, i.e. risk premium of yield. In theory, if stock market follows the characteristic of risk and return based on the assumption that investors are rational, then  $\phi$  is significant positive. Parameter  $\phi$  of first period in Shanghai and Shenzhen stock market does not pass the significant test and the value is very small. This indicates there is no risk premium in the stock market<sup>6</sup>. This result is conflicted with the theory of risk premium that when most of investors are irrational, speculative preference is bigger than investment preference. In the second periods, parameter  $\phi$  in Shanghai and Shenzhen stock market is significant under 10% and 5% significant level and parameter statistics are 0.2411 and 0.2820. This phenomenon indicates the development of China's stock market, decreasing speculative preference and more and more rational investors. In addition, risk premium in Shenzhen stock market is obviously higher than the one in Shanghai stock market. This means risk in Shenzhen stock market is bigger than the one in Shanghai stock market and investors ask for higher risk premium.

$\beta < 1$  is both necessary and sufficient condition that GARCH process is weak stationary. As Table 4 shown, the values of  $\beta$  in both periods are less than one and the models are weak stationary. The result shows that both Shanghai and Shenzhen stock market obtain the characteristic of persistence and the one in Shanghai stock market is longer than the one in Shenzhen stock market. Many empirical studies on developed countries' stock markets show that, commonly speaking, the indicator  $\beta$  of yield series is very close to 1<sup>7</sup>. Though there is gap

between the value of  $\beta$  and 1 in Shanghai stock market, the value of  $\beta$  is increasing from 0.8795 in the first period to 0.9106 in the second period. The phenomenon also happens in Shenzhen stock market and the value of  $\beta$  is increasing from 0.9553 to 0.9645. On the other side, it also witnesses the process that China's stock market is integrating with the world market.

Many empirical studies shows that asymmetry of volatility exists in both mature stock market and emerging stock market<sup>8</sup>. Meanwhile, under the same conditions, good news' effect on stock market is bigger than bad news' effect<sup>9</sup>. As the empirical result shown, all parameter  $\gamma_i$  are significant at 5% level except SH's  $\gamma$  in the second period. At the same time, all parameter  $\gamma$  are minus in both markets and both periods. This indicates that asymmetry of volatility is existed in both Shanghai and Shenzhen stock market and bad news will lead to much more violent fluctuation than good news. This result agrees with other research. The range of asymmetry in Shanghai and Shenzhen stock market are same with each other. Parameter  $\gamma$  in Shanghai and Shenzhen stock market are -0.0468 and -0.0414 in the whole sample at 1% significant level.

Graph 1 illustrates the changes of volatility<sup>10</sup>. The arrows in the graph indicate that there are slowly damped right tails, which means the persistence of volatility. Shocked volatility fluctuates much more violently than general level. As interesting phenomenon observed, volatility of China's stock market made fierce respond to policy shock. For example, on October 22, 2001, state stock reduction policy in IPO and increase issues in stocks was paused. On June 24, 2002, state stock reduction in stock market is stopped. On September 13, 2004, Some Opinions of the State Council on Promoting the Reform, Opening and Steady Growth of Capital Markets was brought forward. On May 18, 2006, Regulations Concerning Administration of Initial Public Offerings and Listings of Shares was implemented and IPO was restarted. All of these policies led to fierce fluctuation in stock market. Therefore, the characteristic of 'policy market' can not be ignored in China's stock market. However, the effect of the shock on Shanghai and Shenzhen stock markets is decreasing. Table 5 shows that the statistics of volatility, such as mean, maximum and standard error, are decreasing after China's entry of the WTO. This indicates China's stock market is perfecting itself.

## Conclusions and Suggestions

AR-EGARCH-M model is utilized to test the characteristics of the volatility of the yield in China's stock market. Some meaningful conclusions we get are summerized as follows. (1) From the theory of risk premium's viewpoint, it shows that the speculation was decreasing and investors were becoming more and more rational; (2) China's stock market possesses the characteristic of 'Policy Market', but the effect is diminishing; (3) Similar to developed country's stock market, the volatility in China's stock market also exhibits the characteristics of asymmetry and quite longer persistence.

Since Shanghai Securities Exchange and Shenzhen Securities Exchange established in 1992, China's stock market has made tremendous progresses in the last decade. However, compared with developed countries' mature stock markets, there is still a big gap in trading system, investor's structure, quality of listed companies and the system of information disclosure, and so on. Besides, China's stock market has to face abstrusive problems, such as equity division reform, market opening-up and the combination of A share market and B share market. There is still a long way to promote China's stock market reform. In spite of these problems, based on the empirical test, this paper finds that Shanghai and Shenzhen stock market are experiencing fast development. The component of speculation is decreasing and investors' behavior is becoming more rational. The reform of China's stock market makes progress. Now, the reform needs to be continued on deepening the understanding of the stock market's development and providing the outer circumstance and policy supporting measures, such as training institutional investors, standardizing listed companies and perfecting rules of law.

### End Notes

To see the reason of volatility clustering, referring to Granger and Machina (2006).

<sup>2</sup>A day-of-the-week effect for a particular type of security exists if (1) the returns for that type of security are greater on some days of the week than others (a trading day effect), or (2) the returns on that security over a trading period are not proportional to the number of calendar days affected (a calendar day effect). Because returns for a given day are traditionally measured from the close of the previous trading day, Monday's returns would be computed from Friday's close to Monday's close, a period that includes three calendar days.

<sup>3</sup> Many literatures support the opinion that the-day-of-the-week effect is existed in China's stock market, such as Xue Jirui, Gu Lan (2000) and Chen, Kowk and Rui (2001).

<sup>4</sup> GARCH models' other estimated methods includes minimum distance and Markov Chain Monte Carlo (MCMC).

<sup>5</sup> To improve the accuracy and reliability, we performed LM test. At 10% significant level, all series do not reject the hypothesis that there is ARCH effect, i.e., ARCH effect is got rid of.

<sup>6</sup> Wang Yurong and Pan Hongyu (2003) performed EGARCH-M test on closing price of Shanghai Composite Index from May 21, 1991 to May 14, 2002 and the result they got was similar to this paper's opinion. The result indicated that there was no significant tradeoff relationship between risk and return in Shanghai stock market.

<sup>7</sup> Many existed literatures support the opinion, such as Bollerslev, Chou and Kroner (1992), Watanabe (2003) and so on.

<sup>8</sup> Referring to Crouhy and Rockinger (1997), Watanabe (2003), and so on.

<sup>9</sup> To see the reason of volatility's asymmetry, referring to Campbell and Hentschel (1992). They thought leverage effect or feedback effect could explain the phenomenon.

<sup>10</sup> Because trends of the volatility in Shanghai and Shenzhen stock markets are similar, Shanghai stock market's volatility trend is provided here.

# **Integrating Asian Polycontextual Assumptions to the Contemporary Managerial Frames: Trends and Transitions**

Samir Ranjan Chatterjee, [Samir.Chatterjee@cbs.curtin.edu.au](mailto:Samir.Chatterjee@cbs.curtin.edu.au)  
Curtin University of Technology, Perth, Australia

## **Abstract**

Globalization is changing the managerial architecture in corporations around the world. The dynamics of this change process has made it necessary for an urgent reexamination of the dominant concepts and practices of management around the world. Most significant contribution of this process may be the rise of a large number of new multinationals from India and China. While U.S., European and Japanese multinationals tended to spread managerial cultures with their unique administrative heritages, companies around the world harmonized upwards in drawing lessons from them in terms of better working practices, managerial visions, ethics and social and environmental responsibilities. The formidable array of skills of contemporary managerial frames in areas of market-related strategies, knowledge intensive work performance, innovation and enterprise may not be sufficient as emerging country multinationals begin to dominate the global scene. It is difficult to dispute that most of the global management knowledge today is dominated by European and North – American (ENA) business schools, scholars and practitioners.

## **Introduction**

This dominance is evidenced through university course curriculums, executive education programs, textbooks and the authors and their affiliations in leading scholarly management journals. It has been argued that about 100% of the leading management journals are published in ENA countries where acknowledgements of non ENA scholars are so rare. Management journals based in Asia may have significantly higher readership but are not recognized as top – tier scholarly outlets and therefore publication in such journals do not lead to support and recognition by the national funding bodies as well as university promotion systems in ENA countries. Most of the research in Asia, Latin America and Africa need to be indigenously contexted in order to be of value. In spite of their unique contributions they rarely draw the attention of the dominant managerial frames. As has been pointed out, “American – based research on organizations, especially research on behavior within them, has been largely U.S. domestic focused” (Porter, 1996. p262). Rigour is defined in terms of the use of quantitative methods and exploration of those variables that are easily quantifiable. The key point of this dominance of the margin is evident in the limitation of influence that research has in the global context. The essential distinction between *analytical* rigor and *descriptive* rigor is of particular relevance in the context of global domain.

Given the western domination in contemporary managerial paradigms, it is surprising that except for culturally contexted formulations on Japanese management, other Asian locations have yet to add value to the contemporary management knowledge. The stream of research on culture using the national context as an independent variable however uses the same theories and similar empirical measures and the area of comparative and international management are overused in simple replications of existing Western Theories. The central underpinning of ‘man’ from the perspective of needs, utilities, satisfaction and preferences leads to a world of ‘managerial hegemony’ with the legitimization of power of managers through the creation and perpetuation of culture, authority patterns, structure, strategies and processes. The question that needs a voice in challenging this domination is: Is the positivistic and scientific method relevant to the study of management from a global perspective?

### **Roots of Western Managerial Assumption**

The first victory of modern management method was signaled by Frederic Winslow Taylor in 1899 with his well known "Pig iron question". The successful raising of individual worker productivity to 45.75 tons of pig iron from 12.5 tons at a wage of \$1.85 per day at the Bethlehem Steel Company heralded the birth of contemporary management. Taylor was hailed as the hero of a new cause and management began as a distinct social function performed by a unique breed of men with special intellectual and behavioral levels in getting not so intelligent people to increase their productivity. He contended, "The science of handling pig iron is so great and amounts to so much that it is impossible for the man who is best suited to this type of work to understand the principles of this science, or even to work in accordance with these principles, without the aid of a man better educated than he is" (Stewart, 2006. p81). It is paradoxical that Taylor's scientific management was not based on any science. The forty percent "adjustment" he made to his ideal productivity achieved through his chosen ten Hungarian workers as model performers has never had any "scientific basis". When the study of lifting bars into rail carts was investigated by the US Congress, his defense of these adjustments was the importance of "managerial judgment", not scientific methods. This first victory therefore was not a positive one. "Taylorism, like much of management theory to come, is at its core collection of Quasi – religious dicta on the virtues of being good at what you do, ensconced in protective bubble of parables (otherwise known as case studies)". In spite of this, Taylor's pig iron story captured the imagination of the whole country as he was successful in generating a wide range of followership and acceptance by the U.S. establishment. His regular seminars at Harvard University were critical in the establishment of the famous Management School in 1908.

In his book titled "False Prophets: The Guru's who created Modern Management and why Their Ideas Are Bad for Business Today" Hoopes argue that the popularity of the impactful writer's of Management led more to the legitimization of immoral and anti – democratic practices of management and less to the values inherent in their concepts (Hoopes, 2003). He categorizes these Gurus's into two groups - *one with heart in the right place* (Mary Parker Follett, Edward Demming and Peter Drucker) and *those whose moral authority was questionable* (Frederick Taylor and Elton Mayo).

A popular management technique with global acceptance in recent years is the concept of balanced scorecard. The conceptual foundations of the Balanced Scorecard were built on the Quantitative Measurability of Organizational Performance on four dimensions of customer service, process management, knowledge generation and financial performance. However, the widespread use of the frame is not in accordance with the ideas of Kaplan and Norton. The aim of this management frame lies in the financial results emerging from the organizations dedicated to meeting four goals. But in most companies, the financial measures are now wrongly the input measures serving these goals (Kaplan and Norton, 1992).

The Search for the transforming concepts that energies the passive – obedient Taylorist employees into holistic partners of a human organization dominated the past three decades. Some of the leading proponents seeking such transformation, however, have not argued on the ideological foundations of the managerial practices. The central question of determining the role of 'human beings' in terms of their relationships with organizations cannot be answered through the conceptual masks of one society over the others. It is interesting how the Japanese managerial concepts and practices impacted on the rise of a new and influential genre of managerial writings around the theme of corporate culture. (Burrell & Morgan, 1979, Ouchi, 1981, Pascale & Athos, 1981, Peters and Waterman, 1982, Deal & Kennedy, 1982, Schein, 1985, Senge 1990). Most of the recent best sellers from these genre essentially revolve around the theme of corporate culture with terms like "shared values", "quality circles", "team development" etc. Until the 1960's, the managerial paradigms on meeting production and other performances but this was just an extension of Taylorism softened by a myriad of concepts around the behavior of individuals, groups and teams. The following decade saw the emphasis move away from making products in large volumes to a newer managerial culture where "creativity" and "initiative" of employees were encouraged. There were very few exceptions in these literatures in the conceptualization of the role of human beings in organizational settings. The 'human element' considered in the management literature over the past few decades is not a 'holistic' or 'global' in essence. The concepts mask the implications the "man" is a fragmented and soulless "instrument of profit" for the organization. As has been pointed out, "It is as if we need only call on this person and tell him or her that we earnestly want him or her to embrace the right culture and symbols, to join the team, and become a champion. It is as if there was no need to have a clearer idea of the reasons, events and circumstances that might bring about such a

metamorphosis. Obviously, such clarity can be gained only if we are willing to take the point of view of the employee who is, after all, the “human element” that these theories want to promote. Thus, it is necessary to construct a vision of the person other than that conveyed by the theoretical framework to be overcome” (Aktouf, 1992, p.411).

The dominant Western frames from the Tayloristic directness to the contemporary subtleties ignore the critical challenge of opening up of the managerial practices that ensures an “agricultural mindset” where the nurturing of the employees holistic and powerful energies results in his / her desire to belong and contribute to his / her work life in spite of economic, industrial, legal and other constraints. This is an anti –thesis of the dominant western managerial assumptions that an employee of an organization is “instrumental element” of the production / service generation and delivery. The answer to the narrow economism and the mask of human relations cannot be incremental reframing of this praxis – but in the search for an alternative paradigmatic canvass.

#### **Weakness of the Western Concepts**

Over the past decade, one of the refreshing voices within the dominant western managerial theories has been the intellectually challenging ideals of Sumantra Ghoshal. In his posthumously published paper, “Bad Management Theories Are Destroying Good Management Practices” and other papers he had presented a series of provocative and constructive thinking to challenge managers in building organizations as better places to work for greater good. (Ghoshal, 2005, Birkinshaw and Piramal, 2005). In Ghoshal’s view, most of the contemporary management assumptions and formulations were seriously flawed. He argued that bad theories being articulated by generations of University academics, and management trainers, and popular authors had a profound and damaging impact on managerial practices around the world. This, he argued, had led to the production of dysfunctional organizations with misguided governance systems, misplaced priorities and poor ethical compass. Western managerial ideas have neither served the shareholders nor created meaningful work environment for employees. Societies and economies around the world have suffered because of these bad theories. His critique of the force for good can be understood as, “If a theory assumes that the sun goes round the earth, it does not change what the sun actually does. So, if the theory is wrong, the truth is preserved for discovery by someone else. In contrast, a management theory if it gains sufficient currency – changes the behaviors of managers who start acting in accordance with the theory. A theory that assumes that people can behave opportunistically and draws its conclusions for managing people based on that assumption can induce managerial actions that are likely to enhance opportunistic behavior among people”. (Ghoshal, 2005 p.77)

In a word, Ghoshal was right. He was right in the sense that the dominant theoretical underpinning of the modern managerial frame accepted and popularized by scholars around the world is needs widening and enrichment. As Kanter maintained that it was the ‘demand side’ of the management theory that perpetuated the dominance of the Western Managerial tools and techniques. She suggests that the gloomy picture portrayed by Ghoshal was correct but it was mainly due to the demand for it rather than its supply. She asserts,” These theories corresponded to what looked like the triumph of capitalism over other economic systems. In 1989, Communism collapsed in Eastern Europe with the fall of the Berlin Wall, Asian financial markets deregulated; Latin America was looking for market reforms. Economics seemed to be more important than societies, as the public sector privatized and shrunk. American theories and theorists had disproportionate influence”. (Kanter, 2005, p.94).

Another long standing critic of the dominant U.S. Managerial frames from a very different point of view is an Australian academic, Donaldson, who has been advocating the creative contingency of context relevant realities as the answer to the problem of misguided management theories over a long period of time (Donaldson, 2002). His criticism of the institutional, population ecology, resource dependence, transaction costs and agency theories and the defence of activist managers have often been criticized as pro-capitalistic paradigms. However, the critical point he makes about the lack of relevance of these major theories in diverse contexts still remains instructive. The idea that an organization will perform better when their values, structures and strategies match the contextual imperatives cannot be disputed. His normative views about managerial competencies may not however be widely shared.

Other voices warning on the limitations of contemporary managerial frames are Henry Mintzberg, Charles Handy and Peter Drucker (Mintzberg 2004, Handy 1998, Drucker 1997) who have spent lifetimes in writing about the need for managerial ideals of the industrial society to be able to absorb and respond to post – industrial societies as they cross over to the knowledge and service economies. Handy explored the internal transformations needed at

every level in modern work organizations in his extensive writings. (Handy, 1998). It is clear that correct questions were being asked but somehow the answers have yet to emerge with global relevance. Drucker's ideas were based on family mentor and famous economist Schumpeter and on the minimalist role of Government. He contended that productivity in manufacturing and agriculture had increased fifty fold in the last century and growing still faster but they only employ less than one sixth of the US workforce. The challenge is that over the three fourths of workforce in most countries now are in the service and knowledge sector. However, the productivity and dignity of knowledge and service work still remains very low in the managerial concepts and practices (Beatty, 1988). The creation of a sustained argument about the role and purpose of managers and work organizations in such societies need to be based on a very different assumption about 'man and "essential purpose of economic success". A transformation of the dominant managerial model requires an integration of global perspectives not only in terms of polycontextuality of locations, but also time, institutions, developmental trajectory of societies.

#### **Japanese Case**

Japan is an interesting example of an Eastern Nation that embraced the western technology and market philosophies with considerable uniqueness. The preservation of many indigenous values while allowing the western thinking to sink into their organizational life may provide a new window. Since 1980's, western logical realm subordinating indigenous ethical, spiritual and aesthetics have been more widespread within Japan while its own managerial philosophies and techniques took the west by storm. As has been argued, "Westernization was somewhat like an impact item for Japan in the free marketplace of ideas. The issue may have been conditioned by external circumstances (most notably, the expansion of Western imperialist powers into Asian and the Pacific), but to some extent, at least the Japanese welcomes the imported product". (Kasulis, 1995, p.228).

Japanese experience may be extended to consider the following:

1. A global managerial framework blending the best of the west and the east can become sustainable without destroying the roots and rich indigenous traditions. The trends of western dominance appear to be taking a stronger hold as many companies abandon their life time employment policy to follow western style employment policies. The tradition of building market through extended '*nemawashi*' (social networking) platforms is no longer unquestionably employed.
2. The Asian (and certainly Japanese) philosophical tradition has opposed a 'single monolithic ontology'. The ideas of multiple truths of pluralism have always had a strong base.
3. The Japanese example of accepting science without embracing 'scientism' may provide an example for others. This positions a society away from "excessive order and structure" as well as "brittleness to outside dominance".
4. The interdependence of economic and business relations as globalization takes hold needs to extend to cultural, social, educational and other relations so that the hegemonic dominance of one over the other can be avoided. The idea of '*ordered flexibility*' has been a successful managerial positioning. The idea of maintaining order as well as embrace circumstance allows the 'core' and 'peripheral' identities to find an intelligent network.
5. Man's nature is undeniably social and community orientated and this has been one of the main traditions of Asia. In a private discussion, one of India's most celebrated management innovators Narayana Murthy reflected on the value of family bonding and enriching the workplace through social commitment as the single most feature sustaining Indian organizations (Chatterjee, 2005).
6. Evidence is available to indicate that for Japanese practices to work in overseas conditions, subjective experience, knowledge of the local context and the strategic motivations at every level need to be taken into account much more seriously (Taylor, 1999).
7. Over the past three decades, there has been an overemphasis of research linked to 'keiretsu' in the mainstream ENA research. The US based leading management journals would welcome scholarly papers incorporating any aspect of 'keiretsu' membership as part of their models while ignoring research exploring whether 'keiretsu' actually exist (Lynn, 2006).

#### **Incorporating Pan-Asian Contributions**

In order for the managerial ideas and ideals to have a global relevance, the action – focused and technique orientated modern managerial formulations may benefit by drawing on the reflective and contemplative civilization heritage of Asia. Exploration of the traditional roots of Asian civilization and the diversity in mindscapes for managers and their worlds began with the wider understanding of the Japanese mindscapes three decades ago (Maruyama, 1994).

Discussions on Japanese managerial mindscapes over the past decades and the Chinese traditional influences in recent years can be complemented significantly by a new investigation into the mindscapes shaped by the Indian wisdom tradition. There is a need for a pan-Asian alternative frame to integrate the ideals drawn from these three wisdom tradition and present itself as an alternative. 'Core' and 'peripheral' values of these three national contexts have exerted differential social control at both individual as well as organizational levels over a very long period of the past decades. The traditional Confucian values of 'kinship' have remained 'core' in the Chinese society for generations.

The traditional Indian 'core' values of reciprocal bonding of 'Sneha' and 'Sradha' discussed later in this paper is an example of such a long sustaining primary ethos of the Indian tradition. In recent years, a global relevance of the Asian heritage has mostly been attempted in terms of Confucianism over the past few decades. After decades of vilification not only by Chinese mainstream but also by Western observers, Confucianism has suddenly been in ascendancy. A large part of tradition in China, Korea, Japan, Vietnam and Singapore derive from Confucian heritage. A contrast to the wider discussion of the role of Confucian frame in the Asian context, the relevance of the Indian tradition has not received scholarly attention in the management literature. It may be of interest to note that the Meta physical literature of the ancient Indian tradition was not only concerned with deeper philosophical and spiritual issues of human values, but also dealt in details on the universal questions of individual behavior, models of social functioning, leadership and organizational governance.

Like the residual frames of Confucianism still dominating the managerial ideas for Chinese, Koreans, and Japanese and to some extent overseas Chinese, the Indian tradition had a strong secular foundation that continues to sustain the interpersonal world in Indian organizations. Like Confucian ideas, the rich Indian tradition focused on individual, community and broader society's commitment beyond narrow economic goals. These ideals provided rigid frames of discipline where individuals learned with the primary motivation to serve the community.

"Asia is the demographic, geographic and developmental future of business. Japan is the world's number two economy; China and India and numbers two and three in Asia. Before too long, half of the world's largest 500 firms will be headquartered in Asia. East Asia and the countries of China, Japan, South Korea, and Taiwan all deserve far more attention...." (Fruin, 2007, p.353). Asia represents about twenty percent of world economy and about forty percent of the world's population. Its emergence as an economic powerhouse, therefore, makes exploration of Asian perspectives in management more urgent. The recognition of the traditional roots of India and China in the managerial thinking worldwide can only benefit the contemporary managerial ideas. Economic reform and sustainability through imported ideas need to be grounded through the freshness of the ideas of generations.

The economic rise of Asia of the past decade and specially the (economic emergence of) China and India over the recent years has increasingly generated global attention to the managerial systems in Asia (Chatterjee and Nankervis, 2007). Despite Asia' diverse and sometimes conflicting trajectory into the world of contemporary business, there are sufficient similarities in geographic, historic and cultural characteristics. The extended family networks within and outside their respective countries have maintained a cohesive entrepreneurial spirit. A number of commentators on Asia have emphasized the potential contribution that Asia can make in developing managerial frameworks beyond the imperatives of narrow competitive strategies, profitability, efficiency or market domination (Dobbs-Hingginson, 1993; Mahubani, 2004). As Chinese and Indian companies show global aspirations through stunning foray into the economic world of business in the region and beyond as well as the imperatives of intellectual globalization draws global corporation into Asia, it is inevitable that lessons of Asian heritage may provide a significant broadening of contemporary managerial frames.

Cultural dimensions of Confucianism – dynamism popularized by Hofstede and Bond has dominated managerial thinking for the past two decades (Hofstede and Bond, 1998). It is now evident that such notion of explaining the complex and multi – faceted roots contributing to Asian work settings needs a much broader perspective than the dimension of long and short terms orientations. The dichotomization of 'long' and 'short' terms may not adequately explain viewing 'time' as cyclical and repetitive where past, present and future coalesce people's behavior as they interpret the world around them. Most of large and small economic organizations in Asia have embraced formal principles and practices of modern managerial culture while the unseen world within these organizations is deeply embedded to the reasoning and intuitive understandings of their respective settings.

Recent decades have witnessed an acceleration of isomorphic acceptance of western managerial values around the world. Amongst the myriad of reasons including joint-ventures, global technological regime, global industry culture, supply-chain networks (for example, the rise of auto parts industry in India over the past decade have seen a techno-managerial isomorphism). “The much cited examples of McDonald’s or Coke hide the fact that most multi national corporations, even when they adopt their products to local tastes, introduce management practices that are the same all over the world. More importantly, because they are the dominant players, they are models generally emulated by most firms in developing countries” (Hafsi and Farashahi, 2005 p. 499). The pan-Asian wisdom may be symbolized as agricultural model where planting of seeds, protection from extreme climatic conditions, fertilizing, watering lead to the harvest. This is a very different approach to the hunting culture where the shooting of the wild game becomes the strategic intent.

This paper argues that the experiences of multinational companies operating across the world should have generated a ‘reverse isomorphism’ and established a countervailing effect on the dominant managerial frames. If the discipline of management is to make a global contribution, it needs to be anchored explicitly on the set of core and peripheral foci across countries (figure 1). At a minimum, the figure explores the cross-verging balances needed in four key areas of managerial attention.

Figure 1 summarizes the key themes of this presentation. The two dimensions of Holistic Emphasis and Polycontextual priorities are overlapped to generate four areas where the priorities of the alternative framework need to focus. The relevance seeking a global frame highlights the process of corporate transformation that involves building multi-directional priorities and capabilities. Success and performance in the new paradigm are defined largely in terms of its sustainability. It is surprising how many scholars and practitioners have considered brilliant marketing strategies while not grasping the elementary principles of community, communication and society. The pillars of success in management practices beginning with Taylor were built on having resources or technology while the pillars of success for tomorrow are knowledge and the people who have the dreams.

The contributions from Asia to the dominant managerial frames are therefore, in terms of scale, diversity, values. The development of such knowledge and dreams depends on a culturally endorsed organic knowledge creation. Such knowledge flow can enrich and empower not only the managerial world but also the world management as new corporate language and symbols. Transnational social and educational network building through conferences such as this facilitate not only the flow of knowledge, but also the network essential. The more the momentum for globalization occurs, more is the need to complement it with contextual inheritance of ‘core’ assumptions and identity. The cognitive skills of conceptual understanding, reasoning and openness to the world complemented by the roots of tradition create a global mindset that empowers the ability to overcome ethnocentric narrowness (Chatterjee, 2005).

## **Blending the Best of West & East**

A central concern in management of work organizations need to be the search for variables that can be generalized not only at the technical micro or strategic meso levels but also at the macro societal wisdom levels. In physics, chemistry or biology, the scholars need to be totally objective across these levels while in disciplines like management, the subjective domains of people, values and tradition are the central areas of concern. The challenges of generalizability across nations in management therefore are much more complex as no models of management function can remain unaffected by the contingent imperatives of locality. The “context-embedded and context-specific” societal variables need to be understood in searching for managerial level variables as well as “context-free” variables may not be so readily generalizable (Rosenweig, 1994, Cheng, 1994). Based on the management extend theories and research practiced and preached in universities around the world.

This is an exciting opportunity for global scholars in management as Indian and Chinese companies are adopting the goals of extending their operational boundaries with wisdom drawn from their societal traditions. The increasing disquiet about the impact of economic globalization and the critical role of global companies can be answered not by making the same managerial mistakes as their predecessors from the west few decades ago. These new global champions can only become history builders if they can leverage their societal wisdom in practical

managerial challenges by seeking sustainability, social harmony, creative inclusiveness, network building and commitments to social responsibility. Dominance of western managerial logic should not be the managerial frames of global companies from Asia. As has been suggested, “The best universities in the U.S., Australia, the U.K., and to some extent continental Europe are populated with many Asians. Some of the best and brightest have stayed, others have returned home. If cleverly exploited, this group can be an enormous advantage to a global corporation. Those who have stayed overseas form a potential network of allies. The ones that have returned bring home potentially a vast wealth of know-how about foreign markets and culture, but prerequisite to leveraging this potential advantage is an appreciation that today it is knowledge and values, not just resources that will be decisive in future global competitive battles” (Meyer, et al 2005, p. 14).

Asia houses about two-thirds of the world’s population and unlike the west majority of Asians are less than thirty years of age. With the rise in Asia’s stature as the economic hub of the world, it is hardly surprising that management education draws the best talents in Asia. It is in this context that the new generation of managers in Asia needs to be able to create a major impact upon the architecture of long-term and relevant management knowledge. The idea of imparting immediately usable skills to management students through specialized courses need to be resisted with increasing devotion to the development of theories that are relevant in a polycontextual setting. As Asian economical progress, business will be increasingly focusing on the short-term and technique orientation. Management scholars need to work together to increase the tolerance for theories that are relevant in polycontextual settings.

# **Effective Management Change Through Change of Company Culture: A Case Study on Cerebos Pacific Limited in Asia**

*Loretta B.Y. Lau, msloretta@polyu.edu.hk  
Ricky Y. K. Chan, msricky@polyu.edu.hk  
Hong Kong Polytechnic University, Hong Kong*

## **Abstract**

**This case study depicts how Cerebos Asia envisioned the need to be proactive in facing the competitive challenges of the 21<sup>st</sup> century and subsequently planned for a total revamp of the company's organization structure to gear towards customer focus and the practice of CRM.**

## **Introduction**

At the end of the millennium, the health (therapeutic and functional) supplement and energy supplement market was valued at US\$100 billion in Asia and had been growing at double digit rate as consumer health consciousness across Asia increased with consumers (particularly the middle class) becoming more affluent and knowledgeable about health issues. The wide range of health supplements catered for different consumption purposes from general health maintenance, building up body resistance, to recuperation from sickness, restoration of physical and/or mental energy and was available in many different product forms and packagings e.g. multi vitamin pills, protein supplement, fiber supplement, royal jelly, bee pollen, cod liver oil, Korean ginseng, American ginseng, essence of chicken, bird's nest, etc.

## **Competitive Landscape of the Health and Energy Supplement Market**

Cerebos Pacific Ltd. marketed in Asia a range of energy health supplement in the form of chicken extract under the brand name of Brand's® Essence of Chicken. The brand's product positioning over the past fifty years had been single mindedly focused on the benefit of physical and mental energy replenishment leveraging on the traditional Chinese belief that regular consumption of double boiled chicken soup delivers the best "bu" (Chinese word "补" meaning "support") to the body which helped improve long term health. Brand's® Essence of Chicken therefore provided consumers with a convenient (since making double boiled chicken soup at home kitchen required at least 4-6 hours of cooking) one shot RTD energy supplement (in a 2.5 oz glass bottle retailing at US\$2/bottle) which provided immediate replenishment of physical and mental energy as it was a pure and natural chicken extract with no artificial preservative or active ingredients.

Competition in the energy supplement was keen and there were some major brands like Lucozade (glucose RTD by Beecham), Centrum (multi-vitamins), Paolyta B and Red Bull (both instant energy drink laced with caffeine and taurine) with huge advertising support while competitive brands in the essence of chicken category were few. Hence, Brand's® Essence of Chicken (BEC) dominated most of the markets in Asia with over 50% market share in the energy supplement category and over 90% in the essence of chicken category. BEC's dominant market position in the energy supplement category was primarily because of its brand heritage, credibility in its product efficacy and 100% natural claim versus competition (mostly artificial concoctions) which blended in well with the traditional Chinese belief in the goodness of chicken. This dominance however changed in 1996 when President Group (one of the biggest conglomerates in Taiwan which was also the 7-Eleven franchisee with over 4,000 outlets islandwide there) launched an essence of chicken product called President's Essence of Chicken (PEOC) and within a year captured almost 20% of the BEC market share in Taiwan. This rang a major alarm to the Cerebos Pacific management as they realized for the first time that BEC was not as invulnerable as they thought despite the strong brand equity that the company had built successfully across Asia in the past fifty years. What was

ironic was that President's Essence of Chicken was not made from real chicken but from cheap chicken powder imported from US which delivered a cost advantage to President. President's ability to make such speedy inroad to BEC's consumer franchise was therefore due to this cost advantage which allowed them to plough back the saving to ATL advertising support as well as reduce the price to consumer by as much as 20% versus BEC's, not to mention its existing channel of 4,000+ 7-Elevens islandwide. Apparently there were consumers who did not see much difference between two brands of essence of chicken as they were made from chicken anyway. In other words, the differentiation of the two brands was difficult to be perceived.

## **Company History of Cerebos**

Cerebos Pacific Limited traced its name to 1892 when a French chemical engineer decided to mix phosphate with salt and invented dry-pouring salt.

The brand name "Cerebos" was registered – derived from "Ceres" for the Roman goddess of wheat harvest, and "os" from the French word for "bone" that the phosphates in salt strengthen.

Cerebos subsequently grew to include a wide range of food products acquiring Brand & Company in 1959 but was in turn acquired by Rank Hovis McDougall PLC (RHM) of United Kingdom in 1968.

The modern history of Cerebos thus began in 1981 in Singapore when Cerebos Pacific Ltd. was formed and bought over all RHM subsidiaries in the Far East in 1982 and itself being subsequently acquired by Suntory Ltd, Japan in 1991. Listed on the Singapore stock exchange since 1983, Cerebos was now a leading food company with its corporate headquarters in Singapore and provided management services to subsidiary and associate companies in the Asia Pacific. Its flagship product, Brand's® Essence of Chicken was the category leader. Its main markets were Thailand, Taiwan, Singapore, Malaysia, HK and China. More than 100 million bottles of Brand's products were sold in 1998. In Australasia, Cerebos' products included gravies, sauces, coffee and cooking aids marketed under established brand names including Fountain, Gravox, Robert Harris and Greggs

## **History of Brand's® Essence of Chicken RTD Health Supplement**

Brand's® Essence of Chicken was invented way back in 1835, by a chef to the British Royal family named H. W. Brand who worked in Buckingham Palace during the reign of King George IV. Concerned about the ailing King's health, Mr. Brand decided to improve on the age-old chicken soup remedy by creating a fat-free, easily digested chicken consommé. This was the very first batch of Brand's® Essence of Chicken (BEC).

In the 1920s, the first shipments of BEC arrived in Asia and quickly became one of the most popular health supplements among British expatriates as well as ethnic Chinese communities across Asia. Part of the reason why BEC caught on so fast was its similarity to the Chinese's double-boiled chicken essence, widely used for centuries as a health tonic. But, BEC was even healthier because it was completely fat-free, unlike grandmother's chicken soup. People also liked the similarities between BEC and traditional Asian medicine since both use 100% natural ingredients to maintain health.

BEC was also convenient to consume as it could be drunk straight from the bottle at either room temperature, chilled or warmed versus home made double boiled chicken soup which usually required 4-6 hours of preparation:- the chicken was placed in a small pot. The pot was sealed and placed into a larger pot with boiling water. The indirect heat kept the contents hot but just under the boiling point. This temperature and pressure control resulted in a thick, rich and healthy concentrate of chicken extract.

BEC was completely fat free while there was a high percentage of fat, even after skimming, in the home made double boiled chicken soup.

## **Meeting Competitive Challenges by Building a Customer Focused (Yeung et al, 2007) Organization**

Brand's® Essence of Chicken range of energy supplements had historically been the key contributor to both substantial sales and profit (EBITDA) of the total Cerebos group accounted for 49% and 72% respectively since acquisition by Suntory. This was obviously both a strength and a weakness for a company to depend so much on one single product line. Although sales and profit had grown by double digits in the last 5 years, in 1997 Cerebos saw the first drop in sales and profit decline due to competitive encroachment which indicated clearly an urgent need to keep abreast of consumer trend, develop new products to remain competitive (McGraw-Hill, 2007) in order to address these health needs. It was an important strategy therefore for Cerebos to be able to retain its current consumer base and at the same time recruit new users to its existing product portfolio/NPD. However, despite increased R&D support from parent company Suntory (which had 200 Ph.Ds alone in their R&D center in Japan), new product launches in the past 5 years had been slow and negligible. Acquisitions had also not been aggressive with only two companies in the table sauce category (with very thin gross margins) being acquired in the last 5 years. The CEO of Cerebos Pacific Ltd. realized, after studying the internal organization structure and the existing culture together with the VP Corporate Planning, realized that Cerebos Pacific had the organizational characteristics of being a "Defender" and it should move on to become a "Prospector" (as defined in Miles & Snow's Strategy Profiles and Kotler's and Keller, 2007) and that one of the key issues was the lack of customer focus culture in the current organization and in order to re-establish Cerebos' healthy growth trend in the health supplement category, there was a real need to redefine the key role of the company as one of excel in customer focus to avoid consumer switching intention (Anton et al, 2007). As such, the following issues were identified:

1. Cerebos' sales and profit contribution depended heavily on one single product line viz. Brand's® Essence of Chicken;
2. The company had limited experience against multinational retail power since it used distributors across Asia instead of utilizing its own sales forces hence heavily dependent on distributors' information & performance;
3. Poor marketing information system due to lack of commitment to customer focus(Gulati, 2007 Penttinen and Palmer, 2007).
4. Lack of empowerment to local leaders due to the functional reporting structure but at the same time lack of strategic direction from corporate head office;
5. Lack of group wide management system and HR policy that would focus employees to CRM( Hoboken, 2007)
6. Lack of resource utilization

In a nutshell, the CEO summarized the problems with Cerebos as being 'a company getting "moldy"' caused by a lack of vision from the previous top management resulting in unfocused strategy (limited business portfolio, delay in strategic business development) and weak in innovation (unchanged image of traditional product leading to less differentiation from competitors). This resulted in the limited growth potential as seen by the investors and reflected in fall of share price from US\$1.80/share in 1997 to US\$0.25/share in 1999. Unless the company could re-engineer its culture to become customer focused very quickly and innovate with new products, he felt that the chances of survival of the company by depending on basically a single product or SKU viz. BEC would be minimal (*Step 1 of Kotter's 8-step transformation: establish a sense of urgency*)

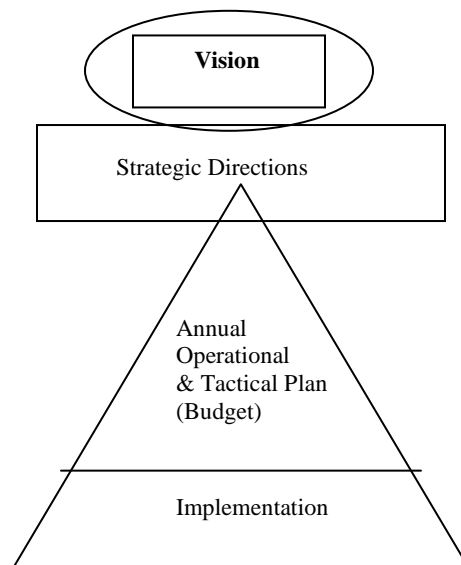

### **Cerebos Restructured: Summer 1998 Adopting Kotter's 8-step Process**

To achieve the above, Cerebos could use a combination of Theories E and O to change its corporate culture and develop human capability through individual & organizational learning (*HBR May June 2000: Cracking the Code of Change by Michael Beer and Nitin Nohria*). The goal as agreed was to transform the company itself to a value creating company focusing on customers by following the guideline as laid down in John P. Kotter's 8 necessary steps (*HBR March-April 1995: Leading Change: Why Transformation Efforts Fail*) for the effective implementation of such critical restructuring/re-engineering program viz.

"1. Establish a Sense of Urgency;

2. Form a Powerful Coalition;
3. Create A Vision;
4. Communicate the Vision;
5. Empower Others to Act on the Vision;
6. Plan for and Create Short-Term Wins;
7. Consolidate Improvements and Produce Still More Change;
8. Institutionalize New Approaches”

As well, the development of a common vision (as shown below) of the company was crucial in that it would a) define strategic focus of the company; b) unify focal point of effort; c) stimulate progress; d) energize people and e) create momentum.

The vision created (*Step 2 of Kotter’s 8-step transformation*) was therefore to be a leading consumer food products organization in the Asia-Pacific Region by creating value for customers, shareholders and employees.

Creating value for our customers meant:

- a) enhancing and enriching their lifestyles with Cerebos’ products;
- b) providing them always with high quality and value for money products
- c) appreciating and meeting their needs and wants

Creating value for our shareholders meant:

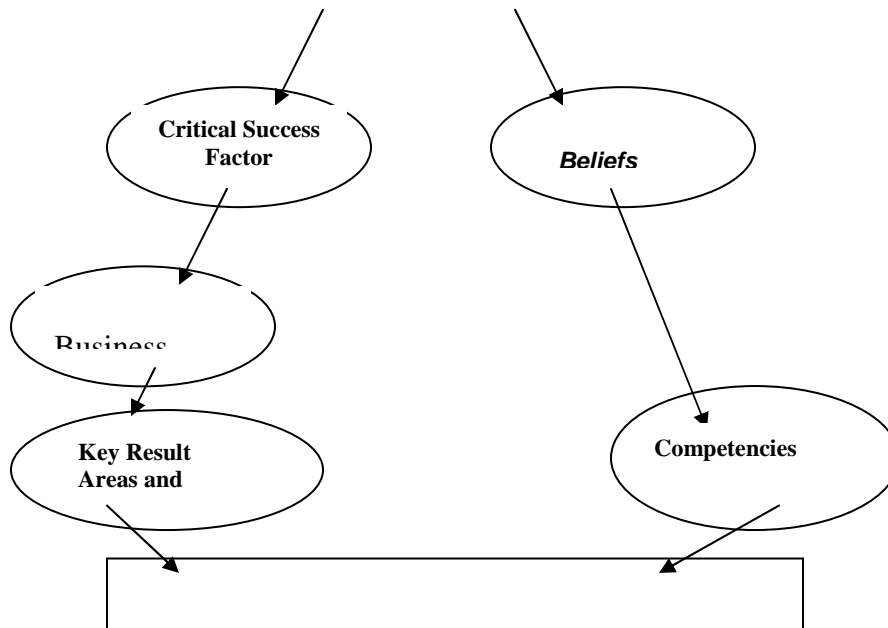

- a) increasing the long term value of shareholders’ equity;
- b) ensuring fair returns to them;
- c) reinvesting earnings wisely and prudently for long term growth

Creating value for our employees meant:

- a) empowering them with the authority to make decisions in their work
- b) encouraging and offering opportunities for continual improvement in their personal growth, career development and work

The new company vision will cascade downwards translating into a strategic road map for the company and ultimately reflected in the new performance management system that would tie in with the key customer focus matrix:

There would be four critical success factors for Cerebos:

- a. Appreciate and satisfy customer expectations
  - i. Creating value for Cerebos' customers
- b. Enhance R&D practices in support of marketing efforts (connecting the backend with the front end)
  - i. Creating value for Cerebos' customers
- c. Increase efficiency by integrating Economic Value Added (EVA®) into business systems
  - i. Creating value for Cerebos' shareholders, customers and employees
- d. Attract, develop, motivate and retain quality employees
  - i. Creating value for Cerebos' employees

It was believed that creating value for Cerebos' customers would create value for the company and the employees and ultimately create value for the shareholders.

The four beliefs for Cerebos will be:

- Customer Focus
  - i. Understanding and meeting the needs and wants of both internal and external customers
- Empowerment (*Step 5 of Kotter's 8-step transformation – Empower Others to Act on the Vision*)
  - i. Creating a sense of ownership by providing clear objectives, control of resources, responsibility and coaching
- Constant Improvement (*Step 7 of Kotter's 8-step transformation – Consolidate Improvements and Produce Still More Change*)
  - i. Continuously challenging employees' potentials to explore and seek better ways to do their work
- Innovation (*also Step 7 of Kotter's 8-step transformation*)
  - i. Developing creative ideas and improvements to the company's products and processes

**Top 3 Priorities of Cerebos Group were:**

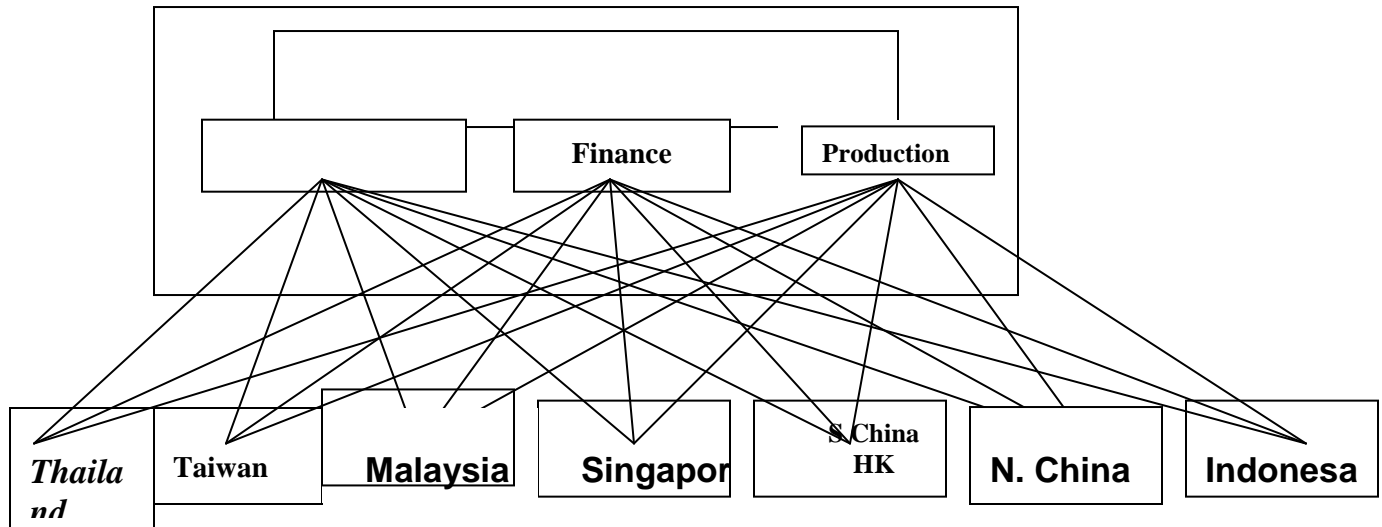

Reformation of Group Structure, Management System

Revitalization of Brand's business

Restructuring of loss-making operation & investment

**Reengineering to bring about Customer Focus Initiative**

The existing organization structure of the Cerebos Asia Division which was the business unit responsible for Brand's® Essence of Chicken in Asia was in a matrix form:

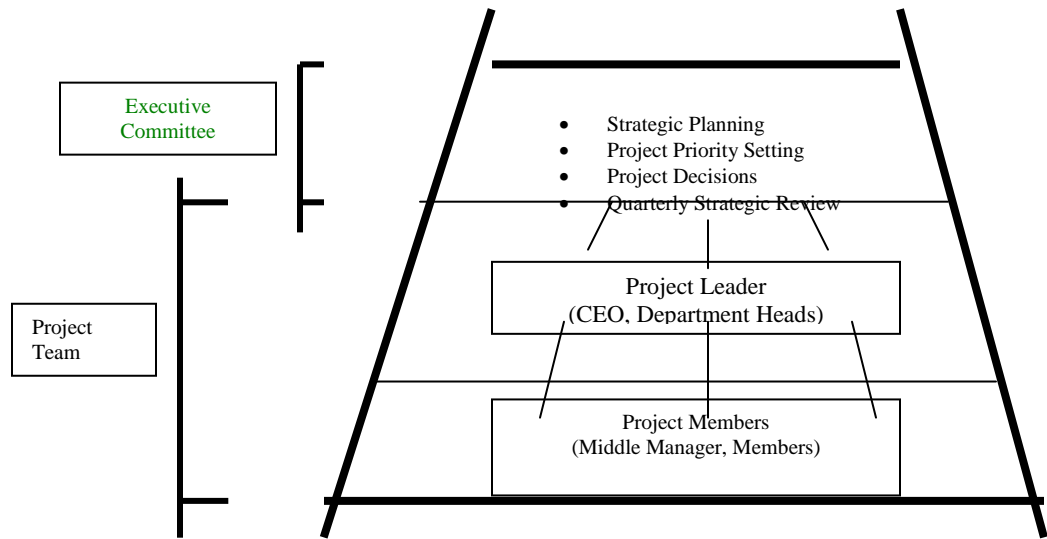

With the matrix organizational design in the Cerebos Asia Division as shown above, it was found that:

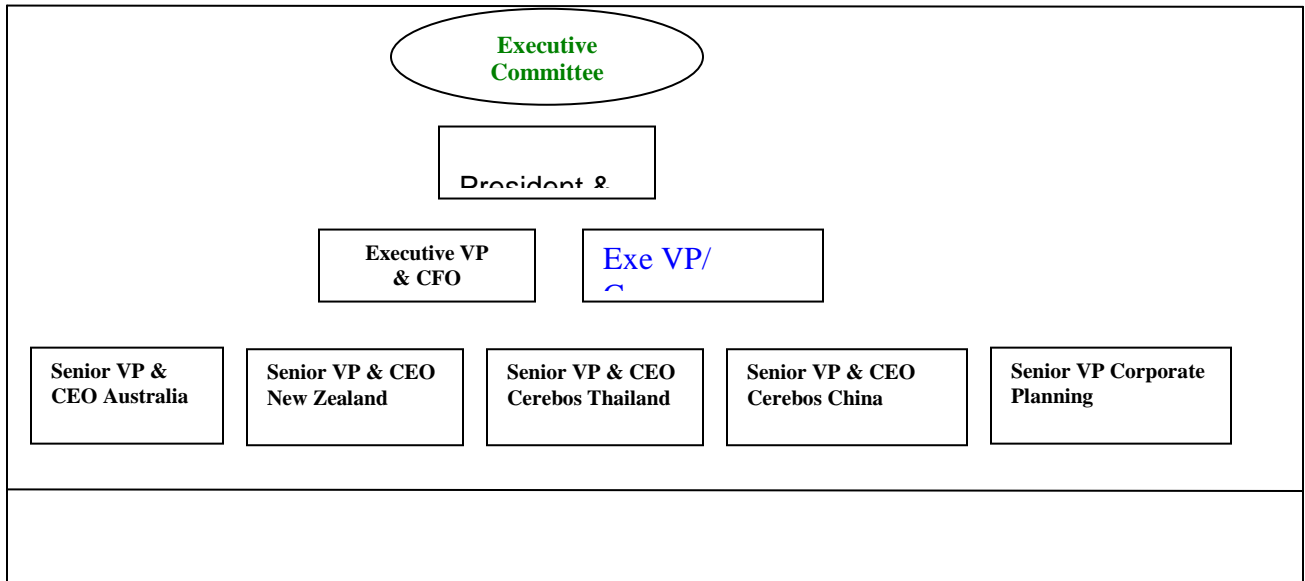

- Functional difference between local markets and Regional Marketing Department (RMD) was unclear
  - RMD was only supporting, monitoring and coordinating
  - RMD had no initiative to create fundamental strategy
  - No brand management function
- Flat structure within RMD caused lack of communication and integration
  - Only GM had full knowledge of everything
  - Integration/joint effort among functions within division was difficult
- Financial performance was not monitored/evaluated in RMD
  - Only Regional Finance Director had full access to overall financial status of the whole region
- Inefficient information system harmed both local/RMD performances
  - Info flow from distributors/local markets was not smooth
  - Consumer info was difficult to access

To facilitate local empowerment (as embodied in Quinn and Spreitzer's "Road to Empowerment") and commitment to customer focus, it was proposed to implement the following new organization structure

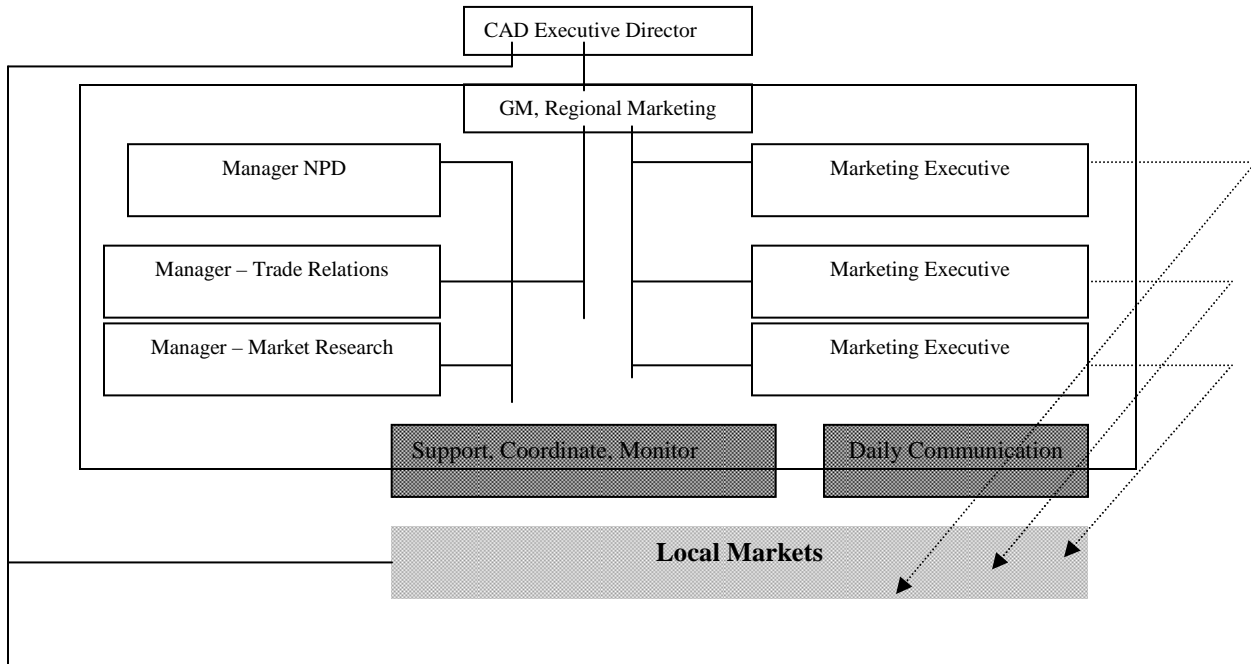

**Executive Committee**

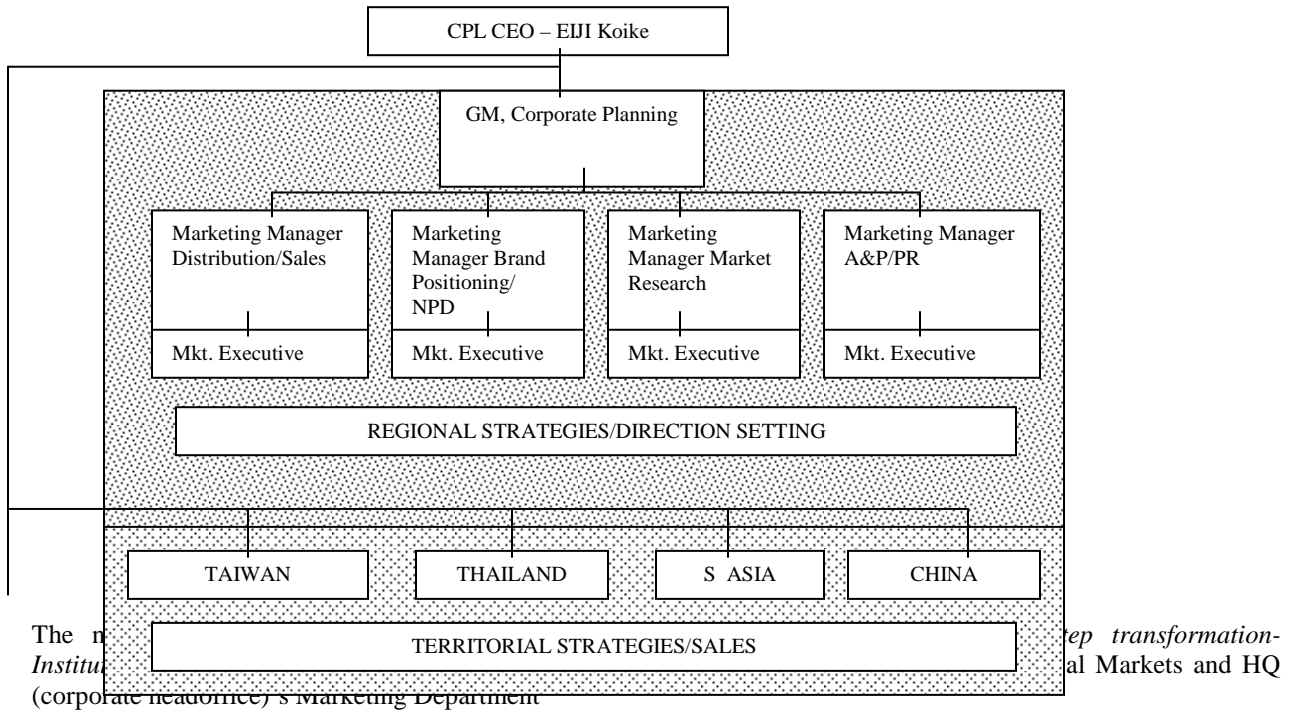

### Previous Cerebos Asia Division's Organization

**New CPL Organization to replace the previous CAD Organization above**

- Local Markets
  - Territorial strategies
  - Sales/profit center function
  - Tactical & operational issues
  - Trade relations & production control
- HQ Marketing Department
  - Regional strategy & direction setting
    - Re-construct product portfolio
    - Refine marketing mix
    - Establish brand management scheme
    - Build up long-term distribution strategy
    - Set the direction for overall A&P strategy
    - Initiate more sophisticated consumer marketing research to help strategic decision making
  - Standardization & implementation of production & system
    - Establish methods to measure customer satisfaction
    - Construct efficient & sophisticated marketing information system
    - Refine internal procedures for NPD, A&P, Sales tracking, etc.
    - Standardize various manuals for better product management/customer service
  - Spearhead group wide issues & project
    - Participate and contribute to projects/task forces for better group management

- Monitor and track territory marketing performance
  - Establish efficient ways to track performance through new MIS & procedures

In the words of the VP Corporate Planning, the whole re-organization was really “going back to basic” to “face the reality”

Back to basic meant the need to establish Customer Focused Marketing Mind; minimize the reliance on distributors’ marketing service function; planning, action, review based on meaningful data, information, research; focus on the flagship brand BEC before moving on to aggressive NPD programs

Face the reality was to understand the previous organization’s lack of structure, system, procedure for effective marketing activities and Cerebos had made mistake by aggressively hunting for expansion (company/product/territory) without the basic marketing infrastructure and the accompanying corporate culture.

In this respect, the right Process for Identifying, Developing & Retaining Customers needed to be implemented per following objectives

- Understand Markets & Customers
  - Understand the market environment
  - Understand customers’ wants & needs
  - Segment customers
- Involve Customers in the Design of Products & Services
  - Develop new concepts and plans for products & services
  - Design, build & evaluate prototypes
  - Refine & customize products & services, then test their effectiveness
- Market & Sell Products & Services
  - Secure channels of distribution
  - Establish pricing
  - Develop advertising & promotion strategies
  - Develop & deploy a sales force
  - Process orders
  - Develop customers
- Involve Customers in the Delivery of Products & Services
  - Offer broad delivery options to become the “supplier of choice”
  - Use delivery customization to attract & retain core customers
  - Identify customers’ delivery needs
  - Develop distribution capability
- Provide Customer Service
  - Establish “points of contact” excellence
  - Build cross-functional “points of contact” cooperation
  - Train employees to improve customers’ expectations for products & services
- Manage Customer Information
  - Build customer profile
  - Establish service information
  - Measure customer performance & satisfaction

To be able to implement the above process smoothly, a new group wide Performance Management System geared to customer focus was also developed:

- Individual performance targets linked to organizational objectives
  - Linked to vision
  - Linked to Critical Success Factors and Belief
  - Linked to Business Plan

***Business Plans for “New” Cerebos were therefore drawn up with Priority on Customer Focus*** (step 6 of Kotter’s 8-step transformation: Plan for and Create Short-Term Wins)

- *Complete review of consumers’ profiles*
- Innovative & diversified marketing approach by country
- Establish distinct marketing competency to distributors & competitors
- Strengthen R&D to be synchronized with marketing to connect the backend with the front end with HQ Marketing Department being the pivot point

## **Conclusion**

“The biggest challenge was to secure the buy-in from the employees despite the implementation of a Performance Management System that linked incentives to achievement of customer focus targets (which was in essence a change in the culture of rewards and punishments)” The CEO spoke to the reporter of CNBC Business Leader of Asia TV program of the Sony 3 CCD TV Camera in the Singapore TV studio in the spring of 2001, reflecting on the progress of the organization restructure after securing Suntory board approval back in the spring of 1998. “The structuring of Performance Management System around the customer focus matrix facilitates acceptance but the key to success of the promulgation of the new company vision has to be attributed to “effective communication” whereby the whole vision and strategic road map down to the business plan linked to a new performance management system are clearly communicated and cascaded to all levels of the company

This communication of the vision is very critical to the success of the whole change management process and as such right at the beginning Phase One, we have organized a series of group meetings attended by management staff across territories, the purposes of which were a) to stimulate the participants’ thinking and interest in effecting the necessary changes; b) provide opportunities for the employees to participate in the actual change management process.

Moreover, to implement the concept of empowerment and to facilitate true understanding by the management staff of what empowerment really meant, a copy of the book “ZAPP: *The Lightning of Empowerment: How to improve Productivity, Quality and Employee Satisfaction*” (by Jeff Cox & William Byham) was given to each individual manager as required reading prior to participation of the group meeting. Effective communication of the new company vision and culture resulted in dramatic improvement in more customer focused based marketing programs as well as a distinct shift in positioning of Brand’s Essence of Chicken towards a health maintenance platform (*Appendix IV – new BEC print ad with new positioning of health maintenance*) from the previous energy replenishment platform .

We have also started line extending to other Chinese herb based natural health supplements developed by Suntory R&D using consumer feedback acquired by local markets and analyzed by our HQ Marketing Department.”

“We see our market shares across Asia stabilized and started back on an upward growing trend and we also see encouraging consumer off takes from our new products launched in test markets like Taiwan and HK” (*Step 6 of Kotter’s 8-step transformation – Plan for and Create Short-Term Wins*) concluded the CEO.

“We are now onto the next phase of improving further our customer focus by moving on to CRM which I envisaged will take at least a year to perfect. I am confident that we will achieve what other companies have failed since we have the past experience of re-engineering a company and managing the change process successfully and we have, as Japanese, the patience. We also understand the success of CRM will depend on creating a customer strategy which we have now in place. If we meet again one year from now, I am sure I will be able to report to you a happy conclusion!”

The Anchor Woman and Reporter of the TV program, replied “I am sure we will meet again next year to talk about Cerebos’ success story. Already we know Cerebos Pacific has been voted one of the best 100 Asian companies by Asia, Inc. magazine in Year 2000 and we are very happy to share this great news.....”

The story of Cerebos Pacific’s quest for continuous improvement in customer force does not end here. The result of its next phase of CRM implementation remains to be assessed.

# The Use of Non-cash and Informal Compensation in Thailand: A Case Study of Five Companies

Pattarin Adithipyangkul, [padithip@cityu.edu.hk](mailto:padithip@cityu.edu.hk)  
City University of Hong Kong, Hong Kong

## Abstract

Much prior economic research addresses executive compensation in large US public companies. Less is known about compensation for lower-level employees and for smaller, private, or non-US companies. This paper describes compensation practices in 5 Thai companies of various sizes and industries. In addition to cash compensation and fringe benefits, which are paid formally according to employment contract or company policy, some employees receive informal payment. While formal cash compensation is more significant in terms of the amount of payment, non-cash and informal compensation play an important role in shaping employee behaviour. The findings suggest that in addition to how much to pay, we should also consider the composition of compensation packages and the payment method (formal or informal). The case studies also suggest that human resource problems (in addition to shirking) which are traditionally solved by monitoring and penalty can better be solved by proper compensation design.

## Introduction

Human resource experts stress the importance of non-cash compensation in recruiting and retaining employees (Healey, 1998; De Young, 2000). Articles in practitioner's magazine report the use of non-cash compensation like luxurious cars, allowing employees to bring pets to work, telecommuting, concierge service, the companies' own products, etc. (Fenn, 1995; Healey, 1998; De Young, 2000; Vogt, 2005). Google, for example, offers excellent maternity benefits, healthy free lunches and dinners, company pool room, low-cost daycare, laundry and dry-cleaning services, massage therapy, health services, and gym facility (Anonymous, 2002). According to the executive interviewed in those articles, all the incremental compensation expenses make employees satisfied, resulting in lower turnover and hence associated costs. Most of the prior compensation literature in accounting and finance, however, investigates empirically and theoretically the use of formal cash compensation in businesses. Less is known about compensation practices in Asia and about non-cash compensation. Very little is known about informal compensation – the additional compensation, apart from the one paid according to employment contracts, company charter, or company policy.

The purpose of this paper is to describe the use of non-cash and informal compensation in Asian settings (south-east Asia in particular). The paper explores why an employer pays in terms of goods or services rather than cash, and why pays informally rather than formally. A case study of five Thai companies shows that employers pay in terms of good to exploit a cost advantage (from providing the goods to a large number of employees or from access to low-cost wholesale suppliers), to better recruit and retain employees, to comply by the law, and to enhance production. Informal compensation is paid because it is more flexible (easier to change) and because it gives the payer some influence or power over the payee. The cases illustrate how the companies studied creatively and intelligently use non-cash and informal compensation to solve employee misbehaviors.

Traditional agency literature focuses on hidden action problem – employees are self-interested and we cannot observe employee's action or work effort perfectly. Compensation contracts are designed to deter shirking. The use of compensation design to solve other employee deviant problems is not yet thoroughly investigated. The case findings suggest that proper compensation design may be superior to monitoring and punishment in mitigating employee misbehaviors.

## Literature Review

Non-cash compensation is used increasing in western countries (Hashimoto, 2000; Dale-Olsen, 2006). Economic researchers discuss various benefits of non-cash compensation: (i) an economy of scale from providing goods or services to a large number of employees, (ii) tax benefits, and (iii) productivity - the beneficial effects of consumption of a certain good (e.g. education) on production (Long & Scott, 1982; Rosen, 2000; Rajan & Wulf, 2006; Oyer, 2006). Empirical evidence tells a consistent story. Oyer (2006) find a firm is more likely to pay in terms of goods when it has a cost advantage (an economy of scale or ability to acquire the good at a lower cost), when the goods (e.g. meal and child care) help reduce disutility from working, when an employee pays income tax at a higher rate, and when an employee has higher preference for the good. Dale-Olsen (2006) finds that a company tends to pay in terms of goods or services when it can exploit an economy of scale and that fringe benefits improve production outcome. Furthermore, the author finds that the number of fringe benefits provided is decreasing in the labor supply and that the probability that an employee leaves the firm is negatively associated with the value of fringe benefits, implying that firms pay in terms of good to attract job applicants and to retain employees. Rajan and Wulf (2006) focus on executive compensation. They find that firms are more likely to pay in terms of goods when the goods benefit production more, and when the income tax rate is higher. Also, a firm with more organizational hierarchies is more likely to allow executive personal use of corporate jets, implying that some perks are paid to convey a high social status to the payee.

Contrary to the above studies, some researchers argue that allowing perquisites, especially for executives, can be undesirable. Jensen and Meckling (1976) addresses perk over-consumption problems. Since perk consumption is more difficult to monitor, self-interested executives may over indulge themselves in perks at the expense of shareholders. Anecdotal evidence can be seen in the press from time to time. Yermack (2006) provides empirical evidence. He finds negative abnormal stock returns when the firms first disclosed the CEO's personal use of a company aircraft in an event study. While Rajan and Wulf (2006) finds that a firm is more likely to have a corporate jet when the jet is more productive (e.g. when the firm is located farther from convenient airports), Yermack (2006) finds that the cost of personal aircraft use is strongly positively associated with an indicator whether the CEO belongs to a long-distance golf club.

As for analytical works on non-cash compensation, Marino and Zábojník (2004), Marino and Zábojník (2006), and Adithipyangkul and Feltham (2006) characterize the optimal use of non-cash compensation in a setting with agency problems.

In addition to the remuneration paid according to employment contract, company charter, or HR policy, some employees receive extra cash, goods or services. For example, scrap raw materials or overstocked items may be available from time to time. When workload is minimal, employees may be allowed to leave early. In this paper, the term informal compensation includes any form of payment (monetary or non-monetary) that is not specified in formal compensation practices, as documented in an employment contract, company's charter, or company policies. It also includes items like expense reimbursement and entertainment allowance, where relevant policy may exist, but the policy does not identify the reimbursement or allowance as compensation to employees.

Mars (1982) remarks that the total compensation from work consists of formal, legal rewards (e.g. wages, salaries, etc.), informal, legal rewards (e.g. tips, perks, etc.), and hidden economic rewards (e.g. pilfering, overcharged expenses, etc.) He documents a case of a journalist being compensated informally for superior news articles through expense reimbursement. A journalist with a better news article can submit a more inflated expense list for reimbursement. Another form of informal compensation is the controlled "theft" system, where a certain employee is occasionally allowed to "steal" a certain amount of a certain item as part of her compensation (Zeitlin, 1971; Altheide, Adler, Adler, & Altheide, 1978; Greenberg & Scott, 1996). In a supermarket, those working on late-night shifts can consume food or beverage while working; this is considered additional compensation for undesirable working conditions (Greenberg & Scott, 1996). In addition, Ditton (1977) reports the following.

For example, an employee is told that the rate of wages is low, but this statement is accompanied by some sort of a figurative or a real wink.<sup>58</sup> Perhaps, he is told that he can purchase products at "give away" (wink) prices. Or, that there are always "cheap" (wink), "spare" (wink), or "extra"

(wink) goods to be had. Perhaps he is told, like I was at the Wellbread Bakery, that “they” would see that I didn’t “go short” (wink) or “lose out” (wink) when I complained that the wages were low. Everybody else, I was told,<sup>59</sup> was able to “make a bit on the side” (wink), or, “have their little perks” (wink), or, “take the odd loaf” (wink). With the meta-communicative wink the employer is able to craftily say something specific about the actual statements he has made.

Ditton, 1977: 48

Adithipyangkul and Simunic (2006) formally analyse this controlled theft system and discuss evidence from large publicly traded US companies. They studied the change in compensation following the Sarbanes Oxley Acts (SOX), which requires a firm to maintain effective internal control, to disclose any material weaknesses in internal control, and to disclose any theft or fraud incidents. A firm which previously implemented weak internal control and allowed informal compensation in form of “theft” and personal use of corporate assets now needs to implement better internal control and cancel informal compensation. Formal compensation is predicted to increase to redress employees for the canceled informal remuneration. The authors find that the percentage change in CEO salary increases in the year 2003 and 2004 following the passage of SOX in 2002, followed by a drop in 2005. They also find a sharp increase in percentage change of other annual compensation in 2002.

As for the advantage of informal compensation, researchers argued that “controlled” theft is a more timely and flexible way to compensate employees, apart from being tax-free (Greenberg & Scott, 1996). Also, knowing that employees “steal” something, a supervisor or an employer has some power over the payee (Ditton 1977).

Rather than studying non-cash and informal compensation in western settings as in prior literature, this paper explores the use of non-cash and informal compensation in Asian settings. Also, rather than focusing on employee “theft”, this paper consider other forms of informal payments. (There seems to be two kinds of informal compensation: legal and illegal. Examples of legal informal compensation include a boss paying for a birthday gift or a party for a certain employee. Some types of illegal informal compensation seem outright illegal, e.g. controlled “theft” discussed above. Other types may not be so obviously outright illegal. For example, consider the “abuse” of an expense account. It can be difficult to define “abuse” if the company does not have thorough reimbursement policies.) In addition to the question why pay informally, this paper explores how informal pay is transferred to employees. How do employers limit informal pay to an acceptable level?

## Methodology

Case studies to describe the use of non-cash and informal compensation in Thai companies were conducted in 2004 and 2005. To provide a good representative picture of compensation practices, the author includes in this study firms from a variety of industries and of various sizes. The Thai business studied includes two pharmaceutical manufacturers, a hotel, an auto parts manufacturer, and a chemical manufacturer. The two pharmaceutical manufacturers and the hotel are family businesses. The automobile parts manufacturer is affiliated with a car manufacturer in Japan. The sample description is summarized in Table 1 below.

TABLE 1: DESCRIPTION OF FIRMS STUDIED

Company Fictitious Name	No. of Employees	Description of Business	Respondent
Pharma A	289	Pharmaceutical manufacturer	Production manager
Pharma B	144	Pharmaceutical manufacturer	Production manager & personnel manager
Auto Parts	636	Automobile parts manufacturer	Advisor
Chemical	151	Chemical manufacturer	Accounting manager
Hotel	588	Hotel (three-star)	Internal auditor

I use questionnaires, email correspondence, in-person interviews, and phone interviews for data collection. The questionnaire first explains the definitions and gives examples of non-cash and informal compensation. The first part of the questionnaire asks for the background information of the respondents and the businesses. The next parts

are about the use of formal (cash or non-cash) compensation and the use of informal (cash or non-cash) compensation respectively.

Questionnaire replies from the hotel are in English. Questionnaire replies from the chemical manufacturer and one pharmaceutical company (Pharma A) are in Thai. Replies from the auto parts manufacturer and another pharmaceutical company (Pharma B) are mixed. When the questionnaire replies in English are quoted, they are shown exactly as the originals, except for minor correction of grammatical errors and word choices.

## The Use of Non-monetary Compensation

Before discussing the use of non-cash compensation, this section briefly reports cash compensation paid in the firms studied. In addition to salary and overtime payment, cash bonus (either for performance or for tenure), commission, and retirement benefits (contribution to provident funds) are paid. Less common cash compensation includes monetary gifts for a new-born child, a funeral, and other important events, which are paid at Hotel and Auto Parts, and gas expense reimbursement paid at Auto Parts.

The data from the questionnaires on the types of non-cash compensation used in each company for most employees and for executives are summarized in Table 2 and Table 3 respectively. Table 4 shows the proportion of cash and non-cash compensation used in each firm.

Privilege (no need to punch time card)	√				
Better health and accident insurance policy					
Additional for foreign executive: Lodging			√		

\* For managing director only.

\*\* Official Checks (used at Hotel) are commonly used in the hotel industry as a quality control measure. A high-level employee can dine at any of the hotel's own restaurants, and sign the official checks. He can order anything at any prices, except alcoholic drinks. There are no limits on the amount a staff can sign the checks. If the employee brings guests, the guests will be billed separately. The portion consumed by the guests is classified as an "in-house entertainment bill," rather than official checks.

\*\*\* In-house entertainment bills (used at Hotel) refer to entertainment at the hotel's own restaurants. The in-house entertainment is controlled by an annual budget.

\*\*\*\* For R & D purposes, a team of hotel's staff from various departments (e.g. Food and Beverage, Kitchen, Quality Control, Marketing, Internal Audit) are invited to dine in a restaurant outside the hotel.

TABLE 4: PROPORTION OF FORMAL CASH AND NON-CASH COMPENSATION FOR AN AVERAGE EMPLOYEE

	Pharma A	Pharma B	Auto Parts	Chemical	Hotel
<b>Cash Compensation</b>					
Monthly Salary	80	89	65	67.5	90
Cash bonus for tenure	10	10	24	8.1	-
Cash bonus for performance	5	1	8	1.4	7

Other	10	40	10	55.6	7
Total	100	100	100	100	100
Cash compensation	60	75	70	96	90
Non-cash compensation	40	25	30	4	10
Total	100	100	100	100	100

Cost advantages are often cited as the reason for paying non-cash compensation. I asked the respondents to specify whether the company benefits from an economy of scale from providing non-cash compensation to a large number of employees. All companies accept that they benefit from cost advantages at least for some types of non-cash compensation, e.g. group insurance and group annual trip. In addition to cost advantage, I find that the firms studied pays in terms of goods for other reasons, depending on the situation of each individual company.

At **Pharma B**, the respondent mentioned in the questionnaire that the company pays in terms of goods to benefit from “... an economy of scale, and employees also can use the non-cash items like uniforms [i.e., the goods also benefit the employees, not just the firm]”. From further interview, I find that Pharma B also provides certain goods for productivity and legal reasons. They provide lodging for some employees – driver and maintenance workers. The driver is allowed to live in a unit on site, and is expected to serve after working hours when an executive wishes to go somewhere after work. Maintenance workers are allowed to live on site just in case machines require emergency repair. Their cash salaries are not decreased because of the additional housing benefits.

As for legal reasons, cleanliness is legally required for consumer safety. Employees are not allowed to eat in manufacturing areas, since the residual food may attract insects and mice. Those employees who are caught will be fined. However, wrapping papers or emptied cartons of milk were always found. This was because some employees did not have breakfast before coming to work, and they became hungry. Pharma B solves this problem by allowing a coffee break once in the morning and again in the afternoon. Employees now can eat only at the break room. The break room is situated far from the manufacturing area. Food and drink are sold at the prices lower than the market prices. There is no cashier. Those who eat must put the money in the pay box themselves. The company announced that the coffee break will be cancelled if it loses money. Employees, who seem to want to keep the coffee break, pay honestly. Sometime they even overpay. Employees have to record their names in the guestbook before using the break room. It turns out that about 30% of the employees use the break room, and that it is the same employees frequenting the break room, mostly in the morning. The employees benefit from the discount on food items; the employer solve pest problems.

Note that the firm sells the food, rather than provide food for everyone as fringe benefit. The practice of selling rather than simply giving the goods to employees seems to be the company's response to its information disadvantage about employee preferences – who wants foods and drink, and the kind of food and drink the employees like. Other companies use different means to learn about employees' preferences, as discussed below.

Uniforms are also given to those in production, transportation, cleaning, and lab departments. Production workers are required by law to wear uniforms for consumer safety. Employees change at work. Uniforms are in very vivid colors to prevent employees from using them at home. There are no uniforms for administrative workers.

For other companies, although they admit that they benefit from cost-saving in providing a good, cost-saving does not seem to be the main motivation. The respondent at Auto Parts replied that the firm pays in terms of goods for "uniformity and convenience". Note that Auto Parts also pays in terms of food as Pharma B. At Pharma B, the food is sold to employees at discount price, possibly because the firm does not know employee's preferences. At Auto Parts, the quality and quantity of food are controlled by the catering committee. The twelve committee members are chosen by the employees. In the past, Auto Parts gave coupon for lunch, but employees requested the firm to pay cash instead. The company accommodates the change on the condition that employees eat only at the cafeteria.

At **Pharma A**, the psychological effects of non-cash compensation seems important, i.e., the business pays in terms of fringe benefits to show that the organization cares for its employees, to allow employees to have social activities together (annual group trip, annual party, monthly birthday party, and religious activities), and to promote sincere loyalty from the employees. Pharma A does not pay its employees in terms of defective or overstocked products, because in Thailand drugs are prohibited from distribution without pharmacists' approval. One exception is the cases of employees' minor illnesses. The pharmacists at the plant can issue some medicine for immediate use. The medicine given is the flawed or excess product that cannot be sold. This appears to suggest the practice of providing a good due to cost advantages.

**Chemical's** respondent replied that the health-related benefit is necessary, since those health benefits help assure and motivate employees – enhancing their morale.

**Hotel** pays in terms of many goods it can produce itself (i.e., food, laundry, lodging, and gym facilities). The hotel also provides sport facilities/activities, which are chosen by popular votes from all staff. Voting seems to be one way the firm extracts private information about employee preferences.

Interestingly, at Hotel, it seems that the company pays in terms of goods to avoid their employees being overly cash-sensitive, which is counter-productive in the hotel industry, where good service is a key to success. Also, the use of non-cash compensation is to deal with moral hazard issues other than shirking. As the respondent put it,

Cash is just a tool to promote an activity, event, and/or experience. If we want certain things to happen, we had better create them. Paying cash and creating experiences are two different things. And, in many cases, cash represents greed and selfishness. Good experience brings morale. We do not want to promote a cash-oriented mind among our staff. ... many compensation types fit into the cost saving scheme [in-house entertainment, official checks, lodging, gym facilities, laundry services]. But they do not play an important role in our organization. There are reasons for each item provided. For example, employee's meal will prevent everyone from going out to find food, and they may not be back on time. Someone may skip lunch because she/he has no money. Laundry will make sure that staff put on clean and good-condition uniforms.

This is reinforced by the fact that Hotel does not pay cash bonus for performance to employees on an organizational-wide basis. (Cash rewards are paid to only an employee selected as an employee of the month. The rewards seem to be in terms of recognition, rather than economic benefits per se.)

While most of us are aware of agency problems associated with executive's over-consumption of perks, as argued by Jensen and Meckling (1976), the reply from the hotel above seems to suggest that the hotel pays in terms of good or services to solve under-consumption problem. For example, for good image, hotel staff should be in clean and neatly ironed uniforms. However, if uniform laundry is not provided, it is not likely that an employee will pay for professional laundry service daily or spend much time and effort to neatly clean and iron her uniform. Also, if an executive needs to pay by herself to entertain a business guest, she may not do it at all or may bring a guest to a

cheap restaurant outside the hotel. So, allowing in-house entertainment ensures an executive will not cut down entertainment activities to a suboptimal level and it is not cost efficient for the hotel to provide food and venue for entertainment.

When asked whether the company thinks that the use of non-cash compensation helps improve the firm's performance, Pharma A, Pharma B, and Hotel gave positive replies. The respondent from Hotel emphasized the importance of non-cash compensation, "Non-cash compensation contributes to better organizational performance because it delivers necessities required for daily living and work activities. It also saves cost and time for everyone." Notice that much of the non-cash compensation provided in these three companies are productive goods.

To sum up, the firms we studied pay in terms of goods or services because of cost advantage and legal requirements. They also pay in terms of the goods or services which help improve production outcome, to avoid under-consumption, and to improve employee morale. The hotel we studied pays in terms of goods to avoid making its employees overly cash sensitive.

It appears that the companies design compensation packages taking into consideration employee preferences, and they generally know their employees' preferences with respect to the goods they provide or have a way to extract the information e.g. by voting, by selling rather than providing the goods or services, by allowing employees to select their representatives to take care of fringe benefits.

## **The Use of Informal Compensation**

### **Nature of Informal Compensation and the Reasons for Informal Pay**

The respondents are asked to describe the use of informal compensation, if any, in their organizations. At **Pharma A**, the production manager reported that he informally pays cash to important employees (e.g. the department head or some other significant employee) in various departments, and to employees in the mixing department. The cash paid comes from the founder-owner. It is included in the production manager's (the respondent's) monthly salary. The production manager then distributes this informal cash compensation himself monthly.

The production manager initiated this pay originally to solve the turnover problem in the mixing department. (Today, the majority of employees who receive the informal pay are in the mixing department.) The mixing job is extremely tiring (but this fact is not necessarily known to employees in other departments). Absenteeism was high, because the workers needed to rest. The turnover rate was also high because of the hard work. This had been very problematic in the past. The production manager solved the problem by paying cash informally to compensate the workers for their hard labor. This system works well; absenteeism and turnover have decreased.

The informal cash compensation is now paid not only to the mixing workers, but also to the heads and key employees in various departments. For low-level employees (assistants to department heads) in the mixing department, punching department, coating department, and glazing department, the average amount of cash per employee is B200 per month. (An average salary per employee is B6,000 per month.) For middle-level employees (department heads), the average amount of cash per employee is B500 per month. (An average salary per employee of B8,500 per month.) The pay, as mentioned in the questionnaire, is to reward the employees' ability to perform the job satisfactorily, to supervise, to solve work-related problems, and to make useful suggestions.

This cash rewards are given after 5-7 years of working. Employees must perform well, report what is going on in the workplace to the production manager, and train any newly hired employee who is still not efficient at her work and is still not loyal to the business. The amount of cash is sometimes adjusted to catch up with inflation. In terms of tax effects to the employer, the pay is added to the production manager's salary, and thus is tax-deductible for the business. The production manager, who is the cash distributor, is taxed for this additional "salary". The employees who receive the pay informally are not taxed. However, for each payee, the amount of informal pay is not very large so that there is no real tax reduction benefit.

The production manager chooses not to ask the department heads or supervisors to distribute the money. He distributes the cash himself, for fear of embezzlement, and because he wants to maintain power over those key employees. The informal pay makes the payees more cooperative and more responsive to his orders, especially those orders related to the job beyond their job descriptions, or the job for which a formal order is not issued yet.

Furthermore, he chooses to pay informally because this method is more flexible. Flexibility seems to be an important motive. In fact, the business even changes the employee evaluation and compensation practices yearly to prevent the employees from resisting the changes by arguing that the current practices are the organizational norm or tradition, as discussed below.

In this setting, the production manager pays informally to obtain power over the key employees so that they will obey his orders, and report to him the “news” in the factory. However, the informal pay seems to have a side effect of deterring undesirable actions like strikes as well. Because employee dissatisfaction is reported to the manager immediately, issues can be resolved early. Also, it is difficult to initiate strikes without cooperation from the key employees, who really run the operation, and who cannot be replaced easily. With this informal pay, the key employees who receive the informal pay seem to be on the manager’s side rather than on the workers’ side.

Note that one issue related to informal compensation is how to control informal compensation (especially controlled theft type) to an acceptable level. At Pharma A, the production manager can easily control the payee, and the amount and frequency of the pay, because he distributes this informal compensation himself. The founder-owner can perfectly control the total amount of pay, since the cash payment is recorded properly each month (as the production manager’s salary) by the firm’s accountant. Additionally, if not paid, the key employees can complain to the founder-owner. This prevents the production manager from keeping the cash for himself.

In addition to the informal cash payments, an in-person interview reveals that a New Year’s party and gifts are another form of informal compensation. During the New Year Festival, gifts are given to outstanding employees. But the management does not announce truthfully that the gifts are given because of performance. They instead claim that a gift is given because a certain employee has been with the business for a long time, and has a good attendance record. (It is usually the same employees who receive the gifts each year.) This is to avoid labour conflict, since all employees think that their performance is good, and they also deserve the gifts. Attendance rates and tenure are objective. An executive is rewarded in terms of bonus and a salary raise rather than with a New Year’s gift. (An executive’s bonus is based on performance rather than attendance. A low-level employee’s bonus is based more on attendance rate. For the both Pharma A and Pharma B, attendance rate is important. It is very desirable to minimize absenteeism to avoid disruption in production, as explained below.)

When asked why pay informally, the production manager gives the following reply.

The business does not pay informally as a main compensating way. It pays informally to promote flexibility in operation. The informal pay is used marginally. It is paid only to supervisors or other key employees. Without the informal pay, it can be difficult to ask them to do something beyond their job description, or to ask them to work on a new job for which the formal job order has not been issued yet. They may not cooperate, claiming they have to wait for the formal order. The informal pay makes them more cooperative and responsive to my request. ... The informal pay is not designed to motivate the employees to cooperate in doing anything that is already within their job descriptions. ... After the supervisor gets cash, they are responsible for monitoring and motivating the lower level employees to make sure the job is done in time. They will report any problems that occur more promptly as well.

The business does not plan to formalize the pay above, because it will lead to inflexibility. The employees are told that the informal compensation is not to be expected monthly – it is paid only at the discretion of the production manager, and it can be cancelled at any time. Note that the informal cash compensation is paid to a rather small number of employees so that it is less likely that they can join forces to resist the change in informal compensation anyway. Therefore, it appears easier to change than formal compensation.

Consider another pharmaceutical manufacturer. In the questionnaire, **Pharma B** mentioned they do not use any informal compensation other than cash bonus. Although cash bonuses are formal in many organizations, cash bonuses are informal in this factory. The company’s charters, policies, or the employment contracts do not indicate the company’s obligation to pay bonuses (discretionary or non-discretionary). The company does not pay bonuses in bad years in which the company earns no or little profit, or the years in which the economic condition is not good.

An annual cash bonus is paid to an employee whose performance and attendance rate are good. Since absenteeism disrupts the workflow, it is really important to encourage employees to minimize their leaves or lateness. The company does not have extra labor to cover those who come in late, or those who take a leave. If

someone is absent, another employee must work harder to cover for her. Lateness is problematic, since the production manager does not know whether that employee will be absent for the whole day or not, and hence whether it is necessary to find someone from another department to replace her.

If employees are not late for work, do not take a leave, and do not call in sick all year, they receive a full bonus of 15% of a monthly salary. If an employee is absent more often than the limit, the bonus is reduced. Those who take a leave right before, or right after the Chinese New Year or Thai New Year (to create a longer vacation), are penalized by having their bonus decreased by 20% instantly.

Furthermore, an additional bonus equal to a month's salary will be given, if performance is good. (But if the attendance rate is not adequate, they will not receive a full one-month bonus.) Nonetheless, the company mostly uses salary raises to compensate employees for better performance. Bonuses are mainly used to minimize absenteeism.

Another way to pay employees informally is through discretionary financial assistance, e.g. employee loans and scholarships for child education. Discretionary scholarships for child's education may be granted case by case to employees who have been with the company for a long time, and also have performed well. The free scholarship is usually given to "good," old employees, whose child's area of study is "good," e.g. pharmacy. Note that "good" is subjective, and hence it allows the employer freedom whether to give a free scholarship or not. A scholarship includes both tuition and living expenses. For an average employee or an average area of study, the company gives a loan, rather than a scholarship.

In addition, for a "good" employee who has been with the company for a long time, the company may grant an interest-free loan for home improvement, etc. Employees then pay back the principal by installments. The amount to be deducted from salary each month must not be too high so that it affects the employees adversely.

Employees who need help can contact the personnel manager, who knows more about the employees' situation and performance. If the personnel manager thinks that it is appropriate to help, she requests a loan or a scholarship from executives. The maximum amount of financial assistance is approximately B50,000.

The company also gives gifts to employees. During the New Year season, the company receives many gifts from its traders. Some of these gifts will be given to key employees who work closely with an executive, have been with the company for a long time, and perform well. However, employees cannot expect these gifts every year.

Note that the items chosen as informal pay are the items which can be easily controlled to an acceptable level.

Similar to Pharma A, the informant from Pharma B reported that the company chooses to pay informally rather than formally because it is more flexible and easier to change.

To compare the two drug manufacturers, both businesses experienced difficulties in their mixing departments. Pharma A invented an informal pay system to effectively solve this problem, and also subsequently implemented it widely in the factory. The problem remains unsolved at Pharma B. Possibly, the unconventional use of informal compensation depends greatly on organizational culture and leadership style. Both are family businesses whose founders are Thai-Chinese. At Pharma B, the ownership family seems more conservative. The operation is controlled by the second generation. At Pharma A, the most powerful figure is the founder, who is still very active as a consultant to the business. The day-to-day operation is controlled by his wife and his older brother (i.e., the first generation.) According to the respondent, the founder is a very capable, resourceful, and creative person. Possibly, a more daring, open atmosphere or leadership style encourages more unconventional use of informal compensation. However, this is not to imply that Pharma B is less capable in problem-solving. In fact, the company uses conventional means creatively to solve the problem, rather than inventing an unconventional solution. For example, both businesses experienced a problem of employees eating on manufacturing sites as mentioned above. While the problem remains unsolved at Pharma A, Pharma B solves the problem by using a conventional coffee room.

At **Auto Parts**, the informal compensation paid includes an entertainment allowance for a Japanese executive, an executive's right to purchase a used car at a discounted price, and gifts for employees.

Concerning entertainment allowances, Japanese executives (department heads) are entitled to an allowance of about B30,000 per month. This allowance is a policy dictated by the parent company. The pay must be approved by the managing director. A Japanese executive must show receipts for reimbursement. The pay is informal in the sense that the reimbursement regulations for executives are more flexible than those for operational employees.

Department managers have a right to purchase a used company car. The amount of discount is about B150,000 per car (an average salary per employee is B 35,000 – 80,000). The purpose of this special pay is to boost employees' morale. This is done once a year, 2-3 cars each year. The company uses a lottery to determine a buyer. Those who have already purchased a car cannot buy another in the next ten years, or until all the remaining managers have a chance to purchase one.

Further, the firm gives awards, plaques, or cash rewards to employees or units which can attain specified goals. The cash reward is to be paid for a celebration party for the unit. The rewards are paid informally because "it is easier to change, and because it helps motivate employees for a certain task." The company tries not to use this informal compensation too often. They use it only at critical times and when they want to create great motivation and morale. (They are afraid that frequent use will make an employee feel indifferent to it so that the rewards can no longer motivate effort.) The company does not plan to formalize the payment since "it is not necessary".

The company does not seem to have difficulties controlling the items chosen as informal pay. The pay seems to be aimed toward morale enhancement.

At **Chemical**, the respondent reports the use of informal compensation in terms of reimbursement for gas, etc., for middle-level employees. A vice-manager of the factory can request about B 2,500 - 3,000 per month. (An average salary per employee is B 30,000 – 40,000.) A cashier is also entitled to B2,000 - 2,500 per month (The average monthly salary is B30,000 – 35,000.) The cash is paid to enhance morale and work efficiency. The respondent mentioned they do not plan to formalize the informal pay. "Before paying this extra compensation to an employee, the executive considers both performance and other factors. Therefore, for convenience, paying extra compensation should be the firm's "option" [rather than commitment]; it is more suitable to pay informally."

At **Hotel**, the respondent mentioned the hotel does not use any informal compensation in the questionnaire. From further enquiry, informal compensation in terms of gifts is paid. As the respondent puts it, "We give gifts to employees at the annual staff party only. We collect gifts from suppliers and high-level staff, and buy some more. Almost all employees receive gifts. The lucky draw will decide who gets what. The values of the gifts range from B30 to B10,000."

When asked why the firm pays informally, the respondent from Hotel gave a different answer than other respondents.

... most employees do not distinguish between formal and informal. If they receive anything regularly, those things will become "formal" to them automatically. They hardly read any rulebook unless someone points out something to them. And formal or informal does not really matter to them because management has the ability and power to change the rules. ... If we want to start something new, we want to try it first. For informal benefits, we can quit more easily if it does not work. Once again, if we do something regularly for a long time, people will think of it as formal regardless of the rules in the book. For example, we have had employee meals for over 30 years; many people think that it is required by law to provide employee meals. Only the personnel manager and few other people know that this is something extra to them. Later on we put employee meals into our employee handbook to make it official.

Interestingly, it seems that we have an example of the firm which does not seriously enforce its control, in order to allow extra compensation here, as the respondent explained below.

New Year's gifts [from suppliers] are prohibited by the managing director. Many gifts slip through because we do not seriously enforce the policy, and rejection of such a gift is difficult – it could be impolite and ruin the relationships. Small gifts, like calendars and organizers, are common. Small gifts can help promote good will and build relationships. The question is how much is small. And this can develop into the bad habit of expecting to receive gifts from suppliers.

#### **Employee Resistance to Changes in Formal and Informal Compensation**

Researchers in organizational behavior argue that it is beneficial to pay informally because informal compensation is more flexible (Greenberg and Scott, 1996). I asked the respondents to report employees' reaction to the changes in formal and informal compensation. From their replies, it seems easier to change informal compensation, and employees do not resist the change in informal pay.

At **Pharma A**, to change the formal compensation practices, one needs to propose the change to the managing partner, explaining the pros and cons of the change. It is rather difficult to change since this will directly affect the expenses.

When asked about employee resistance, the respondent replied, "The change is feasible but not very easy. To some degree, employees resist. ... the business tries to communicate in order to have the majority of employees understand the situation to prevent employees from joining forces to resist the change." The latest changes include

(1) Change the compensation plans for the newly hired employees; (2) Employee performance evaluation is changed yearly to create a pattern of yearly changes; (3) Change a position of an employee (by arguing that the change is based on suitability and employee performance) in order to change the compensation paid to that employee; (4) The business changes the compensation structure every year. This is because the business does not want to its employees to be able to claim that the existing pay is an organizational tradition or custom.

The production manager mentioned that it is much easier to change the informal compensation plan. He needs to do nothing as long as the total amount of the pay is the same. If the production manager wants to increase the total amount, then he needs to ask for the managing partner's authorization. The production manager never reduces the amount of pay. The employees' reactions are positive since they receive more.

To change the formal compensation plan at **Pharma B**, one needs to propose a change to the committee for approval. The committee consists of three members: the personnel manager, one member from administration, and one from finance. In practice, the changes must be approved by the committee, all executives and the personnel department. Usually, it is the personnel manager who proposes the changes. Some employees may resist the change, but usually the problem can be solved in few days by the personnel department through proper communication and explanation. Note that the number of employees is 144 at Pharma B but is 289 at Pharma A. So it appears that employee resistance becomes more problematic as the number of employees increases, and informal compensation seems more useful.

The firm has not experienced employees resisting the changes in informal compensation.

At **Auto Parts**, to change the formal compensation plan, the personnel manager need to consult the administration manager and then propose the change to the CEO (managing director). It takes in total approximately six months to complete rounds of consideration. An employee's reaction seems very important in this Japanese-Thai firm, as the respondent put it.

More than one conference to consult and elicit opinion from employees will be arranged. If the majority of employees disagree, then there will be no change. Any changes in compensation plan will not be undertaken without approval from the majority of employees, since the company wants to avoid labor conflicts.

There has been no employees' resistance, since all the changes are to improve employees' benefits.

At **Hotel**, to change the formal compensation plan, one needs to discuss the change with the general manager, who will then discuss the matter in a management meeting. The general manager then seeks approval from the managing director. The change is not difficult, provided all executives agree. "The personnel department will only object if the change is illegal, or has technical difficulty such as huge data collection." Employees may resist the change, which can be solved by communication.

Since the informal pay used in Hotel includes gifts, it is obviously not difficult to change.

At **Chemical**, to change formal compensation, executives need to propose the change to the board for approval, which is not difficult in practice. However, the change must not be against the law, and it must not make the employees worse off (to avoid employee resistance). Since the changes usually make employees better off, there is no resistance. As to informal compensation, the respondent reported no changes so far.

## Conclusion

This paper describes compensation practices in five Thai companies. It illustrates the nature of non-cash and informal compensation used and the reasons behind each pay. The firms studied pay in terms of goods and services

to exploit a cost advantage, to improve production, to recruit better job candidates, and to enhance employee morale and satisfaction. The firms pay informally to benefit from greater flexibility and to elicit more cooperation and information from the payee.

The findings seem to confirm human resource expert's suggestion that non-cash compensation is important and should be used more and used creatively. It is not just about how much to pay and when to pay (immediate or deferred), but also about the composition of the compensation bundle. Proper compensation design can not only deter shirking, but it also solves other employee misbehaviour problems.

Furthermore, the cases suggest how informal compensation can be used to supplement a formal contract in different ways. It can be used to reward better performance when subjective performance evaluation is used and employers want to avoid labour disputes. It can be paid selectively to individual employees to supplement the standardised formal compensation contract or formal compensation policy. It can be paid to mitigate employee deviant like non-cooperation for the tasks outside formal job description.

In compensation design literature, the optimal contract is usually characterized very much based on the characteristics of the agent (the employee) and of the performance measures available. The only aspects of the principal (the employer) usually considered is her risk preference (i.e., whether she is risk averse or risk neutral). The findings hint that compensation in practice depends much on the characteristics of the organizational leader. Future research on the effects of organizational leadership on compensation practices will contribute to our better understanding in the area.

# Employee Job Satisfaction and Excellence of Total Quality Management

*Richard Wickramaratne, wickramaratne2005@yahoo.com  
University of Kelaniya, Sri Lanka*

## Abstract

The management in total quality implies that it's a management approach, not just a narrow quality control or quality assurance function. Total Quality Management (TQM) is a very people oriented and has many implications for the study and application of organizational behavior. Some principles and practices of TQM may differ among firms and industries, but there is unanimous agreement as to the importance of job satisfaction of employees in implementing TQM. Accordingly the objective of the paper was to empirically investigate the impact of employee job satisfaction on the excellence of TQM. This study limited to twenty private sector banks in Sri Lanka. The sample of the study consisted of 180 operational level employees. The researcher used convenience sampling in selecting the subjects. The instrument used in the study was a survey questionnaire. The Correlation analysis explained a positive moderate relationship between employee job satisfaction and excellence of TQM ( $r=0.484$ ,  $p=0.000$ ) That is, employee job satisfaction is positively related to the excellence of TQM. According to the regression analysis, 23.4% of excellence of TQM is accounted for by job satisfaction of employees. Accordingly this study implies that the job satisfaction of employees plays a vital role in implementing and gaining the excellence of TQM. Key words: Total Quality Management, Employee Job satisfaction, Excellence of Total Quality Management, Private Sector Banks in Sri Lanka.

## Introduction

Oakland (1989) argues that after the industrial revolution of the nineteenth century and the computing revolution of the early 1980s "we are now without doubt in the midst of quality revolution" (Wilkinson, *et al*, 1998). Development in the product markets; technology, and legislation have led employers to search for new strategies and structures. Accordingly product and service quality are high on the agenda of both private and public sector organizations with quality certification and Total Quality Management emerging as key concerns. (Wilkinson, 1996). TQM is a management approach of an organization centered on quality based on the participation of all of its members aiming at long term success through customer satisfaction and benefits to all members of the organization and to the society (ISO 8402). Accordingly TQM is an organization wide approach to continuously improving the quality of all the organizations, processes, products and services (Kotler, 2000)

Having discussed what is meant by TQM, we can look in at the two aspects of the TQM namely 'Hard' and 'Soft' aspects.(Wilkinson,1998).The hard aspect reflecting the production orientation of the quality 'gurus' emphasizes systems, data collection and measurement. It involves a range of production techniques including statistical process control, changes in the layout, design processes and procedures of the organization, and use of the seven basic TQM tools used to interpret data. (Process Flow Charting, Tally Charts, Pareto Analysis, Scatter Diagrams, Histograms, Control Charts and Cause and Effect Analysis).The soft side focuses on the management of human resources in the organization and lays particular emphasis on the need to change the culture. TQM thus emphasizes both production oriented and employee relations oriented elements.

Accordingly the management in TQM implies that TQM is a management approach, not just a narrow quality control or quality assurance function .It should be remembered that every one in the organization is involved in TQM not just project head. In other words TQM is a very people oriented and has many implications for the study and application of Organizational Behavior. An extensive review of literature indicates that the leadership, conducive work culture and positive attitudes of employees as the major factors that affect the excellence of TQM.

FIG. 1: MAJOR FACTORS WHICH AFFECT THE EXCELLENCE OF TQM

According to Collard (1989, pp.7-11) favorable attitudes of employees towards job satisfaction, job involvement, and commitment are determinants of excellence of TQM of any organization. However the researcher has confined the study only to employee job satisfaction as a determinant of excellence of TQM. Locke(1976,p.1300) gives a comprehensive definition for job satisfaction as involving cognitive , affective and evaluative reactions or attitudes and states it is “a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experience”.

## Dimensions

*Job satisfaction of employees is measured by using 12 item questionnaire. The questionnaire addresses the following six dimensions of the concept of Job satisfaction.*

*Dimension 1 - Work itself*

*Dimension 2 - Pay*

*Dimension 3 - Promotions*

*Dimension 4 - Co-Workers*

*Dimension 5 - Working conditions*

*Dimension 6 - Supervision*

According to the theory TQM success is measured in five main areas of effectiveness, efficiency, productivity, quality, and non quality related measures such defects, error rates, cost of poor quality and deliveries not on time etc(Oakland, 1995, Pp.173-187) For the purpose of the research the researcher has given his own operational definition for the success of TQM. That is TQM success is measured in terms of employee perception of the quality. Accordingly TQM success is the perception of a person to see in the production of the final product that, he should be educated in the process and should be participated with full authority and self control with the intention of being innovative, so that the ultimate product or service to be free of errors in accordance with the current prevailing quality concepts. There are seven dimensions identified for the measurement of success of TQM. They are,

- D<sub>1</sub> - Educative Process
- D<sub>2</sub> - Participative structures (Quality Circles, Action Teams etc.)
- D<sub>3</sub> - Greater autonomy and self control
- D<sub>4</sub> - Decreasing trend of errors towards zero defects
- D<sub>5</sub> - Adherence to quality concepts
- D<sub>6</sub> - Creativeness or innovativeness
- D<sub>7</sub> - Perception of customer satisfaction.

## Objective of the Study

The objective of this paper was to empirically investigate the impact of employee job satisfaction on the excellence of Total Quality Management .Accordingly this paper examined the following research question.

Does the employee job satisfaction have an impact on the excellence of TQM?

## Methodology

### The Sample

The sample of study consisted of 180 operational level employees who are working under functional heads of operations, marketing, human resources, and finance departments. The researcher used convenience sampling in selecting the subjects. The subject community has all the characteristics of the type needed for in-depth study of this topic.

### Instrumentation

The instrument used in the study was a survey questionnaire which consists of 34 questions. Job satisfaction has been measured by a 12 item questionnaire which has been originally devised by the Locke(1976).The success of TQM has been measured by a 15 item questionnaire originally devised by the researcher for this specific study. Of the 34 questions, seven were designed to gather background information of the respondents.

### Data Collection and Analysis

Two hundred questionnaires along with a covering letter were distributed among the selected sample of employees. It explained the purpose of the study and the importance of the participation of the employees in responding to the questionnaires.

The first stage of data analysis involved computing descriptive statistics as frequencies and percentages for analyzing characteristics of the subjects. Second a reliability analysis was done to check whether the questionnaires measure the variables reliably .The alpha values were calculated for the same purpose. If the alpha values are greater than 0.5, the questionnaires measure the variables reliably (job satisfaction questionnaire and excellence of TQM questionnaire). Third a factor analysis was performed to find out the dimensions of each variable, how questions are grouped to dimensions, to find out whether any unwanted questions can be eliminated from the questionnaire. Finally the simple correlation analysis was performed to identify the relationship between job satisfaction and excellences of Total Quality Management.

## Results

### Questionnaire Responses and the Profile of Employees

There were 190 responses from the 200 questionnaires. It is a response rate of 95%, which is at a satisfactory level. However 180 questionnaires were selected for this analysis. It shows that 70% of the respondents were male employees while the rest were female employees. The majority of the employees appear to be within the age group of 36-50(58%).The highest number of respondents having been employees with G C E (A/L) qualification (50%) while rest 30% and 20% of employees were degree qualifications and GCE (O/L) respectively. The respondents have been from majority group having job experience of 6-10 years. There were 76% of married and 24% unmarried employees in the sample.

### Reliability Analysis and Factor Analysis

A reliability analysis was done to check whether each Questionnaire measure the variables reliably. The Chronbach's Alpha value was measured for this purpose .The results reveal that the questionnaires measure the variables reliably.

TABLE 1: SUMMARY OF RELIABILITY ANALYSIS

	Questionnaire	Alpha Value	Comment
01	Job Satisfaction Questionnaire	0.6678	acceptable
02	excellence of TQM Questionnaire	0.6832	acceptable

Factor analysis is a statistical procedure to take a large number of constructs and reduce them to a smaller number of factors that describe this measure. A 'factor' is a combination of questions where shared correlation explains a certain amount of total variance. After rotation, factors are designed to demonstrate underlying similarities between groups of variables.

Three measures were considered for the analysis.

- (1) Kaiser – Meyer – Olkin Measure of Sampling adequacy  
KMO measure is acceptable, (KMO = 0.756) since it is higher than 0.5. Therefore the distribution of data is acceptable for performing the factor analysis.
- (2) Bartlett’s test of sphericity  
Bartlett’s test of sphericity: Significance = 0.000. This result is acceptable since data do not differ significantly from multivariate normal. That is the chance to differ occurs at  $p = 0.000 < 0.05$ .
- (3) Component Matrix  
At the beginning there were two components. But, after extracting, two variables come under one component. Therefore the entire set of questionnaire is one-dimensional. It means that the questionnaire has equally measured all of the variables.

**Descriptives**

The Standard Error of Mean (SEM) is less than 3.5% for all variables and the highest standard Error of mean is for job satisfaction (2.6%). The excellence of TQM has the highest average scores while job satisfaction has the minimum. Overall averages are above 03, and it implies that successfulness of all factors.

The following table shows a summary of the descriptives.

TABLE 2: SUMMARY OF DESCRIPTIVES

	Mean	Standard Deviation	Remarks
Job Satisfaction	3.99	0.246	Lowest dispersion : Points scattered close to the mean
Excellence of TQM	4.15	0.248	Points scattered some what close to the mean.

**Correlation Analysis**

Scatter plots were taken to identify relationship of excellence of TQM with the job satisfaction. The correlation between job satisfaction and excellence of TQM is positive and significant at 1% significance level since  $r = 0.484$  and  $P = 0.000$ .

The results of the scatter plots are commented as follows.

TABLE 3: COMMENT ON SCATTER PLOTS

Variables Involved	Correlation Co-efficient(r).	Comments
Job satisfaction- Excellence of TQM	0.484	A positive correlation The points are much scattered around a straight line

**Regression Employee Job Satisfaction – Excellence of TQM.**

The analysis gives s the following information.

1.  $R = 0.484$ , which means a moderate gradient regression line.
2.  $R^2 = 0.234$ , means 23% of the variance of excellence of TQM was accounted for by employee job satisfaction.
3. Sum of squares figures explain a larger proportion of unexplained variance than explained variance.
4.  $Sig F = 0.000$ , which shows that a particular “F” value could occur by a chance of less than 1 in 1000.

**Test of Hypothesis**

The hypothesis states as follows: “Employee job satisfaction is positively related to the excellence of TQM.”

Correlation analysis explained a positive relationship between job satisfaction and excellence of TQM ( $r = 0.484$ ,  $P = 0.000$ ). Regression analysis also supports this by giving a value, ( $B_3 = 0.234$ ). Hence employee job satisfaction is a predictor of excellence of TQM ( $F = 35.189$ ,  $0.000$ ). Hence the decision is: employee job satisfaction is a predictor of excellence of Total Quality Management.

## Discussion

The empirical investigation on the employees of private sector banks of Sri Lanka reveal that there is a positive significant correlation between job satisfaction and the excellence of TQM at 1% significance level ( $r = 0.484$ ,  $P = 0.000$ ). This was based on 2 – tailed tests. The simple regression analysis describes that JS has a positive impact on excellence of TQM with the strength of  $B = 0.488$  ( $F = 54.479$ ,  $P = 0.000$ ). The level of JS of employees gives a measure of excellence of TQM and it has a 23.4% accuracy of predicting. That is 23.4% of excellence of TQM is accounted for by JS.

The JS of the sample gives a satisfactory level (Mean = 3.9889, Standard Deviation = 0.2462). It explains that they have a favorable level of JS. The standard deviation shows that all employees have a satisfaction concerning their job at plus or minus 0.2462 Standard Deviation level.

## Conclusion

This study mainly focused on employee job satisfaction as a determinant of excellence of TQM. The study reveals that job satisfaction has a positive and moderate correlation with the excellence of TQM. Hence the majority of the employees were satisfied in their job. Accordingly employee job satisfaction is a pre-requisite when creating an atmosphere for enhancing the excellence of TQM of any organization. In fact other variables which were not considered on this study should be the variables that will count for unexplained variance in the excellence of TQM. The researcher believes that the important variables may be leadership, strategy, culture, structure, and process quality.

## **An Assessment of China's Economic Engagement in Africa**

*Guy Schulders, [Schulders@wanadoo.fr](mailto:Schulders@wanadoo.fr)  
Université Paris I – Panthéon-Sorbonne, France*

### **Abstract**

Once stifled by the Cultural Revolution, China's recent reforms have produced a political, economic, and commercial renaissance that is transforming the global balance of power. China's rapid economic growth, coupled with its large population, have created unprecedented increases in demand for raw materials and capital formation that is constantly increasing living standards to hitherto unimagined levels. To sustain this growth, Chinese economic policy has moved beyond domestic reform to establishing new trading relations with other regions. These relations encompass manufactured exports to developed countries that depend on a growing flow of inputs from the developing world, not the least of which are the natural resource markets in Africa. In this paper, we examine China's growing economic interests in Africa to determine to what extent they can accelerate African economic integration and improve living standards in the continent.

### **Introduction**

For the past twenty years, three factors have shaped the nature of strategic relations between the West, Asia, and Africa. They are: a. The relative stagnation of western economies, whose real per capita growth rates have generally averaged three percent or less<sup>1</sup>; b. A continuing regression in Africa that with few exceptions reflects successive episodes of political instability, deadly inter-ethnic conflicts, inadequate infrastructural investment, and a general loss of export markets deriving from a loss of relative productivity; and c. The extraordinary economic growth of China and several neighboring Asian economies, often at double digit rates, around an export-driven model. All of these conditions have re-shaped the global balance of power.

### **The Changing Balance of Global Power**

Between 1988 and 2005, global population has increased by 19 percent while GDP has increased by 21 percent. At the same time, China's economic growth has made it the fourth largest in the world, with mean per capita GDEP not at U.S.\$1,740, and U.S.\$1,940 if one includes Hong Kong. In contrast, Africa as a whole has only experienced a 1.8 percent increase in per capita GDP over the same time period. As of 2005, some 925 million Africans produced a collective GDP of only U.S.\$1,080 trillion, and which was highly unevenly distributed at that<sup>2</sup>.

TABLE 1: THE CHANGING BALANCE OF GLOBAL ECONOMIC POWER

Population (in millions)				GDP (in current U.S.\$billions)			
	1988	2005	Pct. Change		1988	2005	Pct. Change
China(+Hong Kong)	1,085	1,310	20.7%	United States	\$4,488	\$12,970	189.0%
India	781	1,095	40.2%	Japan	\$1,924	\$4,989	159.3%
United States	244	297	21.7%	Germany	\$882	\$2,852	223.4%
Indonesia	170	221	30.0%	China (+HongKong)	\$354	\$2,560	623.2%
Brazil	140	187	33.6%	United Kingdom	\$587	\$2,264	285.7%
Pakistan	102	156	52.9%	France	\$716	\$2,178	204.2%
Russia	132	143	8.3%	Italy	\$604	\$1,725	185.6%
Bangladesh	102	142	39.2%	Spain	\$233	\$1,100	372.1%
Nigeria	102	132	29.4%	Canada	\$402	\$1,052	161.7%
Japan	122	128	4.9%	India	\$280	\$793	183.2%
Top 10 Countries	2,980	3,811	27.9%	Top 10 Countries	\$10,476	\$32,483	210.1%
of which Asian top 6	2,364	3,052	29.1%	(of which Asian top 3)	\$2,490	\$8,342	235.0%
Africa	720	925	28.5%	Africa	\$600	\$1,080	80.0%
World	5,200	6,200	19.2%	World	\$14,000	\$42,000	200.0%

Source : Atlaseco 2003 and 2007

China's recent and rapid economic growth carries particular implications for the global economy. One clear implication is that to sustain its recent historical rates of growth, China will look increasingly to foreign markets for the raw materials in energy and natural resources. And it also implies increases in the level of foreign investment within China to accelerate the process of technology transfer and absorption. In short, China's growth requires an absolute commitment to expanding globalization through trade and investment, particularly in developing areas such as Africa, much as is likely to be the case with India in the near future<sup>3</sup>.

### The Magnitude of China's Resource Needs

Given the size of China's economy, it already consumes as much coal, steel, cement, and cereals as the United States or the European Union. In fact, according to World Bank estimates, China's consumption in these areas alone is expected to double China's economy in the next several years. And if these trends continue, China's GDP soon will surpass that of Japan, and will progressively approach that of the United States. And for Africa, it means that China's trade with Africa, which stood at U.S.\$10 billion in 2000, has exceeded U.S.\$37 billion in 2005, and it likely to expand proportionately in the next several years<sup>4</sup>. In turn, this has created rising prices for many of the primary commodities on which African economies so strongly depend, be they agricultural or mineral exports. As such, this is seen as a positive development for Africa, even though the cost of primary materials for other parts of the developed world will place rising constraints on their ability to growth.

In terms of primary commodity markets, one already sees signs of a repeat of the exceptional growth of Japan in the 1970s, during which time rising primary commodity prices provided a temporary boom in African exports and income. In terms of energy consumption alone, experts in the Energy Information Administration estimate that between 2003 and 2030, global consumption of energy is expected to increase by one percent per year, but for China and its Asian neighbors, annual growth is likely to exceed 3.7 percent<sup>5</sup>. Given its low reserve to consumption ratios in energy, Chinese policy has been driven by an ever expanding set of initiatives to develop new sources of energy. This effort encompasses some domestic exploration, but also entails an expanding set of contractual relations with mineral rich areas of the world, of which Africa is one major source.

Few political leaders, let alone economists, have correctly foreseen the range and scope of China's energy and natural resource demand in the global economy. Nor have they foreseen the mechanisms that have been brought into play as this process has unfolded<sup>6</sup>.

If there is one basic explanation of this new growth dynamic, it is the fundamental shift in policy brought about by the reforms of Deng Xiao Ping that began in the late 1970s. Deng's recasting of economic reforms as "market socialism" masked the exceptional role that market forces would come to play in the post-Mao Tse Tung era, putting to rest all of the setbacks that had been wrought under the Cultural Revolution of the 1960s. Indeed, China already faces severe resource constraints within its economy, as can be seen by the Three Gorges Dam project, which is designed to overcome a chronic water shortage in the northeast part of the country as economic growth proceeds.

## **The Nature of China-Africa Economic Cooperation**

China's resource constraints have compelled its leaders to seek straightforward commercial ties with other parts of the world. These ties have been driven by an immediate economic need, and typically operate outside the cultural and political domain. It is this singular pre-occupation with economic cooperation that threatens to undermine efforts to improve the status of governance in Africa, let alone address environmental concerns.

From an African perspective, the sheer weight of China's expanding trade and investment flows has created an undoubted stimulus on local economic growth. Whereas African economies experienced stagnant rates of growth for the past thirty years, they now are beginning to see growth rates in excess of five percent, a rate not seen since the mid-1960s.

China's growing presence in Africa is transforming the historical ties to Europe that evolved during the colonial era. Although post-colonial efforts were undertaken to develop joint partnerships between many African countries and their metropolitan centers in London, Paris, Lisbon, or Brussels, many of these efforts foundered during the 1970s and 1980s. Much of the weak growth took place in the presence of the slow pace of economic reforms in Africa and by the continuing role of protectionism in Europe and elsewhere, especially in agriculture and primary commodities on which so many African economies depended. As a result, many African economies were all too ready to embrace Asian foreign trade and investment opportunities, not the least of which was the result of the outward expansion of China in recent years.

One critical factor in the successive expansion of China in Africa was the competitive position of Chinese exports in comparison to their developed country counterparts. Though geographically more distant from Africa than Europe, Chinese firms could offer an increasing range of capital and consumer goods at prices more closely attuned to the purchasing power of African economies. Part of this was due to relatively low costs from a still low income China. However, another aspect has been China's exchange rate, which has been favorable to its exports, particularly in comparison to traded goods from the EU, North America, and other parts of the developed world.

It is this proximity of relative costs that overcomes geographic distance in China's economic ties to Africa. It has resulted in a "win-win" attitude in which there are clear reciprocal gains from trade. As a result, China's foreign investment alone in Africa has already reached U.S. \$5.6 billion dollars, encompassing some 900 infrastructure projects in some 31 countries<sup>7</sup>. And it has also resulted in debt cancellation of some U.S. \$1.33 billion dollars as Chinese firms seek to sustain growing ties to Africa.

Perhaps the most outstanding example of Sino-African ties has been the Tan-Zam railway project, also known as the "Freedom Train". Begun in the last years of Mao's reign, it has operated for over thirty years. Initially it was designed as an anti-racist gesture in defiance of the apartheid regime in South Africa and neighboring ex-Rhodesia under Ian Smith. However, it has taken on a largely economic significance in recent years, and, as the Soviet Aswan dam project served in the 1950s, an example of South-South cooperation for Africa and China's future economic ties<sup>8</sup>.

The mix of Africa's economic ties to Africa is somewhat unequal. First, while China's foreign direct investment in Africa has already surpassed U.S. \$37 billion in 2005, Africa's exports to the rest of the world only amount to 1.6 percent of the global level. Moreover, China's economic ties to Africa also have been geographically concentrated, with 85 percent of Chinese imports from Africa involve only five African countries, and these are primarily those involved with crude oil exports<sup>9</sup>.

Second, China has expanded the range of these commercial ties with a number of diplomatic initiatives designed to strengthen longer-term ties. Among them are technical assistance, infrastructure projects, scholarships for African students to study in Chinese universities, and various business joint ventures. Within this perspective, China's interests remain firmly rooted in commercial opportunity. Thus Chinese overtures do not encompass such questions as good governance, humanitarian aid issues, or involvement with any of the various local ethnic conflicts that have sidelined so many African countries in recent years. In fact, there is only one political priority among the Chinese, namely, that African governments do not grant diplomatic status to Taiwan<sup>10</sup>.

In terms of diplomatic initiatives, Chinese officials inaugurated a Confucius Institute in Nairobi, Kenya in December 2005. This is comparable to the various Goethe Institutes of Germany or the Alliances Françaises of France, the essence of which is the promotion of cultural understanding. As is the case with their European counterparts, Chinese and Kenyan officials have established university partnerships, most recently one between the University of Nairobi and Tianjin University. Such accords will increase the level of student and faculty exchanges between the two countries.

Another diplomatic initiative involves the startup of the first Chinese FM radio station in Africa, once again in Kenya<sup>11</sup>. Like its French RFI and German Deutsche Welle counterparts, China International Radio will broadcast in several languages on current events and cultural news.

In a further initiative, Chinese officials have sent a team of medical experts to Uganda to work on AIDS prevention and treatment programs<sup>12</sup>. The recent visit of Chinese Prime Minister Wen Jiabao gave formal affirmation of this commitment. But China's technical assistance in medicine has not been limited to Uganda. Over the past 38 years, for example, the Chinese province of Heilongjiang has sent more than 1,000 medical technicians in Mauritania to provide assistance to rural communities. And for the first time, in 2006, Chinese doctors have begun training in social psychology to help them improve services in various local communities in Africa.

Beyond these steps, Chinese officials also have worked to improve telecommunications in Africa. They have provided significant upgrades to the telecommunications grid in Ethiopia, and in 2007 China Aerospace is expected to launch a 3B Long March telecommunications satellite, NIGOMSAT-1, for use by Nigeria telecommunications.

Finally, Chinese firms also provide arms sales to various African countries. As with other initiatives, the intent of these sales is less ideological than commercial. The most notable are those distributed by the China North Industry Corporation (NORINCO) and Polytech Industries, which have made sales of fighter aircraft, military transport, and armored vehicles to various countries, notably in Angola<sup>13</sup>.

## **Sino-African Diplomacy**

Since the 1950's, China has espoused what the late Prime Minister Chou En Lai called the "five principles of peaceful co-existence". These principles have served as a reference for Chinese relations with other Asian countries, with Latin American countries, as well as those in Africa, whether or not they were independent or aspiring to political independence at the time. These principles are: mutual respect of national sovereignty and territorial integrity, mutual non-aggression, non-interference in the internal affairs of sovereign states, and equality and reciprocity of benefits from joint relations. These principles of peaceful coexistence were at the center of the 1955 Bandung conference, which involved representatives of some 29 countries from Africa and Asia. For China, it formed the centerpiece of an evolving South-South cooperative framework for political, economic, and cultural relations.

Despite the lofty tone of the Bandung conference, political divisions rapidly emerged. Among them were China's position on several key issues. First was the notion that South Africa was a racist state and therefore unworthy of recognition, that Israel was anti-Arab and should not be recognized, that Taiwan was an historical part of mainland China and should be politically re-integrated, that Hong Kong would revert to Chinese sovereignty on the expiration of the 99 year lease with Great Britain, and that North and South Korea should be peacefully reunited. In each of these areas, China's position has not wavered even as domestic political and economic changes have taken place.

During the Cold War, China and the Soviet Union each sought to lead the developing world in a struggle against Western political and economic domination. China severed all ties with countries that granted diplomatic recognition of Taiwan, even as the latter continued to hold a permanent seat on the UN Security Council. In 1963, Prime Minister Chou En Lai made a visit to ten countries in Africa to strengthen diplomatic ties. Although France granted diplomatic recognition to mainland China in 1964, China continued to present itself as an ideological window in which every success would be viewed as a victory for communism, and thus state-driven policies. For many African countries seeking greater independence from their former colonial masters, this was a seductive formula. Not surprisingly, of the 76 UN votes in favor of mainland China's application to replace Taiwan at the UN Security Council, 25 were by African countries.

The passing of Mao Tse Tung in 1976 marked a turning point in the Cold War. With the United States no longer at war in Vietnam, China began a slow transition away from the political and military diplomacy under Mao to the expansion of market reforms for economic growth. Much of this took place under Deng Xiao Ping, whose emphasis on market socialism was characterized by the phrase: "It makes little difference if the cat is grey or black as long as it can still catch the mouse".

China's first steps in this reform were diplomatic. In addition to the principles of independence, decolonization and non-interference, Deng added the principle of peace through mutual efforts, and that economic development constitutes the centerpiece of non-alignment. As evidence of this new initiative, China's efforts to secure new sources of petroleum explicitly avoided any reference to governance, the environment, or human rights. And African leaders responded in kind in affirming mutual respect in a climate of cultural diversity.

China's approach to economic ties differs from that of the West. Western countries engaged in mineral resource industries, for example, often tie their commitments to environmental quality, to sustainable development, financial transparency, and in general, to good governance<sup>14</sup>. In this context, Western observers have often criticized Chinese initiatives that are relatively expensive, with doubtful utility, or with unrealistic goals. This has been particularly so in reference to Chinese projects that are more or less grants or without any conditions involving the above criteria. As to the Chinese, their own approach has been expressed in a document put forth by President Hu Jintao in Jakarta in April 2005, The New African-Asian Strategic Partnership<sup>15</sup>. While these differences in approach are significant, in the near term at least, as long as African countries enjoy real increases in per capita income, issues of environmental quality, financial transparency, good governance and the like will probably be ignored by African countries<sup>16</sup>. Some have even characterized China's purely commercial policy as a "Chinese safari in the African El Dorado"<sup>17</sup>.

#### **The Economic Significance of Sino-African Economic Cooperation**

Nothing symbolizes more China's interest in Africa than in the energy sector. We have already noted China's growing demand for energy and raw materials, and that Africa is a likely source for major expansion in the future. To appreciate the magnitude of the energy sector, we show in Table 2 below the economic significance of energy to the two zones.

TABLE 2: PRODUCTION AND CONSUMPTION OF PRIMARY ENERGY

<b>Crude Oil production</b> in millions of metric tons		<b>Primary Energy Consumption</b> millions of metric tons of oil equivalent	
Asia and Pacific Asia*	386 (9.9%)		3,954 (35.1%)
of which China	181		1,717
Africa	465 (11.9%)		579 (5.1%)
Europe**	847 (21.6%)		2,008 (17.8%)
North America	624 (15.9%)		2,580 (22.9%)
Middle East	1,232 (31.4%)		504 (4.5%)
<b>Total</b>	<b>3,918</b>	<b>Total</b>	<b>11,276</b>

\* Asia-Pacific: Japan, Australia, New Zealand

\*\* including Eurasia (Kazakhstan and Russia)

Source : ENERDATA, September 2006

What Table 2 does not show is that the imbalances in petroleum are even more acute. Petroleum, along with natural gas, remains far and away the most desirable form of primary energy, the remainder being accounted for mostly by coal, followed by nuclear energy, and renewable sources. China's entry in the global economy as a major source of fossil fuel consumption complicates not just the energy balances of the rest of the world, but also the effects of China's energy consumption on the environment.

Apart from the impact of the Three Gorges dam project that we have already noted, we find that while China's per capita energy consumption still is relatively small, the rate of growth may place considerable demand on global energy supplies for the future. Already China's per capita consumption of 1.32 metric tons of oil equivalent in 2005 exceeds that of India, at .78 metric tons of oil equivalent. And while China's one-child per family policy will undoubtedly slow consumption somewhat, even at present rates, China's population still is expanding by some 9.6 million each year.

## Tracking the Balance of Trade and Investment

In light of China's growing need for primary resources, and of the role that Africa is likely to play in meeting that demand, it is worth taking stock of the magnitudes in question. As of 2005, China's exports of manufactured goods to Africa stood at U.S. \$18.3 billion, while African exports to China were valued at U.S. \$20 billion. This nominal deficit is actually somewhat greater if we take into consideration the net cost of Chinese foreign direct investment and technical assistance to Africa. As to China, Africa's exports represent only 3.6 percent of Chinese imports, and 3.3 percent of its exports. The small deficit that this entails is more than offset by the trade and investment surplus that China enjoys with other parts of the world, most notably to North America and the European Union. And for African countries, this new source of trade and investment is significant in comparison to historical norms<sup>18</sup>.

Chinese expertise in mineral exploration and refinement has resulted in a major role in the development of fields in Angola, Gabon, Zimbabwe, Sudan, Nigeria, and Algeria, among others. Although China's national oil company, CNOOC, undertook an unsuccessful bid to purchase UNOCAL,

In the Sudan, China picked up the trail of oil exploration started by western companies. In a key move, the CNOOC, Petronas, and Talisman began developing the Muglad oil reserve in the southern part of the country. They bypassed American firms who had disapproved of Khartoum's persecution of Christian rebels in the south. The result of this operation is that China now purchases six percent of all of its crude oil from the Sudan. Muglad now produces 500,000 barrels per day and the Chinese-constructed oil refinery can process 2.5 million barrels of crude per year, and which is transported by oil pipeline to the Red Sea export terminal at Lamu. And, in order to secure the flow of crude oil, Chinese guards have been deployed along the lines leading from the oil field to the refinery and thence to the export terminal<sup>19</sup>. While accurate figures are hard to come by, it appears that China is buying up to fifty percent of Sudan's oil production (some 10 million metric tons out of 18.7 produced in 2005). This is a surprising figure, given the classification in 2006 by *Foreign Policy* that the Sudan is one of the most unstable countries in the world<sup>20</sup>.

In Nigeria, which produces some 232 million metric tons of oil equivalent and exports 60 percent of its production, CNOOC now controls 45 percent of the oil consortium, Nigerian South Atlantic Petroleum. Nigeria is the fifth largest oil exporter in the world, with more than 2.5 million barrels of daily production. At the same time, Nigeria is one of the most corrupt countries in the world and its vast oil production takes place against a backdrop of extreme poverty of the local population. This has resulted in guerilla actions by local forces against major oil companies in the Niger Delta, and have discouraged additional foreign capital inflows to develop Nigeria's potential.

Angola had been abandoned by the Chinese in the middle of the 1970s as the Soviet Union worked to develop local oil production. This situation was reversed in the last fifteen years, with China now purchasing thirty percent of Angolese oil exports. In 2006, Angola became the largest source of oil exports to China, and officials in Luanda have begun plans for a Chinese quarter to expand local production, with direct air flights to Beijing<sup>21</sup>. However, as in the case of Nigeria and the Sudan, Angola's oil exports have become subject to routine raids by local groups seeking to de-stabilize the regime, particularly in the area of Cabinda. Angola's oil production, which

reached 60 millions of metric tons of oil equivalent make the country a powerful magnet for Chinese firms. And to secure the flow of crude, Chinese officials have sold armaments to the local military to counter major opposition groups such as UNITA.

In Algeria, the China Petroleum and Chemical Corporation (SINOPEC), undertook an investment of U.S. \$400 million in September 2002 to develop the Zarzaitine, near Hassi Messaoud, as well as the construction of a refinery in Adrar. In 2003, half of the Algeria's total imports came from China. In 2004, Chinese and Algerian officials signed a bilateral cooperation agreement organizing the trade of Algerian petroleum products with Chinese manufactured goods.

## **China's Foreign Direct Investment Flows in Africa**

Foreign Direct Investment (FDI) is an important corollary of bilateral trade relations between China and its various country partners. While China itself is a major recipient of Western FDI, China is providing in turn major flows to the developing world<sup>22</sup>. Typically, FDI in China is undertaken by governmental agencies, firms, or western investors drawn to the double digit growth that the country has enjoyed for the past several years. However, China's FDI abroad differs in some fundamental respects: western investment in China is predominantly privately owned, whereas Chinese FDI abroad is overwhelming undertaken by publicly owned enterprises. Moreover, these public firms make such decisions only under authorization of the Chinese Communist Party, which continues to retain its monopoly over China's political governance.

China has become the most dynamic destination for Africa's external trade. Between 1999 and 2004, the value of African exports to China have increased by 48 percent per year. In turn, the value of African imports from China have increased by 18 percent per year, reaching U.S.\$11 billion in 2005. At current levels, Africa's trade with China is supplanting that of Japan, which for quite some time was the principal Asian competitor to European and North American firms in the region.

China has an incentive structure to expand new capital inflows to the west of the country even as export industries are being developed. In 2004, the number of Chinese firms undertaking FDI abroad was 2,000 and reached 5,000 in 2006. The value of this Chinese FDI is expected to reach U.S.\$25 billion dollars within ten years. As this pattern unfolds, China's embrace of globalization is basically irreversible for the foreseeable future. And for Africa, it means a Chinese major role in uranium exploration in the Central African Republic, railway, public works, lumber, manganese and niobium in Gabon, bauxite and aluminum in Guinée-Conakry, coal chrome and public works in Zimbabwe, public works in Ethiopia, public works, copper, and cobalt in the Democratic Republic of the Congo, and copper and cobalt in Zambia, just to name a few.

China is the largest importer of African timber. In the Congo basin alone, China imports 4 million metric tons of logs each year. The Gabon National Timber company has opened a branch in Shanghai. Chinese firms, working in joint ventures with local firms, have obtained major logging concessions in Africa. This has provoked major debate over deforestation and sustainability of timber harvesting in Africa. Logging in Africa often is undertaken illegally by local poachers, whether for local interests or foreign firms seeking new sources of supply. To the extent that Chinese firms are displacing either Western or local firms, the concern is whether environmental norms are going to be further undermined from their already precarious state.

The extraordinary deployment of Chinese overseas investment is unfolding against a backdrop of concern over sudden interruptions of supply that could undermine China's dramatic rates of growth. As a result, Chinese firms have become particularly aggressive in seeking local contracts for exploration and extraction of primary materials, especially in comparison to Western oil, timber, and mining firms operating in the area.

Data on FDI flows released by the Chinese Ministry of Trade (MOFCOM) list an inflow value of U.S.\$60.3 billion in 2005, rising progressively to U.S.\$72 billion by the end of 2006. At this rate, China is poised to displace Great Britain and the United States as the primary destination of FDI in the world. Such capital inflows to China stimulate the expansion of China's exports, and in turn, China's need to expand its own FDI in primary commodity rich areas such as Africa.

TABLE 3: CHINESE OUTBOUND FOREIGN DIRECT INVESTMENT

	2005 Pct.	2005	2006*	2015*
Asia Pacific	41.9%	\$2,933	\$3,600	\$10,500
European Union	22.8%	\$1,596	\$2,000	\$5,700
Other Europe	10.0%	\$700	\$900	\$2,500

<b>World</b>		<b>\$7,007</b>	<b>\$8,800</b>	<b>\$25,000</b>

\*Estimate based on growth during 2004 to 2005

\*\*Estimate based on global levels of FDI of \$25 billion in 2015

One factor that underlines China's overseas investment, particularly in minerals, is the political uncertainty in the Middle East. As would any risk averse investor, Chinese firms, like their Western counterparts, are increasingly making efforts to diversify their investments in minerals, for which Africa is a major beneficiary. As this Chinese economic offensive unfolds, we see a web of interrelationships that are flourishing. As African exports, particularly mineral exports, to China expand, what is likely is that Chinese firms, which are essentially para-statal enterprises, will undertake more transformative investments in Africa. Thus far, this has included some 800 Chinese firms in Africa engaged in agribusiness, fishing, mines, exotic timber species, telecommunications, radio stations, and tourism, to mention a few. In fact, Chinese tourism in Africa is taking an ever larger role. And in exchange, China often grants zero tariffs for many African exports as a way of guaranteeing reliability of supply.

### The Downside of Sino-African Economic Relations

Several criticisms have been made of the expanding China-African relationship. Some of them have been posed by foreign observers while others have been made by Africans themselves. We examine briefly the nature of these criticisms and what they portend for the future.

One oft-cited criticism is that when Chinese nationals establish a presence in an African country they do so through a strict system of social and cultural separation. The lack of interpersonal contact is seen as impeding mutual understanding, even though it could simply be a matter of a lack of comprehension of their respective languages of communication. In contrast, Western firm employees typically live in the same areas as their African counterparts, eat in the same restaurants with their counterparts, and hire local Africans for maintenance and household services. From this often flow friendships that are sustained even beyond the terms of an immediate local contract. And it is not that unusual for a Western bachelor to marry an African with whom he or she would have a family.

Chinese contractors typically follow a different pattern. They frequently travel in groups, without their family, and bring Chinese nationals from home to handle such services as health care, household cooks, and the like. They appear rarely to mix with local Africans outside of official diplomatic functions, which reinforces a level of cultural separation. This is particularly so in the context of importing Chinese workers to perform functions that local, and often unemployed, Africans could do. This separatism echoes the criticisms once made of former European colonial powers over "exploitation" of local economies for their natural resources to the benefit of a homeland country.

What makes this image even more problematic is the rising flood of Chinese manufactured goods in African local markets, especially in cotton where recent declines in global prices have severely undermined African production.

Finally, China's commercial interests in Africa take place in a context of efforts to improve local governance, to support the expansion of democratic institutions and the fight against corruption. The rise in financial flows from China create economic opportunity for some, but as long as China's economic policies ignore

the larger political realities of corruption and abuse of human rights, the benefits are seen by many Africans as largely foregone. It is why there has been such vehement criticism of China's economic cooperation in the Sudan in the face of the humanitarian crisis in Darfur, for example.

When faced with these criticisms, Chinese officials often express irritation, and point to their policy of non-interference in the internal affairs of countries with whom they are dealing. They point out that Chinese purchases of petroleum products are well below those of Western firms, particularly those from the United States. Moreover, the Chinese point to the major investments they have made in the infrastructure of several African countries. And Chinese officials consider that criticisms of their policies are simply a cover for Western interests with whom they now are competing for local trade and investment.

## Conclusion

The global economy is in a process of continual evolution. The changes wrought by trade and investment vary substantially from one region to another, and from one time period to another. What makes today's situation unique is the relative stagnation of the West, the chronic problems in Africa, and the dramatic growth in Asia. China is the primary beneficiary of foreign direct investment, and undertakes massive investments in Africa to assure steady flows of the primary natural resources on which its future growth depends. In less than ten years, it has become a major partner in Africa whose comprehensive programs of cooperation in the cultural, financial, economic, and commercial spheres place it in the same ranks as Great Britain, France, Portugal and the United States.

Up till now Sino-African relations have been largely unilateral: the Chinese make major investments in Africa while Africa's presence in China is practically non-existent. While recent declarations by China's Ministry of Foreign Affairs point to a more egalitarian partnership in trade and investment, the very differences in economic and demographic size suggest that this is not likely to take place in the near future. In the present context, one must ask whether Chinese trade and investment in Africa will simply reinforce African economies in their role of producers of primary commodities. Major hurdles to the expansion of higher value-added industry in Africa reinforce this risk. In this regard, many African economists may be right when they look at the growing Chinese presence in Africa as a Faustian bargain.

<sup>14</sup> Non-interference of Chinese officials in authoritarian, dictatorial, and sometimes brutal regimes has become clear in the case of the Sudan. Chinese officials working in the country have refused to criticize the regime in Khartoum in response to the genocide in Darfur that began in July of 2004. China's ambassador on the UN Security Council refused to vote in favor of a resolution condemning events in Darfur, and refused to support an amendment that would embargo arms sales to the Sudan. China also abstained when charges against the Sudanese actions in Darfur were brought before the International Criminal Court in April 2005.

<sup>15</sup> This new partnership is focused on the creation of new economic and commercial strategic ties between Asia and Africa. At the opening of the summit meeting, the President was quoted as saying that “from a glorious past to a bright future: let us build a new type of strategic partnership between Asia and Africa.” The practical import of this meeting was a new emphasis on the building of infrastructure projects in Africa, on the expansion of agricultural productivity, and on the development of human resources in the region.

<sup>16</sup> Since the first Sino-African Cooperation Forum in Beijing in 2000, a consultative mechanism has been established and periodically renewed. At present, Hu Jintao and Wen Jiabao will spearhead the new forces of cooperation between China and Africa.

# Chinese Accounting Standards Convergence in Comparison with the U.S. and Japan

*Yu Wang, io@mail.doshisha.ac.jp  
Doshisha University, Japan*

## Abstract

In an international convergence of accounting standards, the International Accounting Standards Board (IASB) reviewed China; which is considered a new economic powerhouse under "BRIC" (Brazil, Russia, India, China). As a result of this, the China Accounting Standards Committee (CASC) and the IASB held a meeting for accounting standards on the 7<sup>th</sup> and 8<sup>th</sup> of November, 2005 in Beijing. Like the United States and Japan, China is committed to convergence with the International Financial Reporting Standards (IFRS). In February 2006, the Ministry of Finance issued a series of new directives and revised Accounting Standards for Business Enterprises (ASBE); which included the revised Basic Standards, twenty-two newly promulgated accounting standards and sixteen revised accounting standards. In this presentation I will analyze contents of the "Beijing Joint Statement" while confirming the Norwalk Agreement and the Tokyo Agreement. Then I will introduce the changed conditions of Chinese accounting standards after the "Beijing Joint Statement". Finally, I will highlight the main points of the convergence in China.

## Introduction

In recent years, with the globalization of corporate management activity the globalization of the capital market advanced rapidly, too, and thus the demand for the ability to compare accounts has risen as well. In an international convergence of accounting standards in September 2002, the "Norwalk Agreement" was committed to by both the IASB (International Accounting Standards Board) and the FASB (Financial Accounting Standards Board). Furthermore, on January 21, 2005, the ASBJ (Accounting Standards Board of Japan) and the IASB announced their agreement to launch a joint project for convergence; it was called the "Tokyo Agreement".

With China emerging as a strong economy as part of "BRIC" (Brazil, Russia, India, China, a term coined by the American firm Goldman Sachs. These four countries are considered to be the most important up and coming in the world economy) the IASB worked with them in order to have them converge to IFRS (International Financial Reporting Standards). As a result of this, the China Accounting Standards Committee (CASC) and the IASB held a meeting for accounting standards on the 7<sup>th</sup> and 8<sup>th</sup> of November, 2005 in Beijing. After the "Beijing Joint", the Chinese accounting standards have been undergoing changes in order to converge to IFRS. The IASB Chairman Sir David Tweedie pointed out that "Like the United States and Japan, China is committed to convergence with IFRS" [Tweedie, (2006); 11]. This is one of the bases for considering China to be a convergence country.

In this presentation I will begin by introducing the process of accounting development in china from 1949 to the present. Then, I will analyze the contents of the "Beijing Joint Statement" while confirming the "Norwalk Agreement" and the "Tokyo Agreement". Furthermore, I will introduce the changed conditions of Chinese accounting standards and auditing standards after the "Beijing Joint Statement". Finally, I will highlight the main points of the convergence in China.

## The Process of Accounting Development in China

In October, 1949, the People's Republic of China was formed. In December 1949, the Department of Administration of Accounting Affairs (DAAA) was charged with the responsibility to institute uniform nation-wide accounting systems and administer the accounting work in the entire country under the Minister of Finance. Two important functions of the DAAA were to unify the accounting systems across different economic units and to use the accounting system to assist for the economic recovery. "These aim led to the promulgation of uniform accounting regulations as a tool of the centralized economy" [Chang, (2004); p.236, 5].

TABLE 1: THE PROCESS OF ACCOUNTING DEVELOPMENT IN CHINA

Policy and Law Background	Phase	Development Stage of Accounts System	
A planned economy and Economic recovery	1949-1952	A postwar recovery and establishment stage of accounting systems	
	1953-1957	An introduction stage of Soviet Union-style accounts	
Great Leap Forward	1958-1960	A foundation maintenance stage of accounting systems	
Adjustment of national economy	1961-1965		
Cultural Revolution	1966-1976		
Preparations for economic revitalization	1977-1978	No accounting development	
Planned Commodity Economy Accounting Law(1985)	1979-1984	The domestic accounting law and rule maintenance	
	1985-1992	The Chinese government begins a harmonization to international accounting standards, and begins to converge to IFRS	The preliminary stage
1993-1996	The foundation stage		
1997-2006	The making of concrete rules		
2007-now	Enforcement of the convergence		
Socialist market economy with Chinese Characteristics(1993) Accounting Standards(1993) Participation to WTO(2001) Beijing Joint statement(2005)			

50 years later, in October 1998, the China Accounting Standards Committee was established under the MOF. The aim of the CASC is to provide advice and recommendations on setting and improving accounting standards in China. TABLE 1 summarizes the process of accounting development from 1949 to the present.

As TABLE 1 indicates, the Chinese government has been beginning to harmonize to international accounting standards since 1985, and has been converged with IFRS since 2003.

In March 2003 CASC was reorganized. The new CASC under the MOF consists of 20 committees and 160 people as the associated person. "The members are engaged by the MOF and are selected from relevant government agencies, the academic circle, accounting professional organizations, intermediaries and the business, and they are highly representative" [CSAC,(2003); p.3, 3]. However, CASC is different from FASB or ABSJ as it serves as an establishment function of accounting standards for the public sector not the private. CASC has played an active role and provided a lot of constructive advice on setting and improving Chinese accounting standards.

## Correspondence to IFRS in China

The number of countries who have already adopted IFRS as their own standard exceeds 100, with the U.S.A., Japan and China as the convergence countries planning to converge with IFRS. Before turning to a closer examination of the "Beijing Joint Statement", a few remarks should be made concerning IASB, the "Norwalk Agreement" and the "Tokyo Agreement".

### IASB

The International Accounting Standards Board was established in 2001 as part of the International Accounting Standards Committee (IASC) Foundation. The objectives of the IASB are "(a) to develop, in the public interest, a single set of high quality, understandable and enforceable global accounting standards that require high quality, transparent and comparable information in financial statements and other financial reporting to help participants in the various capital markets of the world and other users of the information to make economic decisions; (b) to promote the use and rigorous application of those standards; and (c) to work actively with national standard-setters to bring about convergence of national accounting standards and IFRSs to high quality solution" [IASB, (2007); p26, 9].

### **The Norwalk Agreement**

In the United States, The Financial Accounting Standards Board has been the designated organization in the private sector for establishing standards of financial accounting and reporting since 1973.

The IASB and the FASB reached an agreement the US to move to converge with IFRS at a meeting in Norwalk, Connecticut, USA on September 18, 2002. The agreement is known as the “Norwalk Agreement for a Memorandum of Understanding”. In the Norwalk Agreement, what is important is that “[t]he IASB and FASB agree, as a matter of high priority, to a) undertake a short-term project *aimed at removing a variety of individual differences* between U.S.GAAP and International Financial Reporting Standards(IFRSs, with include International Accounting Standards, IASs); b) remove other differences between IFRSs and U.S.GAAP that will remain at January 1, 2005 , though coordination of their future work programs; that is , through the mutual undertaking of discrete, substantial projects which both Boards would address concurrently; c) continue progress on the joint projects that they are currently undertaking; and, d) encourage their respective interpretative bodies to coordinate their activities.”[IASB, (2003); 7].

### **The Tokyo Agreement**

In Japan, The Financial Accounting Standards Foundation (FASF) was established in July 2001. The Accounting Standards Board of Japan is the core organization within the FASF. The ASBJ is “directly responsible for the development and deliberation of accounting standards and the foundation's contributions to the development and improvement of international accounting standards” [ASBJ, (2007) ; 2].

On January 21, 2005, the IASB and the ASBJ held a meeting in Tokyo, Japan. At this meeting both boards agreed and announced their agreement to launch a joint project for convergence with IFRS. In the Tokyo Agreement, it is important that “1. The boards will identify and assess differences in their existing standards on the basis of their respective conceptual frameworks or basic philosophies with *the aim of reducing those differences* where economic substance or market environments such as legal systems are equivalent. 2. The boards will address the differences in their respective conceptual frameworks. This will take place later in the project, as a separate subproject, at a time agreed by the boards. 3. The boards will consider their respective due process requirements in arriving at agreement. 4. [t]he ASBJ will undertake a study to get an overall picture of major difference between Japanese accounting standards and IFRSs and will identify topics to be discussed. 5. The boards will adopt a phased approach to the comparative reviews of differences in individual standards” [IASB, (2005); 8].

### **Beijing Joint Statement**

After the “Norwalk Agreement” and the “Tokyo Agreement”, on November 7th and 8th, 2005, CASC and IASB held a successful convergence meeting on accounting standards in Beijing. It was named the “Beijing Joint Statement”. The meeting was co-chaired by China’s Vice-Minister of Finance and Secretary-General of the CASC Mr. Wang Jun and the IASB Chairman Sir David Tweedie. *Joint Statement of the Secretary-General of the China Accounting Standards Committee and the Chairman of the International Accounting Standards Board* is attached with TABLE 2 [CASC, (2005); 4] to keep contents under control precisely.

In the “Beijing Joint Statement”, there are some points that differ from the “Norwalk Agreement” and the “Tokyo Agreement”. They are (a) China stated that convergence is one of the fundamental goals of their standards-setting program, with the intention that an enterprise applying Accounting Standards for Business Enterprises (ASBE) should produce financial statements that are the same as those of an enterprise that applies IFRS. (b) The IASB delegation acknowledged that convergence with IFRS will take time and how to converge with IFRS is a matter for China to determine (see the TABLE 2).

On February 15, 2006, the Ministry of Finance released a series of new directives and revised Accounting Standards for Business Enterprises; which included the revised Basic Standards, twenty-two newly promulgated accounting standards and sixteen revised accounting standards. The MOF also issued forty-eight Auditing Standards for Certified Public Accountants (ASCPA) in the same release ceremony in Beijing. The ASBE and the ASCPA are applied to listed companies from January 2007. The adoption of the ASBE brings about substantial convergence between the Chinese accounting standards and IFRS. The Chinese government insists that the meaning of convergence is (a) convergence is the future; (b) convergence is not replacement; (c) convergence is a process; (d) convergence is interaction; (e) convergence is the new starting point [Wang, J.(2006); 12].

TABLE 2 : BEIJING JOINT STATEMENT

**Joint Statement of the Secretary-General of the China Accounting Standards Committee and the Chairman of the International Accounting Standards Board**

□ □ □

Both parties agree that establishing and improving a single set of high quality global accounting standards is the logical consequence of the trend of economic globalization. International convergence takes time to happen. It is a goal to which the IASB as well as national accounting standard setters of all jurisdictions in the world should continue to make sustained efforts. China stated that convergence is one of the fundamental goals of their standard-setting programme, with the intention that an enterprise applying CASs should produce financial statements that are the same as those of an enterprise that applies IFRSs. How to convergence with IFRSs is a matter for China to determine.

The IASB notes that, in convergence their national standards with IFRSs, some countries add provisions and implementation guidance not included in IFRSs to reflect the circumstances of those countries. This is a pragmatic and advisable approach with which China agrees.

During the past year, China has issued Exposure Drafts of the Basic Accounting Standards for Business Enterprises and 20 specific standards. China expects to issue two more Exposure Drafts. At the same time, China has also begun a review of its 16 existing CASs. As a result, China's accounting standards system for business enterprises is being developed with a view to achieve convergence of those standards with the equivalent IFRSs. The IASB applauds and expresses admiration for the enormous progress already made toward convergence.

The two parties acknowledged that differences between CASs and IFRSs still exist at the moment on a limited number of matters, including reversal of impairment losses, disclosure of related party relationships and transactions, and accounting for certain government grants. Both parties agreed to work to eliminate those differences as quickly as possible. They noted, however, that there are relatively small matters as compared to matters on which the CASC's recent work has achieved such significant progress toward convergence.

During the discussions, the IASB identified a number of accounting issues for which China. Because of its unique circumstances and environment, could be particularly helpful to the IASB in finding high quality solutions for IFRSs. These include disclosure of related party transactions, fair value measurements and business combinations of entities under common control. The CASC has agreed to assist the IASB in researching and providing recommendations on these issues. Similarly, in reviewing the revisions to the EDs, existing standards, and the implementation guidance, the CASC will get assistance from the IASB as well.

As a result of the success of this joint meeting the CASC and the IASB have agreed to continue to meet periodically and strengthen the exchange and co-operation between the two parties, to achieve convergence of the Chinese Accounting Standards for Business Enterprises with the International Financial Reporting Standards.

Wang Jun  
Secretary-General  
China Accounting Standards Committee

David Tweedie  
Chairman  
International Accounting Standards Board

We may say that the real intention of the "Beijing Joint Statement" was to declare the Chinese accounting strategy and the result through IASB to the world. That is to say: China was authorized by the IASB to become a convergence country; the Chinese government withholds the right to establish accounting rules to their own standards; existing Chinese accounting standards are near the IFRS level; the promulgation and the enforcement of the ASBE has lead to the realization of convergence; China has made contact with the U.S. and Japan as a convergence country in the accounting standards research field.

## Chinese Accounting Standards

Chinese accounting strategy is presented by the ASBE promulgation and enforcement. Convergence to IFRS is not an easy thing by any means. With the enforcement of the ASBE and the application indicators the Chinese corporate accounting has changed greatly.

On February 15, 2006, the new standards mentioned after the "Beijing Joint Statement" were released by the MOF. In October, 2006, the MOF promulgated the application indicators of the thirty-two accounting standards and an appendix (including the title of the accounts and the interpretation) except the No.15-Construction contracts; the No.25-Direct insurance contracts; the No.26-Re-insurance contracts; the No.29-Events occurring after the balance sheet date; the No.36-Related party disclosure of the ASBE. This new accounting standards system is applied to about 1,400 listed companies from January 1, 2007 and is going to apply to medium and large sized companies by 2010. Here are TABLE 3 and TABLE 4 which show the details of the ASBE and auditing standards.

TABLE 3: THE LIST OF THE ACCOUNTING STANDARDS FOR BUSINESS ENTERPRISES

## **New Chinese Accounting Standards System**

In China, the maintenance of the domestic accounting rules has been continued with the international harmonization of the accounting standards from the middle of the 1980's. As a result, show in the lower left of [FIG 1] "The pyramid type accounts rules" consisted of five classes: (a) Accounting Law; (b) Financial and Accounting Reporting Regulations for Business Enterprises; (c) Accounting Standards for Business Enterprises - Basics Standard; (d) Individual accounting standards; (e) Accounting rules according to the type of Business.

After the "Beijing Joint Statement", the Chinese MOF promulgated the ASBE and the application indicators. The new system of Chinese accounting standards was formed. The listed companies stopped using the "Accounting rules according to the type of Business" by switching to the new standards as of January 1, 2007; which has caused great change in the Chinese accounting system.

The Chinese accounting rules structure has begun to evolve into two levels with the Accounting Law and the ASBE from 2007. The accounting regulations or accounting rules are gathered by the accounting standards. The standards of corresponding to the global economy and the national economy are established according to the Accounting Law. Because Article 8 of the Accounting law states: "The State shall exercise a uniform accounting system. The uniform accounting system of the State shall be formulated and promulgated by the financial department of the State Council in accordance with this law"[Accounting Law 1]. In other words, the included accounting standards unified in the accounting system must be established based on the Accounting Law. Unlike the U.S. and Japan, the companies must make financial reporting based on the ASBE in China.

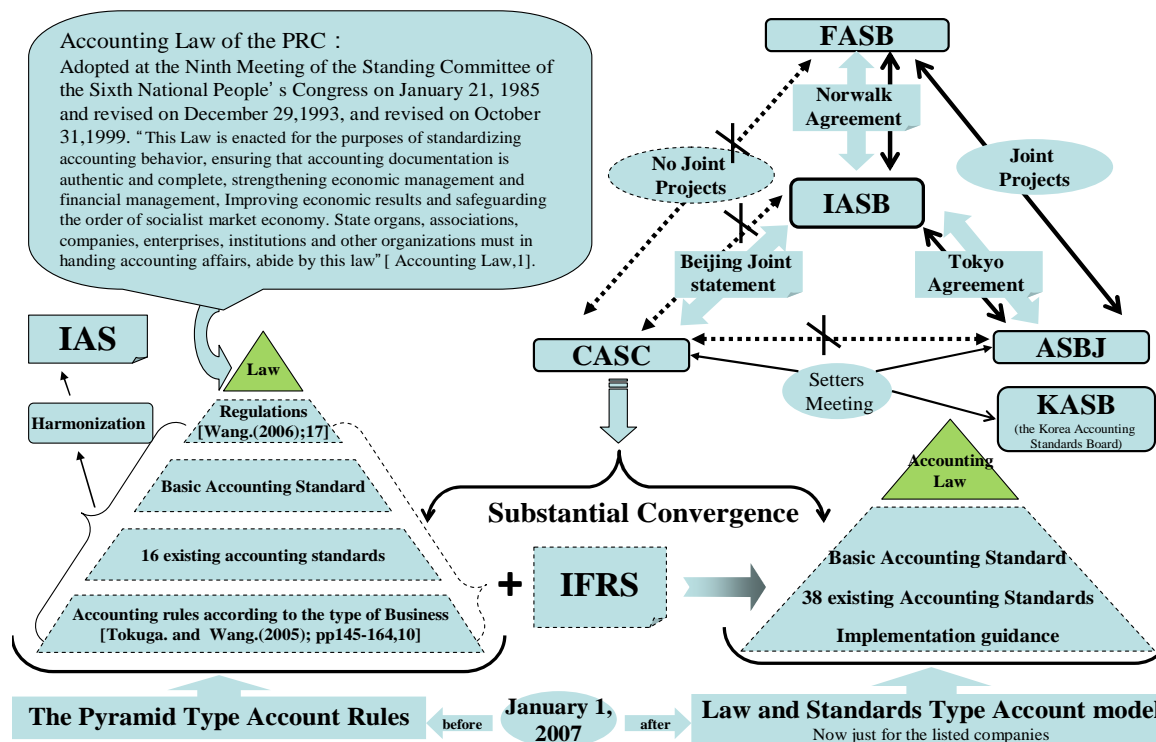

FIG 1: NEW CHINESE ACCOUNTING STANDARDS SYSTEM

## Concluding Remarks

As [FIG 1] above shows, the Chinese government was able to use parts of IFRS in addition to their current standards in the context of the current accounting rules structure. Furthermore, in relation to the establishment, revision and abolition of accounting standards, the IASB will allow China to control them independently. It may be said that this is Chinese accounting strategic success in convergence to IFRS.

The aim of the Chinese accounting standards was changed with the "Beijing Joint Statement" from an international harmonization to an international convergence. In preparation to enter the global economy China has assumed a higher quality of account standards. As is generally known, the U.S., Japan and China have international economic relations. It is certain that the economic relations of these three countries will remain close in the future.

There are, however, some concerns. Although China has joined the WTO, the U.S. and the EU do not recognize it as "a market economy country". Because China is not recognized as a market economy, when it exports products the U.S. and the EU charge high tariffs. One of the causes for the discrepancy in cost is the usage of different accounting standards and is exacerbated by a lack of trained personnel.

As the top right of [FIG 1] shows, the U.S., Japan, and China, as the convergence countries, should cooperate in "developing global accounting standards of a high quality that can be easily understood" with the IASB. The IASB, the FASB and the ASBJ currently carry out many joint projects or periodical discussions, Although China has had meetings with the IASB or the ASBJ, China has yet to do any joint projects with any of the boards. The financial reports that Chinese companies are using for the 2007 fiscal year, based on the new IASB convergence standard, will not be available until March 2008.

The points of convergence in China I want to make is that (a) CASB has to start the joint projects with IASB, or FASB, or ASBJ for proceeding to convergence to the IFRS; (b) to train the accounting personnel who can work in the global economy to come close to the international level; (c) China should strengthen overseas

interchange in accounts study and should introduce the accounts present Chinese accounting conditions in detail; and (d) Not only the convergence of Accounting Standards but also the corporate governance of the companies, business custom of the companies should come up at the international level too.

In November 2006, the IASB trustees appointed Zhang-WeiGuo (Chief Accountant and Director General of the Department of International Affairs of the China Securities Regulatory Commission). He will join the IASB as a full time member on the first of July, 2007 for a five year renewable term. Dr Zhang becomes the second IASB member from Asia. China is expected to make accounting standards of high quality and to maintain the trust of domestic and international investors as well as overcome the handicap of being labeled a “non-market economy country”.

# A Comparative Study of Job Search Behavioral Model between Japan and Korea

*Norihiko Takeuchi, takeuchi@ms.kuki.tus.ac.jp*  
*Tokyo University of Science, Japan*  
*Yu Hee Jung, happyhee7801@hotmail.com*  
*Meiji University, Japan*

## Abstract

Using 347 university student samples from Japan and Korea, we attempted to test the relationships among multiple forms of self-efficacies and job search behaviors. In particular, we hypothesized the mediating effects of job search self-efficacy (JSSE) on the relationships between generalized self-efficacy (GSE) and job search behaviors, based on the Saks and Ashforth's (2002) conceptualization of job search. Results of our path analyses for a Japanese sample supported the hypothesized sequential effects initiating from GSE, JSSE, to various job search behaviors. On the other hand, results for our Korean sample negated our hypotheses in that GSE variables were found directly influencing career planning. In the discussion, a revision to our hypothesized model was, therefore, made to better explain Korean students' job search behaviors based on the notion of theory of planned behaviors (Ajzen, 1985). Cross-cultural differences in the concept of job search and career planning between two East Asian countries were discussed.

## Introduction

It is well known that self-efficacy has now become a crucially important concept that was found in the past to have strong relationships with various psychological constructs, including personality traits, core self-evaluation (Judge et al., 2003), cultural values (Xie et al., 2006), and so forth. The concept of self-efficacy refers to a person's beliefs about his/her abilities. In the area of career development studies, especially those focusing on adolescents, many scholars have argued and examined positive relationships among generalized self-evaluations, expectancies, and job search and career maturity-related concepts (Kanfer, Wanberge, & Kantrowiz, 2001).

It is known, however, that there are a number of issues that call for further explorations and examinations by adding new findings to extant literatures on self-efficacy and job search. Among others, one important aspect overlooked by the previous studies is an examination of the interrelationships between multiple forms of self-efficacy constructs and various job search behaviors among university students. Specifically, prior work of this field tended to regard as relatively independent ones each of the various self-efficacy concepts, including 'career decision making self-efficacy' (CDMSE: Taylor and Betz, 1983), 'job search self-efficacy' (JSSE: Caplan et al., 1989), and 'generalized self-efficacy' (GSE: Saks & Ashforth, 2000). In such an assumption, most of the extant studies have only examined direct and straightforward effects of one type of self-efficacies on job search and career-related attitudes and behaviors. However, it is reasonably conceivable that there would be a sequence or causality among multiple forms of self-efficacy for the prediction of a person's job search: namely, an impact of job and career-related self-efficacy on job search would be in a direct manner, while that of generalized self-efficacy on job search would be in an indirect or conditional manner.

Moreover, the situation where job search activities have become an important meaning of people's work lives is true not only to the Western countries, but also to the Asian societies. In particular, many Asian countries experienced the financial crisis at the end of 90's, which led many companies in Asia to considering organizational restructuring and downsizing and to changing the nature of work for their human resources. Furthermore, employment practices have shifted from, so called, lifetime employment to short or midterm one in order to reduce personnel expenses within companies and to encourage their employees to develop more individualized and autonomous careers in many Asian countries, including Japan and Korea. Since the end of 90's, millions of people in Japan and Korea have engaged in finding their jobs in each year, as a result of an increased number of involuntary job loss, reentry in the workforce, and/or new career opportunities brought by some emerging ventures (Japanese

Institute for Labour Policy and Training, 2004; Korean Statistics Bureau, 2005). However, studies that focused on examining the psychological and attitudinal processes of successful job search have little been conducted to date in many Asian countries.

Guided by the aforementioned backgrounds, our study sheds light on testing the relationships among multiple forms of self-efficacies and various job search behaviors using 347 university student samples from two different nations in East Asia: namely, from Japan and Korea. Specifically, following a conceptualization of job search by the Saks and Ashforth's (2002) work, we attempt to examine the mediation model where job search self-efficacy would mediate the relationship between generalized self-efficacy and job search behaviors, including career planning and preparatory and active job search behaviors. Cross-cultural validity of the mediating hypotheses between Japanese and Korean samples will also be examined in this study.

We believe that a conformation of the proposed mediating model will provide extant job search studies with the evidence of sequential effects that different types of self-efficacy may have on a person's job search in East Asian contexts. Sequential effects of multiple self-efficacy concepts and job search behaviors have not been well-studied even in the Western culture. In practical terms, findings of the study will provide guidelines for career counselors/consultants to understand how they are able to elicit job seekers' motivation to enhance their career maturity during their job search periods.

## **Literature Review and Hypotheses**

### **Saks and Ashforth's (2002) Model of Job Search**

In their studies of examining the relationship between job search behaviors and employment quality of new graduates, Saks and Ashforth (2002) have conceptualized 'job search' as having the following four dimensions: namely, (1) active job search behaviors, (2) preparatory job search behaviors, (3) job search intensity, and (4) career planning. Preparatory job search behaviors involve gathering job search information and identifying potential leads, while active job search behaviors involve the actual job search and choice process, such as sending out resumes and interviewing with potential employers (Saks & Ashforth, 2002). Job search intensity may mean frequency and scope of specific job search behaviors made by job seekers in their attempt to find their jobs (Blau, 1993). Finally, career planning refers to setting career goals and formulating strategies for realizing those goals (Saks & Ashforth, 2002).

It should be noted that the aforementioned Saks and Ashforth's fourfold job search conceptualization regards 'career planning' as one type of job search. In Saks and Ashforth's (2002) work, they followed Blau's (1994) notion of job search, including the first three dimensions in their job search model; that is, preparatory and active job search behaviors and job search intensity. They added to the above three concepts the career planning, following the job search definition by Kanfer et al. (2001) who emphasized the aspect of a goal-directed behavior in job search. In fact, Kanfer et al. (2001) pointed out that most assessments for job search have focused only on the aspect of job search intensity and effort (e.g., Barber, Daly, Giannantonio, & Phillips, 1994). In other words, many of the previous studies tended to focus more on the extent to which job seekers devote themselves to job search activities (intensity) than on the extent to which they can realize their goal-directed behavior (career planning). However, the Saks and Ashforth's work is distinctively different from most job search studies in that it involves a career planning aspect as an important constituent of job search. The study also found that job seeker's career planning during his/her pre-entry period increased his/her perceptions of person-environment fit after their organizational entry.

Importantly, Saks and Ashforth (2002) assumed no clear causalities among all four dimensions of job search, including preparatory and active job search behaviors, search intensity, and career planning. Their job search model that aligns all four dimensions in a row may indicate that career planning is neither an antecedent nor consequence of other job search components, especially preparatory and/or active job search behaviors. This notion is supported by the Krumboltz's theory of planned happenstance (Krumboltz & Levin, 2004; Mitchell, Levin, & Krumboltz, 1999). The essence of this theory is that chance or unplanned events do have a place in the career planning process, inferring no explicit causalities between career planning and job search behaviors.

### **Generalized Self-Efficacy (GSE)**

It is now accepted that the concept of self-efficacy takes various forms. The concept of self-efficacy reflects the core belief that one has the capability to produce desired effects (Bandura & Locke, 2003). Bandura (1977) defined self-efficacy as “the beliefs in one’s capabilities to organize and execute the course of action required producing given attainments” (p.3). However, the Bandura’s original self-efficacy concept has become diversified in many ways, especially with the evolution of self-efficacy and related research in the West, yielding a number of different self-efficacy concepts in which researchers added the situational and contextual meanings to the original self-efficacy concept.

The concept of GSE originated from the notion of a self-efficacy generality, which was developed based on Bandura’s (1997) social cognitive theory. However, GSE is distinguishable from other forms of self-efficacy since most of self efficacy concepts are known as task specific beliefs and has relatively a changeable aspect, whereas GSE is considered as relatively a stable trait like generalized competence beliefs (Chen et al., 2000; Chen, Gully, & Eden, 2001; Eden & Kinnar, 1991). Saks and Ashforth (2001) treated GSE as a dispositional factor promoting work adjustments due to its stable nature. In their meta analytic study of job search, Kanfer et al. (2001) reported that self-esteem including GSE was positively related to job search behaviors based on the 3,887 samples of already published reports ( $r=.25$ ,  $p<.05$ ). To the best of our knowledge, however, there has been no evidence to date that reported that GSE remained a strong predictor of job search even after other forms self-efficacy variables including JSSE were controlled.

#### **Job Search Self-Efficacy (JSSE)**

A seminal work of Kanfer and Hulin (1985) have introduced the concept of JSSE, applying to the job seekers’ contexts a general notion of self-efficacy theorized by Bandura. JSSE can be defined as a self-reported, perceptual competence at specific tasks related to job search skills. In addition, it is well known that how a person views his or her job search skills is influenced strongly by person and environment factors (Caska, 1998; Van Ryn & Vinokur, 1992). What makes JSSE different from GSE can be seen in its nature of changeability and learnability: GSE is more dispositional and unchangeable whereas JSSE is more skill-based and can be learned through a person’s acquisition of skills needed for the job search related activities (e.g., Chen et al., 2000; Kanfer & Hulin, 1985). As such, GSE, as part of overall self-esteem, can be the important foundation for job search seekers to acquire sufficient JSSE in their job search activities, and thereby a dispositional characteristic of GSE would naturally lead to an increase in self-reported, perceptual competence on their skills of job search.

Moreover, self-esteem and GSE have been used alternatively in numerous literatures because they have a very high correlation ( $r=.85$ ,  $p<.001$ ) (Bono & Judge, 2001, 2003). Eden and Aviram (1993) have also argued that either GSE or self-esteem can be used to test for the behavioral plasticity hypothesis since it is difficult to distinguish between GSE and self-esteem operationally. As such, GSE defined as overall beliefs or confidences would be directly influencing JSSE, which then affects actual job search among university students.

In sum, adding the Saks and Ashforth’s job search concepts to the expected causalities between GSE and JSSE, we predict that GSE would first affect JSSE positively, which in turn would influence each job search dimension, including preparatory and active job search behaviors and career planning positively. Hence, we can make the following three hypotheses:

*Hypothesis 1: Job search self-efficacy (JSSE) mediates the positive relationship between generalized self-efficacy (GSE) and active job search behavior.*

*Hypothesis 2: Job search self-efficacy (JSSE) mediates the positive relationship between generalized self-efficacy (GSE) and preparatory job search behavior.*

*Hypothesis 3: Job search self-efficacy (JSSE) mediates the positive relationship between generalized self-efficacy (GSE) and career planning.*

The analytical model of this study is depicted in FIG. 1.

## Method

### Participants and Procedures

The participants of this study were undergraduate students who all majored business administration in two private universities in Japan and Korea. Due to the nature of job search and career planning surveys, we eliminated freshmen year students from the potential sample of our studies, and thus students that fall into the second, third, and fourth years were targeted. We distributed the survey questionnaires during classes in each university, asking them to give responses to all the questions in the questionnaires. Before starting surveys, we explained that any responses given from each student have nothing to do with his/her academic performance at each course. In total, we collected 175 responses from 182 (96.2%) participating students in Japan, and 172 out of 209 (82.2%) in Korea. The frequency distributions of second, third, and fourth years in Japanese data were found to be 68 (38.9%), 80 (45.7%), and 27 (15.4%) respectively, while those in Korean data were 69 (40.1%), 57 (33.1%), and 46 (26.7%). Moreover, the percentages of female respondents to the total ones are 33.7% in Japan and 37.8% in Korea. These results indicate that the demographic compositions of Japanese and Korean respondents in this study are comparable to a large extent.

### Measures

*Generalized self-efficacy.* We used the 12-item version of Sherer et al.'s (1982) GSE measures which was reported in Bosscher and Smit's (1998) work. This global measures is known to subsume three sub-dimensions, including initiative (e.g. When trying something new, I soon give up if I am not initially successful), effort (e.g. When I decide to do something, I go right to work on it), and persistence (e.g. When unexpected problems occur, I don't handle them very well). All items of GSE construct were measured on a 7-point scale (1=strongly disagree, to 7=strongly agree). Coefficient alphas for initiative, effort, and persistence scales were found to be .71, .61, and .64, respectively.

*Job search self-efficacy.* job search self-efficacy was assessed by the six items taken from Vinokur, Price, and Caplan (1991). These six items were designed to measure various skills needed for successful job search and employment ( e.g. How confident do you feel about persuading potential employers ). In fact, we removed two items from the scale construction due to the low factor ratio for these items. All items of this job search self-efficacy construct were measured on a 7-point scale (1=very low, to 7=very high). Coefficient alpha this scale achieved was .91.

*Job search behaviors.* For measuring preparatory and active job search behaviors, we used a 12-item measure developed by Blau (1994). However, two items out of them were not used in this study since they were considered to be applied only for reentry job seekers' subjects. We, therefore, used the rest of 10 items, with which

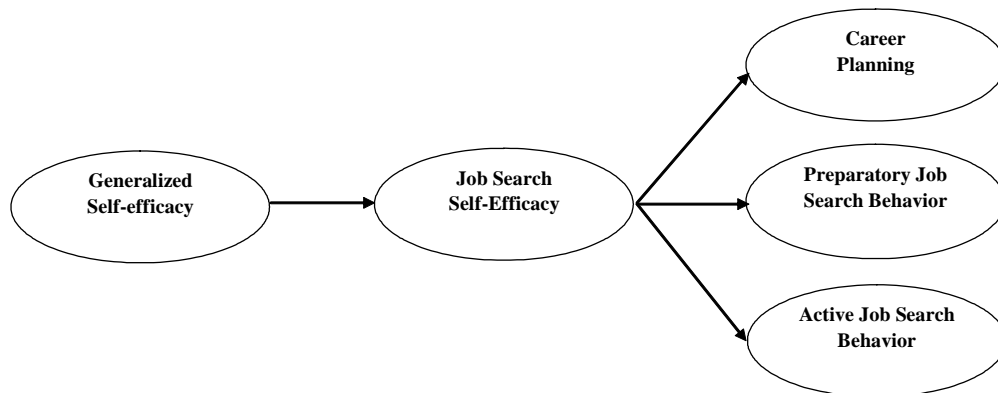

FIG. 1: JOB SEARCH MODEL BASED ON THE SAKS AND ASHFORTH'S CONCEPTUALIZATION

we asked respondents to indicate to what extent they have engaged in preparatory (e.g. Talk with friends or relatives about possible job leads) and active (e.g. Sent out resumes to potential employers) job search behaviors. Participants were asked to respond on a scale ranging from 1(never) to 7(very frequently). Reliability coefficients of preparatory and active job search behaviors were .83 and .83 respectively.

In addition, the career planning of each respondent was measured by the nine items taken from King (1999), Gould (1979), and Coachline's career development needs survey. We asked respondents to give perceptual information about the existence of their career planning and goals as well as an importance of career planning in their career development processes (e.g. I have a strategy for achieving my career goals). All items of this career planning scale were measured on a 7-point scale (1=strongly disagree, to 7=strongly agree). Reliability coefficient for this nine-item measure was .92.

*Control variables.* When running regressions, we controlled for the following four background variables: (1) nationality dummy (1=Japan, 0=Korea), (2) gender dummy (0=male, 1=female), (3) age, and (4) school year.

## Results

### Hypotheses Testing Based on an Overall Sample

We tested a series of mediation hypotheses (Hypotheses 1 to 3) using hierarchical multiple regression analysis. As can be seen in model 1 of Table 1, two out of three variables of GSE, effort and persistence, were found to have significant and positive effects on JSSE ( $\beta=.20$ ,  $p<.001$  and  $\beta=.37$ ,  $p<.001$ , respectively). This indicates that except for an initiative dimension, GSE directly influences JSSE among Korean and Japanese samples as a whole. Moreover, results of models 2a and 3a showed that JSSE has significant and positive effects on preparatory ( $\beta=.37$ ,  $p<.001$ ) and active ( $\beta=.29$ ,  $p<.001$ ) job search behaviors. Interestingly, when the JSSE variable was added to all the control and GSE variables and entered into the third step regression equations of models 2a and 3a, none of GSE variables showed statistically significant for both preparatory and active job search behaviors. This clearly indicates that JSSE mediates the relationships between GSE and job search behaviors positively, providing strong support for Hypotheses 1 and 2 of the study. However, the result of career planning, as shown in model 4a of Table 1, did not give sufficient evidence to support Hypothesis 3 that stated that JSSE would mediate the relationship between GSE and career planning.

### Cross-cultural Comparison between Japan and Korea

The regression results of models 1b, 2b, 3b, and 4b in Table 1 represent those of a Japanese sample, while those of models 1c, 2c, 3c, and 4c show Korean sample ones. As shown in regression results of a Japanese sample (i.e., model 1b), two variables of GSE, effort and persistence, were found to have significant and positive effects on JSSE as hypothesized ( $\beta=.18$ ,  $p<.01$  and  $\beta=.42$ ,  $p<.001$ , respectively). Moreover, regression results in models 2b, 3b, and 4c all indicated that JSSE influence all the aspects of job search behaviors including preparatory and active job search behaviors and career planning. Furthermore, no direct and significant effects of GSE on all the three job search variables were found in Japan, as shown in regression models 2b, 3b, and 4b. These findings clearly indicate that for our Japanese sample, JSSE mediates the relationships between GSE and types of job search behaviors, providing strong support to Hypotheses 1 to 3 of the study. It appears that Saks and Ashforth's (2002) conceptualization of job search model may reasonably account for job search behaviors among Japanese respondents.

Similar findings were seen in the regression results of a Korean sample, as shown in models 1c, 2c, 3c, and 4c. As can be seen in models 2c and 3c, no significant effects of GSE variables on both preparatory and active job search behaviors were observed when the JSSE was entered into the third step regression equation. This provides a consistent support to Hypotheses 1 and 2 even for the Korean respondents. However, the results of model 4c of Table 1 showed that one variable of GSE, persistence, had a direct positive impact on career planning ( $\beta=.16$ ,  $p<.05$ ) even when JSSE was added up to the third step equation of model 4c. As such, Hypothesis 3 was not supported in a Korean sample.

In sum, Hypotheses 1 and 2 were generally supported both in Japanese and Korean samples, whereas Hypothesis 2 that focused on a mediator role of JSSE played on the GSE and career planning relation was only supported in Japan and not in Korea. This calls for an additional analysis by modifying our hypothesized mediation model so as to capture more accurate processes of self-efficacy and job search relations.

## Discussion

### Test of a Revised Mediation Model

A series of hypotheses tests using a regression analysis let us identify that a revision is needed on our hypothesized model tested above. In particular, the results showed that career planning is influenced directly by GSE variables, while two other job search variables (active and preparatory ones) are indirectly by GSE. These findings may suggest that rather than following Saks and Ashforth's (2002) model of job search and taking career planning as part of job search variables, it might be better to consider that career planning plays a mediator role on the relationship between GSE and job search behaviors. Our revised model can be displayed in Figure 2.

Our additional regression analyses for testing the revised model, as shown in Table 2, did clearly indicate that career planning mediated the relationship between all three GSE variables and preparatory job search behavior in overall samples. Moreover, such a tendency is found to be clearer in Korean sample; career planning mediated the relationships between GSE and both preparatory and active job search behaviors. For Japanese sample, however, career planning was found not influencing either preparatory or active job search behaviors, failing to support the revised model. Overall, findings suggest that our original model that relied on Saks and Ashforth's (2002) conceptualization of job search was found tenable in Japanese sample, while the revised model seemed more suitable for the explanation of Korean sample.

**Overall Evaluation**

The present study aimed to examine the interrelationships among generalized and job search self-efficacies and various job search behaviors, including preparatory and active job search behaviors and career planning. In particular, in framing the job search model to be tested in the study, we relied on the Saks and Ashforth's (2002) job search conceptualization where both actual job search behaviors (both preparatory and active job search) and goal-directed behavior (career planning) as a set are considered as an integral part of job search. The hypothesized mediating effects of JSSE on the relationships between GSE variables and job search behaviors were tested for overall, Japanese, and Korean samples. Findings indicated that all three hypotheses formulated in this study were supported only in the Japanese sample, while Hypothesis 3 that predicted the mediating effects of JSSE on GSE-career planning links was not supported in overall and Korean samples. Therefore, we conducted a post hoc analysis by generating a revised model in which 'career planning' as well as JSSE would play a mediating role between GSE and other job search behaviors including preparatory and active job search ones. The additional analyses on the revised model were found supported in both overall and Korean samples, while not supported in the Japanese sample. As such, our original model that relied on Saks and Ashforth's (2002) conceptualization of job search was found tenable in Japanese sample, while the revised model seemed more suitable for the explanation of Korean sample. These findings can be discussed and evaluated as follows.

First, our findings of this study suggest the existence of cross-cultural differences in job search processes between the two East Asian countries: Japan and Korea. Specifically, an empirical support for the job search model in Figure 1 among Japanese students may mean that career planning is a job seeker's outcome and/or objective that can be generated by his/her job search self-efficacy, which was found supported by the broader concept of generalized self-efficacy. On the other hand, Korean students are more likely to consider their career planning to be the 'readiness' to start their actual job search behaviors, given the fact that the revised mediating model of career planning was supported among the Korean respondents. In other words, career planning can be regarded as part of

the job search behaviors among Japanese young job seekers, while it is taken as a necessary precondition for the specific, actual job search behaviors to happen among Korean counterparts.

Such a difference in job search and career planning relations between Japan and Korea seems to be largely attributable to the differences in Japanese and Korean firms' human resource (HR) practices and their implicit messages to the university students who seek their jobs. Employment practices of Japanese firms have long been known as 'lifetime employment' under which career orientations of employees become more 'intra-organizational' (i.e., within an organization). Moreover, the practices of seniority-based wage system and multiple skill-based training 'within' an organization by many of the Japanese firms drive both potential and existing employees to form intra-organizational career orientations in Japan. Although the traditional HR practices in Japan seem to have recently been reconsidered by some progressive Japanese firms to a varying degree, the dominance of such an internally-oriented HR system by Japanese firms are still in common. For Japanese young job applicants, especially fresh graduates, the massive importance is placed on at which firm they can get employed since their career success depends largely on the future of the company they join. As such, career planning of most of the Japanese university students is strongly tied to how successfully they can find promising jobs at reputed companies. Therefore, it seems natural that career planning is part of actual job search behaviors among Japanese university students.

On the other hand, HR practices of Korean firms are more externally-oriented, and so both potential and existing employees in Korea tend to form 'inter-organizational' career orientations. Especially, employment relations in Korea have dramatically changed from long-term to mid- or short-term ones since the Asia's financial crisis in 1997 which brought about severe economic and employment damages to many Korean firms. As such, career orientations among Korean young generations in particular have become more diverse, and externally-oriented. Thus, career goals and/or orientations of Korean students are less tied to the company they initially join than those of Japanese students are. It is, therefore, inferred from the above arguments that career planning may be more independent from actual job search behaviors among Korean university students. More precisely, there should be a clear distinction between career planning and actual job search among them, and thus planning follows behavior in their job search processes in Korea.

Second, findings of the study could offer several contributions to vocational behavior studies in existence. First, our original model that was developed from Saks and Ashforth's conceptualization of job search was empirically supported in Japanese samples. Most of the job search studies, especially those focusing on the job search processes, have little been accumulated in Japan as well as in Asia in general. Moreover, our comparative study may enable researchers to assess the validity of the job search mediation model between the two East Asian societies.

Theoretically, we provided to the existing job search literatures new empirical evidence that JSSE mediated the GSE and actual job search behaviors, including both preparatory and active ones. In Japan, JSSE was found also mediating the GSE and career planning. This indicates that having dispositional traits of self-efficacy (i.e., GSE) may not be a sufficient condition to enhance students' career maturity and job search behaviors. Increasing a student's capacity or capability of his/her acquiring job search self-efficacy would derive him/her to be more involved in job search activities.

Another theoretical contribution of this study is that we prove that the revised model of job search could explain the particular group of samples in our study: i.e., the Korean student sample. The revised model assumed a causal flow initiating from GSE, JSSE and career planning, to actual job search behaviors. This causal order replicates, to some extent, the notion of 'theory of planned behavior' (TPB: Ajzen, 1985) in that the revised model involves an aspect of planned behavior: namely, career planning-job search behavior links. Some recent research has investigated the psychological process of job seeking with an application of a TPB notion, using unemployed and student samples (e.g., Caska, 1998; Van Ran & Vinokur, 1992). Van Hooft et al. (2003, 2004) have examined the job search process based on TPB, attempting to clarifying the relationships among job search attitudes, subjective norms, perceived behavioral control, and job search-related variables. They found that attitudes, subjective norm, and perceived behavioral control all directly and positively affected job search intention, which then had a direct and positive influence on job search behaviors. Although these findings are not fully comparable to those obtained in our study, our results that the Korean group of our present samples supports the revised model which involves a notion

of TPB may be useful for future studies that attempt to theorize a job search model in general as well as a job search model in the Asia Pacific in particular.

Finally, our study demonstrated that there existed a national difference in job search model and processes even between two geographically and culturally less distant countries in East Asia. We also found that such a difference resides in how job seekers in a particular society see their career planning within their overall job search activities. The view that each applicant sees his/her careers seems to be not only influenced by psychological factors like multiple self-efficacies but also by an employment system in a given country and its implicit messages conveyed to potential employees and applicants. Future studies of this sort are, therefore, encouraged to include more socio-economic factors like employment opportunity, labor market conditions, and so forth as predictors of career planning and job search behaviors.

### Abstract

National R&D programs have to be evaluated so that limited resources can be allocated to promising programs and poor programs can be improved. However, very few attempts have been made at the program level since that various R&D programs have their own primary objectives. This study measures and compares performance of national R&D programs using data envelopment analysis (DEA). Since DEA allows each DMU to choose the optimal weights of inputs and outputs which maximize its efficiency, it can mirror R&D programs' unique characteristics by assigning relatively high weights to the variables in which each program has strength. Every project in every R&D program is evaluated together by DEA. Kruskal-Wallis test is then run to compare performance of R&D programs. The performance comparison results help national R&D policy-makers to formulate and implement effective national R&D programs. **Keywords:** R&D evaluation, R&D performance, national R&D program, data envelopment analysis.

### Introduction

As R&D has been considered as a driving force for national competitive advantage, many countries have been raising R&D investments through various national R&D programs [Lee et al., 1996]. Since R&D investment is one of the most crucial elements in promoting scientific and technological progress [Wang and Huang, 2007], Only a country that makes use of the limited R&D resources effectively can benefit from formulation and implementation of national R&D programs. Thus, evaluations on R&D outcomes need to be made so that limited resources are allocated to promising R&D programs and poor R&D programs can be improved.

Although a number of studies have attempted to evaluate R&D performance at various levels, few attempts have been made at the program level. What makes it difficult to evaluate R&D programs is the heterogeneity of R&D programs; Various R&D programs have their own primary objective such as publishing academic papers for basic scientific research, registering patents and developing new product prototypes for applied research, and providing funds with researchers for R&D human resource development.

Thus, two main approaches to R&D evaluation, peer review and bibliometric data, do not work well for program-level evaluation. The peer review method, which is based on perceptions of well-informed experts about various quality dimensions of R&D, are inherently subjective and likely to be biased depending on interests, experience, and knowledge of the evaluators [Brinn et al., 1996]. The bibliometric data are considered relatively objective, but the results highly depend on the measurement method. To incorporate several types of bibliometric data, in particular, the relative importance of bibliometric variables need to be determined and fixed. However, it does not make sense that the same set of weights is employed for all of the R&D programs with different objectives.

To address these limitations, we measure and compare performance of various national R&D programs with bibliometric data using data envelopment analysis (DEA). DEA is a linear programming model for measuring the relative efficiency of decision making units (DMUs) with multiple inputs and outputs [Cooper et al., 2000]. Since DEA allows each DMU to choose the optimal weights of inputs and outputs which maximize its efficiency, it is capable of mirroring R&D programs' unique characteristics by assigning high weights to the variables in which each program has strength. All projects in every R&D program are evaluated together by DEA. Kruskal-Wallis test

is then run to compare performance of R&D programs. A case study on six national R&D programs is presented for the purpose of illustration.

The rest of this paper is organized as follows. Section 2 deals with DEA for R&D performance evaluation. The analysis method is briefly introduced in Section 3. The proposed approach is explained and illustrated with a case study in Section 4. The paper ends with conclusions in Section 5.

## DEA for R&D Performance Evaluation

DEA is a linear programming model for measuring the relative efficiency of decision making units (DMUs) with multiple inputs and outputs. DEA is a non-parametric approach that does not require any assumptions about the functional form of a production function and *a priori* information on importance of inputs and outputs. The relative efficiency of a DMU is measured by estimating the ratio of weighted outputs to weighted inputs and comparing it with other DMUs. DEA allows each DMU to choose the weights of inputs and outputs which maximize its efficiency. The DMUs that achieve 100% efficiency are considered efficient while other DMUs with efficiency scores below 100% are inefficient. The first DEA model proposed by Charnes et al. [1978] is the CCR model that assumes that production exhibits constant returns to scale. Banker et al. [1984] extended it to the BCC model for the case of variable returns to scale. DEA models are also distinguished by the objective of a model: maximize outputs or minimize inputs. For the detailed explanations of a variety of DEA models, see the text by Cooper et al. [2000].

DEA has also weaknesses due its methodological nature. The flexibility in the selection of weights in DEA can be advantageous where there is no information on the relative importance of inputs and outputs. When prior knowledge or accepted views exist, on the other hand, DEA cannot produce realistic efficiency scores [Allen et al., 1997]. Thus, restrictions on weights need to be placed on weights in DEA [Dyson and Thanassoulis, 1988]. The use of weight restrictions makes it possible to mirror preference in a real world. A large diversity of weights restriction methods have been developed and the most common one is the assurance regions model proposed by Thompson et al. [1990]. The assurance regions of type 1 (AR1) is to impose restrictions on the upper and lower bound of a ratio of two inputs or outputs as the following:

$$L_{ij} \leq \frac{u_i}{u_j} \leq U_{ij} . \quad (1)$$

DEA has some advantages in evaluation of R&D performance [Wang and Huang, 2007]. First, DEA can be utilized even in the situation where *a priori* information on preference about variables. This is exactly the context of R&D evaluation in which there is no universally agreed view on importance of R&D inputs and outputs. DEA solves this problem by automatically deriving the weights that represent a relative value system for each DMU [Allen et al., 1997]. This nature of DEA plays an even more crucial role for program-level evaluation than project-level evaluation. When it comes to R&D project evaluation, there may be an accepted view of preference on R&D outputs since all the projects belong to the single R&D program. Due to the heterogeneity of ultimate goals of R&D programs, on the other hand, importance of R&D outputs differ across R&D programs. A published paper in an international journal could be more or less important than a granted patent. The complete flexibility in the selection of weights in DEA not only makes it possible to compare performance of R&D programs with different objectives, but also take away an opportunity for excuse of inefficient R&D program managers because inefficient R&D programs are under-performing even by putting their own weights solely on “self esteem”. Second, DEA is useful for the cases where relationships of functions between inputs and outputs cannot be defined. As mentioned before, since DEA does not require any assumptions about the functional form of a production function, it fits R&D activities whose production functions have not been specified. Third, DEA deals with multiple inputs and outputs simultaneously, which are problem of using standard parametric method. These characteristics of DEA opened the possibility of applying DEA to R&D performance evaluation for various DMU types such as nations [Wang and Huang, 2007; Kocher et al., 2006; Lee and Park, 2005], universities [Cherchye and Vanden, 2005; Feng et al., 2004; Korhonen et al., 2001], projects [Eliat et al., 2006; Swink et al., 2006; Garg et al., 2005], and project teams [Paradi et al., 2002].

## Methods

### Data and Variables

A case study was conducted on six R&D national programs managed by a government foundation for science and technology in Korea. Each program has its own objectives and projects, as shown in Table 1. All projects in Program A started in 2002 or in 2003 and finished in 2005, and all projects in the other programs were finished or in progress in 2005. The primary goal of Program A is to develop outstanding human resources for research while what is at the core of Program B is to create new business with innovative technologies. Program C and D focus on basic research on science and engineering, respectively. Program E deals with R&D projects for bioengineering and clinical medicine. Program F is aimed at developing national core science and technology competitiveness.

TABLE 1: R&D PROGRAMS

Program	No. of Projects	Objective
A	539	Supporting researchers to work in creative research activities individually or collaboratively in the fields of basic sciences emphasizing interdisciplinary research, and encouraging to develop outstanding human resources for research
B	56	Increasing competence in creative innovation, securing national core technologies which will enable to create new businesses
C	27	Supporting creative basic research to ensure exploration of basic theory and knowledge that may lead to outstanding papers and the development of advanced technologies
D	36	Supporting mainly in basic engineering research with the potential for industrial advancement, while encouraging interdisciplinary collaborations between industry and academia and enhancing the international competitiveness of national industries
E	18	Supporting large-scale, long-term R&D activities, the outputs of which are to be used both in bioengineering and clinical medicine, and playing a key role in cultivating human resources in basic medical sciences
F	4	Supporting research centers that are considered capable of creating world-class knowledge and competitiveness in core science and technology fields that require strategic incubation for national interests

Among a variety of inputs and outputs of R&D mentioned in Section 2, three inputs and ten outputs were selected for this study, as shown in Table 2. The amounts of funds given to a project and the number of researchers on a project were selected as proxy of capital input and labor input, respectively. These are typical inputs in this kind of study [Serrano-Cinca et al., 2005]. Since the time length to conduct R&D project execution differs across projects, project duration was also considered as an input. The four variables related with papers were included to the set of output variables. The academic papers published in journals have been considered as the major output of research and widely used to evaluate performance of researchers [OECD, 2001]. Patents were also selected as outputs since patents have most frequently used as direct output of R&D activities [Zhang et al., 2003]. The variables about patents are also categorized into the four types. Finally, outputs incorporate the perspective of human resource development of R&D with two variables, graduate students with master's degree and doctoral degree since it is one of the main objectives of governmental R&D programs [Garg et al., 2005].

TABLE 2: VARIABLES

Type	Variable	Description
Input	Project duration	Years to conduct a project
	Funds	Total amounts of funds given to a project
	Researchers	No. of Ph.D. researchers on a project
Output	Domestic SCI papers	No. of domestic scientific and technical articles published in journals listed on SCI
	Domestic non-SCI papers	No. of domestic scientific and technical articles published in journals not listed on SCI
	International SCI papers	No. of international scientific and technical articles published in journals listed on SCI
	International non-SCI papers	No. of international scientific and technical articles published in journals not listed on SCI
	Domestic applied patents	No. of patents applied in domestic patent offices
	Domestic granted patents	No. of patents registered in domestic patent offices
	Foreign applied patents	No. of patents applied in foreign patent offices
	Foreign granted patents	No. of patents registered in foreign patent offices
	Master's degree students	No. of students graduated with master's degree
	Doctoral degree students	No. of students graduated with doctoral degree

The data were obtained from the foundations' database and arranged for analysis. The whole data set is not presented in this paper due to the space limit. As an example, the data for all projects in Program D is shown in Appendix A.

#### Analysis Methods

Although findings from previous studies on R&D returns to scale are somewhat mixed, most suggested R&D exhibits constant returns to scale [Graves and Langowitz, 1996; Scherer, 1983; Bound et al., 1984]. It is implicitly assumed that the objective of R&D lies in increasing outputs rather than decreasing inputs. Therefore, the output-oriented CCR model (CCR-O model) is used in this study and expressed by the following linear programming model:

$$\begin{aligned}
 & \min \sum_{i=1}^m v_i x_{ik} \\
 & \text{s.t.} \quad \sum_{r=1}^s u_r y_{rk} = 1, \\
 & \quad \sum_{r=1}^s u_r y_{rj} - \sum_{i=1}^m v_i x_{ij} \leq 0, \quad j = 1, \dots, n \\
 & \quad u_r \geq 0, \quad r = 1, \dots, s \\
 & \quad v_i \geq 0, \quad i = 1, \dots, m
 \end{aligned} \tag{2}$$

where  $x_{ij}$  is the amount of the  $i$ -th input,  $y_{ij}$  is the amount of the  $r$ -th output,  $v_j$  is the weight given to the  $i$ -th input,  $u_r$  is the weight given to the  $r$ -th output, and  $k$  is the DMU being measured.

The analysis process of this study is divided into two parts. The first part deals with project-level evaluations for each R&D program. All the R&D projects in a R&D program are evaluated together by DEA. In the second phase, program-level comparisons are conducted. Basically, the performance of a R&D program is measured based on the performance of projects belonging to the program. Thus, DEA is carried out for the whole set of 680 R&D projects in every six R&D program at the same time. Kruskal-Wallis test is then run to compare performance of R&D programs because the derived efficiency scores are nonparametric data. Kruskal-Wallis test is a

nonparametric method that compares between the medians of two or more samples to determine if the samples have come from different populations.

## Results and Discussions

### Project Level Evaluation

Project level evaluation is aimed at measuring performance of individual projects. Only the projects belonging to the same program are evaluated together by DEA. Thus, DEA was conducted six times for each program. TABLE 3 summarized the results, but the whole set of efficiency scores of individual projects is omitted due to the space limit. As an example, the efficiency scores of the projects in Program D can be found in TABLE 6.

In terms of both the average efficiency score and the portion of efficient projects, Program A has the lowest (0.3898, 6.12%) while Program F ranks the first (1, 100%). However, this does not mean anything about program performance. What makes this happen is the number of projects included as DMUs in each program. When the number of DMUs is relatively small compared to the number of inputs and outputs, a large portion of the DMUs will be identified as efficient so the efficiency discrimination is lost [Cooper et al., 2000]. The rule of thumb is that the number of DMUs should be at least three times larger than the combined number of inputs and outputs [Banker et al., 1989] or more than the product of the numbers of inputs and outputs [Boussofiane, 1991]. Since the DEA model includes three inputs and ten outputs, none of the programs complies with the rule except Program A and Program B. It is shown that the more projects included, the higher the average efficiency score and the percentage of efficient projects. The extreme case is found in Program F where all of the four projects are found to be efficient. To conclude, it is meaningless to judge performance of R&D programs with the results in TABLE 3 since DEA was conducted independently for each program with the different number of DMUs. The only thing implicative here is the efficiency scores of projects in each program themselves.

TABLE 3: RESULTS OF PROJECT LEVEL EVALUATION

Programs	No. of projects	Average efficiency score	No. of efficient projects (Percentage)
A	539	0.3898	33 (6.12%)
B	56	0.8718	24 (42.86%)
C	27	0.8161	13 (48.15%)
D	36	0.8352	19 (52.78%)
E	18	0.9373	15 (83.33%)
F	4	1	4 (100%)

### Program Level Evaluation and Comparison

In order for comparison to be made among R&D programs, every project in every program is evaluated together with DEA. The performance of R&D programs is then evaluated by their projects' performance. DEA was run for the whole set of 680 R&D projects. As a result, 54 projects (7.94%) were found to be efficient and average efficiency scores was 0.3939.

TABLE 4 summarized average efficiency scores of the projects for each program. Program D has the highest average score while Program F ranks the lowest. Since all the projects are evaluated together, it makes sense to compare the performance of R&D program based on the average score of projects belonging to programs. The ranking based on average score is D>C>B>E>A>F in order.

However, simple comparison based on average efficiency scores does not have statistical validity since efficiency scores are derived from DEA that is a nonparametric method. It is found that there exist statistically significant differences among efficiency scores of the six R&D programs. What is of interesting is a rank reversal between Program A and Program F. The final ranking of the six R&D programs is D>C>B>E>F>A in order.

TABLE 4: MEAN EFFICIENCY SCORE AND MEAN OF RANK OF PROGRAM LEVEL

Programs	No. of projects	Arithmetic mean		Kruskal-Wallis test	
		Average efficiency score	Rank	Mean rank	Rank
A	539	0.3373	5	303.46	6
B	56	0.5810	3	461.22	3
C	27	0.6333	2	500.28	2
D	36	0.8060	1	593.33	1
E	18	0.3415	4	334.06	4
F	4	0.3144	6	316.25	5

$$\chi^2 = 117.956, df = 5, p=0.000$$

### Incorporating Importance of Variables

As mentioned before, DEA is advantageous for R&D program evaluation and comparison due to the flexibility of weights selection. Each project is allowed to select its own weights so that its strengths in some variables are mirrored in evaluation. However, when universal agreements exist on the relative importance among variables for any program, the complete flexibility does not make sense. For example, it is obvious that a paper published in an international journal listed on SCI is more valuable than a paper published in a domestic journal not listed on SCI. Two alternatives can be employed for this problem. The first one is to integrate output variables. The 10 output variables can be categorized into three types: papers, patents, and human resources. Where the relative importance exists is not among different types of variables, but among variables in the same type. Thus, the importance of each variable is captured by integrating the same types of variables with fixed weights. The weights can be derived from relative comparisons. The pairwise comparison method was employed to derive weights of variables in each output type, as shown in TABLE 5. Then, the value of an integrated output is the weighted sum of observed values of each variable. It is meaningless to compare the absolute size of weights of variables included in different types of integrated outputs since the weights are obtained from the comparison within the same type of output. Regardless of integration of output variables, the weight flexibility still works among integrated outputs so that the advantage of DEA for R&D program evaluation holds true. To illustrate the difference in results, TABLE 6 shows the efficiency scores of the projects in Program D.

TABLE 5: INTEGRATION OF OUTPUT VARIABLES

Integrated outputs	Output variables	Weight
Papers	Domestic SCI papers	0.27
	Domestic non-SCI papers	0.07
	International SCI papers	0.52
	International non-SCI papers	0.14
Patents	Domestic applied patents	0.06
	Domestic granted patents	0.26
	Foreign applied patents	0.12
Human resources	Foreign granted patents	0.56
	Master's degree students	0.25
	Doctoral degree students	0.75

The other alternative is to apply the AR model for weights restriction. Restrictions are also placed only for the relationships between the same types of variables. The upper and lower bound of a ratio of two outputs can be determined based on experts' judgments. We added the following relationships as constraints to the DEA model. In

the presence of weights restriction, infeasible solutions occur for the DMUs that have the observed value of 0 in output variables.

$$1 \leq \text{Domestic SCI papers} / \text{Domestic non-SCI papers} \leq 5$$

$$1 \leq \text{Interanational SCI papers} / \text{Interational non-SCI papers} \leq 5$$

$$1 \leq \text{Interanational SCI papers} / \text{Domestic SCI papers} \leq 3$$

$$1 \leq \text{Domestic granted patents} / \text{Domestic applied patents} \leq 5$$

$$1 \leq \text{Foreign granted patents} / \text{Foreign applied patents} \leq 5$$

$$1 \leq \text{Doctoral degree students} / \text{Master's degree students} \leq 5$$

TABLE 6 compares the efficiency scores of 36 projects in Program D for the three cases. There exist significant differences in the efficiency scores. What is prominent is falls of scores of the DMU who are efficient in the basic model, such as Project 15, Project 20, and Project 28. The discriminatory power also increases from 52.78% to 40.91% (AR) and 19.44% (Output integration). The remarkable increase of the discriminatory power in output integration comes from the reduction of the number of outputs from ten to three. It is concluded that two alternatives can produce more realistic results by mirroring the relative importance of output variables in the reality.

TABLE 6: EFFICIENCY SCORES OF 36 PROJECTS IN PROGRAM D FOR THREE CASES

Projects	Basic		AR		Output integration	
	Efficiency score	Rank	Efficiency score	Rank	Efficiency score	Rank
1	1.0000	1	1.0000	1	0.8118	13

## Conclusions

We measured and compared performance of the six national R&D programs with bibliometric data using DEA. Every project in every program was evaluated together and Kruskal-Wallis test is then run to compare performance of R&D programs. The two alternative approaches to incorporating importance of variables were also considered and illustrated.

The main contribution of this study is to open possibilities of comparing performance among heterogeneous R&D programs. Since DEA allows each DMU to choose the optimal weights of inputs and outputs which maximize its efficiency, it is capable of mirroring R&D programs' unique characteristics or strengths by assigning relatively high weights to the variables in which each program has strength. The derived performance comparison results help national R&D policy-makers to formulate and implement effective national R&D programs with the limited resources. R&D programs doing well deserve more investments while poor programs have to be improved or terminated.

However, this study is subject to a limitation that the results cannot provide information on how to improve a poor program. Although each project can be provided with the way of improving efficiency from DEA results since it offers the way of benchmarking for inefficient DMUs, it is not easy to aggregate project level implications into the program level. This will be dealt with future research. Another fruitful avenue for future research is to compare program performance based on the efficiency scores under two alternative approaches, AR model and output integration. This paper only introduces the concepts and presents the results at the project level. It will be another worthwhile area for future research to employ the super-efficiency approach to increase the discriminatory power of DEA and compare the results can be employed such as super-efficiency.

## Strategies for Economic Growth: The Role of Financial Depth

Nur Azura Sanusi, [juasanusi@yahoo.com](mailto:juasanusi@yahoo.com)  
Nik Fuad Nik Mohd Kamil

University Malaysia Terengganu, Malaysia

### Abstract

Commonly economic development is measured by the performance of economic growth. Several factors had been identified as the causes of economic growth. Among these factors, the role of financial markets in the growth process has received significant attention. Therefore, the aim of this paper is to investigate the importance of financial depth to the economic development in selected Asia Pacific countries. These countries were selected based on the differences between the well-developed financial market and under-developed financial market as well as the middle-developed financial market. By taking into account the individuality of cross sectional unit and time series, it allows us to capture the differences within these units. Therefore a panel data set for the period of 1960-2003 is tested using the panel unit root tests and generalized least square panel estimation technique. Two proxies have been selected to represent the financial depth in those countries. Those proxies cover both the money and capital markets, whereas control variables consist of government expenditure and openness to international trade. The empirical results provide clear support for the hypothesis that there exist positive significant relationship between financial depth and economic growth.

### Introduction

Generally, a nation's economic growth can be defined as the changes in production of goods and services produced by all sectors in the economy. If the production level at time  $t$  is greater than the production level at time  $t-1$ , then we can conclude that the nation has grown positively. Commonly, the economic growth can be measured through the Gross Domestic Product (GDP).

In the determination of economic growth, several factors have been identified as the main causes of economic growth. Among these factors, the role of financial markets in the growth process has received significant attention. In this framework, financial development is considered by many economists to be an important factor for output growth.

According to the classical school of thought in the neutrality of money doctrine, an increase in money stock will increase the price level without affecting the real output. They conclude that money, as the financial variable will not affect the real economy variables. In contrast to the classical view, the Keynesian and Monetarist schools of thought believe that the financial indicators will affect the real sector. The development in the financial market will increase the financial aggregate and make the loan interest rate (lending rate) decrease. Therefore the fall in the interest rate will increase the real sectors through the rise in the domestic investment, domestic consumption and government expenditure.

While the empirical works among others by Gurley and Shaw (1955), Modigliani and Miller (1958), Goldsmith (1969), McKinnon (1973), Shaw (1973), Smith (1991), Levine (1991), King and Levine (1993a), Gertler and Rose (1992), Allen and Ndikumana (1998) and Levine et al. (2000) show that financial development is a significant variable in influencing the economic growth. According to Ansari (2000) financial development includes financial deepening, financial broadening and financial liberalization that take into account the number and the role of financial institutions, financial instruments, deregulation of interest rates, free movement of foreign capital and removal of other restrictive practices. Generally, financial development has predictive power for future economic growth.

Furthermore, the panel studies by Khan and Senhadji (2000) and Rioja and Valev (2002) show that the relationship between financial development and economic growth varies according to the level of financial

development of the country. The positive relationship is reported for the middle and high level of financial development and ambiguous effect in countries with low financial development.

Based on the findings produced by Khan and Senhadji (2000) and Rioja and Valev (2002) that financial development varies between countries, hence, by selecting different countries in Asia-Pacific, we can capture the different level of financial development. We can conclude that the well-organized financial intermediaries are essential for economic growth. And the roles of financial intermediaries could be derived in providing financial services that become the important financial indicators to economic growth. However, the lack of financial institutions in some Asia-Pacific countries is simply a manifestation of the lack of demand for their services. In addition, there are very few papers that have investigated this relationship in less sophisticated financial market, and then compared this finding over a number of countries that are quite sophisticated financially. Furthermore, the measurement of financial development is essential because it has significantly different implications for the development policy (bank-based vs. market-based). However, this measurement remains unclear. This paper employs several financial measures and new data to gain insight into this issue.

This paper is organized as follows; Section 2 discusses the underlying theoretical background. Section 3 illustrates the method of the study including the data and three measures of financial development in order to respond to discussions of financial development. The analysis is discussed in section 4. Section 5 concludes the paper.

## Literature Review

Financial development has taken a prominent role in recent research in several different areas of the literature, such as economic growth, financial stability and international financial integration. In the determination of economic growth, frequently financial development is defined as the improvement in quantity, quality and efficiency of financial intermediary services. Among others, Schumpeter (1911), Gurley and Shaw (1955), Goldsmith (1969) and McKinnon (1973) mentioned the importance of financial intermediaries to the economic growth.

Since Schumpeter (1911), McKinnon (1973) and Shaw (1973), and more recently King and Levine (1993a) and Levine et al. (2000), the relationship between financial development and economic growth has been extensively studied<sup>1</sup>. In the beginning, the traditional view, like McKinnon (1973) and Shaw (1973), offered detailed arguments and evidence on the role of organized financial structure of an economy to accelerate economic growth and improve economic performance. They believe that the surplus funds would be channeled efficiently to deficit units to stimulate the economy. In their view, differences in the quality and quantity of services provided by financial intermediations are the main reasons for different economic growth of every country. Greenwood and Jovanovic (1990) also found evidence that as income level rises, financial structure becomes more extensive, economic growth becomes more rapid.

McKinnon (1973) and Shaw (1973) also stressed on the reform of financial markets that seems to be the optimal strategy to generate both faster and steadier growth in real output by increasing saving propensities and the quality of capital formation. Here, a deliberate creation of financial institutions and markets increases the supply of financial services and thus leads to economic growth. However, these traditional views only focus on the components of financial liabilities like money supply (which includes M1, M2 and M3) through savings or deposits in the financial intermediaries in generating more economic growth.

In contrast, during the 1980s and 1990s (during the financial liberalization), many researchers have concentrated on financial assets in order to indicate the linkages between financial intermediary and economic growth. Williamson (1987) and Gertler (1992) provided the evidence of positive correlation between output and the quantity of intermediated credit (as financial assets). He also found that credit leads output in the sense of Granger causation. However, other models showed that financial assets other than credits (loans) also can be used to prove the greater impact of financial system on economic growth. For example, Levin and Zervos (1998) tried to investigate the relationship between stock markets and also bank credit with economic growth. They found that the rapid growth of capital market plays a crucial role in allocating fund to entrepreneur and thus ultimately influence the decision to invest.

Further more, King and Levine (1993b) not only discussed the relationship between financial development and economic growth but also the role of entrepreneur in generating economic growth. They found that an efficient allocation fund from intermediaries to entrepreneurs was able to lower the cost of investing in productivity enhancement and stimulates economic growth. The reason is that the financial intermediaries can influence the decision to invest in productivity enhancing activities through their ability to evaluate and monitor the prospective entrepreneur<sup>2</sup>, and provide fund to potential entrepreneur.

In 2000, the panel studies done by Khan & Senhadji showed that the relationship between financial development and economic growth varies according to the level of financial development of that country. The positive relationship is reported for the middle and high level of financial development. However ambiguous effect is found in countries with low financial development.

By employing three approaches, the one-step panel estimator, the two-step estimator and recent GMM techniques, Levine and Beck (2002) examined the impact of stock markets and banks on economic growth of 40 countries for the period of 1976-98. Their findings were in line with the theories that stressed on the important positive role for financial development in the process of economic growth. In conducting a study on 69 developing countries by using a cross sectional regression, Trabelsi (2002) found that the influence of financial development on economic growth was significant only in long run. He also pointed out that both financial development and private sector development are important in improving the economic growth. This is because financial sector stimulated economic growth via investment.

In a study done by Abd, Ghafar and Nur Azura (2003), they reported that as income level rise, financial structure becomes more extensive, economic growth becomes more rapid and income inequality across the rich and poor widens. By selecting 45 Islamic countries and using the data of 1970-2001, they constructed four indicators of the level of financial sector development. They are the ratio of broad money (M2) to GDP, the ratio of credits provided by banking system to the private sector to GDP, the ratio of banking system assets to banking system assets plus central bank assets and the proportion of total assets of financial institutions to GDP. They then concluded that the positive impact of the financial development on economic growth is high in countries with high and middle level of financial development and the effect in countries with low level of financial development is vague. According to White (1995), M2/GDP is not a good proxy for financial development. This is because changes in M2/GDP might be caused by the changes of the level of development. For instance, M2/GDP might change when an economy evolves from barter system to a more sophisticated system.

## Methodology

### Estimation Technique

In this section, the pooled cross-section and time series estimations are utilized to measure the long run relationship between financial development and economic growth for each country. We compiled the data from the International Financial Statistics Yearbook from the year 1970-2002. After the screening process from the total of 18 Asia-Pacific countries, we selected 12 countries due to the complete data for the analysis and estimation.

Based on the theory of financial development and economic growth, specifically, the regression model can be specifying as follows:

$$GGDP_{it} = \alpha_{0i} + \alpha_1 FD_{it} + \alpha_2 GP_{it} + v_i + u_{it} \quad (1)$$

Where GGDP is the growth of GDP, FD is financial depth variables that covers the ratio between M2 to GDP (M2/GDP), the ratio of credits provided by banking system to the private sector to GDP (CREDIT/GDP), deposit banks relative to the central bank in allocating domestic credit (BSA), and the ratio between the total assets of financial institutions divided by GDP (TA/GDP). While GP is government policy that is represented by the ratio of openness of international trade to GDP (O/GDP) and the ratio of government expenditure over GDP (GOV/GDP). In this specification  $v_i$  denotes country and time specific effects. The cross-section and period specific may be handled using fixed or random effects methods.

Since panel data relate to individual country, there is bound to be heterogeneity in these units. In order to take into account the heterogeneity explicitly in the estimation procedure, several assumptions have to be made to the

intercept value and the error term. Therefore by including the fixed effects and the random effects to the estimation model, heterogeneity in the model was accounted for.

A pooled combination of cross sectional and time series model that incorporates fixed effect, random effect for both time and specific correlation are applied. The techniques used will be the Ordinary Least Squares (OLS) as well as the Generalized Least Squares (GLS) and panel data regression technique. Under both techniques, the GDP is regressed against the explanatory variables. The purpose of this regression is to identify the relationship between financial development and economic growth (with the government policy variables as the control variables) and to look at the coefficients to be consistent with the theory or not.

The Generalized Least Square pooled time-series cross sectional method are utilized due to the normality distributions of the data. Furthermore, the Generalized Least Square pooled time-series cross sectional specification assumes that all countries have the same behaviors. In other words, it assumed that the slope and intercept of countries are constant across individuals and time. These assumptions of uniform behavior deny any form of heterogeneity, which is in practice very likely to prevail. Therefore, in order to incorporate the individuality of each country for each cross-sectional unit is to include the fixed and random effects in our model.

More specifically, as well as the Generalized Least Square, the estimation technique utilize the cross-sectional weights for correcting cross sectional heteroscedasticity. While the white (diagonal) coefficient covariance robust method is utilize to compute the coefficient standard error (robust coefficient covariance) since the white method is robust to observation specific heretoscedasticity in the disturbances. Therefore the estimator is robust to different error variances in each cross-section.

#### **Unit Root Panel Test**

According to Gujarati (2003), panel data is similar to the pooled data with other names such as combination of time series and cross-section data, micropanel data, longitudinal data and cohort analysis. By referring to Green (2002), pooled data refer to the data with relatively few cross-sections. While panel data correspond to data with large number of cross-sections. This study included 18 countries with the period spanning from 1970 to 2003. Therefore, due to the period observations of more than 30 years for each country, the unit root panel test is needed to test the stationarity of the data.

Unit root test is conducted on the variables in the form that they will be regressed, for example, growth GDP for GDP. Unit root test is conducted to test for the non-stationarity of the data. The econometric software, EVIEWS 5.1 allows 5 methods of panel unit root test, that are Levin-Lin and Chu (LLC); Breitung; Im, Pesaran and Shin (IPS), ADF types of test, as well as Hadri Test. All five-unit root tests are employed, however only the LLC and ADF Fisher test results are reported in the analysis. The choice of panel unit root test follows Cosar (2002), who claims "*LLC test is preferred because of its large potential power gains. Besides, LLC test is widely used in empirical researches.*" Given that the assumptions of individual unit root process, this study considers ADF Fisher panel data unit root test as well.

## **Findings**

#### **Panel Estimation Results**

This section provides empirical evidence on the relationship between financial development and economic growth based on the sub-sample countries and pooled sample. The investigation reported here consists of the panel unit root test and the panel estimation results.

In order to take into account the stationarity of the data, we utilize the panel unit root test in order to determine the null hypothesis of unit root for each variable. Table 1 reported the results of panel unit root test based on the Levin, Lin & Chu (LLC) test that assumes common unit root process and the ADF-Fisher chi square test that assumes individual unit root process. Both (common and individual test) have a null of a unit root. The results of GGDP, M2/GDP, BSA, and O/GDP indicate that the LLC and ADF-Fisher tests fail to reject the null of a unit root at level. For the most part, the data is stationary at 1<sup>st</sup> difference.

TABLE 1: PANEL UNIT ROOT TEST

Unit Root Test	Levin, Lin & Chu <i>Individual Effects</i>		ADF-Fisher Chi Square <i>Individual Effects</i>	
	Level	1 <sup>st</sup> Difference	Level	1 <sup>st</sup> Difference
GGDP	-0.4731	-27.4373*	98.0390*	434.8010*
M2/GDP	-0.3082	-27.3392*	121.044*	713.8150*
CREDIT/GDP	-51.2882*	-	112.1570*	-
BSA	1.3544	9.0199*	228.994*	728.2550*
TA/GDP	-1996.06	-	93.7881*	-
O/GDP	-0.9922	-28.4848*	119.9580*	733.0420*
GOV/GDP	-3.8871*	-	142.2500*	-

\*Significant at 1% level

To run the regression model, we utilize the Generalized Least Square (GLS) method to test the estimation model (equation (1)). The Generalized Least Square method with the White test was able to correct for both the heteroskedasticity and contemporaneous correlation in the estimation model. Table 2 reported the GLS regression results for all sample cross-section time-series with fixed effects and the random effects.

The regression is estimated using robust covariance method procedure pooling Asia-Pacific countries level. Dependent variable is GDP growth (GGDP). The t-test values are given in parentheses.

TABLE 2: UNBALANCED PANEL ESTIMATION RESULTS FOR ALL COUNTRIES

Variable	Fixed Effects	Random Effects
C	5.8895 (34.7154)***	7.4443 (17.3983)***
M2/GDP	0.9563 (11.6604)***	0.5902 (2.7715)***
CREDIT/GDP	0.8999 (8.3657)***	-0.5851 (2.3978)**
BSA	-0.0006 (0.5715)	-0.0014 (1.1514)
TA/GDP	0.1347 (6.8933)***	0.1548 (4.6815)***
O/GDP	1.1384 (6.5136)***	-0.0591 (0.1748)
GOV/GDP	0.9252 (5.4660)***	0.5778 (5.0136)***
R <sup>2</sup>	0.9811	0.1112
Adj. R <sup>2</sup>	0.9807	0.1059
DW	0.2491	0.1661
F	255.2548*	20.8823*
Hausman Test	302.7004*	-
Cross-Section	37	37
N	1008	1008

\*\*\*Significant at 1% level

\*\*Significant at 5% level

\*Significant at 10% level

In order to test the appropriate model with the hypothesis that the individual effects are uncorrelated with the other regressors in the model, the Hausman test are utilized. The results of Hausman test, as shown in Table 3 indicated that the results of generalized least square with fixed effect explained better relative to the random effects on the relationship of the related variables both for the sub sample country and pooled sub sample country estimations. The results implied that the Hausman test allowed the null hypothesis of the absence of correlation between individual effects and the explanatory variables to be rejected in all cases, the GLS estimator of the random effects being inconsistent. Therefore further explanation on the relationship between financial development and economic growth is based on the fixed effects results.

Table 2 showed that all the significant exogenous variables explain the endogenous variables with the consistent effect. Based on the estimation results of the fixed effects, the adjusted R<sup>2</sup> for equation (1), which is the common measure of the goodness of fit, stood at 0.9807. That is 98.07 percent variation in GGDP is explained by the independent variables. For each specification models, the problem of heteroscedasticity is corrected using the White procedure automatically.

For equation (1), the first and the second financial depth variable, M2/GDP and CREDIT/GDP are significant in influencing the GGDP for the fixed effects regression model. The result implies that an increase in the M2/GDP or CREDIT/GDP increases the GGDP. Contrary to other studies, the result shows that BSA is influenced GGDP negatively. But the t test fails to reject the null hypothesis of no correlation between the BSA and economic growth. For TA/GDP, the regression result showed that a positive significant relationship between TA/GDP and the endogenous variable at 1 percent level.

For both the government policy variables, the relationship between O/GDP and GOV/GDP to GGDP were positively significant at 1 percent significant level respectively. This finding showed that an increase in government expenditure and the openness to international trade will increase the economic growth.

## Conclusion

The lack of financial institutions in some Asia Pacific countries is simply a manifestation of the lack of demand for their services. Furthermore, the measurement of financial development is essential because it has significantly different implications for the development policy (bank-based vs market-based). However, this measurement remains unclear. This research employs several financial measures and new data to gain insight into this issue. Therefore, the aim of this research was to determine the relationship between financial development and economic growth.

In order to identify different financial measures of financial development, this research utilized four indicators for financial development that covers the development of financial sector/intermediary, development of financial services, the development of deposit banks relative to the central bank in allocating domestic credit and the development of financial institutions asset.

The empirical results reported in section 4 fulfill the objectives of this research. The unbalanced panel regressions with the GLS method as well as the White coefficient covariance robust method were utilized to investigate the relationship between financial development indicators to economic growth. The empirical results from this study are mixed. Before categorizing the countries, with ceteris paribus, M2 over GDP, bank credit and the total assets of financial institutions has very strong and positive impact on economic growth for all countries. Yet, the importance of bank deposits relative to the central bank in allocating domestic credit that is proxied by BSA is unclear with ambiguous sign.

Based on this simple research it is quite hard to suggest the appropriate policies. However, in order to stimulate economic growth in those low-income countries, the governments could take several moves especially in bank supervision and regulation. Hence, in addition to financial reform, legal and accounting reforms are needed to strengthen the banks rights, contract enforcement, and accounting practices. The strengthening of these elements can boost financial development and accelerate economic growth. They also conversely support the evidence that the countries that have no reform in legal and accounting systems weaken the banks' rights, contract enforcement, and accounting practices. For instance, transparent rules and encouragement should be given.

## Abstract

This paper reexamines the empirical relationship between financial development and economic growth, considering the role of financial opening and foreign investment. We use cross-country and panel empirical regressions for as many as 100 countries from the period of 1970 to 2002. We examine the growth effect of financial development in the long and short run, and study how the finance-growth nexus changes conditional on financial opening and liberalization. Our results of cross-sectional regression analysis demonstrate that there is a long-run significant positive, though non-linear, relationship between financial development and economic growth. The positive finance-growth relationship becomes stronger in more recent periods after 1990, when countries liberalized and opened their financial markets further. The relationship between financial development and growth is also affected by other conditions including macroeconomic stability and financial opening. No significant finance-growth relationship is found in dynamic panel analysis, although the finance-growth nexus becomes positive and significant in the post-1990 period even in the panel regression.

## Introduction

The relationship between finance and growth has been an important research topic to be studied extensively for long by economists. Many scholars have argued that financial development encourages economic growth as the development of the financial sector increases investment and its efficiency altogether (Levine, 1997). On this issue, empirical studies have been developed recently and most findings generally support this argument. A number of empirical researches have introduced cross-country regressions and report that financial development measured by monetary indicators and credit plays a significant role in economic growth (King and Levine, 1993a,b ; La porta et al., 1998; Levine et al., 2000; Rioja and Valev, 2004).

However, although there is seemingly a strong relationship between finance and growth in theory and empirics, there is still skepticism too. Some point to possibilities that the direction runs the opposite way, that is, financial development follows economic growth. Several studies question the growth effect of financial development using time-series analyses (Arestis and Demetriades, 1996; Shan et al., 2001; Graff, 2002). More recent studies, using the panel approach, have demonstrated that the relationship between finance and growth may be weak (Khan and Senhadji, 2000; Trabelsi, 2002 ; Favara, 2003 ).

Given the circumstances, we attempt to reexamine the finance-growth relationship empirically in this paper, using various methods. First, we study whether financial development spurs economic growth using standard cross-country regressions and panel regressions. Hence, our study shows both the long-term and short-term effect of financial development on economic growth. It also covers more countries and periods than current studies to our knowledge, and thus contributes to the current debate. Second, we examine possible preconditions including, most of all, financial opening and foreign investment. As many emphasize, the benefit of financial development could be increased when financial markets are open and foreign investment is active, which could change the financial market much more efficient. Thus, we try to understand the interaction effect of financial development and opening altogether on economic growth.

We find that financial development plays an important role in economic growth in cross-country regressions though the finance-growth relationship is non-linear. In panel regressions, we do not find the shorter-term benefit of financial development to growth, while the longer-term effect is much more significant. Concerning preconditions, there is hardly evidence that commonly mentioned preconditions including macroeconomic stability

help finance to spur growth further. Besides, more financial opening and foreign investment are not contexts in which financial development encourages growth further.

The paper consists of 6 parts. Section II reviews current empirical studies on financial development and economic growth, and indicates that though most studies support the positive impact of financial development on growth recent studies report rather mixed results. Section III presents data and specifications for our empirical research. Section IV discusses results of cross-country regressions and panel regressions following current studies. Section V reports the finding of the role of preconditions to the growth effect of financial development. Section VI concludes.

## **Current Empirical Studies**

There are many empirical studies to examine the relationship between finance and growth, mostly about the effect of financial development on economic growth. The most popular studies apply standard cross-country growth regressions using financial development variables as an independent variable after controlling other variables. King and Levine (1993b) (henceforth KL) study growth over a 30-year horizon (1960-1989) for 77 countries and find long run significant positive relation between finance and growth. In order to address possible endogeneity problem in cross-sectional analysis, KL examine initial financial development indicators obtain highly significant results after controlling for initial conditions and several combinations of institutional indexes as well as regional dummy variables for Sub-Saharan African and Latin American countries.

In order to avoid simultaneity bias in the finance-growth relationship, recent researchers have conducted studies using instrumental variables to extract the exogenous component of financial development. Levine (1998, 1999) and Levine, Loayza, and Beck (2000) (henceforth LLB) use the La Porta, Lopez-de-Silanes, Shleifer, and Vishny (1998) (henceforth LLSV) measures of legal origin as instrumental variables and indicate the positive relationship between the exogenous component of financial development and economic growth.

In light of the problems associated with purely cross-country growth regressions, LLB use a GMM (General Method of Moment) estimator developed for panel data (Arellano and Bond, 1991, Blundell and Bond, 1998). LLB construct a panel that consists of data for 71 countries over the period 1960-95 and find a positive relationship between the financial development and economic growth, productivity growth, and capital accumulation. They find that regressions pass the standard specification tests and the estimates of coefficients of the panel regressions are very similar to those obtained using cross-country studies.

Khan and Senhadji (2000) employ both cross-country and panel regression for different samples and demonstrate strong positive impact of financial development on growth in cross-country analysis. The size of the effect varies with different indicators, estimation method, and functional form of the relationship, and some indicators are insignificant in panel regressions. Favara (2003) also uses both cross-country and panel analysis over 83 countries from 1960-1998 and find mixed results, though using similar variables used in KL. Although the relation between finance and growth is positive in cross-country but when financial indicators are instrumentalized by legal origin the result is opposite to LLB with the finance variable losing its significance. Using the GMM panel, he does not find significant results in general.

Rioja and Valev (2004) examine 74 countries from 1966-95 and find financial development has greater positive impact on growth in countries with middle region, lower positive impact on high region and uncertain impact on low region of financial development, using cross-country and panel regressions. Demetriades and Law (2004) apply cross-country and panel analysis over 72 countries from 1978-2000 and find financial development has larger effects on growth in countries with sound institutions.

Recently Rousseau and Wachtel (2005) reported that the finance-growth relationship has become weaker after the 1990s. They use the data of 84 countries from 1960 to 2003 and perform panel regressions, using parsimonious specification and instrumental variables for financial depth. Their finding is that the finance-growth nexus has become weaker after 1990 in comparison with the former period. Also, they find that the growth effect of financial development disappears when they introduce country specific effects and it is significant for only middle income countries.

Concerning possible preconditions for financial development to be successful in spurring growth, there are only a few empirical studies. One may argue that when the financial market is more efficient due to more financial opening and foreign investment the growth effect of financial development on growth can become stronger<sup>1</sup>. Though there is hardly any report on the conditional growth-effect of financial development, Alfaro et al.(2004) finds that foreign direct investment could encourage growth when financial market is more developed and this is empirically supported by Hermes and Lensink (2003), too. From a different perspective, Chinn and Ito (2005) report that the financial development as such is interrelated with capital account liberalization depending on institutional development.

Thus, the empirical literature to date provides a general support on the finance-growth nexus, however studies using panel regressions report mixed results. In fact, there are many time-series empirical studies that are against the conventional argument ( Arestis and Demetriades ,1997; Ram,1999; Shan et al., 2001; Graff, 2002; Arestis et al., 2004). There are not many studies on preconditions for financial development to spur growth, but we may think that the interaction of financial opening and financial development could be important.

## Empirical Strategy and Data

### Data for Regressions

In this study, we take the approach of standard growth regressions including the cross-country regressions and panel regressions. We use the dataset that is larger than that of other studies to our knowledge and that covers longer time periods. Our data include 100 countries and the period from 1970 to 2002 from the World Development Indicators 2004 from World Bank, and also include financial opening indicator and the variable of institutional development.

As an index of financial development, we use commonly used three alternative financial development indicators, such as, Private Credit/GDP (=PC/GDP), Broad Money/GDP (=M2/GDP), and Liquid Liabilities/GDP (=M3/GDP). Though we try to incorporate maximum number of countries (100 countries) in our study, due to availability of M2 and M3 data for some countries included in our sample we have used 86 observations for them. We report the regression results using the index of private credit for 100 countries in our texts, because this is the most significant indicator in many studies.

Regarding control variables in cross-country regressions, we use the initial level of GDP, initial attainment of education, government consumption, inflation and trade openness. Besides we add GADP as the institutional variable, and regional dummies DS, DL and DE for Sub-Saharan African, Latin American and East Asian countries respectively. According to the procedure prescribed by Hall and Jones (1995), the composite GADP (Government Anti-Diversion Policy) index is used, constructed from several different institutional indicators by Political Risk services (PRS) group<sup>2</sup>.

We are interested in not only the growth effect as such of financial development, but also in preconditions that may be important. One can argue that finance would promote growth in more developed countries, under a certain level of financial development, and under more stable macroeconomic condition. Also the growth effect of financial development can differ depending on financial opening and foreign investment. We use several indexes for financial opening and foreign capital stocks from other studies. These include the IMF dummy variable for capital account liberalization from Mody and Murshid (2002), and more developed capital account liberalization indicator by Chinn and Ito (2005) using the IMF reports, more sophisticated index for capital account opening developed by Lee and Jayadev (2005), and foreign assets and liability data from Lane and Milesi-Ferreti (2006). We test this argument by using interaction terms of this condition variable and the financial development variable in growth regressions.

### Cross-Country Model

In a pure cross-sectional analysis we use data averaged for 100 countries over 1970-2002, such that there is one observation per country. The basic regression takes the following form:

$$G_i = \beta_0 + \beta_1 FD_i + \beta_2 X_i + u_i \quad (1)$$

Where, G is the average growth rate of per capita real GDP for the period from 1970 to 2002<sup>3</sup>; Financial Development Indicators (FD) use M2= Broad Money/GDP or, M3= Liquid Liability /GDP or, PC= Private Credit

/GDP for robustness check; Control Variables(X) include IG= Log of Initial (1970) Real GDP Per Capita; ISEC= Log of Initial (1970) Secondary School Enrollment Ratio; GV= Final Government Consumption Expenditure/GDP ; INF = Inflation Rate; OP = Trade Openness = (Export +Import)/GDP; GADP = Composite GADP Index; DS= Dummy for Sub-Saharan African Countries; DL= Dummy for Latin American Countries and DE= Dummy for East Asian Countries. The white noise error term is indicated by “ $u$ ”. The subscript “ $i$ ” (with different variables) denotes a particular country.

In this general specification, the interaction term is added when we examine the role of preconditions. For example, if we are to test the role of financial opening as a precondition the specification is as followings.

$$G_i = \beta_0 + \beta_1 FD_i + \beta_2 X_i + \beta_3 FD_i * FO_i + \beta_4 * FO_i + u_i \quad (2)$$

Where, FO is the index for financial opening for each country.

#### **Dynamic Panel Model**

In the case of panel data analysis, we use 5-year averaged unbalanced panel data consisting of 100 countries' observation over the period from 1970 to 2002. The data are averaged over non-overlapping 5-year periods (except the final 3-year average from 2000 to 2002), so that there could be 7 observations per country from 1970-2002 (1970-74, 75-79, 80-84, 85-89, 90-94, 95-99 and 2000-2002). The panel regression model is as followings.

$$y_{i,t} - y_{i,t-1} = (\alpha - 1)y_{i,t-1} + \beta x_{it} + \eta_i + \varepsilon_{it} \quad (3)$$

Where,  $y_{i,t}$  is the logarithm of real per capita GDP;  $y_{i,t} - y_{i,t-1}$  is the growth rate of real per capita GDP;  $x_{i,t}$  is a set of explanatory variables(other than lagged per capita real GDP) including measures of financial development,  $\eta_i$  captures the unobserved country-specific effects, and  $\varepsilon_{i,t}$  is the error term. The subscripts (with variables) “ $i$ ” and “ $t$ ” represent country and time period, respectively. Also, it includes time dummies in order to account for time-specific effects which are not reported in the regression results. Now we can rewrite the above equation (3) as :  $y_{it} = \alpha y_{i,t-1} + \beta x_{it} + \eta_i + \varepsilon_{it}$  (4)

The standard Generalized Method of Moments (GMM) approach due to Arellano and Bond (1991) starts with first differencing equation (4) in order to eliminate the country-specific fixed effects. The transformed model takes the following form:

$$\Delta y_{it} = \alpha \Delta y_{i,t-1} + \beta \Delta x_{it} + \Delta \varepsilon_{it} \quad (5)$$

Where,  $\Delta$  is the first difference operator? Since the new error term  $\Delta \varepsilon_{it}$  is by definition correlated with the lagged dependent variable,  $\Delta y_{i,t-1}$ , one should use instrumental variables. The GMM approach uses all available lags of the dependent and the exogenous variables to form an optimal instrumental variable matrix.

Thus dynamic panel GMM technique could address potential endogeneity in the data. Since persistent in the explanatory variables may adversely affect the small sample and asymptotic properties of the difference estimator (Blundell and Bond, 1988; Bond et al., 2001), the difference estimator is further combined with an estimator in levels to produce a system GMM estimator. For GMM estimation of both 2-Step 1<sup>st</sup> difference and system, DPD (package version 1.21) for Ox (version 3.40) is used (Arellano et al., 1997).

## **The Empirical Result of Finance-Growth Nexus**

### **Cross-country and Panel Regressions**

Table 1 demonstrates the basic result of cross-country regressions using the ratio of private credit to GDP as an index for financial development. The dependent variable is the average real per capita GDP growth rate from 1970 to 2002. When we use average values, all of our alternative financial development indicators are significant in almost all growth regressions<sup>4</sup>.

Figures in parentheses ( ) are t-values significant at 1% Level (\*\*\*) or, 5% Level (\*\*) or, 10% Level (\*)

When we use initial values of financial development to avoid serious endogeneity problems (Arestis and Demetriades, 1996; Arestis et al., 2004) still the result is very robust and the result does not change with inclusion of more control variables. However, when we use the legal origin variable as an instrument variable for financial development, the result becomes insignificant. This result opposes the finding of LLB, while it supports Favara's (2003) result<sup>6</sup>. Thus, we find mixed results to support that argument that the argument that financial development causes long-run economic growth in cross-country regression.

Next, we establish a panel regression model using similar specification and 5-year average values for each country. Concerning the empirical method, we use both fixed effects model called Least Square Dummy Variable (LSDV), and General Method of Moment (GMM) that can address endogeneity problem much better.

Figures in parentheses ( ) are t-values significant at 1% Level (\*\*\*) or, 5% Level (\*\*) or, 10% Level (\*) and Figures in parentheses [ ] are p-values indicating significance level at 1% [\*\*\*] or, 5% [\*\*] or, 10% [\*]

First, Table 2 reports the basic specification for economic growth employing 5-year average values, using private credit. The coefficients of control variables including initial GDP, educational attainment and institutions are with correct signs and high significance. We find that the benefit of financial development is not significant in general as the coefficient is not significant in most equations. Our result suggests that financial development does

not have short-term benefits to economic growth, even if it may promote growth in the long-run. This is consistent with other studies using the similar method such as Favara (2003), Khan and Senhadji (2000), Trabelsi (2002), although different from Beck, Levine and Loayza (2000).

This result is understandable taking into account the fact that it may take a long time for financial development to exert a beneficial effect on economic growth. The commonly used 5-year average may capture the short-run relationship only, sometimes affected by economic cycles. When we focus on the longer-run effect of financial development, using 10-year average values in panel regressions, we find that the coefficient of financial development is statistically significant as the following Table 3 demonstrates<sup>10</sup>. Not only using the regression considering the private credit variable, but also using M2 and M3 measures demonstrate the same result. Hence, there is rather a long-run relationship between financial development and economic growth.

#### The Difference across Periods

Recently, Rousseau and Wachtel (2005) report that the finance-growth relationship has become weaker after the 1990s because financial depth may have had greater value as a shock absorber in the former period and careless financial liberalization brought about negative impacts in many developing countries. We test the different effect of financial development on growth across periods by dividing time periods by 10 years simply using initial values of

independent variables in cross-country regression. We find that financial development is more significant to economic growth in the latter period after 1980 in the following Table 4.

This result suggests that financial depth encourages long-run economic growth further in the more recent period probably along with the more development of financial markets in many countries. This cross-country result is involved in rather long-run effects, different from Rousseau and Wachtel's study based on panel regressions. When we use 2SLS using initial values of independent variables as instrumental variables following Rousseau and Wachtel (2005), the result does not change as long as we use 10-year average data.

TABLE 4: DIFFERENCE OF THE GROWTH EFFECT OF INITIAL FINANCIAL DEVELOPMENT ACROSS PERIODS

Figures in parentheses ( ) are t-values significant at 1% Level (\*\*\*) or, 5% Level (\*\*) or, 10% Level (\*)

Moreover, the result using panel regression is also consistent with our finding in cross-country regression. When we compare the period before and after 1990 using panel regressions, the finance-growth nexus has been stronger in the more recent period as Table 5 demonstrates.

This finding suggests that the finance-growth nexus in the recent period becomes stronger even after considering rather short-run relationship and unobserved country-specific effects, opposite to the finding of Rousseau and Wachtel (2005). This implicates that we may expect more benefits from financial development recently along with the further development of financial markets and financial opening, especially in developing countries.

### Preconditions for the Finance-Growth Nexus

This section discusses possible preconditions that financial development can encourage economic growth. First of all, we test whether there is a non-linear effect of financial development on economic growth. Some may think that financial development becomes more helpful to growth as countries develop from the serious financial underdevelopment, however the benefit grows less in highly financially developed countries due to a decrease of marginal benefit. Then, there might be the inverted “U” relationship between financial development and economic growth.

We find this relationship using the quadratic term of private credit in Table 6 and this is robust to the inclusion of other control variables. When we divide samples into 3 groups according to the level of financial development we also find that the benefit of financial development is clearer in countries with the middle development of finance, which is similar to the finding of Rioja and Valev (2004). Since we do not find a similar result using other indexes M2/GDP and M3/GDP there seems to be the inverted U relationship in the case of private credit only.

One may also argue that the finance-growth nexus as such varies across several contexts and preconditions. For instance, financial development can spur economic growth more in countries where other markets are more developed or institutional quality is higher with better financial regulation. In addition, macroeconomic stability such as lower inflation and government consumption could be important conditions for financial development to stimulate growth more. We add interaction terms of the financial development index and other condition variables including the institutional variable, the level of GDP, and also inflation and government consumption so as to test this hypothesis. The following Table 7 demonstrates results using the average value of private credit and various condition variables respectively, which appears to be somewhat opposite to conventional wisdom.

The coefficients of interaction terms are significantly negative when the initial level of growth, educational attainment, and institutional variables are used as condition variables. This implicates that the contribution of financial development to economic growth becomes less in countries where institutions are more developed and the GDP level is higher. It may be understandable if the growth impact of finance is larger in developing countries and it becomes smaller in already developed countries. When we divide countries into 3 subgroups according to the income level, again we find that the benefit of financial development is larger in the least developed countries. Inflation and trade openness are not relevant as conditions, while more government spending appears to be bad to the growth effect of financial development, which supports the importance of macroeconomic stability partly. In sum, our result lends a support for the stronger finance-growth nexus in countries with lower level of income and

institutional development and lower government consumption, where financial intermediation is essential to economic growth in the long-term.

Finally, we test the role of financial opening and foreign investment as preconditions to enhance the growth effect of financial development. We use several variables for financial opening policy including the original IMF index for capital account openness, Chinn and Ito (2005) index, and Lee and Jayadev (2005) index. Table 8 reports the result of our regression. We find that the interaction terms of financial development and financial opening are significantly negative in general though the financial opening index is statistically significant independently. This result is robust to the inclusion of regional dummy variables. In the case of international financial integration using foreign asset and liability altogether and foreign direct investment liability from Lane and Milesi-Ferreti (2006), we do not find that they are preconditions for financial development to spur growth more either because the interaction term is not significant. Using the different foreign direct investment data does not change the result. This is different from current studies such as Alfaro et al.(2004) and Hermes and Lensink (2003).

This is opposite to the common argument that financial development can spur economic growth when the financial sector is more open and hence is more efficient. However, financial opening as such does neither guarantee the increase of economic efficiency and does nor bring about economic growth as many studies and historical experiences demonstrate (Kose et al., 2006). Because financial globalization sometimes just led to more economic instability, the joint effect with financial development may not be beneficial to economic growth. Moreover, our result is consistent with the finding that financial opening encourages growth more in poorer countries with lower institutional development since those countries usually have relatively lower level of financial opening. In sum,

there is no evidence in support of the argument that financial development exerts a larger effect on economic growth where financial markets are more open and there are more foreign capital flows.

We also test these hypotheses about the importance of preconditions using panel regressions. However, we do not find significant results in panel regressions in general. Neither the inverted-U relationship between financial development and growth nor the importance of any precondition variable is found. Hence, we can conclude that there is the conditional relationship between finance and growth depending on several preconditions only in the long run.

## Conclusions

This paper has attempted to reexamine the empirical relationship between financial development and economic growth considering several preconditions and using various methods and data. Our finding confirms that in general there exists rather the long-run, if not short-run, positive and significant relationship between them in cross-country and panel regressions, though the result is not totally free from the endogeneity problem. It is interesting that our results demonstrate that the effect of financial development on economic growth has become stronger in the more recent period in both the cross-country and panel regressions.

We have also examined several preconditions relevant to the growth effect of financial development in cross-country regressions. We find that there is an inverted “U” relationship between finance and growth using private credit. This suggests that the benefit of financial development is larger in countries with middle financial development in comparison with financially underdeveloped and highly developed countries. Concerning several preconditions, financial development promotes economic growth further in poorer countries where the level institutional development is lower. We find that the lesser government consumption is the larger the benefit of financial development is. Finally, cross-country regressions exhibit that financial development spurs economic growth more in countries where financial opening is less developed.

Panel regressions give us insignificant results in most cases. Different from the cross-country regression, financial development is not significant in growth regression using 5-year averaged panel method. Also there is no evidence for the relevance of preconditions. It is not unusual to have such results using the panel method considering that it takes time for finance to encourage growth in many developing countries. Indeed we find that the panel result becomes significant when we conduct 10-year averaged panel regressions, considering longer term effect of financial development.

In conclusion, our empirical evidence suggests a long-run positive relationship between financial development and economic growth, especially in poorer countries and in the more recent period. The relationship depends on several preconditions including the level of financial development, the level of income and financial market opening. Such positive relationship disappears in panel regressions, but it is significant when using longer-run data, and in the more recent period.

## Endnotes

Kose et al.(2006) report that the direct effect of financial opening and globalization as such on economic growth is not clear. However, they argue that there could be indirect and collateral effects of financial globalization, including via the development of financial market.

<sup>2</sup> We construct a new GADP index, different from that used in many studies up to now, because the category of protection for investment has been changed after the late 1990s. We use an equally weighted average of the index for corruption, law and order, bureaucratic quality, and investment risk.

<sup>3</sup> It is calculated as (Log of real per capita GDP in 2002-Log of real per capita GDP in 1970)/32.

<sup>4</sup> Only the result using private credit/GDP is reported here. The results using other financial indicators, M2/GDP and M3/GDP will be provided on request to authors.

<sup>5</sup> Independent Variables: IG=Log of Initial Real GDP Per Capita, ISEC=Log of initial Secondary School Enrollment Ratio, GV=Government Final Consumption/GDP, INF=Inflation, OP=Openness, GADP=Composite GADP, DS, DL and DE are the Dummy for Sub-Saharan African, Latin American and East Asian Countries respectively and PC=Private Credit/GDP. Rationale for using control variables are-initial level of per capita real GDP controls for the convergence effect; initial secondary school enrollment ratio is an educational variable which controls for the level of human capital development; government consumption, inflation and openness control for policy issues and GADP controls for institutional development in the country.

<sup>6</sup> The results using M2/GDP and M3/GDP produce similar results but not reported.

<sup>7</sup> For Baseline Equation, 2 Step 1<sup>st</sup> diff. GMM instruments are : Time dummies (not reported),G(-3), SEC(-3), PC(-3) and all of their next lags ; Again for system GMM, additional instruments used for level equations are  $\Delta G(-1)$ ,  $\Delta SEC$  &  $\Delta PC$ .

<sup>8</sup> For Extended Equation, Time dummies (not reported),G(-3), SEC(-3),GV(-3), INF(-3), OP(-3), PC(-3) and all of their next lags are the instruments for 2 Step 1<sup>st</sup> difference; in addition that,  $\Delta G(-1)$ ,  $\Delta SEC$ ,  $\Delta GV$ ,  $\Delta INF$ ,  $\Delta OP$  &  $\Delta PC$  for 2 Step system GMM.

<sup>9</sup> For Institutions, Time dummies (not reported),  $G(-3)$ ,  $SEC(-3)$ ,  $GV(-3)$ ,  $INF(-3)$ ,  $OP(-3)$ ,  $GADP(-3)$ ,  $PC(-3)$  and all of their next lags are the instruments for 2 Step 1<sup>st</sup> difference; in addition that,  $\Delta G(-1)$ ,  $\Delta SEC$ ,  $\Delta GV$ ,  $\Delta INF$ ,  $\Delta OP$ ,  $\Delta GADP$  &  $\Delta PC$  for 2 Step system GMM.

<sup>10</sup> The Wald (Joint) test is a test of joint significance of the estimated coefficients asymptotically distributed as Chi-Square under the null hypothesis of “No Relationship”.

<sup>11</sup> The Wald (Time) test is a test of joint significance of time dummy variables asymptotically distributed as Chi-Square under the null hypothesis of “No Relationship”.

<sup>12</sup> The Sargan test of over-identifying restrictions is asymptotically distributed as Chi-Square under the null hypothesis of instrument validity i.e. “the instruments used in the model are not correlated with the residuals”.

<sup>13</sup> The m1 test is the test for first order autocorrelation of residuals distributed as  $N(0,1)$ , where the null hypothesis is that the residuals or error terms in the 1<sup>st</sup> differenced regression exhibit no first order serial correlation.

<sup>14</sup> The m2 test is a test for second order autocorrelation of residuals distributed as  $N(0,1)$ , where the null hypothesis is that the residuals or error terms in the 1<sup>st</sup> differenced regression exhibit no second order serial correlation.

<sup>15</sup> When we use 10-year averages we cannot use the system GMM method because the number of observation is not enough. Instead we add the result of the random effect model.

<sup>16</sup> Insufficient Observations for running 2-Step System GMM as well as Sargan Test, m1 & m2 Test.

<sup>17</sup> In fact, the result of Russeau and Wachtel (2005) holds only when they use the OLS method for panel regressions. Many studies already report that panel results considering country-specific effects do not support the growth effect of financial development. Therefore, it is more valuable to examine the longer-run effect using cross-country regression for the different time period. When we use average values of independent variables, not initial ones, the result is much more significant.

<sup>18</sup> 1970s indicates time dimension from 1970 to 1979, 1980s indicates time dimension from 1980 to 1989 and 1990s indicates time dimension from 1990 to 2002

<sup>19</sup> Initial time period in 1970s is 1970, initial time period in 1980s is 1980, and initial time period in 1990s is 1990

<sup>20</sup> Insufficient Observations for running 2-Step System GMM as well as Sargan Test, m1 & m2 Test.

<sup>21</sup> The result for each group of countries is provided on request.

<sup>22</sup> The result is almost same when we use other financial development indicators such as  $M2/GDP$  and  $M3/GDP$ .

<sup>23</sup> When we use the initial value of private credit, the result becomes insignificant except for institutional development as the precondition at 10% level of significance.

<sup>24</sup> IMF dummy is for capital account opening from 1970 to 2000, from Mody and Murshid (2002).

<sup>25</sup> Chinn and Ito index is from 1980 to 2002, from Chinn and Ito (2005).

<sup>26</sup> Lee and Jayadev index is from 1976 to 1995, from Lee and Jayadev (2005).

<sup>27</sup> Foreign Direct Investment is foreign direct investment liability / GDP, from Lane and Milesi-Ferreti (2006).

<sup>28</sup> International Financial Integration is (foreign assets + foreign liability) / GDP, from Lane and Milesi-Ferreti (2006).

<sup>29</sup> We also find that financial development encourages growth mainly through the channel of more investment, rather than the increase of productivity, though not reported. The efficiency of financial markets could be more related with the productivity channel if any. But the investment channel, which is more significant, is much more important in poorer countries.

# Increasing Use of Leverage Finance in European Infrastructure Sector Transactions

*Jozef Komornik, [jozef.komornik@fm.uniba.sk](mailto:jozef.komornik@fm.uniba.sk)*

*Marian Herman, [mherman.miffi2005@london.edu](mailto:mherman.miffi2005@london.edu)*

*Deutsche Bank AG London, United Kingdom*

## Abstract

The article is analysing the recent popularity of highly leveraged transactions in the infrastructure sectors of airports, ports and toll-roads. It analyses how specialised infrastructure investors contributed to the highly leveraged deal structures and substantial increase in infrastructure sector asset class valuations in recent time. The article also tries to predict the use and development of highly leveraged transactions in the Central and Eastern European region, where strong pipeline of transactions in this asset class exists, albeit the banking markets have not yet caught up with the Western European benchmarks in facing this challenge.

## Recent Phenomena behind the Increased Activity

The recent activity in the infrastructure sector can be attributed to two main phenomena which surfaced over the last few years. The first one is the advent of specialised class of investors – Infrastructure Funds that have exhibited predatory behaviour in search for transaction pipeline and have aggressively pursued almost every investment opportunity available. The second phenomena is the oversupply of liquidity on the banking market, making specialised asset-backed debt instruments widely available for M&A activity and project finance at very competitive rates.

These two factors have contributed to the fact that most of the sell-side processes of the infrastructure assets have been organised as competitive auctions with price as the main criterion. Substantial demand from specialised infrastructure investors coupled with pre-packaged debt available from selling vendor banks, which have increased the valuations and competitiveness in any sale process.

### **The Advent of Infrastructure Investors**

The emergence of infrastructure investors is an increasingly important topic given the growth in this sector over the last few years, with the market showing no signs of slowing. Infrastructure investors typically target equity returns in the low-to-mid teens and are focused on assets which offer highly predictable cash flows and earnings – long-term investment horizon, large scale assets, ability to support leverage, IRR and yield driven, and targeting regulated businesses in particular

Sectors of particular interest are utilities and transport (in particular airports, ports and toll roads), however the growth in demand for investments has meant that virtually any infrastructure class is considered. The growth in infrastructure investment has direct consequences for market participants as it represents a fundamental change in the face of the infrastructure markets, in particular:

- represents a potential new source of long-term funding/partnerships
- opportunity to divest non-core infrastructure assets for conglomerates
- aggressive competing bidders in acquisition processes

The market now consists of a large number of well capitalised investors, who can be categorised into four types:

- direct infrastructure owner and operator: have internal management capabilities to operate infrastructure
- infrastructure investment managers/arrangers: arrange investments on behalf of other investors, including managing listed infrastructure funds
- direct investors: take sizeable positions in assets with board representation

- passive investors: hold infrastructure as part of a broad portfolio

Examples of specialised infrastructure fund that have raised capital from investors in the recent years include:

- Macquarie Infrastructure Fund Partnership (MAp)
- Deutsche Bank’s €2bn Infrastructure SPV – Deutsche Bank’s SCM Group established in September 2006 an investment vehicle and secured commitments of €2bn to invest in infrastructure assets across Europe
- SPARK A\$1.8bn Australian Infrastructure Fund - A\$ 1.8bn capital raising and IPO of SPARK Infrastructure on Australian Stock Exchange
- RREEF’s €556m first closing of RREEF Pan-European Infrastructure Fund
- Deutsche Bank in cooperation with Abraaj Capital and Ithmaar Bank is raising Infrastructure and Growth Capital Fund , US\$ 2bn Shari’a Compliant Alternative Asset Fund
- Babcock & Brown –US\$300m
- Hastings Fund Management – Joint underwriter to Australian Infrastructure Fund, managed by Hastings Fund Management, on a A\$225m renounceable entitlement offer to fund a share of acquisitions of stakes in a number of airports
- Lion Global Infrastructure Fund – Deutsche Bank with its partner Lion Capital is in process of raising US\$0.5bn – 10bn for this global infrastructure fund

Profile	Comments	Examples
Infrastructure funds	<ul style="list-style-type: none"> <li>■ Strong global demand for infrastructure assets</li> <li>■ Macquarie is largest investor in airports</li> <li>■ Driven by long-term equity returns (10% – 12% IRR) and cash yield</li> <li>■ Strong interest from pension funds eg Canadians</li> <li>■ Significant new funds raised (&gt;US\$8bn)</li> <li>■ Traditional sponsors entering the space eg Carlyle</li> </ul>	
Strategic	<ul style="list-style-type: none"> <li>■ Diversifying from construction into concessions</li> <li>■ Active bidders in recent processes</li> <li>■ Spanish particularly active driven by tax breaks</li> <li>■ Often bid in partnerships with financial investors</li> </ul>	

FIG. 1: KEY INFRASTRUCTURE INVESTOR CATEGORIES

Figure 1 summarises the key infrastructure investor categories and their characteristics. The main players among the funds are also listed with most of the funds setting up presence in this asset class already.

**Oversupply of Liquidity**

Another recent phenomenon is the buoyant debt markets in which abundant liquidity pushes banks to explore new ways to get exposure to hard assets class of investments.

Financing institutions have become more accustomed to lending across the holding structure in the infrastructure deals (i.e. even debt at HoldCo which is serviced by dividend flow from Opco is now a common feature). Moreover, the role of key financing bank/consortium of underwriters has become more important than ever. These institutions usually underwrite the whole financing on an infrastructure transaction and “slice” the debt package to include various debt subordination levels, in order to make these slices more attractive for potential syndicate partners.

However, the key fact that supports the boom in infrastructure financing is the oversupply of liquidity in the banking markets combined with low interest rate costs which incentivises and enables investors to load in yet more debt onto a transaction or OpCo/HoldCo structure.

## **Infrastructure Assets Lend Themselves to Highly Levered Structures**

The characteristics of infrastructure assets support substantial levels of debt by the virtue of their asset characteristics with stable and strong cashflow generation, regulatory environment allowing/guaranteeing specified returns of the so-called regulated asset bases etc.

Infrastructure assets have stable cash flow and earnings over long-term investment horizons, with relatively low risk providing an opportunity to maximise returns through financial engineering.

### **Stable Earnings**

Assets of an essential nature are preferred, in particular those with high barriers to entry and/or high replacement costs, as they typically offer relatively predictable earnings streams.

Other factors include:

- natural barriers, planning or environmental restrictions, or limited availability of land leading to high costs of competing development
- may have long-term exclusive concessions and customer contracts
- demand for such products or services is generally stable and often grows with underlying economic or demographic growth

### **Duration**

Infrastructure assets typically have a lengthy maturity given the very high upfront investment required.

Similarly, contracted assets generally operate under long term concessions/agreements – eg airport leases may be for 99 years. This attracts pension funds and other investors with long term horizons – in particular under mark-to-market accounting standards long duration assets will result in smoother annual investment returns.

### **Diversification**

Many infrastructure projects provide a unique product or service, therefore offer an exposure that is difficult to replicate. This results in low correlation with traditional asset classes such as equity, property or fixed interest, reducing portfolio risk. In addition, an infrastructure portfolio may offer diversification with regard to currencies, infrastructure sectors and geography.

### **Structuring**

Operational stability allows significant financial engineering to optimise post tax returns. In addition, tax incentives may be available. Typically assets have a high cash generation given strong earnings and limited reinvestment opportunities, resulting in a target dividend yield of between 5.0% – 10.0% – regulated assets and assets with low growth will tend to have higher yield inter alia than higher growth assets.

### **Attractive Returns**

Returns accrue from both:

- annual income stream – high cash yield
- long term capital appreciation – seen as providing a natural inflation hedge

## Infrastructure Asset Themes

### Recent Airport Sector Themes

Airport sector has been characterised by extremely favourable environment - earnings growth driven by increase in traffic and economic conditions and growth of low cost carriers. The sector has experienced a period of unprecedented activity in last few months:

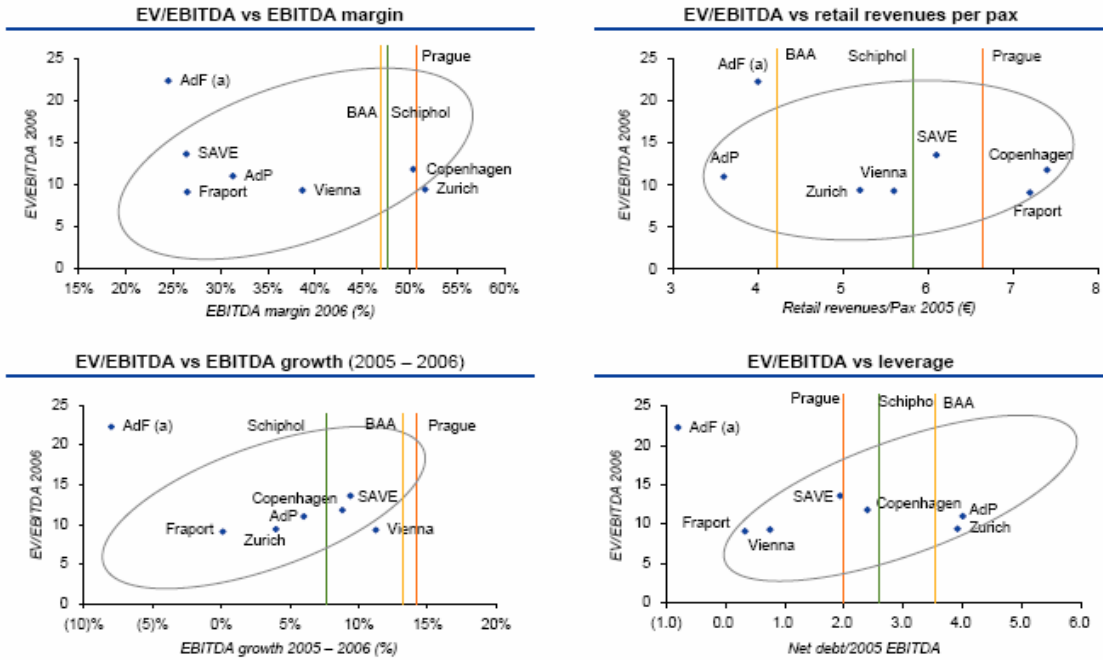

- Ferrovial's €23.6 billion acquisition of BAA
- success of ADP's IPO – proceeds of €503.4 million
- AIG/CS/GE consortium's £750 million acquisition of London City Airport
- Hochtief's likely purchase of Budapest Airport

Sector re-rating has driven valuations higher in public markets and M&A transactions, based chiefly on:

- low risk asset class offering stable long-term returns
- availability of debt financing on favourable terms
- strong competition for assets

Large cash inflows to infrastructure funds have also contributed to high interest in any competitive sale processes or auctions – put simply too much money is currently chasing too few deals. However, the reminder of sector risks remains with the terrorist threat in the UK. Ferrovial market value has fallen down by €224.4 million (between 8 August 2006 and 11 August 2006). Further pipeline of airport sector deals exists as vendors are likely to make use of the favourable conditions and tap into the strong demand. The transaction pipeline will continue to be driven by privatisation plans (e.g. Schiphol, ANA, French regionals, Prague, Leeds/Bradford) and secondary sales (e.g. possible break-up of BAA)

Figure 2 below shows how capital market rewards higher profitability, growth, value added revenues and more importantly – an optimal capital structure. The increased use of leverage levels in sector transactions has been partly reflected also in public companies, while a number of public airport operators have re-capitalised their capital structures, partly to take advantage of the favourable debt markets but also as a defence mechanism against possible takeover (incentivised by potential capital structure inefficiencies).

Note: Prague and Schiphol metrics based on latest financials  
 (a) Forecasted reduction in EBITDA due to 2.5 month closure of the airport for runway maintenance

FIG.2: EUROPEAN AIRPORTS BENCHMARKING

(a) Based on 2005 passenger numbers. Equivalent BAA market shares in 1990 were 72% for total UK; 95% for London; and 93% for Scotland  
 Source: OFT press release

FIG. 3: UK AIRPORT SECTOR CHARACTERISTICS – MONOPOLISTIC CHARACTERISTICS

Figure 3 above demonstrates the monopolistic characteristics of the infrastructure asset class (airports in this case). Its monopolistic market positioning coupled with benign regulation is a significant factor why lending banks can become comfortable with providing generous debt at various levels of corporate structure in any M&A transaction or recapitalisation.

#### Recent Port Sector Themes

FIG. 4: KEY TRENDS IN PORTS SECTOR

Figure 4 above shows graphically the key trends in ports sector. As trade volumes grow, container ports have experienced a significant increase in demand for their services. Traffic volume is projected to grow faster than port capacity. As competition and consolidation among shipping lines intensifies, terminal operators have also consolidated.

The industry overall is experiencing an increase in demand for port services. Traffic volume is growing faster than port capacity can handle. Customer consolidation is driving operator consolidation. Recent M&A activity has significantly consolidated the ports sector in Europe

- DP world's acquisition of P&O
- Goldman's acquisition of ASP

#### Recent Toll Roads Sector Themes

Availability of assets has sparked consolidation as demand for stronger profitability is achieved by increasing network scale. Vinci ranks as No 1 player, pending the Autostrade/Abertis deal which increasingly looks like a thing of the past. Competition for toll road assets has attracted strategic and financial investors, while market for new assets remains highly competitive.

## Recent Corporate Activity in the Infrastructure Sector

Overall economic growth and favourable debt markets have contributed to the attractiveness of the infrastructure space for investors. The corporate M&A activity in the sector has been characterised by:

- Sector re-rating and unprecedented corporate activity have driven valuations to record heights
- Large cash inflows to infrastructure funds – too much money chasing too few assets
- Highly favourable debt market with increasing leverage at lower cost
- Nevertheless there are opportunities of significant scale

Figures 5-7 below show major transactions in each sub-sectors and the respective valuations achieved in chronological order. The uplift in valuations is visible even over a very short period of time as shown in the Figures below.

Acquiror(s)	Target	Close date	Deal value <sup>(a)</sup>	Trailing EV/EBITDA

FIG.7: RECENT AIRPORT SECTOR TRANSACTIONS AND EV/EBITDA VALUATIONS ACHIEVED

## Infrastructure Financing Structures and Their Impact on Deal Characteristics

Infrastructure deals have been strongly influenced by the increasing proportions of debt being put onto the transactions. Increased leverage levels coupled with its low costs have pushed transaction valuations to extreme levels, which is seen mainly in the airports sector space. For example valuations of both transactions of London City airport (EV/EBITDA of 27.5x) and Budapest airport (EV/EBITDA of 28.6x) were driven by aggressive debt packages behind, which enabled the investor to minimize the equity cheque and bid-up the purchase price while still maintaining required IRRs.

The Figure 8 below demonstrates the way infrastructure investors approach projects in this asset class. The suggested structure allows flexibility to run various traffic, regulatory, operational and financing scenarios. It demonstrates the flexibility in financing solutions a typical investor would require:

- Multilayer financing structures – i.e. at Operating company and at the Holding company
- Dividend and cash flow services debt at higher levels in the structure
- Pricing adapts to complexity of transactions

The financing structures bring certain value added to the target company:

- Financial engineering and optimisation of capital structure of target on acquisition and thereafter
- Management incentivisation plans put into place
- Crystallisation of value of the asset through M&A or recapitalisation

Return requirements for infrastructure investors in connection with such a typical M&A deal:

- Typically in the range of 10% – 15%
- Strongly dependent on ongoing yield – dividend discount model

Typical leverage includes aggressive use of debt in capital structure along the whole structure (OpCo and HoldCo) and also various types of leverage, e.g. Project finance leverage, RAB-based debt, Asset-backed debt etc. Dividend policy has to be put in place in most case, as returns for financial investors are achieved partly through dividend distribution - excess cashflow (post debt service) is distributed to shareholders.

Another feature of infrastructure deals, mainly if involving specialised infrastructure funds are the Shareholders agreements:

- Always required for consortia members, rollover equity or management equity holders
- Governing major business decision making, investment and financing considerations
- Covering exit plans via tag-along or drag-along and first refusal rights

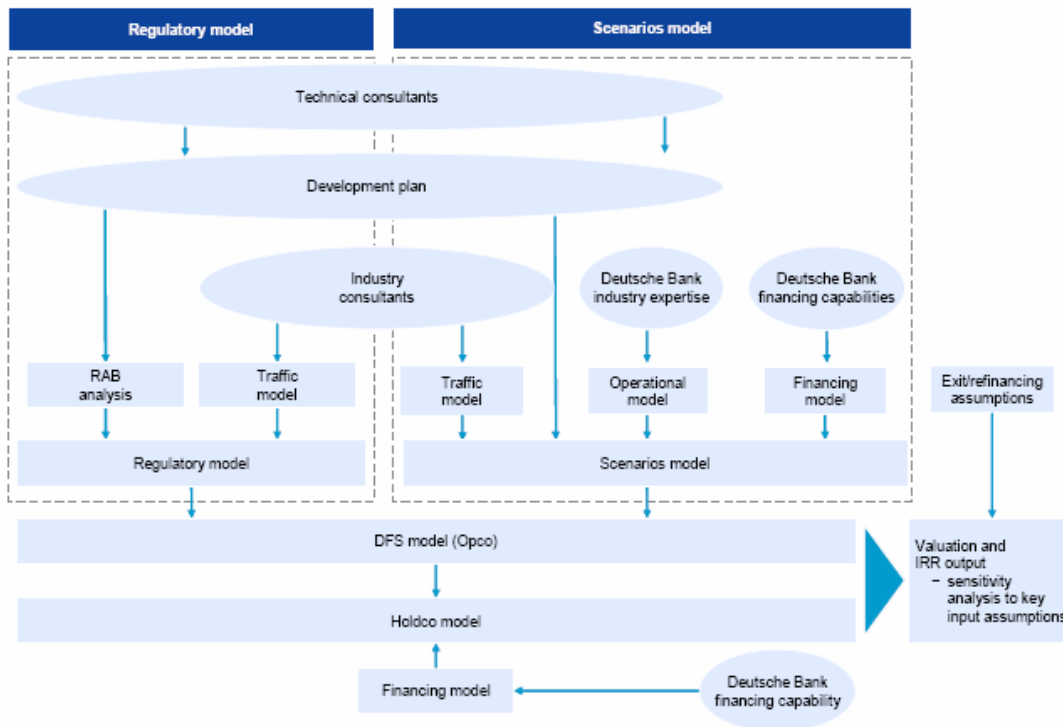

FIG. 8: INFRASTRUCTURE TRANSACTION FINANCING STRUCTURES

### Typical Financing Considerations in Infrastructure Sector

In providing structured debt, the banks take into account several considerations, in particular:

- Location of airport and competitive positioning relative to other airports in the region - primary or secondary hub, tariffs (passenger & landing charges) charged relative to competing airports, proximity to key business/tourist centres, passenger processing times relative to nearby airports.
- Access to follow-on transport (rail and road) connections (both existing and under development)
- Macro-economic outlook for the region, demand/air-traffic projections
- Regulatory framework with respect to tariffs/returns generated (price caps), asset ownership (or just administered), status of concession agreement (when/if does it expire)#
- Traffic mix – how stable is existing passenger base and potential for future growth, passenger vs. freight traffic, aeronautical vs. non-aeronautical revenues (retail, parking etc.), long-haul versus short-haul traffic
- Historical stability of revenues and cashflow generation, resilience to recession. In this regard mix of revenues by business/tourism and cyclicity of revenue segments
- Diversification of customer base (exposure to major carriers as % of revenues), rating/credit of customer base, length and nature of contracts, supply/sub-contractor risk
- Labour relations/agreements, environmental risks (eg. noise pollution constraints, where close to inhabited areas)
- Capex requirements (both maintenance and strategic) and Capacity utilisation - investments in recent past and requirements in foreseeable future.
- How much additional capacity can be handled using existing infrastructure and how capacity utilisation/excess capacity compares to competing airports in the region

- Analyzing the proportion of fixed and variable costs (primarily labour)
- Assets owned by the operating company, their estimated valuation and implied net loan-to-value
- Level of contractual revenues (long term/medium term/short term), breakdown of cargo revenues (bulk vs containerised)
- Competition from other ports/airports etc.
- Is the port critical to the ‘hub & spoke’ network for the distribution of goods?
- Availability of alternative routes
- Presence of any unique infrastructure or customer investment (eg chemical plants for oil) that ‘lock-in’ any revenue source?
- Diversification of revenue stream by service provided (conservancy, docs, logistics, rental etc)
- Are any of the revenue sources cyclical in nature and dependent on external factors (eg grain volumes depend on harvest, commodities can be impacted by world commodity prices, strength of € will have an influence on export volumes, overseas economic environment)?
- Customer concentration (rating/credit of customer base, length and nature of contracts)
- Pension and other third party liabilities

The characteristics of most infrastructure assets are considered to lend themselves to a fairly high degree of leverage. The debt structures for these regulated assets are usually tied in some way to the so-called Regulated Asset Base (RAB), i.e. the regulator’s main measure for determining the allowed level of profitability.

Hence, when structuring the debt at Opco level, the financing banks take into account the current gross debt/RAB, in order for it not to exceed 100% (including any off-balance sheet financing, e.g. capitalised leases).

The debt capacity of Holdco is also possible, however dividend distribution policy must be clearly defined. If dividend distribution concern is addressed and given the high degree of certainty over cashflows, it would be possible to structure additional leverage at Holdco level. Any such debt would be subordinate (legally and structurally) to the debt at Opco with no enforcement rights, it would get serviced via dividends up-streamed from the operating entity. Typical maturity is circa 7 – 10 years and it may be possible to get this debt rated. This might be beneficial if it gets rated in the ‘BBB’ or ‘BB’ area as the pricing for rated instruments is more competitive than unrated debt

## **Infrastructure Sector Financing Structures in Central and Eastern Europe**

Due to the underlying growth potential and utilizing leverage structure similar to other regional airport deals (eg Budapest), infrastructure investors could achieve attractive returns in this region even at relatively high valuations. The capital structures in Fig 9 and Fig 10 below depict financing structure for an airport sector transaction in Czech Republic and port sector deal in Estonia. Their complexity, terms, pricing, quantum and maturity can almost match the levels of similar deals in Western Europe – Fig 11 and Fig 12 below. In some terms (e.g. as the underlying traffic growth is expected higher, the CEE debt multiples might even surpass the Western European ones).

Capital structure assumptions	
<ul style="list-style-type: none"> <li>■ OpCo debt at 14x EBITDA</li> <li>- principal repayment holiday for seven years (interest only)</li> <li>- refinanced afterwards with full cash sweep</li> </ul>	100bps over PRIBOR
<ul style="list-style-type: none"> <li>■ OpCo capex facility of CZK8bn (€280m)</li> <li>- drawn 2007 – 2010</li> <li>- repaid with full cash sweep afterwards</li> </ul>	125bps over PRIBOR
<ul style="list-style-type: none"> <li>■ HoldCo debt at 3x EBITDA</li> <li>- repaid from OpCo dividend stream</li> <li>- full cash sweep after allowing for 5% cash yield to HoldCo shareholders</li> </ul>	350bps over PRIBOR

FIG. 12: EXAMPLES OF RECENT PORT SECTOR TRANSACTIONS DEBT LEVELS

The situation in the entire Central and Eastern Europe has changed dramatically. Nevertheless, the general fact remains that with the privatisation of most of the regional banks into multinational banking groups, the sophistication of the entire banking industry has grown rapidly. There are now active leverage finance banking teams of major investment banks dedicated solely to the region operating from Prague, Vienna and London. The accession of the CEE countries into the EU in 2004 has also put the region on the radar screen of large multinational leverage finance providers in London, Frankfurt, New York etc. This all results in increased utilisation of leverage finance products in infrastructure transaction in the region nowadays. In fact now, after the EU accession of CEE countries, most infrastructure funds bidding in any sizeable auction are actively approached by leverage finance debt providers with pre-packaged financing offers in the level of Western European multiples of the underlying asset

Another important phenomenon will surface in the coming months. According to recent private equity publications <sup>[9]</sup>, corporate sphere in the region started shifting their debt portfolios into Euros, trying to hedge their currency risk associated with the expected wide-scale adoption of Euro in most of the region. The planned European Monetary Union convergence of the CEE countries should therefore have the same effect on infrastructure / buyout transactions. In the near future, large parts of the debt in infrastructure transactions will be arranged in Euros, rather than in local currencies. The companies and infrastructure funds can actually help this way diversify currency risks away from the transactions. By the time they will exit their investment, they will most probably receive the proceeds in Euros anyway (as the local currencies will have ceased existing).

All in all, the infrastructure sector in the CEE has already started catching up with Western Europe and it will inevitably continue doing so. In few years (or may be rather months) time, there won't be any differences in sophistication, valuation or the extent of leverage between transaction in Western Europe and one in Central and Eastern Europe. We will be increasingly seeing more structured transactions, with several layers of debt of various subordination, maturities and risks being attached to the CEE transactions just like in Western Europe. The development of larger debt markets will spur the CEE buy-out activity, much as the availability of debt (mezzanine and junk bonds) was instrumental to the growth of Western European infrastructure industry and in particular the buy-out markets.

## **A Dollar Crisis Theory in Age of Turbulence -With Apologies to Alan Greenspan of “Age of Turbulence”**

Shigeru Yonekura, [yonekurs@cc.saga-u.ac.jp](mailto:yonekurs@cc.saga-u.ac.jp)  
Saga University, Japan

### **Abstract**

A dollar crisis theory has always been popular. Curiously enough, this theory is now set to be in the state of a grey silence despite the expanding world imbalance. This state reminds me of a famous phrase by Alan Greenspan, that is to say, ‘a conundrum’. My article will explain why US current account deficit cannot be a factor to cause a dollar crisis and why it can be a positive aspect, reflecting a powerful proceeding of the capital globalization led by US economy. US giant companies are accelerating their business operation towards the globalization. Optimum allocation of management resources are not limited in domestic level, being extended to cover the rest of the world, whose consequence is that production facilities are being transferred overseas, to cause a huge deficit of current account as well as to produce increased profits, clearly endorsed in the recent stock prices -surge.

### **Introduction-A Dollar Crisis Fading into a Mirage in the Globalizing Capitalism**

Recently abnormal weather condition has been almost always widely reported, but here it is to be emphasized that similar unusual case can be evidenced in the world financial markets. That is to say, a dollar crisis cry, which has been always very popular among the economists of international finance studies. Curiously enough, this theory is now set to be in the state of a grey silence despite the expanding world imbalance, which should be a supporting factor to a crying wolf. This state reminds me of a very famous phrase produced by Alan Greenspan (Ex Chairman of FRB), that is to say, ‘a conundrum’.

It is to be remembered that many leading economist have predicted a coming of a dollar crisis and that they have acted as a crying wolf. For instance, some of them have maintained that, when US current account deficit was near to share 3% of US GDP, the world economy could be on the brink of a serious dollar crisis. The inconvenient truth is that such a mantra has proved to be an oracle, a groundless message. Nowadays, that rate has exceeded well over 5%, almost certain to reach 7% of US GDP. Even so, there is no sign to be detected to justify such an oracle.

According to the theory of the dollar crisis, this element of expanding deficit should be a powerful supporting evidence to show that a wolf is coming just around the corner to attack sheep. Contrary to their expectations, no shade of wolf could be seen, much less its cry not audible recently. I am afraid that this wolf appears to go instinct because of unfavorable climate in the international financial markets. Since late 2006, New York Dow Jones Averages had kept climbing to have reached a historic record. On May.18, 2007, it has hit a peak of \$1,3556.53 . A relative stability of US economic condition does mean to reduce the home for a wolf of a dollar crisis and in the face of such a situation, economic priests of the dollar crisis should feel puzzled, not being able to solve a conundrum mentioned above.

An expanding US current account deficit may cause a dollar crisis in the near future? Reader with a good memory can know that such a theory can be just a new version of arguments set by S. Marris (<Marris1985>138-41), which has enjoyed much attention, because of Black Monday turmoil in October 1997 in New York Stock Exchange. But since then, what fate has dollar experienced? Neo- Marris theory has never been realized, since US economy has attained unprecedented economic prosperity, especially in a decade of 1990s, while in that period US current account has never stopped expanding.

According to *Wall Street Journal*(Feb.28,2007), Greenspan is going to publish a book, “Age of Turbulence”, due to be released on Sept.17, 2007(not on Sept.11), so right now it is a good coincidence to tell a story of a dollar crisis theory of “Age of Turbulence”.

## **US Economy in State of Resilience - Conundrum of Increasing Confidence in Dollar amid the Exploding World Global Imbalance**

US giant companies are accelerating their business operation towards the globalization. In doing so, optimum allocation of management resources are not limited in domestic level, being extended to cover the rest of the world. Economic resources including production, R&A, collection and delivery, finance management as well as personal ones are set to be well aware of the optimum allocation on the world-wide level. So it is quite natural that production facilities are being transferred overseas very actively. In one sense, such a transfer means a domestic de-industrialization in US economy, but it does not mean a decline of US industries as a whole. A good proof for this is an overwhelming earning power of US companies compared to those of the rest of the world, as market capitalization of US corporations as a total shares more than two-thirds of the world.

There is little sign to show that consumption of US people will be in a big decline, while investment activities are still strong to be in no downward-direction. Inflation pressure is well contained since oil price surge has been now stopped. So there stands no big hurdle to US business activities. It is true that a grave problem of sub prime housing loan is emerging, which may be a destabilizing factor in the financial markets to cause a big fall in equities, but so far, not so many economists will predict housing loan problem can cause a great depression on US business activities.

It is often reported that, at G5 conference, a measure is discussed to reduce US current account deficit so that the world economy will not see the world imbalance exploding any more. At G5, US has been every time asked to reduce State budget deficit so as to reduce the world imbalance. But is there anyone to prove a close relationship between these two deficits? If one can show clearly a closer correlation between the twin deficits, he can be a leading candidate for a Nobel Prize in the economic studies. So what use is it to ask US government to reduce the budget deficit just in order to reduce the current account deficit. Budget issue is only US' one, which no other countries can intervene, and current account deficit (the world imbalance) is not solved by bilateral negotiation between US and each country of the rest of the world. Here it is enough to point out that in the decade of 1990s US current account deficit kept rising, while US budget deficit could turn to be in surplus. Both trends have just reflected the higher business activities of unprecedented economic prosperities (so called 'New Economy'), which means that current account deficit can be no problem as long as it is reflecting a positive aspect of US higher business cycle-upturn. So that can be a clue to resolving a conundrum of increasing confidence in dollar amid the exploding world global imbalance.

## **The Expanding Current Account Deficit does not mean that US is a Debtor Country**

### **US Companies and Household in Healthy Condition, no Depending on Foreign Lender such as Shylock**

US companies as a whole have recently enjoyed an amazing price rise in equities, so that their market capitalization is valued to be as much as \$18.5trillion (valued at Feb.20,2007). This means the market capitalization has doubled from Oct.2002, the lowest level because of the burst of the bubble. On the other hand, US individuals have \$40trillion of financial assets, of which stock shares and subscriptions occupy a third (*Nikkei*, Feb. 21, 2007).

US companies have been deeply globalized, so even when their profits in the domestic market should get down, those gained overseas could cover the domestic losses. So, it is quite natural that US can remain to be the richest country in the world. Net assets in USA amount to \$40trillion (the top) and those of Japan is \$20trillion (the second), while, in respect of annual income calculated per a head, Japan stands at the top (\$180thousand), US being the next (\$140 thousand, *Nikkei*, Dec.8,2006:Jan.1,2007).

### **No more Talk on the Relation between Dollar External Value and the World Imbalance**

Recently little attention is paid to the situation of US current account deficit itself. For instance, G7 held on Feb. 10, 2007, has not talked about it much. It is rather a depreciating yen that EU (excluding Britain) has tried to talk about, while US would not do so, which means that US deficit cannot be a big issue at G5. In the eyes of a dollar crisis theory people, such a situation can be inconvenient. US current account deficit amounts to \$856.655bn in 2006, mainly because of oil imports increasing. This being a historic record showing no tendency to stop. On the contrary, this deficit has kept expanding these five years in a row to 2006, occupying 6.5% of US GDP. A revaluation of 2% in Chinese currency (RMB) in summer 2005 could not stop US trade deficit against China expanding at all. This deficit has also continued five years continuously to go over \$200 bn against China (*Nikkei*, Feb.12, 14, Mar.15, 2007). In spite of such a big increase in deficit, US dollar has remained very stable.

It is here good to reconfirm that US current account deficit is in itself no problem, as long as a domestic purchasing power of a dollar is stably maintained, reflecting US economic strength. US does not necessarily borrow money from overseas to fill this deficit. In substance, US is by no means a debtor country. It is true that US economy has kept drawing much money from foreign countries. However, that does not mean that US has declined his world position to be a hopeless, heavy debtor to the rest of the world. If an expanding current account deficit were to show that US is a heavy debtor, is it possible to find unwise world investors who keep lending to a hopeless debtor country, which has little prospects to pay back the borrowed money? In this point, a so called IS Balance theory lacks a sense of balance. Foreign capital inflow into US reflects a promising element of US economy, as world money would tend to find a place, where a good and safe return is expected. In this respect, there can be no good candidate in the world other than US. That is why even Euro cannot be challenging US dollar as a key currency status.

There is no tendency that net capital inflow into US will be exhausted. In evaluating this capital inflow, Bernanke and Greenspan are very wise. Bernanke, just as did Greenspan, has pointed out that a more restriction on a cross border movement of labour and capital is no effective. His intention is to give a caution to a growing protectionism in US Parliaments. In his view, protection measure will reduce US economic vitality, so lowering life-standard of US people. This view is shared by ex-Treasury Secretary, John Snow, who said that a sign of protectionism could be a leading Achilles tendon to US economy. A higher tariff on Chinese goods can be a fiasco to US economy, giving no solution to stop the widening gap in trade with China. What is worrying to Bernanke is a Medicare problem or a social insurance one, which can be a heavy burden to US budget, while he shows little fear to the current account deficit (*Nikkei*, Feb. 1, 7; FT, Jan.19; WSJ, Feb.7, 2007).

Why is US current account deficit no problem to the world position of the dollar? It is true that this element can be a potential for a dollar downfall, but it is remembered that there exists a huge dollar demand in the world economy just because of the important position of the dollar, which fact can be offsetting a dollar-sell off pressure coming from current account deficit. For instance, world petrol trade between the third party countries, having nothing to do with trade with US, is almost exclusively invoiced, denominated and conducted in US dollar. So expansion of world trade for commodities like petrol are sure to cause huge demand for US dollars, which is far larger than US annual current account deficit.

Here one point is to be added. IS Balance theory is no more effective to evaluate the condition of the world imbalance, since this theory is just a by-product of IMF, whose analysis point is concentrated just on the current account side, paying no attention to the significance of expanding capital movements. IMF was established, only when the transaction in goods and services was a main player, with capital one acting as a minor player, but the situation has changed remarkably from early 1960s, when the amount of capital transaction has begun to far exceed that of current account transaction. In this sense, IMF has long been out of date to catch up with the change of the currents.

#### **US Financial Markets Centre of World Capital Transaction - Two 'Conundrums'**

US financial markets are acting as a heart where world money are constantly flowing in and from to sustain the smooth-working of the world economy, which mechanism can ensure a stable huge dollar demand from any direction in the world. So there will be no worry about a probability of sharp downfall in a dollar value. Thus US is firmly assured of a huge capital inflow. A typical case is an effect of oil price surge on the fate of a dollar. Whether oil price is down or not, each way can be favorable to the dollar position. A surge in oil price will cause a huge demand for US dollar on world wide scale. For instance, Japan and China, the biggest trade surplus nations with US, have to increase oil imports from Middle East, when oil price is rising sharply, which means both two nations have to find enough dollar exchanges just to purchase petrol. In the reverse case, that is to say, oil price decline will exert effects to reduce US current account deficit, which, in turn, is favorable to US economy, containing inflation pressure. Oil-exporting countries can get huge dollar exchanges from Japan and China, which proceeds are sure to be in US financial markets just for expecting higher returns. So anyway oil transaction invoiced in US dollar can always create huge demand for US dollar.

An estimated oil-related export of Oil producing countries (2006) is around \$ 1 trillion, which is three times larger than that in 2003. Much of the exports proceeds are flowing directly or indirectly into US financial markets, which can assure US affluent money so as to contain a rise in long term interest rate even if short term one is rising. So a conundrum put forward by Greenspan can be solved in this context to some extent. In February 2005, he has called an unusual case a conundrum, where a long term interest rate is going down, even though a short term one is rising. In 2006, net purchase of US stocks and bonds by foreigners has exceeded \$ 1 trillion as in 2005. This huge inflow reflects a stable condition in US economy and oil price rise can be a favorable element for capital inflow in US, meaning that a huge demand for a dollar is well ensured (*Nikkei*, Jan. 10, 16 (*evening*), 23, 2007).

It must not be forgotten that there is another conundrum. US, a debtor country according to IS Balance theory, has been in fact a recipient country in respect of international income account. A debtor country should have been paying interests, but the case of US has been quite the opposite until 2004 **1**). Here it could be better for us to recollect Aesop's Fables, which tells a story of a working hard ant and a lazy, always singing cricket, doing no work in summer. In this point, British and American crickets, current account deficit countries, cannot be one described in Aesop's, since Anglo American crickets are singing in summer as well as in winter, enjoying their daily life even in winter, feeling no difficulty, while they are no begging to ants at all. This is quite the opposite of those described in original Aesop's. In this point as well, there must be something wrong with a dollar crisis theory.

### **Which a Determining Factor to fix Dollar's External Value, Current Account or Capital Account - Now in Age of Capital Movements**

Recently a Japanese yen carry trade has been a strong factor to support the external value of the dollar. In this trade, investors, borrowing money in yen with very low interest rate, can invest it in a much higher interest currency like dollar and enjoy high returns, just by taking advantage of the wide difference in the interest rates. In doing so, yen is sold and dollar is purchased, which means a rise in dollar exchange rate. However, such a trade can be risky if money trader should judge the dollar to be in the direction of sharp fall. As they think quite the opposite, so they are very active to be deeply engaged in yen trade, to have enjoyed high returns. That implies that they do not think the dollar crisis is a real issue and that capital account element is more crucial than current account one in fixing the external value of the dollar.

By observing yen-dollar exchange rates these years, a recent tendency of less volatile fluctuation can be noticed. For instance, in the case of 2006, the range for that rate is within 11 yen. This also means that a capital account moment is much stronger than trade account one in fixing yen-dollar rate. A mere consideration on the state that even though US current account is still expanding, a dollar demand from Japanese side is very strong can convince one that capital account element is a dominating factor in the world foreign exchanges markets.

It is now time to consider being free from a conventional theory on balance of payments. When talking about the international payments account, it would be more proper to talk about it in terms of changes in the capital account rather than in the current one. Recently the capital account has played as the prime mover of the dollar external value, and adjustment in the disequilibrium in the domain of current account has for a long period proved to be hard. When talking about disequilibrium or about the world imbalance correction, it is necessary from now on to regard capital-account transfers as initiating forces and correcting forces, since, nowadays, capital movements are the prime determinants of exchange rates.

According to Scammell, "Economist now over the age of almost seventy were brought up on the view that current account transactions dominated the balance of payments, while capital-account balance was regarded just as subsidiary to the prime moving balance of trade" (<Scammell 1987>104 ). Surprisingly enough, his view was put forward as early as late 1980s. So these economists alluded by Scammell, if alive, should be near one hundred years. Nowadays no one would deny that the amount of capital transaction are far exceeding that of trade and service in the world foreign exchange markets (<Scammell1987>45, 84-5,104), so it can be safe to say that capital movements dominate the balance of payments, and in this respect, US has been dealing with very well so far, because she has enjoyed a constant capital inflow from the rest of the world.

Here also can be a good proof cited to show that capital account transaction can be a strong pillar for US dollar. When the dollar should fall while the oil price is expected to rise, what will oil importing companies do? Forward rate of dollar is to fall also and oil importers can find a good chance to purchase forward dollar at a lower price, with which they can also purchase oil, thus offsetting the rising cost for getting petrol. And this behavior can give US dollar a helping hand. Dollar demand coming from forward purchase for oil is very huge, amounting to several \$100 bn in lump for demand several months ahead. This can be a good offsetting factor against dollar sale pressure coming from US annual current account deficit expanding to be as much as 600bn.

There is an enormous dollar demand in the world exchange markets. In case of London market, enjoying the privileged status of the biggest exchange market in the world, did deal as much as \$75.3 bn in one day in average in April 2004 (49 %increase than in 2001). A total amount dealt in the world foreign exchange markets is now around at \$2 trillion, of which dollar connected one occupies as much as 90 % (total be 200 %, Euro' percentage be around 38%). What is more, in the case of OTC transaction, one day deal amounts to be \$1.22trillion **2**). On the other hand, according to BIS, the scale of derivative transaction (including futures, options) in 2005 is in the range of \$ 300trillion, setting dollar, Euro, yen together, while a share of dollar is exceeding 70% **3**). There is no change for a dominating position of US dollar since 2002.

## **The World Imbalance being a Positive Effect of Globalization in the Case of Trade Relation between US and China**

### **A Consequence of 2% Appreciation in RMB in summer of 2005—A Smart Joke**

China is now, with its history of more than five thousand years, one of the world super-powers, whose market oriented socialism system has started from 1992 immediately after the collapse of the Soviet regime in 1991. China has succeeded in that policy for the moment to have gone through the long-period slump and is now enjoying the position of the world factory.

In the near future, its GDP is forecast to be Nr.3 in the world, just next to USA and Japan. Recently China has proved to be not only a world factory, but also a world financial products-factory, whose good evidence is that a sharp fall in equities in Shanghai on Feb.27, Tuesday, 2007 (fortunately not Black Monday in Oct.1987), has triggered a world wide equities plunge, so it could be safe to say that China can make and export everything, not limited to consumption goods. For that reason, China is now having a strong criticism that it has caused a serious problem of the world imbalance. Of course, China has responded to it by a 2% revaluation of Renminbi in summer 2005.

“A 2 per cent change in the (foreign exchange) market is nothing”. This view should have been displayed in summer 2005. This is quoted from Mr. Eisuke Sakakibara, being famous as “Mr Yen” (*FT*, Mar.3& 4, 2007). He says, “When I was the vice-finance minister, that kind of adjustment took place every week.” In that period, yen was notoriously volatile.

‘A 2 percent revaluation’s aim is very clear (according to Li Rugou, China people Bank ,deputy governor)4; to improve its exchange rate mechanism and to adjust its rate to be in harmony with the current domestic economic situation; to hold restriction on the cross-border capital transaction to be removed only gradually; not to set capital transfer in the direction of the full convertibility (of the exchange) to the full extent in the near future. So the reforms in RMB are to go just in tandem with the Chinese specific economic condition, considering the macro-economic surroundings; the ability to absorb the external shock coming from RMB revaluation (especially in the export industry sector); progress in the banking sector being haunted with huge bad loan problem. And big upward-adjustment in RMB is not to be considered, since it can be no solution to reduce the expanding external imbalances (especially huge trade surplus with USA).

People assembling at G5 summit must be well aware of this. Although RMB issue is always a popular topic in G5, no concrete proposal for RMB revaluation has been reported. Since summer of 2005, there has been no big appreciation in RMB, while the trade imbalance with USA expanding continuously currently. Chinese trade surplus in this February 2007 has recorded a big increase (ten times larger) compared to that of last year (*Nikkei*, Mar.13, 2007).

Actually the world imbalance problem can be no concern to US economy as well as to the rest of the world. Little concrete news are reported in the news papers that Chinese exports have damaged US economy. Complaints over Chinese trade surplus with US have raised only in the US Parliament members. Even if China continues attaining a huge trade surplus with US, that can be no threats to the position of the dollar enjoying the status of the key currency in the world, as China will not de-link US dollar at all. There is so far no indication that China will introduce the currency basket system showing a de-dollarization, since foreign exchange reserves held by Chinese currency authorities are almost composed of US dollars. It could be safe to say that China still keep the dollar-peg system instead of adopting a currency basket system.

### **2 Percent Appreciation in RMB be no Solution to Reduce the World Imbalance**

In solving the trade imbalance problem, USA has shown a strong tendency to find a scapegoat exclusively in his counterpart. In mid 1980s Japan is set to be a good outlet for US complaints, nowadays the situation has changed, and whose consequence is that China is set to be a scapegoat. It is undeniable that the trade imbalance between USA and China has been expanding, but here it must be pointed out clearly that China exports have caused no serious unemployment problem on US side. As the history shows, the above imbalance between USA and Japan has been increasing in mid 1980s, accompanied with the US leading industry sector falling in plight just because of Japanese rising Sun momentum in the high-technique sector. And during that period, yen has been appreciated very sharply, producing no reduction in trade imbalance, on the contrary, huge expansion of imbalance accrued. In the case of China, is there good evidence that can prove that Chinese imported goods have caused much damage to US economy? Indeed in mid-1980s such evidence was available in US that Japanese high-technique industries (especially semiconductor sector) were threatening to ruin the US ones (Nowadays remarkable recovery. Wintel brand emerging).

In early 2005 the rapid increase in Chinese textile exports to USA and the trade surplus with USA has exceeded \$160bn. However this cannot be a serious problem to USA, since US companies have enjoyed cheap goods from China so as to increase

their earnings. The uninterrupted expansion of Chinese exports to USA is just reflecting a deep co-dependence relationship between the two economic powers. For instance, in the case of Walmart, RMB appreciation can cause a rise in import-price, introducing much distress not only in Wal-Mart customers, but also in China export industries.

Some are insisting that a higher revaluation of RMB can be very effective to reduce trade conflicts. But such a view is apt to be one-sided one. It would rather cause much inconvenience to US industry and consumer, just because of imports-cost rising. Wal-Mart, which employs 1.4mn people just for selling Chinese goods of \$18 bn, so a rise in import-cost to this company can cause restructuring the number of the employee in Wal-Mart.

Some are also complaining that China is manipulating RMB, just so as to stimulate exports to US, but a real situation will not warrant such arguments, since the export boom in China is rising not only because of an artificial depreciation of RMB, but also because of the huge increase of FDI especially from US, which can be a strong factor for broadening the production capacities for exports. Annual FDI in China is more than \$600bn. The share of foreign companies for exports from China is now more than half. There are not so many Chinese brands. Much of goods manufactured in China is only to be sold under the foreign-originated brand. In this sense, China is just donating the export sites for foreign companies, much profit exclusively in the pockets of foreign companies. So in the context of the US-led world globalization, China can be the newest westward state of US, just as a good proof that US westward movement is not only limited by the West Coast, but also extending to Hawaii so as to go through Japan, and finally to reach the East coast of China. Anyway China is now incorporated into the world global economy led by US.

So Chinese trade surplus with US cannot be a serious issue to US economy, and here it is to be noticed that some of US side are showing much understanding to RMB issue as well as to China huge trade surplus. For example, ex-chairman of FRB(Greenspan), who has asked for a wider fluctuations in RMB instead of the fixed rate, has however strongly been opposing to the introduction of retaliation-tariffs, just because tariff retaliation can lower the life standard in USA and in the rest of the world, giving no solution to the trade imbalance. In his view, tariff increase may reduce imports from China, but may increase imports from somewhere else, so no warranting USA domestic employment increase by introducing a tariff measure against China. According to his view, US, enjoying the benefits deriving from the world globalization to the full extent, by enjoying cheap-high quality goods from China, must be prepared to accept the necessary structuring reforms.

What is more, many leading US companies claim the huge benefits deriving from the trade between the two nations. Some even have dismissed the blame that Chinese imports goods should deprive US society of many chances of employment, just criticizing it as being 'unbalanced arguments'. In a sense, growing imbalance between the two can be regarded as the blessings of the advancement of the world-globalization led by US.

A whole structure of US employment shows that China cannot be any evil to US economy. A number of people engaged in manufacturing sectors has decreased by 18 % since 2000 until recently (3.15mn decrease), while service sector enjoying 7 % increase (7.6mn). Is it possible to imagine the situation that Chinese service sector can intrude aggressively into US service ones? It could be safe to say that there exists no co-relation between Chinese exports to US and the US domestic employment situation.

Since US employment structure is now changing to be a service economy or a knowledgeable one, Chinese exports cannot be a menace to US employees at all. For instance, employment share of manufacturing sectors is to be in permanent fall to be 10% recently from 28 % in 1960s mainly because of a growing tendency to transfer factory facilities overseas (the so-called outsourcing), while that of service sectors (including governmental sectors) is going up to be 84 % in recent years from 65 %t in 1960 (*Nikkei*, Feb. 17, 2007). It could be too early to imagine that these service sectors should have been eroded by Chinese ones.

#### **The World Imbalance to be Reset in Multilateral Relation instead of in Bilateral One**

In a genuine economic theory, it is groundless to claim that RMB rise can reduce US trade deficit. Exchange rate for one country cannot be fixed just by the bilateral relation with one other foreign country but be fixed by the multilateral relation with all the other countries. Dollar rate cannot be fixed in bilateral terms, but exclusively in multilateral terms, so, that are the leading reason why dollar remains firm despite the expanding current account deficit. This multilateral relation can cover not only trade between third countries other than US, but also capital transaction on a world scale (something like financial derivative ones). Just have a quick consideration on the oil price huge rise, which can induce China to buy more dollar exchange to import petrol, since oil producing countries export oil invoiced in dollars, so this situation can cause huge dollar demands from China as well as from the rest of the world other than US. This means that dollar can be stable even if US is to face an expanding current account deficit, as there exists a huge dollar demand, having nothing to do with US trade balance itself.

Chinese strong demand for petrol imports can be a strong pillar to support the dollar position. Paradoxically enough, China, being regarded to be a potential rival to US, is in fact a strong pillar for the world dollar system. In this sense, Communist China is a guardian angel for the dollar system. And China has shown little fear of having huge dollar reserves so far. China has kept increasing dollar reserves even after 2 % revaluation of RMB, just to be the largest holder in the world, its amount exceeding \$ 1 trillion. Does it mean that Chinese Currency Authorities resort to currency manipulation (something like a dirty float)?

And what is remarkable is that profits produced in China are not always in the pocket of Chinese companies, instead, many of them have a tendency to flow into the pocket of US ones. China is exclusively strong only at processing, assembly division (labour intensive ones), which is low value added one. On the other hand, high -technique goods produced in China and imported from there, are almost taken care of by the foreign companies (90%), which means only foreign companies (especially US ones) can enjoy high added values. China is, in fact, highly dependent on imports of high-tech -facilities.

In this respect, China can be defined as 'world workhouse', rather than 'world factory'. Exports goods are very low value added ones. For instance, one shirt produces only 0.35dollar profits, so as many as 0.8 bn shirts exports can scarcely be equal to just a US Air Bus. Here is a good story for this to be cited. A Cargo boat leaving China bound for USA, carrying goods to the full extent, can or may be just coming back with goods loaded just half of the load capacity, or , in an extreme case, with loading nothing (According to Chinese Professor, *Nikkei*, May23,2006). That condition tells revealingly that there is a stark difference between material economy (China) and knowledge economy (US) in respect of international trade balance. Still now, China remains to be export transit base for foreign advanced countries. Chinese trade surplus is mainly due to process- trade, importing assembly and parts just to export finished goods from China, which suggests that generally speaking, China produces only low-value added goods. A huge trade surplus cannot always bring in corresponding profits at all. In an economic sense, China is incorporated into the world vertical production system, being situated at low end, while advancing countries standing at high one <Yonekura2007> 218-20.

#### **USA, Japan and China - Triangle Relation**

There has always been a rapid Chinese economic progress. In a total trade (exports and imports both), China stands at 4<sup>th</sup> (2003, 1<sup>st</sup> =USA, 2<sup>nd</sup> =Japan, 3<sup>rd</sup> = Germany ), but the share of foreign companies engaged in both exports and imports of Chinese trade is more than half and US related companies' share is high as well. Trade between USA and China is conducted mainly through US intra-companies. China trade surplus is the strongest moment for US current account deficit. This is no hindrance, just implying the on-going of the global co-dependency between the two. Directly or indirectly US imports have contributed to the rapid economic growth in Asia. China is a most visible symbol of this growth. US recession can hit countries with huge trade surplus with US the hardest .In this point, which is serious, US recession or dollar decline?

Now it is time to confirm that the world imbalance is no hurdle to the world economy, just reflecting a positive effect. Just look at a triangle trade system composed by US, China and Japan. In 2003, Japanese exports to China occupies two-thirds of the increase of exports. Above all, capital goods, IT related goods are the top-increase. From Japan, China imports electronics related goods (parts, components, intermediate materials), these being processed in China and from there to be exported all over the world. And much of the trade in processed goods are taken care of by foreign companies, especially by US related ones. Share of exports dealt by US companies can be reduced to be US intra-company trade. So China does not feel responsible for the increase of US trade deficit, which is just for the benefits of US companies. US imports electricity or IT related goods from China and this trade is to be in a rise. However this also brings much benefits to USA ,because these imports can reduce the cost of parts, intermediated goods, so that finished goods produced in US can ensure high-added values as well as producing a by-product effect, that is to say, import price being lowered to set the US domestic inflation-rate lower. US trade deficit (2004) amounts to be \$ 770 bn, while China trade surplus with the rest of the world is\$ 100 bn and China occupies a third of US trade deficit. But this surplus can be offset to some extent by the imports from the other East Asian countries (especially from Japan), which suggests the triangle trade structure in the deepening global economy. In this trio game, unlike zero-sum game, all can be a winner.

So, the imbalance problem between USA and China has to be reset in the context of the globalization led by USA. Positive attitude of China Communist Regime to introduce capitalist factors into the socialist regime has caused remarkable change in the world economy. Since China was set to be in the capitalist trade network, the world has enjoyed cheap, quality labour amply from China. Due to this network, China has emerged to be a world factory, supplying labour- intensive products to the rest of the world, bringing in positive effects in reducing the world inflation rate by supplying lower priced goods worldwide. Chinese price level can be a standard for the world, especially when combined with IT technique to create higher productivity, just because of mobilizing China as a world factory to the full extent.

So in a sense of mutual benefits, there exists no conflict between USA and China in respect of trade balance. The imbalance between the two is indeed huge in absolute amounts, but there is little possibility to cause a sharp dispute like that between USA and Japan in the 1980s. At the peak, trade deficit of US with Japan was as much as two-thirds (1991) in the total USA trade deficit, while the current Chinese surplus with USA is at most one-fifth of the total USA one. What is more, main Chinese exports to USA are labour-intensive goods like textiles, not those with high-technique goods, and in this sense, the trade between the two can be co-dependent. In sharp contrast to this, 1980s saw the acute conflict between USA and Japan, because US high-technique and car industries were invaded by Japanese competition, having caused much outcry from US side.

So far we have observed that China is deeply incorporated into USA global economy network and China currency authorities have got sufficient foreign exchange reserves mainly in dollars. However, China feels no fear in accumulating dollar reserves. Sufficient reserves are very good to maintain external solvency, effective to deal with currency crisis something like Asian currency crisis in 1997. Also effective to promote RMB confidence externally and to show a good proof of strength of China economy in general.

A dollar sharp fall does not necessarily mean huge loss for Chinese foreign exchange reserves. Many countries having strong dollar linkage place much value in increasing dollar reserves. For instance, China has to import oil exclusively in dollar, which means huge reserves indispensable to Chinese sustainable economic growth. Population with more than 1.4 billion need stable food supply from overseas, trade for which are all conducted, invoiced and denominated in dollars. Ample dollar reserves are also effective to fill the loss in domestic bad loans. Having a stable economic relationship with USA is enough for China. It is easy to remember that Japanese yen has appreciated to be currently 110 yen against the dollar from 360 yen since mid 1971. Even so, no substantial exchange reserve loss having been reported in the financial world, much less little plight among Japanese export sectors. In the days of the oil-crisis in mid-1970s, Japan was at a serious risk of dollar supply shortage in spite of the huge accumulation of the dollars before early 1970s.

It is often reported in the economic journal and newspapers that China is to some extent showing a will to diversify the component of foreign exchange reserves, but actually no substantial shift from the dollar to other currencies is realized. Indeed sometimes some conversion into other currencies is reported, but this is just temporary act to be back to the dollar holding (in other words to increase the amount of the reserves in terms of dollar unit, sell \$ high, buy \$ cheap). After 2% revaluation, China is reported to be favoring currency basket system, which does not mean a policy of off-the-dollar holdings. On the contrary, dollar holdings have never stopped increasing. Even so, the excessive dollar holdings are reported very often in the financial news. Generally speaking, there has been no de-dollarization in Asia coming true. The role played by the dollar is still significant and dominant in Asia. The share of yen invoiced transaction by Japan currently has become lower both exports and imports. Even between Japanese homeland company and foreign branches in Asia, intra-company transaction is conducted in dollar in many cases. As finished goods are processed and produced in Asia, much of which finally goes to USA, it is quite natural consequence that these goods are essentially invoiced and traded in dollars. Intra-regional economic integration in Asia led by USA global economic network can claim its natural consequence being dollar - invoiced transaction. Is there any substantial reason why Asian countries are to opt for de-dollarization despite the heavy dependence on US imports? So we have to be free from an illusion of a call for de-dollarization in Asia.

#### **Influential Economists tend to draw a Rosy and a Grey Picture, always in Wonderland**

It is appropriate to call an East Asian common currency idea just a delusion (mumbo-jumbo). Historically speaking, economists are always praying something like 'dollar crisis' mantra, which is always to end in oracle. Currency crisis in 1997 has nothing to do with the close dollar linkage dependency in East Asia. Strangely enough, a proposed Asian Monetary Fund (whose objective being just to tide over the next currency crisis) is exclusively to be composed of dollars. Why such a proposal can be opting for de-dollarization?

Exchange rate manipulation can be no medicine to cure the world imbalances as shown in the history. No mere change of rates on the trading room board can produce trade equilibrium. There is more effective way to solve the trade imbalance between China and USA. Just lift the ban on the arms-exports to China. In doing so, US can reduce huge trade deficit just through sales of a dozen of missiles and fighter jets to China. In this point, Western people are well experienced, whose most typical example is that around mid 19<sup>th</sup> century the Scottish merchants (not English as is often told) are selling something like hemp (opium), who can claim to be called British Empire men, which trade has produced a remarkable result to reverse the British trade deficit with China into a big surplus (Yonekura 2007: 234-7).

A design for common currency in Asia could rather be a good seed to cause conflicts among Asian nations. China and South Korea being heavily dependent on the dollar system have always been in a very intricate political relation with Japan, while

these three have been enjoying good economic relations each other. An increasing debate on a common currency will cause a hegemonic issue, intensifying political tensions among the three nations. A realization of a common currency in Asia is judged to impose a rigid budget principle (sound equilibrium budget one). Just imagine the serious economic condition set on in Germany and France where the flexible business cycle policy is not possible because of a tight budget principle just for creation of Euro. Especially such a principle is suitable for Communist China? French riots in Fall of 2005, when being spread into China, will cause a second and even a third Mao Tsetung.

Dr.Kawai (deputy governor of Asian Development Bank) has drawn a rosy picture for Asian common currency. However, he has predicted the followings(<Kawai1992>65-66): USA current account deficits nearing 3% of GDP would enforce its people to be satisfied with much lower standard of daily life just because US has to pay the expanding external debt (profits, dividends, interest payments externally in increase). Currently contrary to his oracle, American people have enjoyed much higher life level these more than ten years, even though the current account deficit has now exceeded 6% of GDP. According to Kawai mantra, US must be in deficit in income balance on international account. Actually the international balance of that country is telling quite the opposite .What counter reason is available in his mantra?

Many economists have shown a strong tendency to put much more value on Euro, neglecting a positive side of US dollar. And the present situation has entirely betrayed their expectations. Euro Area has been far left behind, while the economic growth rate for US and Britain has been much higher, which means non-Euro area economic performances have been much better. In this point, Britain has proved right to stand off Euro. So it would be impossible to imagine the polarization of the world currency system (something like the split into the dollar and the Euro). The world economic growth axis towards Pacific Rim ensures a stable dollar system in the entire Asia. All Asian countries find main exports markets in US. Euro area can be no challenge to the rapid growing economic area of the Pacific Rim. Parallel with 2008 Pecking Olympic, the GDP gold, silver and bronze medalist can be lined in the Pacific Rim countries.

When commenting on the unstoppable US current account deficit expanding and by judging this situation to be abnormal as a debtor country, Marxist economist, professor Baba maintains “Currently it is no wonder that a sharp fall of the dollar should break out and to set US economy and the world one into a chaos...”, and he has no choice but to confess , “such a scenario is by no means realized”, and according to him, “which situation is unprecedented in the history, and I cannot find any clues to explaining such a thing.”□<Baba2005>388). I could say that he is a very honest scholar, because he has made a confession that he could see no reason why he could see no dollar crisis coming true at all. But there remains much for him to do before making a confession that his theory is no use in analyzing the international finance situation.

In this point, Susan Strange is quite right in saying that many Marxist economists have not been well trained for understanding the intricate mechanism of Euro Currency markets as well as foreign exchange markets, and that they have shown little interest in these markets(<Strange1986>84). Just as she has pointed above, Japanese Marxist economists cannot be well trained in the analysis of international finance issues.

It is no fair to limit my critical view only to one dollar crisis man, so here my straightforward comment extends to another prominent Japanese economist, Dr. Yoshitomi, who feels three “abnormal” things in the world imbalance in current account level. One is that dollar has remained very stable despite the expanding current account deficit to be near 7 per cent of US GDP. That rate was around 3.5 per cent at the time of Plaza Accord, causing a heavy decline of the dollar. From 1985 to 1987, the dollar against yen has fallen from 250 yen to 120 yen, quite a sharp fall indeed. But nowadays there is little possibility that a heavy decline of dollar should arise, although the deficit rate of GDP is coming near 7 per cent in 2005. In his view, a situation, where huge US current account deficit expanding seems to be “sustainable”, could be “abnormal.” A second abnormal is, in his view, which world capital supply is taken care of by periphery countries, while in late 19<sup>th</sup> century, a core country has taken care of it. A third is that US interest rate remains low, despite the expanding US current account deficit. According to him, a higher current account deficit can cause a higher interest rate, but the fact is that US interest rate has remained very low. An orthodox economic theory tells that the expansion of a deficit in the households as well as in the Governmental budget will cause a rise in interest rate (<Yoshitomi2006>16). The points those Japanese economist have failed to notice are the situation that nowadays capital movements are the prime determinants of exchange rates, just as Scammel has pointed out. <Scammel1987>. Anyway here it is confirmed that many prominent Japanese scholars have not been successful in understanding a real position of US dollar.

## **Greenspan as a Guardian of World Dollar - Greenspan backs Greenbacks, still Deserving a Title of Maestro**

Instead of being blind to the capital movements, Greenspan has got sharp eyes on the prime determinants of exchange rates. The power of Greenspan's remarks is still now influential. But his style is simple indeed, giving caution to excessive optimistic view, while easing a pessimistic one, although his expression seems to be very round about. Anyway his remarks can work as an effective crystal ball of economic forecasts for the global financial markets. The good proof for this is the consequence of his remarks on Monday (Feb.26) in Hong Kong ,where he has told, that a US recession was possible but his initial intention is not accurately interpreted by the world stock markets people. His real intention was something like that, "When you get this far away from a recession, invariably forces build up for the next recession, and indeed we are beginning to see that again", and according to Dow Jones Newswires, what he said is, "For example, in the U.S. profit margins ...have begun to stabilize, which is an early sign we are in the later stages of a cycle". So actually he didn't say that a recession was likely. His comments seemed to be rather questioning how long this time-expansion can last, while the last two business expansion lasted a decade. The expansion of this time has continued for five years so far, so how much space remains for the rest of the expansion period, which is a point he has made a notice. However, his remarks were interpreted quite the other way to produce, "MR.GREENSPAN SAYS A RECESSION IS LIKELY. Whether he liked or not, Greenspan helped fuel a global sell-off in equities. But it is not his fault that investors should pay excessive attention to his remarks. It is rather Greenspan that is most surprised at the impact of his remarks and he is perplexed with the mere misunderstanding on his intentions. In any way, Greenspan is now going to publish a book, "Age of Turbulence" and in the context of this scheme, it is good to say that the turmoil in equities of late February is just a rehearsal for "Age of Turbulence". But it is also necessary to point out that what he has emphasized so far is to tell that the US and global economies nowadays are far more resilient to economic and financial shocks than before (*WSJ*, Feb.28, *Nikkei*, Mar. 9, 2007), especially because of the stabilizing role of world capital movements to deal with the world imbalance.

### **Conclusion – Farewell to a Dollar Crisis Trauma**

What is needed is not a transcendent theory having little connection with the world financial history, but a live analysis to describe the currently developing historic process. However, many professors in Universities are very strong at presenting a transcendent oracle. It is good time to summarize grave defects of a dollar crisis theory and to prove that oracle can be just oracle, no miracle. People crying for the dollar crisis have been too much occupied with learning very grey formula of economics by heart (for instance, IS Balance Theory), instead of observing real economic movements (world capital flow). US Dollar has been in a substantial stability these more than twenty years.

According to the established dollar crisis theory, the external value of the dollar should plummet in the face of the expanding current account deficit. What this theory has missed is a huge demand for US dollar, because of its conduit role between the third nations and of the pivot of the capital global movements. This unexhausting huge demand can keep the dollar in very stable conditions despite an exploding world imbalance, so it is high time to categorize a dollar crying wolf as an endangered species in the world financial markets. Singers reciting a dollar crisis with tenor shall have to check the medical condition of their throats to change into falsetto with golden silence. Here it could be safe to say that a dollar crisis theory can be no expression of economic movements , but an abstract, empty principle.

### Abstract

The sudden announcement on July 21 2005 by the Central Bank of Malaysia to depeg Malaysian ringgit against US Dollar caused a stir in the Malaysian financial market. This announcement motivates us to measure statistically its impact on Malaysian market, economic sectors and international stock markets. Malaysian interest rate and exchange rate are tested to determine their relationship with the market return. Single Index Market Model and cointegration techniques are used. We find that the investors responded favorably to the depegging policy resulting in positive raw and adjusted returns of 1.93% and 2.31% respectively. The most beneficial sector is finance sector which recorded positive raw and adjusted returns of 2.12% and 0.56% respectively while plantation sector recorded negative raw and adjusted return of -0.5% and -2.05% respectively. Our result shows that Malaysian stock market is less vulnerable to S&P 500, Singapore, Hong Kong, Jakarta, Philippine and Bangkok during the pegging period.

### Introduction

Rapid changes in the global business and financial landscape demand regulators and managers to discard traditional business practices for new, innovative outlook, policies and strategies. Creativity and innovation these days do not only occur in product designs, technology, promotions but cut across a wider spectrum of activities including management, leadership styles and lately in monetary policies.

This paper presents the Malaysian experience of innovative and bold move to discard its fixed exchange rate policy it adopted for the last 7 years to a “managed” floating exchange rate system for its Ringgit. The policy change was announced on July 21, 2005 with immediate effect. The swift, unexpected announcement shortly after China announced a floating rate for its Yuan caught the financial market by surprise. This was the second time the market was taken by surprise. The first time of such a ‘surprise’ was when Malaysia announced to peg its Ringgit to only one currency that is US Dollar at RM3.80/USD instead of pegging it to basket of currencies on September 1, 1998. Selected capital controls were also introduced. This pegging was implemented amidst loud criticisms from the financial advisors abroad and locally as being too restrictive. However, Malaysia maintained its stance for 6 years and 10 months (to be exact) and proved that the fixed exchange rate was an effective monetary policy as Malaysia successfully steered its economy from the adverse effects of the 1997 Asian Financial Crisis. Hence, the announcement to dismantle the pegging of Ringgit against USD and replaced by a managed float system based on a basket of currencies marks another bold strategy to remain competitive in the global business. A managed float implies that the value of Ringgit will be determined by economic fundamentals and market forces. The announcement made just before the Bursa Malaysia (the Malaysian stock exchange) closed managed to curb uncertainties and speculative activities on the Ringgit from unscrupulous currency traders and market operators. Nonetheless, the announcement again received mixed reactions from the financial community and investment fraternity. These mixed reactions provide strong motivation for us to analyze further the impact of the liberalization of the fixed exchange rate on the Malaysian capital market, economic sectors and its trading partners. The objectives of the study are as follows.

- i. To measure statistically the announcement impact of depegging of Ringgit exchange rate on USD.
- ii. To extend the investigation of the depegging on the various sectors of the economy and accordingly, to identify the sectors most significantly affected by the change from the Ringgit fixed rate to floating rate system.

- iii. To make comparison between the Malaysian market's reaction to the announcement and other international stock markets such as the stock markets of its trading partners.
- iv. To investigate the relationship between interest rate of Malaysian financial system relative to its main trading partners.
- v. To assess whether large companies with large foreign debts or USD denominated exports benefit or otherwise from the depegging of ringgit at RM3.80 against USD.

Malaysia dismantled its Ringgit exchange rate peg against a single currency USD and replaced it by a managed floating exchange rate against a band of currencies. Although depegging of Ringgit represents a strategic change in monetary policy in the Malaysian financial system, empirical study on depegging is hardly available. We contribute in the following ways; providing feedback to the policy makers on effectiveness of depegging relating to market reactions and Malaysian trading partners. The affected sectors would also be identified. This study would also be one of the earliest documented evidence on the relationship between interest rates and stock market indices of Asian and US stock markets during 1990-2007 periods. What differentiates this study from other reports is that firstly, it addresses the current issue that will continue to be debatable for sometime in the future. Secondly, the empirical findings from this study would substantiate these arguments. The fixed exchange rate policy has provided 'shield' or protection to our Malaysian imports/export and international trade against fluctuations in foreign exchange rates and foreign exchange and liquidity risk. With the value of Ringgit based on floating exchanged rate of a band of currencies, Ringgit will find its fair value. This study provides illustration of the strengthening of Ringgit following the monetary policy change.

This study also contributes to the public greater information and understanding of the monetary policy change and its effectiveness. It appears that Malaysia has taken the appropriate strategy because the Ringgit continues to strengthen at RM3.4410/USD (April 14, 2007 Starbiz). In addition event studies on regulatory announcements are few in emerging economies. This study would add to the existing literature in this area. This paper is divided into 5 sections. Section 2 discusses the issues and Section 3 presents the review of the literature related to the study. Section 4 describes the methodology followed by analysis of findings in Section 5. Section 6 concludes the paper.

## Issues

The immediate reaction from the market on the announcement appeared very positive. The steep increase in the Kuala Lumpur Composite Index, which recorded the highest level of 939.69 points in five years on Friday 22, 2005, suggests a very favorable market response towards the new exchange rate regime. Financial news reported high volume of Ringgit traded in the foreign exchange and money markets (Star 30, 2005). Ringgit was seen to strengthen against the USD1 at RM3.77-RM3.79 and later stabilized at 3.70-75 level. Although much has been said about the immediate benefits of the depegging of Ringgit, serious efforts need to be done to scientifically measure its impact on the overall Malaysian capital market and the economy. Efficient market theory postulates that stock prices in its semi-strong form, adjust rapidly to the release of all public information and stock market is a barometer of economic performance. Hence, any abnormal return occurred from security price and index differentials would reflect how market (investors) reacts to the information and the test of significance of this abnormal return would indicate the magnitude of the impact of such announcement. To date, we yet to find any reports on scientific investigation of depegging of Ringgit although it is a very important monetary policy change taken by the Malaysian government.

Several security analysts reports the impact of Ringgit revaluation on various sectors (BCB Special Economic Issue, 2005; Tee, Business Star, 22 August, 2005). Nonetheless, these are analyses of anticipated performance of each sector in light of the new Ringgit rate. Further studies to identify which sector is significantly affected by the announcement are not currently available, whereas these inputs are useful for firms and investors' investment decisions especially in sectors whose trade activities and trade finance involve Malaysian trading partners.

Another aspect of study is the impact of Ringgit depegging on the exchange rate that is, is the floating rate enhances the value of Ringgit against USD and its basket of currencies?. By using the "managed" floating rate,

could Ringgit find its true or fair value? A major concern among the market players during the fixed rate regime was the possibility of Ringgit being traded below its fair value relative to its regional trade partners.

## Literature Review

Bank Negara Malaysia has announced implementation of prudential measures of continued monetary restraint (BNM Press Release, 28 March, 1997). These measures include selective capital controls and the fixed exchange rate of RM3.80 to USD1 for foreign currency transactions, effective September 2, 1998. There were also other announcements of interest rate reduction and several lending guidelines on credit facilities extended to borrower. Further measures were introduced including new exchange control rules. These measures were introduced to safeguard Malaysia from the risks associated to the contagion effects of global financial markets (Abu Hassan, A., 1998). Subsequent to the announcement, Money Changing Act, 1998 was implemented effective October 1, 1998. Under this act, only licensed individuals under Exchange Control Act, 1998 are allowed to trade in foreign currencies. A new foreign exchange procedure called the Selective Exchange Control Rules was established when the pegging was announced. Among others, the new procedure prohibits the transfer of funds in the external accounts so that no Ringgit can be borrowed by foreigners for speculative activities in overseas markets, a fixed exchange rate for the conversion of Ringgit to USD and the introduction of a 12-month rule to prevent excessive short-term capital outflows. The objective of the peg was to create stability and certainty of key economic parameters to support international trade and investments. The immediate impact of the fixed exchange rate was stability in the foreign exchange market. Another important impact is some financial stability was restored following the Ringgit peg.

Awang Adek (1999) and Munir (1998) reported that the IMF have agreed to accept the decision that under certain circumstances, capital controls are short-term respites from external pressures. Phylaktis (1999) examines the capital market integration between the financial markets of Pasific Basin countries (Singapore, Korea, Malaysia, Hong Kong and Taiwan) and the financial markets of US and China. They find that US and Japanese interest rates drive interest rate in Hong Kong, Singapore, Malaysia and Korea. He also finds that there are close links in interest rate relationships between Japan and Malaysia and between Japan and Hong Kong as the direction of is a two way one in each case. Yong, Kolari and Min (2003) look at the stock markets integration of US, Japan and ten Asian countries. They find that Malaysia is less integrated to other countries during post-crisis period from July 1, 1999 to May 15, 2001. This post-crisis period, by the way is a subset of the pegging period and that could explain why there is less integration between Malaysia and other countries.

Ariff (2005) suggested that one compelling reasons for the depegging is that the dollar would likely to depreciate more in the near future. Many analysts forecast that the US government would like to see the USD depreciate by another 30% by 2008 so that the US current account deficit can be brought down to a sustainable level of 3% of GDP. This means that if ringgit were to remain peg to the USD till 2008 Malaysian export competitiveness will suffer, with the costs of import increase sharply, giving severe impact on inflation. Ariff (2005b) also suggested that a free float of the ringgit will be a very risky option to follow in view of high exchange rate volatility and speculative pressures in the forex market. A managed float with central bank intervention, at its own discretion to iron up short-term fluctuation, would be a practical proposition. Baljeet Grewal (2005) analysed the impact of depegging of ringgit and reported that the move towards managed float system is positive amid healthy economic growth, strong external position and a sound banking system. The benefits of a ringgit revaluation are lower cost of capital expenditures, stronger purchasing power and lower import costs, improvement in government fiscal positions as US denominated debt will be reduced and enhancement in investor confidence which would facilitate the inflows of FDI.

Ang (2005) reported that big caps blue chip companies recorded a sharp rise in their share prices one day after the announcement of the depegging. Meanwhile, OSK Research reported that there would still be a net capital outflows in the medium term. On sectoral basis, the companies in sectors that deal with high raw materials imports for domestic sales (such as consumer, motor, media and airline stocks) will benefit the most from the depegging, whilst companies that are export driven are worst hit. Yeow (2005) reported that top ten index-linked stocks such as

Telekom Malaysia, Tenaga Nasional, Malayan Banking Bhd, MISC, Public Bank among others recorded price increase following the BNM's announcement of the Ringgit depeg. However, the weak market due to lack of buying orders pushed prices down again.

Contrary to the action by BNM to depeg Ringgit, Mendell (2005) suggests that the Ringgit should remained pegged to the USD. His rationale was that it is important for Malaysia to keep its Ringgit value stable. Kamiso (2005) reported that Ringgit has started strengthening against currencies of its major trading partners a week before the announcement of the depegging of the fixed exchange rate. According to analysts, more short-term inflow of hot money to Malaysia is expected to take advantage of the appreciation on Ringgit. However trade surplus may be reduced due to the lack of competitiveness in export and increase in capital goods' import. Analysis of the impact on businesses revealed that companies with foreign currency revenue and foreign currency material cost will have minimal impact due to appreciation of ringgit. However companies with foreign currency revenue but local currency material cost would be mostly affected depending on the degree of ringgit appreciation. Further, companies with foreign currency debts would tend to benefit most.

RAM July 2005 opines that any short-term appreciation of ringgit would not exceed 5%. This is because RAM believes that central bank would most likely intervene to correct any excessive swing in order to ensure stability. It expects that major beneficiaries of depegging would be companies with ringgit denominated revenue but which have substantial imported cost components and/or large debt in foreign currencies. Key beneficiaries include food and beverage sectors, power, media and health care. Companies expected to be negatively affected by appreciation of the ringgit following the depegged include organizations involve in semiconductors (MPI, Hong Leong Industries), timber (Lingui), plantation (IOI Corporation), glove manufacturing (Supermax) and air freight (Transmile). Based on RAM analysis companies in construction sector such as Gamuda are expected to experience higher foreign exchange risk with the depegging of ringgit since these companies are having growing exposure to foreign revenue. Margins would be tightened further. Companies producing consumer products such as Nestle are expected to enjoy approximately 5% increased in gross profit assuming 5% appreciation in ringgit. RAM forecasted that plantation companies, in particular IOI Corporation, would experience slightly negative impact on net profit. However the negative effect of revenue is expected to be offset by lower fertilizer cost and higher interest saving from its foreign currency denominated debts.

Hwang-DBS Vickers Research (2005) suggests that the trade-weighted managed float for the ringgit would pave the way for an immediate appreciation of the ringgit by 2-3% to RM3.68-RM3.72 per USD. It forecasted that the direct impact on market earning is modestly positive. However the market is expected to be temporarily volatile with the outflows of hot money. The research company also forecasted that beneficiaries of ringgit depegging by importance are food and beverages, media, auto, steel and utilities sectors and companies with large foreign debt exposure like Tenaga, Telekom and Public Bank while plantation, timber, oil and gas and manufacturing expected to be the losers.

## **Methodology**

All data comprising share prices of 956 companies, EMAS Index, Composite Index, sectoral indices and the Malaysian trading partners stock market indices are collected from Datastream statistical package. This data involving share prices of all stocks listed both on the Main Board and the Second Board, comprised adjusted daily share prices of the 956 companies. The data has been collected for the 3-month trading period beginning from July 1, 2005 to end of September 2005. Since the announcement of depegging took place on 21 July 2005 ('the event date'), careful attention was given to the price and market reactions on the event date and the surrounding dates to measure statistically the announcement impact of the lifting of the pegging of Ringgit on USD. Data indices of various sectors enabled us to find out the impact of the announcement on various sectors of the economy in Malaysia and to identify the sector most significantly affected by the monetary policy change. The sectors are plantation, finance, construction, consumer, property, infrastructure, industrial, trading and technology. Data on companies listed on MESDAQ was also taken as part of the observations of the depegging impact on technology driven companies.

Another type of data that has been collected are stock market indices of Malaysia's major trading partners such as S&P 500 (the United States), STI (Singapore), Hang Seng Index (Hong Kong), Nikkei 225 (Japan), Jakarta Index, Philippine Index, Seoul Composite (Korea) and Thailand Index. This data is processed to examine if the stock market return in Malaysia changes because of the announcement or because of changes in the international markets. Pegging allowed Malaysia to manage her interest rates without worrying about their impact on the currency. Therefore interest rates of Malaysia are compared to selected countries' interest rates to investigate if interest rates in Malaysia are less correlated to these countries' as a consequence of pegging. Malaysian microeconomic data such as Gross Domestic Product (GDP) and Consumer Price Index (CPI) from 1991 to 2006 were collected to determine if pegging has any significant impact on the interest rates.

Financial data of 99 large companies constituting the KLCI such as Tenaga, Telekom, Petronas and others were collected. Financial data comprises foreign debts, exports, sales figures and foreign exchange exposure. These figures were extracted from the respective companies' annual reports. The purpose is to study the impact of depegging on these companies since they have large foreign exposure and hence, susceptible to changes in interest rate and foreign exchange rate.

#### **Research Design**

We employed several statistical techniques to answer the research objectives. Market adjusted return, single index market model and correlations were used to address the impact of depegging announcement. Correlation and cointegration technique were used to address the effects of pegging on interest rates. Further to that, ordinary least square regression also used to test whether the announcement effect is more pronounced to the companies with large foreign exchange exposure and whether pegging reduced Malaysian market returns dependency on the US market returns.

#### **Market Adjusted Return and Single Index Market Model**

We started by processing the data according to three important trading days namely July 21, 2005, July 22, 2005 and July 25, 2005. To measure the effects of depegging, an event study approach was adopted. Abnormal returns of indices and companies were estimated using market adjusted return as shown in equation (1). The indices of interest are the indices of the different sectors.

$$ER_{it} = R_{it} - R_{mt} \quad (1)$$

where

$ER_{it}$  : Abnormal return associated with depegging for index  $i$  on event day  $t$ .

$R_{it}$  : Actual return of index  $i$  on event day  $t$ .

$R_{mt}$  : Market return on event day  $t$ .

We hypothesized that some sectors will be more affected by the move of ringgit depegging than other sectors. Furthermore we also hypothesized that the move would affect firms in the main board and second board differently. Therefore we compared the return of second board and main board to assess the effect of depegging on these boards.

To assess the effect of depegging on Malaysian market as compared to other regional markets, returns of Composite and EMAS were compared against the returns of stock markets in those regions starting from July 20, 2005 to July 29, 2005. If depegging is good for the economy, we hypothesize that the returns of Composite and EMAS should be larger than the regional indices. To assess the effect of depegging on Malaysian market, single index market model of the following form was also employed.

$$ER_{it} = R_{it} - E(R_{it}) \quad (2)$$

where

$ER_{it}$  : Excess return of index  $i$  on event day  $t$  and  $t = 0$  on July 22, 2005.

$R_{it}$  : Actual return of index  $i$  on event day  $t$ .

$E(R_{it})$  : Expected return of index  $i$  on event day  $t$  if the event had not occurred.

$E(R_{it})$  would be estimated by the market model as follows:

$$R_{it} = \alpha_i + \beta_i * R_{mt} + e_{it} \quad (3)$$

where  $R_{it}$  is the return on Malaysian market,  $R_{mt}$  is the return of a global index (MSCI World Index), and  $e_{it}$  is the error term.  $\alpha_i$  and  $\beta_i$  were estimated based on returns over a-200 day period ending on July 21, 2005. The estimated parameters were then used to compute the  $E(R_{it})$  in the window period. The window period is from two days before the announcement to two days after the announcement

### Correlation and Cointegration Technique

Pegging removes one aspect of uncertainty, i.e Ringgit fluctuations to USD. Since USD is widely used in international trade, we expect that a firm's performance and subsequently its stock performance to be less affected by movements in the currency market during the pegging period. To test this hypothesis, we look at the correlations between returns on Malaysian stock market to returns of stock markets in this region. Pegging also affects the interest rates as Malaysia does not have to worry about managing its interest rate to make ringgit steadier. Therefore we would also look at the correlations between interest rates in Malaysia to selected countries in this region and we would also be looking at the effects of US interest rates on Malaysian interest rates through cointegration method.

### Ordinary Least Square Regression

To assess the impacts of US and Japanese returns on KLCI returns, we estimate the following model:

$$R_t = \beta_0 + \beta_1 \text{S\&P500}_t + \beta_2 \text{lagS\&P500}_t + \beta_3 \text{Nikkei}_t + \beta_4 \text{D4AFC}_t + \beta_5 \text{D4PEG}_t + \beta_6 \text{D4DEPEG}_t + \beta_7 \text{D4PEG}_t * \text{lagS\&P500}_t \quad (4)$$

where

$R_t$  : Returns on KLCI

S&P500 : Returns on S&P500

lagS&P500 : Lag of S&P500

Nikkei : Returns on Nikkei 225

D4AFC : Dummy variable which equals to one for Asian financial crisis (from July 1, 1997 to September 1, 1998) and zero otherwise.

D4PEG : Dummy variable which equals to one for the pegging period (September 2, 1998 to July 21, 2005) and zero otherwise

D4DEPEG : Dummy variable which equals to one for the depegging period (July 22, 2005 to March 30, 2007) and zero otherwise.

PEGXLUS : The interaction between D4PEG & lagS&P500.

We put PEGXLUS since we hypothesized that during the pegging period, Malaysia is more insulated to movements in US market. Therefore the sign of this variable should be negative. To assess the impact of foreign exchange exposures to depegging announcement, the following regression model is estimated:

$$R_i = \beta_0 + \beta_1 \text{LN(ABSGAIN}_i) + \beta_2 \text{LN(MV}_i) + e_i \quad (5)$$

where

$R_i$  : the return of firm  $i$  on July 22, 2005

$\text{LN(ABSGAIN}_i)$  : the natural logarithm of absolute value of gains plus absolute value of losses due to foreign exchange in the fiscal year prior to the depegging announcement.

$\text{LN(MV}_i)$  : the natural logarithm on the firm's market value on July 21, 2005.

We expect that  $\beta_1$  should be positive as the greater is the exposure to foreign exchange, the higher is the gain if ringgit is really undervalued as claimed by the forex traders. The event date in this study is July 22, 2005 since the announcement was made on July 21, 2005 after the close of Bursa Malaysia. However, we would also look at the returns on July 21, 2005 since the Yuan was revalued on that day and many economic analysts in Malaysia had predicted that Malaysia could hold on to the pegging system as long as China does not revalue its Yuan and once China revalues its Yuan, Malaysia has no choice but to follow in its footsteps. Therefore, the event dates of interest are July 21 and July 22, 2005.

### Analysis of Findings

Table 1 shows the results of two types of abnormal returns arising from the announcement of depegging; the raw return and the market adjusted returns (EMAS Adjusted Returns–EAR and Kuala Lumpur Composite Index–KLCIAR) across industries. The results show that companies of all sectors listed both on the main board and the second board (construction all, finance all, consumer all, industrial all, trading all, properties all, plantation all, infrastructure all) with the exception of technology companies, recorded negative returns, both in terms of raw returns and market adjusted returns on the 21 July, 2005 prior to the announcement. There was no abnormal return as yet because the announcement of the depegging was made after the market was closed. The actual impact of the announcement could be seen on the next day, 22 July, 2005 where companies of 7 sectors (except for plantation) recorded positive abnormal returns.

Table 1 also highlights the impact of the event on the sectors. From the results, we observe that the sector most affected by the depegging is the finance sector, which recorded positive mean abnormal returns of 0.02117 or 2%. The EMAS index adjusted return for finance sector yields 0.00563 whilst adjusted return based on Kuala Lumpur Composite Index is 0.000192. The positive adjusted return shows that the depegging is seen as benefiting the companies listed under finance sector. The result is as expected as financial institutions are the organizations that are extensively involved in USD dominated transactions such as their trade finance activities, money market operations, foreign exchange transactions, international lending and hedging instruments such as currency swaps and others. The move to depeg the Ringgit is going to increase the volatility of the foreign exchange market and consequently, will increase the hedging needs of firms with large foreign exchange exposure.

Given that the move to depegging might be more favorable to larger firms, we test whether there is any significant difference in means returns between the Main Board and Second Board on 22 July, 2005. Firms in Main Board are larger and more well known than those in Second Board. We find that there is no significant difference in either raw or adjusted return. This suggests that the announcement of the depegging has equal impact on both boards of the Malaysian equity market. The positive and significant returns by most sectors provide evidence that Malaysian investors favored the action by the Central Bank to uplift the fixed exchanged rate of RM3.80 to USD1. Hence, this finding fulfills the first objective of the study.

Table 2 shows the difference in mean returns between industries. It is noted that finance sector yields statistically significant higher returns compared to construction, consumer, industrial, plantation, technology and firms in the MESDAQ. Both parametric test (as shown in the upper diagonal) and the non-parametric test (indicated by Mann-Whitney test) give a basically the same result. Hence, both tests confirm that finance sector benefits the most from the depegging. Plantation sector yields return of -0.5%. The rationale for this could be that the prices of the plantation crops are quoted in USD for exports. Since the market perceived that the Ringgit is undervalued, the depegging move would lead to an appreciation in the Ringgit value and consequently lower the revenues for plantation sector. The above finding meets the second objective of the study by identifying that the finance sector is the most favorably affected sector while the plantation sector is the most adversely affected sector.

Table 3 shows that on the announcement date of depegging six out of nine bourses recorded positive returns. There are Shanghai (2.52%), Jakarta (1.27%), Hong Kong (1.14%), Kuala Lumpur (1.93%), Singapore (0.35%) and United State ((0.54%). Nikkei, Seoul and Taiwan recorded negative growth of -0.78%, -0.04% and -0.21% respectively. It appears that Shanghai and Kuala Lumpur experienced the highest returns. The growth in Shanghai index was contributed by the announcement made by the China government to revalue its Yuan while for Kuala Lumpur it is a direct consequent of the depegging announcement. There was no other significant economic news on that day (NST, Business Times Section, July 23, 2005).

Table 4 shows the abnormal returns of certain Malaysian indices using market model on the days surrounding July 22, 2005. We use four indices and they are MSCI Malaysian in RM, MSCI Malaysia in USD, Composite Index and EMAS Index. The results show that the abnormal returns range from 1.48% to 2.31% on July 22, 2005 depending on the measure of index. All variables are significant at 1% level. As for the other dates, they are not significant.

The upper diagonal of Table 5 shows correlation between world indices starting from January 1990 to March 2007, while the lower diagonal shows the correlation between world indices before the start of Asia financial crisis (January 1990 to June 1997). The upper diagonal of Table 6 shows correlation between indices during the pegging period (September 2, 1998 to July 21, 2005) while the lower diagonal shows the correlation after Malaysia depegs its currency to US dollar (July 22, 2005 to March 30, 2007). Given that the economic performance in US and Japan influences Malaysian economy, we are interested to look at the correlations of returns of these countries to KLCI returns. Furthermore given the different time period between New York and Kuala Lumpur, and our assumption that US returns influenced KLCI returns, then we are interested to test for the correlation between the lag of one day of US returns (lagS&P500) to KLCI returns.

Tables 5 and 6 show that for all four periods, correlations among US returns and KLCI are higher if we used one day lag of S&P500 than using the same day returns. The correlations between KLCI and all other markets except for Korea decreased during the pegging period. This result shows that pegging to some extent insulated Malaysia from movements in other markets. This result is more significant given that the most of the correlations

among markets increased during the pegging period compared to the period before the crisis. This means that the markets are more integrated after September 1998 except for Malaysia. The reductions in correlations are in tandem with the Malaysian government policy to stabilize Ringgit and to curb speculation in the Malaysian market. Based on the result in Table 6 we find that the Malaysian stock market is more exposed to the movement of other markets and world economy following the depegging. We find that correlations between Malaysia and other markets increased after the depegging except for Singapore.

Table 7 summarizes the findings of model (4). We find that lagS&P500 and Nikkei 225 are significant in explaining KLCI returns. The coefficient of lagS&P500 is about three times larger than the coefficient of Nikkei 225. This shows that US has a greater influence on Malaysia than Japan. This finding is consistent with the results of Yang, Kolari & Min (2003) where, by using impulse response function, they find that the US stock market has more influenced on Malaysia stock market compared to Japan's. PEGXLUS is negative as expected and significant. This shows that Malaysian market is less influenced by the US market during the pegging period. Therefore, pegging insulated Malaysia stock market to movements in US market.

Table 8 presents the correlations between interest rates in Malaysia and selected countries. Before the AFC, it seems that Malaysian interest rate is not highly correlated with other countries. In fact interest rates in Malaysia are negatively correlated with five out of nine countries with the correlation to China and US interest rates being the lowest at -0.5295 and -0.4641 respectively. During the pegging period Malaysian interest rates are positively correlated with other countries including the US. However our correlation with the US is again the lowest. We expect that given that Malaysia has already pegged her exchange rate to the US, the correlation between interest rate of Malaysia and other countries should be low. However this is not a case. A possible explanation is that the interest rates of other countries reached their lowest level during this period, and given that pegging is advantageous during period of high interest rate and the Malaysian government desire to lower its interest rate, the decision of Malaysia to lower its interest rate coincides with the general downward movement in interest rate. Therefore the correlation is positive. Meanwhile during the depegging period, Malaysian interest rate is positively correlated with all countries, except Philippine, and our correlation with the US is the highest at 0.9483. The relationship between US and Malaysian interest rates and exchange rates is shown in Figure 1.

Table 9 shows the cointegration result using Autoregressive Distributed Lag approach (ARDL) between Malaysian interest rate and other variables such as GDP, inflation, money supply, effective exchange rate and US interest rate. We also include pegging period as the dummy variable in this study. From the table we can conclude that since F statistic for the equation; 1.4563 is below the lower bound of the critical value band (between 2.649-3.805), we cannot reject the null hypothesis of no long run relationship between Malaysian interest rate (DLINTM) and the independent variables i.e US interest rate (LINTUS), GDP (LRGDP), inflation (LCPI), money supply (LM3) and effective exchange rate (LEXRATE). One possible explanation is that interest rates in Malaysia are regulated. Therefore outside pressures do not exert any influence on them.

## Conclusion

This study aims to investigate the impact of ringgit depegging on the Malaysian capital market. Specifically this main objective is decomposed into five research questions. Below are the summary of our findings to those research questions.

We find that the investors and overall market responded favorably to the move by the Malaysian government to untie the pegging of RM3.80 to USD1. The announcement of depegging on 22<sup>nd</sup> July 2005 resulted in positive raw return of 1.93% based on KLCI. The positive impact of the announcement is also evident from the result of Single Index Market Model. Statistically the impact yields positive abnormal return of 2.31% based on regressing MCSI Malaysia denominated in US dollar against MSCI World Index.

As to our second objective, we find that the sector that is most effected by the depegging is the finance sector. This sector recorded positive raw and adjusted returns of 2.12% and 0.56% respectively. The possible reason for this positive impact is that investors expect an increase in the volume of finance related activities resulting from market based regime. In contrast plantation sector recorded negative raw and adjusted return of -0.5% and -2.05%

respectively. This could be due to fact that the prices of the plantation crops in the contracts are quoted in USD. Since the market perceived that the Ringgit is undervalued, the depegging move would lead to an appreciation in the Ringgit value and consequently lower the revenues for plantation sector

Our findings also show that Malaysian stock market is less vulnerable to movement of other stock markets such as S&P 500, Singapore, Hong Kong, Jakarta, Philippine and Bangkok during the pegging period. The reductions in correlations are in tandem with the Malaysian government policy to stabilize Ringgit and to curb speculation in the Malaysian market.

We investigated the relationship between interest rate of Malaysian financial system relative to its main trading partners. Our findings indicate that before the pegging, Malaysian interest rate is not highly correlated with other countries. In fact the interest rate in Malaysia is negatively correlated with five out of nine countries with the correlation to US interest rate being the lowest at -0.4641. However, during the depegging period, Malaysian interest rates are positively correlated with other countries including the US. We further investigate the relationship between Malaysian interest rate and its trading partners using cointegration analysis. The result shows that the Malaysian interest rate is not influenced by the US over 1990 to 2005 periods.

Our regression results show that even though foreign exchange exposure positively influenced stock return, it is not statistically significant. This result is based on 99 large companies listed on the Main Board of Bursa Malaysia. Nonetheless, the strong support of the investors reflect that depegging is a good monetary policy decision to move from fixed exchange rate regime to a managed floating rate regime. This bold and innovative strategy has increased international trade for Malaysia and stimulated its Composite Index to 1,322.91 point, the highest since AFC backed by strong exchange rate of RM3.4390 to 1USD (April 17, 2007, Starbiz)

## **Business Financing for Small and Medium Enterprise (SMEs): How to Strike?**

*Mohd Amy Azhar Mohd Harif, amyazhar@uum.edu.my  
Siti Khadijah Md. Zali  
University Utara Malaysia, Malaysia*

### **Abstract**

Small and medium enterprises (SMEs) constitute an important part of the business system in Malaysia. Although their role in the Malaysian national economy has been one of distinction and contribution, but SMEs possess a lack of financial to expand their business. Thus, the purpose of this research is to investigate the factors considered by banks in providing the financing to Small and Medium Enterprise (SMEs) in Malaysia. This study is focused on question: “*Business financing for Small and Medium Enterprise (SMEs): How to strike?*” To answer the research problem, this research employs the convergent interview with the commercial banks including SME Bank around Malaysia. This research have been used a cross case analysis technique to analyzed data. From this analysis, the result suggested that have 15 factors classified as a success factors in getting the business financing for SMEs.

### **Introduction**

Bank lending has played an important role as the major source of funds and liquidity for the private sector in Malaysia (Public Bank Economic Review, 2002). As the main mobilized of funds in the economy, the banking sector was able to support the increasing lending requirements to business activities.

Reflecting that, Bank Negara Malaysia (2004) stated that demand for new financing by businesses was higher in 2004. Loan applications received from businesses were increased by 20% in 2004, a turnaround from the decline of 7.7% in 2003. The increase was driven by higher applications received from the manufacturing, construction and the wholesale and retail trade sectors, amounting to RM76.2 billion. In tandem with higher loan applications, new loans approved to businesses were increased by 9.8% to RM84.9 billion, accounting for 48.9% of total new loans approved by the banking system. Nearly 51% or RM43.2 billion of new loans approved to businesses were channeled to the construction, manufacturing and the wholesale and retail trade sectors.

Banks lending objective is to improve the private sector business activity to enhance their contribution to economic growth. One of the key sectors identified for further development in many economies is the small medium enterprise (SMEs) sector because of its importance to the development of local entrepreneurial capabilities and industry linkages and their high multiplier effects on economic (Rajandram, 2004).

Studies done by Udell (2004) using the data in the United State, found that nearly half of small business (SMEs) financing comes from externally provided debt, and realized that SMEs continued to receive strong support from the banking sector. In 2004, the banking system approved RM31.6 billion of new loans to more than 92,000 SME accounts which shown a significant increase of 21.9% from 2003. Loan disbursements grew strongly by 15.3% to RM100.4 billion, while outstanding loans to SMEs expanded by 7.7% to RM88.3 billion (Bank Negara Malaysia, 2004).

Small business (SMEs) sector plays a vital role in contributing to the overall economic performance of economies. But some studied have identified the main problem facing off by SMEs is getting the financing. For example, in the survey conducted by Daniels (2003) stated that 58 percent of the businesses in their sample have a problem of getting the investment funds while 35 percent have a problem in getting the operating funds.

Banks also are more particular in approving the financing for SMEs, as they do not consider them as attractive and profitable undertakings (Hossain, 1998; Bhattacharya, 2000; and Sia, 2003). A study by Hall and Fang (2004) also found that the lending to SMEs generally more risky than larger firms. Therefore, it has been found that most of the financial institution and non-financial institution required collateral in the form of land or buildings. The

value of the real-estate security is usually set at twice the amount of loan (Bhattacharya, 2000), which many enterprises fail to provide as collateral. SMEs also regarded as high risk borrowers because of their low capitalization, insufficient assets, and high mortality rates (Sia, 2003) and consequently, they are not offered any attractive deals in terms of loans and interest rate.

Previous researchers have examined a variety of issues related to SME lending including the role and nature of relationship lending (Boot, 2002), the importance of small bank lending to economic growth (Berger, Hassan & Klapper, 2004), the impact of technology on small business lending (Petersen & Rajan, 2002), and the nature of non-bank commercial lending (Carey, Post & Sharpe, 1998).

Many studies also have been done to support the argument or contend about difficulty of SMEs in getting financing from the financial institution. In Malaysia, the non-availability of finance has been the most frequently cited problem encountered by the SMEs, and it is also crucial issues to many of them (MITI, 1990). Chee (1986) noted that majority of SMEs indicated inadequate working capital and lack of access to commercial lending as their major problem. Diah, (1985 & Shahadan et al, 1990) also identified inability to raise capital and limited access to institutional credit as the two typical problems of SMEs. Hassan (1992) pointed that SMEs are not able to gain access and utilize available funding due to interrelated factors such as inadequate collateral and lack of performance record to convince the financial institutions into providing them the loans. Other studies in developed countries like United States of America and United Kingdom also suggested that SMEs operating in these countries faced financial problems. Broom & Longenecker (1975) indicated that one problem of major significance to many small businesses is lack of capital and credit. Most bankers associate loans to SMEs with low returns and high risk. Thus, SMEs businesses are not only having problems in obtaining bank finance, but they also claim that the costs are too high. Lee (1998) in his study stated that the bankers who appeared to view any small business loan application as a potential portfolio of non-performing loans. This viewpoint may be attributed to what the bankers perceived as inefficiency in small loan processing and biases in assessing credit worthiness of small business customers. Furthermore, previous studies have found out that SMEs were deprived of funds due to the lack of understanding on the part of bankers and the SMEs owners (Rosli Mahmood, 2000; Deakins & Hussain, 1994; Wyant & Hatch, 1990). The financial institutions that provide a financing for their customer will make sure that the borrower have a good and effective credit management. This is to make sure the borrowers will not default in repayment. So, to assure that will not happen, the bankers must do a proper credit evaluation. Thus, the research question for this study is; *“Business Financing for Small and Medium Enterprise (SMEs): How to Strike?”*

## Literature Review

To initiate the discussion for this financing decision, the literature measuring about the success factors of business financing is explored.

### **Success Factors for the Conventional Business Financing**

Business loan also known as commercial and industrial loan (C&I): There are many purposes of business borrowing such as to finance day-to-day activities, and longer- term needs, and for other business purposes (Rose, 1999). Before banks make a decision to provide a loan, they must evaluate imperfect information about prospective borrowers to determine if they are creditworthy. The information provided to the banks must be sufficient to make a credit decision.

For the business financing evaluation, *12 success factors* have been identified that synthesizing the literature. Seven references literature have been raised to be a platform for this disclaimer, as shown in table 1.

Source: developed for this study

The first factor considered by banks when evaluate the business loan is *financial statement (audited)* (row 1 in table 1). The financial statement used is the audited financial statement for the incorporate company because this financial statement contain both qualitative information (e.g. the auditors' report and chairman's statement), and quantitative information (e.g. balance sheet) of the business (Berry et al, (1993). For sole proprietor and Partnership Company 3 years' unaudited account are required. Analysis of financial statement typically includes four key areas: liquidity, profitability, gearing and operational performance and usually banks will use the last three, four, or five years audited financial statement (Rose, 1999). Information from balance sheets and income statements is typically supplemented for financial ratio analysis. The ratios commonly used by the bankers are; operating efficiency, coverage ratio, liquidity ratio, profitability ratio, and leverage ratio. The cash flow is referred to as the sources and uses of income. Two of the seven authors in table 1 included this factors which shown that this factor is one of the most important. Thus, this factor will be included in this study.

The second factor is *repayment* (row 2 in table 1) which is often considered as the first line of defense. This factor allow the banker know the source of income for the repayment. This factor is important to evaluate the ability of owners to earn a sufficient amount to repay the loan. Three of the authors in table 1 included this factor as success factor for business financing. Thus, this factor one of the most important factors and will be include in this study.

The third factor is *purpose* of the loan (row 3 in table 1). Purpose is the use of loan funds. The purpose of the loan is a significant variable in the lending decision because the loan is raised will be influential in assessing the potential risk involved in the lending decision (Berry et al, 1993). An understanding of the loan's intended use helps the analyst to understand whether the loan request is reasonable and acceptable. Two of the authors in table 1 included this factor. Thus, this factor one of the most important factors and will be include in this study.

The next factor is *business risk/product* (row 4 in table 1). Some businesses, by their nature, are likely to be riskier than others. In finance theory this type of risk is normally referred to as business risk. Business risk is reflected through the volatility of profits (Berry et al, 1993). The business risk also can relate with the product produced by the business, because once the business produce a product which is cannot enter into the market or the business produce a product which is cannot expand it will make a business is risk. The business ability also is referring to the ability of applicant to generate enough cash, in the form of cash flow, to repay the loan. Generally, the borrowers have only three sources to draw upon to repay their loan: cash flow generate from sales or income, the sale or liquidity of assets or fund raised by issuing debt or equity securities. Only one author in table 1 included this factor. Thus, this factor will be included in this study.

Then, next factor as a success factor in business financing is *knowledge* (row 5 in table 1). Knowledge here is referring to the information gather by the bankers in the applicant's business. This knowledge will greatly help a banker in assessing the risk associated with a lending proposal. This knowledge can be derived through past records and bank's own internal records. Also for this factor, only one author out of eight authors from table 1 included this factor as a success factor for business financing. Thus, this factor will be included in this study.

The sixth factor is the *third-party opinion* (row 6 in table 1). Third-party opinion is the information acquired by asking the other parties involved with the applicant's business such as supplier, customers, others bankers, and etc. In particular, if the third party has previously been a source of good introductions presumably the banker will have greater confidence in this third-party's opinion and introductions. Although the information from third parties can play an important part in the banker's assessment of risk, but only one author in table 1 included this factor. Thus, this factor will be included in this study.

Next is the *size of business* (row 7 in table 1). The size of the applicant's business will be extremely influential in a lending decision because it will effect on the banker's perception of risk. In terms of liquidations small firms go into liquidation than larger counterparts. This factor also included only by one author in table 1. Thus, this factor will be included in this study.

The next factor is *capacity* (row 8 in table 1). Capacity is defined as the legal status of the borrower to enter into contract (Reed & Gill, 1989), whether a borrower has the authority to borrow on behalf of his firm or business because if the borrower lacks such as authority, banks may find difficult to collect their loans. Capacity may also refer to the repayment capability of the borrower (Shamsudin et al, 1988), which is measured by the expected cash flow of the borrower's business. Three of the authors in table 1 are included this factor. Thus, this factor one of the most important factors and will be include in this study.

The other factor is *character* (row 9 in table 1). Character assessment is performed to determine the willingness and desire of borrowers to repay the debt (Shamsudin et al, 1988). The borrower's attitude such as honesty, integrity, industry and morality are considered in character assessment. This factor included by the four author out of eight author in the table 1 which means this factor are most important factors in business financing. Thus, this factor will be included in this study.

The next factor is *economic condition* (row 10 in table 1). Bankers need to know how changes in competitive economic conditions, technology, and the demand for products and distributions methods affect the borrower's business. Economic conditions affect the ability of the borrower to repay financial obligations but are beyond the control of the borrower and the lender. Three of the authors in table 1 included this factor. Thus, this factor is important and will be included in this study.

The second last factor is *collateral* (row 11 in table 1). Collateral refers to any asset which the borrower may have to charge or pledge as security against the loan. The range of assets can be pledged to the bank as security. The collateral is important because to reduced the credit risk. For this factor, three of the authors in table 1 included this factor as a success factor. Thus, this factor is one of the most important factors and will be included on this study.

The last factor as a success factor in business financing is a *capital* (row 12 in table 1). Capital represents the borrower's money that he puts into a project. It's indicates the financial worth of the borrower and also reflects the accumulated wealth of the borrower and to some degree as an indication of past success. Two of the authors in table 2.1 included this factor as a success factor in business financing. Thus, this factor is one of the most important factors and will be included on this study.

As a conclusion, based on previous literature on the success factor in conventional business financing, our study will consider the above list of factors as shown in table 1 as the starting point for this study.

**Success Factor in SMEs: Business Financing.**

After we have identified the best success factors used in conventional business financing, now we will explore the success factor for SMEs lending.

The bankers have traditionally taken their knowledge of the borrower and their business market and combined this knowledge with limited financial information provided by borrower to make lending decisions. According to Justas (1982) stated that the success of the small business depends on the management skills and expertise of the owner.

Thus, we will explore the success factors in getting business financing for SMEs based on the synthesis of six references, as shown in table 2. With synthesis of the literature, there are additional of 7 factors apart of 12 factors identified in conventional business financing to be included as a success factors in getting the business financing for SMEs (12 factors have been discussed before in success factors for the conventional business financing).

So, here we only briefly discuss the new seven factors could be included in the success factors in getting business financing for SMEs, as shown in table 2.

The first factor is *competence management* (row 13 in table 2). It's usually is a management skills to manage the business. In reality the success or failure of business is depend upon the skills of the management team. So, banks must have confidence that the firm has good management before a loan is granted. This factor included as a success factor for SMEs financing by one author only in table 2. Thus, this factor will be included in this study.

Second factor is the *financial projection* (row 14 in table 2), or also known as a pro forma financial statement. Pro forma financial statement is a projected statement based on the forecast. The forecast is important to develop internal budgets for the functional department of the business. The lenders seek this financial statement because they want to make sure that the applicant's business will generate enough profit to pay back both the principal and interest on the loan. Only one author in table 2 included this factor as a success factor for SMEs financing. Thus, this factor will be included in this study.

Then, the third factor is *geographical risk* (row 15 in table 2). Geographical risk is the geographical location of SMEs. Some banks limit their exposure to residential property in certain areas because the value and marketability of residential property differs substantially between urban centers and small rural areas. Only one author in table 2 included this factor as a success factor for SMEs financing. Thus, this factor will be included in this study.

The fourth factor included is *market involved* (Row 16 in table 2). The market involved means how far the products that produce by the borrower can establish and also can compete with others product in the markets. Also one author in table 2 mentioned this factor as a success factor for SMEs financing. Thus this factor will be included in this study.

The next factor is the *industry risk* (row 17 in table 2). Risk is a term that is based on the uncertainty of future outcomes. Banks place great emphasis on conditions in the industry and the applicant's competitive position and relative stability. Industry risk also looked at the trends of industry including technological changes, new process, and changes in customer demands. Only one author in table 2 included this factor as a success factor for SMEs financing. Thus this factor will be included in this study.

TABLE 2: SUCCESS FACTORS FOR SMES BUSINESS FINANCING

Sources: develop for this study

Then, next factor is the *trading experience* or track record (row 18 in table 2). Track record is the past experience of the borrower’s business and it’s concerned with relevant past experience such as the number of years spent in the industry, other commercial experience, training etc. The past track records have been used by the banker to assist them in doing the judgment on the forecast information. The past track record could include the assessment of the management’s ability to meet the objective, to manage staff and to manage their finance. Two authors in table 2 included this as a success factor to getting business financing. Thus, this factor also becomes one of the important factors. So, this factor will be included in thus study.

The last factor is *planning* (row 19 in table 2). This factor is a systematic process that takes from some current state to some future desire state. But when we talk about business planning, it should be related to the strategic planning. Strategic planning is a long-term plan for a business and involves establishing an overall plan for the business. Strategic planning concern with establishing company priorities and also it’s allocates resources and takes the steps necessary to meet the strategic goals. This factor considered by two authors out in table 2. Thus, this factor will be included in this study.

In conclusion, 19 factors has been found which is could be used as a based to evaluate the SMEs financing application by the commercial banks. So, after this we will confirm isn’t all these factors are consider by the commercial banks in Malaysia as a success factors in evaluating a financing application by the SMEs.

## Conceptual Framework

Figure 1 shows that, two categories have been identified to determine the success factor for SMEs financing in Malaysia, firstly are 'financial factor' and secondly are 'non-financial factor'. Both categories will be used as a basis for this study about the success factors for SMEs financing.

With the result from previous literature and discussion about the success factors for conventional business financing and SMEs financing, we can make a conclusion that there are four factors under 'financial factors' category. The factors are; financial statement, sources of repayment, capital, and financial projection.

While, under the 'non-financial factors' category, we found 15 factors. The factors are; capacity, character, economic condition, collateral, purpose, knowledge, business ability, geographical risk, industry risk, third party opinion, size of business, experience, strategic planning, competence management, and market involved.

The arrow that connected between the 'financial factors' and 'non-financial factors', shows that each element under the both groups are related with each others and also built a strong relationship. This relationship will determine the success factors for SMEs financing.

## Methodology

The research methodology use in this study is a qualitative method. Qualitative research methodologies were used for this research for three reasons. The first reason is related to the objectives of the research. This research seeks to explore the little-researched area of what are the successes factors in getting the business financing for SMEs? That is, this research is theory building rather than theory testing. Qualitative methods address theory building rather than the theory testing that is used by quantitative methods. In the early stage of theory development like this research, where phenomenon are not known, qualitative research methods could be used because prematurely used quantitative research methods can lead to inconclusive findings.

Interview data is a major source of information for many qualitative researchers (Carson et al, 2001). Interviews can be categorized as highly structured or highly unstructured, these two points being the poles of a continuum (Sekaran et al, 2001). The range from unstructured interviews designed to discover in-depth insights and understanding, and more structured interviewing focusing on a technique called *convergent interviewing*, an approach particularly useful in business research (Carson et al, 2001).

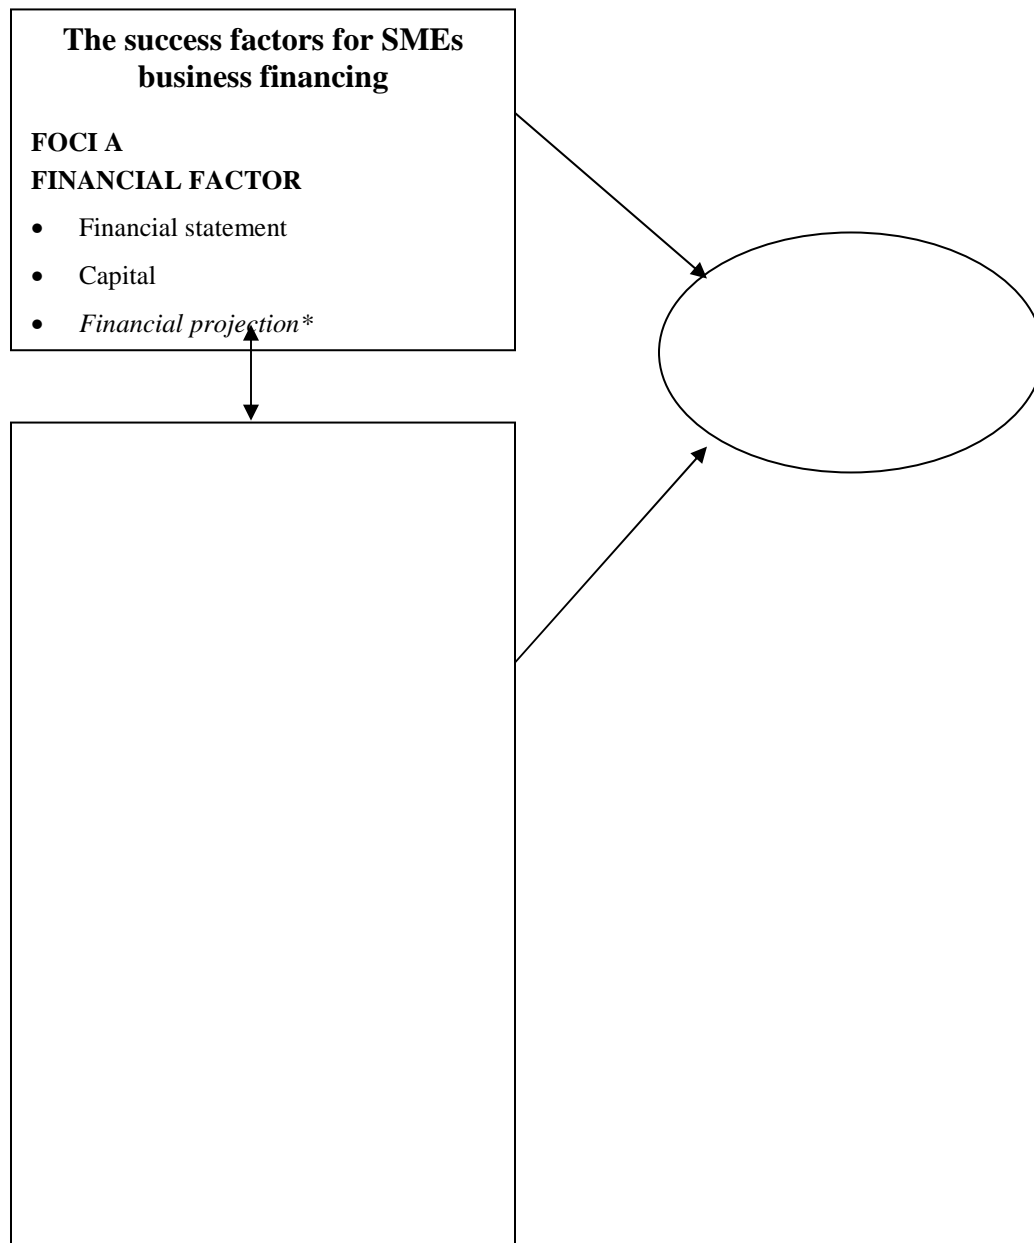

FIG.1: THE SUCCESS FACTORS FOR SMES BUSINESS FINANCING

For this study, the convergent interview is used in the session of collecting data. According to the Carson et al. (2001 a) cited that the convergent interview is a methodology that allows a relatively structured approach to sorting out what needs to be done in a research project in the early stages. It also a technique for collecting, analyzing and interpreting qualitative information about people’s attitudes, beliefs, knowledge and opinions through

the use of a limited number of interviews with experts that converge on the most important issues within a topic area.

Figure 2 shows there have five steps to conduct convergent interview in the process getting the information or data about the success factors in getting the business financing for SMEs. Each step is consequence, but at the step four and five, it must be repeated to each different respondent.

### *Sampling*

All the information required for this study came from primary data and most of the data gathered derived during process of conducting convergent interview. All tens major banks are selected for the purpose of this research because there are the largest and important group of financial institutions in Malaysia. Moreover, for most local businesses, banks are often the major source of credit (Rose, 1999). However, out of ten major banks in Malaysia, researcher managed to conduct interview with only seven banks and these seven banks are actively involved in lending to SMEs in Malaysia. The banks selected are: Alliance Bank Malaysia Bhd, Bumiputra-Commerce Bank Bhd, EON Bank Bhd, Malayan Banking Bhd, Public Bank Bhd, RHB Bank Bhd, Malayan Banking Bhd (Maybank), and SME Bank.

### **Method of Interpretation Data**

Previously, we have discussed the method of collecting the data of this research. Now, the procedure used for analyzing and interpreting the convergent interviewing data is discussed. Firstly, after each individual interview, the taped interview was listened to in order to clarify and expand the key issues into summary notes. Each interview was transcribed within a day of the interview. Secondly, a progressive interpretation report was written by comparing the summary notes of the first two interviews. This progressive report was then compared to each subsequent interview's summary notes and added to, and/or modified according to new issues that emerged after each interview.

### **Cross Case Analysis.**

The methodology going to be used in interpretation data for this study is a cross-case analysis. This method have been done by making an in-depth analysis with each respondents for considering the success factors in getting the business financing for SMEs. The findings in this study was gathered from the similarity existed in the analysis have been done with each respondents (Denzin, 1983). The cross-case analysis enabled the comparison of different cases against predefined categories (*i.e.* commitment process drivers and the assumptions identified in commitment model analysis).

This method have been chosen because the cross case analysis enables the comparison of multiple cases in many divergent ways, which would not be possible within a single case analysis. The case comparison can be made against predefined categories, in search of similarities and differences, or by classifying the data according to data sources. This method also will give more accurate result due to increase in the generalization (Denzin 1983; Miles & Huberman 1994). Besides, this anlysis can increse the understanding and explanation (Glaser & Strauss 1967; Glaser & Strauss 1970) about the issues studied (Denzin 1983). This is because, when have many different situation in the same time the research will get clearly picture and in-depth view about the studied will be done. The researcher will predict the probability of the event or finding will happen or not.

## **Discussions and Findings**

In the convergent interview, the probe questions were developed, so that an assessment could be made of the framework of the success factors in getting business financing for SMEs. The study tended to confirm the conceptual framework developed. Tables 3 constitute all the questions and also answers gathered from the convergent interview.

Source: adapted from Amy Azhar (2001)

FIG 2: STEPS IN CONDUCTING CONVERGENT INTERVIEW

The first question asked of each interviewee (Question 1) was a broad and general question developed to establish rapport, as shown in table 3. The question probes the respondent to tell the interviewer the story of their experiences in banking sector and also their experience in SMEs industry. This question was asked to know about the interviewee experience in banking and SMEs sector, how long they involved in credit. Respond from the respondent shown that most of the respondents are involved in credit since their first start working in banking sector. So, most of the credit officer started their job in credit area since they enter in banking sector which shown that they have a lot of experience in credit. From the seven respondents only two (row 1 in table 3) did not tell about their experience in banking sector because of the time is limited and maybe they think that is not too important for them to answer it.

Questions 2 were asked “how your bank defined SMEs industry?” This question was built to know whether exist the differences between the commercial bank at Malaysia in define the SMEs sector. The definition of SMEs is not consistent across the process of interview with the bank. But for the purposed of this study, we have not attempted to apply a rigid criterion to define SMEs.

TABLE 3: DATA FROM INTERVIEW

Soalan	Bank 1	Bank 2	Bank 3	Bank 4	Bank 5	Bank 6	Bank 7
1. Can you tell about your experience in banking and also in SMEs sector?	-start in loan at MIDF in 2001 -2004 enter RHB also in loan	**	-1993 start in credit at Kuan Yik Bank -2001 resign, enter EON bank Group also in commercial credit until now.	**	-5 yrs experience in SME bank and just 3 yrs transfer to Kedah branch	-14 yrs	- 10 yrs in credit
2. How your bank defined the SME industry?	-Employee <150	-networth or shareholders' fund <10m	Small - Employee< 50 - sales turnover < 10m Medium - employee 51-150 -sales turnover 10-25m	-Employee < 250 -Sales turnover<25m	<b>Manufacturing</b> # medium -sales turnover >10m -employee 51-150 (full time) # small -sales turnover 0.25m - 10m -employee 5-50 (full time) # micro -sales turnover <0.25m employee < 5 (full time) <b>services</b> # medium -sales turnover 1m-5m -employee 20-50 (full time) # small -sales turnover 0.2m -1m -employee 5-19 (full time) # micro -sales turnover < .2m employee < 5 (full time)	<b>Manufacturing</b> -sales between 0.25m - 25m -employee <150 <b>agriculture/ construction/ services</b> -sales between 0.2m - 5m -employess <50	-paid-up capital <RM5 million.
3. Can you explain about the process of giving the financing to this sector?	-application form - once qualify required doc. - evaluation	**	-marketing -request basic document=audited acc (co sdn bhd), unaudited acc.3 yrs.(partnership), bank statement 6 mth, -discuss abt collateral	-application -request document -interview borrower	Depend on the customer whether 1) walk-in 2) by email 3)by letter or call 1st:interview to see whether the customer is qualify or not 2nd once qualify require to submit working paper or business plan	Classify the borrower -the business must operation at least 2 yrs. -required doc - interview and site visit	-marketing i) officer go to search the borrower ii) existing customer-enhance the facilities iii) walk-in customer -request basic doc
4. can you justify what is the factors looking by your bank in giving the credit to the SME business.	-management - capability dlm business. - industry -financial -product	-5C's-capital character capacity condition collateral - industry -produk -financial statement	- financial account (networth) - loan track record -conduct of current account - industry risk -integrity of borrower -scriss report	-financial statement 3 yrs - networth/capital -character -purpose -track record -guarantor /collateral -business plan	Look at 2 criteria 1) starting business - proposal -market - management -financial -knowledge of borrower 2) old business - past record - mgmt acc. - market -purpose of the loan - financial statement	-Already have business to look their financial -purpose of the loan -capacity to repay -character -condition -collateral -knowledge of borrower -business	- vaibility of business -management -conduct of current account -security/ collateral -track record -market -financial statement
5. From the all these factors, which factors is the success factors in getting the business financing for SME.	-operation dr segi management, produk, scriss -financial -market of business	-Character of borrower -produk -opportunity in market -industry -conduct of current account.	- financial account (networth) - loan track record -conduct of current account - industry of business	-financial statement 3 yrs - networth/capital -purpose -track record -business plan	- market involve -financial / past record - management	-character - capacity to repay -business plan -business ability cashflow	-management -track record -vaibility of business -market
6. what is actually the factors will make the loan application from SME will reject by your bank?	-industry -availability of business -management -produk	-ratio yg rendah dr industry -industry -business/product -poor financial statement	- poor conduct of current account -poor financial statement -request not justify -exposure=amt given against collateral	-poor track record -poor financial statement	Because of 5Cs - character - capital -condition -capacity -collateral	-financial -business itself -capacity to repay	-Capability of repayment -poor management

\* the question which asked arise from the previous interview

\*\* the question is not answered

Source: develop for this study

The synthesization of the answer given by the respondents, the researcher found that, most of bank classified the SMEs based on the employees and annual sales turnover (row 2 in table 3). The average number of employees used by these banks (respondent 1, 3, 4, and 5 in table 4.1) to consider as SMEs business is less than 50 employees for small business and less than 150 employees for medium enterprise, while, the average amount annual sales turnover is less than RM10 million for small business and less than RM25 million for medium enterprise. Thus, this definition is aligning with the SMEs definition used in Malaysia.

Respondent 2 (column 2 in table 3) didn't used an employees and annual sales turnover to define SMEs but used a network or shareholders fund. The average amount shareholders fund is less than RM10 million, no differences for small or medium enterprise. Thus, this definition closely suited with the SMEs definition used in Malaysia. Respondent 7 (column 8 in table 3) mentioned their bank used a paid-up capital in define the business is SMEs or not. The amount of paid-up capital for classify SMEs is less than RM5 million.

In question 3 the respondent was asked "how the process of giving the financing to the SMEs sector?" From this question, we can know how these banks process the SMEs loan application, what is the steps before getting the financing and what the customer must do to apply the business financing from these banks. From the seven respondents, only one didn't answer this question (row 2, column 3 in table 3). The answer from the six respondents is quite similar. That is all the banks used the same process in providing the financing to the customer. Thus, it will support the research issues.

The conclusion we can make with the answers given by the respondents that are normally have four steps in loan processing as shown in figure 3. The first step is to identify the borrower which mean the bank do a marketing to find potential borrower. Respondent 7 (row 3, column 8 in table 3) stated that the marketing is done whether the officer will go out to search a potential borrower or the bank enhances the facility of existing customers or walk-in customers. The answer by respondent 5 also supports this statement given by respondent 7. The second step after they classify the potential borrowers, the bankers will request basic document such as 3 years financial statement, bank statement and also for respondent 5 they will request a business plan. Then, the bankers will arrange an interview with the potential borrower to know better about the customer. The last step is making an evaluation with the information gathered from the borrowers as a process to identify whether that customer is eligible or not for financing.

FIG 3: STEPS IN LOAN PROCESSING FOR SMES FINANCING

The question 4 was asked to identify the factors are looking by banks in giving the financing to entrepreneur who involved in the SMEs sector. This question was built is to answer the main research problems of this research. Table 4 analyzed and identified which factors considered by banks in providing the business financing for SMEs.

TABLE 4: THE FACTORS CONSIDERED BY THE BANK FOR SMES BUSINESS FINANCING

Source: develop for this study

In summary, of the 19 factors listed based on literature used by the banks in providing the business financing for SMEs, only 15 factors were identified from the synthesization of the convergent interview as factors used by the banks in getting business financing for SMEs including 1 new factor. All these 15 factors are; financial statement, purpose, business ability, knowledge, capacity, character, economic condition, collateral, capital, competence management, market involved, industry risk, experience, strategic planning, and *conduct of current account*. In addition, 5 factors which are sources of repayment, third-party opinion, size of business, financial projection and market involved are not considered by the respondents as a factor used by the banks in providing the business financing for SMEs.

Then, question 5 asked “from these all factors which factors is considered as a success factor in getting business financing for SMEs?” This question was built to confirm the question no. 4.

The synthesization from the convergent interview with the seven respondents, we found only 7 apart of 15 factors considered by the bank as a success factors in getting the business financing for SMEs. These 7 factors then categorized as ‘core factors’. Beside that, the other 8 factors have been listed as ‘supplement factors’. Then all these factors also have been categorized as ‘financial factors’ and “non-financial factors”, as shown in figure 4.

Source: developed for this study

FIG 4: THE SUCCESS FACTORS FOR SMES BUSINESS FINANCING

Question 6 was asked is to know what are factors will cause the application from SMEs is rejecting by the bank. This question was asked is to identify the exactly reason why bankers rejected the financing application. The answer from this question also maybe can be used by the applicant as a guideline in future when they want to apply the business financing. Considered of answers given by all the seven respondents found that poor presentation in financial statement becomes one of the factors for the banks to reject the application of business financing. The respondent which mentioned it are respondent 2, 3, 4, and respondent 6. They mentioned, if the financial statement submitted by the applicant not present a good performance of the business will make a difficulty in evaluation process because and not achieve the target and the bankers also not confident with the capability of the business to repay back the financing. The other factor is *business* itself will effect the application of financing. Respondents 1, 2, and 6 agreed with this factor because when banks do an evaluation at the business to identify whether the businesses have an ability to generate income with the product and services provided by them. If banks not satisfied and they think the business cannot go on, they will reject the application.

Then, the other factor is a *capacity* to repay the loan. Three of respondents which are respondent 5, 6, and 7 agreed that the capacity of repayment is important in financing. So, in the evaluation process if the bankers not satisfied with the capacity of applicant to repay the loan, the application will reject by the banks. The *management* also one of the factor will cause the financing is rejected by the banks. These are agreed by the respondent 1 and respondent 7. If the banker found the poor management they will not provide the financing because the management team is important as a backbone in determine the success or failure of business.

Two of the respondents which are respondent 1 and 2 mentioned the other factor affect the rejecting of financing is *industry*. This happen because the banks is not finance all the business in industry. For example nowadays most of banks not already interested to finance the property development industry because this sector is high risk. So, if the banker found the applicant is involved in the risky industry, they will reject the application. The other two respondents which is respondent 3 and 5 mention the *collateral* becomes one of the factor the financing

maybe reject by the banks because sometimes bank will request the borrower to prepare a suitable security for financing, so if the borrower failed, they can't provide the financing.

From the convergent interview, one respondent considered the purpose, experience/track record, conduct of current account, character, capital and economic condition as a factors will affect the rejected of financing. Respondent 3 cited the *purpose* of the loan because sometimes the applicant states the purpose of loan is not justify with their business. That why the application is rejected. Respondent 4 was stated the *experience* of owner have a big impact in application of financing. Also respondent 3 stated that the poor conducted of *current account* will make the application is rejected by the bank because it show the applicant is don't know how to manage and use the facilities provide by the banks. Respondent 5 considered *character, capacity, and economic condition* becomes a factors can make a financing failed. That is because character wills influent the business, if the bank found the applicant character is not good they also don't want take a risk by giving the financing to that person. While, the capacity is bank will identify whether the borrower also put their money into the business or all comes from the bank.

In conclusion, based on the conversation during the convergent interview as discussed, 12 factors have been considered by the banks to reject the business financing application. All these 12 factors are; poor financial statement, inability of business, less confident in capacity to repay, poor management, high risk industry, lack of collateral, purpose is not justify, no experience, poor conduct of current account, bad character, lack of capital and bad economic condition. In addition, this research has also analyzed the findings from the convergent interview. From the analysis, we found the following matters:

- Only 15 factors considered as a success factors in getting the business financing for SMEs in Malaysia.
- 7 factors were identified under the core factors based on the number of respond by the respondents during the convergent interview.
- Also 8 factors were identified under the supplement factors based on the number of respond by the respondents during the convergent interview.

## Conclusion

To answer the research problem as stated which are “what are the success factors in getting the business financing for SMEs?”, two models have been designed. Model 1 is listing the 15 factors used by the banks in evaluating the providing of financing for SMEs in Malaysia, as shown in table 4. To provide in-depth findings from this research, model 2 has been designed to list the success factors for SMEs business financing that can be used by entrepreneur in getting the business financing, as shown in figure 4. This model listed the 15 success factors comprised of 3 factors as ‘financial factors’ and 12 factors as ‘non-financial factors’. Moreover, the factors were categorized into two categories: core and supplement factors. From the 15 factor listed, 7 factors were included in core factor and others 8 factors were included in supplement factor. This research finding could be used to other place that have the same settings as this research used, that is, may be could be applied to all developing might as well to developed countries.

# Financial Development and FDI in China: An Empirical Investigation with Granger Causality Tests

Jean-Claude Maswana, [maswana@econ.kyoto-u.ac.jp](mailto:maswana@econ.kyoto-u.ac.jp)  
Kyoto University, Japan

## Abstract

The Toda–Yamamoto version of the Granger non-causality methodology was employed to test the direction of causality between foreign direct investment (FDI) and financial development in China over the period 1980–2004. Our empirical findings seem to suggest that financial development proxies cause FDI. Specifically, both the savings rate and banking credit to the private sector have been found to Granger-cause FDI inflows, while the existence of bi-directional causality between the interest rate spread and FDI has been evidenced. These findings do not confirm the conventional view, which holds that the direction of causality runs from FDI to economic growth via financial development. Consequently, what is proposed is further marketization of interest rates and promotion of financial development in order to keep up the current pace of FDI and maintain economic growth and employment creation.

## Introduction

The consensus in the literature is that financial development promotes economic growth by increasing the level and efficiency of capital and investments (see Levine (2003) for a review). Economic growth is thus dependent on investment, and a significant fraction of all investment flows through financial institutions (Hellmann and Murdock, 1998). Naturally, the performance and effectiveness of financial institutions are important considerations for policy-makers concerned about economic growth. Promotion of the financial sector results either directly, from deliberate policies aimed at changing its course, or indirectly, via a broad institutional setting and externalities. One such externality is spread via foreign direct investment (FDI) flows. While the empirical literature has moved us from assumptions of a passive foreign capital mechanism to explicit linkages between FDI and growth, the role of capital inflows in general, and FDI in particular, on the financial development process has not been emphasized.

The endogenous-growth literature linking domestic financial development and economic growth postulates that the effects of FDI on economic growth depend on the level of development of the host country's financial intermediation (see Levine, 1997; Alfaro et al., 2004). For instance, Aghion et al. (2006) show that in relatively poor countries, catching up requires the involvement of a foreign investor who is familiar with the frontier technology, together with steps taken by a local bank to directly monitor local projects to which the technology must be adapted. In such a context, the extent of local savings is important for innovation, and therefore growth, because it allows the domestic bank to co-finance projects and thus to attract foreign investment.

Regardless of the various channels through which FDI can influence economic growth, FDI inflows should manifest in the form of a greater volume of financial transactions and be rewarded by a greater level of financial development. Increases in capital inflows and financial transactions suggest a positive effect on savings, while increases in FDI into the financial sector are thought to improve efficiency. Furthermore, foreign entry into developing economies reduces the monopolistic excesses of domestic banks, since, as a result of development priorities, the local banking system is often used as a tool for providing directed credit to politically favored constituents or favored but loss-generating sectors of the economy (Goldberg, 2004). Blomstrom (1991) argues that foreign investment could enhance the efficiency of the host country's financial sector, through adoption of more efficient methods or investment in human and/or physical capital. By facilitating the transfer of managerial and technological know-how, FDI is seen as adding to the depth and breadth of the domestic financial market (Bosworth et al., 1999).

Recently, many countries whose economies are in transition have adopted policies aimed at attracting FDI. For instance, three decades after opening itself up to trade and investment, China has become the top recipient of

FDI among developing countries. Between 1979 and 1999, total aggregate inflows of FDI to China amounted to about 10 per cent of world FDI flows, and about 30 per cent of FDI received by all developing countries combined (OECD, 2000). These FDI flows are thought to be one of the major determinants of economic growth in China (Lardy, 1995). Alongside its growing FDI, China has experienced a tremendous increase in its financial development, with financial deepening (M2/GDP) rocketing to 120%. Furthermore, China has long had a practice of imposing interest rates from above, so the ability of commercial banks to price their products tends to be weak; hence, any policy or external shock (such as FDI) that affects the cost of financial intermediation and the resulting level of profitability could ultimately impact the course of development in the financial sector.

One question that immediately arises is, To what extent has FDI been able to causally affect China's financial development? Another, perhaps more important, question is whether causality has occurred in the opposite direction. We have investigated whether there is a causal relationship between FDI inflows into China and its financial development proxies, namely, financial deepness, the savings rate, banking credit to the private sector, and the cost of intermediation. We used the Granger non-causality test procedure, developed by Toda and Yamamoto (1995), in a bi-variate vector auto-regression (VAR) model.

The approach reported here differs in a number of ways from methods used by other researchers who have analyzed issues of this type. First, most studies focus on FDI in the financial sector. However, the present study considers the overall FDI inflows, apart from any sectoral disaggregation. In addition, the impact of FDI on economic growth and development has been discussed extensively, but there has been relatively little in the way of direct discussion of a causal link between FDI and financial development, particularly in the context of China.

The interrelationships between FDI and financial development in China are of considerable interest for analytical reasons, as well as for understanding the implications for other countries whose economies are developing or in transition. In this paper, we lay out some facts about FDI and financial development in China. In our statistical analysis, we compute the integration order of the pertinent variables and we apply several procedures to test for causality.

## **Facts about FDI in China and the Chinese Financial Sector**

For three decades now, China has been involved in reforming its financial sector—and with remarkable adeptness, resulting in a 9% rate of economic growth on average during that period. Since 1978, when China first opened its doors to foreign trade and investment, China's liberalization policies have transformed the country from a centrally planned economy to a more market-oriented one. In recent years, the ratio of broad money to GDP has reached 190%, which is high by any standard (Roubin and Setser, 2005); in addition, China has achieved substantial financial depth (as measured by the ratio of domestic credit to GDP, which has been in the 160% range). China has one of the highest savings rates in the world, at over 40% of GDP. However, due to the underdeveloped nature of the capital markets in China, most of the savings resides in bank deposits, which account for about 70% of investors' financial assets. Only 10% is in the form of bonds and equities, and the remaining 20% is in cash (Kang et al., 2002). At the end of 2004, the level of bank lending stood at about 140% of GDP, and the bank deposit base was 185% of GDP. Bond market capitalization was about 20% of GDP, and equity market capitalization amounted to about \$150 billion, less than 10% of GDP (Hericourt and Poncet, 2007).

Government interference has created distortions that have forced private Chinese firms to look for foreign investors in order to bypass both the financial and legal obstacles that they face at home (Huang, 2003). Between 1979 and 1997, for example, more than 50% of FDI in China was invested in equity joint ventures (Bai et al., 2004). Moreover, because the capital market in China is still in its infancy, Chinese enterprises rely heavily on bank loans, leading to a relatively high financial leverage and a concentration of loan risks in the banking sector.

The banking system in China consists of a number of institutions, most of which are owned by governmental entities at various levels of government. The Big Four state-owned commercial banks (SOBs) dominate the system, accounting for 55% of bank assets. They include the Bank of China (BOC), the China Construction Bank (CCB), the Industrial and Commercial Bank of China (ICBC) and the Agricultural Bank of China (ABC). Their missions differ according to the sectors of the economy (agriculture, versus the major industrial

and infrastructure sectors) to which they extend loans. With the exception of the ABC, close linkages developed between the SOBs and the State Owned Enterprises (SOEs).

China's banking system, though dominant, is generally regarded as weak in terms of solvency, since the levels of non-performing loans are still reported to be high. Under central planning, direct investment from the national treasury has played an important role, but this role has been diminishing (Bai, 2006). It follows that, in general, the SOEs benefit the most from investment made by the SOBs. As the fiscal deficit grew, however, the central government have been forcing the SOEs to meet their financial requirements with bank loans (Dobson, 2006), and since 1995 the government has increasingly introduced institutional and regulatory reforms to impose both efficiency in financial intermediation and a reduction in bad loans.

As part of its gradual transition process from a centrally planned economy to a market economy, China's state-owned enterprises and banks are being restructured, financial markets are being developed, and capital accounts are being further liberalized to allow capital inflows from a wider range of sources. As a result, an increasing number of regions have been opened to FDI. Capital that arises from certain categories of investment is intermediated through the financial system, including portfolio investment via the capital market and deposits and loans made by domestic as well as foreign banks.

Although the most important source of capital flows, namely FDI, is not intermediated through the financial system, that source of investment has not been immune from the effects of interest rate policies and reforms. The Chinese government caps the rates that banks can offer depositors and sets a minimum interest rate on bank loans, guaranteeing the banks a substantial spread so long as their loans perform (Brad, 2006). The Chinese government has been reluctant to raise the basic lending rate, in part because that would jeopardize the health of certain state enterprises. The available evidence suggests that most firms continue to borrow at a rate close to the reference rate (Setser, 2006). In their attempts to maintain overall macroeconomic stability via a policy of controlled interest rates, the Chinese authorities have prevented banks from pricing their offerings on the basis of risk, thereby implicitly forcing them to continue funding the state-owned enterprises.

Moreover, to safeguard banks' profitability, the Chinese authority has imposed caps on various deposit rates and floors on different lending rates, guaranteeing a large interest rate spread. The cap on the benchmark one-year deposit rate in 2006, for instance, was 2.52%, while the floor for the one-year lending rate was slightly over 6%, allowing banks and those institutions that loan money a 3.5% interest spread (Forbes, 2006). The wide interest rate spread gave commercial banks greater incentive to lend. However, since 2004, interest rates on loans (excluding those for household mortgages) have been determined by borrowers and lenders through negotiation. Therefore, the deposit rate ceiling policy also causes funds to be steered into the capital market, which promotes capital market development (PBOC, 2005).

There is a widespread view that China has benefited substantially from FDI inflows, and that FDI accounts largely for its economic growth (Lardy, 1995). As previously noted, China's higher savings rate suggests that the country does not need FDI to finance its domestic capital accumulation. However, FDI inflows are needed because of their contribution in terms of technology, management skills transfer, and spillover effects in all industrial sectors, including the financial sector. Leigh and Podpiera (2006) argue that while institutional inefficiencies account in part for FDI, active policies of the Chinese government designed to yield "know-how transfer" from foreign companies might also be responsible.

Entry of foreign banks into the domestic market can be expected to gradually drive down the cost structure in the domestic banking sector as state-of-the-art technology and best practices are introduced. However, Leigh and Podpiera (2006) argue that, in most other countries, foreign bank entry has taken the form of direct takeover or majority shareholding, whereas foreign investments in China's banks have been minority shareholdings with very limited management involvement. China has managed to accommodate several aspects of a market-based system while still retaining its communist underpinnings.

During the 1980s, FDI inflows grew steadily but remained relatively low, and were largely confined to joint ventures with Chinese SOEs. FDI inflows peaked at over US\$45 billion a year in 1997–98. A further surge in FDI preceded and accompanied China's accession to the World Trade Organization (WTO) in December 2001, promoting China to the highest position as an FDI destination since 2003 (Leigh and Podpiera, 2006). Upon joining the World Trade Organization in 2001, China pledged to give foreign banks full access by December 2006. Foreign

banks in China have started accepting deposits in yuan from individuals for the first time in April 2007, a milestone that marks a significant opening of the country's financial system which was formally introduced in December 2006.

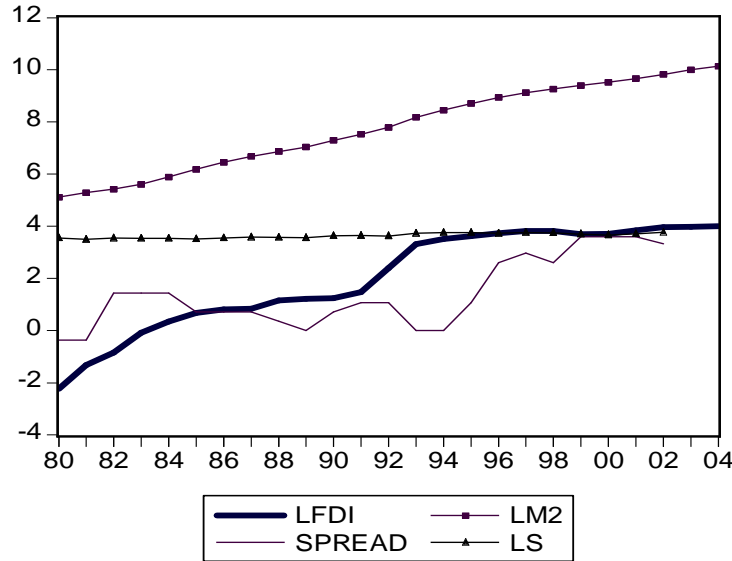

FIG. 1: LOGARITHMIC PLOTS OF FDI, BROAD MONEY SUPPLY, SAVINGS, AND INTEREST SPREAD

Logarithmic plots of FDI, broad money supply, savings, and interest spread for the period 1980–2004 are presented in Figure 4. As indicated by those plots, there has been an upward trend in M2 although the Chinese monetary authorities have been successful in slowing the money supply, without pushing up interest rates, by raising reserve requirements and by partially offsetting the growth of the domestic money supply generated by capital inflows. Also, the upward trend in interest spread suggests increasing intermediation cost or benefits opportunities for banks. Furthermore, broad money and interest spread show an upward trend during the period covered by this study—a trend that matches the strong growth of FDI during that period rather well. Therefore, the relationships between FDI and financial development proxies can plausibly be postulated.

## Model, Methodological Considerations, and Data

### Standard Empirical Framework

Drawing from Pagano (1993), the relationship between capital flows and growth can be examined using a simple endogenous-growth  $AK$  model. The potential effects of changes in financial variables (i.e., financial development and capital flows) on steady-state growth can be deduced from their influence on capital accumulation. In a closed economy, output can be expressed as a linear function of the aggregate capital stock:

$$G_t = AK_t \quad (1)$$

This type of production function can be viewed as a reduced form for either a framework in which the economy is competitive with external economies, as in Romer (1989), or one in which  $K_t$  is assumed to be a composite of physical and human capital, as in Lucas (1988), where the two types of capital are reproducible with identical technologies. In this model, there is no population growth, and the economy produces only one good, which can be consumed or invested. By assuming that the capital stock depreciates  $(1 - \delta)$ , gross investment is

$$I_t = K_{t+1} - (1 - \delta)K_t \quad (2)$$

Financial intermediation consists of transforming savings into investment. The transaction cost involved,  $\phi$ , can be seen as the spread between lending and borrowing rates charged by banks. Following Alfaro (2006), the spread between the lending and borrowing rates is used here as one of the measures of financial development, as it captures the cost of intermediation fairly well. The interest spread includes the costs of ex ante information gathering about investment projects and the ex post information costs of policing investments that arise in a context of imperfect information (Greenwood et al., 2007), as is the case in China. Furthermore, if the gap between the internal rate of return earned by firms and the rate of return received by savers narrows as a result of improvements in the effectiveness of intermediation, then the capital stock in the economy should rise. Since capital market equilibrium requires that net savings (gross savings minus transaction costs) be equal to gross investment, equilibrium in the capital market ensures that

$$\phi S_t = I_t \quad (3)$$

Combining equations (1) through (3) and dropping the time index  $t$ , the rate of growth of output,  $g$ , can be written as follows:

$$g = A \left( \frac{I}{G} \right) - \delta = A \phi s - \delta, \quad (4)$$

where  $A$  is the productivity of capital and  $s$  is the gross savings rate. Equation (4) thus represents the steady-state growth rate of the model with financial intermediation and reveals two main channels through which financial development can affect economic growth. The first channel involves role of the financial sector to influence the fraction of savings that is channeled into investment projects and by this fuelling capital accumulation and economic growth.

The second of channel consists of the efficiency with which savings are allocated to investment. Financial development is assumed to occur as a result of increased financial intermediation, though it could also be influenced by other factors—such as financial innovation or government policies. As banks engage in increased intermediation, they are likely to become more efficient at what they do, and thus the spread between their lending and borrowing rates narrows. In this model, an improvement in the allocation of capital translates into higher growth, because it increases the overall productivity of capital.

As in Bailliu (2000), this framework can be extended to incorporate FDI flows. For simplicity, it is assumed that no distinction is made between Greenfield FDI and M&A<sup>1</sup>. If there is a net inflow of capital, then a larger pool of savings will be available for investment than would be the case in the absence of capital flows. Thus, in the presence of FDI inflows, the financial market equilibrium equation becomes

$$\phi^* (S_t + F_t) = I_t^*, \quad (3')$$

where  $F$  represents FDI inflows. In that scenario, the steady-state growth rate is given by

$$g^* = A^* \left( \frac{I^*}{G} \right) - \delta = A^* \phi^* \frac{(S + F)}{Y} - \delta = A^* \phi^* s^* - \delta \quad (4')$$

The steady-state growth rate of the model with financial intermediation and international capital flows depicted in equation (4') highlights the various channels through which capital flows can influence economic growth via financial intermediation. First, an increase in FDI yields an increase in  $\phi$  via  $A^*$ . Furthermore, FDI can have an impact on financial development via the production process if domestic investment is a function of FDI. FDI inflows can promote FD if they lead to an improvement in both the savings rate and transaction costs. For the savings rate to increase in the presence of FDI, it must not crowd out domestically pooled savings. Domestic banks have a cost advantage over foreign investors in evaluating domestic projects, which implies that the success of FDI-funded projects requires reliance on domestic banks because of their informational advantage.

As in Alfaro et al. (2004), if the success of FDI in China depends on the involvement of local banks, it can be assumed that the flow of FDI-induced resources into the financial system renders the domestic banks more

efficient at converting savings into investment (i.e., if the spread falls) and/or better able to allocate savings to the most productive investment projects. Thus, to the extent that FDI-induced financial flows are intermediated by domestic financial institutions, they can have a positive effect on growth, by causing the banking sector in the local economy to become more efficient (i.e.,  $\phi^* > \phi$ ) and/or better at selecting productive investment projects (i.e.,  $A^* > A$ ). Therefore equation (4') suggests that FDI could lead to increases in investment and savings and an improvement in the interest spread. In sum, FDI can foster financial development if it leads to investments that are associated with positive spillovers into the financial system. Improvements in the efficiency of financial intermediation that are due to improvements in dissemination of information are likely to reduce the spread between the internal rate of return on investment in firms and the rate of return on savings received by depositors.

In the above model, it is assumed that capital inflows are exogenously determined. With this assumption in mind, equation (4') can be used to study how the savings rate, financial deepness, the interest rate spread, and banking credit to the private sector adjust to changes in FDI inflows. From a theoretical point of view, the relationship between FDI and financial development in terms of causality could go in either direction (or both). In such circumstances, a vector auto-regression (VAR) model is more reliable for testing causality hypotheses than a single-equation model. VAR models treat all variables as potentially endogenous, thereby avoiding infection of the model with false assumptions or restrictions [Sims, 1980]. In this study, we estimated the parameters in equation (4') by regressing the logarithms of the financial development proxies with respect to FDI. In particular, we used the following bi-variate vector auto-regression model:

$$Y_t = \alpha + \beta X_t + \mu_t, \quad (5)$$

where  $Y_t$  is a set of measures of financial sector development at time  $t$ ,  $X_t$  denotes FDI inflows, and  $\mu_t$  is the error term. This entailed a three-step process: analysis of the order of integration of the variables, a test for the order of integration of the time series, and implementation of the Toda–Yamamoto version (1995) of the Granger non-causality method (Granger, 1969) to estimate causality.

#### Unit Root and Co-integration Testing Procedure

A non-stationary time series  $Y_t$  is said to be integrated of order  $d$  (and denoted by  $Y_t \sim I(d)$ ) if it achieves stationarity after being differenced  $d$  times (Granger, 1986; Engle & Granger, 1987). To determine the order of integration, the most common unit root test is the augmented Dickey–Fuller (ADF) test (Dickey and Fuller, 1979, 1981), which estimates the following equation:

$$\Delta y_t = c_1 + \varpi y_{t-1} + c_2 t + \sum_{i=1}^p d_i \Delta y_{t-i} + v_t, \quad (6)$$

where  $y_t$  is the relevant time series,  $\Delta$  is a first-difference operator, the linear term  $C_{2t}$  allows for a linear time trend,  $p$  is the lag length, and  $v_t$  is the error term. The above equation can also be estimated without including the linear term. The null hypothesis for the existence of a unit root is  $H_0: \varpi = 0$ .

The tests are based on the null hypothesis  $H_0$ . If the calculated ADF statistics are less than the critical values given in Fuller's table, then the null hypothesis ( $H_0$ ) is accepted and the series is either non-stationary or not integrated of order zero.

#### Causality Test Procedure

According to Granger (1969), if the inclusion of past (lagged) values of  $X$  significantly contributes to the explanation of  $Y$  in a regression of  $Y$  with respect to its own past values and all other relevant information, then  $X$  is said to Granger-cause  $Y$ . To examine the nature of causality between  $X$  and  $Y$ , an appropriate Granger causality test requires determination of an equal lag length VAR involving  $X$  and  $Y$ . The importance of the determination of the lag length is demonstrated by Braun and Mittnik (1993), who show that estimates of a VAR whose lag length differs from the true lag length are inconsistent. Lutkepohl (1993) also demonstrates that overfitting (selecting a lag length which is of higher order than the true lag length) causes an increase in the VAR mean-square forecast errors, whereas underfitting the lag length often generates auto-correlated errors. To avoid over- or underfitting the lag length, Toda and Yamamoto (1995) provide an alternative approach to test for non-causality, one which is based on the test equations of Granger but augmented with extra lags, where the number of extra lags depends on the potential

order of integration of the series of interest. If the series are assumed to be integrated of order one, then one extra lag is added to each variable in the test equation.

The Toda–Yamamoto (1995) approach involves using levels of the variables as in (7) and (8) and estimating the following bi-variate VAR system through the seemingly unrelated regression (SUR) model:

$$X_t = \alpha + \sum_{i=1}^{p+d} \beta_i X_{t-i} + \sum_{j=1}^{p+d} \gamma_j Y_{t-j} + v_t \quad (7) \quad Y_t = a + \sum_{i=1}^{p+d} b_i Y_{t-i} + \sum_{j=1}^{p+d} c_j X_{t-j} + u_t, \quad (8)$$

where  $\alpha$  and  $a$  are constant terms,  $\beta$  and  $\gamma$  are coefficients of exogenous variables,  $k$  is the optimal lag length in the original VAR<sup>2</sup> system,  $d$  is the maximal order of integration of the variables in the VAR system, and  $u_t$  and  $v_t$  are white-noise error terms.

The testing procedure consists of estimation of an augmented VAR( $k + dmax$ ) model, in which the initial lag lengths,  $k$ , are augmented with an extra lag, which depends on the likely order of integration of the series  $X_t$  and  $Y_t$ . If  $X_t$  and  $Y_t$  are both integrated of, say, order 1, then one extra lag is added to each of the original VAR models. Rambaldi and Doran (1996) have proved that this method can be computed by using an SUR form.

The modified Wald (MWald) test for zero restrictions is then used to test the direction of causality. In (7), for example, the lags for  $Y_t$  (excluding the extra lag which is added to capture the maximum order of integration) are tested for their joint significance (i.e., the  $\gamma_j$ 's in (7)—are hypothesized to be equal to zero). If the null hypothesis (that the lags are jointly equal to zero) is accepted, then  $Y_t$  does not Granger cause  $X_t$  in (7). Similarly, the null hypothesis that the joint significance of  $c_i$ 's in (8) equal to zero provides an indication for the reverse causality.

Monte Carlo experiments carried out by Zapata and Rambaldi (1997) provide evidence that the performance of the MWald test is comparable in size and power to the likelihood and Wald tests. The advantage of this procedure is that it does not require precise knowledge of the integration properties of the variables. In addition, a standard vector auto-regression in the levels of the variables (rather than first differences, as is the case with the Granger (1969) and Sims (1972) causality tests) can be accommodated by the model. Such a method can be applied even when there is no integration, and/or when stability and rank conditions are not satisfied, "so long as the order of integration of the process does not exceed the true lag length of the model" (Toda and Yamamoto, 1995).

Before moving into estimation results, however, a word on the sources of the data is in order. The degree of financial development can be measured in terms of different components, namely the size, the structure and the efficiency of the financial sector. In this study, the size of the financial sector is proxied by savings rate and financial depth, M2/GDP. The structure of the financial sector is represented by bank loans granted to private sector. Efficiency of the financial sector is proxied by interest rate spread. The sample period runs from 1980 to 2004, and data were available for every year during that period. The data on savings, broad money (M2), interest rates, and banking credit to the private sector are from *Global Development Finance* (World Bank, 2006) and *World Development Indicators* (World Bank, 2006), while data on FDI are from *International Financial Statistics* (International Monetary Fund, 2006).

## Estimation Results

### Results of Stationary and Co-integration Tests

We performed tests that included just an intercept as well as tests that included a linear time trend. The augmented Dickey-Fuller test (Dickey and Fuller, 1979, 1981) was applied to the variables  $S$  (log of the savings rate),  $M2$  (log of the ratio M2/GDP),  $CP$  (log of the real banking sector's credit to the private sector),  $F$  (log of the ratio FDI/GDP), and  $Spr$  (log of the interest rate spread). The ADF regression and null hypothesis of a single unit root cannot be rejected at the 10 percent level for any of the five variables, and each of the five series was found to be integrated of order 0 after first differencing at the 5% level (10% for  $S$ ). The maximal integration orders ( $d_{max}$ ) of the variables are

given in Table 1, where it can be seen that all the variables were found to be integrated of order 0 after first differencing.

TABLE 1: UNIT ROOT TEST RESULTS

	Without linear time trend		With linear time trend	
	Level	1 <sup>st</sup> Difference	Level	1 <sup>st</sup> Difference
<i>FDI</i>	-2.06	-4.15**	-1.60	-4.14*
<i>S</i>	-0.75	-3.81*	-3.35	-3.61**
<i>M2</i>	-2.66	-3.87*	-2.31	-3.67*
<i>Spr</i>	-1.16	-3.84*	-1.79	-4.14*
<i>CP</i>	-0.46	-4.43*	-2.54	-4.30*

Note: \* and \*\* indicate significance at the 5% and 10% levels, respectively.

Having determined that  $d_{\max} = 1$  for all series, we then proceeded to estimate the lag structure of a VAR system in levels. Our results, which are given in Table 2, indicate that the optimal lag length based on Akaike's FPE criteria is  $k = 3$  for model 1 (the equation for *M2* vs. *FDI*) and  $k = 2$  for the other three models.

#### VAR Lag Order Selection Criteria

In order to confirm the presence of a long-term causal relationship as predicted by economic theory and to check that the algebraic signs were as expected, we also performed co-integration tests.

TABLE 2: OPTIMAL LAG SELECTION

Model	Variable	Optimal lag ( $k$ )	$d_{\max} + k$
1	M2 ratio and FDI	3	4
2	Savings ratio and FDI	2	3
3	Credit ratio and FDI	2	3
4	Interest rate spread and FDI	2	3

We then estimated a system of VAR in levels, with a total of  $d_{\max} + k = 4$  lags for model 1 and  $d_{\max} + k = 3$  lags for models 2–4. The results of the MWald test statistics as well as its  $p$ -values are presented in Table 3.

#### Toda–Yamamoto Causality Tests

The analysis postulated that China's financial development is a function of its FDI inflows. We tested four financial development proxies against FDI. The results, which are given in Table 4, indicate that the  $p$ -values of the tests for four of the models listed there (models 2a, 3a, 4a, and 4b) are very small, which calls for a rejection of the joint null hypothesis at standard significance levels. Specifically, the results point to uni-directional causality, running from savings and banking credit to FDI, while supporting bi-directional causality between FDI and the interest spread.

We ran a series of diagnostic tests to ensure that our underlying assumptions held. Based on the long lag structure, we also conducted the Breusch–Pagan Lagrange Multiplier (LM) test to verify the suitability of the SUR

estimation versus the standard VAR estimation. The results of the LM test—which verify the null hypothesis of a non-diagonal error covariance matrix—lend support to our use of the SUR estimation (see Table 3). As shown in Table 3, the null hypotheses are rejected in models 2a, 3a, 4a and 4b.

TABLE 3: TODA–YAMAMOTO’S VERSION OF GRANGER CAUSALITY RESULTS

<b>Model</b>	<b>Null Hypothesis</b>	<b>MWald Statistics</b>	<b>LM</b>
<b>1a</b>	M2 does not Granger-cause FDI	1.256 (0.125)	1.991 (0.186)
<b>1b</b>	FDI does not Granger-cause M2	4.754 (0.191)	0.291 (0.749)
<b>2a</b>	Savings does not Granger-cause FDI	15.77 (0.000)	0.252 (0.781)
<b>2b</b>	FDI does not Granger-cause savings	4.371 (0.112)	0.005 (0.994)
<b>3a</b>	Credit does not Granger-cause FDI	13.46 (0.001)	0.919 (0.423)
<b>3b</b>	FDI does not Granger-cause Credit	3.367 (0.185)	0.603 (0.561)
<b>4a</b>	Spread does not Granger-cause FDI	10.16 (0.004)	2.913 (0.096)
<b>4b</b>	FDI does not Granger-cause Spread	6.979 (0.048)	0.486 (0.626)

Note: The figures in parentheses are the  $p$ -values.

It should be noted that, given the small sample size employed in this paper, the Toda–Yamamoto test may suffer from size distortion and low power (Mavrotas and Kelly, 2001). In view of this, we checked the robustness of the causality test results by recalculating the  $p$ -values obtained in the initial MWald test, by using a bootstrap test with 1000 replications. The idea behind a bootstrap test is to use the estimation residuals to artificially generate additional observations that have the same distribution as the original ones; this is done via a Monte Carlo type process. Using the additional observations, a more robust estimation can be used undertaken (Greene, 1997). The results are given in Table 4. Given the nature of the test, both the MWald test statistics and the  $p$ -values should be different from those obtained and reported in Table 3. The  $p$ -values in Table 4 show the probability that the value of the independent variable in the regression is equal to zero. The bootstrap results confirm the robustness of the tests and thus the findings reported in Table 3.

TABLE 4: BOOTSTRAP TEST RESULTS

Model	Null Hypothesis	MWald Statistics
<b>1a</b>	M2 does not Granger-cause FDI	0.338 (0.188)
<b>1b</b>	FDI does not Granger-cause M2	0.421(0.191)
<b>2a</b>	Savings does not Granger-cause FDI	0.771 (0.013)
<b>2b</b>	FDI does not Granger-cause savings	0.086 (0.112)
<b>3a</b>	Credit does not Granger-cause FDI	1.334 (0.038)
<b>3b</b>	FDI does not Granger-cause Credit	0.647 (0.185)
<b>4a</b>	Spread does not Granger-cause FDI	0.992 (0.018)
<b>4b</b>	FDI does not Granger-cause Spread	1.357 (0.055)

Note: The figures in parentheses are the  $p$ -values.

All in all, our results suggest that FDI flows have been pulled by credit and savings rather than the other way around. This indicates that FDI inflows are not antecedents of savings and credit, but rather emerging outcomes of interactions among constituent systems that underlie economic growth. This conclusion also corroborates the postulate by Alfaro et al. (1996) that domestic credit acts as a supplement to FDI insofar as the availability of financing influences the course of FDI, since many investors face financial constraints, which can be relaxed only by grants of credit by banks and other financial institutions (credit expansion).

How do we interpret the finding that there is causality running from banking credit to FDI? One possible explanation is that the relationship reflects and is driven by domestic savings, which are either determined by deeper forces or generated through growth itself. After all, if foreign inflows responded largely to investment opportunities that stem from sustained growth and ultimately depend on the local savings rate, there should be an unambiguous causality directed from the savings rate to FDI. Furthermore, this finding is in line with the neo-classical tenet that savings causes investment and not the reverse.

One of the most striking results is the absence of any causality between FDI inflows and the M2 ratio, which makes it reasonable to conclude that sterilization measures have been effective in China insofar as authorities have been successful in their attempts to counteract the effects of capital inflows in general.

Another result worth noting is the bi-directional causality between the cost of intermediation (the interest rate spread) and FDI. Since most of the interest rates during the period covered by this study were set by the government, that finding could suggest that the monetary authorities might have been effective in trying to influence the direction of capital inflows. Despite the huge savings rate and international reserves, the Chinese authorities obviously needed FDI because of its technological and managerial components. Through circular causality, the causal processes become mutually entrained in a coherent and stable system that is conducive to economic growth. This is not surprising, since the Chinese central bank has flexibly adjusted the benchmark interest rates on loans and

deposits which it imposes on financial institutions and has coordinated its interest rate policies with the balance of payments in order to meet its macroeconomic development goals.

Bi-directional causality between FDI and the cost of intermediation reflects the contemporary institutional realities of China, at least to first approximation. Since interest rates were set by the government during much of the period covered by this study, the interest spread co-influenced FDI inflows at the expense of loan risk evaluation by banks. By preventing banks from pricing their offerings on the basis of risk, banks were ultimately forced to continue lending mainly to the SOEs (because of the quasi-fiscal guarantee of the loans they extended to them). As long as that was the case, the private sector had no better alternative than foreign financing, particularly through the joint-venture form of FDI. Still, our bi-directional causality between FDI and interest spread comes as a confirmation that the direct control on loan and deposit rates has been used by the Chinese authorities as a means for maintaining the interest of commercial banks and the necessity of the financial system stability (Dai, 2002).

Our findings do not confirm the conventional view that the direction of causality runs from FDI to economic growth via financial development. Consequently, this casts some doubt on the validity of policies which emphasize the importance of FDI for financial development on the assumption that FDI brings about both economic growth and financial development through capital accumulation. Moreover, evidence of co-movement between the cost of intermediation and FDI lends some support to the efficiency channel of transmission.

The policy implication is that the sustainability of FDI, which is critical in maintaining high rates of employment and economic growth, depends on an effective financial system and further interest-rate liberalization. Evidence that the interest spread affects FDI and conversely (either directly—by affecting savings and the availability of investment resources, and/or the efficiency of intermediation—or indirectly, through higher productivity), indicates the evolving nature of China's process of transition in which the marketization of the cost of intermediation deserves particular attention. The cost of intermediation is a key factor in China's FDI inflows, since the major types of business conducted by the commercial banks—deposits and loans—are still the main channels for the accumulation and supply of a social fund in China.

## Conclusion

The present paper has employed the Toda–Yamamoto version of the Granger non-causality methodology to test potential causal effects on the course of China's financial development over the period 1980–2004 as a result of the country's huge FDI inflows. Our empirical findings seem to suggest that it is financial development proxies that cause FDI. Specifically, both the savings rate and banking credit to the private sector have been found to Granger-cause FDI inflows, while the existence of bi-directional causality between the cost of intermediation and FDI has been evidenced.

In view of our findings, the conventional view, which holds that the direction of causality runs from FDI to economic growth via financial development, is not confirmed. Consequently, this casts some doubt on the validity of policy guidelines which emphasize the importance of FDI for financial development on the assumption that FDI causes both economic growth and financial development through capital accumulation. Moreover, evidence of co-movement between the cost of intermediation and FDI lends some support to the idea that monetary authorities have been protecting commercial by artificially creating lending opportunities for them. Therefore, interest rate marketization needs to be carried out gradually by ensuring a reasonable interest rate spread of commercial banks while avoiding any disruption in FDI inflows. The key issue here is whether increasing entries of foreign banks will be able to bring the alleged efficiency improvement while keeping the volume of FDIs at desired levels.

From those findings, it follows that the introduction of market-based deposit and lending rates holds the key to the success of interest rate reform. Specifically, the impact of FDI on financial development has been in harmony with the cost of intermediation. If monetary policy allows for maintenance of a coherent cost of intermediation (interest spread) with respect to FDI, and if certain borrowers are dependent on banks, so that any change in the cost of intermediation alters the banks' willingness to lend to the private sector, then there will likely be remarkable changes in FDI inflows. Thus it is obvious that the interest rate and financial reforms introduced since

2004 are likely to condition the future course of FDI into China, which will in turn further contribute to the country's financial development.

The findings also suggest that the still higher non-performing loans in the banking sector suggest that FDI still remains a positive contributor factor in further developing the financial sector insofar as FDI inflows provide financial authorities with large maneuver margin in redirecting bank loans to priority projects through higher interest spread. Therefore, the Chinese policy-makers should promote more rapid financial development in order to keep up the current pace of FDI and maintain economic growth and employment creation. Evidence that the interest spread affects FDI and conversely points to the importance of developing a more effective financial system by pursuing the ongoing financial and monetary reforms without jeopardizing the pace of economic growth.

## End Notes

Merger and Acquisition (M&A) commonly refers to the acquisition of existing assets, while the other component of FDI—Greenfield—primarily relates to the acquisition of new assets. Greenfield FDI involves mainly (though not exclusively) new capital assets, while M&A is just a transfer of existing ones; therefore, Greenfield FDI would seem

more likely to affect growth—if at all—via increased physical investment, while M&A FDI would be more likely to do so via enhanced productivity growth.

# FDI Law and Policy in Indonesia: Replacing the ‘Contract of Work’ System

Balbir Bhasin, [bhasinb@sacredheart.edu](mailto:bhasinb@sacredheart.edu)

## Abstract

Indonesia created a novel system to administer Foreign Direct Investment (FDI) in mining. This Contract of Work (CoW) system served the country well from 1967 up to 1997 when the national political (democracy revolution) and economic (Asian Currency) crisis, coupled with the Busang fiasco (where large scale fraud in gold discovery claims caused billions in losses) led to total collapse and cessation of FDI in the country’s extraction industry. Since the stabilization of the political and economic framework in Indonesia after free elections in 1999, the government has attempted to create a new law to replace the CoW system which has yet to be passed. This paper evaluates the new proposals and compares them to the previously successful system and suggests concerns and reforms that need be addressed. Specific focus is placed on issues of security of tenure, taxation and royalties, local government involvement, and environmental damage.

## Introduction and Background

Indonesia has some of the world’s largest reserves of gold and other minerals and commodity prices have soared in recent years. The price of gold has continuously risen from US\$384.40 in 1996 to US\$444.74 in 2005. Indonesia’s resource potential is ranked above Zimbabwe, South Africa, Bolivia, Mongolia, Western Australia, Chile, Nevada, Russian and Congo (Fig. 1). Yet the Wall Street Journal in February this year reported that mining companies “haven’t broken ground on a single mine here since Asia’s 1997-98 financial crisis” (Wright and Barta, 2007).

FIG. 1: INDONESIA’S MINERAL POTENTIAL

Source: Wall Street Journal, February 7, 2007

Mining has been one of Indonesia’s top industries for foreign investment. It contributed 50,197 billion Rupiahs or around US\$5.5 billion to the economy in 2005, which accounts for 2% of the GDP. Total government revenues from taxes and royalties increased 62% to US\$2.7 billion, a record for the last 10 years. (mineIndonesia,

2006) Yet, the same survey by PricewaterhouseCoopers notes that the country continues to lag behind global trend of new investments. Canada's Metals Economic Group (MEG) budgeted worldwide exploration in 2005 at US\$5.1 billion. Current exploration spent in Indonesia is only 2% of the global total (Fig. 2). This is noteworthy in that expenditure on greenfields explorations is critically low in Indonesia, and dropped from an average of US\$40 million (1995-1997) to US\$7 million (2001-2005).

FIG. 2: INDONESIA'S EXPLORATION SPENDING  
Source: mineIndonesia 2006, PricewaterhouseCoopers

The Fraser Institute in its 2004/2005 survey of mining companies ranked Indonesia very low for its investment conditions, scoring 22 out of 100 on the Policy Potential Index, and ranked it sixth last, marginally ahead of Zimbabwe, Papua New Guinea, the Democratic Republic of Congo, Venezuela, and the Philippines (McMahon, 2006). The main concern of foreign investors remains the lack of a clear legal framework. Among the factors that were deterring investment in Indonesia, a very large percentage of respondents (53%) cited the uncertainty in regulations (Table 1).

TABLE 1: FACTORS DETERRING INVESTMENT IN INDONESIA

Factor	% of respondents who consider factor to be a strong deterrent to investment in Indonesia	Comments
Uncertainty concerning the administration, interpretation and enforcement of existing regulations	53%	10 <sup>th</sup> lowest rank
Infrastructure	34%	8 <sup>th</sup> lowest rank

Source: Fraser Institute\*

Source: mineIndonesia 2006, PricewaterhouseCoopers

Indonesia has had in place a very novel and unique law for inviting foreign investment in mining. Yet, the PricewaterhouseCoopers survey of 2005 reports that the new draft mining law, now before parliament "indicates that the CoW system will cease to exist for new projects, which is not favored by foreign investors." (mineIndonesia, 2006).

## **Contract of Work (CoW) System**

Indonesia's unique system to administer Foreign Direct Investment (FDI) in mining was created in 1967 and lasted till 1997 – a full thirty years. The CoW system is a well-developed and transparent system of granting concessions and mining rights and obligations to foreign companies. The basic needs of investors: Security of Tenure (covered as Conjunctive Title which empowers the investor to proceed from General Survey through Exploration all the way through Mine Development, Production, Processing and Marketing)) and Security of Investment (covered as *Lex Specialis* treatment, which assures that the investment is not subject to changes in government laws or policies after signing for the period in force); are expressly stipulated.

The Indonesian Mining Law of 1967 does not cover in detail the terms and conditions under which the foreign investor must operate, so these are expressly outlined in minute detail in the CoW. The later generations of CoWs (3<sup>rd</sup> to 7<sup>th</sup>) standardized working procedures and served to fulfill the needs of investors to the point of acquainting and familiarizing them with the system. Foreign investors came to feel “comfortable” with the system. The shortcomings with regard the inefficiencies in the bureaucracy, the poor infrastructure and bad business practices were overlooked as long as the return on investment was meaningful. Naturally, the political stability in the country allowed for long-term investment. Slow, creeping changes via the various generations of the CoW worked either to increase or decrease the enthusiasm of investors, but the confidence in and workability of the system remained intact. During this time, seven generations of contracts were evolved based on the needs of the country as well as foreign investors, taking into account the prevailing market conditions.

## **Collapse of the CoW System**

Two major developments led to the collapse of the mining industry in the period 1997-1998. First was the Busang Scam also known as the Brea-X scandal, described as the biggest mining hoax in history. A small Canadian company claimed a find of over 200 tons of gold in Kalimantan, Indonesia which was valued at over US\$70 billion. The company's stock price rose from fifty cents in 1994 to \$286 in 1996 and ultimately dropped to nine cents in May 1997 when the false claims were discovered (Francis, 1998). This remains a serious blot on Indonesia's legal system. The second was the Asian Monetary Crisis of 1997 and the heavy depreciation of the Indonesian Rupiah which led to protests and the end of the Suharto era, and after 3 years of uncertainty, a new democratic government was elected in 1999.

The resulting political instability caused a severe decline in mining investment. By 2000, more than 170 exploration projects had been either suspended or withdrawn and rendered inactive, and only 12 of the 268 CoWs were in operation. The 8<sup>th</sup> generation of CoW proposed by the government remained unsigned by any investor (Bhasin, 2002). Indonesia got only 1% of exploration dollars worldwide. No new CoW has been issued for eight years (Table 2). The new democratization process demanded decentralization and this required a restructuring of the investment laws for mining in line with the local autonomy laws, which to this date has not been achieved.

## New Draft Mining Law

The new mining law (The Bill of Mining Law) does away with the CoW system established under Law No. 11 of 1967 altogether. It is intended to comply with the fiscal decentralization and regional autonomy brought about by Laws 22/1999 and 25/1999. The new mining law would also provide greater level of environmental protection and recognize needs of the local community's rights. The key elements as outlined by the US Embassy in Jakarta are:

1. **Reclassification of Resources** – Mineral resources have been reclassified from (a) strategic, (b) vital and (c) non-strategic and non-vital to (a) radioactive, (b) metal, (c) non-metal and (d) coal, peat and oil-shale. To these have been added two new areas of regulation – geothermal and groundwater – not formerly included as mineral resources.
2. **Reclassification of Parties** – Parties that may conduct mining operations are now limited to two: a business entity or a private person. Previously parties included government institution, state owned company, local owned company, cooperative, foreign major company, foreign minor company, a joint venture company, or a person or legal entity.
3. **Foreign Investment** – There is now no restriction on foreign capital. Previously foreign investment was regulated by the contents of the CoW (Article 10 of Law11/1967) and foreign interests could not hold a KP (Kuasai Pertambangan - mining rights) which was restricted to local entities.
4. **Mining Licenses** – The new law simplifies mining administration by eliminating distinctions between foreign and domestic investors. Under the new law, both domestic and foreign investors will operate mines under the authority of a "mining operation permit" (Izin Usaha Pertambangan, IUP) or a "mining operation agreement" (Perjanjian Usaha Pertambangan, PUP). For small-scale traditional miners, a "people's mining license" (IPR) will be issued. Under the CoW system, domestic investors could operate mines under a mining right (Kuasai Pertambangan or KP), a local mining permit (Surat Izin Pertambangan Daerah, SIPD) and foreign investors operated under the special terms of the CoW (Kontrak Karya, KK).
5. **Mining Operations** – The stages of mining have also been simplified to two: the Explorations stage includes the general survey and feasibility study and the Operations stage which includes construction, mining operation, refining, processing, transportation and marketing. Previously, there were six stages: general survey, exploration, exploitation, refining and processing, transportation and marketing.
6. **Taxes and Levies** – Taxes now include a central tax, import duty, customs charges and local taxes. Additionally, there is a non-tax component which includes a fixed contribution, a production contribution, and an unspecified bonus. Previously there was a fixed contribution, an exploration contribution and a state levy.
7. **Refining and Processing** – The new law requires all refining and processing to be done in Indonesia. This was not regulated under the previous regulations.

8. **Decentralization** – control of mineral resources has been divided between the local governments and the central government. The CoW system recognized only the central government’s role. The new law reduces the central government’s role to policy and management oversight and direct management of undersea resources beyond 12 nautical miles. The local government’s role has been expanded and defined.
9. **Community Development Obligation** - The new law requires that community development is a responsibility of the mining permit holder. Community development will be supervised and be developed based on local and community input. Reclamation security fund must also be provided. This was not required under the previous law, but the operator was required to recondition the mining area upon completion of operations.
10. **Additional Changes** - The draft law will also address areas on which Law No. 11/1967 was either silent or vague. These include environmental protection, reporting of data and operations, financial requirements, land compensation requirements, and criminal investigations and penalties.

## Drawbacks of the New Law

Several shortcomings of the new law have been observed both by the mining industry and legal specialists:

1. **Toxic Waste** (Article 39) - The new law does not provide a basis for exempting mining waste from being classified as "toxic waste" or provide a clear basis for conducting mining operations in areas designated as protected forests. While Article 16 allows mining operations to be conducted except in areas where otherwise not permitted with the consent of local authorities and the approval of the authorizing agency. The law is conspicuously silent on the identity of authorizing agencies and the appropriate procedure. On a positive note, the article says that mining operators shall not be obliged to pay regional taxes for mining wastes.
2. **Taxation** (Article 37) - does not clearly establish a tax regime for the life of a mine. It says changes in law and regulation can reduce the tax burden on a mine, but does not protect a mine from tax increases.
3. **Continuity** (Article 62) on transitional provisions does not grandfather existing Contracts of Work by clearly stating that they will continue to be administered under the old law.
4. **Duration** -- The draft law does not state the duration of mining permits.
5. **Central and Local Government role** – The exact roles of the central and local governments is not well stipulated and made specific.

## Major Concerns of Foreign Investors

The PricewaterhouseCoopers (PwC) annual survey of the Indonesian mining industry for 2006, issued in February 2007 strongly called on the Indonesian government not to scrap the CoW system for Mining Licenses. PwC mining partner Sacha Winzenried warned that some sectors of the mining industry are not fully supportive of the draft mining law (JakNews, 2007). The Indonesian Mining Association (IMA) also urged the government to keep the CoW system as it provides greater legal certainty than the proposed licensing system. The IMA serves as link between the mining industry and the government and has as its members all foreign mining companies operating in Indonesia. The main concerns of foreign companies are:

1. The change from dealing with one entity, the central government to dealing with local governments, many of who have no experience in dealing with long term based large investors. They fear that the local government with their new found powers may revoke the permit at any time. They feel that under the CoW arrangement, they had an equal status with the government and in the case of a dispute, they could seek independent arbitration.
2. No differentiation is made with regards to majors and minors. Investors propose that a “mining agreement” similar to the CoW should recognize mining projects involving total investment of more than

US\$250 million. The agreement should also be effective for 30 years, which is the usual life of a CoW, and should be further extendable for 10 more years.

3. The additional requirement of community development and social responsibility. The law sets out the obligations of mining companies but lacks clarity. What concerns investors is the way the new mining legislation weighs them down with additional social responsibilities, the result of intensive lobbying by community-based groups. This would mean that mining companies would need to forge agreements with communities in the region who may be affected by their operations in advance of any mining activity.

4. The new law does not allow for “ring-fencing” which the mining community considers a more reasonable approach to involvement in more than one project at a time. The new law dedicates each license to one mineral and a company will be limited to one IUP or PUP only. The mining industry would prefer to an IUP or PUP to apply to multiple projects in order that excess cash from one project can be applied to another project. Assets from one project could also be secured for use by another project. Similarly, losses or profits from one project could be offset by gains or losses from another project.

5. The requirement for all mineral mining products to be processed within the country and export of partially processed minerals will be automatically banned. This is deemed difficult to achieve as presently, about one third of mineral products are processed in the country. There are only two large-scale smelters operating in the country, for copper and tin.

6. Under the existing (new) regional autonomy law, regional governments retain 80 percent of mining royalties. This has resulted in severe increases in royalty rates. Several companies have held back royalty payments amounting to Rp. 1.4 trillion because of unresolved issues. Another company PT Newmont Nusa Tenggara paid US\$3, 206749.22 in the first quarter of 2003. Mining companies want regional government transparency in the use of these royalty revenues.

7. Many local governments are adding on new taxes for such things as street lighting and mine vehicles. In North Sulawesi, local authorities taxed construction materials Newmont used to build a public road at its own expense.

8. The problems of excessive bureaucratic red tape, security concerns in the regions, illegal mining all continue to plague foreign investors.

9. There is a conflict between mining and forestry regulations. According to Forestry Law 41/200 (Article 38) all mining is banned in higher quality “conservation forest” which covers about 10% of Indonesia. Although this is in line with good international practice, the law goes well beyond legislation in other countries by banning surface mining in “protected forests” which covers 17% of Indonesia’s land area. Companies are having a problem in obtaining forestry permits in this regard. The situation is further exacerbated by the fact that boundaries for these areas are subject to mapping uncertainties.

10. The environment rules are inconclusive and insufficient. Many mining companies have been subject to serious prosecution by Indonesian authorities, even though they had complied strictly with environmental regulations. Newmont settled one civil case by agreeing to pay UD\$30 million over 10 years to fund environmental monitoring and community development (Nones, 2007).

### **Continuing Delay in Passing of New Law**

One main reason for the delay in passing of the new law has been the fight over control of Indonesia’s natural resources by the national and local authorities (Wright and Barta, 2007). The WSJ expects this battle, which is part of a wider struggle for local autonomy in Indonesia, to have an impact on global mining companies and world commodity prices in the coming years. The lack of legislation is preventing the launch of new investment ventures as miners see an investor-friendly mining law. The law is now on hold before Parliament and the mining industry through its association (IMA) issued a White Paper recently which calls fundamentally for a return to the CoW system (Krisnamantari, 2007). The proposal seeks to merge the old contract system with the new licensing system where both the government and the mining companies will have equal say, and disputes would be settled through independent arbitration instead of leaving all decisions up to local governments.

Another cause of delay is the need to synchronize the new law with the multitude of existing regulations in the mining sector. It is expected that the new law could be passed this year, but in Indonesia one never underestimates the power of lobby groups and interested parties such big business.

## Conclusions

The World Bank, in its assessment of Indonesia's need to attract new mining investments, lists seven steps to make the mining fiscal regime competitive (World Bank, 2005):

1. Reduce the rates for production contribution (royalty) from the present average of 4% to a uniform rate of 2% regardless of mineral type
2. Modify Law 18/2000 to include coal and gold dore and silver dore, (but not retail gold and silver bars), within the VAT system and zero rate them when exported
3. Modify Law 34/2000 to establish a closed (but expanded) list of district and provincial taxes and state non-tax fees and levies (which specifically excludes turnover-related) taxes
4. Introduce a tax stabilization provision to provide for stabilization of mining-related state non- tax revenues such as royalties for a period of ten years from the start of production
5. Provide VAT tax refunds without undue delay
6. Make mining sector social support and mitigation expenditures to be tax deductible
7. Modify the mining fiscal regime to permit social assets, which may have been imported duty free during the mine life, to be transferred to appropriate social service delivery agencies at the time of mine closure without incurring tax liabilities.

The World Bank also notes that the profusion of local laws is causing great uncertainty and increases risk regarding discretionary interpretation and implementation of laws. This can lead to weak enforcement of legal framework and corruption. The law must provide certainty and equality. As it is, Indonesia is direly lacking in transparency and governance, when compared with many other nations (FIG 3).

FIG 3: INDONESIA'S GOVERNANCE  
Source: World Bank 2005

The country ranking for bureaucracy involved in regulating businesses with regards to protecting investors and trading across borders, as well as in paying taxes and dealing with licenses is very uncompetitive indeed (Table 3). Indonesia has been constantly listed as a difficult place to do business where nepotism, cronyism, corruption, inefficiency and bureaucracy rule. It is imperative that the authorities use this opportunity to enact and implement legislation that will enhance their credibility and succeed in securing foreign investment, which the country so direly needs.

The CoW system is a well developed and meaningful system of granting mining rights to foreign companies. The basic needs of investors are well covered and protected. The country needs to retain fundamental principles of the CoW. They are Security of Tenure which is covered as *Conjunctive Title*, which empowers the investor to proceed through all stages of mining – from exploration to mine development and marketing without further licenses. Security of Investment, provided under *Le Specialis* treatment assures that the investment is not subject to changes in future laws or policies.

Investment in mining in Indonesia declined once the fundamentals were dismantled. This was certainly exacerbated by the ensuing political turmoil, and though this has long been checked, the issues of illegal mining, security risks and long term needs of investors still demand attention and fixing. Finally, the need to cater for the needs of local communities is paramount but this must be handled in a very congenial manner. The mining companies must be made to feel welcome and their rights and obligations must be clarified in the most transparent manner. Unlike conventional industries, mining is higher in risks and capital and projects are very long term. Hence, predictability with a thorough and upfront understanding of the risks involved is an absolute necessity.

The mining industry has not been able to self-regulate itself. A strong case can be made for a set of international standards of performance applicable to all mining company operations (Garner, 2003). With strong headway being currently made in enacting legislation covering all fields of business and based on global standards, it is only a question of time before calls for greater regulation of the industry on an international scale are heard.

Indonesia's need for foreign investment is particularly acute. The country will need in excess of US\$150 billion in infrastructure development projects over the next five years (Guerin, 2005). In March this year, the Indonesian government at long last passed the new investment bill as part of an effort to improve the investment climate in the country (DPA, 2007). It replaces the 1967 Foreign Investment Law and the 1968 Domestic Investment Law and gives equal legal status and equal treatment to both domestic and foreign investors. It also does not require

foreign investors to divest the majority of their shareholding after a specified period of time. It is time the Indonesian government also enacted a new mining law that will be a win-win for both the investors and the country.

## Abstract

Russia is a transitional economy which is strongly relying on exports on natural resources. However, the political leadership has acknowledged the need to make Russia more high-tech oriented. In realization of this goal, foreign technology transfer plays a very important role. This paper estimates the foreign companies' role in the Russian economy and the potential of Russian economy and local companies to receive positive spillovers from foreign investors. The principal channels of international technology transfer in Russia are studied. Traditionally foreign direct investments (FDI) and spillovers from local affiliates of multinational enterprises provide an important and cheap channel of direct technology transfer. Licensing of technology and intellectual property to an existing business is another channel, and is often a preferred option if a ready route to market exists. Technology transfer can also happen through international trade. Using Russian and international statistical data authors provide assessment on the impact of technology transfer in the Russian economy.

## Introduction

Russia is a natural resource rich country. Due to the high prices of natural resources at the world markets it has been easy for Russian economy to focus on export of natural resources. But the fluctuations in the world market prices may cause a serious risk for the Russian economy. Thus, there is a political need to increase the production of value-added goods and to encourage the creation of high-tech industry. In order to improve the value of the production, Russia needs large investments in production facilities and new technology. Local investments are not enough; Russia needs foreign investors to refresh the business environment.

This paper aims to evaluate the readiness of Russian economy to host foreign direct investors and the interest that foreign investors have shown towards the Russian regions. To receive new technology and enjoy positive spillovers from foreign direct investments, the preconditions in the region needs to be in good shape. If the regional administration is not actively inviting foreign investors and if, for example, the gross regional product in the region is too low, it is difficult to attract foreign direct investors. When the total number of foreign investors in the regions is very low, the chance to receive spillovers is poor. The descriptive analysis shows that there are surprisingly many regions in Russia where the possibilities to receive positive spillovers are very low. Authors selected twenty regions with the highest interest of foreign investors and analyzed their readiness to enjoy FDI-induced technology transfer and spillovers.

Spillovers from foreign direct investment is considered to be the best way to transfer new, more advanced, technology to transitional economies [3]. Other two ways, licensing and foreign trade, are efficient in technology transfer only if they happen in full extent. Unfortunately brand new technology is hardly ever available for licensing since the multinational enterprises like to protect their competitive advantages. Companies learn from export and import partners but these new operational and technological skills will solely spread to companies involved in trading.

Governments support foreign direct investment (FDI) since it is commonly perceived that it will directly create job opportunities, bring new capital and contribute to economic growth. There is also a hidden effect, spillovers from FDI, which indirectly benefit local companies. The reason why local companies are afraid of foreign investors is that the overall effect of spillovers can be positive or negative.

The impact of FDI spillovers appears at least in five forms. First impact is the technological diffusion, which happens through imitation, demonstration, and copying. Local firms recognize efficient managerial and operational practices and new technology or products, and try to implement these new practices into their own operation. Second impact is labor mobility. It is believed that foreign affiliates and joint ventures pay higher salaries and train their workers more than local firms. Workers also learn new practices when employed in a foreign company. When these workers move to work in local companies and other regions they bring the skills they have learned with them. Especially in Russia the labor mobility inside regions is high. Thirdly, local companies get contacts with foreign affiliates through backward and forward linkages. When a foreign company is making purchases locally the quality requirements and measurements will be transferred to the local supplier. Effective supply chain management in foreign companies teaches new procedures for local supply chain. Foreign companies tend to create clusters and bring new foreign companies with them. Clustering increases FDI, which further encourages local spillovers. Finally, the most feared spillover effect is the competition effect. Foreign direct investment increases competition. When multinational enterprises invest abroad they usually have high productivity and they are among the most competitive companies in their own markets. For small local companies the adaptation to changed business environment is difficult and some of them have to exit. Competition effect is also known as “crowding out” effect [3]. However, competition effect might be positive as well. Competition increases productivity in local companies, since they need to focus on their core competences. [2]

Whether the spillover effect is negative or positive depends on multiple determinants. Aitken et al. [1] finds the effect to be positive for small enterprises with high foreign participation, but for larger enterprises and enterprises with small or no foreign participation the effect is negative. For non-exporting firms the effect is usually positive, since they haven’t had a chance to learn from previous trade partners [2]. Yudaeva et al. [11] proves that especially in Russia in the regions with more open policies for foreign investors and less corrupted administration the spillover effect for local companies is positive. Foreign firms located in more reform-oriented regions tend to be more productive than others [11]. This reinforces the assumption that openness towards foreign investors benefits the whole region. Sinani et al. [7] claims that the magnitudes of the spillovers depend on the recipient firm’s size, ownership structure and trade orientation. Ownership structure, whether the companies are private or state-owned, is very important determinant of spillovers in transitional economies like Russia.

Positive spillovers might be limited to certain sectors, either the foreign company’s sector or the ones vertically integrated to that. Kinoshita [6] finds out that in Czech Republic positive spillovers from FDI happen in electrical machinery, and radio & TV sectors, which are also active investors in innovative R&D. Spillovers might be location limited [1]. Only those local companies located at the same industrial district might be able to adapt new technologies from foreign affiliates. Foreign investors tend to create clusters also because there are special economic zones intended for foreign companies. In zones like this it is possible that only other foreign companies get advantage of spillovers while local companies are restricted to enter the zone and will not receive any spillovers. One limitation for positive spillovers is the protection of competitive advantages of foreign companies [5]. Multinational enterprises are sometimes very careful not to spill over any firm specific assets.

Probably the most important requirements for spillovers are small technology gap, R&D investments and educated workforce. In order to enjoy spillover benefits local companies have to have certain level technological capabilities, thus, the technology already in use in local companies should not lag too much behind of the technology used in foreign-owned companies. If the technology gap is too big, the catching up process becomes too difficult [3]. Companies with high R&D investments and effective R&D department are able to adapt new technologies fast. The companies with low R&D capabilities using simple technology are not able to enjoy spillovers from foreign companies. In countries where the workforce is well educated, like in Russia, it is easier to transfer technology than in countries where even the literacy among workers is poor.

## **Russian Capabilities to Receive FDI-Induced Spillovers**

In order to receive FDI-induced spillovers and technology transfers the country has to attract certain kind of foreign direct investments. In Russia the stock of manufacturing FDI during years 1998-2003 has been biggest in sectors of

fuel industry, food industry, machine building and forestry. However, due to the limitations on foreign ownership in strategic sectors, like oil and gas production, investments are estimated to be lower than the overall foreign interest in these sectors. Approximately 50-60 percent of FDI goes to manufacturing sector where the FDI spillovers will most likely happen and the transfer of new technology is fiercely needed. Another likely sector for spillovers is service sector with sizable foreign interest such as retail, telecommunications and IT-services.

Russia is a large country in terms of population and territory. With more than 140 million people and 88 regions it gives enormous opportunities for foreign investors. The size of the country means that foreign companies have to choose the regions they want to enter very carefully, it is impossible to cover the whole country at once. In order to measure these investments and their spillovers, the analysis has to be done in the regional level. If the evaluations are done only on such a huge scale as the country level the aggregated spillover effect will most likely be negative. The positive impacts in some sectors and regions are not enough to cover the negative effect in less competitive sectors and regions.

To select the regions where the significance of foreign direct investors is the highest, a list of the Russian regions with the biggest number of companies with foreign participation (later called as foreign companies) is made in Table 1. In Russia a total number of 16 128 companies with foreign participation has been compiled in the statistics of Federal State Statistic Service Rosstat. This includes 479 greenfield projects started in 2005 according to UNCTAD [10].

TABLE 1: NUMBER OF FOREIGN COMPANIES IN RUSSIAN REGIONS IN 2005 TOP 20 [9]

REGIONS	FEDERAL DISTRICT	NUMBER OF COMPANIES WITH FOREIGN PARTICIPATION
Russia		16 128
Moscow region, incl. Moscow	Central	7 112
Leningrad region, incl. St. Petersburg	North-West	2 318
Krasnodar region	South	508
Kaliningrad region	North-West	434
Primosky region	Far East	324
Rostov region	South	265
Belgorod region	Central	253
Bryansk region	Central	203
Novosibirsk region	Siberia	190
Pskov region	North-West	174
Sverdlovsk region	Ural	151
Samara region	Volga	150
Khabarovsk region	Far East	149
Omsk region	Siberia	144
Stavropol region	South	138
Tatarstan	Volga	137
Tyumen region	Ural	137
Murmansk region	North West	136
Yaroslavl region	Central	135
Perm region	Volga	123

According to the listing from year 2005, twenty regions have been selected from the Russian 88 regions. In the selected regions the number of foreign companies is more than 120. In the regions where the number of foreign companies is less than 100 there is a risk that one big company skews the whole picture. The most popular regions among foreign investors are Moscow region with the city of Moscow, and Leningrad region with the city of St.

Petersburg. These two regions together gather almost 60 percent of the foreign investors in Russia. However, the head offices of foreign investors might be located in the two capitals while the operations are put into action in more distant regions. This also makes the evaluation of spillover effect more difficult. After the obvious success of Moscow and St. Petersburg, the most popular regions among foreign investors are Krasnodar, Kaliningrad, Primorsky and Rostov. All these regions are located at the border of Russia. Krasnodar and Rostov are located in the Ukrainian border with a short distance to Kazakhstan and Balkan countries. Kaliningrad is separated from the mainland of Russia and surrounded by Lithuania and Poland. Primorsky is surrounded by Japan and China in the Russian Far East. Thus, the short distance to neighboring countries tends to increase the amount of foreign investors in Russian regions. It could be anticipated that in these regions the spillover effect is positive, because competition in the regions is higher due to the large number of foreign companies and existing clusters with foreign and local companies.

Table 2 shows the relative richness of the regions. Top 20 regions selected in Table 1 will be used in the analysis during the rest of the paper. In the ranking of gross regional product per capita (Table 2) it could be noticed that many regions get along very well without significant number of foreign investments. Especially Tyumen region, which is known as the energy center of Russia with abundant natural resources such as oil and gas, is very rich compared to the average level of Russia, and it has only about 140 foreign companies. The lack of foreign companies in Tyumen could be explained with the above mentioned fact that foreign ownership in strategically important sectors is limited in Russia. The state ownership of these strategic sectors further hinders the possibilities for technology transfer. As mentioned by Sinani et al. [7] the private ownership with open practices increases the spillovers.

TABLE 2: GROSS REGIONAL PRODUCT PER CAPITA [9]

REGIONS	FEDERAL DISTRICT	GROSS REGIONAL PRODUCT PER CAPITA, RUR	INDEX RUSSIA=100
Tyumen region	Ural	361 028	447,2
Moscow	Central	234 601	290,6
St. Petersburg	North-West	94 717	117,3
Murmansk region	North West	93 492	115,8
Khabarovsk region	Far East	86 326	106,9
Samara region	Volga	85 871	106,4
Tatarstan	Volga	84 676	104,9
Perm region	Volga	83 797	103,8
Russia		80 727	100,0
Leningrad region	North-West	80 102	99,2
Yaroslavl region	Central	78 061	96,7
Sverdlovsk region	Ural	70 864	87,8
Moscow region	Central	67 439	83,5
Novosibirsk region	Siberia	63 103	78,2
Omsk region	Siberia	61 419	76,1
Primorsky region	Far East	60 910	75,5
Kaliningrad region	North-West	54 286	67,2
Krasnodar region	South	54 075	67,0
Belgorod region	Central	52 726	65,3
Rostov region	South	42 313	52,4
Pskov region	North-West	42 129	52,2
Stavropol region	South	40 509	50,2
Bryansk region	Central	36 094	44,7

In any case the foreign investors in these top 20 regions have created some value. Table 3 summarizes the share of turnover of foreign companies of the gross regional product. It can be seen, again, that the biggest value created by foreign companies is in Moscow and St. Petersburg. In addition to these two cities the importance of foreign investors is biggest in Omsk and Sverdlovsk regions. However, the above mentioned regions with high number of foreign companies are succeeding poorly in this ranking. This means that in these regions there are a lot of small foreign enterprises which do not create as much value as the bigger ones. The investors are not always coming from high-technology countries and are focusing more on low-quality consumer products as presented in Table 6 later on. There is also a chance that the poorness of these regions (Table 2) slows down the entry of successful foreign investors. For poor regions the spillovers from foreign companies are very important. However, the technology gap could be too wide for local companies to exploit any technology that spills over.

TABLE 3: TURNOVER OF COMPANIES WITH FOREIGN PARTICIPATION AS A SHARE OF GROSS REGIONAL PRODUCT 2005 (IN %) [9]

REGIONS	FEDERAL DISTRICT	TURNOVER/GRP
Moscow	Central	157,7
Omsk region	Siberia	142,5
Sverdlovsk region	Ural	94,3
St. Petersburg	North-West	93,4
Leningrad region	North-West	88,8
Belgorod region	Central	81,7
Perm region	Volga	76,5
Tatarstan	Volga	74,4
Russia		72,1
Moscow region	Central	72,1
Yaroslavl region	Central	64,4
Primorsky region	Far East	53,2
Tyumen region	Ural	49,9
Samara region	Volga	35,2
Murmansk region	North West	32,2
Novosibirsk region	Siberia	30,7
Kaliningrad region	North-West	30,3
Krasnodar region	South	29,6
Stavropol region	South	29,6
Bryansk region	Central	15,6
Rostov region	South	25,8
Khabarovsk region	Far East	15,5
Pskov region	North-West	10,1

Table 4 shows the share of FDI inflows of the regional gross fixed capital formation and gross regional product. According to World Investment Report [10] in developed economies the FDI inflow's share of gross fixed capital formation is on average about 8 percent. In Russia the average figure is 10.7 percent, which means that in Russia the importance of foreign direct investment is more significant than in developed economies. The ratio between FDI inflows and gross domestic product in Russia is 1.9 percent. In developed economies the similar figure is usually less than 0.1 percent. When measuring the ratio between FDI stock and GDP, which shows the long term influence, in 2005 Russia has a figure of 17.3 when the average in developed economies is 21.4. This difference can be explained with the small-scale foreign investments during Soviet times and the early years of transition, as well as the withdrawal of investors after the 1998 financial crisis.

From Table 4 it can be noticed that there are great differences between Russian regions in terms of importance of foreign direct investments. Some regions do not seem to benefit much from the foreign investments even though the number of investors is quite high, like Primorsky in Far East. On the other hand, Moscow,

Leningrad and Krasnodar regions seem to have great benefits of foreign investors. Krasnodar region, located at the South Federal District, is a huge agro-industrial complex. The administration of the region has been very open towards foreign investors and has been actively seeking new contacts. Foreign companies like Philip Morris and Pepsi Cola have established their plants in Krasnodar [8]. Openness towards foreign investors should increase the spillovers.

TABLE 4: FDI AS A SHARE OF GROSS FIXED CAPITAL FORMATION (GFCF) AND GROSS REGIONAL PRODUCT (GRP) IN 2004 (IN %) [9]

REGIONS	FEDERAL DISTRICT	FDI/GFCF	FDI/GRP
Omsk region	Siberia	25,9	0,2
Moscow region	Central	19,7	4,0
Moscow	Central	13,8	2,0
Russia		10,7	1,9
Leningrad region	North-West	8,2	2,2
Krasnodar region	South	7,9	0,6
Tyumen region	Ural	5,1	1,2
Stavropol region	South	4,9	0,1
Bryansk region	Central	4,8	0,4
St. Petersburg	North-West	4,7	0,6
Pskov region	North-West	4,1	0,9
Rostov region	South	3,0	0,3
Kaliningrad region	North-West	2,2	1,0
Belgorod region	Central	1,7	0,4
Samara region	Volga	1,7	1,3
Murmansk region	North West	1,7	0,05
Tatarstan	Volga	1,2	0,6
Primosky region	Far East	1,1	1,2
Yaroslavl region	Central	1,0	0,8
Khabarovsk region	Far East	0,8	0,3
Perm region	Volga	0,7	0,02
Novosibirsk region	Siberia	0,5	0,2
Sverdlovsk region	Ural	0,4	0,5

Table 5 summarizes the nominal gross regional products of top 20 regions selected in Table 1. The differences between regions are overwhelming as well as the growth rate all over the Russia. Only in four years the gross regional product has doubled or trebled in most of the regions. Regions like Omsk, Tyumen and Novosibirsk have faced extremely fast growth. During the same four year period of 2000-2004 foreign direct investments in Russian economy have doubled [9]. It is rather difficult to evaluate how much have the foreign companies accounted to the growth. But when the economy is growing and foreign direct investments are increasing the competition between local and foreign companies is fierce. This competition effect forces local companies to improve their operations in order to protect their markets and compete against foreign companies.

TABLE 5: GROSS REGIONAL PRODUCT IN RUSSIA IN 2000 AND 2004 [9]

REGIONS	FEDERAL DISTRICT	2000	2004	GROWTH
		mln RUR	mln RUR	%

Omsk region	Siberia	48 477	209 211	331,6
Novosibirsk region	Siberia	76 510	200 029	161,4
Leningrad region	North-West	58 834	174 298	196,3
Primorsky region	Far East	63 989	147 234	130,1
Khabarovsk region	Far East	67 835	135 039	99,1
Stavropol region	South	57 474	132 821	131,1
Yaroslavl region	Central	46 557	121 291	160,5
Murmansk region	North West	57 441	118 165	105,7
Belgorod region	Central	44 440	113 181	154,7
Kaliningrad region	North-West	24 576	65 581	166,8
Bryansk region	Central	26 399	55 108	108,8
Pskov region	North-West	17 178	36 539	112,7

To receive positive spillovers and technology that is useful for Russian companies, the foreign direct investments have to come from successful companies with competitive advantages, for example high-tech companies with multinational operations. Table 6 divides the investments into two categories, the ones coming from innovative countries and the ones coming from less developed countries. Authors are using as a proxy OECD countries of which 80% are classified as high-income countries by World Bank, and almost all of them classified as innovation-driven economies by World Competitiveness Report of World Economic Forum. The highest number of foreign investments coming from high-tech countries is in Kaliningrad, Tatarstan and Leningrad regions. These regions should have more positive spillovers than for example Belgorod, Bryansk and Primorsky regions, where the share of high-tech investors is less than 20 percent.

TABLE 6: SHARE OF OECD AND NON-OECD INVESTOR COUNTRIES AS A % OF SELECTED FOREIGN COMPANIES [9]

REGIONS	FEDERAL DISTRICT	OECD	NON-OECD
Kaliningrad region	North-West	76,5	23,5
Tatarstan	Volga	68,1	31,9
Leningrad region	North-West	62,8	37,2
Samara region	Volga	55,2	44,8

Pskov region	North-West	41,7	58,3
Rostov region	South	41,3	58,7
Krasnodar region	South	38,9	61,1
Stavropol region	South	37,8	62,2
Tyumen region	Ural	34,7	65,3
Novosibirsk region	Siberia	32,8	67,2
Omsk region	Siberia	31,3	68,7
Khabarovsk region	Far East	30,6	69,4
Primosky region	Far East	19,9	80,1
Bryansk region	Central	8,6	91,4
Belgorod region	Central	6,1	93,9

In addition to FDI-induced spillovers, trade is another way to transfer technology and learn new practices. Table 7 shows the share of export and import of gross regional product in Russian regions. In natural resource rich regions, like Tyumen, Omsk and Samara, exports are very important. The companies located in these regions have definitely learned how to do business abroad and used new practices in their Russian operations.

Especially for non-trading companies the FDI related technology spillovers should be larger than for the companies with some experience of international trade. Thus, the regions where the share of export of GRP is low but the share of import of GRP as well as the number of foreign companies (Table 1) are high have huge potential to receive spillovers.

TABLE 7: IMPORTANCE OF TRADE IN RUSSIAN REGIONS (IN %) [9]

REGIONS	FEDERAL DISTRICT	IMPORT/GRP	EXPORT/GRP
Kaliningrad region	North-West	125,8	26,4
St. Petersburg	North-West	40,5	23,0
Leningrad region	North-West	34,5	79,0
Belgorod region	Central	33,1	25,1
Bryansk region	Central	29,8	23,4
Moscow	Central	28,3	57,2
Moscow region	Central	27,5	15,7
Primorsky region	Far East	26,6	15,9
Pskov region	North-West	22,5	21,6
Rostov region	South	21,1	20,3
Russia		15,1	36,2
Sverdlovsk region	Ural	10,6	38,9
Krasnodar region	South	8,4	8,0
Samara region	Volga	8,1	48,3
Novosibirsk region	Siberia	8,0	11,8
Yaroslavl region	Central	7,1	11,1
Khabarovsk region	Far East	6,1	39,5
Omsk region	Siberia	3,6	57,7
Perm region	Volga	3,4	29,3
Stavropol region	South	3,0	9,1
Tatarstan	Volga	2,9	37,0
Murmansk region	North West	2,9	25,4
Tyumen region	Ural	1,0	35,0

In order to evaluate the technology focus of the Russian regions, the share of technology imports of total imports are presented in Table 8. It can be seen that the share of technology imports in Russia is relatively low. In most of the regions the share of technology import is less than one percent of total import. In the natural resource rich regions, like Tyumen and Tatarstan, the share is highest in Russia. Surprisingly the share is extremely low in Moscow.

TABLE 8: EXPORT AND IMPORT OF TECHNOLOGY AND TECHNICAL SERVICES AS A SHARE OF TOTAL EXPORT AND IMPORT (IN %) [9]

REGIONS	FEDERAL DISTRICT	IMPORT	EXPORT
Tyumen region	Ural	56,09	0,13
Tatarstan	Volga	7,77	0,02
Leningrad region	North-West	5,42	0,002
Murmansk region	North West	4,70	2,16
Yaroslavl region	Central	4,47	0,07
Omsk region	Siberia	4,18	0,02
Stavropol region	South	3,40	0,008

Belgorod region	Central	n.a.	n.a.
Khabarovsk region	Far East	n.a.	n.a.
Primorsky region	Far East	n.a.	0,005

## Summary

According to the selected statistics there are only few regions in Russia having the required preconditions for large scale foreign direct investments and thus having opportunities to receive FDI-induced spillovers and technology transfers. Moscow, Moscow region, St. Petersburg and Leningrad region have been popular among foreign investors for a long time. In addition to these regions for example Krasnodar, Kaliningrad, Primorsky, Samara and Tatarstan have high potential to receive FDI and improve their economic condition. These same regions have a high or average investment potential according to the Russian rating agency ExpertRA [4], which measures the investment climate in all Russian regions. St. Petersburg, Moscow region, Krasnodar region, Moscow and Sverdlovsk regions have high potential and only moderate risk. For example Rostov, Tatarstan and Samara receive rating with average potential and moderate risk. According to ExpertRA none of the Russian regions have minimal risk.

## Discussion

This paper takes a look to the Russian investment climate; the capabilities of Russian economy to attract foreign direct investments and opportunities to enjoy spillover effects and technology transfer. Twenty Russian regions are evaluated with descriptive analysis. The analysis shows that there are huge differences between the Russian regions. Moscow and St. Petersburg are obvious gainers of FDI, but also regions like Krasnodar and Primorsky have possibilities to receive positive spillovers. In order to measure whether the overall spillover effect in Russian economy is negative or positive a further analysis is needed. Analysis with company level panel data in each selected region has to be done.

# International Stock Market and Equity-Related Instruments: Global versus Investable Indexes

*Seddik Meziani, meziania@mail.montclair.edu  
Montclair State University, USA*

## Abstract

This article examines the characteristics and performance of selected China's financial indexes. Although several indexes were recently made available, this study focuses on three in particular because they are compiled using distinct methodologies. Based on the differences in their composition, they were categorized as either "global" or "investable" indexes, herein indexes composed of shares that are readily available for trading in the market. From a portfolio diversification perspective, this study found that U.S. investors seeking exposure to China stand to gain the most from funds tracking the Standard & Poor's/CITIC 50 Index (a global index) than from those tracking the FTSE/Xinhua China 25 Index or the Halter USX China Index (investable indexes). Its risk-return characteristics, along with other performance evaluation measures used, show that it is most efficient in providing international diversification benefits

## Introduction

Over the last decade, China's importance to the world economy has increased exponentially. Deemed much too big to ignore, and given its outsized growth and considerable need for capital, China has been garnering sizeable attention from portfolio managers and individual investors alike, hence turning its markets into increasingly important destinations for their investments.

In response, a relatively new generation of indexes has been introduced to serve as benchmarks by which to evaluate the performance of money managers in China's markets. Several benchmarks exist, but, three in particular are considered especially capable of capturing the investment characteristics of these markets. Based on distinctly different investment strategies, the FTSE/Xinhua China 25 Index, the Halter USX China Index, and the Standard & Poor's/CITIC 50 Index represent means to answer important questions such as determination of the investment universe, sector weighting and ongoing performance comparison.

Not everyone, however, is convinced that investing in China's financial markets is an idea whose time has come. Critics believe that the benefits from international diversification are not large enough to outweigh the significant risks associated with its equity markets. The main purpose of this study is then to evaluate the legitimacy of these concerns and provide an overview of the investment environment in China. Issues investors should consider before allocating parts of their portfolios to China's index products include the presence of poor corporate governance, doubtful accounting standards, and other allegedly shady business practices.

In this study, the magnitude of the benefits from international diversification through exposure to China is looked at from the U.S. investor point of view. Its content is organized as follows: section 2 lays out the issues by providing background information about the Chinese markets while data and methodology are outlined in section 3. Section 4 describes some of China's new stock market indicators and the motivation which underlies the study's choice of these particular indices followed by section 5 which discusses the overall results. Summary and conclusion are presented in Section 6.

### Review of the Literature

The benefits to the domestic investor from diversifying internationally have been widely documented by academic and practitioners. Grubel (1968), Levy and Sarnat (1970), and Lessard (1973)<sup>1</sup>, are among the most notable precursors of the research on international diversification, a practice that has become an essential tenet of modern portfolio theory.

Although they all noted the beneficial effects of diversifying investment across countries, they also determined that for international diversification to be successful it's important that individual stock market returns

exhibit a certain degree of independence. For example, Grubel and Levy and Sarnat use cross-country correlation when assessing the performance of internationally diversified portfolios and recommend that such cross correlations should be continuously monitored by international money managers and positions altered accordingly.

The main reason given for international diversification clearly stems from the fact that returns in two individual stock markets may be sufficiently independent to provide a benefit to the international investor. International diversification can lead to a reduction in systematic risk because it reduces domestic market exposure that cannot be diversified otherwise. Overall, the early literature confirms the evidence of an international diversification benefit.

Some of the more recent studies also showcase the benefits of international diversification. Solnik (1996)<sup>2</sup> for one demonstrates that with approximately 40 securities equally spread among major U.S. and European stock markets, U.S. investors can reduce their risk exposure by at least 50 per cent when compared "with a portfolio consisting of only U.S. stocks." Other studies, however, indicate that emerging and developed stock markets have become more closely integrated, thus the benefit of international diversification may be diminishing. Serletis and King (1997)<sup>3</sup> document the process of convergence of the European Union stock markets using data from 1971 to 1992. Ng (2002)<sup>4</sup> raised the same issue for South East Asia by investigating potential linkages between the stock market returns of Indonesia, Malaysia, the Philippines, Singapore and Thailand over the period 1988-97. After splitting the period into two (1988-92 and 1993-97), he finds, based on correlation analysis, that their stocks have become more closely linked in the second period 1993-97.

Like the aforementioned articles, this study is also an examination of market convergence. It focuses on the nascent financial markets of China from the perspective of U.S. investors. After all, China has shown its commitment to reforming its domestic financial markets as demonstrated by Xiang (1998).<sup>5</sup> It views them as viable means to progressively sever the dependence of its state-owned enterprises on the state banking system as a source of capital. This in turn has caught the attention of global investors looking for effective means to diversify their portfolios.

Since China's markets are still evolving in relation to those of other emerging markets, this article posits that they have not been around long enough to start showing meaningful correlations with U.S. financial markets and could as such provide U.S. investors with significant diversification benefits.

#### **Brief Overview of China's Markets**

Few nations have changed as dramatically as China since the 1970s. After years of favoring state-owned enterprises, China has engaged in a series of economic reforms with the goal of development through economic liberalization. This shift toward the private sector is highlighted by an astounding GDP growth, underlined by a rising prominence in world trade, and the growing number of companies listed on mainland China's two primary stock exchanges in Shanghai and Shenzhen.

#### **Important Characteristics**

China's securities markets have undergone rapid growth over the past decade. Between the Shenzhen stock market and the much larger Shanghai Stock Exchange, more than 1300 Chinese companies are now listed, with a market capitalization of nearly \$500 billion.

Although these markets are home to many unproven companies, the majority of the listed companies are cash-hungry state-owned enterprises in which the government has sold a minority share. The purchasers of these equity shares are typically Chinese private companies that doubt their ability to obtain a stock listing and opt instead for this form of back-door listing. With their equity capped at 30 percent, however, they often cannot control the companies in which they are investing, nor can they aspire to turn them around by putting a new and more effective management team in charge. Weak minority shareholder rights, poorly regarded management teams, questionable accounting practices, and weak corporate governance have led many foreign investors to consider most of these companies unworthy of investment.

Nearly all of China's offerings are Class A shares (a complete list of Chinese shares along with a brief description is shown in Table 1) representing domestic companies, until recently reserved to local Chinese investors. These investors generally have scant education about relative value or equity fundamentals and more often than not are looking for short-term profit. When unseasoned investors speculate on shares with limited supply, it is also

conceivable that the share prices are pushed beyond their actual values. Therefore the A-share market tends to roil significantly whenever investors are spooked by corporate scandals and market commotions.

The B-share market was introduced in February 1992. It represents about 10 percent of the total number of stocks outstanding. Both A-share and B-share stocks are listed on mainland China. Chinese investors have been allowed to invest in B shares since 2001.

B shares are freely tradable. They can be listed on either the Shanghai Stock Exchange where they are bought and sold in U.S. dollars or the Shenzhen Stock Exchange where they are traded in Hong Kong dollars but not in both. Considering that B shares are mostly issued to attract foreign capital, and considering that the more seasoned foreign investors have a more realistic view on the growth potential of the firms they are buying into, one can safely assume that the B share market is less volatile than the A share market.

H shares are listed in the more mature Hong Kong market. Beginning 1993, mainland companies able to meet the more stringent requirements of the Hong Kong Stock Exchange were allowed to list their shares in that market as H shares. Red-chip shares are issued by firms that are technically Hong Kong companies although they are largely based in mainland China. H share companies tend to specialize in a single activity or infrastructure projects where red-chip companies are more diversified conglomerates.

TABLE 1: CHINESE SHARES DESCRIPTION

A Shares:	Securities of Chinese incorporated companies that trade on either the Shanghai or Shenzhen stock exchanges. They are quoted in Chinese RMB. They can only be traded by residents of China and the selected investors noted above.
B Shares:	Securities of Chinese incorporated companies that trade on either the Shanghai or Shenzhen stock exchanges. They are quoted in U.S. dollars on the Shanghai Stock Exchange and Hong Kong dollars on the Shenzhen Stock Exchange. They can be traded by nonresidents and residents of China with appropriate foreign currency dealing accounts.
H Shares:	Securities of companies incorporated in China and nominated by the Chinese Government for listing and trading on the Hong Kong Stock Exchange. They are quoted and traded in Hong Kong dollars. As with other securities trading on the Hong Kong Stock Exchange, there are no restrictions on who can trade H shares.
Red-Chip Shares:	Securities of Hong Kong incorporated companies that trade on the Hong Kong stock exchange. They are quoted in Hong Kong dollars. Red chips are companies that are substantially owned directly or indirectly by the Chinese government and have the majority of their business interests in mainland China.

### The Welcome Mat

Clearly, investors are not lacking in confidence regarding China's long-term economic growth. They are more concerned with the underlying fundamental structure of the stock market, which has seen several government-initiated reforms fail one after the other due to the systematic problems that entangle the stock market.

Hoping to infuse its markets with some stability, in October 2004 China decided on a transitional approach to opening up its securities market. Under its Qualified Foreign Institutional Investor program, it cautiously opened its once exclusive A-share market to a handful of foreign institutional investors under strict quotas. These same foreign investors once were restricted to B shares. By targeting foreign institutional investors with strong fundamentals, fiscal transparency, and good governance, China is hoping to help its domestic fund management companies improve their management and operational skills by learning from their foreign counterparts. In addition, by bringing in investors more versed in the concept of value and consequently more demanding of IPO issuers, China is in essence showing its resolve to significantly reduce the corporate scandals that have all too often tarnished the reputation of its markets.

Yet to avoid short-term profit schemes, these qualified investors are not allowed to repatriate their funds during the first year of investment. After that, only 20 percent can be repatriated in a quarter. Whether these qualified investors will have made enough money to compensate for the lock-up period remains to be seen. They have, nonetheless, been seeking bigger allotments in the program. Note that the gains or share dividends resulting from these investments can be remitted in foreign currency after being approved.

### Empirical Methodology and Data

To test the diversification benefit of investing in China, this study uses a relatively new set of indexes built by competing index providers to facilitate investments in China. Indexes are chosen over individual securities for two main reasons. They reduce investment risk; also known as selection risk; an important consideration considering that

information on stocks is still not widely available in China. They also reduce costs which is another important consideration especially in the emerging markets where transaction costs can be significant. Indexes give investors access to a range of stocks for much less than it would cost to buy into individual stocks.

Since the manner in which an index is constructed can be construed as an investment strategy by itself, it is important to identify China's indexes and evaluate them in the first stage of the analysis. By overlooking them, this study could incorrectly assume that they exhibit the same return-risk characteristics. We examine a total of three different China's benchmarks although there are other indexes. These were carefully chosen because they were built on methodologies distinctly different from each other. The oldest of the three is the FTSE/Xinhua 25 Index. The Standard & Poor's/CITIC 50 Index and the Halter USX China Index are more recent additions.

Following Masters' methodology (1998) describing the difference between "global" and "investable" indexes<sup>6</sup>, the Standard & Poor's/CITIC 50 Index will be classified in the first category because it's comprised of A-shares, still largely off-limit to foreign investors and thereby "built up from the perspective of local investors." The other two will be categorized as investable indexes. These are free-float market capitalization indexes where 'free-float' refers to the fact that the shares of the companies comprising these indexes are readily available for trading in the market. As such, they exclude government and strategic holdings as well as other locked-in shares that are not readily available in the market. The analysis is performed using data provided by the indexes' respective compilers. The stock market returns include capital gains as well as dividend payments and are based on value-weighted indices.

The performance of an index fund is almost always judged against an index such the EAFE or S&P 500. In this case, since diversification is assessed from the perspective of a U.S. investor, the S&P 500 will be used as the performance benchmark. Hence, after summarizing both background and construction methodologies underlying these indexes, we will consider next their international correlation structure with the Standard & Poor's 500 Index as well as their risk/diversification benefits. Although the correlation among international markets may have increased in recent years as demonstrated by Solnik and Roulet (2000)<sup>7</sup>, casting some doubt on the benefit of international diversification, securities are still much less correlated across several countries especially when their business cycles are asynchronous as is the case for China and the U.S.

Even though trade between them has significantly increased, this study posits that persistent market imperfections in China will result in low correlations among the securities of these two countries. This assertion will be further established by calculating the betas of these indexes in relation to the S&P 500 index as a means to evaluate their sensitivity to domestic portfolios.

Next, the frequently used Sharpe Ratio (1966, 1994), which considers excess returns per unit of total risk as the appropriate measurement of risk-adjusted returns, is applied as a measure of performance that incorporates both risk and return.<sup>8</sup> Herein, it is used to demonstrate the economic benefits of index-specific diversification.

#### **Index Review**

The history of indexes related to China is relatively short compared to other benchmarks gauging Asia's financial markets. Both FTSE and Standard & Poor's have introduced indexes for asset management companies and other investors who see them as important performance benchmarks. A relative newcomer to the world of indexing, the Halter USX China Index, is also in direct competition with the other two index providers. The methodologies underlying the three indexes differ quite a bit from each other. A side-by-side comparison of the three indexes is shown in Table 2.

#### **FTSE/Xinhua China 25 Index**

FTSE/Xinhua, a joint venture between the U.K. FTSE group and China's Xinhua Financial Network, embraces the idea that the best shares issued by Chinese state-owned enterprises are those listed in Hong Kong and New York, leaving the domestic market with lesser performing ones. Quite a few Chinese issuers have pursued international listings, such as with the NYSE, as a way to gain both cachet and to access a foreign investor base considered more affluent.

All 25 companies represent China's largest and most liquid such as China Mobile and PetroChina or Cnooc Ltd.; the latter being an energy company whose relatively recent \$18.5 billion failed bid for Unocal (a fairly small energy player in U.S. markets but a significant provider of natural gas to Southeast Asia) brought it out of relative

obscurity. The index caps at 10 percent, the maximum weight for any individual company in the index to order to reduce exposure risk to larger stocks.

Of the four types of Chinese shares traded, the index has focused on two in particular: the H shares and the Red-Chip shares, both of which trade in Hong Kong. The former are issued by Chinese-incorporated companies and the latter by Hong Kong-incorporated ones. For investors willing to take on the risk of investing in Chinese companies, these shares logically tend to be more stable and provide greater corporate governance and financial reporting since they fall under the jurisdiction of Hong Kong's securities regulators. In comparison, B shares (not included in the index) represent the Shanghai- and Shenzhen-listed companies foreigners are allowed to buy. Although priced in Hong Kong in U.S. dollars, they are not subject to the same degree of regulatory scrutiny as the H and Red Chip shares.

Critics of the index often point out that it does not provide enough diversity among Chinese companies as it tracks only 25 stocks. Its large concentration risk is reflected in the weight of its top 10 companies, which, together, represent 60.1 percent of the index total market capitalization, per Table 2. A large concentration risk is also seen in the index sector allocation with five industries representing no less than 95.7 percent of the index total allocation, also per Table 2.

For example, note the large industry weight of financials that represents 24.9 percent of the index. The increasing presence of banks and insurance companies in the index could mean that this industry is finally coming together as the banking sector continues to undergo massive recapitalization and thorough restructuring. These changes are explained by the recent buying of small stakes in China's biggest lenders by highly visible finance

TABLE 2: INDEX CHARACTERISTICS

companies such as Royal Bank of Scotland and Merrill Lynch. As a result, shares of Chinese banks have soared, thereby increasing their market capitalization in the index.

On the other hand, this excessively large presence threatens the diversification of the index; especially considering that the sector is represented by only a few large state-owned banks and life insurance companies with lax risk controls. Indeed, it remains an open question whether taking a minority stake with little control will help foreign bankers turn China's financial system into a sector with strict oversight.

#### **Halter USX China Index**

In contrast to the fixed number of the components of the FTSE/Xinhua China 25 Index, the Halter USX China Index expands and contracts at the discretion of the index selection committee. The index includes 58 stocks as of March 31, 2007, up from 38 at inception. That number could rise substantially as more and more maturing companies meet the index committee's selection criteria.

The index tracks a mixture of American Depositary Receipts (ADRs) for Chinese companies and securities of companies that trade in the U.S. but mostly derive their revenues from China. The methodology clearly underscores the index provider's opinion that a search for local stocks will be marred with difficulties, especially for foreigners who are largely excluded from the A-share market to begin with. Loading the index with ADRs and U.S.-listed Chinese stocks issued by SEC-compliant companies such as China Life or China Netcom ostensibly constitutes a system with built-in protection. After all, U.S. financial markets are much more heavily regulated. For the funds that track the index, its dollar-denominated constituents are also easy to buy and sell since they trade in U.S. markets.

#### **Standard & Poor's/CITIC 50 Index**

Standard & Poor's partnered with CITIC Securities Co. Ltd, a local Chinese financial and investment company, to develop the Standard & Poor's/CITIC 50 Index on China's domestic A-shares. The index is created by a completely different methodology than the two other indexes. Only the A shares listed on the Shanghai and Shenzhen stock exchanges are eligible for possible inclusion in the index.

Its structure reflects the view that the index will be better served by the small and nimble companies with better management that constitute the A-share market. Seemingly, this type of market is where investors may have a better chance to find many of the active companies that could benefit from China's expansive growth. According to the index selection committee, the 50 stocks that comprise the index are not only issued by the soundest China-based companies but are also, on a float-adjusted basis, traded actively. All figures are in China's RMB, since it only incorporates shares locally traded.

Its top 10 holdings are also shown in Table 2. The index shares only two companies with the other two benchmarks: China Merchant is also included in the FTSE/Xinhua China 25 Index while China Petroleum figures prominently in all three benchmarks. On the other hand, although the standard & Poor's/CITIC 50 Index is also noticeably concentrated with 50.7 percent of its free-float market capitalization held by its top 10 holdings, this concentration risk, along with that of the Halter USX China Index, is undeniably lower than that of the FTSE/Xinhua Index, with 60.1 percent exposure to its top 10 holdings. The latter's heavier concentration clearly is due to its smaller size.

Considering that the index providers use different industry classification, additional work needs to be done to compare the three indexes in terms of sector allocation. This comparison also needs to be performed over a longer time horizon before drawing any meaningful conclusion, especially considering that their content is in constant flux. An unsurprisingly strong IPO calendar due to its buoyant economy implies that China's historical pattern of large changes to industry weights is unlikely to abate in the near future.

#### **Historical Performance Review and Interindex Correlations**

The cross-index correlations of returns appear below the diagonal in Table 3. While no measure of statistical significance is reported in the table, almost all correlations greater in absolute value than 0.04 are significant at the 5 percent level. In relation to the S&P 500, the study's proxy of the U.S. stock market, the coefficient is fairly large at 0.59 for the Halter USX China Index. In contrast, U.S. equities have weak correlation (0.10) with the FTSE/Xinhua Index and especially the Standard & Poor's/CITIC 50 Index (0.007). In turn, the FTSE/Xinhua Index has a relatively high positive correlation (0.64) with the Halter USX China Index. On the other hand, both are weakly correlated

with the Standard & Poor's/CITIC 50 Index with 0.20 and 0.12, respectively. Such information can be used to build a diversified portfolio by combining those assets with low positive correlations.

TABLE 3: PERFORMANCE EVALUATION AND CORRELATION

COEFFICIENTS OF THE DAILY RETURNS				
	S&P 500	FTSE	HALTER	CITIC
S&P 500	1.0000			
FTSE	0.1042	1.0000		
HALTER	0.5887	0.6389	1.0000	
CITIC	0.0067	0.1975	0.1185	1.0000

Although correlations change over time, these results suggest that U.S. investors are more likely to achieve gains on their international investments at a reduced risk if they purchase index-linked products based on the Standard & Poor's/CITIC 50 Index (especially) and to those tracking the FTSE/Xinhua Index. Results do not show funds tracking the Halter USX China Index as especially beneficial for U.S. investors. The segmentation of the Standard & Poor's/CITIC 50 Index from the U.S. markets could be explained by the source of its constituents. They are all selected within the A-share market known for its persisting restrictions on foreign ownership of domestic assets.

The high inter-index correlation between the Standard & Poor's 500 on the one hand and the Halter USX China Index on the other is at first quite intriguing. Normally, business cycles are not supposed to be synchronous between China and the U.S., especially considering that the former is still in the process of deregulating its capital markets. This result could be, however, traced to the source of the sample. In all likelihood, their risk-return characteristics have been altered by the fact that their components can be easily obtained in Hong Kong and the U.S. This hypothesis will be tested in the next section of this study.

Table 4 provides the U.S. beta measures of China's indexes and the associated coefficient of determination values ( $R^2$ ). Herein, the betas measure the sensitivity of these indexes to the U.S. stock market returns whereas  $R^2$  measures the fraction of the variance of index returns that can be explained by the U.S. market returns. Note that both the FTSE/Xinhua Index and especially the Halter USX China Index have a beta value that is much less than unity. In the case of the former, this means that U.S. stock market movements account for about 11 percent of the fluctuations in the index. Although this average shows that these indexes provide U.S. investors with a valuable opportunity to diversify internationally, it's the Standard & Poor's/CITIC 50 that has the lowest beta value with -0.03 and an  $R^2$  value of 0.04 percent. This means that of all three indexes, the monthly returns of this index behave the least like that of the S&P 500, thereby providing the most effective international diversification. This result is consistent with that indicated by their correlation coefficient which also suggests from a portfolio risk diversification perspective the desirability to invest in funds linked to this index.

Note that in the early stages of its development, the capital asset pricing model (CAPM) offered a straightforward explanation of the relationship between risk and expected return by depicting the Security Market Line (SML) over the range  $\beta \geq 0$ . It's only after Ross and Westerfield (1988)<sup>9</sup> explicitly showed the SML over both positive and negative beta values that the misspecification of beta was corrected. The opposite movement of a negative beta makes negative beta assets particularly valuable additions to any portfolios because even if the expected return of the new portfolio falls in response to the decline in the portfolio's beta, its risk also declines due to the offsetting movements in the negative beta security. In practice, negative beta stocks such as gold stocks and liquidation companies are hard to find since they are rarely listed. In the case of the Standard & Poor's/CITIC 50, the index components seemingly have enough negative beta values to introduce a downward bias in the slope of the regression. This is most likely due to the fact that most of the A shares included in the index are not moving in tandem with the components of the S&P 500 as our prior correlation results indicated.

#### **Performance Review in Terms of Index Risk-Return Characteristics**

Portfolio theory suggests that investors should select funds by considering both returns and risk. Rational investors may be willing to assume additional risk if they are sufficiently compensated by a higher expected return. So we now expand this analysis to cover both return and risk associated with China's indexes.

Table 5 shows summary statistics of the daily returns for the Standard & Poor's 500 in relation to the three stock market indexes under review. The annualized means and standard deviations of daily returns are provided for each year over the 2001-2005 period for the Standard & Poor's 500, FTSE/Xinhua 25 and the Standard & Poor's/CITIC 50, but only for the 2004-2005 time frame for the Halter USX China Index due to its more limited historical performance. Returns, standard deviations, and Sharpe Ratios were also calculated for the two-, three-, and five-year holding horizons except for the Halter USX China Index due to its shorter performance history.

Note that, because the study's horizon includes years when the benchmarks underperformed U.S. Treasury bills, a few of these ratios are negative. For example, both FTSE/Xinhua 25 and Standard & Poor's/CITIC China along with the S&P 500 underperformed U.S. Treasuries in 2001 and 2002. The Standard & Poor's/CITIC China Index in particular underperformed U.S. Treasury bills in four out of the five years that constitute its data history. The Halter USX China Index, on the other hand, underperformed in both 2004 and 2005.

TABLE 5: RISK-RETURN CHARACTERISTICS\*

	S&P 500	U.S. T-Bills	FTSE Xinhua 25	S&P/CITIC 50	Halter USX China
1998 (%)	28.58	4.82	na	na	na
2001 (%)	-11.89	3.45	-5.51	-24.45	na

3 -Yr. Sharpe Ratio	1.37	-----	1.39	0.14	na
5 -Yr. Sharpe Ratio	-0.11	-----	0.64	-0.44	na

\* As of December 31, 2005

Table 5 shows summary statistics of the annualized means and standard deviations of monthly returns for the Standard & Poor's 500 in relation to the three stock market indexes over the 2001-2005 period. Monthly rates of return are calculated by the standard method:  $(Pt - Pt-1)/Pt-1$  where Pt =current month price and Pt-1 = last month's price.

The Sharpe measure is computed using  $S_i = [R_i - RFR]/\sigma_i$  where  $S_i$  is the measurement of the index excess annualized return ( $R_i$ ) over the annualized 90-day risk-free Treasury Bills (RFR) return obtained for each month from the Federal Reserve Bank adjusted for the index volatility as measured by annualized standard deviation ( $\sigma_i$ ) of the monthly index returns.

The results of this peculiar time period translate into a total of four negative Sharpe Ratios out of the 10 shown in Table 5: the five-year ratio for the Standard & Poor's 500, the two- and five-year ratios for the Standard & Poor's/CITIC 50, and the two-year ratio for the Halter USX China index, the only ratio that could be calculated for this more recent benchmark. The notable exception is the FTSE/Xinhua 25 as it displays positive Sharpe Ratios throughout the three horizons. This outstanding risk-adjusted performance is most likely owed to its outstanding 101 percent annualized return in 2003.

In view of the Halter USX China Index's negative Sharpe Ratio and its clearly limiting shorter history, for now this index cannot make a meaningful contribution to our risk-adjusted return analysis. Furthermore, from the point of view of the U.S. investor, its high correlation with the Standard & Poor's 500 as noted in Table 2 (0.59) doesn't mitigate its inclusion in a diversified global portfolio. Albeit based on a short performance history, this strong positive correlation in returns for the two indexes prevents any meaningful reduction in risk when they are combined.

In contrast, the FTSE/Xinhua 25 seems at first the ideal index with positive Sharpe Ratios over the three holding horizons. Its three-year ratio, in particular, compares favorably with that of the Standard & Poor's 500 at 1.39 versus 1.37 for the latter. This, of course, could appeal to U.S. investors interested in translating China's rapid growth into investment gains. With one of the major tenets of investment theory stating that investors should diversify their portfolio by spreading the risk, its low positive correlation of 0.11 with the S&P 500 constitutes risk reduction via diversification without sacrificing risk-adjusted returns as indicated by its high Sharpe ratio. From these two important perspectives, the FTSE/Xinhua certainly provides diversification benefits to the U.S. investor interested in adding China to his or her investment portfolio.

In comparison, over the last three years, the only investment horizon over which its Sharpe Ratio could be meaningfully interpreted, the Standard & Poor's/CITIC 50 conceivably shows at best a modest risk-adjusted gain with 0.14 compared to 1.39 for the FTSE/Xinhua. Nonetheless, its potential diversification benefits are huge if its independence vis-à-vis the Standard & Poor's 500 as indicated (correlation equal to 0.0067) is any indication. Hence products tracking this index could also provide effective diversification tools for the globally minded investors.

In a CAPM world, this also means that the risk-adjusted return difference between the FTSE/Xinhua and the Standard & Poor's/CITIC 50 comes from the difference in the beta risk. As Table 3 shows, with a beta of -0.03 the Standard & Poor's/CITIC 50 exhibits the lowest sensitivity to the S&P 500, thereby demonstrating that by investing in the A share market, U.S. investors can gain additional diversification benefits.

## Conclusion

The emergence of China as an economic force has created tempting investment opportunities for globally-minded investors. A thorough review of three indexes shows that they are by no means redundant. While there is some minor overlap in holdings they are of very different construction methodologies.

As investable indexes, the Halter USX China Index incorporates a basket of China-based companies that have either ADRs or New York-registered shares that trade on the New York Stock Exchange while the FTSE/Xinhua 25 Index is mainly constituted of H- and Red-Chip shares trading in Hong Kong. The "global" Standard & Poor's/CITIC 50 Index solely concentrates on China's A-share market. But, overall, this study has demonstrated that investors with higher tolerance for risk may consider that benefits from international portfolio diversification are likely to be achieved by purchasing products tracking the Standard & Poor's/CITIC 50 Index. In view of their low correlation with the S&P 500 and high Sharpe ratio, this study also indicates that products tracking the FTSE/Xinhua 25 Index are also capable of providing global investors with significant diversification benefits. The same cannot be said of the Halter USX China Index.

Nonetheless, before these results are implemented in a meaningful global portfolio strategy, they need to be reassessed in future research as these relatively recent indexes continue to mature and further observations are available. Considering the dynamic characteristics of international correlations and the other statistical tools used in this analysis, a more substantial historical database can only enhance the robustness of the study's results.

# The Significance of Lightly Regulated Stock Markets for Companies, Venture Capitalists, Shareholders, and Society, as Exemplified by the Frankfurt Stock Exchange's Entry Standard

*Sönke Knop, Sknop@edicto.de  
edicto GmbH, Germany*

## Abstract

On October 25, 2005, the German Stock Exchange introduced the new Entry Standard. The objective of this new stock exchange segment based on the Open Market was to provide an attractive trade platform for small- and mid-cap corporations. For this purpose, the segment was only lightly regulated in order to allow for inexpensive listing admission as well as low follow-up costs for stock listings. Still, the requirements and listing obligations should provide market participants with sufficient information about the corporations in order to allow for efficient trading. By the time the segment was started, 11 corporations decided on the Entry Standard. Yet only little more than two years later, the first corporation had to file for insolvency. The questions that arise, then, are whether the new stock segment was able to fulfill the expectations, whether the chosen regulations have been sufficient and right, and what the role of lightly regulated stock listings can be in an economy.

## Background

In Germany, the burst of the high-tech bubble in early 2000 was followed by a phase of illiquid securities markets for small and medium-sized companies. These values generated little to no turnover at the stock exchange, and capital increases were virtually impossible due to the disinterest of both institutional and private investors. This fact became obvious particularly where new stock listings were concerned. While the number of companies aspiring to enter the German capital markets reached a post-war high at 168 in 1999, only one single enterprise dared to make the leap into the stock market in 2003. The driving force for the previously high number of initial public offerings – the New Market – had lost its significance as a result of numerous scandals and bankruptcies. Though the New Market was not even a lightly regulated market, measures to enhance the attraction of the domestic capital markets included an increased focus on control and regulation. For this reason, the German Stock Exchange reorganized the market segments as of January 01, 2003. The Prime Standard was created for corporations with an international scope. Corporations with a rather national scope were traded on the General Standard. This segment does not require English translations of notifications. The New Market was closed and not followed by a similar segment. The only “segment” below the Prime and General Standards was a free market, now Open Market. This Open Market, however, is not considered as organized stock trade. Mostly foreign securities and second-tier stocks are traded here.

## EU Regulated Stock Markets in Germany

While both the General Standard and the Prime Standard are EU-regulated stock markets<sup>1</sup>, the General Standard represents the minimum legal requirements for such markets in Germany<sup>2</sup>.

The results of the high transparency requirements are regular reports for shareholders. Thus, corporations are required to provide quarterly business development reports. In addition, they need to immediately report all facts relevant to the share value in observance of Article 15 of the German Stock Trade Law. Failure to comply with these regulations may result in severe punishment<sup>3</sup>. The requirements of the General Standard can be considered as the basic framework of the follow-up listing duties on the EU-regulated market, while the requirements of the Prime Standards go above and beyond these regulations. The follow-up duties for listings on the General Standard are:

Additional obligations arising from admission to the General Standard:

- Annual reports and half-year reports according to international balancing standards such as IFRS or US-GAAP.
- Disclosure of directors' dealings<sup>4</sup>.
- Obligation to publish ad-hoc publications.
- Notifications on reporting thresholds.
- Obligatory offer in case of change in control<sup>5</sup>.
- Publications may be in German or English.
- Interim reports for Q1 and Q2.

**The following regulations apply to corporations listed on the Prime Standard:**

Additional obligations arising from admission to the Prime Standard<sup>6</sup>:

- Quarterly reports in German and English
- Publication of a corporate calendar
- Organization of at least one analysts' conference each year
- Ad-hoc publications also in English
- Additional obligations arising from admission to the General Standard

Due to the similarity of the obligations, the operational costs, too, are almost identical. Translation costs for the publications are estimated at several thousand Euros annually. The annual analysts' conference may take place as part of another event such as the annual Equity Forum organized by the German Stock Exchange. The costs then amount to e.g. merely 1,000 Euro for the presentation<sup>7</sup>. Yet particularly requirements such as international accounting and balancing as well as the capacity for immediate quarterly reports should involve significant expenses on the part of small- and mid-caps. However, even if we consider only the communications expenses and those directly involved with the listing, the total costs are as high as 200 to 700 thousand Euro<sup>8</sup>. It becomes obvious that for a small corporation with a turnover of perhaps 10 to 20 million Euros, such an amount is hardly affordable.

## The Regulations of the Entry Standard

In order to create an attractive segment particularly for small-caps, the German Stock Exchange introduced the Entry Standard<sup>9</sup>. The Entry Standard is a not a EU-regulated capital market. The objective of this segment, as communicated in a workshop prior to its official opening<sup>10</sup>, was to lower the entry threshold for new listings and therefore to facilitate the first step into the capital market for these corporations. After the experiences with the New Market, which owed its temporary strong growth mainly to private investors<sup>11</sup>, the Entry Standard from its very beginnings addressed well-informed and risk-conscious investor groups, since lower listing requirements involve a higher risk for investors<sup>12</sup>.

Corporations listed on the Entry Standard must fulfill the following requirements:

On the corporation's Web site:

- Publication of the witnessed consolidated annual balance including consolidated annual report, according to national or international accounting standards.
- Publication of a current short corporation profile and a corporate calendar.
- Publication of interim reports after the first two quarters of the fiscal year.
- Immediate disclosure of all essential corporate news and facts that may considerably impact the share price.

The inclusion of shares in trading does not constitute a listing according to German Bonds and Securities Law. Since the Open Market and the Entry Standard are therefore not organized markets according to Article 2, Section 5 of the German Securities Trade Law, a number of regulations do not apply. These include the obligation to publish ad-hoc notifications, the obligation to issue notifications when certain thresholds have been reached, and the obligation to publish further interim reports. However, these low-level regulations should suffice for companies listed on the Entry Standard to differentiate them selves as more transparent than other corporations listed on the Open Market.

## Listing Costs on the Entry Standard

Parallel to our consideration of the Prime Standard and the General Standard, we will concentrate in the case of the Entry Standard only on the direct listing costs. Accounting costs will therefore not be considered, though the option to account according to German Trade Law constitutes another cost advantage for the corporations.

The current costs of communications and listing therefore amount roughly to the numbers in table 1, though the actual costs may be dramatically higher or lower in individual cases.

TABLE 1: ANNUAL LISTING COSTS ON THE ENTRY STANDARD

Area	Type of costs	Costs in Euro
Communications	Annual shareholders' meeting	10,000
	Creation of the annual report, without print, distribution on CD-ROM	20,000
	IR agency for publications, current consulting, investor and press road shows	30,000
	Distribution of press releases, investors' travel expenses, expenses press talks	5,000
Listing	German Stock Exchange fee	5,000
Trading	Designated sponsor	25,000
Coverage	Creation of research material	10,000
<b>Total</b>		<b>approx. 105,000</b>

Source: edicto internal survey

This calculation serves to show that the lower level of regulation as compared to EU-regulated markets results in significantly lower listing costs. As far as the obligations arising from admission to the segment are concerned, the Entry Standard seems to offer the desired cost advantage.

This leaves us with the question whether the cost advantage makes the segment attractive to companies.

### **The Distribution of Listed Companies across the Different Segments**

As mentioned before, the Entry Standard was launched in October, 2005. Since then, 83 companies have decided on this segment, whether through a segment change, a public offering with increase in capital, or an ordinary listing. For the sake of comparison: 386 companies are listed on the Prime Standard and 371 on the General Standard<sup>13</sup>. The Open Market has the most listings by a wide margin, yet we should bear in mind that mostly foreign bonds are traded here. For these bonds, the Open Market is usually a second trading place after the home country or other markets.

FI

G. 1: NUMBER OF LISTED COMPANIES IN LATE FEBRUARY 2007

Source: German Stock Exchange data

This makes the Entry Standard, roughly two and a half years after its start, the segment with the lowest number of listed companies. A comparison of market capitalizations and trade volumes also shows the Entry Standard's low level of significance. The combined market capitalization of all Entry Standard companies equals less than 1% of the combined market capitalization of the Prime Standard companies. The difference in trade volumes is even more extreme, which illustrates the weak liquidity of these stocks – a fact likely to cause particularly institutional investors to avoid individual stocks in this segment. A comparison with the market capitalizations of the Open Market would not offer any useful results, as the Open Market includes a large proportion of secondary listings of foreign bonds.

TABLE 2: MARKET CAPITALIZATION AND TRADE VOLUME PER SEGMENT

	Prime All Share	General Standard	Entry Standard	Open Market
Market capitalization in Euro	878*	N/A	6	N/A
Trade volume in million Euros per month.	183.9	3.0	0.3	15.6

Source: German Stock Exchange, *facts & figures* 03/2007

\* Basis free float

If we consider the number of initial public offers, however, the comparison of the segments yields different results. We find that by now, companies have come to perceive the Entry Standard as an attractive market.

### Attractiveness of Segments as Reflected by the Number of New Listings

The number of initial public offers depends on several factors. The liquidity of the markets plays a big role – are investors at all willing to buy new issues? Furthermore, companies ready to go public must also be willing to make use of the capital market and the ensuing obligations. The attractiveness of the trade segment as far as listing and follow-up costs are involved is certainly another important criterion<sup>14</sup>.

It is therefore not surprising that the annual number of initial public offers is subject to considerable fluctuation. Thus, the years of the New Market boom saw more than 150 new listings p.a. In the context of the severe price decline on the stock markets and the weak economy in the years following the burst of the New Market bubble, the number of new listings continued to decrease dramatically reaching its lowest point in 2003 when only one company went public. By 2006, however, the numbers had increased again to 210 new admissions, clearly surpassing even the high mark of the New Market era.

FIG.

FIG. 2: NUMBER OF NEW LISTINGS IN GERMANY IN THE PAST 10 YEARS

Source: German Stock Exchange

New listings here include re-listings and admissions without increase in capital as well as classic IPO's, i.e. public offers with capital increases. Due to this heterogeneity, we will not consider the costs involved in the listing at this point. The mere decision whether to enter the Entry Standard with an exposé or with a prospectus will likely entail cost differences of 50,000 Euro or more<sup>15</sup>.

The 210 companies that went public in 2006 are distributed as follows over the individual segments:

FIG. 3: NEW ADMISSIONS IN 2006 PER SEGMENT

Source: German Stock Exchange

If we do not count the Open Market, the Entry Standard reached the highest proportion of new admissions – 59 – in 2006. The General Standard, ranging between the Prime Standard and the Entry Standard as far as the requirements and obligations are concerned, played a subordinate role with only 9 new listings.

## Market Capitalization and Issuing Volume of the Newly Listed Companies

The sheer number of new admissions does not offer a sufficient basis for an evaluation of the respective segments' significance, since these segments address different companies. This fact should be reflected by the companies' market placements and issuing volumes. Pure listings, i.e. admissions in the segment without capitalization, were not included in these calculations. For the Entry Standard, these constituted a considerable proportion. The German Stock Exchange reports that only 35 of 59 newly listed Entry Standard companies increased their capital.

The average market capitalization at the time of the IPO illustrates the fact that it is mostly small companies who consider the Entry Standard as an attractive segment. Thus, the companies were evaluated at an average of 45 million Euros. The average evaluation of companies on the General Standard was 74 million Euros, while on the Prime Standard, companies' values were estimated at an average of 661 million Euro. The average market capitalization upon IPO of the companies listed in the highest segment was therefore more than ten times higher than that of Entry Standard companies.

A similar picture emerges if we consider the average issuing volume. Companies increasing their capital in the context of an initial offer were able to collect an average of 225 million Euro on the Prime Standard, whereas the average on the Entry Standard was 12 million Euros.

TABLE 3: MARKET CAPITALIZATION UPON INITIAL LISTING AND ISSUING VOLUME OF COMPANIES THAT INCREASED THEIR CAPITAL IN THE CONTEXT OF THEIR IPO IN 2006 PER SEGMENT

	Prime Standard	General Standard	Entry Standard
Number of companies surveyed	32	4	35
Average* market capitalization	661	74	45
Average* issuing volume	225	16	12

Source: German Stock Exchange database, own calculations, \*in million Euro

The individual issuing volumes also reflect the attractiveness of the Entry Standard for small-caps. Of the 35 companies that were newly admitted to the Entry Standard, 19 did not collect more than 10 million Euros, while 12 collected between 10 and 20 million Euros. Only one company placed more than 100 million Euros.

On the Prime Standard, only one company out of 32 had an issuing volume of 20 million or lower. Two companies even collected more than 1 billion Euros.

TABLE 4: ISSUING VOLUME CATEGORIES PER SEGMENT 2006

Up to (million €)	10	20	50	100	500	1.000	>1.000	Number
Prime Standard	0	1	7	11	10	1	2	32
General Standard	1	3	0	0	0	0	0	4
Entry Standard	19	12	3	1	0	0	0	35

Source: German Stock Exchange database, own calculations

This puts the total issuing volume numbers in perspective. The 35 Entry Standard companies issued a total of approximately 436 million Euros. Thus, the placement volume of the Entry Standard only constituted a mere 6% of the total issuing volume of all segments in 2006. Numerous single companies that decided to go public on the Prime Standard were able to collect more money in 2006 than all Entry Standard companies combined.

FIG. 4: ISSUING VOLUMES PER SEGMENT 2006

Source: own calculations

### The Performance of the Entry Standard

As pointed out above, the lighter listing requirements of the Entry Standard result in possibly higher risks. The trading range of the Entry Standard, as illustrated below by the performance index, reflects a clear initial out performance in comparison to the Prime All Share for the start of the segment in October 2005. Yet the shares, unlike those on the Prime Standard, did not succeed in recovering from the adjustments starting in May 2006. While the prices on the Prime Standard have started to pick up again, the Entry Standard even had to take further losses. After that, the market shows little movement until late March 2007. The Prime All-Share shows an out performance of approximately 35% in the period under consideration.

FIG. 5: DEVELOPMENT OF THE ENTRY STANDARD PERFORMANCE INDEX SINCE THE INTRODUCTION OF THE SEGMENT

### A Comparison with the Alternative Investment Market (AIM)

Like the Entry Standard, the Alternative Investment Market (AIM) in London is a non-EU-regulated market. Listing obligations for the companies are similar, requiring annual reports and interim reports as well as disclosure of news and facts that may be significant to a company's future or share price<sup>16</sup>.

The AIM has a considerably longer tradition than the Entry Standard, the segment having been introduced as early as 1995. Since that time until the end of September, 2006, more than 2,500 companies have been listed on the AIM, collecting a total of more than 34 billion £. However, a significant percentage of the companies that were listed on the AIM have by now disappeared from the segment, so that the number of companies currently listed is approximately 1,640<sup>17</sup>.

### The Economic Significance of the Entry Standard

The introduction of the Entry Standard led to hopes that this new segment would provide investment and venture capitalists with an interesting exit channel in Germany. This was expected to have a positive impact on the financing options of smaller companies. The Private Equity industry in general does consider the Entry Standard to be an additional exit channel; still, the majority of participants in an April 2006 survey stated that the introduction of the new segment was irrelevant to their own decision-making<sup>18</sup>.

The large majority of investment capitalists, on the other hand, consider the introduction of the Entry Standard to be a significant step forward<sup>19</sup>. The segment was even rated the top exit channel. These evaluations were made at a time when the index showed approximately 60% price gains. Since then, the prices have fallen considerably. Yet despite that fact, the segment does not seem to have lost its appeal to the companies. In Q1 2007, 12 companies have already decided to go public on the Entry Standard, as opposed to 8 who chose either the General Standard or the Prime Standard.

## Conclusion

The Entry Standard was conceptualized and introduced especially for small- and mid-caps, as a simple and affordable route into the capital market. The Entry Standard posed clearly lighter requirements on companies than the higher segments, while simultaneously offering a clear distinction from purely Open Market companies. The relatively high number of new public offerings illustrates the fact that the segment is getting established. However, the first bankruptcy two years after the introduction makes clear that the risks of such lightly regulated markets should not be underestimated. Yet market participants seem to have learned from the New Market craze. There are constant reminders that the Entry Standard is a segment for professional investors. With a total issuing volume of less than 500 million Euros, the actual capacity of the market, as compared to the Prime Standard, is rather small. Yet for companies that formerly had no access to the capital market, this is a considerable capitalization opportunity. The Entry Standard constitutes not only possibility for investment companies to sell shares and thus obtain fresh funds for new investments. The segment and its large number of new admissions have also brought an upward cycle for service providers offering services involved in IPO's and listings. Among these service providers are issuing banks and IR consultants as well as newspapers and magazines that have seen some, though not strong, increase of ad sales in this area. We should hope, therefore, that the first bankruptcy may serve as a warning signal and that market participants and banking institutes do not succumb to short-term coverage thinking in taking companies to the Entry Standard that could shortly thereafter damage the segment's reputation.

# A Statistical Analysis of the Value Created by Tracking Stocks of Selected US Companies

Ram B Misra, [misrar@mail.montclair.edu](mailto:misrar@mail.montclair.edu)

Montclair State University, USA

## Abstract

A tracking stock, also known as targeted stock or letter stock, is issued as a new class of common stock that represents the financial performance of a specific division or subsidiary of the parent company. Since the underlying assets are retained by the parent company, investors can own a high-flying growth company with less risk. If the tracked company is a fledging operation, it can maintain the backing and credit rating of a deep-pocketed parent.

The study reported in this paper shows that there is an upward trend in excess returns starting 45 days before the announcement date and spiking on the announcement date. Over the period of 45 days preceding the announcement, the value of the portfolio goes up roughly by 5% over the market. There is almost a jump of 6% on the day of the announcement. Then, in the next 45 days after the announcement, most of the value is gone even though not all is lost -the portfolio still maintains approximately 2% gain over the market. However, as indicated by the hypothesis testing, the value is not statistically significant. This phenomenon -sustaining some value gain (2% for our portfolio). Such an increase is explained not as evidence of a value creation but as a result of other events that take place coincident to issuance of tracking stocks.

## Introduction

A tracking stock, also known as a targeted stock or letter stock, is issued as a new class of common stock that represents the financial performance of a specific division or subsidiary of the parent company. Since the underlying assets are retained by the parent company, investors can own a high-flying growth company with less risk. If the tracked company is a fledging operation, it can maintain the backing and credit rating of a deep-pocketed parent.

Prior to 1994, tracking stock was the least used technique to separate a subsidiary from its parent. Most companies created better value for their shareholders by spinning off the unit or carving it out through a partial initial public offering or divesting it. Shareholder value creation is now such a dominant, driving objective in global business that most companies are evaluating their portfolios on a regular basis, to assess the synergies that exist between businesses and to estimate the value of individual businesses to themselves and to other potential owners. In theory, the parent company's stock price should already fully reflect the value of the tracking stock subsidiary. However, in reality, companies are shrewdly timing the issuance of tracking stocks while the market will reward them with high valuations. General Motors pioneered the use of tracking stock with its acquisition of Electronic Data Systems in 1984 and Hughes Electronics in 1985. Between 1984 and 1998, over forty tracking stocks have been issued or have been under consideration. (Appendix A). Since 1998 not only many companies have not issued tracking stocks but many parent companies have also withdrawn most of what they issued in prior years (Ross, Westerfield and Jaffe, 2008).

However, there is a renewed interest (Lashinsky, 2007) in using this tool by EMC, the parent company of VMware, the division of EMC for which EMC announced an IPO plan in February, 2007. Since the announcement the stock of EMC has gone up from \$14 to \$17 (an appreciation of roughly 20%).

There are three methods of issuing a tracking stock. The first is an underwritten offering which has the ability to raise capital for the tracking company; market the companies story during a road show, and it ensures the distribution of shares to the various interested investors. The risk of this approach is market risk. The second method distributes the tracking stock shares to the parent company shareholders. This approach provides the parent company shareholders with tracking stock shares. The downside to this approach is that it raises no capital and it does not guarantee that the existing parent shareholders will hold the tracking shares for the long haul. The third method is an exchange of shares by the tracking shareholders with the parent company shareholders. This method provides the

parent company shareholders with tracking shares, however the downside is that the parent company shareholders need to relinquish their parent company shares to participate. Of these three, the first is the most popular.

The purpose of this paper is to explore the use of issuing tracking stocks by corporations as a tool for restructuring. This study is along the same lines used in the pioneering study by Fama, Fisher, Jensen, and Roll (1969).

## **Literature Review**

The most fundamental work applicable to spin-offs, carve-outs and tracking stocks was published by Fama, Fisher, Jensen, and Roll (1969) in which they examined the impact of new information on stock prices. Michaely and Shaw (1995) compared spin-offs and carve-outs as the two choices of going public. While Stephen (1995) and Logue, Steward and Walsh (1996) made a case for issuing tracking stocks by examining how targeted (tracking) stocks could create value for a corporation, Pearson (1998) pointed out the difficulties in creating spin-offs. Allen and McConnell (1998) discussed managerial discretions in issuing equity carve-outs. Anslinger, Klepper, and Subramaniam (1999), Banham (1999), Cowen (1999) and Tessler (1999) made a case for restructuring through spin-offs, equity carve-outs and tracking stocks to create shareholder value. Callahan (1999) reported mixed results for Ziff-Davis that had issued a tracking stock. Coy (1999) warned that tracking stocks were accidents waiting to happen. Kedrosky (1999) called issuing of tracking stocks a delusion and Syre and Stein (1999) reported that Genzyme tracking stocks were off track on returns.

## **Issuing Tracking Stocks as Corporate Restructuring Strategy**

The current literature (Anslinger, Klepper, Subramaniam, 1999; Cowen, 1999; Stephen, 1995), available on the subject of tracking stocks discusses the following primary advantages and disadvantages, key features and mechanics associated with issuing of tracking stocks.

### **Advantages**

- Higher valuations -tracking stocks "unlock" the hidden value of high-growth businesses within established companies by creating a fully traded and separately valued equity security.
- Clarify the company's distinct businesses -tracking stock allows the market to more accurately value the disparate business according to fundamentals that are more relevant to each particular unit. Separate equity market identities create a "pure play." Investors can have more direct access to specific businesses run by a conglomerate-
- Access to equity capital -tracking stock can raise millions in fresh cash by generating valuable currency to fund acquisitions.
- Maintain full control -tracking stock allows the parent company to take advantage of restructuring without complete separation.
- Subsidiary could take advantage of its parent company's capital structure to borrow at lower costs. Tracking stock also maintains the ability of disaggregated entities to borrow at the debt rating of the consolidated company.
- Tax benefits -tracking stock avoids the tax consequences of a spin-off and net operating losses can be used to offset taxable profits thereby reducing taxes.
- Recruit and retain talent -can provide management incentives by issuing high value stock options for tracking stock to attract industry stars and maintain key executives.
- Improve performance of the business unit by exposing them to the market and thus attracting a more focused analyst community and new investors.
- Parent company can retain operating synergies and economies of scale in administrative costs.

### **Disadvantages**

- Tracking stock shareholders have limited rights.
- Tracking stock's performance can be a drag on or cast a shadow over other units and vice-versa.

- Tracking stock can create divisions between shareholders that could put one group or the other at a disadvantage.
- Tracking stock could create obstacles for a take over. (I. e., approval by parent and tracking stock shareholders can be a hurdle for a would-be buyer).
- Tax implications of unwinding the deal could create high disincentives in the event of a potential third party sale of the subsidiary .
- Tracking stock may be left out of industry activity such as consolidations because of its structure.
- Potential conflicts of interest can occur with one board of directors for different sets of shareholders.
- Tracking stock can pit classes of shareholders against one another leading to knotty lawsuits.

#### **Key Features and Mechanics**

- There is no legal separation of the company. Tracking stock represents an interest in the company not direct ownership of a stand-alone business.
- Determine structure -Can be a business division, geographic segment, product line or any other separable business unit.
- Determine method of creation -Can be distributed as dividend to shareholders of parent company or issued via initial public offering.
- Mayor may not have voting rights. Votes per share can be fixed or floating based on relative market share.
- Dividends are optional.
- Can create fully traded and separately valued equity security .Shares can be exchangeable or redeemable.
- Shareholder has no direct claim on the tracked assets. Assets are not physically separated from those of the parent. Parent company continues to own assets-
- Company consolidates the tracked division for tax and accounting purposes. A minimum of three sets of financial statements must be prepared -one for the consolidated company and one each for the two separate stocks. Need to develop an earnings per share methodology. EPS must be reported separately.
- Company continues to file consolidated federal income tax return
- All assets, liabilities, income, expenses and cash flows must be divided and allocated to each of the tracking stock. A future change in allocation methodology could be a change in accounting.
- There are no formal auditing requirements. There is more flexibility with regards to disclosure. There are no accounting requirements for arms length transactions.
- Recommended audit to determine if allocation methodology is reasonable, and appropriately applied for the correct amounts.
- Corporate governance provisions -Control remains in the hands of the parent company's board. A single board must now be responsive to more than one set of shareholders. There is an additional burden to communicate effectively and consistently with each group.
- Fiduciary responsibilities -good segregation of economics, internal management issues, cost allocation issues, inter-company transaction policies, arms length transfer pricing.
- The potential for conflict of interest between the two entities: shared resources: regulatory issues: relationships with competitors and/or customers.
- Shareholder vote required -Must go to shareholders for proxy to amend corporate charter and certificate of incorporation to change the nature of the common stock into two classes. Must file additional proxy if you increase the number of shares-
- SEC Review -Must prepare registration statements for distribution and offering. Pro-forma financial statements are required for a public offering.
- Tracking stock is not taxable after implementation; however, in his 1999 budget, US President Bill Clinton announced plans to tax tracking shares as asset sales starting October 1.
- Liquidation Rights -should develop formula to unwind or agreed upon exchange rates at time of creation.
- May need to develop new stock based compensation plans or amend existing plans.

- Liability Overhang -tracking stock shareholders are subject to the risks associated with the issuing company businesses and liabilities.

#### **Valuation of Tracking Stock**

A primary consideration in the issuance of tracking stock is how the market will value the security. In addition to typical equity valuation measures, most notably projections of revenues and earnings, tracking stockowners have additional considerations, including limited control of the tracked subsidiary. The tracked subsidiary is also secure from a takeover unless the parent company is the target and tracking stock may trade at an overhang discount if less than 100% of the equity interest in the tracked division is initially sold or distributed. Exposure to the liabilities of the parent company is also a consideration. Tracking stockowners have liquidation rights in the assets of the entire parent company, not the tracked division.

## **Quantitative Analysis**

#### **Description of Approach to Stock Valuation and Hypothesis Testing**

The null hypothesis for this analysis is the proposition that the issuance of tracking stocks does not, in and of itself, create any additional value to a company, unless there are events coupled with some other decision which may create value. This null hypothesis is based on the assumption that, in a perfect (efficient) market that excludes the possible tax shield effects (the Modigliani-Miller Proposition (Haugen, 2001), the value of a company (its assets and future cash flows) is already captured in its stock price and that the mechanism used by a company to finance its investments has no effect on that value. This hypothesis is further supported by the fact the issuance of tracking stocks does not raise debt amount and does not have any impact on the value of the tax shield on borrowing. The alternate hypothesis is that the mechanism of issuing tracking stocks indeed creates additional value. The proposition here is that such a value will be created at the time of the announcement and not necessarily at the actual issuance of a tracking stock. This timing issue is based on the concept of market efficiency, etc.

In order to test the hypothesis, the value of the parent company before the announcement is compared with the value of the parent company and the tracking stock subsequent to the announcement

#### **Stock Valuation Technique**

Since 1983, 17 parent companies have issued 26 tracking stocks. The daily stock prices for the parent companies were collected over a 90-day period (45 days prior to and 45 days post first announcement). The market response for each such issue was measured by calculating the expected and actual daily returns before the announcement and after. Actual daily returns were calculated by using a mathematical approximation that consisted of calculating the natural logarithm of the ratio of stock prices on any consecutive days  $\{\ln [P(t+1)/P(t)] - 1\}$ . This is a standard approach that is used in many event studies and suggested by Mesznick (2000).

In all such studies, the intent is to verify whether or not a particular event does generate excess return opportunities for shareholders owning the stock at the time of the announcement. The expected returns are calculated using the **betas** before and the betas after the announcement. The assumption here is that the announcement to issue a tracking stock may change the risk of the firm because it may be a division that is riskier or less risky than the rest. Setting it on its own, as is done in a tracking stock issue, will necessarily change the beta of the leftover divisions. Betas were calculated by conducting a regression analysis between the actual daily return of the parent company and the actual daily return of the market as measured by the S&P index over the same 90-day period. It should be noted that each of the various 90-day periods is unique for each parent/tracking stock combination, as determined by the  $T = 0$  (the day of the announcement for each parent/tracking stock).

## **Analysis Methodology**

As stated earlier, the basic methodology used here to analyze the excess daily returns and the cumulative excess return for each day over the 90-day period for each parent and issue combination. Next, this data is analyzed as if it belongs to a portfolio of all the companies that have issued tracking stocks. To do this, we take the sum of all excess

returns for each day. Due to the portfolio diversification, the excess return of the portfolio should be negligible for all days except if the event creates value. In the latter case, the excess return for the period around  $t=0$  should spike. We plot this data and also conduct hypothesis testing for each parent/issue combination as well as for the portfolio.

**Analysis**

From an initial potential list of 21 parent companies and issues, selective information (daily stock prices and the date of the tracking issue announcement) was available for only 13 combinations. Data collection also included (1) S+P index daily final values from June 1992 to October 1999, which covered the time period of this analysis. The daily and cumulative excess returns for each of the 13 companies included in this analysis were calculated. For each company, the two betas were calculated.

**Excess Returns for Individual Companies**

We have included only one graph (Figure 1a) for a company as an example. A cursory look at these graphs reveals that the daily excess return follows pretty much a random walk pattern. For pretty much all of them, the excess daily return at  $T=0$  (the announcement day) was positive, with almost half (7) peaking. This can be construed as some evidence that value is being created because of the announcement of impending tracking issue. Actually, this effect is more visible on the cumulative excess return graphs (Figures 1b). Even though, the starting point and the length of the upward trend around  $T=0$  varies for each stock, the point to note is that such an upward trend exists for pretty much all 13 stocks. Another observation to make is that after  $T=0$  there is a downward trend, even though the starting point and the length of such a downward trend varies from stock to stock.

Even though, one could easily conclude from the graphs that the excess return over the 90-day period of our interest is not significant, we conducted statistical tests to do hypothesis testing, which confirmed the fact that the value, if created, is not statistically significant

**Excess Returns for the Portfolio**

Since the individual stocks have too much volatility, we treated all 13 companies as if they were part of a single portfolio. The daily excess return data for all 13 companies were combined together to come up with the daily excess return for the portfolio, which then was used to calculate the cumulative excess daily returns. Figures 2a and 2b contain the graphs for the portfolio. Once again - as expected - the daily excess return displays a random walk pattern. What is noteworthy here is the spike at T=0, once again pointing to the fact there is some kind of value creation in the mind of investors as the announcement of issuing a tracking stock is being made. However, as indicated by the hypothesis testing results for the portfolio in Table 1, the value is not statistically significant.

Next, we examined the cumulative daily excess returns for the portfolio (Figure 2b). As is clearly visible, and notwithstanding the daily fluctuations, there is an upward trend pretty much starting at T-45 and spiking at T=0. Over the period of 45 days preceding the announcement, the value of the portfolio goes up roughly by 5% over the market. There is almost a jump of 6% on the day of the announcement. Then, in the next 40 days after the announcement, most of the value is gone (opportunistic profit taking), even though not all is lost - the portfolio still maintains approximately 2% gain over the market. This phenomenon - sustaining some value gain (2% for our portfolio) - has been observed by previous researchers. Such an increase is explained as not evidence of a value creation but as a result of other events that take place coincident to issuance of tracking stocks.

TABLE 1: DESCRIPTIVE STATISTICS AND HYPOTHESIS TESTING

<b>Mean</b>	0.066696507

# Investing in Sustainability: The Changing Face of Canadian Banks

*Anshuman Khare, anshuman@athabascau.ca*

*Athabasca University, Canada*

*Peter May*

*Western Co-operative Fertilizers Limited (Westco), Canada*

## Abstract

Sustainability is no more a goal, but the new way of doing business. It does not have to be achieved, but assimilated in the way we conduct business today. This paper highlights the role of the Canadian banking industry in promoting (environmental) sustainable development and leading this change in approach to doing business. As a powerful industry sector financing all other business sectors in the local and global economy, Canadian banks have moved from ignoring environmental concerns to embracing them by not only making it a part of their own business practices but also encouraging investors to adopt environmentally responsible investing. Their influence and power to be agents of change is significant. The paper examines the programs and policies, both internal and external, of leading Canadian banks in their quest for promoting sustainable development and the difference they are making to Canadian business. There are challenges but the future looks bright. **Keywords:** Environmental sustainability, banks, Canadian banks,

## Introduction

As the Brundtland Report (UN, 1987; p.54) recommended, meeting the needs of business today in a way that they do not compromise our future is a noble goal for organizations to follow.

The state of the environment and its protection is becoming a fast emerging concern for the business community as well as consumers. Today's consumers often take into account the environmental effects of their purchases and marketers include environmental factors in their plans as a way of gaining competitive advantage. The environment has also become an integral part of many business plans because many countries now have increasingly stringent government (federal and provincial) environmental protection regulations. All types of businesses including manufacturing, energy generation and distribution, resource management, transportation, agribusiness, services and retail are in some way affected by these regulations.

A sound environmental policy embedded in the business strategy is not only necessary but it also makes good business sense. Integration of environmental goals with economic and social achievements is gradually becoming essential for sustained growth and for an organization's long term well being. Business literature is full of publications on how organizations and industrial sectors have approached the goal of "sustainable development"; however, there is limited literature available about what role our financial institutions play in its promotion.

This paper examines the role of the banking industry in promoting the idea of "environmental" sustainable development. This powerful industry sector finances all other business sectors in the global economy, banks' influence and power as agents of change is significant. Indeed they have an opportunity to shape whether environmental concerns are embraced in business dealings. This paper examines the programs and policies, both internal and external, of the five major Canadian banks<sup>1</sup> in their quest for promoting sustainable development.

## Banks and the Canadian Economy – a Snapshot

Banks play an influential role in the Canadian economy as they control as much as 56% of business in the financial sector. These institutions are also a significant contributor to Canada's economic growth, employing over 600,000 Canadians in 2003 and having a yearly payroll of over \$35 billion. The sector represented 6 per cent of Canada's gross domestic product in 2003 and contributed close to \$13 billion in taxes to all levels of government (Govt. of Canada, 2005).

The Government of Canada (2002) reports that “as of July 2002 there were 14 domestic banks, 33 foreign bank subsidiaries and 20 foreign bank branches operating in Canada. In total, these institutions had over \$1.7 trillion in assets, which accounted for over 70 per cent of the total assets within the Canadian financial services sector. The six largest domestic banks (in 2002) accounted for over 90 per cent of banking assets. Banks are among Canada’s leading employers. In 2000 the industry employed over 235,000 Canadians and had a Canadian payroll of approximately \$16.1 billion. In addition, in 2001 the six major domestic banks paid \$4.8 billion in taxes to all levels of government. The six major domestic banks have significant international operations, which vary among the individual institutions both geographically and in strategic direction. They have been seeking growth opportunities in the United States, where they are focusing their business activities on wealth management, corporate investment banking and electronic banking. At the same time, the major domestic banks have made investments in select markets in Latin America, Asia, the Caribbean and other countries around the world. In 2001 their international operations accounted for approximately 33 per cent of gross revenues. In recent years Canada’s banks have demonstrated consistent performance. In 2001 the six largest Canadian banks reported earnings of \$9.7 billion, compared to \$9.6 billion in 2000, \$9.1 billion in 1999 and \$7.1 billion in 1998. Also, the total assets of all six banks have increased over the past two years.”

In the World Economic Forum’s Global Competitiveness Report for 2000-2001, Canadian banks are also considered as being amongst the soundest financial institutions in the world after Australian banks (Govt. of Canada, 2002). Soundness is “the ability to sell goods or services profitably relative to other producers of the same goods or services; a number of factors contribute to competitiveness including technological change, a highly skilled labor force, low inflation and a sound public policy environment. As competitiveness improves, costs are reduced and exports expand across international markets” (Govt. of Canada, 2006a).

## **Banks and the Environment – Reasons to be Involved**

The potential contribution of financial institutions toward sustainable development is significant because they play an intermediary role in the economy: a role that has attracted interest from organizations such as the European Union and United Nations Environment Program (Jeuken et. al., 1999). As engines of economic growth, these institutions are uniquely placed to tackle the challenge of how to care for the environment (the physical world) while delivering economic growth.

Within the business world there has been considerable debate as to whether sustainability and corporate social responsibility are valid constructs. Arguments in favor generally focus on the impacts of business on society and the environment and the resultant ethical imperative to minimize and restore function (Hawken et. al., 1999) or the “business case” which includes considerations of attracting and retaining talent, cost-reduction, market related advantages, financial risk reduction, and/or regulatory imperatives (Morhardt, 2002) (ACCA, 2002; Arthur D. Little, n.d.; KPMG, 2005; Sparks, 2003, Willard, 2002). Counter-arguments focus largely on beliefs that social issues are not business’ primary purpose” (Sparks, 2003; Wilson, 2003). Regardless of debates around the validity of these ideas, driving forces exist that are impelling banks forward.

Internal driving forces for banks to integrate sustainability into their operations and policies range from more philanthropic interests emanating from employees and management to opportunities to reduce their already moderate sector footprints (e.g., improvements in paper and energy use).

It is the external driving forces, though, which create very specific reasons for banks’ interest in sustainable development – “environmental obligations can affect the ability of (your) business to repay loans, but also the marketability and value of its collateral or security (real estate, equipment, etc.). Customers are also becoming increasingly reluctant to deal with a business whose products and practices do not meet their expectations from an environmental point of view. The resulting loss in sales may have an impact on the company’s bottom line and could affect its ability to service its debt” (Canadian Bankers Association, 2000; p.2).

The Canadian Bankers Association (no date) further explains that banks as lenders face two kinds of risks when financing a company which is found in violation of environmental regulations or found indulging in unethical

environmental practices. The first is the risk of non-recovery of the loan and the second risk is being held responsible for the environmental clean up costs, management costs and third party damage claims.

A further external impetus in this country is The Bank of Canada Act (Government of Canada, 2006b) which has mandated financial institutions to annually produce a “Public Accountability” statement. This essentially describes the contributions of the bank and its prescribed affiliates to the Canadian economy and society.

## **Canadian Banks and Sustainable Development**

### **Policies and Principles**

This section provides an overview of the (environmental) sustainable development policies and guiding principles of Canada’s five major banks (the “Banks”).

#### **RBC**

Established in 1992, RBC's Environmental Policy (RBC, no date) is to:

- “Responsibly manage all aspects of its business to ensure environmental laws and recognized standards are met or exceeded.
- Give appropriate attention to environmental laws and risks in the operation and management of its businesses, including assessment of proposed credits and investments and the development of financial products and services.
- Apply best-recognized environmental practices to internal operations, having due regard for environmental benefits and costs, including purchasing decisions, conservation of resources, recycling and waste minimization.
- Foster employee work habits which promote respect for the environment and personal health and safety.
- Maintain guidelines and procedures for the administration of its environmental policies and objectives.
- Communicate in a timely and candid fashion on the environmental aspects of its policies, procedures and performance to relevant stakeholders.
- Work with industry, government and public groups and provide support for selected non-profit groups to help achieve a balanced relationship between a sound economy and responsible environmental practices.
- Promote the foregoing principles and practices throughout RBC Financial Group and strive to continually improve these practices.”

RBC is a signatory to the Equator Principles which is “a financial industry benchmark for determining, assessing and managing social & environmental risk in project financing” (The World Bank, 2006).

The company is a signatory to the International Chamber of Commerce Business Charter for Sustainable development and the UNEP Finance Initiative (UNEP FI), a member of the Canadian Banker’s Association Environmental Issues Advisory group, the Environmental Bankers Association and the Canadian Brownfields Network (RBC, 2005; p.28).

#### **CIBC**

To demonstrate their commitment to the environment, CIBC first launched its environmental risk and management program in 1991. In 1993, CIBC’s Board of Directors approved the first corporate environmental policy. Later in 2004 they launched the Environmental Credit and Investment Risk Management Policy. CIBC’s Annual Accountability Report 2005 (CIBC, 2005; p.31) claims that CIBC “continues to integrate environmental considerations into its business activities and decision processes.” Further, it states that “CIBC’s Corporate Environmental Program ensures that environmental issues are systematically addressed and procedures are continually improved to minimize environmental impacts, with their associated costs, while maximizing opportunities to support sustainable development” (CIBC, 2005; p.31). CIBC tries to achieve its sustainable development philosophy by focusing on environmental engagement through proactive engagement with clients and investors, environmental risk assessment which is an integral part of their analysis of credit and investment business and facilities management.

The Corporate Environmental Policy adopted by CIBC (CIBC, no date) states that “CIBC is committed to responsible conduct in all its activities to:

- Protect and conserve the environment,
- Safeguard the interests of the corporation, its employees, customers and shareholders from unacceptable levels of environmental risk, and
- Support the principles of sustainable development.”

For governing this environmental policy, CIBC further breaks down this policy into “guiding principles” (CIBC, no date), whose main components are Communication, Community values, Continuous improvement, Credit and investment risk management, Employee education, Operations and supplier management and Procurement.

CIBC is involved with a number of environmental initiatives with the UNEP Finance Initiative (UNEP FI), Canadian Banker’s Association, Environmental Bankers Association and Environment Canada’s informal network on Linking Environmental Performance to Financial value (CIBC, 2005).

#### **BMO**

BMO launched its environmental policy in 1992. The policy addresses the bank’s commitment to the environment and the principles of sustainable development. The environmental policy states: “We (BMO Financial Group) are committed to the principles of sustainable development and, in particular, to the belief that the quality of our lives improves when economic growth is integrated with respect for the environment” (BMO, 2005; p.38).

BMO acknowledges that their actions affect the environment directly in terms of their own operations, and indirectly through the practices of the organizations with whom they conduct business. They believe that they should minimize the impact of their business on the environment and help ensure that society can meet its needs today in a way that does not compromise the ability of future generations to do the same (BMO, no date).

The guiding principles at BMO (BMO, 2005; p.39) are established “to ensure that environmental responsibility is a real and living part of our cultural landscape.” These are “to:

- Promote environmental stewardship across our business.
- Respect, protect and act to serve the environment around us.
- Engage our employees in our environmental management programs.
- Provide credit to borrowers in a manner that respects environmental management.
- Take responsibility for our environmental performance.
- Work with others to protect and preserve our environment.”

BMO is a signatory to the Equator Principles which it adopted in September 2005. It is also a signatory to the UNEP and Carbon Disclosure Project<sup>2</sup>. It has committed itself to being a green company through initiatives such as Learning for a Sustainable Future, an aggressive paper reduction program, through waste management and energy conservation programs in-house. Their goal is to be a Green Workplace with a Green Workforce (BMO, 2005).

#### **Scotiabank**

Scotiabank’s environmental policy came into existence in 1991. The Bank’s Board of Directors are responsible for formulation and implementation of specific policies and practices that help achieve the goals of the bank’s environmental policy. The policy states:

“Our core environmental policy, supported by additional specific policies and practices relating to individual business lines, includes:

- Maintaining recycling and resource management programs that meet or exceed legislated environmental requirements;
- Conducting our internal operations in a manner consistent with environmental protection and the principles of sustainable development, with due regard for associated benefits and costs;
- Promoting an environmentally responsible workplace by educating and motivating employees to become more involved in the conservation of resources;
- Monitoring the effectiveness of all our environmental activities by conducting environmental audits and assessments of compliance with the Bank’s requirements;
- Incorporating and maintaining environmental assessment criteria in our risk management procedures and in the ongoing management of our assets;

- Including environmental criteria in assessing relationships with contractors and suppliers; and
- Contributing to an ongoing dialogue with government, industry and relevant stakeholder groups to establish environmental goals.” (Scotiabank, 2005; p.34)

Scotiabank’s environmental activities address both direct and indirect environmental impacts. The responsibility for its implementation is shared by the various departments such as Real Estate, Operations and Global Risk Management.

In 2005, Scotiabank adopted the Equator Principles which is based on the World Bank and International Finance Corporations standards. Scotiabank is a long-standing member of the UNEP FI; Canadian Bankers Association’s Environmental Issues Specialist Group and is a signatory (and contributor) to the Carbon Disclosure Project.

#### **TD Bank**

TD Bank Financial Group’s environmental policy is very new compared to those of the banks profiled earlier. The Risk Committee of the Board of Directors formally approved the new Environmental Policy in 2005 (TDBFG, 2005; p.31). The policy states:

“Applying to all our businesses and corporate support functions globally, our Environmental Policy includes guiding principles that commit TDBFG to:

- Responsibly manage all aspects of our business to promote environmental protection;
- Ensure employees as necessary are aware of and implement the policy and identify ways to improve environmental performance;
- Encourage relationships with suppliers who have procedures in place to manage and comply with environmental laws or risks applicable to their businesses;
- Regularly review and update environmental processes;
- Cooperate with government, the business community, and stakeholders in support of responsible environmental management and accountability, and communicate with relevant stakeholders on environmental aspects of our operations;
- Maintain a credit policy to protect against environmental risk;
- Support local, community-based environmental activities, such as the TD Friends of the Environment Foundation;
- Take a responsible approach to energy conservation and managing hazardous products and processes, and encourage conservation by recycling, reduction, and re-use initiatives; and
- Take reasonable care to prevent or avoid environmental incidents associated with our operations.”

(TDBFG, 2005; p.31)

TD bank’s approach has been to involve top management. “Accountability for environmental issues is shared among a number of departments including Corporate and Retail Real Estate, Government and Community Relations, Corporate Operations, Legal and Risk Management groups” (TDBFG, 2005; p.30). They have initiated a project to develop an Environmental Management System and set up a committee to “prepare an inventory of existing environmental practices within TD to pinpoint strengths and gaps” (TDBFG, 2005; p.30).

Like the other Canadian banks, TD Bank too sees the benefits of partnering for sustainability. It has renewed its membership with UNEP FI and participates in the Carbon Disclosure Project. TD Friends of the Environment Foundation has been providing funding to community groups who help the environment for over 15 years now (TDBFG, 2005).

## **Path to Sustainability**

As we have seen, the major Canadian banks have embraced the concept of environmental sustainable development in different ways. This is reflected in the 2006 Corporate Knights 2nd overall rating of the Financial Sector in their annual ranking of the top corporate citizens in Canada (Corporate Knights, 2006).

RBC has been particularly recognized internationally by virtue of being named one of the world's top 100 sustainable companies at the second annual "Global 100" ranking announced at the World Economic Forum in Davos, Switzerland in January 2006.

The environmental and social performance of Canada's five major banks is reflected in their inclusion in a number of financial indices that aim to provide the investor an understanding of the commitment of the companies in these areas.

RBC, CIBC, BMO, and Scotiabank are all listed on the 2006 Dow Jones Sustainability Index and the FTSE4Good Index (RBC, 2006; CIBC, 2006; BMO MBO 2005?), 2006; Scotiabank, 2006). Further, all five companies except for CIBC are listed on the Jantzi Social Index.

It is a matter of great satisfaction to find the top Canadian banks included in these indices. This is an acknowledgement of their strength in meeting some very specific criteria which are globally accepted for measuring environmental and social performance. However, this should not be considered as an end in itself.

Sustainability is not a goal, but a new way of doing business. It does not have to be achieved, but assimilated in the way we conduct business today. Given this, it is more relevant to examine the process of change and how it has emerged in the Canadian banks. An examination of the Public Accountability Reports or Corporate Sustainability Reports of various Canadian banks over a period of last five years reveals progress is being made; from setting criteria to measuring them to reporting and comparing and finally tracking progress. The degree of transparency seen in the 2005 reports shows a high degree of comfort for the banks with reporting environmental and social performance. A few of these reports even acknowledge areas where they have performed poorly.

The company policies and guidelines reflect many things. There is the philanthropic communication for the community, but behind that are very practical reasons such as risk management and efforts towards reducing liabilities due to actions of those with whom the bank invests.

The following paragraphs highlight some key examples of further initiatives from the banks under three categories – Philanthropic, Long-term (green) business investments and operations.

The best philanthropic example that comes to mind is from TD Bank. Their Friends of the Environment Foundation has helped in more than 15,000 environmental projects in Canada and received \$37.4 million in support since 1990. The support not-for-profit groups that protect and preserve natural surroundings, assist children in understanding the environment and those that conduct environmental research or promote environmental cooperation (TDBFG, 2005; p.33). Other banks are also involved in projects and events that are philanthropic in nature like wildlife rehabilitation (TDBFG, Scotiabank), restoration efforts (TDBFG), earth day events (all banks), brownfield<sup>3</sup> development (RBC), children education (all banks), etc.

Under long-term (green) business investment, there are several initiatives underway that demonstrate the banks are looking to the future and investing in green projects. Examples include:

RBC's commitment to reduce the effects of climate change on business. They have been assessing the risks and opportunities of international agreements and have incorporated "carbon risk" in their assessment of borrowers in high impact sectors such as mining and oil and gas (RBC, 2005; p.26).

Scotiabank has provided advice and financing to support a number of innovative environmental projects in the renewable energies sector. In their 2005 report they mention being "co-lead and arranger of \$100 million in unsecured credit facilities for Canadian Hydro Developers Inc. (CHD), a developer, owner and operator of 17 water, wind and biomass power generation facilities in three Canadian provinces. This should help CHD develop a 76.5 megawatt wind project in Ontario's Melancthon Townshi" (Scotiabank, 2005; p.37).

Operations results are important too, as they are the milestones in this long journey towards adoption of sustainability in regular business practices. They are necessary to measure progress and to motivate those involved for better performance. Researchers often call the initial steps which deliver easily understandable results and often lead to a high degree of satisfaction and motivation as "low hanging fruits." If an organization has to move forward, it must see some quick benefits of adopting green practices. Especially notable are the achievements in the area of waste management, energy conservation and facilities management. This is one of the major areas where banks have demonstrated excellent results. Though it is difficult to choose, some are highlighted below.

Waste Management: In 2005, RBC saved about 40 tons of paper by introducing paperless statements for clients. Earlier, in 2004, it had introduced electronic pay statements for employees thereby doing away with printing 2 million statements and saving 16 tons of paper annually. RBC also reduced the number of printers by 52% in 2005 through networking and sharing of resources (RBC, 2005).

CIBC introduced a paper recycling program and in 2005 recycled 7300 tons of paper compared to 1315 tons in 2003. They also reduced their water consumption from 350 million liters in 2003 to 286 million liters in 2005 (CIBC, 2005).

Bank of Montreal (2005) has run a Technology Disposal Program from 2001 with the objective of minimizing the impact of unwanted machinery on the environment. When possible, BMO donates equipment (computers, fax machines, cell phones, etc.) to charitable organizations. Unusable equipment is disposed off using environment friendly means. By the end of 2005, BMO had donated 19,063 pieces of equipment and disposed of another 24,189 pieces (BMO, 2005; p.40).

Facilities Management & Energy Conservation: RBC has reduced its energy consumption from 210,855 MWh in 2003 to 196,303 MWh in 2005. In addition they increased their purchase of Green Power from a mere 600 MWh in 2003 to 1,530 MWh in 2005. RBC is also installing sensors in new building for conserving energy.

In spite of all these achievements it is probable that a plateau might be reached in the near future, especially operationally, as costs of making additional changes may begin to outweigh the perceived benefits with each percent change costing more tomorrow than it did today.

The pursuit of sustainability is not something one organization can achieve on its own. It is a team effort and collaborations with meaningful and well articulated outcomes are critical to keep moving in the right direction. The significance of support networks in a system thriving to sustain its business and its business environment cannot be under-estimated. Review of literature indicates that the banks understand this quite well. The network they have established (or become a part of) should sustain their progress towards being sustainable businesses.

As the quest for sustainability gains momentum, it is possible that in the near future there will be more assistance from other industry sectors and the government in the form of advice and decision making frameworks.

## **Helping Banks Promote Sustainable Development – Some Other Resources**

At the government level assistance can come from organizations such as the UNEP, NRTEE, the Canadian Council of Ministers of the Environment and Environment Canada's Green Lane.

Organizations such as the World Business Council for Sustainable Development (WBCSD), the Pew Centre on Global Climate Change, Pembina Institute, World Research Institute have been presenting in-depth analysis of issues and environmental concerns suggesting frameworks and standards for performance.

Standard organizations such as the International Standards Organizations (those who proposed ISO 14000), Canadian Standards Association and Standards Council of Canada have been helping organizations develop criteria for measuring and communicating environmental risks.

Finally, industry and trade associations have been involved in producing specific guidelines on good environment friendly industrial practices.

## **Conclusion**

Banks are a powerful component of the Canadian economy. Since the early 1990s they have led the way by embracing the challenge of sustainability. They did not use their business position to obstruct (or delay) the effort to move ahead on the path to sustainable behavior.

The banks also gained a quick appreciation of two important things – validation from different bodies and the benefits of collaboration. They formulated their policies and kept them closely in sync with the globally accepted definition of sustainable development as given in the Brundtland Report (UN, 1987; p.54). It would be fair to say that this led to development of policies and practices that have served the industry well during the last five years (given their inclusion in various globally accepted indices recognizing performance). Collaboration and networking

was achieved through membership of similar institutions and adoption of frameworks that promote practices with some degree of standardization (like the Equator Principles, UNEP FI or the Carbon Disclosure Project).

Internally the banks looked at what researchers call the “low hanging fruits.” Aggressive programs in waste management, energy conservation and facilities management brought them enough benefits to keep them moving forward on the path of environmental sustainability. As they encountered success, they became even more comfortable reporting their progress and adding bigger challenges to their list.

There is a lesson here for other important industries in Canadian economy such as the energy sector and the manufacturing sector. They need to embrace the environmental sustainability and drive change rather than resist it. With the Canadian economy flourishing there is never going to be a better time to make this necessary turn in how we conduct business today.

## End Notes

While the authors explicitly examine the Canadian banking industry, they acknowledge the growing influence of the larger ‘Financial Services Sector’ which includes trust and loan companies, credit unions and *caisses populaires*, life and health insurance companies, property and casualty insurance companies, securities dealers and exchanges, mutual fund companies and distributors, finance and leasing companies, as well as independent financial advisors, pension fund managers and independent insurance agents and brokers.

<sup>2</sup> Carbon Disclosure Project (CDP) is an initiative of the global institutional investors to report on corporate responsibility issues including business implications of climate change.

<sup>3</sup> A brownfield is an abandoned, idle or underutilized commercial or industrial property usually in an urban area where past actions have caused, or are suspected to have caused, environmental contamination. Brownfield redevelopment results in the revitalization of communities through increased economic productivity, increased tax revenue, lower municipal infrastructure costs, reduced health risks and improved neighborhoods (RBC, 2005; p. 28).

# China's Hidden Financial Threat of a Banking Crisis

Jennifer Foo, [jfoo@stetson.edu](mailto:jfoo@stetson.edu)  
Weishen Wang, [wwang@stetson.edu](mailto:wwang@stetson.edu)  
Stetson University, USA

## Abstract

Although China achieved remarkable economic growth for the past decade, this cannot be said for its banking system. Its nascent weak bank-dominated financial sector poses a threat to China's rosy growth and long-term stability. In 2006, China has about 1.3 trillion yuan of non-performing loans, in addition to 230 billion yuan still unresolved on the books of the Asset Management Companies. The huge NPLs is a hanging sword over China's economic growth and a potential harbinger of a financial crisis. This paper analyses what factors present a hidden threat to China's financial stability and the challenges and policies implications. Logit analysis is used to evaluate the probability of a potential banking crisis. Our results indicate that the Chinese banks have a temporary reprieve through the disposal of NPLs and fresh capital injections. However, the bad debt problem and potential threats remain.

## Introduction

In China, the practice of government directed lending to subsidize the unprofitable and inefficient state-owned enterprises (SOEs) created a high percentage of nonperforming loans (NPLs). The high percentage of NPLs has been a concern for a long time. To address this issue, China has been over-hauling its banking system. The main measures that the Chinese government took include splitting off nonperforming loans to specialized asset management companies (AMCs), injecting capital, and authorizing the banks to go public. At the end of 2006, three of the four state-owned banks became shareholder owned banks, with two of them listed on the Hong Kong stock exchange. These measures lead to significant changes in China's largest banks in terms of their asset quality, capital adequacy, and corporate governance system. Given the hefty NPLs and these changes, it will be noteworthy to evaluate the safety of China's banking sector.

Although three of the formerly state-owned large banks went public, Chinese banks are still majority owned by the government. Foreign banks are allowed only up to 20% stake, up from 15%, in any Chinese bank. In 2006, China has 189 banks and more than 30,000 credit cooperatives with total assets of US\$5.6 trillion (RMB 43.9 trillion). The four state-owned commercial banks jointly own 57% of the banking market share. At the end of the third quarter of 2006, the China Banking Regulatory Commission indicates that the amount of NPLs was approximately 21.67% of GDP. These NPLs did not include those that are currently held by the government resolution agency, the Asset Management Companies. In 2006, the AMCs resolved 1.17 trillion yuan (US\$145 billion) of NPLs with 230 billion yuan (US\$25 billion) still unresolved on the books. The OECD estimates that another US\$203 billion was needed to resolve the remaining bad debts, although the government has spent nearly \$283 billion to shift NPLs off the books of the four state-owned commercial banks since 1998.

Thus, despite the much touted economic growth of China and the prediction that China will become a super economic power in the next decade to come, China seemingly still faces internal financial problems that unless resolved would impede its path to achieving this distinction. The Japanese banking crisis in the 1990s that finally brought a halt to Japan's headlong economic growth followed by a decade of stagnation is a good case in point and a lesson for China.

## Banking Failures and Systemic Crisis

A banking crisis usually occurs in two phases. The dormant phase occurs when a bank incurred bad loans and accumulated massive NPLs greater than their capital base. When it becomes public knowledge, there is quick action

by investors and depositors to be the first claimants of the assets of the insolvent bank, that is, a bank run. In the second phase, the government typically steps in to resolve the crisis by bailing out the insolvent bank before the situation worsens. When the credibility of the government to bail out the insolvent bank is in doubt, then the banking crisis is triggered. One or a few banks facing insolvency is relatively easy for the country's government to maintain credibility before the public, but when a great number of banks all at the same time becomes insolvent, it becomes difficult for the public, whether internal or external, to have confidence in the government to resolve the crisis. This was the case with the financial crisis faced by Thailand during the Asian Crisis in 1997, and the Argentinean banking crisis in 2001. The Chinese government is aggressively pursuing ways to avoid the precipitation of such a banking crisis from happening. The four state-owned problem banks' NPLs are being disposed off to the AMC's and capital injection obtained from IPOs.

Systemic banking crisis is not as rare an event as one would expect. Beim (2001) looked at 113 banking crisis in 93 countries from 1975-1999 compiled by the World Bank. The author classifies them according to their triggering events. Beim finds that the triggering events are four agents: the depositors, the local government, private external lenders, and intergovernmental institutions, like the IMF. For example, Beim notes that because Japanese banks are closely integrated into the global financial system, external lenders worldwide triggered Japan's banking crisis when they began withdrawing their support, alarmed by the banks' NPLs. The Chinese banking system is not immune to any of the triggering mechanisms, and timely and tough actions are necessary to avoid a crisis.

Honohan (1997) made the distinction between macroeconomic and microeconomic imbalances and endemic failures due to pervasive political interference. A banking crisis due to macroeconomic and microeconomic shocks is associated mostly with developed countries. Macroeconomic shocks of the boom and burst of an economic bubble may be due to real estate speculative excesses like the Japanese banking crisis, or to internal banking excesses from greed like the U.S. Savings and Loans crisis. The downward cyclical spiral of credit withdrawal and borrowers defaulting on loans, which in turn collapses asset values and bank collaterals, pushes the banking system into financial distress, possibly leading to bank runs. The Argentina bank runs even lead to social unrest and riots. The Chinese banking system shows signs of macro- and microeconomic shocks from the unprecedented operational risks from bank embezzlements and excesses in speculative investments in real estate development and the stock market.

Other causes may be due to moral hazard behavior and "disaster myopia" of managers in ignoring risky events, although with a small probability of occurrence, and being unprepared for the contingency. The probability of occurrence increases for such myopia in the event of the liberalization of credit ceilings and interest controls, increased competition, and privatization of financial markets (Honohan 1997). Mismanagement can be another microeconomic cause of a banking crisis, which is closely related to inadequate corporate governance, regulations and enforcement, and supervision and monitoring by government agencies. The systemic problem arises when banks take advantage of inadequate policing by authorities, and embezzlement and corruption becomes rife and the problem is allowed to deepen. Chinese bank managers are rotated constantly by policy to prevent corruption and "guangxi" (connections) but this engenders a lack of continuity and a myopic and moral hazard behavior in bank managers with little concerns for future accountability.

Excessive government involvement in banking operations causes an endemic banking crisis. Government directed policy lending, targeting specific sectors, particularly the insolvent SOEs and favored development projects, to drawing on the banking system as a means of financing the government budget, and to lending to the politically elite, engender conditions that lead to banking failures. Transition countries, in particular, are faced with the hard choices of keeping afloat the insolvent SOEs burdened with huge debts to appease social unrest when unemployment rises or closing the inefficient SOEs and allowing free market allocation of scarce resources in the efficient pursuit of economic growth. The deferment or concealment of economic problems through government directed lending weakens the banking system, given that the loans are implicitly irrecoverable. Provincial or local governments can also use the banks as a source of funding regional projects that will please and earn accolade from the central authorities. In a pervasive government-banking environment, banks do not have a profit-seeking incentive. Banks do not carry out credit-risk assessment of customers. Rather, banks consider their function as implementing the directives of the central authority. The Chinese banking system displays the above characteristics.

However, the government is more opened to acknowledging and committed to resolving NPLs but not to less government involvement.

The causes of a systemic banking crisis, therefore, can be both internal and external factors exacerbated more often by a country's government to conceal the extent of the widespread bank problems, while not addressing and resolving the banking problems on a timely basis. Given the consequences of the huge economic and resolution bailout costs which are ultimately borne by depositors, creditors and the taxpayers, not to mention the disruption to economic growth, the prevention of a systemic banking crisis cannot be overstated. Furthermore, the reverberation of a country's banking crisis and costs can be felt beyond its borders because of the globalized integrated world financial markets, as seen in the contraction of the Japanese banks worldwide in 1990s, the impact of the Mexican crisis in 1994, and the Argentina crisis in 2001-2002 on foreign lenders. The Chinese economy is now integrated with the global economy to a large extent and a Chinese banking crisis would have significant impact on the rest of the global financial markets.

### **China's Banking Reforms and Constraints**

Like most transition countries, China's financial system is still essentially a bank-dominated system. Chinese banks continued to be majority state-owned with small stakes allowed by foreign banks. China began serious efforts in the early 1990s to transform its financial system to accommodate a rapidly growing economy that quickly and constantly outpaced the reforms being instituted. Numerous studies warned of the consequences of carrying out inadequate financial reforms (Mehran and Quintyn 1996, Naughton 1998, Business Week 1998, Lardy 1999, Dornbusch and Giavazzi 1999, Miskin 1999, Bonin and Huang 2001, Lardy 2001).

The mounting NPLS of the banks in 1998 pushed the government to implement major reforms to address the growing problems in the banking system. The reforms required the banks to adopt international standards of bad loans classification and recapitalization of the banks. Regional bank branches no longer had autonomy to make lending decisions owing to undue influence from the cozy relationship with the local governments, thereby effectively bypassing the People's Bank of China (PBC), the central bank's control and supervision. A banking system framework was adopted similar to the U.S. Federal Reserve System. The 31 provincial bank branches were removed, replaced with nine regional central-bank branches: Tianjin, Shenyang, Shanghai, Nanjing, Jinan, Wuhan, Guangzhou, Chengdu, and Xian.

In May of 1998, the CCCPC (the Central Committee of Communist Party of China) created the Commission of Financial Work to consolidate financial control over the PBC and state-owned banks accountable to the State Council (Party Leadership). The goal is to put a stop to the *guangxi* and corruption between the regional banks and the provincial governments that grew out of the opportunistic free-for-all environment following the liberalization of the financial markets and end the influence of the local governments. Conflicts still exist between the provincial government and the new branches of the PBC

Although state-owned commercial banks are outside the jurisdiction of the provincial governments, they still have control over most of the local financial institutions and are resistant to supervision and monitoring. Moreover, because the local judicial system is under the authority of the local government, they cannot be counted on to enforce financial disputes such as the settlement of debts, contract disputes, and deposit and fee disputes impartially and favorably since the local governments have greater sway. The local governments have joint investment in a considerable number of financial institutions and their significant interference and control in the business have contributed to the problems and losses for these institutions. Moreover, the local governments practice moral hazard behavior as well when their losses are limited up to their investment in the financial institutions while interference is considerable.

China currently is able to have a centralized planning financial system supporting a real sector economy coexisting side by side because of the current lack of competition in the Chinese financial markets. However, with the elimination of the four state-owned banks' monopoly in 2006 (under the WTO agreement) to hold local depositors and enterprises captive, the protected Chinese financial markets are now opened to foreign

competition. The centralized banking system and the inability to respond quickly to changing market conditions, pose a problem for Chinese banks to be profitable and efficient. The Chinese have a remarkable high savings rate of 30% of household income compared to a negative 0.4% in the United States. Local depositors and corporations now have access to foreign banks that are more efficient and can offer better quality services and more alternative savings and investment choices. The drying up of captive deposit flows into the four state-owned banks may pose a serious threat to the banks' ability to absorb their NPLs.

The banking reforms were implemented to strengthen the regulation and supervision of the four state commercial banks and to comply with the international Basle Standards. In 1999, an internal supervisory board in each of the four state commercial banks, consisting of members from the PBC, the Ministry of Finance (MoF), the National Auditing Office and other government agencies, was created to supervise and evaluate bank performance and behavior of the bank's board of directors. Accountability is to the supervisory board rather than stockholders with potential for *guangxi*, graft, and corruption to breed. The policy is to rotate managers and those who neglected their duties, have weak performances, incurred growing losses or bad loans would be removed from office and replaced.

The centralized decision making of the banking system is inefficient and goes against firm value maximization and business innovation. The four state-owned commercial banks, Industrial and Commercial Bank of China (ICBC), the Agricultural Bank of China (ABC), the Bank of China (BOC), and China Construction Bank (CCB), are government-permeated banks. Although banks are "encouraged" to be profit seeking, it is difficult to envision how that can be achieved when free market incentives are not present. Managers, ostensibly "profit seeking," would inherently made decisions that would please the central authorities without the requisite risk-return consideration. The 1995 Commercial Bank Law requires the four state-owned commercial banks to achieve efficiency, liquidity, safety, risk-taking, and individual accountability for risk and return. On the other hand, the banks are required to carry out government directed industrial development policies where the government or their agencies set the discounted interest rates on project loans. The bank decision in seeking and selecting loan projects and the evaluation of the project's risk is then carried out independently. The limitation of this process is clear. Normal risk-return loan evaluation requires that higher interest premiums commensurate with higher risk project for taking on greater risk. The state banks would have difficulty in balancing the basic risk-return tradeoff. Riskier loan projects would have to be rejected outright if the given government discount rate on the loan is insufficient to cover the bank's deposit rate to produce the desired profit margin. If risky loan projects were "encouraged" to be selected, the expected losses would be considered part of routine bank operations to be the responsibility of the next manager or to be written off against the bank's reserves since accountability is not transparent, resulting in the accumulation of NPLs.

One of the most important reforms undertaken by the Chinese government is authorizing public offerings by three of the largest state commercial banks in 2005 and 2006: China Construction Bank (Hong Kong listing, October 17, 2005), Bank of China (Shanghai listing, July 1, 2006), and Industrial and Commercial Bank of China (Shanghai and Hong Kong listing, October 27, 2006). CCB has raised US\$ 9.2 billion in the world's largest IPO of 2005, Bank of China raised US\$11.2 billion in 2006, and lastly, ICBC raised US\$ 21.9 billion in 2006, a world record in IPO capitalization. The bank public offerings have an important impact on the Chinese banking sector by providing fresh capital for the state commercial banks. The participation of foreign banks also indicates that the Chinese banks will be integrating a greater measure of international corporate governance into their operational structure.

### **China's NPLs and Resolution by AMCs**

China's high savings rate and sustained high economic growth, while diverting attention away, can lead to the complacency to overlook the potential instability and festering problems of the NPLs in the banking system. China acknowledged the rising bad debt problems of the state-owned commercial. In 1998, the Ministry of Finance recapitalized the commercial banks with RMB 270 billion funded by the issuance of special treasury bills (Xie 1999). Despite the recapitalization, the capital adequacy of the four state banks dropped below 8%

from the rapid growth of the banks' assets and debts by the end of 1998. Further, recapitalization was not possible with the government running budget deficits consecutively, while foreign injection and ownership then was not considered an option. The bad debts of the four banks continued to grow while accountability of bank performance is difficult to evaluate with the constant flux in managers with no continuity, stability and knowledge of bank operations. Managers practice moral hazard behavior and a myopic view of bank decision making to maximize short-term performance to satisfy the supervisory board with no market incentives to consider long-term bank value. The China Banking Regulatory Commission estimates the NPLs to be 9.31% of total loans in September 2006. However, the US-China Business Council estimates the NPLs ratio to be 23.5%, which is considerably higher. Other analysts have estimated China's NPLs from the conservative US\$600 million to a realistic US\$900 billion (Ernst and Young), to as high as US\$1.3 trillion, which is between 23.8 %, to 35.82 %, and 51.75 % of 2006 GDP, respectively.

It is widely recognized that a successful resolution of NPLs in a banking system requires timely and effective resolution of the NPLs and a well capitalized and funded AMC is crucial, as past studies have shown (Crockett 1998, Lindgren 1999, Classens et al 2001, Xu 2005). First, a healthy financial system is essential to support a growing privatized real sector in a transitioning country. Second, a banking crisis imposes a high cost on a transitioning country's scarce resources it can ill afford being diverted away from economic development and growth.

In 1999, four Asset Management Companies (AMCs): Huarong, Cinda, Orient and Great Wall were created and matched up to bail out the NPLs of the four state commercial banks. The four state commercial banks' NPLs were sold to the AMCs to be disposed off over 10 years in exchange for non-tradable 10-year bonds issued by the AMCs. The AMCs are capitalized through the issuance of the AMC bonds, Ministry of Finance equity injection and loans from the central bank (Xie 1999, Ma & Fung 2002). The bad debts are then resolved through various methods of debt restructuring, collection of payments, and sale of equity. Uncollectable bad debts are to be written off against the reserves of each bank. The objective is to resolve the NPLs of the four state banks at a given point in time after which stringent assessment of loan quality would be applied to prevent further growth in NPLs. The loan quality assessment will be based on five international measures: normal, secondary, substandard, doubtful, and loss.

NPLs for all periods and for all four state-owned banks have been decreasing since 2004, according to the Chinese Banking Regulatory Commission, as the NPLs are sold to their respective AMCs (Table 1). On the other hand, the amount of total NPLs purchased by the AMCs from their matching state commercial banks is steadily growing from RMB 1.2175 trillion (US \$147.1billion) in the first quarter 2004 to RMB 1.2627 trillion (US \$159.73 billion) first quarter 2006 (Table 2). The AMCs' accumulated disposal of NPLs steadily increased from RMB 518.68 billion of first quarter 2004 to RMB 866.34 billion of first quarter 2006. The AMCs asset recovery ratio is decreasing while the cash recovery ratio is slowing.

Ma and Fung (2002) estimate that the Chinese government financed the four AMC's with 3% MOF equity capital, 14% PBC credit, and 83% AMC bonds between 1999 and 2002, burdening the AMC's with a debt-to-equity ratio of 34. The total NPLs purchased by the AMC's are estimated to be RMB 1.4 trillion (Table 3). The 14% credit provided by the PBC is a conservative estimate of the lower limit of RMB 192 billion with an upper limit of RMB 563 billion. The central bank credit is effectively subordinate to the AMC bonds with implicit guarantee by the government, the rationale being that in the event of difficulties in debt servicing the government would sooner honor the AMC bonds than to service the central bank credit to project a semblance of stability in the banking system. Unless there is implicit guarantee by the government, the transfer of the NPLs from the four state commercial banks to the AMC's would be illusory with no improvement in the credit worthiness of the state commercial banks. The implicit government guarantee would only engender moral hazard behavior by the four state commercial banks.

## Operational Risk and Unprecedented Bank Embezzlement

The Chinese banking sector is plagued by corruption, embezzlement and inadequate risk management and poor governance, supervision and monitoring, and transparency of the four state banks, exacerbating the poor performance of the four state commercial banks. The application of international auditing standards to the three state-owned banks (ICBC, BOC and CCB) in preparation for their IPOs in 2005 and 2006 uncovered the depth of the embezzlement problem. The Agricultural Bank of China is not financially stable yet to consider any public offering.

A brief internet survey of anecdotal cases of embezzlements by individuals indicates the inherent problems within the Chinese banking system. In the first half of 2005, the Chinese government uncovered 240 cases in the four state commercial banks totaling US\$198 million (RMB 1.6 billion) in losses, amounting to half of the total losses of US\$396 million. According to Forbes (2007), as of September 2006 there are over 800 fugitives still wanted by China for fraud and embezzlement since 1998 to the tune of almost US\$10 billion (RMB 70 billion). The survey of the internet news media shows the extent of the embezzlement and corruption problems, totaling more than US\$975 million (Table 4).

Unlike the Savings and Loans Crisis of the 1980s and the Japanese Banking Crisis of the 1990s, where NPLs are due mainly to speculative investment, it is clear that the four Chinese state-owned banks' financial predicament is due to a combination of government central directed lending policies of mismatched deposit and lending rates, unprecedented bank embezzlements, poor governance, and moral hazard behavior.

TABLE 4: EMBEZZLEMENTS IN CHINESE BANKS

Bank	Year	Perpetrator	Amount
Bank of China	1992-2001	Xu Chaofun, Yu Zhendong (former branch managers of Kaiping branch-Guangdong) & Hui Yat Sing of Ever Joint Properties	US\$ 485 m (largest embezzlement in China)
Bank of China	1993-1995	Chen Man Xiong & wife, Chen Qiuyuan (connection to bank clerks at Zhoushan branch)	US\$ 51 m (RMB 420 m)
Industrial & Commercial Bank of China	1995	Chen Xin (former accountant of small branch)	US\$ 4.84 m (RMB 40 m)
Bank of China	1999-2004	Xhai Changping (former bank data input clerk at Dalian)	US\$ 6 m
Bank of China	2003	Liu Jinbao (former president of HK branch)	US\$ 1.8 m (RMB 14.3 m)
		Bribes	US\$ 1.1m (RMB8.7 m)
Bank of China	2003	Wang Xuebing - fraud	Bank of China fined \$20 m by US and Chinese regulators
Bank of China	2004	Gao Shan (former branch manager – Harbin)	US\$ 130 m (RMB 1.0 B)
China Construction Bank	2006	Zhang Enzhao (former chairman) - Bribes	US\$ 250,000
Bank of Communication	2006	Dai Jinggui (vice-president of Shenyang branch)	US\$ 25 m (RMB 200m)
Bank of China	2006	The Epoch Times (June 14, 2006)	US\$ 146 m
Shanghai Pudong Development Bank	2006	The Epoch Times (June 14, 2006)	US\$ 126 m

## Methodology and Empirical Analysis

Our empirical study is based on financial statements data. We obtained the sample of failed banks from the FDIC web site for the period from 1934 to 2004. We also obtained the banks' financial information from the Bank Regulatory Database on Wharton Research Data Services for the period from 1976 to 2005. For the balance sheet items (call report), we used the information of the last quarter of each year. For the income statement items, we combined four quarters' data to get the annual information. We merged this year's failed banks' information with the banks' previous year's financial information. The merged file has 248,697 observations including 1,525 failed banks.

Previous studies have shown that certain financial variables are significant indicators of bank failure. These financial variables include a bank's profitability, capital adequacy, and non-performing loan ratios. Hsing, Hsiu, Lange, and Gibson (1991) find that the probability of a bank not failing varies positively with capital adequacy and the return on assets, but negatively with nonperforming loans. Gomez-Gonzalez and Kiefer (2006) find that the capitalization ratio is the most significant indicator of bank failures in the Colombia finance crisis. Logan (2001) finds that profitability and loan growth rate are good predictors of a bank failure. Combining the findings in existing literature and considering the paucity of Chinese banks data, we only include return on asset (ROA), nonperforming

loan ratio (NONPF), and equity to total asset ratio (EOT) in the model since they are consistent and strong indicators across many studies.

The ROA is used to measure the bank's profitability, computed as the sum of four quarters net income (loss) (riad4340) divided by total asset (rcfd2170) at the end of each year. Capital adequacy is calculated as shareholders' interests divided by total asset (rcfd3210/rcfd2170). The nonperforming loan ratio equals the sum of call report items, total loans and lease finance receivables: nonaccrual (rcfd1403) and total loans and lease financing receivables: past due 90 days or more and still accruing (rcfd1407) divided by the total loans, which equals call report item number, the total loans and leases, net of unearned income (rcfd2122).

In the logistic stepwise model, we also include variables Cost to Income ratio and Interest Rate Margin besides ROA, NONPL, and EOT. Not surprisingly, the ROA, NONPF and EOT, which are the first three variables that entered the model in turn, have significant explaining power. Therefore, the model is presented simply as follows

$$\ln\left(\frac{P}{1-P}\right) = \alpha + \beta_1 * ROA + \beta_2 * NONPF + \beta_3 * EOT + \varepsilon \quad (1)$$

Where  $P$  is the likelihood that a bank fails; ROA is return on asset; NONPF is the percentage of nonperforming loan; EOT is equity divided by total asset.

Using the data from the U.S. banks, we estimate equation (1) and obtain the following results:

$$\ln\left(\frac{P}{1-P}\right) = -3.7327 - 11.2245 * ROA + 9.5152 * NONPF - 26.2996 * EOT + \varepsilon \quad (2)$$

All of the coefficients in the model are different from zero, significant at 1% level, and the pseudo R-square for the model is 38.3%.

Using equation (2), we estimate the likelihood of the Chinese banks' failure. Since the four large state-owned banks, China Construction Bank, Industrial and Commercial Bank of China, Bank of China, and Agriculture Bank of China, account for about 51% of China's banking asset, we focus on these banks. Specifically, we only estimate the likelihood of failure for CCB, ICBC, and BOC, since they recently went public and their financial data are available. The Agricultural Bank of China is still fully state-owned and we were unable to obtain its financial data. The results are presented in the following tables.

TABLE 5: PREDICTED PROBABILITY OF CHINESE BANKS FAILURE

Bank	Year	EOT	NONPL	ROA	Predicted Probability
Bank of China	1999	0.051097102	0.393	0.00152	0.205812549
Bank of China	2000	0.051597674	0.288	0.00145	0.085688639
Bank of China	2001	0.064974645	0.13	0.00235	0.014290881
Bank of China	2002	0.061120095	0.114	0.00152	0.013714168
Bank of China	2003	0.05119442	0.163	0.00542	0.026836138
Bank of China	2004	0.04808658	0.051	0.0049	0.010300616
Bank of China	2005	0.049304568	0.046	0.0058	0.009425636

China Construction Bank	1999	0.048554609	NA	0.0024	NA
	2000	0.045365517	NA	0.0032	NA
China Construction Bank	2001	0.039080895	NA	0.002	NA
China Construction Bank	2002	0.034779644	NA	0.0015	NA
China Construction Bank	2003	0.05241494	0.043	0.0068	0.008339604
China Construction Bank	2004	0.049676208	0.039	0.013	0.008065294
China Construction Bank	2005	0.049873673	0.038	0.011	0.008142813
Industrial and Commercial Bank of China	1999	0.051245833	NA	0.00117	NA
Industrial and Commercial Bank of China	2000	0.04718835	NA	0.0013	NA
Industrial and Commercial Bank of China	2001	0.044462884	NA	0.0015	NA
Industrial and Commercial Bank of China	2002	0.038103044	0.219	0.0015	0.064957957
Industrial and Commercial Bank of China	2003	0.032761132	0.242	0.0005	0.091668347
Industrial and Commercial Bank of China	2004	0.028727625	0.212	0.0005	0.077242191
Industrial and Commercial Bank of China	2005	0.029439454	0.047	0.0005	0.016851919

From the table above, we can see that the probabilities drop for all three banks. In 1999, the likelihood of failure for the Bank of China is 20.1%. This probability dropped to 0.9% in the year 2005. Similar trends hold for China Construction Bank and Industrial and Commercial Bank. The improvement in the banks' financial condition and the decreasing likelihood of failure as indicated by all three ratios, non-performing loans, ROA and equity to total asset, over the years from 2004-2005 are obvious. Of particular significance is the sharp drop in the failure probability from 2004 onwards. First, the dropping trend since 1999 is due to the hefty transfer of NPLs to the AMCs. Second, the three state banks' books were cleaned up in preparation for their IPOs in 2004 and 2005.

Besides applying the logistic model to estimate the failure probability, we also compare the three Chinese state banks with failed and non-failed groups of the U.S. banks with their respective ratios for the year 2005. We can see that compared with the non-failed banks in the U.S., the three Chinese banks are still much less efficient, as reflected by their lower ROA, lower equity to total asset ratio, and higher non-performance loan ratio, although these ratios are better than those of failed groups. The comparison indicates that the Chinese Banks still need to improve themselves in these dimensions.

TABLE 6: COMPARISON RATIOS OF U.S. NON-FAILED BANKS, U.S. FAILED BANKS AND THREE BIG CHINESE BANKS

Variables	Non-Failed U.S banks (year 2005)	Failed U.S. Bank (year 2005)	Chinese Big Three (year 2005)
ROA	2.49%	-10.21%	0.57%
NONPF*	1.05%	9.11%	4.38%
EOT	11.29%	5.33%	4.28%
Average probability	0.18%	7.67%	1.14%
*The non-performing loans in the U.S. banks are the loans overdue more than 90 days including accruing and non-accruing loans. The NPLs in Chinese banks are for the last three categories based on a five category classification. This may lead to the large difference in the NPL loan ratio. But the other two ratios are defined in the same manner..			

The analysis above is based on data from the banks' financial statements. Scrutinizing the data carefully, we can see that the non-performing loan ratios drop drastically in a short period of time from 2003 to 2004. For the Bank of China, the non-performing loan ratio drops from 16.3% to 5.1%; for ICBC, it dropped from 21.2% to 4.7%. These drops are not due to improvement in the banks' operational performance, instead it is due to the balance sheet restructuring when the books were cleaned up by transferring the NPLs to the AMCs. Transference of the NPLs does not imply that China's bad debt problem has been resolved. The financial costs of clean-up remains, having only been transferred to the AMCs, and therefore, ultimately borne by the state. Our analysis is limited by the availability of only financial statements data and the availability of public data. Our empirical results show that the Chinese banking system still faces many challenges in their restructuring and reforms.

### Hidden Threats, Challenges and Policy Implications

The Chinese government has made determined efforts in trying to resolve the NPLs. The government has stepped up efforts to crack down on bank corruption and embezzlements, prosecuting more than 1,116 individuals alone from January 2004 to September 2005, of which 376 were former senior management officials accounting for 42.15% of the total. The government has instituted more controls on the financial sector to reduce operational risk. However, unless the banks have a strong governance of checks and balances and transparency, preferably accountable to stockholders and transparent public scrutiny, punishment and rotation of management to prevent "guangxi" and embezzlement would be insufficient. Full privatization of the four state-owned commercial banks would be a step forward towards a stable and healthy financial sector.

By allowing foreign participation in the IPOs of the three state commercial banks, the Chinese banking system reaps a number of benefits. First, the state banks were recapitalized to replenish the depleted bank capital, more than what the PBC, MoF and AMCs bonds can provide. Foreign capital injection would be a logical step for the Chinese government without jeopardizing the state budget and economic growth while still meeting the WTO mandate of opening its banking markets to foreign banks strategic equity ownership in Chinese banks. Second, the risk is partially borne by the foreign shareholders as well. However, the amount of foreign stakes is still relatively minuscule in comparison to the total market (Table 5). Thirdly, foreign participation brings risk management and operational skills, new bank products, technology, and international corporate governance and accounting standards. In return, foreign banks are able to secure a foothold in a potentially profitable banking and financial service market through joint ventures with Chinese banks, minimizing start-up costs of building a network of branches and customers.

TABLE 7: FOREIGN FDI IN CHINESE BANKS

Foreign FDI in the Four State-Owned Banks		
Foreign Participants	Amount	Ownership Stake
Tamasek-Singapore (2005)	US\$ 3.1 billion US\$ 500 million	10 % stake in BOC Additional investment in BOC's IPO stock listing
Tamasek-Singapore (2005)	US\$ 1.5 billion US\$ 1 billion	5.1 % stake in CCB Additional investment in CCB's IPO stock listing
Royal Bank of Scotland & Consortium banks (2005)	US\$ 3.1 billion	10 % stake in BOC
Bank of America (2006)	US\$ 2.5 billion US\$ 500 million	9 % stake in CCB Additional investment in CCB's IPO stock listing
Foreign Direct Investment in other Chinese Banks		
Citigroup (2003)	----	5 % stake in credit card venture with Shanghai Pudong Development Bank, with the objective of a 19.9 % stake
HSBC (2004)	US\$ 1.75 billion	19.9 % stake in Bank of Communications (maximum allowed per shareholder)
Commonwealth Bank of Australia (2004 )	US\$ 1.7 million	11 % stake in Jinan City Commercial Bank
Commonwealth Bank of Australia (2005 )	US\$ 77 million	19.9 % stake in Hangzhou City Commercial Bank
Source: International Herald Tribune 2005		

The opening up of the Chinese banking market to a greater presence of foreign competition from independent foreign banks may jeopardize the ability of the state owned banks to absorb their NPLs. Currently, the three state banks are able to clean up their NPLs by transferring them to the AMCs and through IPO capitalization. Unless the state banks are able to improve their financial performance after the clean up, the offering of better quality products, services, and returns by foreign banks may be a threat to the Chinese banks' recovery. The current widening interest rate gap between the deposit and lending rates has improved the banks' recovery. However, the rates are still set by the State Council. The Chinese banks have to be given total independence in setting market deposit and lending rates that are compatible with risk-return tradeoff and in selecting investment projects free from government directives. The inability to react to swiftly changing lending conditions is a drawback on the performance of Chinese banks unlike their foreign counterparts.

The current recovery rate and resolution of the NPLs by the AMCs are improving but low. While the state banks are recapitalized by fresh IPOs injections, the AMCs capital is still dependent on the PBC and MOF. If the AMCs bonds are not repaid and asset recovery stagnates, the cost of the resolution will ultimately have to be borne by the state budget and taxpayers' money at a huge cost, as past lessons from other banking crises, the Japanese crisis, the Argentinean crisis and the U.S. Savings and Loan crisis, have shown. Moral hazard behavior has to be eliminated with market incentives given to managers to manage the Chinese banks profitably.

It can be argued that China has stockpiled US\$1.07 trillion of foreign reserves by 2007, thereby possessing a capacity to avert a crisis. China faces difficult issues in restructuring the banking system. China does not provide an equivalent FDIC deposit insurance to depositors for the four state-owned banks which possess the largest proportion of total deposits. The hint of a bank run could lead to a disastrous domino effect in the event of an insolvent bank not able to cover withdrawals, and in the absence of a deposit insurance this is a very real threat. Therefore, a policy of aggressive resolution of a problem bank or the bailout of an insolvent bank subsidized by the state budget and taxpayers may be necessary. When depositors and investors lose confidence in the banking system, a concerted systemic bank run and currency speculative attack by depositors and foreign investors could lead to a similar Asian crisis or Argentinean financial collapse. The Chinese government has to do more to avert even the possibility of a crisis from getting underway by stepping up the privatization of the financial markets and instituting better banking governance.

## Conclusion

The Chinese banking system is currently plagued with non-performing loans that remain a threat to China's spectacular economic growth. The current optimism and the zealously in taking advantage of opportunities, as evidenced by the enthusiasm in the speculative excesses on the stock market in China and the oversubscription to the Chinese banks IPOs despite their NPLs, speak to the risk of China as an emerging economy. Our paper shows that the four state-owned commercial banks have cleaned up their balance sheets to some extent, but the risk of losing depositors and investors' confidence is still a potential threat to the Chinese banking system. At the moment the risk has been alleviated by balance sheet clean-up and fresh capital injections. Although our results show that the Chinese banks have reduced their NPLs on the books, the improvement is cosmetic. Operational risks still exist and bank performance is still inefficient and poor. Despite the limitation of the data, our analysis sustains the premise of our paper, that the Chinese banking system is still weak and that the threat of a potential crisis is averted but hidden threats remain.

## **Resurgence in the Indian Banking Scenario: A CRM Perspective**

*Rajeshwari Narendran, rajeshwari18@yahoo.com*

*Manju Baghmar*

*Mercy.S.Samuel*

*Mohan Lal Sukhadia University, Udaipur, India*

### **Abstract**

The Global banking scenario has seen a dramatic pace of change so rapidly in volumes and magnitudes that it has entered new era of banking. As a result the Indian banking system also could not remain untouched, hence a revolutionary change in its attitude towards the customers came in the form of CRM and its application. Indian Banking systems have realized that customers are the lifeblood of the business and that the way to protect and grow its customer base - and ultimately its profitability - is to build strong customer relationships. Modern customers require flexibility in hours of operation, greater convenience, customization, transparency, accessibility, and control. In this paper the authors have conducted an empirical research on CRM in The Indian Banking Sector to trace the latest trends , customer preferences and strategies of banks in the process of retaining and widening the customer base. Research has shown that the key drivers of customer loyalty are positive staff attitude, honesty, integrity, and reliability, proactive advice and delivery of promise, consistent delivery of superior quality service, simplicity and ease of doing business, good after-sales service, a fair and efficient complaints resolution policy.

### **Introduction**

The rise in economic activity in Asia, particularly India and China, during the last decade has spurred a surge in banking activities. Technology-driven developments in the financial markets combined with a shrinking universe and the change in outlook of society from that of “saving for the future” to “consume to make a better present leading to brighter prospects” have put pressure on the banking industry to provide continuous and reliable service. The Reserve Bank of India regulations and guidelines on implementation of technology require banks to create reliable IT infrastructure and support procedures to ensure high quality service at all times. “The benefits to be derived from the use and adoption of technology cannot be exaggerated. Central Banks the world over have been providing their unstinted support to development of technological infrastructure and to IT innovations in the banking sector.

The growth in Indian GDP indicates the qualitative growth in the Indian demographic characteristics. There has been a phenomenal change in the customer awareness; he has become knowledge savvy and highly choosy for products and services and brands that he demands. Indian consumers are facing an era of enlightenment. In this scenario it is not only the Banks but any other industry needs to be very conversant with the customers’ needs so as to sustain in the market in a profitable style. With specific reference to the Indian Banking Industry changes were initiated during the early 1990s, RBI (Reserve bank of India) started to work towards establishing the regulatory framework with effective and prompt supervision, and institutional and technological infrastructural development. Continuing attempts have been made to adopt international benchmarks as suitable for Indian conditions. Although many changes in legal infrastructure still need to be put in place, the developments till date have brought financial system in India nearer to the global standards. With technological advancements, banking sector in India has become much accurate, fast, easier, and less time consuming. SMS Banking, Mobile Banking, ATMs, and Net Banking are just the beginning. Evolution of IT-services outsourcing in Indian Banks has now moved on to Facilities Management Level. Banks are now targeting at BPM (Business Process Management) to increase ROI (Returns on Investment), enhance CRM (Customer Relationship Management) and productivity of employees.

The resurgence in the Indian banking industry is happening due to the increased awareness among the customers. Researches have shown that banks can remain competitive only building long term partnerships with

customers. CRM is a tool which can be used for the purpose. CRM can be employed to develop an ongoing dialog with customers, integrated across all contact points. CRM allows retail banks to integrate customer interaction channels and provides consistency to their interactions with customers, generate better customer intelligence, customize their offerings and communications to customer, manages customer portfolio by assessing the life time value of customer. Staying ahead is only a matter of providing value to the customers and it is not that easy. It involves a 360 degree change in perspective of top management.

The research paper presents the findings based on an empirical research of Indian Retail Bank customers which includes ten Indian banks like State Bank India (SBI), Industrial Credit and Investment Corporation of India (ICICI), Housing Development and Finance Corporation (HDFC), Unit Trust Of India, Punjab National Bank, ABN AMRO Bank, the Bank of RAJASTHAN, State Bank of Bikaner and Jaipur, Bank Of Baroda, Centurion Bank. By considering the value added activities of the bank, the research paper provides a strategic framework for evaluating profitable opportunities, crucial areas where they lack from a customer viewpoint, additional services/ facilities that the market is demanding, accuracy and efficiency in service delivery. It also identifies what are the strong points of their bank which they have to maintain, services which have to be prioritized, customer satisfaction levels and payoffs of various sophisticated technology.

## CRM in Indian Banks, Current Status

The IT saga in Indian Banking commenced from the mid eighties of the twentieth century when the Reserve Bank took upon itself the task of promoting automation in banking to improve customer service, book keeping, MIS and productivity. This role played by the Reserve Bank has continued over the years. The pace of IT revolution in the banking industry increased after the nationalization took place in 1990s'.

Previously sidelined by other priorities, but re-emerging strongly In the recent past, CRM initiatives were sidelined for other priorities such as data warehousing, financial systems overhaul, core banking. However, the end result of these projects is that banks now find themselves with much improved data resources to leverage.

To be sure, many banks still be focusing on the fundamentals around data warehouses and customer information repositories, but a growing number will be looking at sophisticated analytics to support a variety of tactical CRM initiatives.

The focus on CRM is driven to a great extent by banks keen to go full force into retail banking. The reasons being:

- **The opportunities offered by retail banking** – potentially high returns supported by significantly huge customer bases, low funding costs, opportunities for cross-sell, and generally lower delinquencies – still remain unrealized the prevailing theme surrounding banks' investments in CRM is that of optimization. This theme is relevant to financial services organizations as they view customer relationships; customer contacts themselves, channels, and marketing resources. Banks would like to find the best use of customer databases, especially as the race for customer acquisition has itself brought a race by banks to contact customers. The survey shows that customers in general are annoyed with the many calls and the many products pushed to them many products pushed to them.
- **Banks are now more focused on lead management.** But these days, banks have become keen to implement effective lead management. Banks have become intent on ensuring that their resources – channels, staff, and marketing budgets – cope with the growing demands of CRM initiatives. Certainly, banks should ensure that channels are adequately equipped and that frontline staff is trained well. Furthermore, there has been a growing focus on marketing optimization, so that competing campaigns are prioritized and marketing budgets and resources are allocated properly, tracked and utilized efficiently. **Banking customers, their awareness, expectations and concerns have also changed in recent years.** Customers are more knowledgeable, sophisticated, and assertive. They demand higher levels of customer service, are less loyal, and more inclined to switch to a competitor. Modern customers require flexibility in hours of operation, greater convenience, customization, transparency, accessibility, tailor made solutions, individual attention, time and control.

## Vitality of the Study

The western world is fast moving in terms of technology interface so as to gain maximum information with high efficiency and speed so as to cover up a major market share. The banks of the developed nations are all well equipped with CRM technology, usage and are all out with bright results.

The position in India is that the Indian consumers are now being influenced by the west and they are now far more enlightened. Moreover the Indian Banking industry is under the government protection as there are many entry hazards in the form of rules and regulations for the foreign banks to enter the Indian land. But all these regulations are proposed to be relaxed by the year 2009. This period is nearing and the Indian players will have to gear themselves to survive in the tough competition to be faced then. They need to equip themselves with all the latest technology and above all ideology to maintain and increase their market share and business above all. So an in depth study into the CRM need, implementation process and paybacks are very important for banks' today.

Typically, customers are looking for convenience, want their bank to sufficiently manage their money and provide up-to-date and accurate communications: statements, email alerts, etc. This defines a "transaction-based relationship," but this type of relationship will only get a bank so far. To break into a more desirable "service-based relationship," a customer needs to feel that their interactions with the bank are professional, fair and friendly. This is where customer service begins to creep up in the list of reasons why a customer stays. It's also how satisfaction increases and loyalty begins to solidify. But the pinnacle relationship every bank should be working toward is the "advice-based relationship." Here, a bank earns the right from the customer to evolve into the role of trusted advisor - someone who approaches the relationship in a customer-centric way. While in this role, a bank can, and is able to, manage more products and services for their customers. This is the stage in which truly loyal customers are born and solid financial partnerships are nurtured. If our polled customers are not feeling that partnership, banks have a long way to go in building profitable customers. This is what Indian banks need to strive for in the remaining time to come when the going may get tough with all the major players into the Indian market to lure the Indian customer.

## Research Design & Objectives

### Objectives

1. **To study the marketing techniques in the banking industry in India.**
2. **To evaluate the effectiveness of these techniques in terms of customer satisfaction**
3. **To study the CRM process and implementation with reference to ICICI and HDFC bank (Two major Indian Banks).**

The research is descriptive in nature.

**Data Collection:** Both primary and secondary data was collected. The secondary data was used for exploratory research. Primary Data was collected pre tested questionnaires covering various problem domain meant for bank customers. Secondary data was collected through internet, Journals and magazines.

**Data Collection Tool:** A 25 point multivariate self structured questionnaire (enclosed at the end of the paper) was prepared for the customers to find the satisfaction levels in terms of various marketing techniques, process and facilities available for customers. The first part of the questionnaire deals with collection of information about the respondents, their age education level, profession etc. The other part deals with their banking experiences, technology awareness and use; and their view about the bank. The questionnaire also aims to find out the satisfaction level of the customers in terms of behavior, efficiency, skill delivery time of the bank employees. It also identified the customers' view of CRM their awareness and preparedness of the whole process and ways by which the relationship can improve. It also proved to be helpful in identifying the loopholes of banking service and how the customers view the banks. The respondents profile was chosen to be at least graduates and have some banking experience. The target respondents hail from varied spheres like private sector, public sector, housewives, self employed, students etc.

**Sampling Plan:** The sampling unit is taken as a customer of any bank having any kind of an account with the bank. The sample taken for the study is 200 customers from 10 banks. They were selected on the basis of non probability convenience sampling. But it was taken care that the respondent is educated and is at least a graduate according to the Indian education system so that the respondent is able to respond effectively and provide insights into the banking services scenario.

## Data Analysis

The raw data collected was tabulated and subjected to analysis using SPSS analysis revealed that:

- The aspect of customer delight is absent from the entire banking transaction right from account opening to later stages. Only HNW customers are catered to at this level.
- It was found that a whopping 94% of the respondents didn't receive any gifts while opening accounts or maintaining a long term association.
- Almost 98% of the respondents believe in multiple banking and have accounts in more than 2 banks.
- It was also observed that the major account opening reasons apart from salary account are interest rates, branch proximity, efficient service and personal attention in terms of tailor made solution providers.
- Regarding awareness about technology enabled products the private sector customers are at a higher level of awareness vis-à-vis the public sector bank customers.
- If we compare the level of usage of these techno products that it is low as compared to the level of awareness in private sector banks.
- Customers prefer going in only for two or more tech enabled services like debit/credit cards, phone banking and SMS services.
- The major reasons for not opting any other technology driven products/services is mainly due to ignorance about its usage, advantage and security and also due to lack of training of the bank employees to convince the customer.

The research has revealed that the banks are facing a strong problem of retaining customers and specific issues of customer loyalty and customer retention. The Indian customers are having a tendency of multiple banking which necessitates the banks to be more competitive and alert in terms of services and products. The Indian customers are also not that much techno savvy and they always prefer to have a personal touch every time they want to avail any service. More over their tendency to technology trust is also low. They need to have more of training programmes for technology use, efficiency and security. These are certain winning edges which the banks can use to create a win-win situation in the Indian market.

### **Research has shown that the key drivers of customer loyalty are:**

- Brand image in terms of market reliability of the bank
- Honesty, integrity, and reliability of services
- Positive staff attitude of Banks
- Qualitative & diverse product portfolio
- Net returns from investments and other benefits
- Extension of competitive advantages to the consumer
- Proactive advice and delivery of promise
- Consistent delivery of superior quality service
- Good after-sales service
- Simplicity and ease of doing business
- A fair and efficient complaints resolution policy

The customers are too eager to have structured tailor made solutions which can create a win- win solution both for banks as well as customers. The respondents were also fussy about the bank staff attitude and proficiency level.

## CRM Perspective: Customers versus Banks

### Customer Perspective

#### Personal Customer Needs

Personal contact  
A knowledgeable reliable banker  
Relevant information  
Customized & timely solutions  
Value for Money  
Honest feedback & co-operation

#### Business Customer Needs

A professional partnership approach  
High levels of information  
Customized and highly responsive service  
Quality customer information

### Bank Perspective

#### Banks' expectations from its staff

Quality customer information  
Product knowledge  
Consultative selling/relationship  
Management skills  
Proactive approach  
Honest feedback & co-operation

#### Bank Requirements in Management & Administration

Strategic thinking  
Understanding the business  
Industry knowledge  
Partnership skills  
High degree of professionalism

## CRM Process and Implementation in HDFC Bank and ICICI Bank

The CRM application in Indian banks is still at an infant stage. Two aggressive banks ICICI and HDFC banks were analyzed for their CRM implementation initiatives. The details are as below.

### HDFC Bank

HDFC Bank, India's 12th-largest bank (but one of the country's fastest growing), kicked off its CRM initiative about five years ago, when it had about 5 million customers. Rahul Bhagat, senior vice president, Retail Banking at HDFC Bank, remarks that from the very beginning, customer data was already well structured to support analytical marketing and enterprise marketing automation technology.

The bank deployed Unica's Affinium solutions to design, test, optimize, execute, and analyze all marketing programs, including event-based and multistage communication initiatives. Affinium's Universal Dynamic Interconnect (UDI) technology allows the bank to simultaneously access its multiple data systems, resulting in a complete view of its customers across channels and products. Affinium enables marketing communications such as registration alerts and product cross-sell. It also supports models for activation propensity, response likelihood, and usage. Alongside the impressive growth in the bank's customer base – the bank currently already has grown to about 9 million customers – marketing velocity has significantly increased. The bank used to run about 120 campaigns in 2004. In 2005, this number had risen to approximately 700 campaigns – a dynamic mixture of campaigns across several channels and ranging in size from about 5,000 to 150,000 customers.

The bank is currently working on a customer data model that covers over 6,000 fields, which should allow it to have one comprehensive and intelligent view of its customers. Also, as the bank's modeling capabilities mature, it will be running more event-based campaigns, quickly identifying when customers are at the point of making financial decisions.

### ICICI Bank

The CRM initiatives in India's ICICI Bank hold together its compelling story of growth – its growth in customer base, channels, and product and service offerings. Since its inception in 1995, the bank has grown to have 15.8 million customers, holding about 17 million accounts. The bank's network has expanded to 610 branches and standalone counters and over 2,000 ATMs.

CRM has been envisioned by the bank to support its goals in sales, customer service, and analytics. Already, about 30 to 40% of the bank's home loans are cross-sold to existing customers. Similar ratios have also been reported in the sale of insurance policies. Ratios of about 50 to 60% have been seen out of the credit cards and personal loans business. The bank's stated intention is to take these ratios to as high as 60 to 5%. ICICI Bank states that these high levels of relationship maximization are made possible by how its CRM system is able to "know and understand the customer better – which customer is most suitable for what kind of product and at what point in time." In the area of service, the bank receives as many as 150,000 customer requests per day, a challenge not only to channel capacity but also to how the bank is able to ensure that each request is recorded, tracked, and resolved. Last, customer analytics have been used to support various strategic decisions of the bank. Recent strategic decisions of note are several anti attrition programs, the intended attrition of unprofitable customers, the imposition of fees, and various customer segment tactical initiatives. ICICI Bank's CRM capability is built on a Teradata data warehouse that integrates data from multiple sources, including the Oracle database and various flat files. The system provides users with **ICICI Bank**

The CRM initiatives in India's ICICI Bank hold together its compelling story of growth – its growth in customer base, channels, and product and service offerings. Since its inception in 1995, the bank has grown to have 15.8 million customers, holding about 17 million accounts. The bank's network has expanded to 610 branches and standalone counters and over 2,000 ATMs.

CRM has been envisioned by the bank to support its goals in sales, customer service, and analytics. Already, about 30 to 40% of the bank's home loans are cross-sold to existing customers. Similar ratios have also been reported in the sale of insurance policies. Ratios of about 50 to 60% have been seen out of the credit cards and personal loans business. The bank's stated intention is to take these ratios to as high as 60 to 75%. ICICI Bank states that these high levels of relationship maximization are made possible by how its CRM system is able to "know and understand the customer better – which customer is most suitable for what kind of product and at what point in time." In the area of service, the bank receives as many as 150,000 customer requests per day, a challenge not only to channel capacity but also to how the bank is able to ensure that each request is recorded, tracked, and resolved. Last, customer analytics have been used to support various strategic decisions of the bank. Recent strategic decisions of note are several anti-attrition programs, the intended attrition of unprofitable customers, the imposition of fees, and various customer segment tactical initiatives.

## Conclusion

The overall analysis revealed that the customers are reasonably satisfied and the public sector banks need to put in many efforts in terms of customer care to remain competitive. Although the SBI has emerged as the highest account holder bank in the survey but it is very closely followed by ICICI Bank. So it should gear up by now moreover to meet the free competition arising after 2009 wherein the entry of MNC Banks will become easier. The Indian customer has an emotional preference for physical preference of branch and staff. Howsoever technology efficient services are provided to them but they still have a tendency to visit a branch and take care of the transactions personally. The survey also reinforced the message that innovations no matter how beneficial but should take place close to the customer. It also revealed that the current Indian consumer is far more elite as compared to the past. But they need to be taught and made aware of the various changes taking place in the banking scenario. Research has revealed that CRM payoffs were positive in terms of customer retention and customer satisfaction.

*Note: The above findings are based on the partial information and data collected and analyzed for the purpose of Doctoral research.*

## Questionnaire

CRM stands for Customer Relationship Management. It is a strategy used to learn more about customers' needs and behaviors in order to develop stronger relationships with them. Good customer relationships are at the heart of business success.

**Personal Profile**

1. Name (optional) : Mr/Ms ..... Education .....
2. Age  
a) 20-30 yrs  b) 30-40 yrs   
c) 40-50yrs  d) 50-60yrs   
e) Senior Citizen
3. Sex : Male  Female
4. Occupation  
Private organization  b) Public sector   
c) Self employed  d) Technology professional   
e) Education Sector  f) Student   
g) Homemaker  h) Others
- 5 Annual Income  
a) a. Upto 2 Lacs  b) b. 2-4 lacs   
c) c. 4-6 lacs  d) d. 6-8 Lacs   
e) e. Above 8 Lacs  f)

**Banking Profile**

6. How long are you a customer of any bank (Banking Experience)?  
a) 0-5 yrs  c) 5-10 yrs   
b) 10-15yrs  d) 15yrs and above
7. Rank the reasons due to which you opened an account with ..... Bank.  
(Rank 1 for the best reason & so on)  
a. Bank's Image / Goodwill  b. Branch proximity   
c. Salary account  d. Bank's marketing professionals   
e. Best in practice technology  f. Dissatisfied with earlier bank   
g. Wide range of products/services  h. Fast and efficient service   
i. Personal approach of the bank staff  j. Interest rate on deposits   
k. Convenient banking hrs  l. Wide network of ATM's   
m. Wanted to go for multiple banking  n. Others specify.....
8. Have you received any gifts from the bank when you opened an account with them.  
a) Yes  b) No
9. Why do you feel the bank values you as a customer?  
.....  
.....
10. Has the bank offered you with any kind of monetary or non-monetary incentive for being associated with them for a long time?  
a) Yes  b) No
11. Do you believe in Multiple Banking  
a) Yes  b) No
12. If yes then tick the Banks in which you have account  
a. SBI  b. ICICI  i) Raj. Bank

- c.  UTI                      d.  SBBJ                       j) Madhav Nagrik
- 
- e.  PNB                       f.  CANARA BANK  k) OBC
- g.  HDFC                       h.  Union Bank                       l) OTHERS.....

13. What are the benefits of multiple banking (Tick as many applicable)
- a) Best of Interest                       b) Management of Funds
- c) Convenience / Separation of activities                       d) Extension of facilities
- e) Loan probable                       f) Business probable
- g) Customer name association with the bank
- h) Others please specify .....

14. Are you aware of technology enabled Banking.  
Yes                       No

15. Which Technology product you know and you use, specify:

	You Know	You Use
a) ATM cum debit card	<input type="checkbox"/>	<input type="checkbox"/>
b) Credit card	<input type="checkbox"/>	<input type="checkbox"/>
c) Demat Account	<input type="checkbox"/>	<input type="checkbox"/>
d) SMS/Mobile service	<input type="checkbox"/>	<input type="checkbox"/>
e) Net Banking	<input type="checkbox"/>	<input type="checkbox"/>
f) Phone banking	<input type="checkbox"/>	<input type="checkbox"/>
g) Instant debit card	<input type="checkbox"/>	<input type="checkbox"/>
h) Bancassurance	<input type="checkbox"/>	<input type="checkbox"/>
i) Any other .....		

16. If you are not using various facilities / technologies then tick  the reasons that are relevant.

- |  |   |
|--|---|
| a) Unaware of the facility /technology <input type="checkbox"/>          | b) Inaccessibility of information <input type="checkbox"/>                |
| c) No training for using the technique <input type="checkbox"/>          | d) Facility not required <input type="checkbox"/>                         |
| e) Confusion caused due to improper information <input type="checkbox"/> | f) Enabled only after repeated follow ups. <input type="checkbox"/>       |
| g) Doubt the security aspect <input type="checkbox"/>                    | h) Product has failed you at some critical point <input type="checkbox"/> |
| i) Cumbersome operational process <input type="checkbox"/>               | j) Others .....   |

17 With technology enabled services available, Do you:

- a) You avoid going to the branch
- b) Still prefer visiting a branch – as a necessity
- c) Still prefer visiting -- as pleasure
- d) Visit only when bank requires

18 Your Bank's .....(Bank's name) is

- a) Highly customer oriented
- b) Highly Product oriented
- c) Service oriented facility

d) Mix of both (a) ,(b) & (c)

19 i. How frequently the customer care executive contacts you? Are you satisfied with such contacts.

a) Frequently  b) Very Frequently   
c) Need Based

ii. Are you satisfied with such contacts?

a) Yes  b) No

20. Tick the specific complaints you have with banking operations

- |  |   |
|--|---|
| a) Procedural hassles <input type="checkbox"/>               | b) Unskilled staff <input type="checkbox"/>                                     |
| c) Delay in procedures <input type="checkbox"/>              | d) Inability to structure tailor made solutions <input type="checkbox"/>        |
| e) Too many calls / reminders. <input type="checkbox"/>      | f) Too many counters without service specified confuse <input type="checkbox"/> |
| g) Long queue for depositing money. <input type="checkbox"/> | h) Delayed cheque clearance <input type="checkbox"/>                            |
| i) Too many documentations required <input type="checkbox"/> | j) Others please specify .....  |

21. How the bank manages to attend to the complaint in the following respect.

a) Attitude of bank's staff

i)Highly co-operative  ii) Co-operative  iii) Least co-operative

b) Competence level of Bank's Staff

i) High  ii) High  iii) Low

c) Response time taken

i)Very High  ii) High  iii) Low

d) Accuracy of service / solution provided

i) Very High  ii) High  iii) Low

e) Clarity of service reps explanation

i)Very Good  ii) Good  iii) Fairly Good  iv. Not Good

f) Degree of professionalism

i)High  ii) Mediocre  iii) Low

h) Level of personal care

i) High  ii) High  iii) Low

22. Do you get mailers/information/post from the bank describing various schemes and new products launched by the Bank.

a) Yes  b) No

23. Has the bank ever provided you with a financial solution even when you haven't approached them with a problem?

a) Yes  b) No  c) Specify .....

24. What do you understand by **CRM BY BANKS**

- .....
- .....
25. Give suggestions to improve the **CUSTOMER RELATIONSHIP** with banks.
- .....
- .....

## Abstract

Using a fix-effect modelling method, this study investigates the effect of foreign bank entry on the performance of indigenous banks in China during the post-deregulation period 1996-2004. Contrary to the results of Claessens' et al. (2001), our results show that it is the loss of market share (as measured by the ratio of foreign bank assets to China's entire bank assets) rather than the increase of bank branches which has a greater effect on China's domestic banks. Moreover, our results support the view of Lensink and Hermes (2004) that as China's banking sector is not well developed, domestic banks have incurred higher costs and margins when learning banking techniques and practices from foreign banks due to the spill-over effect. As a result, China's domestic banks may transfer their implementation costs to their consumers or clients by raising margins and thus gaining higher profits. It is therefore difficult to draw a conclusion whether the foreign bank entry has enhanced the competitiveness of Chinese domestic banks thus improved the efficiency of financial sector.

## Introduction

China has been opening up its banking market in the last five years by following commitments under the terms of its World Trade Organization (WTO) accession. As a result, foreign banks penetration has increased substantially.. It has been reported that by the end of 2005, 71 foreign banks from 20 countries opened 238 branches. In addition, 173 banks from 40 countries and regions have set up representative offices in 23 Chinese cities (Xinhuanet, 2005). The market share of foreign banks is relatively small in relation to the Chinese indigenous banks, for example, the total assets of foreign banks was 84.5 billions in 2005, accounting for 2% of the total banking assets in China (Ba, 2006). Nevertheless, the benefits the foreign banks can offer and the pressure they have brought on the domestic banks are widely recognised. For example, the loans provided by the foreign banks was already 20% of the total loans in the entire banking sector in China (Xunhuanet, 2005).

This paper attempts to investigate the impact of foreign bank entry on Chinese domestic banks by using panel data from 1996 to 2004. The paper is organised as follows. Section II discusses previous studies pertaining to the topic. Section III estimates the effects of foreign bank entry on China's domestic banks, and Section IV concludes the paper.

## Previous Studies

The impact of foreign entry on the performance of domestic banks has attracted increasing attention from economists within the last two decades. The research in this field has gone through exploratory to empirical test stages. Much of the early research was focused on case studies. For example, Cha (1990) argued that after the entry of foreign banks into Indonesia the banking market has become more competitive. Denizler (2000) conducted a research on the Turkish banking sector and drew a conclusion that the foreign bank entry led to the decrease of the interest margin, return on asset and operation costs of domestic banks. Barajas et al. reviewed (2000) foreign bank entry in Columbia and found that the foreign bank entry may contribute to the reduction of the cost of financing for

the financial intermediaries and the deterioration of capital assets. Similarly, McFadden (1994) examined the impact of foreign bank entry in Australia and found that it has led to more efficient domestic bank operations.

Demirgüç-Kunt and Huizinga studied the performance of foreign banks in different countries and suggested that in terms of interest income and profitability, foreign banks from developed countries were lower than the indigenous banks but foreign banks from developing countries often had achieved better performance than their developed counterparts in hosted countries.

Claessens et al. (2001) conducted the first comprehensive empirical research on a large scale. Using 7900 bank observations from 80 countries for the 1988-1995 period, Claessens et al. (2001) studied the extent of foreign bank entry and its impact on the domestic banking markets. The host countries included both developed and developing countries. Their research showed that the foreign banks entering developing countries would obtain higher interest income, profitability and taxations than their domestic counterparts. However, the opposite was found in developed countries. Claessens et al. (2001) also demonstrated that the numbers of foreign banks presented in host countries have bigger impacts on indigenous banks than their market share in the host banking market. In other words, as soon as the foreign banks penetrated the market of host countries, the indigenous banks would be pressurized and start to respond to competition regardless of the actual market share the foreign bank may possess. Claessens et al. (2001) pointed out that although the time spans of their data were not very long, it might not directly prove whether foreign bank entry may intensify the competition in host banking markets. Nevertheless, the short term development of various banking markets showed such a trend. In the meantime, there exist some risks associated with the opening of banking markets, particularly in those developing countries where the regulation system of financial sectors was not well developed. If indigenous banks can not quickly respond to the changes of competitive condition in the market, some banks may not survive.

Having collected data from 48 countries covering the periods between 1990 and 1995, Lensink and Hermes (2004) conducted a series of econometric analyses and observed the short term effects of foreign bank entry on banking industry in host countries. Lensink and Hermes (2004) argued that the short-term effects of a foreign bank entry on the behavior of indigenous banks may be determined by the level of economic development in host countries. Their study showed that the lower the levels of economic development, thus the less developed the banking market, the higher the costs and margins indigenous banks may incur when learning banking techniques and practices from foreign banks. This may be attributed to importance of spill-over in less developed banking market. As a result, the less competitive indigenous banks in less developed banking markets are able to transfer their implementing costs to their consumers or clients by raising margins and thus gaining higher profits. The opposite was found true for banks from developed banking markets. In other words, the costs, margins and profits had not been found to be associated with foreign bank entry.

Lensink and Hermes (2004) had advanced the study by Claessens *et al.* (2001). By investigating the relationship between the levels of economic development and the effects of foreign bank entry on the behaviour and outcomes of indigenous banking sectors. In addition, Lensink and Hermes (2004) also suggested including other variables, in studying the impact of foreign bank entry to indigenous banking sectors such as the level of bank market concentration or the level of financial development in host countries.

Okuda & Rungsomboon (2004) studies impact of foreign bank entry on Thai domestic banks by using panel data on 17 domestic commercial banks from 1990 to 2002. Differing from all the previous studies, Okuda & Rungsomboon (2004) made attempt to disentangle the factors attribute to the effects of foreign entry from those of other concurrent financial reforms by including various control variables both at the firm (bank) and country level. The control variable they used including government ownership dummy, a crisis dummy, the Herfindahl index, the relative bank size, and some macroeconomics variables such as the percentage change in the CPI and GDP. Okuda & Rungsomboon (2004) illustrated that an increase in foreign bank presence would negatively affect the operations of domestic banks thus leads to a rise in overhead expenses, a decline in profits, and an increase in the interest rate spread of the latter.

Following the suggestions by Lensink and Hermes (2004) and using data from 319 banks in the Central and Eastern countries covering period of 1995 to 2001, Uiboupin (2005) studied the relationship between the level of the financial development and the impact of foreign bank entry on domestic banking markets. Uiboupin's main findings were as follows: foreign bank entry had increased competition in domestic banking markets which was reflected by

the increased operation costs and decreased profits (before tax), non-interest income, average interests of loans and loss preparation of loans; Second, the degree of the development of the domestic banking market directly influence the extent of the impact of foreign bank entry on indigenous banks. Indigenous banks in more developed banking markets suffer fewer losses in incomes and loan loss provisions than in their counterparts in less developed banking markets. Furthermore, overhead costs of indigenous banks are also less likely to increase in more developed markets after foreign bank entry. Finally, the markets share of indigenous banks is another factor contributing to the variations of the impact of a foreign bank entry. Banks with higher market share tend to react less on foreign banks entry in terms of non-interest income and loan loss provisions.

## Empirical Testing of Impact of Foreign Banking Entry on China's Domestic Banks

In this study, a multiple regression method is used to test the impact of foreign bank entry on China's banking market. The degree of foreign bank entry is proxied by the ratio of foreign bank assets to China's entire bank assets (FS) and the numbers of foreign bank branches (FN). The dependent variables are the bank performance measures. We have included interest income ratio (IM, or bank's net interest income over total asset) and non-interest income ratio (NIM or non-interest income over total asset) which accounts for banks' non lending activities, the ratio of profit before tax (PRO) and overhead ratio (EXP or overheads over assets).

Equation (1) expresses the relationship among the above variables:

$$I_{i,t} = \alpha + \beta FS_{i,t} + \lambda X_{i,t} + \varepsilon_{i,t} \quad (1)$$

Where  $I_{it}$  are bank performance measures, including IM, NIM, PRO and EXP,  $\alpha$  is the intercept; FS is the degree of foreign bank entry consisting of the ratio of foreign bank assets to China's entire bank assets (FS) and the numbers of foreign bank branches (FN). Since a country's economy has an important influence in banks' lending activities, China's economic growth rate (GDP) is also included in the equation as a control variable, which is denoted by  $X_{it}$  in the equation.  $\varepsilon_{it}$  is the error term,  $i$  denotes for individual bank whilst  $t$  representing the time.

Comparing to the models of Claessens, Lensink, Hermes, Uiboupin, the major difference of our model is the fact that we did not introduce those variables reflecting the individual characteristics of domestic banks. This is because we believe that the Chinese commercial banks were established in the same political and economic environment. The history of the commercial banks is not very long. The earliest one has just less than 20 years' history<sup>1</sup>. As a result, no matter whether it is a state-own bank, a commercial bank or stock-holding bank, they do not significantly differ from each other in terms their business scope, operating environment, organization structure, management structure and human resource management. In the meantime, the Hausman test rejected the random effects model in favor of the fixed effects model. Therefore, we treat all the domestic banks invariant in these aspects in order to simplify the model.

All the data is either directly or adapted from 'China's Finance Statistics Yearbook', 'The Quarterly of People's Bank', and 'China's Statistical Yearbook'. The panel data between 1996 and 2004 was used which included data on China's four biggest state-owned commercial banks. They are Bank of China, Bank of Communications, Industrial and Commercial Bank of China and China Construction Bank. It also includes data on thirteen commercial banks: China Everbright Bank, Hua Xia Bank, China Mingsheng Banking Corp., Guang Da Bank, Guangdong Development Bank, China Merchants Bank, Shanghai Pudong Development Bank, Shenzhen Development Bank, Export-Import Bank of China, Agricultural Bank of China, Bohai Bank, China Industrial Bank and China Citic Bank. The empirical results are provided in Table 1 and Table 2.

The summary of the econometrics can be drawn as follows.

Firstly, t-statistics of the numbers of foreign bank branches (FN) is not significant. This shows that Chinese domestic banks are not sensitive to the increase of foreign banks branches, thus have not accordingly adjusted their strategies. Secondly, in contrast, the market share of foreign banks (measured by the ratio of foreign bank assets to China's entire bank assets) has yielded a significant result. This demonstrates that it is the loss of market share rather than the increase of bank branches which has a greater effect on China's domestic banks. This result differs from that of Claessens' (2001). Thirdly, when using the market share of foreign banks as one of the explanatory variables,

the interest income variable has not achieved a significant result. In contrast, non-interest income, overhead cost and pre-tax profitability have all yielded positive signs with significant results. These results show that foreign bank entry has improved the efficiency of Chinese indigenous banks.

## The Comparison of the Empirical Results

We have summarized our econometrics results and compared them with those of Claessens (2001), Lensink and Hermes (2004) and Uiboupi (2005), which were listed in Table 3.

TABLE 3: SUMMARY OF THE EMPIRICAL RESULTS AND COMPARISON WITH SOME MAJOR EARLIER STUDIES

	Explanatory Variable	Net Interest Margin	Non-Interests Income	Overhead Cost	Pre-Tax Profits
Claessens (2001)	FN	NS	-	-	-
	FS	NS	NS	NS	NS
Lensink & Hermes (2003a)	FN	+	+	+	-
	FS	+	+	+	-
Lensink & Hermes (2004)	FN	+	+	+	-
	FS	+	+	+	-
Uiboupin	FN	-	-	NS	-
	FS	-	-	NS	-
Our analysis	FN	NS	NS	NS	NS
	FS	NS	+	+	+

Note: “+” indicates a significant positive correlation, “-” indicates a significant negative correlation, “NS” indicates a relationship that is not statistically significant

Specifically, our results differ from the previous studies in several respects. First, the extent to which the impact of foreign bank branches and the market share of foreign banks on the domestic banks vary significantly. All the previous research listed above indicated that the increase of foreign bank branches will have a substantial impact on the performance of domestic banks (Claessens, 2001; Lensink and Hermes (2003, 2004; Uiboupin (2005). Our results showed an opposite result. It seems that China’s domestic banks are insensitive to the increase of foreign bank branches. Generally speaking, it takes some time for foreign banks to establish certain market share after they initially open their bank branches. In a developed market economy, the domestic banks may quickly respond to the expansion of the rivals thus may adopt an appropriate strategy to compete with the new arrivals. However, despite the many years of reform, the major big banks of China remain largely owned by the state<sup>2</sup>. As a result, the majority of the top bank managers are still appointed by the government who still serve a government function in addition to their roles of chairman or the directors. They may not act in the best interest of shareholders. Consequently, Chinese domestic banks, particularly, the big banks may not significantly change their behaviour and become market oriented (Xi, 2006; IMF, 2006). Uiboupin (2005) demonstrated that when facing foreign bank competition, big banks may respond more slowly than small ones. On the one hand, big banks that normally have a larger market share may care less about foreign entry; on the other hand, big banks may be too big to react (Uiboupin, 2005). This explanation may be applied to the banks in China since the average size of Chinese domestic banks are relatively large due to historical reason. Specifically, banks have been state owned for many years and their market shares are well established. So this maybe why the Chinese are less responsive to the increase of foreign bank branches.

Second, our results show that there is not strong correlation between net interest margin and foreign bank entry and economic growth. The possible reason may be the low degree of marketisation. Although Chinese domestic banks are given some freedom to charge interest on the lending rate, the rate is still set by the government. Namely, the government can still control the interest margin to a great extent. Moreover, the size and allocation of banks loans to a certain extent are still policy orientated.

Third, there is a significant positive relationship between the foreign bank entry and the increase of non-interest income which is contrary to Uiboupin's result. The increase of non-interest income may be brought by the unique banking regulatory environment and the spill-over of foreign banks. As aforementioned, since Chinese domestic bank can only charge the interest rate within a certain range, when they compete with foreign banks, they try to expand their business through diversification into non-traditional banking activities such as personal financial advice and brokerage. In the meantime, some banks even start to abolish certain bank charges including annual fee of credit cards and fees for non-profitable accounts. However, under China's current separate financial service regulation regime, it is difficult to reach the vast customer base of the capital market.

Fourth, overhead costs are positively correlated with foreign bank presence. Facing the fierce competition and to catch up with banks from developed countries, Chinese domestic banks realize they need to introduce advanced technology and facilities, recruit highly trained personnel and change the business model or even management system. All these will inevitably increase the overheads. This finding is consistent with all the previous studies.

Finally, foreign bank entry has generated a positive effect on China's domestic banks' pre-tax profits. The relationship among all the explanatory variables can be displayed as below:

### **Net Interest Margin + Non-interest Income = Overheads Costs + Pre-tax Profits**

Our result show that even though the overhead costs have increased after foreign bank entry, there still exists a positive association between the foreign bank entry and pre-tax profit. This result, again, differs from the previous studies. The possible explanation is that the increase of the magnitude of non-interest has exceeded the increase of overhead cost which leads to the improvement of profits.

## **Conclusion**

In this paper, we had investigated the impact of foreign bank entry on China's domestic banks by using a panel data on 14 domestic banks from 1996 to 2004. The study proved that the increasing presence of foreign banks has led to a rise in overhead cost, net interest margins and profits of China's domestic banks. This may mean foreign bank entry has enhanced the competitiveness of Chinese domestic banks thus improved the efficiency of financial sector. However, the results may also be attributed to the unique characteristics of China's banks. For example, one of the major findings of our research is the insensitivity of domestic banks towards the impact of foreign bank entry when the net interest margin is used as an indicator of the performance. We believe this could be explained by the slow development of the marketisation of the Chinese banking sector. The majority of the early researches on the impact of foreign bank entry were normally concentrated on the transitional economies, particularly eastern and central European countries where the degree of marketisation is higher than China due to the large scale of privatisation of state-owned enterprise and greater restraints of government direct control over the market. In the meantime, the limitation of the foreign ownership in China's domestic banks may become an obstacle in implementing modern management system thus preventing the banks from full market orientation. The shortage of managerial personnel in China's financial sector who can quickly respond to the market signal is well documented (Xue, B. & Enderwick, 2003; Tsang, 2004).

It may be noted that because China's domestic banks do not have a complete autonomy in deciding their interests, the net interest margins are not necessarily relating to the results of market competition. The focus of further deepening banking reform should be placed onto building up financial infrastructure of the banking sector and cultivating market oriented banks and financial products.

Finally, our research also show that despite that increase of overall overhead costs, the profits of China's banks also increased. We believe this may be due to the efforts of China's bank in diversifying into fee-earning activities, such as service charges on deposit accounts, net service fees, net securisation income, insurance commissions and fees or other banking/brokerage fees.

Overall, it may be concluded that notwithstanding the relatively small share of foreign banks, the presence of foreign banks has changed the competitive environment of Chinese banking sector and brought the pressure on China's domestic banks to improve their management practise and operations. However, as China's domestic banks may transfer their implementation costs to their consumers or clients by raising margins and thus gaining higher profits. It is therefore difficult to draw a conclusion whether the foreign bank entry has enhanced the competitiveness of Chinese domestic banks thus improved the efficiency of financial sector. In the meantime, the banks' fast portfolio diversification may require an assessment of risks involved. It must be noted that there are at least two limitations in this research. First, we did not separate the effects of foreign bank entry from other effect of banking reforms that have taken place simultaneously in China. Second, the sample size may need to increase to draw more convincing conclusion.

## Abstract

This paper investigates the effect of bank consolidation on market structure and competition in Malaysian banking industry over the periods 1998-2005. The study evaluates the degree of competition using  $H$ -statistic proposed by Panzar and Rosse (1987). The estimated  $H$ -statistics are positive ranging from 0.38 to 0.62 and Wald tests for the market structure of monopoly or perfect competition is rejected. The results imply that the financial institutions in Malaysia earned their revenue in the condition of monopolistic competition. Furthermore, the traditional interest-based market however is significantly less competitive than the overall market. The evidence is not strong to conclude for an increase in competition reflecting a change in the market structure. Thus, the findings suggest that some competition policy responses need to be considered to make the Malaysian banking market more competitive in the wave of further liberalization in banking industry. JEL Classification: G21; D24, L1. Keywords: Competition; Panzar-Rosse model; Malaysia; Market structure

## Introduction

Academics and policy makers seem to accept the view that financial institutions play a crucial role in the effective functioning of modern economies. One would expect that the higher the degree of competition, the higher its efficiency in terms of allocating funds and in general operating as an intermediary between depositors and borrowers. There has been considerable concern about how ongoing consolidation in financial systems around the world will affect competition. Indeed, much of the recent public debate seems to assume that perfect competition in banking is ideal. For much of the last century, this has not always been the case where policy-makers focused on stability. Therefore, banking competition generally can be characterized as monopolistic competition that banks do not offer completely homogeneous products (Allen and Gale, 2001).

It is observed that the banking industry in developing economies has been experiencing a fundamental change in its market structure since the Asian financial crisis. One of the main underlying factors behind such a wave of financial consolidation may be the fierce competition among banks triggered by financial deregulation and financial globalization, resulting in a sharp increase in financial management risk. In addition, significant progress in information technology necessitates that banks seek scale economies and risk diversification to gain comparative advantage over rival banks. While that of emerging economies has been forced by government-led structural adjustment policy for the banking industry as a way of overcoming the financial crisis, the financial consolidation in industrial countries has been evolved by market forces

This study is motivated by several factors. First, a number of studies have examined the effects of consolidation on competition and market structure of banking industry; however, these studies have concentrated on developed markets. Our study contributes to the literature by comparing the competitive behaviour of Malaysian banking industry before and after the consolidation period. Secondly, a dearth of bank consolidation and competition studies utilizes the non-structural model approach suggested by Panzar and Rosse (1987), and most of them have been concentrated on the developed countries with very few studies on developing countries. Thus, we extend the

literature by employing a Panzar and Rosse (1987) model to empirically estimate the competitive behaviour in developing countries specifically Malaysian banking industry. Since, the overall effect of greater concentration can be ambiguous it can either be that the greater bank size can lead to an increase in *monopolistic power*. A rise in lending rates or greater *economies of scale* (banks are more efficient) and a decrease in lending rates. Hence, this is an important issue for policy makers, regulators, researchers and economists

The paper is structured as follows: Section 2 provides the structure and trends market concentration in the Malaysian banking industry during the period of 1997 and 2005. Section 3, elaborates on theoretical model of Panzar-Rosse (1987) and some empirical evidences generated from their model. Section 4 presents the data and the empirical model used in the empirical analysis. Section 5 provides the estimation and results of the *H*-statistic for the pre- and post-consolidation periods. Section 6 summarizes the paper with some concluding remarks.

## Malaysian Banking Structure and Concentration

At the onset of the crisis the Malaysian banking system is characterized by its high market concentration consisted mainly of three types of institutions: commercial banks (domestic and foreign), finance companies, and merchant banks. Table 1 shows the evolution of the Malaysian banking structure between 1998 and 2005. Domestic commercial banks had the largest share of the market controlling 73.6 percent of the market share in 2005. Among these, the government controlled the largest bank (Maybank) through a majority share and it fully owned the second largest bank, Bumiputra-Commerce Bank. Foreign commercial banks controlled only 19.2 percent of banking assets. Foreign banks do not make any progress in controlling market share was the result of a deliberate government policy of developing the domestic financial sector, under which foreign banks have been prohibited to open new branches and no new license was granted to foreign institution.

TABLE 1: STRUCTURE OF MALAYSIAN BANKING IN 1997 AND 2005

	1997		2005	
	No. of Institutions	Total Assets (%)	No. of Institutions	Total Assets (%)
Domestic Commercial Bank	22	57.0	10	73.6
Foreign Commercial Bank	13	16.7	12	19.2
Finance Company	39	20.0	0	0.0
Merchant Bank	12	6.3	10	7.2
Total	86	100.0	32	100.0

Following the deepening of the financial crisis that struck the region in 1997/98, the Government took stronger measures to promote merging of banking institutions. A merger program was initiated in 1998 covering only the finance companies initially. The merger program was subsequently extended to include all domestic banking institutions in July 1999 and all domestic banking institutions would be restructured so that six banking groups would be formed. However, as uncertainty remains on the impact of the mergers on the asset quality of the newly formed group, particularly on the anchor banks and thus the plan was finally halted at the end of September 1999. A new merger plan was announced, that all domestic banking institutions to form their own merger groups and choose their own leader in each group by end-January 2001. In response to this approach, approval was granted for the formation of 10 banking groups. It was also intended to avoid the turmoil in the financial markets due to the drastic reduction of financial institutions. The Malaysian banking industry, after its first stage of consolidation that reduced the number of banks to 10 anchor banks, is poised to enter a second phase of consolidation. Table 2 shows the banking groups in Malaysia after the completion of second phase of consolidation process. This phase of consolidation is beginning to involve mergers between banks and their finance company subsidiaries, and the initial stages of mergers between the country's remaining ten banking groups.

Source: Bank Negara Malaysia

The bank consolidation in Malaysia, characterized by the structural adjustment of the banking industry since the currency crisis of 1997, has caused significant change in its market structure. The first phase of structural adjustment during the period of 1998 and 1999 has been carried out to sweep out non-performing banks. Unlike the first phase, the second phase of structural adjustment has been initiated by major large-sized banks to obtain competition power since the 2001 (Bank Negara Malaysia, 2004). As such, each phase of bank consolidation has been carried out with a contrasting motive. In addition, the bank consolidation in Malaysia has been remarkably characterized by horizontal mergers among banks with overlapping market segmentation. As the banking market structure in Malaysia has been reorganized mainly by several leading banks or financial holding companies, it is observed that the size distribution of banks has been widened. As a consequence, the number of banks has sharply decreased and market concentration in the banking market has markedly increased. Moreover, considering that additional bank mergers are currently in progress, it is expected that market concentration in the Malaysia banking industry will be higher in the near future than at present.

The most frequently applied measures of concentrations,  $k$ -bank concentration ratio ( $CR_k$ ) and Herfindahl-Herschman Index (HHI)<sup>1</sup>. Market concentration is used as a measure of market dominating power within an industry or among companies. Following the step of previous researchers, this paper employ a widely use bank concentration index of the highest two ( $CR_2$ ), three ( $CR_3$ ) and five ( $CR_5$ ) bank total assets, total deposits and total loans as an initial measure.  $CR_k$  is computed as the sum of top  $k^{\text{th}}$ -tier firms' market shares and summing only the market shares of the  $k$  largest banks in the market, it takes the form:

$$CR_k = \sum_{i=1}^k S_i \quad (1)$$

*CRk* is a relatively strong measure because it clearly catches the market structure through market shares of a few dominating firms. This index is based on the idea that the behavior of a market is dominated by a small number of large banks. The *CRk* index is very useful to examine the market influence of a few dominating firms in the market, it is not so useful in grasping the general features of market structure. On the other hand, the Herfindahl-Herschman index (*HHI*) is defined as the sum of the squared market shares of all banks in the market. *HHI* takes market shares as weights, and stress the importance of large banks by assigning them a greater weight than smaller banks. The *HHI* can be computed as follows:

$$HHI = \sum_{i=1}^n (MS_i)^2 \quad (2)$$

Where *MS* is the market share of the *i*<sup>th</sup> firm and *n* is number of firms in the market. *HHI* has the advantage of including information of the distribution of market share as well as the number of firms which take part in the industry. Having their own merits, both *CRk* and *HHI* are widely used as major measures of market concentration. As the market concentration index indicates the possibility of firms' anticompetitive behavior in an industry or a market, many countries' regulatory authorities utilize the index as one of the approval criteria of corporate consolidation.

To examine the trends of market concentration in the Malaysian banking industry we estimate the market concentration index based on *CRk* and *HHI* over the period 1998-2005, which includes periods of bank consolidation, restructuring as well as structural reform of the whole banking system. Table 3 summaries *HHI*, *CR*<sub>2</sub>, *CR*<sub>3</sub>, *CR*<sub>5</sub> of total assets, total deposits and total loans, as the indicators of market concentration of commercial banks in Malaysia. The results show that Malaysian banking industry *HHI* estimate is in between 1,231.10-1,644.31 for the periods 1998-2005 which is considered as a moderately concentrated market. For the market with *HHI* between 1,000 and 1,800, anti-competitive behavior could be exercised when *HHI* is increased by more than 100 according to the guideline by U.S Department of Justice.

TABLE 3: MARKET CONCENTRATION OF MALAYSIAN BANKING INDUSTRY

	Total Assets				Total Deposits				Total Loans			
	CR <sub>2</sub> %	CR <sub>3</sub> %	CR <sub>5</sub> %	HHI	CR <sub>2</sub> %	CR <sub>3</sub> %	CR <sub>5</sub> %	HHI	CR <sub>2</sub> %	CR <sub>3</sub> %	CR <sub>5</sub> %	HHI
1998	0.38	0.51	0.70	1317.29	0.36	0.50	0.69	1321.38	0.36	0.49	0.70	1346.40
1999	0.41	0.55	0.70	1551.40	0.41	0.55	0.70	1527.27	0.43	0.57	0.69	1551.28
2000	0.42	0.55	0.55	1563.41	0.42	0.54	0.69	1553.99	0.43	0.58	0.71	1644.31
2001	0.38	0.49	0.63	1315.86	0.38	0.48	0.63	1325.51	0.40	0.52	0.65	1427.91
2002	0.38	0.48	0.59	1297.71	0.37	0.47	0.62	1291.11	0.40	0.51	0.65	1407.52
2003	0.34	0.45	0.59	1181.29	0.34	0.45	0.60	1170.31	0.36	0.48	0.61	1274.35
2004	0.35	0.47	0.63	1193.68	0.36	0.47	0.68	1205.56	0.36	0.46	0.62	1231.10
2005	0.40	0.50	0.69	1334.50	0.40	0.51	0.70	1358.10	0.42	0.53	0.68	1465.88

The market concentration ratio in Malaysian banking industry shows an increasing trend in between 1998-2000, after the first phase of consolidation. The *HHI* estimate based on total loans increases to 1,644.3 (1,346.4 in 1998), *CR*<sub>2</sub> estimate increases to 0.43 (0.36 in 1998), *CR*<sub>3</sub> estimate increases to 0.58 (0.49 in 1998) and *CR*<sub>5</sub> estimate increases to 0.71 (0.70 in 1998). This increasing trend is due to Government measurers to restructure the banking system by including all domestic banking institutions so that six banking groups would be formed and the initial measures to promote merging of finance companies after the crisis in 1998/99. Even though the first phase of consolidation has led to increase in concentration ratios, it was not sufficient to induce the banking system to become anti-competitive. The restructuring of the banking system was mainly to remove the unhealthy financial institutions and to retain sound financial institutions in the system.

The second phase of consolidation in between 2001-2004, market concentration ratios, *HHI*, *CR*<sub>2</sub>, *CR*<sub>3</sub>, and *CR*<sub>5</sub> based on total loans show a decreasing trend of 1,231.1 (1,427.9 in 2001), 0.36 (0.40 in 2001), 0.46 (0.52 in 2001) and 0.62 (0.65 in 2001). In addition *HHI*, *CR*<sub>2</sub>, *CR*<sub>3</sub>, and *CR*<sub>5</sub> based on total deposit reveals a similar trend to that of market concentration based on total loans. These trends indicate the failure of the first plan of consolidation to merge domestic commercial into six anchor banks. It seems to indicate that after the financial crisis in 1998/99, the market concentration ratios reflect the change in the market structure. However, in 2005 the concentration ratios, *HHI*, *CR*<sub>2</sub>, *CR*<sub>3</sub>, and *CR*<sub>5</sub> increase sharply based on total loans and total deposits. The sharp increase in the market concentration ratios reflects the changes in the market structure and distribution of market shares derived from the completion of all merger and acquisition exercise during the second phase of consolidation. In these periods, the completion of merger and acquisition has led to the expansion of market share of the remaining financial institutions. Hence, the plan to initiate further merger and acquisition without opening the market to further competition will increase the market concentration and lead to the financial institutions behaving in anti-competitive manner.

## The Panzar-Rosse Approach: Theory and Evidence

Studies designed to estimate the competition in the banking literature can be divided into two groups: structural approach that focus on market structure parameters (Mason, 1939; Bain, 1951; Demsetz, 1973) and non-structural approach that estimate firm's input-output cost relationship (Baumol, 1982; Bresnahan, 1982; Panzar and Rosse, 1987). Empirical research has been devoted mostly to examine the market-power hypothesis through the profit rate-market concentration relationship (Berger, 1995) and contestability (Shafer, 1994) hypotheses. The findings of empirical investigations towards market structure either in banking or in general for public policy, have so far been inconclusive. Among those studies that appear to show a link between structure, conduct and performance have been recognized as methodologically flawed, rendering their findings unsuitable for public policy (Shafer, 1994).

The Panzar-Rosse (P-R) approach for testing market power relies on the premise that banks will employ different pricing strategies in response to change in input costs depending on the market structure in which they operate. The advantage of non-structural approach is that it is rooted in theory and in principle distinguishes between market power and efficiency as a source of concentration and profitability. It is very useful because it depends on individual bank's data, for which there are sufficient observations. Therefore, whether a bank operates in a competitive market or exercises some monopoly power can be inferred from the analysis of that bank's total revenue as it responds to changing input prices. Panzar and Rosse (1987) introduce a series of tests based on properties of reduced-form revenue equations at the firm level on which the hypothesis of monopoly or oligopoly of profit maximization places testable restrictions.

The test is derived from a general banking market model, which determines equilibrium output and the equilibrium number of banks by maximizing profits at both the bank level and the industry level. Two critical implications exist for this equilibrium model. First, at the bank level, profit is maximized where marginal revenue is equal to marginal cost:

$$R_i^l(y_i, \kappa, v_i) - C_i^l(y_i, f_i, q_i) = 0 \quad (3)$$

$R_i^l$  is the marginal revenue function,  $C_i^l$  is marginal cost function,  $y_i^l$  is the output of bank  $i$ ,  $\kappa$  is the number of banks,  $v_i$  and  $q_i$  consists of exogenous variables that shift the bank's revenue and cost functions, respectively and  $f_i$  is a vector of bank  $i$ 's factor input prices.

The second implication is that the zero profit constraint holds at the industry level:

$$R_i^*(y^*, \kappa^*, v_i) - C_i^*(y^*, f, q) = 0 \quad (4)$$

From these conditions, the  $H$ -statistic is formulated as:

$$H = \sum_{x=1}^t \frac{\partial R_i^*}{\partial f_{xi}} \frac{f_{xi}}{R_i^*} \quad (5)$$

This is the sum of the factor price elasticity, which indicates how responsive revenue is to percentage change in factor prices.

Before outlining the estimation procedure, it is necessary to discuss the various testable implications of the model. The  $H$ -statistic can be used to identify the three major market structures, namely, monopoly/perfect collusion, monopolistic competition and perfect competition/contestable market. Conclusions about the type of market structure are made based on the size and sign of the  $H$ -statistic. That is, both the size and sign are used to differentiate between the different market structures. The intuition behind the  $H$ -statistic rests solely on microeconomic theory, which outlines how income or revenues react to changes in input prices for the different market structures.

Under monopoly, if the input price is increased, then the marginal cost should increase and the equilibrium outputs and total revenue should decrease or remained unchanged. Hence, the  $H$ -statistic should be equal to or smaller than 0. Under monopolistic competition, the change in input price is greater than the change in revenue, thus the  $H$ -statistic should be smaller than 1 but greater than 0. Under perfect competition, the change in input price leads to an equal change in revenue, therefore the  $H$ -statistic should be equal to 1. A summary of the testable hypotheses of the different market structures is presented in Table 4. Using a simple, single product monopoly model with the assumptions of constant price elasticity and a constant returns to scale Cobb-Douglas technology, P-R further showed that not only is the sign of the  $H$ -statistic important, but so too is its size. That is, a larger  $H$ -statistic means that the market is more competitive implying that the  $H$ -statistic is a continuous measure of competition.

Source: Molyneux *et al.* (1994).

In applying the P-R model, it is important to clearly define the production activity of the banks since they are not exactly comparable to other types of firms. The current literature presents two alternative approaches - the “production approach” and the “intermediation approach” – that can be taken in empirical work. Although there is some amount of debate as to which approach should be taken in empirical work, this paper will follow the intermediation approach, which classifies deposits and loans as inputs and outputs, respectively.

There are several studies in the literature have used Panzar-Rosse method to measure the level of competition in the banking sector. A summary of previous P-R studies on banking is presented in Table 5 for various countries. Most of the previous empirical estimations of P-R model is applied to developed countries and recently, several studies have employed this methodology to quantitatively assess the degree of competition and market structure of banking industry in developing and transition countries. In general, all of these studies find that banking market are best described as monopolistic competition. However, none of the studies in banking literature investigated the competitive behaviour and market structure in the Malaysian banking sector.

TABLE 5: SUMMARY OF OTHER P-R STUDIES ON BANKING

<i>Author (s)</i>	<i>Period</i>	<i>Countries</i>	<i>Findings</i>	<i>Average H</i>
Shaffer (1982)	1979	New York	MC

Yuan (2006)	1996-2000	China	PC (nearly perfect competition)	0.89

PC = perfect competition, MC = monopolistic competition, MO = monopolistic market

## Data and Model Formulation

For the empirical analysis, 22 financial institutions comprise of domestic commercial banks, finance companies and merchant banks from 1998-2005 are used, which accounted for approximately 121 observations. Malaysian banks operating in Islamic banking environment will be excluded in the sample of the analysis due to different regulatory framework. Unconsolidated bank-specific annual data are taken from published balance sheet of annual reports of each individual financial institution. The data is an unbalanced annual data due to merger and acquisition during periods of the study. Table 6 shows the summary statistics of the sample distribution in the empirical analysis over the 1998-2005.

TABLE 6: SUMMARY STATISTICS OF VARIABLES USED IN P-R MODEL (IN RM MILLION)

Variable	Mean	Median	Maximum	Minimum	Std. Dev.
Total Revenue	1346.65	898.90	8687.70	23.50	1644.00
Total Interest Revenue	1244.60	802.70	7014.60	7.90	1548.08
Total Loans	13854.76	6515.50	115481.60	4.10	20449.47
Total Deposit	18150.09	11124.00	145572.10	150.00	24607.55
Total Assets	23006.82	13733.20	175434.70	279.20	32285.63
Loan Provision	207.58	106.80	1578.10	-32.30	293.54
Shareholder's Equity	2002.69	1172.60	15179.30	30.20	2694.17
Personnel Expenses	144.63	61.20	974.40	3.50	202.92
Other Operating Income	168.64	68.50	1673.10	-17.10	264.31
Fixed Assets	173.53	62.70	1188.90	0.10	254.69
Net Profit	245.84	97.70	3809.60	-747.50	521.23
Interest Expenses	622.75	423.90	4078.00	1.20	754.86
Operating Expenses	176.89	83.55	2424.10	0.80	303.02

The empirical application of the P-R approach assumes a log-linear marginal cost function (dropping subscripts referring to bank  $i$ ) following Bikker and Haaf (2002):

$$\ln MC = \alpha_0 + \alpha_1 \ln OUT + \sum_{i=1}^m \beta_i \ln IP_i + \sum_{j=1}^p \gamma_j EX_{COSTj} \quad (6)$$

Where  $OUT$  is output of the bank,  $IP$  are the factor input prices (*e.g.* funding, personnel expenses and other expenses) and  $EX_{COST}$  are other variables, exogenous to the cost function  $C_i^l$  in equation (3). Equally, the underlying marginal revenue function has been assumed to be log-linear of the form:

$$\ln MR = \delta_0 + \delta_1 \ln OUT + \sum_{k=1}^q \vartheta_k EX_{REVk} \quad (7)$$

Where  $EX_{REV}$  are variables related to the bank-specific demand function  $z$  in equation (1). For a profit-maximizing bank, marginal costs equal marginal revenues in equilibrium, yielding the equilibrium value for output (denoted by an asterisk):

$$\ln OUT^* = (\alpha_0 - \delta_0 + \sum_{i=1}^m \beta_i \ln IP_i + \sum_{j=1}^p \gamma_j \ln EX_{COSTj} - \sum_{k=1}^q \vartheta_k \ln EX_{REXk}) / (\delta_1 - \alpha_1) \quad (8)$$

The reduced-form equation for income or revenues of bank  $i$  is the product of the equilibrium values of output of bank  $i$  and the common price level, determined by the inverse-demand equation, which reads, in logarithms, as:

$$\ln p = \xi + \kappa \ln(\sum_i OUT_i^*) \quad (9)$$

In the empirical analysis, a methodological choice needs to be made on how to appropriately define a bank's production process. The approach to input/output definition used in this study follows the intermediation approach, which was originally developed by Sealey and Lindley (1977) and posits that total loans and securities are outputs, whereas deposits along with labour and capital are input to the production process of banks. Specifically, the input variables used in this study are the average cost of labour, deposits and capital. Following Shaffer (1982, 1985), Nathan and Neave (1989), Molyneux *et al.* (1994), Perera *et al.* (2006) and Al-Muharrami *et al.* (2006), the reduced-form total revenue and total interest revenue equation can be written as:

$$\ln TREV_{it} = \alpha_0 + \alpha_1 \ln PL_{it} + \alpha_2 \ln PK_{it} + \alpha_3 \ln PF_{it} + \sum \zeta_j \ln BSF_{it} + \varepsilon_{it} \quad (10)$$

$$\ln TINT_{it} = \alpha_0 + \alpha_1 \ln PL_{it} + \alpha_2 \ln PK_{it} + \alpha_3 \ln PF_{it} + \sum \zeta_j \ln BSF_{it} + \varepsilon_{it} \quad (11)$$

for  $t = 1, \dots, T$ , where  $T$  is the number of periods observed and  $I = 1, \dots, I$ , where  $I$  is the total number of banks. Subscripts  $i$  and  $t$  refer to bank  $i$  and at time  $t$ . In this study, we use two measures dependent variables  $TINT$  is the ratio of total interest revenue to total assets and  $TREV$  is the ratio of total revenue to the total assets. The dependent variable is divided by total assets in order to account for size differences. The first specification in which the dependent variable is only the interest part of total revenue is consistent with the approach that financial intermediation constitutes the core business of financial institutions. Although interest revenues still constitute the principal source of banks' earning, recent studies on banking activities report a dramatic increased of other income from fee-based products and off-balance sheet activities in recent year given the increased level of competition in financial markets (Nathan and Neave, 1989; De Bandt and Davies, 2000). This can also be explained partly by the desire of financial services firms to expand their revenue generating sources without altering their risk and thus their capital structure. For this reason, it is appropriate to include total revenues in the model in addition to interest revenues.

This study follows previous studies (Molyneux *et al.*, 1994; Perera *et al.*, 2006; Al-Muharrami *et al.*, 2006) assuming that all funds are input in banks' production function. Under this intermediation approach, banks use three inputs namely labour, deposit and capital.  $PL$  is the ratio of personnel expenses to the total assets, a proxy for cost of labour,  $PK$  is the ratio of other operating expenditure to fixed assets, a proxy for cost of capital and  $PF$  is the interest expenses over total deposit, as a proxy of price of funds. All dependent and independent variables are taken in natural logarithm.

The input prices are followed by a set of bank-specific factors ( $BSF$ ) that are relevant to the modern banking business. The  $BSF$  includes the ratio of total equity to total assets ( $EQASST$ ) is included to control for differences in capital structure. The expected coefficient can be positively related to total revenue well-capitalized banks involved in riskier operations and portfolios and in the process tend to hold more equity, voluntarily or involuntarily. However, according to Molyneux *et al.* (1994) the coefficient can be expected to be negatively related to the total revenue dependent variable since lower capital ratios should lead to higher bank revenue. In addition, the ratio of loan provision to total asset ( $RSKASST$ ) is included to account for a different measure of bank-specific risk (Al-Muharrami *et al.*, 2006). The  $RSKASST$  is expected to have a positive impact on revenue.

Total assets ( $ASST$ ) controls for the size of the bank and can be considered as a proxy for economies of scale (De Bandt and Davies, 2000; Shaffer, 2002). However, the effect of this variable is indeterminate on the

grounds that any positive influence on revenue may be offset by larger banks capable of diversifying their business and spreading the risk of business. Total financing to total assets (*LOANASST*), a proxy for degree of intermediation, is expected to be positively related to revenue, as higher proportion of asset on the bank's book is expected to generate higher revenue, since higher provisions are associated with higher risk and higher expected return.

An important feature of the *H*-statistic is that the tests must be undertaken on observations that are in long-run equilibrium. As suggested in the previous studies (Molyneux *et al.*, 1994; De Bandt and Davies, 2000; Bikker and Haaf, 2002), the test is based on the proposition that in competitive capital markets risk-adjusted rates of return will be equalized across banks. The equilibrium test can be performed by recalculating the Panzar and Rosse's *H*-statistics replacing the dependent variable total revenue over total assets with the natural log of return on assets (*ROA*). This verification is important for the cases of perfect competition ( $H=1$ ) and monopolistic competition ( $H>0$ ), while  $H<0$  is a long-run condition for monopoly. Thus, if the sample is not in the long-run equilibrium,  $H<0$  no longer establishes monopolistic market conditions, but remains true that  $H>0$  disproves monopoly or conjectural variation short-run oligopoly (Shaffer, 1985). The long-run equilibrium can be estimated in the following form:

$$\ln (ROA)_{it} = \beta_0 + \beta_1 \ln PL_{it} + \beta_2 \ln PK_{it} + \beta_3 \ln PF_{it} + \sum \zeta_j \ln BSF_{it} + \varepsilon_{it} \quad (12)$$

It should be noted that following Claessens and Leaven (2004), the measure of *ROA* included in equation (12) is equal to  $\ln (1+ROA)$  and thus adjusted for small negative values due to banks' losses in any year. The long-run equilibrium test measures the sum of the elasticity of return on assets with respect to input prices. If the *E*-statistic  $(\beta_1 + \beta_2 + \beta_3) = 0$ , this implies that the banking market is in long-run equilibrium. If rejected the market is assumed not to be in equilibrium (Claessens and Leaven, 2004). It should be noted however that equilibrium does not mean that competitive conditions are not allowed to change during the sample period. It only implies that changes in banking are taken gradually.

## Empirical Results

There are number of empirical studies generally employs Ordinary Least Square (OLS) estimation methodology on the cross section yearly data but this has a potential to produce unstable results. In addition to basic OLS model, this paper also includes panel regression methodology combining cross section and time series data with the fixed effect estimators, to control for the heterogeneity among banks bank specific factors, which affect revenue, knowingly or not, but are not considered in the basic model. Hausman test for model selection was not carried out due to difficulty in estimating a random effect model. Throughout the study White's (1980) heteroscedasticity consistent statistics were used. Preliminary investigations of data revealed that there was no severe multicollinearity which hinders efficient estimation of the models. The Wald test which follows an F-distribution was used in the competition models to test whether or not the calculated *H*-statistics are statistically different from zero and unity.

In order to test competition and equilibrium of banking industry in the long-run, the equation (10) and equation (11) is estimated for two sub-periods 1998-2001 and 2001-2005. The estimation results for the competitive position using the total revenue (*TREV*) as the dependent variable for the periods 1998-2001 and 2002 to 2005 are reported in Table 7. The period 2002-2005 shows a relatively higher degree of competition than in 1998-2001 indicate that individual banks have some ability to post higher profit due to their unique features and market strategy. The estimated regression equations for panel model and fixed effect model explain in the range of 79% - 96% of the variability in the total revenue (*TREV*) equation. The results for the period 1998-2001 better explained the variation of the total revenue compared to the estimation results for the period 2002-2005. All diagnostic tests confirm the good fit of the models.

The estimate of *H*-statistics in both panel and fixed effect equations are positive ranging between 0.599 - 0.728 for *TREV* equation. The results of *H*-statistics for the period 2001-2005 ranging from are 0.728-0.813 while the results the *H*-statistics for the period 1998-2001 are ranging from 0.599-0.654 which are significantly lower than the recent periods. This is consistent with the study by Claessens and Leaven (2004) on Malaysia and studies on other developing countries (Al-Muharrami *et al.*, 2006; Perera *et al.*, 2006) that find *H*-statistics between zero and

one (i.e. monopolistic competition). Therefore, the results suggest that the Malaysian banking sector earned their revenue in market condition of monopolistic competition any form of conjectural variation oligopoly and monopoly can be clearly rejected during the sample periods.

Adjusted R <sup>2</sup>	0.93	0.96	0.79	0.90
<i>F</i> -statistic	74.26***	49.48***	25.91***	17.83***
<i>H</i> -statistic	0.654	0.599	0.728	0.813
Wald test ( <i>F</i> -statistic) for <i>H</i> =1	65.769***	79.097***	79.888***	67.748***
Wald test ( <i>F</i> -statistic) for <i>H</i> =0	45.741***	43.627**	20.871	16.344
No of observations	53	53	68	68

Notes: The values in parenthesis are *t*-statistics and were calculated using White's correction for heteroscedasticity. The Wald test is used to test the *H*=0 and *H*=1 hypothesis and follows an *F*-distribution. \*\*\*, \*\*, and \* indicate significance at 1%, 5% and 10% levels.

In the estimation results where *TREV* is used as dependent variable, all the banking cost elements such as unit price of labour (*PL*) and unit price of funds (*PF*) have the positive signs, implying the increased factor costs leading to the higher revenue while the unit price of capital (*PK*) has a negative sign in both panel OLS and fixed effect model. However, only two of the variables, unit price of labour (*PL*) and unit price of funds (*PF*) are statistically significant at the conventional level. The major contribution to the *H*-statistic mainly comes from unit price of funds (*PF*) and followed by unit price of labour (*PL*) which is hardly surprising given the fact that funding and labour cost are the main factor in the production function of banks. The positive sign of unit price of labour (*PL*) suggests that personnel costs are as important as overhead costs which are relatively high in the banking industry. Nevertheless, in both specifications, the effect of the price of capital (*PK*) on the overall elasticity appears to be minimal (and statistically insignificant) compared to other input prices. Our results are consistent with other studies that find that the sign of the coefficient on the unit price of capital varies and, in most cases, its impact is negligible on the factor price elasticity.

The coefficient of the *EQASST* is positive in the period 1998-2001 and negative in the period 2002-2005 but statistically insignificant. The results seems to suggest that in the period 1998-2001, the well-capitalized banks involved in riskier operations and in the process tend to hold more equity, voluntarily or involuntarily, i.e., the reason might be banks' deliberate efforts to increase safety cushions and in turn decrease the cost of funds, or perhaps just regulatory pressures that mandate riskier banks to carry more equity and vice-versa in the period 2002-2005. The coefficient of the variable depicting risk propensity (*RSKASST*) has a positive effect on income and statistically insignificant suggesting that banks with a higher level of provisions indicates a more risky loan portfolio and consequently a higher level of compensating return. Thus, positive *RSKASST* in both periods indicates that bank operating with higher provisions to assets in their balance sheet generate higher revenue per unit of assets.

The coefficient of the *ASST* variable is negative and statistically significant both OLS and fixed effect model except for the period 2001-2005 for the case of OLS. The results suggests that size-induced differences between banks may lead to lower total revenue per unit of assets and that larger banks seem to be less efficient compared to smaller banks. This may implies that as a whole the banking market in Malaysia faces diseconomies of scale. Finally, the results show that the ratio of loans to total assets (*LOANASST*) always has the expected positive sign and is significant in both specifications. The positive coefficient reflects that the higher fraction of loans on the total assets' composition envisages greater interest income and total revenue.

The estimation results for the competitive position using the total interest revenue (*TINT*) as the dependent for the periods of 1998-2001 and 2002 to 2005 are reported in Table 8. All tests confirm the good fit of the models. The estimated regression equations for panel model and fixed effect model explain in the range of 90% - 97% of the variability in the total interest revenue (*TINT*) equation. The results for the period 1998-2001 better explained the variation of the total revenue compared to the estimation results from the period 2002-2005. *H*-statistics in both panel and fixed effect equations are positive ranging between 0.531 - 0.631. The results of *H*-statistics for the period 2002-2005 ranging from 0.569-0.631 while the *H*-statistics for the period 1998-2001 ranging from 0.531-0.576. With regard to the degree of competition, the *H*-statistics when using *TINT* as the dependent variable generally produces lower estimate than *TREV* for both OLS and fixed effect. This indicates that traditional interest-based banking is less competitive than the overall market for both periods under investigation. This may suggests that the growing interest by bank in the fee- and commission-based product market segment.

TABLE 8: PANEL REGRESSION RESULTS OF COMPETITIVE CONDITION FOR TOTAL INTEREST REVENUE

ln <i>LOANASST</i>	0.089** (2.396)	0.255*** (9.835)	0.123* (1.742)	0.039 (0.595)
Adjusted R <sup>2</sup>	0.96	0.97	0.90	0.96
<i>F</i> -statistic	36.82***	70.53***	63.63***	46.94***
<i>H</i> -statistic	0.576	0.531	0.631	0.569
Wald test ( <i>F</i> -statistic) for <i>H</i> =1	69.031***	70.991***	83.370***	31.310***
Wald test ( <i>F</i> -statistic) for <i>H</i> =0	73.661***	68.042**	55.196	60.031
No of observations	53	53	68	68

Notes: The values in parenthesis are *t*-statistics and were calculated using White's correction for heteroscedasticity. The Wald test is used to test the *H*=0 and *H*=1 hypothesis and follows an *F*-distribution. \*\*\*, \*\* and \* indicate significance at 1%, 5% and 10% levels.

Similar to the estimation results for *TREV* the unit price of capital (*PK*), unit price of labour (*PL*) and unit price of funds (*PF*) for the model *TINT* have the positive signs (except for the unit price of capital (*PK*) in the period of 2002-2005), implying that increase in factor costs leading to the higher revenue. All the variables of banking cost, *PL*, *PF* and *PK* are statistically significant at the conventional level. The major contribution to the *H*-statistic mainly comes from unit price of funds (*PF*) and followed by unit price of labour (*PL*) which is similar to findings for *TREV* equation given the fact that funding and labour cost is the main factor in the production function of interest revenue. The positive sign of unit price of labour (*PL*) suggests that personnel costs are as important as overhead costs which are relatively high in the banking industry whereas the negative sign of unit price of capital (*PK*) may indicates that preferences of bank customer to deal with labour intensive banks. Nevertheless, in both specifications, the effect of the price of capital on the overall elasticity appears to be minimal compared to other input prices. The results are consistent with other studies that its impact is negligible on the factor price elasticity.

The coefficient of the *ASST* variable is negative and statistically significant both panel OLS and fixed effect model both periods which suggests that size-induced differences between banks may lead to lower total revenue per unit of assets and that larger banks seem to be less efficient compared to smaller banks. This also suggests that as a whole the banking market in Malaysia faces diseconomies of scale with respect to producing interest-based revenue. The results show that the ratio of loans to total assets (*LOANASST*) always has the expected positive sign and is significant in both specifications. This implies that a higher fraction of loans on the total assets' composition envisages greater interest income and total revenue. The coefficient of the variable depicting risk propensity (*RSKASST*) suggesting that banks with a higher level of provisions indicates a more risky loan portfolio and consequently a higher level of compensating return and therefore has a positive effect on income but statistically insignificant. Thus, positive *RSKASST* in both periods indicates that bank operating with higher provisions to assets in their balance sheet generate higher revenue per unit of assets. Finally, the coefficient of the *EQASST* is positive and statistically insignificant in the period 1998-2001 whereas it is negative and statistically significant for the period 2002-2005. Thus, negative *RSKASST* for the period 2002-2005 indicates that bank operating with higher provisions to assets in their balance sheet generate lower interest revenue per unit of assets. The results for *TREV* and *TINT* for both periods show the robustness of P-Z estimation.

In order for the above test results to be valid, the banking industry should be in the long run equilibrium during these periods. The reason for this is that if the market is in equilibrium, a dependent variable will have no correlation with prices of input factor. The equilibrium position in the banking industry is assessed by estimating the equation with *ROA* as a dependent variable which is presented in the Table 9. The Wald test cannot reject the null hypothesis  $H=0$  for both OLS and the fixed effect model leading to the conclusion that the banking industry is in the long-run equilibrium both periods 1998-2001 and 2002-2005. Although banking consolidation is still progressing, it is possible that the market is in equilibrium in reaction to the institution at different times.

## Conclusion

The study examines the competitive condition of Malaysian Islamic financial sector for the period 1998-2001 and 2002 to 2005. This period correspond to a period characterized by substantial reform to restructure and consolidate the banking into a market-driven based economy, and to further liberalize and deregulate sufficiently the systems in order to integrate economically with the international financial market. The basis for the evaluation of competitive conditions is the extant of oligopoly theory in the new industrial organization literature, specifically, the competition model developed by Panzar and Rosse (1987).

The findings of the market competition, the estimated values of  $H$ -statistics for the both sample periods are positive ranging from 0.599 - 0.728 for  $TREV$  equation and 0.531 - 0.631 for  $TINT$  equation. This is consistent with the study by Claessens and Laeven (2004) and many other studies on developing countries that find  $H$ -statistics between zero and one (i.e. monopolistic competition) (Al-Muharrami *et al.*, 2006; Perera *et al.*, 2006). The Wald test rejects the hypothesis for the market structure of monopoly or perfect competition for both periods of investigation. Although the results pointed to the monopolistic competition in the banking, it does not show any indication of the change in the market lead to increase in market competition in the recent years. Furthermore, the evidence suggests that there is less competition in the traditional interest-based market compared to the overall market which includes other operating income from fee- and commission-based product market segment.

Based on the findings on the Malaysian banking sector, the results of the concentration approach and the market structure suggest that the competitive behaviour of banks is not necessarily related to the number of banks in a market or to their concentration, other factors are also at work. The finding of this paper, however need to be interpreted cautiously given the full market liberalization process of the banking system is at the initial stage and is an ongoing process. Recent research has highlighted, however, that the relationships between competition and banking system performance are more complex (Vives, 2001). Although allowing new entry to the market may induce banks to behave in a competitive manner when there are few banks in the market, a well-developed financial system also appears to be important, perhaps because banks face competition from other financial firms and markets (Boot and Thakor, 2000). Few restrictions on the activities that banks can undertake is important to contestability may also be related to increasing competition over the financial system.

### **Endnotes**

The U.S Department of Justice applies the horizontal merger guidelines to the banking industry in practice. In order to reflect the changing competitive environment, it includes thrift institutions when computing HHI. The Department of Justice takes the stance that it grants merger approval when HHI after merger marks at least 1800 and the changes in HHI is at most 200.

# Perceptions and Expectations of Policyholders toward the Services of Insurance Agents

## Abstract

This paper explores the perception and expectation of insurance policyholders towards the services of their insurance agents. Indirectly, the study intends to examine whether insurance policyholders are satisfied with the services of their insurance agents. One hundred and sixty respondents from the Klang Valley area participated in this survey. The 5 SERVQUAL dimensions were utilized for this purpose. The results indicate that policyholders are generally dissatisfied with the services of the agents as there are significant differences between the respondents' expectations and perceptions. The findings suggest that the on going trainings provided by insurance companies to the insurance agents need to be re-looked to promote a healthy insurance sector.

## Introduction

Insurance is a product known to be sold and not bought. What this literally means is that it is a product that is rarely sought out by customers but more of one that requires the company or its representatives to solicit the customers. Insurance is an intangible product by nature and therefore relies heavily on the selling and marketing techniques of its agency force to make sales.

The insurance agents would be the first contact or link that consumers have with the insurance company. These agents are representatives or middle men of their principals or insurance companies. Thus, it is vital that the agents who solicit an insurance application present themselves in a professional manner.

Insurance agents are not actually favorites among customers. Known to be aggressive in their sales techniques, the image of the Malaysian insurance industry in the past has slightly been marred by this negative stigma.

Despite whatever shortcomings associated with insurance agents, they are the "blood" of the insurance companies. In general, insurance businesses are mainly sold through insurance agents. Thus, it is not surprising that these agents are highly rewarded and their contributions play an important part in the insurance company's portfolio.

Numerous guidelines have been issued by the Central Bank of Malaysia to address the issues pertaining to insurance agents. The Complaints Services Bureau under the wings of the Central Bank of Malaysia has been receiving complaints on insurance matters and most of these are related to agency issues.

To enhance professionalism among insurance agents, the Central Bank of Malaysia together with the Life Insurance Association of Malaysia has introduced several innovative measures. Such measures include imposing a minimum qualification requirement on agents, a minimum of 20 Continuous Professional Development hours that all insurance agents have to undergo as well as the 3 tier limit agency structure.

Research on agency matter is still very limited in Malaysia. As of date, there has not been much research that has been documented pertaining to the satisfaction level of insurance policyholders toward the services of their insurance agents. The present study is an attempt to asses the level of perception and expectation of insurance policyholders on the services of their respective insurance agents. The responses to this survey would also indicate the qualities and skills that insurance agents should be equipped with in order to foster a sound agency force in the Malaysian insurance scenario. Ultimately, the findings of this study would give an insight to the gaps in the respective dimensions of service quality for which the insurance companies as a whole would need to address.

## Research Objectives

Based on the fact that there is limited source of data pertaining to the level of satisfaction of insurance policyholders towards the services of their agents, the objective of this exploratory study attempts to investigate on:

- What is the level of perception and expectation of policyholders towards the services of the agents
- Whether there is a link between the amount of sum insured and the policyholders' expectation.
- Which service quality dimension needs to be improved to enhance the level of satisfaction of the policyholders

## Research Methodology

This study focuses on respondents within the Klang Valley and the quality of services being probed is that provided by life insurance agents.

Since the subject of this study is services quality, the SERVQUAL method which is a 22-item scale is being employed. This multiple item scale would be used to measure expectations and perceptions of service quality (Parasuraman, Zeithaml and Berry, 1985; 1988).

The five dimensions of the SERVQUAL that determine service quality, which are, tangibles, reliability, assurance, responsiveness, and empathy are being used in this study.

For the purpose of this study, one hundred and sixty respondents within the Klang Valley area were randomly identified. Data collection was by personal interviews as well as distribution of questionnaires. Each respondent has been identified as one who has at least a life insurance policy. The questionnaires were personally delivered to the respondents either at their homes or at the workplace. A total of 180 questionnaires were distributed but only 170 were received. The total of usable questionnaires was 160. These respondents were asked on their perceptions and expectations toward the services provided by their insurance agents.

The questionnaire is divided into 4 sections. Section 1 comprises the demographic details of the respondents. Section 2 and 3 are adapted from Zeithaml et al (1990).

Section 2 is on Service quality expectations whilst Section 3 is on Service quality perceptions. Both these sections use a 7-likert scale; ranging 1= strong disagree to 7= strongly agree. Section 4 is on the profile of the respondents' insurance policies.

## Review of Literature

### Insurance Agents in Malaysia

Life insurance agents in Malaysia are not directly under the supervision of the Central Bank of Malaysia but are however required to be registered with the Life Insurance Association of Malaysia (LIAM). To ensure a certain level of professionalism among the agency force, the Central Bank imposes a minimum requirement for a new agent to possess the Malaysian Certificate of Education. All insurance agents are also required to pass the Pre-Contract Examination for insurance agents conducted by the Malaysian Insurance Institute.

As at the end of 2005, the number of registered insurance agents was listed as 126,898. (Insurance Annual report 2005). A fund of RM1 million (contributions from the 18 life insurance companies operating in Malaysia) has been allocated each year to assist in the training and development of the Bumiputra life agency force. ([www.liam.com.my](http://www.liam.com.my))

Insurance agents are required to conduct detailed analysis of the financial position and needs of their clients before recommending any insurance plan. The analysis will involve assessing the prospective clients' earnings, assets and liabilities. Other measures introduced to protect the prospective clients from unscrupulous insurance agents include the introduction of the "Best Advice Regulation" which holds insurance intermediaries liable for wrongful advice of life insurance products.

Complaints against insurance agents provided by the Complaints Service Bureau of the Central Bank of Malaysia include misleading advertising, poor handling, misrepresentation of facts, policy twisting as well as forced

selling. Poor handling which encompass delay in policy issuance as well as handling claims contributed to 85% of the overall complaints.

### **Service Quality**

In an era of intense competition, service quality is regarded by many organizations throughout the world as being vital to their survival as well as success. Service quality has been identified in both manufacturing and service sectors as a key strategic value in their respective operations (Lewis, 1994).

Some of the companies that have been identified to have pushed for service quality and made that as their hallmark include Federal Express, Xerox, Hospital Corporation of America, Ford Motors etc...

The benefits/rewards derived from high levels of quality service include:-

- Higher returns on investments and profits
- Increase market share
- Repeat customers and referrals through the development of customers' relationship
- Enhanced corporate image

(Lewis et al, 1989, Crosby 1979, Reichfield and Sasser 1990)

Service providers are expected to perform up to the level of expectations of the customers. In the event that these expectations are not met, this would have a negative impact on the service quality ratings as negative word of mouth communications would be bound to happen (Brown and Swartz, 1989).

On the other hand, when customers' expectations are met, positive word-of-mouth would take place; leading to repeat customers and referrals.

### **Service Quality Defined**

Service has been defined by Zeithaml and Bitner (2003) as all economic activities whose output is not a physical product or construction, is generally consumed at the time it is produced, and provides added value in forms such as convenience, amusement, timeliness, comfort and are essentially intangible concerns of the first purchasers. Service is performance or actions rather than objects; they cannot be seen, felt, tasted or touched in the same manner that we can sense tangible goods.

Allen (1998) supports this definition by saying that 'a service is primarily an intangible activity that one part performs for another. Service can be experienced only as they are performed, used or consumed.

Service quality, because of its elusive and abstract nature is not easy to define as opposed to the quality of a product.

Service quality is defined as how well the service meets or exceeds the customers' expectations (Parasuranam, et al, 1985).

The unique features of service quality as compared to that of products; namely intangibility, inseparability, heterogeneity and perish ability make it difficult to measure.

The "gap" model which compares customers' expectations of services with their perceptions of the actual service performed was designed to address this issue (Parasuranam et al, 1985). Zeithaml et al (2003) defines expectations as the reference points customers have in a service experience while perceptions reflect the service as actually received.

A shortfall in this comparison indicates that a service quality gap is present and the respective organization/service providers would require to close.

Service quality has been defined as how all the service level delivered matches customers' expectations.

The SERVQUAL concept, which is the service quality instrument, measures the service quality gaps using the following equation

$$Q = P - E \quad \text{or} \\ \text{SERVQUAL SCORE} = \text{Perception Score} - \text{Expectation Score}$$

Based on the equation, positive scores reflect high perception of service quality and vice versa.

### **Marketing of Life insurance**

Life insurance, which is based on actuarial and mathematical principles, guarantees a specified sum of money upon death of the person whose life is being insured or upon the maturity of the policy (Lilke, 1995). The function of

insurance is to safeguard against such misfortunes by pooling the contributions of the many to pay the losses of the unfortunate few (Huebner et al, 1982). Due to the exposures to these uncertainties, individuals are encouraged to take proactive measures so as to create some form of financial security especially when there are dependants.

Life insurance products are mainly through marketing intermediaries and one of the most effective marketing strategies employ by insurance companies is to recruit insurance agents to solicit and market their products.

These agents act as representatives of the insurance companies and any information or knowledge obtained by them in the course of soliciting the business is deemed to be that of the insurance companies. Insurance agents are required to portray a professional image and to conduct their business in a professional manner so as to win the client's confidence.

## Results

Table 1 indicates the demographic details of the respondents. The analysis revealed that both males and females have equal participation of 50% each. Most of the respondents are executives (50.6 %) while 44 are non executives accounting for 27.5%. Respondents' in "others" and supervisor categories comprise 14.4% and 8 % respectively. Respondents are generally educated with at least a certificate at hand. The majority of the respondents earned below RM 3,000 per month; 15.6% of the respondents earned incomes of RM 5,000 and above.

TABLE 1: DEMOGRAPHIC DETAILS

Demographic	Categories	Frequency	Percentage
Gender	Male	80	50
	Female	80	50
Occupation	Non executive	44	27.5
	Executive	81	50.6
	Supervisor	12	7.5
	others	23	14.4
Education	Certificate	54	33.8
	Diploma	49	30.6
	Graduate	48	30
	Post graduate	9	5.6
Income (monthly)	Less than RM3,000	91	56.9
	Rm3001 – 5,000	44	27.5
	5001 – 10,000	17	10.6
	More than 10,000	8	5

Table 2 shows the profile of the insurance policies of the respondents. 69 respondents or 64.3 % possess life insurance policies with sum insured of more than RM 50,000.

86 of the respondents or 53.8% effected their life insurance policies for more than 4 years.

111 of these respondents were introduced to life insurance through their agents.

Variables	Amount (RM)	Number	%
Sum insured	Less than 10,000	6	3.8
	10,001 – 50,000	51	31.9
	50,001 – 100,000	69	<b>43.1</b>
	100,001 500,000	34	<b>21.2</b>
Duration of policy	1- 3 years	74	46.2
	4 – 10	55	<b>34.4</b>
	More than 10	31	<b>19.4</b>
Introducer to the policy	Friends	49	30.6
	Agents	111	<b>69.4</b>

Table 3 is designed to establish whether there is a link between the level of sum insured of their policies and the policyholders' expectations. The analysis is done based on the responses obtained for all dimensions.

A high percentage (88%) of the respondents with sum insured of more than RM 50,000 strongly felt that major improvements were required in the quality of the agents' service. For respondents with sum insured of less than RM 50,000, 71% of them shared the same opinion. The results actually conveyed a message that the expectations of policyholders with sum insured of more than RM 50,000 (88%) are higher than that of the policyholders with sum insured of less than RM 50,000 (71%)

Scale	Amount	1	2	3	4	5	6	7	Total
Less than RM		102	67	50	114	169	188	471	1161

	<b>13</b>			<b>6</b>			<b>81</b>	

\*\* 160 respondents X 20 Questions

Table 4 summarizes the level of service quality by comparing between the results in the expectations and perceptions of the respondents. The results show that even though the policyholders were of the opinion that their agents possess the skills and qualities required, their overall performance is still below the expectations of the policyholders. A negative service quality gap indicates that respondents' expectations are greater than their

perceptions. Examining each of the service quality dimensions, 5 negative service quality gaps were recorded. This depicted that the service quality rendered by the customers were lower than their expectations. According to Zeithaml and Bitner (2003), to build a long lasting relationship, the service providers need to close the gap between what is expected and what is received in order to satisfy the customers. The results revealed that the service quality gap for empathy was the lowest with a mean score of – 0.03 while the service quality gap was the highest for reliability with a mean score of – 0.80. Respondents do expect that the insurance agents should be more reliable in the sense that these policyholders could count on their agents to keep them informed on insurance policy matters and also someone they can truly depend on. Overall, it can be concluded that the policyholders are generally dissatisfied with services of their insurance agents and are performing below the policyholders’ expectations.

TABLE 4 : EXPECTATIONS PERCEPTIONS AND SERVICE QUALITY GAPS

Dimensions	Expectation (Average Mean)	Perception (Average Mean)	Service Quality Gap
Tangibility	6.17	5.75	- 0.42
Reliability	6.30	5.49	- 0.80
Responsiveness	4.43	4.38	- 0.04
Assurance	5.97	5.22	- 0.74
Empathy	5.61	5.57	- 0.03

## Discussion

The aim of this study is to find out whether there is a significant difference between the insurance policyholders’ service quality expectations and perceptions. These service quality gaps could be calculated by subtracting the respondents’ expectations from perceptions.

The descriptions of the dimensions used in this study are as follows :

- Tangible : refers to the availability of equipment and the agents’ physical appearance when approaching potential clients
- Reliability : focuses on the agents’ timeliness, dependability, record keeping, and scheduling of services for the customers
- Responsiveness : addresses the agents’ promptness and their willingness to help the policyholders
- Assurance : Solicits policyholders’ opinion on whether they should be able to trust their insurance agents and whether they feel safe in their transactions with their agents

- Empathy : gathers policyholders' opinion on whether insurance agents' should be polite, willing to assist clients' problems and whether they are getting the support from the insurance companies. It also tests the policyholders' opinion on whether insurance agents are expected to give personal attention to the clients, agents' knowledge of the needs of the clients, the agents' interest and the flexibility of their operating hours

Table 4 presents the values for the respondents' expectations, perceptions and service quality gaps. The gaps in all the dimensions indicate minus scores. Therefore, it can be summarized that the policyholders are generally dissatisfied with services rendered by their insurance agents. The areas of improvement are in all the dimensions, with reliability being the most important. Negative scores may also indicate that policyholders may switch to other service providers, commenting negatively about the provider , reducing the usage of the service or simply not recommending the service providers to others.

## Suggestions for Future Research

For future research of service quality in the insurance industry, the following areas could be considered :

- A larger sample size over a wider geographical area
- Analyzing and studying the trainings provided to insurance agents
- Comparing the services of life insurance agents versus that of general
- Formulating other factors/ dimensions that influence customers' satisfaction

## Conclusion

Based on the findings, it can be concluded that the policyholders are generally not satisfied with the services of their insurance agents. Insurance agents are expected to be well versed in their product knowledge and to be able to give the best advice and services to the policyholders. These agents must be viewed as dependable and reliable by the policyholders. In light of the growing competition in the insurance industry with more avenues to purchase insurance services, the findings of this research should be taken as a signal to the insurance companies to improve the skills and expertise of these intermediaries. The insurance companies must continue to provide adequate training to these agents if they continue to depend on the services of these agents to solicit and market their products. At the same time, insurance companies should consider this as part of their social obligation so that the insurance industry is always held in high esteem by the public.

# Efficiency of Foreign-Branch Banks: Evidence from the Wake of the Asian Financial Crisis

*Tosporn Chotigeat, [ecfi-tc@nicholls.edu](mailto:ecfi-tc@nicholls.edu)  
Nicholls State University, USA*

Montclair State University, USA*

## Abstract

During the 1990s two simultaneous phenomena converged to greatly change the panorama in the financial services industry in Thailand. At the global level, large multinational banks were taking advantage of worldwide financial deregulation and rapid technological advances by offering a full range of financial products and services, competing fiercely in both their own domestic and far-flung global markets. At the Thai national level, the financial sector had to restructure in response to the financial reform mandated as an outcome of the financial crisis of 1997. This paper analyzes the determinants of 18 foreign-branch banks' performance in Thailand, using quarterly financial time-series data from 1997-1 to 2003-4. Among determinants (total assets, efficiency ratio, Tier1 capital ratio, loan loss provisions, non-interest income), only loan loss provisions was found to influence (negatively) the foreign-branch banks' performance.

## Introduction

In the period since the Asian financial crisis of 1997, two simultaneous phenomena have converged to greatly change the panorama in the financial services industry, one at the regional level and the other at the global level. In the wake of the regional crisis, each of the victim countries adopted (whether voluntarily and/or under pressure from the IMF and other international agencies) new policies emphasizing *high levels of transparency and the liberalization of capital markets*. At the same time, major players in the global financial services sector continued leveraging advances in telecommunications and information technology as well as cross-border mergers and acquisitions, resulting in immensely intensified competition worldwide and in the crisis countries. The question arises at this point of convergence, then, about whether foreign-branch banks in these countries had any special in the situation and if so what are the salient factors that contribute to the differential in their levels of performance.

This paper attempts to empirically investigate multinational banks' performance in emerging economy. Foreign-branch banks operating in Thailand have been selected for this study because the emerging economy of Thailand has now completely restructured its financial sector and recovered; key economic indicators have been favorable both in internal and external balances since 2000 (Appendix A). Quarterly financial time-series data of foreign-branch banks from 1997-1 to 2003-4 were used. The remainder of the paper is organized as follows. Section two provides a background description of (a) global integration and international competition in the financial services industry and (b) the Thai financial sector and its evolution since the financial crisis. Section three reviews the literature related to bank performance in various countries. The model and time-series data being used to test the efficiency of banks are provided in detail in section four. The empirical results and conclusions are provided in the last two sections.

## Background

### *Global Integration and International Competition in the Financial Services Industry*

Since the inception of global integration, international competition in the financial services industry has become greatly intensified. Few other sectors have raced forward at a pace as swift as that of the banking industry during the last two decades. The sector in which they compete took advantage of financial deregulation worldwide and

rapid technological advances in the 1990's. With deregulation removing regulatory barriers to entry and technological advances reducing the cost of managing affiliates in distant markets, banks undertook a strategy of growth by merger and acquisition to accomplish two objectives: (i) to defend a position within their domestic stronghold by merging with domestic competitors thereby fending off potential foreign competitors, and (ii) to establish bridgeheads in foreign markets by acquiring an interest in foreign institutions<sup>1</sup>.

While the extent of the industry's globalization through international acquisitions is debatable<sup>2</sup>, what is clear is the full effect of deregulation and technological advances, i.e., cross-border mega-size mergers and acquisitions recently undertaken by multinational banks. The large multinational banks now offer a full range of financial products and services, competing fiercely in both their own domestic and far-flung global markets.

#### **Reorganization of the Thai Financial Sector after the Crisis**

Immediately after the financial crisis of 1997, the Thai government closed down 64 of 91 domestic financial companies, leaving only 27 operating along with 13 local banks operating. Those remaining banks and financial companies were allowed to create 300 billion baht for new capitalization by issuing preferred shares and new debt debentures in return for 10-year government bonds. Financial institutions were also required to increase their back-up funds to cover their large non-performing loans (NPLs) [Bangkok Post, 1999]. Although the NPLs were reduced to 12.65% by the end of 2003, even today the financial system is still burdened by them.

In addition, in early 1998 the Financial Sector Restructuring Authority (FRA) and Asset Management Corporation (AMC) were created to handle the assets of the defunct financial companies. The FRA seized the assets of financial companies, and banks and sold them at an average bid of 37% of book value. The process was very slow, and many assets lacked full official documentation. By the end of 2003 in addition to the 13 domestic commercial banks, 18 foreign-branch banks were operating in Thailand.

### **Related Literature on Other Countries' Bank Performance**

The viewpoints of specialists on the effects of deregulation and technological advances are mixed. For U. S. banks, Berger and Mester (2003) found that cost productivity worsened even though profit margins improved substantially for banks engaging in mergers. Focarrelli and Pozzolo (2001) and Williams (2003) evaluate the profitability of international banks in the OECD and that of domestic and foreign banks in Australia, respectively. Both studies argue that efficient banks expand abroad seeking higher profits, but that profits are negatively correlated to their market share. Using Italian data, Focarelli, Panetta and Salleo (2002) show that mergers increase income from expanded services and product lines, but the increase is offset by higher costs. However, the return on equity improves because of a decrease in the capital base of the acquiring bank. Similar studies of commercial banks in other countries have been undertaken, such as the one on Japanese banks by Drake and Hall (2003), Indian banks by Kumbhakar and Sarkar (2003), Portuguese banks by Mendes and Reblo (1999), Turkish banks by Isik and Hassan (2003), and Spanish banks by Grifell-Tatje and Lovell (1996). While the analytical designs and econometric variables used in these studies vary considerably, one common conclusion emerges: following deregulation or technological change, the measures of profitability or productivity, or both, generally declined for banks in these diverse countries.

### **The Measure of International Bank Performance and Its Determinants**

Profitability is a generally accepted way of measuring the performance of businesses, including commercial banks. However, banks vary considerably in terms of size, types of products offered, types of assets owned, and many other factors. Therefore, some form of standardization of profitability measurement is needed. Two potential measures of bank performance are return on assets (ROA) and return on equity (ROE). Due to the nature of bank assets (largely loans), return on equity seems to be the more appropriate measure, at least from a purely logical perspective. For that very reason, ROE is used as the dependent variable for this analysis. Finally, regression analysis is the generally accepted tool for measuring the relationship among variables.

Similar studies of international banks have used five variables (total assets, efficiency ratio, Tier1 capital ratio, loan loss provisions, and non-interest income) to explain bank performance [Allen and Raj (1996), Kim and Singer (1997), and Brimmer (1998)]. For purposes of comparing Thai domestic banks and foreign-branch banks in Thailand, this analysis follows similar lines. Efficiency can be defined as the ratio of a given bank's non-interest expense to total revenue. It is hypothesized that the coefficient of this variable will be negative because higher ratios imply reduced efficiency of bank operations. Second, a measure of risk was ascertained by calculating the ratio of Tier1 capital to risky assets. The Tier1 capital ratio is defined as core capital (essentially the book value of a bank's equity) divided by risk-adjusted assets (basically total assets, weighted more heavily for more risky assets). The coefficient of the Tier1 capital ratio is hypothesized to be negative. Thirdly, loan loss provisions are used to represent bad debts. Here a negative coefficient for the variable is anticipated since increases in the loan loss provisions suggest that the quality of the bank's loan portfolio is reduced. The non-interest income variable is expected to have a positive impact on a bank's performance. Finally, total asset value is considered as the other potential explanatory variable, but the coefficient is not expected to produce statistically significant results.

An empirical study by Grosse and Gart (2001) reports that considerable variations in the key factors influence the performance of multinational banks from different countries. For American banks, efficiency is the only significant variable whereas for UK banks, total assets, efficiency, and loan loss provisions are significant. For German banks, total assets and non-interest income are significant whereas efficiency and Tier1 capital ratio are significant for Japanese banks. Surprisingly none of these variables was found to be a significant determinant for the performance of Swiss banks.

Chotigeat et al. (2004) empirically studied the performance of three major French banks –Societe General, BNP Paribas, and Credit Lyonnais from 1993 to 1999. They found that the factors determining banks' profit are total assets, efficiency, Tier1 capital ratio, and loan loss provisions.

## Data and Model

### Data

For this study 18 foreign-branch commercial banks operating in Thailand were selected. The data used are from quarterly reports of the Bank of Thailand from 1997 to 2003, a time period during which (a) Thailand restructured its financial system after the financial crisis of July, 1997, including a policy of increased transparency and liberalization of the capital market and (b) there were significant cross-border investments taking place in the world's banking industry. The six key variables calculated from the raw time-series data to be used in this study are: return on assets (ROA), return on equity (ROE), total assets, efficiency ratio (non-interest expense to total revenue), Tier1 capital (equity capital divided by adjusted-risk assets), loan loss provisions, and non-interest income.

### The Model

The least-square model used to measure a bank's performance is expressed as:

$$ROE_{it} = \alpha + \beta_1 ASST_{it} + \beta_2 EFF_{it} + \beta_3 TIER1_{it} + \beta_4 NII_{it} + \beta_5 LLP_{it} + \varepsilon_{it} \quad (1)$$

where, ROE = the return on equity; ASST = total assets; EFF = efficiency ratio; TIER1= Tier1 capital ratio; LLP = loan loss provisions; NII = non-interest income; and  $\varepsilon_{it}$  (error term)  $\sim N(0, \sigma^2)$ .

## Empirical Results

The performance of foreign-branch banks in Thailand is provided in Table 1. The foreign-branch banks perform well in terms of total income (both interest income and non-interest income) and pre-tax profit. However, they had higher operating costs and loan loss provisions, reflecting the impact and after math of the Thai financial crisis of July 1997 (the resulting reorganization of the structure of the financial market and the restricted as well as new liberal financial policy).

TABLE 1: PERFORMANCE OF FOREIGN-BRANCH BANKS IN THAILAND, U.S. BANKS AND OTHER EUROPEAN BANKS (IN PERCENT)

	<b>Thailand</b> <b>(Foreign-Branches)</b>	<u>U.S.*</u>	<u>Euro zone*</u>	<u>France*</u>	<u>Spain*</u>	<u>U.K.*</u>
(1) Net interest margin	4.88	3.22	1.68	0.93	2.66	2.19
(2) Non-interest income	3.08	2.65	1.19	0.89	1.36	1.75
(3) Total income: (1) + (2)	7.96	5.87	2.87	1.82	4.02	3.98
(4) Operating cost	3.96	3.80	1.98	1.26	2.67	2.59
(5) Loan loss provision	2.56	0.39	0.31	0.24	0.39	0.22
(6) Pre-tax profit: (3)-(4)-(5)	1.44	1.67	0.57	0.32	0.97	1.13
*Data covered 1996-98 from Larosiere (2000).						

The mean values of the key factors affecting bank performance (ROE, ROA, efficiency ratio, loan loss provisions/total assets, and Tier1 capital ratio) are compared and presented in Table 2. Even though, foreign-branch banks in Thailand have performed positively since the financial crisis, all their key factors are in relatively small positive values. They are rather lower than the banking industry's standard measure of good performance, i.e., ROA > 1 (Ritter et al. (2000, p. 225)). In fact, only a handful of banks worldwide have their ROA > 1, such as Lloyds and Chase Manhattan (Chotigeat et al. 2004).

Table 3 provides a matrix of correlation coefficients among the variables being used in equation (1). Only one of the simple coefficients among independent variables

TABLE 2: PERFORMANCE DATA FOR FOREIGN-BRANCH BANKS IN THAILAND AND OTHER MULTINATIONAL BANKS

Bank and year	ROE	ROA	Efficiency ratio	$\frac{\text{Loan loss provisions}}{\text{total assets}}$	Tier1 capital ratio*
Foreign-Branch Banks (in Thailand) 1997-2003	0.12	0.31	0.12	0.01	0.38
Credit Lyonnais 1992-199	-8.02	-0.08	45.60	1.73	6.16

Credit Suisse 1991-1998	4.59	0.41	63.80	0.43	11.45
*1997 & 1998 average only, except Foreign-Branch Bank					

TABLE 3: FOREIGN-BRANCH BANKS IN THAILAND: CORRELATION COEFFICIENT MATRIX

	EFF	ASST	TIER1	ROE	NII	LLP
EFF	1.00	-0.06	-0.12	0.27	0.16	0.01
ASST	-0.06	1.00	-0.67	-0.11	0.05	0.45
TIER1	-0.12	-0.67	1.00	0.05	0.23	-0.47
ROE	0.27	-0.11	0.05	1.00	0.17	-0.55
NII	0.16	0.05	0.23	0.17	1.000	0.01
LLP	0.011	0.45	-0.47	-0.55	0.01	1.00

(*in absolute value*) is greater than 0.50. The correlation coefficient is between total assets and Tier1 capital ratio, that is -0.67. To avoid multi-collinearity issues, we chose *not* to use both total assets and Tier1 capital ratio at the same time in an equation. Thus, we formulated two models: Model 1 has total assets, efficiency, Tier 1 capital, loan loss provision, and non-interest income as the independent variables; Model 2 is same as Model 1 without the variable of total assets.

The LS regression model of equation (1) was estimated for Model 1 and the estimated parameters are provided in the left two-columns of Table 4. Since autocorrelation of the error-term in the model was detected, the model was modified to correct the problem; the specification of equation (1) thus includes AR(1). Only the coefficient of loan loss provision shows a negative sign as expected and is statistically significant. The coefficient of non-interest income has an appropriate positive sign but is not statistically significant.

The estimated parameters of model 2 (model 1 without the total assets variable) are provided in the right two-columns of Table 4. The pattern of coefficient estimates has not changed for foreign-branch banks in Thailand.

Our findings are consistent with those found in other countries reported by other studies<sup>3</sup>. The determinants of the foreign-branch banks in Thailand are compared to those of other top banks around the world (see Table 5). Loan loss provision as a determinant of foreign-branch banks' performance in Thailand is similar to that of British, French, and Thai domestic banks.

Overall, our findings confirm the previous studies, i.e., loan loss provisions is the dominant factor that determines the profit performance of banks worldwide. More specifically for foreign-branch banks, despite the fact that they (1) are from different countries, (2) operate under different banking systems under different organizational structures, (3) have different corporate cultures, and (4) operate under varying national economies, they share many common variables with global competitors from different parts of the world.

## Conclusion

This paper discusses the restructuring and evolution of the financial system in Thailand (especially commercial banks) after the financial crisis of July 1997. With the new financial system that emphasized and enforced of a policy of liberalization and transparency, many foreign-branch banks are now expanding to operate in Thailand. This paper thus analyzes the performance of these foreign-branch banks in Thailand and compares it to that of Thai banks. Of interest is how foreign-branch banks performed in emerging economy, especially in a country that has just recovered from its financial crisis.

The performance of 18 foreign-branch banks in Thailand was analyzed in light of their responses to the changes in the new global environment. Using quarterly time-series data from 1997-1 to 2003-4, we analyzed foreign-branch banks' performance (return on equity capital ratio). Their ROE was found to be influenced *negatively* by loan loss provisions; the negative sign confirms our hypothesis. When we compared the determinants of performance in this study of foreign-branch banks in Thailand with those of other top banks around the world, we found that the loan loss provisions of the foreign-branch banks' performance is similar to that of French and British banks. Globally, efficiency, total assets, and loan loss provisions are the three determinants of banks' performance.

Overall, foreign-branch banks appears to perform well, reflecting their management style, activities, and policies: (1) since global integration in the early 1980's, foreign banks have recognized the intensified competition in the financial service industry, and they have participated with their foreign competitors in domestic and cross-border expansions; (2) most foreign banks have evolved into global financial service companies through mergers and acquisitions. For example, a large multinational bank, like its foreign competitors, might become a conglomerate, comprised of an investment bank, an asset-management arm, a retail and commercial bank, and a private banking entity for wealthy customers; and (3) foreign banks worldwide have had to react to changing business environments brought forth by global deregulation of the banking industry and advances in communication and information technology to maintain their competitiveness.

# Rise of Sukuk: an Emerging Fund Generation Mechanism

Zohra Jabeen, zjsadiq@yahoo.co.uk  
Institute of Management Sciences, Peshawar, Pakistan

## Abstract

Funding needs and investment opportunities are available in many varieties, worldwide. Securitization too, has been an important tool employed mainly by banks and mortgage houses to generate new funds and sell off or securitize their asset portfolio. A recent important development is the emergence of sukuk. Sukuk (singular sak) are the product of an asset backed funding, like securitization. They are termed to be “equity” bonds<sup>1</sup>. This paper analyses the mechanisms of sukuk product. The product dynamics are discussed in a simplified form to enable the readers to relate its properties to the existing conventional products, if required. A product with a lot of potential, reaching out across the banking, securities and stock market as well as the imprint of real assets’ markets. Among the large variety of sukuk, the Ijara’h sukuk and the recent Musharaka based sukuk are discussed in detail. These sukuk instruments are popular in the Muslim countries but gaining momentum in the capitalist world too. The interesting development of sukuk emerges out of a “meltdown” situation where Islam and the western economics coagulate, without being driven affray by the concept of charging interest on sale of loans (money) which is prohibited in Islam. Hence, it is attempted to describe the commonalities between the Islamic economic doctrines and the capitalist economic system of business and investment.

## Introduction

The need for funding or financing arises out of satisfying the financing needs of governments and businesses and the investment appetite of individual and corporate investors. Decisions on investment alternatives entail risk and reward to the stakeholders in investments and users of funds. **The manner, in which investments are interpreted and propagated, sets the tone of a discipline.** The definitions and treatment of investments differs between the capitalistic economic society and the Islamic economic system. However, there are many commonalities too and none is mutually exclusive. In this article the discussion on the increasing usage of the sukuk investment instrument worldwide and its anatomy, is attempted, in an effort to describe the product and its features and in the process deal with the myth or misunderstanding about Islamic Finance as totally divergent from the conventional capitalistic economics and finance. Practical application of such techniques, as employed in sukuk contracts can be a very powerful tool to utilize otherwise untapped and illiquid resources (like government land, machinery, asset usage rights and others) fruitfully, for alternate capital generation.

## The Investments Setting-Islam and Capitalist Economics Thought

Investment is defined, according to the capitalist economic theory as: “...the current commitment of dollars for a period of time in order to derive future payments that will compensate the investor for (1) the time the funds are committed, (2) the expected rate of inflation, and (3) the uncertainty of the future payments. The “investor” can be an individual, a government, a pension fund, or a corporation. Similarly, this definition includes all types of investments, including investments by corporations in plant and equipment and investments by individuals in stocks, bonds, commodities, or real estate”<sup>2</sup>

However, the Islamic school of thought emanating from the Holy Scripture of the Qur’an<sup>3</sup> and the Sunnah<sup>4</sup>, has a socio-economic system called “Ilmul Iqtisad”<sup>5</sup> (Savharvi, 2001) and also the commonly used title of Islamic Economic System (Mirakhor, A., 2002). It differentiates between investments in equity and debt. In the same note it differentiates between investments involving exchange of fungible assets ( goods and services) and “investments” involving return from only monetary exchange. The Islamic verdict of this differentiation proclaims the investment in equity and earning profit out of exchange of commodities (e.g. in trade, purchasing- selling) and rendering services as permissible. However, categories of “returns” involving purely monetary exchanges, devoid of asset

transformation and value addition are impermissible or “haram”. This category is termed as the root cause of innumerable ills in the society, and the most pronounced among the ills are injustice and deprivation in the society. Islam encourages trade and participation in equity of businesses for earning profits. It proclaims that the return for taking the risk of equity –based investment and trade is in the shape of profit. It is unjust to reap the rewards without (a) adding to the production (and services) and without taking the risk of participation in business enterprise and exchange (trade).

Hence these are two parallel concepts of investments as developed by the western economics and that of Islam. While Islam does not encourage or propagate increasing risk or non-management of risk (like portfolio diversification within the permissible categories) , it propagates risk-sharing in society , by considering the reward of business risk and entrepreneurship risk as the lawful profit . In other words, there is no entitlement to rewards in profit from business investments, until the business risks are shared. Therefore, the investment and financing risk as proclaimed in the Capital Asset Pricing Theory (popularly called the CAPM) of the Portfolio Theory is not recognized in Islamic Economics in that sense. For example, in the asset pricing models of portfolio return and risk measurement and assessment, (like the Capital Asset Pricing Model), an investor can maximize return at a given level of risk, on the efficient frontier of market portfolio. However, a point to be noted is that on the efficient frontier of investment ( in CAPM) , the financing part of investment, which arises from borrowing ( at the risk –free rate) and then investing is impermissible and “haram” . Charging interest and paying interest is impermissible<sup>6</sup> according to Islam as well as in the major religions of the world (for instance in Christianity and Judaism (Lariba .com)) while interest on loans is impermissible, profit from trade is allowed <sup>7</sup>

## Investment Opportunities

The varieties of investment opportunities to the investors in the world markets range from the primary markets of commodities, stocks and bonds to custom-made portfolios and over-the counter investment opportunities available. The bigger the value or volume of investment, the larger the investment opportunities and the higher are the profit-margins available. Banking institutions too offer much better rates to their “high net worth” clients than their market rates or “rack rates”.

Emerging derivative products in the late eighties and early nineties were the feared and revered instruments used by some, although this name has more fear factors attached to them due to lack of proper handling and understanding and speculative elements in them. Securitization too, has been a derived product, based on sale and repackaging of existing, usually non-liquid assets of institutions like mortgage houses, and selling them as securities. Hence the name securitization was coined. **Securitization** now comprises a major chunk of activities of disintermediation and appears in many forms and varieties. The regulatory report namely “The International Convergence of Capital Measurement and Capital Standards Report” (Basel II) <sup>8</sup> identifies traditional and synthetic securitization as the overall broad categories and dedicates a separate section to the regulatory treatment of securitization risk in credit risk. However, the important point to note in the securitization section of the report is the assertion on the economic substance of the securitization product instead of the form (or name) it takes. While risk and reward or borrower are separated through the debt structures, most of the efforts of regulators, fund managers and researchers are consumed in how to mitigate risks<sup>9</sup> , and how to maximize investors returns at a (theoretically) given risk level<sup>10</sup>.

The Islamic postulates (and that of many other religions too, as mentioned earlier) propound risk and reward sharing primarily through equity investment and no debt mechanism usage for profit earning. The option of debt-based “earnings” from interest on money does not exist, altogether. Hence all Islamic finance products and exchanges of business and investment ought to be equity or rent –based, in order to earn “halaal” or permissible profits. However, this does not mean that without interest based financing, no financing would be available. Many innovative sukuk structuring in practice have proved that given the parameters specified by the Divine Rulings of Islam, there are innumerable opportunities available to discover for financing, as long as interest is not charged, and equity and fair play is practiced.

With the differences between the Islamic and capitalistic schools of thoughts being highlighted, one may deduce that the two systems have no commonality. However, we must remember that both of these systems are in operation. Secondly, because the capitalistic society and their economic system have overshadowed the world, one might think that no other system can be better. But given the burgeoning economic problems of the world it is all the more convincing to “see through” the capitalistic economic flaws, and seek a better solution. Even if we deny that any problems exist because of the capitalist economic system, one must re-search the truths, in an effort to seek the betterment of the society.

Putting discussion like the above aside for a while, we present and provide some food for thought about one of the popular product of Islamic finance, which is popularly used for funding /investments purposes, in the Muslim countries and is also being embraced in the western world. Whether it is the money (petro –dirhams) being sought for funding or the efficacy of the “Islamic “product is for the readers to explore or deduce, but what is important from the point-of –view of this study, is that this is a product, that is termed, Islamically permissible” and yet usable by the west in addition to its popular use by the Muslim countries and populace.

## **Introduction to Sukuk**

While bonds are the product of debt markets, sukuk are dubbed as equity bonds. However, they are not debt -based instruments as interest on debt is impermissible according to Islamic principles. Hence it is necessary to analyse sukuk structures to find out why they are called equity bonds. It is also necessary to analyse them, as mentioned earlier to see how they are able to break the barrier of investment by the capitalist society, and being accepted by their yardstick too.

## **Sukuk Defined**

Sukuk or Investment sukuk are certificates of equal value, entitling the owner or bearer to a claim over the financial rights and obligations represented by the certificates. All certificates represent a common share in the ownership of the underlying assets they represent, whether non-monetary assets, usufruct, services or a combination of these including intangible rights, debts and monetary assets. However, they do not represent debt owed to the issuer by the certificates holder/s. The sukuk are issued on the basis of shari’a –nominated contract, according to Sharia’ rules of issuance and trading. Their trading is subject to the terms governing trading of the rights they represent. Their sharing of return is in accordance with the contract terms given in their subscription prospectus and the loss sharing is in proportion to the certificates’ value out of the total pool.

### **Types**

There are different types of sukuk. The most popular or common type seen in many issues, especially the initial ones, were the ijara’h sukuk , or composite sukuk with a majority of ijara’h transactions , to pass the permissibility test. Hence we discuss the ijara’h sukuk first. As per the Shariah Standards<sup>11</sup> of the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) Sukuk or investment sukuk are of different types. They are given as follows. 1)Certificates of ownership in leased assets, 2)Certificates of ownership of usufruct ( a) of existing assets ,b) of described future assets, 3) Certificates of ownership of services of a specified party, 4) Certificates of ownership of described future services, 5) Salam certificates, 6) Istisna’ certificates, 7) Murabaha certificates, 8) Musharika certificates, a) Participation certificates b) Mudaraba Sukuk and c) Investment agency Sukuk,9) Muzara’a (sharecropping) certificates 10) Musaqa ( Irrigation) certificates 11) and Mugharasa ( agricultural) certificates.

According to the same Sharia’ Standard (No. 17) of the Accounting and Auditing Organization for Islamic Financial Institutions, investment sukuk can be issued through subscription procedure on the basis of any of the Sharia-nominated investment contract/s. These investment sukuk can be issued for (to securitize) assets, that are tangible assets, and their usufruct. These assets and /or their usufruct shall be divided into equal shares and sukuk certificates be issued for their value. The contract of issue is its main legal document. It describes the type of sukuk, the legal arrangement between the parties to the contract, especially the issuer and the subscribers.

For the sake of describing the sukuk composition, the Ijarah sukuk (being the most common) and the musharika or participatory sukuk (being the most recent innovation, practically (2006)) shall be describe, instead of describing all types of sukuk. Along with their generic content, description of actual contracts shall be presented culled from their offering prospectus.

#### **Ijara'h Sukuk**

Ijara'h sukuk represent the group of investment sukuk that are: 1)Certificates of ownership in leased assets, 2)Certificates of ownership of usufruct ( a) of existing assets ,b) of described future assets, 3) Certificates of ownership of services of a specified party, 4) Certificates of ownership of described future services as given earlier.

The word "Ijara'h" literally means "to give something on rent". In Islamic jurisprudence, it has two meanings. Firstly, it means, "to employ the services of a person on wages given to him as a consideration for his hired services." Secondly, (type of Ijara'h) means "to transfer the usufruct of a particular property to another person in exchange for a rent claimed from him". This class of ijara'h is similar to the term "leasing", in western finance. It is used as a form of investment and as a mode of financing in general. (Usmani, Taqi, 2002)

#### **The Ijara'h Contract**

Suppose we consider an owner of assets. This owner (of assets) rents out the usage rights to another party in return for return (benefit) in kind (e.g. a portion of agricultural produce), or money decided before-hand. (These usage rights can also be sub-let). The owner of assets becomes a lessor (called Mu'jir) the lessee is called musta'jir and the rent payable to the lessor is called "ujrah". The leased asset ( asset under ijara'h remains the property of the lessor, and the lessor bears all the risks related to the asset except its maintenance and wear and tear, while in the use of the lessee. The subject of lease must have a valuable use. Anything which cannot be used without consuming cannot be leased out. Hence money, eatables, fuel, etc. cannot be leased, as they would perish with consumption. (Usmani, Taqi, 2002). Cultivable Land is an ideal example of ijara'h asset, as it can be cultivated, and the crops harvested, and the land returned to the owner. The ujarah of ijara'h (lease rent) must be determined for the period of ijara'h (lease) at the time of commencement of the ijara'h (lease) contract. The rent is payable only after the asset is in the possession of the lessee.

Hence ijara'h is not originally a mode of financing but a mode of "renting out" particular assets (main property mentioned) in exchange for rent called "ujrah". Owing to the "rent" payment mechanism of leasing suitable to the investors, ( who become the owners of leasing rights or leased assets, for a certain period of time ( investment period)) the ijarah sukuk were an attractive investment opportunity , especially the Muslim investors and the international bond market investors, for the foreign currency denominated sukuk.

Similarly, the arrangement of ijara'h sukuk proved feasible for the development needs of the lessees, (who were indirectly sukuk originators). They comprised large conglomerates, autonomous bodies or sovereigns primarily, who are developing property, infrastructure, or projects (usually medium to long term).

Their target investors, favoured a fixed return amount or a fixed percentage with respect to London Inter Bank Offer Rate (LIBOR), and hence the ijara'h sukuk provided the solution.

#### **Examples of Ijara'h Sukuk**

In general, sovereigns, municipal governments, autonomous bodies, corporates and high Net Worth individuals are mainly the target market for fixed income securities world wide, mainly due to the medium to long term nature of their projects. Ijara'h Sukuk too, present an alternate of Islamic investment opportunity with a fixed income stream, attached to the pre-agreed rentals on the underlying ijara'h contracts. The Sukuk certificates represent an undivided beneficial interest in the underlying assets, be they land parcels or building or project assets.

Sovereigns have mostly favoured ijara'h Sukuk for these reasons and also because they usually have ample resources, like land and buildings which are not for permanent sale but can be sold for a certain period of time and leased back. This arrangement enables them to generate funds for otherwise idle resources. In many instances like the WAPDA sukuk's assets mentioned ,their estimated value is written as the value of the underlying assets, although these units may hardly be of any use, out of context (i.e. out of site ).

However, the exposure of the investors is on the originators, and their fund generating capacity and the legal structure of the contract which is so designed that the sukuk investors, are satisfied regarding the receipt of their periodic payments and maturity or redemption value ans at the same time are shariah permissible. The different sovereign sukuk of similar structures but different sovereign ratings internationally, have accordingly different

pricing ( say LIBOR plus 0.5 for Qatar’s Ijarah Sukuk of 2003 and LIBOR plus 2.2 for Pakistan’s Ijara’h Sukuk of January 27, 2005, issued through the SPV namely, Pakistan International Sukuk Company (PISC). The SPV gets the net proceeds from the issue of Sukuk . It uses them to purchase the underlying assets from the originators, and at the end of the Sukuk period, the Ijarah contract is terminated and the residual assets if any are sold back to the originators (unilateral agreement to purchase the underlying assets) at a price that meets the maturity payments of the Sukuk

In a recent local currency Sukuk (closing date January 06, 2006) for Pakistani Rupee (PKR) 8.0 billion, for seven years by an autonomous body namely Water and Power Development Authority (WAPDA) of Pakistan, which is the sole supplier and distributor of power to the country, an Ijara’h Sukuk floatation through a specifically set-up Special Purpose Vehicle namely WAPDA First Sukuk Company took place. This Sukuk contract has provided the Hydel power generating units as the underlying assets and their value has been assessed as.....

Under the Sukuk fund generation programme, part of the project undertaken was Improvement to the existing capacity of the Mangla Dam. Hence the underlying assets were 10 hydel power generating Turbines of Mangla Hydel Power Station under Sale and Lease back arrangements. The Sukuk assets are leased back to WAPDA for a period of seven years, corresponding to the life the of the ijara’h Sukuk...The issue is facilitated further through a guarantee from the Government of Pakistan and the subsequent qualification of Statutory Liquidity Requirement (SLR) given to the Sukuk , enabling Islamic Banks to invest in the Sukuk for SLR requirement.

FIG. 1: IJARA’H SUKUK’S BASIC STRUCTURE

Source : Author’s own

Ijara’h sukuk has been termed as a structure which reciprocates the debt –based bond structure, or a structure made compatible with the debt-based bonds, while remaining sharia’h compatible. Besides Ijarah sukuk there are other more complex and innovative structures of sukuk with a greater tilt towards participatory shares and equity content are also emerging. For instance, the Saudi Arabian corporate sector Sukuk structures namely Caravan

1, and the PCFC (Dubai Ports) sukuk structures taken as examples below. These are examples of Musharaka sukuk, which shall be described below.

## **Musharaka Sukuk**

Musharaka (or Musharika) is the popular name of Sharikatal-Aqd, meaning contractual partnership<sup>12</sup>. Musharaka Sukuk are defined as equal value certificates, issued for using the funds received, for establishing a new project, or development and financing a business activity on the basis of any of partnership contracts. The certificate holders become the owners of the project or the assets of the activity as per their respective shares. The Musharaka certificates are structured on the basis of participation or Mudaraba or an investment agency. ( AAOIFI, Sharia Standards, 1424-5H, 2004-3<sup>13</sup>).

The **Caravan 1** structure was quite a complex structure<sup>14</sup>. Owing to the Saudi government requirements<sup>15</sup> (their transfer of assets regulations) the sukuk structure complied with all the Saudi Arabian Governments' Legal requirements amicably as well as safeguarding the interests of the international investors, while remaining Sharia'h permissible. Caravan 1 Limited is a Special Purpose Vehicle created for the purpose for issuing Sukuk. It is incorporated with Limited Liability in the jurisdiction of Jersey. It is linked to its sister Special Purpose Vehicle incorporated in Saudi Arabia, which purchases the assets from the originator and receives the funding generated through sukuk issuance from Caravan I. This is a Variable rate Auto-backed Sukuk. Its legal final maturity falls on July 8, 2009. This is a Two-tier structure involving securitization of Automobiles (Inventory). Caravan 1 Limited issues the sukuk and the Redeemable participating Shares (in aggregate amount of Saudi Riyal (SR) 102,167,281.20)<sup>16</sup> and advances these proceeds to Al- Karam. Hanco subscribed to full amount of Redeemable participating Shares, throughout the term of the transaction, Alkaram purchases assets from Hanco, and uses the proceeds for this purpose. SR 4,167,281.20 were paid by Hanco (at closing date of the sukuk issue offer), for purchase of Redeemable participating shares. From these shares, Hanco is entitled to a profit-sharing dividend after redemption of the Sukuk in full. Hanco manufactures the Auto vehicles under consideration (underlying assets). Hanco shall sell these vehicles to Al Karam. By (before) May 8, 2007, the vehicles would be completely manufactured and ready to sell to Al Karam. On May 8, 2007, Al Karam shall pay (is expected to pay) the issuer SR 6,000,000/- . This cash flow would result from sale of Vehicles (bought from Hanco) and the cash available in the excess spread account and the issuer's cash account. This Balloon payment is expected to redeem the outstanding balance on the sukuk. A minimum reserve level of SR 2.5 million will be maintained by the issuer, from end of June 2004 throughout the life of the Sukuk. Dividend and repayment of redeemable Participating shares will not be made before full redemption of sukuk. Sukuk returns shall be paid monthly (in arrears) on 8th of each month, the first one being on 8th March 2004.

According to one legal source, Caravan I sukuk is a two tier structure with credit enhancement features of 15.39% over-collateralisation, a 4.25% equity tranche and 8.77% cash reserves to make it more robust. It also had embedded in it early warning triggers to mitigate its performance. This issue has been unrated, as it would have become more expensive. The legal opinion regarding the enforceability of profit sharing under Sharia'h was also not available and its only investor, Shamil Bank of Bahrain, was satisfied with the structure<sup>15</sup>.

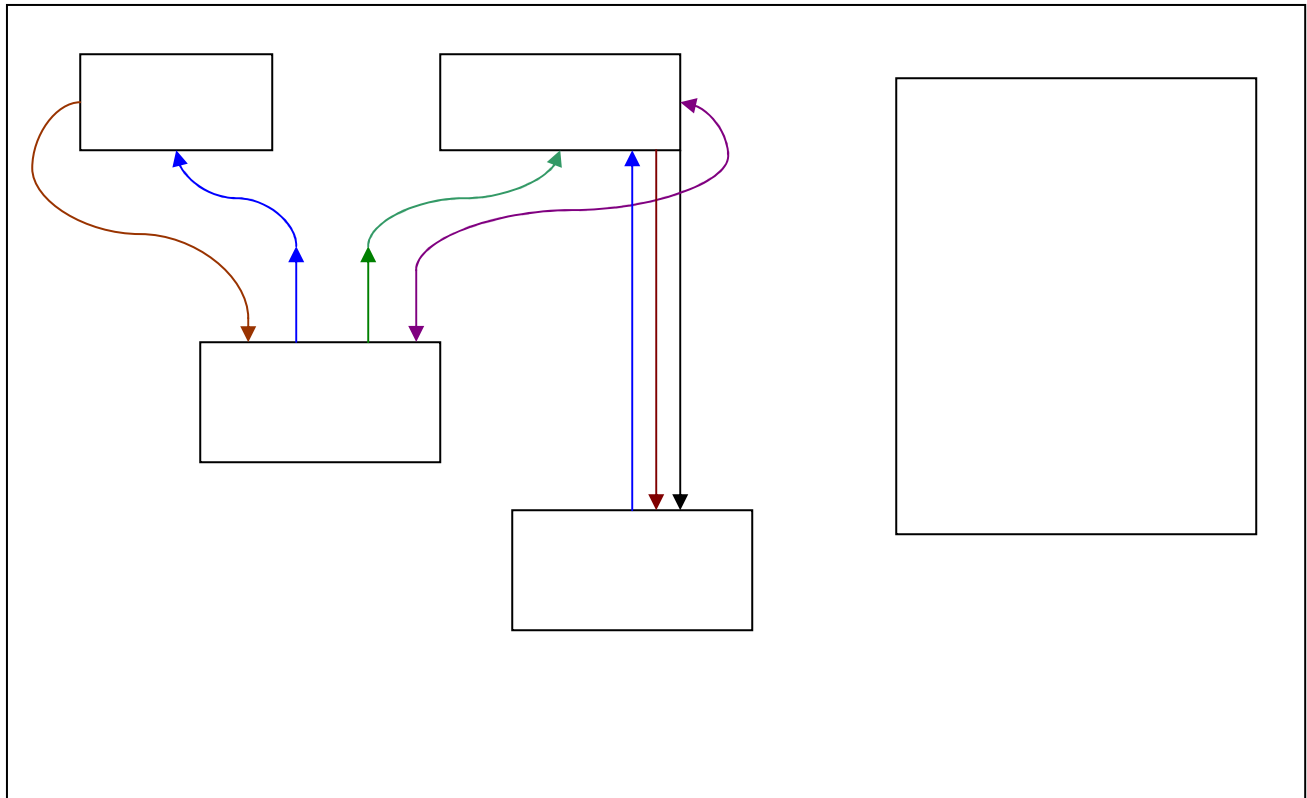

FIG. 2: MUSHARAKA SUKUK- BASIC STRUCTURE

Source: Author's own

**The PCFC Development FZCO Sukuk of Dubai ( Jebel Ali Free Zone)**

Jurisdiction is an example of a Musharika based structure of sukuk or Musharaka sukuk. U.S. \$3,500,000,000 worth of Trust Certificates Sukuk due 2008 were issued (at 100 % of the aggregate principal amount of certificates) on 23rd January 2006. The Certificates were constituted by a declaration of trust on the closing date, (i.e.23rd January 2006) made by the Issuer (SPV) and Ports, Customs & Free Zone Corporation (PCFC). Each certificate (suk) represents an undivided beneficial ownership of Trust assets and ranks pari passu with the other certificates. According to the Musharaka Agreement between the Issuer (SPV) and the obligor (originator), the capital of the musharaka shall be U.S.\$5,000,000,000, of which the Issuer contributes U.S.\$3,500,000,000 and the originator, namely Ports, Customs and Free Zone Corporation (PCFC) <sup>16</sup> makes a contribution in kind<sup>17</sup> of U.S.\$1,500,000,000, while the issue price of the sukuk Trust Certificates is U.S.\$3,500,000,000. PCFC is also the Managing Agent of the Musharaka assets and activities. The sukuk holders are paid as follows on the qualifying Public offering and /or redemption date occurrences, whichever the case may be. a) If Qualifying Public Offering (QPO) redemption takes place, on that date, sukuk holders shall be paid a fixed return of 7.125 per cent. Per annum of the issue price and b) If final or mandatory redemption takes place, on that date, a fixed return of 10.125 per cent per annum shall be paid. According to the Musharaka agreement between the Obligor (originator, PCFC) and the issuer (SPV) the Musharaka profit distribution shall be 30% to the Obligor and 70% to the issuer (SPV) of sukuk. If the accumulation profit of Musharaka is greater than the return paid and/or settled on redemption of the certificates, such excess accumulated profit count as the Musharaka Management incentive fees of the Managing Agent. Issuer will act as trustee of the trust assets on behalf of the certificate-holders (sukuk holders). An innovative feature of the sukuk from the perspective of sukuk holders is that the sukuk were certificates of partnership and sukuk holders as partners in the

instruments,  
their interest  
revenue and  
gain from  
transactions

<b>Legend:</b> ✓ = Applicable, ✗ = not applicable
--

Equity finance is very much a part of everyday business and finance but practice of risk and reward pattern involving individual- level safeguards ( in terms of maximizing investors' returns at minimum risk levels and so on) pushes the investors towards debt based investments and investment in banking portfolios which are also debt-based. Although the present day sophistication in portfolio management software and banking and investment software and systems has increased their efficiency for the purpose utilized, there is no denying the fact that the systematic risks of the financial markets cannot be avoided. Similarly, each market has to look after its own systematic risk. However, in addition to the portfolio diversification and the hi -tech techniques, through risk and reward sharing among various stakeholders as in equity financing , since all stake-holders will share risk and return, systemic risks can be greatly reduced.

## Pricing

Finally, we give a view on the pricing aspect of this investment. One of the positive developments of the introduction of Musharika sukuk seems to be the added dimension to the investment activity regarding pricing. It allows pricing on the basis of profit sharing from the (net) returns of the Musharaka. This phenomenon has the connotation of well-diversified risk and return for the whole economy and not just for individual investors or corporates. It also shows us how to safeguard the rights and interests of various business and investment stakeholders in an undertaking through the structuring of the legal contracts. These aspects can have positive connotations for the financial sectors too, if they are able to issue their own sukuk or participate in Musharaka sukuk of sound business partners. One of the very rare examples in this connection is that of Dubai Islamic Bank which, very recently issued a US\$ 750 million sukuk. This sukuk is also based on the Musharaka principle (Ameinfo, March 17, 2007). For the Islamic Banks, such sukuk securitization is important from their own business perspective too, owing to the nature of their business being a combination of financial -cum commodities based activities.

## Conclusion

It is hoped that the kind of product structures depicted especially in the form of Musharaka based sukuk, would build the world wide investors' confidence in risk and return sharing concept, instead of the risk and return compartmentalization concept of investors risk and return versus borrowers' risk and return, and then the regulatory

buffers, in action, trying to safeguard the individual components' risk as well as the systemic risks and the spillovers or arbitrage among the financial sectors and jurisdictions.

These sukuk structures, (especially the PCFC Musharaka combination) and their success should propagate the real move towards equity financing and risk and return sharing among the international investors<sup>18</sup>. These are also a kind of “bridge” between bond market and the equity (shares) market or in other words, between the mode of financing through bonds and equity shares. One can call it another “confidence-building measure” between the two markets' investors and financiers/borrowers.

As an added comfort factor to the investors, in the sukuk structuring, the investors have the right or option to subscribe to the IPO ( called QPO meaning Qualifying Public Offering) as well as the originating (also called obligor) company's unilateral promise to redeem the outstanding portion in the form of shares in the IPO. Hence whether the sukuk investors opt to convert to the QPO shares or want to liquidate their sukuk at maturity or redemption, they benefit from the investment. Appreciation in the market value of shares after the QPO enables the sukuk investors- turned- share holder, to take the benefit of appreciation in shares' price if they wish to sell the shares.

However, this entire rosy picture isn't possible unless the underlying project is performing well. Rightly said, the underlying assets lie at the core of the transactions, no matter how sophisticated the structure, and no matter how tight or secure the legal contracts and regulations, what are they of any use, if the parent company “falls ill” and can't perform according to the expectations, whether it is a debt structure or an equity investment in shares. This statement is made to reinforce that the primary exposure of any investment ought to be on the originator and redeemer, along with the legal and regulatory structure. These two –tiered (or multi-tiered) and multi-pronged financing structures with extensive, legal and regulatory input considerations also give us important lessons. That is of balancing the risk and rewards sharing among all the stakeholder of the sukuk issue, safeguarding the rights and operationally and legally tying the obligations to be met, to ensure their execution. Despite these structurings, there are elements of risk and rewards being shared between the stakeholders, especially those being financed and those providing the financings. Together, these are the success factors of the sukuk and the businesses, assets and investments they generate<sup>19</sup>.

Looking at the large tranches of investments generated through sukuk, it seems that these types of sukuk would have the institutional investors and high net worth clients as their target. These investors are not in for trading but for long term investments. The retail investment market may be tapped through sukuk of different denominations and maturity provided these investors are comfortable with the risk and return structure too.

The select sukuk product structures' analysis encompassed deductions for investments based on its legal, operational and technical properties. The possibilities of its utilization in other economies can be explored by others in their own indigenous settings. It is currently catering to the funding needs of sovereigns, conglomerates and autonomous bodies, particularly in Muslim countries. They have been able to attract the petro- Dollars or petro – Dirhams (of the Middle East in particular) as well as other International bond market investors. The beneficiaries of the sukuk transactions are the originators of the sukuk , ranging from sovereigns, corporations and autonomous bodies of mainly Muslim countries to non-Muslim European countries like the German state of Saxony and the very recent US sukuk<sup>20</sup> related to petroleum related business. Hence sukuk can be termed as one of the popular products of Islamic finance, which are being embraced as acceptable modes of finance by the investors and users of funds alike. Business aside, they are at least breaking the barrier of shunning or compartmentalizing Islamic Finance as non practical in the capitalist system revolving around interest.
