forms of rationality that consumers (in a more or less conscious way) put in place at the time of purchase, and it is clear that economic calculation is only one of the forms of rationality that consumers can implement. Advertising strategically uses these generic dimensions to targeting a specific audience. It is important to remember that, according to the analysis of Floch, the object-machine itself is marginal, and it becomes relevant only when the subject covers it with certain values. Floch provides an introduction to the potential offered by a semiotic approach to a variety of marketing and communication problems or situations (Floch 1990, 1995). Key semiotic concepts and principles are gradually introduced using real life studies. The semiotic square of Floch has been widely used to describe the positioning of brands and products. However, “the limitation to a particular set of universal values constitutes a form of reductionism, of which the advantage in terms of comprehension and clarity do not attain to counterbalance the inconveniences linked to psychodemografich variations” (Rossolatos, 2012: 25).

Semprini (1992) returned to the square of Floch and translated it into a semiotic brand mapping model (Fig. 2). It is a scheme that crosses two opposite categories: the main category “practical vs. utopian” is qualified and specified by the second category “critical vs. ludic”.

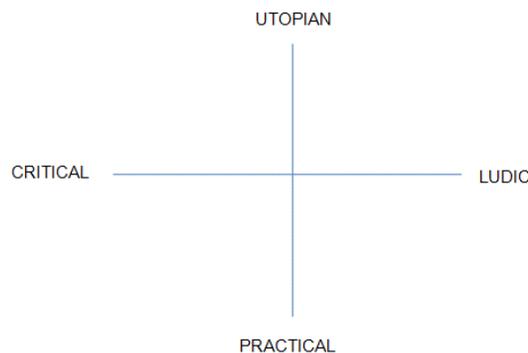

FIG. 2

Through this scheme it is possible to identify the fundamental values of a text and its positioning. In the west, where critical valorization prevails, we find all the values linked to the need of understanding the meaning of things. More specifically in the north-west, closer to the utopian dimension, there is the promotion of culture and knowledge; in the south west, however, the reflection gives way to the analysis and the need to reconstruct the causal connections. On the east, dominated by the valorization of ludic, the pursuit of pleasure and emotion prevails but in the north-east, close to the utopian dimension, the valuations of expression and creativity are stronger than in the south-east, where the values linked to evasion and relax prevail. The northern area is dominated by the utopian valorization, with values that are projected towards a future universe, near the critical pole (vision, future, collective), and more individualistic values near to the ludic pole (innovation, individual happiness). Finally, the south, dominated by the practical valuation, presents immanent values and objective: but if we approach the critical dimension, the practical assumes a certain “engineer logic” (the values are functionality, performance, technical), while if we get closer to the ludic pole practical values are part of a more emotional and psychological logic (cheerfulness, friendliness, emotion).

Compared to the semiotic square of Floch, Semprini’s mapping seems to offer several advantages. It provides a conceptual representation familiar to marketers and allows us to understand not only the differences between the various categories, but also the possible continuum that remains between value and value, between term and term (for example between the “practical” and “critical” evaluation there are various intermediate shades, such as reasoning, rationality, continuity).

Semprini (2005) also introduced the model *Brand Project/Manifestations*. This model involves two levels of analysis: the brand project, or brand identity, and all the brand texts, or brand image (Fig. 3).

FIG. 3

As regards the identification of the brand project (Semprini, 2005), it is necessary to extrapolate the brand identity values through the investigation of the official statements of the company, gathered through questionnaires and through the analysis of their mission. This type of survey allows us to understand what are the values that companies want in their identity, the concept at the base of their existence. Every manifestation of the brand should therefore be considered as a sentence in itself, a complete semiotic structure, a micro-story with a deep meaning. All the brand texts have the same theoretical status, but do not have the same weight or the same importance in reaching the target audience. The analyst's task is to start from the manifestations (texts analysis) and to identify the core values. The objective is to evaluate the consistency between the values established and communicated by the company and the values actually conveyed by the texts. Indeed, on one hand we have the intentions, the goals of those involved in the brand design; on the other hand the textual values, beyond these intentions. Semiotics focuses on the second aspect, on what texts communicate. The semiotic analyst then starts from the text to identify the set of meanings that it condenses. Of course, the more texts reflect with efficacy the brand identity values, the more there will be a harmonic perception by the target.

Another author who attempted to furnish a comprehensive brand semiotic theory is Ceriani (2001; 2007). Ceriani's purpose is to yield a theoretical base for unifying different aspects of branding, including positioning, segmentation, communication, but also to employ this theoretical base as a platform for long term brand management. The author christens this platform "the brand identity mix", comprising the ensemble of elements relating to the marketing mix of a company. Ceriani explores the way semiotic can intervene in the management of brands, products and companies. The hypothesis is that semiotics offers a methodological contribute to the communication mix control and management. The departure point is the category of "concept", that is a set of traits, values that the company decides to award a brand. The concept is "a core of meaning not even put into discourse."⁵ We can see a convergence with Semprini's definition of brand project. According to Ceriani, the semiotic intervention concerns different stages. First, a scenario analysis is necessary to highlight the dominant meanings with respect to a certain theme or topic. For example, if we speak of a technological product, a scenario analysis will mean trying to understand the dominant lines in a certain sector. The study of scenery can be done either through a desk analysis (analysis of texts, such as articles, brochures) and through a field analysis. Secondly, the semiotic analyst should work in teams to devise alternatives concepts: the aim is to develop other pathways than those tracked in order to have alternatives. Each of these two phases will be followed by focus groups with consumers: it is a work of control with respect to the trends indicated in the first and second phase.

The communication channels that determine the marketing mix of the company should have a consistency with the concept. Indeed, the effectiveness of semiotics consists in an strategic action aimed to understand if the company communicates in a coherent manner. According to Ceriani semiotics can also intervene to some extent in the design and in the production of the final product as well as in forecasting trends. These studies go towards a very operational idea of semiotics and have sparked several debates because they seem to call into question the exclusively descriptive nature of semiotics in favor of a significant applicative breakthrough.

A semiotic analysis of the Chanel brand

In the previous sections we have seen the interactions between semiotics and marketing, retracing the main semiotic studies applied to the world of advertising and consumption in general. In this section we will try to clarify the concepts and theories set out above by showing a case study. More precisely, we will focus on the Chanel brand⁶ and we will analyze its brand identity and image by applying the Semprini's model described above.

To make an effective analysis we should consider different levels. According to Semprini, the first is the identification of the brand identity, or the values that characterize the brand essence and which are the basis of a brand. In the case of Chanel we can extrapolate these values by analyzing the history and the mission. Chanel fashions and the Chanel brand were created by Gabrielle "Coco" Chanel, who first learned how to sew while living in a nunnery where she was raised after her mother died. The first Chanel retail store was opened in Paris in 1910 and exclusively sold hats. Chanel's next two stores in France also sold clothing which she designed and sewed herself. The Chanel brand is best known for its little black dress, tweed suit, quilted handbag two-tone shoes and "the perfect red lipstick". Coco Chanel died on January 10, 1971, and Karl Lagerfeld took over leadership as chief designer of the Chanel business in 1983. The Chanel company mission statement is: "To be the Ultimate House of Luxury, defining style and creating desire, now and forever."⁷ We can see that the fundamental values are those of style, simplicity, luxury, timeless fashion. These are the values that the brand wanted to be its distinctive features.

The second step is the analysis of the texts belonging to the brand mix, as the web-site, the name, the logo, the social page, print and television advertising, catalogs, fashion shows, events, flagship stores and boutique. Indeed all these texts are modes of expression of the brand's values, which go under the name of brand image. The analyst task is to verify the correspondence between *identity values* and *text values*. If there is this correspondence, the text will be coherent, thus effective and consistent form a strategic point of view. Chanel is characterized by a strong communication coherence, based on signs deeply rooted in the collective imagination (the little black dress as a sign of timeless fashion, the earrings and the necklaces of pearl as symbol of elegance, the hat as symbol of new femininity), and a clear identity conveyed by coordinated channels. The identity is also characterized by a chromatic consistency: in all the brand communication channels black and white and pastel tones are the dominating colors.

One of the most famous Chanel text is the logotype (Fig. 4). Symbol of the house, it consists of two interlocked letters "C" – probably for "Coco Chanel" – and was registered as a trademark in 1924. Its origin is uncertain and is traced, according to the sources, in a medallion in the Renaissance villa Château Crémant, in the hills of Nice, belonged to a Coco Chanel friend, Irene Bretz, or in the symbol dating back to the sixteenth century "Candidior Candidis" (the most beautiful of the beautiful), adopted by Queen Claude of France and, later, by Catherine de Med, viewed by Coco at the Chateau Chaumont or at the royal castle of Blois.

FIG. 4

The logo stands out in black on a white background without other symbols or decorations. The absolute absence of frills, the geometric clean lines and a preference for the white and black are distinctive characteristics of the entire work of the designer. Coco Chanel revolutionized haute couture, replacing the sumptuous feminine dresses with simple linear models. The twenties and thirties were marked by the new idea of fashion introduced by the designer. Chanel not only gave a twist to the world of fashion, but contributed to break for the first time the wall that separated the female gender from the masculine one, with a stylistic contamination between the two genres. The Chanel logo is representative of the Coco Chanel personality: it expresses uniqueness and originality, a different way of being, a new femininity.

Advertising is another important communication tool. In print advertising "bon-ton" representations prevail, with sobriety, lightness and elegance in the foreground (Fig. 5). The choice of models with delicate features reflects

grace and style. The product is supported by the human body and acquires meanings thanks to the movements and gestures. No part of verbal communication is entrusted to the images and it is noteworthy the evocative power of the photo. Chanel, as well as majority of luxury fashion brands, prefers using more advertisements rather than spots. Indeed we do not find television spots for Chanel clothes, but only for Chanel perfumes, that follows a different communicative approach. The brand, nevertheless, uses web films, which are characterized by a contamination between the language of advertising and the language of cinema, giving the product a higher connotation.

FIG. 5

More recently digital brand channel as websites and social network as Facebook or Twitter have acquired a key role in the communication mix as means able to dialogue with the postmodern consumer (Fabris, 2008). In the website an international dimension overrides, with a strong reference to the world of high fashion and fashion shows. Luxury is placed in the foreground and the valuation of simplicity, combined with that of the style, is recurrent. A visual minimalism recalls the expressive characteristics of the brand. Importance is given to the history and tradition: indeed, we see a timeline, which remember the more recent characteristic of the Facebook diary, which allows visitors to retrace the most important stages in the brand history (Fig. 6). Focus is on tradition and experience, together with the enhancement of the dream: a girl of humble origins becomes a revolutionary in the field of fashion, the universal symbol of class and style. The social wall presents a more accessible language, but it always maintains a distance with the public. On one hand there is the world of haute couture, on the other hand the world of the consumer. Here we find simplicity and expressive minimalism too, although the value of elegance fades into the background. There are all the visual characteristics typical of the brand.

FIG. 6

The Chanel dream continues in the boutique and flagship stores (fig. 7). Here the windows have the most important role, narrating stories.

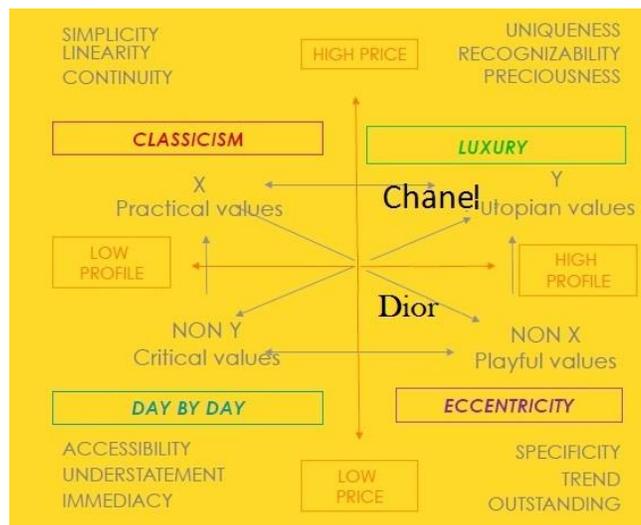

FIG. 7

As for the logo, even in retails the story is set on a neutral background, in the foreground, remembering the typical colors of the brand. In the interiors a minimalist exhibition prevails, with an experiential path based on the essentiality of communication. Currently Chanel has international retail store locations in more than 120 countries, with separate Chanel retail stores for fashion and accessories, fine jewelry, beauty, and eyewear. The Chanel global headquarters are located where the Chanel brand had its beginnings, in Paris, France.

This short excursus about the Chanel communication mix allows to understand that Elegance, Simplicity, Style, Luxury are the most significant brand text values. Thus we can see the presence of a strong communicative coherence between brand identity values (brand project) and text values (manifestations). For a complete analysis these values should then be placed on the semiotic mapping to carry out a comparison. In this case we also consider the identities of competitors and their values.

FIG. 8

For example, the mapping shows a contrast with the Dior universe, closer to the ludic or aesthetic dimension. Chanel, instead, proposes a way of living and being, and is closer to the utopian pole. For luxury fashion, the practical

valorizations is more rare and the critical one is almost absent, even if we find exceptions. Towards this analysis we discover a general trend in the field of luxury fashion and we can also compare different brands at the level of values⁸. The case that we rode helps to understand how it is possible to apply semiotic tools in the marketing field. What is the added value given by the semiotic analysis? It allows to check the consistency of communication and provides important information that may affect the final product. It is a type of descriptive methodology, which recognizes the importance of comparisons although some authors have recently proposed its use also to make predictions and contribute to the creative phase of production.

End Notes

¹ The origin of brands comes from the times when early cattle-rearing men stamped their ownership on their livestock by burning a mark of their name or identity on the cattle, to distinguish on cattle-farmer's stock from another's. Through this means of differentiations, the good quality cattle could be easily identified. The current definition of a brand has however evolved from marks, names, logos and shapes to elaborate marketing development and strategies. The results is the creation of something powerful and consistent, which has the ability to produce emotional and psychological attachment with consumers and financial value for the brand owner (Okonkwo, 2007).

How Companies Can Contribute to Territorial-identity Development: Empirical Evidence from Italian Businesses Cases

Abstract

This study aims to contribute to the development of the knowledge on intangibles management by analysing the territorial-identity concept from a strategic competitiveness perspective. The purpose of this study is to clarify the territorial-identity concept by exploring and highlighting its dimensions and determinants. This study considers the perspective of two historical Italian companies that have long been embedded in their territory. By integrating a literature analysis with well-documented case studies, this study proposes a conceptual framework to capture and explain what companies can develop at the local level in order to improve territorial identity.

Introduction

In a globalised world where interconnection and standardisation in business prevail, competitive challenge for local areas needs to overcome the de-territorialisation processes. Although several studies (e.g., Zanon 2011) highlight that infrastructure projects are at the basis of re-territorialisation processes, we argue the importance of developing strategic abilities of differentiation related to the knowledge-economy principles (Rullani 2004). The differentiating element is not the material product but the intangible value that accompanies the goods' design, production and sale: it particularly resides in the meanings, services, experiences, and availability of collaboration to create relationships with stakeholders who are hidden behind the material product. As such, local areas can increase their competitive advantage and meet the challenges of globalisation by creating, developing or recreating their identity (Levi 2003).

This study intends to stimulate the debate on territorial identity, an issue that has received less attention from a strategic-management perspective. Specific studies on territorial identity have been conducted in Italy (e.g., Baccarani and Golinelli 2011; Rullani 2013), with a focus on company-territory relationships.

Although many of the contributions to the literature on territorial identity examine the connections between identity, territory and competitiveness, there is no specific study that explores the territorial-identity concept for the purpose of increasing territorial competitive advantage.

To discuss this issue it is first important to understand what is meant by the identity of a territory or a local area. This concept is complex because there are many terms and meanings applied to this concept from a number of disciplines. The terms 'territorial', 'local' and 'place' are most frequently used in the social sciences such as geography (e.g., Raagmaa 2002; Magnaghi 2003; Pollice 2005; Luukkonen and Moilanen 2012); environmental psychology (e.g., Bonaiuto et al. 2002; Carrus et al. 2005; Gifford 2007; Lewicka 2008); environmental policy and governance (e.g., Happaerts 2012); viticulture and agri-food (e.g., Cesaretti and Scarpato 2010; Rocchi and Gabbai 2013; Begalli et al. 2014); place marketing (e.g., Erickson and Roberts 1997); and tourism management (e.g., Hallak et al. 2012). In this work, such terms are used interchangeably.

The aim of this study therefore is to clarify the concept of territorial identity by exploring and highlighting its dimensions and determinants. Although we are aware that territorial identity is the result of the contribution provided by all stakeholders of a territory (Baccarani and Golinelli 2011), in this study we consider exclusively the perspective of historical companies that have long been embedded in the territories of the case studies. We examine the manner in which two north-eastern Italian firms operating in the grappa industry contribute to creating the territorial identity of the Bassano del Grappa territory (Veneto region). By integrating a literature analysis with well-documented case studies, we propose a conceptual framework to capture and explain the territorial-identity concept to serve as a starting point for future studies.

This study presents a literature review on territorial identity, followed by a description of the methodological approach that was used to research. After describing and discussing the two historical firms'

experience of developing the identity of the territory in which they operate, theoretical and managerial implications are discussed. This study closes by presenting its limitations and proposals for future research.

Territorial-identity concept in literature

This literature review is executed through an analysis of the concept of territorial identity in the interaction between place and identity, particularly as theorised by scholars of geography, and by highlighting the main characteristics of territorial identity.

Territorial identity is an elusive concept that can be defined as the qualities that make a place capable of being specified or singled out, as well as unique and separate from other places (Erickson and Roberts 1997). Territorial identity is a concept rich in meanings such as the ‘uniqueness’, ‘singularity’, ‘specificity’, and ‘authenticity’ of local/regional material and immaterial assets, systems and networks (Roca and Oliveira 2007, 435). It can also be interpreted as an ‘identitarian relationship connecting a specific community to its lived space’ (Caldo 1996, 285). In this sense, territorial identity is not exclusively related to the mere spatial dimension of identity, but is used to express the relationships of belonging that create ‘territory’. Territory is a ‘lived space’ (Frémont 1978) because it incorporates both the physical dimension of the geographical space and the social dimension of the relational space. Therefore, territory is an ‘human space’, it is built over time as a product of a process of cultural sedimentation; it is a process that focuses in the identity relationship that develops between a community and the space in which it is located. That is, territorial identity is a self-referential process established by a community that takes possession of a culturally default spatial context (Pollice 2005, 75-76).

In addition, territorial identity is not an abstract concept but a fundamental component of any place (Pollice 2005). It is closely related to the concept of ‘genius loci’, which is the perceptual manifestation of territorial identity as the unique set of physical characteristics, cultural messages and emotions that makes the place what it is, that makes it different and unique to any other place (Artusi 1996, 3).

The identity of a territory can be also defined in relation to its flows and networks with other places, both near and far, generating a condition of interdependence and modifying the original and historical distinctive features of the territory. While in the past, the inhabitants of a place felt a sense of belonging to a place through its history and by cumulating mostly local experiences, emotions, and relationships, today, in addition to these distinctive elements that come from the past, companies, people and communities have learnt to hybridise the experience of the places with the experience of global networks (Rullani 2013).

Fundamentally, territorial identity presents three characteristics.

First, identity is not a static, but a dynamic concept (Pollice 2005). It is the result of a continuous interaction between a specific community and its relational space. As territory as a space of belonging is an affective, social, and symbolic product, if local actors trigger mechanisms of identification, they can contribute to the creation of a retrospective and perspective local identity (Dai Prà 2001).

Second, territorial identity is a process because there is no single identity of a territory but a succession of identities (Raffestin 2003). It can be understood as both the cause (‘matrix’) and effect (‘target’) of the territorialisation processes (Turco 2003). As cause, it means that local identity supports the development process by means of a set of conditions providing opportunity and obstacles to actions. As effect, it can increase the specificities of a place and contribute to the consolidation of the sense of belonging to the local community. Territorial identity is related to local development because it orients both collective actions and territorialisation processes. In this sense, a strong territorial identity stimulates the processes of endogenous and self-centred development, and is able to predetermine directly or indirectly objectives and strategies of local development. It can also contribute to the development of innovation processes at the local level. Territorial innovation is successful if it is the result of choices shared by local community members and stakeholders operating in the territory. Such sharing is achievable if a strong identity exists in a territory. As such, self-referential behaviours are avoided, and social and territorial development is stimulated (Pollice 2005).

Third, territorial identity is not a set of exterior manifestations, but of interior values such as a sense of belonging, social identification and cohesion, as well as a shared representation of a collective self.

By means of territorial identity, any territory can become an actor of its own development. The place is no longer a simple physical space, but becomes an active entrepreneurial subject (Schillaci and Gatti 2011) that is the source of not only material, but also immaterial resources (Sthor 1984) such as entrepreneurial propensity, cultural level, collaborative spirit, behavioural ethics, and aesthetic sensitivity.

Method

This study is based on an inductive approach. Through this approach, proposing specific cases allows one to attempt to draw more general considerations.

The research strategy consisted of two case studies. Italy has many areas that have distinctive characteristics of territorial identity. Through theoretical sampling (Patton 2002), we have chosen Bassano del Grappa (Veneto region) as the area of investigation and identified two historic companies that operate in the same industry (grappa) within that territory, and have contributed to the development of its territorial identity. The case-study companies are Ditta Bortolo Nardini Spa and Poli Distillerie Srl. Effort was made to integrate the (poor) existing literature with the uniqueness of the businesses' experiences to begin a theory-building activity (Eisenhardt 1989; Eisenhardt and Graebner 2007). It is believed that such unique businesses experiences offer significant insight into understanding the concept of territorial identity.

To collect data, we consulted secondary sources and conducted in-depth interviews with each of the businesses, as well as consulted their websites. The interview with Ditta Bortolo Nardini Spa was conducted in November 2013 with the external-relations manager, Marta Lazzarin, and for Poli Distillerie Srl, the entrepreneur Jacopo Poli and the external-relations manager, Lorna Geremia, were interviewed between May and June 2014. In both cases, the interviews were conducted in a semi-structured manner. The following two principal questions were submitted to the interviewees: 1) In your opinion, what are the fundamental elements that characterise the territorial identity of Bassano del Grappa? 2) What initiatives has your company activated locally to build and enhance the identity of the territory in which it operates? The duration of the interviews was 40 minutes each and the interviews were audio-recorded and later transcribed.

The results of the case studies are the basis for identifying the dimensions and determinants of territorial identity in this study.

Contribution of historical companies to the development of territorial identity

Before examining the case studies and the contribution that each company makes to the enhancement of territorial identity, it is necessary to clarify some aspects of the identity of Bassano del Grappa that emerged from the voices of the case-study companies.

Bassano del Grappa is a border town whose identity is closely related to the Brenta canal that runs through it. For centuries, the Brenta has been a crucial passage for the conquest of the plain cities by various invaders of the region. However, it has also represented an important means of connection with Europe. Bassano del Grappa has long been a land of conquest and the people of the town are aware of their limited forces, and therefore, have always desired a peaceful relationship of subordination with the different rulers so that there was an atmosphere that could be beneficial to the thriving traditional peasantry and artisan culture. Over the last four centuries, it has developed a variety of activities related to agriculture such as viticulture and grazing, as well as industry-related activities such as printing, woodworking, ceramics, wool, and the distillation of grappa.

"The old bridge, the castle, the squares, the beautiful palaces, the walls, the churches, make it a closed and also open citadel at the same time. People are industrious, but they don't forget the pleasure of life, they are prone to diplomatic mediation, but without byzantine malice, their minds are geared to international trade, but with their feet firmly on the ground" (interview with Jacopo Poli).

Bassano del Grappa is a vibrant town thanks to the many cultural events that animate it during the year, and its atmosphere that creates a sense of cordiality that is much appreciated by many visitors. Highlighting these traits of Bassano del Grappa's identity, which are closely related to those of the general area of Pedemontana Veneta

in which Bassano del Grappa is located, is intended to emphasise the features that are most relevant to the research objective for each case study.

Ditta Bortolo Nardini Spa

The story of the acquavite Nardini begins in 1779 when Bortolo Nardini opened his first distillery in Bassano del Grappa with an attached grapperia on the Ponte Vecchio, the old bridge designed by the architect Palladio that is the symbol of the town. Nardini is member of two prestigious associations that aim to preserve and enhance the cultural value of this historical company. The first is Les Henokiens, an international association of family and bicentenary companies (<http://www.henokiens.com>), and the second is Historic Place of Italy, an association that promotes the oldest and most prestigious establishments in Italian history (<http://www.localistorici.it>).

The history of Ditta Bortolo Nardini Spa has been marked by an alternation of periods of glory and prosperity, as well as periods of difficulty that the company has faced with a tenacity and passion that is typical of this area. The years of World War I presented difficult times for Bassano del Grappa, and were the sad scene of major battles. However, these years also marked the luck of grappa much appreciated by the soldiers at the front. After the war, the appreciation the people had developed for the taste and smell of brandy did not lose popularity, and spread among young people, becoming a symbol of Bassano del Grappa. World War II marked another difficult period for Bassano del Grappa and for the distillery, whose products were often confiscated by the German troops and United States Army. In addition, the retreating German army completely destroyed the Ponte Vecchio, which was subsequently reconstructed by the Alpini, the Italian Mountain Troops (<http://www.nardini.it>). The 1950s and 1960s brought a boom for the distillery, as there was an expansion of its admirers throughout Italy and in the world, which meant the company opened a second location in Monastier di Treviso.

The recipe of grappa remained unchanged over the centuries, handed down from generation to generation, although its production was modified with innovations that have improved its quality. This embodies the truth of Nardini's mission: 'innovation in tradition'.

This outline of the company history serves to identify some aspects of the corporate life through which the Nardini distillery contributes to the development of the identity of the territory in which it operates. In particular, Nardini's actions in support of the identity of Bassano del Grappa can be characterised into four broad areas: 1) communication; 2) architecture; 3) art; and 4) promotion of social and cultural events.

The aspect of the company's communication is exemplified by the logo of Ditta Bortolo Nardini Spa being the Ponte Vecchio of Bassano del Grappa, the place where is located also the company's grapperia. The Ponte Vecchio is the symbol par excellence of the town; it is synonymous with the culture, history and architecture of the area and is an important source of tourism attraction. Ditta Bortolo Nardini Spa's action within this territory is also important in architectural terms because of the design and realisation of the Bolle building. This building represents a significant contribution of the Nardini family to Bassano del Grappa's contemporary architecture because the family commissioned the architect Massimiliano Fuksas in 2004 to create this building to celebrate the 225th anniversary of the company. This building was also created to extend the awareness of the world of distillates and liqueurs: the interior of the building hosts a research laboratory and a quality-control centre, as well as an auditorium in which to receive customers and an ever-growing number of visitors. In addition to the desire to create a more functional research space, the Nardini family invested in this architectural structure to leave a sign of the value that can be left to future generations (Bonfanti et al. 2013). Ditta Bortolo Nardini Spa has transmitted a powerful message of the company's profound connection with its territory.

The Nardini family have also demonstrated special attention to and passion for art, creating Garage Nardini to unite the Nardini family's passion for contemporary art and the town of Bassano del Grappa. The Garage Nardini is a space in Bassano del Grappa created to present the creativity of artists from all over the world. The Nardini family also promotes culture and art by sponsoring and hosting dance festivals. Moreover, Ditta Bortolo Nardini Spa promotes many events, as well as national and international conferences, including Welcome to the Year 2050. The promotion of these events reflects the company's sense of responsibility towards the community in which it operates and is a representation of the company's particular attention to the social dimension of its activities.

The role of Ditta Bortolo Nardini Spa in promoting socio-cultural events should be emphasised in its role in creating the tradition of the meeting place by being an important destination dedicated not only to visitors but also, and primarily, to the people of Bassano del Grappa.

Poli Distillerie Srl

“Only roots that go deep into the land can give such an ethereal fruit as Grappa” (<http://www.poligrappa.com>).

A sense of attachment, deep love and knowledge of their territory characterises the Poli family for many generations. Over a period of five hundred years, the Poli family has moved three times, covering the distance of 18 km, from the native Gomarolo to Schiavon, a village of the Pedemontana Veneta, near Bassano del Grappa, where the family now lives and is current headquarters of the company.

The origin of the Poli history is GioBatta Poli who was a manufacturer of straw hats, and in 1892, the owner of an inn in Schiavon. GioBatta had a great passion for grappa, and chose to follow this passion by building a small distillery assembled on a handcart, going from house to house to distil marcs. During the two World Wars, the production of grappa was very fruitful, as the grappa was very pleasing to the Germans who supplied the distillery with the sugar needed to produce the liquor.

Since the 1980s, the new generation of the Poli family have joined the company, which has enabled a radical change. This change has been based on an awareness of the differences between past and present customers. While in the past the consumption of grappa was essentially the result of a local custom, now tasting grappa distilled is for consumers a sensory experience positively affecting their physical and spiritual well-being.

As such, today the Poli Distillerie Srl possesses an artisan character and ensures research on the quality of the distillate, which has led to it reducing by one-fifth the amount of grappa produced by previous generations.

The mission of the Poli brothers is to change the image of grappa around the world to create an image of a refined product that is a symbol of Italy such as cognac is for France and whiskey is for Scotland. The company is a member of two associations: the Unione Imprese Storiche Italiane, which includes national ultra-centenary companies with the aim of valorising Italian entrepreneurial heritage (<http://www.unioneimpresestoriche.com>); and the Museimpresa, which brings together Italian companies that have set up an their own industrial museum or archive (<http://www.museimpresa.com>).

This history demonstrates that there is a close connection between the Poli Distillerie Srl and its territory, not only with regard to its production, but also to the existence of a territorial rooting that reflects a pride of belonging to that territory.

Poli Distillerie Srl’s corporate action to support territorial identity is mainly developed in two directions: 1) ‘formative’ communication; and 2) the reappropriation of knowledge, memory and local culture, as well as the diffusion of the entrepreneurial culture.

The geographical aspects, the characteristics of identity, and the ‘soul’ of the ‘Poli territory’ are disseminated on a communicative level through means such as the company’s website. Table 1 provides a summary of the contents extracted from Poli Distillerie Srl’s online communication, which not only informs on issues related to the business and the local peculiarities, but also promotes cultural growth.

From this description of the territory emerges the initiative promoted by Poli Distillerie Srl named ‘Welcome to our Territory’, which refers to five actions to be executed to fully experience the area. Poli Distillerie Srl supports this project by offering a bottle of grappa to any person who provides testimony of having completed the entire path. As such, the visitor will come to appreciate the spirit of the territory to which the company belongs.

The five actions are the following: “1) to see at least one of the beautiful Palladian Villas, true jewels of the Vicenza province; 2) to cross the Old Bassano del Grappa Bridge, hand in hand with one you love, exchanging a little kiss of love; 3) to taste a glass of Torcolato wine accompanied by Asiago Stravecchio Cheese; 4) to play chess with living pieces on the large chessboard of Marostica’s Cheese Square; and 5) to climb with a bike up to Monte Grappa or, if you are lazy, go by car, it’s worth it” (<http://www.poligrappa.com>).

TABLE 1: THE “POLI TERRITORY”

This is a land of culture, one that welcomes lovers of beauty to admire the elegant Veneto Villas designed by Palladio, the paintings of Jacopo da Bassano and Giorgione or the sculptures of Canova;

a land with a long memory, accompanying those who have the time along the paths of the Great War that left its mark on Mount Grappa and the Pasubio;

a land that never stays idle, and likes to sing the praises of those craft industries that have allowed the Veneto economy to flourish;

a land with good taste, ready and willing to pull up a chair for those with an appetite for wines and dishes that have earned their rightful place in Italy’s food and wine culture.

Each activity expresses the tradition and the culture at the heart of the Veneto region, that is, the Pedemontana Veneta area that includes Bassano del Grappa. By promoting such activities, the company underlines how its undertakings cannot be separated from its territory.

The second aspect in which the company demonstrates its great investment in its attachment to the territory and its passion for its product is the reappropriation of knowledge, memory and local culture, and the diffusion of entrepreneurial culture.

The company has also established the Poli Grappa Museum in two locations. One is in Bassano del Grappa, and deepens the research on the history of distillation and the diffusion and exploitation of the Italian grappa. The other is in Schiavon, and presents the evolution of the Poli family, a typical family of Vicenza, representing entrepreneurship in the north-east of Italy. These museums also organise various cultural and educational events for the community to witness the traditions and social dimension of local distillation. In addition, the Poli Distillerie Srl is always open to visitors who want to learn about and see the production process. Jacopo Poli also conducted research on the history of distillation (Poli 2014), which provides an important example of how it is possible to exploit a particular tradition of the Pedemontana Veneta area and Bassano del Grappa territory in particular.

Dimensions and determinants of territorial identity: a conceptual framework

By integrating literature analysis with information offered by the companies considered in this study, we propose a conceptual framework to capture and explain the concept of territorial identity. It especially highlights what companies can develop at the local level in order to improve territory-identity.

They can contribute to creating territorial identity by means of four dimensions: 1) physical dimension; 2) social dimension; 3) emotional-spiritual dimension; and 4) local-attractiveness dimension. These dimensions are closely connected along a continuum that defines the territorial-identity concept (see Figure 1).

The physical dimension is an expression of tangible elements that are localised in the territory in such a manner that the territory can be considered unique and special in relation to the local elements. The principal determinant explaining this dimension is 'local embeddedness', which refers to the constant and continuous physical presence in time and on the same territory of local actors and the production and selling of local artisan products.

The social dimension includes the relational proximity. It concerns the enhancement of relationships between local actors and stakeholders, even outside the territory. This means creating opportunities for cultural enrichment, as well as for promotion and enhancement of local resources. Such relationships contribute to developing entrepreneurial projects of territorial growth from the socio-cultural perspective.

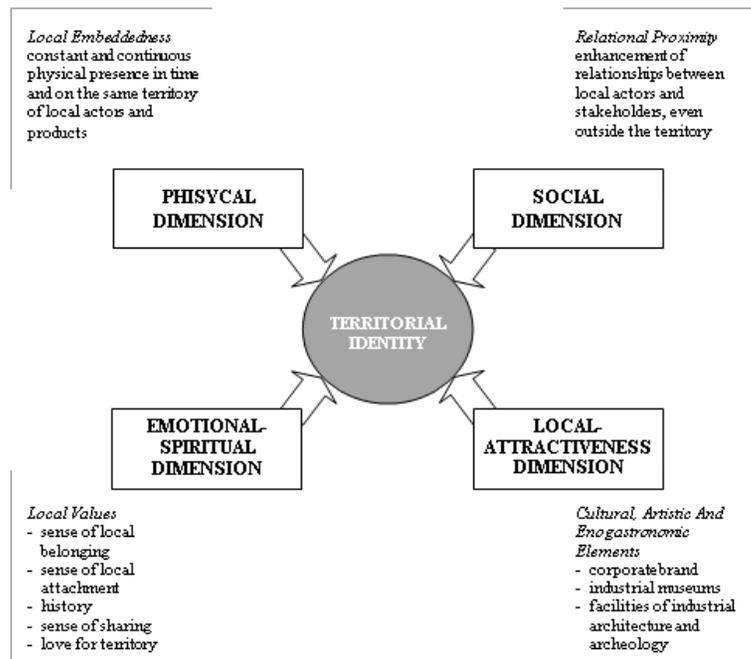

FIG. 1: CONTRIBUTION OF COMPANIES TO THE TERRITORIAL IDENTITY: A CONCEPTUAL FRAMEWORK

The emotional-spiritual dimension, as the name suggests, refers to the emotional and spiritual elements of a territory such as its fundamentally local values that stakeholders develop in time by means of history, traditions, customs and close relationships amongst them and with the territory. This involves a sense of local belonging, attachment and sharing, which can be synthesised in a ‘love for the area’ in which one lives and works.

Finally, the local-attractiveness dimension of territorial identity is the result of historical, cultural, artistic and enogastronomic elements that characterise a territory. Such elements include bridges, castles, squares, buildings, walls, churches, and culinary specialties. Companies can contribute to developing this dimension by creating socialising opportunities in the territory that accommodate a number of art forms (e.g., literature, cinema, music and dance). Several other possible entrepreneurial actions aimed at developing territorial identity are creating a corporate brand, industrial museums, and facilities of industrial architecture and archaeology.

This territorial-identity concept may bring to mind some characteristics of the Marshall’s districts but Bassano del Grappa territory is not a district. It doesn’t have all the traits of a Marshallian district such as territorial aggregations of small and medium-sized firms, presence of widespread entrepreneurship, endogenous process of innovation, monocultural configuration of local area (e.g., Lorenzoni 1979; Varaldo 1979; Panati 1980), and industrial atmosphere (see Marshall 1980). Essentially companies localised in the same geographic area act in order to contribute at creating and developing territorial identity because they live in and love that territory. If they choose not to invest more also in one of above mentioned dimensions, they may warp territorial identity created.

Conclusions, limitations and directions for further research

This study highlights how territorial identity is a concept that has received very little attention from researchers in the business-management field. The analysis made in this study can contribute to extending knowledge of territorial identity in three manners: 1) it clarifies the concept of territorial identity; 2) it presents two Italian business cases that

capture useful actions for creating and developing territorial identity; and 3) it proposes a conceptual framework that offers a foundation for future research by outlining the dimensions and determinants of territorial identity.

This analysis is an attempt to examine the territorial-identity concept, and offers a number of considerations that cannot be generalised: the subjectivity of the choice of the sampling and the selection of the territory (and companies) mean further study is necessary. In addition, this work considers exclusively the companies' perspective, but territorial identity is the result of the thoughts and actions of all local stakeholders. As such, future research should extend the analysis by considering the perspective of the wider group of stakeholders.

Therefore, this study, which is exploratory in nature, is subject to future developments and applications. Future lines of research could gather around two major themes. One concerns the development and subsequent testing of the conceptual framework proposed in this study. The other is to explore a number of new research perspectives.

The model presented lends itself to being implemented with other cases studies in other territories to check the dimensions and determinants proposed in this study, and find possible variables that would be useful for in-depth analysis. This framework can also be empirically tested in the future. The analysis of the literature and the conceptual framework are preparations for submitting items to group in subdimensions that can identify territorial identity.

Another promising area for further research is the analysis of the actors that contribute to creating and developing territorial identity. By means of a social-network analysis (e.g., Anzera 1999; Knoke and Song 2008; Scott and Carrington 2011), it is possible to conduct an ego-network-centered study to identify key stakeholders that are strategically fundamental for creating and developing local identity. It would also be possible to identify other actors such as those that are isolated (i.e., their participation in the network is irrelevant); pendant (i.e., the actor is 'hooked to the network' by a single relationship); bridge (i.e., the actor connects two subgroups); and gatekeeper (i.e., the actor creates relationships between a subset and the outside of group within the network). In addition, it is useful to calculate the indicators of (local and global) centrality to assess the territory's actors that have further connections with other stakeholders, and network density to understand the general level of relationships.

In addition, as competition exists not only between companies but also between local areas (Maizza 2013), it would be interesting to examine how territories, and their local actors, can develop their identity to compete more effectively in business.

Does communication support intangibles? Empirical evidences on Monza and Brianza' SMEs.

Abstract

Intangibles are becoming increasingly important to enterprises for their growth, especially for SMEs, which play a vital role in Italian economic development. This is mainly due to a highly competitive business environment where resources are limited and knowledge is often seen as a commodity. This makes it difficult for firms to differentiate themselves over their competitors, where intangibles became the main drivers for competitive advantage.

This research tries to provide empirical findings on the role of communication developing intangibles assets, with a focus on the SMEs of the territory of Monza and Brianza. Through a quantitative analysis on 886 SMEs, we developed a PCA on the variables of communication objectives and tools, in order to represent the graphical distribution of respondents with respect to their use of communication.

The added value of the research concerns the significant empirical evidence to the how and why for SMEs when implementing their communication strategies.

Introduction

Since 2008, the significant transformations of business environment have been observed. The international economic context has dramatically changed and the effects of the economic and financial crisis are still affecting the world economy. As a direct consequence, enterprises are facing increasing difficulties in borrowing money from the bank system: this forces firms to finance new projects or activities with their own resources. Moreover, according to OECD, access to credit continues to be one of the most significant challenges for the creation, survival and growth of enterprises, in particular of SMEs (OECD, 2009).

Furthermore, the current social, technological and economic situation offers to firms new communication means that allow a quick interaction and dissemination of information and, therefore, contribute to a significant reduction of the competitive lead time: nowadays it is possible to know strategic and operational plans almost in real time. In addition, while ICT sector's revolution allowed customers to access products and services all over the world and put enterprises in a global competition, there are some evidences that physical proximity and localisation have become less important (Chiarvesio, Di Maria, & Micelli, 2004).

In such a difficult situation, in order to stand out among the competitors, enterprises are required to differentiate their offers and grant activities that deliver greater profitability (Gadeikiene & Banyte, 2013).

Particularly SMEs suffer from the general pressure towards change capability brought by dynamic competitive scenario. According to IFAC survey results, 29.4% SMEs in the European Union find the economic uncertainty as the highest business trial, even though when compared to larger firms, SMEs can be competitive thanks to their reactivity to the market's expectation, their flexibility and their commercial skills (Zager, Sacer, & Decman, 2012).

At the same time, due to their lack of funds and means, SMEs have to pay particular attention in managing resources and tools effectively and efficiently. Otherwise, in order to defend their competitiveness, in a long-term perspective, and keep on satisfying their customers. Referring to competitiveness, intangible assets play a crucial role for SMEs.

In fact, as Maritan and Schnatterly suggested, the rapid expansion of goods and factors markets has left intangible assets as the main basis of competitive differentiation (Maritan & Schnatterly, 2002). Business performances are no longer driven by physical capital but by intangible capital, such as knowledge, people, reputation and systems, which are harder to imitate. Being the environment characterized by growing competition and continuous change, intangible assets do also emerge as fundamental economic factors.

Currently, firms are looking for new success factors (Malmelin, 2007) and for this reason intangibles are becoming increasingly important. Many scholars defined intangibles as the key resources for the generation of firms' value, because of their peculiarities such as high barriers to competitive duplication, scalability and increasing scale return (Barney, 1991; Galbreath & Galvin, 2008; Galbreath, 2005; Lev, 2001).

In the current competitive environment, relying on intangibles is necessary but not sufficient for firms to survive, especially for the small and medium sized ones. Thus, intangible resources represent only a potential asset for value creation and they have to be managed having in mind their creation, development, and improvement (Veltri & Nardo, 2013). For sure, in this process communication is an integral part of the organization's management, which includes building and increasing the company's intangible assets (Malmelin, 2007). As a result, the main objective of communication is to create value for all the enterprise's stakeholders (for instance its customers), and can influence tangible and intangible long-term financial results and give benefits to the society as a whole.

In light of what we have shown, the aim of this study is to provide empirical evidence on the role of communication for SMEs, in order to understand if it improves their intangible assets, and how it is managed from the point of view of objectives and tools. The first part of the paper consists in a literature review of intangibles and communication subjects. The second part exposes the methodology and the findings of the survey we conducted on a large sample of SMEs operating in Monza and Brianza province, which is one of most significant industrial area in Italy, and the quantitative analysis we performed on the data. In the third part, we present conclusions and managerial implications.

Literature review

Intangible assets

For some scholars firm's profitability is progressively shifting towards intangible assets, with less attention on production, materials management, inventory management and distribution systems (Schultz & Kitchen, 2004). Consequently, firms pay more attention on intangibles which are the most likely to leave a mark on corporate competitiveness.

As for the definition of intangible assets, many theoretical contributions lead to a proliferation of classifications and categorizations without getting to a universally accepted and shared definition (Kaufmann & Schneider, 2004). In short, no consensus on one set of terms and definitions is obvious.

In particular, the most common and diffused definition is due to Edvinsson and Malone contribution, who describe intangibles as "those assets that have no physical existence but are still of value to the company" (Edvinsson & Malone, 1997). In general, among the various interpretations we can find some common peculiarities such as immateriality and valuable resource that brings long-term benefits to the firm (Bontis, Dragonetti, Jacobsen, & Roos, 1999; Fasb, 2001; Funk, 2003; Gu & Lev, 2010; Lev, 2001). As a consequence, the organization's intangible assets refer to everything else apart from its concrete material assets that constitute sources of economic value and are less flexible, hard to accumulate and not easily transferred (Carmeli & Tishler, 2004). In addition, many authors concentrated their studies on a specific intangible assets category and its management, such as creativity, knowledge, employee competence, reputation and relational capital (Granstrand, 2000; Michalisin, Kline, & Smith, 2000; Sanchez, Chaminade, & Olea, 2000).

Despite the considerable amount of definitions, the literature seems to be oriented towards providing information on intangibles and methods of measuring them, such as innovation, quality, customer relations, management capabilities, alliances, technologies, brand value, employee relations and environmental and community issues (Hartman & Lenk, 2001). Consequently, the literature review concentrates on those approaches that gain and provide information on intangibles but fail in describing how to use and manage them (Kaufmann & Schneider, 2004). Nevertheless, it is generally acknowledged that if managers find a way to estimate the value of their intangible assets, they could measure and manage their competitive position of their firm much more easily and accurately (Kaplan & Norton, 2004).

Communication

In the actual competitive context, the role of communication is gaining significance especially if related to intangible assets. As a result, enterprises can succeed thanks to the ability to communicate with shareholders and stakeholders, and to convince them about their strategies and activities too. Therefore, the ability to communicate becomes one of the most important tool for achieving competitive advantage. On the other hand, because of the "communication revolution" which is characterised by globalized media and popularity of the Internet, accessibility to information is reflected in the increased interest of various stakeholder groups in enterprises' operations (Figiel & Szromnik, 2012).

Clearly, information flows influence the business performance of a firm. In fact, communication creates brand awareness and permits to understand customers' behaviours in dynamic markets (Day, 2000; Gounaris, 2005; Rust, Ambler, Carpenter, Kumar, & Srivastava, 2004; Sawhney & Zabin, 2002; Vlosky, Fontenot, & Blalock, 2000). The function of communication is central to the enterprises' survival, because it allows growing transparency and clarity, reaching a wider audience of actual and potential stakeholders, and finally, meeting the information needs of different groups of stakeholders (Adams & Frost, 2004). Indeed, by communicating the sources of a firm's intangible capital, an organization can influence the behaviour of its constituents and then its business outcomes (Hartman & Lenk, 2001).

Both in academic studies and in practice, we can refer to different objectives of the communication function: financial report results to external audiences achieve a strategic alignment of the goals of the whole organization, coordinate initiatives, create consensus between institutional stakeholders, or make customers aware about the values of the enterprise and its products and services. The literature review suggests a first broad distinction between internal and external audience, while a second and more precise one classifies communication in relation to the beneficiary of its actions in four forms: marketing, institutional, economic and financial and, finally, organizational communication (Pastore & Vernuccio, 2008).

As a consequence, we can notice that when we refer to the subjects of communication and intangibles, the two most cited forms of communication are the organizational and economic and financial ones. Indeed, the discussion of intangibles is completely different when information is needed for internal or external stakeholders (Heisig, Vorbeck, & Niebuhr, 2001)

In the case of organizational communication, knowing that internal missing information of intangibles can lead to a misallocation of resources, enterprises try to build task forces, corporate meetings and management transfers in order to facilitate information flows between corporate headquarters, subsidiaries and colleagues (Maritan & Schnatterly, 2002). Specifically, the intangible assets dealing with organizational communication are human capital, information capital and organization capital (Kaplan & Norton, 2004). In details, human capital indicates the skills, talents and knowledge that a firm's employees possess; the information capital involves the enterprise's databases, information systems, networks and technology infrastructures, while the organization capital concerns culture of the firm, its leadership and how it aligns its collaborators on its strategic goals. Therefore, the purpose of internal communication is to coordinate the whole organization in terms of culture and objectives, in order to create value for stakeholders. As Argenti says "communication is the key to get employees to become more productive and the interaction gives to the management more credibility with employees" (Argenti, 2012).

Instead, economic and financial communication aims to provide information on intangibles to potential investors with the aim of creating advantage in the competition for capital. Indeed, analysts adopt financial and non-financial measures to evaluate enterprises, including also intangible assets as effective predictors best of the enterprise's future performance (Hartman & Lenk, 2001).

To make intangibles visible to external stakeholders and create value for the firm, a large number of models and indicators referring to growth, renewal, efficiency and stability, have been developed (Chiucchi, 2004; Sveiby, 1997). Particularly, through economic and financial communication enterprises sort out information about their social and environmental impacts on the society (Gray, 1996). Even though the debates on this topic are numerous, scholars did not reach a common solution to the problem of measuring and reporting intangibles, yet.

In this paper, when we talk about communication, we indicate the specific form of marketing communication, namely that activity which tries to influence people's life in every dimension (Patanaittikul & Ongkrutraksa, 2011). Specifically, the objective of marketing communication is to credit the firm's brand image and reputation and enhance the value of its offer in the eyes of current and potential customers (which stands for the promotion level of marketing mix).

Methodology

The purpose of this paper is to sort out empirical evidences on the role and importance of marketing communication for on Monza and Brianza' SMEs in terms of objectives, strategies and tools. Specifically, the province of Monza and Brianza is situated near Milan, in Lombardy region, and it is one of the most important Italian industrialized

areas. In fact, in this territory we can find an extremely high concentration of firms, which contribute to the national GDP significantly. In particular, Monza and Brianza's industry is composed by 15.170 SMEs, which represent approximately the 83%¹ of the firms located in this area. As the European Commission suggested, SMEs should be considered "the backbone and the lifeblood of Europe's economy" (European Commission, 2007), and the composition of Italian, and Brianza, industry supports this argumentation. Moreover, particularly in the Italian economy, small and medium enterprises play a very important role: in fact, as pointed out in many academic studies, they represent about the 90% of the Italian business (Cillo, Ricci, & Landi, 2010). In addition, we can consider that Italy is fully populated by a large number of family-run firms, which focus their competitive edge on Made in Italy, craftsmanship and quality. Further, their economy is historically based on traditional sectors, which are not as capital intensive as those technology-based sectors are. For these reasons, we can assume that SMEs are the pillars of our national economic system.

In order to afford an accurate picture of the strategies and perspectives of Monza and Brianza's firms, related to the role of communication in developing intangible assets, we conducted a quantitative analysis. In particular, the survey instrument was a multiple-choice questionnaire sent to 886 SMEs of Monza and Brianza province, which belong to the database of the industrial sector's association, Confindustria Monza and Brianza. The survey period has been carried out from October to December 2013. The inquiry was sent via e-mail to the enterprises and the response rate was 21.8%. More precisely, we used the CAWI method which allowed us to achieve a redemption rate of 193 firms. In line with the business connotation of the province, the sample is composed for the 90.7% by SMEs, specifically by those enterprises which have a turnover of less than 50 million euro. More accurately, 72.4% of the respondent firms have a turnover which is lower than 10 million euro. The average age of the firms is about 33 years, and this indicates their health and longevity. Moreover, the most represented industry in the sample is engineering, followed by the tertiary sector and manufacturing, which incorporates chemical, textile, wood and furniture sectors. In addition, the core business of the enterprises refers for the 58.3% to production activity, for the 12.9% to commercial activities and for the 23.7% to service activities.

Our research is encompassed in a wider analysis of the enterprises of Monza and Brianza province, the "Osservatorio Impresa Monza e Brianza 2013", which takes into account a broad spectrum of topics. In fact, starting from some questions focused on anagraphic data, the questionnaire continued studying the commercial and communication organization, the internationalization, the access to credit, and the relationships between firms and banks. Due to the aim of our research, we concentrated our attention on the questions concerning of communication marketing, its objectives and tools.

The data we gathered were processed through the Principal Component Analysis methodology, because of its property of dimension reduction and factor analysis (Jolliffe, 2002). Through this multivariate statistical method, we could reduce the initial massive matrix of data and find two variables, one for each research terms, which retain most of the variation present in all of the original variables, with little effect on the results obtained (Zani & Cerioli, 2007). In conclusion, we could explain the approach towards communication with two principal components.

The first step of our study was the data cleaning, in order to take into consideration just those enterprises that completed the questionnaire totally. Secondly, we implemented the Principal Component Analysis adopting the software SPSS Statistics 20, both for the variable of communication objectives, and both for the variable of communication tools. This procedure supported us in identifying which variables were the best and the worst ones described by the first principal component of each question. In this way, we pointed out four edges for a Cartesian coordinate system, which is useful for the interpretation of the firms' graphical distribution. In a third phase, we elaborated the graphical distribution of the enterprises through their factor scores related to the first principal component of communication objectives – the x-axis – and the first one of communication tools – ordinate axis. The fourth and last phase was dedicated to match the graphical distribution with anagraphic data, specifically, age, turnover, type of activity, sector, type of management and target of communication. In this way, we tried to point out some further empirical evidences about the how's and whys of the strategic role of this function supporting intangible assets.

Empirical evidence

In order to understand which objectives and means of communication Monza and Brianza's firms take into account to develop their intangible assets and to reach a competitive position, we decided to use the PCA methodology. This choice was validated by preliminary checks we executed on the data set, in order to test if it presented the appropriate characteristics for using this statistical technique. In both cases, the results were supportive. In fact, the value of the KMO measure of sample adequacy for this set of variables was acceptable. Both the questions reached 0.70's (0.706 for objectives and 0.762 for tools), which can be labeled as "middling values". Therefore, the KMO test meets the minimum criteria analysis required to develop the PCA methodology. Moreover, the Sig. value, which figured out as 0.000, allowed assuming that the data set was appropriate for factor analysis.

In particular, due to our research's need, we considered that the best way was to intersect the principal components in order to analyse the subsisting relationship between the objectives and tools of communication. As depicted in Fig. 1, the analysis showed that, with respect to the objectives, on the x-axis there are two firms' opposite propensities. On the left side, there are the enterprises which are inclined to concentrate their efforts on developing tangible aspects of communication while, on the right side, there are those ones that direct their efforts towards improving the intangible aspects of their offer. Next, we proceeded to repeat this evaluation for the communication tools. On the top of the ordinate axis, there are means with orientation to create an active interaction with stakeholders, whereas at the bottom side there are the ones that do not require user interaction.

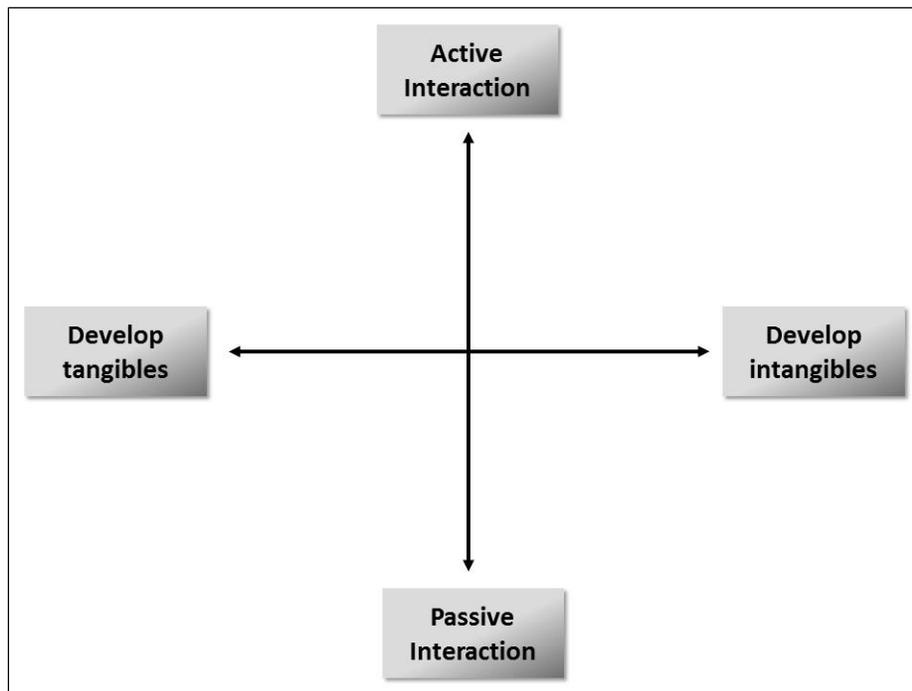

FIG. 1

In the successive step, we generated the graphical distribution of Monza and Brianza's SMEs, employing their factor scores of the two first principal components as the coordinates of the Cartesian plane. Fig. 2 shows the graphical distribution of the firms.

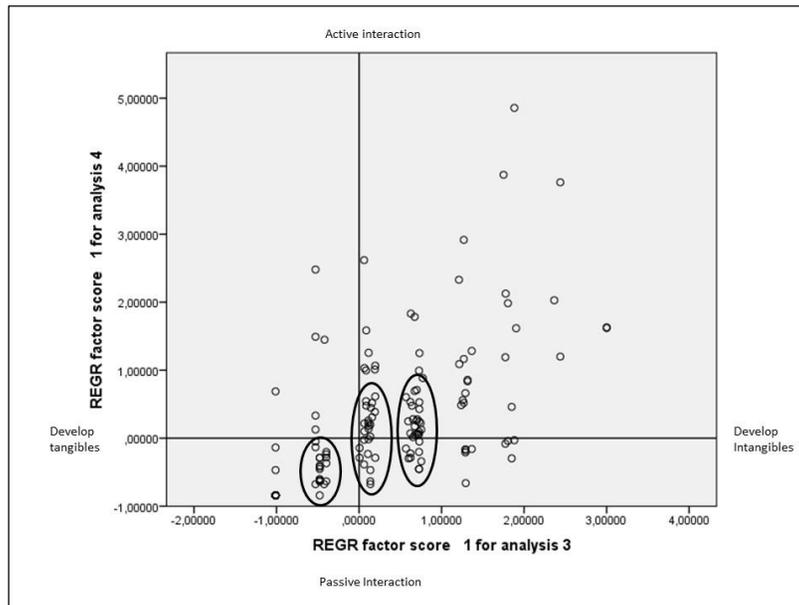

FIG. 2

In the picture, it is possible to identify some peculiarities. The primary observation is pertinent three particular groups where the SMEs of Monza and Brianza province are concentrated. The first group takes a clear position in the third quadrant of the Cartesian axes. This means that all the enterprises in this position try to implement their communication activities in order to enhance the tangible aspects of their offer. Moreover, these goals are pursued through tools that do not involve an active interaction of the receivers. On the contrary, the second and the third group have a radical shift towards the right side of the graph. Specifically, the second group has a more stretched structure, which indicates a wider spectrum of instruments used by the firms. As the second group, the third one has a vertically spread structure but is even more shifted to the right, towards the enhancement of intangible aspects as main goal of communication.

Successively, with the aim of implementing a more accurate interpretation of the groups, we intersected anagraphic data with information related to the function of communication. Specifically, we took into account six different categories of information: age, turnover, activity, sector, management and finally, the communication target. In light of these matches, we can connote the three groups.

The first one is mainly composed by small-size enterprises (60.0%), with a turnover between two and ten million euro and a mean for enterprises' business experience of about 31 years. Referring to the sector, the analysis showed a strong heterogeneity, thereby not allowing identifying a specific prevalence: in fact, the enterprises of the first group are characterized by production activity and work in fields as energy, health and chemical. Moreover, the firms are family-run. The communication of these enterprises seems to be oriented to contact a business customer base (73.0%) with the aim of enhancing the tangible aspects of the offer. In addition, the most used tools are traditional, such as catalogues (60.0%) and institutional website (33.3%), which are instruments that do not require a high level of interactivity with the audience.

The second group contains micro (31.8%) and small sized (40.9%) firms, and it is the oldest one because it is composed by enterprises with an average business experience of 42 years. Firms that belong to this group are characterized mainly by production activities (63.6%) and operate in the tertiary sector (18.2%). Within this group, there are principally family-owned enterprises (68.2%), which address their communication initiatives to several recipients: business customers (59.1%), consumer (40.9%), and agents and intermediaries (40.9%). The communication of firms in the second group pursues a broader set of objectives than the first group. In fact, in addition

to the description of the offer, the communication is used to enhance both the corporate brand, and both intangible aspects of the offer. Also, with regard to communication means that are used by these enterprises, there is an extension of the instruments: not only corporate website and catalogues, firms signal also after-sales support (36.4%), editorials and events (27.3%) and online advertising (18.2%).

The third group consists of micro enterprises (54.2%), mainly with a turnover lower than two million euro. This is the youngest group, with an average for enterprises' business experience of about 28 years. Unlike the previous groups, firms that belong to this one are involved both in production (45.8%) and both in service activities (33.3%). Another difference that comes out from the figures is that there is not a prevalent corporate form: in fact, in this group we can find both family-run firms and enterprises with managerial running (45.8% for both)². In this group the enterprises are mainly engaged in the engineering sector (33.0%), while the main target of their communication activities is business customer (87.5%). Furthermore, as we can see from the position to the right on the graph in Fig.2, the enterprises belonging to this group, pursue objectives of creating relationships, brand enhancement and development intangible aspects of their supply (41.7%) through communications initiatives. The means used to better achieve communication activities are the catalogue (75.0%) and the institutional website (62.0%). However, the set of tools used by respondents in this group is very broad and it includes PR and events (37.5%), sponsorship and indexing on search engines (25.0%), after sales service and online advertising (20.8%), social networks and direct marketing (16.7%).

Conclusions and managerial implications

The purpose of the present paper is to find empirical evidence on the role of marketing communication supporting intangible asset within the strategies of SMEs.

The first observation we have to make is that the relationship between communication and intangibles appear to be closely related to the number of instruments used. In fact, the more enterprises desire to give a strategic connotation to the function of communication through the enhancement of intangible resources, the more the spectrum of tools used increases.

Furthermore, it seems to exist a strong relation between the goals of enhancing intangibles and the tools used. In fact, the most interested firms in the development of tangible assets do use a limited number of instruments. In addition, among these there are only tools that do not require active interactions of the recipients (catalogues and institutional website). Indeed, we can notice that the second quadrant of the Cartesian plane is almost completely empty. This suggests that small and medium-size enterprises of Monza and Brianza province, which project their communication efforts in order to enhancing tangible features of their offer, do not adopt highly interactive tools. This issue demonstrates the link between the communication objectives geared to increase the value of intangible aspects and the number and the type of instruments they used.

On the other hand, enterprises wishing to exploit their intangibles do not give up these tools but they enrich their media mix with modern tools that require receivers' active interaction. These outcomes are in line with Figiel and Szromnik results which point out that such a situation is the more paradoxical because in our times there is an increasing pressure on interactive communication, dialogue and personalization. Indeed, the growth of interactivity in the communication process is undeniable and forces enterprises to change the methods of communication. This does not imply that the traditional unilateral ways of communication such as advertising, direct marketing or traditional unilateral PR will be entirely dropped (Figiel & Szromnik, 2012).

Finally, it is necessary to emphasize the relationship between the type of management and the objectives that are pursued. In fact, mainly family-owned firms (53.3%) and an orientation that brings the firms developing primarily tangible assets characterize the first group. In contrast, group number three is distinguished from the first one because of some characteristics and different objectives. Although they are prevailing micro-enterprises, in many cases they are managerial-run (45.8%) and they pursue objectives related to the enhancement of their intangible assets. On a closer analysis, it is fair to say that the family-managed enterprises are not absolutely bound to the use of traditional instruments with a low interactivity of customers, and that this type of management does not affect the strategic communication objectives.

Limits of the research and future developments

The analysis presents some criticalities and limits. In particular, the limitations of this research refers to the relatively small sample of the firms that participated in the research and returned fully completed questionnaires.

Moreover, although the quantitative method provides a statistically significant contribution for the analysis of intangibles, we are looking for developing a qualitative research that would be favorable useful to produce empirical evidences of how communication influences sustainability and performance when related to intangible assets. In future research, we would like to consider vendors in the analysis of communication, as they play an important role in marketing activities of small and medium-sized enterprises (Pencarelli & Cioppi, 2013).

The Relationship between Brand Equity and Country of Origin from the Retailer's Perspective: A Literature Review

Abstract

Despite extensive body of marketing literature research on brand equity (BE) and country of origin (COO), extant research has primarily investigated these two constructs from the consumer perspective, rarely focusing on that of the retailer. Empirical research have demonstrated that both brand equity and COO influence consumers' evaluations and purchase decisions, while limited attention has been paid to their relationship and influence in the retail context in general and, in particular, on the retailers' attitudes. Based on this, the purpose of the paper is to provide a critical discussion of the fragmented literature on the relationship between brand equity and country of origin in this specific context. Through a review of the extant literature, the paper aims to provide a contribution to overcoming the knowledge gap in this research field and to propose some insights for future research directions.

Introduction

Brand represents one of the main intangible assets of a firm, which embodies its history and undoubtedly creates added value for both producers and customers (Aaker, 1991). In fact, *"a product is something that is made in a factory; a brand is something that is bought by a customer. A product can be copied by a competitor; a brand is unique. A product can be quickly outdated; a successful brand is timeless"* (King, cited in Aaker, 1991, p.1). Although brand value has been thoroughly studied in marketing literature, it focuses predominantly on consumers with limited consideration to the inter-organizational aspects and in particular to the retailers. As a result, the role of manufacturers' brands for retailers is not yet well understood because of the mistaken assumption that brands are relevant only to consumer relationships, and not to resellers (Glynn et al., 2007). However, changes in retailing (distribution consolidation, internet retailing and the creation of buying groups) have made it more difficult for manufacturers to manage their brands. Consequently, many authors recognize the existence of brand equity in the retail context, while extant research remains yet limited (Webster, 2000; Baldauf et al. 2003, 2009; Davis and Mentzer, 2008; Tran and Cox, 2009, Glynn et al. 2007, 2012). In other words, we know little about retailers' perceptions of brand equity.

Country of origin (COO) construct, as well as brand equity, has received large attention in marketing literature. As known, COO impacts on consumers' perception and behavior through the image of the product's country of origin. Moreover COO is recognized to be linked to the equity of a brand, since *"country or geographical location from which the product is seen as coming from may generate secondary associations"* (Keller, 1993). Despite a large body of research on COO and brand equity respectively, literature combining these two constructs is very limited (Pappu et al. 2006, 2007; Yasin et al., 2007), especially in the retailing context (Baldauf et al., 2009). Most research have analyzed relationship between certain dimensions of brand equity (perceived quality and brand image) and COO, producing an incomplete understanding of this relationship.

Considering this gap, the intended contribution of this paper is to investigate the relationship between manufacturers and retailers, focusing on manufacturers' brand equity as perceived by retailers, and COO as a valid antecedent able to positively affect brand equity. Through a literature review on the two constructs, the authors aim to highlight the main studies on this research stream, paying particular attention to the retail context. The authors also propose some insights for future research directions, given that at present a complete comprehension on this theme does not exist.

Brand Equity from the Retailer's Perspective

In this section of the paper, the authors analyze the main existing research on brand equity construct. The aim is to highlight how brand equity has been studied and measured in the marketing literature, what are its main dimensions, antecedents and consequences, and how brand equity could be studied from the retailers' perspective.

Brand Equity Construct

Starting from the 1980s, the concept of brand equity (BE) has received considerable attention in academic research and has been explored from both the firm's and the consumer's points of view (Aaker, 1991; Farquhar, 1989; Kapferer, 1992; Keller, 1993; Blackston, 1995; Nguyen and Nguyen, 2003; Pappu et al., 2005). However, no agreement exists regarding what brand equity is and, more importantly, how it should be measured (Yoo et al., 2001, p.1). Winters (1991, p.70) states that "There has been a lot of interest lately in measures of brand equity. However, if you ask ten people to define brand equity, you are likely to get ten (maybe 11) different answers as to what it means". Since then, a large number of studies have been published, which define BE from a number of different perspectives, and for a number of different purposes (Keller, 1993). As result, the literature on brand equity, although substantial, is largely fragmented and inconclusive (Christodoulides, de Chernatony, 2010, p.44).

One of the most popular definitions, widely accepted in the branding literature, is that by Aaker (1991). He defines brand equity as "a set of brand assets and liabilities linked to a brand, its name and symbol, that add to or subtract from the value provided by a product or service to a firm and/or to that firm's customers" (p.15). In this model, the author identifies five conceptual dimensions of brand equity such as brand loyalty, brand awareness, perceived quality, brand associations, and other proprietary brand assets. Keller (1993), instead, defines consumer-based brand equity (CBBE), at the individual level, as "the differential effect of brand knowledge on consumer response to the marketing of the brand" (p.2). According to this definition, a "brand is said to have positive (negative) customer-based brand equity if consumers react more (less) favorably to the product, price, promotion, or distribution of the brand than they do to the same marketing mix element when it is attributed to a fictitiously named or unnamed version of the product or service" (p.8). Consistent with the associative network memory model, Keller identifies brand knowledge as the key antecedent of CBBE, which can be decomposed into two separate constructs such as brand awareness and brand image (associations).

As regards the dimensions of BE construct, CBBE has been nearly always represented as a multi-dimensional construct consisting of various concepts, most of which are qualitative in nature. In particular, we can identify the dimensions that combine both theoretical and empirical research: brand associations and brand image; brand awareness; brand loyalty; perceived quality and trustworthiness (Aaker, 1991; Farquhar, 1989; Kapferer, 1992; Keller, 1993; Lassar et al., 1995; Yoo et al., 2000, Pappu et al., 2005). Other concepts such as brand evaluation (Farquhar, 1989), brand personality (Kapferer, 1992; Blackston, 1995), and commitment (Martin & Brown, 1990) are used less frequently. Although Aaker (1991) and Keller (1993) conceptualized BE, they did not operationalize a scale for its measurement. Few empirical studies mention how to measure BE, focusing rather on the attitudinal aspects (brand awareness; brand image; brand associations; brand preference) compared to the behavioral ones. In line with Christodoulides and de Chernatony (2010), empirical research in this stream can be classified according to their approach to measurement (i.e. direct or indirect). Direct approach attempts to measure the phenomenon directly by focusing on consumers' preferences or utilities; while indirect approach measures BE through its dimensions. Although most of the empirical research are based on Aaker's conceptual definition, different findings emerge due to fact that the measurement of each component of BE is treated differently. As a result, the consensus on definition and measurement of CBBE has not yet been reached (Tran and Cox, 2009).

However, some efforts in this regard have been made, such those by Yoo and Donthu (2001) and Pappu et al. (2005). Yoo and Donthu (2001) develop a multidimensional measure of CBBE that is "reliable, valid, and parsimonious" (p.2), assessing its psychometric properties. The measure is developed using BE dimensions in accordance to Aaker (1991) and Keller (1993) (brand loyalty, perceived quality, brand awareness and brand associations). Data to calibrate and validate the scale were collected from three independent samples of American, Korean American and Korean consumers on three different product categories. Empirical findings identify ten items, which compose "multi-dimensional brand equity" (MBE) measure consisting of three dimensions of brand loyalty, two of perceived quality and five of brand awareness/associations. Unlike other empirical research, Yoo and Donthu (2001) note that brand associations and brand awareness should be combined due to a lack of discriminant validity (p.6); consequently these two concepts merge into one factor called "brand awareness with high associations". This aspect has been recognized as one of the main limitation of this work (Christodoulides and de Chernatony, 2010). However, Yoo and Donthu (2001) further developed a four-item direct measure of BE, which they labeled as "overall brand equity" (OBE) (p.11). A high correlation between MBE and OBE was found, validating the developed scale.

Pappu et al.'s study (2005) aims to enrich the measurement of CBBE due to the fact that the previous scales do not include some important dimensions such as brand personality. Unlike previous research, the scale constructed by the authors includes brand personality, which is considered a sub-dimension of brand associations and is expected to contribute to BE (p.145). Building on Aaker (1991) and Keller (1993), the research conceptualizes BE via four dimensions. Brand awareness concept is composed of both brand recognition and brand recall. Brand associations include brand personality, defined in terms of the various traits or characteristics that brands can assume from the perception of consumers (Aaker, 1991; Keller, 1993). According to Zithhaml's definition (1988), perceived quality represents the consumer's subjective evaluation of the product. Finally, the authors conceptualize brand loyalty from both attitudinal and consumer perspective. In line with previous research, Pappu et al.'s conceptual model proposes associative relationships among the four CBBE dimensions. The study was conducted on two product categories, including three brands for each one. Unlike in previous empirical studies, the sample was composed of actual consumers and not students (p.146). Initial survey was based on a pool of 19 items. After an exploratory factor analysis the items were reduced to 16, which served as indicator variables in the confirmatory factor analysis. Empirical results show five indicator variables for both brand associations and perceived quality, two indicator variables for brand loyalty dimension, while only one indicator variable for brand awareness (p.146). Although Pappu et al. (2005) achieve a distinction between the dimensions of brand awareness and brand associations, some limitations exist. Their confirmatory factor model operationalizes two of BE dimensions (brand awareness and brand loyalty) by one and two indicators respectively, making the psychometric properties of their scale questionable (Christodoulides and de Chernatony, 2010).

In regard to antecedents of brand equity dimensions, research have suggested that any marketing action has the potential to affect BE (Yoo et al., 2000). Some examples concern brand naming strategies, country of origin, company image (Keller, 1993); advertising expenditures, sale force, age of the brand, product portfolio (Sullivan, 1993); slogan, symbols and packages (Aaker, 1991). Yoo et al. (2000) conduct one of the empirical research in this stream and investigate the relationship between selected marketing mix elements and the creation of BE. Starting from Aaker's model, the authors develop a conceptual framework in which they place a separate construct, the overall brand equity (OBE), between the dimensions of BE (brand loyalty, perceived quality, and brand associations/awareness) and the value for the customer and the firm. They also add antecedents (price, store image, distribution intensity, advertising spending, price promotion) of BE, assuming they have significant effects on its dimensions (p.197). They specify the perceived marketing efforts as the exogenous constructs, which are selectively related to the three endogenous mediating constructs (BE dimensions), which are in turn related to the last endogenous construct (OBE) (p.204). Empirical findings suggest that marketing mix elements directly affect BE dimensions and, consequently, OBE (in this case the relationship is mediated by BE dimensions). Price has been identified as an important extrinsic cue and indicator of product quality. In addition, store image is highly correlated to product quality and brand awareness/associations. According to Simon and Sullivan's results (1993), the authors find a positive effect of advertising on BE. Finally, as expected, price promotions are negatively related to BE because, despite the short-term advantages, they could erode brand equity over time.

Finally, when it comes to BE consequences many authors support the view that a positive and strong product's BE creates value for the firm as well as for the customer. For example, favorable BE can determine a differential response by consumers; have implications for the pricing, distribution, and promotion activities related to the brand; generate larger margins and more inelastic responses to price increases; cause willingness to pay premium prices for the brand and willingness to seek out distribution channels for the product or service (Aaker, 1991; Keller, 1993). It also increases the probability of brand choice, marketing communication effectiveness, brand licensing and brand extension opportunities as well as decreases vulnerability to competitive marketing actions (Barwise, 1993; Farquhar et al., 1991; Keller, 1993; Simon and Sullivan, 1993; Smith and Park, 1992).

Brand Equity from the retailer's perspective

Branding theories and empirical studies in the retail context are very scarce, despite retailers or resellers are recognized as a type of B2B customer (Tran and Cox, 2009, p.132). Relationship between retailers and manufacturers is usually seen as conflicting for many reasons. Some of these address the increasing power of retailers, the development of their own private brands in order to differentiate them from other competitors, the potential rewards of increasing revenue

and profitability, as well as decreasing costs. On the other hand, in most consumer industries, the image of the retailer is created through the good image of the famous manufacturers' brands they sell. Moreover, retailers use manufacturer brands to generate consumer interest, to build store traffic and loyalty (Ailawadi and Keller, 2004, p.332). According to, Webster (2000) identify many obvious benefits offered by manufacturers' brands to retailers, such as established consumer demand, favorable consumer attitudes toward the branded products found in a store, and the credibility and image of the brand itself as enhancements of the retailer's credibility and image (p.18). He also stresses that the relationship between retailers and manufacturers should be a partnership, delivering value to consumers, because in the relationship among brands, reseller and consumers "the quality for any single player depends on the quality and strength of the relationship between the other two" (Webster, 2000, p.20). As a consequence, "the traditional ways of thinking about brands, which have largely left the retailers out of the equation, has resulted in an incomplete analysis of branding both from an academic and company perspective" (Webster, 2000, p.22). In this context, manufacturer of a branded product needs to recognize the important role of retailers, in order to build a strong brand: "first and foremost, the manufacturer must realize that its customer is the reseller, not the consumer" (Webster, 2000, p.22).

Baldauf et al.'s work (2003) represents one the first application of the study of BE from the retailer's perspective. The authors present an empirical study of CBBE theory within the context of organizations in the value chain. The purpose is to consider whether dimensions of BE are important antecedents in providing value (p.221). Based partially on Aaker's model and similar to Yoo et al. (2000), the authors focus on the separate dimensions of BE (brand loyalty, perceived quality, brand awareness) as contributing to performance. Performance measures are classified into two types, brand profitability performance and brand market performance, and are considered as the consequences of the BE model. Brand profitability performance is used as "an indicator of the financial contribution of a brand to the profit of reseller", while brand market profitability "refers to indicators such as sales volume and market share" (p.222). Additionally, customer perceived value is considered as an outcome of the model and is defined as "the consumer's overall assessment of the utility of a product based on the perception of what is received and what is given" (Zeithaml, 1988, p.14). The authors hypothesize that customer perceived value has a direct relationship to purchase intentions, which are in turn positively related to brand's market and profitability performances (p.225). Tile resellers located in Austria composed the study's sample. In line with previous research in the consumer context, findings suggest that the dimensions of BE are significant predictors of reseller performance measures, validating the applicability of the BE construct measures in the retail context.

In a following empirical research (Baldauf et al., 2009), the same authors broaden the analysis of BE in the retail context, evaluating antecedents of "retailer-perceived brand equity" (RPBE) and the effect of country of origin (COO) as a driver of RPBE (p.438). The purpose is to analyze how retailer perceived the equity of the brands they sell. Unlike the concept of retailer equity, Baldauf et al. (2009, p.439) define RPBE as "a set of brand assets and liabilities linked to a brand, its name and symbol, that add to or subtract from the value provided by a product or service to a firm and/or that firms customers" (i.e., the retailer in this study). In the model, building on Aaker's work, the authors conceptualize RPBE as a multi-dimensional construct, consisting of "three reflective first-order dimensions" such as retailer-perceived brand equity, retailer loyalty to a brand, retailer awareness and association with a brand (p.439). They also identify antecedents of RPBE dimensions, in terms of marketing mix elements and product country image, and consequences in terms of brand profitability performance, defined as "the financial contribution of a brand to the profit of the retailer" (p.441). Marketing mix elements are adapted from Yoo et al. (2000) (image, price, and promotion of the supplier). Unlike Yoo et al. (2000), this study splits price into price level and deals, supposing they negatively affect RPBE. Promotion activities concern not only advertising, which has been recognized to be successful in generating brand equity, but also other activities such as free product samples, presence at fairs, exhibitions, sponsorship or publicity carried out by the supplier (p.441). Country of origin effect is conceptualized using Papadopoulos and Heslop's (2003) definition of product country image (PCI). Data were collected from retail managers of tiles located in Austria. Empirical findings suggest that both marketing mix elements and product country image are linked to the RPBE, which in turn mediate the effects of these antecedents on the brand profitability performance. To further validate the model, the authors performed additional analysis, using an alternative outcome (total profits derived from selling tile x), finding the same results.

Similarly to Baldauf et al.'s (2009), Tran and Cox (2009) define retailer-based brand equity (RBBE) based on Keller's definition of CBBE as "the effect of brand knowledge on the retailer's response to the marketing activities of

the brand manufacturer, in which a positive attitude towards the manufacturer's brand leads to the source of competitive advantage in that product category" (p.138). In line with previous research, RBBE is viewed as a multi-dimensional construct consisting of three components (brand association, brand trust and brand loyalty). The first, brand association, in the context of the retailer is defined as what retailers think about a brand as related to their own needs and demands. Thus, the authors conceptualize brand association as "a second-order construct that is made up of two dimensions: brand satisfaction (of the retailer) and consumer-based brand equity" (p.140). This second aspect relates to what they believe consumers think about the brand, corresponding to the concept of "consumer perceived value" in Baldauf et al. (2003) model. Brand trust is the second dimension of RBBE, defined as "the feeling of security held by the retailer in its interactions with the brand, which is based on the reliability of brand supply, the credibility of marketing information shared and the expertise of the brand manufacturer" (p.143). Finally, the authors define brand loyalty as "a commitment by the retailer to maintain a long-term and stable relationship with the brand manufacturer" (p.144). According to Baldauf et al. (2009), the proposed conceptual model's aim is to test the relationship between the three dimensions of RBBE, with the manufacturer support viewed as antecedent and brand performance as consequence of RBBE. Manufacturer support, as adapted from Glynn (2004), includes advertising support, merchandising support, key parts of the range, useful category information, key category growth, and additional choice. Brand performance is defined as "the economic results manufacturers want to achieve from strong brands" (p.146). Data were collected from a sample of Vietnamese retailers. Empirical findings confirm 8 out of 11 hypotheses. The findings show that RBBE consists of three components (brand trust, brand association, brand loyalty), allowing the authors to assert that "CBBE from the individual perspective can be applied to the retailer perspective" (p.167). Manufacturer support is a valid antecedent of the RBBE model, and it positively relates to brand performance. Finally, RBBE dimensions relate positively to brand performance.

Unlike previous empirical research, Davies and Mentzer's study (2008) analyses BE from a relational point of view. Specifically, the research examines the effect of trade equity and brand equity (two key relational resources) in relationships between retailers and brand manufacturers. Their model introduces and develops a new concept of trade equity, defined as "the value that accrues to a firm from being known in a trading network as a trustworthy trading partner" (p.436). At the same time, to explore the effects of a firm's ties with end consumers, they draw on the concept of BE, defined as "a relational resource that is located in relational ties between a firm's brands and the brands' consumers" (p.436). Consequently, they test the differential effects of these relational resources and their interaction on two fundamental properties of exchange relationships: dependence and commitment. Dependence is defined as "the extent to which attainment of goals is mediated by another firm and is available only through the relationship with that firm", while commitment in exchange relationships exists when a firm views a relationship as important, wants the relationship to endure indefinitely, and is willing to work to maintain it. Moreover, BE is considered a moderating factor, which can both strengthen and weaken relational ties with trading partners (p.440). Further, BE is proposed to strengthen dependence by providing access to a variety of brand specific resources. Paradoxically, strong brands are also likely to weaken trade equity's effect on commitment, since a retailer's commitment to a manufacturer with a strong brand might be viewed as a derived commitment (p.441). Data were collected through a mail survey on home appliance retailers. Unlike previous empirical research, the authors develop new measures for trade equity and brand equity, both validated by a confirmatory factor analysis. Empirical findings confirm the positive relationship between dependence and commitment and provide evidence for differential effects of relational resources on relationship properties (p.444). Specifically, trade equity has a greater effect on commitment, while BE has a greater effect on dependence. The moderating effect of BE is also supported, since it strengthens the effect of trade equity on dependence and weakens the effect of trade equity on commitment.

In line with Davis and Mentzer's study (2008), Glynn et al. (2007; 2012) focus on the relationship between manufacturers and retailers, studying how manufacturers' brands benefit retailer and how these benefits affect retailers' evaluation of the brand. Unlike previous empirical study, Glynn et al. (2007; 2012) present BE as one of the manufacturers' brand benefits. A proposed conceptual model consists of ten hypotheses, which link manufacturer benefits to the retailer evaluations of the brand (p.1129). The authors identify four sources of benefits, including financial benefits, brand support, BE and customer expectations, that positively affect retailer satisfaction. Moreover, brand satisfaction influences others endogenous constructs such as trust, cooperation, dependence-commitment and in-store brand performance (p.1131). Empirical results suggest that most of the manufacturers' brand benefits are positively related to retailer satisfaction. To further validate the empirical results, the authors develop an alternative model by

considering the effects of all possible pathways not included in the first alternative estimation (p.1140). Comparing the two models, it emerges that the second one fits the data better. It shows that financial benefits have the strongest effect on retailer relationship outcomes; the second strongest is the retailer's expectation of customer demand. Manufacturer brand support is the third ranked antecedent of retailer satisfaction with the brand. The fourth benefit, brand equity, influences the retailer's commitment to the brand but not the retailer's satisfaction (p.1142).

The relationship between Brand Equity and Country of Origin: focus on the Retailer's Perspective

In this section of the paper, the authors analyze the main research on the relationship between brand equity and country of origin. In particular, we focus on empirical studies, which have analyzed country of origin image effect on brand equity, defined as a multidimensional construct. Although most of them are based on the consumer's perspective, we'll also review one study, in which this relationship have been examined in the retail context.

Country of Origin Construct

The effects of country of origin (COO) upon consumer perceptions, and purchase intentions have been extensively studied in marketing research. Although Dichter (1962) was the first who argued that a product's COO might have some influence on its acceptance and success, Schooler (1965) was the first who empirically tested this notion. Since then, COO effects have been examined with a variety of methodologies, product categories, and source countries. The broad conclusion emerging from almost 50 years of research is that COO does affect product evaluations (Bilkey and Nes, 1982; Peterson and Jolibert, 1995; Verlegh and Steenkamp, 1999). Generally, COO is considered as an extrinsic product cue (Bilkey and Nes, 1982; Erickson et al., 1984; Han and Terpstra, 1988; Thorelli et al., 1989), able to be a consistent and credible predictor of value and quality. However, COO is also one of the most controversial research fields since many studies reach opposite conclusions. Some conclude that COO has a significant influence on the choice of a product or service (e.g., Agrawal and Kamakura, 1999; Ahmed and d'Astous, 2008; d'Astous and Ahmed, 1999; Laroche et al., 2002). Others conversely conclude that the influence of COO is very weak (e.g., Ettenson et al., 1988; Liefeld, 1993, 2004; Lim et al., 1994; Usunier, 2006; Usunier and Cestre, 2008). Originally, the concept of COO was considered as the Made-in country (Nebenzahl et al., 1997), or the COM, country of manufacture (Samiee, 1994), which is the country where final assembly of a good took place. Other concepts have progressively emerged in the COO literature, such as country of assembly (COA), country of design (COD), country of parts (COP), and country of brand (COB) (Insh and McBride, 1998; Samiee, 1994; Nebenzahl et al., 1997; Jaffé and Nebenzahl, 2001).

One of the first conceptualizations of country of origin image (COI) was that of Nagashima (1970), who defined COI as "...the picture, the reputation, the stereotype that businessmen and consumers attach to products of a specific country. This image is created by variables such as representative products, national characteristics, economic and political background, history, and traditions" (p.68). Roth and Romeo (1992) define COI as "the overall perception consumers form of products from a particular country, based on their prior perceptions of the country's production and marketing strengths and weaknesses" (p.480). The authors identified four dimensions of COI such as innovativeness, design, prestige, and workmanship. Past research have shown that COI influences the evaluation of products in general, and classes of products as well as brands in particular.

Country of Origin and Brand Equity

Although there is a large body of research on COO and BE respectively, literature combining these two streams of research is very limited (Zeugner-Roth et al., 2008, p.578), since extant research has provided evidence between certain CBBE dimensions (perceived quality and brand image) and COI, without treated or recognized "neither brand image nor perceived quality as a dimension of BE" (Pappu et al., 2007, p.727). In this respect, several studies have shown that consumers' perception of quality was affected by country of origin (Häubl and Herold, 1999; Thakor and Katsanis, 1997) and also that consumer brand images change as the brands are made in different countries (Han and Terpstra, 1988; Nebenzahl and Jaffe 1996; Kim and Chung, 1997).

Pappu et al. (2006) is one of the first studies that examines the relationships between COO and the multi-dimensional CBBE (p.708). The aim is to identify empirically possible differences in CBBE, according to the country where the product was made. The proposed model identifies COO and product category as the independent variables of interest, while CBBE is hypothesized as a four-dimensional construct, defined in accordance with Aaker (1991) and Keller (1993). Product category-country associations refer to “consumers’ ability to evoke a country when the product category is mentioned” (p.698). Each of the CBBE dimensions is a dependent variable, expected to be affected by COO. Moreover, consumers’ product category-country associations are believed to moderate the effect of the COO on CBBE dimensions (p.699). Based on an experimental research, the model was tested using two product categories, with a sample of individual consumers. The survey questionnaire included three sections: section one aimed at capturing respondents’ product category-country associations, section two measured the dimensions of CBBE, section three was about demographic questions (p.703). Empirical results suggest that CBBE varies according to its COO and each of the CBBE dimensions vary significantly with the COO of the brand, providing further support for Aaker’s (1991) and Keller’s (1993) notion that COO associations are secondary associations to brand associations (p.708).

In a following study (Pappu et al., 2007), the same authors improve the research on the relationship between COO and BE, introducing two different levels of the COI (macro and micro level). Specifically, the study aims at analyzing the relationship between consumers’ country-level and product country-level images of a country, and the equity they associate with a brand of that country (p.726). Conceptual framework is based on macro and micro level of COI and dimensions of CBBE. COI (similar to brand image) is defined as “a set of country of origin associations organized into groups in a meaningful way” (p.727), conceptualized at both the country (macro) level and the product (micro) level. CBBE is defined as “the value consumers associate with a brand, as reflected in the dimensions of: brand awareness, brand associations, perceived quality and brand loyalty” (p.728). The authors assume that COI can influence the key dimensions of BE (brand associations, perceived quality and brand loyalty). Similarly to the previous study, a quasi-experimental research on a sample of consumers in Australia was conducted. Again two product categories were included, with three brands for each one. Second-order confirmatory factor analysis (CFA) was used to establish the dimensionality of respondents’ COI perceptions at both macro and micro levels. Three factors resulted consistent for macro COI (technological, economic and political) and others (innovation, design and prestige) for micro COI (p.732). Empirical findings examined the six different subsamples obtained by experimental research. The results confirm the existence of a significant and substantive relationship between CBBE dimensions and both macro and micro COI of the brand, and that the contribution of each CBBE dimension to the relationship varied by product category, which supports the previous research (p.736).

In line with Pappu et al.’s studies (2006; 2007), Yasin et al. (2007) explores the effects of brand’s COI on the formation of BE. Conceptual framework for BE is based on Yoo et al. (2000) and incorporates COI as the antecedent of brand equity. COI is treated as the independent variable, the dimensions of BE as the mediating variables and BE as the dependent variable (p.39). The study was conducted in Malaysia via a mail questionnaire on a sample of consumers. Three product categories of household electrical appliances were included. Similar to Pappu et al. (2006), the questionnaire contained three parts: part one to measure variable of COI, part two to measure dimensions of BE, and part three to obtain demographic and socio-economic characteristics (p.41). Scales used in the study are partially developed ex novo. Results of the exploratory factor analysis suggest three dimensions for BE (brand distinctiveness, brand loyalty and brand awareness/associations). Empirical results show that these three dimensions have a significant positive influence on BE. Same findings for the relationship between the COI and each of the dimensions of BE. The study also finds out that COI has a positive and significant impact on BE, fully mediated by brand distinctiveness and partially mediated by brand loyalty and brand awareness/associations (p.45).

Finally, Baldauf et al. (2009) is the only study that identifies COO as a valid antecedent of brand equity in the retail context. Specifically, the authors focus on product country image (PCI), which is defined as “place-related images with which buyers and/or sellers may associate a product” (Papadopoulos and Heslop 2003, p.404). Empirical findings suggest that PCI perceptions are not only an important determinant for customers’ product evaluations and purchase intentions, but, more importantly, also for brand equity. Moreover, findings demonstrate the importance of collaborating with suppliers from countries, whose product offering is perceived as highly valuable. From a supplier perspective, the positive link between RPBE and PCI indicates that the product origin matters and this knowledge could be used profitably (p.449).

Conclusions and directions for future research

Relationship between brand equity and country of origin in the retail context appears an interesting research stream both from the academic and managerial points of view.

From the academic perspective, even though the literature on this topic is limited, the research and empirical studies are emerging. As highlighted above, branding literature and specifically brand equity literature is very complex, and no agreement on how BE should be defined and measured yet exists. Moreover, most efforts in this regard have been invested in studying the consumer's perspective. As a consequence, the analysis of the retailer's perspective needs to be handled differently.

Empirical studies on brand equity, as perceived by retailers, agree with the fact that manufacturers' brand equity exists and plays a key role in the channel relationship, positively affecting the retailer's perceptions. However, there is no agreement on the definition of brand equity in the retail context. Despite most of the studies conceptualize brand equity as a multi-dimensional construct, only two define it specifically and both are based on the previous contributions of Aaker (1991) and Keller (1993). A clear definition of brand equity construct in this context will allow a better understanding of its main dimensions and how they can be measured. Another main aspect concerns the identification of the antecedents (e.g., marketing mix elements and COO), which could affect brand equity dimensions. Only one study identifies specific marketing mix elements and country of origin as valid antecedents. The relationship between country of origin image and brand equity in this specific context needs to be analyzed more in depth. Finally, the main consequences of brand equity in the retail context have been explained in terms of brand performance, whereas others aspects, such as retailer's commitment, dependence or satisfaction, have been analyzed less.

From the managerial point of view, a better comprehension of how retailers perceive the manufacturers' brands they sell will help brand manufacturers chose the marketing tools to build a strong brand. Studying brand equity, from the retailers' point of view, would also allow manufacturers to understand which strategies, in terms of price, promotion etc., could increase their brand equity. Moreover, it can be used as guidance to brand managers in setting up marketing plans aimed at building strong and long-term relationship with such strategic actors as the retailers.

When a Museum tells a Company

Abstract

The paper assumes that Corporate Museums are a form of organizational memory to be strategically used for the development and the communication of a company's identity and image. Object of the work is the analysis of Corporate Museums strategic role in telling the company. The theoretical framework is based on Organizational Identity (Albert & Whetten, 1985; Whetten, 2003) and Sensemaking topics (Weick, 1995) together with Fisher's thought (1984, 1987). The exploratory study clarifies the 'organizational identity' nature of the Salvatore Ferragamo SpA. Considering the Salvatore Ferragamo Museum as a strategic asset, that enables to communicate what is 'core' about the company, this study tries to shed light on the relationship between the identity expressed by organization members (both of the Company and Museum) and the identity sensemade by visitors. The paper describes all research phases, the method and the used instruments including the research design and the data collection process.

Keywords: *Corporate Museums, Organizational Identity, Sensemaking, Narratives and Stories*

Introduction

Object of this work is the analysis of Corporate Museums strategic role in telling the company. In particular, it clarifies the relationship between how an organization expresses and communicates its own identity, and how visitors perceive it after the visit to the Museum. Corporate Museums are considered a strategic asset that enables to communicate what is 'core' about a company. This study tries to shed light on the relationship between the identity expressed by organization members (both of the company and of the Museum) and the one sensemade by visitors. The researcher perspective is considered too. The 'organizational identity' nature of the Salvatore Ferragamo SpA is analysed through an exploratory study conducted in depth. This case study explores and better understands the effectiveness of Corporate Museums as strategic tool of communication, considering the identity shown (the company perspective) and the perceived one (the visitors point of view) together with exhibitions, narratives and stories presented in the Corporate Museum. The ultimate goal is to compare the study results to the literary assumptions and to create a method for organizational identity nature and process exploration.

Theoretical Background

1. Corporate Museums

Corporate Museums have been considered a special case of self-referred collected objects, consistent with the activities carried out by a firm (Comunian, 2010). Danilov (1992) defined it as «*corporate facility with tangible objects and/or exhibits, displayed in a museum-like setting, that communicates the history, the operations, and/or the interests of a company to employees, guests, customers, and/or the public*». According to Bossaglia (1997:7) they are «*Those organized by industries or companies, in almost all cases of private management, which collect materials and documents on the activities of the industries themselves*». Negri (2003:19) defines Corporate Museums as «*All Museums generated in different ways from a company, whose heritage is closely connected to its specific activity*». Considering the ICOM definition of a public Museum¹, a new one is proposed in this work. It is based on difference and analogies between the two: Corporate Museums, as the public ones, show a willingness to 'collect', 'document', 'preserve' and 'exhibit' evidences and intangible assets (information) related to the firm (that can be considered as 'particular part of the humanity'). Corporate Museums in this work are 'not for profit institutions in different ways generated by a company as a direct consequence of its business: these Museums preserving, exhibiting and communicating the tangible and intangible evidence of a business or an industry, have to be sufficiently structured, open to the public and have to sustain the development of the community'. Italian Corporate Museums are associated in 'Museimpresa' promoted by Assolombarda and Confindustria.²

1.1 Functions and Objectives of Corporate Museums

The primary function of a Corporate Museum is to 'collect' company's artefacts. They testify the industrial activity, avoiding its dispersion and deterioration. Another key feature is to 'document', 'inventory', and 'catalogue' all its artefacts with a scientific criteria. This is the fundamental difference between a corporate collection and a Corporate Museum. All these activities allow interpreting the image of a company, its industry, its cultural evolution and the one of society too. The Museum shows all those aspects to the public. The implications in the business strategies, especially for the marketing are evident. Despite having a purely cultural purpose, Corporate Museums are contextualized within corporate organization. They have to follow a business logic absolving at the same time to the functions of a Museum and to the activities and policies of corporate marketing and business communication. As a sort of continuum between past and present, tradition and innovation, Corporate Museums can be considered as an additional communicational tool to the traditional and typical ones. Their activity can also affect the internal communication, as part of the corporate culture. A Corporate Museum can represent a source of innovation and inspiration for designers, creative and new products developer too. In addition, in a market system in which the intangible assets are a source for the competitive advantage (Vicari, 1991; Costabile, 2001), Corporate Museums can help to ensure an advantage in terms of social prestige, loyalty and differentiation from competitors. They collect multiple corporate resources and crystallize corporate values. According to Danilov (1992), the first Corporate Museums were predominantly historical since they showed documents, photographs and past productions, or they tried to reconstruct company history or founder and other leaders contributions to its growth. In more recent times, greater emphasis has been given to public relations and market orientation. Montemaggi and Severino (2007:109) considered Corporate Museum as «an organizational asset, whose effective utility is in the context of marketing and communication». They have appropriately been framed between the corporate communications and public relations tools (Kotler, 1993; Lambin, 2000) because of their capability to draw attention on the company, on its merits and its values (CSR) with the ultimate aim to legitimate the firm in its environment. According to Gilodi (2002) a Corporate Museums can be leveraged by those organizations in constant search of difficult to imitate corporate communication tools. They allow to extend the institutional communication range because they can increase the information about the company. Thanks to this information the public can consolidate its perception and its evaluation about the company. Corporate Museums have been considered as form of organizational memory (Kinni, 1999; Kransdorff and Williams, 2000; Nissley & Casey, 2002) to be strategically used to develop and share identity and image. In this perspective they have been framed as strategic assets affecting organization actions. The artefacts together with written stories (official), oral tales (guide), and stories resulting from social interactions coexist within the Museum and within the company that created them. Nissley & Casey (2002) have postulated a kind of organizational memory that can allow a comparison between the traditional model of Corporate Museum (passive collection of artefacts of the organization) and the strategic one (in which organizational memory is a strategic asset). According to the two Authors both the images of Corporate Museum configure physical structures in which the company tells its own story resulting from the agreement and from the sharing within the organization members. The attempt is to explain and communicate what is important about the organization past. Organizational memory has been linked to organizational learning too, as well as to the strategy, to the organizational effectiveness, to the developing identity and image (Simon, 1991; Weick, 1995; Moorman & Miner, 1998). Developing the organization's members sense of pride and belonging (identity of the organization), the Museum informs the visitors about the products and services of the firm (organization's image). Kinni (1999) pointed out that companies such as Coca-Cola, Ford, Motorola, implemented their Museums not only with the intent of preserving their history, but also with the strategic function of facilitating internal and external relations. In this sense marketing and image creation play a key role in many Corporate Museums. Nissley & Casey (2002) explored these realities considering it as tools for a better understanding of the organizational memory. They sustained their validity as a strategic instrument for the development of the company identity and image. The authors quoted Sturken's (1997) 'politics of remembering' and 'politics of forgetting' and recognized it in the choices of Corporate Museums exhibition. In their seminal contribution are indicated the guidelines for this research work: P1- Corporate Museums are a form of organizational memory; P2- Corporate Museums are socially constructed forms of collective memory (history) and episodic (cultural); P3- Corporate Museums are not passive collections of organizational artefacts but they are a kind of organizational memory to be strategically used by the firm for company's identity and image

development; P4- There is, in Corporate Museums, a policy exhibition of the organizational memory. In other words, the organization chooses what to display (politics of remembering) and what not (politics of forgetting).

2. The Organizational Identity Construct, the Sensemaking Process and the Narrative Paradigm

In the past few years, 'organizational identity' issue has been investigated involving various disciplines, different paradigms and research traditions. Since the 80' a lot of contributions have been focused on this topic, starting from the seminal paper of **Albert & Whetten** (1985). The two scholars define 'organizational identity' as the «*set of features that organization members recognize as fundamental, distinctive and enduring (or continuous) considering the past, the present and the future of a company*». Its expression and communication process has been investigated too and only few contributions deal with Corporate Museum as a strategic tool. Anyway, very unusual is a study that stresses 'organizational identity' analysing Corporate Museums stories and exhibited narratives.

2.1 The Organizational Identity Construct

Despite all the difficulties in defining 'organizational identity' nature, this work draws on 'the social actor perspective' grounded in the 'institutional theory'. From this perspective, identity is to be found in the 'claims', in the identity statements that can be found among organization members. These identity statements concerne the fundamental, durable and distinctive properties of organization (**Albert & Whetten**, 1985). The 'claims' are by definition long-lasting and resistant to change, if not in the long time (**Czarniawska, 1997; Whetten, 2006**). According to a functionalist approach the 'core, distinctive and enduring' organization values are defined by top management and can be transferred to the Museum and then from the Museum to its visitors. In this context, the Museum is a 'medium' in which it is possible to transmit and communicate company 'core purpose' and 'core philosophy'. These are attributes giving sense and completeness to organizational identity concept (**Margolis & Hansen, 2002**). This particular interpretation is the key for the organizational identity understanding. It helps to explain the role of Corporate Museums too, especially in organizational identity transmission process. In corporate Museums the choices of exhibition are exclusively linked to the top managers point of view. They choose what to show and what not, in this way establishing an organizational identity deliberate transmission process.

2.2 The Sensemaking construct and process

The sensemaking construct has been defined as 'complex and interpretive' (**Gioia, 1996**). It has been analysed in the debate around the phenomenological reality organizing process. **Weick** (1995:xi) defined it as «*Developing set of ideas with explanatory possibilities, rather than a body of knowledge. Sensemaking exists in the forms of an ongoing conversation*». According to him, the sensemaking process ('sensemaking') exactly overlaps with the organization process ('organizing'). The 'organizing' is the way people give sense to the flow of experience (**Schulz, 1967; Schwandt, 2005**). Reality corresponds to a flow of experience that exclusively takes a sense in a subjective cognitive way: it is something a subject has to read, and takes the meaning people provides to it. The existence of a reality is not excluded, but it is 'ambiguous' by definition. In Corporate Museums the meaning construction process consists in coding and decoding stories and exhibited narratives. The way is completely subjective to the viewer: referring to their own knowledge and experience and cultural reality people give sense to experiences.

2.3 The Narrative Paradigm

The concept of 'narrative' has been analysed in a symbolic-interpretive perspective by scholars such as **Czarniawska** (1997, 1998), **Kleason** (2001) and **Boyce** (1995). Organizations meaning construction dynamics exploitation focused the role of narratives and stories. **Fisher** (1984, 1987), who had a very large vision 'narrative', designed storytelling as the ongoing process through which a subject perceives the world and communicate with others. According to him what is communicated through stories is fundamental to human understanding (Cfr: **McIntyre, 1981:121**). **Czarniawska** (1997:126), in her study on organizational identity, considered Fisher (together with other theorists including **Mead**) as a «*the bedrock of symbolic interactionism*». In Corporate Museums a particular kind of narrative, in some way different from pure rationality, based on human values more than on the logic, enables visitors to make judgements about the exhibited stories and narratives.

3. The Research Questions

This work starts from the conclusions of **Nissley & Casey** (2002) - first conceiving Corporate Museums as a form of organizational, episodic and socially constructed memory to be strategically used for the development and disclosure of corporate identity and image. To better understand their nature the research focuses on whether and how Corporate Museums are able to communicate identity of the organization. These are the emerging research questions: 1) Has the corporate Museum a strategic role in narrating the company? Can the corporate Museum be considered as a strategic asset? 2) What is the relationship between how organizational identity is expressed and how it is perceived by visitors? Is there a correspondence between the identity expressed and the one perceived? Is the Museum communication effective and efficient to sustain the purpose of identity communication?

4. The Research Method

The study uses the qualitative method tools, very useful when the research purpose is to understand the nature of phenomena (**Miles & Huberman**, 1994; **Stake**, 1995). This approach seemed to fit the purpose to explore organizational emerging aspects (**Yin**, 2003). In the specific case of the Salvatore Ferragamo SpA this aspects were framed in the context of narratives and stories exhibited in his Corporate Museum. The case study method, therefore, allows the researcher to become an important part in the process of data collection, as well as to provide contextual information (**Patton**, 2002). **Yin** (2003:19) described the types of data that can support it: these are interviews, observations and document analysis, each one used in this study. **Weick** (1995:172-173) also provided a setting guide to the research design when 'sensemaking' is the investigated factor. The Author suggested guidelines for the data collection, analysis and interpretation. He recommended to keep in mind the following points: 1. Allow actions situated in the context; 2. Work in proximity with the participants, being their 'texts' fundamental; 3. Watch the analysis models, rather than the assumptions; 4. Test explanations against the plausibility; 5. Use few number of cases, related to the investigated phenomenon; 6. Use a method that allows the researcher to deal with the meanings and not with the frequencies. Following this recommendations the data collected were then analysed using an interpretative methods combination. **Fisher's** 'narrative paradigm' (1984;1987) provided a useful lens through which analyse the stories told by the interviewees and the narratives exhibited in the Museum. It helped to clarify the relationship between the Salvatore Ferragamo identity and the one sensemade by visitors. **Czarniawska** (1998:50), who described the strong ties that the narrative methodology has with the study of 'organizational identity', provided an additional interpretative guidance. **Whetten** (2006) himself quoted her work, suggesting to the researchers to look at the emphasis on autobiographical organizational elements considered as the 'organizational identity' source and essence. **Boje** (1991:106) looked at the organizational life as a 'story under construction', describing the storytelling as *«preferred sensemaking currency of human relationships among internal/external stakeholders»*. To reach the goal to explore the Salvatore Ferragamo case, the narrative approach was adopted stating that organization says/performs stories about her own identity, and visitors read/give meaning to these stories. The task and the goal of the researcher was to give voice and meaning to both in order to better understand their relationship. In particular, it has been possible to clarify the role that 'stories' and 'narratives' play in the communication process of 'organizational identity'. The organizational identity attributes - 'core purpose' and 'core philosophy' (**Margolis & Hansen**, 2002) - were investigated collecting Salvatore Ferragamo's administrators 'views'. The comparison between the company perceived identity and the one sensemade by visitors showed the museum effectiveness as an organizational identity communication tool. Subsequently, the three point of view were triangulated to clarify whether the Salvatore Ferragamo's corporate identity was adhering to the vision proposed and expressed by the Salvatore Ferragamo Museum. Finally it was realized if visitors perceived Salvatore Ferragamo's organizational identity without distortion. In other words the study clarifies if the identity expressed by the company and narrated by the Museum was coincident with the one perceived by the visitors. The field survey was divided in three phases. The primary data were collected through some interviews to two Salvatore Ferragamo SpA administrators, and to six Museum administrators (including employees, managers and interns). Through the use of semi-structured protocol eighty visitors were interviewed. Previously, but also in parallel to the course of the interviews, a long period of observation was conducted. It was really usefull to other documents analysis preparation and provided an interview

process solid foundation. The time spent inside the Museum was crucial for visitors behaviour understanding. The empirical evidence were then compared to the related literary assumptions in order to shed more light on the most problematic theoretical aspects.

4.1 Demography

For each of the interviewed subjects a pseudonym was used, while visitors have been marked with a serial number, assigned following the interview order. The respondents demographics is presented in Appendix A. The observed and interviewed Museum administrator were: 'Rina', 'Lola', 'Anna', 'Dana', 'Clara' and 'Romoaldo'. They hold responsibility positions within the Museum. The first three had their offices separate from the exhibition area, to a higher plane: Clara played a leading role during an internship of six months, Dana and Romoaldo had 'front office' role as receptionists and the bookshop. The observed and respondent company administrators were 'Alessio' and 'Falco': the first works in the 'Corporate Communication' area, the second is involved in the 'Investor Relations' activities. They specifically requested to avoid further information in order to maintain confidentiality and reservation. The visitors' demography is shown in Appendix B. It is presented following the interviews order carried out during several days of work in the Museum. A serial number is used for each respondent since the interview was administered in a completely anonymous way.

5. The Study Results

The Salvatore Ferragamo Museum was opened in May 1995, on the initiative of the Ferragamo family in order to show the extraordinary artistic qualities of the company founder. A pioneer in this sense, Salvatore Ferragamo decided to give value to the company history and to its product. The Museum displays the key products and the company history as examples of durability and of excellence. Born from an exhibition at Palazzo Strozzi on the story of the company founder Salvatore Ferragamo, the exposition become itinerant and hosted by many important international Museums. The Salvatore Ferragamo Museum strategic approach was achieved with historians and archivists aid. The Museum is located in Palazzo Spini Feroni in Florence, the Ferragamo's historic head office since 1938. A permanent exposition area shows the company and the brand history to the public while temporary exhibitions and events are hosted in a dedicated area. At the time of the research there was a temporary exhibition on Marilyn Monroe half century after her death.

5.1 The Salvatore Ferragamo Organizational Identity from an 'Internal Perspective'

The understanding of 'core philosophy' and 'core purpose' characteristics helped to shed light on the Salvatore Ferragamo's identity. The administrators interview (both of the Museum of the company) showed that organization's core purpose - and the reason of its existence - is *«to carry on the historical success of the founder in creating high quality footwear, to create and to produce the most beautiful shoes in the world and to produce footwear and other fashion products that make the wearer feel comfortable. Every single product has to be up-to-date in style and designed as a 'worship' objects for the fine attention to details»*. The distinctive way the company reaches this goal represents the 'core philosophy'. Together, these two attributes - 'core philosophy' and 'core purpose' – can help to define Salvatore Ferragamo's basic, durable and distinctive identity characteristics. The respondents recognized the founder entrepreneurial characteristics and his creativity as a key for the long-term organization success. For example in 'The Shoemaker of Dreams' - Salvatore Ferragamo's autobiography - a business crisis and personal bankruptcy of the entrepreneur in 1930s is narrated. The respondents administrators referred to this story to emphasize the entrepreneurial and innovative characteristics of the founder, together with his perseverance and creativity. Even when they recalled critical situations the respondents emphasized Salvatore Ferragamo's extraordinary qualities, contributing to amplify his mythic figure. His aspiration to perfection and his willingness to the personal and brand affirmation are currently pregnant identity characteristics. This is also supported by the choice to maintain the firms headquarters in the historical Palazzo Spini Feroni where the Museum too is located. The founder attention to continuous innovation finds current execution in supporting young fashion creators and designers: to this purpose the Museum devolves to fashion and design young students award its annual tickets proceeds. However, the link between what is fundamental and long lasting for the organization is well expressed by the fact that the shoes still are the creative engine of the entire production. Their high quality is due to the strong craftsmanship characterizing all the production chain, exclusively located in Italy. The core philosophy too - which is stated to be long-lasting - is based on the founder strategic vision. The company' priority, based on the founder's

attention on the foot anatomy are consumers comfort and care. Ferragamo's past almost tailor-made products (the founder studied in America in the early years of the twentieth century) are the source of inspiration of the current customizable products. It is possible to say that the 'core philosophy' remains unchanged over time. It reflects the founder personality, his strategic choices, and his devotion to the goal to find *«the shoe that fits well»*. These findings emerged from the stories and the narratives told by respondents that helped to shed light on the identity of the organization.

5.2 The Salvatore Ferragamo Core Purpose

Salvatore Ferragamo's 'core purpose' is *«to continue the historic success in shoes production still representing the core activity and the creative engine of the entire business»*. The attention paid to the model construction and to the strong craftsmanship represents the characteristic of the entire production cycle. It is still based on the company founder choices and on his strategic vision. While the historical palace and the Museum provide the context within which to show the way the company has pursued over time - and still continues – her core purpose; the innovative and entrepreneurial qualities of the founder, as well as his perseverance, represent the dynamic source for the company identity characteristics. These fundamental elements helped to sustain over time what is the 'core' about the Salvatore Ferragamo SPA. Company Administrators used the elements shown in the Box.1, to explain their understandings of the company 'core purpose':

TABLE 1: FUNDAMENTAL ELEMENTS OF SALVATORE FERRAGAMO'S CORE PURPOSE

Tenacity of the founder	Quality of the product
Innovativeness of the founder	Creativity of the founder
Iconic Brand	

From an 'internal perspective' (the company administrators one) Salvatore Ferragamo's 'core purpose' is *«to create and to produce the most beautiful shoes in the world, and to produce footwear and other fashion product that make the wearer feel comfortable. Those products have to be up-to-date in style and designed as 'worship' objects because of their fine attention to details»*.

5.3 Salvatore Ferragamo's Core Philosophy

Salvatore Ferragamo's 'core philosophy', the ways the organization reaches its 'core purpose', is represented by the elements emerged during the administrators interview and that have already been mentioned in the previous paragraph. The respondents used stories and narratives to illustrate company's core philosophy'. They recalled significant events about the company and its founder. Very important elements emerged such as the link with the territory, the stakeholders relations, the attention to the customer loyalty. Someone reported the challenges the founder faced in order to maintain a high level of quality. In particular they emphasized company philosophy core characteristic such as the high quality standards respect. Despite the generational change this is a categorical imperative that remains unchanged over time. Company Administrators used the elements shown in the Box.2 to explain their understandings of the the company 'core philosophy':

TABLE 2: FUNDAMENTAL ELEMENTS OF SALVATORE FERRAGAMO'S CORE PHILOSOPHY

Human resource care attention	Quality of the product	Innovation	Handwork
Confort care	Brand awareness	Choice of top materials	Made to order
Attention to the evolution	Customizability	Of style and fashion	Exlusivity

From an 'internal perspective' Salvatore Ferragamo's 'core philosophy' is to support the 'core purpose' through a series of 'practices, priorities and actions' showed in the Box. 2. Each one is aimed to sustain the purpose to produce the most beautiful shoes in the world together with other fashion products that make the wearer feel comfortable.

5.4 How the Salvatore Ferragamo's Museum expresses organizational identity (internal perspective)

When company administrators were asked to explain how they believed the Museum was able to communicate the organizational identity, they talk about its function and its aim. In their opinion the Museum tells Salvatore Ferragamo's history and products. communicating company values to the public as an excellence and durability example. The Museum provides a comfortable experiential environment that amplifies the connection between the visitors and the brand. Its primary purpose is to pay homage to the founder, to his creativity and to his entrepreneurial story. As explained by a respondent, the Museum main goal is *«To express Ferragamo's openness and constant interest to the art in general, to the design, to the entertainment, to the costume, to the communications, to the information. They undoubtedly have a strong influence on fashion, costumes and lifestyle»*. What visitors should perceive (from the company point of view) is well explained by Lola: *«The things which should remain to the visitors - and that I am sure remain - are many. First, the idea of a brilliant entrepreneur, the fact that he had fortune from nothing and he joined the success. Second, that creativity is a gift, something wonderful that must be cultivated. The visitors should understand that craftsmanship is an art, and that a simple job can be a success potential source. Another important element, for young people especially at this time, is that a working abroad can give rise to some interesting developments. So, the message is that a family enhanced something of great value and a 'family group' continues this purpose»*. The Museum creates a comfortable and experiential environment that helps visitors to connect to the brand and to the company history. This is emphasized by respondents too, such as Rina who summarized: *« Experience and interactivity are fundamental in everything we do»*; or Lola: *«I think the Museum tells what is the firm. This allows visitors to have a connective experience to the brand»*. For Anna, the Museum purpose is to *«allow an emotional connection with the brand»*. In other words the 'experience' a represents a key issue and plays a very important role. According to Rina: *«Everything we do, every new exhibition, every innovation, amplifies our knowledge and our stakeholder's one. We want people to build an emotional relationship with the brand but our aim is to contribute to the growth of the culture in the field of fashion, design and costume»*. Romoaldo referred to the museal experience as *«something that allows visitors to appreciate the entrepreneurial work. People should believe that even from a simple manual work it is possible to build an empire»*. Alessio highlighted that the Museum role is to *«allow an emotional connection with the brand»*. He continues: *«It is like meeting a celebrity and with him everyone appreciated his work. This Museum crystallizes all the dreams of a man who has become famous. Its great power is that here visitors meet a brand, not a man and people love the brand. They need to identify with a brand»*. Administrators also described the way they pay attention to the 'comfort and care' philosophy. Lola stated that *«'care' is in the DNA of the company. For example, we call our visitors 'guests' and we make them feel at home. We are so conscious about the image we represent, the Ferragamo one, and we try to apply this philosophy to everything we do. We continually ask ourselves if the atmosphere is elegant, refined, if it is 'friendly', if it is interesting. I think our biggest responsibility is to share what Salvatore Ferragamo really is»*. The participants described the care reserved to visitors as a key element of the 'core philosophy' implemented by maintaining a comfortable and refined environment where visitors are treated as guests. All the elements describing Salvatore Ferragamo's corporate identity are presented in the form of narratives and stories and exhibited in the Museum. These are summarized in the following Box.3.

TABLE 3: THE SALVATORE FERRAGAMO'S ORGANIZATIONAL IDENTITY AS EXPRESSED THROUGH THE NARRATIVE AND THE STORIES EXHIBITED IN THE PERSPECTIVE OF ADMINISTRATORS

<p>Telling the story of the founder of the company</p> <p>Create a comfortable environment experiential in order to amplify</p> <p>the connection between the visitor and the brand</p>

5.5 How the Museum expresses organizational identity (external perspective)

Visitor's point of view allows to answer to the research question: *'Is the organizational identity conceived by the company (and communicated through the museal stories and narratives) consistent with the one sense made by visitors?'*. It can be synthesized on the aspects presented in Box.4:

TABLE.4: THE SALVATORE FERRAGAMO'S ORGANIZATIONAL IDENTITY AS PERCEIVED BY VISITORS

<p>Core Purpose:</p> <p>To produce luxury shoes with high quality and craftsmanship.</p> <p>Core Philosophy:</p> <p>To produce shoes in a very exclusive way and to maintain an environment very careful for the consumer.</p>
--

The work sheds light on the sensemaking construction process too, clarifying how visitors make sense of organizational identity. They transpose and communicate it in two different ways. When asked to describe their museal experience visitors used stories and narratives they already knew before the visit. This kind of knowledge is referred to the stories respondents told during the interview and that they recalled from prior experience. Formally they told these stories when asked to recall some experience connecting them to the brand or to some product. During the interviews visitors also recurred to something they didn't know before the visit and learned during the museal tour. This kind of knowledge is referred to the recalled parts of exhibited stories. Respondents used to show a sense of surprise when they communicated their unawareness about something told or shown during the visit. Two elements can help to understand what is perceived by visitors as 'central, enduring and distinctive' of Salvatore Ferragamo. Respondents perceived that the company produces luxury shoes, exclusively made with a devotion to customer and environmental care. These findings emerge from the associations the visitors made between the Ferragamo brand and the qualities perceived (listed in question 10 'What words can You associate with the Ferragamo brand?'). They mainly connected the brand to 'quality' and 'craftsmanship'. The same was for the question 12 about the characteristics associated with the Ferragamo brand. For each of these visitors were asked to indicate what better fitted their opinion). This question clarified the brand perception as 'true luxury icon'. Salvatore Ferragamo was identified as 'high quality hand made product creator'. Visitors have often used similar descriptions to explain Ferragamo's identity. Someone defined its products 'true icon of luxury', another referred to the brand as 'synonymous of made in Italy', someone referred to it as 'fashion icon'. Other visitors focused on the manufacturing process quality still maintaining craftsmanship characteristics. In their opinion craftsmanship is one of the sources

of the historical and current brand success. The second element perceived by visitors as 'central, enduring and distinctive' of Salvatore Ferragamo concerns customer care'. People perceive it as central, realizing that the company works to its complete satisfaction. Environment in which the experience takes place, as well as the redundancy of all the museal narrative and stories are focused on the 'total care'. Some respondent extended this sense of care to the relationship with the local stakeholder and community recalling a particular story told by the guide on the relationship that the founder had with the city of Florence and its artisans.

5.6 The expressed and perceived organizational identity of Salvatore Ferragamo

The following Box.4 shows the adherence between the so called 'internal one' and the 'external one' perspective. The first is related to the administrators perceived identity. The second to the one perceived by visitors. It can be said that the two perspectives are substantially aligned. At a first step it should be possible to say that the corporate museum can be considered a strategic tool. It effectively communicates corporate identity and image.

BOX.4: THE EXPRESSED AND PERCEIVED ORGANIZATIONAL IDENTITY OF SALVATORE FERRAGAMO

EXPRESSED IDENTITY (Company and Museum)	PERCEIVED IDENTITY (Visitors)
Core Purpose:	Core Purpose:
To create and <u>to produce</u> the most beautiful shoes in the world. To produce footwear and other fashion products that <u>make the wearer feel comfortable</u> , up-to-date in style and line, designed as <u>objects of 'worship'</u> because of their <u>fine attention to details</u> .	To <u>produce</u> luxury shoes with <u>high quality</u> and <u>craftsmanship</u> .

The research results show that what company administrators expressed as 'core purpose' and 'core philosophy' is basically adhering to what visitors perceived, despite they often used different expressions, especially in the language. So the company conceived identity is the same visitors perceive. For example, administrators pointed out that the company success is due to the nature of the 'brand', among the most famous in Italy and America and they often used the term '*iconic*' to describe what is essential, distinctive and enduring of the brand; on the contrary visitors never used the term. The administrators often used the word '*brand*', never do visitors who often used phrases such as '*symbol of true luxury*', '*top quality product*', '*made in Italy symbol*' or the locution '*when you speak about the shoes you speak about of Ferragamo*'. The administrators have never made reference to the bankruptcy or to crisis on official narratives but referred to it during the interviews to emphasize the myth of Ferragamo; visitors never heard this kind of stories in the official narrative. Each administrator told stories highlighting entrepreneurial qualities, innovativeness, creativity and philanthropic nature of the company founder; visitors showed to have perceived his characteristics. Respondents who paid more attention to the company founder history showed willingness to talk about his characteristics and about the company story; on the contrary they focused on Marilyn Monroe temporary exhibition. It is possible to say that visitors with greater exposure to the brand history built their own sense in a different way, with more depth. With regard to the shoes production process both administrators and visitors recognized '*craftsmanship*', '*care*' and '*attention to materials*' as an essential characteristic of the Ferragamo production. It is important to note that even if the identity expressed and the one sense-made are very tight there is a gap in the narratives and stories communication. This can be extended from the company to the Museum and then from the Museum to the visitors. The Museum does not use monitoring tools and procedures to hear to the visitors 'stories and narratives'. So while the company communicates stories and narratives to the Museum and it that does the same to its visitors, neither of them collects the feedback. As showed in Fig.1 the company manages a tool for the organizational identity expression (more or less deliberately), but completely neglects listening to the visitor's current or past experience (brand awareness, shopping experience, brand perception...). The organization does not maximize the value and strategic potential of the Corporate Museum.

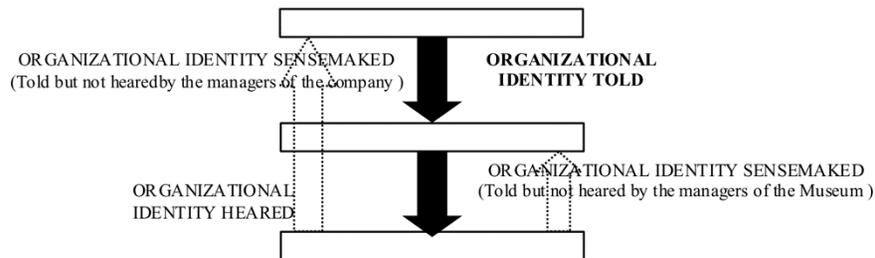

FIG.1: TELLING BUT NOT HERING: AN INCOMPETE NARRATIVE CYCLE

6. Theoretical Implications

It is important to note that, even if in a short period and for a small part of the life of a single organization the researcher took the role of 'sensemaker' in this study. This methodological aspect, based on **Weick** (1979) precept «*How can I know what I think until I see what I say?*» reinforces this study of a single case, despite investigated in depth. The organizational identity definition based on **Albert & Whetten** (1985), extended by **Whetten** (2006) and supported by the results of the empirical study of **Margolis & Hansen** (2002) helps to support its vision as a set of fundamental qualities that remain consistent and stable over time. The study confirms that organizational identity can be framed in its essential attributes ('core purpose' and 'core philosophy') whose characteristic are 'consistency and stability'. The study confirms that individuals are the voice of the organization (**Whetten**, 2006): they are able to share the essential qualities of the identity through the narration. The respondents represent a cross-section of reality able to describe the organizational identity in its core characteristics. They long articulated common themes even in a subjective point of view and using different narratives ad stories. In particular, they used the 'official' narratives showing a clear connection with the history and characteristics of the entrepreneur. Also critical moments in the company history were used to emphasize the myth of the founder and to help to focus on the 'core purpose' of the company, thus confirming the fundamental values of 'corporate philosophy'. It is possible to conclude, in the attempt to reconnect to the theories used, that **Margolis & Hansen** (2002) work allows to clarify the organizational identity distinctive features. Their method provides a stable and consistent support to the identity framed as the relationship between 'core purpose' and 'core philosophy'. The Ferragamo Museum location can be identified as 'space design' in which the organization can express its own identity through a mix of 'seeing and telling' confirming **Yanow's** (1998:7) definition of Corporate Museums. This study also supports **Nissley & Casey's** (2002:11) view of Corporate Museums a strategic tool to manage for organizational identity communication. According to the two scholars, what is exhibited in the Museum «*tell and retell the organization's story trough the verbal and written text and exhibits*» ad can be strategically managed through the 'politics of remembering and forgetting'. The results increased the understanding of the sensemaking process dynamics and content (**Weick**, 1995; **Schwandt**, 2005). As 'meaning makers', Ferragamo Museum visitors indicated as 'core purpose' of the company the one to 'produce luxury footwear with high quality and craftsmanship'. They focused on the founder history key elements such as is attention to the production process and to the study of the anatomy of the foot, as well as to his care to materials choice and use. Someone also made use of personal stories in order make connections to the museal experience. The study confirms that **Fisher's** (1984, 1987) 'narrative paradigm' provides a general theoretical perspective within

to frame the results related to the connection between the expression of identity and visitors meaning attribution process. The stories told by both administrators and visitors are part of a larger narrative that expands the connections and relationships between the company expressed identity and the one sensemade by visitors. The administrators have told stories from their 'internal' perspective, in most cases referred to the founder characteristics and to his creativity. Visitors also told stories drawn from their experience introducing it by the locution '*I did not know that...*', '*I was surprised to know that...*'. This confirms that respondents can be considered as 'story window' through which it is possible to see the corporate identity expression and to reconstruct the sensemaking process (Czarniawska, 1997, 1998; Weick, 1995; Schwandt, 2005).

6.1 A dialogue with the organizational identity literature

The work confirms that the primary source of a stable and long lasting organization identity resides in the company founder story (cfr. Whetten, 2006). The leader who more influenced the organization is the one that most characterizes its identity (Cfr. Cavanaugh, 2005). The strong link with the founder, and therefore its 'myth' supports the stability of organizational identity (Cfr. Margolis & Hansen, 2002).

6.2 A dialogue with the narrative theory

What emerges from this work is that individuals construct meaning through stories and narratives. Organizational members perpetuate and revitalize organizational identity through narratives. Exploiting the story of the company foundation they are able to create personal connections with it. The Museum amplifies the identity perception through an effective communication (Cfr. Fisher, 1984,1987).

6.3 A dialogue with the 'sensemaking'

The work confirms that sensemaking is something dynamic, built through knowledge experience. The sensemaking process in the Museum can be explained: it is activated by stories and narratives told in the Museum. These stories amplifies visitors' brand and product experiences (Cfr. Weick, 1995). The visitors are able transpose in a linear and undistorted way the message that administrators were set to transmit (Cfr. Walsh, 1995).

6.4 A dialogue with corporate Museums studies

The results demonstrate empirically that corporate Museums play a boundary line role between the organization and its identity. In Corporate Museums sensemaking and learning occurs and it is possible to clarify the process (Cfr. Nissley & Casey, 2002). What is not confirmed by the study is the conviction of Kavanaugh (1999) according to which what visitors learn can not be explained.

7. Limitations and Future research Directions

Despite the non-generalizability of the results due to the nature of a single case study, although investigated in depth, it is possible to compare it to the results of other theoretical and empirical works. Anyway some question emerged and could represent a guideline for the future research directions: How could the case of Salvatore Ferragamo be investigated in a different theoretical perspective but maintaining the aim to clarify the nature of organizational identity and in particular the role of the Museum in communicating that identity? How could it be otherwise treated the relationship between organizational identity, its expression and sensemaking? Can an alternative method be used for the data collection? Is it possible not to influence the results?

Future research direction could be focused on: expand the research to a larger number of cases; understand if the mythological component of the story of the founder amplifies the process of meaning construction leveraging on the fundamental elements of a culture (the ethics and the morals of a population); check if 'core purpose' and 'core philosophy' - and so the organizational identity- of the Ferragamo are perceived in the same way by people having a different culture, for example by comparing the results of this study for geographical area; clarify, from a theoretical point of view, the relationship between organizational identity core attribute that mutually define the characteristics of its stability and its consistency; test the utility of the sensemaking construct in another Museum, maybe not a corporate one; explore the question of the incomplete circle of communication by applying the dynamics of sensemaking and sensegiving, where sensegiving is the power to influence and inform the conscious sensemaking.

Joint Effects of Message Framing and Evidence Type on Early Disease Detection and Prevention Messages

Keywords: Message framing, evidence type, prevention message, detection message, cognitive processing

Introduction

Message framing is a commonly used health communication strategy that presents the same message using either positive (i.e., gain-framed) or negative (loss-framed) light. In health communication context, a gain-framed message accentuates the benefits of engaging in a health behavior, while a loss-framed message highlights the costs of not complying with a recommended health behavior. Message framing has not only been a much debated tactic in health communication, previous research yielded inconsistent results with regard to framing effects on persuasiveness of health messages (Gallagher and Updegraff 2012). The theoretical framework proposed by Rothman and Salovey (1997) suggests that the effect of message framing on persuasion depends on the type of recommended health behavior. Gain-framed messages are more persuasive than loss-framed messages for promoting preventive health behaviors (e.g., quitting smoking, using sunscreen, regularly brushing and flushing teeth) with a minimal risk (Detweiler et al. 1999; Rothman et al. 1993). However, in case of a message for promoting detection health behaviors (e.g., screening mammograms, cancer screening, HIV testing) that communicates a higher degree of threat of not complying with recommended health behavior; loss-framed messages are believed to be more persuasive. These propositions receive some support (Meyerowitz and Chaiken 1987; Banks et al. 1995; Schneider et al. 2001; O'Keefe and Jensen 2007, 2009; Garcia-Retamero and Cokely 2011). However, findings of other studies do not support the premise (Lalor and Hailey 1990; O'Keefe and Wu 2012).

Health communication literature on the persuasiveness of types of message evidence, especially narrative or exemplar (e.g., qualitative information such as analogies, stories, testimony) versus statistical (e.g., quantitative evidence such as statistics, empirical data), offers ambiguous conclusions. A number of studies found that message with narrative evidence can be more effective than statistical evidence (e.g., Rook 1987; Banks et al. 1995; Cox and Cox 2001; Feeley et al. 2006; Banerjee and Greene 2012), while others report just the opposite (e.g., Greene and Brinn 2003; Slater and Rouner 1996). Other studies conclude that there is no difference in the persuasive effect between evidence types or both types of evidence are equally effective in changing attitudes (Kazoleas 1993; Kopfman et al. 1998; Morman 2000; Limon and Kazoleas 2004). To shed further light on this ambiguity, there is a call for further investigation to understand at what conditions statistical versus narrative evidence produces more persuasive effects (e.g., Greene and Brinn 2003; O'Keefe 2002). In the context of health communication, the present study maintains that the narrative and statistical information elicit different levels of influence on information processing, attitudes, and intentions depending on the type of recommended health behavior.

To date, only three studies attempted to examine the joint effects of message framing and evidence type on health communication messages (i.e., Cox and Cox 2001; Yu et al. 2010; and Gray and Harrington 2011). Cox and Cox (2001) examined this proposition with 174 women in the context of early disease detection behavior (i.e., communicating the use of mammography), which concludes that positive anecdotes are less persuasive than negative anecdotes. But the focus of Yu et al.'s study was prevention (i.e., communicating fetal alcohol spectrum disorder, FASD). Their study relied in a small convenient college student sample ($n=213$) and offered mixed results in which both loss-exemplar and gain-statistical appeals had been found to have unique advantages in predicting attitudes and behavioral intentions toward FASD. Another experimental study by Gray and Harrington (2011) examined framing-evidence interaction effects in the context of prevention (i.e., physical exercise) using a sample of 345 college students but their results do not provide empirical support.

Scholars stress that there is a need for more empirical research to examine the contexts in which health messages are more persuasive (e.g., Cappella 2006; Gallagher and Updegraff 2012). Researchers also call for more substantive research to examine the relative effectiveness of loss- versus gain-framed messages and their interaction effects with narrative and statistical evidence in motivating prevention behaviors (Cox and Cox 2001; Gray and Harrington 2011). Yet, no study has examined the efficacy of framing-evidence interaction simultaneously in the

contexts of disease prevention versus detection as stressed by Rothman and Salovey (1997). The current study aims to fill the gap and proposes a comprehensive framework that will examine the combined effects of message framing and evidence type in both detection (mammography) and prevention (quitting smoking) contexts. Understanding how evidence type would interact with message framing and how such interaction affects consumers' attitudes and intentions are important for practitioners engaged in spreading health messages as they usually blend message-framing elements with different types of evidence within their advertising messages.

Spending on health communication in low-income courtiers continues to rise, especially to promote disease prevention (e.g., condom use, anti-smoking) and detection (e.g., eye examination, cancer screening). Most research on message framing and evidence type have been developed and tested in developed and western countries, primarily in the United States, but their influence on the health behavior of population in non-Western countries received little attention and therefore, our study centers on those issues in a non-Western context.

Rothman and Salovey (1997) indicate that cognitive processes may mediate the influence of framed information on health judgment and behavior. Similarly, the efficacy of narrative versus statistical evidence may be rooted in differences in the psychological processes that mediate the impact of message evidence on persuasion (de Wit, Das, and Vet 2008). Another study asserts that the persuasive effect of message evidence is generally believed to rely on cognitive processing of the presented information (Reinard 1988). Our study will contribute to literature by exploring mediating role of cognitive processing when examining the effects of message framing and evidence on attitudes and behavioral intentions.

Proposed Model and Propositions

We propose a comprehensive framework for understanding how a loss-gain framed message combined with statistical-narrative evidence directly and indirectly influence effectiveness of preventive versus detective health messages. Our arguments rest on the premise that the persuasiveness of these strategies can vary depending on the purpose of health messages. For example, a loss-framed narrative message, as compared to a gain-framed narrative message, could influence an individual's attitudes and intentions relatively in a different way while promoting a preventive care rather than recommending a detection behavior.

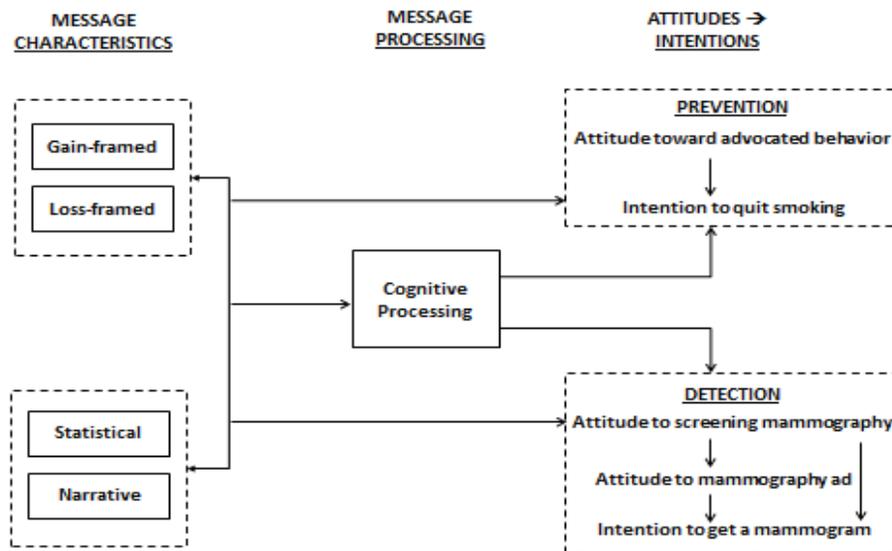

FIG.1: A MODEL OF MESSAGE FRAMING AND EVIDENCE IN PROMOTING PREVENTION AND DETECTION

Message Framing-Evidence Type Effects on Attitude and Intention

According to prospect theory, persuasiveness of messages partly depends on how these messages are framed (Tversky and Kahneman 1981). The theory shows that a negatively-framed message that accentuates the costs of not complying with recommended health behavior can be effective for advocating a high-risk health behavior (e.g., disease detection behavior). Some empirical evidence has been found to support this contention. For example, Meyerowitz and Chaiken (1987) revealed a superior influence of a loss-framed pamphlet over a pamphlet with arguments framed in gain language in improving women's breast cancer screening attitudes, intentions, and behaviors.

Exemplification theory (Zillmann 2006) indicates that exemplar information can be more persuasive in influencing attitudes and behaviors than statistical evidence. One reason is that narrative messages are easy to process and retrieve from memory (Gray 2009).

Literature also uncovers that loss-framed messages combined with narrative information can be persuasive in promoting detection behavior (especially endorsing a mammogram) because such messages emphasize risk and deliver more prevailing arguments of not complying with the recommended behavior (Cox and Cox 2001). A loss-framed message elicits higher levels of severity and fear than the gain-framed message when presented within the context of narratives rather than statistical evidence (Yu et al. 2010). Thus, we predict the following:

Proposition 1: For a narrative message promoting early disease detection, loss-framing will be more persuasive than gain-framing.

In regard to preventive health communication, people are more receptive to gain-framing than loss-framing messages because preventive behaviors have few negative consequences (Detweiler 1999; Rothman and Salovey 1997). Prospect theory suggests that a positively-framed message that highlights the benefits of complying with advocated behavior can be effective in promoting a low-risk behavior (Tversky and Kahneman 1981).

Research also indicates that a narrative message may not be effective when promoting a low-risk health behavior and it indeed may demonstrate a boomerang effect. In contrast, health communication with statistical information can be more persuasive in promoting preventive behavior. Few studies found some support for the notion that statistical messages as opposed to narratives are more persuasive (Greene and Brinn 2003; Slater and Rouner 1996; Allen and Preiss 1997). For example, Greene and Brinn (2003) found an advantage of statistical messages over narrative messages in reducing use of tanning beds. Additionally, *alcohol education messages with statistical evidence were rated more persuasive and believable than anecdotal evidence among individuals for whom the message was congruent with recipients' own values regarding alcohol use* (Slater and Rouner 1996). The Elaboration Likelihood Model (Petty and Cacioppo 1986) further suggests that statistical evidence can be persuasive among the message recipients who are highly involved with the topic.

A study suggests that a prescription drug advertisement that emphasizes the positive consequences of taking medications combined with statistical message is more effective than using broad statements (Ju and Park 2013). A gain-framed message with statistical appeal demonstrates a stronger impact on an individual's perceived external efficacy (one's belief that a particular disease can be prevented) and perceived internal efficacy (one's beliefs about her/his ability to prevent disease) than loss-framed statistical message appeal (Yu et al. 2010). Based on the above, we postulate that a message suggesting benefits of not smoking combined with statistical evidence will be persuasive in encouraging quitting smoking.

Proposition 2: For a statistical message promoting preventive care, gain-framing will be more persuasive than loss-framing.

Mediating Role of Cognitive Processing

Two dominant theories of persuasion namely the Elaboration Likelihood Model (Petty and Cacioppo 1986) and the Heuristic-Systematic Model (Chaiken 1980) state that people *can engage in either systematic/cognitive or heuristic/peripheral information processing* and attitude change may take place through one of these forms of processing. Cognitive processing occurs when individuals engage in a careful, effortful, and deep thinking about the advocated messages. Under cognitive processing, people actively attempt to understand and evaluate the message's arguments and attitudes are then formed based on the conclusions from this careful consideration of the information. Thus, cognitive processing relies heavily on the strength of message content and how the messages are presented. The current study

centers on cognitive aspect of information processing because health communication campaigns associated with prevention and disease detection behaviors involve perceived risk of not following the recommendations.

Message framing strategy can determine how a message is scrutinized and processed. When individuals are involved with an issue that embraces potential threats (e.g., breast cancer), negatively worded arguments with vividness of stories should lead to a higher level of cognitive processing than the abstract messages containing only numerical or general statements (Rothman 2006). *Because* loss-framed messages promoting more extreme outcomes, especially those that are arousing, require more resources to encode and elicit more cognitive thoughts than gain-framed messages, individuals are likely to engage in more extensive message processing (Smith and Petty 1996; Leshner and Cheng 2009). In contrast, gain-framed messages can produce a higher level of cognitive processing, when individuals are not involved with an issue or the relevance and salience of an issue or a situation to them is relatively low such as engaging in preventive care (Rothman 2006).

Reinard (1988) argues that the persuasive effect of message evidence depends on cognitive processing of the presented information. Narrative evidence is superior in conveying personal health risks than statistical evidence (de Wit, Das, and Vet 2008). Studies show that subjects in high-risk condition, compared to low-risk condition, are more likely to engage in higher levels of message processing (Maheswaran and Meyers-Levy 1990; Meyers-Levy and Maheswaran 2004). According to Gray (2009, pp 9), “Narrative featuring characters within a health context may be more persuasive due to these elements of cognitive processing, likely as long as characters are representative, issues are salient to the targeted population, and information is presented in a vivid manner.”

In line with some studies (e.g., Reinard 1988; Rothman and Salovey 1997; de Wit, Das, and Vet 2008), *it is our contention that* the joint effects of message framing and evidence type on attitudes and intentions will be mediated by cognitive processing. We argue that message framing might interact with evidence type through cognitive processing because specific combination of evidence and frames might generate greater levels of cognitive processing which in turn positively affects attitudes and intentions.

Proposition 3: Cognitive processing will mediate the combined effects of message framing and evidence type on attitude and intention.

- a. For a narrative message promoting early disease detection, loss-framing will lead to greater cognitive processing which in turn is positively related to attitude and intention than gain-framing.
- b. For a statistical message promoting preventive care, gain-framing will lead to greater cognitive processing which in turn is positively related to attitude and intention than loss-framing.

Relationship between Attitudes and Behavioral Intentions

The theory of planned behavior (Ajzen 1985) states that behavioral intention is formed in part by an individual’s attitude. Thus, attitude toward advocated behavior can shape one’s intention to quit smoking. Likewise, an individual’s intention to get a mammogram is formed by one’s attitude toward screening mammography as well as one’s attitude toward mammography advertisement.

Proposition 4a: Attitude toward advocated behavior about smoking is positively related to intention to quit smoking.

Proposition 4b: Attitude toward screening mammography is positively related to attitude toward mammography advertisement. Both attitude toward screening mammography and attitude toward mammography advertisement are positively related to intention to get a mammogram.

Conclusion

Message framing has been a much debated approach in health communication and prior research yielded inconsistent results with regard to framing effects on persuasiveness of health messages. Similarly, previous research that examined the effectiveness of narrative versus statistical evidence offered ambiguous conclusions. To shed further light on this ambiguity, our study proposes a comprehensive framework that will examine the combined effects of message framing

and evidence type in both detection (mammography) and prevention (quitting smoking) contexts. The current study also investigates the mediating role of cognitive processing when examining the effects of message framing and evidence on attitudes and behavioral intentions.

Corporate Success: An Analysis of Customer Engagement and Brand Loyalty

Abstract

In main aim of this paper is to analyze how customer engagement affects the brand loyalty of a company let it be a well-established multi-national company or a recently started company. In this world with an ever growing population, for a brand to make its impact on the customer is very important to survive. A study of how the profits get affected by the high end users on famous brands will be analyzed. This depicts whether the product should continue to be in the market or if it should be scrapped. The paper concludes with the proof that having a product not necessarily increases the profits of a company but having a well- defined and an ever growing consumer base will help the company.

Introduction

Customers are the most important assets to any company, be it a small and medium enterprise (SME) or a multi-national company(MNC), so to retail customers and increase a brand loyalty, marketers target a specific section of a group or a community. The companies also aim towards a high profit margin, so what better to give a profit than a highly reputed brand. It becomes highly important as to learn the schemes and tactics used to handle the targeted portion of customers. What a customer chooses to buy at the end of the day solely depends on him/her. A rich women may settle for a mass produced purse or a billionaire might settle to buy a Honda instead of a Rolls Royce, so this scenario is unpredictable. Therefore these variations in the customers has increased the importance of consumer engagement.

Consumer Engagement as Consumer Behavior

Creating and simulating consumer engagement among each group of the population has become the main aim for all organizations, profitable and non-profitable alike as they would like to expand their business further. A consumer's engagement in the company the method in which makes the company unique so as to strength the investment the consumer made to that company. It is obvious that the positive gains the consumer has received from the company or organization cements the loyalty of the customer to the brand and organization alike, but the company has to make a continuous effort to maintain that loyalty. This can be done in a multiple number of ways, the most common being notifying the customer about the upcoming sales, giving them added benefits of buying from the brand label and to involve in what the customer invests personally.

The most important thing to be noted about consumer engagement is the satisfaction of the customer. This in fact holds good to every product be it a hand-made label or a mass produced good, as if a person is satisfied with the product the loyalty towards the brand or organization increases and the company retains its customer. This in turn leads to word-of-mouth advertising, which is proved to be the most effective way of marketing. It is more likely that a potential customer will believe an existing customer about the product than an advertisement on a television. This proves to be very effective with highly engaged customers.

Objectives

- To show the improvement on sales of a company due to consumer engagement.
- To analyze how companies used consumer engagement strategies.
- To show the need of consumer engagement in today's world.

Review of Literature

The focus of marketing shifted its focus from the product to its consumers after realizing that the consumers can either make or break the brand and the company. Previously firms believed that once their product was out in the market, it would sell on its own; for a while it did as their product was unique and marketing it was unnecessary, but with the coming of the Industrial Revolution and the introduction of mass produced goods, a particular type of product was available in surplus. Now the customer had a variety of options to choose from. Thus firms started losing its customers and hence the profits gradually declined. In order to overcome this, companies began to target specific audiences from each section of the population. Although the products they sell; regardless of whether they are hand-made or mass produced serve the same purpose, the fact that the product had a famous brand name backing it up, attracted the customers.

There is a prevailing conception of customer engagement as a way to create deeper and more lasting customer brand relationships (Kumar et al., 2010) making it important for brands to be successful. When a customer buys a certain product, the first thought that would be in the mind depends on their background, if a customer is a well off, they would think on which new high end label should they explore and if a medium wage earner, they check for durability. Each of these cases hold importance in its own way. If the well off customer likes the new brand label he/she tried, they would market it to their friends and in the process the brand gains a new consumer base of high paying customers or the vice - versa would happen and the firm would lose the customer. If the medium wage earner has the product which lasts longer, the firm gains customers as well, sometimes more than the high end customers, but the profit the company gets varies.

Building a strong brand with significant equity is seen as providing a range of possible benefits for a firm, including greater customer loyalty and less vulnerability to competitive marketing actions or crises, among others (Keller, 2001). Researchers that have studied the effects of different types of brands used a number of different proxies for 'strong' or 'high equity' brands (Hoeffler & Keller, 2003), but ultimately there seems to be an agreement that building strong brands refer to increasing the intrinsic value of a brand, or more directly increasing brand equity.

Research/Methodology

Since the project is an Empirical study project, the information is collected quantitatively by the looking for sources of information from various online sources. An analysis of how big and well named companies such as Rolls Royce is seen as to how they attract their customers. As well as the schemes used by the marketing heads popular fashion companies like Louis Vuitton and Ferragamo to expand their customer base. Additionally, as suggested by Hair et al (2002), some other considerations such as data availability, data quality, costs, and time constraints are taken into account in determining the research design and data sources.

Problem Statement

The question that needs to be answered is that why was consumer engagement needed and why is it important for the success of any brand. One of the reasons is that the earlier approach to marketing which was widely based on advertisements has been decreased by a significant amount in the last few decades. No one these days pays attention to the advertisements playing in the background, they simple mute or change the channel. This is because the audience who watched television in the 1990s and the audience who watch television now are completely different. It is the age group of 18-25 years who generally sit in front of a television and watch shows now, whereas, in the 1990s everyone would watch. Also, the new generation spend most of their time online surfing the net and watching movies online. Though there is a conscious effort to show advertisements on popular websites such as YouTube, it is hardly effective. Hence to capture the attention of a consumer is proving to be more difficult by the day.

The other reason is the fall in the brand loyalty. With the coming of internet shopping and the ever increasing competition. It was a challenge for the brand labels to compete with the difference in prices that were offered by the

online shopping websites which were significantly less as compared to those available in shops. Also with the decrease in the trust with advertisements, it became essential to stimulate consumer engagement to improve brand loyalty.

The introduction of consumer engagement seems like a risky business because it is targeted to only a certain section of the population whereas the other sections seem isolated. A good example of this is how big names such as Rolls Royce and Bugatti aim at high paying customers. They make custom made cars which appeal and attract these customers. This isolates the medium wage earners. The risk these companies take may be beneficial or disastrous. Beneficial if they are able to make a sale or several of the cars and disastrous if no one buys them or recession strikes.

Rolls Royce Study

The English manufacturing company Rolls Royce, would target highly engaged customers. For this they would create custom made cars which would appeal to the buyers as they would be unique and one of a kind. They would manufacture cars with different interiors and the color of the exterior as per the liking of the consumer but retain the structure and the body of the car to be the general one like Rolls Royce Phantom. This sure did attract middle age group of the rich population but failed to appeal to the younger generation. Surely they did want a Rolls Royce, but having a Ferrari or a Lamborghini seemed to be a better option because of the speed and also that they were available as a convertible.

Seeing that they did not hold the attention of the young millionaires, heirs/heiresses and celebrities, Rolls Royce thought out of the box and began to design a new and younger looking model which not only appealed to the middle age group but also to the youngsters. The solution for this came as Rolls Royce Phantom Drop Head Coupe. This new car was like a hybrid between class provided by the Rolls Royce Phantom and the suave provided by a sports car. It debuted in the market on 7th January 2007 and in its first year in the market, made its impact worldwide. The first car to be sold in the US was auctioned for charity, it was bought by a local real estate developer and is said to be the highest bid ever for a newly launched car.

Looking into the sales of Rolls Royce, it sold 805 cars in the year 2006, with the launch of Rolls Royce Phantom Drop Head Coupe in 2007, Rolls Royce sold 1,010 cars with 253 cars being the new convertible. This is a significant increase to the sales for the company, as the convertible is the most expensive model of Rolls Royce surpassing its predecessor.

Rolls Royce has a very meticulous method it uses to meet the expectations of its consumers and to develop its new models to increase its brand loyalty. They keep a database of all its existing customers, when a new idea for a car is in process they keep the customers updated and inform them of any recent developments well in advance. Also, they take into account any added insight the customer has to offer about any changes, glitches or ideas. With this the customers remain ever loyal to the brand and never seem to move very far from it. These days to increase its consumer base even further they plan to come up with a more affordable model for everyone.

Louis Vuitton Study

Louis Vuitton Malletier is a French Fashion House founded in 1854. This popular label is the world's most valuable luxury brand and is known to all. It is ranked number 10 in the world's most Valuable Brands. This brand is known for its leather products, bags, shoes, watches and jewelry. It is one of the most profitable brands with the profit margins approaching 40%. So to keep the profits flowing and to increase the profit margin, the executives of Louis Vuitton Moët Hennessy (LVMH), a parent company to Louis Vuitton, decided to increase the prices of its products because of the increasing luxury - hungry customers in the emerging markets. They aim at getting customers who would not mind paying an extra \$500 over an existing total of \$10000.

With this introduction the sales of the LVMH increased 4.3% in the Paris Trading. This was a good news for Hennessy as it was able to cushion the blow for the decline in the alcohol sales. This however did not prove to be beneficial for the entry level customers who get attracted to the logo printed onto the leather of the bags.

The cause for Louis Vuitton to take such a measure was because in the recent years with the coming of the 'democratic fashion' moment which redefined the borders of luxury; some product with a famous brand name that was considered available only to the rich and exclusive is now accessible to masses due to the collaboration of companies with affordable brands.

For instance, Coach sold a bag worth \$400 in the Chinese market impacting the sales of Louis Vuitton bags in that region. Also Kate Spade which took inspiration from Ralph Lauren's growth strategy, aims on becoming a lifestyle brand offering a wide range of products and creating a diverse portfolio that will attract customers from various backgrounds and incomes.

To counteract this designer brands are rising their prices thinking that making their product exclusive and expensive will therefore make the more desirable over the 'ordinary' goods. With this the company is able to retain its old consumer base and is able to expand it by attracting the new high end customers who want to step aside from the 'ordinary'

Even with the price increase Louis Vuitton seems to maintain its growth rate. The company climbs steadily from with profits of 2,160 million in 2006 to 3,909 million in 2012. It is ever growing and acquiring new and existing brands under its label to make sure the profit and the profit margin stay high.

Findings

Rolls Royce had a good number of sales before the introduction on Phantom Drop Head Coupe but the introduction boosted the sales. Louis Vuitton is known for its high end products, by increasing the prices it made the customers feel one of a kind and important. There is a drop in sales of both the companies in 2009 due to recession, but it was the ability of the companies to adapt itself to this and with the help of its consumer base were able to bounce back into the field with no major losses.

Conclusion

As seen in the research done above, it is safe to conclude that famous label mould their strategies and marketing schemes not only for the change in the growing and expanding market but also to expand its consumer base. It is evident that for a company to gain the maximum profit and to expand it should have good consumer base.

Managerial Implications

A consumer is like a new born infant to a company. The organization has to take care of every need they have and look after it well. The relationship between the customer and the brand develops like the attachment a child has to its parents or sibling. They will value, respect and be loyal to the company. So if an organization is able to cater the needs and desires of any customer they will be loyal.

Expanding the consumer base is similar to when a child or a teenager bring their friends over home for the first time. The child would have already explained how his/her family is but it is the first impression that the family makes on the friends that will creating a lasting impression on them. This determines whether they like you or if they will ever visit the family again. So when a new customer walks into the company for the first time, the way in which the staff or the sales executives are towards the customer depends on whether they will buy any product, keep coming back to shop more and whether they are going to expand the consumer base even further.

The product may be an exclusive and unique but with a bad customer service even a famous label may lose its customers. So more than having a right product a company needs to have proper personnel to make a lasting impression on the consumer and to solidify the relationship between them.

Scope for the Future

The concept of implementing consumer engagement in the stores owned by brands is relatively new. There is a lot of scope for it in the future, especially if brands develop on the concept of interactive experiences sans sales personnel. Also having a well defined sales team will play a vital role in expanding a company's business and hence its future.

**Managing and Evaluating the Corporate Brand:
A Model Suggestion Through the Case Analysis**

Fabrizio Mosca, fabrizio.mosca@unito.it

Cecilia Casalegno, cecilia.casalegno@unito.it

Dipartimento di Management, Scuola di Management e Economia, Università degli Studi di Torino

Managing and Evaluating the Corporate Brand: A Model Suggestion Through the Case Analysis

Abstract

In recent years many authors wrote about the importance of the corporate brand, by defining it as a tool to create value and to attract capital. Investors have confidence in a strong brand, the audience begins to trust in a known brand, as well as suppliers and dealers who want to enjoy the popularity of a certain firm brand when they distribute products.

The recent cases of Unilever and P&G reveal how the focus has been transferred from the product communication to the corporate one, now considered essential for the customer loyalty. Communication campaigns latest aim is to create a long-term relationship between the Group brand and the target audience, rather than "merely" the promotion of products in a period in which the audience receive too many messages related to too many products. The only way to avoid confusion is to communicate and emphasize the corporate brand: this implies a long-term dialogue with different audiences and the first part of this paper wants to investigate how.

The value identification of this intangible asset is possible if there are some reference conditions: first, the corporate brand must be recognizable at product or service level, secondly the corporate brand must be individually identifiable and transferable to third parties generating differential advantages for organizations can use it. The basic condition must be the possibility to identify it as an autonomous intangible asset, that gives to a company and its products and services an identification.

The reference methods to be considered are based on the historical cost basis, on the principle of differential results and the comparative criteria. Some other methods are focused on the systematic identification of loyalty resources connected with the corporate brand. Among the different criteria and methods is to identify which takes to a proper corporate brand evaluation, as intangible asset generating differential advantages in the long run and loyalty value.

The second part of the paper examines what criteria and methods are more appropriate in order to bring out the long-term value of the corporate brand.

Keywords: intangible assets, evaluation, integrated marketing communication, brand value corporate brand, reputation, stakeholder loyalty.

Introduction: the importance to evaluate the intangibles

Business management studies consider intangibles as a source of sustainable competitive advantage capable of creating value for all stakeholders. The intangible assets are formed by a set of generic and specific resources and expertise. The classifications of intangibles are numerous and come from both the doctrine, both national and international accounting standards and there is a substantial convergence of three characteristics that intangible assets must possess (Brugger, 1989): must have been generated by such utility costs deferred in time must be transferable, should be measurable in their value, separately from the other assets. In other word, the investment in intangible assets constitutes a buildup of potential (Vicari, 1992). The brand meets the criteria to be classified as an intangible asset as a summary of a set of resources, skills, investment capable of economic assessment in the long run: this is especially true when we talk about the corporate brand (Aaker, 1991, 1996, 2004a, 2004b). The goal of the present paper is, after having identified the brand as an intangible asset specific, to investigate measurement models of the brand and to identify the economic value of the concept of *brand equity* (Aaker, 1991, Pellicelli, 2010).

To reach the main goal, the present research has the following aims: to carry on a deep analysis concerning the most used and considered brand evaluation methods, to survey the evolution of the importance of the brand and the change of the affecting brand factor evaluation and, finally, to understand which is the most effective way for evaluating an intangible asset.

Corporate brand and firm communication: how to manage a strategic intangible asset

Who studied marketing knows how important can be for every organization to have a strong brand, able to acquire over time importance. Aaker (1991, 2004a, 2004b) considers the brand as a stretch of distinction compared to its

competitors, while Macrae (1991) adds a further suggestion: the brand is a vehicle of communication, is a symbol that refers to corporate culture values, shared inside and outside the organization. This is more true when the firm brand is considered: in this case the concept of perceived quality coming from the brand (Candelo, 2012) is enhanced and is embedded in the whole firm structure and organization. The brand, at this point, is not just a sign, a symbol created to sell more or to reach a better awareness degree, rather we are talking about the sum of what a firm wants to communicate to stakeholders. According to the most authoritative authors (Schultz, 1992, 1993; Kungram et al., 1994; Belch and Belch 1998, 2009), the strategic importance lies in the fact that when you communicate with the target audience a brand, the goal lies not so much in coordinating the communication tools of the brand, rather it becomes the identification of a process "brand communication, execution, continuous assessment, interactive, multi-function capable of integrating all parts of the enterprise to maximize the mutual satisfaction of needs and desired re "(Duncan, Mulhern, 2004). Considering the corporate brand, it is possible to talk about the synergy between the different communication tools: the integration efforts lead to better results than the sum of the effects of individual actions (Casalegno, Li, 2012). This is more true if we consider that nowadays organizations have to build a multidirectional communication plan (Romoli Venturi *et al.*, 2014) in order to give an answer to the stakeholders' need of firms' transparency. For instance, Ulrich and Smallwood (2008) consider how much the brand is today one of the vehicles on which is necessary to, as well as the basis of competitive advantage (Aaker, 1991, 2004b; Pellicelli, 2012; Candelo, 2012), firms' internal communication. If managers want, in fact, the efforts of (integrated) communication give planned effects, the same employees shall be involved in the condition of the vision values of corporate culture. The literature (Bridson, Evans, 2004) asserts that the clear brand identity must start from within the company to reach the values dissemination to the public. This is not all: investors feel more inclined to invest in companies that, in addition to demonstrating significant long-term trend in terms of financial results, prove to have a high index of brand equity (Aaker, 1991) and, in correlation, a high degree of reputation. Finally, brand equity and reputation affect suppliers, intermediaries, public opinion, government agencies. Stakeholders talk to each other, and their views are included in a constant stream of information that can therefore be voluntarily released to the environment by the firm or not. Is a strategic action, therefore, to prepare a communication plan linked to the corporate brand.

The corporate brand and its evaluation as intangible asset

The brand is the synthesis of trusted resources (Busacca, Bertoli, 2009) and of the relationship of the company with the market and is useful for the following functions: differentiation, guidance, assurance and personalization. The brand is an intangible specific susceptible to self-evaluation. At this point it is appropriate to ask some question to reach the issue of evaluation of the brand. What are the role models to identify the value of an intangible asset such as a brand? And should be used methods strictly in the costs incurred for the creation of intangible value and referring to historical data? By contrary, can it be more appropriate to make use of methods based both on costs and revenues, but considering the future? Rather, can be possible to examine models less focused on costs and revenues economic dimensions generated by the asset and intangible related to the identification and measurement of the system of relationships that the brand has developed and developing? The main goal of the present research is to find a right answer, by distinguish between traditional methods and *marketing based* ones.

Corporate brand evaluation models: an overlook on financial income streams methods.

Traditional models of brand evaluation as intangible asset can be divided into cost-based methods, methods based on financial income streams, or comparative empirical methods. The *marketing based* models are the method Interbrand and the *brand rating* one. Traditional methods of brand evaluation based on the costs are intended to measure all future benefits generated by the system of relations connected to the brand, by estimating the monetary resources or costs, which should be used to replace the brand subject to an assessment with one that has the same potential. What we want to determine is an expressive value of a current economic reality, which can ensure in the future the production of income. These revenues are the result of a detailed analysis of the methods of construction and presentation of the resource on the analysed resource market (Vicari, 1995).

The cost based methods are widely used in the practice of evaluation of the brand and are accepted by the

doctrine as they are based on certain factors, such as costs that the company has actually incurred to generate the intangible asset being valued and respect, therefore, the pre-requisite prudence of the evaluation.

More in-depth cost-based methods are:

- the historical cost method;
- the method of historical cost residual;
- the method of the cost of reproduction.

The historical cost method involves estimating all the costs that have been incurred for the generation of the intangible consists of the specific brand. It is a method used in particular for the intangibles in the making, that in the initial phase of the company, when the effectiveness of investment for the creation of the intangible asset is still indeterminable and with it the probability of success is difficult to estimate (Guatri, Bini, 2009).

The residual historical or updated cost method consists of establishing the costs that historically have been necessary in the formation of the intangibles, in their updated monetary and in their eventual removal to take into account the residual value of the specific intangible. In this case the valuation is the result of the sum marketing costs, supported by the company in the past, regardless of whether they are capitalized or expensed in the income statement. Following this reasoning, costs concerning adv investments, promotion, marketing communication, R&D, packaging, distribution channels represent, during the evaluation, the “value resources” (Renoldi, 1992) have become the intangible heritage centred on the brand (Bertoli, Busacca, 2009).

Just possibly the historical cost, restated at current prices, should be reduced by depreciation, taking into account the remaining useful life of the intangible specific and overall life.

On one hand, the market share erosion and, more generally, the marketing and the competitive pressure can lead to a de-valuation of the brand with the consequent need for a depreciation that takes into account this effect; on the other hand it is necessary to note that, often, the intense use of the brand, intended as a diffusion application in a number of product categories, generates an increase of its useful life that makes it not appropriate to take into account in the assessment of a process of amortization (Mazzei, 1999).

The reproduction average cost method is the estimate of the costs that the company should address, at the time of the evaluation, to recreate the specific intangible and system resource value associated with it. In other words, this method aims to estimate the investment needed to create the brand at the moment. In order to correctly identify what are the major investment is appropriate to identify the strengths of the brand, that is, those elements that by the outside are perceived as distinctive components of itself and thus constitute a source of clues competitive advantage for the company that owns the brand. Also, it is important to consider not only the investment in itself, but also the possible changes that the investment suffers as a result of the reactions of competitors (Vicari, 1995), who want to hinder the emergence of rival brand.

Next step is to underline investment timetables and its amount. The cost of reproduction that is identified must, therefore, take into account the state of the asset and this is done through a proportional coefficient between residual life and total life of the asset. Cost-based methods are the most used in the practise of evaluation in Italy concerning the valuation of intangible assets. Despite the frequent use, such methods bring with them some weaknesses such as the proper determination of costs relevant to the creation of the resource, the treatment of competitive dynamics and the temporal behaviour of the investments made for the regeneration of the resource. In addition, the cost method does not consider the flow of expected future benefits. The methods based on financial flows results measure the value of the brand determining the present value of future benefits that the resource can potentially generate over its remaining useful life¹.

The future benefits are measured by economic variables (income streams in different configurations) or monetary (future cash flows in different configurations).

The theoretical principle behind these methods is that the brand has a value because it can generate future income or financial flows. In other words, the competitive advantage resulting from the ownership of the brand, its exploitation and resources related to it, translates in positive cash flows for the company that owns it. If the brand is transferred to a third party, it should be able to ensure positive cash flows similar in the future.

¹ As indicated in IFRS 13 principle.

The methods of evaluation based on the financial flows of the result are: the premium price and the cost method of loss. According to the premium price the brand generates specific and measurable differential advantages. The consequence is that the method is based on measuring, for a time horizon of reference, of the differential advantages (Simon, Sullivan, 1993) that the brand brings to the company. In other words, the value of intangible asset in question emerges from the difference between the income that is attributed to a system of products and services with a strong brand and revenue achieved by the use of a system of products and services that identical is devoid of a brand or a brand identified with weaker than the previous one. The differential income is measured in terms of revenues and costs. The higher revenues obtained by applying the premium price obtainable from the exploitation of the brand qualified to be reduced costs, sometimes higher, connected to the high quality of the product, communication and distribution. The advantage gained by this simple operation must then be updated with reference to its probable duration, in years, by applying an appropriate discount rate. Luxury brand can apply to products and services higher prices losing a small percentage of the market share, even in the face of a higher price. The summation of positive and negative variations among $+\Delta$ final price, $-\Delta$ selling costs, $-\Delta$ production costs, $-\Delta$ promotion costs takes to net differential margin ($\Delta\mu$). The result of multiplication of the net differential margin, the total revenues for the sale of the product with the brand and the discount factor in relation to the useful life of the brand $a_{n/i}$ determines the value of the brand.

All these elements help to define the intrinsic value of the asset, critical to the identification of the net differential margin. The method of discounting the differential results is criticized as the most accepted doctrine believes that focuses exclusively on price.

The loss cost method consists (Guatri, Villani, 2010) in the estimation of the damage hypothetical estimate obtained in terms of a fall in the contribution margin and the occurrence of excess costs, the firm would have to bear if the availability intangibles were not. In this model, the calculation goes on for the entire time period necessary to restore the equilibrium and normal. The estimated losses should be discounted. The comparative or empirical methods are quite popular in the practice of evaluation of the brand as intangible asset and the value judgment based on references taken directly from the market taking into account, if any, in comparable transactions. The preconditions to ensure that these methods are properly applied are the ability to identify a representative set of temporally associated transactions at the time of evaluation, the ability to objectively identify the reference values of the transactions mentioned above, the ability to effectively compare and the homogeneity between the assets being evaluated and the comparables in the reference industry.

In the practice of evaluation is often not easy to identify which brands are actually comparable and especially the reference values of the transactions. More in-depth, empirical methods of evaluation or comparison are: the comparable transactions method, the royalty rate method, the method of differentials and the method of multiple multiples implied.

The comparable transactions method consists (Guatri, Bini, 2005) on the recognition to an intangible asset of a certain value corresponding to the prices have been applied in recent transactions for similar items.

This method requires that the substance of transactions compared is really homogeneous, in fact, otherwise the prices cannot be considered comparable and it is therefore necessary to have information about transactions in the time horizon of three to five years earlier. The royalty rate method determines the value of the brand based on the royalties that it could provide to a hypothetical holder of the same. This method has as a prerequisite the theoretical assumption that a person would be willing to pay an amount to obtain the right to use and then the economic exploitation of a specific intangible asset.

The royalty rates method is the best known of the comparative criteria and is based on market information, ie the annual royalty applied in the event of sale in use of comparable brands. The royalties are estimated in most cases with reference to the revenue generated by that mark, then a percentage of the turnover of the company and the royalty rate is based on a comparison with similar cases. Finally, the royalty streams, since they are distributed over a period of time, must be discounted and it is necessary, in order to choose the royalty rate (r), to have an adequate number of transactions, representative and transparent, for a reliable reference.

The choice of the royalty rate to be applied (Bini, 2005) must even consider the *brand power* (f_m) related to: ability to operate actions of brand extension, uniqueness, incremental profit margins, protection, additional sources of

competitive advantage guaranteed by brand, market entry barriers, legal protection, stage of the life cycle of products and services that resulted in the brand being evaluated. A variant of the royalty rate method is the royalty relief method that identifies potential royalties that the company owning the brand should correspond to a third party if he did not have that intangible asset for the right of use thereof. The critical issues outlined above is also confirmed in this method that is based on the identification of references anyway comparable. The implied multiples method is used to identify multiples to be applied to intangible asset subject to valuation. The multiples correspond to standardized prices and the economic rationality lies in the possibility, given to the owner, of economic exploitation of the intangible asset on a medium to long time horizon. The method of differential multiple sales can be used for the evaluation of the brand value when a company listed on a regulated market which has a recognized brand and can be compared with another company ever listed that does not hold a relevant brand. In this case the value of the brand is determined as the difference between the enterprise value of the two companies. (Damodaran, 1994).

Corporate brand evaluation models: an overlook on marketing based methods.

Financial evaluation models seen so far can estimate brand value through economical and financial flows. These models don't consider real value sources represent the base of these flows

Marketing based methods try to evaluate the sources of the value; they analyse factors determining brand power. These factors are the real source of financial and economical flows. How is it possible to estimate in practice the factors that determine the brand power and what are they? A brand has a certain value starting from: the market/the sector (number of competitors, competition intensity, potential new treats, other brands market power, market dynamicity), short term product results, long period product results and treats connected to the brand image (vulnerability), *brand extension*. The problem connected to this kind of evaluation model, based on marketing factors, is how to pass from brand power factors analysis to their synthetic evaluation. The logic path is composed by two phases: first of all the identification of brand power and value factors is fundamental, then a translation of theme in quantitative terms is needed. This second step allows to obtain *multipliers of a economics quantity*. By the way, it is possible to identify two used and known methods: the Interbrand² and the Brand Rating ones. The first one links brand power factors to the brand value itself (Jensen, Murphy, 1990). Evaluation process inputs are the results of some internal and external marketing and motivational researches, they also can be firm available information. Brand power source factors are translated in a numerical values scale and a weighting is assigned to every value.

To these values the evaluator can refer in order to chose the multiple of P/E³ to apply to the flow generated by the brand. Summarising, the Interbrand method is based on the identification of: brand return, brand power, *multiplicative coefficients* (is consider the P/E when a public company is evaluated, while, when the aim is to evaluate a private one, other marketing or empirical indicators are considered). The brand return is expressed through the weighted average of the last years revenues. The brand power is identified through several factors: leadership (concerning the brand market position), the brand stability (concerning the consumer loyalty. This is the base of the concept of *brand equity*), the market (concerning the total demand stability. This is important because brands developing in market without a stable demand are considering week, even if they have a strong market position). Other factors are: the degree of internationalisation, the brand trends, the marketing investments amount (it helps the brand to develop itself), the presence of international legal brand protections. Factors able to represent not just the brand power, but also its present and future configuration are rated on a scale from 0 to 100 and the relation between the brand power and coefficients is expressed through a *S curve* based on the experience, when on the x-axis is indicated the score representing the brand power (to 0 to 100), while on the y-axis is indicated the multiplicative used coefficient.

The multiple is equal, in the majority of the cases, to the maximum value of the market current P/E, so it can be different depending on sectors and on time. The multiple has to be applied to the performance measure, which Interbrand determines as the last three years profit difference between two comparable firms.

The Interbrand method is easy but, at the same time, is based on several and subjective assumptions

The Brand Rating method (Guatri, Bini, 2005) has the aim to evaluate through a marketing based approach

² Interbrand is a worldwide company with the principal aim to give a method of brand evaluation. See: www.interbrand.com.

³ P/E: Price/Earning

and it examines three components: brand iceberg (concerning the brand qualitative performance and its level of loyalty), the price differential (the difference among the analysed brand price and other unknown brands price) *brand future score* (it consider the long term brand potential).

Research design and major findings

The present research considers at a first glance the Interbrand methodology to evaluate world major and most known corporate brands. The aim is to underline if the used methodology could valuate the real corporate brand value, without considering balance sheet based ways to evaluate the brand.

First of all, as already explained, Interbrand recognises that “the influence of brands on current and prospective customers is a particularly significant driver of economic value” (Interbrand, 2013). For this reason, considering the communication importance a brand has toward various stakeholders, Interbrand’s brand valuation methodology is designed “to take all of these stakeholders and value-creation levers into account” (Interbrand, 2013). The evaluation considers management and employee (internal) and customer (external) factors; these marketing inputs are evaluated in a system in which also financial evaluations matter. The brand is evaluated considering the three following dimensions: financial, brand managerial, strategic. Concerning the financial dimension, considered factors are: investor relations, mergers and acquisitions, licensing/royalty rate setting, tax valuations/transfer pricing, balance sheet valuations and asset-backed financing. Brand managerial ones are about: brand performance management, brand portfolio management, brand roadmap development, resource allocation, brand tracking/dashboards, return on investment analysis, sponsorship evaluations, senior management KPIs. Eventually, strategic factors are about the positioning, the architecture, the launch and the extension of a certain brand, plus the analysis of the business case coming from the brand investment.

Secondly, in order to establish the most effective methodologies for managers and professionals, qualitative interviews have been carried on during the last 2 years. It has been verified a sample of more than 100 people among managers, consultants, firm owners and their considerations about best brand evaluation methods have been tested through qualitative and single interviews. Results and interviewed’ impressions are now reported in the present research. Eventually, a corporate brand sample analysis has been carried out (chosen among surveyed firms in the last 2 years and considering the major degree of awareness came out from managers and professionals sample interviews) in order to understand the most used evaluation appraisals. The following table reports analysis results without showing analysed corporate brands in order to defend observed firms.

TABLE 1 – CORPORATE BRAND EVALUATION METHODS

CORPORATE BRAND	BRAND VALUE (€/000)	COUNTRY	USED APPRAISAL	AWARENESS AMONG INTERVEIWED
Corporate brand α	280.000	Italy	Relief from royalties	40%
Corporate brand β	150.000	Italy	Relief from royalties	35%
Corporate brand γ	130.000	Italy	Comparable transaction	45%
Corporate brand δ	115.000	Italy	Comparable transaction	60%
Corporate brand ϵ	50.000	Italy	historical cost method	40%
Corporate brand ζ	21.000	Italy	historical cost method	45%
Corporate brand η	20.000	Italy	historical cost method	55%
Corporate brand θ	17.000	Italy	cost of reproduction	55%
Corporate brand ι	15.000	Italy	cost of reproduction	65%
Corporate brand κ	7.000	Italy	historical cost method	70%
Corporate brand λ	5.000	Italy	historical cost method	55%

Corporate brand μ	2.000	Italy	historical cost method	65%
Corporate brand ν	1.000	Italy	historical cost method	65%
Corporate brand ξ	300	Italy	cost of reproduction	65%
Corporate brand \omicron	150	Italy	cost of reproduction	70%
Corporate brand π	70	Italy	cost of reproduction	75%
Corporate brand ρ	20	Italy	historical cost method	45%
Corporate brand σ	10	Italy	historical cost method	55%
Corporate brand τ	9	Italy	historical cost method	45%

As we can observe in tab. 1 the most adopted evaluation model for corporate brand in the practise of Italian evaluation are still the traditional methods. This is also confirmed by the qualitative interviews that have been carried on during the last 2 years on a sample of more than 100 people among managers, consultants, firm owners. In this case they confirm the efficiency of Marketing Based Method but most of them declare that they are not ready to use them as main methods of evaluation, eventually they use the marketing based as control methods.

Conclusions

The corporate brand value determination may be effected by different models. The traditional are solidly anchored to the economic and financial results, while marketing based ones turn their attention to the system of cognitive relations of the company with the market, present and future relations. Brand value directly comes from its elements' capacity (perceptive and fiduciary) of making actual market relations stable and developing new relations for the future. Marketing based models appear as more adequate to better identify corporate brand value, even if sometimes they don't reach objective results: this could suggest to jointly adopt the two kind of models, when possible.

Eventually, financial models are nowadays the most used in the context of professional Italian brand appraisal practice, especially for Court appraisal, while at an international level the marketing based ones are the most considered in addition to traditional ones or as control models. This happens because the marketing based models consider the future: they pay attention and analyse relations a brand acquires with the firm system time after time.

Even if the major use of traditional methods (financial and economical ones), it is clear that these don't consider the real brand value sources, because they consider results are historical or future. Marketing based methods pay major attention to the identification of real sources of corporate brand value by taking in to account the long term run and the brand real scenarios.

Further steps in next researches can focus on ways to use traditional as well as marketing based methods in an integrated perspective in order to represent the real corporate brand value the best way is possible, considering that corporate brand is not just connected to goods or services.

**Symbolically valuable for the customer?
- A longitudinal analysis of the interlinkages between brand and relationship
development activities of a furniture manufacturer**

Abstract

This paper addresses the symbolic dimension of providing resources for value (co-)creation in business relationships. Prior research on resources in business relationships has predominantly examined their connectedness and embeddedness from more technical, economical and organizational perspectives, while discussion on the immaterial and symbolic aspects of resources has been sparse. To fill this gap in the existing network literature, we draw on frameworks developed within the service-dominant logic, where the role of brands and symbols as resources has recently begun to receive increasing attention as significant elements in the value co-creation process. This paper offers an increased understanding of the role of the symbolic dimensions of the firm's offering for the acquisition, development and retention of customer relationships. A longitudinal case study of a furniture manufacturer is used to empirically illustrate the role of symbolic resource development manifested in e.g. design and branding efforts, and its interlinkages with customer relationship development.

Keywords: symbolic value, brands, customer relationship management

1. Introduction

Within the marketing discipline, the acknowledgement of symbols and intangibles as a fundamental part of exchange goes back many decades. Sidney Levy emphasised already in his 1959 article that sellers of goods are, wilfully or not, engaged in selling symbols and Theodore Levitt (1981), in a similar vein, drew attention to the amount of intangibility of all products, whether being a good or service. He pinpointed the difficulty of assessing, experiencing or pre-testing not only services, but even physical products in advance. And when the buyer cannot fully do that, metaphorical surrogates for tangibility receive an increasing role. Levitt (1981:97) stated that “the less tangible the product, the more powerfully and persistently the judgment about it gets shaped by the packaging – how it's presented, who presents it and what is implied by metaphor, simile, symbol and other metaphors for reality”.

The vast literature on brands and meanings, which has followed along these footsteps, has mainly had a consumer marketing focus, while branding research in B2B settings has been sparse (Ballantyne & Aitken, 2007). The nature of business markets does indeed differ from consumer markets in many respects, for instance with regard to the number of individual buyers and the degree and depth of interaction between buyer and seller (see for instance Ford *et al.*, 1998). But even though the brand literature is mostly interested in the final customer and business marketing in the relationships between companies, it does not mean that the symbolic aspects of exchange would not be of relevance also in business-to-business interaction. The intermediate actors, such as retailers and resellers do also act as customers, who evaluate the offerings of their suppliers Business network scholars Håkansson & Waluszewski (2002); Håkansson *et al.* (2009) for instance point out that when actors are making decisions about physical resources (such as products) it is not only the resource in itself that is considered, but also the image of it. This means that the actors evaluate the business partners' resources also on an intangible level, based on perception, assumption, knowledge and representations.

The discussion on the role of these intangible and symbolic aspects and empirical studies that would focus on examining them, have been particularly limited in the business network research tradition. However, another theoretical stream, which shares a similar perspective on the interconnected nature of business exchange and focuses on the interaction (although usually labelled ‘integration’) of resources for joint value creation (or ‘co-creation), is the service-dominant (S-D) logic of marketing (see Vargo & Lusch 2006 for the principles of S-DL, and Ford 2010 for a comparison with the business network approach). Within this theoretical stream, there has recently been increasing interest towards brands, meanings and symbols as a significant part of the value co-creation process (see e.g. Peñaloza & Venkatesch, 2012; Flint, 2006; Ballantyne & Aitken 2007; Brodie, Glynn & Little 2006; Brodie 2009). Some of the S-D L based studies, such as Fyrberg & Jürriado (2008) and Akaka, Corsaro, Kelleher, Maglio, Seo, Lusch & Vargo (2014) even focus more explicitly on the network level, which brings the discussion even closer to the starting point of this research. Even

though Akaka *et al.* (2014) use the term *service ecosystem* (see Lusch & Vargo, 2014) rather than *network*, they still refer to market interactions on a network level, involving multiple firms, suppliers and customers, which in our opinion resonates well with our business networks viewpoint.

Akaka *et al.* (2014) call for more empirical studies on the role of symbols in value co-creation, as they state to “only have begun to scratch the surface for understanding the particular processes by which symbols guide the coordination, communication, integration and evaluation in service ecosystems”. This provides an indication of the significance of the topic of our study, also from the perspective of the service-dominant logic.

Even more importantly, our aim is to fill the gap in the business network literature’s discussion of resources concerning the role of symbolic resource aspects. To do this, we draw on the aforementioned S-DL – based conceptualizations in order to explore how brands and other signs are used as symbolic resources that firms provide for their (retail) customers and their value proposition to final users. We delimit our perspective by focusing particularly on the provision side of resources, i.e. from the selling firm’s perspective, how they attempt to relate their offering to the various customers (business relationship level), and indirectly, help them provide value proposals for consumers.

After presenting the theoretical standpoints of the paper in the next section, we continue with an empirical account of a case study from the furniture industry. The case, which comprises longitudinal data from a period of 15 years, illustrates how brand and product design provide symbolic resources for business relationships. In the analysis, we examine the dynamics and interlinkages between the development of symbolic resources and customer relationships and we conclude with a discussion on the role of symbolic resources in being valuable for the customer.

2. Theoretical background

The concept of resources

Our conceptual starting point is the notion of resources. We apply the business network research tradition’s (IMP) broad view of resources as *anything that has known use*, be it a product, facility, organizational unit or a relationship (Håkansson & Snehota 1995; Håkansson & Waluszewski, 2001). The IMP view on resources has particularly emphasized the interconnectedness and embeddedness of resources, i.e. that the value of a resource is dependent on with which other it is combined. Therefore, it is argued that resources are best understood from an interaction perspective, as a relative phenomenon, rather than regarding them as “given” assets of an organization. In the context of this paper, this approach to understanding resources draws the attention to the way in which the focal company attempts to make the resources it offers (the focal resource here being the product it sells) align with the resources of the customer, e.g. its assortment, that it in turn offers to the final customer. This reflects the dual nature of resources discussed by Håkansson & Snehota (1995), that a resource has both a provision side and a user side; the resource that the selling firm offers, is used as a resource by the buying firm. From the management point of view, the question is thus to attempt to provide resources that are as useful as possible for one’s business partners.

The service-dominant logic (see Vargo & Lusch, 2006) basically adheres to the same notion, although with more emphasis is on the outcome of resource use, i.e. value (see Ford, 2010) and how it is co-created. The S-D L literature also approaches resources from a more networked perspective, with the semantic distinction that they use the term ‘resource integration’ to correspond to IMP’s ‘resource interaction’. The service literature, being more concerned with value realization for the final user, than the IMP perspective, uses in our perspective the useful concept of *value proposition* (see Vargo & Lusch, 2006) for dealing with the interface between resource provision and resource utilization to describe the selling firm’s aims to provide valuable resources, without fully knowing if and how value actually will become realized for the customer. Service scholars (see e.g. Grönroos 2008) refer to the notion of value-in-use, i.e. that value is not delivered by the supplier, but something that takes place in the customer’s sphere. Grönroos (2008) argues that the role of the supplier is thus to be a *value facilitator* in the process of value creation. In this paper, we will not delve into the value discussion, but remain on the level of the resources, seeing them from the focal firm’s point of view as a value propositions towards its B2B customers and, eventually, the final users.

Symbolic resources

As we referred to in the introduction, the IMP discussion of resources has not dealt particularly with the symbolic aspects that are in the focus of this paper. Also within service literature, Brodie, Glynn & Little (2006) criticized the lack of attention to branding in the original S-D L article by Lusch & Vargo (2004). Subsequent work within S-D L has to some extent begun to address also these aspects, even though Akaka *et al.* (2014) still call for more empirical studies for a deeper understanding of the role of symbols.

Symbols can be seen as institutions that influence resource integration and exchange (Vargo & Lusch, 2011). Levy (1959:119) defines them as “ instances where experience is mediated, rather than direct; where an object, action, word or picture, or complex behavior is understood to mean not only itself but also some other ideas or feelings”. A way to study symbols and signs is through semiotics, which suggests that actors assign meanings to signs, which then become symbols, according to particular “rules” of interpretation that define their social world (Peirce 1932 in Akaka *et al.*, 2014). Symbolic interactionism explores how individuals attach meaning to interactions within a social context, which is largely facilitated by symbols. (Akaka *et al.*, 2014). Meaning is not seen as inherent in objects, but as emerging from social interaction, with humans as active interpreters and modifiers of meanings. (Flint, 2006) An interactive perspective to meanings is also proposed by Peñaloza & Venkatesh (2006), who suggest an expansion of the SD-L value discussion into including the exchange and use of meanings in order to better capture the nature of the exchange relations. Venkatesh *et al.* (2006) even propose the idea of a sign economy, consisting of more nuanced, interactive, enacted markets, jointly produced by consumers, marketers and other culturally constituted forces in the economic system; producing as they engage in exchanges according to mutually negotiated systems of language and meanings.

Extending the more interactive co-creation perspective to comprise meanings, however raises the similar question that Grönroos (2008) addresses with value, i.e. is it a question of co-creation, with multiple actors as active participants in the creation of symbols (Akaka *et al.* 2014) or something that happens in the customer’s sphere – images formed in actors’ minds - like value-in-use? To what extent are the meanings actually shared, or do symbolic meanings emerge that are different from the ones the supplying firm intended to propose?

On the network level, Akaka *et al.* (2014) propose that symbols guide actors in the enactment of practices that enable the co-creation of meanings. In this way, symbols help actors coordinate interaction, communicate information, integrate resources and evaluate value. They further argue that the interpretation of symbols is important for the overlapping and integration of institutional logics; symbols become reinterpreted in new social contexts and new symbolic meanings emerge, possibly varying across the micro, meso and macro levels of analysis. According to Akaka *et al.* (2014) the notion of shared understanding does thus not mean that symbols have the exactly same meaning for different actors, as they all have their own, unique socio-historical backgrounds, but that shared understandings occur when actors with varying viewpoints interact. In other words, even if the phenomenological value of symbols may vary from one actor to another, for interaction to occur, there must be overlap in the meanings of value for particular resources. Critical for this process is that the potential value (value proposition) is articulated and communicated, and symbols constitute a central tool for doing so.

Brands as resources for customer relationships

Brands have been a much researched marketing topic for several decades, having been defined in a variety of ways. For instance the AMA definition (2004) sees the brand as ‘ a name, term, design, symbol, or any other feature that identifies one seller’s good or service as distinct from those of other sellers’. Brands have been approached from multiple perspectives, such as a consumer angle, focusing on e.g. identity, image and similar issues; from an organizational perspective stressing e.g. positioning; a financial viewpoint, focusing on e.g. equity; or a relational perspective, which examines e.g. commitment and experience. Some of the definitions regard the brand as an entity, whereas broader perspectives consider brands also as processes. (Brodie 2009) According to such a process perspective, Brodie *et al.* (2006) see service brands as facilitating and mediating the marketing processes used to realize experiences that drive the co-creation of value. Brands provide sign systems that symbolize meaning in the marketing network and hence function as fundamental resources.

Brodie *et al.* (2006) base this definition on the foundation of the promises framework or value triangle, initially presented by Calonius (1986) and elaborated by Bitner (1995) and Grönroos (1996). The value framework focuses on the marketing processes of *making* promises (organization to customers), *enabling and facilitating* promises (internal

marketing within the network) and *keeping and supporting* promises (interaction between the organization's representatives and the customer). (Brodie et al., 2006)

In empirical studies where this perspective has been extended to include intermediate actors in the supply network (see e.g. Glynn & Brodie, 2004 on manufacturer-reseller relationships) brands were identified to act as facilitators of relations in channels, creating meaning and experience for the resellers. In Glynn & Brodie's (2004) study revealed three types of value from brands for the resellers; (1) non-financial benefits such as advertising benefits, (2) customer brand equity and (3) benefits for the reseller's customers. Brands thus create value not only in the end customer relationship, but also within other marketing relationships (Brodie et al. 2006).

Fyrberg & Jürjado (2009) extend the aforementioned value triangle through a closer investigation of the network aspects of it. They conceptualize the key actors in the co-creation process as (1) brand governor, (2) providers and (3) customers as the three corners of the brand relationship value triangle. The link between governor and providers deals with internal interaction in the network and an exchange of meanings and experiences; the interface between providers and customers in turn represents the co-creation of meanings, while the brand governor-customer axis involves the reciprocal development of value proposition suggested by customers. (Fyrberg & Jürjado, 2009).

3. Methodology

The empirical basis of the paper is a longitudinal case study of a furniture manufacturer. The case firm, Junet, was chosen because it is a company whose development the researcher has had an opportunity of following during a 15 year time period, from 1999 to date. This provides a unique possibility to identify the process nature of symbolic resource development, including the launch of new collections, designs and designer co-operations, and the parallel processes of how the firm has developed its network of customer relationships. Against the conceptual notion of resource value changing over time (Håkansson & Snehota, 1995), a longitudinal time perspective is of particular advantage for understanding the dynamics and longer term effects of investments made in resources and their implications on the network level.

The case study method enables the investigation of a focal phenomenon within its real-life context, where the boundaries between phenomenon and context are not clearly evident (Yin, 1989). As Johnston, Leech & Liu (1999) state, the case study method does not attempt to isolate the phenomenon from its context, but, on the contrary, sees the phenomenon as being of interest precisely because of its context. In this paper, we adopt a focal firm perspective (see Halinen & Törnroos, 2005) where the main units of analysis are the symbolic dimensions of the resources that the case firm is providing and their manifestations in brands, designs and semiotics in communication. These resources are mirrored against the context of the events, changes and developments that the focal company faces, particularly with regard to the processes of customer relationship development. It also takes into account developments in the network context of the focal company, which affect the aforementioned processes. Such network effects are considered both on the meso level, i.e. relating to the most central partners on the supply side, as well as more macro level developments, which affect the product-market decisions of the focal firm.

One of the strengths of case study research is the ability to draw on several different types of data and triangulate them to provide a holistic picture of the studied phenomenon (Yin, 1994; Johnston *et al*, 1999). In this research, the construction of the case study report relies above all on qualitative interview data. Seven personal, thematic interviews and one, shorter telephone interview have been carried out with the managing director of the case firm, a reseller and an advertising agency representative. Most interviews were fully transcribed, or, in other instances, interview notes were taken and used for case description write-up. The interviews took place in 1999, 2000, 2010, 2012, 2013 and 2013. The earlier stage findings related to product and network design have been discussed in an article by Baraldi, Bocconcelli & Söderlund (2001).

In addition to interview data, the researcher was able to utilize observation as a technique for triangulation, since several of the interviews took place in the premises of the focal firm. This, in addition to observations from retail settings, allowed for instance a concrete examination of the firm's products and ways to display them, as the office and production facilities at the beginning of the study period also functioned as a showroom for the company. Furthermore, various printed and electronic documents, such as brochures, catalogues, price lists, company web pages and social media profiles

have also been used as sources of case evidence. A content analysis of this material contributed in particular to the interpretations of the symbolic and semiotic aspects of the value proposition of the firm.

In the longitudinal analysis, the snapshots of reality gained at the different interview occasions as well as informant's reflections on developments over time are analytically used to make interpretations of continuity and gain a holistic understanding, rather than making comparisons of the different cross-sectional points in time, in a linear and objective manner (see Hassett & Paavilainen-Mäntymäki, *eds.*, 2013).

4. Symbolic resources and customer relationships in practice: case Junet

Case firm description

The focal firm of the case study is Junet, which is a joint venture founded by five SMEs in 1993. The five original partners were manufactures of complementary pieces of furniture; one specialized in cabinets, another in upholstered furniture etc., who decided to join forces with the aim of creating and selling a new, joint furniture collection, initially mainly aimed at export customers. Thanks to the businesses' complementary nature, the founding partners have simultaneously also acted as the main suppliers for Junet, hence term 'net' in the corporate brand name. The prefix in turn has its origin in the location of the firms in the village of Jurva, Finland, which has historically had a high concentration of carpenters and furniture makers, and has on the national level been associated with a tradition of quality and skills in carpentry; a heritage which Junet has been drawing on both in terms of concrete competence and as a symbolic element in its communication.

The Junet venture represents only one customer relationship for the partner firms, who alongside this engagement also have maintained their previous activities, selling their individual products to other customers under their own brands. For the different partner firms, the Junet relationship has been of varying importance. For some of the member firms that are smaller in size, the Junet relationship has been one of the more significant in their portfolio, while for others, it has played a more minor role. Also, the significance of the Junet involvement has varied even for the same partner firms over time, depending on developments in their other customer relationships and also on the products that have at different points in time been more in focus in the Junet collection.

The focal firm and its resources are thus significantly characterized by the joint venture member firms / suppliers, but an additional, externally sourced contributor has been the freelance designer(s), that the firm has used. In this manufacturing sector, companies are differentiated partly based on the design(er) intensity of their products and Junet opted from the very beginning for an approach that emphasizes to role of product aesthetics and a distinct style, illustrated by e.g. the following brochure excerpts: *"The design and form is essentially Finnish country style, with modern elements added where appropriate ... All Junet furniture has consistently been based on these elements and that is why we can now call it the Junet style"* (Junet brochure, 1999). It is also characteristic of the designer focus, that the names and introductions of the designers have had a prominent role in marketing communication, both in printed materials as well as on the web.

Analysis of symbolic resources and customer relationships

A summary of the longitudinal case analysis is presented as a table in Appedix 1. When examining the case in a longitudinal time perspective based on the developments of both the symbolic resources and the customer relationships, four distinct phases were distinguished. The phases illustrate shifts in brand-related and market decisions and new directions regarding product design and form, resulting from strategic choices, as well as change forces in the network outside the firm. The phases are mostly chronologically sequential, but some of the phases overlap in time.

The first phase, timed in the 1990's is here termed the **Landhausstil phase**. This depicts the initial formation of the Junet venture and the creation of the first, joint collection between the partner firms. The aim was to overcome the severe domestic recession by joining forces and exporting to the European market, which was at the time beginning to open up to free trade. The collection of products, that was developed for this purpose were *"based on traditional Finnish carpentry skills and craftsmanship, combined with the technology used in modern furniture production"* (1990's Junet brochure). Furthermore, the communication stressed that *"the colour scheme is based on historic styles... adapted to match present day's needs"* and that *"all pieces have been designed to be fully compatible, giving*

the customer a wide choice of furniture and upholstery". The products were/are also made to order, enabling customer specific choices of colours and fabrics. When the initial recognition was being built among customers, quality of the raw materials as "*ecologically sound... pine and birch from renewable Finnish forests*" as well as of the craftsmanship were emphasized, alongside the wax treatment of the surface, which was a production related novelty for the firm, but also a feature that distinguished the early collection aesthetically and haptically. As the main customers during this phase were in Germany, the term "landhausstil" was used as a characterization. At the most, Junet had up to a hundred resellers, the most significant being a German furniture chain for whom the nature of the supplier as a small, Nordic company, providing a full spectrum of compatible quality, massive wood products made of sustainable materials aligned well with the retailer's ecological profile.

Towards the end of the 90's sales on the German market dropped radically due to the general economic situation as well as the entry of Eastern European competitors. When similar looking, several times cheaper alternatives were available, the Junet brand appeared not to hold sufficient content for the customers any longer. The next phase was therefore marked by a gradual withdrawal from exports and entry into the domestic market, here termed as the **Nezz phase**. The Junet brand was not an unknown phenomenon domestically in the 90's, even though its customers were mostly abroad. The export joint venture had received a fair share of attention in the industry due to its novel way of organizing itself, and the existing domestic retailers of the partner firms were curious of the Junet collection. The brand building efforts towards export customers as well as the existing parallel customer relationships of the firms thus paved the way for Junet's domestic brand building and symbolic valuableness. For the domestic market, Junet launched both its existing collection of traditional furniture, but the designer also developed an additional collection, of a more contemporary style, featuring straight lines, new materials and metal details. Due to the diverging appearance from the prior products, the modern collection received its own sub-brand name, 'Nezz'. The name itself also differed from the previous collection names such as Viena or Wiljami, which associated more to tradition and folklore. This phase was characterized by increased brand awareness building also towards consumers, through advertising and presence at furniture fairs.

Approximately a decade later, the brand was reassessed and refined, leading into the **Feels like Sunday phase**; a slogan coined by Junet's new advertising agency. Somewhat prior to this, also the customer portfolio underwent reorganization. Distribution had thus far been very scattered and the number of retailers high, with, according to the managing director, too little time to devote to all customers to e.g. ensure proper product display. Junet chose to enter an exclusive retail distribution agreement with the chain Vepsäläinen, who is profiled as a brand retailer in furniture, with for instance Artek, Fritz Hansen, Vitra and similar design brands in its assortment. Thereby, Junet was able to focus its relationship management activities more. The Vepsäläinen context however demanded increasing brand building investments and also efforts to clarify Junet's position among the brands in the retailer's assortment. Consequently, the company logo was renewed, the Nezz products renamed and new products by new designers introduced. The new products reflected the brand strategy of warmth and cosiness as a distinction to the more clinically modern other design brands. The new slogan "feels like Sunday" aimed at providing a promise of a stress-free, enjoyable Sunday morning – feeling and reflecting the relaxed and genuine, yet qualitative nature of the brand. The form language of the new products was also softer and rounder, colours still mostly light and "Nordic" and the products were given names in Finnish, with meanings such as "joy" (Ilo) and "for you" (Sinulle).

The branding efforts and focused distribution were initially successful and at best, Junet was chosen supplier of the year at Vepsäläinen. However, the general downturn in the economy in the 2010's started to affect the furniture sector severely and caused Junet to reconsider both its offerings as well as relationships. A cheaper collection of products was launched by request of the retailer, but even this did not compensate the loss of sales. The economic pressures grew increasingly when one of the Junet partners (at the same time its biggest supplier) filed for bankruptcy in 2013. In 2014, the exclusive distribution agreement with Vepsäläinen was terminated and a second chain, Kruunukaluste, chosen as an additional retailer in the hope of generating more sales.

The fourth phase, **the project track** is a public space furnishing path that runs through the entire history of the firm, parallel with its retail relationships. Its relative role has varied over time, but it has gained particular strategic importance over the last years. In the 90's, Junet utilized the design of its new collection and its flexible and versatile production possibilities in its value propositions for project customers in e.g. hotel and holiday housing construction projects in Germany. In such projects, the country style appearance of the products and durability of the physical

products were valuable characteristics for the customers, coupled with the capacity to offer adapted solutions. Also on the domestic market, Junet was involved in similar types of projects. One of the advantages was that even though the projects varied, the customer interface many times remained the same. Junet was thus in a closer and more continuous business relationships with the purchasing side architects, compared to the more “market” mechanism nature of its numerous retailer relationships of the time. In the 2000’s Junet began tapping into a new sector, that has become increasingly important, namely elderly care furnishing. For such project customers, e.g. private firms running elderly homes, the symbolic resources that Junet proposes, make use of for instance the durable and sturdy quality, natural materials, domestic origin and warm and cosy imagery along the lines of the latest brand renewal. Junet believes that the consumer branding efforts have been useful for building recognition also among the senior housing decision makers. Therefore Junet chose to introduce “*Junet seniori*” as a sub-brand for this project market and the web shop for these products. Even if brand recognition spins off positively from consumer products to the senior market, it remains yet to be seen if there are possible, possibly negative, effects the other way around.

On the whole, the time span that has been analyzed, shows some developments or trajectories on a more general analytical level. The first is the shift from more arm’s length customer relationships, first abroad but then also to some extent on the domestic level, towards increasing concentration on fewer, significant customers, where the value proposition of the firm and the profile of the customer are more aligned. For instance the choice to focus on Vepsäläinen as an exclusive distributor, or the rationale in entering specific projects, illustrate this tendency.

Another more general observation is the role of the brand and its gradual development from being merely a trademark or a name for a new venture into an actual brand with a symbolic content, one that customers and consumers recognize and associate with meanings. This process has taken time and required investments in visibility, for example by advertising regularly in the leading interior decoration magazines, using advertorials, social media, being present at fairs and introducing new products at a steady pace to stay “on the agenda”.

When looking at the study period on an aggregated level, what can be said about the role of the symbolic resources in the firm’s efforts to be valuable. i.e. provide a lucrative value proposition for its customers? Our interpretation is that on one hand, the process of brand development and the underlying strategic orientation of attempting to make high quality, well designed products in a flexible and adaptable manner has been guiding the firm’s activities all along, although taking its expression in somewhat differing products and communicative choices at different points in time. This brand building can be seen as an incremental development process. Particularly concerning project customers and retail buyers, the symbolic resources appear to relate to the capabilities of Junet as a supplier and a brand holder, rather than to its individual products. The craftsmanship tradition is a similar example of an undercurrent that branding has tapped into in a variety of ways at different times.

On the other hand, the study period with its economic ups and downs and the consequent shifts in product-market strategies shows that the Junet brand has not only followed a linear path of becoming gradually stronger and imprinted with meaning, but been required to repeatedly reassess and refine its way and means of relating to its customers. Here, the role of material vs. symbolic dimensions of the offering appears to receive a special role. In situations of lesser competitive pressures, it appears as if the tangible features can already be sufficient for the value proposition (e.g. in the early, more successful phases on exporting and selling to domestic retailers), while when other, strong resources compete of the customer’s attention (in e.g. the Vepsäläinen environment or the later years on the German market), the role of the immaterial/symbolic characteristics become emphasized and their management requires particular effort. This would support the notion proposed by Gummerus & Hellén (2012) that a product’s tangibility/intangibility is a rather ambiguous concept, and should be assessed in terms of (consumer) perceptions rather than as something inherent in offerings.

5. Concluding discussion

In this paper, we set out to increase the understanding of the resource dimension in business interaction by examining how brands serve as symbolic resources for business relationships. We drew on discussions based in the S-D logic of marketing on symbols and brands and applied them against a business relationship management context.

Based on our findings, we agree with Brodie (2009) and Brodie et al. (2006) in regarding brands not only as entities, but as processes, that facilitate and mediate in the marketing processes used to realize experiences driving value co-creation. Brands provide sign systems that symbolize meaning for different actors in the marketing network and hence function as fundamental resources. Our empirical account shows, that in order for a firm to survive on the market, it must continuously be able to provide resources that are perceived valuable by its customers. On the brand management level, this draws attention to the dynamics of the brand and the need to evaluate it against the firm's network of marketing relationships and the changes occurring in them. Our findings thus indicate that the role of the symbolic content of brands is a dynamic concept, where the valuableness of the resource varies depending on the resource constellation around it, as network theory (see Håkansson & Snehota, 1995) suggests. That is, when the focal brand is in the customer context challenged by other brands offering competing symbolic, utilitarian or economic benefits (e.g. acknowledged design or a lower price), this puts pressure on resource management for a better alignment with customer resources.

In addition to addressing the identified research gap concerning symbolic resources in network literature, we believe that our findings offer valuable empirical insight to the understanding of the interactive nature of brands and symbols also from a S-D L point of view. The paper offers a methodological contribution through the use of longitudinal and semiotic analysis, which we consider as useful tools for an increased understanding of the dynamics of symbolism, when mirrored against changing customer relationship over a longer time perspective.

Particularly from a network theoretical point of view, a limitation of the study is the focus on the brand governor and the provision side of resources. Extending the perspective to comprising selected customers' viewpoints, would be recommended in further research on the topic.

Appendix 1: Longitudinal analysis of Junet

MAIN UNITS OF ANALYSIS				
Products	New collection, massive, waxed wood 'Landhausstil' Customised colors, sizes	contemporary designs heat-treated materials	new, contemporary products by new designers introduced at a faster pace	
Brand	Junet (corporate and product)	Junet / Nezz (the modern collection)	Junet, new logo and slogan "Feels like Sunday" renaming Nezz products	Junet Junet seniori
Customers	International retail International projects	Numerous domestic retailers Hotel & holiday housing projects	Exclusive retail (Vepsäläinen) Subcontracting Elderly care housing projects	Vepsäläinen + Kruunukaluste
CONTEXTUAL FACTORS				
Managerial focus	Organizing the net Internationalizing	establishing position on the domestic market	key customers and projects brand management	
Developments in the network context (macro/meso)	Export promotion EU-membership Ikea's market entry RECESSION	Competitive pressure, plagiarism Increased imports	new designers new advertising agency	member bankruptcy RECESSION
ANALYTICAL TRAJECTORIES				
	From trademark to brand (and sub-brands) From markets to relationships From international to domestics From home furniture market to increasing focus on projects			

Marketing Communication and the Semantics of Information

André Stuth, astuth@outlook.com

Marketing Communication and the Semantics of Information

A comparison of marketing communication

We live in a society in which there is an increasing focus on healthy lifestyle and healthy diet. These aspects are joined by such important factors as the sustainable and green production of all agricultural and industrial commodities, biologically irreproachable cultivation of crop plants with as few chemicals as possible and species-appropriate husbandry of farm animals. There is an equal demand for fair-trade of all consumer goods as a means of apportioning producers in poorer countries appropriate participation in the fruits of their labour. All of these and other aspects have acquired an existential meaning for millions of consumers in the developed, industrial nations at least.

But what is the best way of using marketing communication to disseminate these highly complex semantic components of product information to consumers?

Aspects concerning the meaning of information are now of far greater significance than they have been in the past. These days it would be woefully inadequate to simply slap a tasty burger onto an advertising billboard or on television in the hope that it would generate sales. Now we must also declare where the meat comes from and naturally just as much whether and why we can afford to consume such a high-calorie meal.

It is therefore true that the aspect of meaning and hence the at times highly complex semantics of information play a far greater role in how an advertising claim is communicated than ever before. So pure stimulus-response (S-R) or stimulus-organism-response models (S-O-R) are gradually slipping into obscurity. Their only remaining function is to generate attention for an advertising claim.

Furthermore, the formation of public opinion and in it the preferential appraisal of certain products in modern society takes place in a plethora of discussions on the Internet and in social media, thus enacting a disassociation from the manufacturers and their marketing instruments and shifting the process into larger groups and a more indirect and independent realm. Arriving there the discussion on content and meaning, in other words the semantics and pragmatics of all information available on a product, acquires a vastly greater importance than a pretty picture or an enticing slogan could ever possess. And the rate at which these instruments are developing in the formation of public opinion gathers pace from one day to the next. And all of this directly impacts not only on the meaning of the instruments required in marketing, but also and in particular on the nature and content of each communication within marketing.

Nevertheless, marketing communication did not become one of the most important topics within marketing just yesterday. Reviewing the literature available on the subject today, one quickly encounters far older, common foundations of communication as elements of a longstanding and established paradigm within this specialist field, one that long ago gained entry to the academic realm. The Greek word paradigm¹ consists of the individual terms '*next to*' and '*show*' in the sense of '*to render comprehensible*', also '*example*', '*paragon*', '*distinction*' or '*prejudice*' and in common parlance equally '*world view*' or '*ideology*'.

Georg Christoph Lichtenberg introduced the term of paradigm to academic discourse to denote different schools of scientific thinking. Since the late 18th century the word paradigm has been used to describe a definite scientific perception or philosophy within a scholarly community or a worldview inherent to a defined group of people. In more recent times Thomas S. Kuhn² bestowed considerable significance on the term paradigm, not least due to the at times most controversial discussions that centred on his two books on the topic. Jens Asendorpf³ provided a new definition of paradigm in 2009, stating: "A scientific paradigm is a more or less coherent bundle of theoretical principles, questions and methods that many academic share and that outlives longer historical periods within the development of an academic discipline." In this day and age, whether intentional or otherwise, the term paradigm therefore possesses a truly pivotal significance in any scientific discipline.

¹ cf: Margaret Masterman (1987) The Nature of a Paradigm, In: Imre Lakatos / Alan Musgrave: Criticism and the Growth of Knowledge, p. 59-90

² cf. Kuhn, Thomas S. (1970) Die Struktur wissenschaftlicher Revolutionen und (1977) die Entstehung des Neuen, p. 389 ff

³ cf. Jens B. Asendorpf (2009) Persönlichkeitspsychologie, p. 13

Current literature on marketing communication yields a whole series of common principles and components of a shared paradigm, running like a common thread through all the insight derived and collated in this field and referring above all and in particular to the manifold commonalities in the pictorial metaphors deployed in the general principles of each communicative event and the illustrative communication models applied.

The communication model that Claude E. Shannon⁴ developed in 1948 remains to this day the fundamental basis and prevalent paradigm in this respect, losing none of its distinctiveness as a very simple, figurative, and exemplary metaphor for communication. This may also explain why there is such a pronounced tendency to use it so frequently and willingly, to add to it in varying degrees and to employ it in broader contexts. After all we are constantly faced with two or more communication partners and, in marketing especially, an almost unlimited variety in the means available to transmit data in messages between these parties. But the story does not end here.

As he noted himself, Shannon created this purely sender-receiver model of communication for the sole purpose of considering the means of engineering data transmission from the perspective of probability theory and statistics and hence from the exclusive viewpoint of mathematics. Its only purpose is the purely naturalist consideration of syntactic data transmission from the sender to the receiver of data⁵. Shannon himself remarks that his definition of information along the simple lines of engineering data transmission must on no account be confused with meaning, that is the semantics of information beyond the scope of data engineering.

It is unfortunate that this perspective inherently inadequate for a complete and holistic understanding of information, remains in use in such a variety of different contexts to the present day.

From this model Shannon concludes that data transmission requires a set of redundancies in order to permit a syntactically complete message to reach the recipient, even if there are disturbances in the transmission channel. From his point of view the recipient has no means of achieving an integral understanding of the meaning inherent to the message contents. Therefore, Shannon's "A Mathematical Theory of Communication" is in truth a mathematical theory on how to engineer a message's data transmission. There is no way whatsoever of concluding the semantic informational content merely on the basis of considering the transmission of a limited number of characters from the perspective of syntax, mathematics or probability theory. After all, connecting syntax with semantics requires more than just statistical functions.

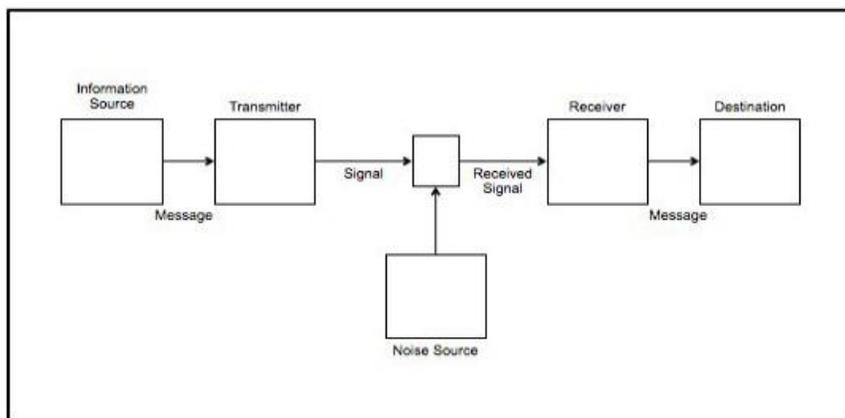

FIGURE 1: COMMUNICATION MODEL BY CLAUDE E. SHANNON⁶ DATED 1948

Unlike the currency value of data, a consideration of data transmission along the lines of statistics or probability theory is insufficient to ascertain the currency value of information. Indeed, only a complete interpretation

⁴ cf. Shannon, Claude E. (1948) A Mathematical Theory of Communication, In: Bell System Technical Journal 27, p. 379 ff. and 623 ff.

⁵ cf. Jahnich, Peter (2006) Was ist Information?, p. 71 ff.

⁶ cf. Shannon, Claude E. (1948) A Mathematical Theory of Communication, In: Bell System Technical Journal 27, p. 379 ff

of the message's actual meaning for the recipient can cater to this aspect. For instance, various sets of data with identical structures may produce entirely distinct semantic appraisals, depending on their transmission in different situations or to different recipients. It is equally possible to achieve uniform semantics with varying syntax. Hence, it is fair to say that in the eyes of the recipient, any operation based solely on the currency value of syntactic data will not yield an adequate yardstick, let alone produce a standalone basis, for assessing the fact-based informational content of a message.

The recipient of a message, conversely, is at all times and exclusively intent on grasping the manifold and extraordinarily complex meaning of the information. After all, this is the actual and germinal purpose of any form of data transmission and any absorption of information. We are by no means satisfied with marvelling at, or seeking short-lived entertainment in, the beauty of syntactical formulation.

It is also true that communication cannot operate as a one-way street. This means that unlike the engineering of data transmission, it at all times requires a mutuality in response and understanding between two or more parties to the communication in order to be successful. Queries can be used to elaborate in greater detail on the integral meaning of a message. Drawing on the semiotic classification that persisted historically until Charles W. Morris⁷, Holger Lyre⁸ described in his book

'Informationstheorie' a sensible approach to acquiring as complete a notion of information as possible by introducing the idea of three-dimensional semiotics, consisting of:

- **Syntax:**

The incidence of individual units of information, their structure and arrangement and the relationships found between the informational units themselves

- **Semantics**

The meaning of the informational units as grasped by the recipient of information and the relationships between the meanings themselves

- **Pragmatics**

The impact of the informational units and their mutual relationships

Each of these three dimensions serves to describe a characteristic aspect of information. But only when all three aspects are brought together do they represent the complete and overall characteristics inherent to a notion of information. The lack of any one of these aspects engenders a substantially abridged perspective on the overall characteristics of this notion of information. It can therefore be concluded that a purely naturalist category of data transmission within a certain syntax is now entirely inadequate in the acquisition of an integral notion of information. Information can only ever be what in our eyes possesses significance and permits interpretation of meaning.

This is why any complete understanding of information always requires an interpreter to navigate the complex variety of semantic interpretations. It would be fair to conclude from this that successful

communication theory must on no account reduce the communication partners to their roles as senders and recipients of data via a predefined medium. The process of semantic and pragmatic interpretation, hence the acutely important role of the protagonists within communication as the interpreters of information and quite naturally also the mutuality of communication (e.g. feedback via the Internet or social media), must now come to the forefront of perception to a far greater extent than historically has been the case.

Attempts so far to circumvent this palpable deficiency centred mainly on prising open and suitably repackaging Shannon's model of communication to incorporate the two aspects of semantics and pragmatics and the mutuality of communication, also. In this respect I would like to introduce two very good, recent examples, which represent a mere fraction of the scientific debate in recent decades on the topic of marketing communication.

⁷ cf. Morris, Charles W. (1938) Foundations of the Theory of Signs (1988)

⁸ cf. Lyre, Holger (2002) Informationstheorie, p. 16 ff.

A very good enhancement of Shannon's model of communication is found in the basics of communication contained in the book 'Marketingkommunikation' by Harald Vergossen⁹ from 2004. Defining communication, he quotes Koschnik from 2003: "Communication is most commonly understood to be the exchange of information (messages). In this a sender, the so-called communicator, uses a definite medium to transmit a statement to the receiver, the so-called communicant, or recipient. In his or her reaction the recipient becomes the communicator and vice versa." In his own communication model and following Weis from 2004, Vergossen joins those using a distinctly enhanced presentation of Shannon's communication model, most certainly as a consequence of his own definition of communication:

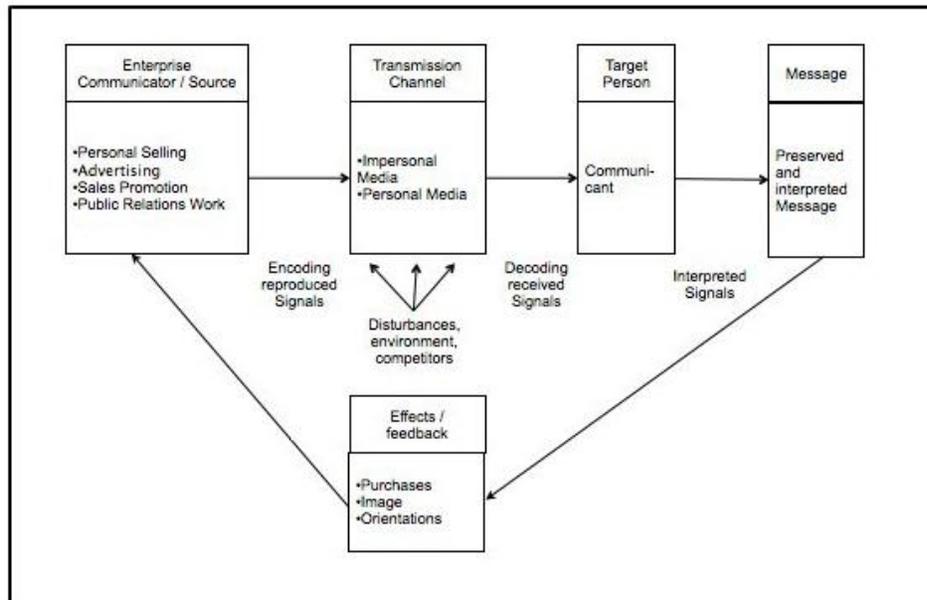

FIGURE 2: COMMUNICATION MODEL BY HARALD VERGOSSEN¹⁰ FROM 2004

But disturbances in the transmission channel by no means constitute the main problem in any form of communication. Instead it is actually and always the interpreter's semantic understanding of actual meaning inherent to the information itself.

This requires not only complete syntax in the transmission of information; it also and especially necessitates a correct manner in addressing the semantically arranged knowledge that the recipient of an advertising claim already holds. Quite naturally, it is also conceivable to add to the recipient's semantic representation of knowledge some entirely new elements of knowledge that he or she may find interesting. The crux of the matter is therefore to verify, falsify or enhance semantic structures in place within the recipient of a message in order to accommodate a new, incoming message. Of course, the only information that can be of interest is such as may sensibly complement or otherwise impressively confirm the knowledge and basic attitudes held by the potential consumers, for instance as concerns a healthy lifestyle and healthy diet; organic farming or husbandry without genetic manipulation; sustained, green production, and on fair trade.

It follows therefore that the focus is not placed merely on the transmission of data and certainly not on the stimulus that in the style of Pavlov's dogs would provoke a purely behaviouristic response in the potential consumer. Instead, the spotlight is trained on transmitting extensive and in places complex semantic information that must tie

⁹ cf. Vergossen, Harald (2004) Marketingkommunikation, p. 19 ff.

¹⁰ cf. Vergossen, Harald (2004) Marketingkommunikation, p. 19 ff.

in with or even meaningfully enhance the consumer's existing representations of semantic knowledge. This means that to a previously unseen extent, modern marketing and instruments of marketing are increasingly morphing into conveyors of comprehensive meaning with pertinence for the characteristics and origins of a consumer product, its manufacture and also its means of dissemination.

Another impressive example of how Shannon's model of communication is enhanced is found in the much read book 'Marketingkommunikation' by Werner Pepels¹¹ in its 2nd edition from 2011. Here we already find a means of applying the most important elements of informational three- dimensionality, although it does, at the start at least, seriously neglect the mutuality of communication.

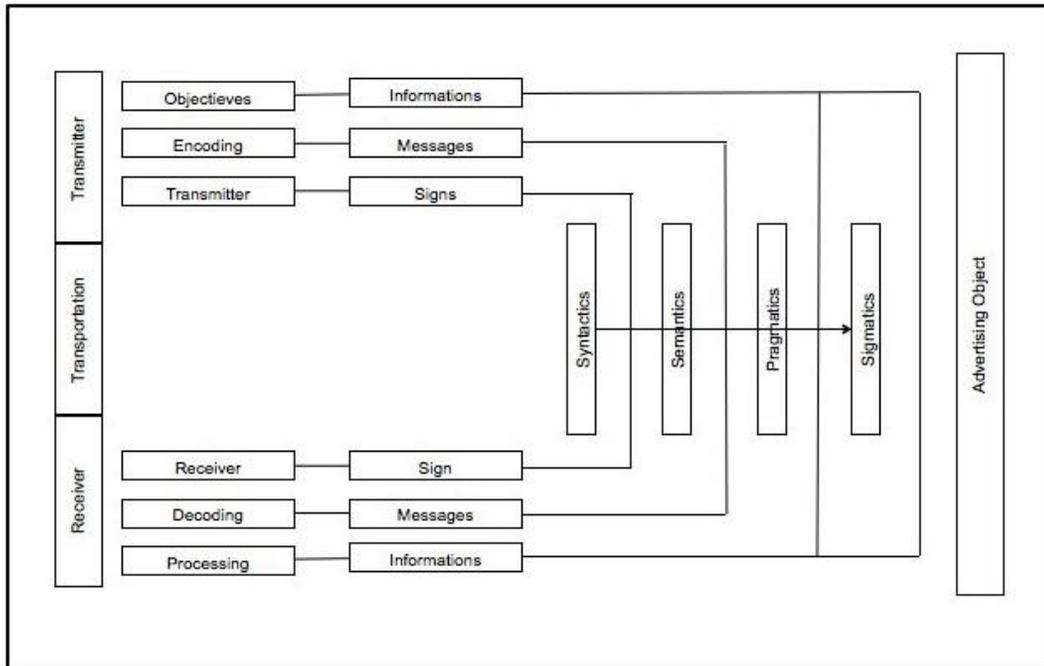

FIGURE 3: COMMUNICATION MODEL BY WERNER PEPELS¹² FROM 2011

Yet nevertheless the old perception based purely on sender and recipient remains the basis of all enhancements. The actual meaning, with the process of interpretation, regrettably remains in the shadows. To the present day, this entire development has been characterised by the markedly naturalist perception that the entirety of a message and its extensive semantic and pragmatic content is already contained in the syntax or in the images of the information as it is transmitted. The role of the party absorbing the information, the interpreter, who deploys the broad scope of his or her own life's knowledge and is aware of current external and internal situations, is unfortunately and seriously neglected.

But information always requires detailed interpretation of its meaning. This is why information will at all times need an interpreter to navigate the requisite avenues of interpretation in their semantic and pragmatic complexity.

In our age, the archaic perception that all three informational dimensions can be transmitted within one message in whatsoever form of syntactic convolution is deemed imperative, disappoints in its adequacy whichever way it is turned. We only recognise even the most basic of signs, symbols or icons if they are associated and

¹¹ cf. Pepels, Werner (2011) Marketingkommunikation, 2nd revised edition, p. 22 ff.

¹² cf. Pepels, Werner (2011) Marketingkommunikation, 2nd revised edition, p. 22 ff

stored with attendant significance in our cognitive representation of knowledge. We require explanation to understand new symbols in their complex interrelationship with meaning. Only then can a symbol or a term in the syntax of an advertising claim trigger the desired association among potential consumers. Hence, the actual meaning is by no means inherent to the symbols communicated to us, but at all times rooted in our knowledge of them and in the semantic representation of this knowledge in our minds. So any attempt by syntax alone to derive in a quasi- algorithmic procedure natural and linguistic communication in the complete formality of its multifarious semantics is doomed from its very inception to failure. Far more than merely what are at times completely different semantic levels of our knowledge on language, on reality and on the intellectual objects we create, prevent any such endeavour.

"You cannot milk semantics out from syntactical processes alone." John R. Searle

Instead, we are called on today to develop an entirely new perception that by transmitting syntax, we only ever address a set of indices in the semantic representation of knowledge existing within our brains. Not until we have recognised a symbol are we able to apply these indices in several stages to reach the semantic building blocks of knowledge secreted in our minds. And these are not found in the syntax of a message, but directly in what our brains hold as semantic representation of knowledge. It is quite rare, and most commonly in a context with entirely new materials, that we receive an extensive explanation of what new information means. It is in these cases that the syntax also delivers the semantics. Yet even then we require a prior foundation of extensive basic knowledge.

Therefore, the syntax within our language is constantly held in a direct relationship with, and as part of shape-shifting interdependencies in, the way our minds represent the knowledge we possess. This semantic representation of knowledge accumulates constantly over the course of our lives and contains all insight and ideologies that we have ever embraced. In this, Klix, Roth and van der Meer¹³ make a very pronounced distinction between declarative object knowledge and more procedural knowledge of a situation or event.

Declarative object knowledge contains the more extensional meaning of symbols or terms as we would find in dictionaries or encyclopaedia, while linguistic procedural knowledge relates to a greater extent to groups of words, sentences or entire texts. There is another immensely important aspect in our context: extensional procedural knowledge of events, whose representation of knowledge to this day remains inadequately researched in terms of its nature, its meaning and also its relationship with declarative object knowledge.

The actual meaning, that is the effective, very extensive semantics of linguistic units, always has a string of constituent elements. They must all be available in our minds in order to comprehend what initially is nothing more than a syntactical message. To improve clarity, the semantics of information will be divided at this point into three fundamental groups:

- **Extensional semantics**

This presents the relationship between symbols and terms and their extensional designators, in other words local objects and procedural events. In this, the meaning of a symbol or a term is initially reduced to nothing more than its designation of a real object or event. Extensional semantics also includes, often unconsciously, an adequate description or visualisation of the designated object or event within our semantic representation of knowledge.

- **Structural semantics**

This denotes the analysis of word groups or entire sentences and thereby determines the meaning of longer forms of linguistic expression than extensional semantics, irrespective of the position of the words, the tense and the sentence structure. This consideration focuses at all times on the comprehensive analysis of, and constant comparison with, our existing linguistic representation of knowledge in the respective language of choice.

- **Intensional semantics**

This discipline analyses the meaning of linguistic units, but not as absolute factors and instead at all times in their relationship with ourselves and our current internal and external situation. Furthermore, intensional semantics address a wide variety of links with other building blocks of our knowledge on at times extremely different semantic levels of the semantic representation of knowledge we hold in our minds, building blocks that have grown over the course of our entire lives and that therefore possess a substantial degree of individuality.

¹³ cf. Klix / Roth / van der Meer (1991) Kognitive Prozesse und geistige Leistung, p. 1 ff. and p. 41 ff.

For these reasons, it is clearly apparent in all variant forms in the semantics of information that content is by no means located simply in the syntax of a transmitted message and that instead it emerges at a later stage through the direct relationship between language and the representation of knowledge we hold in our minds. One can safely conclude, therefore, that a model involving nothing more than a sender and a recipient will be entirely inadequate for a complete consideration of all three informational aspects in syntax, semantics and pragmatics. Any such model must always be expanded to include the recipient in his or her immensely important role as interpreter of the information. Only then are we able to determine the actual, at times extraordinarily complex and diverse meaning of information; only then does it transcend the scope of simple data and indeed evolve into actual information. Therefore, the representation of knowledge existing in our minds plays the most important role in its function of interpreting the information conveyed. It follows therefore that information, in all its three aspects of syntax, semantics and pragmatics, cannot take root until the message has been comprehensively interpreted.

This is why successful marketing communication must on all accounts consider the representation of existing knowledge among potential customers or even and to a substantial extent enhance this knowledge meaningfully in the interests of the customers by adding unique selling propositions inherent to the product itself. The actual semantics of an advertising message cannot bear fruit until the recipient has interpreted the information. If we accept, however, that no two people anywhere in the world will hold the same representation of knowledge or find themselves in the identical internal and external situation, it is clear that the results of interpretation will differ substantially. Consciously or unconsciously, these may be to the benefit or detriment of the party seeking to provide us with information. At times, even truly humorous circumstances may evolve, as each of us has doubtless experienced across a wide spectrum of communicative situations.

Hence, language is always the close mutual interaction between sequentially communicated syntax and the comprehensive interpretation of its semantics and pragmatics by the local representation of knowledge in our minds.

Additional factors include the external and internal situation in which the receiver and interpreter of information is found and that at all times permits a remarkable breadth of possible interpretations for one and the same syntactical sequence. So disturbances in the transmission channel between sender and recipient by no means constitute the only problem in any form of communication. Instead, problems emerge on the one hand as we can never know precisely in which internal and external situation recipients find themselves and on the other that we are unaware of the precise nature of the prior semantic knowledge they may already possess. In terms of what we are trying to communicate, these two facts produce an at times very pronounced range of variety in terms of possible semantic and pragmatic understanding on the part of the recipient. This remains applicable even if the communicated message arrives with the recipient in a syntactic form that is both entirely correct and complete. From this we can derive an urgent necessity to fundamentally reconsider Shannon's sender-recipient model as one tailored to the needs of marketing communication and other fields of science, also. Peter Janich¹⁴ describes this purely syntactic appraisal of engineering data transmission as a simple naturalisation of what is in actual fact culturally-predicated, naturally linguistic, human communication.

Students who complete their homework completely and conscientiously have an entirely different understanding of the teaching materials that build on this, compared with a classmate who has so far failed to internalise the same principles. **(semantic state of knowledge)**

Attentiveness within communication processes is occasionally subject to severe fluctuation, depending on the mental state and emotional situation of the other protagonists within the communication, hence producing sometimes striking disturbances in the process of understanding. **(internal situation)**

It is important also when studying source materials to consider the cultural use of language at the time the source of information was produced. Only a comparison with other sources from a longer history of development and discourse can provide a complete overview. In communication, therefore, the relative meaning of information supersedes its absolute meaning; it must be placed in a direct relation with our knowledge, our use of language and with our internal and external situation.

¹⁴ cf. Janich, Peter (2006) Was ist Information, p. 26 ff

Commonality in the situation of socio-cultural discourse, in which all parties to the communication find themselves, is another mainstay in comprehensive semantic understanding. This factor has a determinant influence on our use of language. To the greatest possible extent, it should be common knowledge in order to assure successful communication. Nevertheless, our awareness of what the other parties to the communication already know and in what kind of internal and external situation they find themselves is, more often than not, inadequate. This is why sufficient clarification of an entirely new semantic perception is required within modern advertising claims. (**common socio- cultural discourse situation**)

Marketing communication is quite simply compelled to consider these aspects due to what is at times an extraordinarily complex nature of ecological contexts in the modern demands that potential consumers express. Accordingly, these demands assume a prominent position and override all previous models of stimulus and response in the field of marketing communication especially. And whatever else is true, we increasingly seize the initiative in the progressive interpretation and assessment of all that is presented to us in a pictorial and textual form. In this, the technical resources and social communities now provide us with previously undreamt-of possibilities. And so it is no surprise that more and more our own representation of knowledge comes to the forefront and occupies centre-stage in all forms of communicative events.

All of this yields an entirely new paradigm for a communication model that, subject to extensive and ongoing debate, will be within our grasp as the future unfolds:

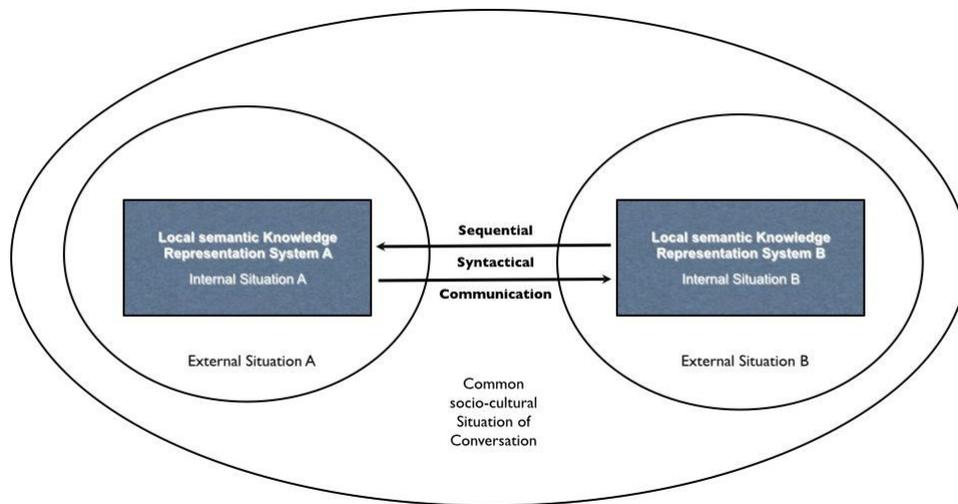

FIGURE 4: COMMUNICATION MODEL BY ANDRÉ STUTH FROM 2012

Accordingly, marketing communication is called upon to place a far greater focus on correctly addressing the building blocks of knowledge we already possess and only then to consider how the attendant claim can be packaged in catchy syntax or appealing images. Equally, it will become increasingly important to convey by semantic means entirely new building blocks of knowledge to potential consumers, ones that meaningfully and sustainably enhance their momentary representation of knowledge.

The Internet and social media mean that these days, the discussion and the final assessment take place to a far greater extent directly between consumers and hence within their own social groups.

In this way, consumers acquire a more pronounced independence from the time-honoured marketing instruments that major providers deploy. So modern consumers are forced within a complex media landscape to rely much more on their own knowledge or the experience held within a larger social group than has ever been the case before.

This means that our own knowledge acquires a far greater meaning than it possessed in the past.

The deluge of information we face in the modern age comes with clearly evident advantages; but there are a number of drawbacks, too. For instance, it is becoming increasingly difficult to sift through the immense, daily flood of information pouring forth via the media and into our own living rooms to identify precisely what is necessary and relevant for our needs. More and more, we are living in a society of information overload, from which only our own knowledge and that of our social group can offer freedom.

We cannot and should no longer occupy our minds with the totality of this information; instead we must focus deliberately on our interests, select according to principles of relevance and therefore assess information only against the knowledge we already possess and the sources we seek.

Increasingly, the spotlight is trained on discussions within a social group. On what seems an endless number of channels, the range of mass media today produce a clearly tangible, background noise of information that for the unpractised observer regrettably conceals a large quantity of important and indeed urgently needed aspects of information.

So Holger Lyre¹⁵ remarks quite rightly that it is absolutely necessary and in actual fact imperative for us to understand and conceptualise the modern world as a knowledge and education society. Only this can enable us to cope with, and meaningfully handle, the colossal flood of information in our living rooms and workplaces.

User's attitude to publicity in social webs. A study developed in Mexico

Abstract

Being publicity defined as the placing of news and messages to persuade or to inform the members of a specific target market about products, services and ideas (AMA, 2013). In the later years advertising in electronic media has been rising its numbers (Nielsen, 2012) and with the users more able to control what they like to watch (Duboff and Wilkerson, 2010), it is important to determine the attitudes of the users towards advertising in social webs. The attitude has been divided in four components: trust, information, entertainment and irritability, in order to verify if the advertising has been effective, or positively received by the users.

Studying several models of attitudes toward the advertising (MacKenzie and Lutz, 1989; Ducoffe, 1996; Brackett and Carr, 2001; Kwek, Tan, and Lau et al., 2010; Hsu-Hsien, 2011; Taylor, 2011), this work came up with a model made of four variables: trust, information, entertainment and irritability) that help to explain the varying attitudes of users to advertising in social webs. For the data analysis, we use inferential statistics; we measured the correlations between these variables and the users (Mexican students). Information of descriptive statistics is also showed to allow a better picture of the results. The study is focused in the analysis of the students and facebook, because is the main social network used in Mexico (AMIPCI, 2012).

This methodology is innovative because advertising has been studied basically on traditional media, and is proposing a new model for the study of the attitude toward advertising on line. Also this research made a review of trends and the use of social webs in Mexico. The outcomes of the research will be helpful for future advertising campaigns, presenting relevant data about which factors are more positive from the users to the advertising.

Keywords: *Social Webs, Advertising, e-marketing, social networks*

Introduction

Advertising is defined as “any kind of interpersonal communication paid, in which the known sponsor presents and promotes ideas, products or services, the ads are then an effective way to disseminate messages, whether to build brand preference, or to educate consumer” (Kotler and Keller, 2006).

The American Marketing Association (2013) define advertising as “the placement of announcements and persuasive messages in time or space purchased in any of the media by commercial businesses, non-profits, government agencies, and individuals seeking to inform and / or persuade members of a particular target market or audience about their products, services, organizations or ideas”.

For purposes of this study is understood that advertising communication by means other companies, either with or without profit, in which they seeks to disseminate messages, inform or persuade a particular target market about their products, services or ideas. In this case the research focuses in the Internet.

Society has evolved rapidly due to the opening in the media such as the Internet; now this is available for a larger number of users growing so it is important to consider its importance in marketing communication. The electronic media advertising has increased in recent years and these can be seen in the report presented by Nielsen in 2013, entitled “2013 Outlook Online Advertising Performance” which surveyed online to a total of 287 companies leading brand, 176 executive agencies and 152 advertising representatives who have participated during the months of January and February 2013. Figure 1 shows the results of the research highlight the importance of social networking in the advertising budget of the company, whose tendency is to increase spending on online advertising, 70% expressed the intention to increase its investment in advertising Social Network this year, these being the first medium in which they are willing to invest, secondly the increase in mobile advertising (69 %) is found, the third place is video advertising (64%) and fourthly Rich Media advertising is a 23 % increase in advertising spending in the means.

Consumers have adopted new habits and ways of interacting with each other, opening communication technologies, people can relate to very large distances and immediately. One means to accomplish this communication in which users can express themselves and talk is social networking. Social media is transforming the way consumers worldwide make purchase decisions, since they are using social networks to learn about the experiences of other consumers, to find out more information about brands, products and services, and to find deals and purchase incentives. (Nielsen, 2012).

Advertising in Social Networks

Social networks can be defined as a well-defined set of actors (individuals, groups, organizations, communities, global partnerships, etc.) Linked to each other through a relationship or a set of social relations" (Lozares, 1996). Social Networks are classified according to the kind of transfer or exchange that occurs in the network, and can perform basic functions for the survival of its members, improve the quality of life of its members or maintain a social bond, social networks serve as an emotional support or instrumental support to provide information, allowing the community to define in terms of relationships and social ties that exist between the members (Abello Llanos, Madariaga Orozco, and Sierra García, 1999). Social networks are clearly on the rise compared to other social media such as blogs, who have become much more specialized than before in their topics, and also within social networks, people are motivated to join communities brands online to be part of a movement and be aware of the news firsthand related brands they care about. McCann University proposes that when a marketing project begins in Social Media; consider why people are getting involved in them and what their motivations are, before trying to understand the platform itself (Hutton and Fosdick, 2011).

Social networks are important for companies because they represent a means of communication that has an impact on the Internet. According to the study presented by the AMIPCI in 2012 on the Habits of Internet Users, the main sites that Mexican Internet recalled seeing advertising was search engine (66%) and on social networking sites (57%).

Social Media sites currently help consumers make purchase decisions by opinions, tastes and preferences of a much larger set of people who before had driven internet access (Nielsen 2012). Currently Social Media users in that period, at least 70% listen to the experiences of others, 65% learn about brands, products or services, 53% expressed positive views of the brands, and 50% also express their complaints or concerns regarding brands or services they have used, which provides a range information available to a large number of people who might be interested and who value those opinions. Moreover not all advertising on Facebook ends in a purchase decision because in an article published by Oreskovic in 2012, emphasizes that four out of five Facebook users have never bought a product or service as a result of advertising or comment on social networking sites, even when the comments and recommendations made by friends in Facebook are very important for them. Also, consulting firm McKinsey & Company, believes in the power of word of mouth recommendations given on the internet, and explains that it is the primary factor affecting between 20 and 50% in the process of decision making Cart (Duboff & Wilkerson 2010). As for internet, 80% of users seeking information about brands and products on the Internet and 75% stop to see online advertising according to the study of Mexico Interactive Advertising Bureau (IAB) in 2012.

Social networks have been a means of communication of important double track between businesses and consumers and is therefore recommended that companies monitor their brand's reputation and respond appropriately when (Duboff & Wilkerson, 2010) this is necessary. Companies in Mexico have used social networks as a communication tool with their market; social networks have served companies to connect with the audience that they wish to connect with the brand. Through this dialogue have managed to generate brand awareness, for example, Grupo Bimbo has focused on music as its best tool to connect with younger audiences through social media and Grupo Modelo has created quality content to the audience by music, sharing videos on YouTube. (Violante, 2012).

Advertising on Social Networks

Advertising in Social Networks can be used to strengthen the brand and position in the minds of consumers, competition, however traditional advertising remains necessary, online advertising, could be carried out exclusively once the brand has achieved considerable recognition and value (Pfeiffer & Zinnbauer, 2010).nThe two main benefits are to make social media marketing include increased exposure and increased traffic. In fact 58% of advertisers had used social networks for more than three years indicated that had helped them increase their sales. (Stelzner, 2012)

Giamanco & Gregoire (2012) note that more and more people research online before making purchases, advertising has changed from being sent to be searched by potential buyers because buyers now begin the process of

buying, research the company and advance in product research and business, for when they get to the store or contact the seller carry most advanced process of purchase.

It has become a trend that people investigate by reading blogs, watching videos on YouTube and participate in forums and using Google to search the offers and promotions and do not look much on advertising that creates a company in its page, and the information circulating on social networks about the company and the product, direct information from people is more valuable when seeking references on products that interest them, not participate in Social Networks puts companies at a competitive disadvantage, it is desirable to train people and create policies participation in them, because once customers learn to have contact through social networks, it will be impossible to sell without them (Giamanco & Gregoire 2012) .

Whenever it can be seen that social networks are used by a greater number of companies to advertise, so it is advisable to know the attitude of social network users to the same, in order to find those factors that are most important in advertising. The media represent a great opportunity for brands to gain recognition among consumers; savvy marketers can leverage the growing adoption and influence of social media for business impact (Nielsen 2012).

People who use social networks have seen advertising in them, and companies are increasingly interested in leveraging this communication platform for people to promote their products or services. It is therefore important to know the attitude of the consumer in terms of advertising on social networks, for brands that advertise in them enjoy good acceptance by users.

Now with the ease of communication offered by the Internet, people can interact with organizations. A tool that provides this facility is a social network, their usage characteristics. Is useful to know which factors considered important to users that organizations using this platform to offer the best experience to your potential or current customers, and they are favored with increasing exposure of their brands.

Within social networks, which has the highest number of Internet registry is Facebook, because 90% of people in a social network are also registered to it. Of the respondents, 90% access social networks daily, and 46% do so also from your Smartphone (AMIPCI, 2012). By the previous discussion, we can highlight the importance of considering social media as an important mean.

The social network users now have more control of the brands than few years ago. Have the ability to use social media to criticize a brand, communicate your experience or opinion, send links to web sites, videos or articles with information and create content on blogs. (Duboff & Wilkerson 2010).

Due to the fact that in Mexico there is no extensive research regarding advertising on social networks, it is convenient to open an investigation to study the attitude of the young users of social networks in Mexico. Specifically this research focuses on young students of the University Center for Economic and Administrative Sciences (CUCEA, in Spanish), since they have the characteristics of people who represent the majority users of Social Media in our country. The present investigation, therefore, possible to extend the knowledge we have of internet users in our country, as there is currently research exploring user attitude toward advertising in social networks but in other countries.

a. Attitude toward advertising

Means attitude, positive or negative evaluations, emotional meaning or tendency to action for a given product or idea, attitudes lead to consistently behave in similar objects (Kotler and Keller, 2006. P.194). It also can be defined as an overall assessment as expressing like or dislike an object, issue, person or action, (Hoyer, 2010. P.122), this being learned and resistant over time, thus reflects the evaluation generally something is done based on the set of associations linked with it.

The attitude toward advertising is defined as a predisposition to respond favorably or unfavorably to an advertising stimulus in particular during an exhibition (Lutz, 1985 quoted by MacKenzie, 1989). It is very important to know the attitude of consumers regarding the marketing strategy of companies, because when they have a strong negative attitude towards one or more aspects of the marketing practices of the company, they will not only leave to use the products but create a bad image for the company to share their negative experiences with family and friends.

In selecting the variables used in this investigation it was found that there are factors that are repeated and that influence consumer attitudes toward advertising. Studies that have measured, have evolved over time, began

having models that included a single variable and then the researchers evaluated other variables considered relevant and included in their models.

Throughout the studies, researchers have included variables that are not statistically significant, so that for purposes of this research, we used only those found to have consistency across studies. The four variables that have been studied in this work and that are validated with higher levels of Alpha Chronbach 95%, and that measure attitudes toward advertising are: trust, information, entertainment and irritation. The models presented here showed statistical validity which gave them the category of constructs as valid scale for measuring attitude. Presented below, in chronological order, the main models that were studied and served as the basis for defining the variables used in this research, the models begin with the study of attitudes toward advertising in general, and then continue climbing Internet advertising eventually the attitude toward advertising in social networks.

b. Ducoffe model (1996)

The models reviewed dealing with attitudes toward advertising in general, Internet advertising, and specifically the attitude towards advertising on social networks, where the variables considered for statistical methods of analysis were took from the following: MacKenzie & Lutz’s model (1989), Ducoffe’s model (1996), Brackett & Carr’s model (2001), Kwek et al. (2010), Hsu-Hsien’s model (2011) and finally Taylor’s model (2011).

This research study of the attitudes of social network users towards advertising on these sites is based in Ducoffe’s model (1996), which evaluates entertainment, information, and irritation. These three factors were the starting point to evaluate attitudes of social network users. The original model measured consumer attitudes toward advertising in general, was also applicable to Internet advertising. Moreover also sought to examine how the value of the ad is related to the attitude towards Internet advertising. The research consisted of a survey conducted in October 1995 in New York, 318 people utilize the internet service. Figure 1 show the model used in the research.

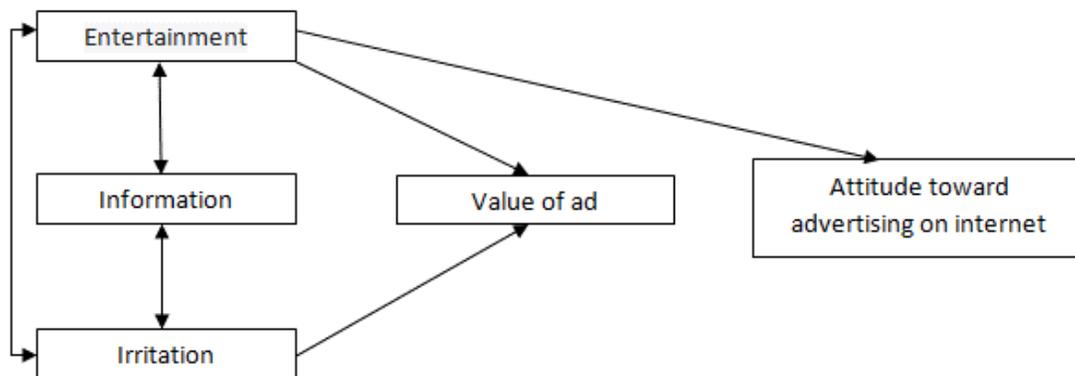

FIG. 1. DUCOFFE MODEL

Source: Own calculations based on the model presented in Ducoffe research (1996).

Advertising is perceived as valuable, combined with other aspects such as the diffusion medium, possibly contributing to the formation of positive consumer attitudes toward advertising. Some of the benefits explained by Ducoffe (1996) in relation to advertising on the Internet are the users who have access to information immediately, to offer the user the information deemed relevant, the flexibility to adapt to the needs ads consumers and the changing environment, and the ability to complete transactions online shopping, among others. He suggests in his study to optimize the value of advertising to consumers by creating messages that are as informative and entertaining as possible.

Later, other authors such as MacKenzie and Lutz (1989) and Eighmey (1997) postulated credibility as a variable with direct relation to measure the attitudes toward advertising. In addition, a variable with relevant demographic data was included. Brackett & Carr's model (2011), includes entertainment, information, irritation, credibility and relevant demographic variables. Hsu-Hsien (2011) makes a comparative study between interactive digital advertising and virtual brand communities, studying the motivations and the response toward marketing activities in social networks. The research presented by Taylor (2011) includes the independent variables aforementioned and the dependent variable attitude toward advertising in social networks.

Research Hypothesis

Among the main features that are important to evaluate the attitude of users toward advertising, according to studies, are information, reliability, entertainment and irritation. According to research, information, reliability and entertainment are positively related to the attitude of Internet users to social networks, and irritation is negatively related. The reliability, the information you provide, the level of perceived entertainment and advertising irritant resulting in social networks explain the attitude of users towards such advertising.

- H1. Perceived confidence by users regarding advertising in social networks influences the attitude of users towards it.
- H2. The perceived level of information users regarding advertising in social networks influences the attitude of users towards it.
- H3. The entertainment level perceived by users regarding advertising in social networks influences the attitude of users towards it.

c. Population and sample

For the purpose of this research study was sampled undergraduates of the University Center for Economic and Administrative Sciences (CUCEA) of the University of Guadalajara, as these students are the group most involved in social networks, which comprises young people between 15 and 24 years (AMIPC, 2011).

According to Bernal (2010), can estimate the size of a representative sample for a finite population using the following formula:

$$n = \frac{Z^2 \times P \times Q \times N}{E^2 (N - 1) + Z^2(P \times Q)}$$

Where:

- n = sample size for estimating (value to be determined)
- Z = confidence level or reliability margin (96%, Z value is 2.05 in tables)
- P = probability of success, because it is unknown is assigned 50%. (.50)
- Q = probability of failure, because it is unknown is assigned 50%. (.50)
- N = population size, CUCEA college students. (16,610) 2012B school year.
- E = the estimation error the researcher is willing to accept in terms of confidence level is defined for the study is 95%, so the error in this case is = 5% (.05). Replacing data in the formula below:

$$n = \frac{(2.05^2 \times 0.50 \times 0.50 \times 16,610)}{(.05^2 \times 16,609) + (2.05^2 \times 0.50 \times 0.50)} \quad n = \frac{17,450.88}{42.57} = 410$$

For a population of 16,610 undergraduates with a confidence level of 95% with an estimation error of 5%, it is necessary to survey a total of 410 college students. The survey was conducted during the school year 2012 B at the Universidad de Guadalajara, in the Center for Economic and Administrative Sciences (CUCEA, as in Spanish). A sample of 425 undergraduate students was sought for its courses in both morning and evening hours in the month of November 2012. In the study a total of 416 valid surveys are analyzed.

Validation of hypothesis

To validate hypothesis, a lineal regression process was run in SPSS program to measure each of constructs relative to the attitude variable. To classify the relationship of each independent variable with the dependent variable is used, the criterion used by Cortina (1993), in which values of .3 indicate a modest correlation, values of .5 indicate an average correlation and values of .7 indicate a high correlation. The results obtained from the SPSS system, are used by introducing all reagents that make each independent variable to measure the relationship with the dependent variable.

Regarding hypothesis 1, table 1 shows that the attitude toward advertising presented on Social Media is explained in 10.4% depending on the perceived confidence by users regarding the advertising they observed.

TABLE 1: SUMMARY OF REGRESSION ANALYSIS MODEL USING CONFIDENCE VARIABLE.
SUMMARY OF THE MODEL

Model	R	R square	R square corrected	Error tip. Of estimation
1	.343	.117	.104	.63525

A Predictor variable: (Constant), TRUST 6, TRUST 1, TRUST 4, TRUST 2, TRUST 3

Source: Results generated by SPSS system when analyzing collected data

Regarding hypothesis 2, the table 2 shows that the attitude toward advertising presented in Social Network is explained in 12.1%

TABLE 2: SUMMARY OF THE REGRESSION ANALYSIS MODEL USING INFORMATION VARIABLE

Model	R	R square	R square corrected	Error tip. Of estimation
1	.366	.134	.121	.62925

A Predictor variable: (Constant), INFORMATION 6, INFORMATION 1, INFORMATION 2, INFORMATION 4, INFORMATION 3, INFORMATION 5

Source: Results generated by SPSS system analyzing collected data

Regarding hypothesis 2, the table 3 shows that the attitude toward advertising presented in Social Network is explained in 18.4% by the entertainment level perceived by users.

TABLE 3: SUMMARY OF THE REGRESSION ANALYSIS MODEL USING ENTERTAINMENT VARIABLE

Model	R	R square	R square corrected	Error tip. Of estimation
1	.286	.082	.071	.64704

A Predictor variable: (Constant), ENTERTAINMENT 6 ENTERTAINMENT 5, ENTERTAINMENT 1, ENTERTAINMENT 4, ENTERTAINMENT 3. ENTERTAINMENT 2

Source: Results generated by SPSS system analyzing collected data

The table 4 shows that the attitude toward advertising presented in Social Network is explained in 7% by the irritation level perceived by users in connection with such advertising.

TABLE 4: SUMMARY OF THE REGRESSION ANALYSIS MODEL USING IRRITANT VARIABLE

Model	R	R square	R square corrected	Error tip. Of estimation
1	.286	.082	.071	.64704

A Predictor variable: (Constant), IRRITANT 5, IRRITANT 1, IRRITANT 3, IRRITANT 4, IRRITANT 2

Source: Results generated by SPSS system analyzing collected data

Development Model

To prepare the linear regression model a factor analysis in SPSS system was made by the method of successive steps to ensure the levels of significance.

It can be seen in Table 5 that the leading variables for the study that have greater relevance are the entertainment variables, trust and information.

The model generates three variables as more important as the limits for the significance level, which was determined in 95%, so that the values were not adjusted to this range was automatically discarded.

TABLE 5: ANALYSIS OF THE COMPONENTS BY THE STEPWISE METHOD INTRODUCED VARIABLES/ DELETED

Model	Introduced Variable	Deleted Variable	Method
1	ENTERTAINMENT 6		By steps (criteria: Prob of F to get in < .050, Prob. Of F to get out > = .100)
2	TRUST 6		By steps (criteria: Prob of F to get in < .050, Prob. Of F to get out > = .100)
3	INFORMATION 6		By steps (criteria: Prob of F to get in < .050, Prob. Of F to get out > = .100)

a. dependent variable: ATTITUDE 6

Source: Results generated by SPSS system analyzing collected data

The linear regression analysis by the stepwise method was used to obtain an overview of the model and observe the changes in R square for each component proposed by the system. It can be seen in table 28.

The first model includes only the entertainment variable and explanatory variable indicates that the attitude toward advertising in social networks itself in 16.5%.

The second model also includes the trust variable and indicates that the set of these two variables explain the attitude towards social media in 20.5%.

The third model also includes information variable and indicates that all of these three variables explains the attitude by 21.3%, with significance greater than 95%.

TABLE 6: QUOTIENTS OF INDEPENDENT VARIABLES USING FOLLOWING STEPS METHOD SUMMARY OF THE MODEL

Model	R	R square	R square corrected	Error tip. Of estimation	Change in R square	Change in F	gl 1	gl2	Next change in F
1	409a	.167	.165	.61338	.167	83.011	1	414	.000
2	457b	.209	.205	.59861	.042	21.676	1	413	.000
3	468c	.219	.213	.59537	.010	5.512	1	412	.019

a predictor variable: (constant), Entertainment construct

b predictor variable: (constant), Entertainment construct, trust construct

c predictor variable: (constant), Entertainment construct, trust construct , Information construct

Source: Results generated by SPSS system analyzing collected data

The value of the square R is the coefficient of determination in the model, and it indicates the proportion of variance in the dependent variable that is explained by the independent or production variables, the coefficient is located between 0 and 1, the higher the value of R square, the greater the explanatory power of the regression equation, and therefore the prediction of the dependent variable. (Hair, 2010. p.193).

In Table 6 the model that includes the three variables that were significant in explaining attitudes toward advertising in 21.3%, taking into account the adjusted R value and not the value of R because increasing the number of observed variables in an equation, it will increase the value of R square.

It is therefore necessary to adjust the value of R so that it is representative. The R square value increased with the increase in the number of variables used, or decrease if a variable that is not statistically significant in the equation is introduced, that is, it does not affect the dependent variable. To obtain the adjusted R squared value, you can detect which variables are the ones which explain better the model and in what proportion do. (Hair, 2010).

Table 7 shows three different models that SPSS system determined that met the criteria of specified significance following the stepwise method. In the first model, entertainment variable is only included and awarded a weight of .421, indicating that for every change in 1 of entertainment, attitude will change in .421.

In the second model, the confidence variable is introduced and values are distributed, entertainment variable has bigger weight and affects attitude in .361 while confidence does in .261.

In third model, the system included the variable information, as this has the least influence of the three, but also meets the criteria of reliability; it give them weights of .304, .234 and .129 to entertainment, information and confidence respectively.

Source: Results generated by SPSS system analyzing collected data

This model is obtained from the above information to explain the dependent variable attitude, based on the significant independent variables: *Attitude toward advertising in Social Media = 1.076 + .304 + Entertainment + .236 Trust + .127 Information.*

Third model that includes three variables found by the system and consider as significant to explain attitude toward advertisement in Social networks was used. This model as a whole using the adjusted R explains the attitude towards social media by 21.3%, the rest is explained due to external factors to those studied here. (Hair, 2010. p.156).

Conclusion

Analyzing data using SPSS statistical system shows that entertainment and reliable information are relevant for social networks users when having a positive attitude toward advertisement presented within them. These findings are consistent with previous research that found that advertising is considered entertaining (MacKenzie & Lut, 1989; Kwek, et al. 2010; Hsu-Hsien, 2010; Taylor, 2011), informative (MacKenzie & Lutz, 1989; Brackett & Carr, 2001; Kwek, et al. 2010; Hsu-Hsien, 2011; Taylor, 2011) and that the credibility is an important factor to evaluate their attitude towards it (MacKenzie & Lutz, 1989; Backett & Carr, 2001; Kwek, et al. 2010).

Moreover, the irritation factor had no significant relevance when determining the attitude of users toward advertising presented in social networks, in contrast to the results obtained by Brackett & Carr (2001).

The research results indicate that 38% of respondents have a positive attitude toward advertising presented on social networking sites. When presenting advertising on social networking sites is important to consider various features of the ads so that users can have the same positive attitude. When internet users are on social networking sites, these are not actively looking for ads brands, but they are interested to know the opinions of people who are part of their social network regarding products or services that have used, and which they can share their experiences. People value the evaluations made by the people who are part of their social circles, so they are receptive to receiving information that might be useful.

Advertising that is presented in the Social Networking sites must possess characteristics that make users have a favorable attitude toward it so it should include features that are valued. It is advisable advertising is attractive, containing characteristics that make it interesting, entertaining and funny, it is also important to be a reliable source of information so what is presented in advertisement must be relevant to spectator to adjust advertising to target audience, finally is important that ads are reliable, it means, advertiser and ads represent a reliable source of information on which the target audience can take as real to base their purchase decision.

The relevant advertising allows Internet users who are constantly looking for information on the Internet to make more informed purchases; an ad which provides clear and honest information will be more attractive to consumers. Reliable advertising will enjoy acceptance among internet users.

Finally, Internet users will have a better attitude toward advertising in social networks, if it has features that make it fun and entertaining. Internet users have a positive attitude toward advertising presented in social networks so they can be used by brand to create brand awareness and loyalty, recommendations spreading the word, favoring the opportunities to become viral certain advertising content. When a Social Network user has a positive attitude toward advertisement seen, he tends to share to share it among his network contacts which facilitates the spread of content, sometimes making them viral.

Limitations

This research focused on students of the Universidad de Guadalajara, in CUCEA, the campus for Economic and Administrative Sciences, but is not representative of the population, so it is necessary to make wider to deepen consumer awareness tests. This research is limited by the studied population; it is therefore not representative of Mexican society, or the population of Jalisco. Therefore, intended to provide a better knowledge of the consumer regarding to his attitude toward advertising in Social Networks.

It is important to consider that this was not a controlled study and it would be desirable to create a study in which the variables are managed and can perform other types of statistical analysis that allows obtaining more precise information.

The study was made considering only advertising showed in Social Networks, and it does not consider pages created by brands inside the social networks. There are research that show that virtual brand communities within Social Networks sites are well received by the internet users, since they are part of those communities seeking information, as well as offering opportunities for brand promotions (Hsu-Hsien, 2011). Investigate about advertising in virtual brand communities is a future line of research that was not covered in the present study.

Brand Preferences of Slovak Consumers

Abstract

The paper describes brand preferences of Slovak consumers in terms of domestic vs. foreign brands. The introduction to brands and brand buying behavior is provided at the beginning, followed by brief description of brand recall and importance of brand preferences. Then description of research methodology is mentioned and finally, research results are presented. The representative research was conducted in year 2013 on a sample of 1067 Slovak consumers older than 16 years of age. They were presented with a list of 27 statements concerning their attitudes towards domestic and foreign brands and their brand buying behavior. Based on the research results, Slovak consumers can be seen as very brand oriented and they care about brands and brands names and they make their buying decision based on brands. They prefer to buy Slovak products, but it is sometimes difficult to find domestic brands in stores, especially in consumer goods and textiles.

Literature Review

Brands are projected values in the minds of customers and without this psychological commitment there are just unrecognizable products or services. Therefore brand is commitment and marketers need to understand consumer and how his mind works to be able to build a real relationship between consumers and products (Temporal, 2010). An understanding of consumer behavior frames a brand's competitive advantage (Greifenberger, 2009). Prior to a purchase the brand can increase consumer's efficiency of perception, processing and storage of information. The actual decision making activity can be easier because brands reduce uncertainty and reduce risk of a purchase and in the post purchase stage, the image benefits of brands emerge (Klaming, 2006).

There are products of various origins offered to customers, which is a consequence of globalization and merging and connecting markets. The formation of global economy has noticeably widened the presence of foreign products on domestic markets. This has stimulated interest in examining the role of country of origin and its consequences on consumer behavior. It can be considered a cue that is capable to summarize information on products, brands and firms from different countries. Therefore, country of origin can be seen as one element of a brand that helps consumers to connect the brand to a specific country. At times, product origin may suppose a barrier to the trade of goods and services within or between countries. Consumer preferences for foreign and domestic products could be influenced by trust in foreign firms, consumer ethnocentrism and negative feelings towards a specific country (Torres and Gutiérrez, 2007). The influence of country of origin on brand buying behavior has been studied for decades. But in times of globalization, when products are designed in one country, manufactured in another and assembled in another one, consumers are confused and are often not able to identify or recognize domestic products. Globalization has increased the opportunities for companies to distribute their goods to consumers all over the world. At the same time, consumers are able to choose from a broad range of products and services in almost any category. International product adaptation makes it difficult to differentiate between goods.

Marketers are eager to understand how consumers form their preferences toward a specific brand. Brand preference is closely related to brand recall, which can activate brand purchase. Knowing the pattern of consumer preferences is an integral part of every marketing analysis. It can uncover the differences in purchase preferences and can lead to more effective segmentation and ultimately to more effective marketing strategies. In marketing, the word preference means the desirability or choice of an alternative. Preferences depend on the salient beliefs that are activated at a given time; the consumer biasness toward a certain brand; the extent to which a consumer favors one brand over another (Ebrahim, 2011). Market researchers have long known that buyer awareness of a brand strongly influences preference for that brand. Research now shows that 70% of buyers must be aware of your product before 25% of them will make it their preference. The relationship between brand awareness and preference follows an S-shaped curve. Most companies must significantly increase awareness to achieve desired gains in brand preference. Awareness-preference ratios do not typically reach a 1:1 relationship until awareness levels are higher than 70%. Typically, a brand known by more than 70% of the market is preferred by 25% of customers. At this stage, brand preference increases 1% for each 1% increase in awareness (5metacom.com, 2006). Brand awareness is the first dimension of the entire brand knowledge system in consumers' minds, reflecting their ability to identify the brand. It is the likelihood that a brand name will come

to mind of a customer. It can be depicted into:

- Brand recognition - consumers' ability to confirm prior exposure to the brand when given the brand as clue. It is recognition of a given brand among others and it indicates a weak link to the brand.
- Brand recall - consumers' ability to spontaneously retrieve the brand when given the product category, the brands are named by the consumer spontaneously. These the brands in the range of a customers' choice when making a buying decision (Moisecu, 2009).

Good brand recall and recognition have a numerous desirable effects for a company (Koniewski, 2013):

- the recall of one brand blocks off the other brands from the range of alternatives in which the consumer makes his decision,
- within a set of familiar brands consumers pick the ones better known to them, especially if they cannot see any special differences between the competing offerings,
- brand awareness forms the basis for a clear and attractive brand image,
- brand recall coupled with high customer satisfaction levels translates into customer loyalty.

In the following part, brand recall of Slovak consumers will be examined and their preferences for domestic vs foreign brands.

Methodology

In order to get accurate results for this paper, a representative research was performed within a scientific project called "Analysis of the strategic process of brand building and brand management in the context of homogenization and individualization of consumer needs". The population for the research were Slovak consumers 16 years of age and older. In total numbers it is more than 4.5 million consumers. According to the nature of the study and the goal to generalize the results for the whole population, following formula (1) for indefinite populations was used to determine the sample size:

$$N = \frac{z^2 \times p(1-p)}{H^2} \quad (1)$$

Where N is the sample size, Z is the value of test statistics corresponding to a confidence level, p is the sample proportion and H is the permissible error. In our research we calculated with the confidence level of 95 percent (test statistics to this value is 1.96), sample proportion was 0.5 since we wanted the most conservative sample size and the permissible error was set to 3 percent, giving us the sample size of 1067. To be able to draw conclusions from the research and to get accurate results, quota sampling was used. It ensures that chosen subgroups are represented in the sample to the exact extent as they are in the population. The quotas of this research were gender, age, education, and income. Data was collected from January to April 2013 in Slovakia and the instrument for data collection was a questionnaire. To determine the spontaneous brand recall, the respondents were asked to name at least one brand they can recall and in the following question, at least one Slovak brand they recall. Then they were presented with a list of 27 statements concerning their attitudes towards domestic and foreign brands and their brand buying behavior. Likert scales, as a very common and easy tool for measuring attitudes, were used in the survey. The scales ranged from -2 (absolutely disagree) to +2 (absolutely agree). The data were evaluated in R, software for statistical computing and graphics. For better visualization of open-ended questions where a lot of various brands were mentioned, word clouds were used. They provide a visual summary of a collection of texts by differentiating the popularity, importance or frequency of appearance by font size. They also serve as a visual summary of document content (Lee et al, 2010).

Research Results

First, the results of an open-ended question are presented, followed by results from the attitudes measurement. To determine the spontaneous brand recall, the respondents were asked to name at least one brand they can recall. There are the 100 most frequent brand names presented in Figure 1.

FIG. 1: BRAND RECALL OF SLOVAK CONSUMERS

The most recalled brands are sport brands Adidas, Nike and Puma. The most mentioned brand overall was Adidas. The second biggest cluster of brands was technological with brands like Apple, Sony, Nokia and Samsung. To this cluster also belong, in terms of frequency appearance, Coca Cola and Škoda. Škoda is leading the spontaneous knowledge among car producers, followed by Mercedes, Audi and Volkswagen. In the third biggest cluster are Rajo, Figaro, Nivea, Panasonic, HP, Kia, Zara and Orion, meaning the most mentioned Slovak brands were Rajo and Figaro. Another Slovak brands that can be found in the cloud are Coop Jednota, Topvar, Orava and Slovenka. The most known clothing brands were Zara, being a leader in this cluster, followed by Tommy Hilfiger, Guess, Mango, Chanel and Hugo Boss. Another brands belonging to the 100 most mentioned brands by Slovak consumers were Milka, IBM, Microsoft, Ford, Orion, Reebok, Mc Donald's, L'Oreal, Nestlé, Eta.

In order to determine consumers' preferences for domestic or foreign brands, the respondents were presented with various statements about their attitudes toward brands and the results can be seen in Figure 2. Concerning attitudes toward domestic brands, Slovak consumers agree that Slovak products are high quality products, but it is sometimes impossible to find Slovak brands of certain products in the stores. Nevertheless, they tend to prefer Slovak products in their purchases because they like Slovakia and they want to support the country's economy. Slovaks trust domestic brands more than those of foreign origin and they usually buy food that is made in Slovakia. Considering foreign brands, Slovaks think they are more available and they usually buy consumer goods, footwear and textiles of foreign

origin. Consumers do not think that foreign brands do have better quality than Slovak brands. General attitudes of Slovaks toward brands can be described as follows: Consumers do have their favorite brands and they do not care if they were produced abroad or in Slovakia but they are very aware of the country of origin. They are brand oriented and they make their purchase decision based on brands. They are not willing to pay more for Slovak products, but they not hesitate to spend more money on their favorite brands. The consumers are interested in the country of origin and they are willing to take the time to search for the information of where the product they want to purchase was made. Brands play an important role for Slovaks, but the consumers are sometimes confused with the great variety of brands.

FIG. 2: BRAND PREFERENCES OF SLOVAK CONSUMERS

Discussion

Slovak consumers are considered to be brand oriented. Marketing experts say the economic crisis has had some effect on perception of Slovak consumers toward brands – the belief of certain brands names and their promise of quality grew stronger and the consumers became more price sensitive and when they give away their money they expect to get the desired performance.

The crisis made stronger the relation of Slovaks to traditional, established brands. Slovaks look for a certain guarantee of quality and certainty. And traditional brands provide exactly such a guarantee for them (Liptáková, 2011). Slovak consumers do not behave as patriots when they are shopping and retailers have already begun to see that Slovak consumers are becoming more price sensitive because of the worsening economic situation and that they are more often ignoring a product's country of origin when shopping. This is caused both by lower purchasing power of Slovaks and by a lack of consumer patriotism that was never built in Slovakia. Based on surveys conducted by GFK in 2011, Slovak consumers have a strong interest in purchasing domestic products but it is questionable whether they actually reach for those products when shopping (Liptáková, 2012).

Slovak consumers are brand oriented, they care about products they buy regardless of the price. When they have their favorite brands, country of origin is not important for them and they are willing to pay more money for it. The main reason for buying Slovak products is to support the economy and we can say that Slovak consumers are very aware of the benefits of supporting domestic production. Nevertheless, consumer ethnocentrism is not typical for Slovaks. In the past 20 years, many companies underwent a privatization by multinational companies that "domesticated" international products in Slovakia. Consumer ethnocentrism also depends on the share of domestic production compared to foreign products. There are certain industries in Slovakia where this share is in favor of domestic production – food industry. But there are many products where consumers are forced to buy foreign brands, because there is nearly no Slovak production, e.g. electronic devices, consumer goods, clothing...

When examining spontaneous brand recall of Slovak consumers, the most recalled brands were sport brands Adidas, Nike and Puma. The most mentioned brand overall was Adidas. The top of mind Slovak brands were Rajo and Figaro, both well established and traditional domestic brands from food industry. To raise the awareness of consumers about the benefits of purchasing domestic products the participation of government and manufacturers is needed. There are several institutions in Slovakia that support domestic production. Industrial Property Office of the Slovak Republic, a central state administration body responsible for industrial property protection; Slovak Association for Trademark Products that protects and promotes the common interests of manufacturers of branded products; Ministry of Agriculture and Rural Development with a program to label domestic agricultural and food products called „Quality Label SK“; Association of Trade and Tourism (ZOČR) introduced an initiative „Quality from Our Regions“ to increase Slovak consumers' awareness of domestic products. Promoting a positive attitude towards domestic product is beneficial and there is a need to invest in consumers' education to support Slovak economy in times of global economic crisis.

Service quality and profitability. An empirical study about clients and financial advisors of the Allianz Bank F.A

Abstract

The paper considers the issue of quality of service provided and the effects of value on customers and businesses, particularly those operating in the financial field. The results of a first empirical analysis are presented in the paper. It refers to a sample of 64 customers of an agency of Allianz Bank FA and the financial advisors of that agency. The purpose of this study has been to measure the relationship between the level of customers' satisfaction regarding the provision of advice and asset management carried out by financial advisors and the value that they allow customers to create in favour of the promotion center Allianz Bank FA. For this purpose it has been used an analysis model of service quality specially designed on the SERVQUAL model and have been carried out the correlation analysis between the CSI of each customer and the profitability relative percentage with the consideration of the specific items of revenue for the agency obtained through the relationship with its own clients.

Introduction

For any company maintaining a loyal base of customers has become a must to remain competitive in its target markets. In service industries this is particularly true because of the word of mouth phenomenon they produce and develop, for the high resistance to switch a service provider (Butcher et. al., 2001) and for the substantial impact on profits (Anderson et al. 1994; Veloutsou et.al. 2004). Fundamental prerequisite for the generation of loyalty and to influence customer retention, market share and profitability (Anderson et.al 2008; Cronin et.al.2000; Nikbin et.al 2012) is the skill to satisfy customers. It's for this reason that customer satisfaction has been the topic of much attention in the literature. According to Oliver (1999:34) satisfaction can be defined as an evaluation of the perceived discrepancy between prior expectations and the actual performance of the product. Therefore customers' satisfaction is a result obtained from customer's before purchase comparison of expected function with perceived function and the paid price (Beerli et al., 2004). In every company, and in particular in service ones, it is essential to satisfy customers in order to create value both for customers and the company. For this scope the company must find the suitable activities in order to solve customers' problems (Gronroos, 2001). In this directions it appears critical the employee's role because directly involved in the service process. Besides their activity they define the service quality (with effect on service perceptions) that is absolutely important to distinguish the organization from its competitors and to gain competitive advantages (Ghobadian, Speller and Jones, 1994). With regard to this the study intends to analyze the relationship between the service quality and the economic performance of the activity conducted by the financial advisors of an agency of Allianz Bank FA located in Lucca. In particular, the main objective of the study is to measure the relationship between the service quality and the value that customers bring to the promoters of the Allianz Bank FA, with focus on the determinants of service quality. For this purpose the study consider initially the service quality assessment using a model developed on the basis of the SERVQUAL model and according to an indicator of economic performance of promoters; this indicator is calculated using specific parameters useful for this purpose. The results have been correlated each other and discuss about the most important aspects and the managerial implications.

The Sample

The sample considered in this study is representative of the total customers of the above-mentioned agency of the Allianz Bank FA and it has been identified through the method of stratified sampling. the total customers of the promoters are 358, classified as:

- 70 Major Account;
- 168 Medium Account;
- 120 Small Account.

The breakdown of the customers in the category large, medium and small has been carried on the AUM of the client, ie the total value of the saving of the individual subject managed by the promoter. The results obtained are the following

- < 20.000 euros: small client,
- between 20,000 and 200,000 euros:medium client,
- 200.000 euros: large client.

Later it has been determined the number of persons of the sample equal to 57, with a proportion of sampling $\frac{n}{N}$ that is $\frac{57}{358} = 0,159$.

Starting from the population and considering the proportion of sampling the sample is as follows (Tab.1):

TAB. 1 – THE SAMPLE

Customers	Proportion of sampling	Cluster of customers	
70	0,159	11	Large client
168	0,159	27	Medium client
120	0,159	19	Small client
358		57	

To obtain the desired sample, and therefore to guarantee a certain level of accuracy in the estimates, it has been decided to send a greater number of questionnaires compared to those just calculated. In particular, assuming likely a response rate of approximately 60%, it has been obtained a number of 95 questionnaires to send. This value has been divided proportionally according to the composition of the reference sample as follows (Tab.2)

$$\text{proportion of sampling } \frac{n}{N} \text{ that is } \frac{95}{358} = 0,265$$

TAB. 2 – THE SAMPLE

Customers	Proportion of sampling	Cluster of customers	
70	0,265	18	large client
168	0,265	45	medium client
120	0,265	32	small client
358		95	

Below a random selection was made of the customers within the predetermined categories in client portfolios and assigned a code number to each subject (c1, c2, c3 ..); this code was written on each questionnaire reported in such a way as to meet the data with those related to profitability. The response rate was 65%, which corresponds to 64 correctly completed questionnaires on a sample of 95. Most of the repliers are men aged between 35 and 55 years old, living in proximity of the financial promoting agency.

Performance indicator

To carry out the analysis about customers' value it has been considered important to refer to an indicator of profitability able to express the monetary value generated by the activated relationship between clients and agency. This indicator has been calculated using the items of income and costs directly related to this ratio and the value of assets under management to the promoter for each customer. In the formula, the indicator in question has been therefore determined as follows:

$$\frac{UT+BA}{AUM} \%$$

Legend:

- UT are expenses "Una Tantum" perceived by the promoter in connection with the purchase of a service / financial product;
- BA are the expenses on an annual basis relating to management fees calculated on the entire Aum customer;
- AUM is the value of savings managed by promoters.

This percentage is multiplied by the Aum of each customer which provides the annual amount that each person is charged as an expense to the company financial promotion; the company pays a part of this amount to the promoter, which usually varies from 30% to 60%, depending on the client's ability to self-management by the promoter, his professionalism, his results. In general, the higher is the result of this indicator and the higher is the profit for the promoter and the company.

Service quality assessment

In order to carry out the analysis of the quality of service it has been referred to the SERVQUAL model (Parasuraman, Zeithaml, Berry 1988). This model predicts that the quality of service can be appreciated by carrying out a comparison between expectations and perceptions of 22 items related to the service divided into 5 clusters: reliability, responsiveness, reassurance, empathy and tangible aspects. This model has been subject to several criticisms (Carman 1990; Teas, 1993a, Smith 1995; Favretto 2004); However, it remains one of the tools of analysis of the most widely used reference that is also requesting to define from time to time, being careful to contextualize the model to the specific scope of analysis (Parasuraman, Berry, Zeithaml 1991).

The Customer Satisfaction Index (CSI) is obtained by performing the sum of the gap between perceptions and expectations related to the 22 items. In our analysis it's equal to 0.0379; it can be therefore affirm that customers are generally satisfied with the services provided by the promoters. To fully understand the meaning of the CIS and assess the critical areas it has been analyzed the scores of the various sections that are in Servqual model (Tab. 3).

TAB. 3 – GAP ANALYSIS

			Gap	
Tangible aspects	1	The information materials of the services are complete and updated	0,19	P>A
	2	The promoter has a neat and tidy appearance	0,78	P>A
	3	The office is functional and beautiful at first sight	0,43	P>A
	4	The website is efficient and updated	-0,05	P<A
Reliability	5	Waiting times to meet the promoter are satisfactory	0,09	P>A
	6	In front of a problem the promoter is interested and ready to solve it	0,02	P>A
	7	The Promoter respects the time of appointments	0,13	P>A
	8	For any questions or problems you can always find the promoter	0,05	P>A
	9	When the promoter makes a promise, he always keeps it	-0,28	P<A
Responsive	10	The promoter is always available to attend to his customers' needs	0,00	P>A

	11	When a problem occurs the promoter solves it quickly	-0,13	P<A
	12	The promoter will communicate accurately to their customers when it is executed the service provision	0,16	P>A
	13	The promoter is capable of providing the required financial solution	-0,09	P<A
Reassurance	14	The behavior of the promoter inspires confidence in the customers	0,00	P>A
	15	you feel safe during the service provision	-0,30	P<A
	16	The promoter is always kind and polite	0,30	P>A
	17	The promoter knows well how to meet all his requirements	-0,06	P<A
Empathy	18	The promoter has the skills required to meet all of its needs	0,13	P>A
	19	The promoter understands your specific needs and is able to direct the choice of investment	-0,09	P<A
	20	It's easy to learn how to surf the site to take advantage of online services	-0,30	P<A
	21	The call center is available and efficient	-0,10	P<A
	22	Purpose of the promoter is to serve the interests of the customers in the best possible way	-0,20	P<A

Source: *Our elaboration*

The results show that for some items there is a positive gap between perceptions and expectations while for others the opposite situation is observed.

The next step has been to analyze the ability of each attribute to contribute to the generation of satisfaction / dissatisfaction. For this purpose, it has been calculated the correlation coefficient between the scores of the gap of 5 Servqual dimensions and the values of overall satisfaction of the service aggregated by each customer (Tab. 4).

The data obtained show that all the dimensions considered to be positively related to overall satisfaction. Among these, in particular, tangible aspects and empathy. On the basis of these findings it is possible to suggest to the promoters, and therefore also to the headquarters of Allianz Bank FA, to focus their attention on these two aspects, especially the empathy that contributes significantly to the satisfaction of their customers and that to date is the dimensions of the service that shows a 4 negative gap on 5.

This piece of information can be very useful to corporate management called on to take decisions to improve business performance through an improvement in the overall satisfaction of its customers in respect of the service.

TAB. 4 - GAP ANALYSIS, CRONBACH'S ALPHA AND CORRELATION BETWEEN THE DETERMINANTS OF SERVICE AND TOTAL SATISFACTION

Value analysis

The value analysis is developed using a performance indicator represented by the risky financial instruments, the percentage of costs that the client must support related to trading commissions, the operation of the securities account and fees for consultancy; while for some asset management products will have entry fees, exit or switch. In particular, this indicator is higher with the increase of risky assets contained in the portfolio of the client; in the present study it has been calculated an average value of 0.52%. This percentage represents the average profitability that the Agency can boast. In order to understand how the value of customer satisfaction is correlated with the value generated by the promoter it has been analyzed the correlation between the CSI of each individual customer and the relative profitability percentage. Between these two components seems to exist a low positive correlation. The value of the Pearson coefficient is in fact 0.0949, that is not significant (v.tab 5) (p-value 0.4558).

In a second step it has been considered a greater level of detail with the consideration of the components of quality assessment.

TAB. 5 - CORRELATION PROFITABILITY, CSI AND SERVICE QUALITY DIMENSIONS

	Profitability CSI	GAPAspTan	GAPReliab.	GAPResp.	GAPReas.	GAPEmp.	Profitability CSI
Profitability	1.0000						
CSI	0.0949	1.0000					
	0.4558						
GAPAspTan	0.3322*	0.1165	1.0000				
	0.0073	0.3595					
GAPReliability	0.1688	-0.1127	0.2111	1.0000			
	0.1825	0.3753	0.0941				
GAPRespons.	0.4557*	0.0048	0.3964*	0.5349*	1.0000		
	0.0002	0.9699	0.0012	0.0000			
GAPReas.	0.4536*	0.0859	0.2058	0.3720*	0.3170	1.0000	
	0.0002	0.4995	0.1028	0.0025	0.0107		
GAPEmpathy	-0.0190	-0.0515	0.4679*	0.0833	0.1502	-0.0126	1.0000
	0.8814	0.6858	0.0001	0.5130	0.2360	0.9216	

* Significant at $\alpha = .001$ or better level of significance

The data obtained bring out the responsiveness and reassurance whose areas of satisfaction are most related to profitability. It is therefore possible to affirm that the essential component to guarantee a satisfactory return, which is then reflected in a higher value for the company, are the technical knowledge of the sector and the ability to interact with customers. These activities are important in order to understand the customer's needs and therefore to allow effective and highly personalized advisory services. The latter are therefore two constitutive elements of the relationship of trust that are established between the investors and the promoters. It's just the confidence that can affect a greater participation of the individual to equities (which result in greater returns for the promoter) due to a lower subjective probability assigned to the possibility of misconduct by the promoter.

Limitations and final considerations

One of the main limits of this research is the restricted dimension of the sample. Thus, the findings should be verified on a numerically higher sample that becomes more representative of the universe of customers Allianz Bank FA. In addition, it will be useful to consider more years in order to determine whether a possible change in the level of the service quality assessment is associated with a change in profitability. In this regard, it could be useful to consider more items or to refer to an analytical model of service quality that takes the aspects considered important for clients into greater account such as, for example, the Revised SERVQUAL (Sureshchander GS, Rajendran C., Anantharamen RN, 2002). Finally, it could be useful to split the sample into clusters based on some variables such as importance of the client, duration of the relationship with the agency, the search for benefits , etc..

The results obtained show however how the management can acquire useful information for the improvement of the service quality especially about those aspects that seem to be more related to company performances. It therefore assumes a strategic importance and a systematic application of this analysis could be important to maintain a position of competitive advantage.

The Implementation of Relationship Marketing in Cluster Management

Abstract

In the article there was characterised the significance of relationship marketing with particular regard to the need for the implementation of this contemporary concept in the process of cluster management. It was emphasised that from the viewpoint of further development, a strategic challenge for decision-makers in a cluster is the establishment, particularly within this organisation, of partner relationships, which are the sign of their highest level of advancement. It was indicated that passive attitude of cluster decision-makers towards building long-lasting, partner relationships not only in a cluster itself but also in its environment may pose considerable threat for the further existence and the development of this organisation. Simultaneously, there was presented a range of benefits related to the implementation of relationship marketing within a cluster. Taking into consideration holistic attitude towards the issue in question, it was proved that the management of relationships with key stakeholders (e.g. clients, suppliers) is conducive to the development of relational capital of a cluster.

Introduction

Presently, clusters are treated as more or less formalised organisations, created as a result of permanent competition of companies and other entities (universities, R&D institutions, business support institutions, public administration), geographically concentrated and mutually related. Dynamic changes that occur in their environment constantly determine their management process. As a result, cluster decision-makers, willing to provide their organisations with adequate development conditions, seek the sources of a permanent competitive advantage, the advantage that will ensure them the permanence of functioning on the market.

In contemporary socio-economic processes, there was a shift of the focus from unit transactions towards building long-term and permanent relations with stakeholders, which are based on mutual trust. Hence, new market conditions necessitate skilful implementation and realisation of the principles of relationship marketing. It ensues from the nature of this concept of marketing that cluster's ability to create and maintain long-term partnership relations, among others with clients and contractors, basing on trust, become the chance of reinforcing the level of its competitiveness. Owing to the immaterial character of the relations determining relationship capital as well as their number, quality and value, clusters have the opportunity of building and reinforcing their permanent competitive advantage.

The aim of the present paper is to characterise the advantages that ensue from the implementation of the concept of relationship marketing in a cluster, within the scope of the initiation, maintaining and development of long-term relationships based on mutual cooperation with key stakeholders, mainly clients and suppliers. The author, taking into consideration the variety of methods and tools used in this process, emphasises the role of strategies and CRM/SRM systems. The paper has been based on the literature review and author's several-year research experience in the area of the significance of cluster management.

The role of relationship marketing in cluster management

The term *cluster* carries a lot of contents and is semantically ambiguous. Hence, it has no single, commonly applied and accepted definition. The majority of the definitions proposed in economic literature refer to the origin concept by M. Porter, according to which a cluster is a geographically proximate group of interconnected companies suppliers, service providers and associated institutions in a particular field linked by externalities of various types (Porter, 2003, p. 562). A similar approach is presented by S. Rosenfeld, who postulates that cluster is a geographically bounded concentration of similar, related or complementary businesses, with active channels for business transactions, communications and dialogue that share specialized infrastructure, labour markets and services, and that are faced with common opportunities and threats (Rosenfeld, 1997, p. 10). The physical proximity of actors within a cluster provides scope for collaborative endeavour aimed at addressing some areas of purported market failure (Enright and Ffowcs-Williams, 2000, p. 14). The industrial complex is characterised primarily by long-term, stable and predictable relations between the firms in the cluster, involving frequent transactions (Iammarino and McCann, 2006, p. 1022).

S. Rosenfeld argues that, like networks, clusters are composed of firms that co-locate around a variety of common interests or needs (Rosenfeld, 2005, p. 6). Whereas V. Boronenko and Z. Zeibote indicate that cluster is an economic subject rather than a juridical person (participants of a cluster are juridical persons themselves); although participants of a cluster have legal independence, they are economically interrelated; participants of a cluster differ in the type of activity and economic status and participants of a cluster are geographically proximate and work in the same region (Boronenko and Zeibote, 2011, p. 36). In Poland, for instance, clusters function as formalised as well as non-formalised structures. In the case of non-formalised clusters, it is the coordinator who plays the key role in the process of their development (cluster organisation).

The level of cluster development is mainly the result of the decisions undertaken by cluster decision-makers. It is their abilities, knowledge, experience, intuition, visionariness, creativity and leadership, including active undertakings that the pace of building cluster' competitiveness advantage depends on. Cluster management can be defined as a complex, interactive and non-linear process, continuous activity of a cyclical nature, and the organisation and coordination of the activities of a cluster in accordance with certain strategy, in order to achieve clearly defined common objectives (Schretlen and Dervojeda, et al., 2011, p. 3). It is an information and decision-making process orientated towards undertaking rational actions inside and outside a cluster, which are connected to the realisation of planning, organising, motivating and controlling functions. In many publications it have been emphasised that it is impossible to manage a cluster effectively in the conditions of market turbulences without mature partner relationships with key internal and external stakeholders. Simultaneously, it creates a need for the implementation of relationship marketing.

While analysing the concept of relationship marketing, Ch. Grönroos emphasised that sometimes relationship marketing is used more or less as a synonym for direct marketing, database marketing, or for establishing customer clubs, and it becomes just another instrument in the marketing mix toolbox to be used to create transactions. In other situations, relationship marketing is used as a synonym for developing partnerships, alliances, and networks, or as part of marketing communications only (Grönroos, 1999, p. 333). As frequently defined, relationship marketing (Palmatier, 2008, p. 4; Percy and Visvanathan, et al., 2010, p. 2597):

- is the continuous process of identifying, developing, maintaining, and terminating relational exchanges with the purpose of enhancing performance,
- refers to all marketing activities directed toward establishing, developing, and maintaining successful relational exchange,
- is the ongoing process of engaging in cooperative and collaborative activities and programs with immediate and end-user customers to create or enhance mutual economic value at reduced cost,
- is to identify and establish, maintain and enhance relationships with customers and other stakeholders at a profit, so that the objectives of all parties involved are met and that this is done by mutual exchange and fulfilment of promises,
- involves creating, maintaining and achieving strong relationships with customers, employee, supplier, community, and other stakeholders of a business with the goal of delivering long term economic, social and environmental value to all key stakeholders in order to enhance sustainable business financial performance.

According to a commonly known statement, customer retention (a result of relationship marketing) affects the company's profitability, since it is more efficient to maintain an existing customer relationship than create a new one (Payne and Christopher, et al., 1999; Reichheld, 1996). P.H. Andersen concludes that the essence of these activities is to decrease exchange uncertainty and to create customer collaboration and commitment through gradual development and ongoing adjustment of mutual norms and shared routines (Andersen, 2001, p. 168). The overall objective of this type marketing is to facilitate and maintain long-term key stakeholder relationships, which leads to the change in focal points and modifications of the marketing management process. Moreover, a key goal of relationship marketing theory is the identification of key drivers that influence important outcomes for the organisation and a better understanding of the causal relations between these drivers and outcomes (Hennig-Thurau, Gwinner, and Gremler, 2002, p. 231). S. Hollensen and M.O. Opresnik claim that the growing interest in relationship marketing suggests a shift in the nature of marketplace transactions from discrete to relational exchanges, from exchanges between parties with no past history and future prospects to interactions between parties with a history and plans for upcoming interaction (Hollensen and Opresnik, 2010, p. 8). According to H.B. Thorelli relationship marketing is part

of the developing “network paradigm”, which recognizes that global competition occurs increasingly between networks of organizations (Thorelli, 1986, p. 47). In E. Gummesson’s opinion, the concept of relationship marketing is the recognition of a new type of organization which needs a new type of management (Gummesson, 1994, p. 10). As early as in 1997, Ch. Grönroos emphasised that in the future, this marketing paradigm most certainly will be a focal point of marketing research, thus positioning itself as a leading marketing paradigm not only in services marketing and industrial marketing but in most or all marketing situations (Grönroos, 1997, p. 328).

G. Scheer and L. Zallinger explicitly point that clusters are mostly very heterogeneous systems, consisting of a number of member businesses and partners whose information, communication and cooperation has to be structured and organized (Scheer and Zallinger, 2007, p. 30). Owing to the heterogeneity of cluster members (the representatives of various branches: business, science, local authorities, institutions of business support, financial institutions), in economic practice, managing such an internally diversified organisation proves to be an extremely complicated undertaking. It has to be emphasised that the level of risk connected to the functioning of a cluster as an entirety systematically increases as the number of members grows. Thus, it has to be assumed that a part of the newly joined subjects will display an opportunistic attitude and take care only for their individual development. Such an attitude coincides, *inter alia*, with the concept of social loafing by Ringelmann. According to this concept, the more people do together a piece of work; the worse is the result as compared with the sum of single results (the phenomenon of dis-synergy takes place). It ensues from the fact that when people work in a group, they frequently realise the limited possibility of evaluating their effort, therefore the motivation to work declines (Ingham, 1974, p. 371). Even this aspect of the functioning of cluster society should be taken into consideration while designing a system of the relationships that is adequate to a particular cluster, including the system of active motivation of cluster members for the benefit of a solid, partner, jointly responsible and ethical behaviour, which is conducive to the creation of the added value of relationships being established in a cluster.

The economic literature on clusters suggests that the strength and the dynamism of industry clusters are enhanced not only by the presence of supporting institutions and organizations but also by the nature and the extent of relations among firms, universities, and government agencies (Morgan, 2004, p. 49). Operating clusters, in which there is a high level of awareness of particular members within the scope of the affiliation to those structures and active cooperation within the realisation of common projects, constitute an example of a partner organisation, which enables their members to produce the effect of synergy. According to H. Haken, if a group of members can cooperate with each other, they can improve the quantity and quality of living conditions, and achieve the result that a single member cannot obtain (Zhang and Yu, 2013, p. 392). Two significant aspects of partnership that are indicated in the concept of a cluster are: the so-called external aspect, which refers to the relationships of cluster members with the stakeholders that operate in external environment, and internal aspect – that ensues from the characteristics of the relationships inside this organisation, which is connected to attitudes, beliefs and feelings of the partners.

In economic literature partnership is perceived as a relatively firm, long-lasting relationship between subjects, which is based on an open information exchange and mutual trust, engagement as well as sharing common benefits or possible risk. A partnership is an agreement to do something together that will benefit all involved, bringing results that could not be achieved by a single partner operating alone, and reducing duplication of efforts (Brandstetter, De Bruijn, et al., 2006, p. 7). This term describes also: a process that lasts in time; co-participation; being a partner; new quality of relationships with partners or a set of standards and rules. In the article it was assumed that partnership are business relationships, which are based on mutual trust, engagement and responsibility, with two or more independent partners who decided to cooperate closely with a view of making the results of their common work permanent and beneficial to both parties. The reciprocity of business relationships basing on partnership excludes the domination of one or a few partners over the other; it is connected to the equality in decision-making, assuming that all partners have the opportunity to influence the aims, processes and results as well as their assessment.

A model partnership in a cluster ensues not only from subject but also object premises based on common values of the partners. It is related to the activities being realised, which are orientated towards the development of resources and abilities in a cluster. Looking to the future and sharing a common vision constitute a chance for further development of the partners, guarantee of stable development, since it contributes to the elimination of a number of sudden, unfavourable changes, which can pose a threat to further functioning. The incentives for working in a partnership are not limited to monetary benefits because they include specific skills derived from the learning

experience, the greater collective capacity to respond to the problem, and the increased quality of the common solutions (Beckx-Bleumink, Billo, et al., 2003, p. 10).

The development of permanent partner relationships in a cluster requires of a manager: the activity, the abilities to cross socio-political and personal divisions, seeking a common basis of activity, the focus on the present and new goals. It requires particular openness and flexibility, mutual understanding, tolerance, transparency of actions and also determination, which guarantees the cohesion of partnership and prevents the scattering of activities. In order to be effective, a partnership must guarantee equal rights and benefits to the both parties of this relationship; otherwise it would signify the exploitation of one party by the other and would be doomed to failure. Therefore, cluster manager should carefully select the members basing on their “stake” or vested interest in the vision and goals of the partnership (Frank and Smith, 2000, p. 29). A lasting and successful partnership enhances the impact and effectiveness of action through the combined and more efficient use of resources and is distinguished by a strong commitment from each partner (Brandstetter, De Bruijn, et al., 2006, p. 7).

The units that have a significant influence on the quality of a partnership in a cluster are stakeholders themselves, not only those internal (cluster members) but also external ones. The term *stakeholder* in economic literature is also described as: a coalition of various groups of partners, strategic supporters, social contractors, power-holders, those who have stake at the game, the electorate of an organisation (Bryson, 2004, p. 22-25). It describes everybody who can positively or negatively influence the functioning of an organisation. A group of stakeholders has certain expectations as regards a cluster; on the other hand, however, its behaviour is conducive to the achievement of cluster’s objectives. Some types of stakeholder groups include employees, local communities, local elected officials and local and central governments, universities, regulatory agencies, customers, suppliers, financiers, shareowners, and non-governmental organizations (Zollinger, 2009, p. 5). The idea of the “stakeholder model” proposes extending the focus of managers beyond the traditional interest group in order to understand the needs, expectations and values of groups previously perceived to be external to the cluster (Ayuso, Rodriguez, et al., 2007, p. 2).

The theory of stakeholders is concentrated on the nature of relationships that exist between the organisation and its diversified group of stakeholders as well as the results of those relationships. It indicates that the group in question ceases to be perceived only instrumental and becomes an active subject of the market play (Perrini, Tencati, and Pivato, 2006, p. 297). Hence, it constitutes an example of a managerial philosophy, the success of which depends on the level to which an organisation can manage relations, connections and dependencies in relationships with the key stakeholders (Freeman, 2010, p. 74). The basis of those relationships can be: a contract, the regulations in force, more or less formalised rules of cooperation, owing to which those relationships may be of various natures, such as contractual, quasi-contractual, or non-contractual, partner, competitive as well as cooperative. The continuity of the cooperation is, however, to a considerable extent dependent on positive relationships, which are built and strengthened in the process of communication and becoming acquainted with each other. A permanent and efficient cooperation is impossible without an adequate level of trust between partners. The literature on trust suggests that confidence on the part of the trusting party results from the firm belief that the trustworthy party is reliable and has high integrity, which is associated with such qualities as consistency, competence, honesty, fairness, responsibility, helpfulness, and benevolence (Morgan and Hunt, 1994, p. 23). Empirical results received by M. Raskovic and M. Makovec-Brencic (2013, p. 16) show that buyer-supplier relationship competitiveness is mostly driven by interpersonal trust and joint problem solving (both relational determinants), as well as by two kinds of transaction-specific investments, namely investments into people and physical assets.

Due to high turbulence of the environment, the creation of one permanent set of stakeholders is unfeasible. As a result of the changes that occur in the market, new stakeholders continuously appear; they determine cluster’s behaviour and influence its identity (personality) and other attributes. Simultaneously, the changing nature of the processes of globalization, glocalization and regionalization creates the need to manage the relationships with stakeholders naturally. According to J.R. Boatright, to manage stakeholder relations is not necessarily to serve each group’s interest (although this might be the effect), but to consider their interests sufficiently to gain their cooperation. He stresses that stakeholder management assumes that management decision making is the main means by which the benefits of organisation’s wealth are distributed among stakeholders, but these benefits can also be obtained by groups interacting with an organisation in other ways, most notably through the market (Boatright, 2006, p. 107). Likewise, R.E. Freeman, A.C. Wicks and B. Parmar (2004, p. 364) indicate that managers must develop relationships, inspire

their stakeholders, and create communities where everyone strives to give their best to deliver the value the firm promises.

The application of CRM and SRM in the process of cluster development

One of the major tasks of a cluster manager is to build long-lasting relationships, inter alia, with key clients through a skilful adjustment to their constantly changing needs or offering them additional benefits, values. P.F. Drucker (2000, p. 28) states that the starting point for organisation management should not be a product, service, market or the final users of the products but, above all, the values and needs of a client. In the literature on marketing and management it is emphasised that a client should not be a customer but a partner, and a satisfying cooperation with them is one of the fundamental conditions that determines the success of business undertakings. As it results from G.B. Voss and Z.G. Voss's research (1997, p. 293), for cluster managers who really attempt to implement relationship marketing it has the importance of:

- using promotion and direct marketing to create awareness and exploration among potential new customers;
- conducting customer segmentation based on the level of relational commitment;
- maintaining a marketing database that enables frequent, interactive communications with ongoing customers and promotes increased relational commitment;
- developing strong bilateral relationships that are based on a governance structure and shared values.

In relation to the implementation of the concept of relationship marketing, Ch. Grönroos (1999, p. 334) states that to create an understanding of relationship marketing in an organization and to implement a culture of relationship marketing, it may be necessary to replace the term "marketing" with a psychologically more readily accepted term to describe the task of managing the organization's stakeholder relationships.

An integral element of a modern management system, which is conducive to a dynamic cluster development, is CRM (*Customer Relationship Management*). This notion for several years now has been very frequently applied; it is particularly connected to the concept of marketing relationship. In the literature on marketing and management a number of definitions of this term can be encountered. CRM is most often defined as (Choy, Lee and Lo, 2003, p. 88; Shani and Chalasani, 1992, p. 44; Parvatiyar and Sheth, 2001, p. 915):

- a process by which an organisation maximizes customer information in an effort to increase loyalty and retain customers' business over their lifetimes,
- an integrated effort to identify, maintain, and build up a network with individual consumers and to continuously strengthen the network for the mutual benefit of both sides, through interactive, individualized and value-added contacts over a long period of time;
- an organisational approach that seeks to understand and influence customer behaviour through meaningful communication in order to improve customer acquisition, retention, loyalty and profitability;
- a strategy within the organization that aims to satisfy and create a long-term relationship with a client;
- a comprehensive strategy and process of acquiring, retaining, and partnering with selective customers to create superior value for the organisation and the customer;
- a business strategy which includes marketing, operations, sales, customer service, human resources, R&D and finance, as well as information technology and the Internet to maximize the profitability of customer interactions;
- it involves the integration of marketing, sales, customer service, and the supply-chain functions of the organization to achieve greater efficiency and effectiveness in delivering customer value.

The above mentioned definitions indicate that CRM is a complex term that involves several aspects within the organization and it cannot be reduced to only one of those aspects (Mendoza, Marius, et al., 2007, p. 914). Basing on the literature review it can be concluded that the main component of any CRM concept/strategy entails the facilitation of a two-way interaction between individual customers and an organisation (external communications) concerning every aspect of the relationship, enabling the organisation to adjust its strategy, including product design,

customer service and channel preferences (Viljoen, Bennett, et al., 2005, p. 112). CRM is a concept that supports management of a contemporary organisation (e.g. a cluster), a concept which is based on a perfect acquaintance with clients and which ensues from the knowledge acquired from them. Relationship marketing enables managers to discover who their clients really are, how they behave and what their preferences and so-far unfulfilled needs are.

Understanding the needs of customers and offering value – the added services are recognized as factors that determine the success or failure of companies (King and Burgess, 2008, p. 421). Thus, this strategy may be conducive to the development of synergy effect as its properly implemented tools allow cluster decision-makers to create a complex system of information on the clients, provide more comprehensive and excellent service.

CRM is defined not only as a business philosophy, a business strategy, a business process but also as a technological tool. In this case, CRM is a computer application that supports the process of gathering and storing data, and subsequently making decision concerning the contact with clients. The IT CRM system is a tool which enables the solution of the current problems with customer service and strengthens the competitive position of the organisation in the market. However, the application is only a tool that facilitates management and on no account can it replace the basic consumer-oriented activities. In the literature on relationship marketing it is frequently indicated that CRM needs to be seen as more than just technology with the technology being regarded as the enabler of the CRM strategy (Xu, Yen, Lin, and Chou, 2002, p. 445).

A contemporary client, having the status of a key stakeholder, is more and more demanding, aware of their rights. They frequently participate in designing the product they buy as a prosumer (Terblanche, 2014, p. 1). They constantly broaden their knowledge and are capable of analysing their achievements and failures, ready to provide entrepreneurs with more pieces of strategic information on their behaviour. According to V. Ramaswamy (2008, p. 9), customers are now informed, connected and empowered on a scale larger than ever before; due to Internet technologies they have the access to new tools that enable them to co-create together with firms. Contemporary clients are: more competent – they are more self-assured and know how to use their experience and the knowledge they acquire. They have more analytical approach – clients' decisions concerning purchase are more related to the key business strategies. Hence, a client should be treated as a partner with individual standards, values, philosophy, lifestyle, needs and behaviour.

CRM can help organizations manage customer interactions more effectively (King and Burgess, 2008, p. 421). The fundamental goal of CRM is therefore to create greater customer loyalty, sales and satisfaction, and to provide a rich source of customer knowledge that can be used to gain a deeper understanding of customers in order to facilitate the provision of a fully personalised service (Viljoen, Bennett, et al., 2005, p. 111). Moreover, the main objectives of introducing CRM in contemporary organisations are: earning client's trust, obtaining information about clients and their buying habits, coordinating the process of gaining and using the information about a client, being distinguished from the competition, decreasing the costs relating to client service, shortening the time of client service, increasing the selling possibilities, enhancing employees' effectiveness within the scope of client service.

Owing to the fact that each cluster is unique and possess an individual system of resources and information flow, the process of CRM implementation can encounter numerous barriers. Certain barriers can result from the attitude of the employees, mainly due to the fact that CRM constitute: additional tool of controlling employees, additional work connected with entering data into the system, the need for sharing knowledge on the clients, the necessity of systematic and organised work. Hence, to successfully implement the concept of CRM into clusters there is a need for: a change of the present practice philosophy, transferring knowledge on the benefits of work with such a system. The implementation of CRM is not the objective itself; however it constitutes a means for the realisation of the aims determined beforehand. An important issue connected to the implementation of CRM system in a cluster is the choice of an adequate technology, which will take into consideration not only the current requirements but also enable its further development in the future. Admittedly, theoretically CRM without technology is acceptable, mainly on the basis of a good strategy, internal procedures, systems or employees' engagement for the benefit of client relationship management, however, ready applications based on relationship databases enable far more successful and effective client service. As it has been already proved in the present article, technologies are only a means to the objective and do not constitute a solution per se.

The core of relationship marketing is the development of positive relations not only with clients but also with suppliers. This concept assumes that undertaking such actions that aim to create firm, effective connections, as regards

the costs, with key clients and suppliers as the links of a value chain that leads to mutual benefits (Croxtton, Garcia-Dastugue, et al., 2001, p. 30). Within the scope of the supply chain as well as within a chain of an integrated cluster, the relationships between a supplier and a receiver should be based on partnership, which is considered the fundamental condition for the creation and development of those value chains. Owing to the fact that more and more number of the factors influence a supply chain, which makes it more and more complex and requires efficient management, the demand for efficient tools like *Supplier Relationship Management* (SRM) or Supply Management in business clusters is constantly increasing. SRM is defined as (Mettler and Rohner, 2009, p. 59; Choy, Lee and Lo, 2003, p. 87; Herrmann and Hodgson, 2001, p. 1):

- a comprehensive approach to managing an organization's interactions with the firms that supply the products and services it uses;
- the process that defines how a company interacts with its suppliers,
- the sourcing policy-based design of strategic and operational procurement processes as well as the configuration of the supplier management,
- a strategic, enterprise-wide, long-term, multi-functional, dynamic approach to selecting suppliers of goods and services and managing them and the whole value network from raw materials to final customer use and disposal to continually reduce total ownership costs, manage risks, and improve performance (quality, responsiveness, reliability, and flexibility),
- a process involved in managing preferred suppliers and finding new ones whilst reducing costs, making procurement predictable and repeatable, pooling buyer experience and extracting the benefits of supplier partnerships,
- new category of supply chain applications, contributes to the supplier selection and thus increases the competitive advantage of the manufacturer through three primary mechanisms: support of improved business processes across the supply chain, a next-generation architecture that can handle multi-enterprise processes, and facilitation of rapid product cycles and new product introduction.

This type of process/tool should be used in a business cluster as it enhances effective communication between procurement management staff in a cluster, which helps in the implementation of ethical business practices. Additionally, the Supplier Relationship Management is a key component, which pertains to the entire supply chain. It involves the following sequential practices (Chenoweth, Moore, et al., 2012, p. 7):

- conducting spending, market, and risk analyses and developing supply strategies,
- rationalizing the supply base and consolidating contracts,
- establishing long-term relationships with best suppliers,
- helping key suppliers improve quality, cost, and performance,
- integrating key suppliers into the organization.

The implementation of a concept of such type is significant from the viewpoint of cluster's development, particularly in the units where there can be observed considerable dependence on the network of suppliers, and complex supply channels. The major business benefits that ensue from its implementation are: the identification of the key suppliers and the creation of an effective strategy of managing the relations with them, streamlining and making the processes between a cluster and its suppliers more effective, minimization of the risk of breaking a supply chain, the reduction of transaction costs, optimization of resources of the entire supply chain, strengthening the competitiveness of a cluster on the basis of partner relationships with suppliers (Lambert and Stock, 2001, p. 510; Momiwand and Shahin, 2012, p. 761).

While choosing and creating a certain type of relations between the links of supply chain, first of all, what has to be understood is the significance of the relations occurring between the features of purchasing processes and the need for a constant cooperation and the level of reciprocal dependency of the contractors. The realisation of relationship marketing within a value chain of a cluster is conducive to the strengthening of competitiveness of its participants, facilitates the maintenance of long-lasting ties basing on trust, the creation of friendly environment for the functioning of a cluster. It is also conducive to: the stabilisation and consolidation of the relations between all of its links or more complete fulfilment of the final needs of key stakeholders (mainly clients and suppliers), new contracts, taking advantage of partner's expertise, the increase in the quality of products and services, the reduction of reserves and the number of suppliers, the protection of supplies, shortening the time of the development of a new

product, the share of the risk connected to a new product and innovation process, the creation of a proper climate for new national as well as international investments. According to many researchers, relational benefits include confidence benefits, which refer to perceptions of reduced anxiety and comfort in knowing what to expect in the encountered service; social benefits, which pertain to the emotional part of the relationship and are characterized by personal recognition of customers by employees, the customer's own familiarity with employees, and the creation of friendships between customers and employees; and special treatment benefits, which take the form of relational consumers receiving price breaks, faster service, or individualized additional services (Hennig-Thurau, Gwinner, and Gremler, 2002, p. 234).

Relational capital as a strategic source of a business cluster

Relational capital as a result of building partner relationships with key stakeholders, including clients and suppliers, is a significant component of intellectual capital of business clusters. It is commonly agreed that intellectual capital, which is comprised of three elements: human capital, structural capital and relational capital. It is calculated by the difference, between the market value of the company and their accounting value (Hormiga, Batista-Canino, Sanchez-Medina, 2011a, p. 620). The term intellectual capital is defined in the literature (Hormiga, Batista-Canino, Sanchez-Medina, 2011a, p. 620) as:

- the knowledge that can be converted into profit in the future, which is made up of: ideas, inventions, technologies, software, designs, and procedures;
- the combination of the immaterial or intangible assets of an organization which, although they do not appear in the traditional accounting records, are directly or indirectly controlled by the organisation and which generate or will generate a future value for this organization and on which a sustained competitive advantage can be built.

Skilful management of intellectual capital as well as the care for its gradual development in a cluster can lead to the strengthening of competitiveness of this organisation. It has to be emphasised that the increase in the value of intellectual capital frequently is a result of the increase in the value of intra- and interorganisational relationships.

Relational capital is based on the idea that clusters are considered not to be isolated systems but systems that are, to a great extent, dependent on their relations with their environment (Hormiga, Batista-Canino, Sanchez-Medina, 2011b, p. 74). R. Capello and A. Faggian (2005, p. 75) define this type of capital as market relationships, power relationships and cooperation – established between firms, institutions and people that stem from a strong sense of belonging and a highly developed capacity of cooperation, typical of culturally similar people and institutions. Moreover relational capital is an intangible asset that is based on the developing, maintaining and nurturing close interactions between internal and external partners, and high quality relationship with any organization, individual or a group that influences or impacts the business, including: customers, suppliers, employees, government, partners, competitors and any other stakeholder (Ogundipe, 2012, p. 208). Owing to the fact that each stakeholder group has its own expectations, needs and values, and that key stakeholders need to be identified in line with organisational values, we can assume that relational capital of a business cluster is the knowledge embedded in relationships with customers, suppliers, industry associations or any other key stakeholder that influences cluster's life (Rosario-Cabrita and Bontis, 2008, p. 220). This capital comprises such elements as, for instance: brand, trademark, and value of the relationships with key stakeholders and their loyalty, distribution channel, profitable contracts with key stakeholders.

Particularly in the conditions of a turbulent environment, the significance of relational strategy increases, which is a planned way of operating that bases on intangible resources – relationships. According to M. Bratnicki (2001, p. 91), the volume of the possessed relational capital becomes an important carrier of organisation's values, especially in the conditions of the competitiveness that is based on knowledge, where the participation of a certain organisation in creating, popularising and using knowledge that has strategic significance, is an issue that is essential for its survival. S.E. Ogundipe (2012, p. 212) argues that cluster performance can be boosted if each member within a cluster can exploit the benefit in relational capital mix through team building, sharing organizational mission and values, and trust with customers. What is significant within this scope is the focus on relationships with key stakeholders, and particularly on the creation of a sense of community, on seeking active platforms of cooperation and internalization of values, identification of the types of ties, assessment of the effectiveness of undertaken actions.

Basing on the results of the literature review it can be stated that relational capital of the cluster can reduce organizational costs in many different ways (Tumwine, Kamukama, and Ntayi, 2012, p. 803; Youndt, Subramaniam, and Snell, 2004, p. 336; De Clerq and Sapienza, 2006, p. 326):

- the knowledge which derived from employees, customers and suppliers and other business agents may result in the process of innovations that eliminate bottlenecks, increase output, reduce variation and etc.,
- by increasing an organization's information processing capacity,
- facilitates both efficient exchange of information by reducing the need for time consuming and costly monitoring and the effective exchange of information by removing the perceived need to veil or hide sensitive information,
- the higher level of relational capital has impact on better planning, problem solving and troubleshooting, all of which, most likely, increase production and service delivery efficiency and thereby, reduce organizational costs,
- affects customer satisfaction by increasing the value that is offered at the market,
- is instrumental in enhancing customer benefits by helping to increase the quality and flexibility, creating value for the customers through the production and service delivery process innovations.

To I.H. Gordon's opinion (2001, p. 15), partner relationships with the environment contribute to the creation of new possibilities of increasing incomes as well as profit or minimising the risk connected to running a business. Thus, as the advantages of relational capital one can indicate its positive influence on: rationalisation of the management process, the effectiveness of learning process; the development of a specialist standards serving the transfer of knowledge and information; the creation of more effective knowledge exchange between partners, removing the necessity of protecting it against the opportunism of the other party; permanent establishment of reciprocal credibility of the partners.

The research shows that relational capital not only integrates the knowledge about relationships with the organization's external partners such as customers, suppliers and local communities but also stabilizes the environment and makes it accessible to the organization (Stewart, 1997, p. 25; Gates and Langevin, 2010, p. 112). Cluster's relational capital, therefore, determines its capability of establishing and maintaining beneficial relationships with the subjects in the environment and understanding the existing regularities, which shape the determinants of the activities undertaken by this organisation.

Conclusion

Taking into consideration a great turbulence of the environment, and the increasing demands put forward to clusters as regards their development, it can be stated that building relational capital presently becomes not only a choice but a necessity. Thus, it is impossible to efficiently create a network of cooperation without professional implementation of the assumptions of relationship marketing.

Partnership, as a dynamic process that lasts in time, a process created and shaped by the interactions of the partners is inscribed in the nature of a business cluster. As a fundamental feature of clusters, it constitutes a dense network of relations between particular partners, a closed structure, which gives a rational basis for mutual trust and cooperation, in which all partners are mutually related. Such a form of the institutionalisation of relationships simultaneously constitutes a necessary condition for the maintenance of the present standards and the one possible to enforce. In the case that a member of such an organisation acts against a current standard, remaining partners can quickly learn about that and make decision concerning the punishment (e.g. through ending further cooperation).

Building relationships, especially those partner relationships in a cluster, is a complex, multistage process, which requires considerable engagement from a leader, cluster manager, as well as the members of this organisation. It has to be emphasised that what is conducive to the building, development and the maintenance of permanent relations with internal and external stakeholders of a cluster is know-how of relationship marketing. This philosophy, which determines new quality of creating and sharing the value of relationships with cluster stakeholders, initially was limited in its assumptions only to the group of clients. Present, broader comprehension of relationship marketing emphasises the significance of a diverse group of key stakeholders in the process of the identification of effective and successful ways of building competitiveness. Thus, cluster decision-makers, focusing on the creation of desirable relationships with this group of stakeholders, are forced by the environment to form a unique system of partnership, a

chain of mutual connection of the subjects, every of which has its own characteristics, different preferences, needs and objectives. A chain of partnership, built in internal and external environment of a cluster, contributes to the fulfilment of the development gap in this organisation, not only operational gap, which ensues from the insufficient use of the possessed possibilities connected to the resources, but also a strategic gap, which results from the fact that the possibilities created by the environment are not used. A result of building such a partnership chain in a cluster is relational capital. It gives access to new knowledge, new markets and new development possibilities to cluster participants. Therefore, it directly influences the creation of cluster values.

However, what is significant to make a cluster able to develop on the basis of its relational capital is to implement the assumptions of relationship marketing into operational and strategic cluster management. It requires a number of complex and consistent activities, which permeate every area, function and process in a cluster. For this purpose, it is necessary to develop such an organisational culture of a cluster that will be orientated towards the creation and promotion of the development of partner relationships in the internal and external environment.

Barriers for effective International Relationship Marketing in Emerging Markets

Abstract

Many previous studies highlighted the importance of the relational aspects in firms' internationalization processes to increase organizational performance. However, critical aspects of International Relationship Marketing in Emerging Markets (IRMEM) are not yet fully investigated. Many internationalized companies still have difficulties in managing relationships with distant stakeholders, with different values and cultures. The purpose of this paper is to explore knots, difficulties, barriers, that are restraining potential relationship capabilities of companies. Then, a deep understanding of the causes of those weaknesses may be helpful to suggest how to react to critical situations.

The first research phase, an exploratory CAWI survey, was conducted to understand emerging market relationship orientations in a particular industry: kitchen furniture industry is global, characterized by high levels of customization and service in global markets, where intangible aspects of relationships are always considered fundamentals. All members of the main Italian furniture association (56 companies) have been invited to fulfill a questionnaire, with a 70% response rate. A second qualitative research phase relied upon in-depth interviews, with twelve top managers from eight companies of the first sample (digitally recorded and transcribed). Interpreting overall data with cross-case and cause-related effect analysis applying Ishikawa's fishbone technique, a useful tool for identifying barriers to success, this research suggests some IRMEM theoretical drivers.

Research findings highlight main knots to effective international relationship marketing, in particular in emerging markets, and connect those barriers to potential causes. A clear identification of cause-related effects can drive practitioners to improve their relationship skills and avoid critical problems.

Keywords: International Relationship marketing, emerging markets, barriers, intangibles

Introduction

This paper conceptually links three "relatively" old and very important research streams: relationship marketing (RM), international relationship marketing (IRM) and internationalization in emerging market (EM).

Despite the increasing importance of international marketing, insufficient attention is being paid in the past to exploring and theorizing relationship marketing in international contexts (Samiee and Walters, 2003). Moreover, extant literature reviews in Relationship Marketing indicate significant research progress, a conceptual framework explaining RM in an internationalized context is still lacking (Khojastehpour and Johns, 2014).

Previous researchers highlighted the importance of the relational aspects in firms' internationalization processes to increase organizational performance, and, at the same time, they noticed that many internationalized companies still have difficulties in managing relationships with distant stakeholders, with different values and cultures. In particular, previous studies underlined that distortions in the information transmission process, associated with inter firm psychic distance, can increase the complexity and confusion of managerial decision-making, which reduces operational efficiencies and impedes the emergence of trust (Katsikeas, Skarmeas and Bello, 2009). Under this perspective, emerging market relationships present larger physical and cultural distance and are characterized by peculiar critical aspects (Bianchi and Saleh, 2011), which are not yet fully investigated and integrated into a International Relationship Marketing in Emerging Markets (IRMEM) theoretical framework (Bressan and Signori, 2014a).

This paper strives to explore knots, difficulties, barriers, that are restraining potential relationship capabilities of companies, when dealing with emerging market partners. More, the goal is to understand related causes in order to help companies to find solutions to those critical relational problems.

Literature perspective

Within the relational approach to marketing, different Schools offered important contributions, such as the North-American School (Berry, 1995; Jackson, 1985; Morgan and Hunt, 1994; Evans and Laskin, 1994; Sheth, 2007), the Nordic School (Gummesson, Lehtinen and Grönroos, 1997) and the Anglo-Australian School (Christopher, Payne and

Ballantyne, 2002). Main authors of these Schools tried to develop the concept that a unidirectional relation, with only one kind of stakeholder, is not sustainable, and that it is strategically important to develop close relationships with a multiplicity of stakeholders (such as customer, suppliers, internal customers, institutions and intermediaries), in order to create a higher value for the final customer (Morgan and Hunt, 1994; Berry, 1995) and eventually compete between groups of organizations and stakeholders (Hunt, 1997). The complexity and the interconnection of different markets are leading to an increasing attention and affirmation of this broader view of marketing with stakeholders inclusion (Ballantyne, 2009).

The Relationship Marketing approach is focused on a long-term, customer value relationship quality (Grönroos, 1996), where managing network, relations and interactions is important to be successful (Gummesson, 1994). Dyadic relationships are based in particular on a long on-going process (Dwyer, Schurr and Oh, 1987), where relationship quality has emerged as a focal point by which a company can succeed in a competitive environment (Bejou, Wray, and Ingram, 1996). This is particularly evident in more mature markets, when the customers do not only get their satisfaction from product or service quality, and they require a relationship quality (Crosby, Evans and Cowles, 1990).

Some studies on Relationship Marketing demonstrated that, despite the strategic importance accorded to relations (Hewett, Money and Sharma, 2006; Styles, Patterson and Ahmed, 2008; Ballantyne, 2009; Bianchi and Saleh, 2011), companies still have difficulty in managing relationships with different stakeholders, focusing more on a dyadic buyer-seller relationship (Egan, 2006; O'Toole and Donaldson, 2002; Zineldin and Philipson, 2007). The internationalization process of a company might impact negatively in this balance, due to the fact that, while companies may reconfigure their product and promotion for a foreign market, failure to adapt methods of relationship may bring about a marketing failure (Palmer, 1997).

Recently, international attention has been on BRICs (Brazil, Russia, India and China) and emerging markets, despite the lack of researches on relational impacts of geographic and cultural distance (Brush and Rexha, 2007), in particular with emerging market partners and in the introduction stage of the relationship. BRICs are not only geographically distant from the country of origin of these companies, but they also have peculiar characteristics that both influence relational behavior and the international relationship marketing approach (Brush and Rexha, 2007; Bianchi and Saleh, 2011). The cultural aspect represents one of the key variables that can influence the creation of a relationship (Franke, Hofstede and Bond, 1991; Chandler and Graham, 2010) especially in emerging markets, characterized by a large physical and cultural distance (Phan, Styles and Patterson, 2005; Shapiro, Ozanne and Saatcioglu, 2008; Bianchi and Saleh, 2011). In particular, the psychic distance should be considered as a key aspect in preparing the company to deal with distant stakeholders (Conway and Swift, 2000; Bressan and Signori, 2014b).

Despite IRM theories stressed the importance of having a structured network orientation as powerful tool to gain success in distant markets, empirical results showed that companies initially act with traditional decision making processes and are not fully prepared to face those complex new environments (Bressan and Signori, 2014c). In summary, an International Relationship Marketing in Emerging Markets (IRMEM) theoretical framework could be build through analogies among related theoretical constructs, but needs its own researches to investigate peculiarities of a context where past main theories may not apply.

Research goals and methodology

The purpose of this research was to explore knots, barriers and difficulties that are restraining potential relationship capabilities of western companies when interacting with emerging market partners. Then, a deep understanding of the causes of those weaknesses may be helpful to suggest how to avoid critical situations.

As above discussed, a main research gap drove this study to adapt international relationship marketing concept into an emerging market context. The main research goal was then to find which problems are limiting a successful international relationship marketing in emerging market. Three research questions (RQ) were defined:

- Which are the main barriers that western companies are facing, when entering in new emerging markets (RQ₁)?
- Which are the main difficulties that western companies are perceiving, when dealing with emerging market partners (RQ₂)?

- Which are the causes of main relational barriers or difficulties perceived by western companies internationalized in emerging markets (RQ₃)?

In order to pursue those goals and find answers to the three research questions, this research has been based on a mixed methodology, as this approach provide richer understanding and more robust explanations of complex and dynamic phenomena (Golicic and Davis, 2012; Mangan, Lalwani, and Gardner, 2004).

In the first research phase, an exploratory Computer-assisted web interviewing (CAWI) survey (Manfreda, Batagelj, Vehovar, 2002), was conducted to understand emerging market relationship orientations in a particular industry: the kitchen furniture industry. This industry is global, characterized by high levels of customization and service in global markets, where intangible aspects of relationships are always considered fundamentals. Affirmed producers are mainly Italians, so that all members of the main Italian furniture association (56 companies) have been invited to the survey, to find answers to Q1 and Q2. Two questionnaires were created, one for closer relationships in traditional markets, such as the western ones, and one for more distant relationships, such as emerging markets, identified as BRIC (Brazil, Russia, India and China). The content of the questions asked was previously tested with sales and international marketing managers and experts; a pilot test of questionnaires was submitted to some CEOs to ensure questions were clear in meaning and appropriate. Since the creation of a relationship starts from the company who is willing to begin an internationalisation process, they are the targets of this research. A reminder mailing and phone support for eventual clarifications were provided. The response rate of the questionnaire was 60.7% (Tab. 1).

TABLE 1. SURVEY SAMPLE

	# of companies	%
Number of questionnaires sent	56	100.0
Total number of responses	34	60.7
Number of responses on traditional markets survey	26	46.4
Number of responses on emerging markets survey	18	32.1
Number of respondents to both questionnaires	10	17.9

In the second phase, a qualitative research relied upon in-depth interviews, with twelve top managers from eight companies of the first sample (Tab. 2). The qualitative research is particularly suitable to extend a theory in different cultural contexts (Naslund, 2002; Gummesson, 2005), and it has been conducted relying on interviews of managers of those companies that are dealing with emerging markets, to understand the main difficulties they face in the stakeholder management. All the interviews, about 1-1.5 hours long, were digitally recorded and transcribed.

During interviews informants were allowed to speak freely on the subject of interest to the researchers, however a general interview protocol was prepared as follow: an initial warm up phase (brief overview of research and participants; assure the privacy of the information given; obtain authorization to record); a descriptive phase on company and participants background (history, industry related information, mission and values of the company, main marketing and internationalization strategies); an open discussion on main research topics (collaboration orientation, cooperation, information sharing tactics with different countries and different kind of stakeholders, main goals, critical problems or barriers, partner selection and related examples with particular interest in emerging markets); a final phase on their way, or solutions found to face those barriers before closing remarks.

TABLE 2. INTERVIEWS SAMPLE

<i>Company pen name</i>	<i>Internationalized</i>	<i>Nr subjects interviewed</i>	<i>Role</i>	<i># of employees</i>	<i>Revenues range € (in 2011 and 2012)</i>
IT1SC	Since 1996	3	General Manager; Vice-president; Export manager	547	Over 50000000
IT2SN	Since 90's	1	Export manager	172	25000000 - 50000000
IT3VA	Since 1996	2	CEO; Export manager	564	13000000 - 25000000
IT4RE	Since 90's	1	Export manager	154	10000000 – 13000000
IT5EU	Since 1992	2	CEO; Export manager	117	10000000 - 13000000
IT6EL	Since 1992	1	CEO	42	5000000 – 10000000
IT7AR	Since 80's	1	CEO	169	2500000 - 5000000
IT8SP	Since 2010	1	Export manager	5	1000000 - 2500000

Two independent researchers used a coding technique on transcriptions to verify the importance of the variables and make a cross-case analysis (Yin, 2003). Interpreting overall data with cross-case and cause-related effect analysis applying Ishikawa's fishbone diagram (Fig. 1), a useful tool for identifying barriers to success, this research suggests some IRMEM theoretical drivers.

Findings

Research findings highlight main knots to effective international relationship marketing, in particular in emerging markets, and connect them to potential causes. Knots may be divided into barriers and difficulties. Barriers were perceived more as country related, as generic macro issues, typical of one particular country or a specific market in it: such as protectionism, taxation, legal issues, physical distance, climate, infrastructures, distribution systems, language barriers, or main cultural values of the society in general. Difficulties were perceived as micro relational problems, that may differ from partner to partner, such as a partner competence, product quality perception, trust, commitment, logistics or other related service problem. As explained, questionnaires were prepared with managers, so that they have been created using manager common dictionary and definition used in their business. Traditional researchers may argue that we didn't use a previous theoretical framework to test past theories, but this exploratory research has been conducted to listen and interpret perceived problems in dealing with distant stakeholders, so we adopted the managerial approach from the beginning, without offering a pre-classification of main problems found in previous studies, even if international marketing theories influenced those lists.

The first research question was to understand which are the main barriers that western companies are facing when entering in new emerging markets (RQ₁). Findings are showing that, starting from the general overview of BRICs, the main barrier perceived is represented by taxation imposed by countries (33.33%, last column in Tab. 3). This barrier, however, is higher for Brazil and Russia countries, while India and China are perceived as more open. This first result should drive IRMEM to consider country peculiarities before generalize any framework.

The second main barrier is related to visibility on local professionals and their competence. We might comment that this barrier is strictly connected to company skills and its ability to get information on the market and correctly identify and select stakeholders (21.67%, last column in Tab. 3). However, this barrier seems considered more an external threat, rather than an internal weakness. Furthermore, only India and Brazil are country were company are very concerned about partner selection.

Reading barriers for each country (Tab. 3, countries in column), the main perceived barrier in Brazil, Russia and other emerging markets is taxation, while for India and China it is the partner identification and selection. It is

also interesting to highlight that China collected all kind of barriers, while in Brazil companies have to deal only with protectionism and taxation.

TABLE 3. MAIN INTERNATIONALIZATION BARRIERS WITH EMERGING MARKETS

	<i>Brazil</i>	<i>Russia</i>	<i>India</i>	<i>China</i>	<i>Other</i>	Tot. per barrier
Taxation	66.67	52.63	23.08	10.53	50.00	33.33
Partner identification and selection	-	10.53	38.46	31.58	-	21.67
Protectionism policies	33.33	15.79	15.38	5.26	-	11.67
No barriers	-	10.53	7.69	5.26	33.33	10.00
Brand protection	-	5.26	-	21.05	-	8.33
Product comprehension	-	5.26	7.69	5.26	16.67	6.67
Physical distance	-	-	7.69	10.53	-	5.00
Know how protection	-	-	-	10.53	-	3.33
Distribution network	-	-	-	-	-	-
Tot. per country	100.00	100.00	100.00	100.00	100.00	100.00

The second research question was addressed to find which are the main difficulties that western companies are facing when dealing with emerging market partners (RQ₂). Considering that one of the main relational barrier companies perceived was represented by partner identification and selection, a similar result came from this second analysis. The main difficulty companies are facing with emerging market partners are related to the lack, or inadequate, professional competence of the partner (23.26%, last column in Tab. 4) and a misalignment on product/service quality perception (23.6%, last column in Tab. 4). These issues are considered fundamental in a dyadic relationship, because the supplier needs to forward its values, and brand related messages, to the final market through an intermediate/partner. If that partner is not prepared, or aligned, or simply not aware of his critical role, an indirect presence in a foreign market exposes the company to the risk of a poor positioning, and also a lack of information on consumers' preferences and trends, losing actual and future market opportunities. Partner related difficulties are perceived more in Brazil, and in Indian market, where some logistics problems related to delivery time are also evident (see country columns in Tab. 4). According to this survey responses, cultural aspects, trust and physical distance don't represent a difficulty when working with emerging markets stakeholders. These results, if considered alone, may drive to the wrong conclusion that trust, commitment and cultural aspect are not considered critical when dealing with distant stakeholders. The qualitative research completed these findings, and better explained these results. Before presenting the second research findings, note that China collected all kind of perceived difficulties (see China column in Tab. 4), while Brazil, India or Russia showed selected problems.

TABLE 4. MAIN RELATIONAL DIFFICULTIES WITH EMERGING MARKET PARTNERS

	<i>Brazil</i>	<i>Russia</i>	<i>India</i>	<i>China</i>	<i>Other</i>	Tot. per difficulty
<i>Professional competence</i>	33.33	23.08	25.00	18.75	33.33	23.26
<i>Product/service quality perception misalignment</i>	33.33	23.08	25.00	18.75	33.33	23.26
<i>Organizational structure and key contact person</i>	-	30.77	-	18.75	33.33	18.60
<i>Delivery time</i>	33.33	7.69	25.00	6.25	-	11.63
<i>Language barriers</i>	-	15.38	-	12.50	-	9.30
<i>Trust</i>	-	-	12.50	6.25	-	4.65
<i>Cultural aspect</i>	-	-	12.50	6.25	-	4.65
<i>Time zones</i>	-	-	-	12.50	-	4.65
<i>Tot. per country</i>	100.00	100.00	100.00	100.00	100.00	100.00

Thanks to the qualitative research, these findings are enriched with explanation and examples permitting researchers to interpret them and connect to their causes (see Tab. 1 for pen names). Based on interviews transcriptions

coding, the interpretation lead to six main critical knots that impact the IRMEM emerged: legal issues, market uncertainty, insufficient product quality perception, psychic distance, logistics and distribution issues, inadequate partner skills.

Legal issues, emerged with great importance in the survey (taxation, protectionism, or brand and know how copyrights), were not discussed largely during the interviews; only one manager recalled an example, explaining why it took 3 years to enter a market, saying *“There were some difficulties in managing import taxes”* (IT4RE). An interpretation of this silence may be that country related barriers are not considered as difficulties where managers can find solutions deeper knowing them and related bureaucracy.

The second knot, labeled as market uncertainty, contains concerns about the fast development of those markets and the difficult in understanding their trends. Uncertainty is perceived since the predictability of trends in an emerging market is not reliable due to its continuous changing. An export manager of a big company said: *“Nothing is solid and it is growing fast, but not so fast as they (locals) also expected to”* (IT2SN); the vice-president of the biggest company of this sample, talking about India, commented: *“It is an evolving market, it has yet to develop his power and strength”* (IT1SC). Talking with practitioners, market uncertainty is an important issue that can cause difficulties in planning an entry strategy and set related investments.

The third knot, related to perceived quality of Italian products, often positioned as high quality with premium price may be explained by multiple reasons. One reason is connected to local similar products, that are more convenient and more basic, and mainly still artisanal (as confirmed by IT4RE). Another reasons is related to the limited country of origin effect; the “Made in Italy”, for the kitchen industry in this sample, is not so powerful. Some comments were given on Made in Italy awareness: *“The market has still a limited culture of the made in Italy and Italian design, and it’s more oriented towards classic products, instead of moderns”* (IT4RE); *“They understand Made in Italy, but only from a certain level upwards (...) otherwise they don’t understand why they should buy a product that comes from so far”* (IT2SN). This finding explains a relational stress of dyadic relationships, when a supplier strives to be known in his strengths and finds a lack of awareness in the partner.

The fourth knot is the cultural or psychic distance, which makes it difficult to establish a strong relationship since the beginning: *“If an Indian knows he doesn’t live up to our highbrow product, he is scared and he doesn’t come to our shop”* (IT3VA); *“We (Italians and Indians) have many touch points, but also many divergences (...), an Indian is so proud that you can’t tell him what he has to do”* (IT2SN). Cultural aspects were largely discussed and drove to many considerations about partners skills. In general, the culture is considered always important, when dealing with distant stakeholders, and managers feel a lack of knowledge on cultural aspect of different markets, both of themselves and their employees.

The fifth knot is connected to logistics and distribution problems, since the great distance impacts both in the delivery times, and also in managing all potential problems that can emerge during the transportation: *“We have some logistics problems because when the product arrives to our distributor, he has to know how to store it (...); when the product is installed in the house, it is safe, but it has suffered before”* (IT4RE); *“There are big problems in India, you have to sell in the surrounding of the harbor, otherwise the local distribution is very difficult to manage”* (IT7AR).

The sixth knot is represented by partner skills, since the product is very complex because it has a high level of customization, its value comes from intangible aspects (quality and “Made in Italy” design) and it requires specific competencies to install it: *“We need to find a person with a similar perception of the product to our, and with a contemporary style and design”* (IT8SP); *“He (the local partner) did not make the necessary investments especially in training the employees (...), the problem is that they don’t have the know-how on how to manage a project with luxury goods!”* (IT3VA). A general partner malcontent emerged from interviews, and more content has been analyzed within the cause-related effect analysis. In particular, many comments were made on trust related aspects, and lack of commitment in stakeholders.

The multiple methods research permitted to correct and confirm results of single surveys, so that for example cultural and trust issues seemed not so important in questionnaire, while they were hot topics in interviews. Intangible aspects are maybe more difficult to be aware of, or to classify under general meanings of direct simple questions. On the other side, during a conversation where daily examples are made it is easier to express personal impressions, and then they are linked to specific codes by expert researchers.

Conclusions

Theoretical implications

Research findings highlighted main knots to effective international relationship marketing, in particular in emerging markets, and connect those barriers to potential causes. It is important to underline the importance of multiple methods, that enriched and validated these conclusions.

The final findings are included in the Ishikawa Fishbone diagram in Fig. 1, that summarized the two steps research results and connect barriers, as perceived by companies in the sample, with related causes. As explained in the findings sections, six main knots have been identified, and related causes are connected as shown in Fig. 1.

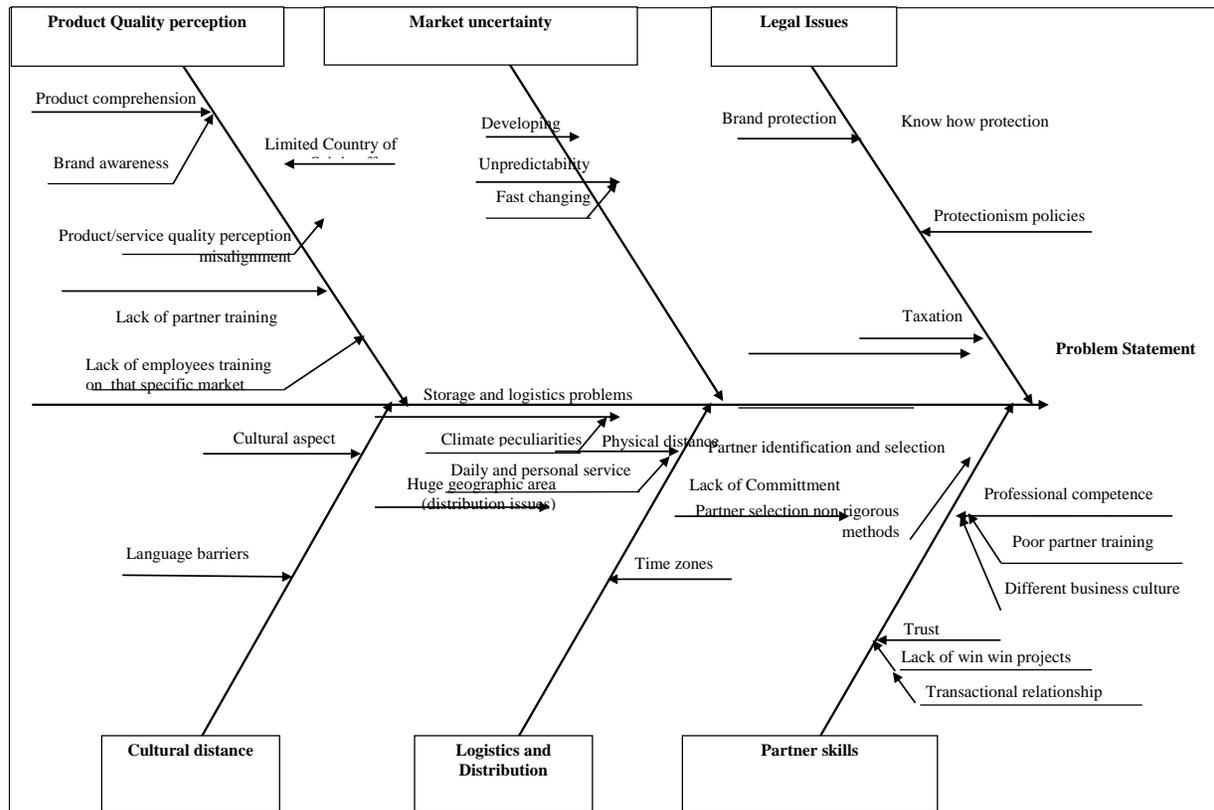

FIG. 1 ISHIKAWA FISHBONE DIAGRAM ON MAIN KNOTS AND BARRIERS FOR EFFECTIVE IRMEM

A new theoretical framework for IRMEM could be based on this fishbone diagram for at least two important reasons: it is showing different relationship variables respect those that are traditionally cited in the literature; it offers a critical perspective on trust and commitment aspects because they are here considered more as causes of problems than key factors of success.

Managerial Implications

A clear identification of cause-related effects can drive practitioners to improve their relationship skills and avoid critical problems. Reading Fig. 1 they can be aware of their situation and find ways to overcome those problems.

Some solutions and suggestions emerged from managers experience, such as the importance to begin a collaboration with a long-term project, instead of single short-terms actions (IT1SC and IT2SN). Another important aspect is the open-mindedness with which a relationship needs to be addressed.

Finally to strengthen the “Made in Italy” attractiveness, an interesting solution is represented by a collaboration with companies of complementary goods (such as bedrooms, and furniture in general) and with others representatives of the Italian life style, such as culinary schools. At least, building strategy as a network is perceived an important strategy to survive on international markets.

Limitations and further research

Due to space constraints, this paper is not deeply exploring barriers and related causes, differentiating them for diverse emerging markets, but it has been summarized to highlight some important concept and to give valuable insights for further researches. Ideally, from this research, should follow an intense exploration on same issues in different industries. Moreover, a future research topic should drive authors to create a new IRMEM theoretical framework.

From product to service: exploring the main barriers of servitization in the Italian footwear industry

Abstract

The purpose of this study is to explore the existing barriers that the firms encounter in starting the servitization process.

In doing so, we adopted a qualitative method in order to better explore and understand this phenomenon. In details, data was collected through 14 in-depth interviews with managers of firms belonging to the footwear industry, an important sector for Italian economy. After this, data analysis was realized through NVIVO software identifying the key elements that provide a first understanding of the drivers and barriers of these potential “servitized companies”.

Results clearly showed the existence of several categories of barriers but also drivers that have lead manufacturers to start their servitization process.

This paper provides useful implications both for managers and for marketing scholars. At the former it helps to understand the main drivers but also the potential obstacles when beginning an effective servitization process. For academics, the study extends the existing knowledge about factors that influence this organizational and managerial change but also it highlights the main barriers of servitizing companies.

Introduction

In the last two decades, “servitization” have been representing an interesting and popular research area. This shift from goods to services is not easy and firms can face several difficulties in changing their focus on the core offering.

Increasingly manufacturing firms are moving away from manufacturing pure physical products to service provision for several reasons: from finding a new competing way or avoiding the price competition, to add value to their traditional manufactures and competing in a market increasingly globalized.

The phenomenon has been recognized by academia in 1988 when Vandermerwe and Rada introduced the concept of “servitization”. This approach has been undertaken from different perspectives.

Several articles have adopted an organizational approach to study this issue but limited attention it has been address from a marketing perspective, considering not only the drivers that have led companies to adopt this approach but also the main barriers firms have to tackle.

The aim of our article is to explore this phenomenon in order to understand the development of this approach in the Italian companies, particularly in the footwear sector. A particular focus will be put on the main difficulties and barriers that companies face when trying to implement the servitization or during the process of transformation of the manufacturer’ business strategy toward increasing service provision (Baines et al., 2009; Turunen and Finne, 2013).

To summarize, the study will try to answer to the following research questions:

a) Are footwear companies servitized? If yes, which are the main service they provide along with their products?

b) What are the main difficulties and barriers these companies face when trying to servitize their offering?

The article is structured as follows: first we will provide a theoretical background about the servitization phenomenon then the research method will be described. Lastly, the main findings will be highlighted with attention to managerial implication and conclusion.

Literature background

Over the last two decades, the manufacturing industry has faced an important transformation due to several factors, such as, the increase of competitiveness, the decrease of profits and the vulnerability of the demand (Hou e Neely, 2013). Servitization has been defined as “the process of transforming manufacturers to compete through product-service systems (PSSs) rather than products alone” (Baines et al., 2007, 2009a, 2010).

This orientation is recognised to be a process of creating value by adding services to products (Vandermerwe and Rada, 1988). The integrated product-service offerings are distinctive, long-lived, and easier to defend from competition based in lower cost economies.

This shift from the traditional manufacturing activities, is a key research theme which has been covered for twenty years from different perspectives (Hou e Neely, 2013).

The main research areas that have paid attention to this topic are operations, business management and marketing (Baines et al., 2009).

Our study will focus on service marketing perspective and the related literature on service offering and development, (Vandermerwe and Rada, 1989; Wise e Baumgartner, 1999; Martin and Horne, 1992; Oliva e Kallenberg, 2003; Brax, 2005; Gebauer et al., 2004; Gebauer and Friedli, 2005).

The main idea is that companies should be able to face price competition and differentiate themselves from competition through the offering of an augmented product with its several levels (Levitt, 1962).

The success of this approach might depend on the capabilities of firms to include all the players of their supply chain in the value creation process, from the suppliers to the final customers.

From this perspective, servitization involves a strategic, dynamic and process dimension where companies can add superior value through services (Vandermerwe and Rada, 1988; Quinn et al., 1990; Gebauer et al., 2006) within their core offering (Oliva and Kallenberg, 2003; Gebauer et al., 2006).

There are various forms of servitization. They can be positioned on a product-service continuum ranging from products with services as an “add-on”, to services with tangible goods as an “add-on” and provided through a customer centric strategy to deliver desired outcomes for the customer (Baines et al., 2009).

This heterogeneity is not just limited at a company level but might be function of the industry and to the product complexity (Dachs et. al., 2013).

A key feature of servitization strategies is a strong customer centrality. Customers are not just provided with products but broader more tailored “solutions”(Miller et al., 2002; Davies, 2004).

A wide part of the international literature has focused on the identification of factors which have lead companies to pursue a servitization strategy. These drivers can range from financial, strategic (competitive advantage) and marketing drivers (Mathe and Shapiro, 1993; Mathieu, 2001b; Oliva and Kallenberg, 2003; Gebauer and Friedli, 2005; Gebauer et al., 2006; Gebauer and Fleisch, 2007; Neely, 2009).

Beyond the drivers that have lead companies to adopt the servitization approach, few research has paid attention to the barriers to servitization, at least at from a conceptual point of view (Hou e Neely, 2013).

The challenge for manufacturers is the organizational change needed to transform the manufacturing culture into a wider approach that support the development of service. In addition, a further barrier is the need for financial resources to provide helpful services to integrate the traditional offering system and to reach a sustainable competitive advantage (Mathieu, 2001a, b). This might lead to resistance in some company functions where a service strategy might not be well understood or considered (Foote et al., 2001; Galbraith, 2002; Windahl and Lakemond, 2006).

Hence, the creation of an organizational context oriented to service is crucial for firms, and represents one of the most successful factors for companies interested to this change.

In particular, a recent study by Hou e Neely (2013), identify seven categories of barriers to servitization (see Table 1), divided before and after the servitization process.

TABLE 1. BARRIERS TO SERVITIZATION

ASPECTS	EXISTING BARRIERS BEFORE SERVITIZATION	BARRIERS DURING SERVITIZATION
<i>Competitors, Suppliers & Partners</i>	<ul style="list-style-type: none"> •A more complex competitive environment involving different actors (Vandermerwe and Rada, 1988) 	<ul style="list-style-type: none"> •Difficult to get coordination and cooperation from different actors (Mont, 2002)
<i>Society & Environment</i>	<ul style="list-style-type: none"> •Lack of policy and infrastructure support (DiPeso, 2000) •Lack of incentives to pursue environmental benefits (White et al.,1999) 	<ul style="list-style-type: none"> •Difficult to achieve environmental benefits, which largely depend on circumstances (Mont, 2002)

<i>Customers</i>	<ul style="list-style-type: none"> •Heterogeneous demands (Vandermerwe, 1994) •Lack of trust from customers (Whiteet al., 1999) 	<ul style="list-style-type: none"> •Difficult to get cooperation & acceptance from customers (Vandermerwe and Rada, 1988) •Lack of control over customers' behaviours (Heiskanen and Jalas, 2003)
<i>Finance</i>	<ul style="list-style-type: none"> •Lack of financial competence for early investment (DiPeso, 2000) 	<ul style="list-style-type: none"> •Service paradox (Neely, 2009) •High risks (Stremersch et al., 2001) •Unexpected costs (Ottman, 1999) •Difficult to price services (Steinberger et al., 2009)
<i>Knowledge & Information</i>	<ul style="list-style-type: none"> •Lack of expertise (Brax, 2005) •Lack of understanding of customer demands and product properties (Mont, 2002) •Lack of innovation ability (Macdonald et al., 2011) 	<ul style="list-style-type: none"> •Difficulties in knowledge & information management (Vandermerwe, 1994)
<i>Products & Activities</i>	<ul style="list-style-type: none"> •Lack of cheap labour (Cook et al., 2006) •Lack of infrastructure (Maxwell et al., 2006) 	<ul style="list-style-type: none"> •Difficult to design service packages or scenarios •Difficult to measure services (White et al., 1999)
<i>Organizational Structure & Culture</i>	<ul style="list-style-type: none"> •Lack of service-based organizational structures (White et al., 1999) •Lack of service-oriented culture (Mont, 2002) •Preconceived thoughts and resistance to change (Vandermerwe, 1994) 	<ul style="list-style-type: none"> •Conflicts between different sectors and different hierarchies in organizations (White et al., 1999) •Internal resistance to servitization (Vandermerwe and Rada, 1988) •Difficult to build service-oriented organizational structures and culture (Vandermerwe, 1990)

Source: Hou and Neely, 2013

The most cited barriers in the literature are those related to customers and their lack to cooperate and to accept some service schemes and also the organizational structure and cultural aspects (Vandermerwe and Rada, 1988; Hou and Neely, 2013).

The purpose of our research is to explore the actual existence of any barriers to servitization that companies face when they decide to increase their service provision.

Research Method

To answer to the research questions we adopted a qualitative methodology in order to better explore and understand in-depth this phenomenon. The main method of analysis was the semi-structured interviews (Creswell, 2007; Contrafatto, 2009). Indeed, there are few empirical evidences on barriers to servitization so an exploratory empirical study would allow to develop further evidence about the obstacles hindering the transformation of the firms.

We have investigated this phenomenon in the footwear industry for many reasons. First, footwear industry is an important sector for Italian economy as demonstrated by ANCI report (2012). Italy is the fourth largest exporter of footwear in the world and Italian footwear represents one of the pillars of the Made in Italy and contributes widely to the trade balance and GDP. Further, the servitization has not been still investigated in this sector and for this reason could emerge new and important insight on the topics.

Based on the literature, an initial interview guide was developed. This was built developing three sections: in the first one we asked an overall description of the firm and respondents plus others information about their role within the footwear supply chain; in the second part we requested the main services offered by firm and finally the barriers to provide these services.

Informants were selected using a 'theoretical sampling' method (Glaser & Strauss 1967) in SME of the Marche Region because in this Region there is one of most important district for footwear production. In addition, theoretical sampling is an adequate methodology for qualitative studies (in particular accord to grounded theory designs) where the objective is not statistical representativeness (which requires random sampling), but theory generation or reconsideration.

In details, data was collected through 14 in-depth interviews, until theoretical saturation was achieved, with managers of manufacturing and others firms belonging to the footwear industry. Given the explorative nature of this study, there were included also suppliers and retailers to enrich results about the topic. The interviews were realized on May 2014 by two researchers following the protocol suggested by Arksey e Knight (2009) and each interview lasted on average 22 minutes. Table 2 shows the characteristics of firms and the respondents interviewed.

TABLE 2: MAIN FEATURES OF THE FIRMS AND THE INFORMANT INTERVIEWED

Company Name	Establishment Year	Supply Chain Position	Interviewer Role	Year of Expertise
Alpha	1989	Retail	Owner	25
Beta	1979	Supplier	General manager	5
Gamma	1978	Manufacturer	General manager	12
Delta	1978	Supplier	Sales and Product Manager	23
Epsilon	1981	Retail	Owner	33
Zeta	1954	Supplier	General manager	12
Eta	1964	Manufacturer	General manager	15
Theta	2012	Retail	Owner	4
Iota	1982	Manufacturer	General manager	4
Kappa	1974	Supplier	Owner	40
Lambda	1972	Manufacturer	General manager	13
Mu	1984	Manufacturer	Financial and Sales Manager	30
Nu	1999	Supplier	General manager	15
Xi	1987	Supplier	Owner	27

The interviews were transcribed and then assessed by an initial reading to get a preliminary grasp of content. After this, data analysis was realized through NVIVO software identifying the key elements that provide a first understanding of the degree of servitization plus the existence of any potential barriers of these potential “servitized companies”. The coding procedures were conformed to those found in grounded theory (Glaser and Strauss, 1967). This implied an initial open coding process to identify the major variables of interest. The analysis unity is the paragraph. The subsequent downloads enabled refinement of the core constructs. Selective coding was utilized to identify relevant sub-categories and finally, theoretical coding allowed linkages with theory. To confirm the reliability of these findings, two research assistants conducted separate coding of the same data (Strauss and Corbin, 1990). The results of the three processes were consistent.

Findings

Results from the interviews confirm the importance of the service for the footwear industry. Indeed, all the respondents affirm that service is an essential element of their company core offering and its importance has increased in the last years. The customers, both business and consumer customers, are paying more and more attention to intangible dimensions of the offering such as services and branding and for this reason also manufacturing firms have to consider the service when designing their offering. For example the interviewed person of Mu firm asserts: "in the last years all the successful firms have provided services to their clients". Another respondent in Kappa firm declares: "In the last decade the service weights a lot. The clients are more demanding for it". All the firms considered in our sample are attempting to achieve a superior market position through the introduction of services in their offering. This orientation is not a choice but needs for the firms that do not want delocalize their production.

This statement is confirmed by the large amount of services offered by the firms interviewed. Table 3 shows the main results of the analysis. Each code reported in the first column represents a service offered by firms while the second column provides with a brief description of the service emerging from interview transcribed. Then the frequency with which codes have appeared in interviews is reported along with a quote that demonstrated the fit with the code. Overall, 14 services have been identified but only some are particularly interesting. For instance, from the table that main service offered by firms are "Modellery" (this code has been cited four times), that is the customization of the product offered and "Repair service" of shoes (this code has been cited four times). In particular, modelling service is devoted to business market and it allows a major flexibility in modifying the offering upon customer's request. These aspects are very relevant for the footwear industry which is characterized for variability. "Customization" and "Repair" services have a double role: first, they enrich and improve the offering to the market and they also strength the relation among footwear firms and business customers. Other services are "Footwear commercial returns" and "handmade"; the first is the replacement of the footwear products when retailers don't sell them even without flaws while the second consists in creating tailored footwear for each client. The "Guarantee service" can be considered as an evolution of traditional "Restitution" service because it provides a formal document on the footwear quality. Finally, it is emerged "Market research" services, by a supplier, which seems predict a changing in favor of the market orientation also in footwear industry.

TABLE 3: SERVICE AND CODES

Code	Description code	Frequency	Quote
Modellery	A process through which the manufacturer creates a footwear product, designing, testing and reworking before of the actual production.	4	<i>...we provide our customers with a prototype and modeling service. They come here with their ideas or drafts on a paper and we are able to transform that ideas into a real product ...</i>
Customization	Customer opportunity to order a customized footwear product choosing among several modules as leather or shapes.	4	<i>...if a client wants something of another color, or she/he wants to t change the leather or the sole, we can make this...</i>
Repair	Service addressed to to fix worn or detaching soles, broken heels or worn material.	4	<i>Even after three year, when a client has a problem with her/his footwear such as with the sole, we are willing to take back the footwear, repair the sole and reship the goods for free.</i>
Returns management	Replacement of the faulty footwear	3	<i>...if there is some problem with the production quality, we are always ready to take back the footwear faulty</i>
Commercial returns	Replacement of the footwear when retailers don't sell them even without flaws	3	<i>...if our business clients don't sell our products, we allow them of exchanging footwear up to 5%, 10%, or 15 % of total order quantity.</i>
Handmade footwear	Footwear creates around at feet of the people	3	<i>...when we make footwear, we take measures directly with the final customers.</i>

Expert advice	The provision of professional assistance and advice in resolving technical problem on footwear	3	<i>...we are always in contact with our client. We advice them in any technical problems they face.</i>
Delivery	The activity of shipping footwear	2	<i>...in my opinion, the shipment on time is a key element of our offering.</i>
Promotional	Offline and online Activity to increase customer sales	2	<i>...we support retailers with online communication</i>
Financial	Customized date and means of the payment to business clients	1	<i>We have chosen to pay after 40 days of delivery and not 30 days with a discount of 3 percent</i>
Guarantee	A formal agreement stating that a product will be repaired or replaced when it does not meet specific requirements	1	<i>...we have created a guarantee for our footwear, through a certificate where it is written when it has been made and the name of artisan that have produced it. We want to communicate that the footwear has been made with Italian raw materials, produced in our firm.</i>
Market Research	A service to test and verify certain features of the products on the market	1	<i>...market research is needed for each brand to understand what customers want. Based on such research, we can suggest the best product to our customer.</i>

In table 4 the main barriers are described. In particular, “Costs” are considered a heavy obstacle to the servitization. It seems to be considered the true hitch to servitization and it is not easy to eliminate them. Other important barriers are: “Attitude” and investments needed for facing the change. Furthermore, “Minimum order quantity” and “District Destructuration” seem to be others aspects which can slow down the provision of the services. The outsourcing processes in the last years have undermined the efficiency of the districts and many firms have a problem in responding to demand that asks a production in small order. In addition, the lack of “collaboration” among the firms could damage the competitive capabilities of Italian firms.

TABLE 4: BARRIERS

Code	Description code	Frequency	Quote
Costs	An amount that has to be spent for the services	5	<i>...when the firms compete on the service, the major difficulty is the costs.</i>
Attitude	The approach toward the way of work and organize the activities	4	<i>...the lack of training and attitude toward services constitutes the main barrier...</i>
Investments	Expenses to realize new services/activities with future returns	4	<i>Nowadays investments are a problem because the markup is limited. Investing is increasingly difficult.</i>
Minimum order quantity	A order with low amount	3	<i>We are used to produce in large quantities and production in small orders is a problem. The personalization force us purchase low amount and this is not easy.</i>
District Destrutturaton	Problems with disintegration of the supply chain , after the delocalization processes	2	<i>Until year ago, there were many warehouses where we can buy the leather. Now, in the warehouses there are few raw materials and this can limit the customization and the delivery on time</i>

Collaboration	Difficulties to work together with other firms	2	<i>I would like more collaboration among Chemistry Laboratory Directors of other companies to share information and knowledge about new colors/effect/treatment...</i>
Coordination	The organization of the firms to provide a service	1	<i>I can't provide a service by myself. I need the entire supply chain to work for it but I have to convince all my suppliers and others firms to participate. This is a huge difficulty</i>
Communication	The effort/capabilities to communicate and promote new services	1	<i>...the firm has to communicate that provides services beyond the product, therefore we have created and promoted a new specific brand for this initiative and this is very difficult.</i>

After having analyzed the results of the coding process, the codes on the barriers to servitization have been compared with emerging aspects in the literature. The intention was to find any differences between literature and empirical evidence. As showed in table 5, most of all the codes are related to literature aspects. Specifically, “Finance” aspect is the most cited code. However, some aspects such as “Customers” and “Society & Environment” do not seem to be relevant barriers.

TABLE 5: MATCH AMONG BARRIERS CODES AND LITERATURE REVIEW

Code	Literature Issue	Presence or Absence	Frequency
Cost Investment	<i>Finance</i>	<input checked="" type="checkbox"/>	9
Collaboration			
Coordination	<i>Competitors, Suppliers & Partners</i>	<input checked="" type="checkbox"/>	5
District			
Destrutturazione			
Communication	<i>Knowledge & Information</i>	<input checked="" type="checkbox"/>	5
Attitude			
Minimum order quantity	<i>Products & Activities</i>	<input checked="" type="checkbox"/>	3
	<i>Customers</i>	X	
	<i>Society & Environment</i>	X	

Conclusion and implication

The findings of this research explored the servitization and its barriers in Italian firms. In fact, the research has been conducted in the footwear sector, which is very important for the Italian economy. However, no research has been previously conducted in this sector about servitization issue.

This research shows how service is an essential element for this industry and new services have been highlighted by respondents compared to those identified from the traditional literature on the servitization. The firms have understood the relevance of the services and they have begun to include them in their core offering as resource of competitive advantage. Moreover, firms can face different servitization level (Martinez, Bast, Kingston, Evans, 2010). Indeed, there are companies that have implemented many services and other companies that have implemented just a few services. However, the manufacturing sector should not be considered as a unique unit of analysis as there are many sectors below this umbrella and in each of them, there could be different kind of the services provided by firms.

Therefore we retain useful to split the services provided by the firms in three categories (Baines, Lightfoot, Smart, Fletcher, 2013): first, the firms provide base services such as “Modellery” or “Customization” which focus on the product provision, second intermediate services such as “Repair” or “Returns Management” which relate to the condition maintenance and finally advanced services such as “Commercial Returns” that focus on outcomes and overall performances.

Regarding the barriers, the research confirm the existence of many barriers already highlighted in previous literature at a theoretical level and, at the same time, it explains how these occur. However, the findings differed from literature as “Customers” and “Society and Environment” are not considered as barriers. The customers are considered as a driver to servitize the company and not as a barrier. In addition, some respondents have quoted “Society and Environment” but they have considered as a general obstacle to business, not just to the services offering.

Research reported in this article provides further insight to better understand the servitization issue for both scholars and managers. From an academic point of view this research provides a first step for future quantitative research because it broadened the knowledge on the variables that could influence and encumber this phenomenon. For managers, this study is useful because it warns on difficulties encountered in this process experienced by other firms.

The main limits of this research are manifold. First, this is the explorative research and it examines only few cases. Therefore is not possible to generalize the results of the research. Furthermore, these cases are localized in one Italian Region and they regard only SME firms.

In future research these variables should be tested in other sectors. Moreover, this research could be accounted as a base for a quantitative research in order to test the effect of the barriers to the process of servitization.

The trigger for positive word of mouth in the after sales service

Abstract

This study aims to study the effect of after sales service experience and its quality on overall satisfaction and word of mouth (WOM) for the automotive service providers in Italy.

Based on the additional marketing mix elements required for services marketing (respectively people, process and physical evidence), we investigated the effects of after sales service experience quality on satisfaction and WOM.

Data were collected through a survey of 210 customers in the automotive service. They were asked to evaluate several items related to their after sales service experience provided by authorized dealers for their car maintenance services. Data were analyzed using linear regression model adopting R software.

Results showed evidence of a relationship between satisfaction and the desire to recommend and supported the fact that after sales service satisfaction represents an antecedent of consumer satisfaction and WOM, at the same moment.

Introduction

One general trend in the automotive industry is that products become more an enabler for beginning relationships with customers. Car sales become a reason to establish relationships, various services help companies maintain them in order to ensure additional financial income. However, the prolonged economic downturn is driving a greater number of original equipment manufacturers (OEMs) to place renewed attention on the aftermarket as consumers put off new purchases and hold on to their cars longer (Accenture, 2010). New car sales growth is slowing, that is still a lot of cars, but an even more promising, and less obvious, opportunity is the aftersales market, including spare parts, service, used car sales, and financing, which serves as an integral component of brand building and sales management. New passenger car registrations continued on the generally downward path started in 2007; since that year they have fallen from 15.6 million to 12.0 million, a decline of 23%. The trend reflects the close relationship between vehicle sales and the economic climate. Accordingly, it is most pronounced in southern Europe, where vehicle sales have decreased by 60% in Spain and 45% in Italy since 2007 (ICCT 2013).

To enable dealer excellence in servicing customer needs, service operations require complex capabilities in terms of tools, processes and systems with no or limited revenue opportunity for OEMs. Despite the significant financial and customer satisfaction impacts of the aftersales business, OEMs have historically given little attention to aftersales and done little to improve the performance of their aftersales functions (Accenture, 2010). Many automotive companies constantly expand their service business and service scope: traditional after-sales maintenance and repair services are supplemented with finance and insurance services and re-formulated into service bundles (Godlevskaja, Iwaarden and van der Wiele, 2011). In an automotive context, after-sales service becomes a vital source of brand building as it represents continuous contact between car producers and customers through authorized dealers network during the the product cycle life.

This paper makes a contribution to the literature by investigating the importance of after sales service quality in achieving high levels of customer satisfaction and positive word of mouth. This study is also important to practitioners, since measurable awareness of customer perception of the after sales service based on intangible elements can lead to changes in firm profitability and customer loyalty. This can be achieved through determination of what has been evaluated right or wrong from the customer's perspective and what should be modified. Moreover after-sales services are taking substantive position to the overall satisfaction, the augmented product offered.

Literature background

After sale experience in service marketing

After-sales service has been widely used to describe services that are provided to the customer after the products have been sold or delivered. Support entails all activities undertaken by service support providers to ensure that consumers continue to get trouble-free use of the product over its life cycle. An after-sales support strategy associated with a product may include elements such as warranty provision, extended service contract provision,

availability of repair service, loan availability, toll-free phone support, returns policy. Some scholars show that the revenue generated from the provision of after sales service and spare parts sales, exceeds three times the value of the initial purchase (Saccani et al., 2007).

Levitt (1983) sees the initial sale of a product only as the start of a seller–buyer relationship, one of that touch point after-sales function of a company crucial. Various terms are used in literature for what here is labeled after-sales service. Goffin and New (2001) list, for example: customer support, product support, technical support, and service. Other several definitions of after-sales service can be found in literature (La Londe et al., 1977; Sterling and Lambert, 1989; Loomba, 1996; Johansson and Olhager, 2004; Kurata and Nam, 2010). Building on these definitions and keeping a general and comprehensive perspective, we say that the after-sales services for manufactured goods encompass the set of activities taking place after the purchase of the product, devoted to supporting customers in the usage, maintained and/or disposal of goods. Earl and Khan (1994) classify after-sales as a business network process, since it has a direct impact on business performance and on the creation of competitive advantage. They might provide complementary services (e.g. field assistance and customer care) as well as competing ones (e.g. field assistance provided by sale points and repair centres or by authorised and unofficial assistance networks). Moreover, the diffusion of Internet and other technologies “expands the number and variety of customer touch points and service delivery channels” (Hill et al., 2002), and, when looking at the supply chain structure, makes the picture even more complex.

Several scholars suggest that well-executed service recoveries increase perceptions of customer satisfaction, build relationships, and prevent customer defections (Keaveney, 1995), whereas poorly executed recoveries can decrease a customer’s loyalty to a firm (Mattila, 2004). Well-handled service recovery considerably rises the association between customer satisfaction and both trust and commitment toward the service provider (Tax, Brown and Chandrashekar, 1998).

Manufacturers may make provisions for after-sales service support either by offering it directly at the plant, through their own network of service centres, through channel intermediaries, through authorized independent third-party service centres, or by some combination of these organizations (Loomba, 1996). Product-based differentiation in the automotive industry is increasingly difficult and firms cannot compete on products alone. Many automotive companies realised enormous growth opportunities in the service area. One additional trend in the automotive industry is changing customer requirements to services, growing service complexity and the need to customise services. (Godlevskaja, Iwaarden and Wiele, 2011).

Increasingly, after-sales customer service is becoming the order-winning criteria for most firms and is now being recognized as an important research priority.

The impact of service quality on overall satisfaction and Word of Mouth

Customer satisfaction is defined as “customer fulfillment response”, which is referring to customers’ post-consumption evaluation on whether the service provided is at satisfying level of consumption-related fulfillment, either under- or over-fulfillment (Oliver, 1997).

Operationally, satisfaction is similar to attitude, as it represents the sum of several attribute satisfaction judgments (Maxham III, 2001). From this perspective, satisfaction is a transaction specific measure (Bitner, 1990; Parasuraman et al., 1988). Others view service-related satisfaction a bit differently. Cronin and Taylor (1992) define satisfaction as a cumulative evaluation, and an outgrowth of service quality. In their view, satisfaction represents a global judgment rather than a transaction-specific measure. Satisfaction is also thought to have an affective element that is experiential, and, probably, is most appropriately assessed after consumption (Ostrom and Iacobucci, 1995).

Our perspective support the great volume of research confirming the fact that service quality is an antecedent of consumer satisfaction (Cronin and Taylor, 1992; Dabholkar et al., 2000).

A further step in our study is to understand the impact of satisfaction on word of mouth. Word-of-mouth is especially important for service providers whose offerings are largely intangible, and experience or credence based. In these services customers rely heavily on the advice and suggestions from others who have experienced the service (Kinard and Capella, 2006).

There is evidence from the literature of the relationship between satisfaction and the desire to recommend (Parasuraman et al. 1988; File et al., 1994; Shemwell, 1998; Söderlund, 1998; Sivadas and Baker-Prewitt, 2000, Hennig-Thurau et al. 2002; Chaniotakis and Lymperopoulos, 2009).

In fact, potential consequences on customer behavior from an very high or low satisfaction might be:

- complaining behaviour
- positive/negative Word-of-Mouth.
- repeat purchasing and loyalty (Szymanski and Henard, 2001).

More specific, positive comments from satisfied customers can increase purchases, while negative comments from unsatisfied customers can decrease purchases (Ennew et al., 2000).

Moreover, companies should enhance their customer satisfaction in order to lead customers to repeat their purchases and to positively recommend the products and services to other potential customers. In doing so, these behaviour might benefit both in terms of retention and acquisition (Gremler and Brown, 1996). After sales service offers differentiation potentials that a producer can use to strengthen their brand equity (Cavalieri et al., 2007).

While there are several studies investigating the effect of service quality on satisfaction and the impact of satisfaction on Word of Mouth, there is limited research related on the effect that service quality dimensions have on satisfaction and WOM, at the same moment (Arasli, 2005; Macintosh, 2007; Chaniotakis and Lympelopoulou, 2009; Ferguson et al., 2010). Fewer articles refer to the direct relationship between service quality and behavioural intention, such as word of mouth (Zeithmal et al., 1996; Olorunniwo et al., 2006, Ng et al., 2011).

In addition, these previous studies considered whole service provision such as bank service, travel agency experience or healthcare treatments, not the service referred to the aftersales experience, an integrated phase which is subsequent to the purchase of tangible goods.

So there is little research has been done in order to understand if the intangible elements in the after sales offering impact on the customer satisfaction and on customer's willingness to widespread WOM.

Research method

Data sample and collection

Data collection focused on after sale service evaluation perceived by customers in the automotive industry. The aim was to explore the importance of each of the intangibles after sales elements, such as the role of which people (personnel), process and physical evidence and their impact, on overall customer satisfaction and word of mouth.

The automotive industry has been selected for different reasons. The complexity for the products in the market has driven final customer searching for advice from trustworthy and reliable sources. Then the automotive market in Europe which has faced crisis in the last decade and the number of cars has dramatically halved (UNRAE, 2013).

The block exemption regulation (BER) inclined European manufacturers to undertake performance improvements. Changes, which manufacturers are confronted with since this regulation came into force in 2003 are: sharply reduced control over their distribution networks, as well as increased competition in the parts and after-sales business.

We chose to investigate the after sales service in one of the biggest authorized car dealer of the North East of Italy, a country where, there is the highest number of cars in terms of density (Autopromotec, 2012). However, due to the crisis, the cars owned by customers become older and older and need further assistance. Under these circumstances, car maintenance services become one effective way for car dealers to increase customer loyalty and revenue beyond car sales. The assistance centres are responsible for repairing and maintaining the product. Several channels can be identified: the ones authorized (through contractual agreements) to sell and repair (dealers), or to repair only (authorized garages), the generic ones (independent garages), the specialized ones (tyres repairers, electrical workshop, etc.), the fast fit (independent or authorized) specialized in handling minor repair works and the soft franchise network (independent, owned by a component supplier or by a distributor). In most cases, only dealers and, to a minor extent, authorized garages bear direct and continuous relationships with the manufacturers (Gaiardelli, P., Saccani, N., & Songini, L. 2007). In our case we collect data from a full authorized after sales service provider, totally integrating with the sales dealer.

Data was collected through an on-site self CASI (*Computer Assisted Self-Interviewing*) survey using the tablet tool. This was useful to collect a real time feedback few minutes after the car assistance service provision.

A pilot survey was administered on a convenience sample of 105 customers.

A ten questions questionnaire was finally structured. Questions were divided into two main sections: section a) demographics characteristics of respondents; section b) after sales service items evaluated adopting 1-10 Likert scale (1=highly dissatisfied to 10=highly satisfied) and two questions about overall satisfaction 1=highly dissatisfied to 10=highly satisfied) and the willingness to recommend the company ((1=highly disagree to 10=highly agree).

The questionnaire was given to a convenience sample of 210 Italian customers. Data collection started in November 2012 and ended in December 2012. Within this time period, the car dealer counted 649 customers receiving an after sale assistance/service. So, the redemption rate is 32.4%. 27.6% of the respondents were females and 72.4% males. The majority of respondents declared to have an age comprised between 35 and 64 years old (77%).

Data analysis

TABLE 7: INTANGIBLE SERVICES IN AFTER SALES EXPERIENCE

Items	Min	Max	Mean	St.dev.
Welcoming	2	10	8.733	1.216
Customer waiting area	2	10	8.676	1.260
Personnel expertise	5	10	8.9	1.074
Personnel courtesy	5	10	9.067	1.083
Contact Service	5	10	8.786	1.189
Documentation quality	3	10	8.790	1.223
Quality versus price	1	10	7.5	1.578
Service lead time	2	10	8.348	1.508
Word of mouth	1	10	8.576	1.453
Overall satisfaction	4	10	8.586	1.204

Respondents were asked to evaluate their satisfaction for following after sales elements.

These might be labeled as physical evidence drivers, such as the customer waiting area (the atmosphere, colors, furniture of the area where customer receive their car assistance and maintenance service), documentation quality (if the documents provided to customer, such as invoice or instruction documents are clear and well written).

Other items related to the after sales service might be related to the process sphere, for instance the welcoming activities, the contact service to require the car assistance, and the service lead time.

Finally the people dimension might play an important role for the perception of a high satisfaction. This is in our case, the role of the personnel expertise and the personnel courtesy which provide added value to the overall offering.

Data was analyzed through descriptive statistics, and a linear regression model exploring the impact of the after sales elements on the overall customer satisfaction and on the word of mouth.

The outcomes of satisfaction and word of mouth were each measured using a single item adapted from Huntley (2006).

The following regression models were elaborated using R software:

$$a) \quad overall\ satisfaction = \beta + \beta_1\ welcoming + \beta_2\ waiting\ area + \beta_3\ expertise + \beta_4\ courtesy + \beta_5\ contact\ service + \beta_6\ documentation + \beta_7\ quality + \beta_8\ service\ lead\ time + \varepsilon \quad (1)$$

$$b) \quad word\ of\ mouth = \beta + \beta_1\ welcoming + \beta_2\ waiting\ area + \beta_3\ expertise + \beta_4\ courtesy + \beta_5\ contact\ service + \beta_6\ documentation + \beta_7\ quality + \beta_8\ service\ lead\ time + \varepsilon \quad (2)$$

In order to assess reliability, the Internal Consistencies were assessed. The value of Normalized Cronbach's alpha was of 0.8, in line with the minimum value of 0.7 suggested by Cortina (1993).

Findings

All the after sales items were positively perceived and customers were extremely satisfied. In fact all the elements have an average mean above 8, except for quality over price which received an average mean of 7.5 to ten. The item which receive the highest satisfaction is personnel courtesy (M=9.06).

Indeed, the overall satisfaction perceived by customer for the after sales experience is very high (M= 8.586) and the same happens for the willingness to report their experience to other people, as the likelihood to widespread word of mouth is on average 8.576.

The first regression analysis focused on the impact of several after sales intangibles elements on the overall customer satisfaction perception (Table 2). Results show that some of these elements positively affect the evaluation of customer satisfaction.

This is the case of welcoming activities, the personnel courtesy, the quality of the service over its price and the service lead time. It is almost significant the contact service perception ($\beta= 0.095$, p-value= 0.071). These elements belong to the *process* and *people* Ps of service marketing, while the elements belonging to the *physical evidence* of the 3Ps of service marketing (in our case the customer waiting area and the documentation quality), seem not affecting the overall satisfaction.

TABLE 2: REGRESSION ANALYSIS FOR CUSTOMER SATISFACTION

	ESTIMATE	STD. ERROR	T VALUE	PR(> T)
Intercept	-0.278	0.426	-0.653	0.514
Welcoming	0.114	0.054	2.097	0.037*
Customer waiting area	0.070	0.044	1.600	0.111
Personnel expertise	0.032	0.070	0.457	0.648
Personnel courtesy	0.303	0.069	4.371	1.98e-05 ***
Contact Service	0.095	0.052	1.814	0.071
Documentation quality	0.015	0.032	0.047	0.743
Quality versus price	0.256	0.033	7.572	1.31e-12 ***
Service lead time	0.157	0.037	4.221	3.69e-05 ***

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
 Residual standard error: 0.6383 on 201 degrees of freedom
 Multiple R-squared: 0.7297, Adjusted R-squared: 0.7189
 F-statistic: 67.83 on 8 and 201 DF, p-value: < 2.2e-16

Regarding the impact of after sales service on the customer's willingness to recommend the company to other people, the courtesy of personnel positively affects customer' word of mouth (Table 3). In addition the contact service plays a positive role in influencing the willingness to widespread positive word of mouth from customers about their after sales experience. The quality of the service compared to its price and the time of service delivery still represent the most important elements for customers. This is confirmed both for their impact on overall satisfaction and word of mouth.

TABLE 3: REGRESSION ANALYSIS FOR WORD OF MOUTH

	ESTIMATE	STD. ERROR	T VALUE	PR(> T)
Intercept	-0.526	0.654	-0.804	0.422
Welcoming	-0.018	0.083	-0.219	0.827
Customer waiting area	0.048	0.067	0.711	0.477
Personnel expertise	0.108	0.107	1.003	0.317

Personnel courtesy	0.270	0.106	2.541	0.011 *
Contact Service	0.171	0.080	2.119	0.035 *
Documentation quality	0.009	0.072	0.013	0.989
Quality versus price	0.311	0.051	5.998	9.16 e-09 ***
Service lead time	0.188	0.057	3.308	0.001 **

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
Residual standard error: 0.9789 on 201 degrees of freedom
Multiple R-squared: 0.5635, Adjusted R-squared: 0.5461
F-statistic: 32.44 on 8 and 201 DF, p-value: < 2.2e-16

Then, our study confirms the relationship between customer satisfaction and word of mouth. In fact, they are highly and positively correlated ($r= 0.714$) and customer satisfaction impact on the propensity of customer to widespread word of mouth ($\beta= 0.861$, $p\text{-value}= 0.0001$).

Conclusion and implication

The automotive industry is one of the most competitive industries in the world, probably one of the most changed industry sector in the last decade. Moreover in Europe, competition is increasing due to market liberalization actions taken by the European Commission and due to globalization and rising customer demands. Automotive companies have a tough time to compete with products only, therefore many firms turn to services as a means to achieve strategic advantages. This trend, known as service infusion into manufacturing, servitization, tertiarization and transition to service-led business can be observed in the automotive industry as well (Godlevskaja, Jos van Iwaarden and Ton van der Wiele, 2011).

Our study contributes to understand the role and the impact of after sales service, based on the service quality perception. In particular we investigated the role of the 3 Ps of service, on overall satisfaction and word of mouth. Results show as the welcoming process, the personnel courtesy and the quality of service (over price and the quality of lead time) represent drivers of the overall satisfaction. On the other hand, customers are willing to recommend the service providers when they are highly satisfied with regards to personnel, contact service, quality versus price and the lead time.

TABLE 4: THE IMPACT OF AFTER SALE EXPERIENCE ON SATISFACTION AND WOM

Welcoming	Customer waiting area	Personnel expertise	Personnel courtesy	Contact Service	Documentation quality	Quality versus price	Service lead time	
<input checked="" type="checkbox"/>	SATISFACTION							
<input checked="" type="checkbox"/>	WORD OF MOUTH							

The main limitation of the study is that we focused only on one car dealer of one industry and further research could expand this study in other industries comparing the after sales experience.

Innovation Propensity and Performance in Tourism Industry: the Mediated Role of Trust in Public Authorities and Market Structure Perception

Abstract

Based on an international survey of 674 firms based in Italy, France, UK, Germany and Spain, this paper is aimed at analysing the relation of firms' innovative behaviour and performance. This study is based on a mixed methods research (MMR), therefore, it relies on both theoretical assumptions and statistical techniques and methodologies, precisely structural equation modelling (SEM). Considering the effects of the trust in public authorities and the market assessment, the mediating effect of NSD plays a sound positive role on performance. NSD oriented firms take advantage from the "competitive market dynamics" by searching, developing and transforming new ideas into business, launching new or updating existing services, thus enhancing their offer. The models discussed constitute the novelty of this research as most prior empirical research investigating mechanisms through which some factors affect firm performance diverges in terms of methodology, population and purpose.

Introduction

Current global crisis has uncovered weaknesses in the economic and business governance framework of many countries worldwide. Many European countries were used to resort to their monetary sovereignty to boost their exportations. However, European monetary union has prevented such practices. Thus, other policies have lately become more and more important among decision makers and business. It is widely recognised that innovation activities are major determinants of competitiveness and economic development of territories (Porter & Ketels, 2003). Innovation activities also play a key role in the competitiveness of firms, to this extent, Chesbrough (2010) sheds light on business model innovation; the author provides a concise taxonomy of barriers that prevent proactive innovative business models and opportunities that innovation can generate. Among the vast field of innovation studies, attention on New Service Development (NSD) is increasing. However, most of studies in this area have analysed manufacturing products and industry; in fact NSD stems from new product development (NPD). A remarkable corpus of literature suggests innovation-related issues to succeed in such a complex environment, among others (De Jong & Vermeulen, 2003; Dwyer & Edwards, 2009; Ottenbacher & Harrington, 2010).

In this study we investigate the effects of a set of factors on performance by understanding the role of NSD as a mediator element. Since both available literature and data provided by official entities lack of specificity, we have preferred to conduct a survey to collect most of the empirical information. We rely on both theoretical assumptions as well as statistical techniques and methodologies. Also, we perform a deep literature review to design and fine-tune the questions to propose in an effort to gain reliable information. Provided the nature of this study, we speculate that the joint employment of quantitative and qualitative methods, can guarantee a deeper understanding of the phenomena we investigate. The main statistical tool we use is known as "Structural equation modelling" or SEM since this approach complies with our scope: (i) hypotheses concerning relations between variables (latent or observed), see Hoyle (1995), (ii) develop and test a theoretical network (Rigdon, 1998) and (iii) verify conceptualised patterns among a set of data we use as observed variables. The remainder of this paper is organised as follows: firstly, an overview of the problem is provided, this is done by introducing major forces that, although not investigated in the proceeding of the study, concur to undermine the sector development. After that, the theoretical framework is presents and major concepts defined. Then we analyse previous literature and present the methodology, the research design and process. After that we present the main results and some conclusive remarks.

Framework

FIGURE 3 indicates how selected latent variables (ELVs) affect the expressed performance with and without the mediating role of innovation propensity, i.e. NSD proxy. The same figure also sheds light on the impact of the

mentioned selected variables on innovation propensity. We a priori assume which variables (and the directions) affect others according to the hypotheses. Accordingly, SEM is used as a confirmatory tool.

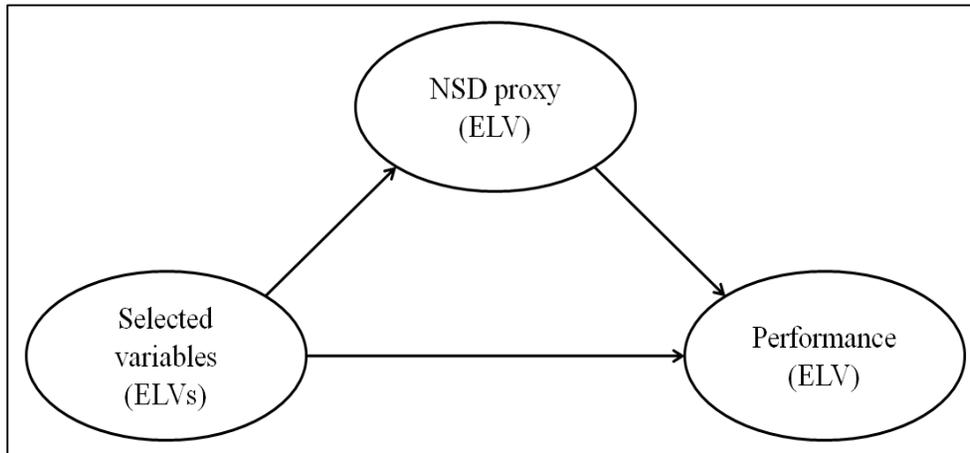

FIGURE 3: FRAMEWORK OF RESEARCH HYPOTHESES

Source: Own elaboration

Literature review

A great deal of studies have been published with regard to what competitiveness is or focusing on what factors drive or prevent it. No exception for tourism. Competitiveness and performance of tourism industry have been widely investigated since the identification of tourism as a major component of modern economics. However, at the time of writing no consensus or frameworks result to be available to address how they shall be appraised (Hong, 2008). To this regard, Gooroochurn & Sugiyarto (2005) propose an approach for evaluate tourism performance relying on some indicators – price, business openness, technology capability, quality of the infrastructure, education and human resources, social and economic development, environment. Di Foggia & Lazzarotti (2013) focus on local development policies as performance and competitiveness enablers. In a recent work Dwyer & Edwards (2009) underscore the changes occurring in the environment and the challenges they generate for management. Considering the global competition, industry and governments shall cooperate as a system in order to fine-tune the offer and enhance competitiveness. Problems however arise when the government level struggles in producing effective products, services and policies. Public authorities (the State) have essentially the following macro-roles: (i) Protect the freedom of individuals, redistribute resources and intervene in so-called ‘market failures’, researching the outcomes of allocation efficiency that cannot be achieved through the normal functioning of the market (Arrigo & Di Foggia, 2013). We argue that the perceived inefficiency of public authorities with productive responsibilities impacts on firms performance because of the decreasing trust. Switching to the new service development (NSD), a great deal of literature on the economics of NPD and NSD focuses on the integration of new business models (Zott, Amit, & Massa, 2011) and on economic assessment of projects (Caron, 2013). In fact, a development process can also be a viable tool for forecasting, especially getting information from what is commonly known as sensitivity analysis. Innovation in tourism industry has been widely documented by scholars of different fields. Hall (2009) doesn’t find significant difference between tourism and other sectors in terms of efforts toward innovation; instead from the analyses of the British industry in the case of Evangelista (2000) and of the Danish industry in the case of Christensen (2008) emerges that tourism undertakings’ innovativeness level lies below the average of other sectors they consider. Results of the study conducted by Miles (2008) champion the second theory, in fact the author finds out that innovation level in hospitality industry is 5% lower than other sectors: 20% against 25% of firms carry out a form of innovation action. Switching to the determinants, it is useful to mention the study of Sundbo *et al.*, (2007) since they propose theoretical

framework meant to measure the inclination toward innovation; as widely confirmed by literature related to other sectors, size, professionalism of employees and entrepreneurship inclination play a crucial role and are positively correlated with innovation. Considering the typology of innovation, Jacob *et al.*, (2003) argue non-technological innovations are more frequent than technological ones. Some scholars have investigated the factors that lead to successful services in tourism, among others Hjalager (2010) surveys innovation typologies and enabling factors while Ottenbacher (2007) focuses on success factors. A recent study performed by Dwyer and Edwards (2009), and focused on strategic management within hospitality sector, provides key important elements that and professionals of tourism organisations should consider in order to minimise the risks of drifts in management. An in-depth cataloguing of different types and levels of innovations in tourism that produced by Hjalager (2010). Although service development studies stem from those related to the development of products, new service development (NSD) has recently emerged as an independent topic. Services have characteristics that products typically don't have (inseparability, heterogeneity and perishability) as Jaw, Lo, & Lin (2010) suggest. As a tool for this study we inspired to a linear or waterfall new service development model to represent a proxy of innovation attitude. According to Bullinger (2003), these frameworks are featured by a sequence of phases and each step embeds a set of activities and routines.

Research design and appropriateness

This study is based on a mixed methods research (MMR). Therefore, we rely on theoretical assumptions as well as statistical techniques and methodologies. Since no suitable data were available to conduct the analyses, we made use of a deep literature review to design and fine-tune the questionnaire in an effort to gain reliable information. Provided the nature of this study, we speculate that the joint employment of quantitative and qualitative methods can guarantee a deeper understanding of the phenomena we investigate. We intend to measure what influence some specific factors have on the attitude to innovate firstly and performance subsequently. SEM can be summarised as a broad statistical approach that can be used to testing hypotheses about relations (casualty of correlation) between different kind of variables: i.e. observed and latent; to this extent the work of Hoyle (1995) provides a comprehensive review. To the same token, Rigdon (1998) describes SEM as a methodology for developing, measuring and testing a hypothetical set of connections among variables, his work specifically applies to business research. Particularly we make use of SEM to tests pattern of relationships, previously conceptualised between variables with the aim of modelling the relationships among factors both external and internal to the firms that compose our sample, see the work of Mac Callum & Austin (2000), mostly concentrated on psychology issues. Appropriateness of the research is confirmed by both research questions and lack of literature linking innovation process and performance in tourism using SEM.

Population

The analysis is based on an international survey of 674 firms (total sample 7000, response rate 9.6%) located in Italy, France, UK, Germany and Spain using a web-based data acquisition approach. The firms are segmented by NACE REV. 2 (mainly 55, 56, 79). Firms are located in France (11.3%), Germany (6.2%), Italy (2.4%), Spain (13.6%), UK (16.5%), Italy (50%). The questionnaire is comprehensive, in fact it comprehends both (i) open questions and (ii) closed questions. Most of the variables are built from items (or observed variables) classified as Likert-type therefore collected on an ordinal basis (from 1 to 7). Even if there are impending problems in using SEM with ordinal values: e.g. the estimation method that is ML by default, there are examples of first-class analyses with Likert scale items (Kline, 2011).

TABLE 8: LIST OF CODIFIED SURVEY QUESTIONS

Code	Description	Obs	Min-Max
nsd1	Brainstorming sessions	674	1-7
nsd2	Systematic collection & evaluation of new ideas	674	1-7
nsd3	Differentiation of service from competitors' offer	674	1-7
nsd4	Trade-off analysis of projects (benefits & disadvantages)	674	1-7

ex6	The government fosters fair competition	674	1-7
ex7	Clear legislation in force, laws and market rules	674	1-7
ex8	Compliance with bureaucratic procedures is straightaway	674	1-7
ex9	Government implements policies in support of industry	674	1-7
p1	Expanded portfolio of services (new services)	674	1-7
p2	Improved the quality of existing services	674	1-7
p3	Improved production or delivery process for services	674	1-7
p5	Strengthened market share	674	1-7
p7	Stimulated the production of ideas (from staff)	674	1-7
p8	Increased positive client's feedback	674	1-7
p9	Increased our skills and competencies	674	1-7
p10	Increased our online reputation and presence	674	1-7
p11	Enhanced the knowledge of the markets	674	1-7

Research questions and hypotheses

In the first stage we investigate (i) the direct impact of the latent exogenous variables on the performance, (ii) the effect on NSD on performance and (iii) the total effect given the mediation of NSD. In the second stage we reiterate our models to compare groups (ITA-EUR).

Research questions:

- I: Do the mentioned variable effect the innovation propensity?
- II: Do the mentioned variables directly influence the performance?
- III: Is the impact of the mentioned variables strengthened by the mediation of innovative attitude?
- IV: Are there any differences among Italian and European firms?

Hypotheses:

- I: H_0 a positive relationship between LVs and Performance exists, H_1 otherwise;
- II: H_0 there is a positive relationship between LVs and innovation, H_1 otherwise;
- III: H_0 Service innovation and performance are positively linked, H_1 otherwise;
- IV: H_0 the impact of LVS on the performance is strengthened by the mediating role of innovation, H_1 otherwise.

- V: H_0 there is no difference between Italian and European firms, H_1 otherwise;

Results and discussion

SEM is aimed at assessing relationships among latent and measured variables (latent variables can exist at more levels, e.g. in higher order models), and this is very important since the interest on interaction effects between measured and latent variables has dramatically increased (Henseler & Chin, 2010). SEM represents a key method in testing hypotheses on the effect of latent variables on measured one and vice versa (Hair, Sarstedt, Ringle, & Mena 2012) and has become more and more accepted among scholars of social and managerial sciences. One main goal of SEM is to measure the effects: direct, indirect and total. It could be demonstrated that, the total effect of a variable on another is made by a direct effect (there are no other overruling variables) and mediating effect, i.e. the indirect effect through one or more involved variables. As precisely explained by Baron & Kenny (1986), with mediator we can define a variable that intervene in the pattern (influence) between a predictor and a variable identified as output (dependent). The analysis of the mediation try to identify the path that leads from independent variables to a dependent (Muller, Judd, & Yzerbyt, 2005). Thus, considering a model in which a mediation relation occurs, the first variable (predictor) shall cause the second (mediator) while the latter, in turn finally causes the third (outcome) variable (Wu & Zumbo, 2008). This is the reason why, according to Heene, Hilbert, Draxler, & Ziegler (2011), it is thought to be one of most used methodology for validating complex constructs. SEM has also gained popularity in T&T research (Nunkoo, Ramkissoon, & Gursoy 2012). Higher-order CFA models are meant to characterise hypotheses about relations (with a hierarchical order) among constructs. This is possible with the specification of what are called, see Acock (2013) “higher-order factors”, this is viable if a causal effect from the higher to the lowers exists.

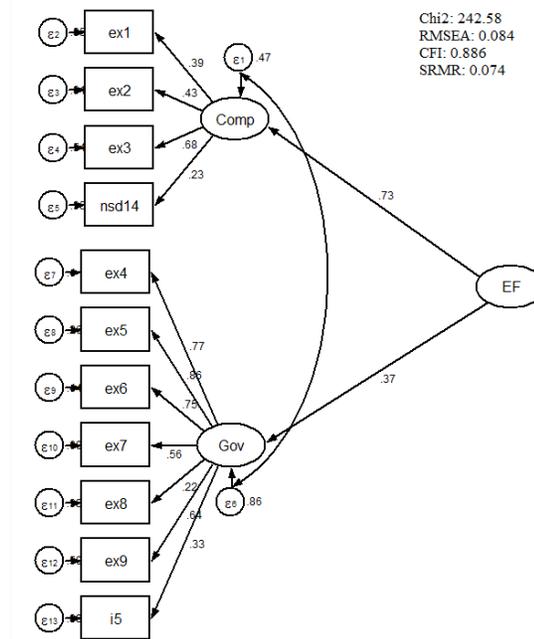

FIGURE 4: EXTERNAL FACTORS (HIGH-ORDER CFA)

Source: own elaboration

FIGURE 4 presents the hypotheses that “Comp” and “Gov” are measured by the respective items (see the chapter on measurement component) and, like the previous model, each first-order factors has, in turn, a direct cause

(and an error). The cause is the EF and represents a proxy of external factors. From the results of this model positive and significant effects emerge 0.37 ($p < 0.1$) of the external factors on “Gov” and 0.73 ($p < 0.05$) on “Comp”.

The model

Our purpose is to apply a set of items to generate a measure, according to the objective. To do this we firstly perform a PCFA this could be an effective way to identify items to be eventually erased. After the first step we perform a CFA, we assume that the latent variables accounts for the items we selected. Since there are no missing data, we use the maximum likelihood estimation type (ml) as estimation method.

The first of the two analyses measurement component (bisesdes innovation propensity and performance) in the evaluation of the competition intensity “Comp”. This is a proxy of the market structure as perceived by firms “Comp” → ex1, e2, ex3, nsd14 (chi2 8.292, RMSEA0.068, CFI 0.956, SMRM 0.025). The second measurement component is the trust and assessment of public authorities “Gov” → ex4, ex5, ex6, ex7, ex9, i5, ex8: (chi2 65.8, RMSEA0.074, CFI 0.964, SMRM 0.034). Actual performance of government is the key to understanding firms' confidence in government. Institutions that perform well are likely to elicit the confidence of firms; those that perform badly or ineffectively generate feelings of distrust and low confidence. People recognize whether government or political institutions are performing well or poorly (Tyler, T. R., 2001). The measurement component aimed at measuring the innovation propensity is “Sinno” → nsd1-nsd10: (chi2 155.86, RMSEA0.072, CFI 0.957, SMRM 0.033).

The revealed performance is measured using “Per” → p1, p2, p3, p5, p7, p8, p9, p10, p11 as a proxy (chi2 80.25, RMSEA0.054, CFI 0.977, SMRM 0.026).

Taking into account the data referring to the standardised effects of the measure “Gov” on the performance, we can infer the share of effects attributable to direct or indirect impact. Specifically, the total impact equals 0.26 ($p < 0.001$) this is a relatively small effect provided its statistical robustness. Since the direct effect is 0.18 ($p < 0.001$) we can say that 69.2% of evaluation and trust of public authorities effects on performance are direct after controlling for the propensity to innovate and develop new services, while 30.8% of the “Gov” effects on the overall performance result to be indirect. Considering the Italian group, the share of direct impact of evaluation and trust of public authorities on performance is (0.15 $p < 0.001$) or 52.9%, while the remaining (0.13 $p < 0.001$) or 47.1% represents the share of indirect effect, i.e. the mediation of the propensity to innovate and develop new services. Therefore even controlling for the inclination toward innovation and service development, the direct effect is the dominant component. Instead, considering the European group, the share of direct impact of the evaluation and trust of public authorities on performance is 56.2%, while the remaining 43.8% represents the share of indirect effect.

Conclusion

There is an inadequate research attention which considers the simultaneous interrelationships among the analysed latent variables, NSD and performance within the context of tourism industry. To shed light on the problem, this study has raised interrelated questions regarding the role of external factors: the government institutions and competition assessment. We provide new evidence on the mediation role of the new service development process used as a proxy of innovation attitude. In an effort to explain more in the detail the hypothetical peculiarities of Italian firms we have reiterated our model in two separated groups: one embedding the Italian firms and the other gathering data obtained by respondents located in Germany, France, UK and Spain. Despite the availability of academic literature, we found a lack of statistics related to Italy consistently with OECD (2011). One must consider that the available information does not accurately reflect the general performance of the sector. To this extent, with the aim of unveiling both weaknesses and latent opportunities we designed a web-based survey to obtain data. Firstly, we concentrated on the direct influence of the latent (exogenous) variables on the expressed performance, on their effect on the innovation performance and on the total effect given the mediation of the service development process. Precisely, the selected exogenous latent variables stand for the judgment of the market they operate in “Comp” and the quality as well as the effectiveness of public authorities “Gov”. The endogenous variables are a proxy of the innovation process “Sinno” and the expressed performance “Per”. After that we reiterated the model to identify differences in two groups respectively. Italian and European firms. To this extent we managed to explain weather and how the mentioned variables influence the propensity to innovate, the intensity of their direct effect on the performance and if their impact is strengthened by the mediation of innovation attitude.

Moreover, we unveiled the difference that occur between the Italian and European sample. A peculiar figure emerged from the standardised effect of the market characteristics; in fact one may note that there is a slight but consistent and significant negative relation among the perception on competition and the performance. This is consistent with the assumptions, in fact one possible interpretation of this coefficient is the following: some firms are used to operate in a non competitive or static market; however, as highlighted in different sections, the market has changed and at the time of writing is being changing rapidly. Some firms are losing their contact with the market arena and experiencing or prone to experience difficulties (Dwyer and Edwards, 2009). The interpretation of this value is straightforward: firms that adopt a service innovation framework of have an innovative attitude take huge advantage from competition dynamics and tend to succeed. Considering the measure “Gov”, we speculated that the total impact equals 0.26 ($p < 0.001$). Since the direct effect is 0.18 ($p < 0.001$), for this reason 69.2% of evaluation and trust of public authorities effect on performance is direct while 30.8% indirect. The results of the models have confirmed that factors external to the firms, trust in public authorities as well as the perceived market structure play a remarkable role on performance. Histogram 1 embeds data of total, direct and indirect effects controlling for a mediation of NSD (it can be demonstrated that provided the indirect effect of the exogenous variables used in this study on the performance are given computing their direct effects times the NSD’s direct effect, see Acock (2013) pp.60 for an extensive explanation.

HISTOGRAM 1: EFFECTS ON PERFORMANCE

Source: own elaboration

From the histogram one can see the negative sign of the direct effect of “Comp”. Provided the robustness of the casualty assumption and the goodness of fit of both the measurement and path models (results omitted since showed in the dedicated paragraphs) a strong statement emerges: the higher the perception of completion level (even in terms of unfair competition, a widely diffused sentiment as stated in the introduction section dedicated to the respondents open ended questions) the lower the expressed performance. This is typical of a dynamic industry in terms of demand elasticity and business innovation (Hjalager, 2002; Kumar, 2013; Ottenbacher, 2007; Dwyer & Edwards, 2009). There is a clear trend: the mediating effect of NSD plays a sound positive role on performance. NSD oriented firms take advantage from the “competitive market dynamics” by searching, developing and transforming new ideas into business, launching new or updating existing services, thus enhancing their offer. Economic theory on industrial organisation, specifically studies on structure, conduct and performance (SCP) predicts this market outcome, see Carlton & Perloff (2005) for a complete review. This work has also implications for policy makers. The Italian assets remain an element of competitiveness because they exert a strong pull on tourists, but the success of tourism products increasingly depends on the ability to act simultaneously on all the levers. This work has many limitations: extensibility, methodology and resources respectively. There is robust scepticism about the worth of online surveys’ responses (Lefever & Matthiasdottir, 2007). Besides the introduced limitations derived from the assumptions and from the methodology, there is a specific issue related to the variable that encompasses the trust and assessment of the market. In fact the following alpha result: test scale of the composite variable “Comp” (Cronbach's alpha 0.461). However we decided to maintain this variable on the light of other assessments. Other items could have been added to improve the scale reliability, however we have preferred to fix on the four reported items.

Understanding Sequences of Business Interactions and Their Influence on Cross-Cultural Inter-Team and Intra-Team Negotiations

Abstract

Many studies show the lack of cross-cultural competence to be a reason for international business failures. The practice of effective communication will help reduce conflict and potentially increase the number of opportunities for international business. Studies in social sciences have not fully scrutinised the dynamics of face-to-face negotiations, in particular the behavioural dynamics that may generate negative effects on such interactions. The Bales IPA model (1950) is adapted in this study to analyse behavioural patterns in group negotiations. This working paper aims at identifying sequences of interaction that determine the relative impact on the negotiation process, discusses the relevant frameworks in order to develop a conceptual model primarily based on the literature and suggests suitable research methods. In due course, this study will enable the researcher to unveil implications and provide recommendations for negotiations across cultures in general and for cross-border negotiations in particular.

1 Introduction

In today's competitive business world, people from different cultural backgrounds interact with each other regularly. These interactions comprise of both verbal and non-verbal elements. Husbands interact with their wives, employers interact with employees, and children interact with their parents etc. in order to reach a mutual agreement. The stakes are not the same in all these types of interactions. Since interaction is a large subject to explore, this study will be focus on business interactions, where the stakes are much higher since it involves careful preparation and planning.

Negotiation is an important component in these business interactions. A breakdown in the negotiation process could be attributed to different factors. However, many studies have shown that most often these breakdowns in negotiations have risen from differences in national culture (Brett, 2000). While the researcher explores the area of business negotiations in depth, she will also develop a model to further understand how national culture can affect the negotiation process and its outcomes. Additionally, the Bales' Interaction Process Analysis (Bales, 1950; see Figure 1) is adapted in this study, to analyse the behavioural patterns in face-to-face negotiations between teams. The model has been chosen because it is the earliest and most durable systems for examining face-to-face interactions in groups (Bales and Strodtbeck, 1951; Perakyla, 2004). It attempts to identify and capture both verbal and non-verbal behavioural patterns in groups, by using a twelve category typology.

The initial focus of this working paper is to investigate how the Bales' IPA model can be modified and used for coding observations and for the identification of behavioural patterns considering sequences of interactions between and within two teams or groups. A second objective of this paper is to gain a better understanding of the micro-dynamics of cross-cultural negotiations, since cultural differences are known to influence the face-to-face negotiation process. The analysis will consider cultural dimensions from Hofstede (Hofstede, 2005) and from the globe project (House et al., 2004), or more generally, West-East differences. The study aims to further the researcher's understanding of sequences of interaction that are conducive to positive outcomes when individuals of different cultural backgrounds are involved.

This paper has the following sections: Literature Review that links the study to relevant theoretical frameworks and models and the suggested research method section that explains how the use of both the qualitative and quantitative methods can help the researcher to collect and obtain data that will lead to identifying those sequences of interactions that have an impact on successful and unsuccessful business negotiations.

2 Literature Review

The literature review section is divided into four main sections and these are explained below. An in depth understanding of the literature will guide the researcher in answering the main research question, which is, "What

influence does different sequence of interactions have on the effectiveness of cross-cultural business negotiations between different teams?"

2.1 International Business Negotiations

The word "*negotiation*" comes from the Roman word *negotiari*, which means "*to carry on business.*" In modern times, business negotiations can be defined as a voluntary process where two or more parties modify their offers and expectations in order to come closer to each other (Ghauri, 2003). From this definition, we can see that the prime objective of both parties is to reach an agreement that favours either parties or groups involved.

Lewicki et al., 2006, Cellich and Jain, 2004, Fowler, 1986, McCall and Warrington, 1989 have come up with some common characteristics that occur within a business negotiation scenario. They are as follows:

- The negotiations generally occur between individuals within groups or between groups;
- There can be one or many issues that need to be resolved;
- The negotiator can take different positions to respond to a particular issue;
- There will be conflicts of interests between the parties or groups;
- The parties involved negotiate by choice instead of simply accepting what the other party offers;
- A "give and take" approach is adopted. This means that the parties will require modifying their initial needs or demands to accommodate some of the other party's demands;
- The parties or groups prefer to negotiate in order to search for a mutual solution;
- The outcome that is reached might not expected by both parties, but the important point is to reach an acceptable outcome; and
- The success of the negotiation depends on the management of tangibles such as price and intangibles, management of the terms of agreement and other such psychological motivations that either directly or indirectly influences the negotiation process.

Following the above mentioned characteristics, it is evident that negotiation is a complex, problem-solving process where if not handled properly can end up with both parties accepting a jointly inferior agreement (Ghauri, 2003). Some literature use bargaining and negotiating interchangeably (Ghauri, 2003). However, the negotiation process we discuss in this study is different to bargaining and could be called integrative bargaining, which results in a win-win outcome for both parties involved (Ghauri, 2000). Bargaining on the other hand, is more competitive and refers to haggling in a typical marketplace setting, where one party maximises his own benefit at the expense of the other, resulting mostly in a win-lose outcome (Ghauri, 2003).

In business negotiations, parties come together with different preferences, objectives and circumstantial details with an attempt to find a mutual solution that is beneficial to both the parties. The solution achieved should be at least partially satisfactory to both parties. This thus requires the use of the integrative strategy that comprises of compromise, mutual trust and far-sightedness, in order to maintain a productive relationship with the other party (Lewicki, Barry, Minton and Saunders 2003).

The preceding section will describe three essential variables namely, background factors, the negotiation process and the atmosphere, as these contribute to business negotiations in different ways (**Ghauri, 2003**).

2.1.1 Background Factors

Background factors include objectives, the environment, market position, third parties influence and negotiators. These are described below to understand how these play a role in negotiations:

Objectives are different interests that each party achieves successfully for their business. These could be common, conflicting or complementary in nature (Ghauri, 2003). When objectives are common and complimentary, both parties are comfortable in proceeding with the negotiations as this is beneficial to both parties. On the other hand, conflicting objectives have a negative influence on the negotiation process.

The environment could be the social, political and market structural factors that could hinder the environment of both parties independently. The social and political factors influence the process or negotiation while the market structure factors influence the atmosphere within negotiations (Ghauri, 2003). For instance, the number of buyers and sellers in the market determine the alternatives available to both parties and this in turn adds pressure to the parties involved in the negotiation.

Third parties like consultants, sub-contractors or the government can influence the negotiation process as each of their objectives is different. As a result, problems relating to foreign exchange, infrastructure, and employment options etc. could arise (Ghauri, 2003).

Negotiators involved in the negotiation process come with different skill sets and different levels of experience. Additionally their personalities also play an important role in the negotiation process.

For instance, a negotiator with technical background will focus more on the technical details and may pay less attention to the terms of payment and other related details, whereas a negotiator with a business background will focus on the latter issues than on technical details.

2.1.2 Stages of Business Negotiations

According to Ghauri (2003), this process is divided into three stages. Here, a stage refers to a particular part within the negotiation process that includes all the action and communication pertaining to negotiations that are completed within that part, before the parties move on to the next stage.

2.1.2.1 Stage I: Pre-Negotiation

In this stage, the parties or groups that are interested in doing business together contact each other to make tentative offers. According to Ghauri (2003), the pre-negotiation stage is the most important stage when compared to the formal negotiation stages as the parties assess the benefits of entering into a potential negotiation with the other party by gathering information about the other parties' background, their operating environment and infrastructural abilities, their involvement with other parties and their influencers and competitors. They accordingly discuss precautionary measures.

On completion, many countries issue a letter of intent/acceptance at this stage (Ghauri, 2003). In Western countries this is referred to as the 'grant of contract' and merely indicates the desire for the other party to negotiate further (Ghauri, 1986; Lewicki, Litterer, Minton and Saunders 1994).

2.1.2.2 Stage II: Face-to-face Negotiation

At this stage of negotiations, different expectations continue to exist especially amongst parties from different cultural backgrounds. This makes the negotiation process more complex. Differences in each party's culture and traditions are brought to surface at this stage of negotiations, and it thus important to understand and adjust to these cultural differences. According to De Mattos, Sanderson and Ghauri (2002), one of the prominent challenges in cross-cultural business negotiations is the diverse expectations that parties from different cultures have and bring forth to the negotiation table. Also, either party tries not to submit a "final offer" at this stage as the aim of the negotiators is to get into a favourable long-term agreement.

2.1.2.3 Stage III: Post-Negotiation

This stage could result in the final contract being drawn up and signed when the terms of agreement have been agreed upon or could also lead to a renewed face-to-face negotiation based on new terms. In order for the latter to be avoided, it will be best to maintain minutes of the meeting at every stage of negotiations to understand if both the parties have the same understanding of the discussion and exchanges (Ghauri, 2003).

2.1.3 Atmosphere

According to Ghauri (2003), atmosphere is defined as the social environment around which parties interact with each other and how the parties regard each other's behaviour. At each stage of the negotiation, parties are looking for mutual solutions to problems and during this time different characteristics of the atmosphere namely, conflict/cooperation, power/dependence and expectations, take control at each stage (Ghauri, 2003).

Conflict and cooperation are vital characteristics depicted in a negotiation process and the degree of these depends on the objectives put forth by the negotiating parties and the way the parties handle them.

The power/dependence characteristic is closely related to the actual power that either party has on the negotiation process. In other words, if one party has alternatives and other opportunities in the market place, it will indirectly

have the ability to control and influence the negotiation to its favour. However, if both parties perceive equal power, then the power relationship is in balance, though this is not mostly the case within business negotiations. The last characteristic is *expectations* and this is of two types namely, long-term and short-term expectations. Long-term expectations take into account future business prospects for both parties and if these are stronger, the parties will be willing to negotiate further to come to a mutual agreement. On the other hand, short-term agreements are when the parties do not think about the future and move over from one stage of the negotiation process to another with the hope of obtaining a good outcome at each stage. According to Ghauri (2003), expectations develop and change at each stage of negotiation.

2.2 Culture

Culture is one of the factors that impact the negotiation process (Brett, 2000), besides other factors such as language differences, differences in work dynamics, communication problems etc. This section will discuss to what extent cultural differences can impact the negotiation process.

According to Bates and Plog (1976), "Culture is a system of shared beliefs, values, customs, behaviours and artefacts that the members of a society use to cope with the world and with one another and that are transmitted from generation to generation through learning." This definition includes most aspects of culture such as religion, ideologies, patterns of behaviour and works of art. Belief systems are a set of values developed within a culture that affect the behaviour of members of that culture. "Values are a learned set of rules for making choices. These are embedded to create one's own belief system. Acting as guideposts, they teach us what is right or wrong what to strive for and how to live our life" (Rokeach, 1973, p.161).

The cultural dimensions that this study will explore further is high context and low context culture. This dimension will help in analysing the interpretation of the different behavioural scenarios. Though other dimensions can also have an effect on negotiations, this dimension seems to be more relevant for this particular study.

2.2.1 High-Context and Low-Context Cultures

This dimension of culture is important to consider because it considers and has direct implications on how the other party should relies on contextual cues and how much explicit information is enough (Hall and Hall, 1990; Cohen 1991).

According to Hall (1976), "A high context communication message is one in which the information is already in the person, so very little is in the coded explicitly transmitted message. Whereas, a low context communication is one in which the transmitted message needs to be explicitly coded."

Generally people from the West practice direct and explicit communication and are considered low context. On the other hand, communication pattern in Eastern cultures are generally indirect and implicit, with subtle meaning embedded behind many written and spoken words. This is thus classified as high context. People from high context cultures, change very little over time in their habits and communication behaviours and this is because of the cultural and traditional background they come from (Hall, 1976, Adair and Brett, 2004b). People from low context cultures are quite the opposite and less homogeneous in behaviour (Hall, 1976, Adair and Brett, 2004b).

Differences between high context and low context cultures will influence negotiations to a vast extent. Negotiators from high context cultures may be comfortable with low context patterns of communication, whereas negotiators from low context cultures may not be as comfortable with high context patterns of communication (Adair and Brett, 2004b).

These variances in the patterns of communication will ultimately alter how each culture approaches and responds to negotiations, especially when there is a conflict of interest between parties. Further study on high context and low context cultures will provide insight into what people from diverse cultures pay attention to and what they ignore during a negotiation.

2.3 Culture and Communication

According to Beamer and Varner (2008), Language and non-verbal communication are products of culture as these are tools intricately bound up in a cultural process. Though culture is an independent variable, it influences verbal and non-verbal communication, which are dependent variables and these in turn can affect the performance within cross-cultural

teams in either a positive or a negative manner. Thus, during international business negotiations, communication plays a vital role.

In face to face negotiations, individuals experience both verbal and non-verbal communication, since communication is a process through which people exchange information in the form of signs, symbols and also demonstrate different behaviour during such interactions (Adair and Brett, 2004a). Whatever the medium of communication, it is important to communicate in an effective manner as this influences and triggers the behaviour and attitudes of individuals. The reason for such an influence is because communication is culture-dependent and different social groups have different ways of expressing themselves (Adair and Brett, 2004a)

In today's competitive business world, the establishment of strong relationships with people through effective communication will lead to reduced conflict and potentially increase the number of opportunities for international business.

2.4 Bales Interactive Process Analysis

Robert F. Bales, a Professor of Social Relations and the Director at the Laboratory of Social Relations in the University of Harvard, proposed a framework in 1950 called the 'Interaction Process Analysis' (IPA) framework, giving foundations for the study of interpersonal interactions between groups. Here groups refer to work teams, family groups, psychiatrist and patient(s), etc. (Bales, 1950). His typology is based on the idea that there is an orderly sequences of phases aimed at solving a problem and a parallel sequence of phases aimed at communication. The activities of problem solving involve gathering of information, evaluation of the information and the making of decisions based on this (McGrath, 1984). According to him, concentrating on such activities will put a strain on the socio-emotional domain. The three task phases continue, which in turn increases the strain and so an effort is made to counter these strains. Thus, there is an increase in both positive and negative social-emotional functions as the individuals or groups progress through the various phases of a task (McGrath, 1984).

Bales' main area of research was focussed on group observation and measuring interaction processes, where he classified group behavioural patterns into two main areas, namely, task-oriented areas and relationship-oriented areas (Bales, 1950). Several reasons support the choice of Bales' framework. First, the twelve categories developed by Bales for his study (see figure 1), consider both verbal and non-verbal interaction; six categories relate to the task domain and the remaining six relate to the socio-emotional domain. These categories are equally grouped into six main functional problems: problems of orientation, problems of evaluation, problems of control, problems of decision, problems of tension-management and problems of integration. Second, coding the group will help researchers in analysing sequential patterns in group behaviour. This approach used by Bales is thus free from members' own biases as the researcher is able to see the group interactions as a whole and code them into categories based on the behavioural patterns he/she witnesses. Lastly, Bales' framework also allows for the researcher to be present in the environment where the interaction is taking place. This makes the data easier to obtain for quantitative research purposes that may be required for the latter part of the study.

The IPA typology would help in capturing those verbal and non-verbal communicational patterns within teams in order to modify them for maximum effectiveness, so that it could lead to a win-win outcome. It will help functional groups to deal with equilibrium in both task and the socio-emotional domains. Conclusions built from the IPA typology would then be validated with responses obtained from interviews conducted with executives to reaffirm those behavioural patterns that could be used to help with cross-cultural group interactions.

3 Suggested Research Method

The negotiation for this study is a simulation of a British company selling their products in Saudi Arabia. The study will follow a mixed method approach called the triangulation methodology. This entails the use of both the qualitative and quantitative methods.

The study consists of three main stages.

In the first stage, an analysis of a relatively small sample of existing role-play video recordings will be carried out to develop a coding system that enables researchers in the same area of research to obtain the same results in coding at all times. In the second stage, a success index is created, to associate it with each negotiation session. Here, the relationship of specific sequence of interactions and the cultural background of the negotiators will be looked into and also the impact of emulated culture in each team (British and Saudi Arabian) and the emulated role of each participant will be investigated. In the third stage, a questionnaire will be developed based on those sequences that have been identified and in-depth interviews with experienced executives in large organisations will be conducted to understand if the identified sequences are used in real-life situations.

The research approach adopted for this study is graphically depicted in FIGURE. 2 below

The results obtained from the qualitative and quantitative techniques will be disseminated to practitioners and peers for them to undertake further research in negotiations and group interactions. Preliminary executive reports will also be prepared and sent out to those firms that have participated in the interview sessions.

4 Conclusion

With the growth of internationalised business deals and the increase in global competition, the success of the business will depend increasingly on how effectively cross-cultural interactions are managed and it is most likely that future international managers will be able to bring about this outcome successfully (Henderson 2005, Varner I.I. and Beamer, L. 2005). When an individual is unable to view another person's point of view, conflicts are prone to stem up. According to Bales (1950), "conflict even if it is constructive could lead to tension that damages group cohesion." It is therefore vital to interact with people from different cultures, to learn more about their personality and their way of life.

This study thus enables the researcher to identify those behavioural patterns that have impacted business negotiations in either a positive or negative manner. Finally, the model developed from this study will be helpful for future researchers to effectively observe and code group interactions and understand to what extent culture has an influence on the negotiation process.

Customer Participation Behavior for Value Co-creation in High- Versus Low- Contact Services: The Roles of Trust-in-Personnel and Trust-in-Brand

Abstract

In light of the changing roles of customers from service co-producer to value co-creator, the customer participation literature has conceptualized two types of participation behavior: co-production and value co-creation. However, there is a dearth of knowledge concerning both the antecedents of a customer co-creation behavior and the outcomes of such behavior in relation to customer perceived value and loyalty. Anchored on the trust-commitment theory, the present research (i) examines the main effect of how a customer's trust in the service personnel could affect his/her cooperative, value-adding participation behavior over the service delivery processes; and (ii) investigates how the potential impact of a customer's trust in service personnel on his/her participation behavior could vary and made contingent upon the customer's trust in the service brand on the one hand, and the types of high- versus low- customer contact service contexts on the other hand. Filling the above mentioned research gaps, the present research contributes to advance our knowledge of the roles played by trust at different levels of analysis in facilitating customer participation behavior; and improve our appreciation of the service contact contexts when designing the service organization for maximizing value of service outcome and sustained brand loyalty over time. To enhance the generalizability of the conclusion, this study examines its hypothesized relationships using matched samples of high-contact hair dressing (salon) services and low-contact mobile phone services. Both the theoretical and managerial implications deriving from the empirical results are also provided.

Suppliers' Segmentation Process: A business-relationship perspective

Maria Rosaria Marcon m.r.marcone@univpm.it
Polytechnic University of Marche - Italy

Suppliers' Segmentation Process: A business-relationship perspective

Abstract

Purpose - This article investigates how firms manage outsourcing in situation of an innovative supplier market niche.

This study analyses the initial outsourcing activities and strategies of mechanics firms. The tentative framework specifying the key conceptual categories was derived to set theoretical boundaries for the longitudinal study.

Design/methodology/approach - An interpretative, qualitative approach - utilizing selected multi-case study interviews such as the primary data collection method - is chosen. This study, surrounding the relationship-building approach, adopts a multi-phase methodology.

Findings - The findings show that greater focus needs to be placed on operational aspects associated with innovative supplier market niches, which contrasts with the traditional strategic view of outsourcing. The factors considered as potential influencers in the collaboration process competencies of medium enterprises are been analysed.

Practical implications - We believe that this study provides valuable information for practitioners and researchers alike. It illustrates the value of a holistic view to managers in purchasing strategies attempting to assess the risk and the complexity facing them.

Originality/value – Our study created new knowledge regarding the network relationships used to access innovation resources. Our results demonstrate that important resources for innovation may be accessible through innovative supply relationship.

Keywords: supplier markets, new product development, innovative supply chain relationships.

1. Introduction

This paper could present a preliminary research concepts and findings concerning the identification and analysis of risks regarding purchasing decisions in manufacturing firms that are belonging to 'interrelated international supply chain'. We map the purchasing choices and present a new framework for categorizing the risks in terms of their driver factors in order to assess the overall impact on the performance of the operation area too.

Thus, there is a need to understand how purchasing strategies may affect a firm's ability to innovate.

A developed supplier market is a basic outsourcing requirement. However, supplier markets can be inefficient; for instance, do to oligopolistic or monopolistic market structures, or asset specificity and opportunistic transaction behavior between buyer and seller (Williamson, 1985; Walker and Weber, 1984; Rindfleisch and Heide, 1997). The present article deals with the so-called innovative supplier market niche (ISMN), which is defined as being context in which it is possible to find suppliers with developed production systems and experience of the components considered for outsourcing (Azadegan, 2011; Holmen *et al.*, 2013; Rehme *et al.*, 2013). This situation differs from the traditional view of a few dominant suppliers controlling elements such as market conduct and prices.

The outsourcing literature has predominantly assumed the existence of a developed supplier market and has addressed markets that are characterized by dominant supplier opportunism (Holcomb and Hitt, 2007; McIvor, 2008; Eltantawy and Giunipero, 2013). However, few studies have focused on how firms manage outsourcing in a supplier market that, from the outset, could be regarded as an innovative niche; a market with a low degree of competition between suppliers, which also lacks knowledge and other resources necessary to implement value-added strategies (Walker *et al.*, 2005; Inemek and Matthyssens, 2013; Va de Vijver *et al.*, 2011; Yan and Dooley, 2013).

The aim of this paper is to develop a decision support framework for purchasing strategies in supply relationship management utilizing an integrated approach to value-based performance and risk optimization. We develop a comprehensive approach to capacity management taking into account related purchasing strategies from a value-based perspective (Hahn and Kuhn, 2011). The article makes three distinctive contributions to the more general field of purchasing and supply management research. Firstly, with the help of our longitudinal case studies, we illustrate how firms manage outsourcing when they lack an initial supplier market. One could contend that an innovative supplier market niche essentially leaves a company proactively to build a supplier market to which it can outsource. Secondly, we combine the resource-based view (RBV) and transaction cost economics (TCE), and contributing by adding greater depth to the understanding of outsourcing to an ISMN. In particular, the findings increase the understanding of the operational

level of outsourcing decisions vs. the strategic level, as well as the value of the traditional core/non-core logic in outsourcing strategies. Thirdly, our proposed outsourcing framework provides managers with an *aide memoire* when considering outsourcing in ISMN.

The remainder of this article is organized as follows. We first provide a literature review on the domains relevant for this research and then we develop hypotheses to explain the moderating effects of environmental uncertainty on 'supply chain integration-performance relationships'. In section 3 we define the key theoretical constructs and highlight the adopted methodology. In section 4 we outline implications of the approach using a case-oriented example. This is followed by descriptions of the competences and skill profile to the best design of purchasing portfolio. We conclude the paper in section 6 with a summary of the findings and an outlook for further research. Finally, we draw conclusions with implications for practitioners and with limitations.

2. Literature review and hypotheses

Strategic management theories methods – including the resource-based view of the firm, transaction cost economics and learning organization – are applicable and beneficial to managing global complexity requirements.

Outsourcing decision frameworks are most often approached with theoretical starting points taken from transaction cost economics or the resource-based-view, either singularly or combined. While TCE considers economic rationales for companies to organize some transactions in either in-house or external governance (Williamson, 1985), the RBV argues that firms' specific assets are heterogeneous, meaning they become competitive by focusing on resources that are rare, highly valuable for customers, and imperfectly imitable (Barney, 1991; Peteraf, 1993; Grant, 1996). Transaction cost theory relies on two fundamental human behavioural assumptions. The first is bounded rationality, where contracts that are incomplete at best are established; and the second is opportunism, where humans are self-interested seekers with guile, which is seldom transparent *ex ante* (Williamson, 1985). Organizational research suggests that firms in dynamic environments with higher levels of information processing, communication and knowledge transfer are more likely to develop competencies which will result in successful technology innovation than firms in these environments with lower levels of co-operative resources.

Proactiveness is an opportunity-seeking, forward-looking managerial perspective (Teece, 2007).

Thanks to an increasing focus on strategy in outsourcing decisions, the RBV achieved a more prominent position (McIvor, 2010). Over the next decade, various authors developed different RBV-influenced frameworks to formulate outsourcing strategies (Insigna and Werle, 2000). The use of single focus on outsourcing 'innovative core components' has been criticized from several angles. One problem concerns distinguishing between the company's present and future core competencies; another concerns the risk that companies may outsource the more problematic activities.

Outsourcing has continued to be a key theme in the purchasing and supply chain literature (Braziotis et al., 2013; Westphal and Sohal, 2013). For example, Gottfredson et al. (2005), Aron and Singh (2005) and Ata and Toker (2012) provided outsourcing frameworks with strong RBV influences. While Aron and Singh (2005) emphasised risk evaluation (operational vs. structural) as an important step in the outsourcing strategy analysis, Gottfredson et al. (2005) argued for a focus on capability benchmarking. Baines et al. (2005) argued that many of the earlier outsourcing frameworks focused too much on one individual boundary decision and missed the holistic view of the supply chain network.

Tate and Ellram (2009) drew on TCE to develop a supplier selection framework for purchasing offshore services. One of their key proposals was that there is a high risk of opportunism and supplier failure if the outsourcing firm's training and investments are inadequate. At the same time, such investments are sunk and increase the risk of supplier dependency and switching cost. Emery and Marques (2011) recently used a lens of transactions costs economics to determine whether a firm will hold raw materials inventories or its supplier will hold the identical intermediate goods as finished goods inventories. Others researchers suggested that considering cost motives alone (TCE) limits outsourcing analysis. Instead, they suggested a theoretical outsourcing model which TCE arguments are complemented by RBV in terms of gaining access to specialized capabilities, which should help firms ensure value beyond efficient cost mechanisms.

Some diligent publishers in the outsourcing have developed interesting frameworks that combine RBV dimensions (contribution to competitive advantage and relative capability position) with the dimensions from TCE (suppliers' opportunism, trust, etc.) (Broedner *et al.*, 2009; Kumar *et al.*, 2010; Day *et al.*, 2013; Lambert and Schwieterman, 2012; Vanpoucke *et al.*, 2014).

In international managerial theory it is a shared opinion that the development of productive activities requires the use of external technological knowledge, which needs to be wisely integrated into the company, so that it becomes firm specific and can be efficiently used (Grant, 1996). The fact that they develop in many diversified areas and follow many diversified paths of expansion, compels, even the smaller firms, to use at the same time diversified and sophisticated organizational modalities (mechanisms of organizational coordination, quality of human resources, etc.). These competencies such as organizational learning and market knowledge use have been topics of sustained interest in business marketing as is evident in more international managerial literature. Applications of resource based view suggest that learning orientation and the knowledge to identify all activities for outsourcing (core and no-core) operate as strategic resource within supply-chain organizations. Hence, we posit the following hypothesis.

Hypothesis 1. Learning orientation is a dimension of strategic sourcing centrality.

In collaborative supply chains, the supply chain processes such as design, planning and production are executed in coordination of supply chain partners.

The key assumption in this 'value view' of the supply chain is that firms can enhance their competitive position by considering the value streams they are operating in, as well as other parallel ones that use the same supply as a grid in which they operate.

Conceptually we see the 'value chain' as an equivalent to product and process architectures, where such 'purposeful design' has been proposed before (Holweg and Helo, 2014). While both product and process architectures have been widely discussed, the complexity inherent in value chains have so far meant that the structure of a value chain determines its dynamic behavior (Marsillac and Roth, 2014).

It is generally agreed that the investment in information technology and collaborative activities are dependent on the anticipated benefits of supply chain, such as cost reduction or sales improvements. Based on the above literature, it is possible to say that collaborative new product development activities within supply chain collaboration will help to improve the supply chain processes. Decision synchronization is widely recognized as one of the important elements of supply chain collaborations. Supply chain decision making involves different players at various supply chain processes, in each of these processes, coordination and support from supply chain players help to create value in the supply chain. Accordingly, we posit the next two research hypotheses.

Hypothesis 2. Collaborative execution of supply chain activities has a significant impact on the success of collaboration.

Researchers have long argued that strategic priorities at the functional level should be aligned with business level strategies. This vertical fit has been associated with superior firm performance and may become a source of competitive advantage (Porter, 1996). The importance of strategic alignment represents a common ground in the field of strategy. However, research on the vertical alignment between supply management and the overall business strategy is more recent: fit between business strategy, and between purchasing strategy and purchasing practices, is key to achieving superior competitive advantage (Narasimhan and Das, 2001; Baier *et al.*, 2008; Vachon *et al.*, 2009; Rebolledo and Jobin, 2013).

Because purchasing and manufacturing form the core of the supply chain, the consistency between both functional strategies is crucial to support the corporate-level competitive strategy.

Despite the recognized importance of the horizontal fit between purchasing and manufacturing, empirical research in this area is scarce. Because purchasing and manufacturing form the core of the supply chain, the consistency between both functional strategies is crucial to support the corporate-level competitive strategy. Our third hypothesis is therefore:

Hypothesis 3. In this paper, we hypothesize that different manufacturing strategies affect into different supply management practices.

3. Research method

a) Theoretical framework

The expected outcome of the complexity analysis is the top-down analysis of characterized purchasing market drivers and their impact, and a more in depth investigation into connection between complexity exposure and operations performance measures.

The management literature implicitly already classifies ‘value chain architectures’ by discussing specific aspects in isolation, such as order fulfillment and product customization strategies, sourcing configurations and supplier relations, global sourcing and outsourcing. Furthermore, as outlined above, the need to align product, process and value chain layout has been proposed. Thus the question arises as to whether a more comprehensive classification would contribute to either the academic debate or managerial practices. In this paper we thus define ‘value chain architecture’ as a design of the inter-firm relationship consisting suppliers, manufacturers, and users, in order to maximum the value creation for the focal firm. See figure 1 about our theoretical framework.

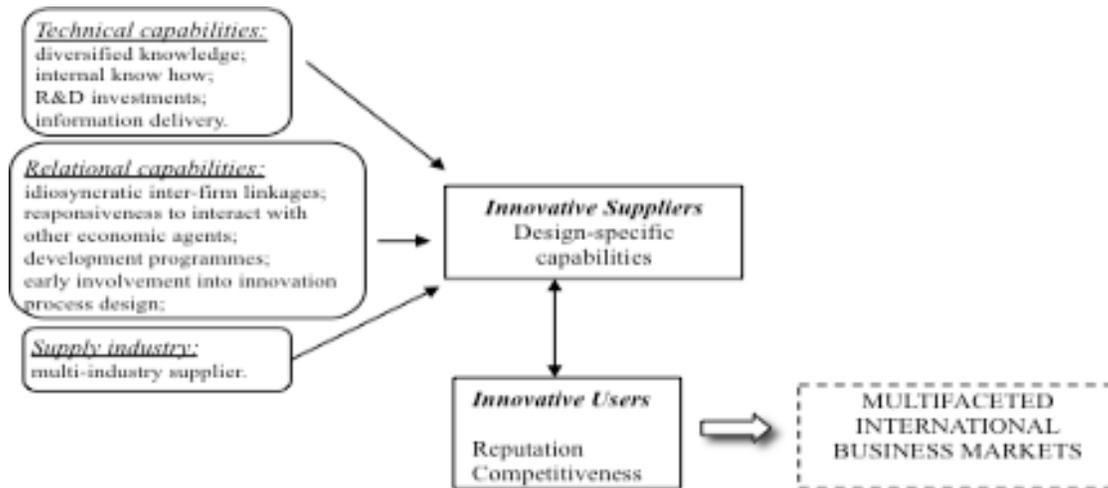

FIGURE 1 - A CONCEPTUAL MODEL OF ATTRACTION IN BUYER-SUPPLIER RELATIONSHIP

b) Information selection and data collection

An interpretative, qualitative approach - utilizing selected multi-case study interviews (Yin, 2003) such as the primary data collection method - is chosen because it helps to navigate and understand the complex issues that are associated with the data quality concept, and its relation to the factors involving managerial practices to implement facilities in modern relationships within the international supply chain. ‘Oriented case studies’ investigate the issue within a real life context, drawing on the reviews of a number of sources, and provides the means to review theory and practice iteratively (Ellram, 1996; Flynn *et al.*, 2010; Hennenberg *et al.*, 2010). Multiple cases ensure that common patterns are identified rather than generalized from what might be change occurrences (Eisenhardt, 1989; Janesick, 2000).

This study, surrounding the relationship-building approach, adopts a multi-phase methodology. It is divided into research stages of pilot investigation and empirical model validation, conducted in sequential order during the period 2005-2013. Such an arrangement helps to integrate and reconfigure a variant view in relevant studies, proposing a framework to be verified in the samples representing different fields of the firm. The pilot investigation phase, comprising an initial exploration and small-scale survey, entails the conceptual framework of relationship-building. The empirical model validation phase, using data obtained from more wide surveys, completes the empirical verification of relationship-building for supply chain collaboration management.

The first part of the analysis in this study aims at finding more appropriate determinants of complexity of the supply-markets and of the supply processes. In this sense a first research framework is developed in which the link between strategic dimensions, process dimensions and organizational dimensions of purchasing activity. Second the research framework analyse the relationship between purchasing performance and operations performance (delivery, quality, time, efficiency).

c) Interview protocol

This study leverages a data set of 10 medium-sized multinationals belonging in many mechanics sub-sectors and that are localized in mid-Italy.

Data were collected through 45 semi-structured, 45 – to 90 – min. interviews with leaders and participants from all the functional area involved in supply activities improvement process, as well as with heads of other divisions affected by the process.

Given the nature of the research, interviewees were not required to stay within the standard questions: an interviewee who seemed to be exploring a fruitful avenue was permitted to continue in that direction. This semi-structured protocol changed over time as each subsequent interview was used to triangulate the responses from previous interviews and expanded the list of questions as we uncovered more elements of the planning process. This continuous expansion and improvement of the protocol after each interview is a normal part of the process of grounded theory development.

To assess these orientations, we explicitly asked interviewees about their incentives, goals, internal work in processes, and relationships to other actors and functional areas (Makkone and Olkkonen, 2013; Brandenburg *et al.*, 2014).

Finally, part of the protocol also included direct observation of the main planning meetings and extensive debriefing time afterwards. This allowed us to observe the behaviour of the different actors in the planning process and to obtain explanations for observed behaviour during the meetings.

All interviews were recorded. We triangulated (Jick, 1979; Stuart *et al.*, 2002; Voss *et al.*, 2002) each interviewee's responses with answers from other actors and documentation of the process and its outcomes provided by the organization, and used follow-up interviews to clarify differences.

4. Purchasing portfolio

a) Learning orientation as dimension of strategic sourcing centrality

Managers selecting a purchasing strategy should first understand the sources of uncertainty and find the way of reducing the level that suits them best. Intuitively, firms with expansive inputs facing highly innovative and uncertain industrial-demand and with many potentially substitute output goods are inclined to build business-relationships with selected suppliers. In this sense, an important role is played by 'purchasing practices' that represent the content of the purchasing strategy and reflect a particular way of performing purchasing activities (Eroglu and Hofer, 2011; Holveg and Helo, 2014).

Learning orientation represents the degree to which the corporate buyer and internal strategic sourcing activities stress the value of learning for long-term benefit, both of the supply chain organization and of the specific supply management unit. Learning orientation is defined, in this study, by the sourcing management's degree of focus on exploiting opportunities for new ideas and process and on pursuing knowledge for long-term benefits of supply management. Applications of resource based view suggest that learning orientation and the knowledge to identify non-core activities for outsourcing operate as a strategic resource within supply-chain organizations. Additionally, managerial and marketing studies indicate that learning orientation fosters strategic sourcing activities. Thus, learning orientation serves as a valuable and unique (i.e. inimitable) resource. When companies invest in performance-based relationships that are asset-specific (such as learning orientation), they reduce opportunistic risk while fostering strategic sourcing.

The results indicate that successfully moving to strategic sourcing centrality will require first cultivating a learning-oriented environment that addresses continual sharing of information. As a consequence, the corporate

culture must become one in which those who continually enhance their knowledge advance within a firm. Second, purchasers must move from a practice of merely reacting to user and supplier needs to a mode characterized by advanced planning, market analysis, and aimed at developing proactive strategies that anticipate market movements. Third, and perhaps most importantly, supply managers must focus on building relationships and driving improvement through these relationships. They must shift toward interacting with the key suppliers to build relationships that extend to the highest levels of the organization and that allow for the free exchange of data across both organizations.

b) Competence and skill profiling

More generally, consistent with stakeholder theory (Parmar et al., 2010), our findings reinforce the need to take account of external as well as internal stakeholders when considering the drivers of buyer-supplier relationship's structure. In fact, in seeking to understand the drivers of buyer-supplier outcomes, the major of empirical research has concentrated on the role played by internal firm factors such as strategic relatedness, organisational fit and culture compatibility. This has generated considerable insights into how buyer-supplier relationship impacts 'internal supply actors', but in comparison relatively less academic attention has been paid as to how external players, such as competitors belonging at diversified but linked (or inter-connected) supply chain, are affected by, and respond to, buyer-supplier relationship activity.

With the increased importance of procurement as a function, suppliers and their dedicated management have increasingly been seen as a source of value (Schneider and Wallemberg, 2013). The most fundamental distinction here is the relationship type or strategy, which should be seen on a continuum between transactional or competitive on the one extreme and relational or cooperative on the other.

The industrial marketing literature has long recognized the importance of a firm's relationship with suppliers and users as a key driver of firm performance in business-to-business (B2B) markets (Cannon and Perreault, 1999). The buyer-supplier relationship has been shown to be one of the primary determinants of the composition of purchasing portfolio, of the market share and profitability.

'Supply chain relationship formation' is the process to select proper suppliers and the way to reach an agreement between suppliers and users (Petersen *et al.*, 2003). Our research focuses on the exchange relationship between the provider and the user, focusing performance-based relationships as a typical application field for relatively new service dominant logic. This service logic argues for a marketing perspective of user value focus, interaction and relational orientation by no longer distinguishing goods and services. Very often providing an integrated solution will extend beyond the capabilities of an individual provider company. To actually relieve the buyer of the operational responsibility, it is recommended that a system integrator (or solution provider) coordinates the necessary suppliers and bundles their inputs (Ng and Nudurupati, 2010; Kleemann and Essig, 2013). More recently, competency profiling is also commonly carried out during the purchasing portfolio design. More research concentrates on observing the changes in key sets of purchasing skills, developing taxonomies of purchasing skills and focusing on identifying and categorizing skills; very little research addresses skills development (Feisel *et al.*, 2011; Eltantawy and Giunipero, 2013; Knight *et al.*, 2014).

The age of globalization is characterized by shared standards and practices across the globe and at the same time enormous complexities and uncertainties. Building supply chain system capabilities in the age of global complexity, firms confront both global and local pressures as their value chains are extended from one end to the other end of the world and managing supply chain complexity requires firms and researchers to examine more than existing theoretical framework (Grogaard, 2012).

Supply chain risk management entails identifying the potential sources of risk and implementing appropriate actions to avoid or contain vulnerability (Srinivasan et al., 2011; Makkone and Olkkonen, 2013; Brandenburg et al., 2014). Hence, in assessing supply-chain vulnerabilities companies need to identify the risks not only to their own operations but also to all other entities, as well as those caused by linkages between organisations. Jüttner et al. (2003) define supply chain vulnerability as the propensity of risk sources and risk drivers to outweigh risk mitigating strategies, thus causing adverse consequences and favouring the supply chain's ability to effectively serve all tier of users and end-customer.

Supply chain management entails proactive relationship formation and integration among various tiers in the chain (Trkman et al., 2007; Vilko and Hallikas, 2012).

d) Purchasing strategy in ISMN

Purchasing strategy and its potential contribution to the firm's objectives has attracted considerable attention. Most of the research in the area has focused on the strategic nature of purchasing and the importance of linking purchasing to corporate strategy. Research on the vertical alignment between supply management and the overall business strategy finds that arm's length interactions, traditionally associated with cost-reduction strategies, were superseded by cooperative interactions in diversified and strongly interrelated international supply chains.

We find that collaborative decision making has a positive significant impact on long-term future collaboration. Overall, results do not show a strong link between manufacturing and purchasing strategies. Manufacturing plants in our sample do not align their manufacturing strategy with dissimilar purchasing practices.

Supply chain formation has become a crucial problem in supply chain, because each participant, i.e. users as well as suppliers, needs to determine its partners as soon as possible in order to maximize its profits. Then, the goal of supply chain management is to plan production to meet requirements of users in order to minimize inventory in the supply chain.

To allow providers to identify the efficiency potentials and to amortize the respective investments to leverage them, a long-term perspective is usually necessary for performance-based relationship. It may therefore be assumed that performance-based relationship is applied to complex product-service systems with a long life-cycle, which require considerable efforts to maintain the systems. This research field, commonly developed from an industrial marketing perspective, emphasizes the opportunity for providers and for users to share the new product processes risks and to increase their profitability¹ (Knight et al., 2014). In this sense the matrix below (see figure two) is the guide structure to develop a segmentation of the firm's supplier base according to the categories' list. The purpose is to find the best way to manage the purchasing relationship.

The stream of literature, based on TCE, argues that firms attempt to maximize their flexibility in uncertain environments by reducing their reliance on inter-firm relationships. TCA-based reasoning suggests that under uncertain circumstances, ex post performance evaluation of the exchange partner is difficult when transactions deviate from expectations. Ex ante, in an environment fraught with uncertainty the parties to the exchange find it difficult to develop long lasting and trusting relationships as such relationships involve mutual commitment and drafting, negotiating and monitoring complex contracts. Social relationships are formed and maintained because the partner firms offer reciprocal benefits to one another over time (Eisenhardt and Schoonhoven, 1996). In this context, supply chain planning is a cross-functional effort within a firm: this multifaceted activities identify social elements that influence the performance of the planning process within the firm and place the information processing attributes within a broader social and organizational context. Then, the successive step is to identify a process (or metrics) as a mediator that can affect organizational outcomes.

5. Concluding observations

In an age of strongly increasing focus on core competencies, the inputs of external suppliers and providers play a major role in a firm's success. The user no longer specifies the individual components of a solution but rather the desired outcome (as the value expected from the solution) whereas the supplier's compensation is tied to successfully achieving this outcome.

The factors considered as potential influencers in the collaboration process competencies of medium enterprises can be divided into the following ways: idiosyncratic inter-firm linkages, meeting frequently, international purchasing activities, negotiating functional transfer, joint operational planning, and early involvement in the innovation or engineering processes design. The importance of product design as a main determinant of process design has been emphasized in operations management literature for decades, but the direct and indirect impacts of product design on process and supply chain activities is a research area that has received less attention to date.

¹ The uncertainties cover aspects such as cost development, a need for a fundamental mind shift both for the provider and the user, and the aspects of performance-based service delivery, where providers are dependent on both users and sub-suppliers for a considerable share of the value creation.

This paper examining the influence among product design, process and supply activities, determine how these influences develop and evolve, and in particular, explores how these changes influence global supply chain behavior and capabilities.

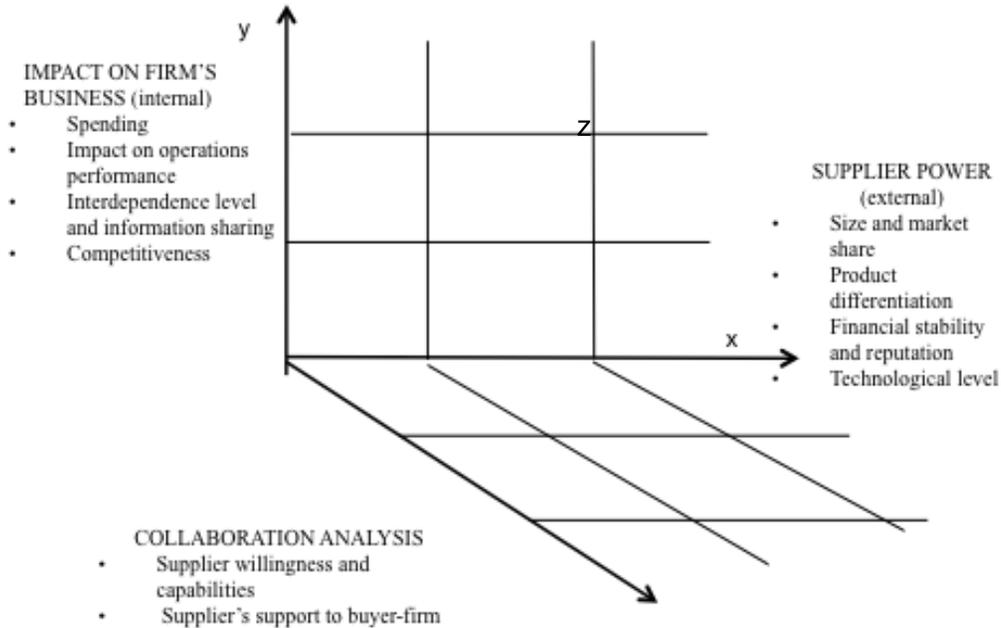

FIGURE 2 – SUPPLY SEGMENTATION WITHIN PURCHASING RELATIONSHIP

The factors considered as potential influencers in the collaboration process competencies of medium enterprises can be divided into the following ways: idiosyncratic inter-firm linkages, meeting frequently, international purchasing activities, negotiating functional transfer, joint operational planning, and early involvement in the innovation or engineering processes design. The importance of product design as a main determinant of process design has been emphasized in operations management literature for decades, but the direct and indirect impacts of product design on process and supply chain activities is a research area that has received less attention to date.

This paper examining the influence among product design, process and supply activities, determine how these influences develop and evolve, and in particular, explores how these changes influence global supply chain behavior and capabilities.

The research has also found that to proactively build a supplier market is multifaceted process.

Supplying ‘innovative core components’ can be criticized: on the one hand, the buyer firm can found more difficulties to distinguish between the company’s present and future core competencies; on the other hand, from this supply activity arises the risk that companies my outsource the more problematic activities.

Purchasing portfolio management is positively related to operations performance and to product innovation performance too. Overall, our results do not show a strong link between manufacturing and purchasing strategies. A possible explanation could be that the purchasing practices reported in this study are best practices that can support any type of manufacturing strategy. Manufacturing plants in our sample do not align their manufacturing strategy with dissimilar purchasing practices. Collaboration, focus on supplier quality, delivery, price, and supplier potential; and the adoption of coordination mechanisms with suppliers have been associated with superior manufacturing performance. This study suggests that this finding is true for firms that have different manufacturing priorities.

As business face the increasing levels of complexity challenges that arise from regulatory requirements, global market opportunities, multi-faceted products and services, rapid technology changes, and global competitive pressures it is critical for firms to develop global supply chain strategy and global supply chain design. Firms aim to

achieve dynamic supply chain configurations in their 'intra and inter-firm resources' in the form of flexible use of physical and knowledge resources. The scope of such integration poses grave risk potential in global supply chain environments with the disruptive elements from both internal and external environments.

We found that specific capabilities in supply collaboration process positively influence the operational and relational outcomes of such supply collaborative initiative. In effect, these competencies such as organizational learning and market knowledge use have been topics of sustained interest in business marketing.

The central research problem of this study was the conceptualization and operationalization of the strategic sourcing centrality underpinned by the resource based view. This study attempt at conceptualizing the dimensions of strategic sourcing centrality. In order for this construct to become more widely adopted and provide a strong foundation for strategic sourcing and supply chain management theory to be built upon it, the construct needed to be well defined and complete in its coverage. This process allows for the exploration and a better understanding of the relationships among strategic sourcing centrality dimensions and other supply chain organizational parameters.

6. Implications for practitioners

We believe that this study provides valuable information for practitioners and researchers alike. It illustrates the value of a holistic view to managers in purchasing strategies attempting to assess the risk and the complexity facing them. In particular, for practitioners, this article suggests that it is important to emphasize that the learning curve for a supplier can be lengthy, and also that the alternative outsourcing routes are available when outsourcing to an innovative supplier market niche. Most importantly, managers considering outsourcing to an innovative upplier market niches should not underestimate the length of the supplier learning curve. We observe also that the development of a suppliers' relationship structure takes time and requires considerable resources. Therefore, firms must thoroughly consider outsourcing component vulnerability, as well as evaluating the supplier market (for example the number of suppliers and their development).

The risk of high dependency and the uncertainty of suppliers' capability and outsourcing experience will complicate such decision.

From a supply manager's perspective, this research provides a greater understanding of the specific dimensions of strategic sourcing centrality. Thus, supply managers may use the proposed framework as a basis for supply management and supplier differentiation strategies. Suppliers, on the other hand, must understand the corresponding key evaluation criteria necessary to achieve preferred suppliers status.

7. Limitations

Our study has been exploratory in nature and a number of limitations should be noted. First and foremost, this study has focused on a limited number of cases-study. The complex nature of our cases-study has provided rich insights, but further work is now required to establish the generalizability of our findings both within many B2B mechanics sub-sectors and more widely within other firms belonging at the same sub-sectors but localized in other geographic contexts. The study also has limitations in terms of generalizability, given the subjective nature of the data: it would also be useful to analyse the financial and qualitative aspects of risk and its effects in the supply-chain context.

Second, the participating manufacturing plants belong to the same industry and are all located in developed countries. On the national or regional level it enhances understanding of such complexity drivers, their likelihood and consequences, which gives a good basis on which to prepare for and respond to them in order to ensure the security of supply.

Finally, our methodology required interviewees to retrospectively recall buyer-supplier integration that occurred up to five years previously. This recall period, while long, is generally not considered excessive (Miller et al., 1997).

Future research seeking to develop more fully specified models should embrace a stakeholder approach, including specific consideration of outcome of purchase's strategy regarding direct competitors.

The customer Relationship Management (CRM) and its impact on competitiveness in the Restaurant industry of Guadalajara, Mexico

Abstract

This research explain the relationship between CRM and competitiveness, analyzing four aspects: customer orientation, considered the key factor to survive in this competitive market (Narver and Slater, 1990; Torgler, 2009; Bentum and Stone, 2005); TIC's, essential element for an effective CRM initiative (Razvan, 2010; Gordon 2002; Sin, Tse and Yim, 2005), administrative capability that includes HR as a key element for organization and CRM success (Payne and Frow, 2006; Mendoza, Marius, Pérez and Grimán, 2007; Xu and Walton, 2005) and knowledge about competitors and global market, (Deshpandé, Farley and Webster,1993); Finnegan and Currie (2010) and Javalgi, Martin and Young (2006) said, knowing your competence you can satisfy your clients offering specialized products and services. The independent variable CRM, and dependent variable the competitiveness, using the likert scale applied to 420 CEO's, the results were analyzed with confirmatory factor analysis (CFA), and the structural equation model (SEM's).

Introduction

Nowadays, competition in any economic sphere is day to day more aggressive due to the fast development of technology, making more difficult for companies to remain in close competitiveness. Companies are interested in doing different things; provide better products or services to differentiate from market rivals in order to attract more customers to survive and in the best case: grow their income.

Globalization and the development of Internet has led to a situation where the information is reach of a finger and consumers are better informed. This contributes to make changes in customer's behavior and increase expectations (Goldenberg, 2004; Mahmoud and Bagchi, 2004). What has turned into a war to stay in business, concerned with generating innovative strategies to attract new customers, focused in penetrating major markets, forcing others to renew or perish in the attempt. These owners should aim for a total transformation of their business philosophy, building on a sustainable competitive advantage that is widely recognized by the customer and prefer over competitors, especially talking about the Mexican Restaurant Industry where it can be seen that conditions have changed over the last decade, because just three new restaurants survive by ten opened as statements given by the president of the Cámara Nacional de la Industria Restaurantera y Alimentos Condimentados (CANIRAC) Manolo Gutiérrez .

Figures do not lie, based on data provided by the same CANIRAC, seven of every 10 open restaurants in Mexico close its doors in less than forty-eight months, alarming information for the industry in general (Regalado, 2013).

These statements become determinants and therefore, this research aims to explain the current situation in the Restaurant Industry of Guadalajara, Jalisco, México and to determine how many establishments have implemented a strategy or specific CRM software.

The problem is that Restaurant Entrepreneurs should be aware that there are many companies offering the same products and services, that there is little differentiation in the industry and is necessary to generate strategies to foster long lasting relationships with clients to persist in market (Chen and Chen, 2004; Jayachandran et al, 2005; Kim and Kim, 2008 and Ryals, 2005) .

As clearly pointed out on its publications, CANIRAC 2012 figures that 250 local food and drink open at the beginning of the year but another 200 down the curtain at the end. This clearly speaks of alarming numbers of micro, small and medium enterprises (MSME) that start in the process of opening their businesses but few are those who have the basic skills needed to stay more than two years on the market (Romo, 2012).

In fact, this paper's main objective is to know and deepen on CRM concept as well as examine the factors that affect successful implementation, first, the customer orientation, in second place, the information and communication technology (ICT), the administrative capacity of the economic entity and finally the knowledge of the

market in which they operate. Added to this will examine how they interact with each other and how these variables affect CRM.

Objectives

Analyze the relationship between the variables that affect the CRM in the restaurant industry of Guadalajara:

- Analyze the relationship between the variable information and communication technology (ICT) with the CRM
- Determine the relationship between CRM and client orientation variable
- Demonstrate the relationship between the variable administrative capacity and CRM
- Show the relationship between the variable knowledge of the competition and global market and CRM

And answer the following research questions:

- How do the information and communication technology (ICT), client orientation, administrative capacity and knowledge of the competition and global market variables relate to CRM?
- How does the variable information technology and communication relate to the CRM?
- How does the client orientation variable impact CRM?
- How does the variable administrative capacity linked with CRM?
- How does the variable knowledge of the competition and global market affect CRM?

Mexican Restaurant Industry

Mexican cuisine is one of the many cultural treasures held by the country, due to the variety and essence, was declared by UNESCO as intangible cultural heritage; hence the importance of the hospitality industry in the country, as expressed by former Secretary of Economy, Bruno Ferrari (Ministry of Economy, 2012). Also considered an important source of investment, the catering industry is the most important element of the tourism sector, so it is an industry with huge potential not only economic but social and cultural (CANIRAC, 2008). It is the second largest employer nationally, surpassing in employment to all persons employed in the sectors of fishing, mining, electricity, water, gas distribution pipeline to the final consumer and construction (in its entirety). With activities predominantly in seven Mexican states, in order of importance: Distrito Federal, Estado de México, Jalisco, Veracruz, Puebla, Michoacán y Guanajuato (INEGI, 2012).

The Tables 1 & 2 show the national figures pertaining to 2012 to collect the above information.

TABLE 1: NATIONAL RESTAURANT INDUSTRY IN FIGURES

CONCEPT	FIGURE
Number of restaurants nationwide	428,000
Concentration of establishments in seven states of the country: (Distrito Federal, Estado de México, Jalisco, Veracruz, Puebla, Michoacán y Guanajuato)	50%
Staff employed by gender:	
Men	55.3%
Women (80% heads of households)	44.7%

TABLES 2: GROWTH OF FOOD AND BEVERAGE INDUSTRY NATIONAL LEVEL (2012)

CONCEPT	FIGURE
Gross Domestic Product (GDP)	3.58%
Job growth	3.67%
Impact of the sector in economic branches	84
Generating of direct jobs	1,300,000
Generating indirect jobs	3,250,000

Source: own elaboration, based on the directorio estadístico nacional de unidades económicas (denue)

Jalisco is the third state nationwide in which the restaurant industry is overriding and generating thousands of jobs because of this economic activity (CANIRAC Jalisco, 2012). But things have not always been positive, the restaurant industry has been hit countless times by various difficulties, but after years of crisis, it seems that the numbers have started to improve.

The market for foods and beverages prepared in Mexico is very diverse, is wide and too competitive; hence, the urgent need to make the difference between a restaurant and other so, diners go to it and become loyal customers.

It is noteworthy that the scope of technology, internet, media, cause that consumers have sources of information that allow them to evaluate, compare and choose from many restaurant options to go; a lot of restaurants manage a range of strategies to remain in the minds of their customers; it means that a slight change in the service provided by the company, a friendly, helpful and attentive staff, can make extraordinary the customer experience and achieve the desired end, survive on their mind and thereby start generating long, lasting and mutually beneficial relations (loyalty). Therefore, customer relationship management (CRM) plays a key role in this economic sector of food and beverages.

Customer Relationship Management

The customer relationship management, better known as CRM, according to specialists, dates back to the early twentieth century. Consistent with the above, Dowling (2002) suggested that CRM has its origin in two separate places: first in the United States, where the term was mainly driven by technological changes of companies (software and data) in order to generate solutions cutting-edge and innovative based on customer needs to attract, satisfy and keep them in the long run.

The second school was born in the Scandinavian and northern Europe with the exponents Gronroos (1994, 1996 and 2000) and Gummesson (2002) as a way to support large enterprises to foster the relationship with industrial marketing and sales department; in order to build trusting relationships with customers in the future.

Another approach was given in the Anglo - Australian school, in the United Kingdom with Payne and Ballantyne (1991) about their six markets theory.

In addition, it was coin to Berry in 1953 the term “relationship marketing” because from the second half of the twentieth century, that was mentioned by first time (but not deeply), the concept was in its beginning (Urbanskiéné, Zostautiené and Chreptaviciene, 2008).

It was not until the nineties, when other scientists Payne, Frow, Ballantyne, Morgan, Hunt, Gronroos, began to conduct extensive research on the subject, referencing this particular term, ascribing a more detailed description. Soon, authors all over the world started talking about it, generating multiple concepts and theories. It is noteworthy that was Gummesson (1999) who formulated a model for the implementation of CRM (Urbanskiéné et al, 2008).

One of the assumptions on which CRM is based it's on the constant and massive changes happening in the market at that time; limitations on the marketing knowledge that existed (Urbanskiené et al, 2008); there was not a culture of maintaining lasting customer relationships, loyalty was an unknown subject, satisfaction was not taken into account by providers of products and services; the market demanded new forms of competitiveness, customer reward, a deep interaction between sellers and buyers, the unification of efforts of the supply chain and all actors involved in the sales process; hence the idea of the CRM born with an extraordinary impulse to bet on tomorrow's markets.

The long-term relationships with customers became the central focus of marketing, (Urbanskiené et al, 2008) and also in one of the major concerns of entrepreneurs, because the CRM borned as a customer orientation to detect needs, generate appropriate treatment and especially the art of preserve them (falls under the concept that attracting a new customer is more expensive than keeping one), so it can be said that CRM is all related to the total satisfaction and fulfilling the needs and desires of a particular client.

In summary, previously there was no such culture of retention, as the business model that existed twenty years ago was run by monopolies or large companies that monopolized the market with generic and undifferentiated products where buyers consumed what they produced regardless if adapted to their needs, today this has changed dramatically, consumers are very demanding and require customized products and services, now almost everything is designed according to the wishes of each. Therefore, fidelity is becoming a major challenge for service and products providers, because if the customer is not happy with the market offer at any time they will change to the competition to attend that need. That is why CRM is acquiring a distinctive importance in this era of diversity and productive innovation. The company that cannot adapt to the new system falls in the risk of failure and disappear from the market. With so many offers available, for every product, there are five, ten or more substitutes and many similar options that generate the same satisfaction as it. In simple words, now the customer is the one with the power in decision making.

Based on these definitions, CRM consists on business strategies to have a thorough understanding of customers, from their needs, desires and expectations of the service; thus may increase satisfaction, creating long term relations that lead down the path of loyalty, which will result in corporate profitability ratios; agreeing with Drucker (1998) considered one of the great exponents of research on the topic, arguing that the objective is to provide a unified enterprise-wide view of customer and cultivating relationships that enhance quality loyalty and profits. Basically the idea is not to let escape an interaction with a client on the central database of the company. Attention is focused on learning more about them and use that knowledge to refine every interaction you have in the future, it offers companies the opportunity to increase revenue, be more profitable and generate sustained competitive advantage to capture, deliver, maintain and monitor the long-term relationships with consumers. This can be the door that leads to success and is key in business today.

The Table 3 collects the contributions of various authors on CRM.

TABLE 3: CRM CONCEPTS BY AUTHOR

AUTHOR	DEFINITION	YEAR
Wayland & Cole	Essential tool to produce revenue growth	1997
Kalakota & Robinson	Systems that integrate sales, marketing and specially after-sales service	1999
Parra & Molinillo	Discipline that consist on establish, develop and commercialize long-term relationships	2001
Parvitayar y&Sheth	Process of acquiring, retaining and partnering with selective customers to create greater mutual value	2001
Swift	Understand and influence customer behavior through the recruitment, retention, loyalty and profitability	2001
Bergeron	Dynamic process that manages the customer - company relationship generating a mutually beneficial exchange	2002

Kim, Suh & Hwang	Efforts of a company to manage customer interactions over the long term	2003
Kincaid	Strategic use of information, processes, technology and people to more effectively manage customer relationship	2003
Bligh & Turk	Business strategy focused primarily on the client in order to maximize their satisfaction	2004
Gartner	Business strategy designed to optimize profitability, revenue and customer satisfaction	2004
IBMs Global CRM study	Important tool to produce growth on revenues through improved customer experience	2004
Salestrack	Internal business process seeks to build partnerships with its customers	2005
Christopher, Payne & Ballantyne	Orientation to generate appropriate relationship between business and customers to create higher revenues	2006
Reinares	Company initiative focused on achieve satisfaction of their customers on time	2009
Abdullateef, Mokhtay & Yusoff	Ability of the organization to integrate people, processes and technologies to maximize positive relationships with customers and prospects	2010
Faed, Shouri & Wu	Technique to maintain continued and lasting relationship with customers to obtain both value	2011

Source: own elaboration

After the literature review, for purposes of this research will address the CRM as the mutually beneficial relationship between customer and company, it supports the information technology and software to generate detailed reports on the activities of each customer, focuses on providing suitable to their wants and needs solutions; in collaboration with various departments within the organization such as sales, customer service, marketing, human resources so that they work together on retention, generate long-term relationships and foster repurchase behavior.

CRM, integrator elements and variables of impact

Managing the relationship with the customer has some specific elements to be successful (Gordon, 2002; Razvan, 2010) which include:

- People (all employees within the organization from the top job to low, not only those work in direct contact with the client);
- Processes (each of the procedures that are carried out within the organization to perform daily activities focused on customer satisfaction) and
- Technology (software or information systems of the company to internally manage their customer relationships).

It is also necessary to point out that CRM is affected by several variables that exert direct or indirect influence, on the first of these is the information and communication technology (ICT) used to collect data that can be analyzed to provide necessary information and thus create a more personal interaction with the client asserts King and Burgess (2007); Swift (2001) . Within organizations is paramount historical storage where their activities are recorded mainly focused on its customers, which include: data mining to identify their needs quickly and be able to solve their requests; it works to create a database updated (Krasnikov, Jayachandran, and Kumar, 2009).

The CRM is responsible for collecting information from all data sources within an organization to give a view of each customer in real time. This allows support and train employees involved in such areas as sales, customer and marketing to make quick decisions that always adapted to their needs; (Razvan, 2010). It is a process that works together to bring benefits to customers; thus represents one of the most useful ways to gather information about them, sales, measure the effectiveness of marketing activities, competition and market trends, without much effort and

dedication, besides it has the advantage of being inexpensive and readily accessible because it takes place within the organization. By using these technologies enable the company to build and maintain profitable customer relationships (Day, 2003).

The Table 4 mentions the authors that relate CRM with the variable information and communication technology (ICT).

TABLE 4: AUTHORS THAT RELATE CRM WITH ITC

AUTHORS	IMPORTANCE OF ICT
Buxmann & Gebauer (1999)	ICT is considered today a key success factor for service organizations
Kale (2004)	The lack of implementation of ICT in a company is the main factor in failure of the same
Sin, Tse & Yim (2005)	CRM technology has generated greater benefits to companies
Payne & Frow (2006)	CRM focuses on customer-technology strategy
Renart & Cabré (2008)	Each company must select the technology that best suits and thereby manage their CRM strategy
Razvan (2010) & Gordon (2001)	The information technologies are a key element for efficient CRM initiative

Source: own elaboration

Secondly and considered a high impact variable is the customer orientation (Sin, Tse and Yim, 2005), a company must focus all or most of their activities to meet the needs and desires of its source of revenues (clients) and maintain a philosophy approach directly on keeping them happy with the product or service they are receiving. This orientation helps to generate loyalty in the long run. Understanding loyalty in Oliver's words (1997, pp.57)...*"the deep commitment to repurchase or systematically favor in the future a product or service which has preference, despite the possibility that situational influences and marketing programs cause behavioral change"*.

The Table 5 show the authors that relate CRM with the variable customer orientation.

TABLE 5: AUTHORS THAT RELATE CRM WITH CUSTOMER ORIENTATION

AUTHORS	IMPORTANCE OF CUSTOMER ORIENTATION
Narver & Slater (1990)	Customer orientation is the most important factor to survive to the competition
Bentum & Stone (2005)	Customer orientation is an indispensable prerequisite for the CRM to be successful
Urbanskienė, Zostautienė & Chreptaviciene (2008)	All organizations must be customer-oriented and focused on meeting their needs
Torggler (2009)	Customer orientation is one of the key success factors of CRM

Kavitha & Palanivelu (2012)	Customer orientation helps build long-term relationships with customers of an organization
Khandekar & Deshmukh (2012)	Customer focus is one of the most important variables to survive in the market

Source: own elaboration

A third variable is considered the organizational capacity of the company, because it helps to understand the preferences and needs of its market, acquiring, collecting and assimilating external knowledge and later transformed into customized products and services for its customers (Branzei and Vertinsky, 2006; Joshi and Sharma, 2004; Marinova, 2004). Therefore it is stated that the administrative capacity of a company, is the set of strategies that cause a profound change in its structure, in its internal organization, which is primarily made up of human resources (Sin, Tse and Yim, 2005); in which the employee-customer relationship is an important factor to consider.

The Table 6 mentions the authors that relate CRM with the variable organizational capacity.

TABLE 6: AUTHORS THAT RELATE CRM WITH ORGANIZATIONAL CAPACITY

AUTHORS	IMPORTANCE OF ORGANIZATIONAL CAPACITY
Maselli (2001)	The failure of a CRM strategy is the lack of integration of the organization among its workers
Sin, Tse & Yim (2005)	Human resources are the key part of an organization to success in CRM
Xu & Walton (2005) & Noruzi (2007)	The employee is considered the "internal customer" and has huge importance as the face of the company to the customer
Payne & Frow (2006)	Employees = key success factor for the organization and CRM
Mendoza, Marius, Pérez & Grimán (2007)	People who work in the business are those that determine the success of the CRM strategy
Ranjar & Bhatnagar (2009)	The success factor of CRM in an organization depends on the openness and adaptability of workers

Source: own elaboration

Finally, the last variable that influences the CRM according to a research by Gordon (2002); Fjermestad and Romano (2002) is the knowledge and understanding of the market in which the company is involved. By understanding the way in which it operates globally, competitors, their marketing strategies, their development; this will help the organization to be better prepared for contingencies and thus be prevented for any unexpected change.

The Table 7 mentions the authors that relate CRM with the variable knowledge of the competition and global market.

TABLE 7: AUTHORS THAT RELATE CRM WITH KNOWLEDGE OF THE COMPETITION AND GLOBAL MARKET

AUTHORS	IMPORTANCE OF KNOWLEDGE OF THE COMPETITION AND GLOBAL MARKET
----------------	---

Day & Wensley (1988); Naver & Slater (19990); Day & Nedungadi (1994)	Understand the actions of competitors and know how to react to them
Deshpandé, Farley & Webster (1993)	Meet the competition to best satisfy customers
Javalgi, Martín & Young (2006)	Companies that know their competition are more successful than those that do not, because they are better adapted to market needs
Zheng- Zhou (2007); Luo, Rindfleisch & Tse (2007).	Meet the competition has advantages in marketing, costs and financial performance
Finnegan & Currie (2010)	A homogeneous CRM strategy must combine several factors, particularly focus on competition and knowledge of market trends

Source: own elaboration

Having described the variables that experts in the field say that are exercising the greatest impact on the CRM, the construct of this research based on them.

Research design

The construct developed for this research is explained with a single independent variable called CRM, which hang four dependent variables of equal importance to each other and above: ICT, customer orientation, administrative capacity and knowledge of the competition and global market, which are composed of dimensions trying to give explanation with which the items transferred to the research are the questions within the body of the questionnaire answer these intrinsic relationships between dependent and independent variables were generated.

The research used various methodological tools for their development; through descriptive research in the first phase for information gathering where construct was generated and subsequently elevated to correlational level, where examines the relationship between them and the results thereof (Salkind, 1998); mixed approach as determined by Hernández et al (2006) it collects, analyzes and links quantitative and qualitative data in a single study or series of investigations to address a problem statement; transversal as data are collected at one and only time; with reach in Guadalajara, focused on the 906 major restaurant MSME registered in the database of DENUE until 2012.

The Table 8 shows the technical details of the investigation.

TABLE 8: TECHNICAL DETAILS OF THE INVESTIGATION

CONCEPT	CHARACTERISTICS
Universe*	906 restaurants
Field of study	Local
Sampling unit	MSME (Micro, small and medium enterprises)
Method of data collection	Personal interview
Sample type	Simple random sampling

Sample size	420 restaurants
Margin of sampling error	+ - 4% and 97% level of confidence
Date of fieldwork	August to November 2013

Source: own elaboration

Regarding field research it was developed a questionnaire structured in seven blocks divided by areas, a total of 52 items, using three different question models, the dichotomy that allows the respondent to select whether or not, the multiple choice, where have a number of alternatives to choose from lists (Kinnear and Taylor, 2003) and the Likert scale from 1 to 5.

Respondents should be fully involved in the administration, management and / or address of the restaurant to have all relevant information to the CRM and its implementation, to respond based on their experience according to the post.

All results from the pilot and finals were tested through statistical analysis; multivariate, Cronbach's alpha, KMO, Bartlett sphericity using SPSS and EQS programs through Confirmatory Factorial Analysis (CFA) and the covariance structure model (CSM).

Results

The KMO obtained was .888, meaning that it can carry out the factor analysis in this model made construct; the Cronbach's alpha of .912 representing a very high reliability.

In addition all hypotheses were tested through the application of MEC which shows that both individual and set variables have a positive impact on CRM in the restaurant industry of Guadalajara as can be seen in Table 9.

TABLE 9: SEM RESULTS OF THE THEORETICAL MODEL

Hypothesis	Structural relationship	Standardized coefficient	Robust t- value	Measures of FIT
H1: A greater use of ICT more CRM	ICT ----- CRM	0.391***	9.885	S-BX2(70)=274.6792 p=0.000
H2: A greater client orientation more CRM	CO----- CRM	0.408***	15.755	
H3: A greater administrative capacity more CRM	AC----- CRM	0.471***	7.236	NFI=0.904 NNFI=0.814
H4: A greater knowledge of the competition and global market more CRM	KCGM----- CRM	0.460***	20.747	
H5: A greater use of ICT, client orientation, administrative capacity, knowledge of the competition and global market more CRM		0.374***	53.624	CFI=0.924 RMSA=0.084
**=p<0.001				

This means that ICT positively affect the implementation of CRM in 40.8%, customer orientation in 39.1%, administrative capacity by 47.1 %, knowledge of competition and global market by 46 % and the effect total joint variables regarding the CRM is 37.4 %.

Conclusions

All variables of the construct have positive effects on the implementation of CRM. Furthermore, in the restaurant industry of Jalisco is observed limited knowledge of what it means managing the relationship with the client, but that does not mean that some strategies of differentiation between competitors are not applied, because although the develop consciously know that the competition is tough; entrepreneurs operate with the notion of satisfying its customers to return in the future and some more with the philosophy of "customer first and always right", it is perceived that the performance of CRM is in levels of initiation, less than 35% of respondents said that they are implementing a strategy in their business.

There is much to do in this industry, checking what in statistics mentioned above, many of the restaurants surveyed are new to the business for less than 40% of them have more than 10 years in the rotation . Most companies are family so poor solid administrative structure is observed. Yet many employers were open to implement CRM strategies in the future relying on Chambers to which they are affiliated.

The role of Service Provider in place management

Abstract

This paper identifies the place, such as natural or artificial spaces able to play important roles in the development process of the quality of life of analyzed places, in a dynamic perspective of catalysts for economic interests, for sociological surveys, for interpretive marketing schemes, for environmental implications. Over time, the attention to the relationship between sustainable and potential development of territory and to the importance of the service providers have acquired increasing significance in marketing and place development studies.

The importance of the service provider is grounded in the assumption of two relevant logic categories -Basic and Relevant Service Provider- characterizing their role in the strategy of value creation and place development: in the reflections about place management, conducted with some international research units, the aim is to highlight the central role of service providers in the development of sustainable places also through the support of the analysis of cases.

Introduction

The document “*Europe 2020 Strategy. A strategy for smart and inclusive growth*” declares a dynamic view of the social market projected into the twenty-first century, with the simultaneous identification of three priorities:

1. smart growth, developing an economy based on knowledge and innovation;
2. promoting a more resource efficient, greener and more competitive economy, that doesn't necessarily have a public guide but a governance able to incentivize a real renewal of industrial districts or declining places – *for example the transformation of certain territories from industrial pure places to local systems of knowledge or high-integration of both*;
3. cooperative governance models; in this sense the importance of services becomes essential in the relationship between business development and places growth.

Two important logical categories of service providers - *basic service providers and relevant service providers*- impact on the importance of Services in the sustainable development of the places. Some literature's contributions indicate the categories of service providers needed to identify a distinctive mix that increase the opportunities for value creation in a Clear marketing strategy. The Relevant Service Provider identify some specific services that determine the arise of distinctive characteristics of places, a new ability to compete and raise the place value, a strong and enduring collaboration between stakeholders often in opposition over territorial policies, a systemic vision of the area; in this work retail is included in the macro-area of Services for final consumption. The Relevant Service Provider emerges as distinctive factors of the area and contribute significantly to its positioning; starting from the post-industrial approach (Bell, 1974), the intangible and knowledge economies, has allowed the overcoming of neo-industrial (Gershuny,1978) that identified the central role of tangible production in the place economies, through the generation of services.

1.1 The evolution of the role of services in place economies and management

Scientific reflections of marketing management not always improve the role of Services Industry in Place Management. Effectively, the position of Services Industry has often been opposed by trade off between consolidation of existing methods and new elements in the progression of the place systems.

Although the place management models and the company management models are different, it's necessary to tend toward the management of the places as Companies; indeed the strategic cooperation between stakeholders caused a repositioning that reenhanced a place area otherwise declining.

In the sixties, reference literature ascribed to Service Providers a limited capability to make money: it evidences an extreme customization capability of services to the detriment of the creation of relevant economies of

significant scale. It underlines the derangement attributed to the service's role in rapport to the industries that could cause a loss of expertise (Baumol, 1967).

Subsequently other authors have proposed a negative view with respect to the contribution of Service Providers to the development of the economy, arguing that the multiplication of service's activities affected the rising costs of industrial products; more attention to the services would generate higher costs for manufacturing industry (Goldfinger, 1996; Thurow, 1987; Rullani, 1988).

The contributions reported are part of a thought that pays for, on one hand, of the limits that result from an excessive conceptual opposition between materiality of production and immateriality of services, on the other hand serves the consequences of the difficulty to determinate methods of productivity of the different sections of services.

In parallel with the cited critical literature contribution, starting from the 80's some lines of thought are developed: they consider positively the contribution of services compared to their role in the economy and notably for the territory. Baumol (2002) wrote about the importance of service providers emphasizing its validity and positivity for economic and territorial development: in particular, the author identifies services as value added to the productive sector. That is because among other things, these are continually being enhanced by the development of new technologies; the paths towards the dematerialization encouraged an evolutionary cycle of new technologies that have contributed significantly to the economic and industrial improvement (Levitt, 1976; Rullani 1995; Gronroos, 1998).

Proceeding with the analyses of the changing role of the services and, more generally, of the tertiary sector it must be paid attention on a specific phase of the 80's: the companies provided free services in exchange of purchase of products. In the 90's some companies began to distribute free products in order to sell services over the long term like maintenance, management and training (Sahalman, 1999).

Since the late 90's the decisive role of knowledge-based economy, the de-materialization and globalization, have further enhanced the services sector and multiplied the value of new technologies (Rifkin, 2000). Particularly, the development of ICT technologies has fostered the exchange of opportunities; the abatement of distances, together with the increased affordability of most modern services. As for the bid, companies have benefited from the opportunity to enhance the interactions with the micro and macro-environment with all the negative and positive resulting features which in any case have favored a more appropriate technological evolution at all levels.

In this regard you can refer to the parallel that develops between the expansion of outsourcing in enterprises¹, the internet diffusion and the development of highly specialized service providers; specifically, Del Monte (2001) emphasizes that, thanks to the network, many businesses rely on external partners for the supply of goods and services different from its own core business.

Moreover, the changing role of the services comes to a sort of passing of the service itself. As several authors argue, the economy of mere service has left the field to the experiential economy. In its new context, the value for the customer – extremely picky – is created by the company offering experiences rather than goods and services: experiences represent proposals that differ profoundly from services at least as much as the services are different from goods (Pandav and Forlani, 2002). Starting from these service definitions, which, also using different approaches, converge toward notions of immateriality and multiformity of the phenomenon difficult to replicate identically, we come to an analysis of service providers in the development of territorial realities, which will obtain benefit if organized in the perspective of place marketing management.

1.2 The relevance of Service provider in place management

The service industry is complex in its forms as there are different interpretations for the identification of specific sectors; when referring to the exponential development of ICT we are talking about high-tech service industry (Momigliano and Siniscalco, 1970) to denote the homogeneous group of services provided by high-tech companies, mainly addressed to BtoB, which define new areas of development of services. In this work, it was decided to borrow certain categories of service providers, that help to determine the competitiveness of territories with particular reference to cities, from the classification of Gadrey and Martinelli (2000).

Specifically, services are classified into four macro-areas in order to highlight their value in relation to the development of the territory from the perspective of place marketing management. The synergistic contribution of

macro-service areas identified will determine the place positioning, the competitive potential, the international difficulties and, finally, the development of the territory. The immateriality of services is linked to the performance of service providers, depending on the quality of the economic environment, will lead to different performances and results.

Table 1 shows the macro-areas of service integrated with service providers of reference.

TABLE 1
Source: *Gadrey Martinelli (2000)*

<p><i>Social services</i> (public administration, defense, justice, security, civil protection, public health, basic and higher education, social assistance, public welfare);</p> <p><i>Services for end consumer</i> (modern retail - <i>trade and personal services</i> - tourist services);</p> <p><i>Infrastructure services</i> (land, sea and air transport, communications and telecommunications);</p> <p><i>Business services</i> (ICT, finance, insurance, real estate services, research and spreading of knowledge, advanced training, other business services)</p>
--

Service providers contribute to the competitive growth of urban economy and of manufacturing system by increasing the creation and development of knowledge, innovation, technology and the proper economic and financial structure of the territory; they integrate with the surrounding territories and, over time, become active and passive stakeholders of territory that, increasingly, bases its development on the stability of service industry and it repositions the place features on the knowledge economies.

In this work, the term Service Provider, refers to all the service providers in general who insist on the territories; the term Relevant Service Provider, in a place in process of upgrading and positioning, indicates service providers able to differentiate themselves from the generality and able to emerge in the market, for competitive skills, income generation, market share, positioning, ability to provide services and to assert its relevance in spatial realities different from the original.

The “ Relevant” service providers that emerge from the territory may be the result of a mix of values, cultural heritage, skills and knowledge characteristics of the land itself, or, they may simply affect the local community through the dissemination of best practices and knowledge. The services contribute to the positioning and re-positioning of entire geographical areas, with particular reference to the cities through the development of an intangible model based on values and with the emergence of the knowledge economy, with globalization and outsourcing in manufacturing.

Several factors have favored, in recent years, especially in Italy, the development of organizational forms and managerial stakeholders, often in coordination and not in opposition to the public authority²: the innovation of industry sector in the urban areas; the appeal of new formats and concepts of sales and administration with indirect purpose of increasing the aesthetic value of real estate and urban well –being; the trend of local communities to prefer “urban” gathering places” in the process of consumption of goods and satisfaction of expanded needs; the vital role of cities and city centers in particular in the rediscovery of the value of art and cultural initiatives.

In line with this approach, the retail service providers in some cities can be considered Relevant Service Provider, for their competitiveness and their importance in the place economy: innovative and shared procedures to manage the competitiveness can originate only through the systematization of ideas, plans and activities in a strategic marketing plan (Ancaroni and Valdani, 2000).

In this phase of work often emerges the fragmentation of decision-making bodies, the cultural heterogeneity of regional stakeholders, various points of view of a place, the disagreement of strategic aims, the lack of a territorial collective intentionality (Gatti and Schillaci, 2011). These factors do not generate any form of land value and spread of knowledge models replicable and measurable even in the urban area, resulting , conversely, the conditions for an impoverishment of the urban fabric.

A clear positioning of the various territorial sub-sites and an effective communication of the “*local supply*”, as inseparable core of goods and services oriented to consumers and to users of utility, arise ex ante from an overall

strategy - *framework strategy* - inclusive programs for tourism marketing, cultural heritage, urban marketing, attraction of inward investment, development of endogenous activities, on the basis of rigorous and analytical activities of place segmentation.

Policy makers should create a place brand only after a careful and scientific analysis of identity, values, characteristics, strengths and weakness, degree of territorial cohesion and aptitude to collective intentionality. It could be proved that, in practice, as the institutional actors often appoint resources and capabilities to create a brand logically disconnected from the conceptual framework, this is a cost and not an effective use of resources for the development of places.

The place marketing management “*reads and interprets*” the places, prioritizing their same segmentation, the critical evaluation of their current status, the positioning and /or repositioning, the size of the urban centers, the importance of manufacturing capacity for the conversion of entire areas in patterns of knowledge and intangible resources: for example, places developed around the large manufacturing enterprise and its satellite activities, supported by subsidies and facilities of various kinds, which decline rapidly as soon as the large company decided to move production elsewhere by choice related to lower cost of factors of production, causing moreover the desertification of entire economic and social areas.

The strategic role of private service providers in support of normal daily activities of residents, is even more evident when you consider that urban space is characterized as “*the densest, the most productive, the most complex of spaces*”, according to various parameters – index of construction industry, residents, stakeholders, economic activities, different skills, creativity, knowledge, structure of employment³.

The ability to attract and the sustainable development have a strategic role for the survival of the places: the increased demand for goods and services through a qualified and specialized supply impact positively on the vitality and livability – *increasing the satisfaction of residents and non-residents* – on the profit performance of economic activities, the value of tangible place assets and general consent to governance.

1.3 Service provider networking in the development of city economies

Major territorial areas with a clear manufacturing identification, in the last years, have been skillful to rebalance the relationship between industrial settlement and dynamic development of service activities in the framework of economic and social offerings of a city or an area using sometimes the lever of events with media resonance extended to start the repositioning of an urban brand through continuous and capillary forms of communication to the stakeholders of this new identity.

Let's consider, among others, the case of the city of *Turin*. Since at least a ten year period, with admirable foresight, it started to redeem the urban fabric and its external perceptions from the town-logo FIAT, (as it was for the *mutatis mutandis* of Termini Imerese) to go toward a new model of identity and a new image of place of culture, of advanced research, of knowledge, of film production, of entertainment, working on touristic and cultural co-marketing of an inter-city and an inter-regional nature. An example of this approach is MI TO, international review of events and cultural performances whose integrated fruition generates synergies and forms of collaboration and cooperation, even between cities and promotes tourist service based exchanges.

Turin is - de facto - a place brand that is prevalent in the Italian region of Piemonte. It represents the tangible example of the strategic foresight of all the players who worked very hard to the strategic redesign of their territory. They had a sharing of purposes with prevalent and obvious top-down choices in technological clusters and in innovation. This has been a winning action of territorial meta-management as all the economic, political, institutional and social components and also University studies and advanced Research have been involved in this place marketing.

These expertise, highly specific and qualified, were combined all together in a marketing plan pointed to change the perception of the identity of the place, to enhance a new one, to intensify relationships of interchange with cities-places-areas that have high planning capacity, to segment the “products and services” and to transmit knowledge of the new assets of the regional territory supplies identified in the historic-artistic heritage of the cities, in the number and the quality of research facilities, in the distinctive features of the locations bordering the county towns, in the town

centers as containers of entrepreneurial of cultural value, in the proximity of areas to be well known winter-like locations.

In the mere point of view of an academic who observes phenomena and deduces considerations and thoughts about it with the purpose of producing models, the Turin and Piemonte case, compared to the cases mentioned before, represents a best practice to be imitated as for predictive capability of context settings and as for new territorial format to be communicated to the market, even of the external investors.

After all the production companies seek, more and more, places and spaces, in these periods characterized by strong stagnation of demand in local environment in line with modern requirements for reducing the cost of the typical factors of production.

There are going to be several years of reconsideration of the territories, of the cities and in particular of the needs of those who live everyday in urban spaces, according to the new rhythms and needs. There will also be the an increasingly strong necessity of sociological and trading support and of assistance of services in general.

As already highlighted, the cities and in general the territorial areas are becoming organized and managed spaces (Minton,2009 and Reeve,1996); the economic trends cited are studied by the marketing and management reference , primarily through concepts related to public and private aggregations for the enhancement of quality of life and the optimization of the evolutionary process of the services and their service providers.

All over the world programs of control, of conservation and of urban re-generation have been designed and initiated, in view of the need of safeguarding the quality of life in the cities, of empowering the city users and of revitalizing urban areas according to new models. In the planning and management of the public and private sectors, many types of governance and especially of collaboration are being used.

Among them we recall the main tools of management and the organizations that have favored the network of service providers in the cities and contributed to limit the impact of the economic and employment crisis in urban areas spreading networks of knowledge and of models.

Many typologies of governance have been utilized in the planning and in the management of private and t public sectors; particularly the main tools of management and the organizations have favored the network of service providers in the city and contributed to limit the impact of the economic and employment crisis in urban areas spreading networks of knowledge and of models: *National Main Street Programme* (USA), *Town Centre Management* (born and developed in UK), *Business Improvement District, Town Center Management place marketing organized* (Italy), *Società di Trasformazione Urbana (STU)*; international organizations – *for example TOCEMA Europe⁴, Institute of Place Management and London ATCM* – for the safeguard of the city centre.

Also in England the tendency to value the service provider in the city is very strong. Over 600 coordinated management experiences of the redevelopment of the city from the perspective of management place between 1998 and 2006 and the activities have enhanced the services and related service providers.

Throughout Europe there is an ongoing process of reorganization of urban areas and in particular in urban areas according to evolving new principles and new demands of city users, investors, companies of different nature.

The governments of countries seek to protect the interests of economic development and sustainability-related in the light of a revolution in services, in advanced services, and the now recognized importance of group and social services for the city.

The contribution of Van den Berg (1990) through the key of the three levels of place marketing identifies the city as a product to be studied by parts and by homogeneous groups - different urban cluster - including, for example, the cluster retail as a synthesis of a homogeneous category of service providers, in some cities identified as Relevant Service Provider, and like driver of the economic revitalization of the urban⁵.

In the concept of place marketing on three levels clusters interact with each other defining the image of the place (in this case the city), because thanks to the interactions between the components, it conveys the place as a single "entity". The single entity values is greater than the value of the individual parts, in which, in certain cases, the retail acts as a economic development leve in a process of urban requalification.

Strategic marketing planning allows the actual development of the systemic interactions between the "places" in the city; therefore in advanced cases in which urban environments are deindustrialised necessarily economic development comes from the service industry and service providers. The task of the marketing strategy for the

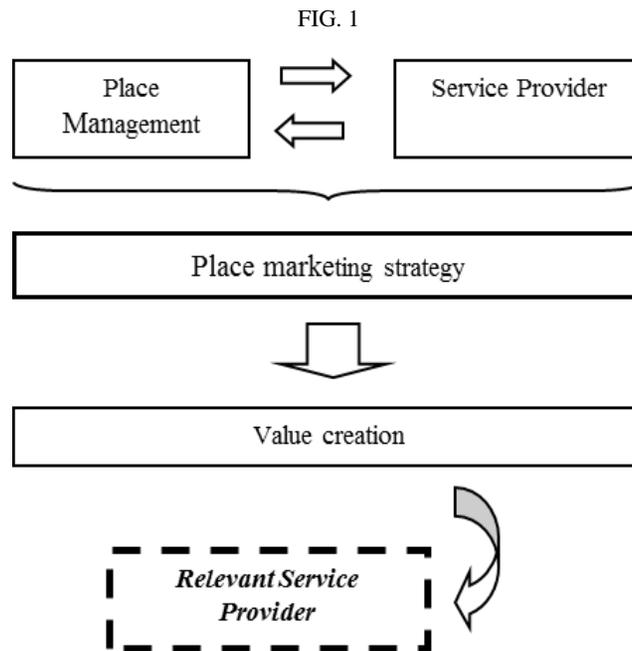

development of the territory is the systematization of the interactions between local stakeholders, for the identification of relevant service providers, which can contribute to the distinctive characterization of the place.

The place marketing management allow for strategic planning towards value creation and sustainable development in areas with strong relations between the local contest and service providers; some of them could be distinguished by efficiency and capacity by proving services to other stakeholders in different places, through knowledge, training and technology development.

In this sense the place management, converts the area into a productive servicescape in which the services are developed in view of “servuction” (Langeard, 1981) and emerge in parallel with relevant service providers capable of positioning the area and determine the development and value creation⁶.

The servuction model highlights the experiential aspects of purchases of goods and services by consumers, who will get the desired benefits through a service divided into visible elements –*environment within which the service experience occurs and the contact personnel of service providers who interact with the consumer during the service experience* - and invisible - *the performance explained at the time that you consume the service or experience, also characterized by the culture of the place* -.

This means that the visible and tangible environment can significantly affect service provider and, therefore, the "places" - *cities, stores, streets, shopping malls, various businesses, etc.* - contribute to offer the best possible service and at the same they are supported by the service provider - *possibly through a place marketing strategy, creating the opportunity for the development of Relevant Service Provider* -. It then generates the two-way relationship described in Figure 1.

The model has also found support in research of Warnaby and Davies (1997); the authors have highlighted the strong role of retail⁶ integrated in the city, understood in a holistic sense as suggested in the approach to development of the area proposed by Ashworth and Voogd (1990a and 1990b). The integration between the development strategies of each service provider, allow for definition of the place positioning.

The expansion and growth of cultural and managerial skills allow to facilitate the assimilation of knowledge and complementary skills from the outside⁷ and to multiply the effects towards development.

1.3 An empirical analysis of service provider in place management

About subject that has been described above, the aim is to analyze some case studies in which it is possible to find the strategic role of service providers in the creation of clear and identifiable place positioning and image, the process that leads therefore to identify "the place" generating benefits for internal stakeholders and attracting many tourists.

The de-materialization and the optimization of industrial processes, the crisis of employment in sectors with high level of industrialization and labor issues have led businesses to outsource and to divest plants and business structures (Levitt 1976; Heskett, 1986; Gershuny and Miles, 1983).

The city of *Liverpool*, for example, in the years '70 underwent this phase of de-materializing both in the more central urban area – with the demise of several factories - and in the urban area of the port – with the port sector crisis due to technological developments and the advent of containerization-

It is greatly reduced the demand for one type of labor and unemployment has increased. This reality has been configured as the real impetus for the redevelopment of the city towards services and knowledge.

It was studied new placements in the city according to service-oriented logic, through new legislation that favored public private initiative and the approach to "places" and to the territories in marketing optics.

In a long process of overall redevelopment, starting from the years '90, the city has been transformed and the public-private initiative has brought important results.

The city's skyline has changed and strategic commitment towards common development goals was shared by both private investors and the local government. - Liverpool was awarded the title of Capital Of Culture 2008 - .

Among the significant initiatives that have enhanced the competitiveness of the city there is Liverpool ONE. Liverpool ONE is a project of urban renewal that has been the motor of economic development town by focusing on trade and services, engaging more than 920 million pounds.

The redevelopment project has revolutionized a vast territorial area of the city centre and encompassed management of streets and public squares according to agreements with the local government.

As evidence of the importance of service providers in the redevelopment of the sites we report the case of the recent "renewal" of Rome's Air Terminal Ostiense, generated by the intervention of private investors - Eataly and NTV-. The terminal Ostiense was born as one of the jewels of the World Cup in 1990 and was to be privileged even after the joint for the connection between the city and the airport of Fiumicino. However, since a few years it is the subject of a thorough and costly retraining, especially thanks to private initiative, which returns it to the city as a multipurpose facility.

The intense redevelopment began with the advent of NTV - *Nuovo Trasporto Viaggiatori*, an Italian railway undertaking operating in the field of high-speed rail. Later, in June 2012, the Rome's Air Terminal Ostiense also became the seat of Eataly Roma, which weaving catering, sales and teaching, art and food, allowed to redevelop an area in decline and at the same time to revive the strengths of 'national economy.

In favour of the whole area involved, the two Companies, while operating in different business areas, managed to give a high added value to a high number of stakeholders.

In particular, NTV and Eataly, for the entire urban area represent a major operation on employment, cultural and urban regeneration⁸, as well as a source of attraction for residents and for the number of tourists visiting Rome, but also for new business opportunities .

The space is also upgrading from the functional point of view due to the presence of "Casa Italo" NTV that, with its many services, can improve the quality of people's lives. Inside the building, the perimeter architecture is designed as a wrapper collected and furnishing elements form circular islands where the traveler can enjoy a range of services. For over a decade the Ostiense⁹ area is a laboratory of urban development in which they were tested the original architectural and urban solutions. It has always been considered a strategic point for the modernization and transformation of the city for three main reasons: the extraordinary nature of the urban landscape, which is characterized by the presence of historically significant buildings such as the former Tobacco Factory, strong local identities as Garbatella, San Saba and Testaccio, high representation of buildings such as the University of Roma Tre, industrial areas disposed of in the course of transformation as the former slaughterhouse, the area Italgas and former Mercati Generali, and finally examples of industrial archeology and cultural goals such as the Teatro India and Montemartini.

Therefore, the presence of Eataly and Italo House represented the beginning of the renaissance of the Ostiense district. The spearhead of this revival is the Air Terminal that from an urban blight has become one of the most important centers of attraction in the city.

Due all of these elements Ostiense can be defined as the neighborhood with *“the highest tone of a total transformation of Rome”* to the benefit of its residents, tourists and the entire urban area.

Another relevant example is that of the “Trans-Siberian Railway in Italy”, a disused railway that connects Sulmona-Carpinone, which was reopened for tourism purposes. In particular, the present project is the re-opening until Castel di Sangro, offering tourists the experience of traveling in space but also in time: the journey, made on board the carriages of the 20's, through the National Park of Majella and climbs up to Rivisondoli-Pescocostanzo, where there is the second highest railway station in Italy, after the Brennero. A path that winds through forests and beautiful landscapes, from the Majella and Gran Sasso, with a variety of climates and vegetation that have earned the Railroad Park the nickname of Trans-Siberian Railway in Italy. On the occasion of the transit of vintage trains along the line, are also organized several events in the stations cross, with a tasting of local products.

The sellout of the trips shows that the introduction of a given service, in this case also redeveloping disused structures, can be driver of an entire place area, and if this is supported through consistent marketing strategies, the place will have an image and a positioning such as to compete nationally and internationally.

The importance of automotive services in the distribution business and their critical factors for success

Abstract

In many industries, services are an increasing source of business expansion and offer the chance to enhance customer relationship management, interaction and retention. In the automotive business numerous new services for end-consumers are discussed in various professional and scientific papers and conferences. However, the importance of services to end-consumers and the success factors in providing them may differ among countries as the regional market development and the strategies and performance of the local market automotive leaders vary. Moreover, many of these services are directly provided through the automotive distribution channel which are mainly the independent or franchise automotive distributors. Therefore, this paper examines the importance of services for car and motorcycle dealers and critical factors for being successful with services through a qualitative study conducted with 20 automotive experts comparing four different geographic areas (Austria/Germany, Poland, Italy and the Czech Republic) in the framework of a European research project.

Introduction

Services play a major role in the post-industrial economy. Beside their tremendous impact on GDP as well as on total employment, services are of significant importance in the so-called “service sector” and in most manufacturing industries (Grönroos, 2007, pp. 2). Gebauer et al (2011) highlight that services are not only a sustainable source of competitive advantage and hard to imitate but also provide financial opportunities through additional revenues and improve the chance of increasing customer interaction quality. Also in the automotive industry, services play a fundamental role. Already in 2000 Ealey and Troyano-Bermúdez emphasized that managers of the automotive manufacturers need to focus on all vehicle-related services to be successful in the future. Kessler and Stephan (2013) argue that especially in mature automotive markets (like Western Europe) where little potential for development and growth predominates, services can support the OEMs in enhancing brand differentiation, overcoming cyclical demand fluctuations and defeating price erosions in high-margin segments. Above that, they point out that the automotive manufacturers generate a significant turnover from business customers, namely fleet owners. They report that in 2011 Volkswagen *already sells 40% of new cars to business customers, more than half are used in fleets* (Kessler and Stephan, 2013, p. 242). Cohen et al. (2006) underline the importance of services for car manufacturers through a comparison of the income from aftermarket sales revenues compared to the one generated by car sales by using the example of GM which *earned relatively more profits from \$9 billion in aftermarket sales revenues in 2001 than it did from \$150 billion of income from car sales.* (2006, p. 130). Following the examinations of Kiefer (2001, p. 304) the manufacturers generate approx. 50% of the turnover and 70% of the profits through downstream activities in the entire lifecycle, i.e. by products and services following the new car sales. Moreover, Hawker (2011) calls attention to the fact that despite increased competition in the primary market, i.e. new car sales, the market repair and maintenance services still provides car manufacturers with monopoly profits. This market power of OEMs and the linked profits of the service business will be preserved in the near future because of upcoming and pervasive vehicle information technology and new design patents. Both require augmented investments in equipment and training and therefore protect the OEMs from third party market entrants.

In the last decade vehicle manufacturers controlled most of the original equipment service business (Subramoniam 2009) from safety or convenience systems to rather simple parts subject to wear. Although the EU block exemption regulation tried to open up this restricted business of aftermarket services in 2002 the latest regulation turned back to more restrictive rights for the OEMs (John, 2013).

Moreover, the automotive distribution chain benefits from new technologies and linked services. The vehicle manufacturers provide their controlled sales channel, i.e. owned distributors and franchise dealers the possibility to benefit from services through restricted third party access to key pieces of intellectual property (Hawker 2011). Services are an important profit contributor for distributors. Kiefer (2001, p. 313) splits the service spectrum into three

areas: mobility creating (like consulting, financial service, insurance, rent, car sharing, training or recycling), mobility securing (e.g. technical service, full-service-leasing or fleet management) and mobility enlarging (like mobility cards, pool leasing, travel agencies or customer clubs) service activities. He emphasizes that services can lead to more customer purchases, higher additional profits or better predictability of resource utilization (e.g. leasing contracts require continuous repair services). This is consistent with the study of Lademann et al. (2001) about common consumer attitudes and customer purchase decision criteria which found that price and personal contacts are seen as being of less importance than guaranteed service provision for new car purchases. Thus, offering services are a prerequisite for new vehicle sales as well. Grünhagen's et al. 21-year longitudinal analysis (2011) additionally points out that the amount of services offered has an impact on the survival chances in the US automotive business. They found out that franchising dealers with a broad range of services tend to have greater longevity than those with a small range. Moreover, they identify that the number of automotive services of franchisors increased even in times of recession. Summing up, services do not only seem to be of future importance for the automotive OEMs but also for the directly linked distribution chain members, i.e. the automotive dealers.

Literature review

The literature about service marketing is enormous as it emerged as a separate area of the marketing discipline in the late 1970s. Brown et al. (1994) pointed out that in the 70s the development and emergence of service marketing was started with the goods versus services marketing debate. According to their research, the high interest and enthusiasm in service marketing grew explosively beginning in the late 80s. Over these past two decades manifold research has emphasized the characteristics of services (Zeitlhaml et al. 1985, Edgett and Parkinson 1993, Edvardsson 2005). Among others, intangibility was defined as one of these typical characteristics of services. However, Vargo and Lusch (2007) emphasized moving away from the service characteristics perspective thus, as well as from the intangibility argument. They argue that these characteristics only become meaningful if a product perspective is adopted. They rather proposed a change to a "service-dominant (S-D) logic" as the central intention of economic exchange.

In a recent study of Kunz and Hogueve (2011) however, the past, the present and the future research topics of service marketing were investigated. With a citation-based measuring method they highlight the significance of specific research opportunities and topics of recent literature reviews. Among others, they suggest that future promising service marketing topics are service infusion as well as enhancing and managing the service value chain. Service infusion means to differentiate the business by focusing on services as a core offering which are recognized by customers (Kowalkowski et al. 2013).

This study tries to contribute to the identified topics of Kunz and Hogueve (2011) as it discusses the infusion of new services in the automotive dealership business and the critical success factors in enhancing services in a specific link of the automotive distribution chain, i.e. at the dealers' level.

Purpose and aim of research

Godlevskaja et al. (2011) identified several trends which influence the services provided in the automotive industry. Among others they point out changes of customer behavior, such as an increase in customer mobility and brand sensibility, a change of customer requirements towards customization and a rise of non-ownership mentalities. Further, they underline that vehicle manufacturers transform the industry through an enlargement of product range and complexities, the embedding of ICT and disruptive technologies in vehicles and the extension of their core-businesses with additional and product-independent services. These changes have an impact on the distribution chain as well. Therefore, this study investigates the importance of services in the automotive dealership business based upon key forces and trends shaping the automotive market in 5 different European countries. The focus is put on two areas of the automotive market, i.e. the car and the motorcycle business. These two areas of investigation have been selected because of the idea that possible findings in one area (e.g. car distribution) may be supportive for the other area or vice versa. Moreover, there are already many manufacturers, like BMW, Volkswagen, Honda or Suzuki, which produce both kinds of vehicles and their distributors sell them parallel. Therefore, the driving factors for the

establishment or enforcement of particular services of dealers are examined and country and industry specific variations are figured out.

Moreover, many scholars emphasize that the transition from product focus to service focus requires changes in the management of the company and its culture and the development of new capabilities, practices, resources or structures (Reinartz and Ulaga, 2008; Jacob and Ulaga, 2008; Ulaga, et al. 2011; Kowalkowski, Witell and Gustafsson, 2013). Kessler and Stephan (2013) underline these necessary changes and develop a model for successfully transitioning into an integrated service provider for the car manufacturers. However, the success factors for the upstream distribution chain members are rarely discussed in the literature. Therefore, the second aim of this study is to identify critical service success factors at the automotive dealership level.

Finally, the study aims at working out similarities and differences among the investigated countries and provides insight into the expert's explanations referring to the two research questions:

- 1) How important are services as key factors for the success for automotive dealers?
- 2) What are the critical success factors for service business of automotive dealers?

METHODOLOGY

It was decided that the most appropriate method to adopt for this explorative-descriptive investigation was to use a qualitative approach by conducting expert interviews due to the insightful character of qualitative inquiry (Patton 2002). This methodology and method applied, enables an exploration of a broad and in-depth expertise from various perspectives of different organizations in different countries in respect to the subject area of automotive dealership management. Bogner et al. (2004, p.7) point out that experts offer insider knowledge through their key positions and accumulated expertise, especially in a field where the target group concerned, i.e. the automotive dealers, do not perceive the importance of new services and have little awareness about their necessities to be successful in offering these services (Stadlmann et al., 2013). Thus, 20 experts were selected and interviewed in four geographic regions, i.e. Italy, German speaking region (Austria/Germany), the Czech Republic and Poland. In each region the chosen sample consisted of five experts from various fields to explore the topic from different perspectives for the following reasons:

- one expert of a sales or marketing department of a car manufacturer or of a National Sales Company (NSC) or importer of the OEM to get a broader perspective from the car business point of view,
- one expert of a sales or marketing department of a motorcycle manufacturer or of a National Sales Company or importer of the OEM to get a broader perspective from the motorcycle business point of view
- one key personnel or trainer of a dealer training institution - contracted by an OEM or a NSC – as his/her main job is to prepare dealers with knowledge and skill necessary for current and future survival and success,
- one expert of an automotive association (top representative) or automotive media (experienced automotive journalist) to gain industry wide knowledge as OEMs often only operate in certain segments (e.g. premium car segment) and
- one key professor in sales or marketing with expertise in distribution management.

The respondents of the face-to face interviews were selected by using a purposeful sampling strategy (Patton 2002). Therefore, and in order to meet the requirement of selecting information-rich cases strategically and purposefully (Patton 2002), the key informants have been determined from a pool of experts of various fields (distribution, green mobility, IT, sales, finance etc.), different countries and different organizations (such as automotive enterprises, dealers, training institutions, companies, higher education institutions and automotive associations) aiming at variation (heterogeneity).

Two methods of data collection were employed, namely telephone interviews and face-to-face interviews. The interviews were semi-structured aiming at a focus on richness rather than volume of the information provided and allowing transcriptions. The questionnaires used were open-ended or causal questions. This led to essay-format answers. All interviews were conducted in the mother tongue which was preferred to capture the richness of answers. The field research was performed in the period from April to July 2012. Finally, the transcripts were translated into English and allowed the researchers to compare the results and perform a deeper content analysis. Even though the

investigation carried out in the framework of the European Union project encompassed a broader range of topics, this research placed emphasis on the expert's opinions about the future importance of services for dealers and their critical factors of success in dealership.

Findings

The major findings of the study are presented in accordance with the two research attentions. Herewith, the focus is put on the experts view about the most important current and future services in the automotive dealer business and their critical related factors for successful realization.

The importance of automotive services in the distribution business

In general, services in the automotive distribution business (car and motorcycle) are considered of major importance by the experts disposing of extensive experience with regard to the markets in Austria/Germany, Poland, Italy and the Czech Republic. Bearing in mind the differing market situations and the intrinsic characteristics of the four markets, services are seen in relation to technological aspects and advancements and therefore driven by technology to a large extent. Given the focus on technology, new forms of mobility arise such as various electric vehicles addressing both cars and motorcycles. Correspondingly, new trends in terms of mobility arise influencing the customer's requirements and behavior which accordingly influence the service offers of dealers. The experts highlighted that mobility services including rental services are currently a relevant field of action in the four markets and will become even more so in future.. One of the key findings is that car sharing seems to be highly in demand by the customers across the four markets. Currently, a broad range of car sharing and car renting models already exist. For instance, in Austria, it is possible to use a chip card to unlock the car and then the costs are deducted on a certain account (cf. A2) or car sharing vehicles are spread all over a city, whereupon access is gained via an app and afterwards the vehicle is placed somewhere and payment is made by credit card (cf. A5). Additionally, "Drive now" services are offered in Munich, Berlin, Vienna, meaning that a mobility service provider offers different vehicles to be used at a certain price per kilometer (cf. A5). In Italy, car sharing in big cities is becoming a new integrated mobility concept as well as renting cars from local municipalities (cf. IT3). Hence, it can be observed that people are changing their mentality concerning ownership (cf. IT3). Furthermore, car sharing models with the possibility of renting a car for a very short period (10 minutes or 1 hour) including benefits of being able to access the city's historic center, special parking areas and use fast lanes (cf. IT4) are in increasing demand. One more possibility would be car sharing offers such as the "Zipcar" company in the USA and the UK where customers could rent a car for example, going on holiday or shopping outside the city instead of owning a car or a second car (cf. IT4). According to an Italian expert, dealers should become a car terminal or a point where one could go and rent a car or a station functioning as a car sharing service (cf. IT4). In the Czech Republic it appears that there is an increasing need for rental services for customers who don't use their car every day (cf. CZ1) and an expert pointed out that there is potential to offer additional mobility related services like car renting for customers who besides their own car need another car for holidays or weekends (cf. CZ5). Also in Poland renting cars or a close cooperation with companies offering short-term lease of cars (cf. PL1) is an area where action could be taken in the automotive service sector. Apart from these examples of services, consideration should also be given to the fact that mobility services are strongly related to the geographical area where they are to be applied. Undoubtedly, it is crucial to distinguish between offering services in rural and urban areas and adapt activities accordingly. In particular, the experts expect that the urban customer will demand innovative models of mobility and it will be a challenge for dealers to adapt related services and be flexible in the understanding of mobility concepts (cf. A5). To sum up, it is crucial, therefore, that initiatives are geared towards offering adequate and customer oriented mobility concepts like car renting and car sharing models.

The respondents reported that another relevant field in terms of services is **electric mobility**, having an impact on the customer's mobility behavior and requirements. These findings are consistent with those of Abdelkafi et al (2013). As manufacturers and suppliers have to face changes in their daily business routine related to electric mobility, the dealers are additionally asked to offer the corresponding services so as to be up to date with regard to technological innovations (e.g. hybrid technology).

Furthermore, experts suggest that dealers in the four markets (Austria/Germany, Italy, Poland, Czech Republic) might concern additional or **innovative sources of financing or to enhance leasing services**. The informants declare that in the future leasing of cars will increase and therefore, the need for a variety of services /offers in this area both in the car and motorcycle sector will arise. This result is consistent with those of Kessler and Stephan (2013) who highlight that especially fleet customers increasingly demand these services. Interestingly, in the Czech Republic smaller corporate customers do not purchase large fleets through operative leasing (cf. CZ 3).

Moreover, **information services** are considered of major importance in the four markets, for instance new purchasing software that will be able to help customers, for example, to choose the color of their future car or to show its technical features (cf. IT3), online information services including activities such as online advertisements, Facebook (cf. CZ1) and possibilities of presenting multimedia content and car configurations on a website (cf. PL2). Beyond these examples, a wide range and variety of services was mentioned by the experts. Additional services revealed are listed below (in extract):

- Additional services like roof rack rental office, roof varnish, seasonal services such as storing winter tires (cf. CZ1)
- Offering test rides (cf. PL1, AT1)
- Potential would be in offering rental of accessories such as bicycles carriers, ski carriers but also bicycles as super standard service. (cf. CZ5)
- Offer additional services such as accessories at attractive prices, insurance and extended warranty for free (cf. CZ3)
- Telematics – additional feature to support/control the service needs (including test rides) (cf. A4)

Country specific findings

Strikingly, a result from the investigation was that there are several differences with regard to the four investigated markets within Europe. First of all, as our findings demonstrate, there is a diverse approach to vehicles across the investigated countries. In Poland, a car is a sign of luxury and social status rather than purely utilitarian object (cf. PL1), whereas in Italy it tends to be the case that vehicles are seen from the pragmatic and useful mobility point of view by many people. In Italy, the second hand market is on the rise and also in the Czech Republic and Poland whereas this is not true for Austria. Polish people appreciate the quality of cars and tend to refuse to buy a lower quality car and, according to experts, fashion trends do not influence the Polish customer to a large extent (cf. PL1). Czech customers seem to be very loyal and stick to tradition and long proven quality and this is exactly the point where there is still potential to sell additional services (cf. CZ1). In Austria, cars are, apart from the daily mobility usage, seen as a leisure product (cf. A1).

In Italy it can be observed that the significance of the second hand market owing to economic aspects is enormous. There are also new business opportunities in the second-hand motorbike market (cf. IT5). According to an expert, the reason is that only a small number of dealers have so far specialised in the used car business market. Therefore, changing the business model towards used cars seems to be a promising opportunity and further, services linked to the used car business appear as a challenge, e.g. reconditioning of used cars (cf. IT4).

Czech experts stated that services linked to very old cars are important (cf. CZ3) and for this reason dealers should offer services such as extended and top-quality warranty of mobility, provision of a substitute vehicle and extended warranty when a used car is purchased (cf. CZ3).

Referring to the informants, the Polish market can be characterised by the following features: The need for immediate service of second hand cars is limited due to the fact that they are imported from abroad in a reliable and excellent technical condition (cf. PL1). However, as this market is three times bigger than the new car market (cf. PL2) – which is similar to the Czech market – automotive services linked to used vehicles seem to be auspicious. Furthermore, Polish roads are often in bad condition and cause damage. Therefore, urgent services such as “Mobilo warranty” or warranty service agreements appear to be important elements in the dealers’ service portfolio (cf. PL 2). Moreover, there are still growth opportunities as the service workshop network (cf. PL1) is not fully established throughout Poland. Concerning the location, the car shop is still highly important as a place of representation (cf. PL2) to attract new customers – also for service business. Finally, the economic situation and an extensive discount policy

have caused a decrease of profitability. Therefore, OEMs require dealers to pay extra for single cars (cf. PL1). Hence, services get even more important as they require either only little or no pre-investment for the single service activity.

There is evidence to suggest that in Austria infotainment and entertainment services as well as event management is on the rise. An expert stated that in general, the offers of the car sector will clearly increase and therefore an entry into mobility and other services would be necessary. Offering service and integration like infotainment (e.g. information and entertainment via internet, television, mobile phone integration, service hotline for free time organisation, automatic service registration) will become extremely important, also for electric vehicles (cf. A2). In line with the experts, future services for the premium sector, additionally to advisory service and product consulting would be, for instance, to host entertainment and infotainment events at the dealers place (cf. A2).

Critical success factors for service business of automotive dealers

In identifying the critical success factors for service business of automotive dealers emerging from the fieldwork it was highlighted by the experts that **finance and management** in general and in respect to services in particular, is of upmost significance across the 4 geographic areas. Beside the dealers' ability to skillfully manage their financial situation (cf. PL1) the experts stress the necessity to rationally decide based upon facts and figures (cf. IT4) and manage the relevant data (cf. PL4). For that a continuous monitoring of the market is essential (cf. CZ1). Further, it was emphasized that the dealers need to professionally establish and manage sales and service processes (cf. CZ1) and after sales activities (cf. PL4). Furthermore, it was highlighted by the experts that a close cooperation between the dealer and the OEM (cf. CZ2, PL1, CZ5) and good relationships with stakeholders like insurance agencies, banks, leasing companies etc. is crucial in order to offer suitable solutions (e.g. in case of accidents).

Drawing on a number of statements, **strategic planning and strategy related aspects** such as the decision to take up a single or multi-brand dealership model are decisive for the development and success of dealerships.

An expert from Austria stresses the advantages of single branding and mentioned this model as a factor for their companies' success owing to the specialization and focus on one brand. Additionally, one has to consider the environmental features and influencing factors on both the regional and national level. In particular, urban and rural areas provide a different basis for dealers and on product selling and services.

A further success factor mentioned by the informants from the Czech Republic is to shed light on the different **customer groups**, for instance fleet, family, starters, elderly customers and women. Services and offers should in fact be strongly oriented towards customer groups and in accordance with an analysis of the lifestyle of each customer group. For example, it tends to be that dealers in the Czech Republic are currently not well prepared for female customers and thus a suggestion of an expert was to employ woman at dealer stores aiming at enhancing understanding the requirements and expectations of female customers. This finding is in agreement with Homburg's et al (2002) findings which showed that customer orientation has a positive impact on emphasis on services, the number of services and the broadness of service offerings.

The experts stemming from Austria, Italy, Poland and the Czech Republic attach importance to **values** in the automotive dealer business. So, on this note, a main success factor seems to be the authentic application of values in daily business related to the customers. Frequently mentioned values are honesty, reliability, loyalty, punctuality, availability, transparency, keeping promises, empathy and fair communication with the customers.

Moreover, undoubtedly, customer and service orientation are a crucial success factor. By additionally approaching customers on an individual level, adapting to their needs and habits and consulting pro-actively trust can be established and thus loyalty increased (besides the prerequisite of high quality of sales processes and services). Another significant aspect underscored by the experts is the increase in advisory services interrelated with a change referring to the role assumption from salesperson to counselor.

There is evidence to suggest that skills, education and training of the whole personnel are vitally important success factors. The respondents agree on the relevance of up to date knowledge and skills in the areas of:

- New technologies (dealing with the increasing complexity of new cars) (cf. A1)
- Financing (comparison and analysis of data as well as know how to understand the figures) (cf. A6)
- Systems (ordering spare parts, equipment, service, warranty, Customer Relationship Management) (cf. CZ2)
- Products and services (cf. PL2)

- Social Skills: efficient communication of the offer (cf. PL4), skills for working with ‘VIP’ customers (cf. CZ2)

Given the increasing training needs on account of fast technological advancement (e.g. multiple drive mechanisms (cf. A2)) and the fact that customers are nowadays better informed, **extensive and up to date knowledge** is a success factor. Hence, lifelong learning related to the whole personnel (from the mechanic to the foreman and the service technician to the sales person), technical trainings and refresher trainings contribute to a strong position on the market. Consequently, continuous staff development and suitable training combined with activities which increase employee loyalty support the dealers to maintain a sufficient human resource base which is fit for the future.

Experts accentuate the value of dealers focusing on **new technologies and new forms of mobility**. Technological changes as well as changes in the forms and concepts of mobility in the 21st century force dealers to invest in new technologies and accompanying services, e.g. photovoltaic charging solutions for electric vehicles and the adaptation of service offers, for instance, car rent and financial and insurance products such as short-term lease. Also in the area of marketing activities new forms of technologies and communication should be used, e.g. social media.

Finally, the experts point out that offering services with regard to events and adventure would be a promising way to achieve success. This means being a service center, as for instance, Toyota’s main office in Tokyo offers a visit to an adventure cinema (4D or 5D). Also European dealers might take the chance and arrange seasonal and local events so as to gain a strong market position.

Differences between the motorcycle and car dealer business

An outstanding characteristic of the motorcycle business is the **role of emotions** in the whole business process. In accordance with the statement of the experts motorcycle dealers tend to be more customer orientated and more attached to the motorcycle lifestyle than car dealers. Moreover, they seem to sell by appealing more to customers’ emotions. Moreover, experts expressed the need that dealers have to act as role models for their customers in terms of the motorcycle lifestyle. This means that dealers have to convey emotional experiences to their clients with activities even outside normal working hours, e.g. motocross tracks, trips or test rides with new products (cf. A3), which are definitely crucial success factors in the motorcycle business. Apparently, this might also be a starting point for car dealerships to take on the significant role of emotions and transfer it to their daily business practices.

Limitations and further research possibilities

In this investigation there are several sources of uncertainty to bear in mind which are stated and explained below. Firstly, from a general point of view one has to state clearly that the results from the qualitative research are not representative of a population. According to Brymann (2012) instead, the findings of qualitative research are to generalize the theory rather than the populations. It is the quality of the theoretical inferences that are made out of qualitative data that is crucial to the assessment of generalization. Consequently, the interpretation and application of the results and findings have to be assessed in the light of restricted generalization of this research data.

Secondly, it has to be considered that, owing to the size and the heterogeneity of the geographic areas (Italy, Austria/Germany, Poland and Czech Republic), the sample size of experts is rather small, although the careful selection of information-rich cases promotes the utility of the findings to a certain extent. Hence, further data collection would be required in order to cover the distinctive features and the various specific regional and national characteristics and to contribute extensively to the knowledge in the field of automotive dealership management. One alternative way to discover further in-depth knowledge in this research area would be to conduct a Delphi study bearing in mind the potential of the assessment and discussion of the expert’s opinions and judgments in a feedback group communication process.

Thirdly, one has to consider, that the translation from the local languages (German, Italian, Polish and Czech) to English bears the risk of misinterpretations of meanings or mistranslations, albeit this cross-national study facilitates the comparison of different European markets, requirements and views.

The differences between the motorcycle and the car business and the diverse cross-national circumstances indicate that this research could be extended to other geographic and business areas, such as into the truck or agricultural sector which extensively operate with dealers as well.

Acknowledgements

The authors would like to thank the European Commission for its generous financial support of the multilateral project “Developing New Distribution Skills” in the framework of lifelong learning. The presented research was embedded in this multilateral project and is also supported by the Polytechnic University of Marche, University of Gdańsk, Skoda Auto University, and the KTM Sportmotorcycles and Snap-On Business Solutions enterprises. The authors would especially like to show gratitude to the researchers Pavel Strach, Silvio Cardinali, Marcin Skurczyński for conducting the field research in their home countries and Boban Krcic for supporting the data analysis.

Lecce (Italy)

The intangible resources in the relationship between real estate agents and customers. What is the role of trust?

Abstract

The house is a complex product. It implies both a higher financial risk than other products and a lot of time to spend for choosing it

The purchase decisions are mainly made within the family. Each of the family members influences the final decision of the purchasing process better than other external incentives do (i.g. advertising, promotion, construction firms, owners and real estate agents).

This study starts from a previous research concerning the in/outsourcing strategies of selling functions in the field of construction firms which revealed a predominant orientation towards the insourcing of the sale and marketing functions; according to the entrepreneurs, the real estate agencies don't have the skills and the domain expertise that are required for selling such a complex product like the house and they don't deal with the customers in the best way. There is a lack of trust, especially as concerns the opportunistic behavior of agents.

The aim of this research is to establish the strategic role of the trust in the relationship between real estate agents and clients.

In order to understand how trust works in this field and which are its main dimensions, an on-desk analysis is carried out on national and international literature. After having qualified the concept of trust, the theoretical hypotheses have been formulated, and subjected to empirical test through a qualitative research (three focus groups).

1. Literature review

According to the early definitions that comes from psychology literature, trust is a generalized expectancy held by an individual that the word promise, oral or written statement of another individual or group can be relied upon.

Trust is a key factor in the exploration of the marketing relationships. In the literature, it is presented as a risk/cost set against the benefits of interacting (Barber, 1983). We can articulate it in terms of assessment of others' reliability and integrity, reliance and willingness to act in your interest (Morgan and Hunt, 1994; Rotter, 1967; Anderson e Narus, 1990).

Trust is "the variable most universally accepted as a basis of any human interaction or exchange" (Gundlach and Murphy, 1993) and can be seen from different theoretical perspectives: contractual relations theory (Macneil, 1980), interaction theory (Hakanson, 1982), organizational theory (Bradach and Eccles, 1989), psychology (Rushton, 1980), social psychology (Blau, 1964), transaction cost economics (Nooteboom et al., 1997), trust theory (Gambetta, 1988), and in the study of online exchange (Lynch et al., 2001; Stewart, 2003).

Some authors conceptualize the trust as the confidence of the exchange actors in the goodwill of each other. It is a noncalculative reliance in the moral integrity and goodwill of others on whom the exchange actors depend (Ndubisi, 2011).

Trust is also an antecedent to communication. The latter one is the way in which we receive information and insights as to the cost, benefits and risk associated with particular situations and the state of the focal relationship.

A topic point of research concerns the development of trust between vendors and buyers in the distribution channel relationships: from the buyer's perspective, the vendor's reputation and its investment in the relationship are trust boosters. This aspect emerges from some studies where reputation is identified to influence the trustworthiness of the vendor (Ganesan, 1994).

As pointed out by Eriksson and Vaghult (2000) a strong relationship between satisfaction and retention exists. Accordingly, as trust is directly linked to loyalty, its role is fundamental.

Trust is affected by the perceived risk in retail purchase. Previous empirical studies demonstrated that this is a common phenomenon in the retail sector (Diallo, 2012; Grayson et al., 2008; Liljander et al., 2009; Semeijn

et al., 2004) both for macro economic conditions and for institutional factors and the business context. The traditional factors like brand and price level have lost their importance to others factors' advantage, like the quality of service or the behaviour of salespersons. Consumers always hold different attitudes towards different types of retailer. This attitude will have an effect on the retailer quality perceptions, on the resultant choice and on the purchasing behaviour (Ajzen, 1985; Hawes and Lumpkin, 1986; MacKenzie and Lutz, 1989).

Trust is often the output of the consumption experience and of the evaluation on cognitive, affective, goodwill and competence trust.

The *cognitive trust* is based on consumer's confidence on service provider's competence and reliability. It enables him to make a conscious decision. It arises from an accumulated knowledge from observation, reputation of and even personal experience (Eastlick and Lotz, 2011).

The *affective trust*, which refers to a consumer's confidence in a service provider, is emotional in nature and arises from an individual's emotional experiences.

The *goodwill trust* is "the expectation that some others in our social relationship have moral obligations and responsibility to demonstrate a special concern for others' interests above their own" (Barber, 1983; Das e Teng, 2001).

The *competence trust* is based on the extent to which one party believes that its exchange partner has the required professional expertise to perform the job effectively so as to achieve relationship benefits (Twing-Kwong et al., 2013).

All these dimensions occur in the field of outsourcing strategies.

The *in-* and *outsourcing* strategies represent a topic, which is frequently discussed in the field of transactional cost analysis and agency theory (Coase, 1937; Williamson, 1978; Quinn e Hilmer, 1994; Hinterhuber e Stuhec, 1996; Mullin, 1996; Elmuti D. et al., 1998; Baden-Fuller et al., 2000; Ricciardi, 2001; Gregori, 2001; Ventricelli, 2004; Le Bon et al., 2009; Pellicelli, 2009; Pastore e Ricciardi, 2010).

Trust is one of the main factors that you need to consider for explaining both the choice to outsource services previously performed internally and the opposite one.

The degree of trust between the outsourcer and the service provider will determine the strength of the business relationship (Ndubisi, 2011). In this context, trust includes reliance on the promises of the outsourcer or the service provider to the other party

2. The nature of the residential product and the construction supply chain

The house is a complex product. It implies both a higher financial risk than other products and, a lot of time to spend for choosing it. According to some authors, its purchase is often characterized by the customer's inclination to negotiate with the internal selling force of the construction firm (Jackson et al., 1999; Bitner, 1990).

The house has evolved from a simple structure to an economic product. On the first hand this transformation is the consequence of the evolution of construction techniques and, on the other hand, of the architectural choices.

It combines various aspects, from the materialistic one up to the emotional one. Certainly, its complexity (Tidd et al., 1999) has expanded with the appearance of new needs, such as energy saving (*zero energy homes*), sound insulation, and new life styles (Abis, 2009; Finizio, 2011).

However, the house is not just what is mentioned above. It is a product (an output of a process of production), which combines building materials, capital, work, entrepreneurship and localization. It is a basket of attributes and a set of functional, financial, social and symbolic utilities (Levitt, 1980; Lambin, 2008).

In fact, considering the various aspects above mentioned, one becomes easily aware of the complexity of the purchasing process, and, consequently, the great difficulties firms have in facing the customer, especially if the negotiation is based on a design (Gameson, 1991; Loe, 2000).

In order to have a good knowledge of the customer, one needs to know more about his world-vision, the way he makes his decision, and how he behaves in the personal environment. Though both, the customer and the enterprise observe the same thing, they however see different things; they use the same words, providing them with

different meanings; when the customer examines a building design, he often ignores construction details and concentrates his main attention on other aspects that reflect on his personality or his life style, his needs and those of his family.

The purchase decisions are mainly made within the family. Each of the family members influences the final decision on the purchasing process in a stronger way than other external incentives do (i.g. advertising, promotion, construction firms, owners and real estate agents) (Brassington e Pettitt, 2000).

In fact, a family enables face-to-face interactions, reduces the perception of risk and activates a joined decisional process. (Brown and Reingen, 1987; Engel et al., 1995; Antonides and Van Raaij, 1988; Wagner et al., 1984).

The construction supply chain is long, complex and well structured. It combines interconnected sectors that correspond to different productive fields and market segments.

There are two principal industries: construction in the strict sense and real estate. The former includes all the firms that work in the following fields: construction, refurbishment, demolition and maintenance of building structures and infrastructures, production of hydroelectric plants, communication systems, multi-sport facilities, extraction of underwater rocks, big structures.

The latter includes the rent of buildings, selling, management and valuation of real estates, rent and leasing of construction equipment, technical and architectural services.

The main actors are:

- *Owners-users*: they manage buildings for their own business;
- *Owners-investors*: the management of buildings is their core-business, they pursue financial objectives;
- Asset management service provider, that support owners in the financial management of the property;
- Real estate services providers that deal with the selling of the buildings (agencies);
- Builder;
- Design services and *general contractor* who provide engineering services, construction services management in the building site also;
- Property and facility management services provider (Politecnico di Milano, 2009).

The construction firms are situated in the field of “project firms”, namely those representing (i) uniqueness of the product (ii) intermittence of the production process (iii) transience of organization (iv) non recurring nature of the commercial transactions (v) flexible structures of the firms (Genco, 2006).

It doesn't offer just a product but a complete solution to a specific demand. In reference to this the complementary relation among systems that integrate physical elements concerning the product and intangible elements concerning the service, is essential.

Real estate agents are the connecting element between the firm and the market. They fill the lack of information especially in regards to the residential market (Milgrom P. e Roberts J., 1994; Grandori A., 1999; Boyd D. e Chinyio E., 2006). In fact, they represent a specific type of intermediaries, because their originality is based on the nature of the product they are selling.

The real estate agent, after having received the mandate from a client, operates in his own interest to select people, firms or organizations that are interested in a commercial transaction such as buying, selling or renting a building.

This means, that they can be considered a kind of distributors of “building solutions”. Their competitiveness depends on the wideness of the assortment, namely the number and the variety of the solutions that are proposed to the customers.

Their role is essentially that of a commercial intermediary: (i) **contact** with the customers, namely with all the people interested in buying or selling the property of the building; (ii) **information**, transferring to the counterpart a flow of technical, financial, and economic data and information that are useful for both, the decisional process and, for ensuring the correct balance among the characteristics of the products and the needs of satisfaction; (iii) **fractionation** of the construction firm's production in many parcels, each of which meets the needs of a specific segment or niche; (iv) **promotion** through an heterogeneous set of tools (signs, brochures, websites etc).

In the end, they assume an essential role for all the legal and administrative activities (drafting of the contract, payments, assistance during the notary phase etc).

The relationship between the customer and the construction firm is essential for both of them. The choice of the house represents a highly delicate moment, because as a matter of fact, it is very difficult to find the one that meets all the needs of the customer.

The intervention of the real estate agent influences the customer's choice, either in a negative or in a positive way, directing the interest towards specific residential solutions.

For instance, the agent can assume an opportunistic behavior in order to influence the price; furthermore the agent can appeal on psychological and emotional variables of the customer, which can be in contrast with the principal's interest.

For this reason, the construction firm has to manage correctly the relationship among the sales forces and, at the same time it has to have the average control on them.

3. In - or outsourcing? The role of the trust in the construction industry

In a previous research we highlighted the company's policies about the distribution channels and, specifically, the alternative options between direct and indirect channel in the construction industry.

That paper aimed at understand and analyses the determinants of the in/outsourcing processes in the construction sector and, especially, in the residential market.

At this end, a qualitative research on a sample of small firms had been carried out through 15 interviews.

The main objectives of research was: 1) studying the relationships between construction firms and real estate agents; 2) analysing the main factors which push the first ones to manage directly the sales of their products or to, otherwise, externalise that function.

The results demonstrate that there is an evident preference towards the first option. The enterprises, in 13 cases out of 15, prefer carrying out directly the selling functions and the eventual involvement of the agencies, without an exclusive mandate through human specialized resources, which coincides sometimes with the same entrepreneur.

This orientation is motivated by the distrust towards the agents and their abilities.

In fact, they say:

"The real estate agents have few knowledge about how buildings and facilities are made up...because...they don't read up, they don't have the humility to learn, to ask us, to make any check on site in order to understand".

In the entrepreneurs' opinion, the agents make a particular mistake, namely considering the building product as a commodity, which sets up the shop window such as the one of a supermarket. For them, a house purchase is identical to any other purchase and is not considered "a project of life".

"The agents aren't really interested to know their customer's preferences and needs in order to build a specific project for them."

The entrepreneur has generally prejudices towards the effective contribute of the agent. According to the entrepreneur's view, the agent doesn't really transmit all the necessary information to the customer and, furthermore, he isn't able to make the customer feel at ease.

In addition to that, the agent just introduces the customer to the entrepreneur, so that the customer has all the necessary information about the building. Nevertheless the customer prefers often to meet the manager personally and talk to him rather than to the agent.

Many interviewees have confirmed this aspect and motivated it with the propensity of the buyers for saving the agent's commission and, for the opportunity to have a better explanation of all the details of construction.

Another interviewed person has argued that a relevant problem for him is to find an agent "*willing to run a risk*", namely a partner to whom commit an exclusive mandate for carrying out a selling plan, with a true guarantee for selling a certain number of houses: "*when we make this proposal, the agents often refuse and don't want to take charge of this kind of mandate*".

The non-balance between the two parts is too evident and it wouldn't be reasonable to ignore it.

The propensity of the construction firms depends on a direct management of the commercial function; the recourse of an intermediary could be justified just when it is possible to take in advantage inflexibilities of the agent about fixed prices.

“Once the agent fixes the price for the customer, he can't change it, he is rigid and can't change the conditions; on the contrary we are more flexible than he is, because the customer turns directly to us.”

There are other reasons that explain insourcing in the construction firms. Thanks to the interview, the following evaluations of the builders have emerged, concerning in particular:

- a) Brand-awareness in the local market;
- b) Direct relationship to the final customer.

In reference to the former aspect, the main part of the answers demonstrate the importance of the enterprise's brand, as an asset whose strength is the notoriety in the local market, which is in turn based on trust:

“My enterprise is well known on the local market thanks to the previous generations that were able to connect our brand to quality. Our customers choose us for this reason.”

The client's preferences are based on the firm's notoriety, which depends in turn on previous experiences of acquaintances and friends. In this context, word-of-mouth is essential to create awareness. It makes the traditional communication tools (advertising, promotion etc), less important:

“We have never done a lot of advertising, we did it sporadically. Advertising is not very important for a small firm such as ours, which for its dimensions is able to differentiate itself through word-of-mouth marketing. This one strengthens the relationship among the enterprise and our potential client”.

The potential client feels not attracted *“by marketing but by knowing the internal personnel. People come to us because they put their trust in us, they rely on us and they know us directly. The contact is then essential”.*

The customer also appreciates *“the continuous, constant and meticulous care of the works”*, that is to say, the presence of managers on the building site where they start working with the workers since the early morning. The assistance is one of the most important points of strength, which makes the brand stronger. Usually, the firm's owner who gives advices and suggestions supervises the various steps, from the early contact until the sign of the contract. This approach is highly appreciated by the client.

This constant contact is a source of competitive advantage. *“It makes the difference to a more articulated enterprise, where a commercial department and a technical department exist”*; word-of-mouth is also based on these factors in order to attract more and more clients”.

The respondents consider the personal assistance of the client as a real driver for the competitiveness, and so an effective source of competitive advantage compared to other enterprises that instead *“delegate many functions to the technical staff and don't check the quality of buildings; nevertheless the technical staff does never have the necessary skills and, furthermore their interest can be different to the owner's one”.*

4. The purchaser's preferences between construction firms and estate agents.

In order to understand if the construction firms' approach is motivated, a deeper analysis was carried out. It involved three distinct focus groups of the demand side, made up of people from 20 to 50 years old

The first goal is to identify the drive factors of the choices and the sources of value emerging from the relationship.

The general approach prefers the direct relationship with the construction firm. The latter is perceived as more reliable since it has already turned out its own competences and know-how in the construction activities.

I think builder pays more attention to my needs. He builds my home as I want it, the estate agents don't.

I surely choose the construction firm. I don't trust the agent because he acts just in his own interest to selling what he got. In my opinion he tries to influence me according his interests. I want to be free.

If you turn to a builder, you can buy what he's building. You can see it. You can verify it on site. You can examine the design.

I want to feel the house as my home. The agent does not give you this opportunity. If you turn to him, you must accept what he proposes you and you have no alternatives.

I would avoid the agent a priori. I can't trust him. I'm scared of unpleasant surprises. I am so suspicious

This is the prevalent approach when the customer has to choose between the construction firm and the estate agent. “Investing” in trust is affected by some important cautions. Firstly we refer to the need to get information from

parents and friends who have already had previous experiences with builders. They enable to be informed about the quality of constructions, the reliability, the know-how, the fairness. Secondly we refer to the need of consultants who support customer to fill the gap of knowledge on the characteristics of building.

Between the two solutions, I would prefer the builder even though I need some references, I would like to know what he built. I would need some advices and opinions from trusted persons. I prefer to assist to the construction activities.

I would turn to an already known builder but I would ask to a trusted engineering to support me.

I prefer an already known builder. He can provide me all the information I need. I feel safe. However I would get help from a trusted person.

I feel safer turning to a construction firm because I have the perception it runs the risk to damage his name for itself. On the contrary the agent runs less risk.

In my opinion the builder sell his product, he is more involved than an agent. He is more responsible. He takes the passion for the building he produces. He feels the importance of his work. For these reasons I prefer the construction firm.

Many participants consider their participation to the design phase as very important and as affecting the final choice. Home is a project of life for them. It's a special product that has to represent their own personality. They want to take part while the characteristics of homes are to be decided:

I wouldn't buy an house which is already built. I prefer providing a design draft, to a trusted engineering who transmits it to a trusted builder for building it. A trusted builder is a person, or an enterprise, that I know as consequence of previous constructions. I would choose it for these factors, not for advertising. It doesn't matter. What is matter is word-of-mouth.

Even if the dimension of the product of the agent could affect positively, the opinion of the majority doesn't change; to them it is highly essential to take part actively of the selection of material and in general in the choice of the characteristics of the building:

The builder's and my vision enable me to get what I want. The agent doesn't. I don't think the agent provides me a wider set of options. If a builder is skilful, if he's able to get my ideas then I have got a wider range of houses compared to the agent.

Despite of these prevalent opinions, other participants consider the agent's role essential. According to them, the alternative options are not so evident since there is a geographic factor which affects the choice.

Then we have asked, if the option of agent has to be dismissed:

Not quite! If I lived in another city I would rely myself to the agents, especially to the bigger one that have to maintain their reputation. I think they make a selection of the most reliable firms, they distinguish the houses according to the different energy saving requisites etc. They provide some services that a single person aren't able to get hold oneself.

It depends on the specific case.

If you have to buy a foothold in a city far, I would rely myself to an agent because I think he provides me a wider range. Though I'm aware that agents won't tell me the truth, I prefer them because I could have more options.

The situation is different if I had to buy an house in my geographic area. For sure I would choose a builder after having decided how the design should be.

The wide portfolio products is the main reason that guide a small group of respondents toward the agencies:

I have look carefully at the house I want to buy. Even though the agent tried to get me to buy what is more convenient for him, at the end the only one who chooses is me.

Therefore I think that the agent shows you the final product, the builder doesn't. The latter one provides a concept, an idea of the house which could be different to what I imagined once it is finished. I want to see the house once it finished!

I'd turn to an agent so we can analyze together the various option that are available. I want to see the finished house insides to get if I likes it.

For some people it isn't of great difference rather to have a builder or an agent.

The fact that there was an uncertainty regarding a good solution, was due to the specific period in which the research took place; because of a very deep crisis that has affected the real estate market, many failures were caused. So a great fear in the purchasers has emerged:

I thought that I would be safer to rely on a construction enterprise and that this was ever the most convenient option. But in this period ever the guarantees aren't useful. Large companies have gone bankrupt when they seemed they were in their best period.

I'm scared. How could I sign a contract for an house that will be built many months later? I don't want to run the risk. So, I prefer the estate agent even though there are not real advantages. The only one is that the building is there.

I'm sure: if I had to buy an house, I would turn to a builder and I should ask for a finished house. Then I would turn to an agent to evaluate together with him other solutions. The word "trust" in the field of the relationships with the agencies is meaningless. We don't have to use the word "trust" but "risk". The question is: who could take on the risk for the potential damages? Who is the actor who makes me run less risks? The choice depends on the answer.

Finally, according to someone there's no question of it because they prefer avoiding every channel (agent or builder) and having a direct relationship with the owner buying a "second hand" house from him:

I prefer not either one.

The agent does not inspire me confidence. I feel he wants to sell me something I don't need. And the builder too.

I prefer an house to be restored like I want . Why do I have build something new? In my opinion turning to an architect who says "there is this nice house, do you want to see it together?" is better. Then, if I liked it, I would try to adapt it to my needs.

5. Conclusions.

This research reveals that trust influences the choices of the builders and of the customers in the estate markets.

Firstly, the entrepreneurs mistrust the estate agents. In their opinions they are not reliable and unwilling to a collaborative relationship.

For this reason the builders prefer to directly manage the relationship with the customers.

Secondly, the perceptions of builders about the opportunism of agents and their lack of attention for the customer's need is confirmed. The purchasers, indeed, also show an high mistrust .

They think that the agent is inspired just by his own self-interest for trying to sell what is more convenient for him, and not for his client. Then, there is a lack of trust.

On the contrary, according to the participants at the focus groups, the builders pay more attention to the customer's needs and get them involved in the choices concerning the building. Therefore, they prefer to rely on well-known builders, on trusted engineers, friends and relatives.

The research has some interesting managerial implications for estate agents. Knowing the perception of them by clients and builders, is an important input for adopting new relationship models.

The distance between them and their potential clients and the mistrust from builders are some great limits. If the agents will be aware of it, they will be able to improve their image and their performances.

Global sourcing and back-shoring: towards a possible shift of sourcing strategies?

Abstract

Companies are paying more and more attention to volatility in the supply chain and many manufacturers are reassessing their global sourcing strategies. Will multinationals retreat to a hemispheric, near-shoring model or opt for a hybrid that maintains an international component? This paper investigates the current challenges for Chief Procurement Officers facing risks and evaluating total costs along the global supply chain. The authors have reviewed both practitioner's and academic literature, exploring the main trends in the global approach to supply markets and the trade-offs that could affect strategic sourcing decision in the near future.

1. Introduction

The phenomenon of global sourcing is often analyzed jointly to the globalization of production and sales. Companies, in fact, seem to follow a process of gradual globalization of all their functions in search of new competitive advantages. Firms shall adopt, in fact, different configurations of global sourcing and global distribution (defined as the sale and distribution of products outside the country). The data analysis of the International Manufacturing Strategy Survey (2009) shows how there is a majority of companies (65%) which operates predominantly locally and a small portion (6%) of companies strongly globalized. The latter are also companies with globalized production networks. The remaining companies are divided into those that either have a high level of global sourcing (10%) or global distribution (19%). Of course, companies can over time change their strategy of purchasing management. The well known Swedish furniture retailer IKEA, for example, was initially focused on supply management at the local level: business development (through entry into new markets and diversifying into new products) led to change sourcing strategies as well as those corporate summarized in offering quality products at an affordable price. In particular, the company due to problems of capacity and relationship with its suppliers, which were proving less and less cooperative in lowering prices as requested by their client, started researching suppliers first in Europe, starting from East, then in China and the Far East and, finally, in the United States. The search for vendors in this region has followed the local opening of new stores (Hultman, Johnsen, Johnsen, & Hertz, 2012).

A further aspect concerns the fact that global sourcing is not a trend followed uniformly by all businesses. Especially in recent years, even facing the acceleration of certain processes due to the crisis, there has been a slowdown in some areas of internationalization processes, up to the reversal of this trend. Often we refer with the term 'back-sourcing' (or outsourcing back-shoring) to the phenomenon that some companies 'abandon' the foreign supply markets to return to a more local supply base (Tunisini, Bocconcelli, & Pagano, 2011). The reasons that can lead to this phenomenon are different, even though it may in fact be summed up in a loss of affordability of overseas supplies or in the difficulty of management of foreign investment.

The practice of global sourcing can be implemented in very different ways. First, we can distinguish between the situation where a company decides to outsource an entire production activities abroad and one in which the company buys one or more products or services from a foreign supplier. In the first case scholars and practitioners usually speaks of offshoring. There are many cases in recent years of companies that have resorted to this type of investment. Consider, for example, FIAT, Renault, or other car manufacturers, who have relocated part of their production in Eastern Europe countries through investments in production facilities in these areas (sometimes retaining sole ownership, other times in forms of joint-venture).

The World Investment Report (UNCTAD, 2013), which studies the flows of productive investments among countries, reports a growing trend in recent years, although there is a strong correlation with economic cycles that can sometimes lead to trend reversals. In the international scenario, Europe is the continent that sees more incoming and outgoing flows.

In case of direct purchase from foreign suppliers, we talk about *global sourcing* in the narrow sense to refer to the supply of raw materials or components, or of *global outsourcing*, in case of purchasing of production capacity.

Of course, the line between these two areas is not fully demarcated and thus we treat them jointly.

While the phenomenon of back-reshoring of operations is being studied scholarly and a relevant data-base has been created and used for research (Fratocchi, Di Mauro, Barbieri, Nassimbeni, & Zanoni, 2014; Tate, Ellram, Schoenherr, & Petersen, 2014), there is still a lack of academic research, particularly in Italy, about the (eventual) decision of relocation of global sourcing activities and its antecedents.

Thus the paper is concerned with assessing whether and how the “global” dimension of sourcing is still a feasible and effective path for leading companies. Specifically, this paper debates the following three research questions: 1) under which conditions and with which degree of awareness of risks and costs have industrial companies relied on global suppliers? 2) Considering that cost saving is still the main reason for the scouting of foreign suppliers especially in low-cost(wage) countries, what kind of management tools (if any) are actually used to effectively measure and monitor the total cost of global supplies in order to evaluate the real convenience of global sourcing? 3) Is the return to domestic supply base or nearshore sourcing an option considered for the future?

The research methodology is qualitative and based on a focus-group organized in May 2014 with the Chief Procurement Officers of seven leading Italian manufacturing companies which operates globally, some with production and sourcing activities, some only with sourcing activities. A preliminary and exploratory part of the results of this focus group will be summarized in this paper after the presentation of the theoretical background.

2. Theoretical background: a literature review

2.1 Globalizing operations and supplies: is the pendulum swinging back?

For more than twenty years, deciding where to build a manufacturing plant to supply the world or where to find global suppliers to source from was quite “simple” for many companies (BCG, 2011). Unsurprisingly, the underlying principles of Adam Smith’s book ‘An Inquiry into the Nature and Causes of the Wealth of Nations’ (1776) provided a simple, yet convincing explanation for why economies as a whole, and individual companies in specific, should engage in international trade: arguments have subsequently found their way into the Operations and Procurement Management domain, where they have been applied to three streams in the literature, representing some of the most fundamental decisions that purchasing and production managers face (Holweg, Reichhart & Hong, 2011). The first decision relates to the value adding tasks to be performed by a firm, known as the so-called ‘make-or-buy’ decision (Higgins, 1955; Venkatesan, 1992) or under the term ‘outsourcing’ (Quinn & Hilmer, 1994). Secondly, once decided what to keep in-sourced, managers need to decide where to locate the operations to perform these tasks (Skinner, 1964; Ferdows, 1997). Thirdly, managers need to decide where to source the required parts and/or services that are not produced in-house (Choi & Hartley, 1996; Nassimbeni, 2006).

In this period manufacturers have viewed offshoring as a necessity—one virtually mandated by the price demands of customers and by the cost advantages of competitors that had already aggressively off-shored. Most larger companies today engage in global sourcing in some form and to some extent (Horn, Schiele, & Werner, 2013). The rationale for offshoring (either for in-sourced products or out-sourced supplies) was, in fact, a rather straightforward economic one. Suppliers in low cost countries (LCC) such as China have been able to offer “perceived” prices 25 to 40 percent lower than those available on shore—the typical threshold or tipping point for moving off shore. These reduced prices were made possible by low labor costs, cheap commodities, and favorable exchange rates (Ferreira & Prokopets, 2009).

Global companies (MNCs) adopt dynamic strategies towards the global configuration of their activities and, for this reason, divestment and new investments go hand in hand (UNCTAD, 2013). This type of companies govern a complex internal system of interlocking value added activities positioned across countries. This system evolves continuously, with expansion in one sector or territory sometimes accompanied by contraction in another. The composition and organization of value added activities by a MNC change continuously to respond to exogenous environmental, technological and social factors, as well as new endogenous strategic priorities. The key forms of strategic positioning are defined in the table 1.

TABLE 1: TERMS AND DEFINITIONS FOR GLOBAL STRATEGIC POSITIONING

Offshoring is the process of transferring part or all of the value added activities conducted by a company from the home country to another. When it engages in offshoring, the firm maintains ownership over activities conducted overseas. This differs from offshore outsourcing, which involves purchasing products or services from another firm located overseas (UNCTAD, 2013)
Relocation is the movement of existing assets, resources and people from one location to another. It can be linked to divestment. Companies may decide to relocate all or part of value added activities in response to new environmental conditions or to reflect new strategies adopted by the firm. Relocation can take place within a host country, across borders to a new host country or back to the home country of the company (UNCTAD, 2013)
Reshoring is the process through which a MNC relocates all or part of value added activities conducted abroad back to the home country of the company (UNCTAD, 2013)
Nearshoring is the process of positioning all or part of the value added activities in a country that is geographically, economically and culturally close to the country of origin of the company
Back-sourcing is the “production return relocation from an [...] external entity” (Holz, 2009, 156) for (Out-sourced) manufacturing activity abroad (partial vs. total)
Back-shoring is the “Re-concentration of parts of production from own foreign locations as well as from foreign suppliers to the domestic production site of the company” (Kinkel and Maloca, 2009, 155) “The geographic relocation of a functional, value creating operation from a location abroad back to the domestic country of the company” (Holz, 2009, 156; Fratocchi, Di Mauro, Barbieri, Nassimbeni, & Zandoni, 2014)

Now, however, a combination of economic forces is fast eroding China’s and other LCC’s cost advantage both as an export platform for the North American and European markets and as a low-cost supply source. Meanwhile, Germany, France, Italy, UK and, mostly, the U.S., with an increasingly flexible workforce and a resilient corporate sector, is becoming more attractive as a place to manufacture many goods consumed on this continent. Indeed, many manufacturing and procurement executives now recognize that quality problems, longer supply chains, lack of visibility, piracy and intellectual capital theft, are also part of the off-shoring operation, meaning that not all of the 25 to 40 percent off-shore sourcing savings goes to their bottom line. Moreover, working capital is increasingly tied up in inventory trapped on slow-steaming ocean transit and in safety stock held at distribution centers. Innovation also suffers from the physical, and sometimes cultural, distance between manufacturing and design operations. “Over time, the balance of labor shifted and the unemployment rate in the wealthier countries soared to new levels” (Tate, Ellram, Schoenherr, & Petersen, 2014, 382; see table 2).

TABLE 2: FACTORS THAT GENERATE THE NEED TO CONSIDER MANUFACTURING LOCATION AND ADVANTAGE OF NEARSHORING OR RESHORING

Factor indicating need to reconsider location	Potential advantage of nearshoring or reshoring
Strong domestic customer base is being served by offshore manufacturing	Reduced inventory and transport costs, especially with the lowest global fuel costs in North America
Very sensitive IP	Domestic and nearshore locations offer greater protection and enforcement. Easier to monitor closer locations
Increasing shortages and price increases of local, routinely needed services, like transportation, warehousing, and labor as indicated by factor market rivalry. Generally increasing price levels significantly faster than global averages.	More predictable pricing and availability
Repeated environmental and/or human rights violations	Greater visibility, commonality, and enforcement of sustainability laws
Regional financial instability in manufacturing location	Locating in the same region as customer may create a more balanced financial flow, stability in currency exchange
Labor costs are a decreasing factor in manufacturing due to automation, or could be due to potential automation	Since cheap labor is generally a major advantage of low cost countries, it might be worth reanalyzing the situation

The reversal of off-shored decisions is not a new phenomenon and it has been documented since the eighties (Mouhoud, 2007), but cases of repatriation of production are being increasingly reported in the economic press (The Economist, 2013) and in consulting firms' reports (Accenture, 2011; BCG, 2011, 2013).

In last few years several manufacturing companies have, in fact, announced the return of part of their off-shored production (either captive or out-sourced) to their home countries. Industrial giants such as Caterpillar, Bosch, and Philips are featured among them, but also a plethora of small- and medium-sized enterprises that are reconsidering their international location and/or sourcing strategy. Yet, the return back to the home country (back in-shoring) or the relocation of supply sources in countries closer to headquarters (near-reshoring) is not always connected only to the decision of backshoring manufacturing operations. Fratocchi, Di Mauro, Barbieri, Nassimbeni and Zaroni (2014, 57) have created a few years ago a research group (Uni-Club MoRe Back-shoring) that has built a data base on back-shoring based on secondary data gathered from a variety of sources. The data base consists of 294 back-reshoring operations, among which US and European companies are almost equally represented. The countries most present in the sample (USA, Germany, and Italy) are also highly focused on global manufacturing activities. Differently from the German and European survey results, almost 70% of cases concern returns from China and other Asian countries, while Eastern Europe accounts for around one tenth. However, this evidence is largely differentiated between US and European companies, confirming the stronger region-centric approach of the latter ones in term of off-shoring strategies (Daudin, Riffart, & Schweisguth, 2011). Further, breakdown by industry shows that back-shoring activities were implemented in almost all manufacturing industries, without any relevant difference among labor and capital intensive ones. Time based analysis reveals that the phenomenon is not recent – especially for European firms – and that repatriations from China are significantly swifter than from other countries, with about 25% of firms returning from China within a time span of six years. Finally, quality issues and logistic and labor costs emerge as the foremost reasons for back-reshoring.

TABLE 3: SELECTED CASES OF RESHORING OF MANUFACTURING OPERATIONS TO THE UNITED STATES, 2010–2013 (SOURCE: BASED ON INFORMATION FROM THE RESHORING INITIATIVE. AVAILABLE AT [HTTP://WWW.RESHORENOW.ORG/RESOURCES/ LIBRARY.CFM#](http://www.reshorenw.org/resources/library.cfm#))

NCR Corporation	India, China and Hungary	The company returned part of its ATM production to a new manufacturing facility in order to be close to customers and innovate directly on-site with them. It was not seeking the lowest cost manufacturing location but reshoring realize other benefits: decreased time-to-market, improved internal collaboration and lowered current operating costs.
General Electric Appliances	China	The company manufactures dishwashers, refrigerators and heaters. Labour savings were eaten away by an inability to carry appropriate inventory levels as well as by inconsistent delivery schedules, resulting in overall costs that were 6 per cent higher than in the United States.
SolarWorld	China	A builder of solar panels committed to western labour and environmental standards that were not matched by its Chinese site. Labour accounted for less than 10 per cent of total costs, and close to half of the savings on labour from using Chinese workers was lost to higher shipping costs. The other half, or more, was made up for by the higher labour productivity in the United States.
LightSaver Technologies	China	The company produces emergency lights for homeowners. It found that manufacturing in the United States was 2 to 5 per cent cheaper after accounting for the time and trouble of producing overseas, although manufacturing alone was 30 per cent cheaper in China.
ACE Clearwater Enterprises	Hungary and China	The company, a maker of complex formed and welded assemblies for aerospace and energy generation, reshored mainly because of quality control issues.
Offsite Networks	China	Rapid improvements in technology made it more affordable for the company to manufacture locally. This meant that labour costs, which had driven the search for cheaper workers overseas, would be a smaller percentage of total costs. In addition, other costs in China, such as shipping, had been increasing.

2.2 Global sourcing: motivations, opportunities and obstacles

Global sourcing has received growing attention both in the academic literature and in business practice since the 1980s (Monczka & Giunipero, 1984; Baldassarre, 2012; Quintens, Pauwels & Matthyssen, 2006; Steinle & Schiele, 2008; Trautmann, Bals & Hartmann, 2009; Trent & Monczka, 2003), and has remained an active area for research since (see for example Levy, 1995; Nassimbeni, 2006). While the terms ‘global sourcing’, ‘global procurement’ and ‘international sourcing’ are often being used as synonymous in the literature, a general consensus, in the more recent literature, follows the works of Monzka and Trent (1991), defining global sourcing as the final stage in the strategy evolution, seeking to include foreign supply sources as part of the overall purchasing strategy. For the purpose of this paper, we will use ‘global sourcing’ as synonymous for a sourcing arrangement outside of the market, where either the final product is assembled, or being sold (retailed) to its end customer. This growth trend has driven researchers to more thoroughly analyze the impacts of global sourcing on companies’ processes and performance to determine the best ways to cope with it. In fact, recent studies have shown that global sourcing, especially from low-cost sources, makes it harder to manage the cost versus response trade-off (Nair & Closs, 2006; Lowson, 2003). There seems, however, to be strong consensus that global sourcing is either inevitable and/or beneficial to firms. International sourcing has been called “... an automatic expectation to respond to competition” (Carter, Maltz, Yan, & Maltz, 2008, p. 225), which would leave firms little choice as to whether or not to engage in it.

There are traditionally three main motivations behind the decision to source globally: (a) cost savings, e.g., due to lower factor costs, such as wages or currency influences; (b) access to highly innovative products or technology that companies otherwise would not have and (c) promotion of sales activities in the sourcing region (Barney, 1999; Bozarth, Handfield & Das, 1998; Trent & Monczka, 2003).

TABLE 4: RATIONALE FOR GLOBAL SOURCING (IN ORDER OF IMPORTANCE).

Monczka & Giunipero (1984)	Monczka & Trent, 1991	Nassimbeni (2006)
Lower prices	Cost reduction	Purchase materials and components at lower costs
Firm had worldwide operations and attitude	Quality improvements	Achieve resources not available in the home country
Availability of foreign products	Increased exposure to worldwide technology	Possibility of acquiring less expensive manpower
Improved quality of foreign products	Delivery and reliability improvements	Global competition
Technology available from foreign sources	Introduction of competition to the local supply base	Global attitudes of the company
To fulfil countertrade/offset/local content requirements	Establishing a presence in a foreign market	Possibility of acquiring advanced technologies
Due to developing worldwide competition	Satisfying offset requirements	Reduction of commercial barriers
Improved delivery of foreign product	Increase the number of available sources	Possibility of developing a presence on foreign markets
	Reacting to the offshore sourcing practices of competitors	Presence of plants in foreign countries
		Possibility of selling products on supplying markets
		More favourable taxation

There are numerous factors influencing the adoption of global sourcing. It is to a large extent dependent on the company, the sector in which it operates, the type of product purchased and the country where the foreign supplier is located (Quintens, Pauwels, & Matthyssens, 2006). For example, Nassimbeni and Sartor (2007) reports that in Italy, textiles/clothing and chemicals/pharmaceuticals are the sectors where global sourcing is more widely adopted.

Company size is not always relevant in determining global sourcing strategy; even smaller companies often appear willing to globalize their sourcing (Cagliano, Golini, Caniato, Kalchschmidt, & Spina, 2008; Cavusgil, Yaprak, & Yeoh, 1993; Quintens, Pauwels, & Matthyssens, 2006; Leonidou, 1999; Scully & Fawcett, 1994). However, small companies may face difficulties because appropriate resources (i.e., people, money, and competences) are required to effectively operate purchasing on a global scale (Arnold, 1989; Narasimhan & Carter, 1990; Ellram, 1991). Moreover, larger companies with worldwide production facilities have easier access to foreign supply markets (Trent & Monczka,

2003; Cagliano, Golini, Caniato, Kalchschmidt, & Spina, 2008).

2.3 Evaluating the Total Cost of Global sourcing: static, dynamic and hidden costs

Earlier research (Handfield, 1994; Monczka & Giunipero, 1985; Spekman, 1991) demonstrates a clear focus on the cost-saving aspects of global sourcing, particularly for western companies. A fundamental question, though, has not yet been fully answered (Horn, Schiele & Werner, 2013): does it really help and if so, under which conditions? Few attempts have been made to quantify empirically the impact of global sourcing - particularly in low-wage-countries - and its benefits, linking the level of global sourcing to firm performance (Akkermans, Bogerd, & Vos, 1999). Moreover, the findings are somewhat ambiguous concerning the success of attempts to save costs. While “firms located in developed countries often find that labor costs are high, compared to the value that is added to their products” (Kotabe & Mudambi, 2009, p. 122), substantial differences in factor costs between developed and less developed countries, such as these labor costs, should theoretically lead to lower prices. Both managers and scholars, however, highlight the difficulty of calculating the objective value of global sourcing initiatives (Horwell & Soucy, 2007; Trent & Monczka, 2003). Favorable factor costs do not automatically translate into lower sourcing costs. The findings on the actual cost-saving results from global sourcing vary greatly, ranging from negative or zero (Kotabe & Omura, 1989; Murray et al., 1995) to 20% (Alguire et al., 1994; Petersen et al., 2000; Weber et al., 2010). Despite the importance of cost in global sourcing, few authors have proposed comprehensive cost-based decision frameworks for assessing global sourcing decisions. Instead most contributions focus on specific risks or costs associated with global sourcing, such as inventory costs (e.g. Srinivasan, 1988; Cavinato, 1992), currency fluctuations (e.g. Carter and Vickery, 1989), logistics cost (e.g. Zeng & Rossetti, 2003), or the specific disadvantages of global sourcing in comparison to local sourcing (e.g. Handfield, 1994; Levy, 1995; Nassimbeni, 2006). When planning for successful international sourcing, a company’s opportunities to conduct detailed ex-ante analysis of its purchasing strategy’s effects are limited. Purchase price comparison is often the method of choice when it comes to planning, monitoring and measuring the success of international sourcing activities (Trent & Monczka, 2005). However, a low purchase price might be offset by lower quality and delivery reliability (Degraeve & Roodhooft, 1999). Additional expenses might occur, e.g., for negotiating and contracting in a foreign language, supplier qualification, travel and transportation costs to more distant places, etc. Furthermore, uncertainties and risks might increase, e.g., the risk of supply chain interruptions.

Holweg, Reichhart and Hongand (2011), in order to assess the Total cost of global sourcing, proposed to differentiate three different cost types for LCC sourcing; (1) Static costs, notably the purchase price ex-factory gate, transport costs, customs etc.; (2) Dynamic costs such as increased pipeline and safety stock and (3) Hidden costs such as labor cost inflation, currency fluctuations or the loss of intellectual property (table 5).

TABLE 5: A FRAMEWORK FOR FINANCIAL ASSESSMENT OF GLOBAL SOURCING.

Static cost	Dynamic cost	Hidden cost
Purchase price ex- factory gate	Increased pipeline and safety stock due, which is amplified by demand volatility and product variety	Labour cost inflation due to rising standards of living and competition of the labour market
Transportation cost per unit, assuming no unexpected delays or quality problems	Inventory obsolescence due to long logistics lead-times, e.g. in case of quality problems	Currency fluctuations, in particular for cases of artificially pegged currencies
Customs and duty to clear a shipment for export	Cost of lost sales and stock-outs, as the supply chain is unresponsive to shifts in demand	Rise in transportation cost, e.g. due to higher oil price and carbon offset costs
Insurance and transaction cost	Expedited shipments, e.g. air-freight, to ensure uninterrupted supply	Overhead for managing the international supply base, including travel cost or cost for local personnel in the supplying markets
Cost of quality control and compliance with safety and environmental standards		The loss of intellectual property to contract manufacturers

Search cost and agency fees to identify and interact with local suppliers		The risk of political and economic instability or change
---	--	--

Other scholars put in evidence that geographical distances not only increase transportation costs but also complicate decision-making because inventory tends to increase due to longer lead times in the supply chain. Moreover, infrastructural deficiencies in developing countries (e.g., transportation and telecommunications, inadequate worker skills, supplier availability, supplier quality, etc.) create challenges that are normally not experienced in developed countries (Meixell & Gargeya, 2005). Furthermore, global supply chains carry specific risks such as variability and uncertainty in currency exchange rates, economic and political instability, and changes in the regulatory environment (Dornier, Ernst, Fender, & Kouvelis, 1998). One evident effect is that longer lead times and less dependable deliveries from suppliers require companies – *ceteris paribus* – to maintain higher safety stocks to preserve the same service level. This has been confirmed at an aggregate level (Golini & Kalchschmidt, 2011). According to Nassimbeni (2006), the incompatibility of just-in-time (JIT) and global sourcing has been an important area of discussion (Vickery, 1989; Das & Handfield, 1997). The key conflict here is induced by the lack of buyer–supplier proximity, since JIT sourcing places emphasis on the delivery of small quantities in frequent intervals and rapid problem-solving cycles, whereas the large distance of global sources invariably commands transportation in large batches (to achieve full container loads, for example) and renders closed-loop kaizen improvement projects difficult, since attributing cause and effect is hampered by the long logistics lead-times. The required ‘organisational’ proximity is seldom attainable for globally sourced items, which are characterised by longer, less reliable international supply lines that pass through several intermediaries (Fawcett & Birou, 1992).

Another important issue is the quality of globally outsourced products. Steven, Dong and Corsi (2014) investigate how sourcing strategies are associated with product quality recalls. In particular, the authors examines how make-or-buy decisions (i.e., outsourcing), the use of foreign suppliers (i.e., offshore outsourcing), the relocation of production to offshore markets (i.e., offshoring), and decisions to consolidate supply bases (i.e., the use of few vs. myriad suppliers) are related to product recalls. Product recalls are serious quality failures in supply chains with significant, negative impacts on firm performance. Quality compromise by one chain member would result in a quality failure of the final product. For instance, they remind the 2007 Mattel toy recall that involved a Chinese supplier compromising quality by using paint with excessively high levels of lead (Steven, Dong & Corsi, 2014, 244). Product recalls are frequently connected to the globalization of supply chains and globalization has, at times, promoted inconsistency in quality control and standards, leading to quality problems and failures. Data across multiple industries, with widely reported recalls, have been collected by the three scholars and analyzed using regression techniques: the findings indicate that offshore outsourcing (global sourcing) has a greater impact on recalls than offshoring without outsourcing; outsourcing domestically has the least influence (for a list of global sourcing obstacles and risks segmented by region see table 6: adapted from BrainNet, 2009).

TABLE 6: TOP 5 SOURCING OBSTACLES AND RISKS BY REGION

	Eastern Europe	Russia	Brasil	India	China
1	Increasing labor costs (47%)	Political risks (76%)	Currency risk (44%)	Missing standards for sourcing governance (56%)	Missing environmental standards (77%)
2	Fraud compliance (28%)	Fraud compliance (61%)	Lack of qualified workforce (32%)	Missing environmental standards (55%)	Loss of intellectual property (73%)
3	No innovation from suppliers (27%)	Trade regulations/customs (53%)	Trade regulations/customs (29%)	Poor infrastructure (53%)	Missing standards for sourcing governance (67%)

4	Bad/missing local supplier performance management (27%)	Missing environmental standards (47%)	Missing environmental standards (27%)	Increasing labor costs (41%)	Fraud compliance (64%)
5	Missing environmental standards (26%)	Currency risk (46%)	No innovation from suppliers (26%)	Quality problems (32%)	Increasing labor costs (60%)

3. The empirical analysis

3.1 The focus-group methodology

There are many definitions of what constitutes a focus group (Morgan, 1988, 9-10; Morgan, 1998,1-2; Powell, Single, & Lloyd, 1996; Stewart & Shamdasani, 1990). Essentially, a focus group is “an interview style designed for small groups” (Berg, 1998, 100) It typically involves from six to ten people discussing and commenting on particular topics or concepts under the guidance of a moderator. A key distinguishing features of the focus group approach is the ability of individuals from a similar community to interact: “The hallmark of focus groups is the explicit use of the group interaction to produce data and insights that would be less accessible without the interaction found in a group” (Morgan, 1988,12). Focus groups are particularly useful for learning about participants’ conceptualisations of particular phenomena and the language they use to describe them (Stewart and Shamdasani, 1990, p.15).

The seven participants of the focus group organized in May 2014 in Milan where chosen among those companies whose ownership is mainly or totally Italian, in order to have a comparative idea of the underpinning logic of global sourcing decisions with that of other countries’ companies, understanding if there is an “Italian way” of facing these strategic challenges. The seven represented industrial sectors were: medical devices and equipment, chemical, mechanical, electronics, safety footwear and furniture. Two companies are large companies, three are mid-sized companies and two are small-sized companies: the total sales turnover (2013) represented by the seven companies is 3,2 billion Euro, while the number of employees range from 3.700 to 60 for the smallest. The total purchasing volume (direct and indirect) managed by CPOs is 2,08 billion Euro; out of this procurement turnover the seven CPOs declared different degrees of globalization of supplies, ranging from a maximum of 55% (electronics) to a minimum of 20% (mechanical). Four of the represented companies (furniture, medical devices and equipment, footwear and electronics) have more than two production facilities abroad, geographically dispersed (China, USA, Romania, Vietnam, Brasil, Tunisia). All of them have relevant experience in global sourcing from Far East to Brasil, from Eastern European countries to South Africa, from Turkey to Morocco: they declared to have 37 different countries in their global suppliers geographic portfolio.

According to all seven CPOs the growing costs and changing dynamics pose new challenges for global sourcing. To succeed in the new environment requires moving away from traditional sourcing models toward a more holistic approach that considers the total cost of sourcing from various countries. As a result, all the seven CPOs declared that their companies have shifted their focus from low-cost-country sourcing to “best cost” country sourcing or “best value” country sourcing, two approaches that evaluates a range of factors besides just labor costs. According to our findings, BCCS is here to stay. In fact, we found broader participation overall—and companies are also taking a more strategic approach, building portfolios of supply sources and seeking to achieve competitive advantages rather than just pure cost reduction.

Participation in global sourcing is expanding beyond the major multinationals to include small to midsize companies in Italy. This is partly because it has simply gotten easier to buy from overseas suppliers. Greater market transparency has helped smaller companies to set up direct sourcing arrangements from low-cost countries. But the primary reason for increased participation is the growing sophistication of LCC-based suppliers, which are proving to be credible substitutes for Western suppliers on the world stage.

In addition, the categories of goods being sourced are expanding from traditional high-labor-content products such as garments and toys to more technology- and capital-intensive products. This is generally true across all major low-cost supply bases around the world. For example, companies are sourcing more capital equipment from these regions to reduce overall capital expenditures. From pumps to chemical plant equipment, from storage tanks to blast furnaces, companies are finding a growing number of suppliers with extensive product-development and

manufacturing experience - often the result of serving their fast-growing local economies.

All participants indicated that their companies will continue to maintain or increase their sourcing activities from best-cost countries, especially from Asia, given that their savings are still significant. Many participants noted that although the financial crisis had a negative impact in some areas, it also brought opportunities for those countries. For instance, currency devaluation has made some relatively high-cost regions such as South Korea newly viable best-cost supply bases. Other historically low-cost countries such as Mexico and Vietnam are becoming even more attractive owing to currency changes.

All CPOs observed that the global downturn brought the topic of cost reduction to the attention of top management. This attention generated pressure and incentives for procurement teams to explore other countries and supply sources as cost-saving alternatives.

At this moment of the discussion we introduced to all participants the Total Cost of Global Sourcing model proposed by Holweg, Reichhart and Hongand (2011) we ask about their experiences in measuring the financial performance of global sourcing projects.

Two CPOs (mechanical and electronic firms) reported two of their unsuccessful experience of sourcing manufactured components from China and India: after less than one year of deliveries from the Far East they realized that, through a Total Cost analysis, the price-convenience had been substantially deleted by hidden costs and quality problems. After the sharing of these experience all the participants stated that half of their global sourcing projects performed in the mid term a total cost reduction lower than the expectation

However, the risks and uncertainty surrounding labor shortages, currency volatility, and protectionism have raised concerns among the focus group participants. Four CPOs stated that they are aggressively migrating to a more diversified approach to global sourcing and are maintaining a portfolio of supply sources in different regions to mitigate risk.

The CPOs of the two larger companies also noted that the benefits of global sourcing go beyond cost savings to include strategic advantages that come from competing both locally and globally. One of the companies is transferring other steps of the value chain besides sourcing - such as R&D and manufacturing - to LCC to further develop their design capabilities and manufacturing networks. Advances such as these can create a sustainable competitive advantage. Apart from creating competitiveness on a global scale, companies are also leveraging their sourcing offices in emerging regions to help penetration in local markets. By providing access to local markets, establishing relationships with government officials, and demonstrating innovation throughout the supply chain, LCC can generate significant top- and bottom-line advantages even in emerging-market businesses.

4. Conclusions

The theoretical background and the empirical analysis provide us with a complex but interesting vision of the global sourcing phenomenon that allowed us to reviewed the existing debate on the costs and risks of such global sourcing strategies, We further postulate that many global sourcing ventures do yield less than expected benefits – or are in fact not economically viable – due to unforeseen costs that had not been accounted for in the initial calculations, a fact that was vividly illustrated in our focus group. Combined these tools will give the management much stronger conceptual and analytical guidance to improve global sourcing decisions, and thus help reduce future failures of such ventures. Conceptually, the Total cost of global sourcing model can be applied to both global sourcing, as well as international manufacturing (i.e. “offshoring”) decisions alike - the factors to be considered in either global sourcing or offshoring projects are virtually identical apart from the higher capital investment that also needs to be factored in. Future research is encouraged to apply, test and further develop the proposed framework. In particular, its application to additional cases (and preferably industries) is likely to yield additional insights into the dynamics of global sourcing decisions.

**Applying the Geomarketing Concept to Develop a Car Dealership Network in Iași,
Romania**

Ovidiu Dascălu, ovidiu.dascalu@porsche.ro

Applying the Geomarketing Concept to Develop a Car Dealership Network in Iași, Romania

Abstract

In the aftermath of the financial crisis, car dealership networks need to increase efficiency and competitiveness through spatial marketing applications. Currently, the marketing analysis of territories through geographical informative systems and spatial data known under the name of Geomarketing is highly considered, especially in the car distribution networks. Consequently, lately there has been a high increase in the interest to Geomarketing, as a useful universal analytical instrument so that managers can make more informed location decisions.

In this vein, the hereby article presents a case study on the Škoda dealer from Romania, Iași having as major objectives to specify the optimal place of dealer point placing in the Iași area through the generation of a heat map and to define it's optimal attributes. The conclusion of this case study is that, in Iași, Škoda managers need rethinking their marketing place strategy either by relocating in territory (in the area where are concentrated the deliveries of competing brands) or by opening a new dealer shop in the same area of strategic interest of its competitors, currently uncovered by Škoda.

Introduction

The Objective and Applications of the Geomarketing Concept

Geomarketing represents a multifaceted approach allowing not only comprehensive overviews of market but also company data and precise micro geographic studies. In the attempt of companies to increase their potential and pinpoint their target group within highly competitive markets, the Geomarketing flexibility is vital, since it must take into account not only local but also other different factors. (Hardt-Beischl, 2014).

The Geomarketing sums up planning, coordination and control of the customer-oriented activities using geo-information system (Schüssler, 2006). The Geomarketing analyses current or potential markets from the regional / spatial point of view, for an effective planning and measuring of the distribution. Geomarketing completes the classical mix of marketing; Price, Product, Promotion and Distribution to a spatial method of approach, which helps to differentiate the market geographically. It is no more about “who is my customer?” but about “where is my customer?” as in the figure below (number 1).

FIGURE 7: APPROACH OF THE GEOMARKETING REGARDING THE CLASSICAL MIX OF MARKETING

Source: Herter, 2007

The process of globalization has brought the need for companies to study possible new markets because customers are always in search of facilities with regards to the products offered (Ramos, de Oliveira, Neves, Ferreira, 2011, p. 4752). Based on this new market context, analysis methods are constantly arising, such as Geomarketing, which follows a similar trend with that of the market growth. The Geomarketing was defined by Yrigoyen (2003) as “a set of techniques that analyze the economic reality through a geographical point of view, using cartographic instruments and tools of spatial statistics.” Cavion and Philips (2006, p. 1) emphasized that geography, cartography and marketing are directly interconnected within Geomarketing, so that each has a fundamental contribution to a more efficient outcome.

The integration of spatial analysis tools such as Geographical Information Systems (GIS) and marketing techniques can offer to entrepreneurs important information about the relationships and needs of its customers. Thus, this paper aims to demonstrate how techniques of representation and spatial analysis of geographic information contribute to the process of Geomarketing and its applications in a given market (car dealership).

In this new method customers become the main assets and therefore, Geomarketing studies geographic data according to their spatial behavior which is generally based on concepts among which we mention: less effort, connectivity or accessibility.

From the point of view of its applications, the term of geo-marketing is often associated with studies regarding the expansion of networks of Point of Sale (POS) or services (Da Silva, Domingues, Parra Miranda, 2012, p. 7). Indeed, the history of this field of market intelligence is strongly related to the development of techniques for locating/relocating business units. There are, however, numerous applications of geo-marketing, less known, but which are fundamental to understanding the breadth of modern Geomarketing (Gregori, 2010). As Gregori (2009) stipulates, the geo-marketing offers resources to preserve or strengthen an organization by means of the applications highlighted below:

a) Optimization of sales territories and routes: companies face significant waste by not defining sales territories and routes of vendors’ potential. Through geo-marketing methods, one can measure the potential of the market at a micro-regional level. By combining this information to spatial data, including roads access and transportation, one can optimize routes and strategies for managing and hedging markets.

b) Networks optimization via points of contact (PoC). Companies that distribute their products or services through networks of points of contact (retail, banking, financial, etc.) can significantly improve their results by optimizing their placement of POCs, ensuring that their resources are allocated in the most efficient and appropriate manner to their company's strategic time mode.

Main Objectives of the Paper

In our article we will focus mainly on market potential and turnover.

From the point of view of the object of our research, Geomarketing is considered a major quality of a company’s distribution policy (Chasco-Yrigoyen, 2004). The hereby study is meant to bring success and performance through regional market management, especially for the development of a car dealership network, in our case in Iași, Romania.

Why examine the access to car dealership networks and their position in the Iași area?

- In order to develop an efficient car dealership location in the Iași urban area and determine the degree to attract possible customers, by identifying the ideal area where Škoda dealership can be founded;
- In order to analyze the competitive environment of the car dealership networks in Iași and therefore to identify the highest demand for cars of different types according to the spatial opportunities;
- In order to evaluate a certain location by various characteristics of car dealership networks such as: spatial behavior of customers, turnover and market share;
- In order to analyze the feasibility of a new location for Škoda in Iași or the relocation of the existing one.

Therefore, the concrete objectives of this research are to develop a car dealership network in Iași, for Škoda dealer. In this vein, the case study presented in this article focuses on the Škoda dealer from Romania, Iași and the main goals are to identify the ideal location of dealer point placing in the Iași area by generating a heat map and by defining it’s ideal features.

Further on, a description of outcomes of the research is presented in terms of methods and techniques originated by investigating both the Geomarketing field and the case study company.

Method

To address the above mentioned research issues, a particular methodology is proposed that includes a paradigm for visual representation and navigation along with Geomarketing techniques aiming at experimenting it in different domains. This research will be an explorative research that will examine if and how the Škoda car dealership network are managing efficiency and competitiveness situations through spatial marketing applications and what are the specific steps that they are taking in order to prepare the organization for rethinking their marketing place strategy. Using a Geomarketing approach the research will be highly analytical, examining if it is necessary or not to open a new Škoda dealer shop, and in which area of strategic interest in the specific region.

The collection of primary data will be conducted from Geomarketing instruments. By these tools, the author will examine sales territory planning by using large wall maps, pins and strings. Along with its specialized software, Geomarketing will provide in depth data regarding the process of sales structure directly on digital maps, will plan new idealized structures and perform fine-tuning measures for Škoda dealer network from Iași, Romania. Secondary data will be collected from reviews of other comparable researches conducted in this field, as well as from review of the literature written on this subject.

For the statistical database several variables were collected in order to identify the market share of each car dealership in Iași:

- a. Car dealership locations, addresses, market shares and yearly deliveries.
- b. The number of adjacent locations, if any, were collected from field observations in each location.

Results

Step 1. Locating the car dealership networks in Iași. First of all, it should be noted that, Škoda dealer location in Iași is not in the same area as the rest of its main competitors (Dacia, Renault, VW, Opel, Ford, etc), as it can be seen in figure number 2.

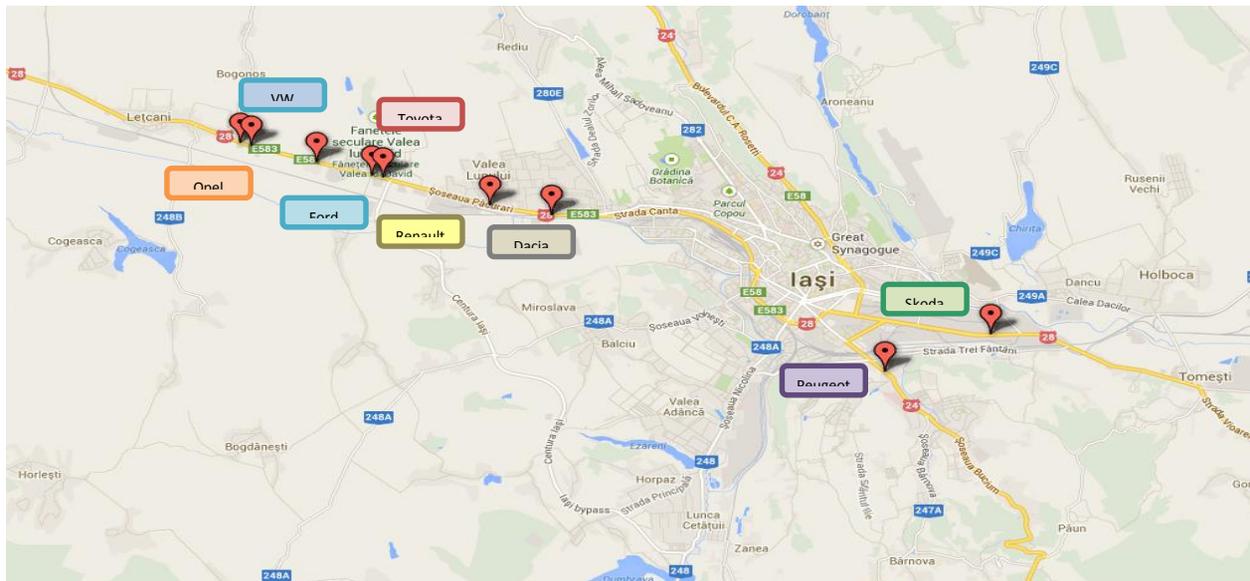

FIGURE 2: CAR DEALERSHIP NETWORKS LOCATION IN IAȘI

According to our researches and figure number 2, six major car dealership are located in the North-West of Iași, on Pacurari Street, meanwhile Škoda and Peugeot are located in the opposite part (South-East) of the city, but in the same area.

Step 2. Locating the heat map with regards to the car dealership networks in Iași. Additionally, from our results it becomes clear that the heat point of the car geographical distribution is situated on the Pacurari Street area, in Iași), where most car dealership networks are located, and not where Škoda dealership is located, as it can be observed in figure number 3.

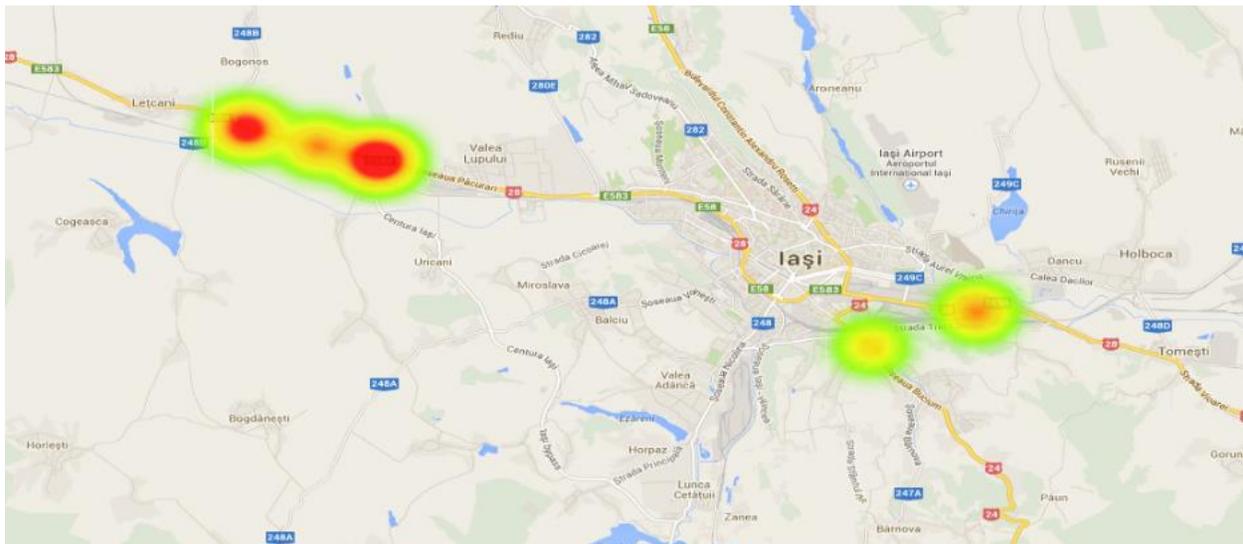

FIGURE 3. CAR DEALERSHIP NETWORK HEAT MAP IN IAȘI

Further on, was calculated the market share evolution during 2009-2013 without taking into account Dacia (the national car sales leader) in order to get a perspective view on the share evolution of each car dealership network from Iași.

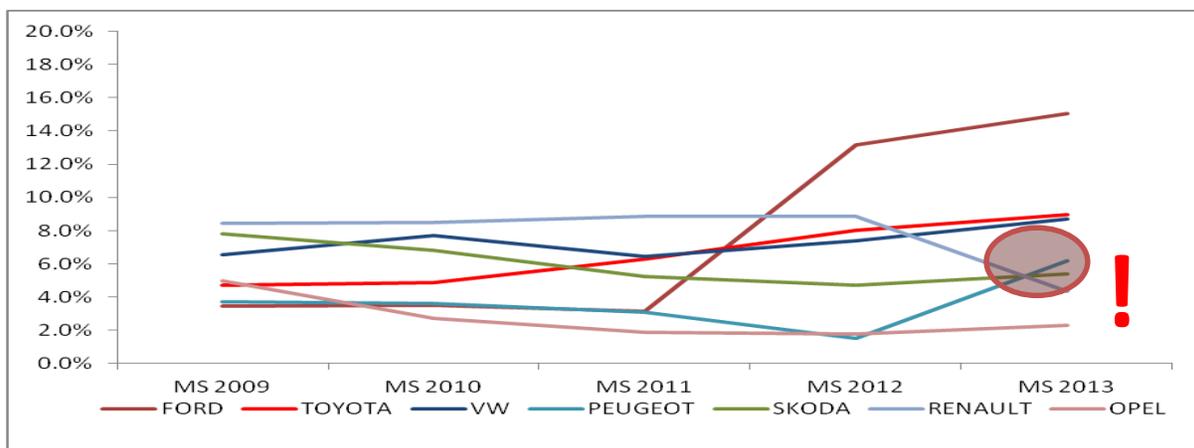

FIGURE 4. CAR DEALERSHIP NETWORK MARKET SHARE EVOLUTION IN IAȘI (WITHOUT DACIA)

We chose to calculate the deliveries of the car dealer networks in Iași, during 2009-2013 according to their location, in order to understand if Škoda has or not a competitive advantage due to its location. Without taking into consideration Dacia, as already mentioned above, the scale expands and this gives us the opportunity to analyze in detail the performance of all competitors in the field.

Step 3. Locating the main problems faced by Škoda dealership. Lately, Peugeot enjoyed its geographical position winning Škoda customers (see 2012 versus 2013 benchmarking in figure number 4)

As in every distribution business, the controlling of the distribution policy is very complex and has an important role for the success of the company. It has not only to check if the products arrive at the final consumers in a desired way, but it also has to analyze the costs of the logistics in order to reduce them as much as possible. The fact that Peugeot has taken over Škoda's clients is a big threat for Škoda, especially when we speak of about 15% customers loss.

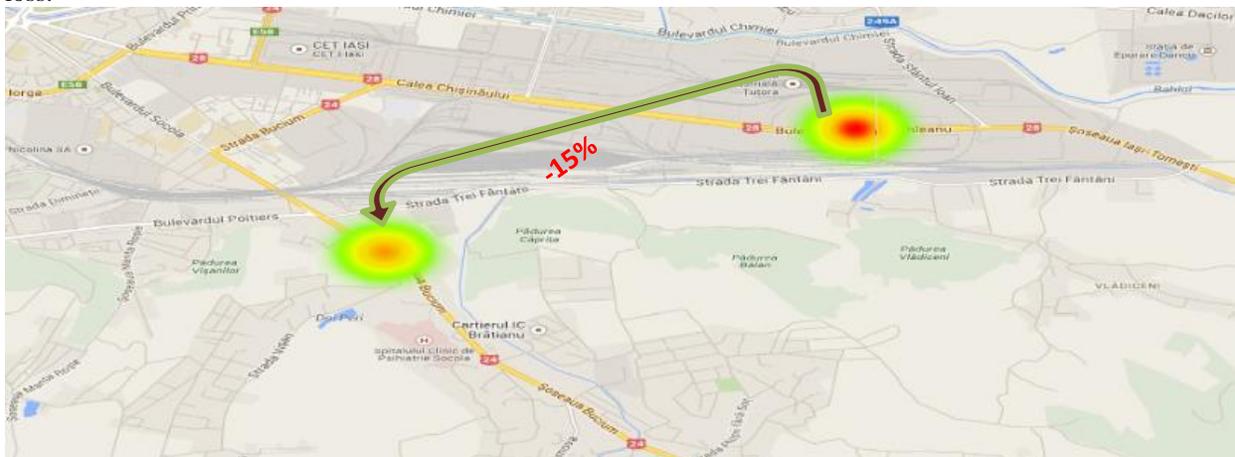

FIGURE 5. DELIVERIES 2009 – 2013. GEOGRAPHICAL SUBSTITUTION OF DELIVERIES BETWEEN ŠKODA & PEUGEOT

Step 4. Locating the ideal Škoda dealership location. The results of the research prove that managers need rethinking the location of Škoda dealership network in Iași, which, although close to Peugeot, is in the opposite part of the city compared to the other car dealership networks. As the article proved, the deliveries of competing brands are much higher, due to their location. Also, Peugeot is stealing customers from Škoda. Therefore, the solution proposed for Škoda is either relocating in territory (in the area where are concentrated the deliveries of competing brands) or opening a new dealer shop in the same area of strategic interest of its competitors, currently uncovered by Škoda.

Discussion

Even if Geomarketing activity begins to have an increasing recognition in larger firms in Iași, Romania, by creating specific departments and placing it at a strategic level, Geomarketing still remains at a low developed level

The research also points out that:

- a. The more diverse are the variables taken into consideration for the classification of car dealership network, the more precise and accurate will be the typology obtained;
- b. In accordance with the methodology used in the paper, Geomarketing solutions should be based on the approaches below:
 - the highest market share principle;
 - positioning in the given area according to a hedonic model;

- suitability of the area for building/renting a new location;
- location-allocation model;
- quantitative models for assessing the possible interaction between suppliers and customers;
- customers' behavior.

We can conclude that the distribution of car dealership networks in Iași is rather even, because there are so far two major areas where car dealerships are located. Among these, the Pacurari Street stands out, being the area with the highest values of car market share. Also the Geomarketing research indicates this zone as being the most suitable for opening a new/relocating the old Škoda car dealership.

Innovation, Internationalisation, and Business Performance: Case Studies from the Italian Furniture Industry

Abstract

Innovation and internationalisation processes are relevant key drivers for the development of companies. Their role in performance and success of firms is still an open question in the literature, suggesting the need for further research. In this context, our paper¹ aims to improve understanding of the relationship between innovation, internationalisation, and performance focusing on the Italian furniture industry. In a systematic effort to match the empirical world to theory, we adopted a qualitative approach based on a multiple-case study of four Italian furniture firms. First, we found that, for the managers interviewed, innovation is relevant if it creates new value for customers. Second, our findings suggest that the relationship can be better explained through in depth analysis of the key dimensions of innovation and the different local contexts.

Background

Innovation is one of the most studied topics in management today. From Schumpeter's (1942) pioneering contributions onwards, innovation has been considered to be a multifaceted concept whose meaning extends well beyond the narrow boundaries of technological innovation. Several literature proposals on this topic tried to define innovation and its taxonomy; they all recognised that innovating is an activity that pertains less to the domain of technology and more to domains such as marketing, operation management, supply chain management, and their combination (Bortoluzzi, de Luca, Venier & Balboni, 2014).

One of the most popular distinctions is the one introduced by Damanpour (1991) that distinguishes between technical and administrative innovation. While the former (technical) refers to the launch of new products in the market and to the adoption of new production processes to increase efficiency, the latter (administrative) refers to new procedures, policies, and organisational forms. The Oslo Manual (OECD, 2005: 46) defines innovation as "the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organisational method in business practices, workplace organisation or external relations". Another proposal comes from Tidd and Bessant (2009), who refer to a 4Ps framework of product, process, position and paradigm. While product and process represent traditional aspects of innovation, position refers to a change triggered in the consumers' perception of a product, a brand, or a firm. By innovation at the paradigm level, the authors refer to changes occurring at the business model level. It goes without saying that pursuing such types of innovation is very complex, since it involves different levels (strategic, operative) and functions (marketing, supply chain, operation management, finance, etc.) in the firm.

An interesting contribution, coming from Sawhney, Wolcott, and Arroniz (2006), defined business innovation as "the creation of substantial new value for customers and the firm by creatively changing one or more dimensions of the business system" (p. 29). While managers might consider innovation only as synonymous with new product development or traditional Research & Development (R&D), the authors consider that "such myopia can lead to the systematic erosion of competitive advantage, resulting in firms within an industry looking more similar to each other over time". In contrast, the authors point out that "business innovation is far broader in scope than product or technological innovation" (p. 28). In this perspective, business innovation: a) is new value (not only new things); b) comes in many flavours; c) is systemic. A new tool, called "innovation radar" by the authors, presents and relates all the dimensions of business innovation, anchored by the offerings a company creates (what), the customer it serves (who), the processes it employs (how), and the points of presence it uses to take its offerings to market (where) (Sawhney et al., 2006, p. 30). There are 12 dimensions:

¹ This study is a part of a wider research project supported by the University of Trieste (Italy) under the FRA 2012 Program.

1. Offerings (develop innovative new products or services);
2. Platform (use common components or building blocks to create derivative offerings);
3. Solutions (create integrated and customised offerings that solve customer problems end-to-end);
4. Customers (discover unmet customer needs or identify underserved customer segments);
5. Customer experience (redesign customer interactions across all touch points and all moments of contact);
6. Value capture (redefine how the company gets paid or create innovative new revenue streams);
7. Processes (redesign core operating processes to improve efficiency and effectiveness);
8. Organisation (change form, function, or activity scope of the firm);
9. Supply chain (think differently about sourcing and fulfilment);
10. Presence (create new distribution channels or innovative points of presence, sale and consumption);
11. Networking (create network-centric intelligent and integrated offerings);
12. Brand (take a brand into new domains).

Independently of the type of innovation, several studies show that innovative companies are more successful. First, according to some authors (Cooper & Kleinschmidt, 1995; Poon & MacPherson, 2005; Bhaskaran, 2006), they achieve better business results, such as more market share and profits. Second, innovative companies stand out on qualitative aspects, such as increased reputation, customer loyalty, relative attractiveness of products to the customer, and so on (Kuster & Vila, 2011). In any case, the relationship between innovation and economic performance is still an open issue in the international literature (Garcia & Calantone, 2001). While several studies highlight that innovation positively affects performance (Hall & Mairesse, 1995; Adams & Jaffe, 1996; Chesbrough, 2007), other studies point out that innovation is not sufficient to garner economic and competitive success, suggesting an uncertain relationship (Rosenbusch et al., 2011; Lazzeri & Piccaluga, 2011).

Why do innovative companies show different economic performance? In recent decades, the competitive landscape has changed consistently for firms in all industries. The globalisation of the world economy and the continuous evolution of technologies have pushed firms to evolve continuously and considerably, in different countries and markets. Consequently, coupling strategic agility with the capability to innovate has become compulsory (Doz & Kosonen, 2008, 2010). Some authors contribute to the discussion by pointing out the existence of strong strategic synergies between innovation and internationalisation processes, also in affecting company performance (Kotabe et al., 2002; Kafouros et al., 2008; Wilson & Doz, 2009; Onetti et al., 2010; Siedschlag et al., 2010; Cassiman & Golovko, 2011; Küster & Vila, 2011; Lecerf, 2012; Louart & Martin, 2012; Yu & Si, 2012). The relevance of that relationship appears above all in the case of emerging markets, where some empirical evidence reveals the failure of several market entering decisions, due above all to the inability of the firms to adapt their innovation strategies to the economical and institutional features of foreign markets (Ramamurti, 2000, 2004). Consideration of the role played by market-specific factors, such as the local socio-economic context, in innovation development is not recent. In the past, Schumpeter (1934) highlighted the role of context in innovation. Furthermore, at a very abstract level, Nelson and Winter (1982) discussed about the survival of firms propelled by innovation, but determined by the environment. At a less abstract level, according to the literature on technological capabilities in developing countries, other authors (Kim, 1980; Dahlman et al., 1987; Lall, 1992) considered the sensitivity of innovation to local conditions. From another point of view, the literature on social capabilities (Abramovitz, 1986) also proposed the need to develop favourable conditions for innovation (Srholec, 2011).

Consideration of the context leads one to consider the role of market orientation in innovation (Lukas & Ferrell, 2000). The literature suggests that market orientation behavior leads to more innovation and greater success with new products. According to Jaworski and Kohli (1993), market orientation implies carrying out new actions in order to respond to market conditions. Consequently, as pointed out in recent studies (Lado & Maydeu-Olivares, 2011; Agarwal, Erramill & Dev, 2003), market-oriented behavior has an impact on innovation; that is, companies that are more market-oriented will be more innovative. In the end, both market orientation and innovation lead to business success (Küster & Vila, 2006: 40-41).

In this perspective, in an international context, market orientation encourages one to consider the question of standardisation versus adaptation. Indeed, on the one hand, the need for adaptation to a specific foreign context could lead to innovation, repeatable in turn in different markets. On the other hand, innovation—along all its dimensions—

could facilitate the internationalisation process, allowing greater effectiveness and efficiency when competing in specific foreign markets.

Research Questions and Method

Innovation and internationalisation processes are relevant key drivers for the development of companies. Their role in the performance and success of the firms is still an open question in the national and international literature. The findings from existing studies differ in many respects, suggesting the need for further research. In this framework, our paper aims to improve understanding of the relationship between innovation and internationalisation as they affect economic and competitive success. Some research questions were developed:

RQ1: What does innovation mean and what are its main dimensions from a company's perspective?

RQ2: What do managers think the relationship between innovation and internationalisation?

RQ3: How can different local contexts affect the relationship between innovation and internationalisation?

RQ4: How can innovation and internationalisation contribute to economic and competitive success?

In order to answer to these questions, qualitative research was undertaken using a multiple-case study (Eisenhardt, 1989; Yin, 2009). The objective was to explore deeply the existing relationship between innovation and internationalisation through systematic work to find a match between theory and practice (Eisenhardt, 1989; Dubois & Gadde, 2002; Strauss & Corbin, 1990; Yin, 1994, 2003, 2009). Indeed, as different scholars have pointed out, the case study approach, allowing detailed examination of a specific phenomenon or other related events (Yin, 1984; Gummesson, 2000; Ojasalo, 2012), offers an important advantage, namely, the opportunity for a holistic view. This method is very flexible, due to the fact that case studies can be descriptive, exploratory, or explanatory. Furthermore, according to Eisenhardt (1991), multiple cases become powerful tools in building theories, because they allow replication and extension to other singular cases. Replication means that single cases can be used to help researchers simplify recognition of patterns. Extension refers to the use of multiple cases to create a complex theory, since different cases often reveal complementary aspects of the same phenomenon.

This paper is based on an analysis of the data collected in a specific industry, house furnishing by Italian firms. The choice is based on the fact that this is one of the leading branches of Italian manufacturing, as well as on its status with the emblem of *made in Italy* in the world², even if in the last few years it has been confronted with changing scenarios—first of all the stagnation of internal demand³, then the growing competitive pressure from new producers, such as China⁴—that threaten to reduce the market share of Italian firms in the foreign markets. In this new and even more complex competitive field, the business innovation of a firm, defined as a new value for customers (Sawhney et al., 2006), is identified with the capacity to grow by consolidating presence on the international markets; this has become a strategic imperative (Vianelli, de Luca, & Pegan, 2012).

We have studied four cases of Italian furniture firms that have operated for several years in foreign markets, also via commercial/administrative branches, and that present in the majority a high rate of foreign sales on total sales. In Table 1, we summarise the main features of the analysis. In the first phase of the study, we analysed a single case⁵ and in the second phase, we conducted a comparative study of the different cases, in order to spot common patterns. The case study method required collecting primary and secondary data. Secondary data came from different sources, such as companies' documents, web sites, and reports. We collected primary data through in depth interviews of export managers who are strongly involved in the strategic decisions of their respective companies. The interviews, lasting

² After the USA (19%), Italy (8%) represents the main furnishing producer in the seven main industrial economies of the world that together cover 47% of the total production worldwide. Added together, the production in all the developed countries covers 61% of the total (World Furniture Outlook 2013).

³ The international crisis, from 2007 till now, has reduced national consumptions by 30% (Il Sole 24 Ore, 2013).

⁴ Production in emerging countries covers 39% of the total, while China on its own is 20%, followed by Poland, Brazil and Vietnam. These are countries that have seen their production increase thanks to specific investments in specialised structures, designed and built to promote exportation (World Furniture Outlook 2013).

⁵ In this paper, we pay attention only to the results that emerged from the second phase of the study.

60 to 90 minutes, were taped and transcribed⁶. Our coding scheme development was driven both by the data and theory.

TABLE 1: MAIN CHARACTERISTICS OF THE FOUR CASES OF ITALIAN FURNITURE FIRMS

	Turnover 2013 Millions €	Foreign Sales/Total Sales (%)	Number of employees	Core business	Commercial/administrative foreign branches	Number of countries	Sale points owned
Firm C	130	65%	600	Furniture	Yes	90 countries	Yes
Firm M	30	80%	146	Padding and seats for high quality furnishing	Yes	84 countries	No
Firm S	180	78%	1200	Kitchens	Yes	80 countries	Yes
Firm V	35	37%	165	Kitchens	No	NA	No

Findings and Discussion

With the aim of answering the first research question (what innovation means and what its main dimensions are from a company's perspective) we propose a definition of innovation given by the interviewed firms and a derivation of the main dimensions that have been the investment objectives of the same firms in the last 5 years (see Tables 2 and 3). As you can see in Table 2, companies proposed different definitions that showed clear links to their specific businesses.

TABLE 2: DEFINITION OF INNOVATION FROM A COMPANY PERSPECTIVE

	Definition of innovation
Case C	<i>"I can imagine innovation as a show schedule of supporting tools that are needed to make happen what has been decided to..." ..innovation is shifting from selling products, most of all tables and chairs, to selling branded spaces."</i>
Case M	<i>"The innovation in the furnishing field is mainly characterized by the use of materials known in a new way rather than the research of new ones." "In the furnishing sector there's the presence of a low surplus value from a technological point of view." "Innovation of refinement, for example a carpet used as a upholstery because the director had decided." "Proposing new products is a standard of our sector, however, some remain only proposals and other become catalogue products." "Giving a definition of innovation is hard: for me innovation often means going back to past values."</i>
Case S	<i>"If for innovation we intend change/evolution/improvement it has happened everything, we changed our group structure, we created platforms of group products that gave us the opportunity for a new positioning of prices in a lower sense, this much is tied to the product/process that are the two things that have been in syntony with the change of the markets targets as well as the client/consumer."</i>

⁶ The data collected through the interviews have been literally translated in English, in order to maintain the original meaning. For this reason, the tables can present several errors.

Case V	<i>“In the furnishing field innovation means most of all innovation of material, materials that are used in kitchen or in furnishing, innovation of shape and there’s in any case the innovation which is linked to a new way of using ergonomically the kitchen...”</i>
--------	--

In two cases, C and S, it emerges that innovating is an activity that pertains more to domains such as marketing, operations management, and supply chain management, and their combination, in agreement with the prevailing literature (Tidd & Bessant, 2009). In the other two cases, M and V, however, the interviewed subjects placed importance especially on the technological aspects, such as materials, shape, usage functions, and ergonomic features. In any case, innovation is not easy to define, as M underlined: *“Giving a definition of innovation is hard...”*

To look more deeply at the concept of innovation from the managers perspective, in Table 3 we have summarised the results that emerged on the main dimensions of the innovation radar (Sawhney et.al., 2006, p. 30) that, according to the interviewed subjects, have involved their companies in the last five years.

TABLE 3: MAIN DIMENSIONS OF BUSINESS INNOVATION DURING THE LAST 5 YEARS

Dimensions of Innovation		Case C	Case M	Case S	Case V
<i>What</i>	Offering	2	1	1	1
	Platform				
	Solutions				2
<i>Who</i>	Customer	4		4	
	Customer Experience				
	Value capture				
<i>How</i>	Processes	3		2	3
	Organization		3		4
	Supply chain				
<i>Where</i>	Presence	1		3	
	Networking		2		
	Brand		4		

First of all, in most cases, the dimensions linked to offering (*what*) turned out to be the most relevant aspects of the radar selected from the interviewed managers, not only in terms of innovation of the product, but also in terms of real, true furnishing solutions proposed to satisfy efficiently the changing needs of the market. However, with the purpose of creating new value for customers, there is agreement on the primary importance of innovating via organisational internal or external processes. This type of innovation can improve effectiveness and efficiency, giving the company a chance to meet the challenges of a more complex and competitive market. Especially in the two larger companies’ cases (C and S), it in fact surfaced that “managers think holistically in terms of all possible dimensions through which their organisation can innovate” (Sawhney et al., 2006, p. 29). The strategic relevance of investing in branding in such a fragmented sector represents a crucial aspect of operating successfully in foreign markets. It is interesting to highlight how, in the case of firm M, the revision of the processes was introduced most of all in a new value given to marketing, where the core aim is to make brand equity. For cases C and S, the co-creation of the brand value all along the supply chain represented instead a strategic imperative that is nowadays also consolidated abroad. Indeed, these companies are used to proposing innovative furniture solutions, offered to the customers in branded points of presence, where the distinctive value of *made in Italy* enhances their product offering (Mattiacci & Pastore, 2014; Pegan, Vianelli, & de Luca, 2013).

With regard to the second research question (how managers consider the relationship between innovation and internationalisation to obtain economic and competitive success), from the results of our case analysis three main categories emerged (see Table 4).

TABLE 4: RELATIONSHIP BETWEEN INNOVATION AND INTERNATIONALISATION

	Innovation drives internationalisation	Internationalisation drives innovation	Bidirectional relationship
Case C			<i>It's a symbiotical relation...an egg-chicken relation: it is difficult to say if it is more the fact of becoming international that has boosted innovation or vice versa." (C)</i> <i>"It's hard to define which is the cause and which is the effect...the two things nourish one the other." (C)</i>
Case M		<i>"The foreign market –so internationalization- has forced us to change, to renew, to stay ground to the concept that if you adapt yourself you survive otherwise you exit from the market." (M)</i>	
Case S			<i>To me it is bidirectional...there is a tension to internationalization that is businesslike and this nourishes the will to innovate." (S)</i>
Case V	<i>"You cannot internationalize without innovation." (V)</i>		

First, innovation drives internationalisation, as in case V, where the interviewed manager said that without innovation, internationalisation is impossible. Second, internationalisation drives innovation, as in case M, where the interviewed manager highlighted the role of the foreign markets in the innovation process; for example, a law in a foreign market excluding the use of specific materials could affect the firm's innovation process. Third, the relationship between innovation and interrelation is bidirectional, as pointed out in case C and S. Both the interviewed managers emphasised that it is difficult to recognise which is the cause and which is the effect; in the real global context these two dimensions are strongly interrelated. The interviewed managers, according to what the literature emphasized (Kotabe et.al, 2002; Kafourous et al., 2008; Siedschlag et al., 2010; Cassiman & Golovko, 2011; Küster & Vila, 2011; Lecerf, 2012; Louart & Martin, 2012; Yu & Si, 2012), agreed on the existence of a strong strategic synergy between innovation and internationalisation processes that affects company success.

In this general framework on the relationship between innovation and internationalisation, it is really interesting to highlight that, from the analysed firms' perspectives, this relationship is clarified by studying the possible interactions with the single key dimension of innovation. In particular, you can see this in Table 5, where some interviewed managers (C and V) state that an innovation along the product dimension, that is, the creation of a new product or service valued by customers, represents a key driver of the internationalisation process of a firm. The decision to expand or enter into new markets, for all the participating firms, drives business innovation, especially along their core operating processes, in order to improve efficiency and effectiveness. The interviewed managers agreed that a firm can take advantage of foreign market opportunities only if there's the possibility to innovate its organisation. Also Case V, in agreement with Sawhney et al. (2006), underlines the fact that an organisational innovation often involves a redefinition of people's roles and responsibilities. The challenge of internationalisation and the establishment of new and stronger competition lead to an increase in investment in branding, moreover, consisting in the creation of new points of presence that boost brand awareness of all the foreign intermediaries and final customers. As suggested by managers, these investments represent a strategic tool for competing successfully in the furniture industry, where generally the final consumer cannot perceive the added value of the *made in Italy* products (Pegan, Sambri, 2009; de Luca & Pegan, 2013).

The main results of our study, related to the third research question (how different local contexts affect the relationship between innovation and internationalisation), are illustrated in Table 6. The experience of company S indicates how this relationship is linked to the different markets in this study. The complexity of a furniture product that enters in

Eastern customers' houses with their very different cultures emphasises the importance of adopting a localized approach (Alon & Jaffe, 2013). In other words, an adaptive approach to the local market is needed, whereby innovation is achieved in a way specific to that market and along different dimensions, most of all in the so-called emerging markets, such as India. Also, in the case of firm M, the driving role that markets such as India, Japan and Brazil – according to the CAGE distance framework, these countries are very different from the western ones - have in stimulating business innovation along different dimensions is clear, especially the ones anchored to offering and to the organisation process. These results seem to support the idea that, in agreement with Jaworski and Kohli (1993), market orientation implies carrying out new actions in order to respond to market conditions. Consequently, companies which are more market-oriented might be more innovative (Lado & Maydeu - Olivares, 2011; Agarwaal et al., 2003).

It is important to note that, according to the interviewees, another crucial context factor in the relationship between innovation and internationalisation is surely the international crisis. On this issue, case S points out how the same crisis has been a great opportunity to innovate or improve business: *“the positive aspect of the crisis is that it made brains move, the will, the duty to call again into question and what was good before is no longer so, if you remain fixed there you are “dead”; each delay on change meets a competitor that is quicker, more good in changing...eliminate the frippery, everything that is in excess and improve the product's quality, you can no longer afford inefficiencies...you also have to be very efficient in your processes...”*

In the international markets, the economic crisis effects speeded up a change both of intermediaries' and end customers' expectations, that is, of more value for money—not only lower prices, but also better services. In order to create new value for foreign customers, a furniture firm should be very innovative in this department. In this way, it will be easier to erase the negative image of Italian furniture firms that are expanding their services abroad (case S). To sum up, most of the cases show that context plays an important role in influencing the relationship between innovation and internationalisation.

Finally, we studied how managers perceive that the relationship between innovation and internationalisation contributes to economic and competitive success (How can innovation and internationalisation contribute to economic and competitive success?). In all the cases studied, this relationship turned out to be very complicated, above all due to the difficulty of measuring the impact that innovation has on company performance. According to Kafouros et al. (2008), the relationship between innovation and performance cannot be understood without taking into consideration the internationalisation process. For the case C, for example, innovation along the brand dimension represents the nourishment of the internationalisation process, and one of the main factors influencing the firm's performance. Also, what turns out to be relevant here is the need to understand the operational context. For example, case S says that: *“there are markets where there's a price for innovation, for the product's design, for the exclusivity of the product, for the differentiation of the product. For example in Russia we sell with a premium prize that is important because you sell the brand, the image, the product, you only sell high image products so the marginality is very high”*. In other markets, such as India, the same manager asserts that the customer is not always willing to place more value on innovation: *“If you go in a market where the client has a price level for the product, you can be as innovative as you want but you cannot go over a certain price level, you will not succeed in selling, so marginality is also linked to this...in India innovation cannot cost too much; we are having great developments but with an average marginality”*.

TABLE 5: TYPE OF RELATIONSHIP AND ITS INTERACTION WITH KEY DIMENSIONS OF INNOVATION

Dimensions of Innovation	Innovation drives Internationalisation	Internationalisation drives innovation
<p>WHAT (Offering, Platform, Solutions)</p>	<p><i>“The only way to differentiate and to differentiate our self is to offer products that are more innovative, different, more beautiful, that solve problems...so we want most of all innovation of the product.”(S)</i> <i>“There are products because you designed them in the right way, because you found the proper shape, you find clients that fall in love, wants you and put you into a shop...in Moscow rather than New York; clearly if we talk about innovation of product this is the innovation that gives you the opportunity to export.”(S)</i> <i>“Something that gave us luster is having inserted glass as a kitchen material, for what concerns worktops as well as shutters and surfaces. Glass is a noble material , it has several features that that made it a great success.” (V).</i> <i>“An opening system created by us and that only we do, that let us hide the kitchen area very quickly, because the general trend worldwide is to merge the kitchen with the day area of the house, and this is a mega trend of modern architecture, which is true in America, Europe, Asia, everywhere.”(V)</i></p>	
<p>HOW Process, Organization, Supply chain</p>		<p><i>“We had to project again product/process to enter in specific markets, because otherwise the delivery times would have been too long, the transportation costs and the duties too high.” (S)</i> <i>“If you want to go in some markets, if you don’t have something different it becomes difficult to face with the price, if we talk about retail. Vice versa we had to innovate in terms of production process/composition of the product, to succeed in entering in other markets.” (S)</i> <i>“...This new way of being in foreign markets requested the renewal of our processes capacity to give services, supports that we give to clients.”(C)</i> <i>“What I do is dealing with the area with local partners, a lot relation and less direct sell. It is important to create a relation that can convey mi brand and therefore my product.” (M)</i> <i>“The organizational innovation has been very influent, for example we only hire people that speak at least English, we didn’t do it before...We innovated several things in the company to face internationalization..”. (V)</i></p>
<p>WHERE</p>		<p><i>“In the last years we have been developing also in terms of service, much presence toward the International client, in the sense that we invested, sometimes directly other times indirectly,</i></p>

(Presence, Brand, Networking)		<p><i>with people that speak the local language with a back-office (for example in Russia and in Germany).”(V) “Let’s say that the innovation of shifting from selling products, most of all tables and chairs, to sell branded spaces has redefined the way in which we are present in the foreign markets.” (C)</i></p> <p><i>“in opening mono-brand shops we had to take into consideration competitors that where no- producer or not only producer but suppliers or retailers. Thus our internal competences had to change.” (C)</i></p> <p><i>“When we talk about vision and mission we want to become more life-style than we are now so that the brand becomes strong enough to be recognized l lover the world. On the brand itself we have been working in this perspective for 6 months.” (M)</i></p>
WHO (Customer, C.experience, Value Capture)		<p><i>“The noticed change in the luxe sector requested a re-segmentation of the clients. not only it can be said “he has the money to buy”: it is necessary to have more information on the segment.” (M)</i></p> <p><i>“We are still changing the way of making sale points; previously we had an expositive concept, now the world is different and the clients are different too.”(V)</i></p>

TABLE 6: ROLE OF THE LOCAL CONTEXT IN DRIVING BUSINESS INNOVATION

Foreign Markets	Dimensions of Innovation			
	WHAT (Offering, Platform, Solutions)	HOW (Process, Organization, Supply Chain)	WHERE (Presence, Brand, Networking)	WHO (Customer, C. Experience, Value Capture)
China/ India	<p><i>“We developed for markets such as India and China a project system of dealing with the product in a disassembled way to succeed in delivering the products in short times and to deal with transportation cost efficiently.” (S)</i></p> <p><i>“... Even in China it’s complicated to import therefore to be quicker and have less spreading problems we make aluminium structures.” (M)</i></p>			<p><i>“Chinese brought market to a lower level, but they have rebalanced it, asking us to re-evaluate payment procedures.” (M)</i></p>

	<p><i>“If we talk about India there is a type of kitchen which is done in a specific way, a specific cooking is needed, dedicated spaces for the kitchen are needed too in opposition to our technical solution...so you have to find electrical appliances; we created specific appliances and devices, in our shops if you buy a rice tin and keep it in the pantry is done; there they have rice keepers of 50 kilos that needs to be kept at a precise humidity and you have to find solutions for this...”(S)</i></p>			
Singapore		<p><i>“We are reflecting on Singapore, to establish an office that supports the orders collection, the sale point assistance for all the Asiatic south-east... “because our product, every kitchen that we do is different from an other, it’s an extremely customized product.” (V)</i></p>	<p><i>“In the case of investor, such as Singapore, that invest in spaces of branded products, there we adapt because we know we have to be commercial.” (M)</i></p>	
Africa	<p><i>“Knowing that exporting wood in Africa is not possible due to the fact that taxes are very high, for me the technological innovation is exactly in introducing aluminium structures for some products. Adaptation from one hand and innovation for us has been referred to Africa that introduced this type of development. In North Africa, South Africa and China importation is complicated so to be faster and have less delivery problem we make aluminium structures.. (M)”</i></p>		<p><i>“In Africa a distribution network doesn’t exist, I need a Lebanese who create a network and the contact. He has an interest and we have to leave the 50% of deal on the markup.” (M)</i></p>	

Japan/ Brasil		<p><i>“ The consciousness of consumer it’s high and objections come from Japan because this product doesn’t meet the target (chair with air bubble). For them it is important to know why and if you have a tension to improvement. Till the easier solution and they don’t reply anymore because they know it is the best result possible. The Japanese market makes you implement a process innovation. They force you to bring this improvements and if you can you use them in other places.”(M)</i></p>	<p><i>In countries such as Japan and Brasil – that are extremely closed markets with entry boundries duties or a controller distribution- here we can evaluate licensed collaborations of product or brand, but we haven’t acted yet.”(V)</i></p>	
------------------	--	--	---	--

Conclusion

The relationship between innovation and internationalisation, usually studied with the aim, above all, of understanding its effects on business performance, is still an open question in the international literature. Several studies pointed out the existence of a complex relationship, influenced by different firm, industry and market-specific factors. In this framework, our study contributes by integrating into the literature a deeper view of the multifaceted phenomena of innovation, internationalisation and their complex relationship, as well as their capability of influencing business performance, in a specific context, that is, Italian furniture companies.

First of all, our findings highlight that interviewed managers do in fact tend to consider innovation from a holistic perspective. Indeed, by avoiding a narrow view of innovation, companies can obtain economic and competitive success in their specific sector. In this way, acting with regard to the key dimensions of innovation, a firm can create new value for customers.

Second, our results suggest that the relationship is very complex and mutually dependent. Furthermore, our case studies imply that the relationship between innovation and internationalisation can be better explained through in depth analysis of the different specific local contexts. In other words, from our analysis the critical role of the market orientation of a firm comes to light and leads one to consider the question of standardisation versus adaptation. Indeed, on the one hand, the need for adaptation to a specific foreign context could lead to an innovation, repeatable in turn in different markets. On the other hand, innovation, in all its dimensions, could facilitate the internationalisation process, allowing greater effectiveness and efficiency when competing in specific foreign markets. The relationship between innovation and performance cannot be understood without taking into consideration the internationalisation process.

Since the relationship between innovation, internationalisation and business performance is gaining relevance from both the academic and managerial points of view, it would be useful to do further research by also considering other firms from different industries. Future studies should more deeply investigate market-oriented attitudes and behaviours of companies, as well as the different phases of the internationalisation process. After qualitative study, a quantitative approach could be useful to better understand how that relationship appears in a larger sample of companies.

Creative cities: emerging Italian cases

Maria Della Lucia, maria.dellalucia@unitn.it
University of Trento, Italy

Creative cities: emerging Italian cases

Abstract

In post-industrial societies, culture is frequently deployed to innovate traditional sectors and their outputs through the injection of creativity and knowledge into the urban system. The term *creative city* identifies both the source of creativity and the many processes which use it as a driver of sustainable development and renewal. In Italy the dynamic between heritage resources and policies, both contributing to the development of creative cities, usually produces traditional development models based on cultural tourism. Trento is an Alpine city which is bucking this general trend and exhibits many culture-led development paths and *smart specializations*, i.e. forms of hybridization between local heritage and the creative economy. However Trento cannot yet be considered a fully fledged creative city since it has still not articulated a shared, informed and organic development plan focused on culture-led processes. A greater awareness of how culture can be linked with other sectors – tourism included – and the creation of a governance system which fosters and manages cross-sectoral fertilizations and social innovations are required before Trento can really be described as a creative city.

1. Introduction

The combination of the knowledge (Scott, 2010), the experience (Pine & Gilmore, 1999) and the digital economy (Zuboff & Maxmin, 2002; Rifkin, 2011) that shapes post-industrial societies, has made *intangibles* strategic assets for sustainable development and competitive advantage (Sedita & Paiola, 2009). Knowledge-based resources and symbolic components in production meet complex individual personalities and evolved motivations thereby transforming consumption into experience and learning patterns defined for, and with the participation of, the user. The Internet generation has defined a new capitalism that acts as a multiplier of these processes of dematerialization and symbolic value creation (Scott, 2000). This “distributed capitalism” (Rifkin, 2011) allows organizations and individuals to interact widely, to participate in virtual communities (Funilkul and Chutimaskul, 2009) in which interactions are not mediated by the market alone (Potts et al. 2008) and to exchange and co-create knowledge-based resources on a global scale (Cooke and Buckley, 2008). The potential of technological infrastructure (its ubiquity and interactivity) combined with the non-rivalry and non-excludability of knowledge-based resources are increasingly blurring the boundaries between supply and demand in the co-creation of intangibles. The activities in which they assume economic and social value for individuals, enterprises and places’ growth and well-being are thus multiplying (Sacco, 2011; Sacco et al., 2013).

Culture is an intangible at the heart of both place regeneration and the competitiveness of post-industrial societies, which they requalify as “mixed economies of leisure, culture and creativity” (Mommas, 2004, p. 507). It is a sector – the culture and creative industry (KEA, 2006); an immaterial input into non-cultural sectors and productive clusters – in which it plays a part in the sense making of products (Cooke & Lazzarretti, 2008; Paiola & Sedita, 2009; Sacco & Crociata, 2013) and brands (Papadopoulos, 2002; Cattaneo, Guerini & Uslenghi, 2006); a strategic component of the tourism industry (Richards & Wilson 2007, Richards & Marques, 2012; Golinelli, 2012, Richards, 2011, 2013) and an “artifact” whose consumption increases human capital (Florida, 2002), social identity and cohesion (Tavano Blessi, Tremblay, Sandri & Pilati, 2012).

The common denominator of these culture-led development paths is the ability of culture to link creativity and knowledge – generated by different combinations of personal predisposition and ability with social context – with innovation (KEA, 2009) (Smart Specialization Platform, 2012). The processes that innovate traditional sectors through their hybridization with the creative economy have been dubbed *smart specializations* (Smart Specialization Platform, 2012) and *creative tourism* is an important manifestation of these (Richards, 2011, 2013). They inject creativity and knowledge into local economies and their outputs and promote structural change and new balances which allow emerging competitive scenarios to be dealt with more effectively (Dwyer, Edwards, Mistilis, Roman & Scott, 2009). These culture-led innovations naturally occur most frequently in cities (Castells, 2004). The urban contexts which use such innovations as drivers of development and renewal have been identified as *creative cities* (Landry & Bianchini, 1995). Their development is place specific and relies on the combining of urban heritage resources and traditions of production with innovative policy-making (Penco, 2012). In Italy policies around heritage resources usually produce traditional

development models based on cultural tourism and there is a great deal of skepticism about the hybridization of productive traditions with the creative economy (CSES, 2010; Sacco, 2011).

An examination of case studies which provide empirical evidence of the many ways in which culture catalyzes urban regeneration may help to overcome these obstacles. The first part of this paper discusses both the creative city, allowing us to describe the processes of culture-led urban development, and creative tourism – one of the main forms of smart specialization present in the creative city. These categories are used to analyze the nature of the creative city of Trento, an Italian Alpine city that has become an experimental lab for many forms of the creative economy and where both good practice and challenges are evident.

2. Theoretical Background

2.1 Creative cities and their development factors

Cities stimulate creativity and knowledge – the intangibles that act as the most powerful drivers of development in post-industrial societies (Florida, 2002; Caroli, 2004; Castells, 2004; Hutton, 2009; Scott, 2010; Cappellin, Ferlino & Rizzi, 2012). The term *creative city* (Landry and Bianchini, 1995) identifies both the source of creativity and the many processes which use it as a driver of urban development and renewal.

Urban concentrations of *talent* (Florida, 2002) and businesses specialized in the *cultural and creative industries* (Hall, 2000) are seen as creativity sources. Urban development driven by the creative class originates in individuals' education, talent and vocations, in combination with their occupations in knowledge-intensive sectors. Urban amenities play a strategic role in attracting the creative class to cities (Clark, Lloyd, Wong & Jain, 2002; Florida, 2002; Glaeser, 2005). However, the causal link between amenities, talents, and urban development has never been proven rigorously and has, in fact, been widely questioned (Peck, 2005; Storper & Scott, 2009). An alternative theory is that innovations generated by the interaction between the cultural and creative industries and other economic activities result in urban development (KEA, 2009; Scott, 2006). The creativity that arises from these sources produces knowledge and technology-intensive outputs (Trullen and Boix, 2002) and artifacts that meet the highly evolved experiential needs of contemporary societies (Hubbard, 2006). These processes define the creative city as – in the first case – a *knowledge city* and – in the second – a *consumer city* (Penco, 2012). In the knowledge city, knowledge and technology-intensive businesses develop synergies and interdependencies with other companies involved in the knowledge supply chain at local and global levels (including research and higher education centers, universities, public institutions) (Castells, 2004). In the consumer city, the supply of advanced immaterial products and leisure opportunities from cultural institutions, organizations and associations, and from the cultural and creative industries and service sector, results from the dense urban population and the flexibility of post-industrial socio-economic structures. Consumer cities are, in fact, also called *cities of leisure* and *entertainment machines* (Clark et al., 2002). Creative cities – in various ways and to varying degrees – are both consumer and knowledge cities (Penco, 2012), since they provide the right conditions for sustainable urban development (Sacco, 2011). An exclusively consumer city is likely to impoverish high added value urban services, to attract less investment and talent and to undermine the integrity of the cultural heritage itself due to the intensity of its use (e.g. tourist pressure), thus affecting the quality of cultural consumption and of urban life in general.

The development of creative cities is place specific and relies on the combining of urban heritage resources and traditions of production with innovative policy-making (Penco, 2012). A city's history, cultural capital and creative institutions define the natural endowment that enables it to pursue culture-led development paths (Scott, 2006). Its history bequeaths both a tangible and an intangible cultural heritage – artistic-cultural and professional-productive (Hall, 2004). Over time, networks of interdependencies and the trade within and between urban communities of creative workers produce a cultural capital, one which facilitates knowledge sharing and stimulates creativity (Inkpen & Tsang, 2005). The scientific and cultural institutions based in the city provide both formal and informal spaces for social interaction (Hutton, 2009; Cohendet, Grandadama & Simon, 2010; Tavano Blessi, Tremblay, Sandri & Pilati, 2012) and host and disseminate these creative processes. Their training and educational programs and their involvement in research and knowledge transfer foster the production and reproduction of creative

urban practices and the development of other scientific and cultural organizations and cultural and creative sectors (Leslie & Rantisi, 2006).

Beginning with these local heritage resources, urban regeneration policies enhance the strengths of existing urban development models, overcome their weaknesses and equip them to face the challenges of emerging scenarios (Dwyer, Edwards, Mistilis, Roman & Scott, 2009). Many of the urban regeneration policies are aimed at transforming the urban “genetic code” because the absence of a sufficiently strong cultural heritage is one of the main problems faced by these cities. The public sector can promote the development of knowledge cities by encouraging research, innovation and the establishment of knowledge and technology-intensive enterprises/organizations, and investing in knowledge centers and university buildings and the development of networks with international research hubs. Interventions to create consumer cities include: tourism and cultural policies, the development of innovative and sustainable residential complexes, the renovation of disused industrial areas and their use as cultural spaces, the investment in iconic architectural buildings that combine research, educational and cultural functions, service digitalization, the organization of large events, the connection between the tourism industry and the cultural and creative industries, the upgrading of amenities and the creation of cultural districts or clusters.

2.2 Creative tourism as a smart specialization

Creative tourism (Richards, 2011 and 2013) integrates and hybridizes culture and tourism, thus fostering the dual identities of consumer and knowledge city. Creative tourism was first defined by Richards and Raymond (2000, p. 18) as “*tourism which offers visitors the opportunity to develop their creative potential through active participation in courses and learning experiences which are characteristic of the holiday destination where they are undertaken*”. This advanced form of cultural tourism enhances the intangible components of culture to meet local communities’ needs for cultural and creative expression and contemporary visitors’ demands for meaning and authentic experience. The co-creation of meanings and tourist experiences through the involvement of visitors in the daily life and culture of a place allows people to enhance their skills, develop their creative potential, express their identity and pursue their own welfare (D’Auria, 2009). This idea is embodied in experiences that allow the visitor to “meet the locals” or “live like a local”. Creative tourism is therefore increasingly conceived as a relationship between people who are seeking more engaging and active creative experiences; however, it can also involve less active forms of creativity, such as ‘taster’ experiences, which are now enjoyed by much larger numbers of visitors (Richards, 2011).

This innovative form of tourism is still only a small part of cultural tourism but it can help to overcome a lack of tangible cultural capital and the serial reproduction of culture and mass cultural tourism (Richards & Wilson, 2006). A city’s ability to transform its urban cultural endowment into assets that have a distinctive symbolic value thus becomes crucial for its competitiveness, as does its capacity to use these assets to attract sustainable tourism segments (Franch, Martini, Buffa & Parisi, 2008; OECD, 2009). Creative tourism may assume many different forms (Richards & Wilson, 2007), within three broad, interconnected categories (Richards, 2013): the *cultural events* or creative performances typical of advanced tourism products; *clusters or cultural districts* which are an expression of creative spaces; *creative strategies* and policies that promote the hybridization of culture with place specific resources. Accordingly, creative tourism may either be seen as a culture and creative industry (Bagwell, 2009), or as an important sector for smart specializations within the creative economy (Andersson and Thomsen, 2008).

3. Case study and methodology

Italy’s cultural heritage and creative potential should put culture at the centre of national and local development policies, including urban policies (Sacco, 2012). However, in Italy policies around heritage resources have led to traditional development models in which the generation of value through culture is focused on cultural tourism and local products (Sacco, 2012). Italy has a rich artistic and cultural heritage and culture plays a fundamental role in the shaping of the national identity and brand image as a cultural tourism destination (Golinelli, 2012). Italy has one of the largest cultural and creative industries in Europe, both in terms of GDP and numbers employed in the sector, and some of the cultural and creative sectors enjoy a strong international position (Santagata, 2009; Unioncamere & Symbola, 2011). Although traditional cultural tourism promises development opportunities for both the great art cities

and smaller urban centers (ONT, 2009; TCI, 2009; BIT, 2010), the sustainability and competitiveness of these cities would undoubtedly benefit from complementarities with research and innovation, education and social inclusion policies and forms of smart specialization between culture and traditional sectors (Sacco, 2012).

The city of Trento, provincial capital of the autonomous province of Trento in the northeast of Italy, is bucking the general national trend of small and medium-sized cities, which focus on cultural tourism as their main lever for urban development (Lazzeretti, Boix, & Capone, 2008; Capone & Cinti, 2009). In fact, Trento (pop. 115,000) is among the few urban systems experimenting with the combination of traditional and new culture-led development paths, based on knowledge and innovation. This case is interesting for many reasons. Firstly, cities specialized both in the cultural and creative sectors, like Milan and Turin, are usually large and have extensive heritage resources; secondly, although the province of Trento is a competitive tourist destination, cultural tourism in Trento has only developed within the last ten years; thirdly, Trentino has invested in its culture infrastructure as a driver of sustainable local development rather than as a mere tourism marketing tool (Sacco, 2012).

A single case study design (Yin, 2003) is used to provide insights into the numerous culture-led urban development paths and the place specific conditions which influence and promote their realization. The particular nature of Trento's status as a creative city and the forms of smart specialization in the city are analyzed with reference to research on the evolution of Trentino's development model (Marcantoni, Postal & Toniatti, 2011), desk analysis of the sectoral policies of the municipality of Trento over the last 15 years (Strategic Plan, Tourism and Cultural Plan) and in-depth interviews with key players in the area.

4. Main results

4.1 Features of Trento as a *creative city*

Trento has developed multiple value creation paths based on knowledge and culture, which qualify it both as a *knowledge* and as a *consumer city* (Table 1). Trento's status as a knowledge city is due to its excellent network of scientific and technological research and higher education bodies, whose standing is recognized at both the Italian and the European level. Three public institutions have been involved in the development of this system: the FBK Foundation, the Mach Foundation and the University of Trento. The network attracts skilled human capital, students, innovative businesses, resources and investment from all over Italy and abroad and the local area benefits from the research, training and knowledge transfer carried out by these institutions. Trento, for example, is the only Italian partner in the European Institute for Innovation and Technology and the city's collaboration with this Institute's European ICT research and industry networks has led to other international centers of research and higher education taking off here, and the consequent transfer of technology to locally based companies. The knowledge workers employed in this research network account for a major share of the city's demand for immaterial consumption, due to their high level of education and, often, their higher disposable income. In the academic year 2012-2013, for example, the University expressed the consumer demand of more than 1,200 people – professors, researchers and technical and administrative staff – in addition to more than 16,000 students.

Trento owes its consumer city status to its cultural and artistic heritage, both religious and secular, and to the concentration in the city of cultural and creative industries (e.g. publishing and audiovisual) and the main cultural institutions and associations of the province. These combine popular culture and local tradition with innovation and the contemporary, the hosting of cultural events and the offering of services and amenities. Residents, including knowledge workers, students, commuters; external users of advanced services (commercial, health) and leisure and business tourists consume the services and cultural activities of the city. The investments of the 1980s in the restoration of historic buildings to house the cities' libraries, important collections of modern and contemporary art, and science museums, were intended to provide local communities with educational and leisure opportunities. Only later did they become tourism marketing tools and now, twenty years later, this choice has been reinforced by sizeable provincial investments in two iconic museums: the Mart, a gallery of modern and contemporary art, and the Muse, a science museum.

TABLE 1: FEATURES OF TRENTO AS A *CREATIVE CITY*

Creative city	Features
<i>Knowledge city</i>	<ul style="list-style-type: none"> • Excellent scientific and technological research and higher education network (FBK Foundation, the Mach Foundation, the University of Trento, Fiat Research centre, Create-Net, Irvapp, GraphiTech, Celct, COSBI, CIBIO) • Attraction of skilled human capital, students, innovative businesses, resources and investment (European Institute for Innovation and Technology, Trento RISE, CNR Centres) • Creative class: Knowledge workers employed in this system
<i>Consumer city</i>	<ul style="list-style-type: none"> • Significant religious, secular, artistic and cultural heritage situated between Central Europe and the Mediterranean world <p>Cultural institutions and associations which combine popular culture and local tradition with innovation and the contemporary (Folk Museums, Museum of Buonconsiglio Castle, Foundation of Historic Museums of Trentino, Mart - gallery of modern and contemporary art - and the Muse - science museum)</p> <ul style="list-style-type: none"> • Cultural and creative industries (publishing and audiovisual) • Hallmark events, services and amenities • Creative class: knowledge workers, public administration employees, business and leisure tourists, residents

4.2 Forms of smart specialization in Trento

The forms of smart specialization between culture and other sectors found in Trento mainly involve creative tourism and creative connections and hybridizations between culture and the traditional small industries/craft. They are generated by independent business initiatives or promoted by provincial and municipal policies (Table 2).

All three forms of creative tourism are evident in Trento – *creative strategies, creative spaces and events*. The provincial investment in the Muse (<http://www.muse.it/>), which opened in July 2013, is a creative strategy designed to enable and encourage a virtuous, synergistic relationship between culture, knowledge and tourism. The province’s oldest cultural organization connected to its Alpine identity has been transformed into a modern, eco-sustainable architectural structure which combines the traditional roles of a science museum with modern functions as a research center, including scientific and didactic/edutainment laboratories. Almost one year after its opening it had already established itself as an important tourist attraction, having received over 500,000 visitors from Italy and abroad. The museum is located in an area of the city where major urban regeneration projects are underway and promises to become both the mainstay and an incubator of an “Evolved Cultural District” (Sacco, 2010). This ongoing project involving the provincial cities of Trento and Rovereto is intended to foster a creative space that connects the cities’ different culture-led development paths and encourages smart specializations between culture, tourism and the economy in order to innovate urban development. The district leverages urban heritage resources and cultural investments and relies on a participatory approach involving institutional actors and the representatives of various sectors – culture, education, tourism, science and technology industry, institutions and banking foundations, etc. – in the development and implementation of the project. The hallmark cultural events hosted in Trento are the creative achievements of the most dynamic sectors of the cultural and creative industries in the area (publishing and film). The strong symbolic value of the Festival of Economics (<http://2014.festivaleconomia.eu/>) – run for the eighth successive year in 2014 in some of the city’s most beautiful buildings and squares – lies in its being a forum for the innovative use of communications technologies and publishing to disseminate international expert debate on major economic and societal issues to a wide audience. The valence of the Mountain Film Festival (<http://www.trentofestival.it/>) – now in its 62nd year – derives from its use of audiovisual media, film and writing to bring the scientific and cultural debate

around mountains and sustainability. As annual events, these festivals are gradually becoming so closely associated with Trento’s urban identities that they have become drivers for the image-making and urban marketing and branding of Trento as a knowledge and culture city.

Smart specializations between culture and traditional small industries involve both the use of the latter’s products and services in the area’s institutions and cultural associations and the use of culture to innovate the offer of traditional industries. On the one hand, the products of small industry are used in cultural processes – e.g. specialized local companies are involved in the construction of university buildings and major scientific and cultural infrastructure projects such as Muse, in setting up exhibitions and running events. Traditional industrialists’ responses to the specific needs of institutions and creative associations can also stimulate the development of partnerships to design and develop new specialist products for culture – e.g. innovative systems for the conservation and restoration of cultural artifacts, the culture-sensitive restoration of buildings, systems for the protection and sustainable management of cultural sites. On the other hand, culture is a creative input in the development of new specialist craft products and services, increasing their symbolic, aesthetic and emotional value through their connection with a particular place. It also encourages the creation of new businesses, either spin-offs of the university’s cultural bodies or private initiatives – e.g. arts and crafts, designer products for the museum bookshop, updating the packaging and publicizing of food and wine products through collaboration with designers. The study that Trentino Sviluppo – the provincial agency that promotes local sustainable development through sectoral integration and innovation – has just carried out on the connections between culture and craft, shows that the economic and occupational impact of cultural investments on the turnover of the province’s small traditional industries is quite significant. The Agency aims to foster initiatives that support the exchange of ideas and the development of joint projects between public institutions, scientific research bodies, technological innovators and institutions and businesses in the cultural and creative industries. These initiatives include “the craft bid” – an event intended to foster links between institutions and businesses and awareness raising meetings for companies who want to collaborate with the world of culture and technical workshops with artists.

TABLE 2: SMART SPECIALIZATION IN TRENTO

<p>Culture and Tourism (Creative Tourism)</p>	<ul style="list-style-type: none"> • Creative strategy/policy: Muse - science museum- • Creative place: Project to develop a culture and creative cluster incorporating the cities of Trento and Rovereto • Creative events: Hallmark events (Festival of Economics, Mountain Film Festival) organized in partnership with local culture and creative industries (advertising, film, video, multimedia)
<p>Culture and traditional small industries/craft ("Creative craft")</p>	<ul style="list-style-type: none"> • Handicraft sectors participating in the culture value chain • Innovation of the handicraft offer through culture and creativity and creation of new businesses as spin-offs from universities and cultural institutions or private initiatives

5. Discussion

Trento’s dual status as both a knowledge and consumer city is the result of place specific conditions, which combine local heritage resources and imaginative development policies. The history of this Alpine city, a result of its geographical position on the border between Central Europe and the Mediterranean world, has produced a significant – both religious and secular – artistic and cultural heritage. Its openness to intercultural exchange and long traditions of self-government have shaped the city and its services, networks of cultural and research institutions and standard of living. This legacy has been enhanced by innovative policies, both provincial and municipal, which have had a

critical role in anticipating post-industrial development processes based on culture and knowledge. Since the 1960s the Province of Trento has invested – singlehandedly, and taking advantage of its autonomous status – in research facilities and the training, retention and attraction of qualified human resources. The province’s far-sighted investment laid the foundation for a knowledge economy which has led, over the years, to the gradual fertilization of the Alpine economy with the post-industrial economy.

In the last decade, the municipality of Trento has reinforced this knowledge-based urban development driven by provincial policies and has embarked on its requalification as a cultural city in order to exploit its rich historical urban legacy through innovative policies and sizeable – for a small city – investments. The city government’s main tools have been designed to use a participatory approach to urban development which results in the gradual formation of a developed concept of tourism, culture and tourism and cultural policies. The Strategic Plan 2001-2010 marked the beginning of a municipal planning logic of urban development that leverages sectoral, institutional and social interdependencies. The 2009 Tourism Plan has enhanced the tangible and intangible cultural heritage of the city through the lever of cultural tourism. The 2013 Culture Policy, rather than just considering the relationship between culture and tourism, has developed a transverse cultural policy which integrates innovative urban development and sustainability (Sacco, 2010). The smart specializations between culture and traditional small industries and between culture and tourism are signs of real progress in this direction. As at the provincial level, Trento’s resources and design skills were crucial to defining these pioneering – in the context of a small Alpine city – development policies.

5. Conclusion

The case of the city of Trento clearly illustrates the diverse ways in which culture can drive urban development and transformation and how the scale and the nature of these changes are determined by the combining of cultural heritage resources and policies. The latter aim at enhancing existing resources and / or helping to overcome their lack through sizeable and / or innovative investments. In Trento provincial and municipal policies, rather than the city’s intrinsic cultural heritage resources, played, and still play, a crucial role in sustaining the knowledge and culture economy. Due to these policies, Trento exhibits many of the features of both a knowledge city and a consumer city and is an experimental lab for many forms of smart specialization, in particular of best practices in creative tourism and emerging initiatives in “creative crafts”. These hybridizations between culture and other sectors sustain Trento’s dual nature as both consumer and knowledge city. The demand for intangible and experiential consumption supports the development of innovative entrepreneurship specialized in the cultural and creative industries and these industries complement and strengthen the city’s public institutions of knowledge and culture.

Although Trento already exhibits many of the features of a creative city, its transformation continues. The coexistence of diverse culture-led development paths confirms the studies on the Italian creative economy which show Trento to be a rare urban system specialized in both the cultural and creative sectors (Lazzaretti, Capone, & Cinti, 2008); these paths, however, have not yet been integrated. They are the result of the accumulation and subsequent chance combination of actions on the part of the provincial and municipal governments. A shared, informed, organic development plan to draw together these interactions and hybridizations between culture, knowledge and other sectors, tourism included, has not yet been put in place.

The development of such a plan within a fragmented institutional, sectoral and social urban context depends on the vision and power of the value-adding partnerships and public and private networks engaged in the process of culture-led urban regeneration at both the provincial and urban level. This complex situation raises important issues: how can the awareness of the opportunities to create value by connecting culture, economy and society be increased? How can social and sectoral interactions be encouraged to promote hybridizations between culture and creative activities, tourism and other sectors? What might institutions in research, culture and education stimulate the development of a productive fabric in culture and creative sectors? Which levers are needed to integrate heritage, knowledge, culture and tourism in a creative urban identity? What might the impact of culture-led urban regeneration on urban image and brand building be? Given that the province of Trentino as a tourist destination does not currently include culture or knowledge among its main assets, how can the relationship between the brands of the city and the province be managed?

These and other issues can be investigated in future research addressing interactive and multilevel governance systems (Kooiman, Bavinck, Chuenpagdee, Mahon, Pullin, 2008; Go & Trunfio, 2011) which facilitate and manage both cross-fertilization between sectors and social innovation by building on social capital (Inkpen and Tsang, 2005). Social capital is crucial because it underpins stakeholder inclusion, engagement and capacity building in culture-led urban regeneration and branding by taking a place specific perspective. The joint management of public resources in knowledge, culture and tourism areas is closely related to the creation of a new system of governance. The reduction in local authority budgets – including that of Trento – caused by the economic and financial crisis, means that resources and investments must be focused on projects with maximum impact on the entire urban system and its development (economic, social, image, etc.). It is also vital to identify mechanisms for innovative public-private financing (Della Lucia, 2013). Finally, in order to achieve the status of *creative city*, Trento still has many challenges – economic, cultural, civic and of place governance – to meet.

An ugly store in a beautiful place? Exploring the effect of store interior and urban design on consumers' inferences and store patronage intentions

Abstract

Although the role of store environmental cues on shopping behavior have been well documented, the effect of “external variables” (e.g. building architecture, character of the surrounding urban area etc.) remains relatively neglected. This paper investigates the influence of the aesthetic design of a urban area - and of its interaction with the store design - on consumers' evaluations of store image, product quality, service quality and store patronage intentions. Results from an experiment based on a videotape showed that while the store design represent a cue upon which customers draw inferences on store image, product quality, service quality and willingness to buy, the design of urban environment plays a significant direct role only in affecting patronage intentions. Interestingly, the interior store design was found to moderate the relationship between the urban aesthetic design and consumers' perceptions, On the basis of results, the paper discusses the theoretical contribution and provides implications for retail location and urban marketing choices.

Keywords: Urban design, Store design, Physical environment, Service quality, Product quality, Patronage intentions.

1. Introduction

Marketing scholars have devoted significant attention to analysis of the influence of environmental stimuli on consumer behaviour, and the role of environmental cues in consumption settings, such as retail outlets, has become an established research stream. Notwithstanding this, there remains the potential for further research contributions. In particular, the main emphasis of extant research is on the influence of “internal variables” *within* the retail/service outlet, while the effect of “external variables” (e.g. building architecture, character of the surrounding urban area etc.) – and the interaction between the internal and the external physical appearance -remains relatively neglected by comparison. Considering the importance of external appearance of a retail outlet, Turley and Milliman (2000, p. 195) suggest that “*this portion of the environment deserves more attention in that the exterior is the first set of cues normally seen by a consumer*”, and Puccinelli, Goodstein, Grewal, Price, Raghurir and Stewart state that “*we require more research to know how the consistency between elements of the retail store atmosphere, such as design cues, and exterior atmospheric cues (e.g. store exterior, signage) influence consumer evaluations and purchase intentions*” (2009, p. 24).

This research examines the influence of store interior design and urban aesthetic design on consumers' inferences of store atmosphere, service quality and product quality and subsequent patronage intentions, via a laboratory experiment based on a videotape which manipulated 2 different levels of aesthetic urban environment and store atmosphere attractiveness combined in a 2x2 between subjects design. From the theoretical point of view the proposed research adopts concepts and issues developed in theory relating to retail atmospherics (Kotler, 1973; Donovan and Rossiter, 1982; Baker, Grewal and Parasuraman, 1994), servicescape (Bitner, 1992) and service quality (Parasuraman, Zeithaml and Berry, 1988; Cronin, Taylor and Taylor, 1992; Cronin, Brady and Hult, 2000).

The next section briefly reviews extant retailing and service literatures on physical environment and highlights some gaps that call for further research. It is then presented the research gap and hypotheses investigated in this study. In paragraph 4 it is presented the study method and the results from an experiment involving a sample on students. Finally, the study concludes with discussion of managerial implications and suggestions for further research.

2. Literature Review: the Physical Environment as a Marketing Tool

Marketing research has provided a quite clear picture about the relationship between physical environment and consumer behavior. Since Kotler (1973, p. 50) defined the concept of “atmospherics” as “the effort to design buying

environments to produce specific emotional effects in the buyer that enhance his purchase probability”, many authors have investigated the influence of the physical environment on consumption outcomes. Results suggest that a wide range of physical stimuli related to the store atmosphere - including color, lighting, architectural style and music - are an important determinant of consumer perceptions and future behaviors, relating to merchandise and service quality (Baker, Parasuraman, Grewal and Voss, 2002), desire to stay and repatronage intentions (Wakefield and Baker, 1998). The effect of physical environment has been assessed in a wide range of situations where a product or a service is purchased or consumed, including retail stores (Donovan and Rossiter 1982; Chebat and Morrin, 2007), restaurants (Jang and Namkung, 2009), hotels (Aubert-Gamet and Cova, 1999), leisure services (Wakefield and Blodgett, 1999), sporting events (Hightower, Brady and Baker, 2002), events (Mason and Paggiaro, 2012) and on-line stores (Eroglu, Machleit and Chebat, 2003).

Within the different kind of environmental stimuli, variables related to aesthetic design appear to be a significant antecedent of consumers' shopping behavior. For example, the color of a store was found to influence store and merchandising perceptions (Chebat and Morrin, 2007), purchase intentions and shopping time (Bellizzi, Crowley and Hasty, 1983). Lighting was investigated by Summers and Herbert (2001), whose research suggest that lighting level is positively related to approach behaviors of customers. General interior design has also been found as a component of store image: for example Mazursky and Jacob (1986) used pictures of a store's general interior as one of the external cues in evaluating store image and they found that consumers use general interior design to infer impressions regarding quality of merchandise and pleasantness of shopping. However research based on environmental psychology has provided controversial support to the notion that store design is able to influence consumers' emotional states: while research by Wakefield and Baker (1998) and Wakefield and Blodgett (1999) reported that an attractive architecture is significantly related to feelings of excitement, Sherman, Mathur and Smith (1997) found a positive correlation between design factors and pleasure and a negative correlation with arousal.

The study of the physical environment has also been specifically applied to service industries. Perhaps the most widely cited research relating to the conceptualization of the physical environment in a service context is Bitner's (1992) analysis of the effect of the physical surroundings on the behaviors of service employees and customers. The author coined the term *servicescape* to identify three primary dimensions of the physical environment that influence employees and customers' holistic perceptions and their subsequent internal (i.e. satisfaction with the servicescape) and external responses (i.e. approach/avoidance, staying, repatronage). These dimensions are: (1) ambient conditions (i.e. weather, temperature, music, odors), (2) spatial layout and functionality (i.e. the way in which equipment and furnishings are arranged, and their ability to facilitate consumers' enjoyment), and (3) signs, symbols and artefacts (i.e. signage and décor used to communicate and enhance a certain image or mood, or to direct customers to desired destinations). The servicescape concept has provided the theoretical background for subsequent research investigating the effect of the service environment on consumer behavior. Findings from this stream of research show that physical components of a servicescape indirectly affect repurchase intentions, loyalty, facility image, and word of mouth (Baker, Parasuraman and Grewal, 1994; Wakefield and Blodgett, 1996, 1999) and that such influence is mediated by cognitive and emotional responses (Bitner, 1992). Moreover, the design of physical environment is also related to service quality evaluation, albeit with contradictory findings. While research by Parasuraman, Zeithaml and Berry (1991) and Baker, Grewal and Parasuraman (1994) reported that tangible elements related to facilities design have no effect on service quality perceptions, results by Wakefield and Blodgett (1996), Hightower, Brady and Baker (2000) and Baker, Parasuraman, Grewal and Voss (2002) in both store and leisure settings provided reliable support to the hypotheses that when ambience and design are more attractive consumers perceive higher service quality.

While retailing literature has devoted a relevant attention to the influence of internal stimuli within a store or service setting, the role of the exterior of the service facility remains relatively neglected in comparison. From a consumer perspective, there is an increasing body of literature – deriving from the location planning and development and the retail agglomeration management literatures (Teller, 2008) - which conceptualizes the attractiveness of retail destinations (see Teller, 2008, Teller and Reutterer, 2008, for extensive overviews of this area) and identify a range of factors influencing “retail agglomeration” attractiveness, including “retail-related” factors (such as tenant mix and merchandise value), and “environmental” factors (in particular “atmosphere”) as being of particular importance (Teller, 2008). Despite the limited number studies dealing with this aspect of the

environment, exploratory results supported to the notion that the exterior of a store or a service provider is able to affect consumers' evaluative perceptions and behavior. Namely, an attractive and innovative window display is found to significantly affect store image (Cornelius, Natter and Faure, 2010), and to exert a positive influence on decision to visit a store (Sen, Block and Chandran, 2002) and on sales (Edwards and Shackley, 1992). Moreover, in a study conducted on fast food restaurants Ward, Bitner and Barnes (1992) found that exterior environment resemblance is a stronger predictor of consumer attitudes and market share than interior resemblance. More recently, De Nisco and Warnaby (2014) investigated the influence of urban aesthetic design, tenant variety on consumers' emotional states and stated that that the variety of tenant-mix positively affects both pleasure and arousal while esthetic design has a significant influence only on pleasure. Emotional states induced by the urban environment, in turn, exert a different influence on shopping outcomes, with pleasure increasing the amount of money and time spent, and arousal positively influencing unplanned shopping and negatively affecting time and money. The same authors (De Nisco, Warnaby, 2013) analyzed the effect of urban design, space layout and functionality and external store appearance on overall perception of the service quality delivered in the urban area and found that physical space functionality and store appearance provide cues upon which customers base their perception of service quality provided in the shopping street and that service quality inferences, in turn, are able to affect desire to stay and repatronage intentions

3. Research Gaps and Study Hypotheses

In spite of the large attention devoted by marketing scholars on the relationship between physical environment and consumer behavior over the last thirty years, still some gaps remain to be addressed.

First, while a number of studies conducted at store-level have examined the effect of specific internal environmental characteristics on consumption outcomes, much less effort has been devoted to external variables (De Nisco and Warnaby, 2013, 2014). As consequence, although conventional wisdom suggests that external variables are able to affect consumers' perception, there is still need of more detailed empirical evidence to support such relationships and provide managerial insights.

Second, research to date has focused mainly on traditional store and service settings (shopping centers, specialty stores, restaurants, hotels, etc.) and there remains a lack of research about the influence of the physical environment in more complex and multi-functional consumption settings such as town and city centers, which are devoting increasing resources to designing, building and refurbishing their main streets in order to increase their attractiveness as venues for shopping and consumption activities.

Finally, there remains the need for more empirical research on the relative impact of physical environment on perceived service quality and product quality. Although classical service quality measurement models (e.g. Parasuraman, Zeithaml and Berry, 1988; Cronin and Taylor, 1992) include tangible elements as antecedents of perceived service quality, such elements have been found to have little or no significant effect on consumers' service quality perceptions. Moreover, while prior research suggests that the design of a store environment is a significant antecedent of a customer's evaluation of merchandise perception (Baker, Parasuraman, Grewal and Voss, 2002), extant research provides only limited empirical evidence to this relationship.

To address these aforementioned research lacunae, the present study adapted inference theory to the evaluation of store design and urban aesthetic design and incorporates insights from Baker, Grewal and Parasuraman (1994) and Baker, Parasuraman, Grewal and Voss (2002) conceptualizations of how physical environment affect consumers' inferences and behavioral intentions. The main hypothesis of this study is that perception of store design and urban aesthetic design are able to affect consumers' inferences of a store's image, product quality, service quality and store patronage intentions. Moreover, the study assumes that configuration of the urban design is able to moderate the relationship between the store design and perception of store atmosphere, product quality, service quality and behavioral intentions. Such assumptions were based on prior research on retail atmospherics suggesting that variables related to ambience and physical design (i.e. color, light, etc.) are able to affect consumers' perceptions and expected behavior (Wakefield and Blodgett, 1996; Hightower, Brady and Baker, 2000; Baker, Parasuraman, Grewal and Voss, 2002) and on the intuitive notion that since urban aesthetic elements

are the first set of visual stimuli experienced by consumers when they visit a urban area for shopping purposes, they are likely to include the perception of the surrounding physical context as a cue in their overall evaluation.

On the basis on the above considerations, the following hypotheses were therefore proposed and tested:

- H₁:** *The interior store design has a positive influence on consumers' inferences of product quality (H1a), service quality (H1b), store image (H1c) and patronage intentions (H1d). Namely, consumers will rate product quality, service quality, store image and patronage intentions as higher if the store has a high-attractive internal designed than if it has a low-attractive internal design.*
- H₂:** *The aesthetic design of the urban location has a positive influence on consumers' inferences of product quality (H2a), service quality (H2b), store image (H2c) and patronage intentions (H2d). Namely, consumers will rate a store's product quality, service quality, store image and patronage intentions as higher if the store is located in a high-attractively designed urban environment than if it is located into a low-attractively designed urban environment.*
- H₃:** *The interior store design will moderate the relationship between the aesthetic design of the urban environment and consumers' evaluation of product quality (H3a), service quality (H3b), store image (H3c) and patronage intentions (H3d). Therefore, the aesthetic design of the urban environment is expected to affect consumers' evaluations of product quality, service quality, store image and patronage intentions in a different way if the store has an high-attractively interior design than if it has a low-attractively interior design.*

4. Method and Results

The study hypotheses were tested in an experiment which manipulated urban aesthetic design and store atmosphere into a 2 (high vs. low attractively designed urban environment) x 2 (high vs. low attractive interior store design) between-subjects factorial design. Both urban aesthetic design and store atmosphere were manipulated with more environmental elements, which were drawn or adapted by previous literature on store and service environments.

The experiment involved 283 students enrolled on business courses at an Italian university and a videotape was used in order to simulate the shopping experience. The context chosen for this study was a young fashion clothes store located in an historic town center. The kind of store was selected on the basis of the socio-demographic characteristics of the sample. Four experimental versions of the videotape were created in order to combine a high vs. low attractively designed urban environment with a high vs. low attractive store atmosphere. As for the urban environment, the treatment which included the high attractively designed urban environment encompassed a well maintained pedestrian street, refurbished and attractive buildings and clean streets while the low attractively designed urban environment included the same items in a more obvious state of disrepair (see Fig. 1). As for the store environment (see Fig. 2), on the basis of previous literature (Baker, Grewal and Parasuraman, 1994) the high-attractive design was employed through an open layout, cold white lights and colors and a neat organization of merchandise while the low attractively designed store environment was operationalized in the opposite way. A series of pre-tests were made in order to ensure that proposed environmental stimuli were perceived in the right direction and that the students had no familiarity with them.

FIGURE 1: HIGH ATTRACTIVELY DESIGNED VS. LOW ATTRACTIVELY DESIGNED URBAN ENVIRONMENT

FIGURE 1: HIGH ATTRACTIVELY DESIGNED VS. LOW ATTRACTIVELY DESIGNED STORE DESIGN

Small groups of subjects viewed the videotape, which visually “walked” them into the urban street and the fashion store. Each videotape had exactly the same length and included environmental stimuli in the same sequence. At the end of the video, students were asked to complete a self-administered questionnaire based on a 7-point Likert scale in order to rate their evaluations on the study measures. The research instrument included measures of store image, service quality, product quality and consumers’ patronage intentions drawn from previous research (Baker, Grewal and Parasuraman, 1994; Wakefield and Blodgett, 1996; Cronin, Brady and Hult, 2000; Baker, Parasuraman, Grewal and Voss, 2002). For each latent scale, internal consistency was evaluated through Cronbach’s Alpha, and results ranged from 0.93 to 0.97. The specific items are provided in table 1.

TABLE 1: MEASUREMENT SCALES AND CRONBACH’S ALPHA

	MEAN	STANDARD DEVIATION	CONBACH’S ALPHA
STORE IMAGE	3.64	5.60	0.97
This store would be an attractive place for shopping	3.67	2.38	
This store has a pleasant and fascinating atmosphere	3.66	2.37	
This store is attractive	3.58	2.34	
SERVICE QUALITY	3.91	5.19	0.94
I would expect high service quality in this store	3.84	2.35	
Employees of this store could be expected to give prompt and professional service	3.89	2.19	
I would expect to receive personal attention in this store	4.02	2.30	

PRODUCT QUALITY	3.52	4.54	0.93
I would expect high quality products in this store	3.51	2.21	
The workmanship of products from this store would be expected to be high	3.53	2.04	
STORE PATRONAGE INTENTIONS	3.34	4.81	0.96
I would like to shop in this store	3.48	2.22	
I would like to spend time in this store	3.24	2.14	
I would suggest my friends and relatives to shop in this store	3.34	2.22	

All the hypothesized relationships were tested using ANOVA with SPSS. The results for H1, H2 and H3, summarized in Table 2, are discussed next.

As for the influence of store design the data analysis confirmed that interior design manipulations were effective for all the dependent variables. Namely the results showed that the high-attractively designed store environment is able to enhance consumers' inferences of store image ($M_{\text{high-attract}}=6.05$ VS. $M_{\text{low-attract}}=1.59$; $F=3,179.08$; $p<0.001$), product quality ($M_{\text{high-attract}}=5.39$ VS. $M_{\text{low-attract}}=1.75$; $F=1,044.02$; $p<0.001$), service quality ($M_{\text{high-attract}}=5.97$ VS. $M_{\text{low-attract}}=1.97$; $F=1,733.36$; $p<0.001$) and is a significant antecedent of consumers' patronage intentions ($M_{\text{high-attract}}=5.31$ VS. $M_{\text{low-attract}}=1.51$; $F=1,338.70$; $p<0.001$). Such results provided support to hypotheses H1a, H1b, H1c and H1d. On the other side, results for the external design revealed that the urban aesthetic is able to influence only consumers' patronage intentions ($M_{\text{high-attract}}=3.65$ VS. $M_{\text{low-attract}}=3.16$; $F=22.689$; $p<0.001$) but not inferences of store image, product quality and service quality. Therefore, H2d was supported while H2a, H2b and H2c were rejected. Results from the ANOVA also showed a significant interaction effect of store design and urban design on the store patronage intentions ($F=6.56$; $p<0.05$).

In order to test the moderating role of the internal store design on the relationship between the urban aesthetic design and dependent variables the dataset was splitted into the high-attractively designed store VS low-attractively designed store treatments and two separate ANOVA were runned with the urban design as the independent variable and evaluations of store image, product quality, service quality and patronage intentions as dependent variables. Interestingly, results showed significant differences between the two experimental conditions. On one hand, in the low-attractively designed store treatment the effect of the urban aesthetic design was significant only for the evaluation of the patronage intentions ($M_{\text{high-attract}}=1.62$ VS. $M_{\text{low-attract}}=1.39$; $F=5.117$; $p<0.05$) but not for the store image, product quality and service quality inferences. On the other end, in the high-attractively designed store condition results from the ANOVA reported that an attractive urban location is able to significantly enhance consumers perception of service quality ($M_{\text{high-attract}}=6.14$ VS. $M_{\text{low-attract}}=5.80$; $F=6.545$; $p<0.05$), product quality ($M_{\text{high-attract}}=5.59$ VS. $M_{\text{low-attract}}=5.19$; $F=4.653$; $p<0.05$), and to increase expected patronage intentions ($M_{\text{high-attract}}=5.68$ VS. $M_{\text{low-attract}}=4.92$; $F=16.837$; $p<0.001$). Conversely, no significant effect was found with the store image inferences. On the basis of the above results it can be assumed that internal store design moderates the effect of urban design for product quality, service quality and patronage intentions but not for the store image. Thus, H3a, H3b and H3d were supported, while H3c was rejected.

TABLE 2: RESULTS FROM THE ANOVA AND MODERATING TEST

	ANOVA STORE IMAGE (F values)	ANOVA SERVICE QUALITY (F values)	ANOVA PRODUCT QUALITY (F values)	ANOVA PATRONAGE INTENTIONS (F values)
STORE AESTHETIC DESIGN	3,179.08**	1,733.36**	1,044.02**	1,338.70**
URBAN AESTHETIC DESIGN	2.876(n.s.)	3.291 (n.s.)	3.34 (n.s.)	22.689**

5. Conclusion and Implications

This study used an experimental approach in order to investigate the influence of store interior design and urban external design on consumers' perceptions and expected behavior. Results showed that the aesthetic appearance of the store provides cues upon which customers base their inferences of service quality, product quality and store image and it is able to affect store patronage intentions. On the other end, the aesthetic design of the urban environment appears to be able to affect only the perception of the store image and intentions to visit. Interestingly, the store interior design was found to play a significant moderating role in the relationship between the urban environment and the consumers' outcomes. According to our results, a prestigious store location is able to enhance consumers' inferences only when the store has an attractive interior design while if the store has a low-attractively design environment the effect of a prestigious location is irrelevant. Such findings suggest several theoretical and managerial implications.

From a theoretical point of view, this paper provides an original contribution to the marketing literature on retailing and urban marketing in at least two directions. First, the study provides an additional understanding about the effect of store design on consumers' inferences and expected behavior. Although previous research has investigated the influence of specific store design components such as the colors (Bellizzi, Crowley and Hasty, 1983; Chebat and Morrin, 2007) and the lighting (Summers and Herbert, 2001) only a limited number of contributions have analyzed the role of the store design from a more holistic perspective.

Second, in our knowledge this is the first paper to analyze the effect of the urban design attractiveness – and its interaction with the store design – on consumers' inferences of store image, product quality, service quality and on expected patronage intentions. Most of the existing research has focused on internal stimuli within a store or service setting, while the effect of what can be termed “external variables” (e.g. building architecture, the character of the surrounding urban area etc.) – and the cross-effect of the internal and the external environment - remains relatively neglected by comparison (Turley and Milliman, 2000; Puccinelli, Goodstein, Grewal, Price, Raghuram and Stewart, 2009). This study provides a contribution in filling this void into the retail atmospherics and urban marketing literatures. Moreover, the employment of a laboratory experiment in order to understand the effect of the physical environment on consumer behavior can be considered a significant innovation in the urban studies.

From a managerial point of view, results from our study provide potential insight to both retail managers and police makers. Since many urban centres are devoting increasing financial and managerial efforts to improve the attractiveness and functionality of the physical space to attract consumers, retailers and leisure activities, public and private stakeholders should be aware not just that the physical environment is important in the customer's experience, but also of what specific elements of the physical setting are most significant. The present study provides a guidance in developing appropriate strategies for managing retailing location and urban marketing choices. For example, our results would discourage managers of discounted designed stores to sustain a significant economic effort in order to find an “attractive” urban location with the aim to enhance consumers' perception of store image and quality inferences, since this choice might not lead to the expected results. On the other end, attractively designed stores can draw significant image benefits from the selection of a “right” location.

Moreover, the notion that an attractive location is able to enhance consumers' patronage intentions both for the highly attractive and for the low attractive stores seems to be also relevant from a urban marketing perspective. Given ever more intense place competition, there is among those responsible for the management of urban locales, a perceived need to maximize feelings of place association and belonging among users (particularly in terms of shopping and recreation), in order to optimize place competitive advantage. This study supports the notion that an attractively designed urban environment plays a critical role in order to enhance the attractiveness of inner city shopping streets

and downtown patronage intentions. Therefore, urban shopping destinations should follow the example of the retailers therein, and engage in what Badot and Filser have termed the “re-enchantment of retailing”, which encompasses the development of a set of practices “that activate non-functional sources of value” during a visit (2007 p. 167), thereby immersing the consumers in a memorable shopping experience within a carefully designed urban atmosphere.

There are a number of limitations, which combined with the findings identify directions for further research. First, results from the experiment presented in this study are based on a student sample. Although non-probabilistic samples are largely used in store environment research, results could be biased from the sampling procedure, since the effect of retail environment could be affected by individual characteristics such as age, income and education). Second, results from the study are necessarily limited to the study’s context. Therefore, future research is needed to explore the effect of store and urban environments in different store types. Moreover, further research might also compare consumers’ perceptions for high-involvement products (e.g. luxury goods) vs. low-involvement products (e.g. food, personal goods). Finally, the proposed research framework could be expanded to include other dependent variables - such as price and brand names – that are likely able to affect consumers’ inferences and consumption choices.

Who Needs Big Data Computing?

Abstract

The world's largest computer exhibition CeBIT in Hannover/Germany, in 2014, was devoted to two topics. One topic was data protection and the other was business intelligence including Big Data computing. In almost all economic sectors consultations are currently being offered that handle with Big Data computing. But even experts in the field of business intelligence ask the question, what can Big Data provide that was not previously available? A well-known search engine provider failed in an attempt to predict the course of a flu season by the use of Big Data computing in Winter 2013/2014. When reading, or hearing, the term Big Data many people meanwhile think inevitably of excessive acquisitiveness of personal data by the U.S. American authorities. But the term Big Data has never been clearly defined.

The present paper will give an overview about what can be understood as Big Data computing. It will be critically discussed if the term at all brings any innovations. It will also be checked how efficient the so-called Big Data practices can be used and if more efficient solutions can be provided here by the use of traditional statistical methods and algorithms. A practical example shows how large amounts of data were as efficient as effectively processed and evaluated more than one decade ago. It will be discussed in which case it will make sense to use the term Big Data. Finally, it will be questioned on the basis of facts and hard numbers whether and how economic added value can be achieved for companies through the use of Big Data and who needs Big Data computing.

The terms Big Data or Big Data Computing

When doing research about this topic and searching for a definition of the term Big Data it is striking that there seems to be no clear boundaries, nor generally accepted definitions, of the term. In most articles about Big Data we can read terms like challenges, chances and benefits. Most of these articles seem to be more advertisement of consultant companies than really usable information. One thing is clear “Big” means that we handle large amounts of data and lots of data sets. But: What is a large amount of data? Remembering the past of business intelligence it was stated in the early 90s that a data warehouse that would include more than 50 Mbytes would make no sense and that it would never exceed this value. What was called a large amount of data twenty years ago is hardly worth mentioning today. Just a few high resolution images require more than 50 MB of disk space today. Such an amount of data is therefore quite small by today's standard. If we use terms in information technology like database or router, the meaning is the same in 2014 as it had been in 1994 and it is likely, even if the technology evolves, that the meaning in 20 years will still be the same. Maybe it will be conducive for a discussion, to have a look at the second part of the term, first. Data means values, numbers, facts and other attributes that describe a real state, event or object. Even if this is a very simplified definition, the part “Big” is still undefined. An article of the German Society for Informatics (GI) explains, that the term “Big” may be used when the amount of data is so large that they cannot be handled by the use of conventional technologies [KTGH2013].

Conventional Technologies

If we follow the idea that we speak about Big Data as soon as conventional technologies are not practicable for computing the amounts of data, we will face some other problems. It is not enough to access an amount of data by an analytical system and hope that useful information will come out of it. We need a frame of information as a target for any analysis and it seems to be an elementary requirement to know, what kind of information is looked for. Do we search for correlations? Or do we look for trends? Many publications about Big Data describe it as a system that gets huge amounts of different and incoherent data and generates best information out of chaos. Facing such descriptions, that will often explain the difference between the “ancient” ideas and techniques of business intelligence and data mining and the superiority of Big Data, it seems that someone has found the Holy Grail of Information Technology. Whatever Big Data might be, it will not be able to make gold out of filth. Any analytical system is useless as long as no one knows how to administer and use it and how to interpret the output. It's not a system that creates analytical solutions – it is the human who uses the system as a tool to realize his ideas. But where is the link between the human and the conventional technology? If conventional technology, let's use this term for relational database management systems and the “ancient”

Structured Query Language (SQL), is used the efficiency of the usage depends also on the knowledge of developers and administrators. The following real example will show what this means:

Example: A multinational trading company had built a data warehouse. During the night, sales data of the previous day were transferred to the headquarter as flat files of a uniform shape, since there were many different systems in use. These flat files had to be parsed into a data base. In the next steps, the parsed data was validated and aggregated and in the last step, data was available in different data base tables for reporting. The head of the company insisted that the reports about the sales of the previous day would be available at 9:00 o'clock in the morning. Since the last flat files with raw data arrived at 6:00 o'clock in the morning, there was only a time frame of three hours. Unfortunately the processing of the daily data and the actualization of the report tables took up to six and a half hours. Since very powerful servers had already been used for processing the data, the problem of the short time window appeared not solvable, first. Picture 1 shows the chain of processes, that were built to generate information out of raw data.

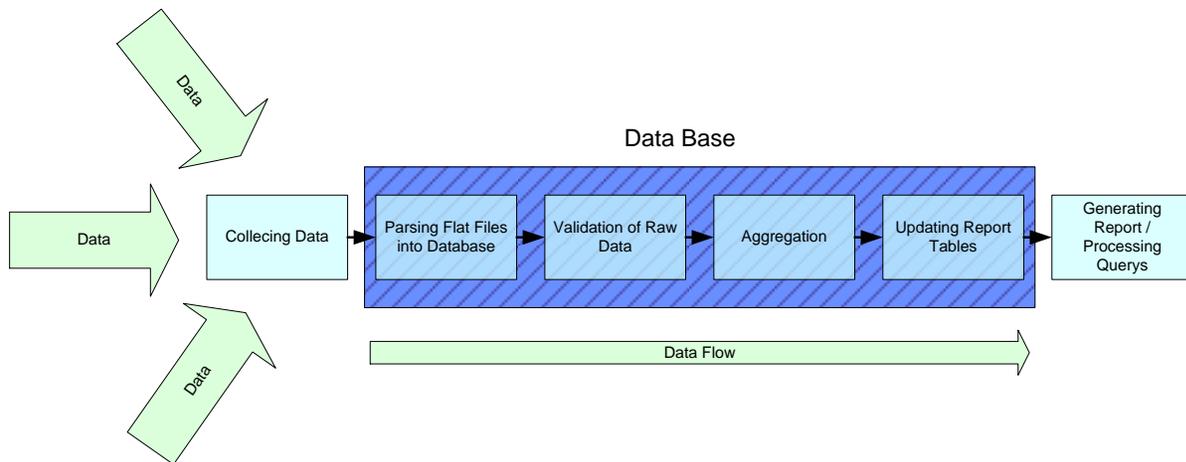

FIGURE 1: DATA WAREHOUSE BEFORE OPTIMIZATION

The great philosopher René Descartes provided the solution to this problem by the second of his four rules which states that a problem that seems to be unsolvable in total, should be broken down into smaller sub-problems which then will be dissolved [Des1960]. In this case, the database was identified as the problem, which caused the time-consuming processing. Since millions of data sets are written during the whole process, there were many locks of data sets. Reading or writing data sets, the used data base management systems locks these data sets and writes entries about that into the lock-tables. This process was identified as the main reason for slowing down processing the data. After the source of slowness had been identified, the next question was about the need for locks. To avoid the creation of reports, while thousands or millions of data sets are written into the report tables, locks are reasonable and necessary. But all other jobs in the chain of processes of this data warehouse worked in a sequential way. The next process/job was started, when the previous one was finished. Therefore there was no danger of any collision and for most of the processes locking of data sets was dispensable. Some relational data bases allow disabling the locking function. In this case, it was only possible to disable it in total or not. Since the report tables needed the locking mechanisms, it had been decided to split the data base into three new data bases. This construction was much faster than the model that is shown as picture 1. Since it was possible to start parsing and processing again at any time and data sets would have been overwritten, data base logs were also disabled for the sequential working processing data bases. Picture 2 shows the data warehouse model after the reengineering.

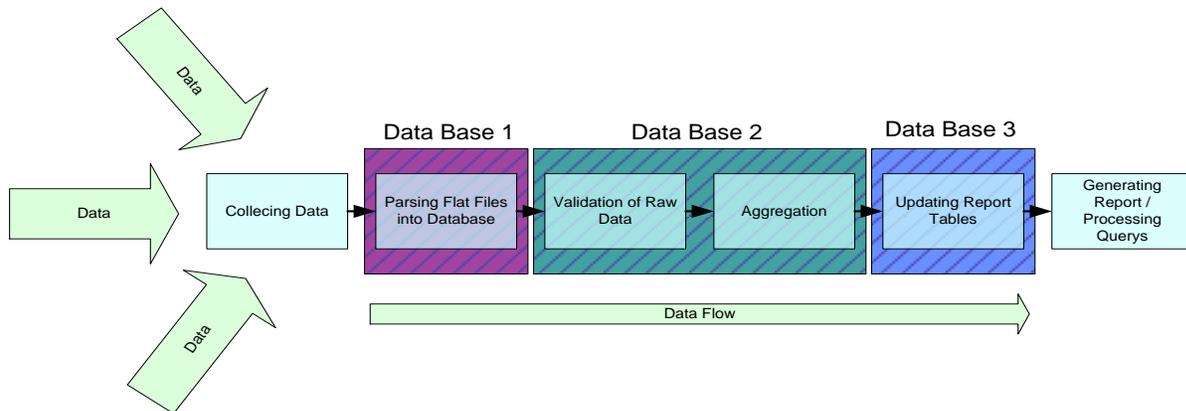

FIGURE 2: DATA WAREHOUSE AFTER OPTIMIZATION

After this reengineering, the daily processing time was brought down from approximately 6 hours and 30 minutes to less than 20 minutes. Other optimizations were also realized like an improvement of the hard disk configuration of the data base server. More improvements can be realized by optimizing queries, additional indices, algorithm changes, clustering and many other usable methods of performance tuning [see IRBS199].

Do we now think again about the limits of conventional technologies, it has been shown by a real example that limits, do not necessary become absolute and, may depend more on the skills of a developer than on any hardware or data base.

Methods

As one method that is often named as a typical method of Big Data, NoSQL can be looked at. The short name might be misleading, because the full name is Not Only SQL. The term “not only” implies that SQL is still important, but there are some more functions available. NoSQL can be used for huge amount of data bases as well as with distributed systems. But it is also used for data bases than includes documents in order to make the content of stored documents available for searching routines. This last function proves, that NoSQL may also be used for small data bases that include documents. Therefore, even if it may be used for computing with huge amounts of data, NoSQL cannot be understood as a child of Big Data Computing. Another method that should be discussed here is a way of visualization that is often shown in the context of Big Data Computing. Picture 3 shows such a visualized result of a Big Data analysis.

FIGURE 3: VISUALIZATION OF DATA

Irrespective of the values in picture 3, this example is shown to ask if such a report is really readable, or usable, or if these results should better prepared by a classical data warehouse. Visualization in data analysis is meant to be a tool to read information out of data much faster than it would be possible by working with endless columns of numbers/values. Each reader of this work can decide for himself if he can or if he wants to read data from a graph like the one that is shown as picture 3.

Big Data in Health Care

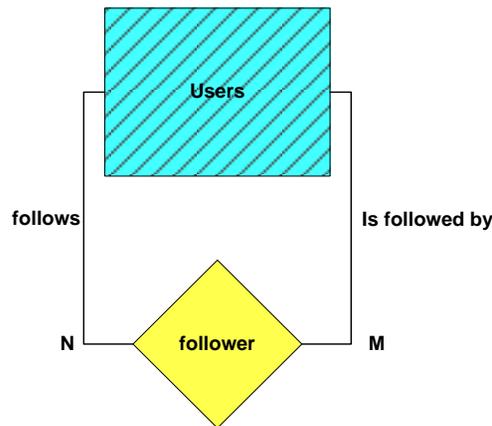

As an example of a branch where Big Data is advertised in the last months like being the Philosopher's Stone, health care and especially the clinical environment is chosen in this study. Even the biggest hospital groups do not create such huge amounts of data, that relational data bases would not able to process this data. Let's think about a hospital group that has in total a capacity of 30.000 beds/units distributed over many locations. This hospital cares about inpatients and outpatients while the relationship between these groups is assumed as being two to one. It is realistic that each unit (bed) is used for 35 – 40 patients per Year. That means, that the hospital group can medicate around 1.5 – 2.0 millions of in- and outpatients per year. Even if we calculate very high and assume that each case would arise 100 records/data sets, we would have in total not more than 200 million of data sets per year. The highest demand for hard disk capacity in health care IT is caused by radiological records (e.g. Computed Tomography, Magnetic Resonance Imaging). These devices can generate some Terabyte of data each year, but even inside a very large hospital group, all this data can be handled by so called conventional technologies. While working for this study there were not even one example found, were special methods or techniques are needed to compute or analyze clinical data. Even in the field of clinical research, knowledge about Biometry and Medical Statistics seems to be more important, than any special data base. The reason, why something abstract that is advertised by using the term Big Data is not needed in the area of health care, is the fact that the amount of data in the clinical area is of a manageable size. Therefore it is completely sufficient to use conventional techniques and “ancient” method of business intelligence to analyze health care data.

Who needs Big Data?

As explained in the previous chapter, any Big Data Computing is – at the actual point in time – not needed in health care business. The extension “actual point in time” should remember the reader to an earlier chapter, which cited a statement from the 90s about the maximum size of a data warehouse. In analogy to the calculated example from the field of health care, we can assume that most of the companies in the world do not actually need Big Data Computing. But which company or organization has such a lot of data, that special methods are needed to handle them?

The internet portal Twitter created proprietary solutions for handling enormous amounts of data. If the term enormous is used in this context, so is the meaning that Twitter collects and processes data to an extent that is beyond all amounts of data that would be feasible for industrial or commercial enterprises.

One problem that Twitter had to solve is the function “follower”. In January 2014 this company had 241 million users. In theory each user can follow all other users so that a follower list could have nearly $241,000,000^2$ entries. In the world of relational data bases, this would mean that a recursive relationship of a table (user) with itself would result in an additional table that would –in worst case – include the Cartesian product of its data (picture4). We think about 58,081,000,000,000,000 data sets (in one table). Even if such a table would have well planned indices, it would take some time to process a query on it. And time is the next component that makes us think about new methods of data handling. Because by using such a system users expect immediate results.

PICTURE 4: RECURSIVE RELATIONAL OF A USER TABLE

Now we can think of a hypothesis that methods beyond conventional technique would make sense, if there is

- a high combinatory that results in an amount of data, that is difficult to handle or if we face a kind of data collection mania (e.g. NSA) and,
- the results have to be available to the users immediately.

Conclusion

The term Big Data is problematic because of two reasons. There is no exact or clear definition what Big Data or Big Data Computing includes and what is not in the focus of this term. The second problem is, that the term is misused for advertisement and users and customers were made to believe, that Big Data would be the ultimate development of business intelligence or data mining. Big Data is not a method, function, philosophy or solution. The term Big Data merely points out, that there might be limits where additional solutions are needed to compute huge amounts of data. But this insight is not a merit to the discussion about Big Data. Methods like denormalization, methods of optimization, improved indexing and reengineering as shown in the chapter about the data warehouse optimization, are not new. Since data bases exist developers think about improvements and about processing higher amounts of data. The Big Data discussion is also not the source of methods that are often described as Big Data methods. These methods are solutions for special applications that need functions, algorithms and solutions beyond the conventional world of relational data bases. That means that such methods do not substitute any of the so called conventional techniques. Statistics, mathematics and common data mining are still actual but in cases of special requirements, these methods can be supported by the methods that are designed to handle huge amounts of data and to provide data and information in the shortest time [see MKG2014].

However, one merit goes to the account of the Big Data discussion: It has moved into the general consciousness as excessive personal data is collected about us. Some companies seem to know more about us than we do and they seem to know our needs before we know them. So this merit of the Big Data discussion is a new discussion about ethics and the question if we really want to let companies look into our head. Perhaps the data collection mania will cause the “information overkill” and we will come to the point, where the cost of profiling outweighs the benefits.

An evaluation of the effects of consumer cultural values on self-congruity: the case of “Apple” in the Chinese market

Abstract

Self-congruity, a combination of self-image and product/brand image, is a crucial concept for scholars and marketers. When brand image matches with consumers' self-image, it ensures preference and purchase intention. The purpose of this study is to investigate image congruence between global consumer brand image and consumers' self-image towards purchase intention from a value-oriented perspective. The brand “Apple” by Apple Inc. is used as a typical global consumer brand. Based on a critical literature review of two subjects: self-congruity and consumer cultural values, a model emphasising aspects of global consumer culture such as materialism, innovativeness, nostalgia, ethnocentrism, and environmentalism was developed and tested. This study's results are dramatically different from the self-congruity studies that applied Hofstede's national-cultural framework; this research therefore provides a new way to evaluate self-congruity towards purchase intention by focusing on consumer cultural values. Our findings and recommendations are expected to benefit global firms in adapting their positioning strategies and brand portfolios.

Introduction

Consumer researchers assume that product and brand image interrelate with self-concept or that they are congruent and therefore influence consumers' buying behaviour and brand performance (e.g. Kressmann et al., 2006; Kuester et al., 2007). Empirical studies have determined that the notion of self-congruity plays a significant role in the evaluation of global brands and self-image also significantly influences purchase intention (Jamal & Goode, 2001). Although existing studies of image congruence regarding global consumer brands encountered problems with widespread implementation, a broader application of self-congruity theory could overcome these difficulties by extending product categories and target consumer groups (Kwak & Kang, 2009). The purpose of this study is therefore to investigate image congruence between brand image and consumers' self-image apropos the purchase intention of global consumer brands from the perspective of consumers' cultural values. The brand “Apple” by Apple Inc. is used as a typical global consumer brand. The data of the Chinese market have been collected and the data analysis has been conducted to provide the results for the issues that this study tries to solve. The example of the Apple brand illustrates the interaction between self-congruity and consumer cultural values. The theoretical contribution of this study will be a new self-congruity model regarding consumption cultural issues that could be used in various domains of global consumer brands and provide recommendations to benefit global firms in adapting their positioning strategies and brand portfolios.

Theoretical Background

Self-congruity

The term self-congruity is a common use of self-image congruence (Sirgy et al., 2008). It plays an important role in both pre- and post-purchase behaviours (Johar & Sirgy, 1991). Self-image congruence theory claims that consumer purchasing behaviours are based on products and brands' symbolic values as well as functional properties (Aaker, 1997; Bhat & Reddy, 1998; Dennis et al., 2002; Hsieh, 2002; Kapferer, 1998; Kwak & Kang, 2009; Levy, 1959; Markus & Wurf, 1987; Sheth et al., 1991). Consumers also tend to portray images that match who they are and who they wish to be (Sirgy, 1985b). Considering self-congruity is grounded in the self-concept theory, self-congruity can accordingly also be classified as actual self-congruity and ideal self-congruity, in terms of the relationships between brand image and self-concept.

Self-congruity has a significant influence on a variety of consumer behaviour. Consumers who purchase products do so not only for utilitarian purposes, but also for self-expressive benefits (Sirgy et al., 2008). The studies suggest that the greater the self-congruity of brand image and actual self-image, the greater the satisfaction of self-consistency needs; this in turn, enhance consumers positive attitudes toward the brand (Graeff, 1996; Johar & Sirgy,

1991; Sirgy, 1982, 1985a, b). On the other hand, the greater the self-congruity of brand image and ideal self-image, the greater the satisfaction of self-esteem needs, which enhances the chances of changing consumer attitudes, in turn, enhancing their positive attitudes toward that brand (Johar & Sirgy, 1991; Nolan & Harold, 2010; Sirgy, 1982, 1985a, b). In this sense, some particular brands can help consumers re-define their self-images (Ericksen & Sirgy, 1992), because consumers are attracted to the brands that have symbolic images most similar to their ideal self-concept (Kwak & Kang, 2009). Once image congruency is decided, consumers are more likely to consistently choose the products that match their actual or ideal self-perceptions (Sirgy, 1985b). Moreover, the studies clearly present a significant relationship between self-congruity and purchase intention as consumers tended to purchase the products whose images are closer to their own (Hoelter, 1983). Ericksen and Sirgy (1989) emphasized that self-congruity influences brand preference, purchase intention, ownership, usage, and loyalty to specific products. Hence, we can make the following assumption.

Hypothesis 1: the self-congruity of the brand Apple has positive effects on its consumers' purchase intention.

Understanding self-congruity in the context of consumer culture

Consumer goods and services can deliver significant satisfaction and dissatisfaction in people's lives, so that the satisfactory self-concept through consumption will be enhanced with the proper collection of material products (Wright et al., 1992). Moreover, consumer goods refer to products that can be consumed (Arnould & Thompson, 2005). Considering self-concept is one of two components of self-congruity, and materialism is one of the important domains of consumer cultural values, in this sense, it builds a linkage between consumer culture and self-congruity.

Regarding the theory of consumer culture, there is no consensus on the definition of consumer culture (Arnould & Thompson, 2005; McCracken, 1988). According to Arnould and Thompson (2005), it rather refers to a group of theoretical perspectives that focus on the dynamic relationships between consumer behaviour, the market, and cultural implications. Similarly, Slater (1997) summarised those perspectives by stating that consumer culture started with a broad use of consumer goods in the people's daily lives across all social structures; consumption was therefore inspired by the desire of possession for the new products. The culture could eventually be formed and bonded through the establishment of infrastructures, corporations, and performances; this benefits from the new markets, such as the increasing of shopping and marketing activities (Slater, 1997). Furthermore, Usunier (1996) deemed that consumption tightly links to lifestyles and culture, as it seems that consumer culture centres around consumption. For example, consumers would like to purchase new products because innovative consumers look for new experiences to fulfil their needs via new consumption (Steenkamp & Gielens, 2003), and new products play a significant role to level up consumption (Ritzer, 2004). This may indicate a linkage between innovativeness to self-concept and purchase intention. Another example also links ethnocentrism to the consumer's attitude towards foreign products. Previous studies demonstrate that ethnocentric consumers hold positive attitudes towards local brands, and they are more willing to purchase domestic brands in developed countries (Netemeyer et al., 1991; Sharma et al., 1995; Shimp & Sharma, 1987; Steenkamp & de Jong, 2010), but it might not be the case in developing countries (Wong et al., 2008; Zhang, 1996).

The above ideals may hence be the reason why Slater (1997) called consumer culture the culture of 'consumption'. Consumer culture indicates a social arrangement where the relationships between day-to-day culture and social resources, as well as between the meaningful lives and the symbolic or material possessions which consumers rely on, are mediated through marketplaces (Arnould & Thompson, 2005). It is consistent with Firat (1997) that contemporary/post consumers seek meaningful experiences in their consumption lives, as well as constructing their self-images within their consumption experiences due to the trend of globalisation. The dominant mode of consumption is thus mentioned in the definition of 'consumer culture' that consists of firms' collective actions with regards to their marketing activities (Holt, 2002). Moreover, capitalism requires interdependence between cultural frameworks and market prerogatives in order to work properly, which influences how people become conversant with a market's offerings and interact within it (Holt, 2002). This idea bridges the gap between the culture of consumption and the symbolic values of products which have significant influence on brand/product image and in turn, on self-congruity.

Consumer culture is bound with modernity (Featherstone, 2007). Global consumers seek consumption based on modernity, namely cultural modernisation (Holton, 2000). In other words, consumers do not merely consume for

the utilitarian purchases, they also consume for symbolic meanings, such as self-satisfaction. Similarly, Tsai (2005) refined the argument from the previous studies (Belk, 1995; Brown, 1995, 1997; Firat & Venkatesh, 1997; Fischer, 2000; Fournier, 1991, 1998; Hogg et al., 2000; Holt, 1997; Kleine III et al., 1993; Voase, 2002) that contemporary consumer behaviour associated with post-modernity as a socio-cultural phenomenon, because one involved in consumption pursues an identity of themselves and culture, not only trying to fulfil basic needs. It is assumed that the purchase behaviour of contemporary consumers mainly focuses on products' symbolic meanings in the relation of self-concept and cultures, through the view of social-cultural symbolism; brands in consumer culture nowadays are highly related to producing symbolic meaning in the process of defining one's self to construct self-concept (Tsai, 2005). From this point view, the symbolic meanings of products play an important role in both consumer culture and in the process of forming self-congruity.

Additionally, one crucial element of constructing self-congruity is attitudes towards brands/products, revolving around the notion of brand attitudes significantly influencing the dynamics of creating brand image, and brand image is measured by attitudes towards brands/products in many self-congruity studies (e.g. Ericksen, 1996; Faircloth et al., 2001; Sirgy, 1982; Sirgy & Su, 2000). This is also consistent with Keller's (1993) conceptualised attitude toward brand/product as a part of brand image. On the other hand, Steenkamp and de Jong (2010) examined the effects of cultural values on attitudes toward local and global products, since cultural values have significant influence on attitudes, in turn, on consumer behaviour (Adler & Gundersen, 2008). Steenkamp and de Jong (2010) argued that consumers try to discover meanings in their lives via consuming products recognised internationally and beyond their individual national cultures. Consumers enjoy the homogenisation of consumer culture, which has benefited from the global economy and the development of global companies (Alden et al., 1999). As a result, consumer cultural values, especially for innovativeness and materialism, have a significant effect on attitudes towards global products (Steenkamp & de Jong, 2010). Considering the significance of attitudes towards brands/products on brand image, it could be assumed that consumer cultural values may influence self-congruity, at least indirectly. However, as mentioned previously, most studies of self-congruity regarding cultural issues employ the national cultural frameworks. Hence, there is a lack of empirical evidence to attest this relationship and it needs to be tested.

Consumer-cultural values

Consumer culture is highly dynamic and subject to change (Slater, 1997). Ideas or values as cultural principles are the implication of cultural categories (e.g., time, space, and occasions), which could transfer meanings to the product and the consumer respectively (Hoyer & MacInnis, 2009). Consumers also attempt to discover meaning in their lives throughout the consumption of products that are generally recognised as international and transcending individual national cultures (Steenkamp & de Jong, 2010). Hence, in the recent study of Steenkamp and de Jong (2010), consumer culture is classified into three categories of consumer-domain specific values, recognising that consumer culture deals with the consumption of products across times and space, consistent with Hoyer and MacInnis (2009), by considering materialism, innovativeness, nostalgia, ethnocentrism, and environmentalism. The first two consumer values are primarily related to products; nostalgia to the time perspective; and ethnocentrism and environmentalism to the social and physical context (Steenkamp & de Jong, 2010). The empirical evidence shows that materialism and innovativeness have a positive influence on consumers' attitudes towards global products, but nostalgia and ethnocentrism have a negative influence on consumers' attitudes towards global products (Steenkamp & de Jong, 2010). The last dimension, environmentalism, has no effect on consumers' attitudes towards global brands (Steenkamp & de Jong, 2010). Based on the literature review in the previous section, and considering the tight relationship between consumers' attitudes and self-congruity, we can therefore make an assumption that consumer-cultural values will significantly influence self-congruity. Accordingly, we have made the following hypotheses below. The conceptual model is shown in Figure 1.

Hypothesis 2: materialism significantly influences self-congruity of the brand Apple.

Hypothesis 3: innovativeness significantly influences self-congruity of the brand Apple.

Hypothesis 4: nostalgia significantly influences self-congruity of the brand Apple.

Hypothesis 5: ethnocentrism significantly influences self-congruity of the brand Apple.

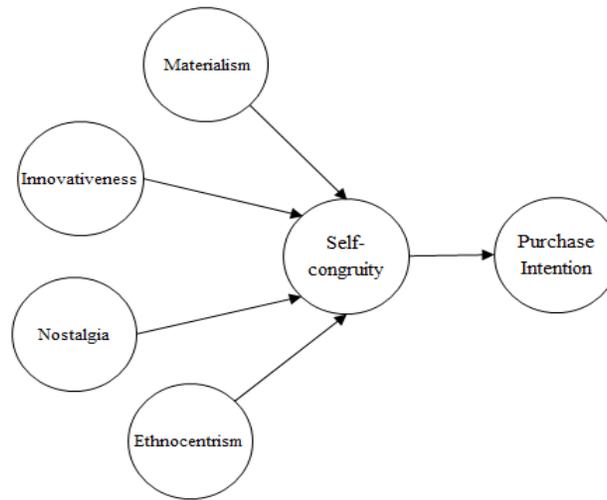

FIGURE 1: CONCEPTUAL MODEL OF THE BRAND APPLE

Methodology

This research primarily used cross-sectional data collection. The study was conducted using one survey as a pre-test to identify the appropriate attributes of brand/self-image from a pool of 50 brand image attributes (Graeff, 1996) in order to measure image congruence. A combined technique of Likert rating and ranking was employed to make sure the right brand image attributes were chosen (Driesener & Romaniuk, 2006). One hundred fifty-two valid questionnaires were collected in the high streets (the primary business streets) of Manchester in the United Kingdom. Next, 20 brand image attributes were selected as image dimensions to measure brand image and self-image by using five-point Likert scales. The consumer cultural framework applied in this research was first testified in the work of Steenkamp and de Jong (2010) and was partially performed in his previous studies (Alden et al., 2006; Steenkamp et al., 1999) as a short-form version. This study follows the instruction of Steenkamp and de Jong (2010) and traces back to the original sources for each construct. The materialism dimension was measured by three scales taken from Richins and Dawson (1992). The innovativeness value was measured by three scales take from Steenkamp and Richins (2003). The study measured nostalgia, consumer ethnocentrism, and consumer environmentalism with two scales for each one of them taken from Holbrook (1993), Shimp and Sharma (1987), and Grunert and Juhl (1995), separately. A five-point Likert scale was applied and rated by participants so as to measure national-cultural values and maintain the consistency. Purchase intention was also measured using a five-point Likert scale. The final questionnaire was conducted in high streets of the four cities (Beijing, Guangzhou, Shanghai, and Shenzhen) in China. Eventually, 624 valid questionnaires were collected. The study used Structural Equation Modelling (SEM) with AMOS 20 statistical package to test the hypotheses. The estimation techniques of SEM can be decomposed into two stages: the measurement and structural models (Hoyle, 1995). After confirmatory factor analysis (CFA) was conducted to confirm the measurement models, SEM was utilised to check the structural models and test Hypotheses 1-6, whilst confirming relationships among observed and latent variables, moving beyond regression to gain additional insight.

Data Analysis

CFA of measurement model

The correlation analysis was firstly conducted in order to examine the relationships between each brand image attribute and consumers' self-image. Only the pairs of image attributes (brand image and actual/ideal self-image) that had significant relationships were selected. Sixteen image attributes were selected followed by the calculation of self-congruity (Ross, 1971; Sirgy, 1982, 1985b; Sirgy et al., 1997; Sirgy et al., 1991) for each brand. After testing the

original measurement model, the model generated an unsatisfied outcome. The normed chi-square ($\chi^2/DF=3.560$) achieved the acceptable level of 5. The goodness-of-fit index (GFI) reached the good fit threshold of 0.95, scoring 0.961. The adjusted goodness-of-fit index (AGFI) was 0.930, meeting the good fit level of 0.90. The values of standardised root mean square residual (SRMR) was 0.0565 and root mean square error of approximation (RMSEA) was 0.064, both less than 0.08 but greater than 0.05. However, normed-fit index (NFI) did not pass the acceptable level of 0.90, scoring only 0.876. Comparative fit index (CFI) just reached the acceptable level of 0.90, scoring 0.906.

The measurement model therefore needs to be modified. Based on the output of AMOS, the standardised factor loadings of both factors of innovativeness and one factor of nostalgia were less than 0.05. We dropped off one factor of innovativeness and the dimension of nostalgia. The values of all the model fit indices ($\chi^2/DF=1.903$, GFI=0.986, AGFI=0.969, SRMR=0.292, RMSEA=0.038, NFI=0.958, CFI=0.979) indicated that the modified model had a good fit to the data. The reliability and validity of the measurement model were also tested. Cronbach's alpha values and the composite reliability of all the constructs of consumer-cultural values and self-congruity were above 0.70. This demonstrated high construct reliability and internal consistency. The values of average variance extracted (AVE) were above 0.5. For each construct, the values of maximum shared squared variance (MSV) and average shared variance (ASV) were less than the AVE. Hence, these results indicated satisfactory convergent validity and discriminant validity in the model.

Assessment of structural model

Next, the study established the initial structural model based on the results of CFA. The assessment of the initial structural model presented satisfactory results of model fit indices ($\chi^2/DF=3.159$, GFI=0.969, AGFI=0.947, SRMR=0.0658, RMSEA=0.059, NFI=0.900, CFI=0.928). Based on the modification indices of AMOS, it indicated there was a relationship from innovativeness and purchase intention. Thus, we drew a path from innovativeness and purchase intention in order to make better fitness. The results of model fit indices ($\chi^2/DF=2.819$, GFI=0.973, AGFI=0.953, SRMR=0.0622, RMSEA=0.054, NFI=0.913, CFI=0.942) indicated that the modified structural model had a satisfactory and better fitness to the data.

As a consequence of a newly added path from the value of innovativeness to purchase intention, an additional hypothesis was introduced for the modified structural model below.

Hypothesis 6: Innovativeness significantly influences the Chinese consumer purchase intention toward the Apple brand.

Hypothesis test

In order to test the hypotheses, the study therefore examined the significances of the path coefficients estimates. The path coefficient from self-congruity to purchase intention was 0.221 ($t=3.167$, $p<0.01$), which supported Hypothesis 1. The path coefficient from materialism to self-congruity was 0.159 ($t=2.123$, $p<0.05$). Thus, Hypothesis 2 was supported. Hypothesis 3 was also supported, because the path coefficient from innovativeness to self-congruity was 0.227 ($t=2.905$, $p<0.05$). The study discovered that nostalgia did not have significant effects on self-congruity. Hence Hypothesis 4 was rejected. The path coefficient from ethnocentrism to self-congruity was -0.095 ($t=-1.511$, $p=0.131$), which showed that the value of ethnocentrism did not have significant influence self-congruity. Hypothesis 5 was therefore rejected. Finally, the newly added path from innovativeness to purchase intention was 0.196 ($t=3.556$, $p<0.001$). Therefore, Hypothesis 6 was supported.

Discussion

Consistent with Hoelter (1983) and Ericksen and Sirgy (1989), a strong support has been found for the relationship between self-congruity and purchase intention of the brand Apple. The findings demonstrate that the image congruence of Apple's brand image and its consumers' self-images positively influence the Chinese consumers' purchase intention; this means that the higher degree of the congruence between Apple's brand image and its consumers' self-images, the more Chinese consumers desire to purchase Apple's products. The second hypothesis was to show how the value of materialism impacts the self-congruity of the brand Apple. Consistent with the literature (Arnould & Thompson, 2005; Steenkamp & de Jong, 2010; Wright et al., 1992), the results present that there is a

significant and positive relationship between materialism and self-congruity with the Apple brand. Hence, this outcome indicates that the stronger Chinese consumers hold their belief in the value of materialism, the higher their degree of self-congruity it will be. Moreover, the same result is seen in the relationship between innovativeness and self-congruity. The results are consistent with Steenkamp and de Jong (2010) and Steenkamp and Gielens (2003), as innovations significantly and positively influence self-congruity of the brand Apple, which means the image congruency of the Apple brand is higher when Chinese consumers' dispositional innovativeness is stronger. The results do not support Hypotheses 4 and 5; this means that the values of nostalgia and ethnocentrism do not have significant effects on self-congruity. Nostalgia refers to people believing things were better in the past (Holbrook, 1993). The results implicate that Chinese consumers might not hold positive and strong attitudes toward this value. Ethnocentrism means that consumers believe it would be wrong to purchase foreign products because it would hurt the local economy (Steenkamp & de Jong, 2010). However, the results show that there is no significant relationship between ethnocentrism and self-congruity. Hence, this outcome is consistent with Wang and Chen (2004) and Zhang (1996), as country of origin does not seem to influence Chinese consumer's product evaluation, attitude to US brands, and purchase decisions. In addition, the impact of ethnocentrism is mitigated by quality perception of consumer conception values in developing countries (Wang & Chen, 2004). Finally, consistent with Ritzer (2004), new products can raise consumption to a higher level. Consumers like to purchase new products because innovative consumers seek new experiences to fulfil their needs via new consumption (Steenkamp & Gielens, 2003). Therefore, the study discovers that innovativeness does have significant and positive impacts on the purchase intention of Chinese consumers of the Apple brand, which means the more innovative the Chinese consumers are, the higher the image congruency will be between Apple's brand image and its consumers' self-image.

The outcomes will have important managerial implications for multinational marketers entering developing countries and will benefit global firms in adapting their positioning strategies and brand portfolios. For instance, Chinese consumers have higher self-congruity towards electronic products when they hold stronger attitudes of materialism and innovativeness. Global companies will therefore have a better understanding of why Chinese consumers buy such products, and how they can better focus on the right market segmentation. They will also know nostalgia and ethnocentrism do not impact self-congruity, so they would not spend as much on marketing campaigns by targeting these values. Our empirical findings can also help global firms evaluate the receptivity of consumer-cultural values in China in order to establish better positioning strategies of their brands.

Conclusion and Limitations

Based on a review of the previous literature, this study has proposed a conceptual model to examine the effects of consumer-cultural values on self-congruity of the Apple brand toward purchase intention. Twenty self-image and brand-image dimensions have been selected using pre-tests. The analytical technique of SEM with AMOS 20 was applied. The findings suggest that the values of materialism and innovativeness have significant and positive effects on the self-congruity of the Apple brand. The value of innovativeness also directly influences the purchase intention of Chinese consumers of the Apple brand. However, the values of nostalgia and ethnocentrism have much less significant impacts on the self-congruity of the Apple brand. The findings can provide a new insight into how consumer culture influences self-congruity in the Chinese market. Further research could extend this study to other brands or product categories. It could also examine the same brand across other cultures. This study did not consider demographical factors such as gender, age, education, or incomes.

B2B vs B2C, which different approaches to social media marketing. Empirical evidence from the Marche Region

Abstract

In Italy the adoption of social media for marketing purposes is a fairly recent phenomenon. Web 2.0 and social media have spread very quickly among users and businesses often do not yet fully grasp all opportunities. The social universe is extremely diverse: there are several tools that differ in structure, rules and functionality, it is therefore strategically select those platforms that are more in line with the company's profile and with the image that the brand wants to deliver online. In this work we analyze the presence of any differences in approach to social between B2B and B2C businesses. The aim of this research is to investigate whether there is a correlation between the adoption of a tool-set of social platforms and the business area of the company. The study was conducted on a sample of companies in the Marche Region.

Introduction

Recently, the Web has established itself as one of the pillars to consider in order to create innovative marketing strategies. In particular, the phenomenon known as Web 2.0¹ has had the greatest impact on business (Jussila, Karkainen, Aramo-Immonen, 2014). Web 2.0 is configured, in fact, as the set of innovations that took place on the net, thanks to the introduction of new tools and features, have changed how to access and use.

A key element of revolution introduced by Web 2.0 are definitely social media. They are defined by Kaplan and Haenlein (2010) as a group of internet-based applications based on the ideologies and technologies of Web 2.0 and that allow the creation and sharing of User Generated Content (UGC) (Smith, Fisher & Yonjian, 2012). This point of view is of fundamental importance for understanding the real revolution in marketing: End users now play a crucial role in low the content generated by them trasmetted on the Web, are able to influence perceptions and consumer trends, elements that remained under the control of marketers until few years ago (Mangold & Faulds, 2009). This phenomenon has spread more quickly from the user side compared to that of companies, which have spent more time in overseeing social media and exploit them to their advantage. Considering the Italian situation emerges that in 2012 85% of Internet users (€ 24.3 million) regularly access social media² and only 37% of companies have integrated these tools into their marketing mix³.

Looking at this context, we can say that social media platforms are the place where most of the information is produced and managed by end users. The panorama of social media such as, Facebook, YouTube, Twitter and LinkedIn, is very large and each platform is distinguished by features, architecture and standards that affect how you can use by businesses (Kietzmann et al., 2011, Smith , Yongjian & Fisher, 2012).

It's therefore clear that the adoption and use of these tools may take different modes and intensity depending on the type of relationship that exists between the company and its customers. It is now clear that there are types of businesses more likely to use social media as a marketing tool; this is one of the reasons why much of the research focuses on business-oriented business to consumer (B2C Michaelidou, Siamagka & Christodoulides, 2013).

Referring to the B2B sector, although many authors identified considerable advantages in the adoption of social media for this type of company (Shin, 2009; Safko, 2010; Wollan & Smith, 2010; Barlow & Thomas, 2011) the research is still scarce and fragmented. The purpose of this work is to provide a contribution to the literature on the comparison between B2C and B2B context of the adoption of social media for marketing purposes.

¹ The term Web 2.0 was coined in 2004 by Dale Dougherty of O'Reilly Media vice president during a brainstorming session between O'Reilly and MediaLive International.

² <http://www.iab.it/news/social-media-marketing-strumento-strategico-di-business.-italiani-sempre-pi-presenti-sui-social-network-per-comunicare-seguire-attualit-e-programmi-tv-radio.html>

³ eCircle – Mediacom 2013

There are questions, in particular, on whether or not a propensity to choose a particular set of social media, depending on the orientation of the business. To do this, we have identified a sample of 140 manufacturing firms from the Marche region in Italy, of which 70 B2B and B2C 70 and was made a mapping of their social media presence most popular Facebook, LinkedIn, Youtube, Twitter, Pinterest and Instagram.

The analysis could provide a first support for future research on this particular topic as well as insights about the need for a more holistic view of social media marketing.

Social media marketing, the delay of B2B

As stated earlier, research on social media marketing in recent years has developed focusing particularly on the relationship between these tools and business to consumer oriented. Blackshaw and Nazzaro (2004) are among the first that identify the marketing potential of social media in the literature, they describe the social networks as a set of new sources of online information created, disseminated and consumed by consumers with the purpose of keeping abreast of products, brands, services, and personality problems.

According to Mangold and Faulds (2009), social media can be considered as a hybrid element of the communication mix as they have elements of traditional communication, such as the interaction between brand, and consumer to innovative features, such as the expansion of word of mouth, often referred to as eWoM (Bulearca, 2010), a key element of many digital marketing campaigns.

There are also many the works that studied the marketing opportunities provided by social media. From market research of Breslauer and Smith (2009) and e-Marketer⁴ (2010) emerges that firms are using social media to build direct relationships with consumers, increase traffic to the website, identify new business opportunities, build communities, disclose the contents and collect feedback from their customers. Other business processes, with a broader view of social media, have been added to support such as customer relationship management (Kim et al., 2010; Harris & Rae, 2009; Hawn, 2009), the management of the network both internal and outside the company (Kim et al., 2010;-Leader Chivéé et al., 2008; Misner et al., 2008) and finally the recruitment (Millard, 2007).

At the same time there are studies that address the different barriers that prevent or slow the process of adoption of social media by businesses (Schwarz-DuPre, 2006; Chen and Wellman, 2009; Belo et al., 2013). These barriers are often recurring and are of endogenous origin, such as resistance to change, lack of internal resources, both human as well as economic use in the management of social media.

Because in this work we try to identify some difference of approach to social between B2B and B2C, we should pause on what the literature says about it. The common view is that on the one hand, the delay of B2B businesses is evident, on the other hand, is increasing the interest of B2B marketers than social media (Michaelidou et al., 2011; Jussila et al., 2014). According to one study, only 5% of B2B marketers consider social media marketing an integral part of their marketing mix, 17% do not use any type of social media and 58% is considered the beginning of a strategy for social media marketing (Gianmarco & Gregoire, 2012).

The Social Media landscape

The universe of social media is wide and varied, so talk of social media marketing without taking into account the many differences that exist between the instruments would be simplistic and could be harmful in the planning phase of a digital marketing strategy.

As stated earlier, social media is a set of tools and may differ from each other in structure, network, how to use and interaction. Haenlein and Kaplan (2010) carried out a classification of social tools on the basis of the combination of two dimensions (table 1):

- Social presence, media richness: based on social presence theory (Short, Williams & Christie, 1976) and Media richness theory (Daft & Lengel, 1986). According to these theories, the media differ in the degree of "social

⁴ e-Marketer (2010). "Leveraging best practices for social media, November 23 2010". Available on <http://www.emarketer.com/Article.aspx?R=1008057>

presence" that must be used to interact with a given media. A media may also differ for the wealth of content that you can communicate with it, or the amount of information that can be transmitted to the inside in a given period of time.

- Self-presentation (Goffman, 1959), Self-disclosure: the ability to provide information about yourself and build your own image with the aim of positively or negatively influence the perceptions of others towards themselves. Such information may be disclosed either consciously or unconsciously (Self disclosure). Table 1. Classification of Social Media by social presence/media richness and self-presentation/self-disclosure.

TABLE 1: CLASSIFICATION OF SOCIAL MEDIA BY SOCIAL PRESENCE/MEDIA RICHNESS AND SELF-PRESENTATION/SELF-DISCLOSURE

		Social presence/Media Richness		
		Low	Medium	High
Self-presentation/ disclosure	High	Blogs	Social networking sites (e.g., Facebook)	Virtual social worlds (e.g., Second Life)
	Low	Collaborative projects (e.g., Wikipedia)	Content communities (e.g., YouTube)	Virtual game worlds

Source: Kaplan & Haenlein, 2010

In Table 1 are shown the main types of social media, in this case allocated on the basis of the level of information / interaction connected to them.

Below we provide a definition of social media considered in this work (Gundecha & Liu, 2012):

- Online social networking: they are web-based services that allow individuals and communities to connect with friends, or coming from real size online. Users interact through status updates, comments, content sharing, private messages, etc.. The most popular social networking are Facebook, LinkedIn and MySpace.
- Blogs: mix of the words web and log, the blog is, to all intents and purposes, an online journal. In these web pages bloggers can publish textual content often enriched by multimedia content such as video or animated gif. Blogs can be maintained by an individual or a community. Among the most popular blogging platforms are Wordpress and Tumblr.
- Microblog: has the same features but with the limitations of the blog for content, for example, Twitter allows you to post text messages of up to 140 characters.
- Media sharing: in these platforms, users share, view and comment on multimedia content such as video, image and audio content. Social media reference are YouTube, Instagram, Pinterest, and Soundcloud.

Social Media analyzed

In this section we provide a brief description of social media considered in this work, trying to identify the role that each instrument can play within a digital marketing strategy. Social media identified for research are the ones most used by companies for marketing purposes⁵.

With regard to the social networks have been chosen Facebook and LinkedIn, for the category of microblog Twitter and was chosen for the platforms of media sharing YouTube, Pinterest and Instagram.

Facebook

⁵ Social Media Examiner, 2014, "2014 Social Media Marketing Industry Report. How Marketers Are Using Social Media to Grow Their Businesses" May 2014

It 'a social networking service founded in 2004. With over 1 billion monthly active users is the most popular social network in the world⁶. Users create personal profiles whose interface appears in the form of bulletin board or profile page where you can insert the contents of various kinds such as comments (status updates), images, videos and links to external content.

Users interact expressing appreciation to the content (like) to share their time, or by leaving a comment. They can get in touch with friend requests. On this platform, companies can create fan pages related to their brands and interact with users (fans) who come to this page.

There are many additional services that have appeared over the years on Facebook, such as Graph Search⁷, the ability to use the hashtag⁸ or the ability to integrate their pages with external applications produced by other developers. The contribution of research to the study of the use of Facebook for brands is still limited (Zhang, Sung and Lee, 2010; Smith, Yonjian and Fischer, 2012).

LinkedIn

Is the largest professional social network with over 200 million members⁹ and operates in over 200 Countries. Through this platform, users are able to manage and share their professional identity.

According Bonson and Bednárová (2013) the most significant contribution that gave LinkedIn businesses is the ability to expand their recruitment activities at an affordable cost (Lybaert, 2002). Several studies have focused on the impact or effects of the instruments LinkedIn many of which are related to the users' profile (Breitbarth, 2012; Guillory and Hancock, 2012).

YouTube

It 'a platform for media sharing founded in 2005. Users posting videos which can be commented and shared on other social media. Users can organize own videos by creating personal "channels".

According to research conducted by Forrester (2012), video content online is the most enjoyed by consumers. In a commercial context, over 50% of users on the web prefer watching a video rather than reading a review or a blog article. Also according to the research, watch videos produced by the brand is the third mode more frequently with which users interact with businesses.

In addition to being a platform dedicated to entertainment content, YouTube is an excellent resource to display information contents as a tutorial or instructions. It should be emphasized that while the videos get more views are professionally produced (Kruitbosch and Nack, 2008), the ones that get the most comments are produced by end-users (Burgess and Green 2009).

Twitter

It's the only platform that has as its textual limitation 140 characters per message. Its attractiveness comes from the ability to read the news and the latest information. The micro-blogging service, founded in 2006, allows marketers to send these short messages (tweets) to a network of followers (followers) at any time and with a myriad of electronic media (Twitter, 2013).

⁶ In March 2013, active users on Facebook are 1 billion and 110 million Source: "Facebook Reports First Quarter 2013 Results". Facebook. Retrieved May 2, 2013.

⁷ Facebook Graph Search is a semantic search engine that was introduced by Facebook in March 2013. Is designed to provide answers to user queries in the form of natural language, rather than as a list of links. The function combines the Graph Search data acquired by Facebook users and external data in a single search engine that provides search result user-specific.

⁸ The hashtag is a tag used in some type of social networks to create labels. They are made up of words (or combinations of words concatenated) inserted in the comments preceded by the # (pound). They are mainly used as tools to allow web users to more easily find a message related to a topic and participate in the discussion, but also to encourage them to participate in the discussion on a topic indicated as interesting.

⁹ <http://blog.linkedin.com/2013/01/09/linkedin-200-million/>

Each user can also share a tweet (re-tweet) or replicate by writing directly to the user concerned. Also in this social media, the use of the hashtag is very important and frequent. Jansen et al. (2009) noted that 19% of brand-related tweets is, however, almost half of these cases, the brand is not the central element of the content of the post. Tweets where the brand is the focal point, users express opinions about the brand or seek information regarding products or services offered.

New Tools

In order to better represent the actual scenario of social media marketing, it was considered appropriate to include in the object of study, two social media Pinterest and Instagram. Despite being relatively new - both were launched in 2010 - has witnessed a rapid spread among users¹⁰ mainly due to the growth of mobile, which has made them attractive and interesting tools for brands (McNely, 2012).

Both social media platforms in question are of image sharing through which users share images and photos taken with mobile devices often. Through these social, brands are able to convey their identity by associating often intangible elements such as style, culture, mission and corporate vision.

Faber (2002) introduces the concept of image-power to describe the ability of a brand to communicate its image to the outside so fixing it in the imagination of consumers.

- Pinterest: founded in 2010 by Evan Sharp, Ben Silbermann and Paul Sharra is a social media dedicated to photos sharing, videos, and images. Users can load, save, sort, or manage images through the use of virtual "pins" through which you can collect content in "bulletin boards" that act as containers and often are organized thematically. Each user can also share in turn (re-pin) content found in message boards of others. Pinterest offers dedicated services to companies such as Pinterest for business, a service that helps businesses in creating a profile to be used for marketing purposes.
- Instagram: is configured as a mobile application whose operation reflects the logic of social media. Instagram allows users to take photos, apply filters and share them on the platform and on all major social media. The app is available for media with the operating system iOS, Android and Windows Phone. Even in the use of this platform hashtag is a basic function.

Methodology

The aim of the research is to see if there is a specific propensity of companies to the use of a particular toolset social platforms, depending on the orientation to the business of the enterprises themselves: Business to Consumer (B2C) companies would be more oriented likely use of certain social networks, such as Facebook, Pinterest and Instagram, while Business to Business (B2B) companies would be oriented more geared towards the use of social networks such as LinkedIn, Youtube and Twitter.

The survey was conducted over a period of three months (from January 2014 to March 2014) on a sample of 140 firms randomly drawn, drawing on the ranking of the leading enterprises of the Marche year, 2013, prepared by the Centre Enterprise Foundation Aristide Merloni¹¹.

Identified the sample of firms, we proceeded with the analysis of the presence of the same on social networks identified by the inquiry in the search engines.

¹⁰Pinterest founded in 2010 in 2013 reached 242 million members with an increase of 150% compared to 2012 (Global Web Index). Instagram App, also launched in 2010, reached 150 million monthly active users in 2013 (Wikipedia).

¹¹ The Aristide Merloni Foundation was founded in 1963 with the aim of supporting the institutional creation of new businesses in the Marche region. Since 1986, with the "Observatory Companies", the Foundation collects and processes the financial statements of the leading enterprises of the Marche, organizing the data of over two hundred companies in a ranking accompanied by comments on the economic and financial system. Drawing on data from the observatory, is annually compiled a list of the main companies of the Marche.

Social networks are being analyzed Facebook, Twitter, LinkedIn, YouTube, Pinterest and Instagram, and, as shown above, are the most representative type adopted by marketers (Socialmediaexaminer 2014).

Results

The results reveal that 67% of the analyzed sample is present on at least one social media, specifically the 48% of businesses have a page on the social network Facebook, the 39,29% have a corporate Youtube channel; 35, 71% have a company profile on LinkedIn, the 31,43% have a Twitter profile, 17% of companies have an official profile on Pinterest, and finally 7,14% has an official profile on the app Instagram:

TABLE 2: THE PRESENCE OF BUSINESS ON THE SOCIAL NETWORK

SOCIAL MEDIA SITE	TOT	%	B2B	B2C
FACEBOOK	67	48%	19	48
LINKEDIN	50	35,71%	16	34
YOUTUBE	55	39,29%	18	37
TWITTER	44	31,43%	14	30
PINTEREST	24	17%	1	23
INSTAGRAM	10	7,14%	0	10

It is then proceeded with the breakdown of the sample according to the type of business going to calculate the percentage of B2B and B2C companies that are present on social (Table 3).

TABLE 3: WEIGHT PERCENTAGE OF THESE COMPANIES ON SOCIAL NETWORK

SOCIAL MEDIA SITE	B2B	%	B2C	%
FACEBOOK	19	27,14%	48	68,57%
LINKEDIN	16	22,86%	34	48,57%
YOUTUBE	18	25,71%	37	52,86%
TWITTER	14	20,00%	30	42,86%
PINTEREST	1	1,43%	23	32,86%
INSTAGRAM	0	0,00%	10	14,29%

Facebook appears as the most popular social network adopted by companies belonging to the Business to Business sector, 19 of them, in fact, have a company page on this social network, which corresponds to 27,14% of the total sample. Following the social in which companies are present to the extent of 25,71% is Youtube (there are 18 companies that have their own channel). The third social network by number of firms is LinkedIn, with 22,68% of registered companies. Follow the Twitter social network (20% of the sample has its own page) and Pinterest (1,43%, equal to a company). Among the 70 companies in the sample Business to Business has no active profiles on the social network Instagram.

Analyzing the results obtained for the Business to Consumer companies and making an overall assessment with respect to the total sample, it appears that the propensity to use social always sees Facebook as a first choice with a 68,57% of B2C companies in the sample with their own business page. Followed by the presence on social networks, there are Youtube (52,86%) and LinkedIn (48,57%).

This type of evaluation suggests a convergence strategy in positioning on social networks, irrespective of the business of belonging (Fig. 1).

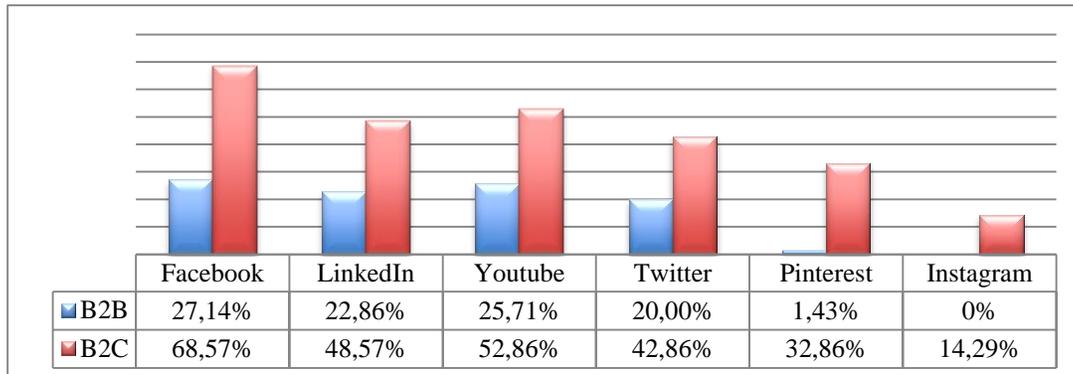

FIG. 8 THE PRESENCE OF BUSINESS ON THE SOCIAL NETWORK WITH RESPECT TO THE TOTAL SAMPLE

These results were processed by comparing the values with the total sample of firms, thus including companies devoid of social pages. The scenario changes by estimating the weight in percentage terms instead of the results obtained exclusively in the set of companies that are present on social media.

In this case, in fact, Figure 2 shows the comparison between the two compartments on the basis of their "weight" with respect to each social media. The use of this representation might be useful to look at the actual "attitude" of the companies in respect of a tool-set that consists of more social media.

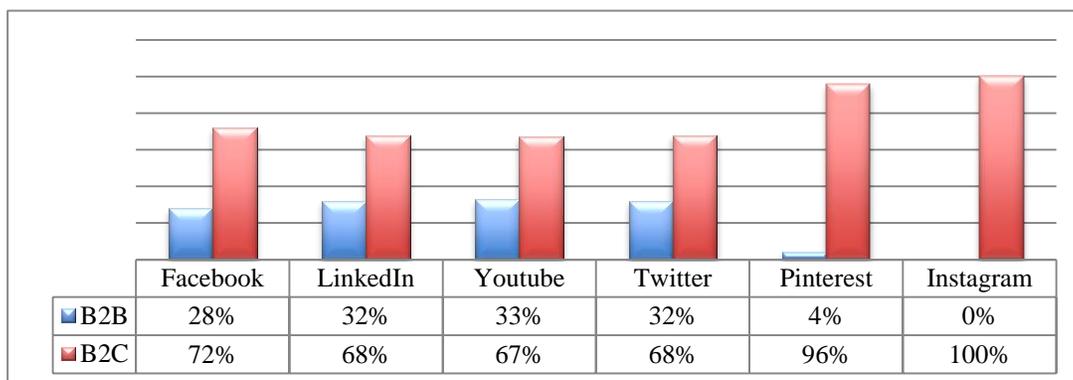

FIG. 2 THE PRESENCE OF BUSINESS ON THE SOCIAL NETWORK WITH RESPECT TO THE WEIGHTED SAMPLE

The result that emerges from this analysis is that, although in absolute terms the most guarded by B2B social media is Facebook, YouTube are social media (33%), LinkedIn (32%) and Twitter (32%) instruments where companies B2B has a weight more important than the B2C. On the other hand, using the same approach, we can see that social media such as Facebook and Instagram Pinterest tools are preferred by B2C companies, or in which the proportion of B2C companies who will preside over the greatest impact. The social media such as Instagram is adopted for the whole of the undertakings B2C, Pinterest and Facebook by 96% from 72%.

It would therefore appear that companies choose different toolset tools by virtue of the scale of use of the social networks themselves (Belo et al., 2013). This representation is in line with the observations made by the authors analyzed in this work. There are in fact social media more oriented to the production and dissemination of professional contents and thus able to influence within a network of professionals such as LinkedIn, Youtube and Twitter. Just as there are social media such as Instagram, Pinterest and Facebook designed for end-users who, with their contents, help fuel the network.

Conclusion

In this work we tried to verify the existence of different approaches to social media marketing in relation to the type of business in which the companies operate. In particular, making the comparison between B2B and B2C companies we can believe that there might be a different propensity to adopt a particular portfolio of social media.

It is important to note that marketers in order to define a marketing strategy based on social media, they should consider the social universe as a set of tools that differ in many ways but at the same time, they can be an integral part of a single strategy. The choice of platforms to use can significantly affect the marketing performance of the company and should be carried out by taking into account the type of business in which a company operates.

From the analysis of the sample was confirmed a concept expressed in the literature that a delay of B2B companies than the B2C adoption in the context of social media for marketing purposes. The more tools are used for both segments Facebook, LinkedIn and YouTube.

However, at a second level of analysis was sought to understand what was the weight of the two types in relation to each social media. With this approach it was possible to verify some usage trends. The app Instagram for example, was adopted for the whole of the B2C companies from which one might infer that this instrument is perceived as more functional for a marketing-oriented consumers. Similarly, it is in social media YouTube B2B businesses weigh more than the B2C which might suggest that the video-sharing platform is seen as a marketing tool can also be used in the world of business to business.

Being at an early stage the study has several implications for the future. It is believed that the sample is not representative of real industrial fabric of the Marche Region consists mostly of small and medium-sized enterprises. It is also believed that the first division of the sample in B2B and B2C is an understatement. The goal is to identify clusters based on the macro field of belonging so as to perfect the study of different orientations.

Customer Knowledge to improve the Innovation: The Relationship in México

Abstract

The Knowledge Management (KM) improves the innovation in the firms based on information (OECD, 2003). Gebert, Geib, Kolbe, & Riempp, (2013) showed the sense of information: for, from and about the customers, that increase the market opportunities; this is called Customer Knowledge Management (CKM). The different Innovation Stages (INNOVS) increase the competitive advantage (OECD, 2005). Hence: ¿Which is the conceptual model that relates the variables, dimensions and indicators from CKM with INNOVS? A questionnaire was designed using Likert scale and the Cronbach's alpha for confidence measurement, Pearson's Correlation and Multiple Regression Analysis (MRA) with stepwise method, was applied in 200 SME's belonging to the software developer sector located in Guadalajara City (SDSGC), México. Independent variables are based on CKM to explain the dependent variable INNOVS. CKM as a Driver Innovation (CKMADI) and CKM other sources of Knowledge (CKMOSK) on INNOVS showed correlation.

Keywords: Customer Knowledge Management, Innovation Stages, Competitive Advantage

Introduction

Today, are considered amongst others important key factor to develop competitiveness: the CKM (Garcia-Murillo & Annabi, 2002) and the INNOVS (Chesbrough, 2006). Therefore, this study is aimed to identify the CKM variables, dimensions and indicators that are predominant on the INNOVS of the 200 SME's belonging to the SDSGC; they are considered as one of the most successful industrial sectors in the creation of innovation. This work is divided into the explanation of: 1) contextual reference, problem, research questions, hypotheses and rationale for the study; 2) the theoretical framework, which is a collection of concepts about CKM and INNOVS, closing with the design of the questionnaire; 3) methodology; 4) analysis of results; 5) Discussion and 6) Conclusions.

Contextual Reference

One sector in México that is considered successful, fast-growing and highly dependent of CKM to drive the innovation in different stages is the SDS. According to INEGI (2014), into GC located in Jalisco state there are around 200 firms that are directly or indirectly related with SDS, which have opportunities to develop them into the Digital Creative City program. The project, was officially announced on January 30, 2012 by President Felipe Calderon, to enable 1000 acres, with an early investment close to 1000 million USD looking for create 20,000 jobs in 10 years. Disney, Pixar Studios and Dreamworks already have shown interest in joining to the *Jaliwood* concept of Mexico, hence the importance of identifying and promoting in a systematic way, the major factors such as CKM to encourage the INNOVS in SDS.

The Global Innovation Index Report (INSEAD, 2012) places México on site 63/142 that is reflected in its level competitiveness level, which is located on site 53/144 according to The Global Competitiveness Report 2012-2013 (WEF, 2013). Hence, the rationale for the study is to know the principal indicators for, from, about the customer (CKM) as information aimed to increase evenly the competitiveness by means of the innovation stages (INNOVS) in the SDSGC.

Problem, Research Questions, Rationale for the Study and Hypothesis

So, our problem is described in a general question as **GQ**: ¿Which is the conceptual model that relates variables, dimensions and indicators from CKM with INNOVS? By other hand, the specific questions (as **SQ**), are: **SQ1**: What is the scheme of the model?; **SQ2**: Which are the variables, dimensions and indicators?; **SQ3**: Which are variables and indicators more significant in the model?. The general hypothesis (**GH**) is: from the current knowledge

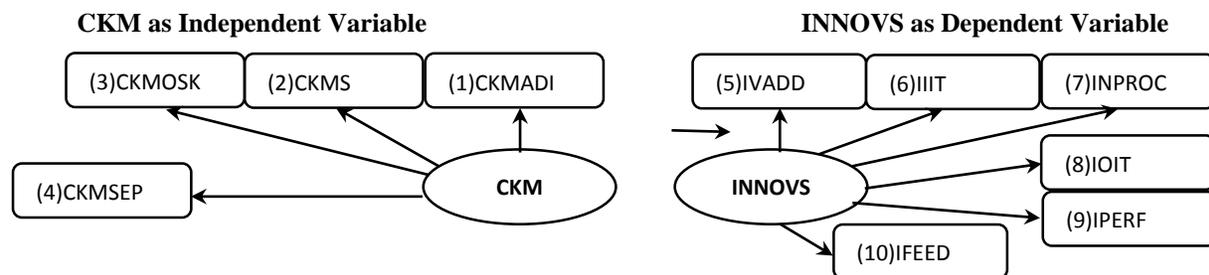

and importance given by SDSGC firms to the CKM, this is present in at least, on 20% of the variability in their innovation stages.

Theoretical Framework

The competitiveness recognizes the potential of the CKM and INNOVS (Hill & Jones, 2011). Many authors have tried to identify different senses of CKM information like: for, from, about and to co-create (Nambisan, 2002; Desouza, Awazu, Jha, Dombrowski, Papagari, & Baloh, 2007; Nicolai; Keld & Pedersen, 2011). Even more, there are efforts to determine the Negative side effects of Customer Integration (Gassmanna, Kausch & Enkel, 2012). The importance of how the knowledge can be supported by means of the human resources, the exchange amongst them, the rewards (Nicolai; Keld & Pedersen, 2011; OECD, 2003; Gebert, Geib, Kolbe, & Riempp, 2013; Gloet & Samson, 2013) and the influence of the Information and Communication Technologies (ICT) (Laudon & Laudon, 2012) is evident to boost the innovation stages. The firm must keep special care about the internal and external sources of information and how to extract them for CKM process (Baker & Hart, 2007; Garcia-Murillo & Annabi, 2002; Gebert, Geib, Kolbe, & Riempp, 2013). It's important to remark the results around the terms of satisfaction, experience and performance as principal indicators of the CKM (Garcia-Murillo & Annabi, 2002).

By other hand, we have the INNOVS as a matter of study in several stages that we have proposed like a system, involving: value added to several agents apart the customer (Bonel, J. I., Bonel, F. J., & Fontaneda, 2003) the relation value-price (Gale & Chapman, 1994), the customer emotions and desires to identify the attributes of products and services (Chaudhuri, 2006). The early phase of innovation that recognize the idea (Gassmanna, Kausch & Enkel, 2012), the tangible (Shipp, 2008; McKinsey, 2008) and intangible resources (Afuah, 1997; Canibano, 1999; Shipp, 2008; Lev, 2000; Howells, 2000 Popadiuk & Wei-Choo, 2006) As part of the proces, is impotant to consider the concepts like Research, Deevlopment and Innovation (R&D+i) (Shipp, 2008, McKinsey, 2008; OECD, 2005 Chesbrough, 2006) and the lifecycle product (Gale & Chapman, 1994), the design, prototype and pre-production (Nicolai; Keld & Pedersen, 2011; Chesbrough, 2006; Shipp, 2008; McKinsey, 2008). The cycle of customer since the early innovation until the obsolete state of a product, is described by Rogers Model (1983) and Mejía-Trejo & Sánchez-Gutiérrez (2013a); the efforts of the technology (Dussauge & Ramantsoa, 1992). The novelty, training and type of innovation is considered as primary prerogatives (OECD, 2005; Afuah, 1997) to determine the attributes and characteristics in the new product and service development (Shipp, 2008; McKinsey, 2008; Lev, 2001; Dussauge & Ramantsoa, 1992). The results must be measured, by means of indicators (Bermúdez-García, 2010) aimed to reinforce the agreements amongst the government, the firm and the universities (Smith & Leydesdorff, 2010).

Finally, like an autocontrolled system there must be an information feedback of innovation, by means of capital investment (Lev, 2001; Shipp (2008); Nicolai; Keld & Pedersen, 2011), the improvement to the firm due the product, service, process, marketing, organizational, technology, infrastructure and other aspects of the innovation (Dussauge, & Ramantsoa, 1992; OECD, 2005; Chesbrough, 2006; White & Bruton, 2011), value added (Bonel, J. I., Bonel, F. J., & Fontaneda, 2003; Gale & Chapman (1994) and the kind of leadership that boost the innovation (Mejía-Trejo, Sánchez-Gutiérrez & Ortiz Barrera, 2013). As a result of the documentary analysis and making several groups of concepts answering SQ1 we obtained the **Figure 1**.

FIG 1: GENERAL CONCEPTUAL MODEL

Methodology

This is a descriptive and transversal study; it is based on documental research, to design a conceptual model and questionnaire to obtain several groups of variables, dimensions and indicators that are involves between CKM and INNOVS value creation and innovation generation. The subjects of the study were the managers from 200 SME´s SDSGC. The results were analyzed through statistical inference tools like: Cronbach´s Alpha in pilot test, Pearson´s Correlation and MRA with stepwise method, contained in the SPSS program.

Analysis of Results

To answer **SQ2** we present the **Table 1** with 10 variables, 45 dimensions and 110 indicators.

TABLE 1: FINAL QUESTIONNAIRE THAT RELATION CKM WITH INNOVS

CUSTOMER KNOWLEDGE MANAGEMENT					
VARIABLE	DIMENSION	INDICATOR	Q	AUTHOR	
(1) CKM AS A DRIVER OF INNOVATION (CKMADI)	1).-Information from Costumer (IFMC)	Customer is a Resource of NPD ideation; Customer Driven-Innovation (Innovation from Customers). Mutual Innovation.	1	[25]; [7]; [12]; [13]	
	2).-Information about the Customer (IABC)	Strategy of close collaboration with customers. Communities of creation.	2	[25]; [13];	
	3).-Information for Customer (IFRC)	Customer as a User collaborates intensively in the product testing and support. Customer Focused Innovation (Innovation for Customers)	3		
	4).-Information as a Customer Co-creator (with) (IWIC)	Customer as a Co-creator helps over NPD design and development; Customer Centered Innovation (Innovation with Customers); Prosumerism; Team-Based-CoLearning. Joint Intellectual Property	4	[26]; [7]; [13]	
	5).-Negative side effects of Customer Integration (NSEC)	The firm is warned about the dependence on customer´s personality (NSEC1)		5	[11]
		The firm is warned about the dependence on customer´s experience (NSEC2)		6	
		The firm is warned about the dependence on customer´s point of view (NSEC3)		7	
		The firm is warned about to choose the wrong customer (NSEC4)		8	
		The firm is warned about the risk to integrate the customer to the company´s side (NSEC4)		9	
	(2) CKM SUPPORT (CKMS)	6).-Knowledge Incentives (KI)	Salary associated with the ability and willingness to share knowledge (KI1)	10	[26]; [27]; [12]
Salary determined by willingness to improve skills and upgrade knowledge (KI2)			11		
Tolerance of Failure (KI3)			12	[14]	
Rewards and Recognition (KI4)			13		
7).-Knowledge Fluence (KF)		Exchange the knowledge between employees across departments (KF1)	14	[26]; [27]	
		Communication among employees and management (KF2)	15		
8).-Knowledge and ICT (KICT)		ICT to support and control the Customer Knowledge Management	16	[20]	
(3) CKM OTHER SOURCES OF KNOWLEDGE (CKMOSK)	9).-Internal Sources of Knowledge (IOSK)	Technical Services (IOSK1)	17	[2]; [10]; [12]	
		Engineering Department (IOSK2)	18		
		Research and Design Development (IOSK3)	19		
		Production (IOSK4)	20	[10]	
		Marketing and Sales (IOSK5)	21		
		Purchasing and Supply (IOSK6)	22		
		Other Employees (IOSK7)	23		
	10).-External Sources of Knowledge (ESOK)	Supplier (ESOK1)	24	[2]; [10]	
		Scientist, Universities, Patents, Exhibitions Technological Consultant (ESOK2)	25		
		Distributor Agents (ESOK3)	26		
Competitor (ESOK4)		27			

(4) CKM, SATISFACTION, EXPERIENCE AND PERFORMANCE (CKMSEP)	11).-Paradigm (PAR)	If Only We Know What We Knew (KM) as a Customer Retention (PAR1)	28	[10]
		Retention is Cheaper than Acquisition (CRM) as a Customer Satisfaction (PAR2)	29	
		If We Only Knew What Our Customer (CKM) Know as a Customer Experience and Creativity (PAR3)	30	
	12).-Performance (PER)	Performance against budget; Customer retention rate.(KM) (PER1)	31	
		Performance in terms of customer satisfaction and Loyalty (PER2)	32	
		Performance against competitors in innovation and growth; Contribution to customer success. (CKM) (PER3)	33	
INNOVATION STAGES				
(5) INNOVATION VALUE ADDED (IVADD)	13).-Emotions & Desires of Customer (VAEDC)	The innovation actions are aimed to increase the Emotions & Desire of the Customer	34	[5]
	14).-Cost & Risk (VACR)	The Cost is the main constraint to increase the value (VACR1)	35	[3]
		The Risk is the main constraint to increase the value (VACR2)	36	
	15).-Customer (VACUS)	The innovation actions are aimed to increase the Customer value	37	
	16).-Shareholder (VASHO)	The Innovation actions are aimed to increase the Shareholder value	38	
	17).-Firm (VAFRM)	The innovation actions are aimed to increase the value of the Firm	39	
	18).-Sector (VASEC)	The innovation actions are aimed to increase the value of the Sector	40	
	19).-Society (VASOC)	The innovation actions are aimed to increase the value to the Society	41	
20).-Price Value Relation (VAPVR)	The innovation is introduced to the market considering the relation price-value added	42	[9]	
(6) INNOVATION INCOMING ITEMS (IIT)	21).-Early Innovation Phase (EIPH)	Opportunity Identification (EIPH1)	43	[11];
		Opportunity Analysis (EIPH2)	44	
		Idea Generation (EIPH3)	45	
		Idea Selection (EIPH4)	46	
		Concept Definition (EIPH5)	47	
	22).-Facilities for Innovation (Tangibles, FFI)	Provides the most sophisticated equipment to support innovation (FFI1)	48	[31]; [22]
		Invests in R&D+I (FFI2)	49	
		Assigns staff to R& D+I (FFI3)	50	
	23).-Efforts for Innovation (Intangible assets, EFFI)	Makes efforts to use and / or generate Patents (EFFI1)	51	[1]; [4]; [31]; [21]; [17]
		Makes efforts to create and / or improve Databases (EFFI2)	52	
		Makes efforts to improve the organizational processes (EFFI3)	53	
		Makes efforts to use the most of knowledge and skills of staff (EFFI4)	54	
		Makes planned decisions to increase its availability to the risk (EFFI5)	55	
Makes efforts to discover New Market Knowledge (EFFI6)		56		
Makes efforts to study the Existing Market Knowledge (EFFI7)		57	[29]	
(7) INNOVATION PROCESS (INPROC)	24).-Research & Development + Innovation (RDI)	Makes actions to improve existing processes of Research & Development + Innovation (RDI1)	58	[31]; [22]; [28]; [6]
		Makes studies about Product Lifecycle (RDI2)	59	[9]
	25).- Design (DSGN)	Makes actions to improve the existing design (DSGN1)	60	[28]
		Employees have influence on their job (DSGN2)	61	[26]
		Employees engaged in teams with high degree of autonomy (DSGN3)	62	
		The strategy is based on Open Innovation concepts (DSGN4)	63	[6]
	26).-Prototypes (IPPF1)	Makes actions to develop prototypes for improvement	64	[31]; [22]
	27).-Pre-Production (IPPIP)	Makes improvement actions to pre-production	65	
		Makes to investigate market needs of obsolete products (MR1)	66	

	28).-Market Research (MR)	Makes to investigate the needs actions and / or market changes for innovators (MR2)	67	[8]
		Makes to investigate needs and / or market changes for early adopters (MR3)	68	
		Makes to investigate needs and / or market changes for early majority (MR4)	69	
		Makes to investigate needs and / or market changes for late majority (MR5)	70	
		Makes to investigate needs and / or market changes for laggards (MR6)	71	
		Makes to investigate the onset of a new technology (MR7)	72	
		Makes to investigate the term of a technology (MR8)	73	
		29).-Novelty (NOVY)	Decides actions to improve or introduce new forms of marketing (NOVY1)	
	Seeks to be new or improved in the World (Radical Innovation) (NOVY2)		75	[28]; [1]
	Seeks to be new or improved to the Firm (Incremental Innovation) (NOVY3)		76	
	Seeks to be new or improved in the region (Incremental Innovation) (NOVY4)		77	
	Seeks to be new or improved in the industry (Incremental Innovation) (NOVY5)		78	
	30).-Training (TRAI)	Makes actions to train the staff continuously (Incremental Innovation)	79	
	31).-Type of Innovation (TOINN)	Makes actions to innovate in technology (TOINN1)	80	[28]; [1]
Makes actions for innovation in production processes (TOINN2)		81		
Makes actions to improve or introduce new products forms (TOINN3)		82		
Makes actions to improve or introduce new forms of service (TOINN4)		83		
Makes actions to improve or introduce new organizational structures and functions (TOINN5)		84		
Innovation activities tend to be rather radical (TOINN6)		85		
Innovation activities tend to be incremental (TOINN7)		86		
(8) INNOVATION OUTCOMING ITEMS (IOIT)	32).-New products/ and/or services (NPSD)	Detects the projected level of revenues generated by innovation (NPSD1)	87	[31];
		Detects the projected customer satisfaction level generated by innovation (NPSD2)	88	[22]
		Detects the projected sales percentages levels generated by innovation (NPSD3)	89	[21]
		Detects the level of the number of launches of new products/services in a period (NPSD4)	90	[8]; [22]
		Detects the net present value of its portfolio of products / services in the market generated by the innovation (NPSD5)	91	
(9) INNOVATION PERFORMANCE (IPERF)	33).-Cost-Benefit of Innovation (PCBOI)	Do you use an indicator like: Innovation income / (Investment in Innovation) ?	92	[2]
	34).-Opportunities Index for Collaborative Innovation (POIFCI)	Do you use an indicator like: Innovation Identified Opportunities / (Total Contributors on the Process)?	93	
	35).-Generation Ideas Rate (PGIR)	Do you use an indicator like: Generated Ideas / (Market Knowledge Opportunities x Total Contributors on Process)?	94	
	36).-Effectiveness of Idea Generation (PEOIG)	Do you use an indicator like: Number of Approved Ideas / (Number of Generated Ideas)?	95	
	37).-Implementing Effective Prototyping (PIEP)	Do you use an indicator like: Number of Correct and Timely Prototype Terminated / (Total Prototyping Approved)?	96	
	38).-Innovation Generation Rate (PIGR)	Do you use an indicator like: Number of Generated Innovations / (Identified Innovation Opportunities)?	97	
	39).-Index not Successful Innovations (PINSI)	Do you use an indicator like: Number of unsuccessful innovations implemented / (Total Innovation)?	98	
	40).-Triple Helix Politics (PTHP)	Does exist any relationship among : university- government- industry, to develop the innovation?	99	

(10) INNOVATION FEEDBACK ITEMS (IFEED)	41).-Capital (IFCAP)	Based on the results identifies intellectual capital dedicated to innovation for its improvement	100	[21]; [31]; [26].
	42).-Product & Process (IFPP)	Based on the results identifies the stages of new or improved process for upgrading (IFPP1)	101	[8]; [28]; [6]; [33].
		Based on the results identifies attributes of new or improved product / service for its improvement (IFPP2)	102	
	43).-Innovation (IFINN)	Based on the results identifies the stages of new or improved form of marketing for improvement (IFINN1)	103	
		Based on the results identifies the stages of new or improved technology for improvement (IFINN2)	104	
		Identifies the stages of the new or improved structure and functions of the organization to its improvement (IFINN3)	105	
		Identifies the type of innovation (radical or incremental) that has given best results (IFINN4)	106	
	44).-Value Added (IFV)	Based on the results identifies the new or improved value proposition (benefits / costs) for its completion; relation value-price	107	[3]; [9]
	45).-Leadership and Innovation (FLINNO)	The type of leadership that drives innovation is Transactional (FLINNO1)	108	[24]
		The type of leadership that drives innovation is Transformational (FLINNO2)	109	
The type of leadership that drives innovation is Passive (FLINNO3)		110

Table 3 shows the MRA Model Summary where we can see Model 1 the independent variable CKMOSK accounts for 33.7 % of the variance and Model 2 with the independent variable CKMADI accounts for 41 % of the variance in the scores of INNOVS dependent variable respectively.

TABLE 3: MRA MODEL SUMMARY (b)

Model	R	R Square	Adjusted R Square	Std. Error for estimate
1	.581 ^a	.337	.334	.397
2	.641 ^b	.410	.404	.376

(a) Predictors: (Constant), CKMOSK ; (b) Predictors: (Constant), CKMOSK, CKMADI

Source: Results in SPSS program

Table 4 confirms Model 1: F (1,198)= 100.789; p<0.01 and Model 2: F (2,197)= 68.522; p<0.01

TABLE 4: ANOVA (a)

Model	Sum of Squares	Df	Mean Square	F	Sig.
1 Regression	15.915	1	15.915	100.789	.000(b)

	Residual	31.265	198	.158		
	Total	47.180	199			
2	Regression	19.356	2	9.678	68.522	.000(c)
	Residual	27.824	197	.141		
	Total	47.180	199			

(a) Dependent Variable: INNOVS; (b) Predictors: (Constant),CKMOSK ; (c) Predictors: (Constant), CKMOSK, CKMADI

Source: Results in SPSS program

Table 5 determines the regression equations about Model 1: $INNOVS = 2.147 + .389 CKMOSK$ and Model 2: $INNOVS = 1.854 + .243 CKMOSK + .216 CKMADI$.

TABLE 5: MRA COEFFICIENTS BY STEPWISE METHOD (a)

Model	Unstandardized Coefficients		Standardized Coefficients	t.	Sig.	Collinearity Statistics
	B	Std. Error	Beta			Tolerance
1 (Constant)	2.147	.158		13.564	.000	
CKMOSK	.389	.039	.581	10.039	.000	1.000
2 (Constant)	1.854	.161		11.520	.000	
CKMOSK	.243	.047	.363	5.165	.000	0.606
CKMADI	.216	.044	.347	4.936	.000	0.606

(a) Dependent Variable: INNOVS; Note: values check for any collinearity in our data. As a general rule, a tolerance value below 0.1 indicates a serious problem (Hinton *et al.*, 2004)

Source: Results in SPSS program.

So, we answered **SQ3** since Table 3 that shows the most significant variables were CKMOSK and CKMADI. Since same Table 3, **GH** is explained because of 33.7% of our model produces the variability on the dependent variable INNOVS. Doing the same MRA for the CKMOSK Indicators: ISOK1 until ISOK7 and ESOK1 until ESOK4 and CKMADI Indicators: IFMC, IABC and IFRC we found like the most significant indicators were: NSEC4, ISOK6, ISOK4, ISOK7, NSEC3, as see in Table 6.

TABLE 6: MRA MODEL SUMMARY (a)

Model	R	R Square	Adjusted R Square	Std. Error for estimate
1	.529b	.279	.276	.414
2	.632c	.399	.393	.379
3	.665d	.442	.433	.367

(b) Predictors: (Constant), NSEC4; (c) Predictors: (Constant), NSEC4, IOSK2; (d) Predictors: (Constant), NSEC4, IOSK2, IOSK6; (e) Predictors: (Constant), NSEC4, IOSK2, IOSK6, IOSK4; (f) Predictors: (Constant), NSEC4, IOSK2, IOSK6, IOSK4, IOSK7; (g) Predictors: (Constant), NSEC4, IOSK2, IOSK6, IOSK4, IOSK7, NSEC3; (h) Predictors: (Constant), NSEC4, IOSK6, IOSK4, IOSK7, NSEC3

Source: Results in SPSS program

Discussion

There are great opportunities to develop CKM concepts and their applications in SDS/GC, México because the model discovers only 5 of 33 indicators with 41% of the variability on INNOVS. The Descriptive Statistics results, show in average, there are around a 20% of the indicators that are considered in 3 or less than, situation that does not encourage the development for more innovation, specially on some indicators or variables like: CKMSEP, IVADD, IIIT and IFEED. Future studies are suggested around this issues and how affects the different innovation stages.

Conclusions

We discover 4 variables (CKMADI, CKMS, CKMOSK, CKMSEP) with 12 dimensions and 33 indicators that are trying to explain CKM; at the same time too, INNOVS is described with 6 variables (IVAAD, IIIT, INPROC, IOIT, IPERF, IFEED) with 33 dimensions and 77 indicators. The **GQ** is solved involving the relationship between CKM with INNOVS for 200 SMEs SDCGC when is answered the **SQ1**: obtaining the **Figure 1** with 10 variables; **SQ2** is answered by mean the description of variables in the theoretical framework and the questionnaire design showed in **Table 1** with 45 dimensions and 110 indicators associated to the variables; **SQ3** is answered by means the variable correlations (**Table 2**) and **Table 3**, showing as the most significant variables with CKMOSK and CKMADI; in fact, **GH** is answered in a positive way because at least 33.7% (more than 20% proposed) of our model produces the variability on the dependent variable INNOVS by CKMOSK (Model 1) and CKMADI (Model 2) action. **Table 4** confirms the Model 1 and Model 2 and **Table 5** the regression equations of each Models. **Table 6** shows: NSEC4, ISOK6, ISOK4, ISOK7, NSEC3 as the most significant indicators of the model.

The Effect Of Visual Layout Of Assortment Breadth And Depth On Individual Perceptions Of Assortment Size And Evaluations

Abstract

The aim of the present research is to relate the shelf visual layout, perceived (and not just actual) assortment size, and post-choice consumer evaluations. To this purpose, two experimental studies will be presented. Study 1 shows how different visual layouts affect the perceptions of assortment size and consumers' post-choice evaluations. When assortment breadth (i.e. the number of brands) is displayed horizontally on shelves, the same number and type of products is perceived as being more satisfying and numerically larger than when it is assortment depth (i.e. the number of alternative within each brand) to be displayed horizontally. The second study aims to isolating the underlying causal mechanisms, thus ruling out alternative explanations and linking the effects observed in the first study to the mere effect of the visual layout strategy adopted by the retailer to display the same amount of SKUs.

Introduction

Imagine going shopping at your local grocery store for some *pasta*, to cook a nice meal for yourself or your family and friends. You could already have your favorite kind of *pasta* in mind, being a *pasta* addict as one of the authors, or you could be clueless about *pasta* as the other author, and therefore assess in store what kind of pasta appears to be the best one for you. The literature refers to these two different kinds of customers as “preference matchers” and “preference constructors”: matchers have an articulated ideal point in mind, builders do not (Chernev, 2003). Previous studies have already documented that matchers and builders can differ in the degree of selectiveness in processing information, in the likelihood of adopting a comparative rather than confirmatory approach, and ultimately in their final choices (Mogilner, Rudnick and Iyengar, 2008).

To slightly complicate the picture, the store you shop into, could have a large or a small assortment of pasta. To these regards, previous literature has investigated the impact of assortment size on consumer satisfaction and found that it is moderated by the extent to which consumers have articulated attribute preferences. Furthermore, the literature has shown that the perception about the assortment's size can be as relevant as –or more relevant than- its actual size (Mogilner et al., 2008). However, while there is agreement that matchers and builders react differently to comparable levels of assortment, previous studies disagree as to the magnitude and the direction of the effect.

Different –often separate- streams of literature appear to lap at the shore of assortment management. To guide the navigation amidst this turbulent confluence of different research streams, we present two empirical studies that put together assortment layout, assortment size, consumers' perceptions and choices. Study 1 demonstrates that the same assortment is perceived as having different sizes according to the visual layout adopted to display the product on the shelves. More precisely, the study addresses horizontal and vertical layouts: a horizontal layout can be defined as displaying assortment breadth by row and assortment depth by column; conversely, a vertical layout can be defined as displaying assortment depth by row and assortment breadth by column.

Study 2 explores the relationship between preference articulation and visual layout, ruling out that the effects emerging from Study 1 are due to different levels of preference articulation (i.e. consumers having a well defined preference structure vs. consumers assessing their preferences from contextual cues), or due to the different levels of task complexity (i.e. the amount of time needed to complete the choice task) induced by visual layout.

Theoretical background

Shelf Visual Layout

Recent studies have highlighted the different impact exerted by attribute- and benefit-based merchandise display on consumer choices and decision satisfaction (Lamberton and Diehl, 2013), and have found asymmetric effects of horizontal versus vertical shelf layouts. More specifically, a benefit-based architecture is more likely to favor sales of

the lower-priced items, to reduce the perceived variety through the enhancement of perceived similarity among the alternatives, and to increase decision satisfaction. While insightful, the focus of this body of literature has not provided meaningful indications about the visual layout that best suits the grouping logic adopted by customers in their in-store evaluations and about how the grouping logic should be translated into shelf layout. With these regards, a different stream of studies has focused on the physical location of the items on the shelves finding that search patterns might be influenced by the position of the products on the shelves (Reutskaja, Nagel, Camerer, and Rangel, 2011). However, those studies have relatively neglected the underlying grouping logic, focusing instead on how much space should be allocated to each SKU (Murray, Talukdar and Gosavi 2010), and the effect of shelf orientation on sales (Chandon et al., 2009).

It has been found that consumers develop different assortment perceptions according to the different levels of complexity in the evaluation task rather than to differences in the actual assortment size (Mogilner et al. 2008) as a function of the way assortment is organized and displayed (Kahn and Wansink 2004). Indeed, consumer perceptions about the assortment could be influenced by the extent to which the visual layout of the shelf (i.e. the physical ordering of the products) adheres to the set of consumers' information acquisition structures (i.e. horizontal versus vertical). Similarly, also consumer satisfaction could be influenced by the visual layout of the shelf, with some physical ordering of the products reducing the difficulty of the choice task.

Decision Satisfaction

Satisfaction captures the post-decisional evaluation of a product or of an experience (Oliver 1997) and these post-choice evaluations affect a company's long term relationship with a customer. However, factors affecting switching or choice deferral (Chernev 2006) cannot be automatically assumed to be identical to factors affecting satisfaction with the choice made (Gregoire and Fisher 2006).

Analyzing the effect of larger assortments on satisfaction increases the understanding of the psychological processes and the managerial implications associated with assortments. Decision satisfaction is a cognitive and affective state in which the individual experiences satisfaction with the process made in selecting the preferred product (Gregoire and Fisher 2006); it is a personal evaluation of the choice experience, closely connected to the context where the choice took place, rather than to (expectations about) the product that has eventually been purchased.

Decision satisfaction is important as it leads consumers to specific intentions and behaviors that in turn have consequences for retailers. If decision satisfaction is low—for example, because consumers are anxious or uncertain—this could lead to negative word-of-mouth for the store and lower repatronage intention for the store (Fitzsimons, 2000).

Preference-matching and preference-building

The conditions for making decisions can be divided into two types: certainty and uncertainty. Certainty is the case when consumers have strong existing preferences so that they know beforehand which product they are would like to buy. Uncertainty is the case when consumers have no strong pre-existing preferences, and decide within the store which alternative to buy. In the first case, the consumers are preference matchers: they have to assess the best match between the product in their mind and the products in the store. In the second case, the consumers are preference builders: they have to construct their preferences and make a context-dependent choice.

In rational-choice models, individual preferences are taken to be given beforehand, rather than constructed and revised through on-going social processes, but a great deal of literature has already shown that this is not how things usually work in reality nor how the human brain usually operates choices (Bettman, Luce and Payne 2008). A huge deal of work has been done in the last decades to understand the limits of rational-choice theory's operating parameters, especially in real-world situations where individuals face decisions in circumstances far different from the classic ideal. Nowadays, decision theorists recognize the importance of the context for guiding choice, and consider the presence of strong pre-existing preferences as exceptional in real life.

Some relevant analyses dealing with the effects of assortment size have directly or indirectly dealt with this issue. For instance, Chernev (2003) directly tests the effects of pre-existing preferences, and Mogilner and colleagues (2008) compare consumers who are unfamiliar with a product category (and therefore less able to form preferences prior to exposure to the assortment) with consumer familiar with a product category.

In line with these studies, this work studies the effect of pre-existing preferences and lack thereof, on how people react towards large and small assortments. Adding the consideration of context-dependent choices, instead of focusing on pre-existing preferences or pre-existing preference compositions (Briesch, Chintagunta, and Fox 2009; Diehl and Poynor 2010), adds in this specific case to the realism of the analysis and allows for a broader generalization of the outcomes of the present study.

Empirical Analyses

Study 1

The purpose of Study 1 is to determine if the same levels of assortment are perceived as having different sizes (small versus large) as a function of the visual layout (horizontal versus vertical) adopted to display the products on the shelves.

Sample

To recruit participants in this study, an invitation email was circulated to a list of 100 consumers randomly picked from a panel owned by the authors. Participants were told that their task was to simulate the purchase of a product (pasta pack) as if they were taking their decision in front of the shelf. A total of 61 responses was gathered (response rate 61%); participants' age ranged from 18 to 61 (mean = 27), and 48.8% were females. The invitation email included a link to the webpage with the simulation.

Experimental Stimuli

Participants were asked to choose a pasta pack from a simulated shelf. The pasta packs displayed on the shelves were real products marketed by existing brands and differed in brand and format (e.g. macaroni, spaghetti, etc.). The brands were identified on the basis of a pretest with a pilot sample of 20 respondents not included in the main study. Participants in the pre-test were asked to list the names of the brands and formats of pasta in the order those brands and formats came to their mind, and to state which one they preferred. Results from the pre-test ensure a selection of 5 brands that are comparable in brand image, brand knowledge and that were ranked as "top of the mind" by the respondents. Similarly, this procedure allowed the selection of 5 formats that are almost equally familiar to respondents.

Experimental Procedure

Participants were randomly assigned either to the horizontal or vertical visual layout experimental condition. Visual layout was manipulated between subjects. Respondents were exposed to the same set of 25 pasta packs (5 brands \times 5 formats): what changed was the way the products were arranged on the shelves. In the horizontal layout experimental condition, the products were ordered so that each brand occupied a single horizontal line of the shelf, with the formats ordered vertically across the shelves (i.e. row = brand; column = format). Conversely, in the vertical layout experimental condition, the products were ordered so that each format occupied a single horizontal line of the shelf, with the brands ordered vertically across the shelves (i.e. row = format; column = brand).

First, respondents were exposed to the shelf. Then, respondents were asked to choose one of the pasta packs, and to rate their decision satisfaction on a 5-point scale. Finally, participants were asked to assess their perceptions of the size of the assortment by means of a bipolar 5-point scale "*This store offers a 1= very small selection and 5= very large selection*".

Results

No significant differences emerge in the choice shares of the product alternatives between the two conditions: the manipulation of the visual layout alone is not capable of switching consumer preferences ($\chi^2(16, N = 61) = 15.140, p = .514$). Significant differences emerge instead on the perceived assortment size. While the number of SKUs is the same between the experimental conditions, respondents perceive a larger selection when breadth is displayed horizontally and assortment depth vertically ($M_{\text{horizontal}} = 3.32$) than in the opposite case ($M_{\text{vertical}} = 2.34; F(1, 59) = 47.967, p < .001, \eta^2 = .45$).

Results also show that the effects by visual layout encompass also the levels of decision satisfaction: respondents are more satisfied when assortment breadth is displayed horizontally and assortment depth vertically ($M_{\text{horizontal}} = 4.07$) than when assortment breadth is displayed vertically and assortment depth horizontally ($M_{\text{vertical}} = 2.77$; $F(1, 59) = 55.07$, $p < .001$, $\eta^2 = .48$).

In summary, the way assortment breadth and depth are displayed (i.e. vertically vs. horizontally) appears to affect how large the assortment is perceived to be. Differences in perceived assortment size are not only relevant per se, but especially because they lead to different levels of decision satisfaction. However, the findings reported in this study could be explained also differently: the literature has shown that different levels of decision satisfaction can stem from different degrees of preference articulation (Mogilner et al., 2008). Furthermore, also the perceived complexity of the choice task, as reflected by the time needed to master it, has also been found to affect decision satisfaction (Iyengar and Lepper, 2000).

Study 2

The purpose of Study 2 is to rule out that the individual reactions to the different assortment visual displays that were observed in Study 1 are due to preference articulation, or task complexity. In fact, different levels of preference articulation have been shown on one hand to lead individuals to react differently to assortments of different actual size (Chernev, 2003), and on the other hand to moderate individuals' perceptions of the same assortment (Mogilner et al., 2008). More specifically, preference matchers have been found to prefer to choose from larger assortments (Chernev, 2003). Instead, actual assortment size being equal, preference constructors are more satisfied when they are confronted with a larger number of categories and perceive the assortment to be larger, while preference matchers are unaffected by categorization (Mogilner et al., 2008). Study 2 aims at ruling out that the differences in perceived assortment size assessed by Study 1 are due respondents' level of preference articulation rather than to the horizontal and vertical visual display.

Finally, complexity of a task leads to more time being needed for the task completion (Iyengar and Lepper, 2000). Thus, if the horizontal and vertical visual layouts considered in Study 1 had different levels of complexity, then one would observe a different amount of response times across the different experimental conditions.

Therefore, Study 2 replicates the structure of Study 1 but extends it along two directions: 1- it adds the experimental manipulation of preference articulation; 2- it includes the time needed to complete the choice task in the dependent measures.

Sample

Participants in Study 2 were recruited from the same panel used in Study 1, by excluding those who had already been contacted for the previous study. A total of 86 responses was gathered (response rate 86%); participants' age ranged from 18 to 59 (mean = 26.9), and 47.7% were females.

Experimental Procedure

The respondents were randomly assigned to a 2 (preference matchers vs. constructors) \times 2 (vertical vs. horizontal visual layout) between-subjects experimental design. As in Study 1, the actual size of the assortment was kept constant across all the experimental conditions: respondents were presented the same set of 25 pasta packs (5 brands \times 5 formats) as in Study 1. Visual layout was manipulated similarly to Study 1 by randomly displaying brands (vs. formats) horizontally (vs. vertically); furthermore, the order in which each brand/format appeared was randomized by the software to avoid sequence effects. Prior to the evaluation and choice task from the virtual shelf, similarly to Chernev (2003), participants were exposed to a preference articulation task that served as experimental manipulation for preference matching versus constructing. Participants assigned to the preference matching condition were asked to describe their ideal pasta pack along four key attributes each with five levels. The four attributes were: cooking time (5 – 7 – 9 – 11 – 13 minutes), format (spaghetti, macaroni, farfalle, rotini, penne), brand (Brand A, Brand B, Brand C, Brand D, Brand E¹), and price (50 € cents, 75 € cents, 1€, 1.25€, 1.50€). The remaining part of respondents were assigned to the preference construction condition and read the description of the products along the same four attributes

¹ The five brands presented in the preference elicitation task were the same as in Study 1.

and levels, but without being asked to state any a priori preference. Next, respondents were exposed to a screen with the representation of one of the possible virtual shelf layouts (vertical vs. horizontal) and asked to choose one of the products. The software recorded the time spent to complete the choice task. Finally, respondents were asked to rate their satisfaction with their choice and perceptions of assortment size by using the same scales as in Study 1.

Results

Consistently with the results of Study 1, no significant differences in the choice shares emerge across the four experimental conditions, $\chi^2(66, N = 86) = 59.658, p = .696$. This evidence supports the notion that visual layout together with preference articulation are not capable of shifting individual choices.

Consistently with Study 1, the data reveal a multivariate effect of visual layout (Wilks $\lambda = .746, F = 17.11, df = 3; 95, p < .001, \eta^2 = .25$) on the perceived assortment size, decision satisfaction and time to complete the choice task. Univariate analysis of variance yields significant differences in the levels of assortment perceived by respondents exposed to a vertical ($M_{\text{vertical}} = 2.30$) and an horizontal layout ($M_{\text{horizontal}} = 3.07, F = 25.371, p < .001; df = 1;97; \eta^2 = .21$), and in the levels of decision satisfaction as a function of visual display ($M_{\text{vertical}} = 3.30, M_{\text{horizontal}} = 4.02, F = 14.201, p < .001; df = 1;97; \eta^2 = .13$). In other words, when assortment breadth is displayed horizontally individuals tend to perceive the assortment as being larger and to be more satisfied with their choice than when assortment breadth is displayed vertically.

Instead, no differences emerge in the average time (in seconds) needed to complete the choice task as a function of visual layout ($M_{\text{vertical}} = 212.28, M_{\text{horizontal}} = 50.71, F = .806, p < .001; df = 1;97; \eta^2 = .008$). This evidence rules out the possibility that different levels of difficulty in the choice task emerge as a function of visual display, since respondents did not need significantly more or less time to reach a final choice whether they were confronted with a horizontal or vertical display.

No significant differences also emerge in the levels of perceived assortment size and decision satisfaction as a function of different levels of preference articulation (Wilks $\lambda = .980, F = .642, df = 3; 95, p = .59, \eta^2 = .02$). Moreover, preference articulation does not significantly interact with visual layout in shaping individuals' perceptions of assortment size and decision satisfaction (Wilks $\lambda = .961, F = 1.299, df = 3; 95, p = .279, \eta^2 = .04$). This evidence rules out the possibility that the effect played by visual layout on perceived assortment and decision satisfaction, that was found in Study 1 and confirmed by Study 2, can be ascribed to different levels of preference articulation. These results do not contradict previous researches that found differences in satisfaction between preference matchers and preference constructors when confronted with large versus small assortments (Chernev, 2003; Diehl and Poynor, 2010). Instead, Study 2 integrates the findings reported in the extant literature as it investigates differences in the perceived, rather than actual, assortment size by keeping actual assortment breadth and depth constant across the experimental conditions.

General Discussion

The literature has traditionally focused on the analysis of the effects of the actual size of the set on consumer choices. At the same time, some studies have suggested that the way in which the assortment is placed on the shelf influences consumer perceptions. This work contributes to the literature as it considers how and when the same assortment, whose actual size remains constant, is perceived as larger or smaller depending on how the products are arranged on the shelf, empirically isolating the effects of the shelf display from that of the assortment size.

The managerial implications from the results presented in this analysis are of simple and immediate applicability. Two experiments showed that a display with brands in rows and products in column leads consumers to perceive a larger assortment and increases decision satisfaction. These results hold regardless of the structure of consumer preferences, that is, both for those who already have a clear idea of which product to buy, and for those who mature preferences inside the store by looking at the different options on the shelf. Furthermore, our analysis rules out that the effects we find on decision satisfaction and perceived assortment size are not due to the degree of articulation of consumers' preference structure, but are only due to a different visual layout of the same SKUs on shelf.

Internet of Things and value co-creation in the cultural industry towards Service Dominant logic perspective

Abstract

In the new Era of connectivity for anything, there is a growing interest in the Internet of Things (IoT). New forms of communication are, in fact, realized in the Internet between human and things that interact within social and environment contexts in a continuous process of value co-creation. The paper aims to understand the IoT paradigm, its role and impact in the co-creation of value drawing from the Service-Dominant (S-D) Logic perspective. The study provides a better understanding of how value is collaboratively created (co-created) in the cultural industry through an examination of two projects (QRator and the “O”). As this paper demonstrates, IoT can be conceptualized as an operant resource capable of acting on other resources to create value, and for value co-creation. The study could be considered a first step in a stream of research on different aspects of IoT and value co-creation which are yet unexplored.

Key words: Internet of Things, value co-creation; S-D logic, cultural industry

1. Introduction

In the last decade, the radical evolution of the current Internet into a network of interconnected objects reveals the growing of an emerging paradigm called the Internet of Things (IoT) that led to the possibility of seamlessly merging the real and the virtual world (Tan and Wang, 2010; Vermesan et al., 2011; Gubbi et al., 2013; Mahalle et al., 2013). This innovative phenomenon is growing in importance and its pervasive presence has an high impact on several aspects of everyday-life, allowing potential users to interact with each other to reach common goals (Atzori et al., 2010). Thus, IoT opens up new opportunities in terms of a potentially dissemination of digital content in order to reach and engage users in a collaborative way that facilitate the value co-creation. This paper aims to understand this phenomenon with an analysis of how value is collaboratively created (co-created) in the cultural sector through the lens of Service-Dominant (S-D) logic perspective.

2. Conceptual background and research questions

2.1. The concept of IoT in literature: principles and definitions

In recent years, a new phenomenon called the Internet of Things (IoT) has emerged as one of the most important paradigm with regards of the future state of Internet, in which any object will be interconnected and based on interoperable communication protocols (Tan and Wang, 2010; Vermesan et al., 2011; Gubbi et al., 2013; Mahalle et al., 2013). Undoubtedly, the term Internet of Things was used for the first time in early 1990s in the area of ubiquitous and pervasive computing (Ashton, 2009). Later on, this concept became popular through the market analysts publications at Massachusetts Institute of Technology (MIT). One of the first definition was attributed to the Auto-ID Labs, (a world-wide network of academic research laboratories) according to the “things oriented” perspective that consider things as very simple items (for example Radio-Frequency IDentification tags). In the field of computing and communication, the IoT is considered a technological revolution based on the concept of anytime, anyplace connectivity for anything. According to this vision, the physical and virtual objects have identities, attributes, and virtual personalities being connected in everyday life through the Internet in effective, practical, and inexpensive ways using intelligent interfaces in dynamic global network infrastructure (CERP-IoT, 2009). The spread of this paradigm has grown considerably and opens up new interesting directions for both research and business. As emerged from literature review, Scholars, made different definitions of IoT in the time. Starting from these, we identify the primary components of each definition, as summarized in the table 1.

TABLE 1: DEFINITIONS AND PRIMARY COMPONENTS OF IOT

Primary components	Definitions
- identifiable objects - virtual representations	<i>IoT refers to uniquely identifiable objects (things) and their virtual representations in an Internet-like structure (Ashton, 1999).</i>
- virtual things	<i>The basic idea of the IoT is that virtually every physical thing in this world can also become a computer that is connected to the Internet (ITU, 2005).</i>
- universality of communication - integration of data and content - unique identification	<i>A “metaphor for the universality of communication processes, for the integration of any kind of digital data and content, for the unique identification of real or virtual objects and for architectures that provide the communicative glue among these components” (CASAGRAS, 2008).</i>
- things with identities - smart spaces - intelligent interfaces	<i>“Things having identities and virtual personalities operating in smart spaces using intelligent interfaces to connect and communicate within social, environmental, and user contexts” (Eposs, 2008).</i>
- active participation of objects - smart objects - information network	<i>“A world where physical objects are seamlessly integrated into the information network, and where the physical objects can become active participants in business processes. Services are available to interact with these smart objects over the Internet, query their state and any information associated with them, taking into account security and privacy issues” (Haller et al., 2009).</i>
- interoperable communication - virtual things with identities - intelligent interfaces - information network	<i>“IoT is an integrated part of future Internet and could be defined as a dynamic global network infrastructure with self-configuring capabilities based on standard and interoperable communication protocols where physical and virtual ‘things’ have identities, physical attributes, and virtual personalities and use intelligent interfaces, and are seamlessly integrated into the information network” (CERP-IoT, 2009).</i>
- pervasive presence - unique addressing schemes - cooperation - common goals	<i>The basic idea of this concept is the pervasive presence around us of a variety of things or objects – such as Radio-Frequency IDentification (RFID) tags, sensors, actuators, mobile phones, etc. – which, through unique addressing schemes, are able to interact with each other and cooperate with their neighbors to reach common goals (Giusto et al., 2010).</i>
- unique identification - accessibility - combination of digital and physical world	<i>The “Internet of Things” describes a vision where objects become part of the Internet: where every object is uniquely identified, and accessible to the network, its position and status known, where services and intelligence are added to this expanded Internet, fusing the digital and physical world, ultimately impacting on our professional, personal and social environments” (Coetzee and Eksteen, 2011).</i>
- virtual word - ICT	<i>It is a concept in which the virtual world of information technology integrates seamlessly with the real world of things (Uckelman et al., 2011).</i>
- technologies - real world objects	<i>The term Internet of Things (IoT) is a concept that encompasses a variety of technologies and research areas that aim to extend the existing Internet to real world objects (Sánchez López et al., 2012).</i>

Source: our elaboration

Initially, starting from the 1990s, the subject of many definitions was the relation between IoT and every physical thing in the world, for example “virtual things”, “identifiable objects”, “cyber-physical systems” (Ashton, 1999; ITU, 2005; Casagras, 2008). Later on, starting from the 2000s, the emergence of the relation between IoT and the interoperable communication process was noted, but only in the recent years has become an important issue (Eposs, 2008; Haller et al., 2009; CERP-IoT, 2009; Giusto et al., 2010; Coetzee and Eksteen, 2011; Sánchez López et al., 2012). Currently, “active participation”, “accessibility”, “virtual word”, “intelligence interfaces” are mainly associated with the concept of IoT. Moving the locus of IoT from technicality (things) to use (process), means transforming our understanding of value from one based on units to one based on processes that integrate resources.

Finally, Scholars have identified the main system-level characteristics of the Internet of Things (Miorandi *et al.*, 2012): 1) communication for anything: things have the ability to communicate with each other in an interconnected

network of objects; 2) identification for anything: things are identified with an unique address in the digital domain; 3) interaction for anything: things can interact with the local environment through sensing and actuation capabilities.

Despite the widely recognized importance of the IoT, limited studies have analysed the impact of the IoT in order to help people in the process of value co-creation. To reach this aim, this paper analyse this process in the cultural industry according to the S-D logic perspective. The forthcoming conceptual sections of this article attempt to address this limitation through the following research questions:

RQ1. What is the contribution of IoT in the value co-creation process (in the cultural sector)?

RQ2. Can be IoT conceptualize as an operant resource in the process of value co-creation?

2.2 Service Dominant Logic and value co-creation

In the literature, Service-dominant logic (S-D logic) is a growing perspective which differ from the traditional, goods-dominant (G-D) logic paradigm (Vargo and Lusch 2004, 2008; Vargo, 2008). According to the G-D logic, value is created by the firm and distributed in the market in the form of a good through exchange of money. From this perspective, the firm's production process creates value for customers and the roles of producers and consumers are distinct. On the contrary, in the S-D logic view, value is always co-created through the integration of resources and competences of producers and consumers that are not distinct. The first important difference between service-dominant and goods-dominant logic lies in the basis of exchange, in fact, in a S-D logic, value is stated in use, while in a G-D logic, value is stated in exchange (Vargo et al., 2008). S-D logic focuses on the action of operant resources whereas G-D logic focuses on the exchange of operand resources (Constantin and Lusch 1994; Vargo and Lusch, 2004). In the S-D logic views, all exchange are based on service and "when goods are involved, they are tools for the delivery and application of resources" (Vargo et al., 2006, p. 40). Value is at all times co-created with the client, and comes from the favourable use of operant resources (Vargo and Lusch, 2008; Vargo and Lusch, 2004). Thus, from S-D logic view, value is co-created by the mutual effort of all stakeholders (Vargo et al., 2008). In contrast with this perspective, G-D logic states that value is embedded during the company's production process and the economic exchange is based on the creation and delivering of objects to be sold. S-D logic perspective stated that value is constantly co-created and must be established in use, from the customers point of view with a transformation of the position of value creation from exchange to use (Vargo et al., 2008). Following S-D logic, the concept of value co-creation differs from the traditional and suggests a value system where producer and customer generate value in an interactive system through the integration of their resources (Lusch, 2011). From this view, co-creation implies that value is recognized and determined by the client in use. As noted, in the S-D logic view all exchange is based on service that is considered "the application of competences (such as knowledge and skills) by one party for the benefit of another" (Vargo et al., 2008, p. 145). Moreover, the basic unit of analysis for service-for-service exchange is the service system, which is a configuration of resources, including people, information, and technology, connected to other systems by value propositions (Vargo et al., 2008). In this context, service science is the study of service systems and of the co-creation of value within complex configurations of resources and competences. "When value creation is seen from a service systems perspective, the producer-consumer distinction disappears and all participants contribute to the creation of value for themselves and for others" (Vargo et al., 2008, p. 149). To sum up, service system is considered as "an open system (1) capable of improving the state of another system through sharing or applying its resources (i.e., the other system determines and agrees that the interaction has value), and (2) capable of improving its own state by acquiring external resources (i.e., the system itself sees value in its interaction with other systems). Service systems are dynamic configurations of resources, both operant resources that perform actions on other resources and operand resources that are operated on. In this context, economic exchange depends on voluntary, reciprocal value creation between service systems (each system must willingly interact, and both systems must be improved)" (Maglio et al., 2009, p. 149). Thus, "a service system is an arrangement of resources (including people, technology, information, etc.) connected to other systems by value propositions. A service system's function is to make use of its own resources and the resources of others to improve its circumstance and that of others" (Vargo et al., 2008, p. 149). The capability of the service systems to co-create value, effectively depending on the resources of others in terms of interdependence of service-for-service exchange and resource integration. Value co-creation occurs through the integration of existing resources with those available from a variety of service systems that can contribute to system well-being as determined by the system's environmental context. "Service systems interact through mutual

service exchange relationships, improving the adaptability and survivability of all service systems engaged in exchange, by allowing integration of resources that are mutually beneficial” (Lusch and Vargo, 2006; Vargo et al., 2008, p. 145). It emerges that value co-creation is one of the key components of service systems, which has been conceptualized by Service-Dominant (S-D) logic perspective as a phenomenon that spread from customer’s involvement in production, design, customization or association process (Vargo and Lusch, 2008; Vargo, 2008; Gummesson *et al.*, 2010). This perspective has been used to emphasize the customer’s collaborative role in value creation, in fact, the customer is always a co-producer (Vargo and Lusch, 2004) and an active part of the system. This implies the evolution of value creation from a solely company-centric approach towards one with more interaction with the customer (Hribernik et al., 2011). In this optic, “co-creation is the process by which products, services, and experiences are developed jointly by companies and their stakeholders, opening up a whole new world of value. Firms must stop thinking of individuals as mere passive recipients of value, to whom they have traditionally delivered goods, services, and experiences. Instead, firms must seek to engage people as active co-creators of value everywhere in the system” (Ramaswamy, 2009, p. 11). On the basis of this concept, “all participants in the value-creation process be viewed as dynamic operant resources. Accordingly, they should be viewed as the primary source of firm and national innovation and value creation. “The terms “co-creation”, “co-production”, and “prosumption” refer to situations in which consumers collaborate with companies or with other consumers to produce things of value” (Humphreys and Grayson, 2008, p. 963). In contrast with the traditional models of value creation, which suggest that value is created by firms (Normann, 2001), this new perspective suggests that customers are active participants in the process of creation of value (Prahalad and Ramaswamy, 2004; Vargo and Lusch, 2004, 2008; Vargo et al., 2008). The literature regarding S-D logic emphasizes the primacy of operant resources, who are capable of acting on other resources to contribute to value creation (Constantin and Lusch 1994; Vargo and Lusch 2004). The study attributes importance to the value-creating processes that involve the customer as a co-creator of value (Lusch and Vargo 2006, p. 181), but relatively little is known about how value is collaboratively created (co-created) in the cultural sector. To fill this gap, the next section contribute to a deeper understanding of this topic through the lens of S-D logic perspective. Finally, two initiatives (QRator and The “O”) concerned with the given phenomenon are analyzed according to the S-D logic in order to explore the nature of the value co-creation process.

2.3 Internet of Things and value co-creation in the cultural sector according to the S-D Logic

In the cultural industry, value co-creation is an emerging concept associated with the opportunity to gain competitive advantage aiming at better satisfying customers’ demands for personalized products, services and experiences (Prahalad and Ramaswamy, 2004). Compared to past, when cultural institutions (museums, theatres, libraries etc.), decide the services they will produce, and visitors have little or no role in value creation; today, in the vision of an increasing number of cultural institutions, the customer becomes a co-creator of value. The Internet of Things and its embedded devices are making possible new and more effective ways for producers and consumers to collaborate, in the co-production and co-creation of value (Bogers *et al.*, 2010; Greer and Lei, 2012). In particular, in the cultural organizations that mainly produce symbolic goods whose value arises from their ability to bring forth an emotional response from consumers (O’Connor, 2000), value co-creation arises less from producing tangible benefits for consumers and more from increasing symbolic and emotional value. Consequently, customers’ knowledge and skills can become a valuable resource for firms, allowing them to gain the flexibility needed to adapt to the rapidly-changing business environment (Prahalad and Ramaswamy, 2000). These concepts share the idea that passive consumers/audiences have become active value creators. In fact, “a digital environment promoting interactivity has fostered a greater capacity and a greater interest by audiences to change, alter and manipulate a text or a textual narrative, to seek co-participation in authorship, and to thus redefine the traditional author– text–audience relationship” (Cover, 2006, p.140). According to the S-D Logic perspective, IoT can be conceptualized as an operant resource that can act on other resources (including other operant resources) to create change.

The choice to study the value-co creation in the cultural sector is motivated by the fact that the cultural industries, in economic terms, is one of the fastest growing sectors of the world economy. This growth is accounted for by rapid techno-economic change in products, distribution and marketing that allows for easier production, distribution, consumption as well as co-creation of cultural products and services.

3. Research methodology

The objective of the paper is to explore issues relating to value co-creation in the IoT era. In particular the work intends to focus that issues in the field of cultural institutions. The methodology used to investigate value co-creation in the cross section field of IoT and cultural institutions is mainly qualitative which is well suited to exploratory investigations where the objective is not to validate a research proposition but to explore and develop a proposition (Miles and Huberman, 1994). The research, essentially exploratory in nature, was developed using a case study methodology (Yin, 1994, 2003). The case study approach, as suggested in the literature has the dual aim of “grasping in detail the main characteristics of phenomena being studied” and of understanding the dynamics of a given process (Ryan *et al.*, 2002). Thus, the paper proposes an analysis of two initiatives. Each initiatives was analyzed according to the S-D logic perspective in order to understand the role of all participants in the co-creation of value. The study has been conducted on the basis of the following items: 1. configuration of resources; 2. at least one operant resources; 3. service as the application of resources; 4. value is improvement in a system (ability to adapt to an environment); 4.1 value in use (value driver); 5. economic exchange on a voluntary basis; 6. value creators; 7. process of (co-)creation; 8. purpose of value; 9. role of good (operant resources). All of these elements derived from the S-D Logic theoretical framework explained in the previous sections. One of these is the QRator project at the Grant Museum of Zoology and at the Museum of the Brands in London. The other is the “O” at the Museum of Old and New Art in New Zealand. These projects are interesting because, in both cases, visitors contribute in the creation of value.

4. The QRator project in the Grant Museum of Zoology and the Museum of the Brands in London

The QRator is a visitor engagement project, applied in the Grant Museum of Zoology and in the Museum of the Brands in London with the aim to actively engage visitors in the co-creation of their own interpretations of museum collections with the adoption of IoT devices such as QR Code, iPhone, iPad and Android apps. It is a collaborative initiative between the UCL Centre for Digital Humanities (UCLDH), UCL Centre for Advanced Spatial Analysis (CASA), and UCL Museums and Collections, to develop new kinds of content, co-curated by the public, museum curators, and academic researchers, to enhance museum interpretation, community engagement and establish new connections to museum exhibit content. In line with the S-D logic perspective, this initiative is based on the idea to give the visitor the opportunity to become a co-curator while interpreting and commenting on exhibition content in an individual way. In fact, “through this approach visitors thoughts become part of the museum object’s history and its display, creating digital living labels which subsequent visitors can read and respond to in real time” (Claire Ross, UCL DH). This project is based around the technology behind “Tales of Things” (<http://www.talesofthings.com>) which “has developed a method for cataloguing physical objects online, which could make museums and galleries a more interactive experience” (Giles, 2010). At various stages, throughout mobile phone application or direct via the iPad’s keyboard, users are invited to interact with the device and contribute to the continuing conversation and co-creation of value. The system interlinks with Tales of Things and distributes the information to an accompanying website (<http://www.qrator.org>). According to the S-D logic propositions, QRator aims rethink museums as a place not only for a passive experience, but also for conversation – a cultural laboratory for the meeting of minds and a place of experimentation, dialogue and debate.

5. The “O” at the Museum of Old and New Art in New Zealand

The Museum of Old and New Art in New Zealand, better known as MONA is the most visited single attraction in Tasmania. When visitors enter MONA they are each equipped with the “O” device: an iPod Touch loaded with an app that draws on ubiquitous wi-fi and active RFID technology to deliver interpretation about nearby artworks. This not only creates a seamless experience for visitors but provides the museum with data on how many people have viewed which works (and how many times), how users remix the provided information to create their own tours, and what

they choose to “love” or “hate” about the museum. The “O” application, according with the S-D logic perspective, delivers information in a way that enhances the visitor’s experience of the gallery, facilitating access to engaging multimedia via a highly usable interface in a continuous process of value creation. Delivered on an iPod Touch, the “O” uses an internal positioning system to locate visitors when they request information about nearby artworks. Visitors are provided with various types of content (written, audio and video) and are invited to love or hate the works they view on the device. Given the option to save their tour, visitors can log in to the MONA website at a later date and view a 3D model of their tour through the museum and investigate all the information made available on the device (even for the artworks they missed).

6. Discussion

In this section we discuss the QRator and the “O” projects according to the S-D logic in order to better understand how value is collaboratively co-created in the cultural industry. In particular, we individualize the presence or not of nine S-D logic items concerning value (see table 4). Starting from the first item, “configurations of resources”, each project include people, information, and technology. For this reason, the first assumption is validated for both. In particular, the QRator project is based around the technology behind “Tales of Things”. Continuing with the second assumption, the role of operant resources is fundamental to enable access to benefits of firm competences. In the QRator project, information technology is considered as an operant resource whereas in the “O”, the IoT should be understood as an operant resource and “as a set of practices and processes, as well as symbols, that contribute to value creation or fulfill a human need” (Akaka and Vargo, 2013). According with the definition of service as “the application of resources, including competences, skills, and knowledge, to make changes that have value for another (system)”, it is clear that, these two projects describe the process of value co-creation through interaction and integration of resources within and among service systems. Thus, these systems interact through mutual service exchange relationships, improving the adaptability and survivability of all service systems engaged in exchange, by allowing integration of resources that are mutually beneficial. In this context, value is improvement in a system, as determined by the system or by the system’s ability to adapt to an environment. Value is fundamentally derived and determined in use. Certainly, customers are value creators. In fact, in the QRator project visitors are engaged in the co-creation of their own interpretations of museum collections with the adoption of IoT devices with a little contribution cause of a predefined way of interaction. In the “O”, they deliver interpretation about nearby artworks with a great possibilities of content combination. In each project museum propose value through market offerings, customers continue value-creation process through use. Customers co-create value through the integration of firm-provided resources with other private and public resources. The purpose of value increase adaptability, survivability, and system wellbeing through service (applied knowledge and skills) of others.

TABLE 4: COMPARISON BETWEEN QRATOR AND THE “O”

S-D logic	QRator	The O
1. Configuration of resources	Yes	Yes
2. At least one operant resources	Information Technology	Internet of Things
3. Service as the application of resources	Yes	Yes
4. Value is improvement in a system (ability to adapt to an environment)	Yes	Yes with increasing possibilities of choice
4.1. Value in use (value driver)	Yes	Yes
5. Economic exchange on a voluntary basis	Yes	Yes
6. Value creators	Yes: human and IT (little)	Yes: human and IoT (more)
7. Process of (co-)creation	Yes with a little contribution cause of a predefined way of interaction	Yes with a great possibilities of content combination

Source: our elaboration.

7. Implications and Conclusions

According to the S-D logic perspective, customers are active players and co-creators of knowledge contributing in the development of value creation processes according to the S-D logic perspective. As this paper shows, IoT can be conceptualized as an operant resource - one that is capable of acting on other resources to create value - and, thus, becomes a critical resource for value co-creation, service innovation and systems (re)formation. To sum up, Internet of Things, is a new revolution of the Internet because objects can get an active role in the communication process. They, in fact, can communicate information about themselves and can access to the information created by other things (see fig. 1).

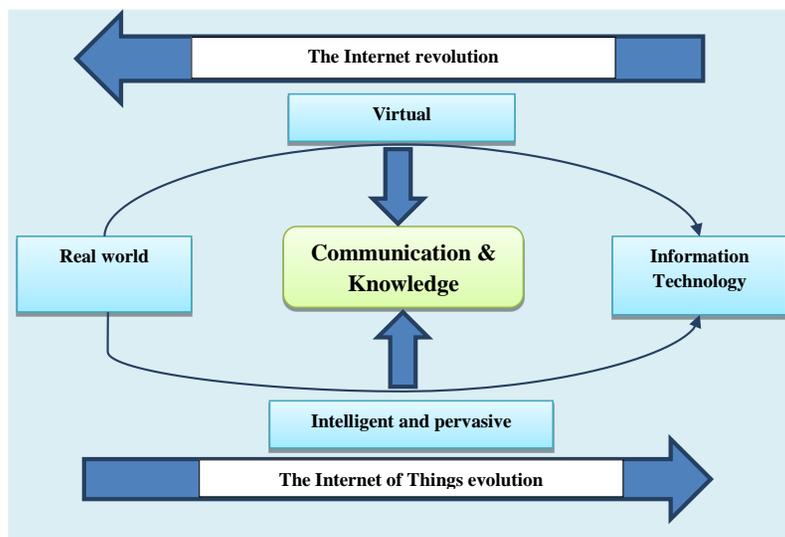

FIG. 1: THE INTERNET REVOLUTION VS THE INTERNET OF THINGS EVOLUTION

Source: our elaboration

The Internet revolution had transformed the real world into a cybernetic world in which, all the computers connected can talk to each other and every knowledge is virtual. Then, with the Internet of Things there is an evolution of this Internet to all the things in the world. This change refers to a world where humans and things communicate and interact with each other in the same space and time (see fig. 2). In fact, people with the IoT, are able to access, adapt, select, and integrate resources in a continuous value co-creation process.

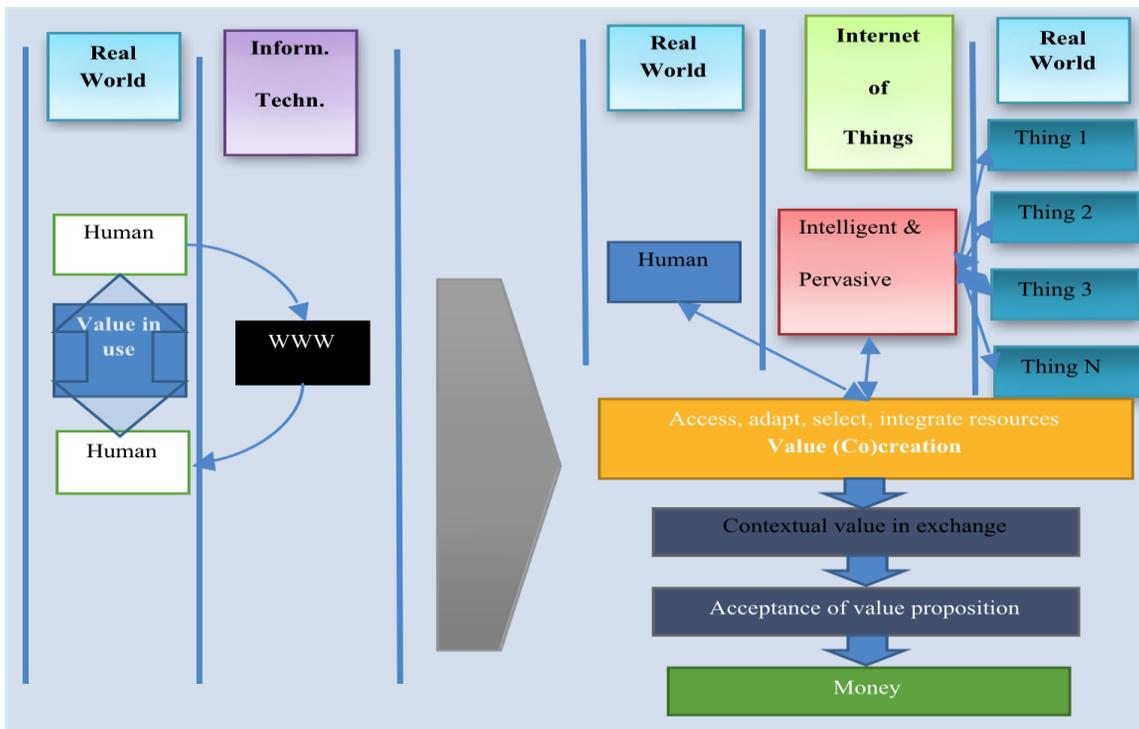

FIG. 2: FROM INTERNET OF PEOPLE TO INTERNET OF THINGS

Source: our elaboration

This study could be considered a first step in a stream of research on some unexplored aspects of IoT. This may involve in future, quantitative surveys, new practices and research challenges concerning Internet of Things and value co-creation in a service dominant logic perspective.

The Impact of Information technology, Information and Communication Flow and Storage Control

Abstract

Governance bodies and management need to be cognizant of various impacts of information technology (IT). The paper deals with the topic of the right to control the flow of data including the storage of communication. The authors are focusing on the issue of executing this right in the right of the Slovak Electronic Communications Act. The main point of the paper is tracking a probable realization of the constitutional-law violation of this kind of data retention in relation to the right for personal privacy. Since this interstate act was a result of implementation of the EU Directive 2006/24/EC on the retention of data generated or processed in connection with the provision of publicly available electronic communications services or of public communications networks this topic is gaining a kind of global dimension.

Wide range of communication possibilities as well as the mobility of communication devices led the legislation to the state that is reaction of the law to the development of communication devices, media and related to this, methods of communication. It is the diversity of technical communication presented not only by the plurality of devices, but also by a wide range of communication interfaces and a multitude of operators that became a base for the necessity to deal with issues connected to communication and its operation in the legislation itself.

Compared to previous decades, where the exchange of information has been carried out by conventional means, such as in particular the telephone (landline) or post, we are now faced with technically almost unlimited possibilities of transmission of the information, which in addition to the plurality of communication devices cannot be watched over, but even their range of use cannot be defined in advance. In the case of exchange of information we cannot be talking about some kind of evolution similar to the development of technical means of communication. Whether we are talking about the era of antiquity, modernity, or the present day, the content of communication between people is categorically the same information. Thus, we are talking about the content of the communication, which in principle is not a subject to evolutionary development. Despite the 'cosmetic changes' of a certain era in which communication between people has been taking place, we are always talking about categorically the same content of the communication (business communication, personal life, arranging meetings, etc.). New Era presented mainly by the developments over the last 15 years, however, has led to almost revolutionary changes in the way we communicate. Here we should pay attention especially to the wording "*the Method of communication.*" The method is defined primarily by the form in which the above-mentioned content of the communication takes place. The primary means of communication presented by gestured characters through inception of speech, the transfer of information in the written form, later the transport of information via couriers, mail, telegram, telephone and now the internet are cross-linked by a common endeavor towards a simpler and immediate transmission of information. This phenomenon has reached its greatest expression in the current times, when the means of communication meet the most numerous choices in which the exchange of information can take place.

Coupled with a wide range of communication options, comes a possibility of misuse of these means of communication for the exchange of information, carrying along an unlawful content. A significant element of modern communications that is the capability for immediate exchange of information has become the focus of criminals as a possible direct assistance to reach a more flexible fulfillment of their goals. As well as the communication itself, also the attainment of an unlawful result has become more easily achievable and the process of its execution became more coordinated. The shady side of the evolving phenomenon of modern communication has not escaped the attention of the competent authorities that have decided to monitor the exchange of information related to the illegal conduct.

Circumstances that stood behind the early initiative of observing the information communication, has not been only committed illegal activities, but also the importance of the data from the traffic presented as information with a neutral value is leading us to the conclusion of the fundamental importance of such data and their potential value. Reflecting on the circumstances that led state authorities to justify this kind of initiative, raises the questions, that are as significant in itself as the answers to them.

The reason for monitoring

As we already mentioned above, wide scale of communication capabilities offer in addition to the positive side based on flexible exchange of information also some negatives related to the transmission of information useful during criminal activities. The coordination of an offender with other offenders during committing a criminal act or coordination of a group of people involved in the crime is one of the most important factors in the process of the preparation of offence and its execution. This factor has one of the key positions in the successful accomplishment of the crime. This factor has become one of the essential facts among the reasons in justifying the necessity to adopt such articles into the legislation allowing and permitting monitoring of the communication traffic.

Mentioned circumstances suggest a classical reasoning process of new legislation in the national legislative process. In the case of the act we are talking about in this article however we cannot speak about the classical way of passing this legislation. Monitoring of the communication service has been initiated into the legal systems of the EU member states by the Directive No. 2006/24/EC. Since this is a secondary act of EU law with an indirect effect, it was necessary to incorporate the text into a national law. The implementation process was carried out in the Slovak Republic by adopting a new law called Act. No. 351/2011: Act on Electronic Communications. The main scope of this directive is stating conditions for providing and use of electronic communications networks, the rights and obligations of business subjects and users, as well as privacy, processing of personal data and competence of state administration in the field of electronic communications.

Basically we are talking about a relatively wide scope of the Directive, which by their nature resembles an area that should be regulated by regulations with national origin. In this case, however, the content is mostly taken from the above-mentioned Directive of the European Parliament and the Council. In order to clarify the origin of this initiative we pay particular attention to the reasons why was this Directive from the initiative of the EU bodies created.

Modern era beside all the inventions, cosmopolitanism and international interactions has also introduced certain negative aspects that bear similarities to those already mentioned. Conflicts of interest and clashes that accompanied the evolution of humanity right from the beginning itself adapted their character to the character of this modern era. These circumstances have become one of the reasons for the adoption of legislation constituting the collection of communication data. The large-scale terrorist attacks in the United States were the reason that initiated the idea of retention of communications data. Even better said, it was not only the justification of the need for such treatment of the private rights, but rather a kind of regret of the necessity in its intervention into private integrity of the monitored individuals.

History

Although we talk about monitoring of communication devices, it should be noted that in this case that the devices are not so relevant in itself, rather than the *user*. Therefore we are talking about a subject who carries certain identifiable characteristics. Despite the fact that the given individual is an entity that carries personal integrity and therefore, the rights and obligations, it is necessary to note that with respect to the effects of the Slovak law and even with respect to the effect of the Directive this natural person becomes the object of the monitoring and also of the automated analysis of the individual identifiers- *personal data*.

Regarding the evaluation of the development of the area of monitoring, we must note that it is *the protection of personal data* which will take in this sense one of the dominant positions. End of nineties in the EU showed a trend towards maximum protection of privacy and personal data of citizens in the field of electronic communications. Directive on the protection of privacy in the telecommunications¹, adopted in 1997 strengthened the privacy of phone users, mobile phones users, digital television users and users of other telecommunications devices. It is especially worth mentioning the duty of the mobile operators to erase all of the data after the call has ended, as well as substantially reducing the possibility for private companies to use their customer data for marketing purposes. This trend in protection of privacy and personal data continued to evolving of the next Directive in 2000. Here, however,

¹ **Directive 97/66/EC of the European Parliament and of the Council of 15 December 1997 concerning the processing of personal data and the protection of privacy in the telecommunications sector**

took place an initiative of the Council, which was focused on the effort to include the obligations of Internet and mobile operators to retain data on telecommunications for use by security, police and judicial authorities to the draft of the directive. This initiative resulted in the response of the Committee on Civil Liberties, Justice and Home Affairs (LIBE), which rejected the proposal, arguing that the proposed measures would expose citizens *an unacceptable level of a very intensive supervision*. The Committee likened this draft to a legislation known as the *American Patriot act*. It is this Act and the original initiative of its adoption in the U.S. which has become a model for the introduction of similar arrangements in the EU Community law. The terrorist attacks of 11 September as well as U.S. political pressure reinforced supporting some EU states² increased attention to "data retention". Thus there was subsequently adopted Directive on privacy and electronic communications³, which in Art. 15 (1), entitled "Application of certain provisions of the Directive No. 95/46/EC "establishes the right of Member States to adopt legislative measures to *restrict the scope of rights and obligations* regarding the handling of personal data when such restriction *constitutes a necessary, appropriate and proportionate* measure within a democratic society to safeguard national security (ie State security), defense , public security and the prevention, investigation, detection and prosecution of criminal offenses. To this purpose, Member States may, adopt legislative measures providing the retention of data for a limited period justified on the grounds laid down in this paragraph. This general clause presented a major breakthrough in the regulation of privacy and personal data in the given period.

Later terrorist bomb attacks in Madrid in 2004, created a reliable base for the adoption of rules to guarantee the availability of traffic and location data for counterterrorism purposes in the Member States of the Union. These facts were reflected in legal reality by the European Council Declaration on Combating Terrorism of 25 March 2004⁴. This document presents the European Council instructed the Council to consider "proposals for establishing rules on the retention of communication traffic services" with a view to adoption in 2005. This priority was confirmed in the Conclusions of the European Council of 16th-17th June and also at the extraordinary meeting of the Justice of the terrorist attacks and Home Affairs on 13 July 2005 in London⁵. Noteworthy is the fact that at the time when the Directive was evolving, the chair of the Council was held by Great Britain, which developed an enormous pressure for the adoption of the Directive, which is known by an abnormal except by legislative process, also reflected an unprecedented hearing the shortest time of approval in the history of the EU. The time between the presentations of the Commission's proposal in its adoption by the European Parliament lasted only three months instead of the usual legislative developments take years. The mood during the pending before the legislative approval wasn't quite monotonous. Against the approving the proposal stood wave of resistance, mainly by Working Party 29, the European Confederation of police EuroCOP and European Personal Data Protection Supervisor Peter Hustinx. The largest response of disagreement, was however, echoed by two of the largest and most important European organizations to protect privacy: European Digital Rights (EDRi) and Privacy International⁶, as well as by the European consumer organization BEUC⁷. Despite the public initiative of over 50,000 Europeans signed against the adoption of the Directive, the Directive was in March 2006 finally adopted. The single statements of retention of communications data should be under this Directive harmonized by the laws of the Member States. Providers of publicly available electronic communications services are so obligatory acquired to keep them preventative generated or processed traffic

and location data in the specified range for some time with the obligation to disclose to them to a legitimate authority of the Member State.

Impact on the constitutionality

Although in this case we are talking about the legislative system of the Slovak Republic, we must remember that the Constitution of the Slovak Republic, as well as other constitutional majority of EU member states, is based on the same principles. The origin of these principles is hidden in the historical development of free and democratic societies based on respect of dividing the public power and maintaining the civil rights. It is for this reason that the constitutional fate of this Directive is in many member states the same. Its provisions have run into legal principles that have law-natural character which is not limited by state borders principle.

Before we move on to questions of constitutionality, we must define what the monitoring actually means. Directive brought the notion of monitoring in Articles 4 to 8. Article 4 of the Directive provides that "*Member States shall take measures to ensure that the data specified in Article 5 of this Directive shall be kept in accordance with its provisions, to the extent that they are generated or processed by providers of publicly communication services or of public communications network within their platform in the process of supplying the communications services.*" This provision thus symbolized a **key title for the retention of communications data** and their subsequent use. The Article 5 defines the categories of data which are subject to retention:

- a) Data necessary to trace and identify the **source**,
- b) Data necessary to trace and identify the **respondent**
- c) Data necessary to identify the **date, time and duration**
- d) Data necessary to identify the **type**
- e) Data necessary to identify **users** of a communication device or alleged device
and
- f) Data necessary to identify the **location** of mobile communication equipment.

Directive in this article points out, that it does not serve as a tracking tool and states that "in accordance with this Directive shall not retain any data revealing the **content** of the communication." Legislative bodies of the EU wanted to give this provision clear that monitoring communications **should not be confused** as a force into the integrity of the person to such as is known as a common practice in criminal proceedings against the suspects.

However, the question stands: "was this goal fully filled?"

One of the fundamental constitutional rights, is the right to secure the confidence of the correspondence. This right defines the Constitution of the Slovak republic in Art. 22 together with the personal data protection as guaranteed by the words "no one may violate the secrecy of letters and other written records, which are kept in private, or sent by mail or otherwise, except the cases provided and stated by law." "Similarly, is guaranteed the secrecy of communications provided by telephone, telegraph, or other similar device." It follows that the main subject in this context is **all custom content** of the communication. The European Court of Human Rights in its cases, however, indicates that such breach to the private life must be understood despite checking the contents of mail and telephone calls⁸ also in sense of checking the caller identification numbers⁹ of people, or storing information that the person made a phone call with somebody¹⁰. It makes no difference whether the data were somehow used or disclosed¹¹. In

⁸ ECHR judgment in the matter Klaas vs Germany, 22 9th 1993, no complaint. 15473/89.

⁹ ECHR judgment in the matter P.G. and J.H. vs United Kingdom, 25 9th 2001, no complaint. 44787/98 and ECHR Judgment, Malone vs United Kingdom, 2 8th 1984, no complaint. 8691/79

¹⁰ ECHR judgment in the matter Man vs. Switzerland, 16 Second 2000, no complaint. 327798/95.

¹¹ ECHR judgment in the matter of Copland vs UK, 3 4th 2007, no complaint. 62617/00, ECHR Judgment in the case Rotar vs Romania, 4 5th 2000, no. 28341/95

literature we find also that "interference with the fundamental rights and breaching the private life means not only immediate intervention, but also measures of state authorities, which *can predict the effect the restriction* of fundamental rights and freedoms."¹²

Although the constitutional right to protection of confidentiality of correspondence speaks primarily to ensure proper content of the communication, the legal practice states that this content should not be *the only subject* to protection under the substantive law. In the case of data relating to communications and especially data on the course and method of operation therefore we are not talking only about the *content* of communication as such, but also about the data which were during making the communication response created. These data figures *actually part of the content* of the communication, whereas they are inextricably linked to the main content of the communication. This is the main reason why we have to consider this kind of "side information" to have an appropriate form of protection as the content itself. These data represent a kind of "metadata" of the main communication and have a comparable value of informative worth as the content itself. Ultimately, their private character is as though they are a separate entity but operating as a single unit in-time with the main content. Therefore they are a genuine part.

The Act established for the saving of these communication data duration based on the Directive itself, divided into 6 months of communicating via the Internet, and 12 months for other types of communication. This duration, however presents a latent danger of further intervention by public authorities. This risk is increased by the fact that deposit of the data itself is entrusted to *the communication services operator, which is a private person*. It is a known fact that the interests of private entrepreneurs are to reduce costs to a minimum. Together with the fact that the data is maintained by many employees of the provider also contributes to the increased risk that deposit of these data wont be taken by a such care that could be called as a fully *secured storage*.

Communication data

As mentioned above, under the notion of "*data communication*" is in the course of monitoring understood the *operational data, location data* and an indication of *communicating parties*. The significance of these data can apparently sound like a formal statement of provided communication without any actual content. But the opposite is true. The essence which these communications data have with the pure content in common is their information value. Not just the content itself may have for monitoring an information value, but often it is just this "metadata" information, which is capable of many important clues about an individual's profile and its behavioral side. Based on these data, it is possible to compile a comprehensive profile of the individual for his *personality, communication* and *physical* side. It is possible from these data to compile such as group of contacts of the concerned person, her private life as well as the intensity of the social and interpersonal relationships. Any information obtained may be meaningful to the private site of the person who has a very sensitive nature. The collection of the communication data may finally testify a personal life of a person (such as calling in the night a nightclub may point that this person is single and live a rich social life), some psychological methods are eligible to determine of concentrated communication data either a sexual orientation of the person. Combining different communication data in the internet traffic may testify many about the very probable content of the communication. The nature of the recipient, the e-mail address can be as *alcoholic@sanatorium.com* or *marriage_affairs@consultant.com* clearly tells not only about the pure fact that a communication was made between these recipients, but it also testifies for personal status of certain person. In this way the data communication shall gain even higher value of the information meaning than just providers. Based on the logical interpretation of the real (interpersonal) environment, this blunt data is talking also about an indication of the activities of man, as well as about the range of his personal life and problems. Even the telephone communication is analogous to that question. In the case when comparing two respondents of communication that communicate regularly and for some time they change location to a location that is right for them common at the same time, this fact suggests that these people were together at the same time and in the same place outside the place where they normally reside. On basis of this profile, it is possible to predict the behavior of the individual.¹³

¹² Windthorst, K. Verfassungsrecht I. Grundlagen, 1st vydanie, Munich, 1994, p. 295, ISBN 9783406385360.

¹³ More on: <http://reality.media.mit.edu/dyads.php>.

Despite the fact that the communication data does not include a statement about the actual content, its character is significant with regard to its information value. It isn't necessary to build a collage of communication data to give a comprehensive profile of each individual, just that single communication data contains information about a particular a time, location and the respondents involved to the communication. This fact also supports the very notion of the importance of the value of this information to the content of communication itself, which is explicitly protected by the communications secret.

Reflecting on the nature of the communication data also leads us to conclude that the *identification value* of the so-called simple data of the providing of the communication. This value is increased by the fact that the operating data may earn such status as the personal data itself. Personal data is in the virtue of the Slovak law defined as "data related to an *identified* or identifiable natural person who *can be identified, directly or indirectly*, in particular by the general identifier or *to one or more factors* specific to his physical, physiological, mental, economic, cultural or social *identity*."

Above mentioned facts lead us to conclude that communication data, especially in conjunction with the first and last name, respectively the phone number itself, can fulfill the nature comparable to the nature of the personal data.

Specific situation is the case of collecting the communication data of the person who has a specific status. In particular, we recognize the cases of lawyers, doctors and journalists specially protected by the right of confidentiality of communications. This specific nature of their activities leads them to the obligation to maintain the secrecy among their professional affairs¹⁴. The content of the communication data is in the case of these persons confident information regarded to the area of their clients as well as the frequency and intensity of their communication.

The Slovak Act on advocacy in its § 23 stipulates the direct duty secrecy by the advocates profession "of all the facts they *learned in relation to the practice of law*, must be kept by the obligation of maintaining the secrecy." It is also provided that "deprives the lawyer confidentiality obligations is possible only by the decision of his client and after the client's death or termination of a client just his successor. If the client has more successors, effectively depriving the lawyer confidentiality obligation requires expression of will of all successors client. The act must be done in written form only" In a similar vein, the duty of confidentiality to his client is formulated in any other professions. At this point, therefore arises a question concerning the observance of confidentiality, in the event that they have a liable entity communicating with them via the form that is monitored. Definite answer can be derived from logical reasoning on this issue, namely, that monitoring of the communication is directly leading to the information involving the area of the clients themselves. This view is either supported by § 9 (1) of the Lawyers code of the Slovak Advocates Chamber¹⁵, which states that: "A lawyer shall keep confidential all matters on which he learned during his profession (§ 23 of the Act on advocacy), as well as *personal data* protected by special law. "This rule extends or rather said specify the area involving the duty of confidentiality on the personal information of clients and individuals included in the pending legal matters. Given that the Act on Electronic Communications (Directive and therefore itself) are stating a cross board and non-addressed monitoring, this power gets into conflict with the sovereign right of the client and the responsibility of the individual professions for keeping the confidentiality of concerned data. Regardless of the formulating the obligation of confidentiality to the beneficiary, it must be emphasized that this confidentiality is dedicated to a concrete area of a concrete persons. So if we talk about secrecy as such, we are talking primarily about identifying the entities that are required to maintain the confidentiality of all facts on which they learned during their professional relations. Although the point of secrecy is based on the protection of the content and common relationship, it has to be stressed that this relations are based on the concrete subjects that are identifiable by their identification data. It is undisputed that by the monitoring of the communication is processed by the gaining and storing the data of the respondents. This fact leads us to conclusion that this process is threatening the very pure point of keeping the secrecy and confidence of the respondents involved in the communication. As is known in the democratic and transparent societies custom provisions protecting fundamental rights and transparency before the public authorities are also applied in the Slovak law. One of the most important breach in the private life is

¹⁴ For example: § 80 Act no. 578/2004 Z.z., § 23 Act. No. 586/2003 Z.z

¹⁵ https://www.sak.sk/blox/cms/sk/sak/doc/37/42/___docList___/rows/123/attr/name/preview; 18.2.2013

the interception performance. This competence is in Slovak law involved in the Code of Criminal Procedure, where its performance is a subject to strict oversight and approval responsibilities. The Criminal Procedure defines monitoring as "the collection of information on the movement and activities of people or things moving, which is done as a classified manner" This power is not absolute and it is a subject to an approval by the competent authority. The formal title for the implementation of monitoring is the "command" which is issued in written form. Before starting the prosecution it is issued by the chairman of the court senate, and after the criminal prosecution (pre-trial) is the state attorney (prosecutor) the reliable person. As can be seen, the mutual relation of competence, to carry a criminal tracking information is comparable to the information based on the data from the processed communication. In both cases, we are talking about obtaining the same category of information about the monitored person, who may have the same meaning during their evaluation.

In this connection it should be noted the position of an advocate in criminal proceedings. In obtaining information for criminal proceedings in the form of tracking a person's is said that "If during the interception and recording of the telecommunication process is noted that accused person is talking to his defender, this cannot be used for law enforcement purposes and must be immediately erased"¹⁶ Similar statement to already mentioned isn't in the Act on Electronic Communications even in the Directive even stated.

We can therefore conclude that the power to obtain information about persons and their relations movement is in the case of the *simultaneous existence* of two nearly identical regulations about the governing powers of state authorities *dealt with a different approach* to the protection of a fundamental constitutional rights and professional obligations of persons involved in the communication.

As an individual group in this context stands the group of journalists. Monitoring of the communications of a person engaged in the profession of journalism is a restriction on freedom of expression and freedom of the press (Article 26 of the Constitution). By tracking the respondents included in communications with journalists is also a direct violation of the Press Law¹⁷, which about the protection of sources and content says: "Publishers of periodicals and press agencies must not disclose the source of their information obtained for the publication so that it cannot determine the identity of the source, when the source ask for keeping this information in secrecy."

In the interest of full secrecy and protection of subjects and places where communication is made, there is no other way to search for alternative options of communication which is not subject to monitoring by virtue of the Act on Electronic Communications. It should be noted, however, that these alternative routes do not meet the essence of practicality and flexibility.

Procedural issues of the using communication data

In the case of the obligation of the communication provider to retain the data, is a necessity to give a few words about the protection and the guaranties against the misuse of these data.

In order to maintain the confidentiality and security of the communication data related to a particular person is required to establish legislation on a highest possible level of safety equivalent to the current state of knowledge in this area which will be independent on the discretion of private providers, who will primarily reflect mainly economic perspective¹⁸. Slovak legislation is solving the essence of safety in the fifth part of the Electronic Communications Act, entitled "Protection of networks and devices" and "the integrity and safety of networks and services." The Act solves these issues in a very general way and addresses the duty to take an appropriate technical and organizational measures to the liability of providers of communications services. Legislative solution of the processing and storage of communication data enters into circumstances, when state receives the benefit of their retention, but the responsibility for the storage, as well as a guarantee of confidentiality, in our opinion, quite unjustifiably left to the responsibility of the private entity. The state should, in this respect at least establish a legal framework corresponding

¹⁶ Act. No. 301/2005 Z.z. Art. No. 115 (1) tiež Art. No. 113 (3)

¹⁷ Art. No. 4 (1) of the Act no. 167/2008 Coll (Press Act)

¹⁸ Judgment of the German Federal Constitutional Court dated 2.3.2010, 1 BvR 256/08, 1 BvR 586/08

to internationally recognized criteria for data protection in storage of the providers and indirectly to guarantee surveillance on the compliance with the provisions of the safety parameters and monitoring by its authority. Otherwise will the *legally vague terms* such as "*appropriate technical and organizational measures to protect the security of networks and services*" or "*state of the technique providing the level of security that is appropriate to the risk*" become only a the subject of subjective interpretation by the private provider. It is worth to say either about the potential risk of misuse of data stored on the provider, especially for the purpose of marketing their services. The issue of insurance of the personal data is a sensitive issue in Europe. According to Ponemom institute, which conducted a survey in 785 British companies focused on information technology, has been granted a 55% loss of data in these companies, 49% had experienced more than two cases in the last two years¹⁹. Currently, when the IT business has become one of the fastest growing and most prevalent type of business can be drawn an issue on security of data stored in repositories of such companies. With respect to the economic side of security and technical demands on their protection is therefore appropriate to consider *the necessity of keeping some data* in information systems. Consideration of this issue is based mainly on the *purpose and necessity* of storing as well as the *effectiveness* of their further use.

The limitation of fundamental rights and freedoms can only occur if it is to achieve the intended objective *appropriate and necessary* and such action is not due to its intensity in *proportion* to the importance of the case and the injury caused to the persons concerned. In view of these facts it is therefore necessary to subject the obligation to retain data the proportionality test. This mean is a standardized legal instrument of European Constitutional Courts as well as the international ones used to determine the conflict in terms of the provisions of law relating to the protection of constitutionally guaranteed rights or public interest with another fundamental right or freedom.²⁰

This principle is processed on the basis of three criteria:

- Test examines whether the *legitimate aim* is not to achieve a legitimate aim
- Necessity test examines whether *such action is necessary* to achieve the objective of
- Test of proportionality *stricto sensu* determines *whether the injury* on the fundamental right *is not disproportionate to the intended objective*.

Ad.1 Test of the legitimate aim

Data retention is a tool used by the state to ensure national security, defense and public safety. It is thus an important social goal.

Ad. 2 Test of the necessity

At this point it should be assessed whether the retention of traffic and location data is really so necessary for the protection of the public interest in a democratic society. Furthermore, if the range of data stored and the retention period is required by criminological research to combat this type of crime. Also, whether there are less invasive and equally effective ways of combating a serious crime.

Ad. 3 Test of the proportionality in the narrow sense

The adequacy of the impact of these measures on the affected person must be taken into account in particular the effectiveness of this information in the fight against serious crime, the extent and severity of the interference with the constitutional right to privacy in respect of minor regulations, which the Act in fact is and also the assessment of the existence of adequate and sufficient safeguards against abuse stored data. At this point it should be noted the essence of who stood to justify the adoption of adjustment data retention. The underlying point of this action lies justifying the right to breach the privacy in respect of the protection of society and the state. This protection is specified as "*the right of criminal proceeding authorities, court and other state authorities to request the provision of data communication for the purpose of investigation, detection crimes and prosecution of criminal offenses related to*

¹⁹ Source: <http://securityworld.cz/securityworld/alarmujici-vyzkum-vice-nez-polovine-britskych-firem-jiz-unikla-data-251>; 10.2.2013.

²⁰ Volker und Markus Schecke GbR C-92/09 a C-93/09

terrorism, illicit trafficking, organized crime, evasion and compromise of classified information as criminal acts committed by a dangerous group.” It is thus an exercise of procedural rights during criminal proceedings. The very fact that the communication performance is monitored for these purposes and it is done cross board and in indirect way leads us to conclude that the conflict with the principle called “*praesumptio boni viri*” known as the **presumption of innocence**. This principle is an old law institute, whose roots go back to the germ of the rule of law and protection of essential civil and human rights. We’re talking mainly about the right to a fair trial, which is character by an accusation process where the nature of the trial is based on the dispute between the accusers and the accused (the defender). This process is the opposite process of evolutionary older Inquisition process, which did not apply the presumption of innocence and due to the defendant bears the burden of obligation to convince the trial he is innocent, because the actual allegations were held him guilty.

We see a similar comparison in the case of processing the communication data in order for their potential uses for the investigation of the above-mentioned crimes. Cross boarded monitoring as indicated by the fact that non-targeted and automated data collection leads to conclusion about **violating the presumption of innocence** to the citizens who are blameless in these cases.

Efficiency

One of the principal criminological studies in this area is the study of the Max Planck Institute entitled “Stuzlucken Wegfall der durch Vorratdatenspeicherung?”²¹. The results of the study point to the fact that collecting location data (probably for the reasons given above) does not at all comply a better detection of serious crime. In following it is arguable that from the nature of these types of crimes stipulates that the crime carrying the characteristic signs of a serious nature will be not easily detectable or implied. The offenders of these crimes, often acting in clusters have a reliable information only about the best committing their plan, but also a well knowledge of the methods of the crime detection an its investigation. In consideration of coordinating their joint action, as well as enforcement of a particular offender in the course of committing the offense is not expected that the criminal investigation of the relevant facts in this case will be built on reliable information, use of communications data.

Standalone issue is communicating via service provider of a third country and thus beside the validity of the Directive. The effectiveness of the Directive is limited by the territorial determinism of the states that have implemented the rules of Directive and therefore providers who do not have the territorial jurisdiction of the retention of communications data act are not obligated to store such a data.

Another example is communicating via the depository in an e-mail account. Information stored as a draft is not transported and thus not follow the sphere, which is under the control of monitoring.

It is worth mentioning the possibility of making the communication anonymous by The Onion Router (TOR) and the JAP (jondo). Commercial services offering anonymous actions are based largely on proxy servers.

The above mentioned facts suggest that there are many other ways either easier or more difficult to avoid monitoring the communication. It should be emphasized that the perpetrators of organized crime know much more sophisticated ways to avoid forensic analytical methods to track them. Based on these facts, we can therefore conclude that the ambitions of the legislature in this area to justify approval of the data retention are not likely to achieve the target resolutions.

Constitutional factors

Adoption of Directive 2006/24/EC was accompanied by legal turbulences in several EU member states. The amount of negative feedback on the unconstitutionality of this provision was reflected in the proceedings on the constitutional courts. It was mainly on the country where the directive declared unconstitutional between which they are mainly Germany, Czech Republic, Romania, Bulgaria and Cyprus. Germany, Czech Republic Romania haven’t adopted any

²¹ http://vds.brauchts.net/MPI_VDS_Studie.pdf.

statements related to the Directive which would replace the previous one. Romanian Constitutional Court explicitly rejected the constitutionality of *per se*. Some Member States have still not transposed the Directive because of its unconstitutionality.

By the virtue of the competence of the Court of the European union²², we could engage to the views of the unconstitutionality of articles of the Directive providing for the retention of the data itself, the extent and duration of storage. It is mainly a question of compliance with the provisions of the Charter of Fundamental Rights. Nor the pure fact that the EU acts as a secondary result of the legislative does not release these rules from doubts about their reliability and constitutionality. Therefore, it is also necessary for this regulation approach to the analytical evaluation of the site for legitimacy, proportionality and the protection guaranteed natural rights and freedoms. The Court in this regard says that *"it should be ascertained whether the Council of the European Union and the Commission held a balanced consideration of the interests of the Union in order to ensure the transparency of its actions and the optimal use of public funds on the one hand, and interference with the rights of the beneficiaries in their private life and the general specific protection of their personal data on the other. Exceptions and limitations of privacy must operate within what is strictly necessary."*

Constitutional court of the Slovak Republic, as constitutional courts of other Member States would therefore be in accordance with Article No. 276 of the Treaty on the Functioning of the European Union, request the Court of Justice of the European Union to assess compliance with the principle of retention of Articles 7, 8 and 52 paragraph 1 of the Charter of Fundamental Rights of the European Union. Also, it must be examined by the Council and the Commission, in adopting the Directive, and in particular with a view to considering the interests of the Union to ensure the protection society against serious crime and the interference with the rights of all citizens of the Union and interference in their private life and personal data on the other side.

Conclusion

Present times brought with them many changes of the course of events and social relations. This result demonstrates the need for the fast transfer of information for the purpose of fast communications and interoperability either for the better professional or the social life. These facts have led the majority of the population to using modern communication technologies to ensure the fulfillment of their interests. But the reality is that these technologies, contrary to the straightforward way of exchange of information, depend on a third party in this relationship that acts as an intermediary for the transfer of the contents of communication. Participants of the communication thus become increasingly dependent not only on their communications devices, but also on the way in which their communication takes place. Important in this regard is that in the very near future these forms of communication will spread not only in relation to the range of communications devices, but also in relation to the number of users of these devices. The essence of classical communication based on spatially closed parties is now being reshaped into the communication based on network access of the participants. This trend we could call the technical centralization of information exchange. Despite the fact that the outcome of these developments has brought to us a great deal of accessibility and convenience, It also has brought along better capability of committing crime. One has to consider the question whether the government intervention into confidentiality of our contacts and communication corresponds to a protection of a society, of which we ourselves are part of.

TQM firms, risks identification and the use of non-financial performance measures: an empirical investigation

Abstract

Both total quality management (TQM) and risk management (RM) are concerned with the realization of strategy. Some authors have recently focused on the potential integration of quality management and RM, highlighting the need of combining information to improve decision making.

The exploratory study presented in this paper addresses the field of TQM and RM, to investigate the influence of the adoption of TQM on risk identification in a sample of large Italian firms. Further, drawing also special attention to the effects of the intangible resources, it examines differences on emphasis placed by firms on non-financial performance measures.

The results are based on a survey and non-parametric statistical data analysis is employed.

The sampled firms are divided in TQM firms and non-TQM firms, and comparisons are provided between the two groups of firms with reference to the importance placed on identification of strategic risks (Simons, 1999) and to the emphasis placed on non-financial performance measures.

Introduction

In a contemporary manufacturing environment characterized by the challenges of global competition, the search for competitive advantage has raised “the priority of quality and risks in industrial and business strategies” (Kenett and Tapiero, 2009). In international markets, consumers have increasingly required high quality products and services; advanced managerial and manufacturing practices, such as total quality management, have known a significant dissemination during the last decades. Risk management has also become an important topic in recent years, and the interest has intensified in the aftermath of the 2008 crisis and other corporate disasters (Mikes and Kaplan, 2013).

Quality, defined as “the consistent conformance to customers’ expectations” of products or services (Slack et al., 2001), has risen to a strategic competitive variable (Chenhall, 1997) and TQM has become a “pervasive strategic force in today’s industrial economy” (Powell, 1995). Thus, scholars have recognized total quality management (TQM) as a business level strategy (Reed et al., 2000) and have demonstrated the existence of a link between the use of TQM practices within organizations and the achievement of competitive advantages (Douglas and Judge, 2001). Other authors (e.g. Prajogo and Sohal, 2006; Yung et al., 2009) have recognized that TQM can support the implementation of a differentiation strategy, whereas the relationships between TQM and a cost leadership strategy are weaker. Since TQM requires firms to coordinate a wide range of intangible resources, the resource theory of the firm provides an appropriate perspective for analyzing the effects of the use of quality management practices on firm’s performance (Powell, 1995).

At the same time, many questions about risk need to be taken into account in formulating business strategies; risk may represent a threat to the ability of an enterprise to execute business processes effectively and to achieve strategic objectives (Baird and Thomas, 1985; O’Donnell, 2005). RM is the process whereby firms methodically address the risks relating to their activities (Dequae, 2007). The development of an integrated RM approach (commonly referred to as Enterprise Risk Management), in which all risks are viewed together within a coordinated and strategic framework, seeks to directly relate RM with business strategy and objective-setting (Power, 2007; CoSO, 2004; Arena et al., 2010). Several authors emphasize the role of RM as a critical tool in supporting strategic decision making (e.g. Nocco and Stulz, 2006; Frigo and Anderson, 2011).

The resource theory of the firm recognized that the central theme for explaining the achievement of a competitive advantage is the role of factors that are internal to the firm. Idiosyncratic resources contribute to create a superior market position allowing the firm to generate more valuable returns (Conner and Prahalad, 1996; Barney, 1996). Resources include: “assets, capabilities, organizational processes, firms attributes, information and knowledge” (Barney, 1991) and can be classified in three all-encompassing categories: physical, human and organizational. However, as knowledge management became more widely implemented and sophisticated, the intangible resources

are viewed as being the main drivers of TQM and RM performance impacts. This new emphasis on intangible resources in quality and risk management literature allows to shed light on how and why the implementation of TQM and RM practices unleashes the potential to generate benefits for firms.

The exploratory study presented in this paper addresses the field of TQM, RM, and performance measures. In particular, the study aims to investigate the influence of the adoption of TQM on risks identification and on the use of non-financial performance measures in 58 large Italian firms. The sampled firms are divided in TQM firms and non-TQM firms, and comparisons are provided between the two groups of firms with reference to both the importance placed on identification of strategic risks (Simons, 1999) and on the use of non-financial performance measures.

Literature review

The literature view is divided in three sections. The first section provides an overview on the key characteristics of TQM and RM, whereas the second one deals with the connections between TQM and RM. Finally, the third section examines TQM's role as a strategic resource, drawing on the resource based theory of the firm and intangible literature.

TQM and RM

TQM is the most significant contemporary approach to QM. TQM is “an integrated management philosophy and set of practices that emphasizes, among other things, continuous improvement, meeting customers' requirements, reducing rework, long-range thinking, increased employee involvement and teamwork, process redesign, competitive benchmarking, team-based problem solving, constant measurement of results, and closer relationship with suppliers” (Powell, 1995). It lays particular stress on the need to provide customers with high quality products, in order to increase efficiency at all stages of the production process (Chenhall, 1997). Under a TQM approach, quality managers attempt to minimise the likelihood of potential events (failures) in the operations which can be critical for product quality and reliability (Slack et al., 2001). In other words, TQM is based on the principle of risk prevention.

RM is a process representing “a critical facet of an organisation's control system where timely identification, assessment and management of the portfolio of risks faced by an entity are linked with the achievement of its goals and objectives” (Subramaniam et al., 2011). It is developed through a coordinated set of actions, directed at identifying and assessing risks that could affect the firm's capability to achieve its objectives. Risk identification is the first phase in RM operationalisation, and it is based on the development and update of a list of potential events (risk register) to which the firm is exposed and that could affect both business process performance and the ability to achieve objectives (O'Donnell, 2005). Since RM embraces the whole organization instead of focusing on specific parts, the range of risk typologies has been continuously enlarged, shifting away from operational risks toward strategic and competitive risks.

Simons (1999) defines strategic risk as “an unexpected event or set of conditions that significantly reduces the ability of managers to implement their intended business strategy”, whereas competitive risk relates to changes in the competitive environment which affect the ability of a company to differentiate its products/services from its competitors. He identifies different sources of strategic risks, among which operational risks, asset impairment risks, competitive risks and reputational risks¹.

Operational risks derive “from the consequences of a breakdown in a core operating, manufacturing, or processing capability” and it can result from human errors, system failures, and inadequate processes or controls. Operational risks are often the results of poor management of key processes by the firms and its staff (Williams et al., 2006), and can hamper the flow of high quality products, exposing the firm to potential loss and liabilities.

Competitive risks can arise from events involving: a) the actions of competitors in developing higher quality products and services; b) changes in regulation and public policy; c) shifts in customer tastes or desires; d) changes in supplier pricing and policies. Moreover, competitive risks can also be caused by inappropriate employee behavior in dealing with customers, suppliers, and competitors.

Reputational risks² are linked to business problems or actions adversely affecting customer perceptions of value in using the business's products or services, or to a loss of confidence by other stakeholders (Simons, 1999).

Reputational risks may occur as a consequence of excessive operational risk, asset impairment risk, or competitive risk.

Connections between TQM and RM

Williams et al. (2006) have addressed a number of key issues in examining the connections between the field of risk management and the field of quality management. They recognize three ways in which quality management expertise and experience can influence RM: “(1) in distinguishing between risks which can, and which cannot, be treated statistically; (2) through knowledge and experience in managing key processes; and (3) in implementing major organizational and cultural change”.

TQM and RM also share other common concerns. They both deal with problems resulting from uncertainty, driven by internal or external causes, which are subject to probabilities defining their occurrence. As a result, they are both required to handle variability and may resort to statistical methods. As Kenett and Tapiero (2009) highlight, “the many tools used in managing risks seek to define and maintain the quality performance of organizations, their products, services and processes”.

Popescu and Dascalu (2011) suggest that a risk-based approach strengthens the effectiveness of quality management systems. They propose a methodological framework for integrating RM in QM, assuming that “the two dimensions complement each other, being components of the indicator system that measure the performance of the organization”. RM is seen as a key activity, associated with a wide set of decisions in support of strategic management, project changes and basic processes.

Further, as Nitu et al. (2011) note, the international standard ISO 9004:2009 explicitly includes RM as a key feature of quality management process for organizations which are interested in continuous improvement. In ISO 9004:2009, the identification and assessment of risks is considered as an element of TQM principles.

TQM, RM and intangibles

Scholars argue that TQM and RM practices can be used to generate competitive advantage, improving product and process quality and then increasing revenues and customer’s satisfaction and reducing risks (Powell, 1995). Because TQM and RM implementation requires firms to “coordinate a wide range of behavioral, tacit and intangible resources” (Powell, 1995), literature in TQM and RM has paid substantial attention to the role of intangible resources in improving a firm’s performance. The diffusion of knowledge management practices both in manufacturing and service firms, allows to move the TQM and RM theory landscape to the resource theory of the firm emphasizing the role of intangible resources and, thus, overlapping with the traditional management theory (Dean and Bowen, 1994). This new dimension of theory building has generated an immediate appeal for drawing new insights on the theoretical link that exist between TQM (and other quality management practices) and a firm’s competitive advantage.

The adoption of resource based theory and, especially, the intangibles literature allows to expand the knowledge of the quality literature introducing a new lens for studying the benefits of the use of quality management practices (Reed et al., 2000). Among the authors a complete agreement exists about the benefits of the use of TQM practices: improving customer satisfaction and reducing costs. These two benefits are increasingly explained by using the model centered on the firm’s resources that provide a superior market position. Firm’s resources are organizational factors that are firm-specific, embedded in the firm’s culture and history, difficult to imitate, path-dependent and developed over time. These resources are viewed as being the main drivers of competitive advantage and their nature is increasingly becoming intangible. The “lasting and superior nature of intangible resources” (Hall, 1993) allow to better explore, from a theoretical perspective, the relationship between TQM and competitive advantage. Using concepts from the intangible literature, scholars showed how the process of TQM and other quality practices has the potential to create a sustainable competitive advantage. Human and organizational factors (such as competencies, team work, leadership, training, top management commitment, norms, procedures and manufacturing processes non-financial performance measures) are identified as a fundamental component of TQM practices and, then, they are considered in exploring and understanding the potential for competitive advantage generation.

Development of hypotheses

The identification of strategic risks and their mitigation are recognized as important factors for the implementation of a strategy aimed at meeting customer needs and, thus, to improve a firm's performance. In the TQM context, the identification and mitigation of strategic risks are at the heart of successful TQM implementation. Adopting the Simons approach (1999), strategic risks can be divided into: a) operational risks, b) competitive risks, c) reputational risks. All these categories identify specific types of intangible resources that are rooted in human (capabilities, training, commitment, leadership) and organizational factors (procedures, rules, reputation).

Concerning the operational risk, TQM practices are aimed to bring quality improvements and to reduce costs. They rely on the detection and the analysis of what can go wrong in key operational processes. Thus, TQM firms pay particular attention to potential failures regarding operations design, facilities (machines, equipment, buildings) and staff (Slack et al., 2001) and are more oriented to introduce knowledge management tools for making operational processes more transparent and knowable. TQM approaches are mainly based on efforts for workforce training and knowledge formalisation intended to eliminate operational errors and product or service defects. Thus, these considerations suggest the following hypothesis:

H1a: The identification of operational risks is more important in TQM firms than in non-TQM firms

Concerning the competitive risk, TQM practices typically are focused on understanding customers' need and their evolution over time in order to meet their requirements. To entail closer relationships with customers, TQM firms use benchmarking techniques and acquire specific market knowledge from customers and competitors (Powell, 1995). Moreover, TQM firms put attention to the role and responsibility of personnel because their behaviors can affect the relationships with customers and competitors. Popescu and Dascalu (2011) note how analysis of suppliers developed by TQM firms represents a specific form of risk analysis, and Avanesov (2009) suggests that TQM must take into account risks arising from the competitive environment in which the firm operates and from environmental changes. Thus, these considerations suggest the following hypothesis:

H1b: The identification of competitive risks is more important in TQM firms than in non-TQM firms

Concerning the reputational risk, TQM practices are oriented to significantly influence customers' perception. A positive reputation is an important driver of successful relationship with customers (Ruso et al., 2012) and can affect a firm's performance. For example, the reputation for delivering high quality products and services can enable firms to charge higher prices and earn higher profits (Kaynak, 2003). Further, firm reputation may be considered as a signal of the firm's ability to satisfy the customer's expectations (Nguyen and Leblanc, 2001). Under TQM, reputation among customers is a primary source of competitive advantage (Powell, 1995). Despite most firms considering reputational risk as a consequence of operational or competitive risk, and damages to reputation are rarely acknowledged by audit or risk committees (CIMA, 2007), TQM firms assign a crucial importance to the detection of a wide range of failures to meet customers' expectations. These considerations suggest the following hypothesis:

H1c: The identification of reputational risks is more important in TQM firms than in non-TQM firms

As already stated, scholars agree that the main aim of TQM is to reduce cost and improve customers' satisfaction. Equally consistent is the view that the link between the use of TQM and competitive advantage is theoretically validated (Flynn et al., 1995, Powell, 1995) but there have been only a few attempts to empirically verify it.

For example, Easton & Jarrell (1998) investigated the impact of TQM on the performance of 108 firms that began TQM implementation between 1981 and 1991. Hendricks and Singhal (1996) explored the link between quality and financial performance analysing accounting data of firms that have won quality awards, against a control group

of non-winners. Powell (1995) examined 39 US manufacturing firms and found that only the intangible aspects of quality practices (employee commitment, shared vision, customer focus) contributed to organizational performance.

While the definition of TQM is well established in literature, performance remains a loosely defined construct. This multifaceted concept makes the selection of the most suitable indicators difficult. Previous research on the link between TQM practices and performance has covered both soft and hard performance indicators. Hard indicators are accounting variables, while soft indicators (non-financial performance measures) are strictly linked to intangible and intellectual dimensions of the sources of competitive advantage. As Mc Adam & Bannister (2001) suggested, both hard and soft measures of performance are needed within the TQM framework. However, considering that TQM has an extensive focus on intangible and intellectual variables, we argue that the analysis aiming at empirically verifying the link between TQM and performance should also focus on non-financial measures.

Thus, according to the literature on TQM, we state that the use of TQM practices can accomplish the following internal benefits: a) improving efficiency and enhancing productivity (Hendricks and Singhal, 1997); b) improving human resources management (Ho et al., 2001) b) increasing customer satisfaction and loyalty (Handfield et al., 1999).

Ittner and Larcker (1995) suggest that TQM practices are related to information systems placing greater emphasis on non-financial performance measures, including physical measures of operational performance, information regarding the workers performing the job, and customer satisfaction. Abdel-Maksoud et al. (2005) conclude that TQM firms “are likely to take considerable interest in a wide range of non-financial measures”.

These considerations suggest the following hypothesis:

H2: In TQM firms non-financial performance measures are more important than in non-TQM firms

Research design and data collection

The study employs a survey-based methodology, using a questionnaire to collect data.

The questionnaire was compiled by the Chief Financial Officer (CFO) and Chief Executive Officer (CEO) of a sample of large Italian manufacturing companies. Only firms with at least 500 employees were included in the target sample, which was selected from the population of firms (49 firms) included in the dataset obtained by the Industrial, Commerce and Agriculture Confederation (CCIAA). The CCIAA dataset captures all the Italian companies and it contains companies listed on the Milan Stock Exchange.

We focus on a sample of large size firms, as several studies agree that size is a determinant of RM adoption (Mikes and Kaplan, 2013).

The survey was structured in three phases. In the first phase, a random sample of 179 firms was selected, and a letter was mailed to the firms' CEO or CFO in order to ask them for the availability to receive and compile the questionnaire. 70 firms agreed to be surveyed. In the second phase, a web questionnaire was sent to them. A total of 58 complete and usable questionnaires were returned, giving a response rate of 32.4%.

In order to assess the possibility of non-response bias, we conducted a comparison of the profile of respondents against a sector of firms in the selected sample. This comparison showed that respondents are significantly similar to sampled firms with regard to sector. For the sample selection, we considered the hypothesis of missing-at-random.

The questionnaire consists of four sections: information on firm characteristics (including a question on the use of TQM practices), pressures from business environment and business strategies, implemented by listed and non-listed in large manufacturing firms, impact of the business strategy on management accounting innovations, influence of the business strategy on risk management techniques.

The questionnaire was pilot-tested by a number of face-to-face interviews with Chief Risk Officers (CROs) or CFOs operating in different sectors. Semi-structured interviews were used to insure the pertinence of the questions and to amend their formulation.

Measures

Firms are classified into two groups, according to whether they use TQM or not. An item of the questionnaire requested firms to indicate whether they use TQM practices. A value of 1 was attached to firms using TQM and a value of 0 to firms that do not use TQM.

Another item requested firms to indicate whether they effect a RM process in order to identify specific strategic risks.

In order to study the relationship between TQM and the identification of strategic risks, the respondents of firms using RM were asked to indicate on a 5-point Likert scale (from 1 = not important to 5 = crucial) the relevance assigned to the identification of the different sources of strategic risks: operational risk, competitive risk, and reputational risk.

Moreover, in order to study the relationship between TQM practices and the importance of non-financial performance measures, the respondents of TQM firms were asked to indicate on a 5-point Likert scale (from 1 = not important to 5 = crucial) the relevance assigned to different non-financial performance measures.

To test the hypotheses, a Mann-Whitney test (Conover, 1980) was used. Mann-Whitney is a rank-based test which allows to detect differences in the locations of two groups of observations. We applied it to compare the average importance assigned to the identification of strategic risks and to the use of various RM quantitative techniques across the two groups of firms (TQM firms and non-TQM).

Survey results

Table 1 summarizes the categorisation of firms that responded to the survey according to whether they use TQM practices and whether they effect a RM process.

The majority of respondents in the sample (56,9%) use TQM practices, and most of the firms (almost 71%) effect RM processes in order to identify, assess and control risks.

TABLE 1 – SUMMARY STATISTICS ON RESPONDENT FIRMS

	RM	Non RM	Total
TQM firms	24	9	33
Non-TQM firms	17	8	25
Total	41	17	58

Table 2 summarizes responses on the importance assigned by firms to the identification of the different strategic risks. Mean and standard deviation are displayed separately for each source of strategic risk and for the two groups of firms (TQM and non-TQM). The results of statistical analysis (one-sided Mann-Whitney test) are also presented, with the aim to understand whether the use of TQM practices affects the identification of strategic risks and thus to test H1a, H1b, H1c.

Table 2 shows that there are significant differences (at the 5% level or at the 10% level) between the two groups of companies regarding the importance attached to the identification of strategic risks in the RM process. In particular, although both TQM and non-TQM firms using RM rely on the identification of strategic risks (the mean importance is larger than 3 in all cases), the average importance is significantly higher for TQM firms in relation to all sources of strategic risk. The attention required by TQM principles to quality failure diagnosis and prevention and to continuous improvement may lead managers to take into account, in the RM process, a number of potential events affecting operations, employee behavior in dealing with customers, suppliers and competitors, and reputation. These potential events, as sources of strategic risks, can produce an adverse influence on customer perceptions and require managerial attention in order to mitigate them.

TABLE 2 – A COMPARISON OF THE IMPORTANCE OF IDENTIFYING STRATEGIC RISKS FOR THE TWO GROUPS OF FIRMS

	TQM firms		Non-TQM firms		Mann-Whitney	p-value
	Mean	SD	Mean	SD		
Operational risk	3.96	0.93	3.43	0.76	216.0	0.033**
Competitive risk	4.04	0.82	3.64	0.84	204.5	0.075*
Reputational risk	3.96	1.07	3.40	0.83	230.5	0.037**

*Significant at: * 0.10 level; ** 0.05 level

Hypothesis 2 (H2) seeks to identify a relationship between the use of TQM practices and the importance placed on non-financial performance measures. Since non-financial performance is a multifaceted construct, we try to provide empirical evidence on whether or not implementation of TQM practices affects the importance of three levels of firm's non-financial performance measures: physical measures of operational performance, human resources and customer satisfaction. Based on the results of literature review (e.g. Abdel-Maksoud et al., 2005), we identify 10 variables able to explain the different levels of performance measures. The variables from 1 to 5 concern physical measures of operational performance; the variables 6-8 concern human resources and, finally, variables 7-9-10 concern customer satisfaction.

Table 3 displays the mean scores and the standard deviations for the responses provided. Mann-Whitney test and p-values are included, as well. Statistical results highlight that there are significant differences between TQM firms and non-TQM firms concerning manufacturing cycle efficiency and on-time delivery to customers. Moreover, the results show that the relationship between TQM practices and defects and capacity utilisation is positive but with a lower standard coefficient.

TABLE 3 – A COMPARISON OF THE IMPORTANCE OF NON-FINANCIAL PERFORMANCES MEASURES FOR THE TWO GROUPS OF FIRMS

	TQM firms		Non-TQM firms		Mann-Whitney	p-value
	Mean	SD	Mean	SD		
Number of set-ups	2.56	1.16	2.27	1.05	485.5	0.132
Manufacturing cycle efficiency	3.59	0.84	3.12	1.18	523.0	0.038**
Defects	3.81	0.82	3.38	1.17	499.0	0.083*
Efficiency	3.88	0.86	3.88	0.91	413.5	0.973
Capacity utilisation	3.75	0.80	3.50	0.91	496.5	0.089*
Schedule adherence	3.41	0.87	3.12	0.95	483.0	0.135
On-time delivery to customers	4.06	0.98	3.65	0.80	533.0	0.027**
Absenteeism	3.00	0.98	2.69	0.93	492.0	0.103
Number of complaints from	3.75	1.05	3.50	1.07	476.5	0.163
Number of customer returns	3.09	1.30	2.96	1.28	443.0	0.335

Discussion and conclusions

This exploratory study, based on a large firms sample, provides an initial attempt to identify the effects of the use of TQM practices on RM, as regards risk identification, and provides insights on the use of non-financial measures of performance by TQM firms.

A first result of the study demonstrates that TQM firms are interested in monitoring strategic risks and, thus, are more attentive in managing intangible resources that underpin the TQM implementation. Some of the suggestions of recent literature and TQM standards appear to have been implemented in practice.

We considered strategic risks that can stem from three sources of strategic risk: operational, competitive and reputational. Strategic risks identification is a source of information about the firm's operating and competitive environment, and a tool for continuous improvement in the extent it allows failures prevention and provides managers with a better knowledge and comprehension of their business and of the events that can prevent the firm from achieving its strategic objectives.

By statistical analysis we explore the differences between the two groups of large firms (TQM firms and non-TQM firms) on the emphasis placed on the identification of operational (H1a), competitive (H1b) and reputational risks (H1c). The results of the statistical analysis allow us to accept the hypotheses. Thus, a first result of the study is that in TQM firms (using RM) the identification of strategic risks is more important than in non-TQM firms (using RM). Our expectation is supported by the data.

A second result is that TQM firms partially place greater emphasis on non-financial performance measures than non-TQM firms. We examined the differences between the two groups of large firms (TQM firms and non-TQM firms) in relation to the importance recognized in the use of non-financial performance measures. Differences are not significant, with the exception of manufacturing cycle efficiency, on-time delivery to customers, defects and capacity utilisation, which are significantly more important for TQM firms. Thus, H2 is only partially accepted.

As with any research, this study has various limitations. Firstly, due to the limited number of observations, this study raises questions about the generalisability of the survey results. A test was conducted in order to prevent the threat of non-response bias, but, although the response rate is 32.4%, we can not definitely assert that respondent firms are suitable substitutes for the whole population of Italian large firms.

Moreover, there may be different "environmental factors that potentially affect the use of RM", e.g. regulatory pressures (Subramaniam et al., 2011), or internal factors, e.g. the culture of RM throughout the firm (Mikes, 2009), whereas this study considers a single factor.

Ultimately, further research is necessary in order to better understand the connections between TQM and RM.

End notes

¹ See Simons (1999) for a discussion of all sources of strategic risks.

² A firm's reputation is "a collective representation of a firm's past actions and results that describes the firm's ability to deliver valued outcomes to multiple stakeholders" (Fombrun and Van Riel, 1997). It is built over time, and has to be considered in the context of the marketplace and in relation to the actions of the other firms. Reputation can be influenced by different factors (Bebington *et al.*, 2008): financial performance; management quality; social and environmental responsibility performance; employee quality; the quality of the goods/services provided.

**Managing intangible assets in international contexts:
an empirical analysis on Monza and Brianza SMEs**

Managing intangible assets in international contexts: an empirical analysis on Monza and Brianza SMEs

a. Abstract

The paper presents the results of a quantitative research on 886 SMEs of one of the most productive territories in Italy. The aim is to analyze their internationalization strategies, the entry modes selected and the role played by intangible assets when operating abroad. A questionnaire was distributed with a redemption rate of 21.8%. The data were collected with CAWI method and processed with PCA and Cluster analysis methods. Different strategic approaches have emerged.

Briefly we point out that for the respondents the internationalization process is something consolidated and crucial for their growth, and this is true also for small firms. They go abroad to react to a decreasing domestic demand (both Italian and European) but above all to fulfill the foreign requests (B2B customers). As for entry modes, direct investments are the most diffused, although strategic approach differ among clusters. Intangible resources are key factors for them to keep competitive.

b. Some insights on internationalization and Italian enterprises

In the current economic context internationalization seems to be an inevitable way to survive and grow for most enterprises (Fong Reynoso, Ocampo Figueroa, 2010) and with positive **impact** on their own performance (Pangarkar, 2008). Also for SMEs many things have changed due to the global and dynamic competitive scenario. The current economic/financial crisis has changed the competitive context deeply, challenging SMEs to compete in a global arena and face new markets.

For SMEs the internationalization strategy can become complex if we consider their **limited resources**. In particular, Italian SMEs are characterized by a small financial base, a difficulty in gaining credit, a domestic focus, a limited geographic scope, a family run business, and undercapitalizing situations (Armstrong, Craig, Jackson, Thomson, 2010).

Despite these limits, the internationalization process can drive them exploit their own strategies, expand and improve their capabilities, increase their business (Grant, 1987).

Going abroad, SMEs try to compensate the decreasing domestic demand and at the same time to raise their profitability by allocating, transferring and augmenting their capabilities (Chiao, Yang, 2011).

For instance, with **made in Italy**, many firms have become quite competitive, working in food, fashion, furniture, art and culture industries, thanks to key factors like design, creativity and beauty. If that is true, we cannot forget that other SMEs are performing very well although they operate in different industries like engineering, furniture, electronics, and others. For all these reasons we can state that Italian SMEs can play an important role in the global market (Oviatt, McDougall, 1994). Then, what is the point?

c. Intangible assets and competitive advantage

As we saw, internationalization is not confined to industrial realities, with a high concentration of knowledge, service and technology. It is something reachable also by those enterprises that operate in more traditional sectors and this because they can use unique and valuable resources also on foreign markets. According to the resource-based view (Barney, 1991, Grant, 1991, Wernerfelt, 1984) a firm is unique thanks to its combination of resources and capabilities. Enterprises that deploy effectively unique, inimitable, valuable and rare resources can reach strong competitive advantage, product differentiation and higher profitability (Chiao, Yang, 2011).

Playing on a global arena means investing both on tangible factors and on intangible assets. Managing intangibles is crucial to achieve and defend a competitive advantage (Martin, Harltley, 2006, Aaker, 1989). They can be something that can enrich and bring value to the firm's offering or become a core competence that let the enterprise leverage over its competitors (Zigan, Zeglat, 2010, Hall, 1992).

d. Towards a taxonomy on intangibles

Despite their importance, intangible assets are something difficult to define and manage. The complexity in defining intangibles lies in their articulation, the fact that there is not a unique taxonomy for them and the difficulty of measuring and express them into monetary terms. While tangibles are considered measurable and related to hard factors, intangibles are related to not-so-easily quantifiable soft factors (Lönnqvist, 2002, Williams, 1998).

From the point of view of the theoretical contribution numerous attempts have been carried out by scholars.

Lönnqvist (2004) classifies critical success factors taking into account four dimensions: financial and non-financial, tangibles and intangibles dimensions. Referring to the last one (intangible dimension), we find that financial intangibles can be brand value, goodwill, value of immaterial properties, while among non-financial intangibles we find competences, customer satisfaction, customer retention, innovation, motivation, personnel satisfaction. Zambon and Bergamini (2007) have classified them through six dimensions: customer and market, strategy, innovation and intellectual property rights, human resources, organization, corporate governance. The DTI – Department of Trade and Industry UK Report (2001) provides a list of intangible assets which comprises knowledge, leadership, relationships, communication, culture and values, reputation, trust, skills and competences, systems and processes. Other scholars have proposed different lists of intangible assets to explain SMEs success (Bones, 2007, Brooking, 2010, Watson, 2010, Fong Reynoso, 2008).

With respect to SMEs, intangibles like human capital, reputation, customer relationships, intellectual property and marketing skills are key issues when talking about their success and competitive advantage (Spitzer, 2007) and in response to the growing knowledge economy (Jarvis, Meyrick, Mirkovic, 2006, Watson, 2010).

e. Empirical analysis

f. Motivation for the research

The research presented in this article is based on the “Osservatorio Impresa Monza e Brianza 2013”. The observatory has been organized by CRIET, Research Centre in Territorial Economics – University of Milan-Bicocca, in collaboration with Confindustria Monza and Brianza Association and BNL BNP Paribas Group. Every year the Observatory monitors the enterprises associated with Confindustria Monza and Brianza through a survey which is focused on a specific topic.

The main theme for the 2013 edition was investments for growth. Fig.1 The survey was organized into specific thematic sections: commercial organization and communication, internationalization strategies, access to credit and relations with banks.

The aim of the internationalization section was to investigate the reasons why the sample enterprises do internationalize, particularly from the point of view of motivations, foreign and domestic markets, entry modes they prefer, the entry modes for the future, the motivations to internationalize, the advantages they achieved and the difficulties they came across with.

The survey instrument was a questionnaire administered electronically to the 886 enterprises associated to Confindustria Monza and Brianza Association. The survey period was from 29th October to 22nd December 2013. The data were collected with CAWI method (Computer Assisted Web Interviewing), which was accompanied by an activity of telephone recall (20 days, with 1326 successful calls) and individual telephone tutoring (5 tutors were specifically trained). The use of CAWI method, in combination with the telephone recall, made possible achieve a redemption rate of 21.8% (193 enterprises) for fully completed questionnaires, which reaches 34.1% including partially filled questionnaires (109 enterprises). The redemption rate is in line with the response range commonly reached in surveys which is between 5 and 30 per cent (Diekmann, 2005).

Aim of the research:
Analyze the managerial approach towards some specific issues (sections of questionnaire).

Population frame:
886 enterprises associated to Confindustria Monza and Brianza Association

Sample of respondents:
21,8% (193 fully completed questionnaires)
34,1% (+ 109 partially filled questionnaire)

Structure of the questionnaire:
5 sections, 70 questions

Data collection
CAWI
Period (29th. Oct. – 22nd Dec.12 2013)

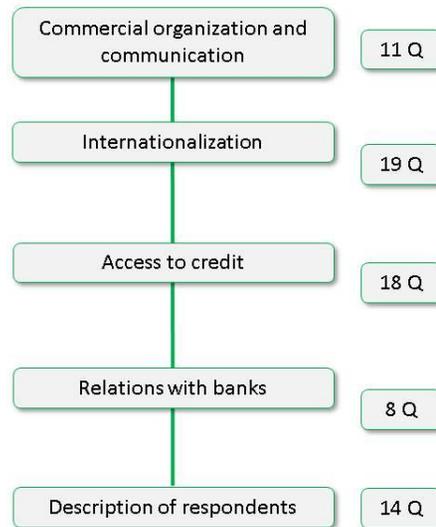

FIG. 1: RESEARCH DESIGN

g.

h. Research methodology

The respondent enterprises represent an auto-selected sample (all the 886 associated firms to Monza and Brianza Association). Even if the total population is small, we assume that it is a significant sample from the point of view of the quality of the data we collected with a CAWI method. This method has been frequently criticized in literature because of its low reliability. Nonetheless the strong involvement of respondents corresponds to more precise information with fewer mistakes and higher reliability (Petty, Cacioppo, 1984; Sears et al., 1980). In addition, the survey is suitable with the aim of the research to gain an overview on the strategic approaches of respondents towards internationalization and intangible assets (Synodinos, 2003). Finally, the associated firms to Confindustria Monza and Brianza Association represent 45.000 employees, with a GDP of 12 billion euro of turnover of one of the most industrialized territories of Italy (Monza and Brianza province).

After constructing the questionnaire a pre-test was carried out in order to check the questions in terms of order and comprehension, lay out of the form, navigation of the platform and eventual problems with the fill in process.

Once gathered the data were processed through the principal component analysis (PCA) and cluster analysis (Johnson and Wickern, 2007). This let individuate groups of enterprises with similar behavior in managing intangible assets in international contexts. In clustering literature, PCA is sometimes applied to reduce the dimension of the data set prior to clustering (Jolliffe I.T., Jones B. and Morgan B.J.T., 1980). In fact, PCA transforms and reduces the dimensionality of the original data set consisting of interrelated variables into a new set of uncorrelated variables called principal components (PCs). These PCs retain of the variation present in the original data set as much as possible (Jolliffe, 2002). In particular, the interrelated variables analyzing the internationalization experience of each enterprise, the main markets to invest in, the entry modes preferred, the investments abroad for the future and the intangible assets used were reduced and transformed. On the basis of five latent variables produced by PCA analysis, a hierarchical cluster analysis was performed to define the number of clusters. The k-means procedure was then used to create clusters. Thanks to this methodology five groups have been individuated so that the enterprises within each group were similar with respect to five latent variables (produced by PCA analysis), and the groups themselves stand apart from one another. At the end, the five groups were analyzed taking into account descriptive info, such as revenue, number of employees, industry, and date of foundation.

i. The sample of respondents

The sample is in line with the peculiarities of Monza and Brianza province. Most respondents are micro and small firms with a turnover below € 10 million euro (72% of respondents) and under 50 employees (78%). The sample is mainly active in engineering industry (23%), but with a good presence in the tertiary sector, chemical and other manufacturing activities (7% of respondents for each sector). As for their main activity they are concentrated on production (46 %) if compared with services (19%) and commercial activities (14%). The sample is mainly active in business to business markets, serving other SMEs (47%) and large enterprises (44 %), retail and wholesale operators (30%) and municipalities (10%). Referring to the governance, the enterprises of Monza and Brianza province are in most cases family-run business (64%) with simple forms of company (66%). The relationship between management and firm size, in terms of employees and turnover, is inversely proportional: this confirms the pattern of the small family-run enterprise which is typical in Italy. Another peculiarity is the established history of respondents: 63% of firms have been settled since the '80s up to the present, while 23% since 2000.

j. The results

In general terms, the research shows that internationalization is a cornerstone for the growth of enterprises in Brianza province. Working abroad allows them to follow their business customers and increase profits. Firms that internationalize have been doing that for a long time (66 firms for over 10 years), although they do have small sized business. In addition, they also intend to internationalize in the next 12 months. In particular, the propensity to internationalize in the coming 12 months is significant: a full 41% of respondents said yes to foreign markets, while only 36% is not interested in going abroad. These data indicate a pretty proactive approach of respondents towards internationalization.

As for the markets, in addition to Europe, which is considered a domestic market (for 32% of respondents), firms operating in the BRICS countries are 19 %, in U.S. (16% of respondents), Eastern Europe (15%) and Arab countries (13%). If compared with 2012 edition of the Observatory, Europe records a significant decrease of attractiveness among respondents: 32% of preferences in 2013, 24% in 2012.

The main reasons that drive enterprises internationalize are to satisfy the foreign market, a decline in domestic demand and the habit of doing so. The advantages obtained in operating on foreign markets refer to the acquisition of new foreign customers, a better corporate image and increasing profits.

However, there are also difficulties: the first lies in the dimensional limits of respondents, the second in making their brand recognizable also abroad and the third in customs barriers (adaptation to local regulations).

Among the investment strategies direct investments prevail. This is a sign of the resourcefulness of firms and their strong intention to oversee the markets with strong relationships with B2B customers: such attitude prevails among the more experienced firms (firms that internationalize for more than 5 years), with a focus on direct sales force (76% of respondents), networks of agents (63%) and subsidiaries and affiliates. Over the past 5 years, the preference of these investments was reversed, putting at the top of preferences branches (26%). If the choice of importers is now an established practice (65%), exporters are less used. Over the last 12 months 50% of respondents have oriented themselves on export consortia. The more recent strategies are those related to agreements with third parties: among the most consolidated options we find equity holdings (75% of respondents), joint ventures (29%) and franchise solutions (20%). As for the last 12 months most respondents signal licenses (33%), followed by franchises and consortia of companies (20% of respondents for both) and "other" (including distribution agreements, consulting, subcontracting, Italian companies with establishments abroad) for 17 % of the sample.

For all respondents intangible assets are something crucial to implement their strategies and to keep competitive among larger competitors.

k. Five clusters with different approaches towards internationalization and intangible assets

Thanks to PCA and Cluster analysis, five different clusters have emerged with specific characteristics and approaches.

As it may be seen from Table 1, **cluster 1 – medium enterprises with traditional approach** – is the second smallest group. It consists of nine enterprises, mainly specialized in engineering industry (33.3%), furniture (22.2%) and textile (11.1%). Most of these enterprises have 50 to 249 employees (medium sized enterprises) with 2 to 50 million euro turnover (small and medium sized enterprises). About 78% of enterprises are family run business.

Moreover, this cluster exhibits the highest score for business experience. In fact, with an average experience of 48 years.

Cluster 2 – small enterprises with global approach – consists of six enterprises. It is the smallest of the five clusters. It is characterized by enterprises that mainly belong to engineering (66.7%) and electronic industry (16.7%). Cluster consists of small sized enterprises: their turnover is between 2 to 10 million euro of turnover and the majority of the enterprises has 10 to 49 employees. Moreover, they have both family and managerial running and show a 31 years' business experience.

Cluster 3 – the youngest enterprises with managerial approach – comprises companies with 20-year business experience and are run in most cases by managers. This cluster contains 14 enterprises that mainly belong to the engineering and manufacturing (21.4% each) and tertiary sector (14.3%). Furthermore, the enterprises in cluster 3 have 10 to 49 employees and an average turnover of 0-50 million euro.

Cluster 4 –small enterprises with traditional approach – is the second largest group: it consists of 35 micro and small sized enterprises. In fact, they have a number of employees in the range of 1 to 49 and a million euro turnover in the range of 0 to 10. Moreover, they are specialized in engineering, textile and construction industries and present a 29 years of business experience. About 63% of these enterprises are family run business.

Finally, **cluster 5 – medium enterprises with proactive approach** – is the largest of the five clusters with 36 enterprises. This cluster consists of medium sized enterprises: about 75% of the enterprises have 10 to 250 million euro turnover and 10 to 249 employees. Most respondents in cluster 5 belong to the engineering (44.4%) and chemical industry (13.9%) and are family-run (61.1%). Moreover, this cluster shows the second highest score for business experience (46 years average).

TABLE 1: DESCRIPTIVE INFORMATION

Cluster	Number of enterprises	Turnover (million euro)	Number of employees	Industry (main presence)	Business experience (years)	Experience abroad (years)	Business running
1	9	2-50	50-249	Engineering Furniture Textile	48	>10	Family-run
2	6	2-10	10-49	Engineering Electronic	31	>10 1-5	Family-run Managerial
3	14	0-50	10-49	Engineering Manufacturing Tertiary	20	1-5	Managerial
4	35	0-10	< 10 10-49	Engineering Textile Construction	29	>10 1-5	Family-run
5	36	10-250	10-249	Engineering Chemical	46	>10	Family-run

These five clusters have different approaches towards internationalization and intangible assets.

Cluster 1 – medium enterprises with traditional approach – consists of medium sized enterprises that reveal a consolidated and quite traditional approach towards internalization. In fact, the nine enterprises of this cluster go abroad by more than ten years and they do direct investments in internationalization. In order to better control their foreign target markets, they prefer to invest in direct sales force and agent networks. In addition, they also intend to internationalize in the next 12 months. In particular, 88.9% of respondents are going to invest in the future to reinforce their direct sales force abroad and to increase their presence abroad. Despite the traditional current and future entry modes, these data indicate that enterprises in cluster 1 have developed an international presence in a successful way and that they will continue to do so.

As for markets, this cluster operates in Western Europe (55.6%), in BRICS countries (22.2%) and Arab countries (22.2%): these firms are likely to focus on both domestic and potential countries.

Going abroad let them increase their profitability and to achieve sustainable competitive advantages. This happens by deploying their unique intangibles resources too. Flexibility, customer and suppliers relationship, brand value and pre and after-sales services play a key role to implement their international strategies.

Most enterprises in **cluster 2** are **small enterprises with global approach**. They have been internationalizing for more than 10 years and some others for more than 5 years. They face foreign markets with direct investments and, a small percentage, with agreements with third parties. As for direct investments, they prefer direct sales force, subsidiaries and affiliates, while, referring to the agreements with third parties, shareholdings prevail. Thanks to the entry modes selected, these enterprises operate all over the world. They have penetrated Western and Eastern Europe, BRICS countries, US market and Arab countries, reaching the highest presence of the sample in BRICS and U.S. countries.

In spite of the heterogeneous entry modes and diffused presence on foreign markets, these enterprises have no intention to invest in the coming 12 months. They declare difficulties to make their brand recognizable beyond national borders and fit in with the local norms, even if they show a sound experience in international business and pay particular attention to their customers and brand value. In fact, in order to pursue international opportunities, these firms see flexibility, pre and after sales assistance, brand, and the relationship with customers and suppliers, like key factors for competitiveness. In short, this cluster seems to be in trouble and less motivated to invest abroad in the future probably because they did not achieve any particular competitive advantages abroad till now.

The **youngest enterprises with managerial approach** are those of **cluster 3**. They show a short experience beyond national borders: they go abroad for less than 5 years. In addition, these enterprises are the only ones that do not adopt direct investments. In fact, it seems that this cluster adopts a step-by-step approach to developing a business strategy for international growth. According to this approach, firms tend to start with entry modes that do not need direct commitment and financial risk. As a matter of fact, they prefer indirect investments (57.1%) and agreements with third parties (42.9%), hoping in immediate and more attractive financial returns. In particular, cluster 3 choses importers, consortia of companies and joint ventures. Moreover, 50% of enterprises in cluster 3 intend to keep on investing in international markets in the next 12 months to strengthen their commercial capacity and consolidate their competitive position abroad. If these respondents will go abroad for sure, another 50% has not yet a clear propensity towards foreign markets: if we elaborate these answers together with the question about the difficulties of going abroad we find out that these respondents signal as the highest difficulties their size limit.

With reference to the markets, 64.3% of respondents internationalize in Western Europe, while 28.6% do so in BRICS countries. Like in cluster 1, these firms are likely to focus on both domestic and potential countries. In addition, these enterprises base their international competitive advantage on strong relationships with their customers and suppliers: direct and trust relationships between firms' management and customers (B2B or B2C) and suppliers enable them to internationalize their business activities. Differently from the other clusters, cluster 3 does not see flexibility as a core competence to be spent on foreign markets.

Cluster 4 consists of 35 **micro and small enterprises with traditional approach**. As for cluster 1, these enterprises present a quite traditional approach towards internationalization: most of them do direct investment and go abroad for more than 10 years (45.7%) or for more than 5 years (28.6%). In particular, they invest in direct sales force to oversee their international target markets. In spite of the consolidated and quite traditional approach, only the 48.6% of the respondents in cluster 4 are willing to invest in the future, not only with direct investments but also with agreements with third parties, especially with shareholdings. Thanks to internationalization process, these enterprises have obtained important benefits: increasing profits, acquisition of new foreign customers and a stronger in brand image. However, 40% of respondents are not convinced to invest on internationalization for the future because they have to deal with their limits in firm size and the adaptation to local legislation. In fact, in addition to Western Europe (88.6% of the enterprises), this cluster operates in BRICS countries (34.3%), which is considered a new emerging market with different custom barriers and laws. In these target markets, cluster 4 gains sustainable competitive advantage and fulfills the foreign requests by using relationships with customers and suppliers as a strategic issue. Managing this asset, firms can understand the different need of local customers and business buyers and identify new B2B or B2C clients through established relationships.

Finally, the enterprises in **cluster 5 are medium enterprises with proactive approach**. Their presence on the international markets is older than of the other clusters. In fact, all of the firms operate abroad for more than 10 years. Their strong international business experience explain their widespread presence on foreign markets and their use of entry modes. Indeed, they work all over the world. They have penetrated Western and Eastern Europe, BRICS countries, the U.S. market and Arab countries, reaching the highest percentage of presence in Arab countries. They prefer direct investments, but they also do indirect investments (16.7%) and agreements with third parties (11.1%). Among direct investments strategies direct sales force, network of agents, subsidiaries and own networks are the principal choice. Among indirect investments these enterprises prefer importers. They also prefer joint venture and shareholdings related to agreements with third parties. Furthermore, they have intention to invest in the future in order to increase their commercial capillarity. The success of these enterprises on foreign markets is due to relations and brand: they base their competitive advantage on a strong relationship with customers and suppliers and making their brand recognizable also abroad.

I. Discussion and managerial implications

The aim of the research was to investigate the internationalization strategies chosen by the enterprises operating in one of the most industrialized areas of Italy, the entry modes selected and the role played by intangible assets when operating abroad.

The sample of respondents demonstrate a strong international focus and a recent opening to new markets to the detriment of the European market by now considered to be domestic. Generally speaking, respondents have a long experience in internationalizing. They also intend to continue to do so over the next 12 months. In their strategies they prefer direct investments (point of sale, network of agents, subsidiaries and affiliates, own sales network on the spot). This denotes courage and intention to penetrate the foreign markets. The choice is also consistent with the proximity to B2B customers that respondents want to keep in terms of relations and quality of service, together with the need for market control. As for agreements with third parties, the respondents are oriented on equity investments and joint ventures. This is a sign of resourcefulness. Although the propensity towards foreign markets is strong, there are still difficulties to face new markets that are due to the small size of firms and the difficulty they have to understand different and sometimes complex contexts: hence the need of specific skills arises.

If this is true in general terms, the analysis let us go into detail with respect to the five different strategic approaches we already described.

To conclude, we can give some insights about the relation between intangibles and internationalization.

The relation between internationalization and intangibles is confirmed by the research. In all clusters intangibles are well present, although the level and intensity of their use can differ deeply between the respondents. Cluster 2 includes small enterprises, which use intangibles more diffusely, but at the same time they declare difficulties in internationalizing. This is also confirmed by their future propensity: they won't invest abroad in the next 12 months. Cluster 5 includes medium-size enterprises, which use intangibles less than cluster 2. Nonetheless they are quite satisfied with the experience abroad. This suggests that intangibles are a distinguishing factor for the enterprises of Monza and Brianza within their internationalization strategies.

The respondents that prove to face more difficulties abroad are the small ones. Clusters 2 and 4 give evidence of that. In cluster 2 the enterprises show a low propensity towards a future internationalization. This is mostly due to their difficulty in making their own brand recognizable abroad. On the other hand, cluster 4 – which includes micro enterprises too – recognize in their size the deepest difficulty when thinking about internationalization. In short, despite the respondents see internationalization as an opportunity to increase their profitability and the number of customers, the size limit remains a high barrier to entry foreign markets.

A group of respondents look more cautious. 57% of the respondents of cluster 3 have a managerial running, a 1 to 5 year-experience abroad, do not adopt direct investments strategies and do not recognize flexibility as a key factor for competitiveness. From these evidences we could deduce that where management and ownership of business are separate a cautious approach towards the various markets prevails, together with an interest in alternative entry

modes (for instance, indirect investments, agreements with third parties) unlike other types of investments that are most consolidated among the enterprises of Monza and Brianza province (direct investments).

Within the sample of respondents some enterprises show a more proactive and innovative approach towards foreign markets. It is the case of medium-size firms.

Nevertheless, the orientation towards internationalization is not homogeneous. Cluster 5 contains the most exploratory firms both in terms of market diversification and entry modes. Cluster 1 maintains, on the contrary, a more traditional attitude: it prefers direct investments and this is aligned with the majority of respondents.

Finally, a traditional consolidated approach in the territory of Monza and Brianza does persist. One reason can be that it guarantees good results both on domestic and on foreign markets. The enterprises that adopt this approach are characterized by a focus on direct investments, customer relationships, family-run business and a concentration in engineering industry.

The research brings evidence on the tight relation between internationalization and intangibles. This relation is confirmed in all the clusters we analyzed. At the same time intangibles do not solve all the problems referred to internationalization automatically. For sure, they are a driver for competitiveness but they are not the only one when planning internationalization strategies.

m. Limits of the research and future developments

The research presents some criticalities and limits, too. Intangibles were not measured and related to SMEs performance through indexes. Nor was investigated the causal relationship between intangibles and performance when internationalizing.

Future developments could drive the analysis towards a more detailed list of intangible assets, the use of a larger population of firms and the introduction of methods to assess intangible effectiveness into internationalization process strategies. In this direction some groups of indicators could be taken into account, like for instance profitability indicators, growth and market position indicators, indicators on subjective perception of the importance and the impact of intangibles on firm's performance (Lopez, 2006).

A qualitative stage of the research could then give some insights on the motivations of entrepreneurs to internationalize and their strategic approaches.

Hybrid Strategy, Ambidexterity And Environment: Toward An Integrated Typology.

Abstract

Hybrid strategy, which emerged as a contingency option to Porter's (1980) generic strategies framework, defends that in a dynamic environment the simultaneous pursuit of "Low Cost" and "Differentiation" approaches is fundamental for the short-term performance and long-term survival of the firm. A vast amount of literature supports the benefits of adopting a mixed approach of strategy: several empirical studies have proved that a hybrid strategy establishes a firm's performance superiority over the pure strategy choice.

However, the hybrid literature has concentrated all its focus on the performance linkage and to the debate of countering the pure strategy approach, but very little attention has been paid to the challenges that the mixed strategy implementation present. In fact, despite the rich empirical literature, it has still not been elucidated how firms that adopt a hybrid strategy may successfully integrate the inherent contradiction of the "Low Cost" and "Differentiation" approaches, escaping from the "Stuck in The Middle" outcome. Furthermore, the literature reveals that several types of hybrid implementations, which should correspond to different strategy-structure-environment paradigms, exist. In order to study the characteristics of these different types of hybrid strategies, we suggest a typology composed of four types of hybrid implementation, defined by two antecedents of the firm and two antecedents of the environment.

Additionally, we align and contrast the hybrid and ambidextrous approaches, which share many similarities. Despite the fact that they have been confounded in empirical studies, we concluded that hybridity and ambidexterity are distinct and complementary concepts: while hybrid strategy defines the value proposition of the firm (a composition of "Low Cost" and "Differentiation"), ambidexterity focus on how to deliver this value with efficiency (Exploitation) and how to renew it effectively (Exploration).

Keywords: hybrid strategy; exploration; exploitation; ambidexterity; organizational architecture; turbulence; hypercompetition; uncertainty

Introduction

In this literature review, we decided to focus on the study of the adoption of hybrid strategy, also known as combination, mixed or dual strategy (Markides and Charitou, 2004; Pertusa-Ortega et al., 2009; Claves-Cortes et al., 2012). Since the success of Porter's generic strategy framework, a long debate has been settled between two points of view: the proponents of Porter's model, who defend that the pursuit of both "Low Cost" and "Differentiation" strategies by a firm would result in a poor performance situation called "Stuck-in-the-Middle", and the proponents of the adoption of hybrid strategy, which involves a combination of "Low Cost" and "Differentiation" elements, and who defend superior performance over the pure strategy adoption. At the centre of this debate, the concept of trade-offs has been playing a key role as it could be considered the central part of the coherence of a strategy (Magretta, 2011). Trade-offs are determined by choosing one strategic dimension to the detriment of the other. In the trade-offs paradigm, opposed strategic dimensions could not be pursued at the same time without creating some sort of inefficiency in the firm's value chain (Porter, 1980; Porter, 1996). This is because strategic positioning, such as differentiation and cost leadership, involves contradictory activities and resources allocation that are mutually exclusive. In fact, the choice of a differentiation strategy usually requires an emphasis in product innovation, customer customization, service differentiation and premium image to sustain a premium price. In contrast, a low cost strategy usually requires an emphasis on limited product and service scope, standardization, efficiency through economy of scale and learning curve to achieve a lower cost. Consequently, the firm that does not choose one type of strategy, or tries to implement the two simultaneously, will find itself in a poor performance situation, referenced as "Stuck-in-the-middle" (Porter, 1996). Numerous empirical studies defend this point of view (Aulakh et al., 2000; Dess and David, 1982; Thornhill and White, 2007). In fact, a firm that chooses a particular position in an industry, which should

be by “Low Cost” or “Differentiation” approaches, could sustain a competitive advantage based on two types of sources: the attractiveness of the industry associated to the barriers that could offer protection (Porter, 1981; Porter, 1996) and the set of unique resources that were developed internally that could offer protection through heterogeneity and imperfect mobility (Barney, 1991; Peteraf, 1993; Amit and Schoemaker, 1993). Consequently, the rules of trade-offs associated with the industry idiosyncrasy, which shape the strategic choices of this firm, remain valid until these industry characteristics remain unchanged (Spanos and Lioukas, 2001). In such a context of predictability and stability it is recommended and sensible that a firm concentrates its focus on one strategic dimension and specializes in a few competencies.

Conversely, in a turbulent environment marked by a high level of competition, instability of demand and fast transformation of the industry, the rules of trade-offs lose their importance, because at best they have a temporary validity (D’Aveni et Al. 2010). Consequently, a firm in such a context is forced to deploy a more complex and dynamic approach to strategy (Chakravarthy, 1997; Lapersonne, 2013). The modern era of globalization, high speed and instability has been at the origin of this need. In fact, many authors defend that business environments have been much more dynamic, unstable and competitive. These turbulent environments are commonly described by increased competitive intensity, disruptive changes in the industry structure, volatility of demand, and unpredictability of customer behaviour; alongside instability of economic, social and political factors. In these uncertain business environments, firms have been compelled to adapt to survive and to maintain their financial performance. In such a context, the adoption of traditional approaches to strategy, such as the positioning school, which assumes a relatively stable world, has been questioned by the emergence of the hybrid strategy adoption, which seems to be more suitable for adaptation. A voluminous body of theoretical and empirical studies defends the pursuit of a combination of the “Low Cost” and “Differentiation” strategy approach (Beal and Yasai-Ardekani, 2000; Philips et al., 1983; Spanos et al., 2004; Hill, 1988; Murray, 1988; Proff, 2000). Additionally, several studies demonstrate that firms that have adopted a hybrid approach in a dynamic environment have presented a superior or at least equivalent performance compared to pure strategy ways (Pertusa-Ortega et al., 2009).

However, the hybrid literature has concentrated all its focus on the performance linkage and to the debate of countering the pure strategy approach, but very little attention has been paid to the challenges that the mixed strategy implementation present. In fact, despite the rich empirical literature, it has still not been elucidated how firms that adopt a hybrid strategy may successfully integrate the inherent contradiction of the “Low Cost” and “Differentiation” approaches, escaping from the “Stuck in The Middle” outcome.

The Link Of Hybrid Strategy Adoption With The Environment

Contrasting with the pure strategy adoption that is more related to a stable environment, hybrid strategy has been associated with a turbulent, dynamic and volatile environment. Turbulent environments require flexible combinations of strategies (Kim & McIntosh, 1999). The competence of combining harmoniously “Low Cost” and “Differentiation” elements brings flexibility and a capacity for adaptation to an unpredictable and complex business context. Miller (1992) advises about the risk of adopting a too simple strategic repertoire. An excessively narrowed strategic focus could lead to failure by having a too simple offer, to ignore important consumers needs, to be easily imitated by rivals and to make difficult the adaptation to a business context changes. Consequently, the study of hybrid strategy has been to some degree related to specific dynamic environmental factors.

Hybrid strategy adoption in an emergent and mature market. Emergent economies have been marked by fast-growing markets and rapid changes but also by high uncertainty, institutional voids and hypercompetition, which create serious strategic challenges for firms (Hoskisson et al. 2000). In accordance with this, some studies on hybrid strategy concentrate their study in emergent economies. Gopalakrishna and Subramanian (2001) explain how the business context in India was suddenly transformed from a protected-stable to open-hypercompetitive: hybrid firms in such an environment demonstrated superior performance over the ones that had adopted a pure approach. They explain these results by the fact that firms that have adopted a hybrid approach are more flexible and adaptable to the fast-changing, complex and hypercompetitive new environment. Acquaah and Yasai-Ardekani (2008) find similar results in Ghana, a Sub-Saharan African economy that has been transforming its economy from state-controlled to

free market capitalism systems: firms have been suddenly thrown into a fast-growing-hypercompetitive context, and the hybrid adoption demonstrated it to be a viable alternative to superior performance and survival. Li and Li (2008), explain how the fast-growing Chinese economy has become one of the most dynamic and competitive business environments, and concluded that hybrid strategy is associated with superior performance. And finally, Kim et al., (2004) found that hybrid strategy has superior performance over the pure strategy adoption in a sample of Korean online shopping malls. Studies of hybrid strategy have also been done in developed countries, particularly in mature or recessive economies such as those in Western Europe, who also present turbulent environments such as unpredictability and volatility of demand and supply (Proff, 2000). Spanos et al., (2004), defend empirically that hybrid strategy adoption is maybe the only feasible and attractive strategic alternative for Greek firms to survive in a recessive economy associated with a high competitive environment and with very limited capacity for investment. And, Pertusa-Ortega et al., (2009), demonstrated that Spanish firms that pursue a hybrid approach are associated with higher levels of performance.

Hybrid strategy adoption and competitive intensity. Studies on hybrid strategy have also considered market-environmental factors, mainly in relation to competitive intensity. In fact, competitive intensity is considered one of the most important factors contributing to environmental hostility (Dess and Beard, 1984; Zahra and Covin, 1995). The literature suggests that firms need to engage in a greater level of entrepreneurial activities, such as exploration, strategic renewal and innovation as environmental hostility intensifies (Zahra, 1993; Zahra and Covin, 1995). In accordance with this, some studies have tested the relationship between competitive intensity and hybrid strategy adoption and its effect on a firm's performance. Acquaah and Yasai-Ardekani (2008) employed market competitive intensity as a control variable to prove that under high competitive intensity firms that adopt the hybrid strategy are superior in performance to those firms that adopt the pure or "Stuck-in-the-Middle" strategic approach. Auh and Menguc (2005) tested the effect of competitive intensity on a firm's performance by an ambidexterity approach in the Australian market: they demonstrated that as the level of competition increases, Defenders and Prospectors tend to choose a more balanced approach between exploration and exploitation, which matches the hybrid assumption of effectiveness (differentiation-exploration) and efficiency (Low cost-exploitation) approaches.

In conclusion, most empirical studies on hybrid strategy adoption and its relationship with environmental factors have been focused on the study of competitive intensity. Empirical studies in emergent markets and mature-declining economies are broader and less precise as they are contextual and not linked to specific environmental factors. Consequently, the premise of the relationship of hybrid strategy adoption with a turbulent environment is partially explored. One of the environmental factors not tested by empirical studies is the volatility of demand and changes of preferences of consumers. In fact as Proff (2000) explained, changes in customer price sensitivity should require a hybrid approach. Hill (1988) and Murray (1988) demonstrated in their theoretical studies that customer price sensitivity and the importance given to other attributes are directly related to the adoption of a hybrid approach. Evidence from the literature demonstrates that two environmental situations could define very different types of hybrid adoption. One is related to the adoption of hybrid strategy in a fast growing and changing market accompanied by an increase of competitive intensity (Gopalakrishna and Subramanian, 2001; Acquaah and Yasai-Ardekani, 2008; Li and Li, 2008). In this situation the firm that reached a strong position in one of the two strategies may lead by improving the position of the other (Hill, 1988; Pertusa-Ortega et al., 2009). Hill (1988) exemplifies this with a firm positioned originally as differentiation, which attains an important market share and enjoys the benefits of economy of scale, scope and learning curve. This is possible in a fast-growing market where the initial simple "Differentiation" focus is used as a lever for the "Low Cost" approach. Additionally, for this firm to make the efforts, investments, and risks in implementing an additional "Low Cost" approach to its "Differentiation" strategy, pressures from the environment should come from an increase of competitive intensity.

The second situation is related to the adoption of hybrid strategy in a mature-declining market. Also highly competitive, this market could become turbulent because of uncertainty provoked by volatility of demand or supply. This is much more a survival aspect of hybridity than the growing perspective. In this situation, the market does not allow the benefit of efficiency associated with an increase in volume, because gain of market share is limited or not possible. Uncertainty of demand and supply could brutally affect the offer that will demand a change in the strategic approach. Then a hybrid approach could bring the necessary flexibility for adaptation. In his case study of the German automotive industry, Proff (2000) identified six turbulent environmental factors that have been influencing the

automotive industry and lead to the adoption of a hybrid approach. On the demand side: a stagnating demand for new cars; an increasing practice of providing the full range of equipment as standard rather than as optional, reducing profit; and the increasing demand for niche product, increasing complexity and cost. On the supply side: an increase of differentiation of product lines with more variety of models; an overcapacity and a decentralization of production have brought an increase of complexity.

Unfortunately, despite the fact that many scholars have cited the use of hybrid strategy as a survival and adaptive perspective, we have not found any empirical studies on the subject to date. That will be of particular interest to study the performance of firms that have used a hybrid strategy to adapt to turbulent environments characterized by uncertainty of demand and volatility of supply in mature-declining markets. Furthermore, based on the different stages of industry life cycle described by Wright et al., (1998), we propose that further research should study the characteristics of Hybrid implementation in two distinct market scenarios: The growing and highly competitive market scenario, also referred to as Competitive Turbulence (Wright et al., 1998) and the mature-declining market with association of unpredictability of demand and/or volatility of supply, which we will refer to as Demand-Supply Turbulence.

Identifying Distinct Pathways To Hybrid Strategy

Additionally to the different environmental conditions that could shape the type of hybrid adoption, the original characteristics of the firm could play an important role when the firm decided to adopt a hybrid approach. In fact, the use of hybrid strategy involves strategic challenges, complex processes and cultural changes and consequently elevated risks to be managed. One of the main challenges is to deal with the contradictory nature of a duo-focus, to avoid the nullity effect of simultaneously emphasizing opposite goals and to transform them into a complementary effect. It is no easy task and it should not be a natural choice. Ultimately, attaining a competitive advantage through a pure strategy approach has an easier and less risky implementation.

Thus it is highly probable that prior to the hybrid adoption the firm had already attained a competitive advantage either by a “Low Cost” or “Differentiation” approach. As we demonstrated, an increase of uncertainty and hostility in the environment could have forced the firm to change its original strategic positioning and to adopt a hybrid approach. It is also not impossible, but less probable that a firm “Stuck in the Middle” migrated directly to a successfully hybrid implementation. This is because this firm that has neither developed a distinctive “Low Cost” or “Differentiation” competency, will have an enormous challenge in developing simultaneously and appropriately the two approaches. On the other hand, the firm that already has a well-developed and established competency will have to develop the new competency without destroying the value generated by the original one. Based on evidence in the literature, two main paths for hybridity were identified. The first one is related to the adoption of a hybrid approach by a firm that is positioned as differentiation. A firm that has been successful in adopting a pure differentiation strategy gains market share, and through the logic of the economy of scale, economy of scope and learning curve, also attains the benefits of a cost advantage (Hill, 1988; Miller, 1992; Miller and Friesen, 1986). The second situation is when a firm originally positioned as “Low Cost” decided to complement its strategy through “Differentiation”, because it’s able to invest its profits in marketing, service or product attributes (Hill, 1988; Pertusa-Ortega et al., 2009).

The adoption of hybrid approach by a firm originally positioned as pure “Differentiation”

As explained by Porter (1980), firms that choose a differentiation approach create competitive advantage by offering a product or service with unique attributes. This unique offer associated with a customer that is more willing to pay a premium price, allows the firm to sustain superior revenue. The uniqueness of the offer creates two barriers for a rival to enter the market. Firstly, it reduces the bargaining power of the customer, because there are no other offers that allow comparison. Consequently, customers tend to be less sensitive to price and more loyal to the firm’s offer. Second, as the “Resource Based View” proponents have elucidated it, the uniqueness attributes of the offer are difficult to be imitated by a rival due to its resources and capabilities complexity. Protected by these barriers, the firm that adopts a “Differentiation” strategy easily sustains superior margin, even if it has to manage a superior cost. But

change in the environment could reduce or nullify the protection provided by these barriers. Increases of competitive intensity or change in consumer preferences are the main reason for a firm originally positioned as “Differentiation” to adopt a hybrid approach. It is therefore necessary to distinguish two different types of adaptation. One is related to an increase of competitive intensity, characterising a turbulent competitive environment, where the firm reinforces its actual “Differentiation” positioning with a “Low Cost” approach; we named it the Reinforcement Adaptive Perspective. The second is related to a change in the customer taste, characterising a turbulent demand-supply environment, where the firm modify its actual “Differentiation” positioning with a “Low Cost” approach; we named it the Survival Adaptive Perspective.

The Reinforcement Adaptive Perspective. Hill (1988) defends that in certain conditions a firm positioned as differentiation could experience a growth of market share and acquire the benefit of the cost advantage. This is more likely to happen under the following circumstances: when consumers’ commitment to the products of rival firms is low, when market growth is high, when market structure is fragmented at the demand side, when the production process is new and complex and when economies of scale and scope exists. Using the advantage of its differentiated brand image associated with a consumer not so loyal to other rivals offers, this firm could adjust down its premium price to reach the larger part of the market consumers. Then supported by a growing market, the increased volume could bring economies of scale that reduce the unitary cost and surpass the additional cost caused by differentiation. A fragmented market could allow the firm to attend different types of consumption need, and create a portfolio of differentiation offers for each consumer segment, acquiring the benefit of economies of scope. Also, complex and new productive processes will complement the cost advantage bringing the benefit of the learning curve effect. A typical example of this type of situation is that of Apple Inc. which originated from a niche premium computer producer and turned into one of the largest electronic device producers for mass consumption. But these circumstances are not sufficient for the differentiated firm to achieve the cost advantage. In the same way that this firm has the core competence to differentiate its product and explore new consumption segments, this firm will have to develop new managerial capabilities of exploitation to take advantage of the cost benefits. Economy of scale, scope and the learning curve will demand a certain focus on cost control, optimization of the production process as well as efficiency. We named this type of situation the Reinforcement Adaptive Perspective because it is more likely that this firm will take the effort and risk to increase the complexity of its strategy adding a “Low Cost” approach in a growing market as a mechanism to protect its original competitive advantage based on differentiation against an increasing competitive intensity coming from imitators. In fact, an increase of competition is characterised by a proliferation of similar offers on the market. Despite the resources and capabilities complexity of the firm’s differentiated offer, which makes it difficult to imitate, access by rivals to knowledge, technology, talents and best practice is not impossible. Knowledge, talent, and new technologies can be easily acquired in the globalized and integrated environments of today. In this case, rivals would reach a comparable offer, not an exact one, but sufficiently equivalent in terms of attributes to be comparable. With a multiplicity of choice, the less loyal customers could tend to give more importance to a less expensive offer that has similar value attributes than the offer by the differentiation firm. The increase of a rival’s offers also strengthens the customer’s bargaining power, pressuring down the average price of the industry, which should provoke an erosion of industry average price and challenge the stability of the firm positioned as differentiation. Wright et al., (1998) exemplify this type of situation with the case of Federal Express that occurred in 1992. After having been a leader in its segment with a “Differentiation” strategy approach, the company experienced a loss of consumers who migrated to imitators offering a similar service for a lower price. Federal Express reinforced its position by increasing its differentiation through the offer of new types of service such as “Just In Time” transport and online order tracking, while it was simultaneously lowering its cost through technological-efficiency initiatives to maintain a competitive price.

The Survival Adaptive Perspective. In a mature market where growth is low, brand loyalty is well established and productive processes are already optimized, the achievement of “Low Cost” advantage through “Differentiation” is more difficult because gains of efficiency based on economy of scale, scope and learning curve has already been used (Hill, 1988). Mature markets are also characterised by competitive intensity because normally the overall offer is greater than the demand that is stabilizing or declining. In this delicate market equilibrium, turbulences coming from the demand or supply side could present a huge challenge of adaptation for a firm positioned as differentiation. An uncertainty on the demand side is when the consumer becomes more sensitive to price due to a disruptive change in

the economic environment. An increase of inflation, the interest rate and unemployment rate, could affect consumers' purchasing behaviour that passes on to give more importance to price than other attributes. In such a situation, the firm that has based its premium price on brand image, tailor made service offer, unique design or special added product's features, could be surprised by a loss of its less loyal consumers that suddenly altered their purchase behaviour. In fact, a more pessimist consumer tends to be less willing to spend their income with more sophisticated offers, concentrating their expenses on basic consumption needs. Less differentiated rival's offers could match the needs of these customers that are looking for similar or less value for a more affordable price. That was the case during the crisis of 2008, when Wal-mart captured important market share from other retail chains such as Target and J. C. Penney by having a more affordable offer (1). More recently, El Corte Inglés, a premium food retail and department store in Spain, in an attempt to adapt to a recessive market, reduced its prices by 25% while it was focusing on efficiency, inventory working capital and cost reductions (2). This adaptation was triggered by an important change in the consumer behaviour, which with the economic crisis turned to be more sensitive to price and favoured "Low Cost" rival.

The firm positioned as "Differentiation" will suffer a loss of market share due to the less loyal and more price sensitive customers that migrate to competitor offers. Then the firm has two choices: to stay with the remaining part of the market share or to change the approach of its "Differentiation" strategy. If the firm's option is to remain with a less important part of the market share, the "Differentiation" approach should be strengthened, reinforcing the uniqueness attributes against the rival's offers, which will characterize a migration from a generic to a focus strategic approach. Unfortunately this option is not always available: the migration to a smaller part of the market could not be compensated by an increase of the premium price compared to the increase of unitary cost provoked by the diseconomy of scale. As Hill (1988) noted, there exist thresholds of volume production in most industries, where producing under certain volume conditions will not be possible due to high unitary cost. Otherwise, if the firm wants to maintain an important market share, it is logical that this firm will alter its "Differentiation" approach. A new complementary focus on "Low Cost" should be used to make the firm more competitive in the eyes of more price sensitive customers. Different to the Reinforcement Adaptive Perspective, in this situation the firm is intending to review its value proposition, eliminating the attributes that are no longer valuable for the customer, and consequently reducing the overall cost. Additionally to the review of the value proposition, initiatives of cost and expenses reduction not related to scale logic should be undertaken to bring about the necessary competitiveness.

The Adoption Of Hybrid Approach By A Firm Originally Positioned As Pure "Low Cost"

As explained by Porter (1980) the firm that chose a "Low Cost" position, is cost minimization oriented, exploits a value logic based on economies of scale, and has a strong focus on cost control. Two barriers protect its advantage. First, by attaining the lowest cost in the industry sustained by its capability of exploiting efficiency and the benefit of economy of scale, scope and learning effect. Second, by its customers who are highly sensitive to price and do not give importance to other attributes. Theoretically, firms that adopt this position can always beat the competition based on price as it is sustained by the lowest cost. However, as Hill (1988) demonstrated, there exists a threshold level of market share, where above it, gains of economies of scale, scope or learning curve are minimal. Considering that this threshold in most industries is relatively low, there is no unique "Low Cost" leadership position, and many firms could easily attain an equivalent cost advantage. In this situation, the only way for a firm originally positioned as "Low Cost" to remain competitive is to complement its strategy through differentiation. We will explore this type of hybridity through the Reinforcement Adaptive Perspective and the Survival Adaptive Perspective.

The Reinforcement Adaptive Perspective. In a fast-growing market, a firm could choose the "Low Cost" strategy to attain an important share of the market and gain the benefit of scale, scope and learning curve before their rivals. Once established with an important share of the market, the firm will benefit from financial resources to invest in differentiation in order to reinforce its leadership position and create protection against competitors (Hill 1988, Pertusa-Ortega et al., 2009). This is possible if in this market, consumers are initially more sensitive to price and as far as the demand side develops; they also give importance to other attributes. Additionally, the fast-growing market should also have a minimum degree of fragmentation and the product and service sold by the firm should present a minimum scope for differentiation. Otherwise, in a non-fragmented market, dominated by highly commoditized

products or characterized by customers that give importance only to price, the addition of a differentiation strategy could increase the marginal cost without an equivalent increase of marginal revenue. Wal-mart is an interesting case of a retail store that started with a pure “Low Cost” strategy, with a strong focus on cost control and efficiency, gained an important market share through developing an efficiency competence in supply chain and strengthened its leadership position through differentiation initiatives such as offering a broad assortment and adding new services (Dess et al., 2012; Baroto et al., 2012).

The Survival Adaptive Perspective. The position of a “Low Cost” firm could be threatened if consumers start to give importance to attributes other than price and if competitors offer products with added values for an equivalent price. If this firm is in a mature market with few opportunities of growth to achieve new levels of economy of scale, then this firm could suffer a loss of market share by the migration of parts of its customer to the rival’s offers. Competitors could sustain a competitive price, because having captured new consumers through their attractive offers; they achieve benefit of scale and scope. The central problem for this firm is that its offer remained too simple for the consumers’ taste. Consumer behaviour could have changed for two principal reasons. A change in economic environment, such as an increase of middle class income could move the consumption to more sophisticated needs. Then the consumers will give importance to competitors that have a more differentiated offer. The other reason for a change in consumer taste is related to the success of marketing and communication strategy of rivals, who could change the value perception of consumers by provoking and unveiling new needs. Gehani (2013) describes how after the 2008 economic slowdown, how a large composite fabric and accessories enterprise transformed its original “Low Cost” positioning to a “Differentiation” positioning in order to escape from an increase of competition coming from emergent countries.

The firm positioned as “Low Cost” could decide to add new value-added features to its offer in an effort to retain market share. In this case, the primary strategy should be complemented by a “Differentiation” approach, retaining old consumers or capturing new ones through the new approach. Adding extra value features to an existing offer will bring a significant challenge as to the development of explorative capabilities and ability of the firm to differentiate its products. Obviously this is possible, if a certain degree of fragmentation in the market exists, and if the offer has sufficient scope for differentiation (Hill, 1988; Murray, 1988). One of the challenges of this firm in implementing the differentiation complementary approach will be to choose a dimension of differentiation that creates uniqueness in relation to rivals. As this firm could not further extract any benefit from efficiency and economy of scale, there only remains the opportunity for creating competitive advantage on the ability of the firm to differentiate its offer from competitors.

Hybrid Strategy And Ambidexterity

Hybrid strategy has been identified as a strategic approach that emphasises both low cost and differentiation strategy (Pertusa-Ortega, 2009; Claves-Cortes, 2012). The pursuit of such a mixed strategy involves the management of contradictory and mutually exclusive choice. Similarly, strategic ambidexterity has been defined as concurrently pursuing, managing and executing an exploitative and explorative focus, which are considered paradoxical strategies (Han, 2008). Exploration is determined by activities involving search, experimentation, flexibility, discovery and innovation, while exploitation is defined by activities involving refinement, execution, selection, implementation and efficiency (March, 1991). Both hybrid and ambidexterity have as their main purpose to manage tensional objectives and trade-offs (Han 2007) and to lead with performance dilemmas (Chakravarthy and Lorange 2008). Ultimately, strategic ambidexterity has been associated with the development of a particular dynamic capability, which has been defined as the organizational competence to transform tension within paradoxical strategies into short-term complementary effects for long-term sustainability (Han, 2007). Considering the perspective of managing dual opposite and antagonist strategic focus, we can consider that hybrid strategy and strategic ambidexterity are two approaches with a common purpose. This purpose is associated with the development of an adaptive capability associated with a complex environment.

Despite this, the two perspectives have different origins. On the one hand, hybrid strategy is rooted in the positioning school, in particular to Porter’s generic model and to some extent that of the Miles and Snow framework

(Miles et al., 1978). On the other hand, strategic ambidexterity is rooted in the organizational learning school (Duncan, 1976; March, 1991), organizational ambidexterity (Simsek, 2009; Gibson and Birkinshaw, 2004), and the idea of capabilities that found its root in the Resource Based View (Han, 2007; Han and Nikhil 2008). More recently, strategic ambidexterity has been associated with dynamic capabilities as an extension of the RBV approach (Gibson and Birkinshaw 2004; Han and Nikhil, 2008; O'Reilly and Tushman, 2008). As has already been elucidated, positioning and resource schools constitute the two sides of the same coin and could be considered as complementary (Wernerfelt, 1984; Spanos and Lioukas, 2001). A firm should define its strategy to fit the environment and to develop internal competencies that enable it to achieve success. Through this point of view, hybrid and ambidextrous approaches could be envisaged complementary as well. In fact, a firm positioned as "Low Cost", emphasizes its activities on efficiency, economy of scale, cost optimization and reduction. As this firm tends to attain the lowest cost possible, it normally offers a reduced and simplified scope of product and service, in order to achieve maximum efficiency (Porter, 1980). With a less variable scope, the firm could concentrate on exploitative learning activities such as refinement, operation optimization and gain of efficiency through learning curve to sustain its "Low Cost" positioning.

Conversely, a firm positioned as "Differentiation", emphasizes its activities on the creation of unique offers that allow sustaining premium price. Such an approach concerns the discovery and development of new and unique products and services. Then, it is expected that a firm positioned as differentiation has a well-developed explorative learning activities characterized by the search for new opportunities, scope variation, play, risk taking and experimentation to sustain its competitive advantage based on differentiation. Consequently, a firm that adopted a hybrid strategy which involves the combination of "Low Cost" and "Differentiation" elements in its positioning should have developed an ambidextrous approach in its capabilities development and learning activities.

However, it is important to note that this complementarity came about mainly from different angles. In fact the two theories are concerned with strategic adaptation of environmental change, but while the hybrid approach is concerned with the external aspects of firm's strategy, the ambidexterity theory is more concerned with the internal ones. Having its root in the positioning school, the hybrid approach has the heritage of the external firm perspective choosing a value configuration that is represented by a particular market competitive position. More complex and dynamic in nature than the pure approach, the Hybrid approach combines "Low Cost" and "Differentiation" elements, that allows adaptation to the environment change by capacity of altering its value proposition and positioning or managing multiple value propositions and market positions. The ambidexterity perspective rooted in the Organizational Learning School and dynamic capabilities has the same characteristics of complexity and dynamism as it combines exploitative and explorative activities, but is more concerned with the optimization or change of routines, characterising an internal focus of the firm.

Consequently the two approaches work on different dimensions of the adaptive perspective. The hybrid approach represents a capacity of managing a dynamic positioning and value proposition in the market, by the dynamic combination of "Low Cost" and "Differentiation"; while ambidexterity represents the capacity of optimizing this value proposition by "Exploitation" or create new ones by "Exploration". In fact, an activity could create value through a "Low Cost" or a "Differentiation" focus. But independently of its type of value contribution as a routine it could be optimized through "Exploitation" to increase efficiency or could be changed through "Exploration" to enable innovation and flexibility. Then "Exploitation" is not exclusively for a "Low Cost" focus activity, nor is "Exploration" exclusively for a "Differentiation" focus activity. "Exploitation" could increase efficiency both for a "Low Cost" and "Differentiation" activity. Analogously, "Exploration" will increase effectiveness (flexibility) either for a "Low Cost" or a "Differentiation" activity. The conclusion is that "Low Cost – Differentiation" and "Exploitation – Exploration" are two different and independent dimensions that complement each other and should not be confused.

However, this distinction between hybrid and ambidextrous perspective is not explicit and clear in empirical studies. Hybrid strategy has been investigated by testing activities that characterize "Low Cost" and "Differentiation" emphasis. Strategic ambidexterity has been studied by testing activities that characterize explorative and exploitative activities. In Table 1, we classified the dependent variables that have been tested from the main studies of both approaches. As we can see, despite the different nature of the two perspectives, most of them test the same set of variables. In the "Low Cost" and "Exploitation" approaches, variables such as: cost and expenses optimization and reduction; manufacturing and distribution processes improvement; product and service efficiency, quality optimization and standardization; gain of economies of scale and optimal capacity utilization, are commonly tested.

In the “Differentiation” and “Exploration” approaches, variables such as: introduction of new products and services; entry into new markets; exploration of new opportunities; gain of market share; innovation of marketing techniques; intensive advertising and promotional actions and brand identification building, are also commonly tested. Thus, despite the fact that the hybrid and ambidexterity approaches are different perspectives, their empirical studies use the same set of variables, resulting in ambiguous results. Nevertheless, it is important to note that some studies on hybrid strategy have tested competitive positioning variables, which is not tested by the strategic ambidexterity approach. Variables such as: “Low Cost - Low Price”, rather than competitors; products, services, brands differentiation and sustainability of higher price are considered only by some hybrid studies, demonstrating that the two different approaches have been separated, despite this not being explicitly cited.

In conclusion, empirical works failed to distinguish the external strategic approach from the internal ones. Indeed, the fact that a firm places a high emphasis on “Low Cost” and “Differentiation”, does not necessarily imply that it has a high emphasis on “Exploitation” and “Exploration” as well. For example, we could have the situation of a firm that has attained a high emphasis on “Low Cost” and “Differentiation” simultaneously but have internally only a high emphasis on “Exploitation”. This firm has probably attained a leadership position and it is offering one of the best combinations of unique value with low cost. Once having attained an important market share this firm experienced the benefit of economy of scale and learning curve that brought the benefit of the “Low Cost” advantage. Explorative activities should be intense and important at the beginning for this firm, but now its exploitative activities maintain the performance of the firm. If not threatened by disruptive change, this firm does not need to maintain a high emphasis in explorative activities such as exploration of new opportunities or innovation of new product or services.

Considering this, the confusion made by empirical works in testing the same variables for hybrid and ambidexterity approaches generate ambiguous results and do not elucidate the very important distinction and complementarity that exist between the dynamic adaptation of the firm value proposition and positioning (hybrid approach) from the optimization and renewing of this value proposition (ambidexterity approach). Finally, despite the hybrid and ambidexterity approaches having a common goal of adaptability, that they are complementary by nature and have similar empirical research methods, they should be considered as two different approaches of strategy and treated independently. A very interesting avenue for future researches could be the study of how the two pairs of dimensions “Low cost– Differentiation” and “Exploration-exploitation” are combined.

TABLE 1: COMPARISON OF COMPETITIVE STRATEGY VARIABLES TEST BETWEEN HYBRID STRATEGY AND AMBIDEXTERITY APPROACH

Strategic Dimension	Types of variables tested	Hybrid strategy approach	Strategic ambidexterity approach
Operational efficiency, exploitative activities	Cost optimization, Cost reduction, Optimize and Reduce material consumption and expenses.	Wright et al. 1991; Kim 2004; Thornill 2007; Acquaah 2008; Gopalakrishna 2008; Pertusa-Ortega 2009; Santos 2011;	He & Wong 2004
	Improve Manufacturing and distribution processes. Products, services efficiency and quality optimization and standardization.	Wright et al. 1991; Kim 2004; Thornill 2007; Li & Li 2008; Acquaah 2008; Gopalakrishna 2008; Pertusa-Ortega 2009; Santos 2011	Han 2008; Auh 2005; He & Wong 2004; Menguc & Auh 2008
	Gain of economies of scale, Optimal capacity utilization	Wright et al. 1991; Li & Li 2008; Santos 2011	Menguc & Auh 2008; Auh 2005
Cost advantage	Lower Cost, Lower price than competitors	Wright et al. 1991; Kim 2004; Li & Li 2008; Acquaah 2008; Gopalakrishna 2008; Pertusa-Ortega 2009;	

Product and service effectiveness, explorative activities	Innovation, introduction of new products and services; Extend product and service range.	Kim 2004; Thornill 2007; Wright et al. 1991; Acquaah 2008; Pertusa-Ortega 2009; Santos 2011	He & Wong 2004; Menguc & Auh 2008; Auh 2005
	Enter new markets; explore new opportunities; Gain of Market share.	Pertusa-Ortega 2009; Gopalakrishna 2008	He & Wong 2004; Han 2008
	Innovation in Marketing techniques; Intensive advertising and promotion actions. Brand identification building.	Wright et al. 1991; Kim 2004; Acquaah 2008; Gopalakrishna 2008 Pertusa-Ortega 2009; Santos 2011	Menguc & Auh 2008; Auh 2005
Differentiation advantage	Product, service, brand and marketing differentiation. Sustainability of higher price.	Li & Li 2008 ; Wright et al. 1991; Acquaah 2008; Gopalakrishna 2008; Santos 2011	

A Suggested Typology For Further Studies Of Hybrid Strategy

Despite the fact that the literature strongly defends the importance of the hybrid adoption with a firm's performance, very little attention has been given to the study of the characteristics of the hybrid perspective. Through a literature review, we demonstrated that there exists convincing evidence of very distinct hybrid applications and implementations. Such differences are sustained by two approaches: the type of environment where the hybrid is adopted and the original strategy and cultural characteristics of the firm. Environmental antecedents divide into two polar situations: one characterized by competitive intensity, normally associated with a growing market, this situation is normally associated as hypercompetition or competitive turbulence. The other is characterized by volatility and uncertainty of the demand and supply side, normally associated with a mature or declining market: we named this situation demand-supply turbulence. The adoption of a hybrid strategy for these very different contexts requires different approaches to implementation. In a competitive turbulent environment, where the market is growing and competition intensifies the firm should adopt a reinforcement strategy approach, where the "Low Cost" or "Differentiation" complementation is integrated to reinforce the original positioning: we named this situation the Reinforcement Adaptive Perspective. In a demand-supply turbulent environment, where the market is stagnated and the demand or/and supply side present high volatility the firm should adopt a change strategy approach, where the "Low Cost" or "Differentiation" complementation is integrated to change the original positioning: we named this situation the Survival Adaptive Perspective.

We also identified two different firm's origins for the adoption of a hybrid strategy. One is related to a firm that is originally positioned as "Differentiation" that decides to adopt a hybrid strategy, adding a "Low Cost" approach. We named this type: "Differentiation Originated Hybridity". The other is related with a firm that is originally positioned as "Low Cost" that decides to adopt a hybrid strategy adding a "Differentiation" approach: we named this type: "Cost Originated Hybridity". Based on these two dimensions, environment antecedents and firm antecedents, we suggest the following typology to support further studies of different types of hybrid implementation (Fig. 1).

Antecedents of Environment	Demand-Supply Turbulence	A Low Cost Strategy's firm changes its original positioning adopting a Differentiation approach as an adaptive mechanism in response to an increase of uncertainty	A Differentiation Strategy's firm changes its original positioning adopting a Low Cost approach as an adaptive mechanism in response to an increase of uncertainty
	Competitive Turbulence	A Low Cost Strategy's firm reinforces its original positioning adopting a differentiation approach as a protective mechanism against increase of competition	A Differentiation Strategy's firm reinforces its original positioning adopting a Low Cost approach as a protective mechanism against increase of competition
		Cost Originated Hybridity	Differentiation Originated Hybridity
Antecedents of Firm			

FIGURE 1: A PROPOSED TYPOLOGY FOR THE STUDY OF HYBRID STRATEGY

Conclusion

The aim of this article is to make a literature review centred on the subject of hybrid strategy and to understand its relationship with the concepts of ambidexterity and environments. First, it was identified that the hybrid strategy and ambidexterity approaches share a similar purpose of adaptation but are distinct in nature: the hybrid approach is more concerned with an external view of the firm as inherited by the positioning school, while the ambidexterity approach, which is rooted in a “Resource Based View” perspective is concerned with an internal view of the firm. Secondly, a hybrid strategy involves the composition of “Low Cost-Differentiation” whereas ambidexterity involves the dual focus on “Exploitation-Exploration”, two distinct and complementary dimensions: while hybridity defines the strategic value (a composition of “Low Cost” and “Differentiation”) of the firm, ambidexterity optimizes (Exploitation) or renews (exploration) this value. Despite this, most of the empirical studies on hybrid strategy and ambidexterity do not make this distinction and have the same variables in their tests on a firm’s performance, leading to ambiguous results. We therefore suggest that future research should make the distinction between the use of hybrid strategic positioning and its ambidexterity implementation.

We also identified different situations that could characterize different types of hybrid implementation. From the environmental linkage, we identified two different types of environment that could characterize diverse approaches of hybrid strategy implementation. One is related to the use of hybrid strategy as a mechanism to reinforce the competitive advantage of the firm in a turbulent competitive environment; we named this situation the Reinforcement Adaptive Perspective. The second is related to the use of hybrid strategy as a mechanism to change the strategic approach of the firm in a demand-supply turbulent environment; we named this situation the Survival Adaptive Perspective. Additionally, we identified two different firm’s origins that could characterize different types of hybrid implementation. One is related to a firm originally positioned as “Differentiation” that adopts a “Low Cost” approach, and the other is related to a firm originally positioned as “Low Cost” that adopt a “Differentiation” approach. Based on these distinct situations identified, but not so explicit in the literature, we proposed a hybrid strategy typology that should support further studies, and permits a refinement and better understanding of the benefit of the hybrid implementation, particularly to elucidate how a firm that has implemented the hybrid approach has combined and solved the paradox of its nature.

Finally, we conclude that further research on the study of hybrid strategy should be more precise and consider the type of environment and the firm's origins in their study on performance and organizational structure. We also suggest that the variables of the hybrid "Low Cost-Differentiation" and ambidexterity "exploitation-exploration" approaches should be studied in a distinct and complementary way.

Micro-enterprises and the internet adoption: an Italian case study

Abstract

This paper aims to expand on the knowledge regarding the relationship between small business and the Internet, through an analysis of the main factors that influence the decision to use this technology in the management of micro-enterprises. After a thorough analysis of the literature, a model was created and four hypotheses were developed which were subsequently subjected to empirical testing on a sample of 600 firms. The four hypotheses are related to different factors that are relevant to Internet adoption: company size, geographical location, the type of industry and the level of internationalization. The statistical analysis carried out on the companies surveyed shows that there is still not widespread use of the Internet and that the decision to use this technology is influenced by the size of the company and the sector it operates in, while location is not a significant factor. The results of the research constitute only the first phase of a larger research process which will also investigate the ways in which the Internet is used and the related implications concerning the competitiveness of these enterprises.

Keywords: SMEs; micro-enterprises; Internet; company size; internationalization.

Introduction

Numerous research studies have shown that firms that are active on-line grow more rapidly and have a higher degree of internationalization, from the standpoint of sales, than do firms that are not (The Boston Consulting Group, 2011, 16). In Italy, however, recent studies reveal that Internet usage by small businesses remains rather low, despite the advantages that could be had through the use of the Web in terms of business management, productivity and growth. As a matter of fact, increased use of the Internet could represent an important and strategic innovation for many smaller businesses, thanks to the organizational flexibility and rapid decision-making ability deriving from their smaller size which would make them better able to exploit the dynamics and variety offered by electronic environments, through experimentation with new business models and innovation, compared to larger firms (Pascucci, 2012, 177; Jutla et al., 2002, 140). Empirical studies have shown a relevant and positive relationship between Internet usage and the economic performance of SMEs, measured in terms of increased revenues and reduced costs, albeit with some differences due to the business sector to which they belong (Johnston et al., 2007, 359; Drennan and McColl-Kennedy, 2003, 306; Davis and Hareston, 2000, 115).

The new information and communication technologies could significantly contribute to improving the competitiveness of Italian SMEs, even on the international level. Worth noting is the importance of the role played by these firms in both the domestic and European economies: SMEs make up 99.8% of the enterprises in the 27-nation EU and 67.4% of total employment ("EU SMEs in 2012: at the crossroads", Annual Report on SMEs in Europe, September 2012). Italy is the country with the highest number of SMEs (99.9% of total firms) and the majority of these are micro and small enterprises (94.6% and 4.8%, respectively). Of these, artisan businesses carry a significant weight, in terms of numbers (28.1% of Italian businesses), employment figures (18.3% of the total), and national added value (12.8% of the total), as well.

In light of the relevance of this category of businesses, it appears quite surprising that so few studies have been conducted on Internet usage by these firms.

An analysis of the literature on the adoption of innovations (ICT and the Internet, in particular) in SMEs is the underlying basis upon which the research framework and hypotheses were built; subsequently these hypotheses underwent empirical testing on a sample of 600 businesses in the Marche region. This represents the first phase of a much broader research project which foresees a two-pronged analysis, initially, of the implications of Internet usage for business performance and subsequently, of the ways the Internet is used as a marketing tool.

The paper is structured as follows. First, a brief review of the literature pertaining to the relationship between the Internet and SMEs will be made, followed by the description of the research model, hypotheses and methodology;

then, in the final paragraphs the findings will be presented and the main implications of the analysis conducted will be discussed, along with the limitations of the study and prospects for future research paths.

Literature review

The relationship between SMEs and technological innovation, especially ICT and the Internet, is one of the topics that is most often the object of research by management scholars as well as by industrial economists. Most of these studies, however, concern the vast and non-homogeneous sector of SMEs (Cedrola, 2009; Alam, 2009; Levy et al., 2005, 6; Grandon and Pearson, 2004; Ramsey et al., 2003; Drew, 2003; Caldeira and Ward, 2003; Vescovi and Ieseppon, 2002, 511), which includes organizations of varying size (from 1 to 250 employees) and structure.

Business size is a significant factor that can influence the behaviour of SMEs vis-à-vis technologies such as ICT and/or the Internet and therefore, also influence the decision to adopt innovation or not. The relationship between company size and Internet usage can be explained from two different perspectives:

- a) Size as a proxy for the availability of resources to invest; according to this view, smaller business size represents an obstacle to the adoption of technology because it is an indicator of a lack of financial, managerial and knowledge resources, which characterizes smaller enterprises .
- b) Size as a proxy for “information complexity” within the organizational structure of the firm; according to this view, smaller sized businesses do not perceive the need to adopt the Internet as a tool because their information needs are less complex than those of larger firms. As the organization grows, the degree of complexity of the information to be managed also grows and thus, there is increased incentive to invest in Internet technology (Burke, 2005, 80).

Some scholars have highlighted the existence of a “digital divide” even within the category of SMEs as well as between them and large enterprises (Arbore and Ordanini, 2006, 84). According to Levenburg (2005, 101), not only are there significant differences among micro-, small- and medium-sized enterprises regarding technology usage, in the sense that micro-enterprises are lagging behind the others and their usage is very basic, but there is also a variance in the entity of the consequent benefits. This means that when smaller businesses begin to use the Internet in a more structured way, the benefits they derive from it are much greater than those being reaped by the other categories of enterprises.

In light of this, it could be too limiting to investigate the relationship between Internet usage and SMEs without taking into consideration the size variance of the enterprises, the consequence being inconsistency and contradiction in the research findings (Bordonaba-Juste et al., 2012, 213; Parker and Castleman, 2007, 30; Bengtsson et al., 2007, 38; Burke, 2005; Levenburg, 2005, 101).

This work positions itself in the latter research stream, as it recognizes, on the one hand, the relevance of business size even within the SME category and, on the other hand, the importance of focusing attention on a specific sub-category which is often overlooked by research studies, i.e., micro-enterprises and artisan ones, in particular . In fact, from an analysis of both Italian and foreign literature, there emerges a significant knowledge gap on Internet usage by small businesses, especially by micro-enterprises. Little has been published on the technological behaviour of this particular type of enterprise (Bordonaba-Juste et al., 2012, 213; Davis and Vladica, 2006, 1; Fillis et al., 2004, 180). In some studies, the smallest enterprises were explicitly excluded from the analysed sample (Bayo-Moriones and Lera-Lopez, 2007, 357; Ihlstrom and Nilsson, 2003, 212; Wade et al., 2004, 343) .

The literature review reveals the following two primary research streams regarding small businesses.

1. Analysis of the factors (internal and external to the company) which either hinder or facilitate the adoption of the Internet as a management tool. Hairuddin et al. (2012, 497) investigated the barriers to the adoption of IT in Malaysian micro-enterprises that produce traditional batik cloth and found the main obstacles to be lack of knowledge and capability as well as scarcity of financial resources. The characteristics inherent to the sector were also considered among the influencing factors, particularly, intense competition (Peltier et al., 2012, 423; Pontikakis et al., 2006, 346; Dholakia and Kshetri, 2004, 319; Kowtha and Choon, 2001, 237; Hollestein, 2004, 338; Premkumar and Roberts, 1999, 481; Premkumar and Ramamurthy, 1995, 334), degree of uncertainty (Peltier et al., 2012, 423), type of business activity (Cheung and Huang, 2002, 382), pressure from international competition (Hollestein, 2004, 338), and pressure

from clients and suppliers to adopt new technologies . According to these studies, firms show a greater propensity to adopt new technologies in those sectors characterized by more intense competition and by a higher degree of uncertainty. In a sample of Italian SMEs, Arbore and Ordanini (2006, 90) found a relevant relationship between the size of the city in which the firm is located and the adoption of a broadband Internet connection; this is especially true of smaller sized businesses located in small towns or rural areas where the location represents an obstacle because there are fewer resources available (e.g., fewer IT specialised services or providers), making it more difficult for these businesses to use innovative technologies effectively.

2. Analysis of the implications that Internet adoption can have on company performance. Poon and Swatman (1999, 11) conducted a qualitative survey of 23 Australian firms in which they analysed the perceived benefits of online activity and in particular, of e-commerce, classifying them as “direct” or “indirect”, as well as “short-“ or “long-term”. Examples of direct, short-term benefits are savings in communication costs and increased sales, whereas direct long-term benefits could be increased client loyalty and the development of long-term business relationships. Examples of indirect benefits are unexpected business opportunities in the short and the long term.

Methodology

The aim of the paper is to study the relationship between small business size and Internet usage so as to determine not only the degree to which this technology is adopted, but also to highlight the factors that most greatly influence that adoption.

Figure 1 presents the framework of the study and related research hypotheses; it shows both the first phase in which the results of the research are outlined and the second phase which is still in progress. While in the first phase the object of the research is the strategic decision to adopt Internet technology made by the firm’s governing body, in the second phase attention is shifted to the management action, i.e., the way in which the Internet is utilised in marketing processes.

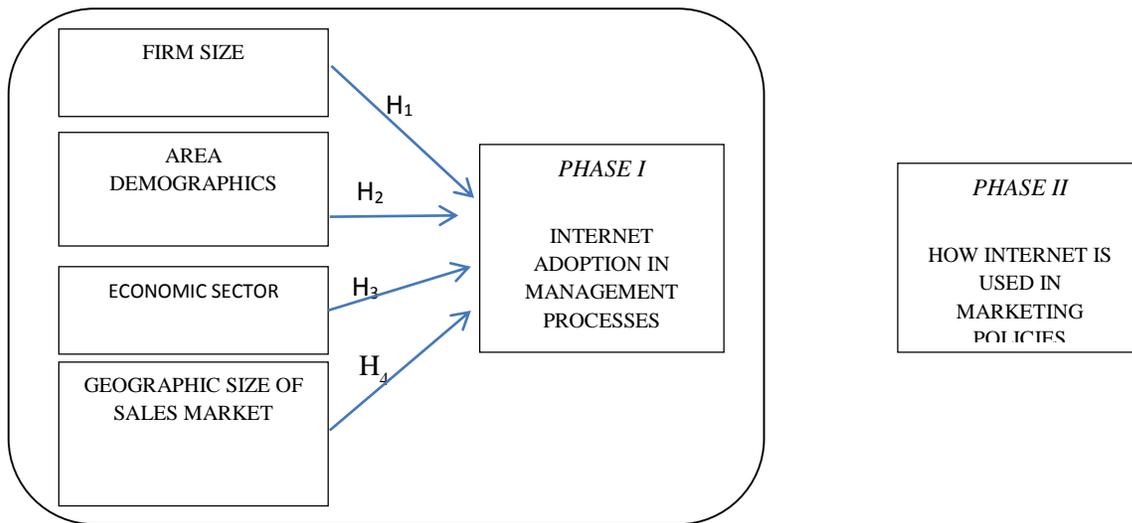

FIGURE 1: RESEARCH MODEL AND HYPOTHESES

Source: Authors’ work

The model strives to describe Internet usage in the management of artisan micro-enterprises in the Marche region, as a function of the following four variables.

1. Firm size – as an expression of the availability of resources and competences internal to the organization, which can be utilised to adopt technology effectively. Studies focused on the relationship between firm size and the adoption of the Internet (as well as ICT) have yielded contrasting results, some have shown the existence of a positive relationship (Bordonaba-Juste et al., 2012, 220; Kowtha and Choon, 2001, 237; Khemthong and Roberts, 2006; Lertwongsatien and Wongpinunwatana, 2003; Dholakia and Kshetri, 2004, 319; Khemthong and Roberts, 2006, 56; Burke, 2005, 83; Levenburg, 2005, 101; Arbore and Ordanini, 2006, 89; Dandridge and Levenburg, 2000, 86; Thong and Yap, 1995, 437), while others have not found there to be any relevant relationship (Tan et al., 2010, 50; Pontikakis et al., 2005, 349). The non-homogeneous nature of the findings points to the need for further research into the role played by firm size; the first hypothesis is therefore:

H1 Internet usage is positively influenced by firm size.

2. Geographic location of the firm – as an expression of the availability of environmental and therefore “external” resources that can facilitate or hinder the adoption of the Internet. Since small enterprises find it challenging to overcome the hurdle of managing the complexity of introducing new technologies using their own internal resources, dealing with the quantitative and qualitative range of services offered can represent a determining factor, both technically and strategically, in the decision to adopt the Internet as a management tool. Depending on where the business is located, the services offered and the available infrastructure may vary considerably, according to whether the firm is in a large city or in a small town or rural area, in a coastal area as opposed to an inland area, or to which province it belongs. Thus, the second research hypothesis is:

H2 Internet usage is positively influenced by the demographics of the area in which it is located.

3. Economic sector – as an expression of the type of business activity undertaken by the organization. As far as the influence the economic sector plays on a firm’s propensity to adopt the Internet is concerned, the results of the studies conducted are not univocal; some show that the adoption of Internet (and ICT in general) is influenced by the features pertaining to the sector to which the firm belongs (Love et al., 2005, 961), whilst others conclude that there is no such influence (Thong and Yap, 1995, 436; Bordonaba-Juste et al., 2012, 221; Pontikakis et al., 2005, 349) and Bengtsson et al. (2007, 39) have found that market pressure only exerts marginal influence on Internet usage by SMEs, no matter what their size. Thus, there is a need for additional research on sector influence. Hence, the third research hypothesis is:

H3 Internet usage is influenced by the economic section in which the firm operates

4. Geographic size of the sales market – for the firm’s products can be very small (only provincial or regional level, at best) for some and can be larger (even to the international level), for others. As regards the firm’s level of internationalization, it is worth pointing out that some contributions to the literature interpret international market presence, in some cases, as the cause (Bayo-Moriones and Lera-Lopez, 2007) and, in other cases, as the consequence (Mostafa et al., 2005) of the usage, or lack thereof, of new information technology. In this phase of the research, internationalization was researched as a causal factor, thus testing the following hypotheses:

H4 Internet usage is influenced by the firm’s local, domestic and international market size.

Over the course of 2012, the research hypotheses were subjected to empirical testing on a sample of 600 firms in the Marche region, by means of a structured questionnaire administered through a telephone survey. The sample was put together by EBAM (Ente Bilaterale Artigianato Marche), a bi-lateral agency for Marche region artisan enterprises as a stratified sample (based on sector, turnover, and size factors) of regional enterprises in the ‘Asia’ archive produced by ISTAT.

In order to test the relevance of the impact of the factors presented in Figure 1 regarding Internet usage by firms, a logistic regression model was developed in which the dependent variable is represented by the probability of using the Internet ($y=1$) compared to the probability of not using it ($y=0$). This type of regression model is applied in cases when the dependent y variable is dichotomous, as in this case under analysis. The logit model is as follows:

$$\text{logit}(p) = \log\left(\frac{p}{1-p}\right) = \beta_0 + \sum_{i=1}^K \beta_i x_i,$$

where $\text{logit}(p)$ is the logit function, p is the probability that the event $y=1$ will take place and x_1, x_2, \dots, x_K are the explanatory variables. This model therefore assumes that it is the logit transformation of the probability of using the Internet that has a linear connection to the predictor variables.

The explanatory variables in this case are the number of employees (as a firm size proxy), the size and proximity to the coast of the municipality in which the firm is located and the province (as a proxy of the firm's geographic location), the ATECO code referred to the firm's business activity (as the economic sector proxy), and the percentage of turnover at each of the regional, national and international levels (as a proxy of the geographic size of the sales market).

Results and discussion

First of all, the research findings show that in the year 2012 less than a third (31.17%) of artisan enterprises utilised the Internet for their business activity and the remaining two thirds 68.83% stated that they do not use it.

The average number of workers in artisan enterprises that do not use the Internet is 3.4, whereas the average is 7.4 in those enterprises that do navigate on the Internet. Therefore, it appears that size significantly influences Internet usage by artisan enterprises in the Marche region. The principal sectors in which there is the heaviest Internet usage are the mechanical and the woodworking sectors, whilst the family services sector hardly shows any web navigation. There do not appear to be any marked differences in the propensity for Internet usage among coastal and non-coastal municipalities, as seen in Table 3. This table also shows that the size of the municipality in which the business is located does not seem to affect the number of enterprises using the Internet; in particular, the frequency of use figures are about the same, regardless of whether it is located in a municipality with a population below or above the regional average for the Marche (approximately 8,600 inhabitants). There do not appear to be any marked differences in the propensity for Internet usage among coastal and non-coastal municipalities, as seen in Table 3. This table also shows that the size of the municipality in which the business is located does not seem to affect the number of enterprises using the Internet; in particular, the frequency of use figures are about the same, regardless of whether it is located in a municipality with a population below or above the regional average for the Marche (approximately 8,600 inhabitants).

In order to establish whether the evidence from the Tables discussed above is statistically relevant, seven different logistic regression models (see Table 1) were estimated. The first five models separately analyse the effects of each explanatory variable; the first model (M1) analyses the municipality (i.e., its size and proximity to the coast) where the artisan enterprise is located; the second model (M2) considers the differences between enterprises located in different provinces; the third (M3) studies the impact of the number of workers; the fourth (M4) analyses the effects of the enterprise's sales market size; the fifth (M5) looks at the differences by economic sector.

Each model was tested for multicollinearity among the independent variables, through the use of a VIF (variance inflation factor). If the VIF index values are greater than 10, then the independent variable can be considered a linear combination of the others, whereas in the case of a model with a single regressor, the VIF index is 1. All of the regressors for the seven models present indicator values that are well below the critical threshold (the maximum value is equal to 2.43 for the size of the municipality in model M7), thereby showing an absence of multicollinearity in the models proposed. The average value of the VIF index for each model is reported in Table 1.

From an early analysis, it emerges that:

- (i) neither the size of the municipality, nor its proximity to the coast have a relevant impact on Internet usage;
- (ii) the province of Fermo displays significantly higher Internet usage compared to the other provinces in the Marche region;
- (iii) as the number of workers employed in an enterprise rises, so does the probability for Internet usage;
- (iv) enterprises that sell their products outside of the province (in the region, in Italy, in Europe or abroad) use the Web significantly more than do enterprises whose clientele is predominantly local;
- (v) enterprises in the woodworking and mechanical sectors use the Internet significantly more than do those in the textile sector; those in the family services sector show the least use of all.

Model M6 studied the combined effects of the features of the territory where the enterprise is located (province, size of the municipality and its proximity to the coast) along with the size of the firm and its exports; the estimates obtained are analogous to those of models M1 through M4.

TABLE 1: ESTIMATES OF THE SEVEN LOGISTIC REGRESSIONS

	M1	M2	M3	M4	M5	M6	M7

From an early analysis, it emerges that:

- (i) neither the size of the municipality, nor its proximity to the coast have a relevant impact on Internet usage;
- (ii) the province of Fermo displays significantly higher Internet usage compared to the other provinces in the Marche region;
- (iii) as the number of workers employed in an enterprise rises, so does the probability for Internet usage;
- (iv) enterprises that sell their products outside of the province (in the region, in Italy, in Europe or abroad) use the Web significantly more than do enterprises whose clientele is predominantly local;
- (v) enterprises in the woodworking and mechanical sectors use the Internet significantly more than do those in the textile sector; those in the family services sector show the least use of all.

Model M6 studied the combined effects of the features of the territory where the enterprise is located (province, size of the municipality and its proximity to the coast) along with the size of the firm and its exports; the estimates obtained are analogous to those of models M1 through M4.

Lastly, model M7 represents the final complete model which takes into account the combined effects of all of the explanatory variables considered. A first remark worthy of note regards how the impact of all the explanatory variables on the variable target (i.e., the sign of the coefficients) remains nearly constant throughout the various models considered, thereby indicating the robustness of the estimates. It follows then, that all regressors remaining equal, the probability of using the Internet does not depend, in a statistically relevant manner, on the size of the municipality in which an enterprise is located, or on its proximity to the coast. This finding remains consistent in all of the models considered.

In analysing the provincial location, the situation changes slightly in the final model where the economic sector is included, which does not occur in the others. Here, it is no longer the province of Fermo but that of Ascoli Piceno that stands out with significantly higher Internet usage compared to Ancona, whereas the province of Macerata shows significantly lower usage. One partial explanation for this difference lies in the fact that most of the micro-enterprises in the Fermo area are in the footwear sector, thus the relevance of these enterprises shows up in the economic sector variable and not in the province sector variable. It is plain to see, from Table 2, how important the footwear industry is for the province of Fermo.

This explains why, in model M7, this province no longer appears so significant once the economic sector is included in the regressors.

Research hypothesis H2 can therefore only be confirmed in part, with reference to the province variable.

Firm size again shows a clear impact on the propensity for Internet usage as, *ceteris paribus*, the number of workers increases the probability that the enterprise will utilise the Internet for business purposes also increases. This confirms the first research hypothesis (H1).

TABLE 2: RELATIONSHIP BETWEEN PROVINCIAL LOCATION AND ECONOMIC SECTOR OF THE ENTERPRISE

Province	Textile	Footwear	Woodworking	Mechanical	Family services	Other manufacturing	Other services	Total
AN	19.0	0.6	8.1	23.0	14.9	10.9	23.6	100.0
	37.9	1.2	16.5	44.0	30.2	27.9	42.3	29.1

	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Source: Authors' work based on EBAM data.

Differences in Internet usage are also due to the economic sector in which the enterprises operate, thus confirming the third research hypothesis (H3). Table 5 plainly shows how the economic sector (the woodworking, the mechanical, and the footwear ones, especially) significantly influences the probability of using the Web, all other regressors remaining equal. Specifically, the odds (i.e. the ratio between probability *p* of using the Internet and the probability of not using it) in woodworking firms are equal to 3.6, the odds in mechanical firms are 7.2 and the odds in footwear firms are 2.3 times the odds for Internet usage by firms in the textile sector .

The fourth research hypothesis, too, is confirmed by empirical evidence; the analyses clearly show that the larger the sales market is, the larger the probability of Internet usage is. In contrast to model M7, in this model once the economic sector is inserted as a control variable, sales of goods and services within the region or in nations outside of Europe is no longer statistically relevant. In particular, looking at the odds for Internet usage by enterprises that only sell within their province, the odds for enterprises that sell in all of Italy are 3.6 times greater and the odds for enterprises that export to European nations are 7.9 times greater.

In the M7 model, "Family services" and "Other services" lose relevance because they are heavily dependent on the level of internationalization, as shown in Table 3.

TABLE 3 : RELATIONSHIP BETWEEN SIZE OF SALES MARKET AND ECONOMIC SECTOR

Sector	Mostly in the Province	Mostly in the Region	Mostly in Italy	Within Europe	Outside of Europe	Total
Other manufacturing	39.71	14.71	33.82	8.82	2.94	100
	8.33	10.99	16.79	22.22	10	11.35

	100	100	100	100	100	100

Source: Authors' work based on EBAM data.

Selling “within the region” loses relevance because it is heavily dependent on the footwear sector (which becomes relevant in model M7). Internationalization “outside of Europe” loses relevance because it is heavily dependent on the footwear (which becomes relevant in model M7), the woodworking, and the mechanical sectors.

It is therefore evident that there exists a relationship of “dependence” between the “economic sector” variable and the “level of internationalization” variable, as well as between the firm’s business sector and its “province of provenance”. In order to determine the order of importance of the explanatory variables considered in the analysis, it becomes necessary to compare the pseudo- R2 indices for each univariate logistic regression model (indicated in Table 5). As can be observed, the variables that identify the localization of the artisan enterprises do not have a conjoint relative impact on the propensity for Internet usage (the p-value of the Chi-squared test is far greater than any level of acceptable relevance and the pseudo- R2 equals zero). Of borderline relevance is the province variable, for which the p-value of the Chi-squared test is under 10% and the pseudo- R2 is very low (0.012). The best explanatory variables for Internet usage are, in increasing order of importance: the number of workers employed (pseudo- R2 equals 0.103), the size of the firm’s sales market (pseudo- R2 equals 0.148) and the economic sector in which it operates (pseudo- R2 equals 0.167).

Implication and further research

As regards the factors that influence Internet usage, the results of the present study confirm some of the evidence already discussed in the national and international literature on the broader topic of SMEs. Nevertheless, it is to be stressed that micro-enterprises do not, from different managerial aspects, display homogeneous characteristics within this macro grouping, a factor which has come to light in this analysis.

Internet usage is not uniform in the various economic sectors under scrutiny: it is more frequent in manufacturing than in services sectors. This appears somewhat surprising in that it would have been fairly reasonable to expect greater Internet usage in consumer sectors, such as people services, than in business to business ones, such as the majority of the manufacturing sectors included in the study. A possible explanation can be found in the fact that Internet adoption by industrial micro-enterprises has been induced by “pressure” from larger client-firms that already use this technology.

Still with regard to empirical evidence, it appears that firm location – analysed in terms of the size of the municipality to which it belongs and the geographical area (coastal or inland area) – does not influence Internet usage for managerial

purposes. This is only partly in line with the findings of other studies. Nevertheless, it is worth highlighting the fact that in our analysis, the larger cities were not considered separately from other municipalities and that, in this region, there are no “metropolitan areas”. The latter could be made up of a different socio-economic fabric and so, be more influential on the factors that were considered in the present analysis.

The non-relevance of firm location taken along with the relevance of firm size could further be read as an indication that the resources internal to the firm have a greater influence than the external environmental resources do in determining Internet usage.

A final aspect that was examined, of particular interest for our analysis, was the degree of openness towards foreign markets and the possible influence this can have on the adoption of web-based tools for the growth of artisan business activities. We point out that this factor can be considered both an “antecedent” and a consequence of the adoption of these technologies, as is evidenced in the literature. In this first phase of the research we have found, and the empirical evidence has provided “strong” confirmation of this, that firms which show a greater propensity for selling their products beyond Italian borders are those which have a greater probability of adopting Internet technology. One possible explanation could lie in the fact that those firms which manifest a greater degree of internationalization also present more complex information and management needs than others, thus they have a more powerful incentive to utilise the Internet as a management tool.

A final point that cannot be overlooked is the peculiarity of small Italian businesses (that often belong to industrial districts, as in several cases in the sample) which means that it becomes more complicated to generalize the findings to other geographical contexts.

A Structural Model to Explain Customer Repurchase Intentions in Co-operative Banks

Abstract

Customer motivation and satisfaction have attracted the attention of bank management for a long time. They are key factors to better understand consumer behavior and encourage repeat purchase and customer loyalty.

The study has involved the submission of a questionnaire to 600 customers of small-sized co-operative banks in the North-eastern part of Italy. The main factors that are believed to characterize the originality of the contribution are identified in the following aspects:

- Italy has been facing the most profound economic crisis of the post-war period and, in this context, similar analyses have not been implemented yet;**
- Motivation and customer satisfaction surveys are less common for small-sized banks even if their core competitive advantage lies in a higher presence in the local market and in a higher degree of closeness to the customer's needs;**
- The hypotheses were tested with SEM (Structural Equation Modeling) techniques.**

Introduction

In the current competitive scenario, companies achieve better performance levels if they are able to increase their efficiency, provide high quality products/services, and improve the relationship with their customers. Long-term customer loyalty has become fundamental in service markets. In the banking sector, increasing the value perceived by the clients is considered crucial to improve customer satisfaction, value creation, and performance levels. The increased competitiveness and similarity of provided services have pushed banks to better identify the determinants of customers' choice between different financial intermediaries. Thus, understanding customer needs has become an imperative in order to measure the behavioral intentions of the clients. A successful banker should be able to anticipate customer needs, by providing high quality and more efficient services to increase customer satisfaction. Nonetheless, there is still a lack of consensus about the exact nature of the relationship between customers' needs, motivations, and their future behavior. Factors such as the ability of the service to satisfy specific and hidden clients' needs, or the emotional response arising from the trade-off between expected and perceived value of the relationship with the bank, are affected by the context, both historical and geographical, in which they were born, and they have different meanings because of the nature and characteristics of the financial intermediary that performs the measurement (ie. bank vs. insurance, national institution vs. regional institution).

This topic acquires particular relevance for small-sized banks, in which their local character, the traditional high retention rates, and the effects of the economic-financial crisis had a deep effect on the consolidated relationships with their customers. The main aim of the study is to describe a conceptual framework of the relationship between basic motivational determinants in consumer bank selection, customer satisfaction, and repurchase intentions of the customers.

The present paper focused on small-sized co-operative banks in the North-Eastern part of Italy because customer satisfaction and motivation surveys are more common for large-sized banks with a national significance, while they are less common for small-sized banks even if their core competitive advantage lies in a higher presence in the local market and in a higher care for the customer's needs. The study involved the submission of a questionnaire to a sample of 600 clients of co-operative banks. Data was analyzed with multiple statistical analysis techniques based on confirmatory factor analysis and Structural Equation Modeling (SEM). The hypotheses were tested with SEM techniques based on a latent structure model with explicit causal relations, developed by LISREL (Linear Structural RELationship) statistical packages 8.8 and 8.51 (Jöreskog and Sörbom, 2001).

Literature review

A correct relationship with the customers is based on interaction and dialogue, and represents the tool through which the bank seeks to increase its profitability and to decrease customers turnover. As stated by Ruggiero and Ciorra

(2007), the current competitive environment, the comparability of different offers, the increasingly personalized solutions, and the resulting increased customer mobility have forced banks to provide a service able to improve the trust relationship with their customers (El Saghier and Nathan, 2013). The greater the ability of the bank to meet the needs of the consumers, the greater the possibility that they will repeat the purchase in the future and provide positive feedback to other potential customers (Wong and Sohal, 2002). A loyal client buys more, has a lower price sensitivity, can introduce new customers, and leads to lower management costs compared to the acquisition of a new one (Omarini, 2004). This is also supported by the data obtained from the World Retail Banking Report and the Customer Experience Index (CEI) (Capgemini and Efma, 2013), which measure the perceptions of 18.000 customers in 35 markets: in the second half of 2013, 10% of the surveyed retail clients worldwide may have terminated the relationship with their banks and 41% of them were not sure to maintain that relationship in the future. As a consequence, it is fundamental to identify which managerial variables can influence the outcome of this relationship (Molina, Martin-Consuegra, and Esteban, 2007). Nonetheless, even if the main literature has suggested the most relevant factors that encourage the purchase intentions of the customers (Heskett, Jones, Loveman, Sasser, and Schlesinger, 1994; Reicheld and Sasser, 1990; Zeithaml, Parasuraman, and Berry, 1990; Gummesson, 1993; Anderson and Fornell, 1994; Schneider and Bowen, 1995), there is still a lack of consensus about the exact nature of the relationship between the perceived value of the product/service and the future behavior of the consumer (Gera, 2011). Cronin, Brady, and Hult (2000) stated that there was a significant divergence of opinion about the relationships (both direct and indirect) between quality, value, satisfaction, and behavioral intentions.

Henning-Thurau, Gwinner, and Gremler (2002) suggested that customer satisfaction is a central element in the process of exchange between company and consumer. Satisfaction is a key factor to better understand consumer behavior and encourage repeat purchase and customer loyalty. Banks need to better understand customers service requirements and their impact on behavioral intentions (Gerrard and Cunningham, 2001). An increase in customer satisfaction leads to higher levels of customer loyalty and retention (Bowen and Chen, 2001). Several scholars recognized the existence of a strong link between satisfaction and post-purchase intentions (Patterson and Spreng, 1997; Rust and Oliver, 1994; Cronin and Taylor, 1992; Anderson and Sullivan, 1990; Bitner, 1990; Zeithaml, 1988). Similarly, the perceived value of the product/service seems to be positively linked, both directly and indirectly through satisfaction, to the behavioral intentions of the customers (Brady and Cronin, 2001; Cronin et al., 2000). If the trade-off between the potential benefits and sacrifices generated by a product or service is positive, it seems reasonable that the customer will be satisfied and will repeat the purchase in the future or will provide positive feedback to other potential clients. Besides, satisfaction is also positively affected by the perceived value (Bolton and Drew 1991; Woodruff 1997). The motivation of the customers in the choice of a bank has been extensively analyzed (Yue and Tom, 1995). Some scholars suggested the existence of a link, both direct and indirect, between the motivation of the clients and their satisfaction (Shankar, Smith, and Rangaswamy, 2003; Czepiel, Solomon, Surprenant, and Gutman, 1985). Similarly, the motivations that push the consumer to choose a specific bank are also linked to the perceived value of its products/services (Jones, Mothersbaugh, and Beatty, 2002; Driscoll, 1999; Mylonakis, Malliaris, and Siomkos, 1998; Yue and Tom, 1995). In addition, there seems to exist a mediating role of the perceived value of the product/service in the relationships between motivation and satisfaction (Shankar et al., 2003; Bitner and Hubbert, 1994; Oliver, 1997) and between motivation and behavioral intentions (Yue and Tom, 1995; Mylonakis et al., 1998; Jones et al., 2002).

The study is related to specific aspects considered as relevant determinants of the motivations that push customers to choose a particular bank, and of the experience that affects the loyalty process. In this context, the study presents typical phenomena of social psychology, such as cognitive dissonance, which can produce significant distortions in consumer behavior and in the purchase model. Cognitive dissonance is related to the inconsistencies and contradictions between thoughts and actions that create psychological distress in the individual, which generally have been faced by changing the reference environment, the behavior, or the system of cognitive representations and their functional relationships (so-called cognitive world). Nonetheless, it is believed that the following hypotheses can explain the relationships between the initial choice of a bank, the perceived value of the products/services, the level of satisfaction, and the repurchase intentions. Thus, the study attempts to provide an answer to the following research questions:

- H1: Is there a positive and direct link between consumer motivation (MOT) and perceived value (PV)?

- H2: Does a positive and direct relationship exist between consumer motivation (MOT) and customer satisfaction (SAT)?
- H3: Is perceived value (PV) the antecedent of customer satisfaction (SAT)?
- H4: Is there a positive and direct relationship between perceived value (PV) and behavioral intentions (BI)?
- H5: Does a positive and direct link exist between customer satisfaction (SAT) and behavioral intentions (BI)?
- H6: Does perceived value (PV) mediate the effect of consumer motivation (MOT) on behavioral intentions (BI)?
- H7: Does perceived value (PV) mediate the effect of consumer motivation (MOT) on customer satisfaction (SAT)?
- H8: Does customer satisfaction (SAT) mediate the effect of perceived value (PV) on behavioral intentions (BI)?

The predicted hypotheses are presented in FIG. 1.

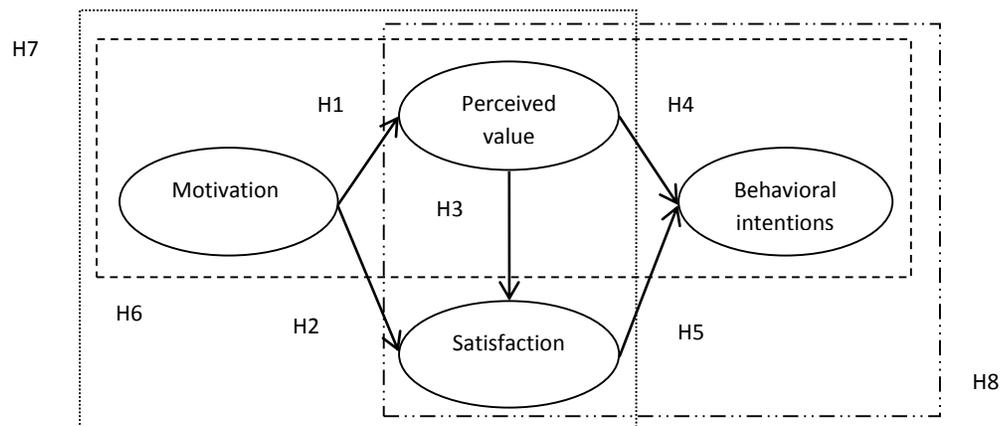

FIG. 1: STUDY MODEL

Method and measures

Sample and site

This cross-sectional study was carried out in the North-Eastern part of Italy and involved the submission of a questionnaire to the clients of co-operative banks. The sample was defined on the basis of the following steps:

- The selected co-operative banks were divided with reference to their size. The study focused on small-sized co-operative banks;
- In each of the selected co-operative banks, the clients were divided with reference to their segment (retail, corporate, private). The study focused on the retail segment;
- For each of the retail clients, the participants were selected on the basis of a random sampling.

A profile of the sample is provided in TABLE 1. All the participants were personally interviewed; the study was explained to them and their collaboration was requested. The study was undertaken during the period January to March 2013 and involved semi-structured face-to-face interviews. All participants gave their oral informed consent. A total of 600 replies were surveyed. The respondents showed the typical profile of retail customers of small-sized banks operating in restricted territorial areas. The most critical aspects arose from the lack of interest in becoming a shareholder of the bank, by subscribing equity shares, the reduced number of new customers, both in terms of age and length of the relationship, and the use of not particularly profitable basic services.

Multiple statistical analysis techniques were used in this study. These procedures include confirmatory factor analysis SEM. The hypotheses were tested with SEM techniques based on a latent structure model with explicit causal relations, developed by LISREL 8.8 and 8.51 (Jöreskog and Sörbom, 2001).

TABLE 1: PROFILE OF THE SAMPLE % (N = 600)

Gender		Age		Degree		Relations with banks		Length of the relation	
Male	54.22	18 to 29	6.12	Primary school	4.64	Only with 1 bank	54.33	<1 year	3.33
Female	45.78	30 to 39	11.18	Middle school	21.10	From 2 to 4 banks	44.17	1 to 4 years	14.50
		40 to 49	23.00	High School	48.73	>4 banks	1.50	5 to 10 years	19.33
		50 to 65	37.13	University	25.53			>10 years	62.84
		> 65	22.57						

The questionnaire was divided into three sections. The first one focused on socio-demographic aspects (type of customer, gender, age, level of education, professional position). The second part was related to the so called "banking profiles" of the client (relationships with one or more banks, length of the relationship with the bank, shareholder status, knowledge of the benefits of this status, types of services related to this status), in order to better understand the operational aspects of the relationship. The third part proposed a set of questions related to the perceptions of the customers, the atmosphere of the bank, the products offered, the quality of the service, loyalty, and satisfaction.

Measurement of Constructs

The constructs examined in this study were mainly explained by using a 7-point Likert scale, from a very low level of the item (scored as one) to a high level of the item (scored as seven) adapted from the main existing literature. The choice of the following scales derived from a selection of the main items to better understand how the motivations that led to the choice of a specific bank affect the value perceived by the customers and their satisfaction, and how these two aspects can influence customer loyalty.

Consumer Motivation (MOT) was measured by adapting the scales by Driscoll (1999), Mylonakis et al. (1998), and Yue and Tom (1995). The issue of customer motivation criteria in the banking sector has been extensively studied by several scholars (Safakli, 2007; Metawa and Almosawi, 1998; Hegazi, 1995; Ross, 1989; Anderson, Fox, and Fulcher, 1976). Even if the relevance of each determinant varies a lot among the different studies, there appears to be a consensus about the factors that have a higher impact on consumer motivation. In particular, convenient location (Yue and Tom, 1995; Kaufman, 1967; Mylonakis et al., 1998; Driscoll, 1999), quality/price ratio (Jones et al., 2002; Driscoll, 1999), advice of friends or family (Yue and Tom, 1995; Martenson, 1985; Mason and Mayer, 1974), staff courtesy and competence (Yue and Tom, 1995; Mylonakis et al., 1998; Ying and Chua, 1989), and service quality (Yue and Tom, 1995; Mylonakis et al., 1998) have been considered as the most important determinants of customer motivation within the banking industry. This information has become fundamental in order to better know the customer and implement a marketing strategy needed to reach new potential consumers and retain the old ones. A better knowledge of the motivations that push the consumers is also vital to differentiate the offer of the bank from those of its competitors (Safakli, 2007).

Perceived value (PV) was measured by adapting the scale developed by Zeithaml (1988). The concept of value has been considered as a trade-off between the potential benefits and sacrifices generated by a service or product to the customer (Gera, 2011; Zeithaml, 1988; Ravald and Grönroos, 1996; Lapierre, 2000; Teas and Agarwal, 2000; Woodall, 2003; Lin, Sher, and Shih, 2005; Parasuraman, Zeithaml, and Berry, 1988). Nonetheless,

the perception of value is characterized by several attributes and a high level of abstraction that leads to a concept considered as highly personal and context-specific (Sweeney and Soutar, 2001). The patterns of value perception may vary a lot from consumer to consumer. As suggested by Zeithaml (1988), consumers' responses may lead to a concept of value focused more on the price of the product or service, or on the quality they perceived by using that specific product/service. Obviously, each definition brings different sets of determinants that may have an influence on the consumers' choice. However, the concepts of value and quality cannot be considered as synonyms. In fact, value has a more individualistic core and is more related to the balance between the benefits and the sacrifices of a purchase. Besides, even though some conceptualizations of the value construct have included quality as its most relevant component, there could be several other factors that consumers may consider as relevant, such as prestige and convenience (Zeithaml, 1998; Holbrook and Corfman, 1985). As a consequence, benefits are mainly linked to the quality, prestige, and status symbol of the product or service, while sacrifices include the monetary and non-monetary (time spent, efforts) costs of a purchase. Though the value construct is a complex topic, with different potential meanings according to the context (Lin et al., 2005), its foundations are linked to the quest for the required functions or services at the lowest possible cost without lowering quality (Fong, Shen, and Cheng, 2001).

Customer Satisfaction (SAT) was measured by adapting the scale developed by Oliver (1997). Customer satisfaction is a key to long-term business success (Zeithaml, Berry, and Parasuraman, 1996). Its concept has been extensively analyzed since Cardozo's (1965) article. Nonetheless, there is a lack of a consensual definition of the theme. Furthermore, the concept of customer satisfaction is affected by the context in which its determinants may arise (Marsh and Yeung, 1999). So, the factors that lead a customer to a satisfaction status may differ from those that characterize another customer. Several scholars provided a notion of customer satisfaction related to the evaluation process that occurs after the purchase of a product/service (Oliver 1997; Halstead, Hartman, and Schmidt, 1994; Fornell, 1992; Howard and Sheth, 1969). In their opinion, the expectations and ideas that moved the consumer before the purchase have a fundamental influence in guiding his/her opinions after having experienced the product or service. As a consequence, satisfaction arises from the ex-post comparison between an ideal perception of the product or service and its effective advantages for the customer. Some other scholars focused more on the type of experience of the consumer. In particular, customer satisfaction has been conceptualized as either a cognitive (Bolton and Drew 1991; Howard and Sheth 1969; Tse and Wilton 1988) or an affective response to a purchase experience (Oliver 1997; Halstead et al., 1994; Westbrook and Reilly 1983). Even if there is a lack of consensus over the type of satisfaction, the most recent literature agrees on the emotional response of the construct (Giese and Cote, 2000).

Behavioral intentions (BI) was measured by adapting the scales by Patterson and Spreng (1997) and Babakus and Boller (1992). Behavioral intentions refer to the consumers' actions after the purchase experience and are mainly related to the repurchase intentions and positive word of mouth (Gera, 2011; Patterson and Spreng, 1997; Oliver, 1993; Anderson, 1998; Boulding, Kalra, Staelin, and Zeithaml, 1993; Babakus and Boller, 1992; Bagozzi, 1992). As regards the determinants of the behavioral intentions construct, repurchase intentions and positive word of mouth are considered as dimensions of the customer loyalty (Cronin et al., 2000; Durvasula, Lysonski, Mehta, and Peng, 2005; Parasuraman, Zeithaml, and Berry, 1994). Customer loyalty can be defined as "customers' behavioral response, expressed over time by some decision-making units, with respect to one or more alternative brands out of a set of such brands, and is a function of psychological processes" (Jacoby and Kyner, 1973). Several scholars have focused on the direct and indirect relationships between value, quality, satisfaction, and ex-post actions (Williams and Soutar, 2009; Cronin and Taylor, 1992; Bolton, 1998; Ostrom and Iacobucci, 1995; Fornell, Johnson, Anderson, Cha, and Everitt, 1996; Chang and Wildt, 1994). Even if there is a lack of a convergent view about the effective relationships (both direct and indirect) between the cited constructs, most part of the literature has suggested a strong link between satisfaction and repurchase intentions (Williams and Soutar, 2009; Rust and Oliver 1994; Bitner 1990). Patterson and Spreng (1997) also found the mediating role of satisfaction in the relationship between perceived value and repurchase actions.

TABLE 2 shows the scales used to measure the constructs.

TABLE 2: SCALES USED TO MEASURE THE CONSTRUCTS

Constructs	Scale Items	Cronbach alpha	Source
Consumer Motivation (MOT)	Proximity / comfort of the agency (MOT1) I knew someone in the agency / It is the agency used by my family (MOT2) It was the most convenient one (MOT3) I chose this bank because I was advised (MOT4) The bank provided me with a better service (MOT5) I liked the advertising (MOT6) The bank provided me with products to suit my needs (MOT7) Trustworthiness and reliability (MOT8) Staff courtesy and competence (MOT9) It offered a good quality / price ratio (MOT10)	0.819	Driscoll (1999), Mylonakis et al. (1998), Yue and Tom (1995)
Perceived Value (PV)	The value of the services is high (PV1) The relationship between quality and price is fair (PV2) The prices are reasonable (PV3)	0.919	Zeithaml (1988)
Customer Satisfaction (SAT)	Service in accordance to my expectations (SAT1) Service in accordance to my ideal service (SAT2) Overall satisfaction (SAT3)	0.921	Oliver (1997)
Behavioral Intentions (BI)	I will continue to use the services of the bank in the future (BI1) I would recommend the bank to someone who asks my advice (BI2) I would express positive views on the bank (BI3)	0.926	Patterson and Spreng (1997), Babakus and Boller (1992)

Analysis

Prior to testing and estimating for causal relationships between observed and latent variables, a confirmatory factor analysis was undertaken to determine whether earlier research findings on the identified constructs as well as the scales used and the assumptions made in the previous paragraphs could be confirmed. The factor analysis, incorporating the varimax option, assessed the validity of the measurement ($KMO=0.915$; $Sig.=0.000$). Internal consistency reliability was tested and the Cronbach alpha results of 0.819, 0.919, 0.921, and 0.926 were obtained for the constructs of MOT, PV, SAT, and BI respectively. The analysis supported the dimensional concepts and provided fullest evidence of construct validity.

The hypotheses were tested with SEM techniques based on a latent structure model with explicit causal relations. The estimated SEM, developed with LISREL 8.8 and 8.51 (Jöreskog and Sörbom 2001), follows a logic based on two steps. The first one is related to the process of estimating parameters, based on an interactive procedure aimed at minimising the gap between data produced by the model and observed data. The second step is based on a

comparison of the theoretical model with the data observed. If the gap between the matrix of the observed covariance and the expected matrix, generated by the programme, is higher than the gap attributable to the stochastic error, the model is rejected. The analysis will then determine if the model is able to represent the examined phenomena, through four different sets of fit indices: χ^2 test, overall model fit indices, incremental fit indices and residuals indices.

The integrated examination of the fit indices confirms whether the model is able to fit the data or not. χ^2 scores 573.86 with 147 degrees of freedom, p-value 0.00. Overall model fit indices show reasonable fit results. The Goodness of fit index (GFI) scores 0.91 and the Adjusted goodness of fit index (AGFI) 0.88. Critical N (CN) scores 205.41. Incremental fit indices show even better results. The Normed fit index (NFI) scores 0.97, the Non-normed fit index (NNFI) 0.97, while the Comparative fit index (CFI) scores 0.98. Residuals indices confirm that the assumed model is able to explain most of the observed data. The Root mean square residual index (RMR) scores 0.17, the Standardized RMR 0.046 and the Root mean square error of approximation index (RMSEA) 0.070, with 90 per cent confidence interval between 0.064 e 0.076. As regards the recommended values for the fit indices suggested by Schermelleh-Engel, Moosbrugger and Müller (2003) the model shows a reasonable fit. FIG. 2 provides the path diagram of the study model with regressors and stochastic error estimation.

With regard to the structural model, it should be noted that the hypothesized direct relations are partially confirmed. Lisrel model and statistical tests support hypotheses 1 (t-value=9.60; p-value<0.001), 3 (t-value=18.58; p-value<0.001), and 5 (t-value=17.18; p-value<0.001). Lisrel model does not support hypotheses 2 (t-value=1.46; p-value>0.05), and 4 (t-value=1.26; p-value>0.05). Data fails to confirm hypotheses 2 and 4. As regards the indirect effects, the structural model confirmed the mediating role of perceived value between motivation and behavioural intentions (t-value=8.51; p-value<0.001) and in the link between motivation and satisfaction (t-value=9.13; p-value<0.001). The relationship between perceived value and behavioral intentions is also mediated by satisfaction (t-value=13.09; p-value<0.001). A summary of these results is presented in TABLE 3.

The results show a strong direct link between SAT and BI, consistent with hypothesis 5, and between PV and SAT (hypothesis 3): the related coefficients, estimated by the statistical package, suggest a remarkable significance. The analysis also reveals a significant relationship between MOT and PV confirming the level of interdependence between these constructs (hypothesis 1). Finally, the study shows significant indirect effects between PV and BI (mediated by SAT) (hypothesis 8), between MOT and BI (mediated by PV) (hypothesis 6) and MOT and SAT (mediated by PV) (hypothesis 7). These results seem to be consistent with those obtained by similar studies, according to which the main determinant of customer loyalty is customer satisfaction, as well as customer satisfaction is mainly related to the perceived value of the provided products/services (Gera, 2001; Bagozzi, 1992; Cronin and Taylor, 1992; Parasuraman et al., 1988; Boulding et al., 1993; Zeithaml et al., 1996).

TABLE 3: ESTIMATION, T-VALUES, P-VALUES AND CONFIRMATION OF HYPOTHESES

DIRECT EFFECTS			INDIRECT EFFECTS		
REL.	COEFF.	T-VALUE	REL.	COEFF.	T-VALUE
SAT→BI	0.87***	17.18	PV→BI	0.67***	13.09
PV→SAT	0.77***	18.58	MOT→BI	0.35***	8.51
MOT→PV	0.42***	9.60	MOT→SAT	0.33***	9.13
MOT→SAT	0.05	1.46			
PV→BI	0.05	1.26			

Note: *: p-value<0.05; **: p-value<0.01; ***: p-value<0.001.

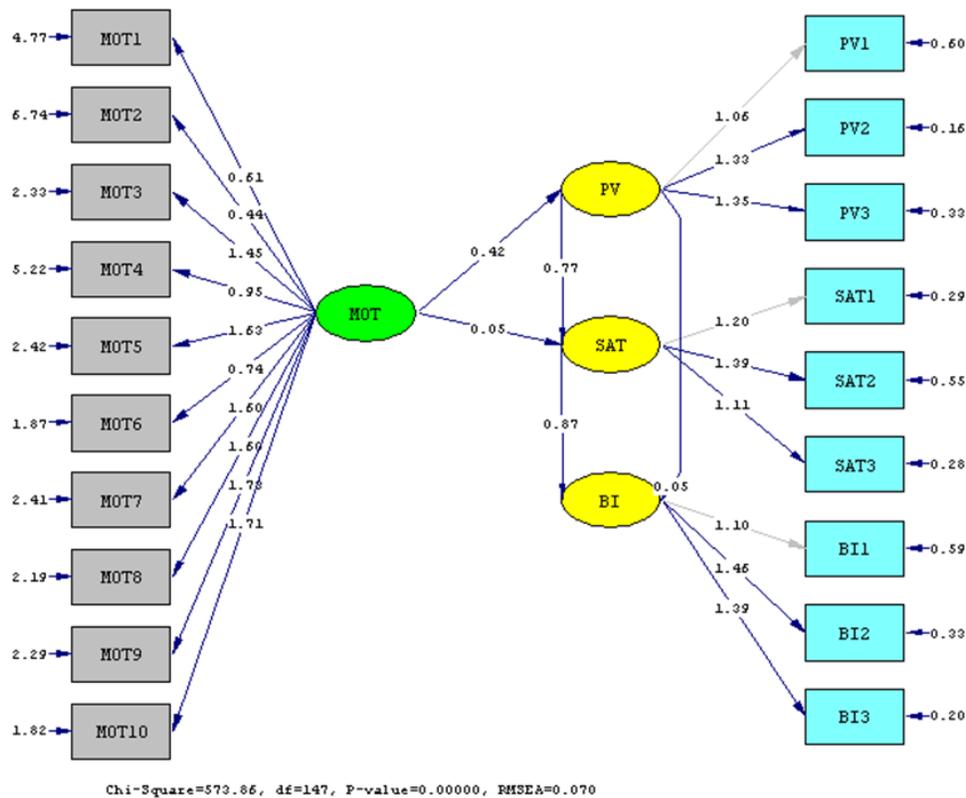

FIG. 2: PATH DIAGRAM OF LISREL MODEL WITH REGRESSORS AND STOCHASTIC ERRORS ESTIMATION

Discussion and conclusion

The robustness of the sample and the specific methodology used for the analysis lead to significant results. In particular, it is believed that some aspects may be useful for the management of small-sized banks, with reference to the efficient supervision and control, current and prospective, of the market share. It should be also emphasized that, thanks to a better understanding of the determinants of customer satisfaction and loyalty, the managers should be able to face those weaknesses that negatively affect a balanced management of the bank in the future, and increase the degree of attractiveness to young customers, a fundamental lever in the development of the business. It is also believed that a higher level of discrimination within the segment, with the related diversification of the supply, can positively influence the cross and up-selling phenomena. In this respect, the range of the offered products/services should be revisited in advance, in order to make it more suitable to the needs, both expressed and implied, of the customers.

The analysis of the data shows a strong relationship between the level of overall customer satisfaction and loyalty (to be understood in terms of repurchase intentions), in spite of the relative heterogeneity in the composition of the respondents. Even if the result is not surprising, it is possible to hypothesize a sort of “generalist and indistinct” perception of the bank by different customer segments, that perhaps should be appropriately differentiated in order to implement more appropriate commercial initiatives. The level of satisfaction requires a deeper consideration of customer expectations: it is known that the increased competitive pressure requires greater attention to the relationship

management and to the offer of quality products and services. Similarly, contact personnel should be focused on the identification of customers' latent needs, not just on the delivery of products and services.

The study also shows a very weak relationship between perceived value and behavioral intentions: this data seems to reflect a perception of products and services almost used as commodities and thus unable to produce an effective negative value in terms of the utility gap between use and non-use of them. If the relationship between perceived value and behavioral intentions is mediated by satisfaction, the results emphasize the existence of an even more significant link. As the perceived value was measured with a scale based on economic aspects, recording almost exclusively an impact of general satisfaction on customer loyalty means that the price lever can be hardly used to generate satisfactory economic returns. Customer loyalty should be related to factors other than the price paid, especially because of the main features of the respondents (ie. long-term relationship with the bank, high loyalty rates).

Finally, it is important to stress the relationship between consumer motivations and perceived value. In particular, as the main determinants of motivations are represented by the professional characteristics of the staff, as well as by the expectations of a good quality/price ratio, it is possible to confirm the perceptions of the clients (perceived value was mainly measured by economic aspects). This evidence seems to confirm the existence of a strong relationship between perceived value and customer satisfaction: the high value of products/services obviously leads to a good level of overall customer satisfaction.

Development and Exploitation of Relational Resources in IT Outsourcing

Abstract

The relational resources represent key assets for outsourcing success. Achieving full potential in the development and exploitation of relational resources in outsourcing can be understood as occurring in two closely intertwined phases: i. during the choice of the provider; ii. through the governance of the relation that develops over the execution of the contract. The current paper aims to provide conceptual insights into these two phases, as they apply to the particular area of companies' IT outsourcing. A first objective is to illustrate the role of relational resources in determining the ultimate degree of success in IT outsourcing and to observe its potential as an "instrument to address risk". A second objective is to outline managerial criteria for correct choice of the IT provider and for appropriate direction of client-vendor relations over the course of the resulting contract execution.

Introduction

Since the late 1980s the outsourcing of IT services has seen enormous growth (Beasley et al., 2009) and remarkable change in objectives, content and forms (Popoli, 2011). Initially, the externalization of IT activities and functions was primarily tactical in character. The primary aim was to obtain cost savings (outsourcing *for cost saving*), and secondly to keep abreast of technological evolution and the development of competencies that individual companies could not resolve alone (Quinn and Hilmer, 1994). Given these aims, companies also developed the first practices of "offshoring" (Mol, van Tulder and Beije, 2005; Jilovec, 2005). Such international outsourcing was primarily intended to exploit cost differentials, particularly with respect to emerging nations gathering the first yields from investment in technological knowledge (India, the Philippines, Brazil, Ireland, etc.).

Subsequently IT outsourcing became a strategic choice (Accabi and Lopez, 1995; Hinterhuber and Stuehec, 1996; Quinn and Hilmer, 1994). IT structures were increasingly required to render management processes not only more efficient and economical, but also more innovative and flexible for strategic purposes. IT structures became more critical in the implementation of business logic, capable of conditioning the effectiveness and efficiency of processes for creation of company value (outsourcing for "value creation"). IT implementation was no longer simply a factor in the support of the value chain. Thus we now speak of "strategic IT outsourcing" to indicate the strategic aspect of outsourced activities, and "tactical IT outsourcing" to indicate the "commodities" of IT functions and activities.

The changes in objectives and aims for IT outsourcing brought about parallel changes in the relationships developed between client and vendor. The paradigm shifted from *transaction-based* outsourcing to *relationship-based* or *partnership-based* outsourcing (Lee, 2001). This led to the adoption of new systems of governance, control and coordination. Relations were no longer centered exclusively on contracts alone, which became insufficient to regulate relations that had become much more complex. The new systems involved relational governance, governance through organizational processes and structures, and governances based on systems of risk-reward (Behrens, 2006). This evolution in governance systems became necessary in all IT outsourcing where the primary or parallel aim with respect to cost saving was the generation of new common knowledge, founded on the exchange and sharing of knowledge.

This paper aims to discuss the centrality of relational resources in IT outsourcing, particularly the practices for externalization of functions or internal processes which are closely related to the core business (strategic IT outsourcing). In these cases the need for partnership is very high, since the success of outsourcing in these situations is based on the sharing and exchange of knowledge.

Many studies on outsourcing focus on why, how and what firms determine to outsource, but few studies have examined relational resources in terms of risk management. The value of the current paper lies in two areas: i) it examines the use of relational resources as an instrument to address the risks of IT outsourcing; ii) it identifies results that can be expected from the adoption of appropriate criteria for provider selection and from systems for governance of relations that go beyond simple contract control.

The next section of the paper analyses the theoretical frameworks that focus on social and behavioral problems in business-exchange relations, from which we identify the importance of relational resources in company management. Sections 3 and 4 deal with the paper's central theme: the consideration of relational resources as an "instrument to address risk", and the proposal of conceptual insights on managerial criteria for the correct choice of the IT provider and the appropriate direction of client-vendor relations over the course of the resulting contract execution. In particular, our insights concern broadening the evaluation and choice of potential providers from the traditional "subjective requisites" to now include "relational requisites". Finally, in Section 5 we identify the conditions that can determine whether the outsourcing contract serves as an "instrument to address risks" or "generators of risks". The concluding section of the paper indicates further research directions.

Theoretical frameworks

Scholars have applied various theories that address the relational aspects of client-vendor exchange relationships. These have often been applied in studies on outsourcing, in attempts to better understand the decisive factors for the potential success of outsourcing operations. The principle theories applied have been "agency theory" and "relational exchange theory", both of which concentrate on the specific issue of relational resources.

Agency theory (Williamson, 1985, 1986; Eisenhardt, 1989) analyzes the relations of business exchange in terms of two main factors: i) information asymmetry, where the actor delegating the execution of an activity (the principle) is in a weak situation with respect to the actor being delegated to carry out the activity (the agent); b) ii) risks of opportunistic behavior, through which the agent could attempt to exploit the information asymmetry in his favor. The occurrence of these factors raise a series of potential problems in the agency relationship, since the principle is not always able to control the behavior of the service provider and it is in fact very costly to determine what the agent is doing (Aris et al., 2008). In addition, the contract is defined under the limits of available information and understanding (bounded reality) and thus cannot cover all contingencies and future behaviors (Das Aundhe and Mathew, 2009). Studies have demonstrated that the most common opportunistic behaviors on the part of vendors are shirking, poaching and renegotiation (Aron and Liu, 2005). Such behaviors are based on information asymmetry in favor of the vendor and the impossibility for the principle to control the exchange. Shirking consists of deliberate underperformance on the part of the service provider, while still demanding payment as if the tasks were completed according to terms. Poaching is the attempt to achieve extra revenue by misusing the client's critical business data. Renegotiation is the request by the service provider for greater payment than appropriate: the provider outsmarts the client, opportunistically exploiting his much greater knowledge of IT services. Hence the focus of agency theory is on how to define the most efficient contract possible to govern the agency relationship, which would permit the principle to have the maximum possible control over what the provider does in terms of quality of services, and at the same time permit the agent to satisfy the principle through achievement of his specific objectives (Logan, 2000).

Relational exchange theory, or RET, was introduced by McNeal (1980). This conceptual approach focuses on the *relational norms* created in exchange relations, which constitute the base elements of efficiency in contract governance between the client and vendor. Relational norms are specific behaviors that subjects in transactions assume, to identify, maintain and develop relations under conditions of present and future equilibrium, even during the inevitable situations of contractual insufficiency. The specific relational norms of interest are: flexibility, information exchange and solidarity (Gottschalk and Solli-Saether, 2006). The role of these norms is to complement and strengthen the contractual norms, which cannot alone govern the unforeseeable future contingencies that could negatively influence the relationship (Goles and Chin, 2002).

RET concepts are based in social theories, most specifically on the further development of "social exchange theory" (SET) as originally introduced by Homans in 1958. Social exchange theory identified the existence of social and behavioral dimensions in relations between business subjects, in addition to the dimension of pure economic exchange. SET begins from the premise that the aim of the two actors in creating a voluntary exchange relationship of is to obtain benefits that are clearly greater than the related costs. However SET illustrates that such relationships are not limited to mere economic exchange and that they also contain elements of social exchange, such as trust, communication, knowledge sharing, cooperation, and sharing of both risks and benefits (Yanhong, 2011). The actors create such exchange

relations when in examining the potential behaviors of their counterpart they perceive possibilities to achieve common benefits (Thibaut and Kelley, 1959; Homans, 1961; Emerson, 1972).

In the subsequent sections of the paper we address three central issues in IT outsourcing, in the light of the theories summarized above: i) selection of the provider; ii) contract management, and iii) ongoing management. RET is particularly related to the stage of selecting the most appropriate provider, providing assistance in resolving the problems of knowing the provider in terms of capacity to adopt relational norms (Joshi and Stump, 1999; Gottschalk and Solli-Saether, 2005). Agency theory is firstly relevant to the stage of contract management, meaning the design and management of the contract that governs the relationship. In particular it supports the design of contract elements that favor the creation and maintenance of a climate of reciprocal trust, and strengthen the contract through the addition of systems for governance of the relationship. Secondly, agency theory is also relevant to stage of monitoring the relationship during contract execution. In this stage it assists in defining the appropriate means for maintenance of long and short-term equilibrium between the needs of the two parties: on the client side, the need for guarantees of high levels of service; on the vendor side, the need for agreement that the client's objectives have been satisfied in full (Eisenhardt, 1989; Logan, 2000; Poppo and Zenger, 2002).

Relational resources as an instrument for addressing risks

In understanding the value of relational resources in IT outsourcing, a first necessary consideration is that the relational resources required depend above all on the type of outsourcing intended, particularly on the externalized items and the aims that the client intends to pursue (Nam et al., 1996; Kishore et al., 2003). An important distinction is thus made between tactical or operational outsourcing and strategic outsourcing, which indirectly signify outsourcing “*for cost savings*” and outsourcing “*for value creation*”. It is clearly evident that as the strategic content of the relationship grows there is also a growing need to govern the relationship on a partnership basis.

Thus if the object of externalization is a strategically “non-critical” activity or process, the relation between client and provider can be classified as a lower level of collaboration and partnership. The expected performance is predefined in the contract and can easily be measured along defined parameters. The subsequent stage of managing the relationship consists primarily of “control” that the performance actually provided respects the technical and performance terms identified in the contract. The situation is the opposite where the objects of externalization are activities, functions or processes with strong impact on firm business. In this case the client expects to receive contributions from the provider that increment the firm's capacities in innovation and value-creation. Such needs will best be satisfied through a *partnership-based* approach that inserts processes for the generation of new, shared knowledge (*knowledge development*).

Given these premises, in our opinion the value of relational resources should be reconsidered in the perspective of risk management, and for this aim we consider it useful to first of all to recall that the process of IT outsourcing can be subdivided in elementary stages, as follows:

1. Evaluation & decision to outsource and what to outsource;
2. Definition of objectives;
3. Choice of provider;
4. Negotiation of terms and conditions; service-level agreement, stipulation of contract;
5. Managing relations;
6. Monitoring and evaluation of results.

Each one of these steps implies the assumption of choices on the part of the firm. Each entails risk factors that can determine lack of success in the outsourcing, to greater or lesser extent. As a whole, the series of steps requires specific managerial competencies capable of identifying what strategic, organizational and economic profiles are concerned in the outsourcing choice.

The six steps can be synthesized under three macro-stages, corresponding to three distinct but closely interdependent moments in the governance and control of relations:

Formulating the choice (governance):

1. Evaluation & decision to outsource and what to outsource

2. Definition of objectives

Implementing the choice (ex ante management):

3. Choice of provider

4. Negotiation of terms and conditions; service-level agreement, stipulation of contract

Managing the relationship (ongoing management):

5. Managing relations

6. Monitoring and evaluation of results

The identification of these macro-stages permits better observation of the outsourcing process for risk management. It creates a link between relation resources and some of the risks through a reasoning process. If we exclude the initial risks related to erroneous externalization of an item that should not have been externalized, then the remaining risks in IT outsourcing are situated in the two macro-stages of *implementing the choice* and the third of *managing the relationship*, meaning in the stages where relational resources can play a role. In fact the major risks in outsourcing are identified in a well-known list produced by Berthélemy (2003), developed through empirical examination of approximately 100 cases of unsuccessful outsourcing in European and North American firms, as follows:

1. Outsourcing activities that should not be outsourced;
2. Selecting the wrong vendor;
3. Writing a poor contract;
4. Overlooking personnel issues;
5. Losing control over the outsourced activity;
6. Overlooking the hidden costs of outsourcing;
7. Failing to plan an exit strategy.

These “seven deadly sins of outsourcing”, to use Berthélemy’s term, can be associated with specific moments in the IT outsourcing. In particular, given our schema of maxi-stages, the associations are: Formulating the choice: Error 1; Implementing the choice: Errors 2, 3, 4, 7; Managing the relationship: Errors 4, 5, 6.

From all the above it becomes evident that the majority of risks in outsourcing can be addressed through greater relational resources, through which to evolve the client-vendor relationship towards a partnership relation, beginning with the moment of the selection and choice of a provider. It is from this observation that we derive our conceptual framework of considering relational resources as an instrument for risk management. Our thesis is that many of the risks in outsourcing can be minimized through: a) selection of a provider capable of developing a partnership relationship that meets defined conditions; b) structuring the partnership relationship through the adoption of systems of governance that are not only embedded in the contract, but that also provide formal and informal mechanisms of coordination and strategic and organizational integration between the client and vendor.

The choice of a provider

The choice of a provider is usually identified as one of the most critical moments in the IT outsourcing. Various authors have advanced lists of criteria to use in the process of choosing the provider. These tend to be articulated differently: i) for different market segments of providers (Kamanth and Liker, 1994; Wind and Cardozo, 1974); ii) according to the strategic relevance of the object for outsourcing and the risk level in the relationship (Kraljic, 1983), and iii) according to the type of client-provider relationship intended (operative versus strategic; short versus medium-long term; transactional versus relational).

The variables proposed for use in the selection process refer to “subjective requisites” demanded of the potential provider, such as: business-financial solidity; specific competencies and technologies of IT infrastructure; a certain portfolio and prices of services, including certain qualities or degrees of innovation; experience in the sector, and reputation in the market in (reliability, security, transparency, etc.).

The emphasis on these subjective requisites for the business practice of the provider is revealed in two empirical studies identifying the criteria most frequently actually applied by firms in the choice of vendors for IT outsourcing. An

investigation by the Cutter Consortium (2001) proceeded by interviewing the managers of “outsourced” firms that had engaged in outsourcing relationships. Interestingly, according to the manager’s reports, “they selected the appropriate vendor only 41% of the time”. Tab. 1 provides indicates the average frequency with which the client firms had applied specific criteria in the selection of their provider.

TABLE 1: CRITERIA APPLIED IN PROVIDER SELECTION (CUTTER CONSORTIUM, 2001)

Technological capacity	48%
Previous working relationships with the client	41%
Proven experience	37%
Reputation	36%
Price	30%
Stability of the provider business	28%
Understanding of the client firm’s needs	24%
Recommendation by a consultant	23%
Propensity and commitment to quality	21%
Considerations concerning times for service provision	19%
Provider’s knowledge of the client firm’s business sector	18%
Localization	18%

A second study by Aris et al. (2008) produced similar results, again indicating that client firms tend to focus on subjective requisites in the choice of the potential provider, as shown in Tab. 2.

TABLE 2: FACTORS IN SELECTION OF SERVICE PROVIDER (ARIS ET AL. 2008)

Factors	Ref
Reputation and Performance	17
Experience	54
Financial stability	54,61
Personnel assigned	6
Access and ability to adopt to latest technology	6
Practices of standard, policies and procedure	12,21
Practices of security	12,21
Responsibility towards disaster recovery plan	53
Usage of third party	25

From “subjective” requisites to “relational” requisites

The two empirical investigations reported above, as well as many other studies in the literature, show that client firms’ evaluation of potential providers tends to deal exclusively with subjective variables. The firms appear to ignore all the variables that express the true potential of the provider to achieve full partnership-based outsourcing, meaning full strategic and organizational integration with the client firm. Even when the client firm examines the providers’ strategies, management capacities, or potentials for development of future business, it appears that the evaluations lack or are weak in considering a series of variables that refer to: i) the capacities for integration of the structures, procedures and cultures of the two subjects entering the relationship; ii) the compatibility of the objectives pursued by the two parties; iii) the potentials for development of a true strategic partnership.

The subjective requisites typically applied in the analysis of providers are clearly important, but our belief is that alongside these there should also be consideration of the “relational requisites” for the provider. We identify two questions concerning governance and management of risk in outsourcing as being particularly important:

1. The questions as to whether and how the respective value chains of the two parties in the relationship are integrated, and in particular whether the client firm represents a significant, logical client of the provider firm;

2. The question as to whether the provider demonstrates true capacity and availability to develop a partnership relationship with the client firm – in particular if the provider’s approach to the market is aimed at the simple “stipulation of a contract” or if it has mid-long term aims for the construction of partnership-type relationships involving cooperation and trust.

Concerning the first question, one of the most important conditions for the outsourcing relationship to express its full potentials and reduce risks of failure is the *potential for integration of the two value chains*. The activities, processes and functions entrusted to the provider should be consistent with and enter within the provider’s value chain, and thus in its normal business. It is only when the object of outsourcing belongs to the core business of the provider that there can be adequate provision for the client-provider relationship to attain a win-win logic, with advantages and benefits accruing to both parties in the relationship.

One of the crucial questions for the client firm should be if the activity, process or function to be externalized pertains to the core business of the potential provider, or if it is simply something the provider is able to do given its production technologies and market strategies. If the object outsourced matches the provider portfolio then the provider can draw on experience and technological, organizational and management knowledge that has already been consolidated through its operations. The provider can exploit cost economies linked to a higher degree of standardization in the product or service being provided. In this case the provider’s activity will take on the character of the “one product for many” approach typical of competitive strategies based on cost leadership. Such strategies are typical of contractual relations based on commercial exchange (transactional approach), where the object is an activity, function or service that can provide only marginal effects in the client’s processes of value creation. In this case, the client will perceive all the economic advantages that derive from exploiting the investments already made by the provider, obtaining higher levels of performance and lower costs compared to what could be achieved by internalization. In summary, the client will obtain advantages from the provider’s competencies and resources, to apply in improvement or innovation in its business.

If the product or service requested from the provider is outside its historic business then new investments will be necessary in technology, human resources and professional skills. The provider must evaluate the investments demanded according to the usual business principles and techniques (Williamson, 1986, 1996; Stuckey and White, 1993; Bensaou, 1999). Thus the provider must first identify and then evaluate the resources of new technologies, processes or products, new professional skills and potential organizational changes, with a view to consolidating and completing the current elements of its business.

Finally, integrating the two value chains also implies the harmonization and coordination of the organizational structure, operational procedures and routines, and the values and cultures underlying the business exercises. It also implies “harmonizing” the leading people belonging to the two organizations. Key company figures will be called to integrate with each other in the organizational mechanisms for interface, necessary for the correct management of relations in whatever type of outsourcing, for its entire duration. In this regard, Dyer and Singh (1998) assert that the possibilities for allied partners to generate “relational advantages” through sharing of complementary strategic resources increases with the greater compatibility in their organizational systems, processes and culture.

Concerning the second question, a frequent reason for failure to achieve cost savings (given equal quality of performance under outsourcing or insourcing) or of unsatisfactory levels of performance obtained through the provider market (given a predefined cost) is found in the *basic strategic framework of the provider chosen*, and thus the market strategy adopted. This type of failure can occur in two ways.

First, the provider could equally adopt either a “contract orientation” (typical of *transactional marketing*) or a “renewal orientation” (typical of *relational marketing*). In the first case, the provider is primarily motivated by the aim of arriving at the stipulation of an outsourcing contract, which will also permit pursuance of his own objects. In the second case, the provider’s relational propensity actually serves as an important asset to the client firm for the protection of his objectives in the outsourcing choice.

Second, the provider’s entrepreneurial offer could equally be characterized by a strategy taking a “*marketing oriented*” approach, centered on the satisfaction of needs as specifically stated by the client, or by a “*product oriented*” approach. In the second case, the objective of the provider basically to sell or impose his product or service, achieved under a logic of standardization. In the successive structuring and execution of the relationship, the provider will then demonstrate little availability to differentiate and flexibility in the product for the purposes of the contract objectives.

We can conceive of a hypothetical example where the provider operates on a vast scale with a logic of standardization in the offer. In these circumstances, it is highly probable that the provider will result in unsatisfactory terms of differentiation and flexibility in the offer, which the client will often request.

In conclusion, the analysis of relational needs is clearly much more complex than the analysis of subjective requisites, where the outsourcing firm can resort to quantitative measurement and from this develop comparative ratings of potential providers. For identification and evaluation of the relational requisites there is no analogous possibility. This means the evaluation of relational requisites can only be conducted at the qualitative level, making it a critically challenging factor in the final choice of the vendor.

Contract management and relational governance

A second area where relational resources reveal their critical importance is in the stage of structuring the client-vendor relationship and creating the organizational conditions to control the execution of the contract on the part of the provider. Again in this area, the partnership-based approach requires the identification of organizational solutions for the client-vendor interface that will render the cooperative intent operational and concrete, effectively activating the search for new knowledge and innovation.

Since in strategic outsourcing the aim is co-generation of new shared knowledge, our observation is that it will not be sufficient to only define the contractual rules for the coordination of the two parties' actions. Instead it is necessary to create the organizational conditions that can ease the sharing of knowledge and the integration of the client and provider firms' value chains.

Here, the most important implication in terms of structuring the outsourcing relationship is the need to go beyond the purely contractual terrain and search for forms of regulation that revolve around a shared search for advantages and development in the respective businesses. In other terms, the shift from transactional to relational logic renders the area of *contract engineering* insufficient, at times unsatisfactory or even counterproductive, to obtain long-term results in innovation and creation of new knowledge. In this regard, McIvor (2005) shows how the "relational contracting" requires much more than the stipulation of a formal contract. It includes the activation of "social mechanisms" to permit the development of information exchanges, flexible interaction and joint resolution of the problems that arise from time to time in the relationship. Similarly, Han, Lee and Seo (2007: p.31) state that "the interactions between the clients and their service providers often go beyond rules, agreements and exceptions; they also depend on intangible factors that cannot be easily incorporated into a contract".

The legal instrument of the "contract" thus cannot be considered as the only instrument to apply in striving to meet the needs for coordination and integration between the two parties (Leimeister, 2010; Behrens, 2006). The initial regulation of the exchanges within relationships is only a first, although necessary level in their structuring. The relationship must also find other mechanisms of interaction and coordination that permit the possibility of long-term evolution of the partnership.

In taking a relational approach, the organizational tools for management of the relationship change. The instruments are no longer based simply on contractual norms, but now extend to formal and informal mechanisms of coordination that ease the common activity, both in its planning and implementation. The development of the new knowledge and innovation that characterize strategic IT outsourcing cannot be governed by contractual regulation alone (norms, clauses and detailed technical specifications), but instead require further elements: i) the true desire for interaction; ii) the possibility for both parties to develop their businesses through the relationship; iii) strategic and organizational conditions for the integration and coordination of the respective businesses.

It is thus indispensable to come to a new logic in establishing the relationship between the interacting parties, including in part through a different conception of the contract itself, the source instrument in the regulation of the relationship. The contract must be understood as an instrument for interaction in the partnership, and not simply as a tool to regulate the commercial instruction. In the next section we illustrate how in strategic IT outsourcing, the contract must be structured in such a way as to be an instrument for flexibility, and not of rigidity.

The contract as "risk factor"

The contract is usually seen as an “tool for risk control” in outsourcing, or rather as an set of rules and conditions that shelter the client firm from risks of opportunistic behavior and distancing of the provider’s performance from the client’s expectations or from what is predetermined by the stipulated terms (Gellings, 2007; Leimeister, 2010). There are different types of contracts in function of the objectives and aim of the IT outsourcing relationship, oscillating between the two opposing characteristics of *rigidity* and *flexibility*. Contracts are also termed as “tight” or “loose” (Grover and Teng, 1993). A tight contract leaves low margins of maneuver to the two parties. A loose contract is less formalized and rigid, intended to structure conditions for greater flexibility and adaptability with potential changes in the internal or external conditions that can affect the contract objectives.

A tight contract intuitively represents a higher degree or risk of inadequacy in meeting the changing conditions surrounding the activity defined under the contract. This will result in needs to frequently redefine the terms of the relationship, generating one of the many types of “hidden costs”.

However it is also true that a contract providing numerous legal norms and the definitions of the contractual terms (performance objectives, criteria and parameters for control, sanctions in case of inadequacy, etc.) offers means of “defense” and “control” for the client firm in regards to the provider’s operations. This is especially true where there is strong information asymmetry between the two parties, and thus with potential opportunistic behavior.

From this discussion we observe that the type of contract adopted must be closely linked to the type of outsourcing, in terms its aim and objectives. For strategic IT outsourcing the contract must function in the creation of a client-vendor partnership, and thus take a “loose” form, leaving margins for the provider’s action and reciprocal adaptation between client and vendor. If not, the contract is actually transformed from a “tool for risk control” to a “risk factor”. In fact it very often happens that in the desire to exercise greater control and defend against potential opportunistic provider behaviors, the client firm specifies the contract to the greatest extent possible, ultimately rendering it excessively rigid and blocking the development of a true partnership. On the contrary, a “loose” contract offers advantages of flexibility, making it possible to adapt to conditions that cannot be perfectly foreseen *ex ante*, and thus minimizing risks of inadequacy. In addition, flexibility in the contract permits the client to exploit the innovative capacity of his provider, since the provider is freer to express his competencies and specializations through proposal of solutions that were unknown and unforeseeable at the moment of stipulating the contract.

For this reason, in strategic IT outsourcing the contract must from the outset provide for procedures of *change management*. It must foresee what mechanisms and means will permit proceeding, in successive moments, to the revision of the outsourcing and its redirection towards characteristics of greater adequacy and coherence with respect to changing internal and external conditions, and in consideration of new business needs for the client. According to Barthélemy (2001), this doesn’t imply that the contractual clauses are “vague” or “indeterminate”. Instead it means conceiving and using the set of rules and conditions agreed between client and vendor in a flexible manner.

In strategic IT outsourcing, the “tight” contract can also become a “risk factor” for another important reason, arising from the means, parameters and intensity through which the client firm controls the provider. In our opinion, a pressing and bureaucratic type of control to achieve rigid respect of the contract’s predefined and codified norms and procedures can result as counterproductive. It can produce effects of “flight from control”, or “subjection to control”, where the provider shows greater preoccupation with satisfying the control criteria and successive levels rather than with responding to the client’s true needs through the achievement of the defined objectives.

Contrarily, the role of control systems should be to serve in the achievement of the fixed objectives, meaning that they should be oriented towards control of the results obtained. Outcomes should in fact be analyzed at the double level of analyzing the *results/objectives* and *results/resources* relationships. Rather than structure a system to control the providers’ behavior under a hierarchical type of relationship, the client firms must consider the provider as an actor in a partnership relationship. The relationship is founded not only the sharing of objectives, but also on equal governance of the relationship itself. This includes the governance of the moments of controlling the relationship results and the provision of corrective interventions as necessary to realign the relationship in the desired direction.

Conclusion and future developments

This paper focuses on strategic IT outsourcing, meaning the externalization of functions, activities or processes that are closely tied to the company's core business and thus have high strategic value and strong impact on the creation of value. In this type of outsourcing, the relationship that develops between the client and vendor is best understood under a partnership-based or relational-based paradigm, where relational resources are seen as playing a crucial role. The paper contributes to existing research and literature on IT outsourcing, providing conceptual insights on the role of relational resources and their impact on mechanisms of governance in the client-vendor relationship.

In particular, we have analyzed relational resources from the view of risk management, and as an instrument to address risk. We have shown that almost all the risks generated by strategic IT outsourcing (except for those concerning erroneous decisions on if and what to externalize) are concentrated in three stages of the process: in choosing the provider, in contract management and in the ongoing management of the relationship. In these stages, relational resources are crucial to success in any outsourcing intended "for value creation".

Beginning from this conceptual framework, we focused consideration firstly on the choice of the provider, showing how traditional evaluation of the "subjective requisites" for potential providers is insufficient to ensure the development of a relationship of client-vendor partnership. We thus advanced the idea that in addition to the subjective requisites for the potential provider it is also necessary to identify and evaluate "relational requisites", which we consider as preconditions for evolution of a win-win relationship.

In the second place, we have illustrated how the contract is generally not a sufficient instrument for the evolution of a true partnership. Alongside the "contractual norms" there is also a necessity for "relational norms". These permit governance of a series of intangible factors that are essential in a mid to long term relationship of partnership: mutual trust, mutual respect, flexibility, information exchange and solidarity. In addition, not only is the contract likely to be insufficient as the sole instrument for regulation between the parties, it could actually revert from its intended role as the "instrument to address risk" to a "factor generating risks" in IT outsourcing. This happens when the contract is primarily an attempt to define a balance of terms and conditions that would protect the two parties from negative events or potential conflicts. Under this approach, the contract serves only as a rigid instrument for regulation of the parties' relationship, and fails to provide the characteristics of flexibility necessary in evolution of a true partnership. Thus the contractual governance of the relationship must be structured in a manner that guarantees the flexibility called for under conditions of a changing environment and the client's changing business needs.

The current paper develops these considerations in purely conceptual terms, providing deeper understanding of the role of relational resources in IT outsourcing. Our considerations lead above all to insights that provide support to the company's in its tasks of choosing an IT provider and in defining the governance mechanisms for the relationship. Further research at both the conceptual and empirical levels could provide additional constructive contributions. At the conceptual level, it would be useful to analyze the different roles of relational resources in the various typologies of IT outsourcing (business process outsourcing, application outsourcing, infrastructure technology outsourcing). Research at the empirical level could investigate if and how the choice of firms' providers in IT outsourcing takes account of "relational requisites" for the potential provider: in particular what variables are actually used in the company processes of selection and choice. A second useful line of empirical research would be to investigate what formal and informal mechanisms of governance are used in the subsequent stages: of contract management and ongoing management.

Sustainability and SMEs: the case of CSR4UTOOL web application

Abstract

Several business administration scholars recognized the presence of ethical roots at the base of the actual crisis both in large and small companies. In addition, Small and Medium-sized enterprises (SMEs) positively represent the backbone of the European economic system and, negatively, they represent the 64% of all European environmental pollution, generated by an unethical conduct (Eurobarometer, 2012).

The purpose of this paper is to understand and explain if SMEs are able to change their management practices with more sustainable practices using a self-assessment and learning tool. A literature analysis of how SMEs address sustainability issues will be discussed especially, the need of tools for SMEs. The focus of the paper relies on the presentation of an experimental and innovative web-based tool for interactive assessment of CSR for small entrepreneurs, called CSR4UTOOL. The theoretical model at the base of the algorithm is the Carroll's Pyramid of Responsibilities (1979).

Introduction

There are 23 million small and medium-sized enterprises (SMEs following the European definition) in the European Union, representing 99% of all businesses and providing around 90 million jobs in the single market. SMEs contribute to the European economy generating the 57.6% of the entire value added and, in that sense, they are considered the backbone of the European economic system. This means that the contribution given by small entrepreneurs is essential for pursuing the goals of "Europe 2020," that is the EU's strategy for a smart, sustainable and inclusive growth of Member States (Eurobarometer, 2012). Despite the term "small", Morsing and Perrini (2009) noted 'that the "smallness" of the individual SME is not proportional to the collective "grandness" of SMEs as a whole. As a matter of fact, at the same time, SMEs are responsible for roughly 64% of the total European industrial pollution because of the existent difficulties in complying with environmental legislation and, in the meanwhile, 24% of them actively engage in actions to reduce their environmental impact, mainly the reduction of energy consumption and the adoption of environmental management systems (Eurobarometer, 2012). In addition, other data on social impacts of SMEs are impressive. For instance, according to a research of Link Lab 2014, the number of Italians that committed suicide for a motivation linked to economic reasons has grown up of +70% in relation to 2012 (149 people in 2013 and 89 in 2012). The most impressive data is that nearly half part of these people were small and medium-sized entrepreneurs and they have committed suicide declaring a reason related to the economic crisis.

In order to boost the economic competitiveness of SMEs, the European Commission has implemented an action plan namely "Small Business Act – Think Small First" (SEC/2008/2101) which aims to put the needs of the SMEs at the heart of European policy. The Small Business Act provides ten specific principles and line of actions as: environment which rewards enterprise; second chance for honest entrepreneurs who face bankruptcy; the design rules according to 'think small first'; public administration response to SME needs; adapt public policy and tenders to SME needs; access to finance by SMEs; opportunities from the single market; skills and innovation; turn entrepreneurial challenges into opportunities; benefit from the growth in markets.

Moreover, in 2011, the European Commission have stressed the important role of SMEs also for the sustainable development of Europe. In particular, into the document called "A renewed EU strategy 2011-14 for Corporate Social Responsibility", it is stated that, CSR is "*the responsibility of enterprises for their impacts on society*" and this logic implies to foster the adoption of processes to integrate social, environmental, ethical, human rights and consumer concerns into business operations. The principal element of innovation relies on the introduction of a strategic view of CSR in close collaboration with their stakeholders, with the aim of: (i) maximizing the creation of shared value for their owners/shareholders and for their other stakeholders and society at large; and (ii) identifying, preventing and mitigating their possible adverse impacts. The document addresses

several crucial issues that SMEs face in applying sustainability practices as: their limited resources; the pressure exerted by the presence of administrative burdens; the role and importance of intermediary organizations; and, the tendency of communicating social and environmental information informally and on a voluntary basis.

Recently in April 2014, the European Parliament has promulgated a directive (Communication 78/660/EEC and 83/349/EEC) that will be successively approved in September 2014, which impose communication of social and environmental information duties to large companies and listed group. Following these communications, SMEs are not directly involved but, indirectly, if a large company or a listed group will be called to comply or explain data i.e. on their supply chain, then, they need tool to collect and manage these data. Several ICT technologies are burgeoning, but the main limit of these technologies, that is also the limit of the general CSR approach, is that they have been created for large companies (Tilley, 2000). In the near future, small entrepreneurs that work in the B2B could receive auditor on sustainability issues by their “main customers” that imply to provide a pursuit in providing the information requested.

In the last decade, academia and scholars have started to discover and demonstrate the peculiarities of SMEs that act in a social and responsible manner and, for that reason, the paper starts with a revision of the state of the art of the literature. A literature analysis of how SMEs address sustainability issues will be discussed, especially, the need of tools for SMEs. The purpose of this paper is to understand and explain if SMEs are able to change their management practices with more sustainable practices using a self-assessment and learning tool. The focus of the paper relies on the presentation of an experimental and innovative web-based tool for interactive assessment of CSR for small entrepreneurs, called CSR4UTOOL. The novelty of the web-based tool is the effort of moving away by the mere collection of data, experiencing the user/entrepreneurs into a self-evaluation, and understanding the motivations behind the actions. The paper is classified as a demonstration paper, as the aim is to show the technology prototype that relies on the Carroll’s Pyramid of Responsibilities (1979). In future, entrepreneurs, researchers, practitioners, politicians, large companies and banking sectors will benefit of the results deriving from a massive experiment and diffusion of this technology.

An overview of the studies on sustainable SMEs

The particularity of SMEs in approaching sustainability issues

Scagnelli et al. (2013) have given special attention to SMEs cognizant of their sustainability impact. In general, SMEs have relatively informal organizational structures, often managed by owners or family members. This implies that there is a close correlation between the head of the company, his/her way of manage the business, his/her personal choices, attitudes and moral values (Petts et al., 1999; Surbutts, 2003; Grayson, 2004; Longo et al, 2005; Longenecker et al., 2006; Vives, 2006; Worthington et al., 2006; Jamali et al., 2008; Lange and Fenwick, 2008; Redmond et al., 2008; Hamman et al., 2009; Moore et al., 2009; Nielsen and Thomsen, 2009; Fassin et al., 2011; Schlierer et al., 2012).

The proximity between the owner-manager and his employees relies on personal relation, that are often fluid and informal (Cambra-Fierro et al., 2008; Hamman et al., 2009; Russo and Tencati, 2009; Fassin et al., 2010; Fenwick, 2010; Rivera-Lirio and Muñoz-Torres, 2010; Russo and Perrini, 2010; Cassells and Lewis, 2011). These relationships, built out of intangible components as trust, reputation and legitimacy, represent the lifeblood of an SME and, in the meantime a constraint (Spence, 1999; Graafland et al. 2003; Spence et al., 2004; Courrent and Gundolf, 2009; Revell et al., 2010). Davies and Crane (2010) provide a descriptive theory of how SMEs implement CSR in their business, and they state that one of most used approach is dealing CSR issue through Human Resources management practices. Undoubtedly, the “proximity” is also at the firm-local community level, and therefore, it implies to be involved in community affairs (Longo et al., 2005; Fuller and Tian, 2006; Lawrence et al., 2006; Perrini, 2006; Williamson et al., 2006; Niehm et al., 2008; Fisher et al., 2009; Muller and Kolk, 2009; Russo and Tencati, 2009; Russo and Perrini, 2010; Del Baldo, 2010; Fassin et al., 2011).

Obviously, SMEs face the competitive pressure exerted by the economic environment answering with limited resource, in terms of cash flow, knowledge and human resources. These motivations attenuate the attitude of small entrepreneurs towards investing time and resources on sustainability. Usually disaffected entrepreneurs

tend to perceive CSR as a business cost without benefit and they concentrate their attention on short-term strategic planning (Spence and Rutherford, 2001, 2003; Lepoutre and Heene, 2006; Roberts et al., 2006; Avram and Kuhne, 2008; Chiappetta Jabbour and Puppim-de-Oliveira, 2012). Managers–owners justify social and environmental investment only if there is an economic and competitive feedback deriving from a customer or a project/business (Deniz and Suarez, 2005; Jorgensen and Knudsen, 2006; Williamson et al., 2006; Brammer et al., 2012; Torugsa et al., 2012).

On the cognitive level, it has to be noted that SMEs often misunderstand the meaning of ethical terms like CSR, sustainability reporting, code of conduct and ethical codes and they perceive them as distant, possibly inoperative or counter-productive (Grayson, 2004; Murillo and Lozano, 2006; Fassin, 2008; Rivera-Lirio and Muñoz-Torres, 2010; Baden and Harwood, 2012). On the other side, they prefer a sunken, internal and proactive approach because it stems from voluntary involvement (Matten and Moon, 2004; Fuller and Tian, 2006; Jenkins 2004, 2006, 2009; Lynch-Wood et al., 2009; Del Baldo, 2010).

On the terminological level, Ahmad and Seet (2009) demonstrated that CSR is perceived as honesty, integrity and willingness to admit mistakes and to tell the truth; while Petts et al. (1999) and Fassin (2008) refers to doing the right things; Surbutts (2003) employ the concept of ability to say sorry. Courrent and Gundolf (2009) report that “ethics” has been viewed as a management tool for managing corporate reputation and image. Therefore, Baden and Harwood (2012) provide a discussion on the ambiguity of the term CSR especially in the view of an SME. They stress a need for a better choice of words and suggestions including a focus on the totality of responsible business practice that means to focus on the use of action verbs that reflect the nature of the engagement with the community and environment. This, it is also confirmed by the study of Fenwick (2010) on the CSR in everyday practices and actions. On the contrary, Deniz and Suarez (2005) analysis confirm that some SMEs associate at the term CSR the concept of philanthropic activity. Graafland et al. (2003) refer to expectation and responsiveness towards stakeholders.

Several studies have demonstrated that SMEs adopt different behavior in addressing sustainability. Some of small entrepreneurs believe that they have an inexistent or little impact on the environment (Gadenne et al., 2009); while other tend to adopt a chameleon approach that Unioncamere (2003) classifies as: cohesive, multi-certificate, aware, skeptical and movable. A new body of literature is growing on the issue of CSR within the supply chain, especially in relation to SME behaviour (Jorgensen and Knudsen, 2006; Roberts et al., 2006; Perrini et al., 2008; Baden et al., 2009; Gadenne et al., 2009; Muller and Kolk, 2009; Baden et al., 2011). Moreover, scholars are beginning to study the phenomenon of business networks as a driver for the diffusion of CSR within SMEs (Spence et al., 2003; Moore and Manring, 2009; Battaglia et al., 2010; Fenwick, 2010; Hoivik and Shankar, 2011; Jamsa et al., 2011).

SMEs, social accounting and disclosure

The adoption of sustainability practices leads managers to observe economic, social and environmental performance as an equilibrium of three inter-connected dimensions (Guthrie and Parker, 1989; Gray, et al., 1995, 1996; Adams, 1999). Scholars agree on the fact that social and environmental accounting practices is not a fertile terrain for SMEs as there is general lack of information on their social responsibility actions (Spence et al., 2003; Lawrence et al., 2006; Lepoutre and Heene, 2006; Parsa and Kouhy, 2007; Fisher et al., 2009; Nielsen and Thomsen, 2009; Fitjar, 2011). An extensive lack of technical knowledge, awareness of benefits and, most of all, high cost of implementation explain why SMEs does not provide a systematic social account Hillary (2000).

While the provision of CSR tools and social reporting guidelines is burgeoning rapidly, there is a general lack of tools dedicated to SMEs that want to adopt CSR disclosure account (i.e. social, environmental or sustainability reports) (Catska et al., 2004; Russo and Perrini, 2010). Enderle (2004) points out that, overall, CSR reporting standards might be inappropriate for small firms because such standards have been developed mainly with large businesses in mind. Besides, from the SMEs perspective, the possible ineffectiveness of informal tools such as codes of conduct and social and ethical standards might be explained by the requirement of a greater investment in terms of time, funds and energy. Furthermore, much more study and work is needed in order to develop appropriate ethical tools capable of connecting new theories to small businesses practice (Tilley, 2000). In general, Baden et al. (2011) which a ‘downstream’ corporate social responsibility activity into the views and actions of SME owner-managers.

Conversely, Parsa and Kouhy (2007) investigate the prevalent view that SMEs are unlikely to report social information due to their financial constraints and the perception that they have very little social conduct on which to

report. On the contrary, they show that SMEs report social information regardless of their financial constraints. For small companies a good reputation is crucial in attracting resource holders and fulfilling their expectations (Sabate and Puente, 2003).

Towards a theory of CSR in SMEs

While Garriga e Melè (2004) have provided a deepen debate on the existent theories that compose the CSR field of study, Spence and Perrini (2010) invoke the need of an emerging complex of theory, tools and mechanisms to contextualize small entrepreneurs' social responsibilities. Exemplifying a bit, Epstein (2007) describes a socially responsible firm those firms in which the usefulness of the firm itself is optimized to the diverse stakeholders and, in the meantime, the possible deleterious effects are minimized. That is to say, the behavior that trying to achieve financial results minimizing negative spillovers and maximizing positive externalities to the environment and society.

Under these lenses, the CSR approach can be represented as a continuum starting from a compliance behavior (reactivism) to ethical and moral commitment that leads to voluntary actions (proactivism). Some authors interpret the small businesses social responsibility as a relatively reactive approach (Uhlener et al., 2004; Ahmad and Seet, 2009; Lepoutre and Heene, 2006; Udayasankar, 2008). Reactivity means the attitude of a small entrepreneur to improve his social behavior under external pressure like external expectation from stakeholders (including public policies) and increasing competition (Uhlener et al., 2004; Williamson et al., 2006; Fitjar, 2011). Other authors explain the interpretation of social responsibilities as social priority, long-term survival factor and the "wanting to give back" to community less than profit oriented motivation (Spence and Rutherford, 2001, 2003). The importance of adopting pragmatic actions is also underlined by Schlierer et al. (2012), including the institutional structure of the national economy but also wider cultural norms and habits regarding economic activity. Cambra-Fierro et al. (2008) found that the behavior of SMEs involved in environmental CSR is expressed as several actions: complying with the reference legislation, adapting the management to the owner and / or managers' value system, and trying to make a profit with the effort. Lozano (2012) gives an in-depth analysis of the voluntary initiative contribution towards CSR, but often SMEs tend to adapt the tools developed for large enterprise to their own needs, even if "SMEs are not little big firms" (Tilley, 2000).

Among these tools are Social and Environmental Management System (SEMS) certifications. SEMS and the related certifications have also been very successful in the SME framework, as demonstrated by (Bouma and Kamp-Roelands, 2000; Jirillo et al., 2003; Miles and Munilla, 2004; Catska, 2004; Catska and Balzarova, 2008a and 2008b; Llach et al., 2013). Recently, Bürgi (2010) has affirmed that among SMEs, the adoption of SEMS is continuously growing as a formal request of a customer and, this adoption influences the approach towards sustainability as demonstrated also by Fatoki and Chiliya (2012) and, empirically by Uhlener et al. (2012). Bürgi (2010), in Spence and Painter-Morland (2010) presents a theoretical model that we can label holistic or liquid approach of CSR in SMEs that unify SEMS, moral value and small business. Even though, they states that there are not enough research in business ethics, regarding SMEs, despite the fact that there are differences between large firms and small and medium size firms beyond the number of employees (Spence and Painter-Morland, 2010; Burgi, 2010). In general, the greater part of the studies on CSR in SMEs have been conducted under the business ethics approach, even though these theoretical models have been developed starting from large companies' perspectives.

The methodology

In order to offer at the reader a perspective of the new technology, it occurs to premise and briefly summarize those relevant insights that have inspired it. Following Spence and Perrini (2010), several elements are important in small entrepreneurial context that deals with sustainability issues:

- There is a generalized lack of codification of CSR actions;
- The role played by small entrepreneurs' personal moral values are fundamental;
- Who conduct or manage is the principal and also the agent of the firm itself;
- SMEs are often involved into project carried out by the community;
- Flexibility and reputation are considered as a source of competitive advantage;

- Human resources are a privileged stakeholder;
 - Exogenous factors like business sector, belonging to a group or network of firms influence the corporate behavior.
- In addition, Spence and Perrini (2010) have invoked the need of new tools for boost CSR in SMEs and the tool that will be presented wants to offer a practical answer to that need.

The rationale

CSR4UTOOL (www.csr4utool.org) is a web-based application especially dedicated to the interactive self-assessment of CSR performances in SMEs. CSR4UTOOL has been developed during the European project LOIEs (Lessons and Options for an Integrated European approach to CSR) financed by the DG Occupation, Social Affairs and Inclusion.

LOIEs was an experimental European project which aims to stimulate dialogue between profit and nonprofit organizations as leverage to identify and test new models of collaboration and interactions in applying CSR concepts. LOIEs involved six companies in twinning and three public institutions in three EU countries (Bulgaria, Italy, Spain), identifying some methods of interaction more effective and efficient in terms of social and managerial value. Synthesizing a bit, in LOIEs several different tools were created and tested, among which a checklist of items on CSR issues was created. This checklist was based on ISO26000 core concepts, around 50 items and the answers followed a Likert-type of scale. The scope of the checklist was to provide a self-assessment on CSR issues at those firms involved in the project and suddenly the checklist was formally included in the official manual of the project. After the administration of the test, several problems arose: (i) the test required a consultant in order to explain the specific terms used to explain sustainability issues; (ii) the test required time and human resources in order to retrieve the information and give the desired answer; (iii) the results were infected by a high percentage of social desirability bias.

On this base, CSR4UTOOL has been developed in order to be:

- Not structured as a survey;
- Free of charges, anonymous and completely available in any time on any devices, enabling the information retrieval without a loss of data;
- Used with or without the help of a consultant;
- Developed as a service, at the end of the test the system provides a conclusive report to the user that contains scores and benchmarking on specific sectors;
- Used to compare the CSR performances of a firm into different strategic areas of interest;
- Easy to understand providing examples of actions, verbs, situations, and most of all, a clear language and an in-time translation;
- Used as a self-evaluation and/or learning tool and for editing a preliminary sustainability report.

The users of CSR4UTOOL are typically the owner or the CEO of the SMEs, also a member of the administrative staff can use the tool, but only if he/she has a complete overview of the firm. After the login phase, in order to personalize the experience, the first step of the algorithm profiles the user evaluating: country; role; juridical status of the firm; profit orientation (in order to provide the correct prospect for the value added determination under IV Directive and also for those SMEs that use only a cash flow statement); dimensions; sector; and, among those not mandatory items there is the presentation of the firm, number of local units and production sites; mission statement. The second and third steps consist in the self-assessment phase based on common items and specific sector supplements (using GRI guidelines) for a total of 56 items that can be skipped, while the fourth step consists in the final evaluation and the user has the possibility to download the final report.

The development levels

The developing phase has taken into account different operational levels: a scientific level, a materiality level and a syntactic level.

The scientific level refers to the need to interpret the data collected into a theoretical framework. As presented in the state of the art, the literature on CSR in SMEs is fertile, but there is a substantial lack of theories to interpret SMEs behaviors. In that sense, the literature demonstrates that small entrepreneurs are also sensitive to the reach a competitive level, it was assumed that the Corporate Social Performance model could be used as a referring theory. In that sense, at the base of the tool there is the Carroll's Pyramid of Responsibilities (1979) model. Garriga and Melè

(2004) classifies Carroll's theories under the integrative theory group as those theories that searches for social legitimacy and processes to give appropriate responses to social issues. In the model provided by Carroll, the author considered a definition of social responsibility, as a way to fully address the entire range of obligations business has to society, must embody the economic, legal, ethical, and discretionary categories of business performance. As discussed above, the continuum between reactivity and proactivity is considered as a linear model. Carroll's Pyramid cannot be adopted as a linear model, as it is obvious that firms can decide to approach the sustainability pyramid both in top down and bottom up sense (or in the middle).

Inspired by this model, the answers given by the CSR4UTOOL algorithm matched the Epstein linear model with the Carroll un-linear one. In particular, the algorithm codifies the answers in a framework supported by Unerman (2012) that includes four different motivations at the base of sustainability actions:

- 1) CSR actions to comply a legal standard or a managerial system;
- 2) CSR actions that can increase profit or reduce costs in the short-term;
- 3) CSR actions that can represent an investment and a source for competitive advantage;
- 4) CSR actions that are related to ethical and moral motivations.

In order to consider all the possible events, the algorithm includes also the case of: not interest on CSR, and, the case in which the entrepreneur wants to be socially responsible, but he perceive the CSR as a not affordable process and, for that reason, he does not want to be "socially responsible". Fig. 1 represents the scheme used for codifying the answer in the algorithm.

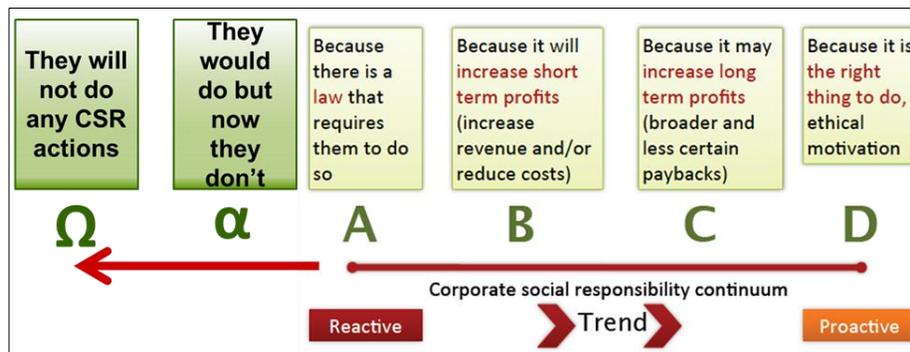

FIG. 1

The materiality level refers to the importance of referring to external and international standards in the selection of the items included in the algorithm. Complying with the previous checklist, the items has been selected and presented in the following order: CSR "term" and moral values; stakeholders; human rights; labor practices; suppliers; product or service responsibility; community development; environmental responsibility; financial responsibility; NGO. This order complies with the ISO26000 core concepts and, for each items a benchmark with international SEAR guidelines have been provided. In particular, each items was compared to GRI, GBS, GRI INGO, AA1000 Stakeholder engagement, OECD guidelines, UN Global Compact, Not-for-profit Agency guidelines, SA8000, ISO 14001, and EMAS. The comparison consisted to check if the item is present in these guidelines, how it is addressed and select the significance of the issue for an SME. This process is the equivalent of a materiality analysis as suggested by GRI. As there is not a scientific criterion for select the items, the tool has been created to be updated and modified with no costs of implementation.

For CSR "term" and moral values is intended: the knowledge of the acronym and the term; assess if the firm is following a policy, strategy, norms or a SEMS; eventually existence of SEAR process or reports or codified actions; external communication of CSR; internal communication of CSR; moral values that inspired the management culture. For the section stakeholders: the knowledge of the term stakeholder; an interactive stakeholder map using categorizing those who can influence and be influenced by the firm operational activities; eventually existence of stakeholder engagement actions. For human rights: sensitiveness towards human rights issues; eventually adhesion in human rights

defense actions and initiatives; presentation of a simulation (business case) in which the user is called to take a decision. For labor practices, the algorithm consider topics such as: gender equality in administrative and operational level; seniority levels; qualification; type of contract; CSR actions towards employees in terms of internal welfare; training and other benefit; evaluation of risks and safety. The theme “suppliers” aims to investigate the nature of the relation with the suppliers especially on topics such as: fair labor practices; audit and control on risks of non-compliant behavior (i.e. child labor, illegal labor, corruption, etc.); the role played by moral values during the dealing phase; CSR actions adopted by the firm; importance of networks of local suppliers; capacity to solve unmoral situation in dealing. About the responsibility related to product and service, the algorithm provides only the opportunity to select a list of CSR actions performed. About community development, the algorithm takes into account: CSR actions as corporate citizenship activities; relations with not-for-profit and social enterprises; awards received on sustainability subjects; value creation with public administrations. In relation to environmental responsibilities, the algorithm provides an evaluation on: understanding of the meaning “act in respect of the environment”; respect of the environment as source of competitive advantage; resolution of environmental issues/situation; environmental responsibility actions; performance data on waste management. About financial responsibility, the algorithm helps the entrepreneur to calculate the economic value added generated and distributes; it also asks data on fines for non-compliant actions, investment on CSR, and composition of the member of the board (presence of external manager not related to family in family business). The section related to NGO, is presented only to those NGO according to their profile, and it deals with: creation of shared value between purpose and financial equilibrium; importance of financial resources; management of funds; use of voluntary work and benefit provided to them, if any. After this general question, the algorithm present further sections on those supplement sectors identified by GRI, if any.

Moreover, the syntactic level has regarded the way through which one topics is addressed. First, different forms of questions/answers compose the algorithm:

- open answers used for present the firm and the mission: no semantic analysis are conducted on this;
- single-choice answers: used for applying the theoretical model discussed above (different $\Omega - D$);
- multiple-choice answers: used in order to list those CSR actions already adopted by the user;
- examples, practical situations or simulations: they have the aim of presenting a real case in which the user has to take a decision. Every case has been studied in order to imply a moral decision making process according to Kohlberg (1971);
- tables: in order to account and report quantitative information;
- interactive tools used only in the case of stakeholder map.

Secondly, a review of the terminological background of each items was performed. The structure of the sentences was revised in order to clarify the meaning of the questions and let the process easier to understand. For instance, according to Schlierer et al. (2012), and, in order to simplify the terminology used in CSR literature, the algorithm avoid the case of misinterpretation presenting a definition of the term included in the questions. In order to clarify a bit, the algorithm avoid the questions like: “*Is there a written agreement to exercise due diligence in order to identify, prevent and tackle the impacts, real or potential, linked to the activity in the field of human rights?*” in favor of a more clear question like: “*Does your organization join or adopt human rights defense programme/tools?*”

Third, in order to follow the rationale of the model, the answers are presented following the previous $\Omega - D$ scale, for example:

Ω No, I have never heard this term

α No, I have never heard this terms but I am interested in getting more information

A No, it does not, it only complies with mandatory laws and standards

B Yes, it does, because we needed it in order to strength business relation or increase organization reputation

C Yes, it joined UN GLOBAL COMPACT and it adopted the principles implementing them into its contracts and corporate policy in order to identify, prevent and tackle the impact, real or potential, of its activity in the field of human rights

D Yes, it joined UN GLOBAL COMPACT because we want to be a different organization that actively denounce and prevent human rights violations

The results page

The fourth step of the algorithm consists in the page of results. In that page, the user can have an overview of his corporate social performances divided by area of interests. For single-choice questions, the algorithm provide a score calculated as the mean of the answer given following the $\Omega - D$ scale. The use of the numerical scale to explain a non-linear behavior is *di per se* an error, as obviously the mean reduces the variability of the behavior especially in this un-linear context. In order to reduce this error, the scores are provided divided in area of interest, but the error remains.

For multiple-choice questions, the tool provides a benchmark of the users choices vs. other respondent of the same sector(s). It is supposed that showing the benchmark can help the user to identify if his firm lead the peer group or lagging behind. In addition, the report contains a summary of the overall occurrences for these type of questions.

For data inserted in tables, the tool provides a graphical representation of the performances and a benchmarking with other peers. Sometimes, the system provides different alerts, to advice the user if there are problems related to the data filled in.

Discussion on ongoing results

In July 2013, CSR4UTOOL was successfully presented during the final conference of LOIEs project and, in November 2013, it was completely functional. Nowadays, 125 users have been logged in and one third has finished the process of self-evaluation. Globally, it accounts more than 26000 pages visualized and more than 30 articles on press release. The tool is actually available in English, Italian, and Spanish. A Suomi translation will be uploaded during September 2014.

At June 2014, the 74% of the users are Italian firms, while the remaining 26% in equally distributed between European and non-Eu countries. The 76% of the users represent a profit company and 85% are SMEs, half of them is a micro enterprise (the remaining 15% has declared to act on the behalf of large company). As the collection of data is an ongoing process, the results after the first testing phase are under analysis and daily updated.

Several aims can justify the existence of the tool. First, it gives an answer to the need of tools for involving small entrepreneurs in applying sustainability core concepts into a free of charge and easy to use manner.

Secondly, the structure of the algorithm can be evolved including for instance an application in the field of vendor rating, banking sector for the evaluation of reputational risks and most important, in the public procurement process. The tool is developed explicitly for SMEs, but the data obtained can be used to derive important conclusions on the research side and for example in defining and studying public policy.

Of course, the existence of other ICT software to collect data and rate the sustainability of the performance are growing, but the CSR4UTOOL demonstrated that a web-based solution can be efficient overcoming the problems related to licenses and fees. In that sense, the opportunity for the user to download a brief report on his scores is perceived as incentive to use the tool as a service. For instance, the possibility to personalize the report has just been implemented.

While the findings could be useful for government in order to set public policies, for large companies in order to assess their supply chains, for banks to evaluate reputational risks, the process of self-evaluation is also a learning tool for academic purpose. A study on the adoption of the tool for academic teaching is ongoing and it will characterized the future versions of the CSR4UTOOL.

As a demonstration paper, the aim of this research is to shed light on the new technology that has been adopted to solve a gap both on literature and on the real economy side. As it is an innovative methodology and technology, the tool suffers of error and possible mistakes that are due on the statistical model and content side. In that sense, every scholars and practitioners that want to provide suggestions and insights are welcome.

Web Marketing and SMEs: needs, problems and opportunities. An Empirical Study in the Marche Region

Abstract

From several years, the Internet universe is going through an important phase characterized by new tools called social media, new methods of production and use of contents and new ways of interaction by users. This phase, called Web 2.0, is still developing and producing many effects in the marketing and business communication. Many companies have introduced Web 2.0 functionalities within their marketing strategies. In particular SMEs, for the first time, are found to have available a set of tools in line with its own resources and be able to make them competitive in many areas.

This study investigates the use of Web marketing tools by SMEs; particularly, it is aimed at:

- to describe the main characteristics regarding the use of Web marketing;
- to point out the needs related to the use of Web for developing marketing activities;
- to find the main problem aspects perceived for increasing the use of the Web in a marketing perspective.

Introduction

The aim of this paper is to analyze the role of the Web in marketing and communication activities of SMEs, and in particular to:

- detect the characteristics of the application to the Web, paying particular attention to the implementation of the sharing tools related to the so-called Web 2.0 (social networks, blogs ...);
- comply with the increasing demands and concerns related to the use of digital communication tools, and highlight the possible interventions aiming to stimulate further deployment in SMEs.

From the methodological point of view, a survey was carried live by the administration of a semi-structured questionnaire to a sample of SMEs located in the Marche (Italy); the set is defined by random drawing from the database of Chambers of Commerce based on the variables on the size and area location (province).

In addition, four focus groups were conducted with the owners of SMEs from different sectors involved and identified with the help of several professional associations; this qualitative research carried out by the focus group was divided into two phases:

- the first, for the exploration of the phenomenon and the detection of the main aspects characterizing the use of the web communication in enterprises of more limited size; the results were also useful for the setting of quantitative research;
- the second, focused and in-depth interpretation of some specific aspects that emerged in the survey directly.

Social Media, Marketing and SMEs

Although social media are widespread among users from the first half of the 2000s, the study of the relationship between these tools and marketing is fairly recent (Harris and Rae, 2009; Solis 2010).

Even more recent are the works that analyze the adoption of social media by SMEs for marketing purposes. Looking at Figure 1, which represents the trend of the frequency with which Google has been researched the term "social media" attached to the term "SME", you can see that the interest on this issue, almost non-existent before 2009, has grown significantly in recent years.

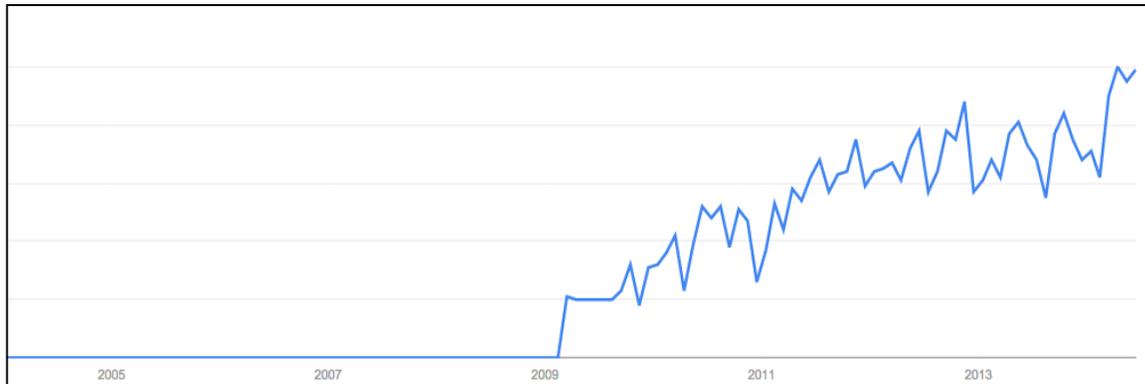

FIG. 1: GOOGLE TREND, ANALYSIS OG THE SEARCH CRITERIA “SOCIAL MEDIA” AND “SME”

Recognition at 06/16/2014

One of the most authoritative definitions of social media is that provided by Kaplan and Haenlein (2010) which describes social media ad a group of internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of User Generated Content.

According to Luke (2009) social media are very important to the marketing environment, the marketing and communications transmitted on social, assume a "viral" nature and encourage consumers to interact with the brand by producing so many benefits to the business (Steinman and Hawkins, 2010).

Mangold and Faulds (2009) attribute to social media a “hybrid” role in the promotion mix. According to the study in fact, social media can be considered a hybrid element which combine aspects of traditional communication (companies interact with consumers) with innovative elements of marketing such as the ability to amplify word of mouth (consumers interact with each other) aspect that often remains outside the control of marketers.

Research of Breslauer and Smith (2009) shows that firms are using social media to build direct relationships with consumers, increase traffic to the website, identify new business opportunities, build communities around brands, collect and disseminate content feedback from customers. However, it is necessary to underline that not always these benefits are also caught by SMEs.

Carrying out an analysis of the literature on the relationship between social media and SMEs, different approaches emerge. A first suggestion by McGowan and Hampton (2006) highlights how the context in which SMEs operate is strongly characterized by the management of the network of personal relationships.

Concepts such as trust and commitment are the basis of the system of relations that an SME entrepreneur establishes with its business partners. With the advent of social media, these concepts have been declined online opening new scenarios for entrepreneurs. The technology in this context is seen to be useful as an opportunity to expand their network of relationships, both as a possible threat as it would lead to business relationships on a more impersonal.

On the issue of the relationship between social media and SMEs, the study by Durkin, McGowan and McKeown (2013) identifies two different approaches: a proactive approach defined, adopted by private SMEs in which these instruments are seen as an opportunity. This is offset by a reactive approach, typical of public SMEs, in which firms decide to be present on social media, not so much for the opportunity to be seized, but as a reaction to potential threats produced by a possible non-use of these channels.

The attention to the scarcity of resources available to the SMEs, has created a line of research that links social media to SME as a cheaper marketing tools respects to the traditional ones (Harris and Rae, 2009; Belo, Castela and Fernandes , 2013).

An interesting view is provided by Kirtis and Karahan (2011) which identifies the adoption of a cost-efficient social media marketing strategy can in fact to be sustained even in a context of global crisis. The crisis, they argue,

has put a strain on the survival of enterprises that in many cases have responded with a reduction in the budget, in particular that of marketing (Harris and Rae, 2009).

With this in mind many SMEs have responded to the crisis by seizing the new opportunities provided by the web integrating these tools to offline marketing depleted by lack of resources. According to Belo, Castela and Fernandes (2013) in front of a clear economic impropriety on the part of the SMEs is to acquire proprietary management software, the adoption of social media could be a sustainable solution to maintain competitiveness in the so-called information society.

However, although SME entrepreneurs are well aware of the potential of the use of social media for marketing purposes (Govender, 2013), methods of use and application fields do not seem to appear equally clear. It is impossible to speak of social media and SMEs without discussing the obvious barriers that contribute to slowing down small businesses in the process of adoption of new forms of digital marketing.

The issue of barriers to the use of social media is common and has been addressed by several authors (Michaelidou, Siamagka and Christodoulides, 2011; Chen and Wellman, 2009; Schwarz-DuPre, 2006). The most important and frequent barriers are endogenous (Hywel et al.), such as the propensity of entrepreneurs to remain at means "classics" such as phone or email, or the lack of time for use in the management of social media or the lack of technical expertise and technological know-how.

A very present theme is the lack of resources, both human, both in time to be used in the management of the online channel (Harris and Rae, 2009). As mentioned previously, the application fields do not seem to appear clear. Govender (2013), analyzing the social media marketing strategies implemented by SMEs, for example, has identified an action almost nil in viral marketing campaigns and sponsorship forms online.

Belo et al. (2013) speak of resistance to change and lack of alignment of the business prospects of firms with effective opportunities provided by the tools of the web. Another aspect on which we must reflect and that is a factor that greatly affects the level of adoption of social media is the type of business in which the company operates.

As stated earlier, social media are powered by user generated content or content from those produced by end-users; it is therefore considered that a communication based on social media can be more profitable for B2C, turning to final consumers, are able to take advantage of the online communication channel.

In this perspective B2B oriented companies often make it hard to grasp the real potential of these tools. Michealidou, Siamagka and Christodoulides (2011) identified a lack of research and literature on the relationship between social media marketing and B2B businesses. The studies are focused on almost all B2C business oriented. The authors argue that although it appears that all of the B2B business is willing to increase their investment in social media, the delay in the adoption of these tools for marketing purposes, compared to companies in the B2C sector, is still quite substantial. In support of this thesis have been identified barriers that maintain the gap and a high level of use of these platforms in an embryonic state.

In this regard, the authors have identified the main strengths such as not knowing the ways in which technology could support the brand and again, lack of time, resources and expertise to implement a strategy for social media marketing.

Table 1 shows the main contributions to the literature on the topics discussed.

TABLE 1: LITERATURE REVIEW

Authors	Year	Theme

Main results of the direct survey

The survey was conducted on a sample of 802 SMEs located in the Marche Region, which was administered via CATI and CAWI a structured questionnaire; the set was selected from the database of Chambers of Commerce with random mode on the basis of the variables on the size and territory (province of localization).

With regard to the dimensional characteristics should be noted that the majority (60.6%) of the companies have a number of employees less than 10 units, 22.6% between 11-20 units, 6.4% between 21-30, over the remaining 30 unit; In addition, about more than half (55.4%) of the undertakings has an annual turnover of less than one million euros, a firm out of three within the band of the 1-5 million euro, the remaining excess of 5 million euro. Below is a percentage breakdown of the sample by sectors: trade (18.2%), engineering (16.3%), footwear (11.2%), services (8.8%), wood and furniture (7.3%), food (5.3%), food (4.6%) and tourism (4.1%).

For the 14.5% of the companies clients are represented only by final consumers, for only 39.4% of companies and other organizations, for only 12.3% as traders; in other cases the type of clientele is more varied. With regard to the geographical origin of customers, it is noted that this is a purely local company for about five; in addition, 17.8% of the companies market extends within the boundaries of the region, to 26.5% by national ones; for over a third of the market is also or mainly international.

WITH REGARD TO THE INTERNET, ONE FIRST NOTICES THAT 28.8% OF COMPANIES SAID THEY DID NOT HAVE ITS OWN WEB SITE IN ADDITION, ABOUT TWO OUT OF THREE COMPANIES FEEL THE NEED TO DEVELOP THE USE TO COMMUNICATE AND INTERACT WITH CUSTOMERS; THE MAJORITY FOR PURPOSES OF ADVERTISING AND PROMOTION ON THE MARKET (TABLE 2).

TABLE 2 – TO WHAT PURPOSE IS A NEED TO DEVELOP THE USE OF INTERNET IN YOUR COMPANY?

Activities (multiple answers)	Units	% of total
Communicate, interact with customers	522	65.1%
Advertising / promotion on the market	432	53.9%
Reach foreign markets	243	30.3%
Collaborate / cooperate “at a distance” with parties outside the company	236	29.4%
Sales (e-commerce)	221	27.6%
Buy	220	27.4%
Market Analysis	201	25.1%
Crowdfunding	46	5.7%
Other	90	11.2%
<i>Total respondent</i>	<i>802</i>	<i>100.0%</i>

Source: our calculations based on the results of direct survey

AMONG THE MAJOR SOCIAL MEDIA USED BY COMPANIES FOR THE COMMUNICATION AND PROMOTION PURPOSES, FACEBOOK STANDS OUT WITH A PERCENTAGE OF 26.2% (TABLE 3), FOLLOWED, WITH MUCH LOWER PROPORTIONS, YOUTUBE (6.9%) AND TWITTER (6.4%). FOR OTHER KNOWN MEANS THE ACTION IS RATHER LIMITED. IN THE 86.4% OF THE CASES FOR THE USE OF SOCIAL MEDIA WOULD BE USED IN INTERNAL COMPANY STAFF.

IT SHOULD ALSO BE POINTED OUT THAT 66.3% OF RESPONDENTS STATED THAT THE HOLDING SHOULD NOT WE MAKE USE OF THESE CHANNELS.

TABLE 3 – SOCIAL MEDIA USED BY COMPANY FOR COMMUNICATION AND PROMOTION PURPOSES

Digital tools used (multiple answers)	Units	% of total
Facebook	210	26.2%
Youtube	55	6.9%
Twitter	51	6.4%
Blog	20	2.5%
Forum	13	1.6%
Instagram	11	1.4%
Flickr	5	0.6%
Myspace	3	0.4%
Others	78	9.7%
No one	531	66.3%
<i>Total respondents</i>	<i>801</i>	<i>100.0%</i>

Source: our calculations based on the results of direct survey

THE MAJORITY (52.4%) OF RESPONDENTS EXPRESSED A POSITIVE OPINION ON THE USEFULNESS OF THE USE OF WEB COMMUNICATION TOOLS, FOR THE DEVELOPMENT OF THE ENTERPRISE. THE 7.9% THINK THEY ARE RATHER USELESS.

FOR THE 17.4% OF COMPANIES THERE IS A PARTICULAR FOCUS ON COMMUNICATION ON MOBILE DEVICES, WHICH WOULD MATERIALIZE IN THE DEVELOPMENT OF SPECIFIC APPLICATIONS OR WEB PAGES.

Regarding to the possible interventions aimed at developing the use of the web communication, we observe the following aspects:

- Support the development / improvement of the website is judged on average helpful;
- About half of the respondents (50.8%) welcomes the opportunity to increase the knowledge of the instruments;
- The 48.1% welcomes the opportunity to develop competencies;
- Incentives to encourage the integration of young graduates are more appreciated in larger firms;
- 45.2% of respondents welcomes the opportunity to obtain economic incentives for the development of marketing and communication projects;
- The possibility of aggregation of enterprises to make use of external expertise, assessments expressed by respondents are quite dissimilar;
- The 51.9% awarded expresses the need to strengthen the technological equipment.

It was considered useful and appropriate to review these results taking into account the heterogeneity of the sectors and characteristics of the target market of the companies making up the sample. In this sense, it was decided to divide the results obtained on the basis of two variables: the type of customer (BtoB or BtoC) and the geographic extent of the market (local market or not Predominantly Predominantly local market). They were thus identified four clusters of firms. Below we propose the outline of the main findings.

TABLE 4 – SOME COMPARISONS

Aspects	SEGMENT "A" Companies that cater to consumers. Predominantly local market (19.0% of the sample)	SEGMENT "B" Companies that cater to consumers. NOT predominantly local market. (23.7% of the sample)	SEGMENT "C" Companies that DO NOT cater to consumers. Predominantly local market. (14.0% of the sample)	SEGMENT "D" Companies that DO NOT cater to consumers. NOT predominantly local market. (43.2% of the sample)

% of Businesses with no website	37.9%	17.4%	47.3%	25.8%
Development needs of Internet usage (first 3 goals in priority order).	1st Communicate, interact with customers. 2nd Advertising, promotion on the market 3rd Sales (e-commerce)	1st Communicate, interact with customers. 2nd Advertising, promotion on the market 3rd Reach foreign markets	1st Communicate, interact with customers. 2nd Advertising, promotion on the market 3rd Collaborate / cooperate "at a distance" with parties outside the company	1st Communicate, interact with customers. 2nd Advertising, promotion on the market 3rd Reach foreign markets
% Of companies that do not use social media to communicate and promote	64.1%	45.8%	83.8%	72.8%
Perceived usefulness of the web communication Average values on a scale from 1 (useless) to 5 (very useful)	3.3	3.9	3.2	3.5
Interventions found to be most useful for the development of web communication Top 3 interventions for the average of the opinions expressed on a scale from 1 (useless) to 5 (very useful)	1st Increase the knowledge of the tools (3.3) 2nd Develop internal expertise (3.2) 3rd Strengthen the technological equipment (3.1)	1st Strengthen the technological equipment (3.8) 2nd Increase the knowledge of the tools (3.5) 3rd Incentives to develop marketing and communication projects (3.5)	1st Increase the knowledge of the tools (3.2) 2nd Strengthen the technological equipment (3.2) 3rd Develop internal expertise (3.1)	1st Increase the knowledge of the tools (3.5) 2nd Strengthen the technological equipment (3.4) 3rd Develop internal expertise (3.4)

Source: our calculations based on the results of direct survey

The focus groups involving a total of 29 representatives of small and micro enterprises in different sectors; the aim was to examine the methods and problems of use of digital communication. Among the main aspects are confirmed:

- The recognition of the importance of the use of the internet to communicate and promote the markets, in reference abroad. In some cases, given the characteristics of the sectors or types of markets / customers, the assessment of the usefulness of digital tools and social networking in particular, is less positive; however, you encounter some bad experiences in relation to what was perceived poor response following the development of certain activities on the Web.

- In most cases, digital communication, both with reference to the website with the other instruments, is performed using, primarily, if not totally, external expertise to the enterprise; the use of internal staff, qualified through involvement in training, would be made solely for simple updating of content. The management of data useful for assessing the efficiency and effectiveness of the various online channels, is not always done; when this happens, they would be outside consultants to provide, creating reporting.
- Among the major perceived problems and needs regarding the use of digital tools, you observe, in particular, the limitations related to human resources, in terms of both quantitative and qualitative. With regard to the latter, the awareness that for proper use of digital tools are needed expertise; But it is not sustainable for a small company to have an internal figure with those skills. The use of external suppliers is often inhibited by the limited economic resources.
- Moreover, it is stressed that the lack of an appropriate culture of online communication and internal figures prepared, make it more difficult the process of adoption of new instruments; the biggest challenge for providers of services and technologies is not to find people with whom the internal interface and collaborate in order to develop their business more efficiently and effectively.
- It is often highlighted the importance of developing an appropriate culture and raise the level of knowledge; this, it is essential to facilitate the adoption of tools, allow you to interface with the best service providers, and even to make informed choices in the context of the possible solutions, so that they are consistent with the needs and characteristics of 'company.
- Another important aspect is formed by the aggregation of enterprises; the reference is especially the possibility to make use of specialized skills, which would otherwise be inaccessible to the individual small business, for reasons of economic unsustainability.
- Additional information converge in the idea to create technology platforms for the promotion of collective enterprises in the same sector; it is noted, however, also have the opportunity to create similar tools for companies belonging to different sectors in order to promote the possible integration of skills and forms of collaboration.

Concluding remarks and managerial implications

The results of the study allow us to highlight different aspects of business development and marketing communications based on the use of ICT.

It is first observed, in general, a limited use of digital communication tools, both "old" than "new" generation. The results of the research confirm, however, that the potential of innovative tools of communication have not been properly educated by this type of business; This is not only due to economic reasons, as in some cases the resources to invest may be relatively small. The problems, in fact, be sought in the cultural characteristics, the approach to the use of the instruments, human resources and skills available; the limits of the application are also related to the characteristics of the target market and business model.

It 'should also be pointed out that SMEs need tools and approaches specific; often mistakenly believes that we can respond to the needs and problems of the companies of more limited size, simply by transferring them to the models and tools that "work" for larger ones. In fact, it would be more appropriate to develop ad hoc solutions with respect to their different structural characteristics, but also cultural and behavioral.

It is considered important, also does not consider SMEs evenly and develop solutions with the claim that they are "valid for all"; it is more appropriate to adopt a differentiated approach, taking into account the characteristics of size, sector and market. As shown by the fact, based on these variables can significantly change perceptions about the usefulness of using these tools, and you can have different assessments regarding the possible interventions to facilitate their adoption. As far as the latter is observed, first, the need to encourage cultural growth and increase knowledge regarding the different tools of digital communication and the possible uses of the same for business purposes; also emerged in the focus groups often not aware of the existence of some rather well-known means. It appears in this sense, the creation of useful and informative interventions targeted training programs for different types of business features and needs.

It should also be considered to be the theme of skills. In the case of undertakings that may entrust the management of online communication to internal human resources, the use of training can bring important benefits. In other cases, it may be useful to promote the integration of young graduates who can bring ideas and knowledge necessary to develop the use of tools; as noted above, the availability of an internal figure prepared can facilitate the process of adoption, as it can also encourage interaction with suppliers of solutions and services for the development of on-line communication. It should be noted, however, that the impossibility of hiring the young by the company, then the problem could pose management tools once the partnership; the risk appears to be greater in the case of micro enterprises, which, in fact, do not seem to appreciate this solution.

An interesting intervention considered in some sense alternative consists in aggregating companies in order to benefit from the assistance of a competent figure, with the possibility of supporting a lower cost. The aggregation could be promoted through the development of technology platforms for the delivery of community services for increasing visibility into network and business promotion.

Another problematic aspect highlighted is the limited technological resources; in this sense, were also observed the critical technological infrastructure especially with reference to some internal areas of the region.

In order to have a greater impact on the development of digital communication in SMEs, can not escape, therefore, the importance of use of synergistic actions between the different public and private stakeholders of the territory.

The innovation approach to the internet-marketing efficiency evaluation

Abstract

The authors present the results of the evaluation in efficiency on marketing promotion in internet for regional provider of communication services. The technologies of relationship marketing and value - oriented marketing are used to involve and keep the customers via internet. The key indicators are based on the postclick-analysis and postview-analysis. They afford to calculate the effects of online promotion policy. CLTV (Customer Lifetime Value) is the main indicator for measurement of customer's loyalty and average profit from one client in the perspective.

In current marketing communication the internet is taking the essential place. According to the Association of the Communication Agencies in Russia (ACAR) in 2013 about 22% of the total marketing budget was spend to the media and context advertising in virtual space by national companies. In this situation the internet advertising is still one of the major segments of the market, which keeps the rapid growth with the annual increase by 25-35%. This rapid growth demands from the marketing researches the serious study of the marketing tools and methods to promote in the internet more efficiently.

Often the internet-marketing is known to be the advertising in the internet, including the e-mail advertisements (Eley, Tilley, 2009), or the reach of the marketing targets by using digital technologies (Chaffi, Mayer, 2006), or using the internet or other digital communication with target markets by the most efficient tools (Vella, J. Kester, 2009). Many authors agreed that the internet-marketing is based on the traditional marketing and they add the following: in the promotion mix the virtual communications play the major role and it's the same for the companies, products and the services.

The Institution of the Direct Marketing (IDM) provides the following the most competed definition of the internet-marketing: it's the integrated usage of the communication channels in virtual space for the supporting the marketing activity of the company, targeting on the profit and customer loyalty with the improving the on-line services for the best customer satisfaction and the increasing their knowledge about the company, the brand knowledge, the products and the services. The key point for us in this determination is the presence the customer loyalty goal and the profitable mutual benefit long-term relationship with the clients. So the innovation of our approach is based on the relationship marketing with the customer as the great value for the brand, this is the crucial for the efficiency of the digital communications.

The internet-marketing communication performance is considered from the customer relationship staged: attraction, engagement, conversion, holding. The main element for the efficient digital promotion is the customer value. The customer lifetime value in current situation and in the future (CLTV) we can estimate by the following formula (Jeffry, 2013):

$$CLTV = -AC + \sum_{n=1}^N \frac{(M_n - C_n) * p^n}{(1 + r)^n} = \sum_{n=1}^N \frac{NPV}{k} * p^n$$

AC – the expenses for the customer attraction;

M_n – profit we can receive with the client in period n;

C_n – the expenses for the marketing and customer services;

p – the possibility that the client not leave the company for one year;

N – the total number of the years or periods;

r – the discount rate;

NPV – the net discount value.

We used the circle model SOSTAC as the base for the planning of the company promotion on-line, which means the situation data, objectives, strategy, tactics, action, control. The brand and it's main competitors activity is the study for the situation stage, also it's paid attention to the peculiarities of the goods and services, the sales and

consumption conditions, and customer behavior models in the internet. Basically the internet-marketing can provide the following objectives for the company: to create the new products demand, to establish the particular brand essence, to increase the sales and to provide the customer loyalty.

The target audience segmentation is performed by creation the promotion strategy; also it's carried out the basic choice of the internet-marketing tools with the market current situation, by example, the seasons, the specifics of the customer behavior in the internet and the budget. The right strategy allows the company to minimize the budget and to reach the business goals with the usage of internet-marketing. All the tactics can provide the detail plan for the strategy and also include the choice of the specific advertising tools, the development of the advertising campaigns based on the target audience performance, seasons and the available budget. After all this, the performance of the strategic plans and the control stage are going on.

We propose the stages of the choice internet-marketing tools for the company promotion in internet based on the data of the analytics services with seasonal demand and other factors (Table 1).

TABLE 1: THE STAGES OF THE CHOICE INTERNET-MARKETING TOOLS FOR COMPANY PROMOTION

The stage	Data for analysis	Data sources
1 Business analysis	The field of business; The area; The clients (b2b/b2c); The positioning; The major competitors; The market segments; The business goals and internet-marketing.	Company web site, internal paper, media
2 The analysis of the marketing activity in the internet for the company and it's comparison with competitors	The share for the internet advertising in the total budget; The used tools of the internet-marketing; The analysis of the company web site view and functions; The company web site rating in the global searching systems; The volume and dynamics Queues index, PR, internal links to the site; The context advertising; The customer involvement to the brand activities; The methods of customer loyalty.	AdIndex, SimilarWeb, Yandex metrics, Google Analytics, company web site, PR-CY.ru, AdVse, groups in social networks
3 Target audience analysis	Social-demographical; Product and services; Segmentation DigitalLife; The most visited web resources.	Marketing Index TNS, LI, Yandex metrics, Google Analytics, groups in social networks (structure), product and company reviews in social networks and discussions, iStar, WebIndex
4 Customer behavior analysis	Used media; The involvement to the choice; Used gadgets for the information search; The position in matrix by Rossiter-Persi.	Consumer Barometer,
5 The search demand analysis	The navigation and information searches structure; Seasonal factor; Area popularity in navigation demand.	Yandex Wordstat

The main approach to the evaluation of the efficiency in the internet-marketing is the postclick-analysis, and we fixed the boards of it's usage for the measure the tools of the internet-marketing, which propose the immediate transfer to the company web site for the particular actions. In the same time, we have to mention that the brand essence and the brand loyalty are not to be measured by only with the postclick analysis. It's not obligatory to be attracted by

the advertising by clicking the links. The postview analysis is proposed to get over that, it provides the possibility to observe the user actions on the web site after the viewing the ads.

In table 2 we provide the differences between the internet-marketing tools, which can be analyzed by postclick and postview.

TABLE 2: THE DISTRIBUTION OF THE INTERNET-MARKETING TOOLS BY THE TYPES OF ANALYSIS

Postclick-analysis	Postview- analysis
<ul style="list-style-type: none"> - context advertising - searching and returning retargeting - searching optimization - partners program - profitable email 	<ul style="list-style-type: none"> - media advertising - performing the groups in social networks - reputation monitor - paper promotion - pr email

The virtual space can be measured very precisely and we introduce the approach to the efficient estimation of the internet-marketing with the each of the four customer performance stages: attraction, engagement, conversion and holding. In the calculation we also mentioned the factor of the current money value; it's vital and obligatory for the companies which objected to the long-term relationship with the clients. The system of the indicators for the efficiency evaluation is presented in the table 3.

TABLE 3: THE INTERNET-MARKETING EFFICIENCY INDICATORS

The stages of the customer relationship	The indicators of the internet-marketing efficiency from the position of the relationship marketing based on the customer value
Attraction	Reach, the number of views, CTR - Click Through Rate, CPT - Cost Per Thousand Opportunities To See, CPC - Cost Per Click. Affinity, GRP - Gross Rating Point, TRP - Target Rating Points.
Engagement	Pages views, number of visitors, the deep of the view for one visitor (the average number of the pages visited by one user), return index (the number of the visitors, which close the page after it's enter), CPV (Cost Per Visitor).
Conversion	Target reach – the number of the success completed actions on the site (purchase, information claim, contact request and so on). Conversion – the number of the reached goal to the total visitors. The cost of conversion, ROMI – Return On Marketing Investment, IRR Internal Rate of Return, NPV - Net Present Value, PI - Profitability Index, DPP – Discounted Payback Period
Holding	Number of the repeat target goals, customer outflow, the difference between the one and the total number of repeat target goals to the total number of clients, who made only one target action. CLTV (customer lifetime value) – total profit (lost), which the client and the target segment provide.

We develop the internet-marketing communication plan for the mobile operator Motiv in the Sverdlovsk oblast in 2014 and we also have estimated its efficiency. The company PLC Yekaterinburg-2000 presents the brand Motiv, which provide the cell communication for 18 years in Ural region. The brand Motiv is one of the major on the regional cell communication market, the positioning is the following: Motiv is the quite cheap and available cell operator for the well cover of the whole Ural region including Sverdlovsk oblast.

The key factors for the cell operator in the connection quality and its availability, in this situation we recommend to focus in promotion on the mobile advertising social network, emails and the reviews and feed-back analysis.

According to the service Consumer Barometer it was discovered that the major customers (74%) search the information about the cell operator and its tariffs before the purchase, 88% of them uses the PC, notebooks, tablets, which cuts the availability of the mobile ads for this target audience.

In matrix Rossiter-Persi the cell phones are the part in High involvement-information tune, as demand from the potential client's deep study and the caring out the rational analyze of the proposal benefits and limitations. Also it's important to provide the information support to the clients, when they are in the situation of making choice. It's possible to reach this by almost the all internet-marketing tools: web site, search optimization, context ads, banners ads, retargeting, emails, content marketing, managing the groups in social networks.

The main tool for the brand awareness is still the media advertising and we propose to use it, according to the target audience analysis, it's behavior and consumption actions, we develop the following activity focused on the attraction new customer and holding the current:

1. The media plan with the 14 popular web sites. According to the statistics we received 14.31 mln views of ads. The total budget was 778 thousand rubles. Postclick analysis provides 12 185 visitors for company web site after viewing the ads. Postview analysis - 42 720 visitors. So, we have proved than the postclick analysis describes less that 30% cases of the efficient actions of the banner ads and it's nor recommended to use the only it. The advertising campaign was successful. The estimated number of the attracted customer – 2 323, the net profit – 674 thousand rubles, CLTV – 289 rubles.

2. We propose to increase the number of participants in famous Russian social network Vkontakte to 40 000 people for the next 10 months. Part of the data was not collected due to the limitation of the social network, the budget will be about 1.2 mln rubles. The net profit can be about 20.78 mln rubles, CLTV – 519 rubles.

Both of proposed campaigns are efficient and competitive, moreover the activity for the decreasing the customer outflow will be more attractive for the brand.

Digital Marketing in Germany

– functional principles, status, development and perspective

Abstract

Digital Marketing in Germany is on the way to grow to one of the most important Marketing branches. But still a major part of the small and medium companies doesn't use the existing possibilities – and new opportunities are created by the development to mobile and location based Marketing.

This article describes the status of digital marketing in Germany by showing the functional principles of Google Adwords and Adsense, Affiliate Marketing and Social Media Marketing and discussing the usage of Digital Marketing in different types of enterprises.

A summary of current studies regarding the changing usage of media and technology by the German people shows the direction of the future development. The new possibilities of mobile and location based marketing are analysed by discussing the Go To Market of the Munich – based Start up “Shopstar”, which transfers the principles of Google Marketing to the stationary retail shop.

1. Situation

Digital Marketing is the promotion of products or brands via one or more forms of digital media. The term was first used in 1990 for advertising via electronic media, which was e.g. BTX or portals like T-Mobil or Yahoo. To this time the World Wide Web had just 1000 servers and was used mainly from research institutes without commercial intentions.

With the growth and commercialisation of the World Wide Web as the main application of the Internet, as shown in FIG. 2, Digital Marketing is now almost completely standing for advertising via Internet, this includes a companies own homepage, advertising on other homepages, in search engines, social media sides or via email. (Compare Lammenett 2012)

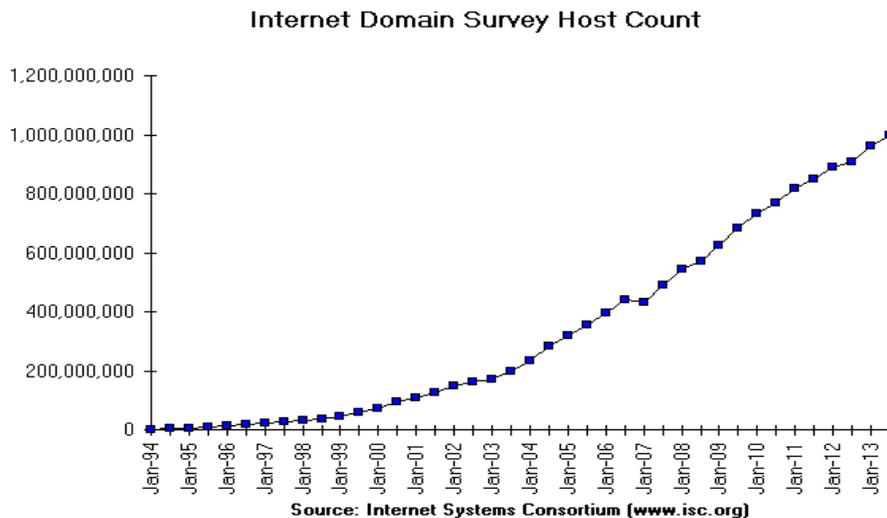

FIG. 2: DEVELOPMENT OF THE NUMBER OF WWW-SERVERS, SOURCE: ISC 2014

The growing usage of the World Wide Web in Germany is analysed by two studies, which are representative for the German people (Initiative-D21 2013) and the German companies (Deutsche Post 2013). FIG. 3 shows the usage of the Internet in the German population over 14 years of age. We can see that the growth of the usage of Internet is slowing down, reaching saturation at around 80%.

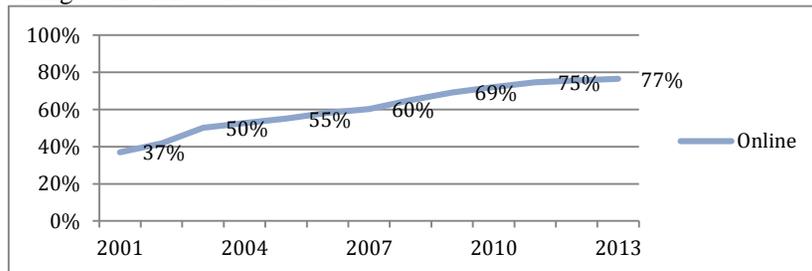

FIG. 3: INTERNET USAGE IN GERMAN POPULATION
Data from initiative-d21 2013

FIG. 4 is drawn from data of the Dialog Marketing Monitor, a yearly study done by Deutsche Post, where ca. 4000 companies are asked about their marketing budgets spending and the results of this representative survey are projected on the whole ca. 3 million German companies. So we can see an amount of jitter around a growth similar to FIG. 3

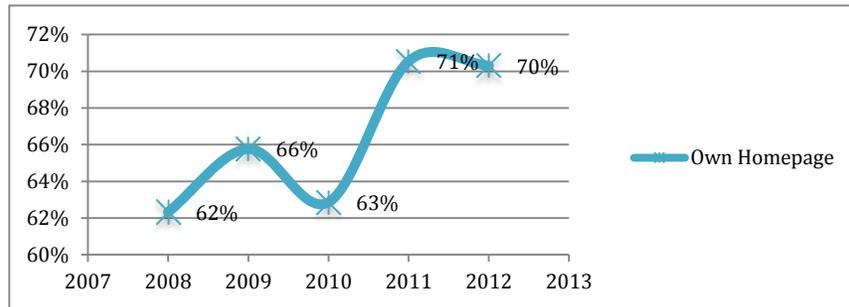

FIG. 4: PERCENTAGE OF COMPANIES WITH OWN HOMEPAGE

The growing usage of the Internet also changes the shopping behaviour of the German consumers. FIG. 5 integrates the data from two sources (Shopbetreiber-blog 2014 and GIM 2014) to show the share of online business in Germany of the mail order business and of the whole retail volume in Germany. It is clearly visible that, despite of the online revenue growing faster, the share of retail is still small by 11% - by both online and retail volume growing further in the same rate, the online volume will reach 50% of the retail volume in not less then 20 years.

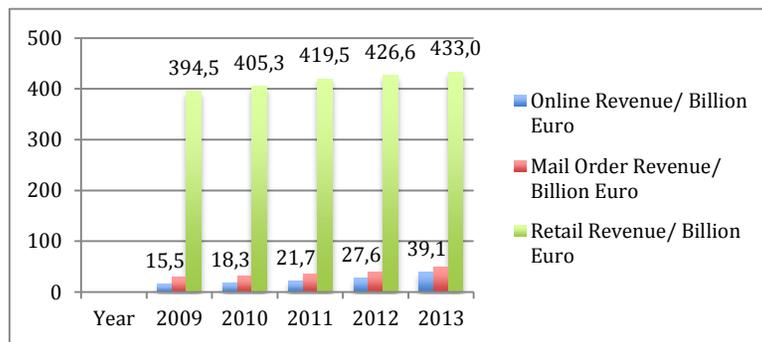

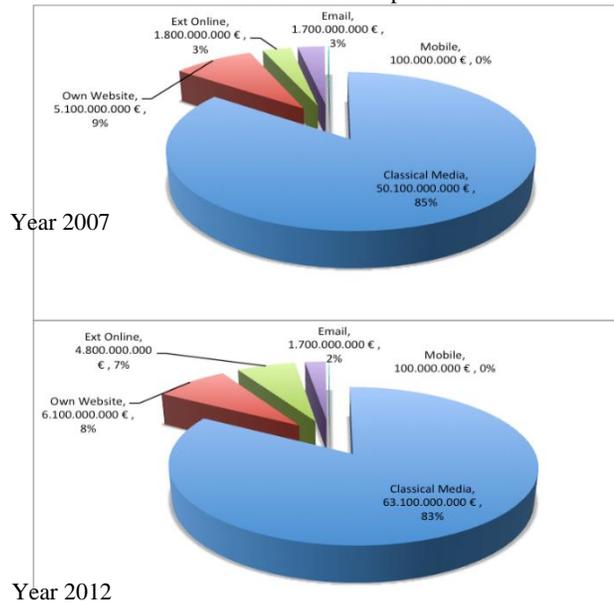

FIG. 5: DEVELOPMENT OF RETAIL-, MAIL ORDER- AND ONLINE REVENUE IN GERMANY.

Data source: shopbetreiber-blog 2014 and gim 2014

Following the growing impact of the Internet for the consumers and also for the Online Retail business the companies are shifting a part of their marketing budget. The DMM studies of Deutsche Post show the changing distribution of the marketing budgets of German companies, where the “classical” marketing media as TV, Radio and Print-Advertising are almost stagnating, whereas the Online- (or Digital-) Media are growing.

FIG. 6 shows the distribution of the marketing budget in German companies in the year 2007 and 2012 with data from the respective DMM studies. It is clearly shown, that the distribution has not much changed in this 5 years besides a significant growth on spending for external Online Marketing.

FIG. 6: DISTRIBUTION OF MARKETING BUDGET IN 2007 AND 2012
Data source: deutsche post 2013

We will have a look on the differentiation of marketing budget between different companies size. The DMM study differentiates between four classes of companies by the yearly revenue: up to 250 Thousand Euro, from 0,25 Mio up to 1 Mio Euro, from 1 Mio up to 25 Mio Euro and up from 25 Mio Euro. In

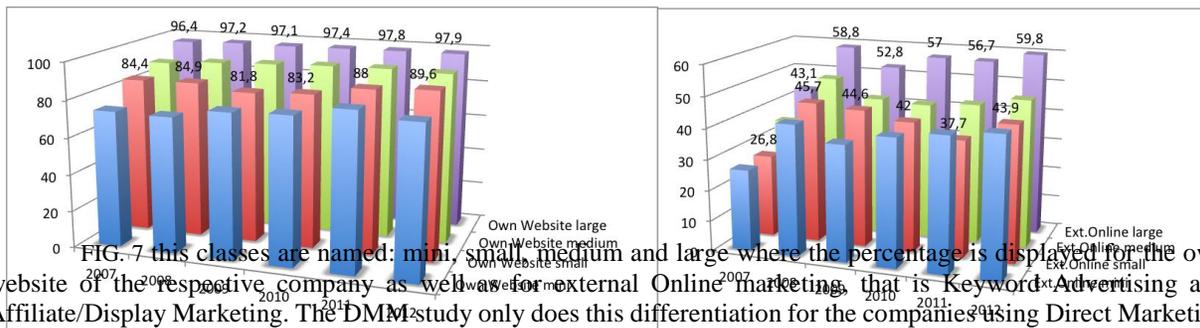

FIG. 7 this classes are named: mini, small, medium and large where the percentage is displayed for the own website of the respective company as well as for external Online marketing, that is Keyword Advertising and Affiliate/Display Marketing. The DMM study only does this differentiation for the companies using Direct Marketing media. Therefore the average of the four classes is significantly bigger then the respective value of

FIG. 4.

FIG. 7: PERCENTAGE OF COMPANIES IN GERMANY SPENDING MARKETING BUDGET FOR OWN WEBSITE/EXTERNAL ONLINE MARKETING.

Data from: deutsche post 2013

We see that over the last 5 years with more than 97% almost all large companies doing Direkt Marketing spend money for their own website, but more than 10% of small companies still miss this opportunity. In the important segment of external Online Marketing even 40% of these large companies and more than 55% of small companies still neglect these media. To see if the changes in marketing are sufficient we will have a closer look on the drivers of change.

2. Drivers of change

2.1. Changes in Technology

“Moore's Law”, a principle in technology innovation, found by Gordon E. Moore in 1965 is describing the development of semiconductor production: all 20 month the number of switching elements or transistor on the same area of a semiconductor chip is doubling. This principle is valid until today on a wide range of electronic components and devices (Lehmann 2012, Page 64ff.) and is causing an enormous raise of performance in technology. A modern Smartphone has an equal computing power as a High End Personal Computer 10 years ago for a tenth of the former price.

The same development affects the available bandwidth in mobile data transmission: in 1997 the GPRS technology enabled mobile phones to a mobile data upload of 171 kBit/s. The UMTS technology, established in Germany from 2007, raised this rate up to 14,4 Mbit/s, the current LTE technology introduced since 2012 up to 150 Mbit/s. Comparable to the devices performance gain is accomplished by price reductions, leading to wide availability of “Flat Rates” for mobile data transmission for as low prices as ca. 10 Euro per month in 2014.

2.2. Mobile Internet

FIG. 8 shows the number of smartphones sold in Germany over the last 4 years. We can roughly estimate that half of the smartphones sold in 2010 and 2011 are still in use and all of the smartphones sold in 2013. With this

estimation we have 61 million smartphones in use – this equals the size of German population between 10 and 70 years (Reitze 2014).

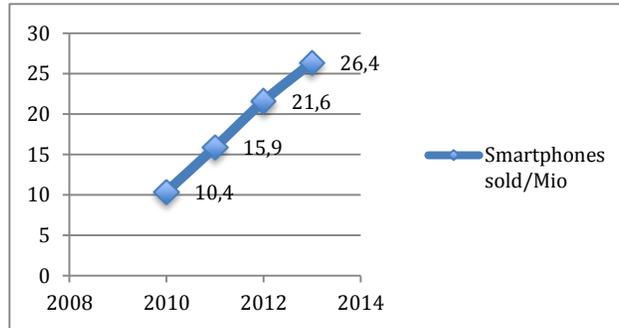

FIG. 8: SMARTPHONES SOLD IN GERMANY.
Data source: bitkom, 2013

The JIM study (Jugend, Information, Media 2014) analyses the media usage in the age group from 12 to 19 years in Germany. The results are, that with 96% in this age group almost all German teenagers own a mobile phone and for 72% of them this mobile phone is a Smartphone. Looking at the Internet usage and not at the hardware is a survey of HDE (Handelsverband Deutschland 2014). In the age group from 16-24 Years the mobile usage of the Internet has a peak by 81% in 2013, coming from 59% in 2012.

2.3.Changes in Internet Usage

The usage of Internet differentiates significantly between the age groups of the German population. FIG. 9 shows almost 100% up to the age of 39 years with an enormous decrease over 60 years.

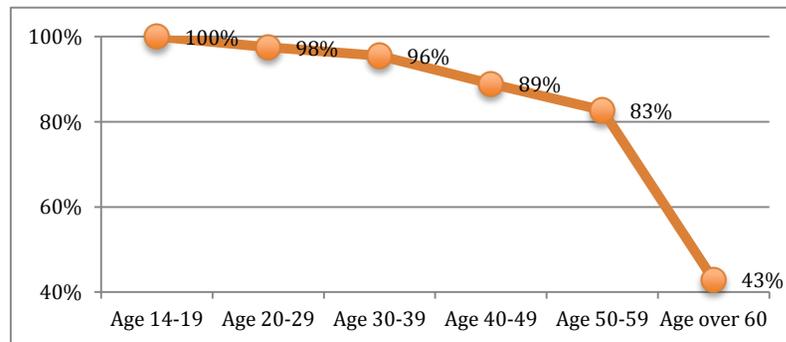

FIG. 9: INTERNET USAGE (OCCASIONAL) IN GERMAN POPULATION
Data from reitze 2014

But not only the quantity of usage differs. For marketing it is almost more important that the quality of usage also differentiates significantly over the age groups. FIG. 10 shows the differentiation in the usage of digital media between the age groups in the German population in 2013. Whereas the more traditional applications email

and search engine are almost equally common over the age groups, the „Web2.0“ applications like chat and online communities are clearly differentiated between the younger generation and the people over 30.

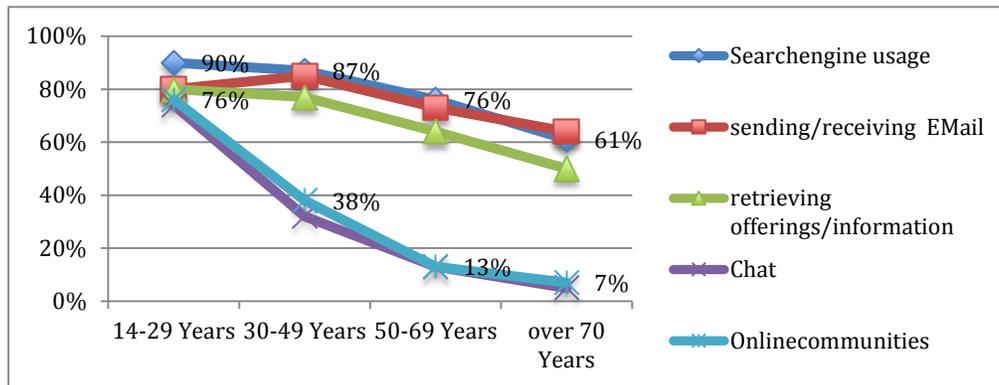

FIG. 10: DIFFERENTIATION OF INTERNET USAGE PER AGE GROUP
Data source: reitze 2014

Similar differentiation can be seen by the time spend for different media per day. A study about the media usage is „Media Perspektiven“, done by Hessischer Rundfunk in 2014. This study shows for 2013 for the first time in one age group that TV has lost it's first position in media time: the group of 14-29 years old consumed online in average 237min a day compared to TV 168min, whereas over all age groups the online time of 169min is still topped by the TV time of 189min. (Reitze 2014, Page 70 and 83)

2.4. Developments in Marketing

Classical marketing media as TV, radio and print advertising in magazines and journals developed with the mass media, the distribution of mass journals starting with the utilisation of rotary press printing by the London Times in 1869 (Glocker 2007, Page 199), radio from 1922 and Television from the 1941, both in New York (Americanradiohistory 1956). Coming from mass marketing the development is more and more to targeted marketing to reach smaller customer segments and with more personalised messages. Kotler called it: „Less broadcasting and more narrowcasting“. (Kotler 2008, Page 692)

This led to „Direct Marketing“, a term coined by Lester Wunderman in 1961 for „a new and more efficient method of selling, based on scientific advertising principles and serviced by increasingly more automated warehousing, shipping and collection techniques (Wunderman 1996, Page 159). Direct Marketing was first using the classical media like mail, but quickly changing to new, more suitable digital media when available.

The first WebSide „Banner“ in the World Wide Web was published in 1994 –by the telecommunication company AT&T copying direct print marketing to the Internet (Schwarz 2008). The new business model „Pay per Click“ changes the payment from the classical „contact price“, estimating the number of „viewers“, to „Click Prices“ with a payment only when the advertising is really having impact on the customer. The first „Affiliate“ marketing started in 1997 with Jeff Bezos, Fonder of –then- Startup „Amazon“ selling books for commission over third Web sides.

The next important step was the first „Key Word Advertising“ by „Goto.com“ in 1997 (Goodman 2010, Page 78). There are two unique success factors of Key Word Advertising caused by the special situation of the User when searching for particular key words:

- the attention filter everyone has in his mind is fully open to all information connected to this key words
- often this is exact the right moment in the buying decision process to influence the user.

Google started in 1998 revolutionising the search-engine market by their unique “Page Rank” method for delivering the fitting search results to the users key words. Google adapted the Key Word Advertising from Goto.com in their highly successful “Adwords” as key business model in 2002 (Lammenett 2010, Page 32).

The term “Web2.0” was first used by O’Reilly in 2004 for the “Web of participation”. Users add value, often „as a side effect of ordinary use of the application:.. the system gets better the more people use them“ (O’Reilly, 2005) . The best example for Web2.0 is Facebook, founded in 2004 and today claiming to have worldwide 1,2 Billion “monthly active user” and 757 Million “daily active users” (Facebook 2013). FIG. 11 shows the biggest Social Media sides in Germany, also with Facebook leading.

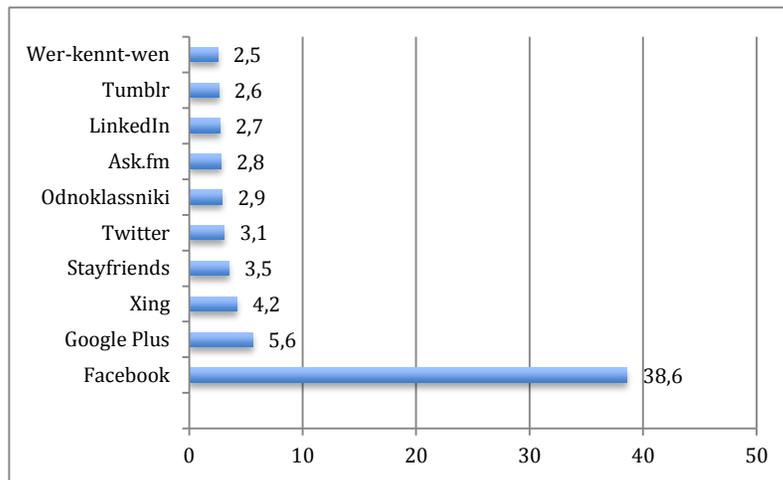

FIG. 11: SUBSCRIBERS OF SOCIAL MEDIA SIDES IN GERMANY IN MIO USER
Data source: comscore 2013

Social Media usage in Germany is very concentrated on Facebook, having more than six times more subscribers than the next biggest side Google Plus, as shown in FIG. 11. To reach consumers therefore Facebook is the right channel, for Business to Business marketing Google Plus and Xing also have some importance.

FIG. 12 shows the spending of German companies for digital marketing over the last 5 years. The efforts for the companies website and for external Online advertising are constantly growing. The efforts for Email marketing are decreasing over the last two years – probably because of the growing legal requirements for permission to send email to consumers.

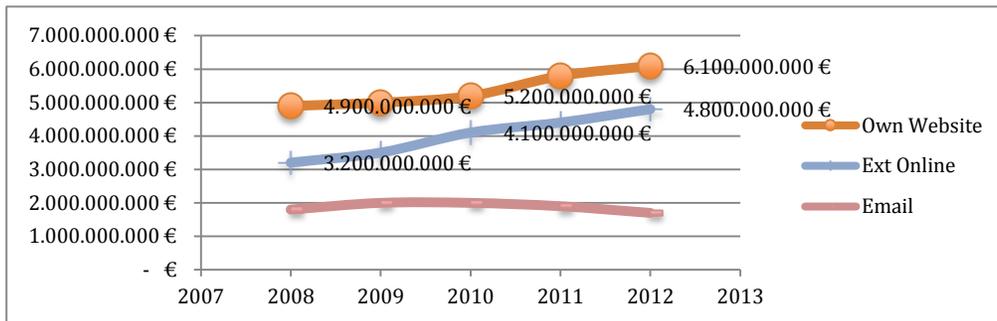

FIG. 12: COMPANIES SPENDING FOR DIGITAL MARKETING,
Data source: deutsche post 2013

3. New forms of marketing – mobile, location based

3.1. Possibilities of location based mobile Marketing

More and more potential customers have Smartphones – some target groups almost 100%, as shown in chapter 2.2. Almost 100% of Smartphones are equipped with GPS-Technology: Application on the smartphone can locate the consumer with an accuracy of 10m in open environment.

Newer Smartphones (Apple up from as IOS7, Android up from V4.3) can locate the User also in Buildings with the Beacon Technology: small near field sender (from 30 meter to 100 meter reach) can communicate with apps in smartphones when the customer is in reach. This technology also enables the transfer of data without any costs for the consumer – even without Internet flatrate.

Another method of accurate location is to use the build-in camera for scanning Labels and Tags. With this simple method build in Applications like “Shopstar”, the location is possible in buildings and to an accuracy of less than 1m.

3.2. New Start-Up for location based Marketing: Shopstar

Shopstar is a new Munich based start up company trying to bring the new possibilities of mobile and location based marketing to traditional „brick and mortar“ retailers.

The slogan from Shopstar is “We reward you for that, what you like to do most – go shopping!” (Shopstar 2014)

Shopstar is an intermediary between the mobile consumers and the stationary retailers

In February 2014 Shopstar has published Apps for Apple IOS and Android and opened for subscribing customers. As retail partners it has until yet won 5 retailers in Munich, which offer bonus points, called “Shopstars” for scanning their entrance – so bringing the consumers in the shops – and further scanning chosen products. The consumers can collect this “Shopstars” and change them later to a coffee in Starbucks or a gift card in their partner shops. If the consumers come near or in the shop they get via Beacon technology further information, special offers or services. Further bonus points are granted for scanning tags on chosen products in the partner shops.

So shopstar can reach the following targets:

- strengthen the stationary retail shops against competition of pure online shops by adding the mobile online shopping to the positive shopping experience onsite.
- Bringing the customers into the shop
- Getting permission of the subscribers to target the by sending Emails and SMS
- Getting Data from the subscribers about their online and physical shopping behaviour

4. Conclusion

The impact of Digital Marketing is growing significantly over the last years and will further raise with upcoming changes by demographic development new possibilities of using technology. German companies are not adapting sufficiently, with their distribution of marketing spending barely changing.

The urgency of this changes is clearly visible in the new Amazon Smartphone which was presented in the USA in June 2014: this innovative phone is able to recognise more then 100 Million objects by scanning them with it's cameras, analysing on Amazon Servers and showing immediatly further information including the price of this object when available in the Amazon shop with the option of "One-click-Buy" (SZ 2014). When this Phone will be delivered in Germany, the pressure on the "Brick-and. Mortar retailers will further rise.

So especially small companies are falling behind and are threatened by incumbents, which are using the new possibilities to a bigger amount.

The Social Media Manager as the Reputation's gatekeeper. An analysis from the New Institutional Theory perspective

Abstract

By drawing on New Institutional Theory, the aim of this paper is to provide an overview on the Social Media Manager as a new professional figure who is gaining an active role in the management and control of the firm's reputation. Social Media have indeed increased direct interaction and dialogue across organizations and stakeholders, but, on the other hand, they have expanded the spectrum of reputational risks. In order to monitor and create a dialogue with stakeholder and to gain positive reputational effects, firms have to take into account the need of a specific professional role in charge of the Social Media Strategy on the behalf of organization. After having provided a classification of the Social Media Managers, we have highlighted how Social Media have reached the stage of diffusion in the S-shaped institutionalization process but they have not up until now reached the institutionalization phase yet.

Introduction

Social Media¹ have changed the way society communicates, learns and carries out business (Lewis and Nichols, 2012, Kietzmann et al. 2011). They have become an important communication platform in many organizations (Kaplan and Haenlein 2010, Laroche et al. 2013, Linke and Zerfass 2012, Vernuccio et al. 2012) and the centre of many marketing strategies (Kietzmann et al. 2011, Graffigna et al. 2012, Mangold and Faulds 2009, Pastore 2009). Thanks to the introduction of Social Media, the power of consumer-driven communication is transforming the way in which businesses communicate, thus leading to a "revolution" in corporate communication which is not a one-way communication anymore, where a message is controlled by a business and delivered to its audience, but an interactive, two-way communication (Cosenza 2012). As a result, Social Media have to be taken into careful consideration to exploit new business potentialities (Kaplan and Haenlein 2010, Romenti et al. 2014) because they allow firms to engage in timely and direct end-consumer contact at relatively low costs and higher levels of efficiency than those achieved through more traditional communication tools (Kaplan and Haenlein 2010, Mangold and Faulds 2009). Most managers consider Social Media as a highly efficient communication and distribution channel (Kaplan and Haenlein, 2010), as powerful means of influencing customer perceptions and behavior (Laroche et al. 2013, Williams and Cothrell 2000) and as a critical part in driving purchase intent as well as delivering brand engagement (Meadows-Klue 2008, Vernuccio 2014).

On the other hand the most common challenge for managers is to accept the lack of control associated with Social Media, not knowing what people might say or do (DiStaso et al. 2011).

In order to be fully developed, Social Media need a clear strategy and guidelines although, as suggested by Kietzmann et al. (2011) and Macnamara and Zerfass (2012), many executives are reluctant or unable to develop strategies and allocate resources to engage effectively with Social Media. The lack of policies or guidelines for Social Media strategy expose organizations to significant risks such as the release of confidential information, legal actions for defamation or damages and reputation damage.

One of the main risks related to Social Media is indeed that they expand the spectrum of reputation risks because they fuel new expectations or beliefs about organizations, to which organizations should respond. As a consequence, the Social Media Manager, or who deals with Social Media networking and marketing on the behalf of organizations as an employee or as a consultant, is gaining an active and important role for firms.

Even though firms are increasing the adoption of Social Media in their communication strategies and this phenomenon has received attention in the practitioner literature, it has, however, remained under-investigated in scholarly research (Garrigos-Simon et al. 2012, Mancamara and Zerfass 2012, Mangold and Faulds 2009, Vernuccio, 2014).

¹ Social Media are a group of internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and Exchange of User Generated Content" (Kaplan and Haenlein, 2010, p. 61)

In this paper, by relying on a literature review, after having gained insights about the reputational risks in the Social Media landscape, we provide a classification of the emerging figures who deal with Social Media and who can be seen as new professional roles inside or outside a company (freelance or consultants)².

Considering the problems in giving a clear definition of Social Media Manager, by drawing on New Institutional Theory, we try to develop a framework in order to understand whether Social Media Managers require the institutionalization of Social Media or not in order to become legitimate professionals as the other functions in an organization (e.g. CFO, CCO). On the basis of our findings, we argue that Social Media have not become institutionalized yet but they have reached the stage of diffusion. The paper concludes with several research and managerial implications.

1. Theoretical background

1.1 Reputational risks in Social Media

Reputation is defined as “stakeholders’ perceptions about an organization’s ability to create value relative to competitors” (Rindova et al. 2005, p. 1033) and it is viewed as an intangible asset that provides a firm with sustainable competitive advantage. “Building reputation with key stakeholders can lead to market growth and the uncovering of new market opportunities” (Waddock and Googins 2011, 28). Hall (1992) found that CEO’s consistently ranked corporate reputation as the most important key intangible resource.

Numerous studies have analyzed the topic of reputation from different perspectives, such as management, economics, sociology and marketing and institutional theory.

From the institutional theory perspective, reputation represents how a stakeholder group perceive a firm and it is formed as a result of information exchange and social influence among various actors interacting in the organizational field (Rao 1998, Rao et al. 2001, Stuart 2000). Since Social Media are platforms based on information exchange where many actors can share ideas and opinions about the company, the products and the activities, we will rely on the institutional perspective to analyze how Social Media can influence firm’s reputation.

Institutional theory focuses on the context and it is used to examine how firms gain legitimacy and cultural support within their institutional contexts to build their reputation (Walker, 2010). “Reputation risk presents a threat to organizations in many ways. The loss of reputation affects competitiveness, local positioning, the trust and loyalty of stakeholders, media relations, and the legitimacy of operations, even the license to exist.” (Aula, 2010, p. 45).

As suggested by Kietzmann et al. (2011), “reputation has significant implications for how firms should effectively engage social media” (246) because they expand the spectrum of reputation risks by fuelling new expectations or beliefs about organizations, to which organizations should respond. Reputation is indeed one of the seven building blocks of the Social Media honeycomb framework provided by Kietzmann et al. (2011)³ and it could be defined in different ways: for example on Twitter as “the number of followers”, on YouTube “the number of views” and so on.

In order to avoid reputational risks and to try to engage stakeholders, Social Media implies an effort for firms. They should take in consideration the need of a specific key professional role in charge of Social Media strategy on the behalf of organization: the so-called Social Media Manager. In base of our findings⁴, academic literature has not

² Only 30% of businesses are outsourcing some portion of their Social Media Marketing, a very slight increase from 28% in 2011 (Selzner 2012)

³ Kietzmann et al. (2011) presented a framework that defines Social Media by using seven functional building blocks: identity, conversations, sharing, presence, relationships, reputation, and groups.

⁴ The following online journal databases were searched to provide a comprehensive bibliography of the academic literature published during from 2000 to 2014: Emerald Fulltext, Scopus Science Direct, Google Scholar. The literature search was based on the following descriptors: social media, social media manager, social media marketing, social media management, social customer relationship management, web 2.0, social media strategy. We decided to exclude from the analysis journals dealing with education, tourism management and health care, taking into consideration mostly marketing, public relations and management journals strictly correlated with the aim of the paper (Business Horizons; Database Marketing & Customer Strategy Management; European Journal of Marketing; International Journal of Strategic Communication; Journal of Computer mediated Communication; Journal of

investigated the specific role of this kind of professionals, their skills, the individual characteristics and the specific role in an organization yet, as in the case of Corporate Communication managers or other managerial functions.

1.2 New Institutional Theory and Social Media Management

Given that it is quite difficult to define the Social Media Manager and to identify the role and identity, we suggest to adopt New Institutional Theory in order to understand if Social Media Managers need an institutionalization of Social Media or not in order to be fully qualified and legitimated as in the case of other managerial roles inside firms (e.g. CEO, CFO, CCO)⁵.

Scholars tend to equate institutional effects in diffusion as institutionalization but, as suggested by Colyvas and Jonsson (2011), diffusion is concerned with spreading, how things flow, institutionalization is concerned with stickiness, how things become permanent and self reproduced. Indeed “the ubiquity of a practice may suggest that it has become widely accepted but activities that diffuse may never develop a foundation that enables them to persist” (Colyvas and Jonsson 2011, p. 27). Scholars have investigated and provided evidence of an ongoing process of institutionalization of corporate communication function – defined by Invernizzi (2008) as the “widespread and increasing importance of PR/Communication at strategic and operational management levels of large organization” - adopting New Institutional Theory in order to understand its core functions better (Invernizzi and Romenti 2009, Grandien and Johansson 2011, Sandhu 2009). Using this perspective scholars have highlighted the embeddedness of the communication function, the actions of communication professionals in organizing structures and the influence of institutional frameworks on organizations (Grandien and Johansson 2011).

Also in the European Communication Monitor (ECM) the professional practice of public relation/corporate communication is approached from the theoretical perspective of new institutionalism (Moreno et al. 2010). In this perspective, “public relation becomes more institutionalized until it finally becomes a condition for obtaining social legitimacy for the activities of the organization” (Moreno et al. 2010, p. 98).

New Institutionalism argues that the behavior of social actors is driven by contextual factors, societal scripts and schemas. Organizations follow such rules of appropriateness in order to gain legitimacy⁶ for their actions (March and Simon 1993, Meyer and Rowan 1977). The process “by which a given set of units and a pattern of activities come to be normatively and cognitively held in place, and practically taken for granted as lawful” is called institutionalization (Meyer et al. 1990, p. 10). Traditional models of institutionalization are typified by the S-shaped diffusion curve (Powell and DiMaggio 1991) but they mask a variety of temporal patterns in base of the pace of the institutional process and the stability of the institutions produced (Lawrence et al. 2001).

Diffusion studies generally investigate the introduction and the widespread of an innovation in the society (Strang and Soule 1998) and the motivations of adoption of a new practice assuming that organizations adopt practices in order to improve their performance (i.e. rational-instrumentality logic) and to appear legitimated to powerful evaluators (i.e. social appropriateness logic). As a result, institutional motives of adoption are clearly present in later phases of diffusion.

Tolbert and Zucker in 1983 have developed a two stage model in which early adopters search the efficiency, the technical or managerial benefits the practice could provide to their activities, by contrast, late adopters gradually choose to adopt a practice to obtain social legitimacy.

Communication; Journal of Marketing; Journal of Marketing Management; Journal of Mass Communication Quarterly; Journal of Interactive Marketing; Journal of Marketing development and competitiveness; Long Range Planning; Management Decision; Mercati & Competitività; Micro & Macro Marketing; Public Relation Review; Public Communication Review; Sinergie; The Electronic Library). It is interesting to see that a scant literature on top journals is dedicated to these arguments. The total ranked articles are more than 200.

⁵ or as other professional figures (e.g. lawyer, accountant)

⁶ Legitimacy is a central concept in new institutional theory since its foundation in 1977. It is a “generalized perception or assumption that the actions of an entity are desirable, proper or appropriate within some socially constructed systems of norms, values, beliefs and definitions (Suchman 1995, p. 574).

The model developed by Greenwood et al. (2002) outlines six stages of institutional change which could be useful to analyze the development and the increasing adoption of Social Media by firms and to read the emergence of the figure of the Social Media Manager as an institutional change.

Stage I occurs when events or “jolts” (Meyer, Brook and Goes 1990) destabilize established practices. In the case of Social Media, these jolts take the form of technological disruptions and also social upheaval. As we have seen before, the worlds of businesses and consumers are increasingly overlapping. Facilitated by the explosion of social media and the possibility of interaction, consumer and business co-create brands and companies use social media to support the creation of brand communities or for marketing research thanks to the information and knowledge produced and shared by users for free. Therefore we reach the Stage II (Deinstitutionalization), in which “new players”, “existing actors” or “local entrepreneurs” disturb the constructed field-level consensus by introducing new ideas and thus the possibility of change. We can assume that the emergence of the figure of the Social Media Manager could be viewed as a *new player* if he works as a consultant, as an *existing actor* if he comes out from the communication/marketing team, inside the organization, or as a *local entrepreneurship* if he is a freelance. These professional figures develop the Social Media strategy changing the traditional practices and offering opportunities to interact with a wide range of stakeholders (employees, customers, competitors, suppliers, investors, the media) in an easier, faster and more efficient way.

In the III stage, Preinstitutionalization, organizations innovate independently, seeking technically viable solutions to locally perceived problems. Social Media Managers develop their strategies in order to innovate and gain consensus inside society listening to the voice of customers and involving them thanks to Social Networking Sites or Content Communities (Kaplan and Haelein 2010). Customer engagement turns customers into fans and social media allow fans to connect with other increasing mutual satisfaction and advocacy (Sashi 2012).

After the Preinstitutionalization we can reach the Theorization (stage IV), which is the development and specification of abstract categories and the elaboration of chains of cause and effect.

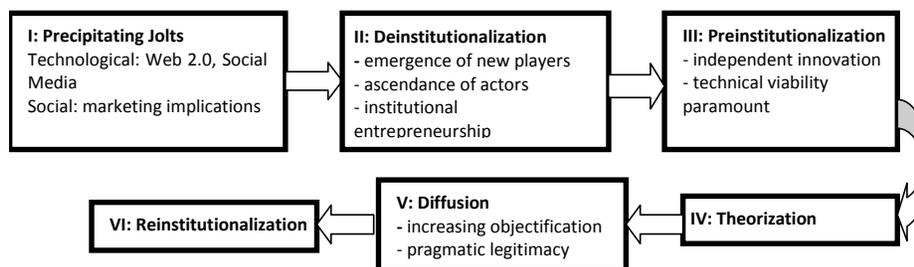

FIGURE 1: STAGES OF INSTITUTIONAL CHANGE

Source: adapted from Greenwood et al. (2002)

It is possible to identify, firstly, at least two processes of theorization connected with the phenomenon of Social Media. The first is the process through which consumers give their personal information for free allowing firms to interact with them in a more direct and personal way. Thanks to brand communities – “a group of ardent consumers organized around the lifestyles, activities and ethos of the brand” (Fournier and Lee 2009) – users can share information and experiences regarding a certain product. From the point of view of firms, this information provide marketers with a means for identifying consumer needs and promoting brand loyalty involvement, with a cost efficient way to retain customers and strengthen relationships (Casalo et al. 2008, Sica and Scotti 2007).

The second contribution of theorization is related to the concept of “crowd” (e.g. crowdsourcing, crowdfunding) where the access and the autonomous, shared usage of knowledge and of resources (e.g. human, capital, social) could be the reasons to adopt Social Media. In this perspective firms could operate as platform enabling crowd experience by users (and/or community members) and value production guided by the crowd itself.

Successful theorization is followed by diffusion (stage V). As innovations diffuse they become objectified, gaining social consensus concerning their pragmatic value and thus diffuse even further. Full institutionalization (stage VI) occurs when the density of adoption provides idea with cognitive legitimacy and ideas can survive across generations, uncritically accepted as the definitive way of behaving (Greenwood et al. 2002).

The difference between diffusion (stage V) and institutionalization (stage VI) is well defined by the matrix provided by Colyvas and Jonsson (2011). “The quadrants indicating low or high levels represent both the behavioral elements of diffusion (how widespread a practice or organizational structure has become) and the cultural and cognitive aspects of institutionalization (how legitimate it is).” (Colyvas and Jonsson, 2011, p. 28).

TABLE 2: MATRIX COMPARING DIFFUSION AND INSTITUTIONALIZATION
Source: adapted from Colyvas and Jonsson (2011)

		Institutionalization	
		No	Yes
Diffusion	Yes	Ubiquitous but not accepted	Widespread, conventional, appropriate
	No	Uncommon and inappropriate	Accepted, but not prevalent

Since the practices which are not diffused are rarely studied, we will focus our attention on the upper cells. The upper right cell represents practices both diffused and institutionalized. For example, human resource management departments are now commonplace in organizations, so much so that we hardly question their existence (Dobbin and Kelley 2007).

The upper left cell represents practices that are common but not accepted yet. Even more firms are aware of the benefits related to the adoption of Social Media⁷ but the practice to have a Social Media Manager who deals with these tools inside the company has not been institutionalized yet. According to Schwartzmann et al. (2009), indeed, the public relations/corporate communication department⁸ has widely become the department which is responsible for organizing and maintaining a company’s Social Media presence, followed by Marketing Department and IT Department. Also Owyang’s report (2011) claims that Social Media teams reside mostly in marketing department (40%) and Corporate Communication/PR (26%). We can therefore state that the presence of a Social Media Manager could be considered as a common practice that has reached the level of diffusion in the S-shaped curve but not the institutionalization level.

2. The roles of the Social Media Manager

After having developed the theoretical background on which we rely, in this paragraph we are going to specify the roles of the Social Media Manager.

Given that the figure is not well defined in the academic literature, we can argue that the Social Media Managers or who deals with Social Media on behalf of the organization can be considered as a middle manager. Middle manager, indeed, are often closer to external stakeholders than are top managers (Dutton, Ashford, Neill, and Hayes, 1997). They “perform a co-ordinating role where they mediate, negotiate and interpret connections

⁷ According to Seltzner’s study (2012), a significant 83% of marketers claim that Social Media are important for their business and that the top three benefits of Social Media marketing are the following: generating more business exposure, increasing traffic, providing marketplace insights.

⁸ Until the 1970s, practitioners have used the term “public relations” to describe communication with stakeholders, largely consisting in communication with the press. When also other stakeholders started to demand more information from the company we can see the roots of the corporate communication function. “Corporate Communication is a management function that offers a framework for the effective coordination of all internal and external communication with the overall purpose of establishing and maintaining favorable reputations with stakeholder groups upon which the organization is dependent” (Cornelissen, 2008, p. 5).

between the organization's institutional strategic and technical operational levels" (Floyd and Wooldridge, 1997). Floyd and Wooldridge (1997) articulated four strategic roles of middle managers: the traditional role springs from thinking that is consistent with existing strategy and from attempts to integrate subordinates' activities around this strategy. They have also a role of synthesizers who interpret information and channel it to top management and of champions because they try to reshare upper management's concept of strategy. As facilitators, "they encourage organizational actors below and around them to engage in idea generations and other experiential efforts"(Wooldridge, Schmid, and Floyd 2008, p. 1203).

Social Media Managers, indeed, on one hand, have to communicate the firm's strategy to external stakeholders and, on the other hand, they have the role to react to stakeholders comments and needs in order to avoid reputational attacks.

Grey literature⁹ or practitioner literature provide many definitions which try to summarize the roles and the skills of the manager who deals with Social Media. In Table 1 we present both the contributions provided by Owyang (2011), Xhaet (2012) and IWA (2013) and our classification. Since we have noticed some common elements among the profiles provided by previous authors, we have classified them in four areas which represent, in our opinion, the main tasks of the Social Media Manager: analysis, content development, strategy and community management. Then, we have associated a label to each group in order to summarize the four main roles of the Social Media Manager:

- *Social Analyst*: for a Social Media Manager it is very important to monitor and to analyze the power of an effective Social Media program in terms of its ability to generate positive buzz about a firm's, its goods and services (Castronovo and Huang 2012). The importance of the discipline "social media analytics" is increasing with the aim to help firms to measure, evaluate the performance of Social Media strategy and provide useful insights in order to improve firm's strategy (Owyang 2011, Cosenza 2012). A lot of analytical tools are provided to measure the performance of each Social Networking Site (Cosenza 2012).
- *Content Manager*: in order to develop a relationship with users, content has to be always fresh and dynamic. Managers have to engage in discussions, beyond responding to negative comments and defending product offerings, but allowing users to become "prosumers" (Toffler 1980)
- *Social Media Strategist*: it is crucial for firms to have a set of guidelines that can be applied to any form of Social media (Kaplan and Haenlein 2010, Macnamara and Zerfass 2012); the Social Media Manager should develop a clear strategy in order to know how to react to a question or to a crisis situation. In addition, as suggested by many scholars, integration among social media and traditional media is the key. Bruhn et al. (2012) have demonstrated that traditional media exert a stronger impact on brand awareness whereas Social Media on brand image. Therefore, "the joint implement of these different communication instruments offers opportunities for further increasing brand equity" (Bruhn et al. 2012, p. 781).
- *Community Manager*: is the spokesman of the community, he has the role of enhancing the enthusiasms of the community by ensuring a good relationship between companies and communities. He/she has to improve organization's marketing activities, promote products and events, and improve the organization's reputation by enhancing the participation and collaboration of a variety of stakeholders in order to improve some "crowdsourcing" processes at different points of the value chain (Garrigos-Simon et al. 2012). Ang (2011) has introduced the term Community Relationship Management (CoRM), in order to overcome the limits related to the topic of Social CRM. The last one is related to customers, CoRM highlights a more generic community because it reflects more accurately what people do in online communities - connect, converse, create and collaborate (Nadeem, 2012, Micelli, 2010).

As we can see, it is quite difficult to provide a clear and unique definition of the manager in charge of Social Media because Web 2.0 is a transforming and ongoing world that needs a lot of skills, experiences and practices.

⁹ A list of documents which can be reached by surfing web using key words.

In most small and medium enterprises the four roles should be integrated in one person, given the time and resources restrictions. In big firms, as suggested also by Owyang (2011) we can have a Social Media Team which deal with Social Media from different perspectives.

TABLE 1: CLASSIFICATION OF SOCIAL MEDIA MANAGERS

	Owjang (2011)	Xhaët (2012)	IWA (2013)	Our classification
Analysis	<p>Social Analyst: by using brand monitoring, social analytics, web analytics, and traditional marketing tools, he is responsible for measurement and reporting across the entire program and for individual business units.</p>	<p>E-reputation manager is specialized in the analysis of online word of mouth by managing and interpreting linguistic and semantic elements; Web analyst reads, evaluates, compares analyses in order to adapt and improve strategy and metrics; SEO (Search Engine Optimizer) provides the project with the highest online visibility, especially on search engines.</p>	<p>Web project manager is responsible of the project, plans and coordinates all the activities, therefore has to monitor constantly time, costs, quality, risks and results.</p>	<p>SOCIAL ANALYST</p>
Content	<p>Social Media Manager: this role coordinates business units to launch Social Media initiatives. The Social Media manager may straddle internal and external communications, direct resources, and formulate program plans.</p>	<p>Transmedia web editor: is the person in charge of the web contents. He uses a particular voice, an unmistakable style, which is the result of an ongoing work of refinement. Content Curator is the person in charge of the filtering and aggregation of online information.</p>	<p>The Web Content Specialist deals with contents, texts and multimedia and pays attention to the target and the platform which is going to be used. He has also to monitor the usability of the website and customer satisfaction.</p>	<p>CONTENT MANAGER</p>
Strategy	<p>Corporate Social Strategist: responsible for overall vision and accountability towards investments. The strategist is primarily internally-facing and rallies business units.</p>	<p>Digital PR is the evolution of the PR in the digital world. He integrates online and offline in order to gain and maintain relationships; All-line advertiser is the person in charge of online promotion tools even though offline channels must not be forgotten.</p>	<p>Digital strategic planner: supports the strategic choices of the top management and give inputs to the other professional figures involved in the process.</p>	<p>SOCIAL MEDIA STRATEGIST</p>
Community	<p>Community Manager: Is the manager who deals with the online community. He/she has to develop empathy with the community in order to involve and engage stakeholders.</p>			<p>COMMUNITY MANAGER</p>

3. Discussion and conclusion

Despite the fact that Social Media provide a very unique and cost-effective way for business to communicate with a large body of consumers and that they have improved the way in which companies communicate, the development of Social Media strategy, as examined before, could be considered as a common practice that is not been legitimated yet, that has reached the level of diffusion in the S-shaped curve but not the institutionalization level. We can consider the Social Media Manager as a new player if he works as a consultant, as an existing actor if he comes from the communication/marketing team, inside the organization, or as a local entrepreneurship if he is a freelance. These

professional figures develop the Social Media strategy by changing the traditional practices and offering opportunities to interact with a wide range of stakeholders (employees, customers, competitors, suppliers, investors, the media) in an easier, faster and more efficient way (Castelló et al. 2013, Driessen et al. 2013, Schultz et al. 2013).

The analysis and the classification of the roles of the Social Media Manager have identified the competences which characterize the figures. As we have seen, the Social Media Manager can have different roles inside the organization. He/she can develop the analysis, the strategy, create the content or manage the community. Since most of the Italian firms are small and medium enterprises, Social Media are usually managed by only one person. It is quite difficult that Social Media are managed by teams. Nevertheless, Social Media Managers assume an important role because, if we considered them as middle manager, they stand between the company and the stakeholders and they represent a filter from the inputs received by the stakeholders and the firm.

As regard the reputational risks related to Social Media, every professional profile has a specific role on the reputation's management.

The *Social Analyst*, by analyzing and monitoring what happens on Social Media, has to monitor stakeholder's perceptions through an analysis of online conversations and act upon possible misunderstandings in order to save the reputation of the firm and to adopt the most efficient strategies. As before mentioned, the dark side of Social Media is that individuals can create and widely distribute unsubstantiated accusations about an organization. As a consequence, if the content goes viral, spreading exponentially through social networks, it can cause an organizational crisis (Ulmer, Sellnow and Seeger 1998). For example, one of the most cited case study is the Domino's pizza case (Veil et al. 2012). Back in 2009 they found themselves launched into a viral attack when two employees in their Conover N.C. franchise uploaded a video to Youtube of themselves doing disgusting things to a sandwich before it went out on delivery. They quickly set up a Twitter account to respond and reassure customers that this was an isolated incident and that they were in the process of taking the necessary measures to correct it. Immediately after Dominos released a brilliant official response to the crisis via Youtube, the same channel used before by the employees in order to counter the hoax message for the same audience that received it.

The *Content Manager*, on the other hand, has to think about the most suitable content for each channel used by the firm. In order to avoid reputational risks, the underlying message has to be the same but each social media requires different contents. As suggested by Mangold and Faulds (2009) Social Media are a "hybrid component of the promotional mix" and therefore have to be incorporated as an integral part of the organization's Integrated Marketing Communication strategy. For example Dove campaign for Real Beauty (Singh and Sonnenburg 2012) started with "The Evolution Spot" on YouTube which showed a normal looking woman being transformed into the stereotype of a beautiful woman. Following the success gained, the campaign expanded into other media: to its own Internet website inviting women to discuss beauty, on Facebook allowing to post pictures, as well as offline through tv spots and print advertisements.

The *Social Media Strategist* will develop the strategy by taking into account the risks and the benefits related to each Social Media. Kietzmann et al.'s framework (2011) will help managers to choose the most efficient Social Media in relation to their objectives. Even if the most popular Social Media is Facebook, as suggested by Cosenza's Social Media Positioning Map (2012, p.223), Facebook is useful to improve relationships with a large audience without any specific interests, therefore it is located within in the space "delocalization conversation". On the other hand LinkedIn is more suitable to stimulate focalized conversations about specific topics with a niche-public (Cosenza 2012, Kietzmann et al. 2011). As suggested by Cosenza (2012) one of the key elements of Social Media Strategy definition is given by the positioning on the Social Media Map in order to "allocate resources to engage effectively with social media" (Kietzmann et al. 2011, p. 242). For example, an Italian multiutility has decided to not join Facebook or Twitter since they are not considered as strategic tools for the company, given the industry in which they are involved (Moretti and Tuan 2013). They have created a LinkedIn page which enable them to manage a more direct and formal approach with potential employees and with stakeholders in general.

The *Community Manager* has an important role to understand the needs and the opinions of different stakeholders. Even more companies are using co-creation and innovation communities to involve consumers in company's development processes and increase loyalty (e.g. Gebauer et al. 2013, Fuller 2010). On the other hand, communities need an ongoing management because they can also evoke angry reactions, as happened for example for Henkel in Germany. Engaged participants were not satisfied with the selected winners of the label design contest and

they reacted with negative word of mouth. In cases like this, the Community Manager has to react immediately to manage consumers' complaints by developing a rich and open dialogue with the community (Varey and Ballantyne 2006). As a consequence, as suggested by Walker (2010), even if reputation is viewed as an aggregate perception of all stakeholders, it should be measured for each stakeholder group because it differs from one to another.

Nevertheless, in this paper we have focused the attention on the reputation but it represents only one of the topics which can be related to the Social Media Manager. As before suggested, Social Media are not only a communication tool but they should be considered as a phenomenon which needs to be placed within an economic and managerial perspective: the evolution of the production of value based on knowledge which is created, disseminated and shared, where ICT plays a role of enabling drivers (Rullani 2004a, 2004b).

It would be interesting to analyze if the presence and the activities of the Social Media Manager have an impact, for example, on the customers' loyalty and on the stakeholder relations, on the firm's financial performance and on the attractiveness to potential employees.

In this context, in order to allow a complete understanding of the role of Social Media Manager, we suggest at least two future research paths dealing with:

- the training processes of Social Media Managers;
- the management and control of Social Media Managers by firms.

Considering the first path, we need to identify which kind of elements are functional to the training process of Social Media Managers. A first list of elements could be the following: mono or plural dependency relations from firms; single or multiple industrial experience and operations; contemporary presence of plural projects in different stages of Social Media development.

For example it could be interesting to know if a value added element is given by the fact that a Social Media Manager is a freelance working with more than one firm or if the multi-dependency generates bad results in terms of community management or users engagement. Another aspect to be taken into careful consideration, when dealing with training, is given by the variety of industrial/territorial/genre setting in which a manager is involved. A Social Media Manager needs to operate in different industries to be able to be legitimated in terms of its role, or on the contrary is it more important to have a multiple presence in the same industry to be legitimated?

Does a Social Media Manager improves its performance if he is involved in projects characterized by different evolutionary step or it more effective working in similar project (e.g. all start-up community sites)?

These kinds of questions have important managerial implications which could be better investigated through clinical interviews with those who identify themselves as Social Media Managers.

With regard to the second path, the management of the Social Media Manager has important implications for the firm's strategy. We can have Social Media Manager inside a firm, inside a consultancy agency, inside an ICT company, or they could be freelance working for more than one company. If we do not know their organizational role, hierarchical dependency, contractual performance management, we could have problems in term of their management. The possibility of incongruity between the aim of Social Media strategy and the organizational position of the Social Media Manager may negatively affect the SM strategy.

It is also possible to highlight how a clear understanding of the characteristics of the role (internal, external agencies and/or other) can be achieved through a good integration with the definition of the specific duties and responsibilities of this kind of condition. For example, how can the contributions to the achievement of the results of a Social Media strategy given by a Social Media Manager working in a communication agency be measured? Which are the levers which a Social Media Manager can deploy when he/she is internal or external to the company? Which are the specific timing relationships between Social Media Managers and the business? For example, if a Social Media Manager working for a communication agency goes free lance, do the clients who are loyal to him/her become a "personal asset" of the manager or, on the contrary, is the Social Media Manager simply replaced?

This paper is the first step of an explorative process which needs to deepen the aspects related to further analytical empirical implications. The two areas of empirical research on Social Media Manager and the paths of development which have been previously identified, are the aim of further research in this area. The lack of Databases on professional figures which are, or can be identified as Social Media Managers, represents the main difficulty in developing the second research path. Therefore the first stage of development of future research will consist in a

number of specific researches (through clinical interviews, observed participation) concerning operators who are already available and play a key role in companies with regard to the topic.

Privacy, security and utility perceptions on social commerce by Mexican consumers, and its impact on adoption of Social Network Sites as marketing medium

Abstract

The increased popularity of social networking sites (SNSs), such as Facebook and Twitter, has opened opportunities for new business models for electronic commerce, often referred to as social commerce. This research aims to identify and explain some of the factors related to security and trust that may inhibit people and some factors related to easy of use that may encourage people to adopt social media as a marketing medium. To explain the adoption of social commerce by Mexican consumers, we build on the main models developed to explain the processes of technological innovation such as the perceived risk model, the theory of reasoned action, the technology acceptance model, and the innovation decision process; and a more specific model that aims to explain social commerce adoption; the social commerce acceptance model, SCAM. In particular this study measured confidence and perceived utility as drivers of purchase intention on SNS. A questionnaire was developed and applied to 311 respondents and structural equation modeling tested the model empirically. Results show a high psychological risk and a low sociological risk perceived by Mexican consumers. Perceived risk correlated inversely with purchase intention on SNSs while perceived utility showed a positive effect.

Keywords: social commerce, social shopping, social networking

Introduction

The Internet has spurred the reshaping of businesses and their strategies (Jachyra, 2009) as online transactions are available without having physical stores, and stakeholders are being managed through the Internet (Willis, 2004). In a narrow sense, electronic commerce (e-commerce) is an electronic way of buying and selling (Willis, 2004; Malucelli, Palzer & Oliveira, 2005). On the other hand, in a broad sense, e-commerce is not just selling and buying but includes managing the processes of stakeholders (Fingar, 2000; Zhu & Kraemer, 2002). Regardless of the scope, the most frequently cited benefits of e-commerce are cost reduction resulting from relatively less resource consumption (i.e., spatial, temporal, material and labor force) and data collection (Gerald & Efrim, 2009; Willis, 2004; Malucelli et al., 2005).

Web 2.0 is a phenomenon that has transferred Internet and the WWW to a social environment, creating platforms where people can interact and create content online (Lai and Turban, 2008). This advancement has also elevated online communities to a level where new business plans can be developed and implemented (Lu et al., 2010). Among emergent online social tools, or social media, perhaps the most preeminent are SNSs – online platforms on which users can create profiles and build personal networks for communicating and exchanging content (Boyd and Ellison, 2007). Social media has had a significant impact on communication since the first weblogs, or blogs, appeared more than a dozen years ago (Thackeray et al., 2008).

SNSs connect people with each other and help them to stay in contact with friends and family (Mital & Sarkar, 2011). Social networking websites act as a platform for coming together of people with similar interests, beliefs, and ideas. Users of social networking web sites connect to each other with the purpose of finding and exchanging content. Some of the other ways in which social networking can be used are for self-disclosure and self-representation and thus create and manage a social or even a professional identity (Haythornthwaite and Wellman, 1998). Social media is a subset of Web 2.0, and the social media revolution in the use of the Web is making social commerce a new extension of e-commerce (Fraser, and Dutta, 2008; Stephen, and Toubia, 2010; Zwass, 2010; Turban, Bolloju, and Liang, 2011).

Literature review

SNSs are applications that enable users to connect by creating personal information profiles, inviting friends and colleagues to have access to those profiles and sending e-mails and instant messages between each other (Kaplan and Haenlein, 2010). Tredinnick (2006), defines SNSs as those sites driven by user-participation and user-generated content. These definitions highlight the central philosophy behind SNSs which is self-disclosure, described by Kaplan and Haenlein (2010) as the conscious or unconscious revelation of personal information, for example feelings, thoughts, likes, and dislikes.

Profit making organizations use SNSs for interacting with customers and marketing their products. Muniz and O'Guinn (2001) observed that several companies are using SNSs to support the creation of brand communities. This means that social media holds enormous potential for companies to get closer to customers, and by doing so, facilitates increased revenue, cost reduction and efficiencies (Baird and Parasnis, 2011). Although it is certainly clear that large numbers of people are using SNSs, it is extremely difficult to determine the exact number of users because the numbers keep rising each and every day. A study by Waters et al. (2009), for instance, has indicated that an average of 250,000 people register to use Facebook daily. As consumers use online social media (e.g., weblogs, social network services), it is also important to understand consumer's media use and social communication in online shopping. Papacharissi and Rubin (2000) examined interpersonal, media, and new technology motives and found five computer-user computer mediated technology (CMC), motives for using the Internet: interpersonal utility, passing time, information seeking, convenience, and entertainment. Flanagin and Metzger (2001) classified ten motive clusters for people's Internet use including information, learning, playing, leisure, persuasion, social bonding, relationship maintenance, problem solving, status, and insight. Ray (2007) investigated why people make use of CMC, via social networking websites and examined people's motivations of CMC; motivations include entertainment, information, and social utility. Also, Nadjm (2007) found several reasons why people use social networking websites, such as to be popular, make friends, exchange information, self-improvement, entertainment, belonging to a group, etc.

Social Commerce

The social interactions of people on the Internet, especially in social networking site (SNSs), have created a new stream in e-commerce. This new stream is social commerce, s-commerce. Yahoo first introduces the label "Social commerce"! In 2005, with the earliest academic article entailing it in 2007 (Jascanu, Jascanu & Nicolau, 2007). Although there is no standard definition of the term, s-commerce, (also known as social business), generally refers to the delivery of e-commerce activities and transactions via the social media environment, mostly in social networks and by using Web 2.0 software. According to Petersen (2011), s-commerce is the fusion of e-commerce and social networking. Hajli (2012), defines s-commerce as "a new concept, which enables customers to have an active positioning cyber space. It is a development in e-commerce based on a network of buyers and sellers. It is more commonly found in social and interactive forms of e-commerce". S-commerce is the use of Web 2.0 and social technologies to support interactions in an online context to support consumers' acquisition of services and products on the Internet (Liang and Turban, 2011). As a relatively new phenomenon first widely acknowledged in 2005, s-commerce, presents new opportunities to examine issues related to information/content, business strategies, management, technologies, and people's behavior. It involves using Web 2.0 social media technologies and infrastructure to support online interactions and user contributions to assist in the acquisition of products and services. (Liang and Turban, 2011), its major feature is conducting various types of commercial activities on social media to take advantage of online social capital (Ting-Peng et al, 2011-12). The increased popularity of social media such as Facebook and Twitter has further developed s-commerce. Since June 2009, Facebook has been transitioning beyond just a social media site, and into a viable commerce venue (Parry, 2011; Sands, Harper, & Ferraro, 2011). Projected retail sales through Facebook storefronts (retailers that run Facebook pages and conduct e-commerce transactions through the Facebook pages) may grow to \$15 billion by 2015 (Word of Mouth Marketing Association, 2011). The process of buying and selling products has then, evolved from traditional physical storefronts, to catalog shopping, then shopping electronically using online retail storefronts, and most recently to the social media venue, Facebook, for transactions (Jansen, Sobel, & Cook, 2011). The future of e-commerce is s-commerce (Hajli, 2012). According to Sau-Ling (2011), s-commerce has four characteristics: 1) there is harnessing collective intelligence, i.e., the key to market dominance lies in the creation of massive networks of contribution;

2) an architecture of participation in which all parties are involved; 3) viral marketing, which is one way to achieve loyalty with consumers and greater affinity; 4) Rupture of marketing, i.e., the most successful companies are those that gain the most from their consumers and at the same time, have a new and different approach to do things. Some SNS's have developed applications to make purchases within its site, i.e. Facebook. It has led to the emergence of a new sub-category for s-commerce called F-commerce, where users with similar tastes and interests can make purchases within Facebook. (Petersen, 2011)

S-commerce has quickly emerged as a new area of inquiry for both practitioners and researchers, suggesting the potential impacts of social media and social networking technologies and services in shaping commercial channels on the Internet (Zhang, Zhou and Zimmerman, 2013). Social relationship is the key element that differentiates social commerce from other forms of online commercial activities. (Ting-Peng et al, 2011-12). However, except for a few recent studies (Zee-Sun, 2011; Ting-Peng and Turban, 2011-12), there has been a general lack of strong empirical work to enable the establishment of models to find out the factors that can explain the adoption of s-commerce.

Adoption of innovations

Past studies used to explain adoption of innovations include various frameworks and models to clarify the factors or determinants influencing the acceptance of technology in consumer context. Most of them are based on theories such as perceived risk theory (PRT), (Bauer, 1960), the technology acceptance model (TAM), (Davis, 1989), Theory of planned behavior, (TPB) (Ajzen, 1991) and diffusion of innovation, (DOI) (Rogers, 1995). TAM assumes higher Perceived Ease of Use (PEOU) and Perceived Usefulness (PU) of a system cause a greater intention to use a system. TAM proposed that perceived usefulness (PU) and perceived ease-of-use (PEOU) are both able to predict the behavioral IU a technology of users. PU is the extent to which an individual's expectation that the use of the technology will improve one's job performance whereas PEOU is the belief that using the technology will be free of effort (Davis, 1989). TPB is a theory about the link between beliefs and behavior. The theory states that attitude toward behavior, subjective norms, and perceived behavioral control, together shape an individual's behavioral intentions and behaviors (Ajzen, 1991). TPB was extended from theory of resonated action (TRA). Besides, technological factors, TPB also focused on social and individual factors (Khalifa and Shen, 2008). The theory of planned behavior stated that behavioral intention to perform an activity is determined by attitude, perceived behavioral control, and subjective norm (Ajzen, 1991). Social Commerce Acceptance Model (SCAM) indicated the importance of s-commerce components in intention to buy behavior of customers. Trust as well as forums and online communities play key roles in the SCAM model. According to SCAM, forums and communities positively increase customers' trust and consequently intention to buy increases. (Hajli, 2012). This is the first model in s-commerce to date.

Barriers and factors influencing s-commerce adoption

Barriers existed for both fans and online Facebook retailers. Retail Facebook fans needed to trust the brand, feel engaged, and be social when they visited retail Facebook sites (Nambisan & Watt, 2011). If fans did not feel in control of their online retail experience, they had a lowered sense of trust (Gil-Or, 2010). Facebook retailers faced many barriers when marketing to retail Facebook fans. Included in these barriers was a lack of understanding the Facebook environment, identifying the resources needed to market to fans, and not knowing which marketing tactics influenced Facebook fans (Karakaya & Stahl, 2009). Barriers to brand building are due to consumer trust perceptions of an organization and the culture of an organization (Gil-Or, 2010). Fans mostly used a social networking site such as Facebook to connect with family and friends. Only 23% used it to interact with brands (Baird & Parasnis, 2011).

Marsden (2009) notes that social shopping is influenced by the social intelligence of the individual, i.e., their ability to learn from the knowledge and experience of people you know and / or trust. This type of purchase is governed in part by the heuristic thinking of each individual, i.e., to ignore the information that is available and leaning usually consideration of recommendations made by acquaintances or you trust and that usually given as result of intuitive decision making by the buyer (Marsden, 2009). The behavior exhibited by the social buyer has

been studied by modern psychology. It states that there are six heuristic laws that governed social buyers: 1) social support, 2) power, 3) scarcity, 4) admiration 5) coherence and 6) reciprocity (Neuromarketing , 2012).

Risk perception

Consumer perceptions of risk have been widely dealt with in the past literature and have been shown to shape all purchase decisions to varying degrees, and thereby influence consumer behavior (Bauer, 1960; Bettman, 1973; Chaudhuri, 1997; Cox, 1967; Cunningham, 1967; Mitchell, 1992, 1999). A purchase decision involves risk when the consequences connected with the decision are uncertain and some results are more desirable than others (Kogan and Wallach, 1964, 1967; Pollatsck and Tversky, 1970; Rapoport and Wallsten, 1972; MacCrimmon and Wehrung, 1986). Consumer perceptions of risk have been widely dealt with in the past literature and have been shown to shape all purchase decisions to varying degrees, and thereby influence consumer behavior (Bauer, 1960; Bettman, 1973; Chaudhuri, 1997; Cox, 1967; Cunningham, 1967; Mitchell, 1992, 1999). A purchase decision involves risk when the consequences connected with the decision are uncertain and some results are more desirable than others (Kogan and Wallach, 1964, 1967; Pollatsck and Tversky, 1970; Rapoport and Wallsten, 1972; MacCrimmon and Wehrung, 1986). Social risk included seeking the opinions of family and friends prior to making an online purchase through Facebook storefronts. Risk perceptions lowered and decreased the purchase barrier when Facebook storefronts made the process transparent to fans and offered complete information (San Martin et al., 2011).

Trust

Historically the issue of trust (i.e. “the confidence of the exchange actors in the goodwill of each other” Gounaris, 2005, p. 127) dissuaded many buyers and suppliers from participating in e-markets. Trust theory is used in interpreting social behavior and may be able to shed light on issues in s-commerce research (e.g., Caverlee, Liu, and Webb, S., 2010). Negative interactions among retail Facebook fans, was a barrier to convert from fan to buyer (Zeng et al., 2009). Negative comments and inappropriate postings lowered the sociability that fans experienced (Nambisan & Watt, 2011).

Easy of use

Easy of use of innovations is sometimes measured by its opposite: perceived complexity. Rogers (1995) defined complexity as the degree to which an innovation is perceived as relatively difficult to understand and use. Complexity refers to what makes people perceive innovation as a complex (Tornatzky & Klein, 1982). The construct of Davis 'perceived ease of use' (Davis, Bagozzi & Warshaw, 1989) is the opposite of complexity (Moore & Benbasat, 1991). Is defined as "the extent to which a prospective user expects a target system is free of effort" (Davis, Bagozzi & Warshaw , 1989 : p 985.) . This effort covers both physical and mental effort (Moore & Benbasat, 1991). The complexity thus relates to more than just the difficulty to understand and operate an innovation. Exemplary is the inclusion of 'uncomfortable to use' and 'frustrating to use' on the scale of usability by Moore & Benbasat (1991). Regarding s-commerce, it can be argued that issues such as security, user difficulty of neglect and technological dependence can make a user perceive it as complex.

Methodology

Aims and research question

This research aims to answer which factors explain the adoption of social commerce in Mexican SNS's users. Thus, research question of this study was: What are the factors that inhibit the adoption of social media as a marketing medium in Mexico? The basic proposition in this study is that there are factors (i.e., distrust and perceived risk) that inhibit s-commerce adoption and some factors that facilitate its adoption (i.e., perceived easy of use).

The proposed research model

From the review and the subsequent discussion on the findings, a model was drawn to study the adoption of s-commerce among Mexican consumers. It focuses in analyzing perceived risk, trust and easy of use to predict intention of using and buying intention trough social commerce, as shown in Figure 1:

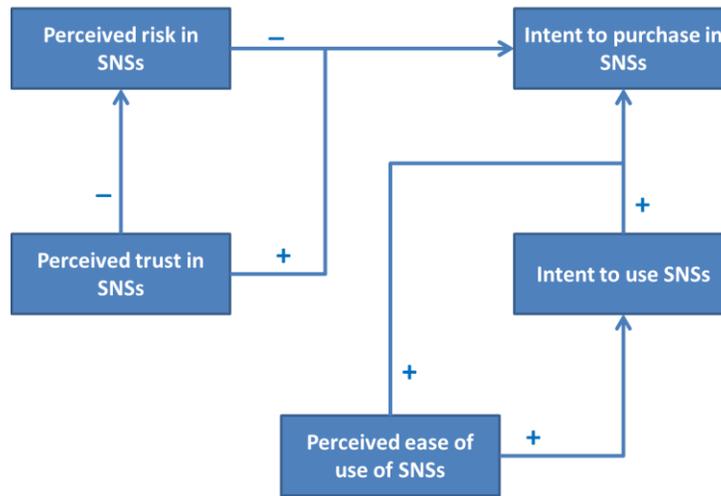

FIG. 1: PROPOSED RESEARCH MODEL

Therefore we predict:

- H1: Perceived risk on social networks will negatively affect the purchase intention of social networks users.
- H2: The trust of users towards social networks lowers the perceived risk in social networks.
- H3: The trust of users towards social networks increases the purchase intention in SNSs.
- H4: The greater ease of use perceived by users, the greater the purchase intent of social networks users.
- H5: Perceived ease of use of social networks will positively affect the intended use of social networks.
- H6: Intention of the use of SNSs will be positively associated to the purchase intention of social networks users.

Measures

To measure Perceived risk on SNSs, we used the 5-item scale (RP) developed by Lorenzo-Romero et al, (2011), based on the work by Jarvenpaa et al. (2000), McKnight et al. (2004b), Wakefield y Whitten (2006), González et al. (2006), Flavián y Guinalfú (2007), Ruiz et al. (2007), and Muñoz (2008). Examples of items of this scale are “if my friends / colleagues know that social networking use my public image could be adversely affected” and “using social networks can sometimes make me feel bad”. Response categories ranged from 1 (not at all characteristic of me) to 5 (extremely characteristic of me). Cronbach's alpha for the scale was 0.775, which is lower to other research using the scale (Lorenzo-Romero et al, 2011, $\alpha=0.90$), but still higher than 0.7, which is the minimum accepted value (Hajli, 2012; Han, B., & Windor, J., 201 and Hair et al., 1999), who also state that the lower limit for acceptable Cronbach's alpha may drop to 0.60 in an exploratory research. To measure trust in SNSs, we used the 11-item scale rated on a 5-point scale (C) developed by Lorenzo-Romero et al, (2011), and based on the work by Pavlou (2002, 2003); Flavián y Guinalfú (2007); Camarero y San Martín (2007); Ruiz et al. (2007); Muñoz (2008)). Examples of items of this scale are “I believe the information in SNSs is sincere and honest”, “social networks are characterized by openness and transparency”, “social networks are worthy of trust” and “companies that manage social media act responsibly”. Three of the items in this scale were dropout as they had a low charge in the Factor analysis (items C9, C10 and C11, with charges below 0.60. Concerning this, Hair et al. (1998, 2006) recommends that, in addition to being significant, the average of the loads on each factor is greater than 0.7 or as Bagozzi and Yi (1988) and Vila et al (2000), proposed, individually greater than 0.6.). Cronbach's alpha for the revised scale in our study was 0.82. To measure Intent to use SNSs, we used the 4-item scale rated on a 5-point scale (IU) developed by Lorenzo-Romero et al, (2011), based on the work by Davis (1989); Moon y Kim (2001); Mathwick (2002); Chan y Lu (2004); Castañeda (2005); Muñoz (2008); Willis (2008). Examples of items of this scale are “I intend to start or continue using social networks” and “I will recommend to others to use social networks”. Cronbach's alpha for the scale in our study was 0.76. To measure

perceived easy of use, we used the 6-item scale rated on a 5-point scale (FU) developed by Lorenzo-Romero et al, (2011), drawn from the work by Davis et al. (1989); Venkatesh (2000); Moon y Kim (2001); Pikkarainen et al. (2004); Munoz (2008); Shin (2008a, b); Willis (2008). Examples of items of this scale are “Learning to manage social networks is easy”, “interaction within social networks is clear and understandable” and “Social networks are easy to handle for anyone”; item FU4 was dropped out due to a low charge in the Factor analysis. In our study, $\alpha=.76$. To measure intent to purchase in SNSs, we used the 2-item scale and is rated on a 7-point scale (IC) developed by Mir & Zaheer, (2012). Items of this scale are “I will consider in my future product purchases those offers that companies present in SNSs” and “I intend to take my future purchasing decisions based on the information users share in social networks”. Cronbach's alpha for the scale in our study was 0.82.

Data collection procedure

This study focuses on adoption of s-commerce of college-aged adults for a variety of reasons. First, although Internet adoption rates have increased in all demographic groups, usage still varies across age groups with the highest penetration (88%) among young adults aged 18 to 29 (Rainie, 2005). Second, young adults have grown up with this technology and the distinctions between the online and offline world are often blurred (Rainie, 2006), which suggests that Internet communication is a way of life for this group. From a behavioral perspective, these two reasons suggest that young adults are more likely to use the Internet for sharing information with their family and friends. We administered a survey to undergraduate students enrolled in marketing courses at a university located in Guadalajara, Mexico. Participants were informed that the purpose of the project was to develop an understanding of the factors that inhibits the use of SNS as a marketing medium. Inviting 985 Facebook users to an online survey, which took approximately 20 min to complete, collected data. The final sample was comprised of 190 females (61%) and 121 males (39%). The ages of the subjects ranged from 18 to 51 years of age, with a mean of 22.5 (SD=2.6). 14% of the participants were undergraduate students, 66% of the participants had finished their college studies and 20% were graduate students. 81% of the participants informed to use SNSs on a daily basis.

Data analysis procedure

We used the two-step approach to structural equation modeling (SEM) which calls for the evaluation of the fit of the measurement model using confirmatory factor analysis (CFA) prior to assessing the fit of the structural model (Schumacker and Lomax, 2004). The fit measure included a χ^2 /degrees of freedom ratio of 1.785 ($\chi^2= 437.436$, $df=245$), which is below the recommended cutoff of 3.0 (Kline 1998). Similarly, based on the recommendations of Hu and Bentler (1998) we meet the criteria for an acceptable model fit: comparative fit index (CFI)=0.911, non-normed fit index (NNFI)=0.90, and standardized root mean residual (RMR)=0.068. The construct reliabilities ranged from 0.88 to 0.91 confirming internal consistencies of the measures. Overall, the measurement model was supported by the results of CFA. The research hypotheses were examined using structural equation modeling (SEM) which allows all paths to be examined simultaneously. The conceptual model (refer to Fig. 1) was tested using EQS 6.1. The model was tested with the maximum likelihood method of parameter estimation and the covariance matrix was used as input. Although the chi-square value was significant ($p<0.001$), the structural model provided a satisfactory fit to the data (Hu and Bentler, 1998). The ratio of chi-square to degrees of freedom is 1.785 ($\chi^2=437.436$, $df=245$), comparative fit index (CFI)=0.911, non-normed fit index (NNFI) = .950, and standardized root mean residual (RMR)=. 068. However, not all structural paths between constructs were significant as McDonald's (MFI) Fit Index =0.072 in our study (MFI recommended for a satisfactory fit ≥ 0.90 , (Mir y Zaheer, 2012).

Research findings and discussion

Validity and reliability of the scales

Because the model originally proposed does not meet the criteria to be considered successful, it was necessary to perform an adjustment that involved the removal of some variables; in this case, trust and intent to use SNSs were cutoff. Results for the modified model proved satisfactory as shown in Table 1 and Table 2. The internal consistency of the constructs, reliability is presented in Table 1. In this case, Cronbach's α exceeds the 0.7 recommendation by Nunnally and Bernstein

(1994). In table 2 we can observe that the comparative fit index (CFI) which represents the shared variance between the set of variables observed that measure the same construct (Fornell and Larcker, 1981) measured 0.946, well above the minimum 0.6 considered reasonable by (Bagozzi y Yi, 1988). McDonald's (MFI) Fit Index rose up to 0.921 in the modified research model, well above the minimum satisfactory, while the other indices also have had satisfactory results as presented in Table 2 (Bollen's (IFI) Fit index = 0.913, Joreskog-Sorbom's GFI fit index = 0.892, Joreskog-Sorbom's AGFI fit index = 0.867). Content validity of the scale is derived from the adequacy of scales; all of them previously used according literature review (Vila et al., 2000). To ensure validity such a thorough review was conducted. Even if most previous scales were used in different contexts to the present work, mainly for e-commerce or online banking, they were used in the context of SNSs by Lorenzo-Romero, et al, (2011).

TABLE 1: FACTOR ANALYSIS: RELIABILITY AND CONVERGENT VALIDITY

Factor	Item	Factor load	Cronbach's alpha
Perceived risk	RP1	0.748	0.775
	RP2	0.755	
	RP3	0.778	
	RP4	0.689	
	RP5	0.68	
Perceived trust	C1	0.611	0.822
	C2	0.644	
	C3	0.649	
	C4	0.691	
	C5	0.648	
	C6	0.723	
	C7	0.626	
	C8	0.651	
Intent to use SNSs	IU1	0.793	0.755
	IU2	0.702	
	IU3	0.849	
	IU4	0.702	
Ease of use of SNSs	FU1	0.764	0.758
	FU2	0.601	
	FU3	0.734	
	FU5	0.667	
	FU6	0.755	
Intent to purchase in SNSs	IC1	0.922	0.823
	IC2	0.922	

TABLE 2: FIT MEASURES FOR THE MODIFIED RESEARCH MODEL

$\chi^2/\text{degrees of freedom}$	CFI	IFI	MFI	GFI	RMSEA	AGFI
2.211	0.946	0.947	0.921	0.949	0.064	0.917

SEM analysis

As previously mentioned, Table 2 collected Indicators of structural adjustment model, showing that the model has a good fit. In addition, the adjusted structural model as shown in figure 2, largely explained variables perceived risk ($R^2 = 0.3292$), perceived ease of use ($R^2 = 0.254$) and intent to use SNSs ($R^2 = 0.191$).

Results of hypothesis testing

The results of the structural equation model showing the significant paths ($p < 0.10$) in solid lines are presented in Fig. 2. Table 3 shows individual parameter estimates, standard errors and t-values. Hypotheses H1 through H4 examined the direct effects of the key motivations associated with FIRO theory on forwarding online content. The individual path coefficients for the need to belong, individuation, altruism, and personal growth initiative were examined and we found only partial support for this set of hypotheses

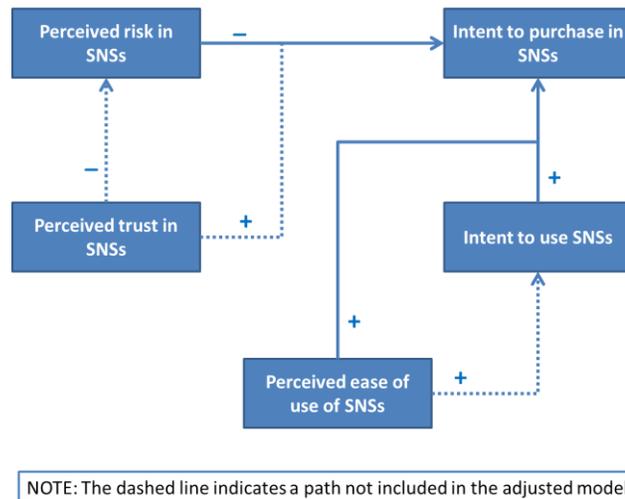

FIG. 2: ADJUSTED STRUCTURAL MODEL

Results of hypothesis testing

Table 3 shows individual parameter estimates, standard errors and t-values. Perceived risk has a negative and significant effect on the Intent to purchase in SNSs ($\beta = -0.356$; $p < 0.10$), accepting therefore, hypothesis 1. Perceived ease of use has a positive effect on Intent to purchase in SNSs ($\beta = 0.568$; $p < 0.10$), supporting thus hypothesis 4. Intent to use shows a strong positive effect on Intent to purchase in SNSs ($\beta = 0.718$; $p < 0.10$), accepting therefore, hypothesis 6.

TABLE 3: PATH ESTIMATES, STANDARD ERRORS, AND T-VALUES OF THE MODEL

Hypothesis	Causal path	Parameters estimates	Standard error	t-value
H1	Perceived risk --> Intent to purchase	-0.356	0.022	-2.701
H4	Perceived ease of use --> Intent to purchase	0.568	0.203	2.781
H6	Intent to use --> Intent to purchase	0.718	0.261	4.136

Conclusions

As can be seen, the majority of social network users logged on to this kind of web / electronic daily community sites using lots of your time on them. Although there is a belief that young people are better to change and adapt technological advances, you can see even a certain amount of users who are reluctant to change, or, skeptical about the security that SNSs offer for a-commerce. Even if there is a perceived high risk can not be said that the social network users rely 100% on them, because a user group showed an unfavorable position, for example, even though a

large number of users does not believe that social media can damage them psychologically, there is a percentage that does not rule out another number that idea and believes that social networks can reach them feel bad sometimes. From the above mentioned, it can be concluded that the risk perceived by social network users is psychological type, as the perceived social risk is relatively low; however, the sum of the number of users who are in total disagreement with the number of users who are in disagreement with that social networks are worthy of trust is very high, considering that almost half of respondents were indifferent to this statement, and a very low number answered it agree. This shows that although users perform various activities within social networks; published information, spend much of their time on these sites and maintain relationship with your contacts, do not trust this kind of sites and this could be partly due to some users believe that companies that manage social media act irresponsibly.

As shown, many users do not trust social networking, or are indifferent to this factor, however, the number of users having confidence in them is relatively low and only few consider the behavior is ethical social networks. These insights could be derived from previous user experiences, beliefs or possibly culture as discussed above. However, building trust is an important issue not only for social networks but also to any business either electronic or physical. While this study has ruled out the relationship of trust factor with the other factors, does not mean it has no influence on the buying behavior of the social buyer in Mexico, because as you can see, some of the items in this scale are related to other statements that are other scales measuring factors. However, if the perceived risk factor showed to be related to purchase intent of users belonging to social networks, it is considered timely conducting mechanisms to care for the safety of the user at the time of the transactions, and the distribution information about security policies and privacy that social networking and other marketing sites online that offer, so that the perception of perceived risk decrease, a factor that is not unique to Mexico , since as discussed above, in any other country , although very developed , the issue of privacy and security, as well as fear and user perception issues are still under study. Finally, the hypotheses related to perceived risk and intention to use and although SPSS threw relationships with other factors tested, we failed to find a consistent relationship between all the variables proposed in the initial model, which does not necessarily mean that no such relationship exists, it is necessary to consider some other factors as may be necessary so that the variables have a more consistent relationship.

Value of the Study

A goal of this research was to provide practitioners with insight into some of the factors that may inhibit, and some of the factors that may boost, adoption of s-commerce. Retailers who are building a Facebook storefront, or who currently have a Facebook storefront, should understand how to market effectively to fans. Effective marketing strategies may contribute to a higher conversion rate, turning SNSs fans into SNSs storefront buyers (Parent et al., 2011). Once consumers choose a retailer's SNSs storefront, it is likely they will make purchases if the products are available (Internet Retailer, 2011a). According to Marsden (2010), 51% of Facebook fans convert to purchasers on Facebook storefronts after they like a retailer's fan page; and 75% of all Facebook fans have liked a brand page. Thus, this study contributes to the literature and provides understanding of online s-commerce activity formulating managerial implications by investigating key attributes (e.g., trust, perceived risk, easy of use) of social shopping and provide evidence for retailers regarding if and how social shopping might be effective in customer decision making and how it might enhance the customer shopping experience by adding value, and ultimately, increasing sales

Limitations and future research

The study of e-markets is relatively new in the management and systems literature and their importance fuels a continuous and growing demand for more research on barriers to their adoption. While this exploratory study identifies a number of barriers and challenges to their adoption, the implications drawn from this research should be considered in light of several constraints. First the generalizability of the study is limited by the use of a convenience sample of college-aged students While the use of student samples can impede concluding how nonstudent consumers will respond, given the primary objective of this research was to provide theoretical insights into the adoption of s-commerce of the e-maven, we believe the use of a student sample is justified. Furthermore, as discussed previously,

college-aged students tend to be heavy users of the Internet and thus comprise an important segment to marketers. Second, our results are limited to the particular scales used. Since a number of different scales are available that can potentially tap the same constructs used in our study, it is possible that the use of different scales might impact the results. Despite these limitations in this research, the present study sheds light on some of the factors that affect adoption of s-commerce among SNSs users.

Social media use by government to reduce damages following a natural disaster – inhabitants communication, e-government, and intangible social capital of collaboration

Abstract

Ensuring an effective mechanism to disseminate valid information to inhabitants that allows them to escape a disaster rapidly and effectively is a critical issue for governments. Social media is not only effective as a method for a government to deliver disaster information but by utilizing information sent by inhabitants, it also enables the government to process and deliver on-the-spot and up-to-the-minute information, which considerably improves the functioning of e-governments as an entire system, including social media. In order to best utilize these advantages, it is necessary to elucidate the current and actual status of inhabitants' usage of social media during a natural disaster. This study approaches this problem by conducting a questionnaire survey of inhabitants who provided information during the Lushan earthquake that occurred in Sichuan Province, China in 2013.

Keywords: social media, e-government, natural disaster

Introduction

Focus of this paper

One major responsibility of a government is protecting the people living under its authority. Even in times of disaster, a government must look after the safety of its citizens by providing appropriate information regarding safety. In recent years, many governments have recognized that social media is an effective tool to disseminate disaster information widely. Social media can play a range of roles, such as disaster risk reduction, emergency management, and community development (Paton, 2006). Dufty et al. (2012) indicated that government is required not only to provide information to save inhabitants' lives but also to devise a system to provide such notice. In terms of community development, Schellong (2007) indicates that creating social capital by social media also works for community development. This paper focuses on government use of social media in disaster settings and also examines citizen use of such channels to determine the impact of a two-way communication channel on reactions to disasters.

Advantages of social media

Emergency management requires a strong communication channel that enables the government to deliver accurate and appropriate information in a timely manner. The development of e-government portals is one such way governments have sought to achieve outcome. In times of major disaster, however, safeguarding citizens requires unusually rapid transmission of information from the government to the people, at a time when people might not think to access normal portals of e-government—or when such portals might face disruption due to the nature of the disaster. Accordingly, ensuring an effective and robust mechanism to disseminate valid information to inhabitants that allows them to escape from a disaster rapidly and effectively is also a critical issue for governments. Sutton et al. (2008) used a case study of a 2007 California wildfire to determine that social media is an important tool enabling governments to achieve such information diffusion. Therefore, social media can be said to an effective information dissemination system for governments. Social media also has the potential strength of crowd-sourcing front-line developments by opening a two-way communication channel between government and citizens affected by a disaster.

By feeding accurate and first-hand information to the government, social networks can improve the information that the government can disseminate to those on the disaster's front line. In addition, a communication medium where people report first-hand enables governments to calculate overall damages by gathering information direct from people who suffered from the disaster. If conducted through a survey or other means, such a task could take substantial amounts of time and labor. Therefore, gathering information direct from inhabitants of various areas and disseminating it further is an effective method for governments to aid victims of a disaster promptly as well as accurately gauge the scope of a disaster.

Problems of social media

However, information gathered from social media as provided by citizens has a credibility gap. Anyone can say anything, and rumors and fears can be amplified as panicked people desperate for information repeat everything they hear; repetition can confer inaccurate speculation with the weight of truth. To overcome this potential weakness, Yokobe et al. (2011) used a case study of the Great East Japan Earthquake to determine that correct information on Twitter could be extracted by referencing geographic information using GPS.

Damages from disasters and the situations of victims can vary widely, and therefore, a government cannot simply develop a single social media and communication policy that can cope with every type of crisis a country may face. In addition, different types of disasters can require dissemination of different type of information. Magro (2012) investigated the development of social media utilization by governments during the Haiti (2010) and Queensland (2011) earthquakes, and determined that government utilized social media effectively to save people's lives in the actual disaster situation. However, he concluded that it is difficult to successfully apply a method from one case to another because the types of damage and range of victims can vary widely. Therefore, an e-communication of social media communication strategy cannot be simply formulated beforehand then enacted wholesale. It will necessarily require tailoring and adapting to suit the needs of the time.

Study purpose

As indicated above, many studies have pointed out that social media is an important tool for delivering disaster information, thus saving victims' lives. The utilization of social media is not only effective as a method for delivering government's disaster information but it also, by utilizing information sent by inhabitants, it enables the government to process and deliver on-the-spot and up-to-the-minute information, which considerably improves the function of e-government as an entire system, including social media. In order to best utilize these advantages, it is necessary to elucidate the current and actual status of inhabitants' usage of social media during a natural disaster. This study is intended to approach this problem by conducting a questionnaire survey of inhabitants that provided information during the Lushan earthquake that occurred in Sichuan Province, China in 2013.

Method

We sent questionnaires to social media users who had forwarded (retweeted) announcements provided by the official governmental account of China earthquake information by e-mail during August and September, just after the earthquake occurred in July 2013. The questionnaires were sent to 131,140 users, from whom we received 1,530 responses. The questionnaires asked for information covering the five areas as listed below.

1. Types of social media usually used;
2. Changes in interest in natural disaster information provided by social media before and after the earthquake;
3. Changes of intent in use of social media before and after the earthquake;
4. Changes in methods used to contact family or friends before and after the earthquake; and
5. Methods to obtain natural disaster information provided by governments.

Results

Respondents overview

Detailed results of the questionnaire survey are provided below.

In terms of the gender ratio of respondents, men (57.9%) slightly outnumbered women (42.1%). According to the report on China's internet status by CNNIC, in 2013, the gender ratio of all people online was 55.6% men, 44.4% women. Therefore, we can conclude that our survey has good correspondence with actual gender ratios of Chinese internet users. .

In terms of ages of respondents, those in the teenage to under- 30 age bracket accounted for approximately 93% of respondents. CNNIC reports that the total percentage of internet users from this same bracket was 78.7% as of June 2013. Our survey respondents therefore were slightly younger than the average Chinese internet users.

As for the typical social media use, instant communication tools are most common (86.7%), followed by movie sharing sites (82.3%) and social news (75.8%). Mini-blogs (56.7%) came after blogs (70.9%) and social games (65.8%).

Interest on disaster information

Only 7.5% of the respondents “often” watched the mini-blog of China’s rapid earthquake report before the Lushan earthquake. Even totals of respondents saying “often” and “sometimes” only amounted to 36.3%. After the earthquake, the percentage of respondents who “often” watch increased to 39.7%, and the total of those who “often” and “sometimes” watch rose to 87.3%. We can therefore conclude that the occurrence of the big earthquake substantially increased the number of people seeking to obtain prompt information about earthquakes from the government’s online information resources..

In what ways did respondents use social media immediately after the earthquake? Of respondents used social media within 72 hours of the earthquake, collecting information was the most common reason (87.1%), followed by confirmation of family’s and friends’ safety (56.3%). Social media is seen as a very important as a tool to collect up-to-the-minute information on emergency situations and to communicate with family and/or friends.

Communication methods

In terms of normal methods of communication with family and friends, telephone calls made using cell phones are the most common (70.8%), with social media accounting only for 11.9% of contact among even social media users. But immediately after the earthquake, social media use increased to 35.7% while telephone calls dropped to only 22%. Over the next days and weeks, the rate of telephone calls gradually recovered. This indicates that telephone calls are the usual method of contact, but in times of natural disaster, direct communication via social media comes to the fore.

As for the methods of obtaining administrative information during a disaster, mass media, i.e., television (68.2%), radio (50.6%) and newspapers (30.1%) come before social media (34.7%). Information provided by the government itself on the internet is used by only 18.7% of respondents. From the above results, it can be said that the dissemination of information by the government is less preferred.

Discussion

By analyzing the result of the questionnaires, we obtained a much clearer picture of social media use in times of disaster. First, inhabitants who disseminated information in the event of natural disasters were comparatively younger among internet users. In particular, students comprised up to 40 percent and were therefore a relative majority. Students have a strong ability to disseminate information via social media. A robust government strategy should seek to harness their ability and reach.

Most social media users are also regular users of instant communication tools. After the Lushan earthquake, they became interested in the natural disaster information provided by the government and followed the China earthquake information feed.

Second, it became clear that social networking service (SNS) users who do not usually gather and disseminate information refrain from this activity because they do not see the need in times of normalcy. Social media use increases during a disaster because traditional networks are disrupted due and people are forced out of their homes by a disaster not having access to TV or radios. Accordingly, such users’ information dissemination activities tend to be concentrated in times of natural disaster. In addition, the most important purpose of their gathering and disseminating information was to confirm the safety of family or friends. Their second most important purpose is to support an area that experienced a disaster, and SNS messages and inquiries are both collected from and passed on to the entire nation as well as overseas. Moreover, our survey revealed that although social media is a new form of media that has seen exponential growth in recent years, it has nonetheless developed into an important information channel next to television and radio.

Especially as the number of social media users is increasing substantially, the medium’s efficacy as an emergency communication tool in times of natural disaster is widely recognized. On the other hand, relatively fewer users directly access a government’s web site to obtain natural disaster information. They obtain information through

mass media, such as television or radio, and social media, all of which they already use on a regular basis. A government must be able to provide natural disaster information more effectively by using tools already in widespread use among citizens.

In addition, social media can be an effective tool to gather information from inhabitants regarding damages suffered by varied areas. At the same time, by disseminating information about areas suffering damages, a government can ensure inhabitants' safety. Hirano (2013) indicates that in an emergency, people tend to provide information via the media format that provides responses. Most government social media accounts do not respond to inhabitants' comments and queries as a matter of course. But responding to inhabitants' usual communications is very important and leads to increased social capital between inhabitants and government. Such capital is then available at the time of a natural disaster, enabling a government to harness citizens' good intentions to save lives.

Brand management in the hotel industry: from company to network brand. Opportunities and limits of networking for small-sized hotels¹

Abstract

In the worldwide competition for attracting tourism flows, a strong brand can increase the capability of a hotel to be recognized, appreciated and visited. Thus a brand can represent an important key success factor. However, like every other corporation hotels should manage their brand efficiently and effectively. Hotel brand should be coherent with the network or franchising chain the hotel belongs to and with the place brand of the territory where it is located. Attention to brand architecture help hotels leverage and reinforce the positive image and value proposition of the specific place. Since SMEs represent the main actor in hotel industry, this paper aims to explore small hotel owners' awareness on the importance of branding and explore which brand management activities they perform alone and within the network. Empirical analysis is performed with reference to the Province of Rimini in Italy.

1. Introduction

Academics have already recognized the increasingly importance of intangibles resources in the tourism sector and the hotel industry in particular (Krambia-Kapardis and Thomas, 2006; Nemeč and Mihalic, 2007; FitzPatrick et al. 2013). Among intangible resources that help tourism organizations differentiate from their competitors, attract and retain customers, the company brand plays a fundamental role (Bailey and Ball, 2006). Brand is a key success factor and source of competitive advantage which leads to revenue (O'Neill and Mattila, 2004, 2010; Hong-bumm Kima and Woo Gon Kim, 2005; O'Neill and Carlback, 2011).

However, small tourism businesses – which represent the majority of actors involved in this sector in Italy and Europe - seem to possess a smaller extent of intangibles in comparison with larger companies (Jermañ et al., 2009). With reference to brand management, traditional SMEs' lack of managerial competence and resources (skills as well as financial resources) might hinder these organizations to build a proper marketing strategy, promote their tourism offer and carefully define, maintain and improve a brand to increase customer loyalty and sales. Maintaining brand equity and/or gaining brand value requires a comprehensive understanding of the brand, its target and the company's overall vision. In other terms it involves the development of a strategic plan (Aaker, 1991). Thus, brand management could appear a too complex activity to be accomplished for SMEs.

To overcome similar limits due to resource shortage, Italian SMEs have experienced several forms of inter-firm cooperation like consortia, associations and product clubs - an organizational and marketing alliance that brings together a group of hotels with the purpose of promoting and marketing the tourist product of the associated companies - (Forlani, 2005; Lombardini, 2006; Pencarelli and Splendiani, 2008). More recently tourism organizations are cooperating through the 'network contract': a formal agreement emanated by the Italian Government in 2009 with the aim to increase national and international competitiveness of SMEs. Latest research (Aureli and Forlani, 2013; DelBaldo, 2013) indicate that tourism organizations are using the network contract to promote the network's members and accomplish marketing initiatives; increase the visibility of the territory where members are located; share ideas and favor the adoption of innovative processes; achieve economies of scale and scope; reach new clients and augment members' international expansion.

The network contract creates stable relationships which help SMEs develop new commercial opportunities, achieve growth and improve competitiveness like other formal alliances (Chathoth and Olsen, 2003; Pansiri, 2008). However, it differs from franchising agreements and management contracts commonly used in hotel industry. These create networks (similar to hotel chains) whose members should share several similarities and provide a standardized

¹ This work is the result of a common research project however paragraphs should be attributed as following: Selena Aureli wrote par. 1, 2.3., 3, 4.1.; Fabio Forlani wrote par. 2.2, 4.2; Tonino Pencarelli wrote par. 2.1.

service whereas the network contract is more similar to consortia which tend to preserve members' identity and autonomy.

Despite this difference the network contract might offer hotel property owners the opportunity to benefit from a common network brand like for hotel chains. Building a strong brand capable to differentiate network members from other competitors and attract customers can be a great resource. In addition, when the single hotel brand, the network brand and also the brand of the territory where hotels are located are linked together, all hotels might leverage the positive image of the network and the place (tourism destination). With a proper brand architecture several synergies can be exploited (Dooley and Bowie, 2005; Kavartzis, 2004; Hanna and Rowley, 2011). Coherently, this study aims to explore current small hotel² owners' awareness on the importance of branding and explore which brand management activities they perform alone and within the network. Questions we aim to answer are the following: (RQ1) Do small-sized hotels consider hotel brand a key success factor? (RQ2) Do small-sized hotels devote attention to brand management? (RQ3) What's the role of hotels' networking strategies in brand management?

Findings from interviews indicate hoteliers' awareness on the role of brand in the competitive arena and the type of brand management activities they carried out. Moreover, they reveal whether formal alliances help small-sized hotels to create an entity capable to promote the network and its members also through the creation of a strong network brand. Among brand management activities particular importance is given to brand architecture. Findings reveal whether brand architecture has been properly designed (i.e. there is consistency among the hotel brand and the destination brand) and therefore when hotels can benefit from the attractiveness of the destination and the reputation of its brand. In the majority of hotels here investigated there is no deliberate process about brand strategy. Moreover brand strategy is absent also at the network level because networks were created mainly for other purposes (i.e. to reduce the cost of provisions, to promote the local territory).

The main contribution of this study refers to its focus on small sized hotels, while international literature on intangibles and brand management has mainly focused on large listed hotel companies (O'Neill and Mattila, 2004, 2010; O'Neill and Carlback, 2011; FitzPatrick, 2013).

2. Literature review

2.1 Brand and brand management

According to the American Marketing Association, a brand is "a name, term, design, symbol or any other feature that identifies one seller's good or service as distinct from those of other sellers". Similarly, Kotler and Scott (2002) state that a brand is "a name, term, sign, symbol or design, or combination of the same, used to identify the products or services of a seller or group of sellers and distinguish them from those of their competitors", while Aaker (1991) affirm that a brand is a "a set of assets or liabilities linked to an identifying feature (trademark, name or mark) which add to (or reduce) the value generated by a product or service".

French researcher Séquéla advocates the concept of the brand-person, as a brand takes on not just the name but the "soul of the product"; the brand name can be linked to tangible characteristics, while the soul refers to the universe of closely connected values. Following Séquéla's approach, Pratesi and Mattia (2006) state that "a brand has its own expressive meaning; it is therefore a combination of tangible and intangible signs and symbols which create its face and personality, as for a person".

Brand management scholars (Aaker, 1996; Kapferer, 1997; Nandan, 2005) emphasize the difference between brand identity and brand image. Kapferer (2008) terms brand identity the brand's meaning as put forward by the firm. It is the way a company wants to present its brand to its target groups. Brand image, on the other hand, is the consumers' perception and interpretation of the brand's identity. Academics typically conceptualize brand identity and image as multi-dimensional constructs of which brand personality is an important component (Patterson, 1999; Hosany, Ekinci, Uysal, 2006).

² Lodging firms classification is usually related to the amount of rooms offered and the average number of employees. According to the studies reviewed Franch et al. (2005), a hotel can be defined as small business when it has less than 50 rooms.

Given today's brand's importance and its vulnerability to customers' and stakeholders' negative critics, it is increasingly important to correctly manage a brand in order to ensure that its potential can be fully exploited and enhanced. Each company should manage its own brand or brands by adopting a branding policy defined on the basis of the products sold, the context and the image it intends to promote.

Brand management or branding refers to the "process by which the brand is laden with meanings, transforming it into a 'living' entity with its own expressive capability by means of which a complex combination of actions are planned and carried out in compliance with a single strategic intent: to aid the lasting growth of the business by consolidating the brand's reputation and distinctiveness" (Pratesi and Mattia, 2006).

- Branding activities essentially consist of (Keller, Busacca, Ostilio, 2005; Pencarelli, Betti e Forlani, 2009):
- conception and design of brand identity (which translates into the definition of three key components: the brand name³, the logo or mark⁴ and the pay-off or motto⁵, which all enable a brand identity to be visually distinctive, recognizable and identifiable);
 - definition of the positioning sought;
 - creation and implementation of the marketing plan of the brand (branding);
 - protection of property rights and legal safeguarding of the brand;
 - "fueling" – support in economic terms and through activities (branding);
 - monitoring and control (brand audit).

In addition, a company selling more than one product and/or operating in different markets and nations should decide which brands to use and how many in the light of the so called brand architecture. The issues is to decide whether to use the *corporate brand* (name, logo, etc. of the company which represent the organization as a whole, its history, values and culture) to identify all items of its product range (or some of its products) or create different brands for different products and businesses (brand portfolio). Corporations may define the *range brand* (it can be adopted as an alternative to the corporate brand to sell products in different categories), the *line brand* (this is placed, together with the corporate brand, with the company products perceived as complementary to some extent) and the *product brand* (which identifies the specific nature of each type of product in the company's range).

"Brand architecture is an organizing structure of the brand portfolio that specifies brands' roles and the nature of relationships between brands" (Aaker and Joachimsthaler, 2000). On one hand, a company may prefer to use its corporate brand as a 'Branded House'. In this case the organization uses its own name to identify the whole array of products, thus maximizing the brand extension. When this policy is implemented, the organization achieves economies of scale in communication and distribution and it exploits its positive image by providing credibility to the various stakeholders, while a decrease in sales or the weakening of the brand's positioning related to one single product has the potential to negatively affect all company's goods and businesses.

On the other hand, a company may opt for a multibrand policy (called 'House of Brands'). In this second case a company creates, uses and manages a combination of brands which identify and differentiate the various products and services, within a single category. The management of a brand portfolio appears quite complex because each brand should be considered both as a separate entity and in relation to the others in order to fully benefit from this brand policy. Conversely, this multibranding approach reduces the risks usually associated to the House of Brand Strategy, since the negative performance of one brand does not affect other portfolio's brands. The two mentioned approaches are at the opposite ends of a continuing scale. A company may decide to use the same brand identity for all its portfolio's products relying on the magnitude of the corporate brand or it may define various brands which are independent one from each other and from the corporate brand or choose a position in the middle.

2.2. Brand usage in tourism and the relevance of the destination brand

³ The brand name should have a series of vital characteristics including recognizability, memorability, distinctiveness, attractiveness, emotional meaning, creativity and legal defensibility (Valli, 2003).

⁴ Pastore and Vernuccio (2006) define the logo or mark "as the combination of typographical, figurative and plastic elements".

⁵ The motto or slogan is the final phrase in an advertisement and usually appears after the brand.

An effective and efficient management of brands and brand architecture is important for tourism businesses like for every other organization. In fact, also in the tourism domain customer's perception of the brand value associated to a hotel, for example, can strongly impact on its ability to attract and retain travelers. However, there are additional aspects (or levels) to be considered. First, a company like a lodging firm may decide to join a branded hotel chain (a chain of franchisee hotels, a proprietary chain, etc.), placing its corporate brand and the chain brand side by side. Second, the brand of the destination where the company is located may strongly impact its perceived value.

Consequently, in tourism studies it is necessary to focus on how the hotel brand relates to the brands of the chain, association or network the company belongs to and, even more important, to the brand of the destination (Pencarelli and Splendiani, 2008; Pencarelli, Betti and Forlani, 2009; Aureli and Forlani, 2013).

A destination brand is "a name, symbol, logo, word mark or other graphic that both identifies and differentiates the destination; furthermore, it conveys the promise of a memorable travel experience that is uniquely associated with the destination; it also serves to consolidate and reinforce the recollection of pleasurable memories of the destination experience" (Ritchie and Ritchie, 1998). More recently, Kavartzis (2004), Dooley and Bowie (2005), Kerr (2006), Balakrishnan (2009) and Hanna and Rowley (2008; 2011) emphasize the need to move from destination brand to place brand (like a city, region, nation brand). In this case, since brand management pertains a specific territory, it is assumed (by politicians and academics) that brand management activities and related tourism actions should be attributed to public bodies and inserted in the larger context of territorial government.

A territorial brand or place brand is therefore a promise to the potential users of the area, an expectation of performance and a sign of integrity and reputation. Its proper management requires the definition of the most appropriate brand elements and the most suited means used to convey the brand to its target audience and ensure its appropriate reception in order to provide a unified representation of the different components of the geographical area's offer (Balakrishnan, 2009; Hanna and Rowley, 2011). In addition, as suggested by place brand management models (Hanna and Rowley, 2011) brand architecture is fundamental for the overall performance of the brand.

Literature on brand architecture and place branding suggest that brands of different objects as well as brands of different places can be intentionally managed to link individual brands together and generate strong associations capable of influencing consumer purchase intentions (Dooley and Bowie, 2005; Kavartzis, 2004 and 2012; Hanna and Rowley, 2011). Consequently, it is very important to verify if all the different subjects located in a territory eventually pursue contrasting objectives and communicate a divergent image to travelers.

Lastly, it is essential to preserve harmony in the architecture of a tourist brand also to create and distribute value to local stakeholders. Well known place brands associated to positive values and a good reputation capable of attracting tourists do not only represent valuable sources of competitive advantage for the country. When place brands are consonant with the local actors' values and brands, they can increase the effectiveness of the marketing policy of the latter, increasing the potential benefits achievable.

2.3. Hotel networks

In hotel industry networking strategies are quite widespread. Hotels may informally cooperate with other tourism operators and/or create formal alliances with restaurants, travel agencies, transportation companies, etc. in order to create integrated tourism packages and offer an 'all-in-one experience' and/or they can build horizontal networks, usually in the form of franchising chains (Medina-Munoz and Garcia-Falcon, 2000; Pansiri, 2008). Actually there are several forms of inter-organizational cooperative arrangements used in the tourism sector: Joint venture, Equity participating alliance, Brand sharing, Franchises and licensing, Marketing and distribution agreements, Joint selling or distribution, Sharing information and communication technology, and Joint purchasing and equipment/office sharing (Pansiri, 2008).

At the international level the traditional independent privately owned small hotels seem to have given the way to larger multinationals and multiple brand affiliations (Bailey and Ball, 2006; Lomanno, 2010). According to Slatery (2003) 31 per cent of all hotel bedrooms worldwide were affiliated to a 'branded' hotel chain in 2002, a figure forecast to increase to half of the total by 2030.

International studies suggest that hotels should grow in size to face increasing competition and avoid inefficient management practices due to power and knowledge concentration in the owners-proprietorship hands

(Schulze et al., 2001). On the contrary, Italy seems to be still strongly characterized by small owner-run outlets operating in the same fashion for generations (Ferri, 2009). These hotels prefer informal collaborations and some specific types of contractual modes of cooperation: associations, consortia and product clubs. Management service⁶ and franchisee agreements - typical in US - are here less widespread.

What are benefits of belonging to a hotel chain or franchising network indeed? Brand affiliation brings a well known name (name recognition), brand awareness, marketing activities, staff training, access to bulk purchasing discounts and some services (i.e. a central reservation system, other management systems, loyalty programs) that independent operators might not be able to match. Some of these benefits might be achieved through cooperative purchasing groups or other alliances. Thus, brand affiliation major value consists in a strong brand which translates into higher occupancy rates deriving from customers attracted by the brand's promises of experiencing a certain quality and emotion. In fact, hotel guests rely on brand names to reduce the risks associated with staying at an otherwise unknown property (O'Neill and Xiao, 2006). Moreover, the study of O'Neill and Xiao (2006) indicates that when brand affiliation is associated to a reputation for high quality service, hotels can record an important increase in revenue.

Nevertheless, O'Neill and Carlback (2011) highlight that 'branded' hotel do not always record better financial performance compared to independent operations, especially when high franchising fees are requested. Moreover, although the group or network brand should signal customers the precise quality level they should expect from single hotels, previous research shows that franchising tends to have a detrimental impact on overall system quality when it involves too many subjects (Michael, 2000). The high numbers of hotels belonging to the network does not allow for proper controls in quality from the franchisor, thus single lodging firms might create dissatisfied guests who criticize the brand as a whole and translate into lower occupancy levels for all network's members. Lastly, in case of franchising, it also important to note that branding decisions are controlled by the franchisor while local partners (franchisees) can decide only on lower-risk marketing aspects (e.g. pricing) (Dev, Brown, and Zhou, 2007). For this reason, individual hotel owners need to be sure that the chain's branding strategies are appropriate for its property (O'Neill and Mattila, 2006).

When a formal network or hotel chain is formed, issues of brand architecture arises and different approaches to hotel brand (i.e. logos, names, identifying information) can be adopted. As stated by O'Neil and Mattila (2004), *Choice Hotels International*, for example, preferred a House of Brand strategy (Dooley and Bowie, 2005) for the different hotel concepts ("type of service" offered) like 'quality hotels' vs. 'comfort suite hotels' to simultaneously distinguish hotel brands from each other and identify them as all being part of a unified organization, thus differentiating them from their competition. In other cases, especially in case of property chains, individual brand names disappear and the parent company name prevails for all members. These hotels are usually located in different cities and regions all over the world but they use the brand to signal customers the consistency in the quality offer. In fact, brand names give customers important information about the product/service (Briucks, Zeithaml & Naylor, 2000).

As described above, choices of brand architecture emerge as the outcome of a deliberate decision-making process, usually conducted at the corporate level of an hotel chain by the strategic department. What happens in case of non equity based formal alliances and networks other than franchising? Is this decision and those regarding other brand management activities the outcome of a shared process? Are SMEs alliances dealing with this issue? For example, in the study of Alonso (2010), which focus on Australian SMEs, alliances do not deal with brand aspects. The major expected positive impact is that strong collaborative relationships can potentially enhance a destination 's image with further implications for the area 's promotion and marketability

3. Methodology

⁶ "A management service contract is a long term agreement, of up to ten years or even longer, whereby the legal owners of the property and real estate enter into a contract with the hotel firm to run and operate the hotel on a day to day basis, usually under the latter's internationally recognized name" (Contractor and Kundu, 1998).

In order to collect data from Italian small-sized hotels participating to horizontal networks, authors decided to search them in the Province of Rimini: a quite famous beach location on the Adriatic Coast, known both at the national and international level, with more than 58,015 rooms available and characterized by a high level of competition (many three-star hotels and two-star hotels offering similar services and the same price)⁷. Key and distinctive variables of Rimini's hotel offering are staff cordiality and cheap rates in comparison to other Italian locations (Rossini, 2003)⁸.

From the national dataset of the Chambers of Commerce, authors found only one network contract in Rimini, named "Made in Rimini- Holidays" recently formed (May 2013) by three hotel consortia. It is a network of networks and thus particularly interesting for our research purposes. Altogether the three consortia groups more than 100 hotels, which represents about 10% of the total lodging offer.

Due to time and resource shortage, authors decided to identify three hotels, randomly selected, for each formal alliance. Each single hotel represents a case study (Yin, 2003) whose characteristics and brand management activities have been investigated through direct interviews. Because of the complexity of the topic under investigation which can be hardly translated into closed-ended questions and considering the low response rate of SMEs to mailed questionnaires (see the studies cited by Alonso, 2010), authors decided to conduct face-to-face semi-structured interviews with hotel owners/managers at the single hotels premises.

Interviews regarded the following aspects:

- HOTEL BRAND. Interviewees were asked to express their agreement or disagreement (on a 5 point Likert scale) on regarding brand as a key success factor in the hotel industry, the impact of financial resources on brand success, the actual popularity of hotel brand at local, national and international level. This information is intended to highlight possible gaps between what hotels would aspire to have and what they have achieved so far in terms of brand popularity;

- BRAND MANAGEMENT. Hotel owners/managers were asked to tell the story of how they (or their family) choose the hotel name, logo and payoff in order to understand how the brand identity was designed. Moreover, linkages to or inclusion of territorial brands in the hotel brand were investigated. Questions also regarded the most important activities performed during the last three years to maintain the hotel brand and the amount of financial resources devoted to them, including activities of brand monitoring. Answers are expected to help understand if hotel name is really conceived as a brand and which are most recurrent activities of branding. Particular attention is devoted to brand architecture here considered within brand management activities.

- NETWORK PARTECIPATION. Questions concerned hotels' objectives and expected benefits associated to network's participation.

To increase authors' knowledge of the three networks and provide a richer context for understanding the phenomena under examination, also the President or Vice-President of each consortium were contacted and interviewed. At the same time, authors analyzed official websites and other public documents. In the following paragraphs, there is a presentation of the recently signed network contract, the three consortia and then data derived from interviews with hotel owners are discussed.

4. Case study analysis

4.1. Objectives, members' characteristics and brand of the three formal networks

"Made in Rimini-Holidays" is the network contract built to increase the competitiveness of the hotels belonging to the three consortia that formed it. In particular its strategic objectives are: to develop and qualify members' tourist offer; improve members' ability to define and promote their individual tourist offers; create an integrated tourism offer and promote the territories where they are located; increase hotels' capacity to innovate; identify new market opportunities and augment members' presence on national and international markets. To reach these results, the common entity is

⁷ According to the Provincial Observatory on Tourism, Rimini hotel offer in 2013 is the following: 98 one-star hotels with 18 rooms on average; 244 two-star hotels with 24 rooms; 596 three-star hotels with 41 rooms; 67 four-star hotels with 69 rooms; 2 five-star hotels with 106 rooms.

⁸ Another reason for choosing this specific geographical area is because it is near one researcher's university.

entrusted to promote the area of Rimini and its hotels, enhance members' tourist offer also through the organization of training courses and the conclusion of agreements with suppliers, define a joint communication strategy, create a web site, a common brand, educational tours, commercial initiatives and advertising campaigns regarding both national and international markets. Achievement of these objectives will be measured (not for the moment) every year in terms of number of new clients, improvements of the competitive positioning and clients' satisfaction measured through the use of questionnaires. However, at the time of writing, the network contract has only build its official website filled with institutional information. Direct booking of hotels is not possible, nor foreseen for the future. For our research purposes it is more interesting to analyze the three consortia.

a) The consortium "Hotel Tipici Riminesi" (Typical Hotels of Rimini) was build in 2010, although several of its members had a common experience of collaboration since 2001. It groups 34 hotels (82% are three star hotels while others record lower hotel rankings) located in few fractions of the city of Rimini. These are characterized by the following key elements that are conveyed in all marketing and communication activities: friendliness, attention to local traditions, typical gastronomy and authentic atmosphere and love for the local territory..

These aspects actually build the distinctiveness of the hotels' tourist offer and represent a prerequisite for joining the network. In details, to belong to this consortium members have to own a list of specific characteristics regarding: hotel location (near the sea), structural aspect (a vernacular building style), ambience (the atmosphere should link to local traditions and history also using objects and symbols), management (family run hotels with at least 5 consecutive years of hotel management, family hospitality and a welcoming atmosphere, being, independent hoteliers), food (include local dishes in the menu) and relationship skills (hoteliers distinguishing for warm personality and ability of storytellers). In line with these characteristics both the network's name and logo refer to the city of Rimini emphasizing the local culture and its history. There are not all the key components of a brand identity (pay-off is absent) but the network is aware of its importance and has decided to register the network name. Network's aims are: to promote hotels and the territory where they are located, attract foreign travelers, make joint purchase and offer staff training to the associated hotels.

b) The second network is "Torre Pedrera Hotels e co" created in the form of a cooperative. It is 25 years old and groups 42 hotels (74% are 3 star hotels). Its main goal is to promote a fraction of the city of Rimini named Torre Pedrera, which was marginalized because of its location, by providing information about lodging firms, public services and events to both tourists and inhabitants of the area. In details, the network aims to enhance the uniqueness and identity of the fraction, encourage members to work together, increase hotels' room occupancy (the network's website also works as a booking system) and augment hotels' political bargain power in relation to the Municipality of Rimini and other public institutions. Given these objectives, the network's name was designed to merely emphasize the location and the logo actually represents the tower located in the fraction. However, name and logo were not created nor are currently conceived as a brand. There are no shared values or similarities among hotels which are at the basis of the network brand identity. What hotels have in common is only the location in the same suburb of Rimini. Coherently, the network website does not communicate hotels' characteristics but it promotes the "destination", describing its personality and making promises for a remarkable experience.

c) The last consortium is "Piccoli Alberghi di Qualità" (Small Quality Hotels). It was born in 1999 but it originates from a previous experience of cooperation launched by the Municipality of Rimini at the beginning of '90s and limited to Rimini's lodging firms at that time. Today it groups 31 hotels (61% are 3 star hotels) located in Rimini and other nearby cities (Riccione, Cattolica, Misano). These hotel share several characteristics: a small dimension (a limited number of rooms), being family-run, a friendly atmosphere, a highly personalize concept of hospitality, an excellent price-quality ratio, fine cuisine and genuine home-made cooking. Network's goal is to combine the values of the traditional hospitality of the region (Romagna) with the style and efficiency of modern hotels. Actually, it is the first hotel grouping to receive ISO 9001 Quality Certification in Italy in 2002 because of its hotels' high professional standards, methods and procedures. The motto is: a fine service at a reasonable price. Moreover the consortium is engaged in environmental sustainability and social responsibility. Various members have undertaken the consortium's environment qualification project devoted to safeguard the environment (i.e. activities and staff training in waste disposal, water use, energy savings, etc.), while the consortium itself has developed a set of behavioral rules that are informed by concepts of social and ethical responsibility. In this case there is no link to the territory in network brand's

name nor in the logo. Associated hotels are located in different cities but still within the same Province. Actually, the consortium does not exclude the possibility to expand to other cities in the future.

4.2. Findings from hotels' interviews

Results from case study analysis synthesized in the following figure indicate that small hotel owners consider hotel brand an important key success factor whose popularity strongly depends from the amount of financial resources invested. At the same time they are aware of the poor popularity of their individual hotel brand both at national and international level. Sometimes, hotel brand is scarcely recognized even in the local area of Rimini.

Indeed, the most interesting result emerging from interviews is that hotel owners/managers pay scarce attention to brand and its management. Only one hotel has carefully designed all the three key components of a brand identity. Slogan is missing very often and some hotels have not created a graphical or distinctive sign for their brand. Moreover, the brand name is never the result of a deliberate managerial decision process. Hotel naming comes from personal experiences of hotel owners or it was inherited by the previous hotel management. Although some hotels have recently reviewed their names and slightly improved some components of the brand, the surveyed hotels are still tied to the concept of brand as trademark (a word or symbol which identifies the hotel and can be legally protected) and do not conceive the brand as source of value for the company due to the positive emotions it creates into its target audience.

Hotels	A	B	C	D	E	F	G	H
Star Rating	3	3	3	3	2	2	2	2
Ownership (O) or Management (M)	O	O	M	O	O	O	O	O

RQ2 – Do small-sized hotels devote attention to brand management?								
Origin of the hotel's name	Historical	Historical	Historical	Historical	Historical	Historical	Made ad hoc	Historical
Creation of a brand identity to communicate the hotel	No	No	Yes	No	Yes	No	Yes	Yes
Brand identity system (Logo, Naming, Payoff)	Revision of the historical name in the phase of requalification and enlargement of the hotel	No	Improvement of historical logo and hotel name from a brand management perspective; seasonal slogans	Revision of historical name to emphasize hotel's location "by the sea"	Revision of historical name to communicate the concept of beach and "the sea"	Revision of the logo to evoke the sea and summer (inserting a boat and the sun)	Registered trademark; familiar and easy to remember name; payoff: "Your house by the sea"	Systematic use of logo in hotel communication; payoff: "A small jewel just a few steps from the sea"
Activities carried out to support the hotel brand	Content management on Hotel website, FB, Youtube; trade fair participation (alone and with the consortium)	Content management on Hotel website, FB, Twitter; presence on Travel web site (Tripadvisor & OTA); advertising on newspapers; trade fair participation with the consortium	Theatrical setting, use of mascot representing the summer; content management on Hotel website, FB, Pinterest, Google+; seasonal greetings cards; presence on consortia's websites; trade fair participation (alone and with the consortium)	Renewal of the Hotel website; presence on the tourism portal "Rimini beach"; presence on OTA (Venere.com, Booking.com), FB, Twitter	Content management on Hotel website, FB, Flickr, Twitter, Youtube; promotion on the local free press and internet portals	Advertise on free press; content management on Hotel website, FB, Twitter, Pinterest, Google+; participation to the consortium's website and local tourism portals (i.e. Riminidamare)	Content management on Hotel website, FB, creation of newsletters; limited advertising on newspapers	Content management on FB, Twitter, Google+; participation to the consortium's website and other local tourism portal (i.e. Riminibeach); seasonal greetings; trade fair participation with the consortium
Financial investments in promotion (% of annual turnover)	3,00%	3,00%	7,00%	2,50%	2,50%	5,00%	20,00%	5,00%
Mechanisms of brand auditing (in terms of popularity and reputation)	Monitor Tripadvisor, OTA & social media; direct contact with guests; monitor the N° requests for information received	Monitor Tripadvisor, Google Analytics, Pay per clic	Monitor Tripadvisor; monitor the N° requests for information received	Monitor Booking & Tripadvisor; direct contact and feedback from hotel guests	Monitor Tripadvisor (seldom and only when a new guest review appears)	Monitor Tripadvisor	Monitor OTA, Google Analytics and Tripadvisor	Monitor Google Analytics and Tripadvisor
Territorial (place) brand associated with the hotel	Torre Pedrera – Rimini's Coast	Torre Pedrera – Rimini – Romagna's Coast	Rimini	Rimini	Rivazzurra - fraction of Rimini	Rimini	Rimini	Miramare - fraction of Rimini
Reasons for the choice of the territorial brand	Torre Pedrera is a very quiet place and its image is more consistent with the hotel's target	To highlight the area around Rimini and its characteristics (tranquility)	Rimini has a greater visibility while Torre Pedrera is small and not well known	Rimini is the hotel location	Rivazzurra because it is the specific hotel's location	Rimini is the hotel location	Emphasize hotel's location in the city of Rimini and not in any of its fractions	Rimini is a large city; the fraction indicates customers that the hotel is walking distance from the beach
RQ3 – What's the role of hotels' networking strategies in brand management?								
Reasons for joining formal networks with other tourism enterprises	Cost saving, promotion and marketing; More recently also internationalization	Promotion and commercialization (with on-line booking); To live up the fraction of Torre Pedrera	Cost saving; Communication and trade fair participation; Use of the booking portal	First to enhance the territory, its traditions and products; Second to participate in trade shows; Cost savings	To differentiate from competitors (by emphasizing local characteristics); Create events and activities for clients; Reduce	To increase the capacity of communication; Cost savings; Create activities and services for guests (guided tours)	To increase and communicate hotels' quality; to strengthen the whole category of small hotels in Rimini	To inform customers about the quality of small hotels by using the network brand; Share experiences and problems
Changes in brand management derived from/after the collaboration	No	No	No	No	No	No	No	Yes concept of co-branding
Network brand popularity (local)	2	5	5	4	3	2	3	3
Network brand popularity (national)	2	3	2	1	1	1	1	2
Network brand popularity (international)	1	3	1	1	1	1	1	2
In customers' perception, the network brand replaces/could replace the hotel brand	Yes, if the network brand functions it will prevails (like for hotel chains)	Yes	No	No, however the network brand represents an opportunity	No, however it could be a benefit if it works like for hotel chains	No, the two brands are placed side by side	No, high investments are needed to achieve this effect	No, the two brands are placed side by side

Management activities that could be included in brand management are limited to web marketing, social network communication, advertising on traditional media and internet. Anyway they are not implemented with the aim to exploit hotel brand but are more similar to traditional promotional activities. The amount of financial resources assigned to them is 5% of hotel turnover on average. This corresponds to a limited budget in absolute values which does not allow them to implement an effective communication policy. Coherently, hotel owners usually take care of communication activities in person. Also brand monitoring is carried out directly by the owner or other family members and it consists in monitoring hotel rating and customers' reviews on travel web sites like Tripadvisor and online travel agencies like Booking.com. It is interesting to note that Tripadvisor is used to monitor the brand and it is not cited among the activities performed to sustain the brand, thus it is not used as a communication tool to interact with actual and prospect customers.

Similarly, also hotels' brand architecture does not emerge as the outcome of an analytical process. The link between hotel brand (hotel name above all), network brand and place brand is sometimes absent or is the result of a spontaneous process. This situation is probably due to the weakness of the analyzed network's brand policy. Networks (consortia) have been mainly created to increase the visibility and attractiveness of the territory, promote hotels' touristic offer, create additional services for tourists like city tours and parking and reduce costs, while there was no strategic aim to create a network brand capable to distinguish network's offer from other competitors.

According to hoteliers the network brand has a slightly higher popularity compared their individual brand. With one exception, all interviewees declare that the network brand has greater or at least the same popularity of their organization at both the local, national and international level. Thus, joint activities of communication and promotion are held important in supporting the diffusion of network's image. Nevertheless results are limited to the local arena so far. In the rest of Italy and Europe networks are not famous.

This perception seems to be in line with hoteliers' opinion on network brand's incapability to increase their recognizability enough to be able to replace individual hotel brands in the customers' mind. What occurs for hotel franchising chains is considered impossible by the majority of respondents because it would require too much financial resources and it is believed to works only for proprietary chains. At the moment hotel brand and network brand are put side by side in individual hotels' website and advertising material.

These findings suggest that the opportunity of creating a strong network brand is somehow not fully exploited or maybe not really wanted by the associated hotels. Network brand is not a priority in hotels' networking strategies. Hotels communication and hotel brands mainly leverage on the brand of the territory where they are located underestimating the opportunities deriving for synergies with the network brand. In conclusion there are several challenges for small-sized hotels at both the organizational and network level and several potential improvements to achieve.

However, results are limited to the case studies here analyzed and the local area investigated. Future research steps will involve a greater number of hotels and possible comparisons with medium-sized and large hotels of the same tourism destination could be help identify possible difference due to hoteliers' personal mindset and managerial approach.

An interpretative model for the Web image analysis: the case of a wine tourism destination

Abstract

The paper aims at getting to know the online transmitted image (by a wine tourist destination of excellence) and the relative perceived image (by third actors), through a gap analysis model designed for this purpose.

So, the analysis is structured in different steps:

1) the identification of a wine tourist destination (*best practice*) through the study of the online content posts, by looking up the word “wine” in the top 100 international travel blogs; 2) text mining on the website contents of the DMO selected and on the articles of the blogs selected; 3) use of the interpretative model proposed (AIWA).

The model represent a cause for reflection for DMOs in order to reach: a) a multiple effect of awareness and brand recall; b) increasing the sensorial, emotional and cognitive perception of the destination; c) evaluation of the level of communication of web users and the DMOs’ strategies; d) creation of targeted forms of promotional communication.

Introduction

Wine tourism is growing as a special form of tourism (Charters and Ali-Knight, 2002; Getz and Brown, 2006). Understanding what factors are evaluated by consumers is very important for both wine makers, for the development and strategy of marketing, and policy makers, for the development of the Territory. Competitive positioning is becoming a strategic issue for many wine areas (Williams, 2001), which have taken strategic marketing initiatives to attract high-yield wine tourism and have developed the territory. Moreover, it is important to understand how present and potential tourists perceive specific aspects of wine tourism and how these turn into actual intentions of engaging in consumer behavior.

Wine tourism destinations must reflect on their image. Today they should include functional and symbolic elements but also all intangible attributes that give each region its distinctive appeal as a destination (Echtner and Ritchie, 1993; Morrison and Anderson, 2002; Rosato and Iazzi, 2008; Scorrano et al., 2013) and clearly discriminate such destinations as opposed to others (Cai, 2002).

At the moment, the social web communication is the best driver for building a correct image of destination.

According to the definition by Tim O’Reilly (2007), Web 2.0 is not technology in itself but rather a social attitude, centred on the rediscovery of the value of relationships. The Web is the field in which the knowledge of different areas of investigation is created and assembled.

In particular, in the tourism sector, it is possible to observe an increasing diffusion of online platforms and virtual communities; these are populated by increasingly well-informed and demanding consumers. For this reason it is important to get to know these user generated contents (UGCs) in order to investigate the consumer’s perception of tourism destination – web user talking about (WUTA) – and to profile the main characteristics of the most influential tourist.

Theoretical context

The literature of web communication

The opportunity of sharing experiences and exchanging opinions has, actually, imposed a meaningful overturn in both traditional marketing approaches and business communication paradigms (Hennig-Thurau et al., 2004) by stimulating horizontal cooperative processes and thus transforming consumers from “targets” to “sources” and “channels” of the communication stream. Today the consumer, who is always available for an involvement (emotional and rational) in the process of choosing (Holbrook e Hirschman, 1982a; Hirschman e Holbrook, 1982b), proves to be more volatile in the path of creating a stable relationship with the brand (Firat and Venkatesh, 1995; Firat Shultz, 1997; Fabris, 2003) and mainly inclined at maximisation of experiential value of consumption (Bosio et al., 2011; Resciniti, 2005; Brown,

1993; Prahalad and Ramaswami, 2000; Fabris, 2008). Therefore, the Enterprise needs to seriously evaluate its Customer orientation that, far from the mere adoption of a specific technology, is connected to its culture and reputation. Customer orientation takes shape in the growing capacity of listening and quickly answering to Consumer requests. The enterprise has to encourage and engage consumers by offering, contextually, symbolic (style, sociality, personality, affective value) and pragmatic value (quality/price/performance). It has to create a communicative and relational sphere (Fiocca, Marino and Testori, 2006), when the consumer is positioned in the centre of the marketing process, for stimulating conversational relationships (Stokes, 2000) based on techniques and instruments which take advantage of potentialities of communicational and bidirectional paths (Brioschi, 2005). In this way, informative asymmetries between the Enterprise and the Consumer have been weakened, while individuals' learning circuits have been widened, thus enabling the production of new knowledge through interactions and shared experiences and simultaneously leading to the reinforcement of the consumer empowerment process (Pires et al., 2006).

The literature of wine tourism

The literature of wine tourism is growing and it includes practical development and marketing considerations. The definition of wine tourism has not resulted in a uniform approach. When it is analyzed from the perspective of the traveller's motivation and experience, it is defined as "[...] *visitation to vineyards, wineries, wine festivals and wine shows for which grape wine tasting and/or experiencing the attributes of a grape wine region are the prime motivating factors for visitors*" (Hall et al., 2000). In other studies it is considered from three perspectives: a) a form of consumer behavior, b) a strategy whereby destinations develop wine-related attractions and imagery, c) a marketing opportunity for wineries to educate and to sell [their products] directly to consumers (Getz, 2000).

"*Wine tourism destinations*" are defined as regions that base some or all of their appeal on wineries and wine-related benefits. Wine, food, tourism and arts collectively comprise and are recognized as the core elements of the wine tourism product (Getz, 2000; Hall et al., 2000; Carlsen and Dowling, 2001; Dodd and Beverland, 2001; Telfer, 2001; Williams, 2001; Getz, 2002; Lane and Brown, 2004; Loubser, 2004; Roberts and Deery, 2004; Sanders, 2004; Sparks and Malady, 2004). Other elements are included in this definition because they give each region its distinctive appeal as a destination for wine tourists: a) "*touristic terroir*" which describes the combination of physical, cultural and natural environments (Hall and Mitchell, 2002); b) wine rural country which comprises leisure, cuisine, scenery and outdoor activities -visitor facilities and events at wineries, wine-themed interpretation and information centers, wine museums, wine-themed villages, wine country tours- (Williams and Dossa, 2003; Hashimoto and Telfer, 2003), the natural resource -land and water, labor, capital, and infrastructure inputs necessary for grape growing and wine making- (Cambourne et al., 2000; Williams and Dossa, 2003) and the specific impacts caused by wine-related tourism -development of services and facilities in agricultural areas, and new and increased spending patterns- (Hall et al., 2000).

The appeal of wine regions has to be based on the "difference of place" and these differences must be branded (Bruwer, 2003). In this paper, therefore, the wine tourism destination refers to its geographic area which, on the basis of the specific resources of tourist *terroir* (Hall et al., 2000; Peters, 1997; Hall and Mitchell, 2002; Telfer, 2001), may build processes of destination management directed towards these market segments which recognize the *value-proposition* of the *wine-related* destination (Rosato and Scorrano, 2010).

The literature of image of wine tourism destination

In international managerial literature, the topic was approached by applying four different perspectives (Elliot et al., 2011): the importance that a destination image gains in the process of the tourist choice (Woodside and Lysonski, 1989; Pearce, 1982); the calculation of the destination image through the definition of specific models (Echtner and Ritchie, 1991); the analysis of the image creation process (Baloglu and McCleary, 1999); the identification of positive effects for destination in terms of attractiveness and competitiveness associated to its positive image (Tapachchai et al., 2000).

Since the initial theorizations (Gunn, 1972; Mayo, 1973), the subject relating to image has been of fundamental importance in the theorization literature on destinations (Blain et al., 2005; Kaplanidou and Vogt, 2003; Nandan, 2005; Lassar et al., 1995), thus becoming a critically important success factor which is able to act in terms of promotion, distribution and the development of tourist products (Sonmez and Sirakaya, 2002; Pikkemaat, 2004), as

well as bringing benefits in terms of distinctive features, profitability and innovation (Pencarelli and Gregori, 2009). If, in actual fact, tourists consider destination in the same way as any other product, by evaluating the tangible and intangible features (Clifton, 2003; Murphy, 1998; Ward et al., 1999; Beerli and Martín, 2004; Florek, 2005) through which an organic process of functional, symbolic and experiential elements converges (Chon 1990; Foster and Jones 2000; Gartner 1993; Kim and Yoon 2003; Walmsley and Young 1998), it is obvious that the development of a positive and highly distinctive image is crucial, not only in terms of identification and the positioning of the specific tourist destination (Kapferer, 1997; Pappu et al., 2005; Ries and Trout, 1973), but also for the creation of a solid competitive edge (Baloglu and McCleary, 1999).

Hypotheses Development

The present contribution is part of the studies relating to the image of tourist destinations. In actual fact, the latter are called to reflect upon their image by taking into consideration, not only the functional and symbolic aspects, but also those characteristics which are mainly immaterial thus rendering them unique (Echtner and Ritchie, 1993; Morrison and Anderson, 2002; Rosato and Iazzi, 2008) and clearly different from other competitive destinations (Cai, 2002). The approach becomes innovative due to the fact that the creation of a communicative and relational image sphere goes back to techniques and instruments that stimulate conversations (Stokes, 2000) taking advantage of the bi-directional communication potentialities offered by the Web (Brioschi, 2005).

Present discussions on online communication are therefore going to be considered – with particular reference to the 2.0 Web (Blanchard, 2011; Di Fraia, 2011; Castronovo and Huang, 2012; Thrassou and Vrontis, 2008) – assigning a fundamentally important role (Tapscott, 2008; Armano, 2008; Wilson, 2008) to the “interaction”, the “co-creation” and the “socialization” of values and contents in the attainment of positive performances in terms of image perception.

For this purpose the paper introduces an analysis which deals with online destination image suggesting the a) identification of the main themes dealt with and their importance in communicating destination image; b) highlighting the eventual gap existing among what is communicated by the DMOs, what is transmitted by third actors (bloggers) and what is perceived by actual or potential tourists (fans); c) evaluating the efficiency of web communication activity. In actual fact, the experimentation of the model takes place through the case study technique on wine destinations in order to observe the image transmitted by the DMOs, perceived and transmitted by bloggers as well as that perceived by the WUTAs. Assuming that, in particular, present or potential wine tourists may perceive wine destination using as cognitive keys what has been communicated by the DMOs and by travelling bloggers, this empirical analysis hypothesizes that:

H1: the communicative online process of a DMO focuses around specific constitutive features of the core elements of a wine destination, intended at getting the actors within this sector (specialized bloggers, tourists, tour operators, travel blogs, news, etc.), to allocate the very same importance to these elements once they have been perceived;

H2: the effectiveness of the communication process and the perfect balance resulting from what has been conveyed by the DMO communication process as perceived and transferred by third actors.

An interpretative model for the Web image analysis

The interpretative model, hereafter defined as **AWIA** (*Answering web image analysis*) has been conceived as follows:

- Regarding web information and its interpretation, the perspective of *question answering* modified and adapted to *marketing oriented* (Voorhees, 1999; Cooper and Ruger, 2000; Kwok et al., 2001);
- For the elaboration of data received, the logic of quantitative – *content analysis* (Berelson, 1952; Krippendorff, 1980; Weber, 1990); the *text mining* perspective (Bolasco, 1997; Feldman and Sanger, 2007), responds adequately to the informative purpose of the model. As a matter of fact, the differences and similarities of the conveyed messages are highlighted by the textual analysis, and, as they are social instruments, the process of the consumers’ co-creation of topics are highlighted too.

Two operational dimensions are foreseen:

1. *pre-processing*: a preparatory phase orientated towards the identification of three variables corresponding to the following queries:
 - a. *What?*: the identification of the target analyzed and the eventual selection of related sub-categories that may better qualify it from a semantic point of view (wine destination, mountain destination, ethnic destination etc.);
 - b. *Who?*: the identification of types of individuals from which information is to be gained (tourist, blogger, fan, tour operator etc.). The identification of such a variable is strictly dependent on the nature of the source analyzed.
 - c. *Where?*: The identification of two spatial dimensions: 1) geographic, aimed at dividing up the information according to how intensely the phenomenon needs to be analyzed (e.g. information gathered from *Google Spain* to analyze Spanish tourists speaking of the Napa Valley); 2) virtual, consisting in the identification of non-structural sources where the research needs to be carried out. Adopting a bottom-up logic, a crawling process takes place based on a set of research queries that highlight the textual contents that result being closer to the *research objective/informative source* relationship. In this way data collection is achieved focalizing on the research and the type of individuals that are observed;
2. *processing*: in such a phase, *data collection* is submitted to *text mining* and the output is interpreted as a result of the following *question answering* aimed at transforming useful cognitive data into decisional goals:
 - a. *How?*: how one speaks in non-structural pre-identified sources in order to identify the topics relating to messages and conversations conveyed which were relevant in the research. In this context, words identifying destination core elements are included, whether they are tangible (Getz, 2000, 2002; Lane and Brown, 2004; Sparks and Malady, 2004) or intangible (Hall and Mitchell, 2002; Williams and Dossa 2003);
 - b. *Why?*: why one talks – elements relating to utilitarian and functional value, which is assigned to a destination in a psychological point of view, are considered. Words indicating *psychological attributes* are included (Williams, 2001; Hall and Mitchell, 2002; Bruwer, 2003);
 - c. *When?*: when one talks, that is, looking for subjective and emotional benefits related to the need for entertainment. In this way it is possible to observe the hedonistic value of a destination, which is not necessarily related to the moment of consumption but rather to the research for information. Words relating to *Pleasure and enjoyment* are found in this category and they are an expression of the *Symbolic e Experiential* value (Hall et al., 2000; Williams, 2001; Hashimoto and Telfer, 2003; Cambourne et al., 2000).

The final aim of the present model is to meet the engagement needs of the consumer. For this purpose, the answer to each question corresponds to the following interpretations of the phenomenon:

- *Functional dimension*, which relates to the *Traditional core resources (How?)* of a destination and for this reason the intrinsic and extrinsic features of this very same destination are included;
- *Holistic dimension*, this is the process of psychological abstraction that features the perception of the elements that characterize the destination. These are words that identify the relationship with history, art, landscape, traditions and, because of this, defined in the model as *psychological attributes (Why?)*;
- *Sensitive Dimension*, which identifies the emotional abstraction that accompanies the evaluation of a destination. Therefore it comprises words, mainly adjectives, which represent *Symbolic e Experiential attributes (When?)*.

Empirical Research Methodology

The experimentation of the model has taken place adopting a *case study* approach (Malhotra, 1993; Johnston et al., 1999; Yin, 1984; Gummesson, 2000) which allows access to a remarkable quantity of specifically qualitative data and offers wider suggestions on the nature of the phenomena rather than those adopted by the quantitative method (Dubois and Gibbert, 2010; Easton, 2010; Piekkari et al., 2010; Dubois and Gadde, 2013).

In the following phases the empirical framework foresees:

1) *pre-processing* identification of the:

- *wine destination* where the model is tested (*What?*). The first step consists in drawing out the first *Google.com* pages obtained by using the key search words “travel blogs”. The blogs were submitted to web metrics as

suggested by *Alexa* (<http://www.alexa.com>) using a classification system based on traffic, on popularity and on site engagements. In this way 100 travel blogs were reached. During the second step, 30 posts for each blog were taken out using the word “*wine*” in the search tool of each one. In this way data collection of 2,631 articles was obtained (about 505 contextual word pages). The corpus was submitted to an automatic procedure of lemmatization by using the *T-Lab software* (the re-elaboration of 1 text, 4,738 elementary contexts, 17,448 forms, 13,864 lemmas, 203,284 occurrences with a threshold equal to 12). In this way, the main keywords (1,531) were identified – keywords, out of which, destinations having a major number of occurrences were drawn out. Amongst these, the most frequently quoted wine destination is the Napa Valley (freq. 106), the wine destination which refers to those geographical areas that, owing to territorial tradition or to marketing choices, have taken the decision of linking their wine vocation to tourism.

- *subjects* to be analysed: according to the present analysis, these are the DMOs, the first 100 travel blogs identified and the blogger fans (*Who?*).
- *spatial dimensions* (*Where?*), from a geographical point of view, no limit has been taken into account. As a matter of fact, the blogs chosen were drawn out using *Google.com*. Regarding the sources, the following have been considered: a) the DMO’s website “Visit Napa Valley” (<http://www.visitnapavalley.com>), drawing out 480 word format pages; b) the articles edited by bloggers referring exclusively to the wine destination examined, drawing out with the keywords “wine Napa Valley”. 331 word format pages were pointed out which corresponded to 179 blog articles; c) the comments in response to the articles by bloggers, analysing about 222 word format pages, corresponding to 1,690 comments;

II) processing: three texts have been normalized and lemmatized through the T-Lab software. The data collection obtained is made up of the following three levels: a) for the company website: 2,192 elementary contexts, 7,932 forms, 6,370 lemmas, 91,167 occurrences and 992 keywords (with threshold equal to the resulting 10); b) for the articles edited by bloggers: 3,475 elementary contexts, 15,060 forms, 12,029 lemmas, 161,432 occurrences and 498 keywords (with threshold equal to the resulting 10); c) for comments to the article: 2,026 elementary contexts, 7,896 forms, 6,628 terms, 65,249 occurrences and 683 keywords (with threshold equal to the resulting 7). Before proceeding to text mining, three sub data collections have been created, taking exclusively into consideration the words that appeared to have a lexical relationship with the words “*wine*” and “*destination*” in order to reach a better focalization of the phenomenon analysed. The statistic method used for text mining is: a) *correspondence analysis*, aimed at pointing out the most important macro themes in each context analysed and highlighting eventual homogeneities or differences (H1); b) *cluster analysis*, pointing out groups of words that could represent the *core communication* components of the destination as well as the relative importance (weight percentage) given and the eventual gap with respect to the perception of third actors (H2). For both methods, the interpretative phase was carried out adopting the “3 *question answering perspectives*” identified in the AIWA model.

Results and Findings

Guiding dimensions of web communication of image

Text mining, through the analysis of correspondences has been able to spread the dispersion of the data within a limited space, illustrating the polarization of variables and lemmas by means of factorial axes on a Cartesian graph. The axes on the matrix correspond to the factors, that is, to the newly created variables that justify the different oppositions amongst the factor poles. Factorial polarity, that is the contrast on the horizontal and vertical axis of the graph, is determined by the *value test*; this index has a threshold value of 1.96, that is equal to the more common significant statistics (p. 0.05), and a positive or negative sign. With this method, it was possible to synthesize the information obtained from the blog, the forum and the community in a bi-dimensional space. In this way, the relationships amongst the context units in terms of imminence-distance (similarity-difference), have undergone a preliminary analysis.

By analysing the following figure (Fig. 1), it is possible to observe that:

- 1) DMOs have a more relevant thematic content – characterized by the enrichment of lemmas around the same variable “DMOs” – represented by words recalling tangible attributes of a destination like the services (hotel, spa,

- resort, etc.) and the territorial elements (territorial areas, towns, etc.). It is therefore believed that for DMOs, the *How?* component has a more important role in the communicative process with respect to other elements;
- 2) Bloggers who resort to words associated mainly to *wine* (taste, smell, grape, etc.), to the experiential virtue of consumption (enjoy, event, experience etc.) and to the territory (Valley, country, Napa, California, San Francisco, Los Angeles etc.). In this way, as opposed to the previous point, the elementary forms *Why* and *When* appear to be more frequent. It is however noteworthy when considering the positioning of words on the quadrants, that the separation from the DMOs is not net. As a matter of fact, there are terms that tend to converge towards the centre and this recalls points of contact in communicative elements;
 - 3) The users whose words appear to be particularly disconnected and are not indicative of a specific macro-theme. In particular, they appear to be very distant from the DMOs, which are positioned in the opposite quadrant.

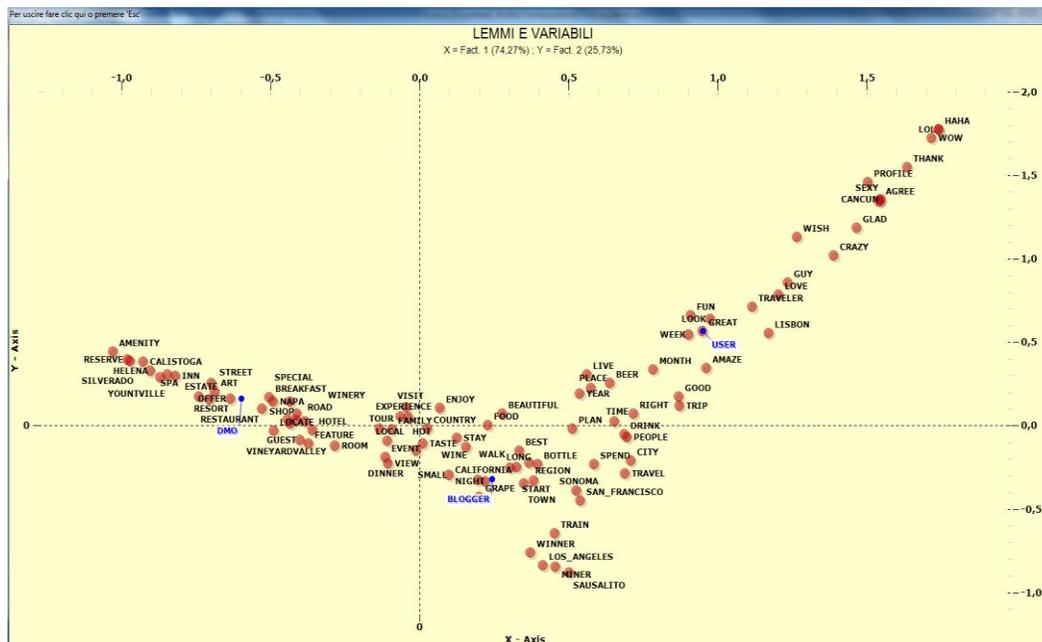

FIG. 1: FACTOR PLAN ANALYSIS OF THE VARIABLES-TERMS CORRESPONDENCE

The initial text mining phase has therefore highlighted the presence of context unity (*words*) that, when led towards the internal single question answering, highlights the web communication guiding dimensions of the DMOs which are mainly orientated towards the traditional *core elements* of the destination (*How?*) and the tendency to overlook the symbolic and experiential elements of the wine product connected to it. Vice versa, the process of perception and transfer of elements comprising the *image* of a destination by bloggers is on a larger scale because, as was earlier mentioned, they have a tendency to use hedonistic (*Why?*) and experiential (*When?*) words.

Such preliminary studies do not complete hypothesis 1 and, for this reason, a more intense analysis has taken place in order to evaluate whether there are groups of lemmas that may be homogeneous with specific communication drivers and with the internal perceptions of each context analysed.

Group of words which represent the specific communication driver

The apparent presence of points of contact between the DMOs website and the blogger has, as a matter of fact, led towards a consequent in-depth analysis in order to understand whether the aggregation of words within each context may be characterized by a level of homogeneity able to generate groups of terms that could represent the *specific*

communication driver per single context as well as the specific importance placed on each driver in the process of image communication.

In order to achieve this, a first cluster analysis phase has been carried out where inputs are represented by lemmas subdued to the processing phase and for each context analysed. The hierarchical procedure (Johnson, 1967; Everitt 1979) was analysed using the *Ward method* as it allows the aggregation of those specific groups which have a minor increase of deviance “within” the very same groups, thus guaranteeing major homogeneity within the elements. Seven clusters were taken out for the DMOs as well as for the bloggers and, the creation of clusters took place excluding the words having $p > 0.50$.

For the users, the CHI² significance test has highlighted the impossibility of recurring to cluster analysis; this is related to the high number of lemmas in the conversation. For this reason, such an in-depth content analysis will take place in a subsequent research.

The phase of output interpretation obtained with data collection clusters from the DMOs websites and from blogs, is based on the analysis of lemmas that fall back into each cluster and on the allocation of each one with a definition/category representing one aspect of the phenomenon. For this reason, the following clusters have been identified made up of lemmas that have three interpretative dimensions:

1. *Wine* – in this cluster the *functional dimension* is represented by words linked to the product in the strict sense (Sauvignon, Cabernet, Appellation, grape, taste, blend, balance blend, balance, Pinot, noir, Merlot Blanc, Varietals, Chardonnay, Vineyard, etc.) and to the areas and the production techniques (Winery, estate, Cellar, distillery, winemaker, winemaking, etc.); the *holistic dimension* of lemmas such as Mountain, hill, Oakville, Silverado, knoll, Train, Napa, region, Sonoma, California etc.; the *sensitive dimension* of words that express the experiential element of consumption (Visit, vintage, romantic, tasting, boutique etc.);
2. *Destination services* – which groups words identifying a) tourist services (Hotel, resort, tour, room, Inn, Services, golf, package, Guest, park, airport, bath, Transportation etc.) and sport and free-time activities (ride, Pool, tennis, golf, massage, body, spa, Wellness, etc.) identifying the *functional dimension*; b) territorial references (Valley, country, escape, Lake, San Francisco Golden, Meadowood Meritage, cove, etc.) for the *holistic aspect*; c) adjectives expressing the pleasure of travelling (experience, luxury, treatment, relax, pleasure, hospitality, etc.) and thus the *sensitive dimension*;
3. *Environment and territory* – this is the cluster made up of terms recalling the natural elements (woods, memory, sightseeing, redwood, nature, monument, tree, hillside, cathedral, forest, grove, creek, animal, fall, etc.). This does not exist for DMOs and for bloggers when considering the nature of the words recalled – mainly found in the *holistic dimension*;
4. *Art and Culture* – this includes words expressing art and culture in the area. Art, culture, theatre, music, perform, artist jazz, opera, museum, exhibition, dance, entertainment, festival are words representative the *functional dimension*; landmark downtown, Napa, Southbridge, heritage, valley, landscape, etc., these represent the *holistic value* of the phenomenon; night life, artistic, collection, historic, restore, night, lovely, fine, celebration, original, character, inside, attract, showcase, innovative, for the *experiential aspect*;
5. *Food* – this comprises names and adjectives recalling the relationship with food. The *functional value* is represented by words like chef, cook, shop, culinary, open table, ingredient, food, café, dinner, grill, beer, kitchen, bar, lunch, cuisine, table, pizza, bistro, marketplace, market, store, specialities, fish, bakery, pizzeria, farmer, wine bar, meal; the *holistic dimension* represented by vine and wood; the *sensitive dimension* by fresh, local, seasonal, Napa style, organic, adventure, executive, casual, delight, innovative, authentic, lounge, love, story, specialities;
6. *Regions and Cities* – these are lemmas indicating places and urban/geographic elements. This cluster is totally inexistent for DMOs while for bloggers the following words gain importance referring to the *functional dimension*: City, San Francisco, Sausalito, bridge, ferry bus Alcatraz Pacific shop car Island; the *holistic dimension* gain importance using the following terms: bay, beach, park, ocean, coast, attraction, statue, build, landmark, sea, sunset, architecture, experiential with golden, treasure, art, museum, night life, walk, pleasure, heart, live, night, culture, famous, picturesque;
7. *Information on Travel Experiences* – comprising lemmas indicating elements that ease the holiday. The *functional dimension* is represented by words relating to: information, property, Inn, bed, breakfast, B&B, lodge, hospital, location, factory, hotel, country, cottage; the *holistic dimension* of words like Helena, Canyon, Calistoga, Oak,

knoll and the *experiential* from words like facility, health, premium, win, adventure, relief, meet, happy, inspire, lifestyle, event, love, funny, passionate.

The above-mentioned procedure was used separately for the two contexts and there was a tendency to compare the clusters analysed. As can be seen in figure 2, there is a different incidence in the creation of core communication. In actual fact, the DMOs are characterized by destination services clusters has an incidence of 47.04%, followed by food clusters at 21.76% and by wine clusters at 18.10%.

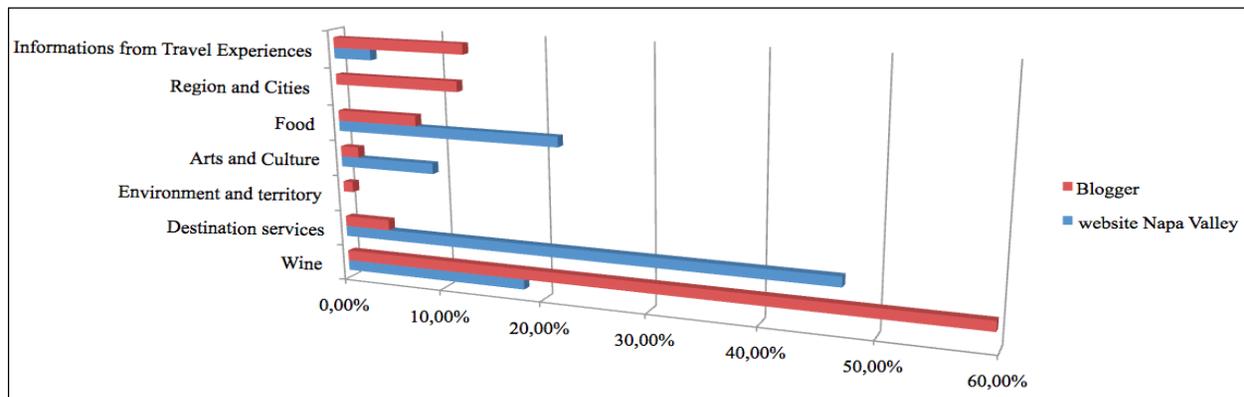

FIG. 2. CLUSTERS OF THE CONTEXTS ANALYSED

The figures, therefore, seem to show the tendency the DMOs have to communicate their destination online thus placing, substantially, gradual importance on all elements without, necessarily giving too much importance to the role of wine. The goal is that of a synergic representation of elements, symbolizing in this way a passage from a simple vocational territory of wine production towards a wine tourism destination; this seems to be obtained – from a communicative point of view – thanks to the synergic valorisation of its material and immaterial components around the territory-wine relationship.

Such analysis seems to show a part of the H1 hypothesis for which the DMO online communicative process is founded on the concomitant importance belonging to attributes of the two core elements – *wine and destination*. All that needs to be done is to observe that the sum of the three clusters characterizing the communicative online strategy – *Destination services, Food, Wine* – illustrate about the 87% of the phenomenon. At the same time, however, there is a gap between the elements communicated by the DMOs and those perceived and transmitted by the bloggers. Such a result does not seem to confirm the second part of the H1 hypothesis represented by the harmony between communication and perception by third actors. The *core communication* perceived by the latter is thus characterized by the importance of cluster “wine” which alone illustrate 59.65% of the phenomenon, the other clusters being somewhat limited.

According to what has been analysed, a few interesting considerations on the second research hypothesis need to be taken into account:

- a. There is an obvious balance between communication (DMOs) and the acknowledgement of the message (bloggers) regarding the *functional dimension* of the phenomenon. As a matter of fact, regarding Napa Valley, there is an exact valorisation and a relative perception of the structural elements of the two main components of wine tourism destination (*wine and destination*);
- b. Major care should be taken of the psychological abstraction process that the receiver launches. This can be seen in the wider view of the value proposition which appears to be distributed amongst all clusters highlighting an interest for the *land-wine* relationship with a particular acceptance of the naturalistic elements (as demonstrated by bloggers);

- c. A process of abstraction which is completed by the *emotional dimension* where perception and importance given by bloggers to the land-wine relationship happen to be greater and more complete as opposed to that transmitted by DMOs .

Such considerations confirm that the perfect balance (H2 hypothesis) is not an absolute condition for obtaining an adequate communicative positioning but it is undoubtedly necessary in the long term. As a matter of fact, the existence of a process of psychological and emotional abstraction, which is in truth active in the receiver, must perceive that the simple communication of structural elements is non-sufficient. This needs to be emphasized by the holistic and sensitive dimension of the land-wine relationship so that, the tale of the territory, as well as its tradition, its culture, its emotions experienced at the moment of consumption may turn into relevant information for whoever chooses that territory or simply needs to get information.

Conclusions and managerial implications

In the present competitive context, this paper intends highlighting the fact that web 2.0 tools are important in the process of image creation and communication of a territory. Today, the creation of the relational and communicative sphere with the customer takes place by adopting techniques and tools that encourage conversational relationships; they exploit the bi-dimensional potentiality of communication through which the actors are, not only transmitters (DMO websites) but also receivers of messages (bloggers and fans).

The originality of this study consists in suggesting, in the important branch of research of destination image, a model of analysis through which observing the relationship between the online communication of the image and the reception of its elements by means of web 2.0 tools.

The model herewith suggested, inspired by the consumers' engagement need and tested by using *case study* techniques, has given proof of its valid interpretative course by:

a) Identifying the main themes dealt with and their importance in the communication of the destination image. In this analysis, the core online communication of DMOs move around a synergy of three main topics - *Destination services, Food, Wine* – that together illustrate 87% of the phenomenon;

b) Highlighting the eventual gap between what has been communicated by DMOs, what has been perceived and transmitted by bloggers and what is perceived by fans. In actual fact, the gap between transmitter and receiver takes place when the clusters relative to DMOs and bloggers are confronted. As a matter of fact, for the latter, “wine” cluster alone illustrates 59.65% of the phenomenon. This aspect is a limit of empirical methodology and needs further study. A further in-depth analysis on the topic dealt with will take place gearing it towards the qualification and quantification of the importance of lemmas within each cluster in order to evaluate in an exact manner their interpretive dimensions rendering them comparable with each other.

c) Evaluating the efficiency of their web communication. The empirical results have, in actual fact, highlighted how the perspectives regarding the analysis carried out result being adequately structured in order to reach the increase of useful information. In actual fact, the case study has highlighted how the perfect balance hypothesized between transmitter and receiver is not an absolute condition aimed at obtaining an adequate online image but it becomes undoubtedly necessary in the long term. In actual fact, the existence of a psychological and emotional abstraction process which is truly active in the receiver is non-sufficient when relating to the simple communication of structural elements. This needs to be reinforced through the *holistic and sensitive dimension* of the land-wine relationship in terms of telling the story of the territory, as well as its tradition, its culture, its emotions experienced at the moment of consumption as it may turn into relevant information for whoever chooses that territory or simply needs to get information.

Generally speaking, the interpretive course of study carried out seems to lend itself to and also applied to other themes as it is an integral part of text mining techniques. Indeed, the information obtained is transformed into useful acquisitions of entrepreneurial decisions as it identifies and simplifies those very same elements through which enterprises define and reinforce their competitive strategies, bearing in mind, in particular, the co-evolution of web contents so as to reach: a) a multiplication effect of brand recall awareness; b) the increase of sensorial, emotional and

cognitive perception of the destination; c) the evaluation of web users' level of communication with respect to the strategies adopted by DMOs ; d) the creation of forms of well-focused promotional communication.

Recovery and revitalization of disadvantaged areas by transfer of “ethical capital” – Some empirical evidences in the wine sector.

Abstract

In business studies, territory was previously considered in a structural view (as a mere reservoir of resources) and then as an expression of a dynamic system of interpersonal relationships, benefiting from contextual resources having a relational, cognitive and organizational nature. In this view, many perspectives and different contributions analyze the interdependence that exists between businesses and communities. It is therefore interesting to introduce a perspective able to examine the path from the knowledge economy to the relationship economy, in which the ethical capital of entrepreneurial actions becomes an intangible asset essential to the vitality of the territorial system. The paper is divided into two parts: the first has outlined a theoretical model of territorial social responsibility; in the second, a qualitative study examines the experience of “Libera Terra”, with a focus on the wine sector. Social cooperatives operating in the lands confiscated from organized crime have been studied, to bring out their (possible) transfer of “ethical capital” to the territory. The empirical analysis, with an exploratory nature, allows to apply the theoretical model proposed in the storytelling of the case study. Finally, the paper conceptualizes some scientific and managerial implications about the transfer of “ethical capital” from the business to the territory.

1. Introduction

In current corporate scenarios characterized by increasing competitiveness at international scale, territory is taking on a relevance which had seemed to have weakened with the onset of “globalization”. Agro-alimentary products, craftsmanship and know-how on the part of individuals or groups, so covering the main economic sectors (primary, secondary and tertiary), are once again claiming prominence also thanks to the capacity of the respective sources of having and representing a specific identity, fundamental for defining the “citizens” of a globalized world.

In some cases, reference to territory would seem to constitute a weapon of unquestionable value for (traditionally) more developed countries, which seem to have succumbed in terms of “pure” competition to emergent countries that up to recently, could only be defined as developing. An inimitable factor is “territory of origin” (“country of origin” in the literature of international marketing). This attribute needs to be preserved especially in the face of clumsy efforts to imitate Made in Italy products (we may think for example of the “Italian sounding” for agro-alimentary foods).

Territory however is not merely a source of utility above all if one considers not only *hard* assets (such as landscape, subsoil or infrastructure etc.), but above all *soft* assets (such as society, culture, identity, community, etc.). In this respect the present paper attempts to analyze the potential entrepreneurial dynamics in act in disadvantaged territories (that so far have been object of a not particular attention in the literature of business studies, excluding the work of De Chiara in 2012), in particular in areas where there is an “ethical” disadvantage by virtue of a significant presence of organized crime. By means of the case study “Libera Terra”, in fact, specific entrepreneurial experiences have been highlighted as concerns the wine industry in Sicily and Apulia, in particular with reference to the management of lands confiscated from organized crime. It was thought that a such “virtuous” behavior could explain the beneficial effects also (above all?) in social and cultural terms. A specific contribution of our paper furthermore, concerns the devising of a model of territorial social responsibility in which “ethical capital” acquires great relevance.

2. A general overview on the contribution of territory to business development

Territory has always represented a constant component of socio-economic development. Up to the early 1970s, in scenarios basically uncharacterized by complexity, from a reductionist-structural perspective based on the analysis of objective resources as an artificial space to plan rationally for productive needs (Rullani, 2003), territory was thus considered merely as a “container” within which individual activities, individual enterprises and individual administrations (as separate monads) operated independently one of the other. After the economic crisis in the 1970s

on the contrary, location and development logics were no longer interpreted in terms of excluding the territorial context. On the basis of Marshall's contributions, territory began to take on great relevance for enterprises as a source of relations through which to develop skills for incrementing competitiveness (Marshall, 1919; Becattini, 1979; Becattini, 1987; Camagni, 1991; Porter, 1998). The literature, dealing in particular with the issue of local development (Bagnasco, 1977; Becattini, 1989; Fuà, 1983), clarified the possible combination in such models of industrialization involving small enterprise and innovative capacity, in particular where territory becomes the background for production of specific skills (contextual knowledge) and for mechanisms of social interaction (networks of interpersonal relations) (Garofali, 1991). At the same time, more strategically oriented literature proposed that the search for competitive advantage should be based beyond the confines of the enterprise also on local territory, by means of clustering models (Lorenzoni, 1997).

With the consolidating of the process of globalization, begun in the 1980s, studies on the issue have attributed ever greater importance to the characteristics/peculiarities of the territory in elaborating entrepreneurial visions, delineating a paradigm in which territory itself becomes the organization with its own identity and responsibility for development (Golinelli C.M., 2002). Meanwhile, the perspective of territory as "accumulator" implies distinctive competitive advantages based on factors which are knowledge-related (widespread entrepreneurial resources, human capital and contextual know-how), relationship-related (relational capital consolidated over time), culture-related (propensity for entrepreneurship, based on a deep rooted local culture) (Garofali, 1999; Becattini, 2000; Viesti, 2000; Belletti et al., 2009).

The complexity of territorial systems has been characterized by constant exposition to crises both of a financial, economic, social and environmental nature, in particular since the new Millennium, by virtue of global integrations. In this perspective, emerges the necessity of a new planning capacity for safeguarding places not only from an environmental but also cultural point of view in order to transform them into drivers to overcome from a sustainable perspective the current context of crisis (Maizza, 2013). In short, conditions should be created to favor co-evolutionary processes involving enterprise, institutions and local communities (Valdani, Ancarani, 2000; Golinelli, 2011).

As concerns enterprise, consequently, territory is interpreted as having an ever more active role, evolving from a mere location of geographical choice to a positive element capable of contributing to its own development. This means entrepreneurial and managerial capacity for grasping further competitiveness by preserving, incorporating and enhancing in core processes the specifics of a place, consequently being distinct from other businesses located in quite different contexts.

Thus, the culture of a territory is elected in support of the specifics of that place. Furthermore, applied to enterprise and in line with sociological studies, "glocalization" highlights the role of local communities in respecting the territory and particularly its traditions and cultures (Bauman, 2005).

A "systemic" vision of the territory consequently appears to be fundamental in that it is made up of a series of interacting elements that contribute to defining and developing over time a territory's distinctive characteristics. In this perspective, territory cannot be defined merely as an extension of space or in terms of natural landscape but rather as an expression of "territoriality" (Raffestin 1981; 2007), the product of interpersonal relations capable of the sedimentary embedding of cognitive, organizational and relational resources of a contextual kind (Rullani, 2002, Baccarani, Golinelli, 2011). From this perspective the territory thus becomes a catalyzer of resources.

Accordingly, it emerges clearly that the territory is configured as a "highly complex system" (Golinelli C.M. 2002, Barile, 2011), underlining the importance of anthropological activity and the constant interaction between man with his environment, as a result of synergic co-evolutionary processes involving human settlements and environments. Therefore, the action of the systemic components present in a territory (individuals, groups, organizations, institutions) contributes, under certain conditions, to enriching over time the structural equipment of a territory, i.e. "territorial capital" (Camagni, 2009).

Thus, even from an economic perspective, the evolving of a territorial area cannot be circumscribed to an analysis of the development process of a productive sector or a local cluster of enterprises but has to be considered from a far wider perspective, that also involves the social and cultural sphere of territorial communities, i.e. the capacity for stakeholders of a specific area to self-determine a concrete sustainable valorization. In this kind of logic, the vision of the enterprise-territory relation can be framed in multi-prospective terms in which economic, social and

environmental dynamics are interwoven together with immaterial resources such as system of civic and social values, skills in the productive fabric, reputation, solidarity, quality of human resources, and relational fabric.

However, such considerations find difficult application from a practical point of view even in the case of territories connoted by “positive” characteristics, consequently the situation becomes much more complex when territories are connoted by “negative” characteristics requiring in other words, not only a dynamic and fruitful enhancing process, but also prior a correct and pragmatic recovery action. In this respect the focus of our paper is on the analysis of disadvantaged territories, when distinguished by the density of organized crime which at a certain stage of a territory’s history has upset the harmonious co-evolutionary balance between the territory itself and its actors.

A context of embedded organized crime defying the most basic rules and regulations governing society and the market clearly impacts negatively in terms of productive investments by causing negative and ruinous effects on the economic activities (modifying the framework of opportunities offered by local contexts) and favoring at the same time, a climate of mistrust and frustration both in individuals as well as in the community itself. In such cases a distinct sensation of reduced value, corrosion and the de-qualifying of territory capital is strongly perceived. Such capital needs to be retrieved above all from a socio-cultural perspective more than economic, as in the case of when enterprises are in difficulty and an appeal is launched for an increase in equity capital (in this case, on the part of members of the company in the strictest sense and not of society at large) together with the courageous search for new and lasting balance.

3. Research design and methodology

The study of territory capital as a fundamental structural equipment for the healthy development of a territory from a multi-dimensional (environmental, social, cultural, economic, etc.) perspective is characterized inevitably by a multidisciplinary approach. Studies deriving from various disciplines (economics, geography, sociology, architecture, etc.), contribute to such analysis and highlight the issues and opportunities deriving from resorting to theories and applications of differing conceptual matrices.

Besides its multidisciplinary nature, a research on territory capital needs a contextual basis, certainly considering territory as a specific geographical area but also considering the particular conditions of the territory, if reasonably replicable elsewhere, or other dimensions, like for example the actors of the territory under investigation. The latter in effect constitutes our object of analysis given that as we intend to examine territories disadvantaged by virtue of the dense presence of organized crime, when interested by contributions of recovery/revitalization on the part of “healthy” economic actors as is evidenced in the case study “Libera Terra”. This is even more applicable to the wine business sector, given the strong bond existing between wine and territory (here the concept of “terroir” is extremely appropriate). Thus, we may rightly use a “unique” or “extreme” case (Eisenhardt, 1989; Pettigrew 1990). Extreme cases facilitate theory-building because, by being unusual, they can illuminate both the unusual and the typical (Patton 2002). In other words, in extreme cases, the dynamics under examination tend to be more visible than they otherwise would be in other contexts.

To this end, our research followed a qualitative approach and used the case study methodology (Yin, 1994, 2003; Fayolle, 2004). The fieldwork approach, as suggested in the literature (Adams, 2002) has the dual aim of “grasping in detail the main characteristics of phenomena being studied” and the understanding of the dynamics of a given process (Ryan et al., 2002). The building of a case study represents a “research strategy that focuses on understanding the dynamics that characterize specific contexts” (Eisenhardt, 1989, p. 532). Case studies address the research questions with an emphasis on qualitative approaches and forms of ongoing research (action research) and enable the description, explication and comprehension of business scenarios from the perspective of their dynamics and evolutions.

Specifically, it is considered that the present study could contribute to responding to the following research questions:

RQ1: «Which particular dynamics characterize the relation between an enterprise (especially if “virtuous”) and a disadvantaged territory?»

RQ2: «Which actions can be put in place by enterprise for the potential recovery and subsequent revitalization of a disadvantaged territory?»

RQ3: «Would it be feasible to surmise that “ethical capital” deriving from such actions could be transferred by a virtuous enterprise to the territory especially if reference is to disadvantaged territory?»

In methodological terms, we shall attempt to respond to RQ1 and RQ2 by means of a “grounded” analysis of the selected case study whereby through the use of primary (above all) and secondary data the storytelling of “Libera Terra” will be presented. As concerns RQ3, we shall attempt to respond to this research question by empirically testing a theoretical framework we have devised relative to “territorial social responsibility” in which the concept of “ethical capital” can emerge specifically. In the case of secondary data, mainly electronic sources have been consulted (via the internet), while in the case of the primary data in-depth interviews via telephone and e-mail have been conducted.

4. Revisiting the concept of territorial capital and proposing a theoretical framework for “ethical capital” in “territorial social responsibility”

The co-evolving enterprise and territory process, being a complex and multi-prospective phenomenon, has to be grounded within the context of a systems based approach in which the anthropological and economic dimensions are strictly linked. The basic underlying concept envisages roles and needs of more simple systems, then arriving gradually at the analysis of more complex systems in line with the principle of systemic recursiveness (Beer, 1991). Furthermore, by means of the systemic approach, the essence of phenomena can be grasped. This means going beyond a prevalently objective and reductionist view towards a holistic outlook capable of interpreting the behavioral dynamics of any systemic entity.

Hence, the structural equipment which in any given moment qualifies a territory are none other than the result of an accumulating/decreasing process deriving from the action of systemic components present in the territory itself. The systemic qualification emerges from the perspective of a territorial approach addressed to economic development whereby processes of collective learning are highlighted. In fact, as Camagni (2009) underlines, the constitution of territorial capital involves the following components:

- natural and cultural capital;
- settlement capital;
- cognitive capital;
- social and relational capital.

As concerns territory competitiveness, this can be summed up as the harmonious combination of the above elements with a primary role attributed to the “capacity for enhancement” both at private or public sector scale and deriving from the convergence towards a common vision (Golinelli, 2012) thus contributing to system viability.

In the public sector case, reference is to processes of governance, oriented towards cooperation and relationship-ability: the organ of territorial government, in contextualizing its action, should take on the role of facilitator in terms of cooperative relations and ties among the economic actors; in the private sector case, reference is to the sense of belonging, i.e. loyalty towards the territory and expression of the degree of cohesion in cultural and value terms characterizing the governing body of any entrepreneurial organization. Central to government action is therefore the search for consonance, i.e. the capacity underpinned by convergence and sharing (Golinelli, 2000; 2005; Barile, 2009) for satisfying the expectations of interacting subjects/entities.

Such processes of interaction and cooperation among local actors, enrich the relational infrastructure of the territory and underpin the evolving in a positive sense for the territory of the causal links integrating creativity, knowledge and innovation (Cafferata, 2011). In this logic, it is to highlight the significant contributions, in the literature of business studies, which interpret the territorial systems as cognitive systems that, in the economy of intangibles and knowledge, are a key resource, especially for smaller firms (Rullani, 2004). The emerging of a local territorial system therefore, irrespective of its geographical qualification, defines the milieu in which the various actors perceive themselves as similar and consider themselves mutually responsible for the same (Impronta Etica, 2009; Schillaci, Gatti, 2011).

In a recursive logics, taking into consideration the territorial dimension in business development implies the need for the enterprise to take responsibility for its actions by incorporating the social and civic dimensions, and not only the economic one. In this respect a culture oriented towards the voluntary integration of social and environmental objectives in corporate strategies and processes (Perrini, Tencati 2008a), shared and embraced by all the members of the organization, facilitates the coordinating of activities and relations both in the enterprise and with respect to the actors of the territory, representing the vital sap of loyal and transparent attitudes encouraging virtuous and synergistic actions both for the enterprise and for the territory. From such logics, a vision of Corporate Social Responsibility based on strong relational and cooperative values, emerges (Perrini, Tencati, 2008b) wherein the capacity of entrepreneurship to generate positive changes in the territorial community by means of corporate initiatives is exalted while at the same time, responding to social needs (Mair, Marti, 2004).

It is clear, in fact, that a comprehensive view of corporate social responsibility can't be represented solely by an internal perspective, such as appears to emerge in the model of the Triple Bottom Line (Elkington, 1997), based on the acronym of the 3Ps (profit, people, planet). In this sense, an advancement of studies in this issue, towards a more external perspective, derives from the pyramid model of Carroll (1991), that is, in a bottom up path, an expansion of corporate responsibility, from the economic one to the legal one, from ethics to philanthropy. Decision-making processes aimed at searching virtuous equilibrium solutions, within the above responsibilities, would expand the space of consonance and allow also to reduce the risk of failure about the economic purpose (Sciarelli, 2005). In an expanded vision of corporate social responsibility the correct behavior of the enterprise can originate only from ethics, by sharing the thought of that part of the doctrine intended to qualify ethics as a model of conduct aiming at determining values and criteria for guiding the conduct towards the "good", focusing on the principles of honesty, justice, respect for the individual (Ciappei, 2006; Sciarelli, 2007).

Civic impulse consequently, is an integral part of corporate social responsibility, and find its right place in the spectrum of meanings based not only on altruism or solidarity, but above all on creativity, i.e. farsighted initiatives, blending with economic principles and objectives, cooperative dynamics, and "public happiness" (Bruni, 2004, 2006; Gui Sudgen, 2005). In other words, it is a widespread corporate responsibility whereby behaviors are addressed to consolidating sentiments of citizenship and rectitude (Keeley, 1998). From the perspective of entrepreneurship as citizenship, the role of firms stands out, being able to create shared value, qualifying themselves as catalyzers of social wellbeing and at the same time, improving their competitive status (Porter, Kramer, 2006; Husted and Allen, 2009). In a kind of broad based social contract (Donaldson, Dunfee, 1999) the obligations of an enterprise part of a territorial community, extend far beyond the traditional corporate boundaries in line with a relational system perspective (Pellicano, Ciasullo, 2010) centered upon a complex, organized, open and dynamic flow of relations of trust. In this respect, unwritten rules emerging from widespread and ongoing relations among the enterprise and its stakeholders, represent the basis of a process of sharing and joint responsibility in the context of value creation processes.

In terms of competitiveness, enterprise needs to define strategic action that would be synergistic with the local system, favoring interactions characterized by co-participation to strategic and operational processes by means of a shared, coordinated, and synergistic use of respective resources. Such considerations apply in particular when the territory impacts to a great extent on the competitiveness of the enterprise and where it represents an essential productive factor as in the case of the agri-food sector (the wine business sector in particular) but above all when the territory is characterized by disadvantages of an "ethical" nature by virtue, as in the case study analyzed, of the dense presence of perpetrators of organized crime.

Precisely in so characterized territories, in fact, the need for a collective intentionality emerges, that would be capable of implementing instances of change through dynamics of cooperation and reciprocity, properly channeled in different initiatives and having as their relevant aim to contribute to the accumulation of ethical capital. In this logic, each individual responsibility must be able to integrate itself in a common collective responsibility, that may be understood at the same time as foundation and tension of ethics. On the basis of the above considerations and an empirical research the purpose of which being to determine the extent of the contribution of corporate organizations towards the growth of territorial capital (Impronta Etica, 2012), our research attempts to conceptualize a theoretical framework in order to delineate the "territorial social responsibility".

With regard to the model, the four main concepts of “capital” proposed in our research concern the social, eco-systemic and cognitive dimensions. Leaving aside the dimension of “settlement-infrastructural capital”¹ which we consider contributes in a non-dynamic (i.e. static) manner to the generating of territorial social responsibility, beyond the other three, we propose a further dimension that can be considered fundamental to developing effective territorial social responsibility, i.e. a “diffuse (ethical) tension”, highlighting the unquestionable importance of effective “ethical capital”. In particular, the fourth dimension impacts in two ways, because it can be considered both the cause and the effect (as outlined above) of territorial social responsibility.

Finally, the model conceptualizes the drivers associated with each dimension thus achieving research advancements compared to the models that have inspired and underpinned our research: Impronta Etica (2012) and Camagni (2009). Therefore, the dimensions and drivers proposed in the theoretical model of the “territorial social responsibility” can be articulated as follows (see Fig. 1):

- a) “Corporate Social Responsibility” (*social capital*): entrepreneurship, relationship-ability, sustainability (recovering/adapting the traditional model of the “3Ps”: profit, people, planet);
- b) “Systemic Qualification” (*eco-systemic capital*): viability, governance organ, consonance (inspired by the viable systemic approach by Golinelli);
- c) “Synergic Circularity” (*cognitive capital*): “economicity”, quality and innovation (thinking analytically about the concept of competitiveness);
- d) “Diffuse Ethical Tension” (*ethical capital*): legality, integrity, solidarity (recovering /adapting Carroll’s pyramid on corporate social responsibility from the second step: legal, ethical and philanthropic).

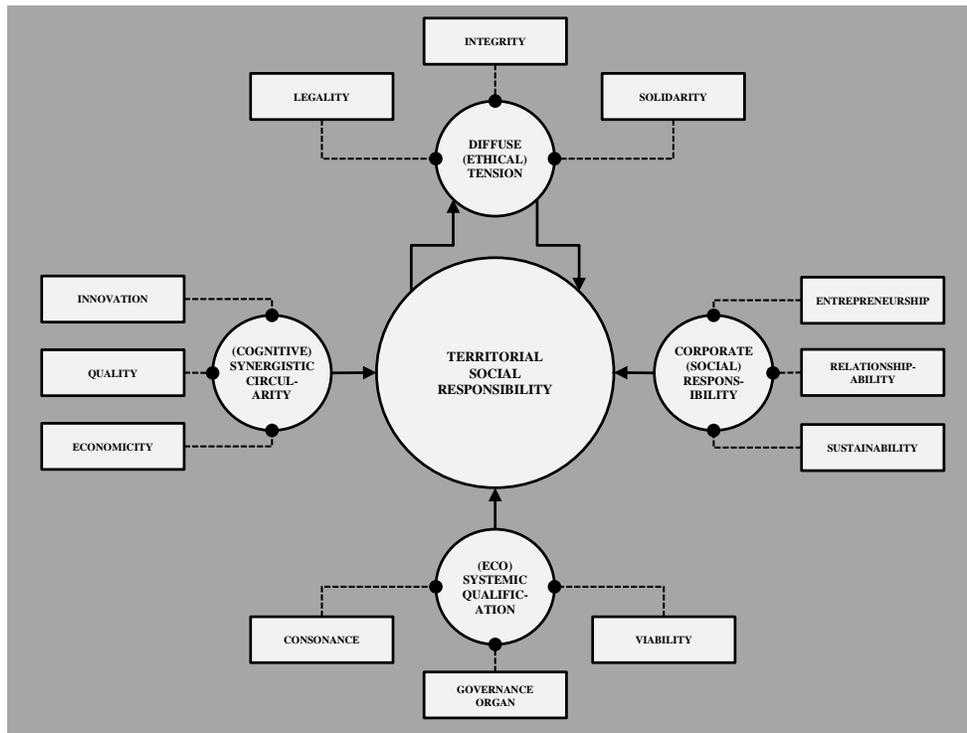

FIG. 1 – THE THEORETICAL FRAMEWORK OF THE TERRITORIAL SOCIAL RESPONSIBILITY.

Precisely the dimensions (four) and their relative drivers (twelve) constitute the foundations/pillars of the theoretical framework that we propose as the main contribution of our research in order to qualify the territorial social

responsibility which will subsequently be empirically tested, by a fieldwork confirmation, in the storytelling of the case study “Liberata Terra”.

5. The case study “Liberata Terra” with the experiences of “Centopassi” (Sicily) and “Liberata Terra Puglia” (Apulia)²

«“Liberata. Associations, names and numbers against mafias” was born on March 25, 1995 with the intention of stimulating the civil society in the fight against organized crime and promoting legality and justice. “Liberata” is currently a co-ordination of over 1600 associations, groups, schools, grassroots groups, territorially committed to build political-cultural and organizational synergies capable of spreading the culture of legality. The law on the social use of property confiscated from the mafia, the education for democratic legality, the commitment against corruption, the anti-mafia training camps, the projects on work and development, the anti-usury activities are just some of its specific commitments. “Liberata” is recognized as an association for social promotion by the Ministry of Social Solidarity. In 2008 it was included by Eurispes among the Italian excellences. In 2012 it was included by The Global Journal in the list of the hundred best NGOs in the world: it is the only Italian organization of “community empowerment” whose name appears in this list, the first dedicated to the universe of non-profit» (from www.liberaterra.it, last visited on June 15, 2014).

Nine social cooperatives belong to “Liberata Terra” on the Italian territory (for the moment, only in the South of Italy). There are five in Sicily, two in Calabria, one in Apulia and one in Campania, while a tenth will start shortly again in Sicily (in the province of Trapani).

Of these social cooperatives, four, of which three in Sicily and one in Apulia, are engaged in the cultivation of the grape and the production of the wine (this latter activity does not apply to Hiso Telaray, which commit the transformation of the grapes to contractors selected by the Consortium “Liberata Terra Mediterraneo”, even though the winemakers of the cooperative coordinate all the stages of the winemaking process). The wine social cooperatives are grouped into two large “souls”, “Centopassi” in Sicily (www.centopassisicilia.it) and “Hiso Telaray” in Apulia (www.hisotelaray.it).

In particular, “Centopassi” is the wine soul of the Sicilian entities of “Liberata Terra”, involving the Social Cooperative “Placido Rizzotto”, the Social Cooperative “Pio La Torre” and the Social Cooperative “Lavoro e Non Solo”. The cooperatives handle agricultural goods confiscated from organized crime in the area of Palermo, on lands belonging to the “Sviluppo e Legalità” Consortium of Municipalities, and in the provinces of Trapani and Agrigento.

“Hiso Telaray”, instead, is the name of the wine soul of the Social Cooperative “Terre di Puglia”, which handles the goods confiscated from organized crime in Apulia. The cooperative manages vineyards in the province of Brindisi, in the towns of Mesagne, Torchiarello and San Pietro Vernotico.

The social commitment of these initiatives emerges naturally from the very same names. The first is related to the famous “hundred steps” that separated the house of Giuseppe Impastato (a political activist victim of the mafia) from that one of Gaetano Badalamenti (condemned as instigator of the murder); the second is related to the young Albanian man (who was killed at the age of only 22) who had dared to challenge the illegal hiring linked to organized crime (for which he was punished as an example/warning).

In business terms, more specifically, “Centopassi” and “Hiso Telaray” employ in various ways several workers, of whom at least the 30% are disadvantaged, in compliance with the Italian legislation on social cooperatives (in general, “Liberata Terra” develops a system of about 140 workers). “Centopassi” produces different types of wines, all in biological processing, from about 90 hectares of vineyards, for an average distribution of 500 thousand bottles of wine per year, sold in Italy and abroad. As regards “Hiso Telaray”, instead, the bottles produced on average are about 120 thousand per year, from about 30 hectares of vineyards.

In the case of the wine sector, the ethical approach to the territory is definitely identical to that one that “Liberata Terra” take/pursue also for the other agricultural productions (on which we will reason extensively below), but rather there has been a turnaround as to the type of production. Before the management of vineyards by “Liberata Terra”, in fact, the cultivators aimed to maximize the amount of grapes, to be able to access funding for crisis distillation, apart from any consideration of the quality of the grapes: nowadays, instead, the relationship with the vineyards is completely changed, because the focus is mainly on indigenous grapes (Grillo, Catarratto, Nero d’Avola and Perricone in Sicily; Negroamaro

in Apulia), using exclusively biological crops, aiming at the maximum quality of the product, up to real *crus*, with numerous awards at national and international level.

In terms of advantages/disadvantages of the territory of origin, neglecting agronomic, oenological and commercial references to the true “terroir” (Ciasullo, Festa, 2012), one can generally distinguish between what happened in Italy and what happened abroad (moreover, it should be noted that the engagement in the wine sector is relatively recent, dating back to 2006). On foreign markets, in fact, the products have succeeded because they have a good quality/price ratio; after this judgment, in case, also the “social” soul of the enterprise may have been recognized.

In Italy, instead, undoubtedly there has been a greater recognition in this sense, both in terms of notoriety/approval, and in terms of practical support on the part of the cooperative world (for distribution and sale), emphasizing the relational capital (Cardinali, 2009): however, there may have been some disadvantages, that have been connected not so much to the land of origin, as to the prejudice on the social cooperatives in general, that in case at the beginning cannot be considered capable of handling quality productions. These prejudices have been defeated “simply” with the daily work involved in producing quality wines, which, as we said, have now reached a level of notoriety, popularity and reputation of unquestionable value, in Italy and abroad.

The case study has been treated in a merely exploratory perspective, in order to reason about the relationship between “Libera Terra” and the reference territory, in view of the transfer of “ethical capital”, especially in the case of the wine sector (“Centopassi” and “Hiso Telaray”). This contextualization has been considered interesting because in the case of grape cultivating and wine making the link with the territory of the enterprise is of course very intense, up to the same concept of “terroir”.

Naturally, the reflections that follow are valid in general for all the social cooperatives belonging to “Libera Terra” (which handle various agricultural products), and then more specifically affect also the social cooperatives engaged in the wine sector, on which previously we developed a more contextualized analysis. The case study is illustrated below by the storytelling approach, adopting the perspective of the territorial social responsibility and therefore breaking down the story of “Libera Terra” in the four dimensions that constitute the theoretical model previously proposed.

The dimension of the corporate social responsibility (“social capital”)

The economic activities carried out by the social cooperatives belonging to “Libera Terra” were inspired by a relevant, if not predominant, social purpose, in which the cult of the legality is a fundamental value of the entrepreneurial vision. It is obvious, in any case, the necessity/opportunity of a good governance and management of the firm, combining «... the characters of economic efficiency and innovation of the enterprise with the values of mutuality and solidarity that are typical of the third sector, creating a participatory and democratic enterprise, formally private, but oriented to objectives of general order», also because precisely «... in the evolution of the third sector social cooperatives represent the entrepreneurial dimension of the non-profit group»³.

Social cooperatives that are members of “Libera Terra” are based on a double “social” inspiration. Firstly, they are oriented (in compliance with the related law) to the inclusion of disadvantaged workers, but at the same time, they are oriented (in compliance with their own mission) to spread on the territory examples of civic engagement, capable of inspiring virtuous behaviors (or more precisely just “civil”) in the communities that inhabit the same territory and, thanks to the power of example, even in the communities that inhabit different territories, but similar (Putnam, 1993).

It remains essential, of course, the proper functioning of the enterprise as such, that is from an economic point of view (considering entrepreneurship as an attitude, capability and ability to imagine, design and develop economically sustainable initiatives), becoming the economic purpose also a vehicle to better promote these social and civil objectives. In addition, always in economic terms, it is important to remember that, in the view of the territory promoted by “Libera Terra”, the tension to the enhancement of the public good is a priority, since the land confiscated from organized crime remains in the property of the State and social cooperatives are only entrusted under concession. This enhancement, in particular, aims at creating a virtuous circle of economically self-sustainable enterprises, involving of course also the supply chain and thereby generating employment for the territory, directly or indirectly.

Beyond the promotion of the public good in an economic sense, there is also a valorization in an environmental sense, which results in a real philosophy that starts from the consideration of land as a source of life (“Mother Earth”), focusing the efforts of “Libera Terra” on agricultural work. The cult of the environment is of fundamental importance to

the cooperative project, because the environmental responsibility, in territories with a substantial criminal presence, is one of the most critical viaticum to get to a widespread sense of legality: so, the message that should emanate from this commitment is that it is possible to make a product that is “good, righteous, and clean”.

Moreover, in an even broader vision, that message gets translated into a principle of convenience of the legality, considering it as a not only social, but also economic remuneration. Indeed, the land confiscated and now managed by the social cooperatives were cultivated even previously (rather, during the transition from the requisition to the concession of course they remained uncultivated) and even earlier, as a consequence, some economic value was generated, but it was wealth (even and especially in terms of work) that was not distributed fairly, obviously benefiting the employer (organized crime). With the economic initiative of the social cooperatives belonging to “Libera Terra”, however, it is shown that the legality is not only right, but it makes sense as well, because it allows a more equitable redistribution of wealth in the territory.

In social terms, finally, the cooperatives of “Libera Terra” of course require the use of (at least) the 30% of disadvantaged workers, as required by law (381/91). In addition, nearly all workers reside in the municipalities to which the lands under management compete geographically, and this gives the initiative a high social impact, shortening the chain of transmission of the legality towards the community of the territory.

Moreover, the choice of the members of the cooperative is by public announcement, involving public and private institutions, in order to identify individuals who for personal skills (ethics) and professional ones (know-how) are in harmony with the spirit of the enterprise. This combination is crucial: “Libera Terra”, in fact, puts as a foundation of its own initiatives certainly legality (and then ethics), but also a reliable entrepreneurial project, that must be supported by adequate professionalism, because the hypothetical economic failure of the project would ultimately affect negatively also the social impact of the overall initiative.

The dimension of the systemic qualification (“eco-systemic capital”)

The involvement of public and private actors assume in the case of “Libera Terra” a particular importance. In fact, it must be remembered that the law 109/96 provides that the goods seized by the State to organized crime are assigned to provinces, municipalities and consortia of municipalities, which subsequently can assign them under concession to social cooperatives.

In the case of those ones belonging to “Libera Terra”, the members of which, as we said, are selected by a public announcement, for these lands, just in the public-private partnership (Province, Prefecture, Municipality, Consortium of Municipalities, Italia Lavoro, Libera Terra, etc.), a detailed territorial study has been developed, putting at the center of the territorial strategy a precise pin, namely the enterprise creation, in order to constitute in the territory a real “network” of economic, social and civil values (thus arriving at a contextual and multi-subjective governance organ of the territory). The governance of the territory so far represented regards similarly also the relations between “Libera Terra” and the associated enterprises, whose levels of government, in fact, are quite distinct, even though they obviously share a total harmony of principles.

In this system of values, as we said earlier, the most important one is undoubtedly legality, that we have already declined in an institutional component (respect of the law) and in an economic one (“legality is economically convenient”). Most of all, therefore, the principle emerges that an alternative of legality is also (especially) an economic alternative, i.e. an entrepreneurial path to the survival of the enterprise, of the workers and then of the territory in the broadest sense.

At the level of the territorial system, finally, the social cooperatives of “Libera Terra” try to keep the vocation of the single soil for the cultivation practiced there traditionally, reaching up to biological productions exclusively in all the makings of the cooperatives, tending to the highest possible quality of the production of that specific land. The tension to the vocation of the territory is very intense, both in *hard* terms (i.e., the propensity of that specific soil to that specific cultivation, up to the concept of “terroir” in the case of wine) and in *soft* terms (i.e., the professional and traditional skills existing in that specific community that inhabits that specific soil), constantly pursuing a systemic consonance with the territory.

The dimension of the synergistic circularity (“cognitive capital”)

From the point of view of production and trade, it is possible to find in “Libera Terra” a particular organization: the social cooperatives, in fact, focus exclusively on what they do best, which is the biological cultivation of the assigned lands to generate the highest possible quality. Transformation and sale, however, are carried out by the Consortium “Libera Terra Mediterraneo”, which therefore can exploit economies of scale and experience, making use of technical and allocative efficiency, redistributing even more fairly the wealth produced on the whole.

Besides, the Consortium “Libera Terra Mediterraneo” also buys from other transferors and not only from by the social cooperatives of “Libera Terra”. Anyway, in order for any company to be a supplier of the Consortium, it must undertake to comply with a very rigid discipline, both for technical production both for ethical behavior.

It is clear that the Consortium does not constitute a specific resource of a specific territory (it is situated in San Giuseppe Jato, in the province of Palermo), but is instead a kind of meta-territorial actor, because in fact it is the main outlet of the agricultural productions of the various territories. This relative “certainty” allows social cooperatives to engage in innovation and quality (with biological crops) of the single agricultural productions, taking advantage of the upstream “economicity” that the Consortium will be able to develop.

The dimension of the diffuse ethical tension (“ethical capital”)

It is natural that the humus of legality is in any case present in all territories, including those ones with a considerable criminal presence, because it is understandable that the vast majority of residents in a community has a perfectly clear sense, in terms of legality, of what is right and what is wrong. Anyway, contextual circumstances (living of the economic retardation, perception of the institutional slowness, etc.) can equally understandably slow down or even block the application of that inner feeling, unless one arrives, as the social cooperatives of “Libera Terra” do, to show that socially, but above all economically, a “legal” initiative it is possible, reliable and sustainable.

Moreover, the territories on which the activities of “Libera Terra” insist have a dual core, because the economic and social redemption which undoubtedly is brought to light, certainly supported, as mentioned above, by a background humus, in any case it is combined with a local presence, at least in historical terms, of a sub-culture with values, principles and rules of criminal nature. In the relationship that these social cooperatives have with the territory, therefore, we must always consider this dual identity, not enhancing, but giving due weight to results that elsewhere may appear “minimum”.

Furthermore, it is interesting to note that, for the operators of “Libera Terra”, the work of the cooperatives is a “normal” craft, i.e. in which they deal with opportunities and problems in the everyday entrepreneurship, without outbursts of “heroism”, as erroneously it could be perceived outside. Of course, there are considerable difficulties in transferring the message of the cooperative project: indeed, the subjects that had been confiscated lands are fearsome, more than for any threats or actual retaliations (also occurring), in an attempt to demolish “culturally” the effort of starting a legally clean and economically viable initiative, because in those local communities would be emerged the evidence of a concrete alternative to the criminal management in the broadest sense of those same lands.

It is important to note that members and workers of “Libera Terra” are also engaged in respecting a veritable code of personal behavior, which requires not only to produce legality, but also integrity (avoiding completely, for example, even only personal relationships that can be questionable). For those who work with the cooperative/project, therefore, the concept of “hero” must be deconstructed and brought back to a level of normality: doing their job, doing their duty, respecting the law, we can realize a “normality” that at the same time becomes solidarity, as demonstrated for example by the more equitable redistribution of the wealth produced in the territory (which was mentioned earlier).

Also because of these reasons, after the commitment of the social cooperatives of “Libera Terra” it is possible to note in the territory a larger support to the initiative on the part of citizens and operators (also thanks their economic involvement, direct and indirect), a greater vitality in the broadest sense of the community (including numerous projects in collaboration with various municipalities) and a more evident culture of legality (we may think of the fact that few years ago it was unthinkable, as instead happens now, that one would “normally” wear the t-shirts of “Centopassi”), extending continuously the civil front of the community of reference.

6. Results and implications

The study of the social cooperatives belonging to “Libera Terra” has allowed, by storytelling, an in-depth analysis of entrepreneurial behaviors, in terms of dynamics and actions, that can be put in place by virtuous enterprises operating in disadvantaged areas, thus responding to RQ1 and RQ2, obviously in an exploratory rather than prescriptive manner. For example, in the case study we have verified the undoubted importance, in the dissemination of ethical capital, of *dynamics* such as the enhancement of the vocation of the territory (both in terms of soil and in terms of skills) helping to give it a clear ethical identity (Totaro, 2005) and of *actions* such as the respect not only of the law (legality), but also of specific duties (integrity).

In addition, we have tried to determine whether and by what margins of consistency/inconsistency the theoretical model of “territorial social responsibility”, previously proposed, could find its application precisely in the specific case of “Libera Terra” (responding positively to RQ3) and still more particularly in the case of the social cooperatives of “Libera Terra” operating in the wine sector. It should be remembered, however, that in this sector very substantial differences have not emerged with respect to other agricultural products, except for the fact that, of course, in the case of wine as a product inevitably the concept of “terroir” emerges strongly.

Therefore, below we propose the application of the theoretical model of the territorial social responsibility (as a system of the contributions generated by the efforts of the entrepreneurial actors in the territory) to the case study “Libera Terra” (see Fig. 2). In methodological terms, of course, the exploratory intent of the study has to be emphasized: in fact, it has been not proposed to derive from the observation of a case study a theoretical model valid in general (induction that would be unreliable with a single case), but, instead, after developing the theoretical model, it has been proposed to verify its consistency with respect to a specific case study, chosen according to specific motivations, in order to bring out generic possibilities and impossibilities of application.

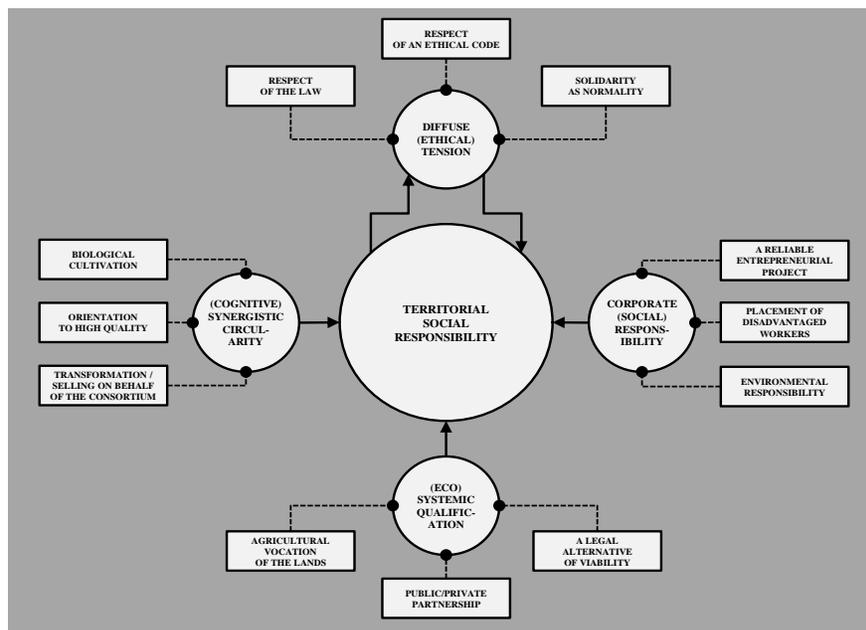

FIG. 2 – THE APPLICATION OF THE THEORETICAL MODEL OF TERRITORIAL SOCIAL RESPONSIBILITY TO “LIBERA TERRA”.

In terms of scientific implications, the current exploratory study, of course, is open to further investigations, requesting to try to determine the evaluation parameters of the single drivers of each dimension, up to a kind of synthetic index for the evaluation of the territorial social responsibility. Furthermore, surveys with quantitative methods will be necessary to verify the possible generalizations of the model.

In terms of managerial implications, the conviction of the ethical purpose (and not only economic and social) of the entrepreneurial activity is strengthened, being paradoxically more evident precisely when the economic responsibility, specifically for disadvantaged areas and, more generally, in times of crisis, seems to waver. Besides, business ethics acquires a collective value (because it flows into the territorial social responsibility), but also individual (because it is embodied in a real “ethical capital”), generating a virtuous circle even at an economic level (we may think of the demonstration, offered by “Libera Terra”, that legality is also convenient).

Other possible implications, of course, affect the decisions of territory governance that have to be developed by the public actors involved as policy makers, hopefully also in cooperation with private actors. The ethics of the actors generally operating in the territory, especially when entrepreneurial actors, that (as it has been verified) can transfer ethical capital to the territory, should in fact be an indispensable factor for the planning and development of the territory, up to becoming a real “collective consciousness” (Schillaci, Gatti, 2011), most of all for those areas hampered by specific handicaps, as is certainly the case, for example, of the areas with a considerable criminal presence.

7. Conclusions

It is now accepted, for business studies, that the territory is a very important variable, although not decisive, for the economic development of organizations, and consequently of individuals and societies, almost taking for granted that a particularly strong territorial capital constitutes at least a starting advantage for the enterprise (we may think, furthermore, to the *Inquiry into the Nature and Causes of the Wealth of Nations* by Adam Smith or the much more recent *Competitive Advantage of Nations* by Michael Porter). It seems less obvious, however, the role that economic organizations and enterprises in particular can play in helping the possible recovery/revitalization of disadvantaged areas, in an relationship characterized by interactive and fruitful exchanges not only in purely economic terms, but also social and cultural.

In this paper we have investigated some dynamics of the behavior that virtuous businesses may have towards the territory, transferring to the surrounding entrepreneurial and social fabric some benefits of exemplarity or at least solidarity. In this sense, specific object of investigation has been “Libera Terra”, intended as a subject that is coordinator (in a certain sense even meta-organizer) of different realities, even entrepreneurial, that are dynamic in promoting on the territory, with commitment and success, activities with a relevant ethical interest, as well as first of all economic.

In the study, moreover, also by analyzing the case study “Libera Terra”, it has been possible to propose a theoretical model for the creation and dissemination of “territorial social responsibility” (especially thanks to the “ethical capital”), of which we have presented a theoretical analysis and proposed an articulation in drivers. In this way, in fact, it is possible to consider the ethical capital (linearly) as a “cause” of the territorial social responsibility (benefiting the territory also thanks to the commitment of virtuous businesses) and (synergistically) as an “effect” of the territorial social responsibility (benefiting the enterprises operating in the territory).

Linking CRM and competitiveness in the hotel industry

Abstract

In the hotel industry, customer relationship management (CRM) is a strategic factor to attract and increase the number and customer loyalty. (Sigala, 2005). This paper analyzes the relationship between CRM and competitiveness in 4 and 5 star and luxury class hotels in Guadalajara, Mexico. Theoretical concepts relating to the subject of the study were reviewed considering the relationship of management capability and innovation in marketing with CRM (independent variable), and with Competitiveness (dependent variable) financial performance, technology and costs.

Introduction

Hotel industry in Guadalajara, the second city in economic importance in Mexico, has a hotel capacity of over 16,000 rooms ranging from economy class to five-star and luxury class. The city is the most visited of Jalisco with an economic impact of \$ usd 25 millions, (SETUJAL, 2013). With regard to the offer of rooms available, nationwide Guadalajara Metropolitan Area (GMA) is located at No. 5, and is the most visited state, receiving 45.81% of the total tourists.

There are several studies on the importance of studying the dimensions of CRM in the hotel sector (Akroush et al, 2011, Sadek et al, 2011, Sin et al, 2005), that although the CRM can enable effective differentiation and improve customer loyalty and therefore the profitability of the company. As a hotel company is an economic agent aims to maximize its benefits from the management and exploitation of the resources are there to serve the needs and demands of the guests (Sigala, 2005).

With the implementation of CRM organizations can gain a great benefit, because they can get increase in their sales through better market segmentation, customization of products and services, obtaining higher quality products, access information and employee satisfaction, and above all ensure a long lasting customer retention and loyalty. (Alomtairi, 2009; Ozgener and Iraz, 2006, Stockdale, 2007, Verma and Chandhuri, 2009).

Theoretical framework

Using the CRM can be shown in the hospitality industry; through the collection of data on its guests a profile of each of them is created. Based on the profiles created, it is possible to know each every guest a special and personalized as the management and staff of the hotel will be familiar with the wants and needs of guests. When the hotel has enough information about your guests, you should classify and segment it to personalize the needs of each individual client or group of clients. (Ivanovic et al, 2011).

Implementation of CRM has been widely studied, from the financial sector (Akroush et al, 2011, Hussain et al, 2009, Sin, Tse and Yim 2005), even in health services (Bunthuwun et al, 2011; Hung et al, 2010), but has not done extensive research on CRM in the hospitality sector (Luck and Stephenson, 2009, Wu and Lu, 2012). Vogt (2011) mentions that although there is an increasing use of CRM in tourism is still limited number of studies of various industrial applications.

The hotel industry capture large amounts of data about customers, which can be transformed into better knowledge about them, which can be useful for the implementation of CRM, obtaining and improving efficiency, (Mguyen et al, 2007; Nasution y Mavondo, 2008; Dev y Olsen, 2000).

Although the hotel chains seek new ways to build relationships with your customers, (Hu et al., 2010), Zineldin (2000a, 2000b) mentions the importance of CRM in the hospitality industry, and argues that most of these organizations offer, even differentiated by number of stars, is very similar to their products and services, so make it different is a challenge for companies with more resources.

CRM in the tourism sector is at an early stage of development and needs time for companies to recognize the power and importance of its application in tourism. One of the limiting factors are the financial resources necessary for the implementation and use of these technologies, as we know that a large number of companies operating in this

sector breakeven or below breakeven. (Ivanovic et al, 2011).

The CRM according to Laudon & Laudon (2004) is a business and technology discipline for managing customer relationships in order to increase revenues, profitability, satisfaction and retention thereof.

CRM involves identifying and rethinking all strategic processes that take place between an enterprise and its customers (Payne & Frow, 2005). Being an outgrowth of sales force automation and with a focus on data-mining (Chen & Popvich, 2003) CRM finds a continuous challenge in making CRM relevant to service and to non-marketing employees.

Kotorov (2003) believes that for CRM to be successful, the most important is the understanding and the approach to it, and also considers a strategy and not a software solution or a software package.

CRM and Management capability

According to Blesa (2005), part of management capability are coordinated behavior of the various functions in the organization, which must be directed to seek and gather information from consumers, competition and environment for dissemination in the organization and design and implement a response with the aim of satisfying customers by providing superior value.

The implementation of a CRM strategy involves changes both in the way a company is organized, as in their business processes (Sin, Tse and Yim, 2005), therefore it is necessary to include a variable that projects the importance and impact of administrative factors in the success of CRM. It is also essential to analyze the business objectives and organizational culture (Chalmeta, 2006). An important factor of management capability is the leadership provided by the administration and its support will be a key requirement to establish the philosophy of customer orientation at the corporate level and to support the adoption of a CRM system throughout the organization (Alt and Puschnam, 2004).

For the success of a CRM project is necessary internal and marketing support, and that the initial strategy with the client should be supported with adequate internal corporate culture that reflects the philosophy of customer relationships, from the level of top management to front-of-house staff. (Haley and Watson, 2002).

CRM and Marketing Innovation

The effectiveness and efficiency of CRM are increasingly recognized as means for developing innovation capability and providing a lasting competitive advantage, also (CRM) implemented in manufacturing and industrial clients not only retains customers but also encourages them to offer important suggestions for improving products and services (Ramani and Kumar, 2008).

CRM helps firms refine their knowledge about customers' tastes and preferences. The effectiveness and efficiency of CRM are increasingly recognized as means for developing innovation capability and providing a lasting competitive advantage (Ramani and Kumar, 2008; Sahay and Ranjan, 2008).

Marketing innovation, it refers to market research, price-setting strategy, market segmentation, advertising promotions, retailing channels, and marketing information systems (Vorhies and Harker, 2000; Weerawardena, 2003).

Innovation is a key factor to improve competitiveness of enterprises; Swiss research on small tourism enterprises, shows that one of the main reasons for success in these hotels is the high level of innovation in the sector, coupled with a high level of research. (Blanke and Chiesa 2009; Chib and Cheong 2009).

Due to the importance of this factor, several studies have analyzed the impact of innovation on competitiveness of the company and have come to the conclusion that companies that invest in research and development and conduct innovative practices are more likely to remain market and increase their performance (Ahuja and Katila, 2004).

Competitiveness

The concept of competitiveness has been defined in various dimensions and time with inaccuracies (Budd and Hirmis 2004, Porter and Ketels 2003). It has also been determined by the level of research: approaches macro, meso and micro levels, which define it differently, and from the point of view of competitiveness in companies, which are mainly based on the low cost of production. (Buzzigoli and Viviani, 2009).

Gelei (2003) has used the definition of business competitiveness as "the ability to perceive basic changes in both the external and internal environment and the ability to adapt to these changes in a way that the flow of profit

generated to guarantee operation long-term business”, also competitiveness comprises a function of two factors first, is determined by the extent to which a company can identify the value dimensions that are important to your customers the second factor is the sum of the resources and capabilities that make a company is able to create and deliver value dimensions identified important customer.

Competitiveness and Financial Performance

Boulding et al (2005) mentions that competitive performance of CRM refers to managerial perceptions about competitive performance achieved through the process of CRM, it also through continuous "dual creation of value" for the customer is obtained and company. Therefore it is important to measure the performance of CRM from both perspectives.

The competitive advantage is directly reflected in the company’s capabilities to obtain a financial result than its competitors (Arend, 2003). Currently, there is a general indicator used to measure competitiveness, however, the trend is to use financial indicators such as profitability (Kim, et al., 2008).

Competitiveness and Costs

To gain a competitive edge in the business model, the combination of low cost, high frequency, "lower cost" becomes the key strategy presentation focused on customer value, as well as benefits (Williams, 2004).

Likewise Buzzigoli and Viviani (2009) mention that competitiveness is based on the principle of least-cost production.

Competitiveness and Technology

Competitiveness in markets makes the adoption of technology has become a need for businesses. Taking it to respond to the same concepts themselves, generating competitive advantages that improve the performance of their processes. (Daft, 2008)

Several studies have both highlighted a positive relationship between the company technological level and competitiveness, in addition found that firms with higher technological levels, increase productivity and are more likely to compete in more advanced environments (Koc and Bozdag, 2007, Baldwin and Sabourin, 2002).

Based on the literature review, the first objective of this study is to expand the conceptualization of CRM and determine their relationship to competitiveness, particularly looking at the role of each of the factors involved in the hotel industry, which is presents the theoretical construct. See figure 1.

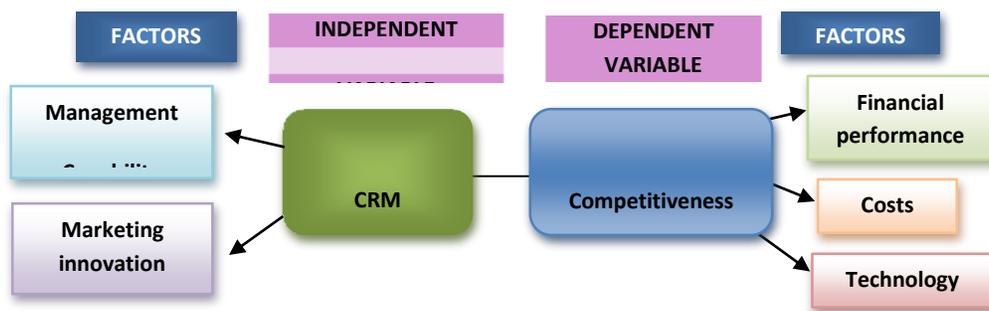

FIG. 1: THEORETICAL MODEL OF THE RELATION BETWEEN CRM AND COMPETITIVENESS
Source: Own elaboration

Methodology

The survey was applied to 418 middle and senior managers in the hotels of four and five stars in Guadalajara, used for processing information from the multivariate analysis and structural equation modeling, implemented via software (SPSS) Statistical Package for the Social Sciences, and (EQS 6.1) Structural Equation Modeling Software.

The questionnaire was designed based on the literature review, comprising a first block on CRM variable, consisting of 9 questions for the application of management capability factors and marketing innovation, and a second

block consisting of 18 questions which are based on the dependent variable competitiveness, and includes financial performance factors, technology and costs, all evaluated using a scale from 1 to 5 indicating strongly disagree or totally agree.

Based on the above theoretical model, we propose the following hypothesis:

Hypothesis:

- H1: A greater management capability, most CRM.
- H2: A greater marketing innovation, most CRM.
- H3: The greater the CRM, higher level of competitiveness.

Analysis and Discussion

The results of reliability analysis of five factors: management capability, marketing innovation, financial performance, technology and costs, using the Cronbach's alpha was satisfactory, because the five factors meet the minimum acceptance value of 0.70. The highest alpha value factors found was that of the variable costs, with 0.935, while the lowest value of the five factors found was the variable marketing innovation with alpha value of 0.775.

With Confirmatory Factor Analysis (CFA), was valued reliability and validity using the method of maximum likelihood. The results of applying Confirmatory Factor Analysis (CFA) are shown below in Tables 1 and 2.

Table 1 shows that the model provides a good fit of the data ($S-BX^2 = 303.1404$, $df = 109$, $p = 0.000$; $NFI = 0.925$; $NNFI = 0.938$; $CFI = 0.950$, and $RMSEA = 0.065$) all data are satisfactory and acceptable.

TABLE 1: INTERNAL CONSISTENCY AND CONVERGENT VALIDITY OF THE THEORETICAL MODEL

Variable	Indicator	Factorial Loading	Robust Valor-t	Cronbach's Alpha	CRI	VEI
Management capability	CRM1	0.600***	1.000*	0.820	0.838	0.569
	CRM3	0.855***	11.683			
	CRM4	0.848***	11.897			
	CRM5	0.685***	10.391			
Marketing innovation	CRI1	0.688***	1.000*	0.775	0.786	0.551
	CRI3	0.783***	15.283			
	CRI4	0.754***	13.219			
Financial performance	FP3	0.762***	1.000*	0.884	0.886	0.661
	FP4	0.861***	16.938			
	FP5	0.883***	16.472			
	FP6	0.740***	13.929			
Costs	PC3	0.922***	1.000*	0.935	0.933	0.784
	PC4	0.964***	42.198			
	PC5	0.871***	27.602			
	PC6	0.774***	19.713			
Technology	TE3	0.919***	1.000*	0.817	0.825	0.704
	TE4	0.752***	9.636			
S-BX ² (df = 109) = 303.1404 (p < 0.0000); NFI = 0.925; NNFI = 0.938; CFI = 0.950; RMSEA = 0.065						

* = Parameters in the identification process

*** = p < 0.001

Table 1 shows the values of Cronbach's alpha, the composite reliability index (CRI) and the variance extracted index (VEI). Alpha values are above 0.70, while the CRI and VEI values are superior to 0.7 and 0.5 respectively, which is satisfactory. As evidence of convergent validity, Cronbach's alpha results indicate that all items related factors are significant (p < 0.001) and size of all standardized factor loadings are greater than 0.60 (Bagozzi & Yi, 1988).

TABLE 2: DISCRIMINATING VALIDITY OF THE THEORETICAL MODEL MEASUREMENT

Variables	Management capability	Marketing Innovation	Financial performance	Costs	Technology
Management capability	0.569	0.554	0.244	0.277	0.405
Marketing Innovation	0.418 , 0.690	0.551	0.275	0.310	0.397
Financial performance	0.160 , 0.328	0.177 , 0.373	0.661	0.040	0.103
Costs	0.165 , 0.389	0.180 , 0.440	0.066 , 0.146	0.784	0.132
Technology	0.277 , 0.533	0.255 , 0.539	0.009 , 0.215	0.026 , 0.290	0.704

The diagonal represents the variance extracted index (VEI), while above the diagonal shows the variance (the correlation squared). Below the diagonal, is presented to estimate of the correlation factors with a confidence interval of 90%.

Table 2 shows the measurement provided in two ways. First presents the estimate of the correlation factors with a confidence interval of 90%. Secondly extracted variance between the pair of constructs must be greater than the variance extracted index (VEI).

Based on the above two criteria, there is sufficient evidence of reliability and convergent and discriminant validity of the model.

Table 3 shows the results of the hypothesis test of the theoretical model is obtained by performing a structural equation model (SEM)

- H1: A greater management capability, most CRM.
- H2: A greater marketing innovation, most CRM.
- H3: The greater the CRM, higher level of competitiveness.

TABLE 3: SEM RESULTS OF THE THEORETICAL MODEL

Hypothesis	Structural Relationship	Standardized Coefficient (β)	Robust t-value	Fit Indices Measure
H1: A greater management capability, most CRM	Management capability → CRM	0.415***	11.323	$S-BX^2_{(101)} = 280.8916$ p = 0.000
H2: A greater marketing innovation, most CRM.	Marketing innovation → CRM	0.479***	14.151	NFI = 0.930 NNFI = 0.938
H3: The greater the CRM, higher level of competitiveness.	CRM → Competitiveness	0.531***	22.355	CFI = 0.954 RMSEA = 0.065

*** = p < 0.001

Table 3 shows the standardized coefficients, the t-robust and fit indices. According to Romero & Zunica (2005), the beta coefficients (β) or allow standardized coefficients determine the explanatory variable is strongest for the explanation, that is, allow us to evaluate the relative importance of each independent variable in the equation. Moreover, Wooldridge (2009) explains that robust statistics is an alternative approach to classical statistical methods. The object is to produce estimates that are not affected by small variations from the assumptions of the models. A robust t-statistic must be greater than 10.

Also, regarding the hypothesis **H1** the results were ($\beta = 0.415$, $p < 0.001$) which indicate that explains management capability y 41% the CRM. For hypothesis **H2** the results were ($\beta = 0.479$, $p < 0.001$) and indicate that marketing innovation has greater weight and importance as it explains 47% CRM independent variable. Finally for **H3** results obtained were ($\beta = 0.531$, $p < 0.001$) indicate that the CRM has significant positive effects on competitiveness. As far as management capability increased marketing and innovation together, there is higher level of competitiveness.

Limitations

Although the universe selected for this study were the hotel category 4 and 5 stars and luxury class, is intended to include for future research known as boutique hotels, as this kind of establishment is showing strong growth in the Guadalajara metropolitan area for a market segment with very distinctive features including personalized service stands out.

Conclusions

Note that the five factors that emerged from the study variables meet the minimum acceptance value, however for the hotel sector, competitiveness depends mainly on cost management and a lower proportion of customer relationships depend on the marketing innovation.

It is noteworthy that this research, the most important element in the CRM is the management capability, which in the hotel sector is essential, as there must be a culture of customer-oriented company, where all departments should have as priority to meeting the needs of those to create loyalty.

The costs and competitiveness keep a close relationship, with costs greater weight element in competitiveness. Hotel companies must therefore deliver services in time, place and manner preferred by customers at better prices than those offered by competitors, covering at least the opportunity cost of the resources used.

The purpose of business is to earn profit hotel, offering high quality and are competitive, in order to participate in a dynamic market. Hotels must consider the global implications to be prepared to address the issues that arise in a world and changing environment.

For all of the above, it is considered to analyze and measure the initiative and implementation of CRM in hotel enterprises of Guadalajara is helpful because by building lasting relationships by understanding the wants and needs of each client in particular, adds value to the company and the customer and therefore competitiveness levels rise.

Intangibles as feedstocks to capability differentials: a DMO perspective

Abstract

From the perspective of destination management policy and strategy, the present research aims to: 1) identify the role of intangibles – in the perception of destination management – in supporting the achievement of a DMO’s institutional goals; 2) verify the adoption of programs that effectively recognize intangibles as a source of equitable development; 3) identify the main elements that may positively affect network development in terms of collaborative project management, strategic planning, organizational focus and fostering cooperation among destination actors.

After identifying and categorizing the intangibles that differentiate a tourism destination and make it more competitive, the paper presents a quali-quantitative analysis based on in-depth interviews with DMO managers and stakeholders, and an examination of projects that DMOs have developed, financed or participated in over the past five years.

1. Introduction

In recent years, the strategic management of territories in a regional marketing perspective has been the subject of growing interest on the part of both the scientific community, in Italy and elsewhere (Pechlaner and Weiermar, 2000; Ejarque, 2003; D’Elia, 2007; Pencarelli and Splendiani, 2008), and the institutional figures responsible for local development policies.

Indeed, the theme of destination management, understood as “the sum of the strategic, organisational and operational decisions by which the process of specifying, promoting and marketing a region’s tourism goods and services is managed, in order to generate incoming tourism flows” (Martini, 2005), is held to be crucial in terms of guaranteeing a tourism destination’s growing levels of competitiveness.

In this conceptual framework, the central hypothesis of this paper is that the complex system of tourism destinations’ material attractors is necessary but not in itself sufficient to guarantee competitiveness. The latter may be seen as a broader concept, closely linked to the activation of a combination of abilities and skills of an organisational and managerial character. By their very nature intangible, such skills enable first the conceptualisation and then the provision of an integrated range of goods and services, able to meet the real needs of their potential market of reference (Cantone, Risitano and Testa, 2007). This is shown by the presence of destinations which, despite having attractors of particular renown, are characterised by unsatisfactory levels of competitiveness.

For these reasons, the objectives of this study are: 1) to identify the role played – in the perception of destination managers – by intangible assets in supporting a DMO in reaching its institutional objectives; 2) to verify the adoption of planning measures that recognise intangible assets as a source of both competitive advantage and sustainable development; 3) to assess the role and involvement of the actors, and thus the activation of the network, in the development of planning strategies focused on intangibles.

2. Attractiveness and competitiveness of tourism destinations

A “tourism destination” may be considered as a group of products, services and attractions variously arranged in a geographically defined space that is recognised as a unified system via the tourist’s experience of it (Franch, 2010). Seen in this way, it is clearly the fruit of a continuous and dynamic process of a shared construction characterised by the involvement, in a network of mutual interdependence, of institutions, the destination’s economic actors and the individual consumer (with his/her baggage of expectations and experiences), whose judgements and memories are influenced by the other consumers with whom he/she comes into contact.

The competitive success of a tourism destination thus depends on its ability to bring to market a package of functional, psycho-social, experiential and value-based benefits (Busacca and Bertoli, 2009). It must guarantee the potential user a level of satisfaction at least equal to what other rival destinations are able to provide (Murphy, Pritchard

and Smith, 2000; Enright and Newton, 2004) and it needs to be sustainable over time, taking account of economic, social and cultural aspects (Ritchie and Crouch, 2000; Caroli, 2006).

This perspective redefines the terms of the relationship between the attractiveness and competitiveness of a tourism destination. Sometimes used inappropriately as synonyms, in fact the two terms express quite distinct concepts. Attractiveness refers to the aptitude of the destination – primarily based on its own resources, both specific and generic – in generating incoming flows of tourists who are potentially interested in the specific destination (Hu and Ritchie, 1993; Kim, 1998; Gallarza, Saura and Garcia, 2002; Van der Arka and Richards, 2006). Competitiveness (Crouch and Ritchie, 1999; Buhalis, 2000; Kozak, 2002; Dwyer and Kim, 2003; Ruhanen, 2007; Sainaghi, 2008) lies in the ability to guarantee, in a long-term perspective and on the basis of the incoming flows it generates, economic and social returns that are sustainable and in line with the expectations of both the regional system of which the destination is a part (internal stakeholders such as companies, institutions, citizens, etc.), and specific segments of the potential market (external stakeholders).

Attractiveness thus represents a fundamental precondition on which to build a destination's competitiveness, which however is a broader concept, closely connected to the socio-economic development of the area in which it is situated. In this sense, it can be argued that in order for a destination to be competitive, it has to activate a specific system of resources (mainly of a tangible nature) that is able to make it attractive, as well as a combination of abilities and skills (by their very nature intangible) of an organisational and managerial character (Aaker, 1987; Brondoni, Gatti and Corniani, 2002). Such skills must enable first the conceptualisation and then the provision of an integrated range of goods and services, able to meet the real needs of their potential market of reference. Competitiveness is therefore the result of the interaction of a number of different factors that need to be recognised, interpreted and managed.

The international managerial literature has proposed various models for identifying and analysing the determinants of a destination's competitiveness (Newall, 1992; Pearce, 1997; Kozak and Rimmington, 1999; Ritchie and Crouch, 2000; Dwyer, Mellor, Livaic, Edwards and Kim, 2004; Enright and Newton, 2004; Ruhanen, 2007). Schematically these determinants – on whose constant interaction a destination's degree of competitiveness depends – can be divided into three macro-categories:

- the variety of the specific and generic tourism resources that make up the destination and the combination of tourist facilities that serve to construct the range of goods and services it has to offer; these two factors represent the elements on which the destination's attractiveness to tourists is founded;
- the destination's management processes and activities; these reflect the organisational and governance models and the development strategies of the destination, devised on the basis of the resources it can draw from and external factors (the behaviour of current demand and the main trends of potential demand);
- the perception of the DMO in terms of awareness, image and reputation.

This approach to the theme of a tourism destination's competitiveness highlights the need to create a framework of reference in which to identify the determinants in accordance with a systemic logic that gives due consideration to the interdependences. In this regard, it is worth pointing out that if the above-described macro-categories are viewed in terms of the tangible/intangible distinction, a large and particularly significant proportion of the determinants of a destination's competitiveness fall on the side of intangible assets. This appears to be the appropriate key in which to provide management with useful support for decision-making with a view to enhancing the competitiveness of their destination.

3. The intangible assets of tourism destinations: a proposed schematic theoretical representation

Now that we have set out the features of the constructs of "attractiveness" and "competitiveness", the objective of this paper is to study in greater detail the concept of intangible assets with reference to tourism destinations, in order to observe their contribution to competitiveness. Indeed, intangibles have long been a key topic in the managerial literature, which has highlighted their significant contribution to the competitiveness of companies (Vicari, 1992; Buttignon, 1993). It is important to understand that this refers not to individual firms but to a particular type of

aggregation, i.e. tourism destinations, composed of a combination of products, services and attractors that are variously distributed in a specific regional space. The range of resources linked to a *tourist destination product (tdp)* thus require detailed study in order to identify the features of each of them and provide information to management that will be useful in planning strategic choices.

The tangible resources of a *tdp* can be classified as follows: a) general resources, such as economic and social infrastructure and financial resources; b) specific resources, distinctive and otherwise, such as cultural and archaeological items, as well as landscape and natural heritage; c) tourist services, in various forms and at various levels, which physically enable the tourist to visit and stay in the area.

The identification of intangible resources with reference to a *tdp* requires: a) a review of the literature on intangibles, in order to grasp their features and specific properties; b) a fresh reading of the literature on tourism destinations and strategic area management.

The first resource referred to here, adapting the concept of enterprise culture, is a “culture of the territory”, understood as the combination of values and experiences that guide the behaviours of the actors who are involved in a destination and determine their ability to take strategic decisions. This construct is particularly relevant for complex organisations, such as aggregations of companies on a regional basis, for which the centrality of enterprise culture in the management of its internal and external relations is clear. Indeed, it should be remembered that aggregations of this kind are characterised by two levels of competitiveness: one concerns the competitive comparison between the destinations present on a global scale, while the other develops within the specific destination and concerns the companies that operate in it (Buhalis and Cooper, 1998; Franch, 2002; Keller, 2006).

The presence of this “culture of the territory” in the context of tourism destinations can be verified by observing: i) the sensitivity of local government to the theme of tourism (measurable with reference to its readiness to intervene); ii) the entrepreneurial dynamism of the tourism sector (assessed with reference to indicators of the survival/vitality of companies or their activities); iii) the attitude towards internal integration, understood as the willingness to undertake joint initiatives together with other actors who may be one’s co-opetitors; iv) the diffusion of a culture of hospitality, an indicator of particular significance in an area with high tourism flows (the presence of info points, tourist guides, the favourable attitude of the local population); v) the presence of initiatives to promote and at the same time to safeguard the region, with a view to sustainability in both a social sense (protecting the area’s traditional forms of production) and an environmental sense (in terms of safeguarding the territory itself), not forgetting sustainability in economic terms.

Another intangible asset is “human resources”, which include the managerial skills and abilities of local actors and stakeholders (thereby counting together all the human resources of an area) and their knowledge, understood in all the senses cited in the literature including the range of expectations that orient their actions (Castaldi, 2007).

This intangible asset entails: i) the ability of the public administration to guide the growth of tourism in the area (measurable by verifying the presence of local government bodies in the local tourism systems and tourism districts, their role in the mechanisms of governance and the amount of resources allocated to the smooth running of the destinations themselves); ii) the readiness of entrepreneurs in the tourism sector and the associated production chains (food-processing, services, etc.) to supply a range of goods and services that are able to satisfy the expectations of consumers (the quality and differentiation of the accommodation structures present and the level of user satisfaction); iii) existing knowledge, together with the exploration, identification and integration of new knowledge; iv) organisational routines, i.e. consolidated approaches followed by companies that allow them to adapt to changes in the socio-economic context and their own internal configurations; v) scientific expertise, understood as the presence of universities and research centres that contribute to the genesis and spread of the abilities and skills that the region needs.

A resource of particular importance is the DMO’s “*reputation*” among stakeholders (Deephous, 2000). This arises from the ability of the destination’s management to promote the region’s identity, thereby generating an image that acquires renown and is sought after by the final user. Put briefly, this entails developing a “brand heritage” that will lead in turn to a brand loyalty that confers a long-term competitive advantage (Roberts and Dowling, 2002). The process that enables the management to increase the area’s positive reputation among potential visitors can be summarised as follows: a) identification and promotion of the destination’s tangible assets (the starting point for tourism in the area); b) development of a distinct regional identity, which results from (among other things) the

formation of a cognitive consonance between the specific features of this identity and the expectations of the potential user; c) promotion of the range of goods and services on offer and the creation of an image that is consistent with the specific features of the area and is able to enhance its renown. It is clear that the value of this asset is partly determined by the characteristics of all the resources, both tangible and intangible, representing the entire heritage that the context of the destination is able to provide.

Worthy of specific mention is the information system, the support architecture for managerial choices, considered in the literature to be an intangible asset (Brondoni, Gatti and Corniani, 2001) due to the contribution it makes to competitiveness via the management of information flows (Brondoni, 2004). While information as a resource has a natural tendency to circulate, an efficient information system can boost the potential of the intangible assets by ensuring the sharing of information on the entire range of resources. By way of example, consider the following types of information (Hitami, 1988): information on the context and the specific sector of reference; information from the social interlocutors (customers and others) which serves to raise the area's credibility and image and thus its reputation among the stakeholders; internal information, which serves to improve and develop company organisation and thus organisational routines (Fig. 1).

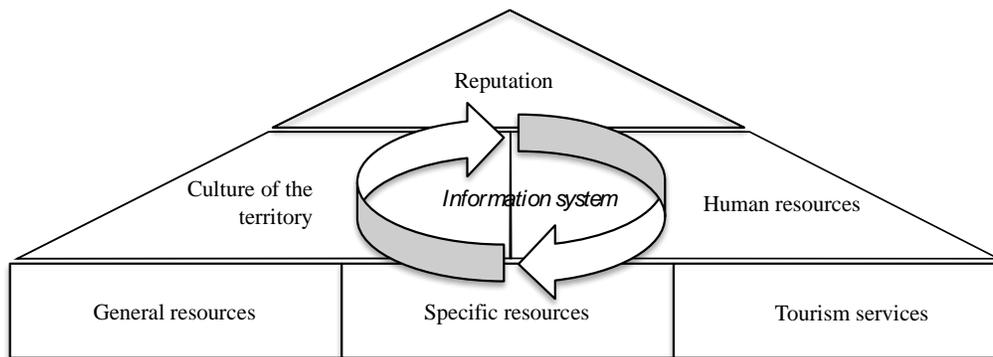

FIG. 1: RESOURCES IN A TOURISM DESTINATION

From the considerations set out thus far, it follows that as a resource, “Reputation” represents the end result of the management of the other resources, tangible and otherwise, as it is strongly influenced by their characteristics and the ways in which they are used. The ability to construct an area's reputation and promote it by means of suitable branding policies represents a strategic necessity for destinations in order for them to be able to effectively compete in the current context. It is in this way that the visibility necessary to be noticed is developed, thereby fuelling the processes that bring visitors to the area. This requires the ability to coordinate and monitor the various actors and stakeholders present, i.e. a strong and unified governance of all the resources, designed to ensure a differentiation that is useful for the destination's competitiveness.

4. The methodology of the research

The objectives set out in the premise required a study organised into the following steps:

- a) analysis of the managerial literature on the competitiveness of tourism destinations and their intangible assets;
- b) formulation of a hypothetical representation of the system of the resources that make up the heritage of tourism destinations;
- c) in-depth interviews with semi-structured questions, designed to measure the degree to which the various types of tangible and intangible assets identified in the proposed theoretical model contribute to the competitiveness of a tourism destination, and the role played in this sense by the local network.

On-field investigations were conducted in 15 Italian and international DMOs¹, all under public administration, 11 of which are governed by a board of directors. Common features of these DMOs include a historic and cultural component and the widespread presence of food-and-wine, rural and MICE tourism. They are also contexts which, with only one exception, have seen the presence of tourists grow in the last few years, particularly from abroad.

The DMOs forming the object of this study were selected by considering regional contexts with an organisation dedicated to the promotion of tourism that were characterised by strategic attitudes oriented to the pursuance of the four objectives identified by Pike (2004): improving the destination’s image, increasing the wealth produced by companies, reducing seasonality, ensuring long-term financial growth.

5. Main results

As previously stated, the objective of the research is to provide a representation of the contribution – in the perception of the DMOs – of tangible and intangible resources to the competitiveness of a tourism destination.

The opinion of the interviewees is that intangible resources generally have greater weight in the competitiveness of destinations. The differing emphasis on the two macro-categories of resources is confirmed by the planning practices enacted by the DMOs over the last 5 years, which are characterised by greater investment (in budgetary terms) in the enhancement and promotion of intangible resources (Fig. 2).

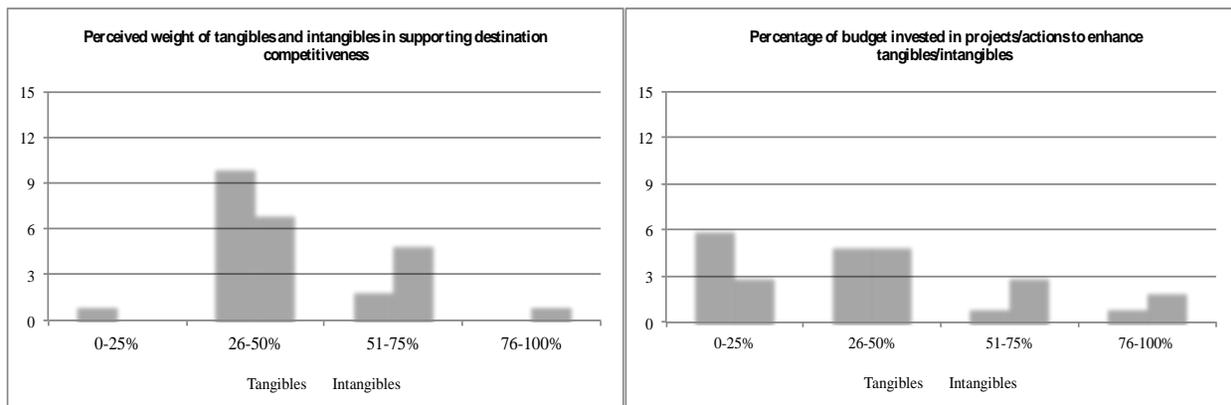

FIG. 2: TANGIBLES AND INTAGIBLES IN DESTINATION COMPETITIVENESS: PERCEIVED WEIGHT AND BUDGET INVESTED

It should be pointed out that half of the DMOs have implemented up to 5 projects, while 4 have implemented more than 20 projects focused on intangible resources. This shows that the projects implemented have placed greater emphasis on the development of intangibles in order to support the competitiveness of the destinations. The priority areas of intervention in previous projects are shown in the following graph (Fig. 3).

¹ The DMOs referred to in the text are: Valle D’Aosta, Trentino Alto Adige, Puglia, Piemonte, Molise, Friuli Venezia Giulia, Basilicata, Zaragoza Turismo, Vaduz, Stockholm, Propriano, Norfolk, Leicester, Lancaster City Council, Austria.

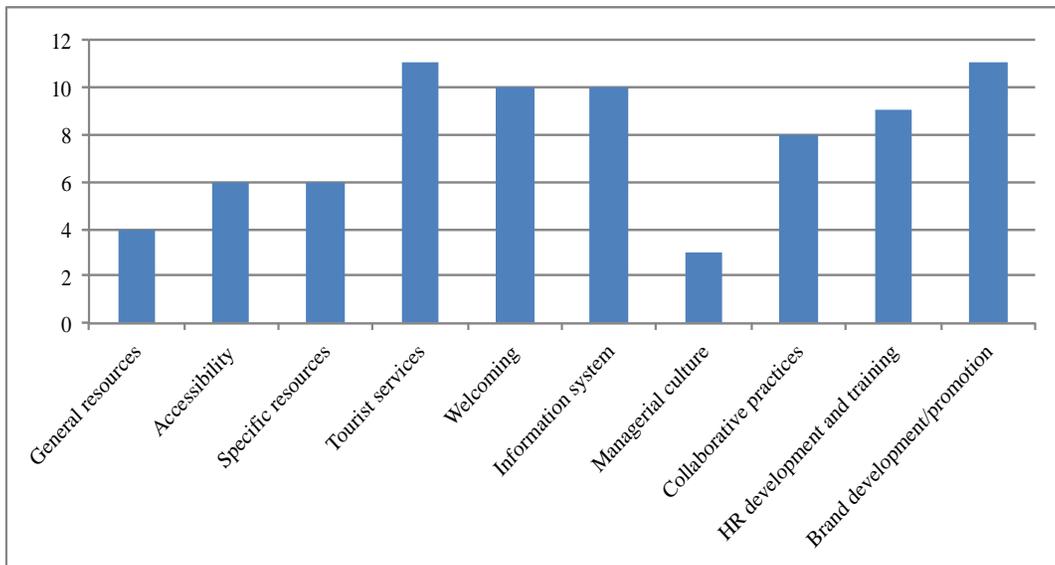

FIG. 3: AREAS OF INTERVENTION IN DMO PROJECTS

This orientation has not entailed modifications to the planning and management of the projects. What emerges in the management of the destinations observed in the present study is a certain attention to the construction of networks, regardless of the object of investment. The main interlocutors are: entrepreneurs, business federations and institutions. Of lesser importance in terms of the frequency of recourse are sector intermediaries and the management bodies of the destination's main resources (museums, parks, etc.) (Fig. 4).

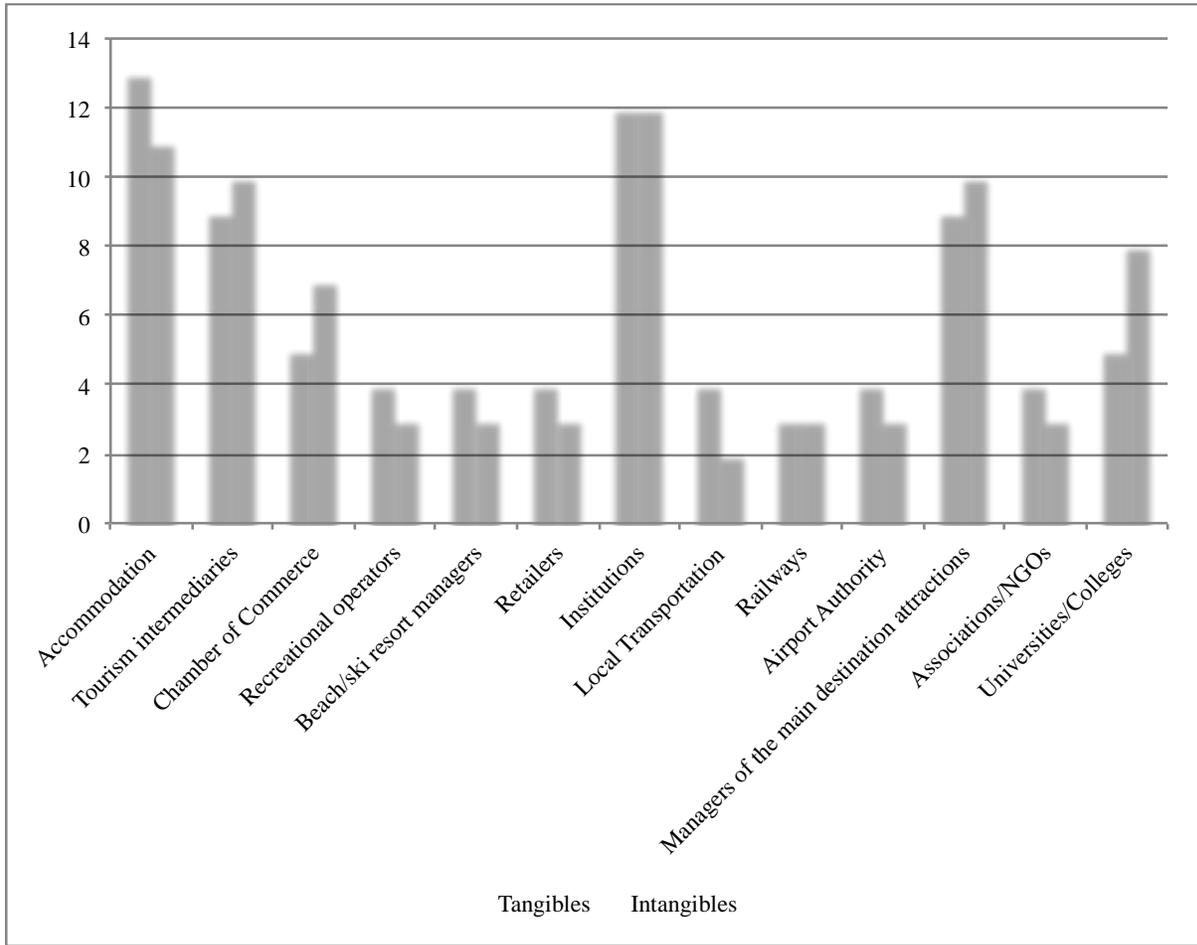

FIG. 4: PARTNERS INVOLVED IN DMO PROJECTS

To complete the study the interviewees were asked to assign a score, on a scale of 1 to 5, to a series of items that identify the different types of resource. Note that the first 6 items by average score are intangibles: Web marketing activities, Development/strengthening of the destination brand and Reputation of the destination are the top three items for competitiveness, with values close to the maximum and a narrow standard deviation (Fig. 5).

FIG. 5: ITEMS DEFINING DMO RESOURCES: PERCEIVED IMPORTANCE ON COMPETITIVENESS

Thus “reputation”, broadly considered, is cited as the indispensable resource for the construction of a competitive DMO. High levels of importance, above 4, are also attributed to culture of the territory (among the associated items indicated as important are the hospitality of the residents and the ease of obtaining information) and to human resources (above all knowledge of foreign languages, the ability to use technology in the promotion and commercialisation of the product, the ability to develop and implement planning initiatives in terms of destination development).

6. Conclusions and managerial implications

The recognised importance of intangible resources from the perspective of destination management shows that the process of reading the context and strategic planning for tourism destinations requires further effort in terms of awareness-raising in order to be complete. Indeed, for too long the focus was on increasing attractiveness, leaving competitiveness in the shadows. As argued in the premise and confirmed in the literature, destination management processes must embrace all potential resources, neglecting no factor that may generate a competitive advantage.

The study highlights the special attention paid by the interviewees – who acknowledge the current importance of competitiveness among geographical areas and destinations – to the construction of reputation. In this sense, it appears that a special role can be played by technology, particularly applications linked to the Internet. The culture of the territory, as defined above, begins to take on importance in the course of promoting the specific features of a location, as a result of the increased value of the experience from the perspective of the visitor. In this sense it is a good idea to consolidate the culture of hospitality among both the operators and the local population in general, for example by developing a platform for cross-sectorial information-sharing or by launching a series of awareness-raising campaigns on the themes of tourism and its related sectors. Lastly, there is a clear awareness of the role played by human resources in a destination’s competitiveness.

A further interesting point to emerge is the steps taken by the DMOs analysed to ensure the involvement of a range of local stakeholders in the preparation and execution of planning projects, regardless of their focus. The activation of growth processes linked to reputation cannot exclude the involvement of a destination’s actors and stakeholders, especially given that reputation itself is necessarily determined by the resources that are present and activated in the area.

Something that has begun to take root and needs to be supported is the notion that a DMO must, like a *learning organization*, be able to activate the multiple skills present in the area in a systemic perspective of continuous learning. Indeed, the implementation of adequate knowledge management processes, designed to enhance a destination’s human resource skills, would improve the ability to proactively adapt to rapid shifts in the surrounding environment and to generate new knowledge. In this sense, the development of training programmes to improve the communicative, technological and relational skills of people working in DMOs and, more generally, to drive the growth of human capital, could have a positive impact in terms of increasing the culture of hospitality and providing a product that is more and more in line with the expectations of the tourist.

Seeking an adrenalin rush or the chance to relax? Analysis of motivation of adventure tourists. An Italian case study.

Abstract

Purpose of the study: This paper contributes to a theoretical understanding of adventure tourism in natural park of the Friuli Venezia Giulia Region (North Est of Italy) in two ways. Firstly it proposes to determine the key motivational factors that are important for adventure tourists' decision to visit the park and to analyse the relationship between these motivational factors and their behavioural intention. Secondly it aims to analyse risk perception of each one of the different adventure tourism's activities under investigation and specifically how this perception affect behavioural intention.

Design/methodology/approach: The Friuli Dolomiti Alps Natural Park was used as a case study. A visitor survey was conducted in a 317 adventure tourists at the end of their experience in the park. The sample was selected on the basis of visitors' participation in hard adventure activities that include risk and challenge intercepted. The survey included the individual's risk perceptions inherent in many hard activities. Specifically this study using stepwise regression analysis investigated the direct effect of motivations on visitors' behavioural intention. Then, using post hoc analysis (Scheffe's test) the differences that exist between different level of adventure tourists' risk perception and their response to the five behavioural variables behavioural intentions were analysed.

Findings: The analysis of motivation factors in relation to participation of hard tourism adventure activities indicates that "activity related motivations" is a multi-dimensional phenomenon comprising four distinct motivational factors (i.e. Nature; Risk Perception; Contemplation and Socialization). Second the step wise multiple linear regression results show that nature is the only motivational factor that and tourists' behavioural intention i.e. the nature motivational factor. Finally the study encompass the risk perception as a motivational factor of adventure tourism and tries to discuss how this concept can be operationalized in tourism marketing.

Originality/value: The paper summarizes motivational factors for adventure tourists decision to revisit a park especially "nature" and "risk" which are worthy of increased research attention.

Practical implications: The present analysis helps to understand the adventure tourists' behaviour. It provides a framework as to how organizations might usefully implement a marketing strategy.

Keywords: Adventure tourism, Risk Perception, Motivation, Behaviour models; Parks.

1. Introduction

Adventure tourism has recently grown in popularity as a niche form of tourism (Swarbrooke, Beard, Leckie, & Pomfret, 2003). It is "characterized by its ability to provide the tourist with relatively high levels of sensory stimulation, usually achieved by including physically challenging experiential components" (Muller & Cleaver, 2000, p. 156). This is a specific kind of tourism, that has often been vaguely associated with ecotourism (e.g. Kutay, 1989). It should, however, be noted that adventure tourism is differentiated on the basis of the importance assumed by the three elements given below which are (Weaver, 2001): 1) an element of risk in the tourism experience (Ewart, 1989; Hall, 1992; Fennell, 1999); 2) higher level of physical exertion by the participant (Ewart, 1989); and 3) the need for specialized skills to facilitate successful participation. This is a type of tourism that is usually linked to nature, even if it is not a necessary condition since it is possible to enjoy adventure tourism even in places far from natural landscapes but with a specific implication of risk (as in Fielding's the world most dangerous places guidebook – Pelton, 1997). Therefore adventure by definition involves elements of risk that are extremely attractive to adventure tourists. Inside the macro area of adventure tourism, it is possible to identify activities such as: white-water rafting, wildness hiking, sky-diving, sea-kayaking, caving, orienteering, mountain climbing, diving and hang-gliding, according to the famous classification in literature (Sung et al, 1996/97). Within this type of tourism, mountains, lakes, oceans and the most distant and wildest places represent "escape locations" giving the tourist a feeling of adventure and risk perception as per below mentioned activities in table 1 (Pomfret, 2006).

TABLE 1: CONVENTIONAL AND CONTEMPORARY ADVENTURE TOURISM ACTIVITIES

Land based	Water based	Air based	Mixed (land/water/air)
Abseiling	Body boarding	Balloonng	Adventure racing
Backpacking ^a	Canoeing	Bungee jumping	Charity challenges
Bicycling	Canyoning	Cliff jumping	Conservation expeditions
Caving	Cruise expeditions	Gliding	Cultural experiences
Climbing ^a	Kayaking	Hang-gliding	Gap year travel
Dog sledding	Sailing	Micro-lighting	Hedonistic experiences
Hiking ^a	Scuba diving	Paragliding	Spiritual enlightenment
Hunting	Snorkelling	Parachuting	Wildlife watching
Horseback riding	Surfing	Skydiving	
Jungle exploring	Water skiing		
Motorcycling	White water rafting		
Mountain biking	Windsurfing		
Mountaineering ^a			
Orienteering			
Quad biking			
Scrambling			
Skiing ^a			
Snowboarding			
Snow mobiling			
Snow shoeing			
Via Ferrata ^a			
Wilderness experiences			

^aBackpacking, climbing, hiking, mountaineering, skiing, via ferrata and wilderness experiences are all mountaineering-related activities.

Table 1 summarized a wide variety of adventure tourism activities either “hard” or “soft” (Sung, Morrison & O’Leary, 2000) that are able to maximize the adventure tourism’s appeal to a full range of paying clientele (Beedie & Hudson, 2003). Although highly subjective, hard adventure tourism activities differentiate from others activities because they allow practitioners to experience speed, height physical exertion or a combination of these factors, that result in a risk perception or in an adrenaline rush feeling for the tourist practicing them. The present paper in order to avoid overlapping with other tourism types (e.g. ecotourism) analyses a sample of adventure tourists selected on the basis of their participation to hard adventure activities such as trekking, wilderness hiking, mountain climbing, mountain biking, rafting, canyoning, hang gliding, down hill bike and orienteering. Nowadays empirical research on adventure tourists seems to be scarcely developed (Pomfret, 2006; Fluker & Turner, 2000) especially regarding motivational research (Bentley & Page, 2001; Williams & Soutar, 2005). In accordance with this purpose we focus on the impact of motivations in an adventure tourism setting analysing specifically risk perception and the relation with behavioural intention. Existing empirical research on motivations of adventure tourists seems to need more in-depth research in order to lack the identification of adventure tourists’ motivations (Schneider & Vogt, 2012). Motivation is “the process that accounts for an individual’s intensity, direction, and persistence of effort toward attaining a goal” (Robbins, 2003, p. 155) or “the need that drives an individual to act in a certain way to achieve the desired satisfaction” (Beerli and Martín, 2004, p. 626). Another definition is the one proposed by Pizam, Neumann, & Reichel, (1979) which refers travel motivation to a set of needs that cause a person to participate in a tourist activity. As motivation can be defined as the driving force behind all behaviour (Fodness 1994; Gnoth 1997, Prebensen et al., 2013) research on motivation can be fundamental for understanding the reasons for participating in adventure tourism (Ross & Iso-Ahola, 1991). In other words motivation is a critical variable for explaining tourist behaviour and motivation has been employed as a fruitful criteria for segmentation in a large number of studies (e.g. Kerstetter et al, 2004; Rid et al, 2014; Tangeland et al., 2013). Buckley presented a meta analysis of adventure tourists’ motivations for participating tourism activities (Buckley, 2012). Some of these are known

as to relax, to see different places, to discover new cultures, to swim etc. Nearby them, there are some other reasons like to feel rush, thrill or enjoyment of risk. These latter elements can also be accepted as core ingredients of tourism for participants' motivation. We argue for the thesis that risk perception (Beck, 1992) coincides with feeling that is a combination of thrill and excitement. This definition comes very close to the concept of "rush" that is defined by Buckley as simultaneous experience of thrill and a more complex construct i.e. flow (Csikszentmihalyi, 1990) that are "associated with the successful performance of an adventure activity at a high level of skill" (Buckley, 2012, p. 963). We investigate the risk perception as part of the keys motivational terms in adventure tourism and how different level of perceived risk are associated with the different high adventure tourism activities and their relation with the behavioural variables. This paper contributes to a theoretical understanding of adventure tourists in a natural park in two ways. Firstly it proposes to determine the key motivational factors that are important for adventure tourists' decision to visit the park and to analyse the relationship between these motivational factors and their behavioural intention. Secondly it aims to test the significance of the differences in the mean among the different level of risk perceived by adventure tourists and the behavioural intention's items. Empirical understanding of this relationship has received little research attention thus examining this subject has theoretical and practical value.

2. Methodology

Data collection was performed at the Friuli Dolomiti Alps Natural Park in spring 2014. This park is located in the western mountain zone dominating the upper plain of Friuli Venezia Giulia Region (north East of Italy). The area extends over 36.900 hectares and it's characterized by the wilderness of its large valleys which present nor main roads or villages and stretch among the Dolomitic peaks. The sample for this study comprises 317 adventure tourists who participated in hard adventure activities. The interviews were selected by their participation to an hard adventure activity. Visitors were surveyed at the end of their experience to the park on weekdays and weekends in order to increase the quality of the data. The survey questionnaire consists of five parts. Part 1 of the questionnaire measures motivations; part 2 deals with the perception of risk; part 3 deals with general characteristics (socio-demographics). All scale items were measured by a 7-point Likert scale ranking from Strongly Disagree (1) to Strongly Agree (7). The questionnaire was in Italian, thus all respondents were Italian speaking tourists (99% were Italian and 1% foreign).

3. Results

The general sociodemographic characteristics of tourists interviewed is presented in Table 2. The sample was equally distributed by gender (49.8% male and 50.2% women). Tourists were predominantly relatively young: 71.92% were between 19 and 29 years old, 0.63 % under 19, 8.2% between 30 and 39 years old, 8.83% between 40 and 49, 7.89% between 50 and 65 and only 2.53% around 65 or older. Tourists in the sample showed high levels of education on average, as 64.35% of respondents had a high school degree, 32.18% a college degree or higher and only 2.84% had a junior high school level of instruction.

TABLE 2: SOCIODEMOGRAPHIC PROFILE OF RESPONDENTS

Socio-demographic variables of survey respondents (N=317)		
	Percentage	No.
Gender		
Male	49,80%	158
Female	50,20%	159
Age		
Less than 19	0,63%	2
19-29	71,92%	228
30-39	8,20%	26
40-49	8,83%	28

50-65	7,89%	25
65 and above	2,53%	8
Educational level,		
Primary school	0,63%	2
Junior high school	2,84%	9
Senior high school	64,35%	204
University or above	32,18%	102

The motivational items were defined in line with the literature on leisure motivation and specifically with the Recreation Experience Preference (REP) scale that was developed within the experiential approach for measuring what motives people to perform activities in natural areas (Manfredo et al., 1996). Means and standard deviation of the items motivation were also reported to determine which of the motivations were the most important ones (table 3).

TABLE 3: MEAN SCORE AND STANDARD DEVIATION OF THE MOTIVATION ITEMS

Motivation items	Source	Mean	Standard
To enjoy natural resources	Kim et al. (2003)	5,47	1,608
Experience peace and quiet in nature	Tangeland, Vennesland, Nybakk (2013)	5,15	1,587
To appreciate beautiful natural resources	Kim et al. (2003)	5,57	1,282
Experience fellowship whit nature	Tangeland, Vennesland, Nybakk (2013)	5,30	1,381
Experience the landscape and moods of nature	Tangeland, Vennesland, Nybakk (2013)	6,29	1,044
To be where things are natural	Manfredo et al. (1996)	5,34	1,462
To be close to nature	Manfredo et al. (1996)	6,17	1,006
To enjoy the natural scenery	Manfredo et al. (1996)	4,65	1,633
To enjoy fauna and flora	Tangeland, Vennesland, Nybakk (2013)	5,29	1,549
To have thrills	Manfredo et al. (1996)	3,76	1,776
To experience excitement	Manfredo et al. (1996)	4,66	1,770
To experience in the paced nature of things	Manfredo et al. (1996)	3,10	1,567
To feel exhilaration	Manfredo et al. (1996)	3,38	1,763
To take the risks	Manfredo et al. (1996)	4,94	1,569
To change dangerous situations	Manfredo et al. (1996)	5,90	1,192
To rest and relax	Beerli & Martín (2004)	3,77	1,683
To get away from the hustle and the bustle	Tangeland, Vennesland, Nybakk (2013)	5,66	1,377
To change from daily routine	Tangeland, Vennesland, Nybakk (2013)	3,93	1,581
To have time to think about life	Tangeland, Vennesland, Nybakk (2013)	3,57	1,636
To find peace and quiet	Tangeland, Vennesland, Nybakk (2013)	3,43	1,682
To get away from everyday life	Tangeland, Vennesland, Nybakk (2013)	4,03	1,664
To have a time for natural study	Kim et al. (2003)	5,09	1,581
To have enjoyable time with family/friends	Kim et al. (2003)	5,17	1,437
To be with others who enjoy the same things you do	Manfredo et al. (1996)	5,09	1,429

Note: Individuals were asked to indicate their level of agreement on a 7-point Likert scale ranging from 1—strongly disagree to 7—strongly agree.

To examine the dimensions underlying the motivation factors a principal component factor analysis with varimax rotation was undertaken. The 24 motivation factors items yielded four factors with eigenvalues greater than one (table

4). The first factor loading on nine items and was called “Nature”. The second factor was named “Risk Perception” and loaded heavily on six items. The third factor called “Contemplation” loaded on six items. The final factor labelled as “Socialization” loaded on three items. The Kaiser-Meyer-Olkin that measures of sampling adequacy for the motivation scales was 0.883. As shown in table 4 these four motivation dimensions accounted for 60.863% of explained variance.

TABLE 4: MOTIVATION FACTORS

Motivation factor	Factor 1	Factor 2	Factor 3	Factor 4
Motivation Item	Nature	Risk and excitement	Contemplation	Socialization
To enjoy natural resources	0,764	0,138	0,056	0,134
To experience peace and quiet in nature	0,735	0,064	0,125	0,254
To appreciate beautiful natural resources	0,727	0,099	0,223	-0,013
To experience fellowship whit nature	0,713	0,008	0,149	0,306
To experience the landscape and moods of nature	0,704	0,029	0,298	-0,029
To be where things are natural	0,692	0,014	0,247	-0,065
To be close to nature	0,661	0,083	-0,028	0,394
To enjoy the natural scenery	0,643	0,300	0,027	-0,073

To have enjoyable time with family/friends	0,149	0,170	0,306	0,742
To be with others who enjoy the same things you do	0,466	0,335	-0,045	0,494
Eigenvalue	5,082	4,356	2,889	2,280
Variance Explained	21,174	18,150	12,039	9,499
Cumulative Variance	21,174	39,325	51,364	60,863
Cronbach's Alfa	0,884	0,889	0,808	0,744
Grand Mean Of Factor	5,542	3,685	4,469	5,306
Keiser Meyer Olkin statistic	0,883			

Regarding behaviour intention first descriptive statistics were used to evaluate mean, standard deviation and secondly, exploratory factor analysis using principal component methods with varimax rotation was used to summarize the five behavioural items in order to run the regression analysis. Table 5 and 6 provides statistics information, including the mean, standard deviation for the dependent variable behavioural intention as well as the results of the factor analysis.

TABLE 5: MEAN SCORES, STANDARD DEVIATIONS AND FACTOR LOADING OF THE FIVE INTENDED BEHAVIOUR VARIABLES

Behavioural variable	Source	Mean	Standard deviation
I would spread positive word-mouth about this park	Maxham 2001	5,74	1,21
I will recommend this park to friends/relatives	Maxham 2001	4,84	1,78
I intend to revisit the park	Huang & Hsu 2009	5,62	1,28
I desire to revisit the park	Huang & Hsu 2009	5,52	1,31
If my friends were looking for a park to visit, I would tell them to try this park	Maxham 2001	5,43	1,43

Note: Means were derived from a 7-point Likert scale ranging from 1—strongly disagree to 7—strongly agree.

TABLE 6: FACTOR LABELS AND STATEMENT

	Factor Loading	Eigenvalues	Per cent of variance	Alpha coefficient	Grand mean of Factor	Keiser Meyer Olkin statistic
Behavioural variable		3,726	74,516	0,889	5,43	0,831
I would spread positive word-mouth about this park	0,876					
I will recommend this park to friends/relatives	0,576					
I intend to revisit the park	0,938					
I desire to revisit the park	0,954					
If my friends were looking for a park to visit, I would tell them to try this park	0,915					

To identify the relative importance of each of the four tourists' motivation factors on the respondents' behavioural intentions a step wise multiple linear regression was employed. Table 7 contains the results of the regression. As can be seen in the table only the motivation factor named "nature" contributed to the dependent variable suggesting that this is the main factor ($\beta = 0.596$; $p < 0.000$) to face adventure tourists' behavioural intention

TABLE 7: REGRESSION ANALYSIS RESULTS ^a

	Values	Non Standardized Coefficient B	Standardized Coefficient β	t-value	Sig.
Constant		6,241	-	4,749	0,000 ***
Nature		0,491	0,596	13,158	0,000 ***
Durbin-Watson	1,984				
R²	0,355				
Adjusted R²	0,353				

^a dependent variable behavioural intention. *Significant at 0.05 level. **Significant at 0.01 level. ***Significant at 0.001 level.

In nutshell, it can be said that the nature motivation factor only had a significant relationship with the intention to revisit the park. This seems to be partially in contrast with previous studies showing that adventure tourists use outdoor natural environments as a setting for excitement-based recreation rather than appreciation of nature (e.g. Buckley,

2010). These findings suggest to examine deeply the risk perception construct and specifically its relationship with behavioural intention. In table 8 descriptive statistics are provided simply as a way to characterize tourists' risk perception related to their participation in the different "hard" adventure tourism activities that we have considered in the present study. The table shows a discrepancy between the perception of risks that's quite low and the objective risk that is related to each activity. Specifically it appears that hang gliding was differentiated as the most risky activity followed by mountain climbing and canyoning. No big difference was observed for the other types of activities, although, on relative basis orienteering was ranked as the lowest risky activity and trekking as the second lowest one.

TABLE 8: PERCEIVED LEVEL OF RISK FOR TOURISM ACTIVITIES

Perceived level of Risk for tourism activities	Mean	Standard Deviation
Trekking	1,85	1,37
Wilderness hiking	1,88	1,27
Mountain climbing	4,17	1,52
Mountain biking	2,89	1,40
Rafting	2,10	1,22
Canyoning	3,51	1,58
Hang Gliding	5,06	1,85
Downhill bike	2,16	1,28
Orienteering	1,30	1,01

Analysis of variance with a Scheffe post hoc procedure was carried out in order to determine whether the different level of adventure tourists' risk perception differ in their response to the five behavioural variables. The results are presented in table 9. However, contrary to what might expect, the results show that a low risk perception seems to be associated to stronger tourists' positive word of mouth and a stronger intention to revisit the park.

TABLE 9: SCHEFFE RESULTS

Behavioural Intention Items	Low Risk	Medium Risk	High Risk	F-ratio	Sig. level
I would spread positive word-mouth about this park	5,99 **	5,45 **	5,88	7,89	0,000 ***
I will recommend this park to friends/relatives	5,10 *	4,59 *	4,64	3,16	0,044 *
I intend to revisit the park	5,84 **	5,37 **	5,64	4,94	0,008 **
I desire to revisit the park	5,76 **	5,28 **	5,44	5,13	0,006 **
If my friends were looking for a park to visit, I would tell them to try this park	5,73 **	5,16 **	5,08	6,68	0,001 ***

*Significant at 0.05 level. **Significant at 0.01 level. ***Significant at 0.001 level.

4. Conclusions

Effective marketing strategies for the promotion of adventure tourism settings i.e. natural parks are generally based on the analysis of tourists' motivations as driving forces for travel behaviours (Bradley et al., 1997; Cini et al., 2013; Raj, 2004; Um & Crompton, 1990). In line with this view important findings from this study warrant discussion. First, the analysis of motivation factors in relation to participation of hard tourism adventure activities provides evidence that "activity related motivations" is a multi-dimensional phenomenon comprising four distinct motivational factors (i.e. Nature; Risk Perception; Contemplation and Socialization). Second the findings do not completely support the proposition that adventure tourists use outdoor natural environments as a setting for excitement-based recreation rather than appreciation of nature like the recreationists. More specifically the a step wise multiple linear regression results

show only one positive significant relationship between motivational factor and tourists' behavioural intention i.e. the nature motivational factor. Our results suggest there is a demand for high adventure activities focusing on "nature" themes. Finally analysing whether the different level of adventure tourists' risk perception differ in their response to the behavioural variables we pointed out that a low risk perception seems to be associated to stronger tourists' positive worth of mouth and intention to revisit the park. By showing that the natural environment is identified as the key motivational factor for revisit the park and for a positive word of mouth it is necessary to promote adventure tourism focused on the natural environment. Also we found that tourists who express a low perception are associated to a stronger behavioural intention. Given that a significant number of new adventure tourists visit the park as a result of word of mouth communication managing perceptions is paramount to sustain adventure tourism in the park. The perception of risk is an important component in the tourists' behaviour and should not be overlooked. Risk-based adventure tourism provides bright potentials especially if it's centred on the correct use of natural resources.

How large companies communicate sustainability in an international environment: a crossroads between grounded information and greenwashing

Abstract

Sustainability is becoming a widespread topic of discussion also for companies: the aim of this research is to understand how the world largest companies communicate their eventual environmental and social commitment. To achieve this aim researchers have examined sixteen large companies' web sites, considering four sectors, that are Oil and gas operations, Iron and steel, Computer hardware and Food processing, observing what kind of communication tools they use (sustainability reports, certifications, sustainability web sections). Findings highlight a particular attention to sustainability communication but, at the same time, it is also evident that some of those companies are suspected to be unethical: from a marketing point of view greenwashing could be a risky choice for companies' long-term survival while a communication based on concrete and verifiable information can represent a great opportunity for them.

1. Introduction

The word sustainability has become part of the business dictionary during the last decades: it is a tripartite concept, because it includes a social, environmental and economic meaning. Actually its boundaries are wider, considering the definition enunciated by the World Commission on Environment and Development in 1987: sustainable development is defined as "development that meets the needs of the present without compromising the ability of future generations to meet their own need", without references to a specific dimension. Because of their impact on society, companies are more and more involved in this process of creation of a development characterized by a more intense attention to environmental and social issues. The heavy dependence from non-renewable energy sources, the importance to safeguard natural resources and the necessity to respect human rights should make companies aware about their impact on communities and, consequently, about their potential survival. On the other hand the business lexicon contemplates also the expression Corporate Social Responsibility, which consider the accountability of an enterprise as the way it has to satisfy the social, environmental and economic expectations by stakeholders, coherently with the corporate strategy, and not simply a series of philanthropic initiatives (Collis, Montgomery, Invernizzi & Molteni, 2007). Obviously a responsible attitude implicates the involvement of the entire business activity and not only of a single part of it, following a path as described also by Nidumolu, Prahalad and Rangaswami (2009): as a matter of fact every department can contribute to achieve a responsibility objective, as exemplified below:

- supply activities: suppliers selection on the basis of ethical prerequisites;
- production: use of renewable energies and reduction of water consumption;
- human resources management: training. health and safety, equal opportunities;
- inbound logistics: reduction of emissions caused by transports;
- outbound logistics: reduction of packaging impact on environment;
- marketing: cause related marketing, communication transparency.

It is clear that a sustainability aim cannot be achieved if all the supply chain is sustainable, so it is not correct to reduce sustainability to a façade attitude because, in this case, this could have deleterious consequences on image and reputation. Technically this phenomenon is called "greenwashing" because it parades, through a precise communication style, a strong sustainability oriented commitment, concealing their negative behaviour. Granted this, in this research sustainability is specifically studied from the point of view of marketing communication, in order to comprehend how some large companies communicate sustainability and how, in case, the same companies are accused to put into practice unsustainable behaviours and, of course, to be untruthful.

2. Theoretical background: a literature review

Through sustainability a company integrates its economic objectives with social ones: however it is difficult to think that responsible initiatives remain limited to their boundaries and, from this perspective, they can become not only a moral duty but also a tool for marketers, insomuch that Kumar, Rahman, Kazmi and Goyal (2012) defined ecology as a new paradigm in marketing strategy while Abdul Rashid, Abdul Rahman and Annuar Khalid (2014) highlighted that environmental initiatives can have a role in marketing strategies. Kotler and Lee (2008) underlined that responsible initiatives can have important positive consequences in terms of sales growth, market share, image, employees' motivations, decrease of operating costs, attractiveness for investors and these elements can be considered sufficient to communicate transparently sustainability. The importance of sustainability in marketing communication is confirmed by the existence of a typology of marketing named *Sustainable Marketing* and one specifically dedicated to its environmental dimension, that is so called *Green Marketing* (Sarkar, 2012; Grant, 2009; Kilbourne, 1998). Polonski (1994) specified that it “*consists of all activities designed to generate and facilitate any exchanges intended to satisfy human needs or wants, such that the satisfaction of these needs and wants occurs, with minimal detrimental impact on the natural environment*”, a definition which add respect for the environment to the classical objective of marketing, that is the satisfaction of wants and needs; moreover Menon and Menon (1997) underline that Green Marketing represents a part of the whole corporate strategy.

It is possible to distinguish four strategies linked to the practice of Green Marketing: Orsato (2006) highlighted that two strategies (Eco-Efficiency and Environmental Cost Leadership) are connected to a lowering of costs while the other two (Beyond Compliance Leadership and Eco-Branding) refers to a generic differentiation strategy. These are the main features:

- Eco-efficiency: the aim is to increase the productivity and to decrease costs and, at the same time, the environmental impact;
- Beyond Compliance Leadership: it is important to improve the organizational process but also to make customers know what are the enterprise efforts through certifications, business codes and environmental unprofitable investments;
- Eco-Branding: this strategy starts from the premise that consumers need to understand what are the benefits deriving from the purchase;
- Environmental Cost Leadership: the goal is to blend lower costs with a lower impact on environment.

According to Rex and Baumann (2007) Green Marketing can be developed also inspiring to conventional marketing considering also a larger target and not only so called green consumers and applying a more incisive promotion of green products, going beyond the traditional ecolabels while Liu, Kastiratne and Moizer (2012) underlined the necessity to integrate Green Marketing and Sustainable Supply Chain Management, focusing the attention on six dimensions, that are product, promotion, planning, process, people and project. Some scholars highlight that Green marketing can be applied considering it as a part of a more overall strategy: for example Easterling, Kenworthy, Nemzoff and College (1996) focused on green advertising, which can be put into practice only in the case companies have a general environmental strategy while Fengwen and Yuhua (2003) described an environment-oriented marketing as a step of a general green supply chain, which consists in five phases, that are Green Designing, Green Production, Green Package, Green Marketing and Green Recycling.

Obviously a serious marketing activity, and Sustainable marketing is not an exception, needs an effective communication system: from this point of view sustainability reports and certifications could represent important tools to promote ecological and social initiatives. Sustainability reports are documents companies draft to provide qualitative and quantitative information in order to highlight and integrate their economic, environmental and social activities (Daub, 2007): the most important world organization which promotes reporting is the Global Reporting Initiative (GRI), that has formulated a series of reporting guidelines; transparency is defined by the GRI as an imperative and this shows, one more time, how much important is a communication based on real information, a prerequisite to implement a Sustainable marketing strategy. Kolk (2010) specified which are the most relevant reasons for reporting and for non reporting, as summarized in the following table (tab.1).

TABLE 1: REASONS FOR REPORTING AND FOR NON REPORTING BY KOLK (2010)

Reasons for reporting

Enhanced ability to track progress against specific targets
 Facilitating the implementation of the environmental strategy
 Greater awareness of broad environmental issues throughout the organisation
 Ability to clearly convey the corporate message internally and externally
 Improved all-round credibility from greater transparency
 Ability to communicate efforts and standards
 License to operate and campaign
 Reputational benefits, cost savings identification, increased efficiency, enhanced business development opportunities and enhanced staff morale

Reasons for non-reporting

Doubts about the advantages it would bring to the organisation
 Competitors are neither publishing reports
 Customers (and the general public) are not interested in it, it will not increase sales
 The company already has a good reputation for its environmental performance
 There are many other ways of communicating about environmental issues
 It is too expensive
 It is difficult to gather consistent data from all operations and to select correct indicators
 It could damage the reputation of the company, have legal implications or wake up 'sleeping dogs' (such as environmental organisations)

This table points out, in particular, the role of reputation: reporting, according to Kolk, can have a positive impact on companies' image, creating a chain reaction with positive consequences in terms of cost savings, new opportunities and improved work conditions; on the other hand a superficial and a non transparent report could activate a boomerang effect with negative consequences on companies' reputation: this concept reinforces one more time the necessity to apply a communication style based on truth.

Certifications represent another tool to communicate with stakeholders, in particular the international standard ISO 14001 is a recognized document to show a company's environmental management system, while OHSAS (acronym of Occupational Health and Safety Assessment Series) 18001 groups a series of criteria in order to safeguard a healthy and safe work condition. Some studies have shown that ISO 14001 have a positive impact on environmental performances (Boiral & Henri, 2012; Melnyk, Sroufe, & Calantone, 2003) while its positive influence on profits have been studied by Davis (1991) and Summers Raines (2002). Studies about the role of OHSAS 18001 have been carried out by Abad, Lafuente, and Vilajosana (2013) who specified its importance in the achievement of safety as well as Lo, Pagell, Fan, Wiengarten and Yeung (2014) demonstrated a link between it and an improvement in terms of safety, labor productivity and profitability.

Social sustainability has been analyzed also considering companies' ethical choices, in particular by De Pelsmacker Dryesen and Rayp (2005) who examined the consequences of social activities on consumers' choices, pointing out that they can express their ethical certainties in two ways: the first one consists on purchasing product with specific positive features, the second one is based on boycott of determined enterprises because of their negative conduct; Boulstridge and Carrigan (2000) stressed that the ethical factor is considered secondary for most of people, because price, quality, convenience and brand influence more deeply their decisions; Carrigan and Atalla (2001) studied a young target, formed by 18-25 aged respondents, organized in two focus groups: they showed that an ethical conduct does not affect young consumers behavior probably because fashion and brands play a more important role in their decisions. Singh, Iglesias and Batista-Foguet (2012) studied the relationship among perceived ethicality, brand trust, brand affect and brand loyalty on a sample of 4.027 Spanish consumers: results highlighted that there is a positive association between perceived ethicality, brand trust and brand affect and these latter have, in turn, a positive relationship with brand loyalty; Singhapakdi, Vitell, Rao and Kurtz (1999), on the other hand, showed that there is a difference between the ethical decision-making process of marketers and those of consumers: they found that consumers tend to be more idealistic and less relativistic compared to marketing professionals and, according to them, a reduction of this gap could be a source of competitive advantage for those marketers who will be able to understand better consumers' ethical requests.

3. The empirical analysis

3.1 Methodology

This research has the aim to highlight how large companies communicate their sustainability initiatives and whether, in case, their conduct is considered negative in spite of what they declare, putting into practice a greenwashing action. For this purpose researchers have analyzed sixteen large companies' websites, in order to verify the presence of:

- sustainability report;
- references to ISO 14001;
- references to OHSAS 18001;
- a general sustainability web section.

This study has been carried out through a content analysis (Berelson, 1952; Kassirjian, 1977).

The choice of companies started considering the word largest companies ranking published by Forbes.com: researchers have focused the attention on four sectors, two in behalf of b2b enterprises and two on behalf of b2c ones. The following table describes the sample of this study.

TABLE 2: SELECTED COMPANIES

B2B Companies	B2C Companies
<i>Sector: Oil and gas operations</i>	<i>Sector: Computer Hardware</i>
ExxonMobil	Apple
Petrochina	Hewlett-Packard
Royal Dutch Shell	Lenovo Group
BP	Quanta Computer
<i>Sector: Iron and Steel</i>	<i>Sector: Food Processing</i>
Nippon Steel	Nestlé
Posco	Unilever
JFE	Mondelez International
Vale	Danone

All these companies occupy the first four places in their respective sector ranking.

3.2 Findings

Findings highlight that the largest companies tend to give to sustainability communication a certain importance, insomuch as none of them is indifferent to this. Data collection is summarized in the following table.

TABLE 3: FINDINGS

Oil and gas operations				
<i>Company</i>	<i>Sustainability Report</i>	<i>Sustainability Web Section</i>	<i>Iso 14001</i>	<i>Ohsas 18001</i>

ExxonMobil	x	x	x	x
Petrochina	x	x		
Royal Dutch Shell	x	x	x	
BP	x	x	x	x
Iron and Steel				
<i>Company</i>	<i>Sustainability Report</i>	<i>Sustainability Web Section</i>	<i>Iso 14001</i>	<i>Ohsas 18001</i>
Nippon Steel	x	x	x	x
Posco	x	x	x	x
JFE	x	x	x	
Vale	x	x	x	x
Computer Hardware				
<i>Company</i>	<i>Sustainability Report</i>	<i>Sustainability Web Section</i>	<i>Iso 14001</i>	<i>Ohsas 18001</i>
Apple	x	x	x	
Hewlett-Packard	x	x	x	x
Lenovo Group	x	x	x	x
Quanta Computer	x	x	x	x
Food Processing				
<i>Company</i>	<i>Sustainability Report</i>	<i>Sustainability Web Section</i>	<i>Iso 14001</i>	<i>Ohsas 18001</i>
Nestlè	x	x	x	x
Unilever	x	x	x	x
Mondelez International		x	x	x
Danone	x	x	x	

As illustrated, all the companies use most of these tools in order to communicate with stakeholders, in particular it is important to observe the presence of a sustainability section in every website. It is interesting, furthermore, to note that sustainability reports are widespread documents and, as a matter of fact, they are published by all the analyzed companies except Mondelez International: this information confirms the growing tendency to report sustainability as observed by Kolk (2004). Another feature to highlight is relative to the report's name, which is sometimes different from a company to another: for example ExxonMobil names it "Corporate Citizenship Report", BP "Sustainability Review", Unilever "Sustainable Living Plan"; Apple, moreover, drafts different "Environmental reports" for every product and a specific report called "Supplier Responsibility Report" analyzing the sustainability issue from another perspective.

Sustainability web sections are full of data and information. ExxonMobil distinguishes six areas of analysis, that are safety in the workplace, reduction of environmental consequences, climate changes, human rights, corporate governance and economic development; similarly the other oil companies concentrate on their environmental efforts and, in particular, BP makes reference to its commitment to recover the area close to Gulf of Mexico, damaged by an oil spill in 2010 for which this company has been accused. Nippon Steel highlights its environmental policies, in particular underlining its low carbon dioxide emissions and the development of eco-products; Posco, among the various information about green and social responsibility, makes reference to its recognition as an Dow Jones Excellent Sustainability Corporation. As the other iron and steel companies also JFE

and Vale focuses on environment aspects and in particular the last one allows stakeholders to evaluate its sustainability report through a questionnaire. Apple dedicates several web pages to this issue, in particular with a focus on environment: durability and recycling are two attributes that this company thinks to be essential for its products. Effectively one of the most relevant problem, nowadays, from an ecological point of view, is the duration of technological products, probably characterized by a certain level of innovation but also by a short lifetime, which means an incredible resources waste. Another communication tool is the creation of a direct contact with the customer, as Hewlett-Packard do providing a space where it is possible to submit a question relative to its environmental policies: moreover this company includes in its supply a series of environmental oriented products, proposed in order to convince consumers to do an ecological choice. Lenovo Group publishes several pages about sustainability and also in this case it highlights the attention to the long lasting characteristic of its products and the respect of human rights; Quanta's sustainability, moreover, includes some initiatives such as publicity programs and planting of trees. Food companies represent their information in reference to different sustainability dimensions, adding also data about nutrition issues and environmental problems caused by food packaging.

Regarding the certifications it is evident that the environmental ones are more widespread and this could be mean a greater sensitivity to green aspects: most of the examined companies make references to ISO 14001, sometimes also showing relative certifications; Ohsas 18001 is quite widespread but less in oil and gas sector.

These findings show that communication of sustainability is perceived as fundamental by the largest companies; all of them publish a mass of information, not limiting to give hasty data but focusing on various aspects which can be interesting for different stakeholders: from this point of view the reference target can be considered the real discriminating factor between b2b and b2c companies.

4. Greenwashing issues

Is this communication real? It is clear, as shown above, that the largest companies want to communicate their social responsibility initiatives but this does not mean automatically that what they declare is true. As a matter of fact, a lot of large companies are accused of being irresponsible, in spite of what they report: this could signify that sustainability reports rather than other kind of information could be considered limited tool. The question is: are companies conscious about the impact of their communication style? Nowadays there is a greater awareness about companies' role in society and an irresponsible conduct could have negative consequences, for example it could damage both suppliers' and consumers' relationships. Anyway, even if sustainability is becoming a topic of discussion, therefore there is more attention on it, Grunert, Hieke and Wills (2014) found that consumers in general are aware about sustainability but they do not pay much attention to information included on labels and, furthermore, they link the concept of sustainability only to the environmental dimension. A communication based on falseness can be noxious from a marketing point of view because it can contribute to develop a bad reputation, which can cause a drop of customers or even a boycott (Glazer, Kanninen and Poutvaara, 2010). Many times the largest companies are suspected of being irresponsible and, among those examined in this research paper, some of them are an example, as shown below.

Shell. This company has been accused of horrible actions to the detriment of a population living in the delta of the river Niger, the Ogoni. During the 50's it started to exploit its oilfields with negative consequences for this population, both from a social and an environmental point of view, and this caused a rebellion by the side of this population. Against Shell, specifically in the 90's, there were accusations of tortures and murders with the complicity of the military Nigerian government towards protest movement (MOSOP) which demanded rights in reference to social, environmental and economic dimensions. In spite of the International mobilization, in 1995 Ken Saro Wiwa (MOSOP spokesperson) and other Ogoni were hanged by the regime, creating indignation all over the world, and Shell was charged with being participating, through its financings and weapons to the government (Boele, Fabig and Wheeler, 2001). This was a terrible blow for Shell, tarnished by the accusation of human rights violation and environmental destruction: its responsibility has been demonstrated and, as a consequence, it has been convicted to compensate the Ogoni for their shameful conduct.

BP. In 2010 this company came to the fore because of an enormous environmental disaster. On April of that year there was an explosion on the drilling rig Deepwater Horizon, leased by BP. The consequences were very serious in terms of human lives (11 men died) and environmental catastrophe: huge quantity of oil were poured into the Gulf of Mexico, with relevant damages on sea life (Perrons, 2013; Forrest Harlow, Brantley and Martin Harlow, 2011): as a matter of fact, as reported by Liu, Liu, Gardner, Shank and Ostrom (2014) 4.9 million barrels of oil and 2 million gallons of chemical dispersants were roughly released in the Gulf from April to July 2010 and, for this reason, this British company was convicted to pay a large fine.

ExxonMobil: Similarly to the disaster caused by BP, Exxon Valdez, an ExxonMobil oil tanker, released a large quantity of oil in the vicinity of Alaska in 1989 after an oil spill. The consequences were terrible for the ecosystem (Peterson, 2001) and also in this case this oil giant has been obliged to pay a large fine.

Vale. On the web the “International Movement of People affected by Vale” has published so-called “The Vale 2012 Unsustainability Report” in order to expose data and information relative to negative consequences deriving from this mining Brazilian company’s activity. This Movement imputes Vale to be unsustainable, first of all explaining that only a minimal part of its enormous profits are used for Corporate Social Responsibility activities and that it was selected in 2012 as the world worst company in terms of environmental, social and labour related issues. From the environmental perspective Vale has been blamed to damage water sources (for example in Brazil and Argentina) and to have increased their nitrogen oxide and sulphur oxides emissions: in Canada it is involved in the biggest public civil suit for environmental disaster in the history of this North-American country; from a social point of view there are accusations of violations of human rights, disrespect for workers and damages for local communities, for example in Mozambique.

Nestlé. This Swiss food company has often been accused of unethical conduct, in particular considering the case of infant formula in Third World countries (Boyd, 2012) causing boycott by some consumers groups (Brinkmann, 2004): this Swiss multinational corporation was imputed to be responsible of children sickness, caused by baby formula prepared in unhealthy hygienical conditions exploiting the lack of knowledge by local communities and passing off infant formula as superior to breast milk (Brady, 2010).

These examples represent emblematic cases because they highlight that what is communicated could not coincide with the real concrete activities and probably the largest is the company, the largest are the possibility of unsustainable activities to be known, damaging enterprises both from a moral and an economic point of view. The question is: will sustainable marketing be a decisive factor for a successful company? Probably the growing sensitivity and awareness on environmental and social issues will play a more decisive role and this will signify that transparency will be essential. An unsustainable conduct could impact very negatively both for b2c and b2b companies and, consequently, communication is not sufficient in a marketing perspective: communicating good initiatives could be useless if companies conceal the bad ones, because they will emerge in future. Probably it is necessary to pass, using a terminology used by Grant (2009), from a simply “green” attitude to a “greenest” one, that means passing from a simply communication to an innovation-oriented strategy, which will consist in conceiving sustainability as a normal lifestyle and business model. It is clear that, from this point of view, sustainability has to be interpreted as an opportunity and not as a burden. As a matter of fact a concrete attention to environmental and social issues can not only contribute to build a better reputation but can be a competitive advantage source as also stated by Porter and Var Der Linde (1995): benefits of sustainability choices, therefore, are not limited only to an image level but are actually visible on a competitive side and on a financial one; in other words greenwashing is a useless attitude that cannot guarantee a company’s long-term survival.

5. Conclusions and limits

This research has highlighted that sustainability has become a widespread topic of discussion and the largest companies have understood that they have to reckon on it. From a pure communicational point of view it is evident that these companies use various kind of tools, starting from sustainability reports, a more and more used document,

to environmental and social certifications. Certainly sustainability communication is not focused on a single dimension but it involves different contents such as energy savings, water, emissions reduction, workers' health and safety, respect for local communities, prohibition of child labour and respect of human rights. Possession of certifications is evidently considered an important factor because they are a communication tool but also, at the same time, a prerequisite for business relationships: anyway, in this case, environmental ISO 14001 is more widespread than OHSAS 18001. On the other hand it is essential to consider that communication is not a guarantee of truth and this means that it can be also based on appearance: it is fundamental, in this sense, to comprehend which are the consequences from a marketing point of view. Certainly the largest companies are often suspected to be irresponsible, in particular considering some sectors such as those of oil and energy, therefore it is not useful to declare falsities, also because their possible negative conduct can easily emerge; on the contrary a coincidence between what is communicated and a real commitment can have benefits in a long term perspective.

As shown above some companies have been accused of an unethical behaviour and, observing their websites, it is evident that they do not want to be considered negatively because they are aware of some possible effects on their economies: in other terms they are conscious that a bad reputation could represent a risk for them. From this point of view greenwashing embodies a non forward looking attitude, dangerous for companies which decide to apply it: it is a synonymous of lack of vision by companies and a company without a vision is destined to the decline, in particular today, when sustainability is becoming a necessity that cannot be recognized only by more sensitive subjects. The increasing attention to this subject could play an important role in future in order to discriminate praiseworthy companies from those irresponsible: marketing communication is absolutely useless if it does not reflect a real and concrete conduct. A forward looking company does not have to have doubts in choosing what part of the crossroads they have to go through: rejecting greenwashing and make sustainability a concrete model to follow.

This research has some limits: first of all this is an explorative study so it has to be deepened; moreover the analyzed sample is limited so it is necessary to enlarge it, also considering other sectors' companies because, in this case, findings could be different. For future research it could be interesting to analyze the impact of what is communicated on consumers choices in order to verify if sustainability is already an essential factor.

Is environmental sustainability a strategic driver? An explorative investigation in the Italian mining sector

Abstract

Raw materials have a considerable weight for the development of countries but they are also strongly linked to environmental defacement. In fact, mining activities are often related to all those diseconomies on a territory and can create conflictual situations among the population in terms of consensus and acceptability. Although lots of studies investigate the triple bottom line theory and how sustainability can be a strategic asset to improve firms' performance, in literature nobody focused on mining industry.

This work, with an exploratory cluster analysis based on a CAWI questionnaire, aims to understand whether Italian mining enterprises see environmental sustainability as a key asset and if it has got a corresponding reflection on firms' performance. Evidences point out that for some respondents the adoption of environmental sustainability policies is mainly based on institutional goals rather than on strategic ones. However, there are some enterprises that without a pure monetary return adopt environmental sustainability policies to reinforce their reputation.

Literature review

Since the Brundtland Commission Report in 1987, the sustainability issue has been widely debated by academics from many business disciplines, including management, marketing and operations. Also managers have accepted sustainability as a precondition for doing business (Hedstrom, Poltorzycki and Stroh, 1998, Holliday, 2001). A lot of firms appoint corporate sustainability officers, publish sustainability reports (SustainAbility, 2000) and incorporate sustainability into their communication strategies.

The triple bottom line theory

From the point of view of firms' perspective, sustainability means meeting the needs of their direct and indirect stakeholders without compromising their ability to meet the needs of future stakeholders (Dyllick and Hockerts, 2002). Thus, enterprises have to integrate the economic, social and environmental aspects in a triple bottom line. This concept, developed by Elkington (1998), considers and balances economic, environmental and social issues from a micro-economic point of view simultaneously. According to the triple bottom line theory, companies should conduct their business in a way that respects both environment and society, while being profitable (Elkington, 1998; Hart and Milstein, 2003, Savitz and Weber, 2006).

The triple bottom line theory has also received a strong endorsement from the World Business Council for Sustainable Development, a coalition of 160 international enterprises (Vandenberg 2002). Government agencies around the world and at all levels have been required to implement the triple bottom line (Vanclay 2004; Wight 2007).

However, what is sometimes not so clear is the measurement of these three dimensions. Some scholars refers economic sustainability to plants regarding production or manufacturing costs (Cruz and Wakolbinger, 2008), others consider economically sustainable those companies that can "guarantee at any time a sufficient cashflow to ensure liquidity while producing a persistent return to their shareholder" (Dyllick and Hockerts, 2002: 133).

Considering the environmental aspect of sustainability, a large body of literature relates it to corporate environmental policies. Among these, González-Benito and González-Benito (2005) and Bansal and Roth (2000) studied actions of businesses to mitigate their negative influence on the environment and the motivations behind them (i.e., competitiveness, legitimation, and ecological responsibility). Environmental sustainability refers to the use of energy and other resources and the footprint that firms leave behind as a result of their operations. In this way, environmental sustainability is measured by indicators that are related to waste and pollution reduction, energy efficiency, emissions reduction, frequency of environmental accidents and so on.

Social sustainability shifts the focus to both internal communities and external ones (Pullman, Maloni and Carter, 2009). Social sustainable companies add value to the community in which they operate and influence stakeholders in such a way that they can understand motivations and can broadly agree with the value system of the firm. Indeed, enterprises that invest in Corporate Social Responsibility try to enhance their social reputation (Fombrun, 2005). Another

relevant theory – corporate citizenship – present the social involvement of companies in a more holistic way, which is conceptualized as “the role of the corporation in administering citizenship rights for individuals” (Matten and Crane, 2005, p. 173). Thus, to measure social sustainability indicators including social cost, level of capital stock, structure for self-renewal, fairly distribution of resources and property rights can be used (Gladwin, 1995).

Environmental sustainability and firm performance

The literature on sustainability provides limited answers to the reason why certain firms do adopt sustainability management practices while others do not and under which circumstances firms can realize competitive advantage by adopting sustainable practices (Delmas and Toffel, 2004; Etzion, 2007; Rivera-Camino, 2007).

TABLE 1: PAST RESEARCH ABOUT THE IMPACT OF ENVIRONMENTAL SUSTAINABILITY ON FIRM'S PERFORMANCE

Autors	Performance variables	Main findings
Cohen, Fenn and Naimon (1995)	ROA, ROE, Total Return or Common Shareholders	The group of low-polluting firms has better economic performances.
Hart and Ahuja (1996)	ROA, ROE, ROS	Pollution prevention activities have a positive influence on financial performance within 1–2 years.
Russo and Fouts (1997)	ROA	Positive and significant impact of environmental performance on ROA.
Judge and Douglas (1998)	ROI, Earnings Growth, Sales Growth, Market Share Change	Positive and significant impact of environmental issue with the financial performance.
Edwards (1998)	Return on capital employed (ROCE), ROE	Environmental high-performing firms perform better (not always at a significant level).
King and Lenox (2002)	ROA, Tobin's q	Lower emissions are significantly associated with higher financial performance. ROA and Tobin's q have a significant and positive relationship with waste prevention.
Wagner, Van Phu, Azomahou and Wehrmeyer (2002)	ROS, ROE, ROCE	Negative and significant effect of environmental performance on ROCE. No evidence of significant impact of any economic performance variable on environmental performance.
Gonzalez-Benito and Gonzalez-Benito (2005)	ROA	Environmental management can bring about competitive opportunities for companies, although some environmental practices produce negative effects.
Wagner (2005)	ROCE, ROE, ROS	There is a negative relationship between environmental performance and financial performance.
Aragon-Correa and Rubio-Lopez (2007)	ROI, ROE	Environmental progress is not related to financial performance.
Montabon, Sroufe and Narasimhan (2007)	ROI, Sales Growth, Product Innovation, Process Innovation	There are significant and positive relationships between environmental management practices and measures of performance.

However, numerous researchers have investigated the relationship between efforts made on sustainability by a firm and their effects on its performance. On this topic there is no alignment. On one hand, some researches find a negative correlation between bad environmental performance and the intangible asset value of firm (Cordeiro and Sarkis, 1997; Gilley, Worrell and El-Jelly, 2000; Konar and Cohen, 2001, Link, Naveh, 2006).

On the other hand, some studies show a positive impact of environmental sustainability on firms' performance (Hart and Ahuja, 1996; Klassen and McLaughlin, 1996; Molina-Azorin, Claver-Cortés, Lopez-Gamero and Tari, 2009, Jacobs, Singhal and Subramanian, 2010). Russo and Fouts (1997) reveal that firms with high environmental performance enjoy higher profitability, higher return on assets ratio. Moreover, Bansal and Clelland (2004) find a negative correlation between environmental legitimacy and financial risk. Firms with high environmental legitimacy – for examples firms that meet stakeholders' expectations for corporate environmental performance – show less unsystematic risk compared

to firms with low environmental legitimacy. In addition, their study points out that the risk component could decrease if each enterprise expressed publicly its environmental commitment, especially for those firms that operate in industries with high environmental impact (like mining industries).

Regarding the performance variables, the researches mainly use financial performance such as ROA, ROE, ROS and stock price. Table 1 shows the main studies that have analyzed the impact of the environment on firm performance with accounting performance ratios.

The mining sector

It is generally agreed that the mining sector comprises only resources that have economic and symbolic values. These resources are typically oil, coal, natural gas, gold and precious metals. However, in mining industry there are also activities related to the extraction from quarries and mines of non-energy commodities like sand, clay, ornamental and building stones.

Despite their low unitary economic value, these raw materials are crucial not only for traditional industries (e.g. construction industry, cosmetics, animal feed), but also for the manufacture of the new and innovative products that are required by our modern society (e.g. batteries for electric cars, photovoltaic systems and devices for wind turbines). Thus, the supply of raw materials is increasingly under pressure. This topic is so strategic that the European Commission has proposed a European Innovation Partnership on raw materials (COM (2012) 82 final)¹. The Partnership is focused on non-energy and non-agricultural raw materials and represent vital inputs for innovative technologies and environment-friendly applications².

As we saw, raw materials have a considerable weight for the development of countries but they are also strongly linked to environmental defacement. For this reason, mining activities are very often related to all those diseconomies on a territory and can create conflictual situations among the population in terms of consensus and acceptability. In this context, it is clear that taking care of environmental issues means for mining enterprises encourage the acceptance of their activities by the community as well as strengthen their corporate reputation.

Nevertheless, the mining industry is not always perceived as important in everyday life and, being indeed confined only to negative externalities like dust, noise, impact on environment. In other words, mining activities are very often related to all those diseconomies on the territory that can create conflictual situations among the population and problems of consensus and acceptability. In fact, the mining industry has citizens as a key stakeholder, which can play an important role in shaping sustainability actions of firms. The characteristics and environmental attitudes of communities where firms operate have an impact on environmental performance (Kassinis & Vafeas, 2006), while pressures by external stakeholders can even affect environmental policy decisions about global standardization in multinational companies (Christmann, 2004). In this context, mining firms cannot be successful in the long term if they consistently disregard the interests of their key stakeholders.

Methodology

As said before, this research aims to understand whether Italian mining enterprises see environmental sustainability as a key asset and how they include it in their strategies.

To do this, in the period 17th October to 14th December 2012 a questionnaire was distributed to 658 Italian enterprises. The enterprises have been identified with a non-probability sampling for timeliness and convenience reasons (Troilo, Molteni, 2003). The data were collected with CAWI – Computer Aided Web Interview – method, together with phone recall and individual telephone tutorship. The universe although represents 35.1% of all active enterprises in the mining industry, it represents 87.11% of national turnover¹.

¹¹¹ COM(2012) 82 final, 29th February 2012 – “Making Raw Materials Available for Europe’s Future Wellbeing. Proposal for a European Innovation Partnership on Raw Materials”.

² For further information see <https://ec.europa.eu/eip/raw-materials/en>

The questionnaire included eight sections with specific topics and questions, all related to the theme of competitiveness. In this paper we consider only the section about environmental sustainability.

The sample is composed by 80 enterprises with a redemption rate of 12.2%. This percentage reached 19.8% including also partially filled questionnaire.

The collected data were processed in an aggregated way, in order to maintain the privacy of the respondents.

As for the turnover, the respondents are principally micro and small enterprises: 54% have 2 to 10 mil. euro turnover and 24% have up to 2 mil. euro turnover. Medium enterprises are 13%, while the big ones are 6%. Three enterprises did not declare their turnover.

Almost half of the sample (49%) have 11 to 50 employees, 21% have up to 10 employees, while only 15% declared to have 51 to 250 employees and only 4% have more than 250 employees. This demonstrates that in Italy the mining industry is mainly characterized by micro and small firms.

A two-stage cluster analysis was carried out. First, a hierarchical clustering method was applied in order to determine the number of strategic groups. Ward's method, which minimizes the mean square distance between the center of a cluster and each member, was chosen because its algorithm provides maximum between-group variance and minimum within-group variance (Averred, 1974). Between the two procedures recommended by Aldenderfer and Blashfield (1984) that can be used to determine the number of clusters to retain, we graphed the number of clusters by the proximity coefficients and inspected the jump in values of the proximity coefficients. Subsequently, a non-hierarchical cluster served to place the firms in different groups. K-means cluster analysis was used to group enterprises on the basis of similarity in their scores on the adoption of environmental sustainability as a strategic driver.

Finally, to give a cluster connotation, each group is described by demographic features, such as revenues (*Source: AIDA – Bureau Van Dijk*), average life, number of employees, diplomas acquired by staff, raw material extracted), strategic choices about sustainability and performance ratios.

Empirical results

In general terms, the respondents decide to undertake environmental sustainability policies in order to comply with institutional goals (4.25 of a 5-point Likert scale), followed by image and reputation strengthening (average 3.8) and making the brand recognizable (average 3.40). On the contrary, customers' requests (average 2.57), ethical considerations (average 3.12) and entry into market niche (average 3.13) do not seem to be taken into great account.

Among the benefits, the chance to make new eco-friendly production processes (average 3.48) and to differentiate the firm over its competitors (average 3.47) are recognized. Lower effects are associated with purely economic aspects in terms of costs reduction (average 2.61) and turnover increase (average 2.86).

Referring to how sustainability is pursued, the majority of enterprises strengthen their R&D activities and works with consulting agencies. It is also interesting to note that few firms buy patents from third parties – being this choice quite expensive - or work with environmental organizations or NGOs.

Moreover, results show that environmental sustainability process is overall managed by the entrepreneur (61.5%).

In short, evidences point out that for the majority of respondents the adoption of environmental sustainability policies is mainly based on institutional goals rather than on strategic ones. Although these policies have not a pure monetary return, they are considered as a driver to differentiate the firm over its competitors in terms of image and reputation.

The cluster analysis was designed to generate different groups that minimize within-cluster variance and maximize between-cluster variance. From it, we obtained five different groups that all together include 59 firms that have successfully completed all the questions about sustainability. Each cluster can be described as follows.

Cluster 1 – Consolidated firms

The first cluster consists of 15 medium-size enterprises, mainly extracting building stones, marlstone, limestone and chalk (33.3%). The majority of the enterprises has from 10 to 49 employees with a compulsory education (on average 62%). These firms registered the highest level of turnover (average: 12,812 thousand Euro) and show a 35 years of business experience.

Their approach towards environmental sustainability is consolidated. Although most of the enterprises have started these policies over the past five years, the 33.3% of the firms of this group implements them for over 10 years.

Environmental sustainability is applied both to the product, such as the recovery of materials from non-hazardous waste (3 firms) or the increase the recyclability of the product (5 firms), and to the manufacturing process with the reduction of production waste (9 firms) and air pollutant emissions (10 firms).

Investments are steadily increasing and correspond to more than 5% of annual turnover. The source of funding is mostly internal to the company. In fact, only 20% of the cluster's respondents were able to count on public funding.

The consolidated firms show the best performance indicators, with an annual profit of over 1 million Euro, ROI equal to 4.8% and ROS equal to 5.6%. This aspect points out that the economic efforts incurred in the adoption of environmental policies build a competitive advantage.

Cluster 2 – Adaptive firms

The second cluster consists of 10 micro-small sized enterprises that mine gravel, sand, clay and kaolin. Although the composition in terms of employees is heterogeneous, 50% of the enterprises have from 10 to 49 employees with a compulsory education (on average 68%). The small size (average of 4,239 thousand Euro) is a hallmark of these enterprises that have also the most seniority on the market (57 years of business experience).

Environmental sustainability policies of the 10 firms belonging to this cluster appear to be quite marginal. These firms have started environmental activities over the last 2-5 years with investments that range between 0.1% and 0.5% of turnover. Although their investments are constant, they are the lowest ones if compared to all other clusters. Like in the first group, the firms of this cluster have not benefited from public funding (90%).

The activities they carry out are mainly related to the production process in terms of the reduction of air pollutant emissions (80%) and the reuse of materials through waste recycling (70%). These actions have also an impact on the product using raw materials that are obtained from non-hazardous waste (50%) and secondary raw materials substitution (40%).

The adaptive firms show good performance ratios. In particular, they record profits and have a return on equity equal to 1.3%, the highest percentage among clusters.

Cluster 3 – Proactive firms

The 4 firms in the third cluster are the youngest (only 22 years of business experience) and the smallest ones (the average turnover is 4,180 thousand Euro). Gravel, sand, clay and kaolin are the mostly extracted raw materials (40%). The majority of the enterprises have 10 to 49 employees with mostly a primary education (average of 64%).

In contrast to the other clusters, these firms seem to pay more attention to environmental sustainability related to the product, seeking for alternative raw materials that can replace those currently in use. To achieve this goal, they invest more than 5% of their turnover in environmental sustainability.

The investments are steadily increasing, also thanks to public funding used by the firms of this cluster.

The supported investments have positive economic returns. In fact, all the profitability ratios point out that the proactive firms are in equilibrium from an economic point of view.

Cluster 4 – Unsatisfied firms

This cluster contains 14 enterprises that are small sized, quite mature with 41 years of business experience and have an average turnover of 7,457 thousand euro. Nearly 60% of them extract gravel, sand, clay and kaolin and has fewer than 50 employees. Taking into account their education, in this cluster there is the highest percentage of employees with a high school diploma (39%).

Environmental sustainability policies appear to be quite consolidated, beginning less than 10 years ago. Investments are constant over time and their amount is between 1% and 5% of revenues. As for the other clusters, even in this case, the majority of firms have never enjoyed public funding. The activities are focused only on the manufacturing process (92.9% of the firms) with the main aim to reduce atmospheric emissions and noise pollution.

Despite the firms in cluster 4 continue to investment in environmental sustainability, their efforts do not turn into satisfactory financial results. In fact, they record annual loss of approximately 213 thousand euro, ROE is negative (on average -7.6%) as well as return on investment (on average 0.7%).

Cluster 5 – Non-green firms

This cluster of 17 firms is the largest one and is the second in terms of revenues (average 9,140 thousand euro). Almost the totality of enterprises has fewer than 50 employees, this demonstrate that the respondents are small sized.

Although this group reaches the highest percentage of graduated employees, the majority of employees have only a compulsory education level (73%).

The enterprises in cluster 5 show a considerable maturity in the mining industry with 44 years of business experience. They pull out heterogeneous raw materials with a prevalence of gravel, sand, clay and kaolin.

A distinguishing feature of this cluster is the lack in the adoption of environmental sustainability policies. The main reasons are the excessive costs and high technological constraints, that have get a medium-high score of answers (4 or 5-points Likert scale) by the 70.6% and the 58.8% of the firms. This result shows that not all enterprises are sufficiently prepared to adopt green policies. In addition, some firms give little importance to the local community as a stakeholder. In fact, half of the member of this cluster think that the adoption of green policies does not have positive effects on local communities where mining activities are carried out. This could be interpreted like a sign of a strategic myopia of the sector in which they operate.

The non-green firms present the worst performance, with average annual losses for more than 3 million euro. This negative result impacts on financial ratios that, except ROI, are all negative.

In Table 2 the higher frequencies associated to each cluster are presented. As shown, the number of employees and their education level are a recursive feature in each cluster.

TABLE 2: DESCRIPTION OF THE CLUSTERS

	C1 Consolidated	C2 Adaptive	C3 Proactive	C4 Unsatisfied	C5 Non-green
<i>N. of Enterprises</i>	15	10	4	14	17
<i>Business Experience (years)</i>	35	57	22	41	44
<i>N. of Employees</i>	10 - 49	10 - 49	10 - 49	10 - 49	10 - 49
<i>Employees Education Level</i>	Compulsory	Compulsory	Compulsory	Compulsory	Compulsory
<i>Raw Materials</i>	Building stones, marlstone, limestone, chalk	Gravel, sand, clay, kaolin	Gravel, sand, clay, kaolin	Gravel, sand, clay, kaolin	Heterogeneous, with a slight prevalence of gravel, sand, clay, kaolin
<i>Revenues (.000 euro) (*)</i>	12,812.29	4,238.89	4,180.25	7,456.71	9,139.81
<i>Field of application</i>	Product and Production Process	Product and Production Process	Product	Production Process	None
<i>When?</i>	< 5 years ago	Between 2 and 5 years ago	Between 5 and 10 years ago	< 10 years ago	None
<i>% Investment on Revenues</i>	> 5%	0.1 % - 0.5%	> 5%	1% - 5%	None
<i>Investment Trend</i>	Increasing	Stable	Increasing	Stable	None
<i>Funding</i>	Private	Private	Private and public	Private	None
<i>Profit (.000 euro) (*)</i>	1,387.07	90.67	32.25	-212.93	-3,283.88
<i>ROE (*)</i>	0.79%	1.33%	1.25%	-7.57%	-9.13%
<i>ROI (*)</i>	4.79%	1.89%	1.25%	0.71%	1.31%
<i>ROS(*)</i>	5.64%	3.22%	1.75%	3.43%	-2.94%
<i>(*) average values of firms in each cluster</i>					

Discussion and managerial implications

The literature review shows that most applications of the triple bottom line approach have been more philosophical than practical. In cases where a measurement mechanism is used, this is primarily adopted from the business side only (Faux and Dwyer 2009). Although the importance of the triple bottom line for manufacturing firms is recognized, in this work we focus mainly on the economic results of firms that had decided to adopt green policies without quantify the impact of social and environmental dimensions.

In fact, some researches have pointed out that managerial practices that are focused on environmental sustainability (recycling, waste reduction, remanufacturing, environmental design, and surveillance of the markets) have a positive impact on firm performance (Montabon, Sroufe, & Narasimhan, 2007).

The results of the research lead to further reflections.

First of all, most of the investments try to pursue eco-efficiency strategies to optimize the use of resources and to strengthen firms reputation. The majority of the respondents exploit eco-friendly production processes in terms of pollution control, waste minimization (CO₂ and noise), product and resources reusing and recycling. This aspect will probably strengthen firms' reputation among environmentally sensitive stakeholders.

However, evidences point out that for the majority of respondents the adoption of environmental sustainability policies is mainly based on institutional goals rather than on strategic ones. It is also interesting to note that although these policies have not a pure monetary return for the respondents (cost reduction and / or turnover increase), they are considered by some of them as a driver of relationships with the external environment and can be seen like something that can differentiate the firms over their competitors in terms of image and firm value (Jacobs, Singhal, and Subramanian, 2010).

Especially the medium sized enterprises belonging to the first cluster recognize the constraints of the law as a pressure element towards the adoption of green policies. Nonetheless, at the same time they are seeking to capitalize on the competitive advantages and strengthen their reputation with the promotion of environmental sustainability. The constant and considerable investments are then paid off in economic terms. In fact, consolidated firms in cluster 1 show the best business performance.

The firm size does not seem a factor that explains the effects of environmental sustainability on firms' performance. Indeed, despite their small size the proactive point out a satisfactory business performance.

Cluster 5 also proves the correlation between the adoption of green policies and business performance. In fact, the non green firms that do not consider environmental sustainability as a strategic asset, show the worst economic performance. They are not sensitive towards the implementation of environmental strategies and they do not perceive as positive the relationship between eco-investments and economic benefits. An explanation can be found in the trade-off between additional costs for sustainability efforts and its benefits. For instance, investments in sustainable manufacturing technologies pay off to a certain degree due to higher efficiency and resource savings, but at the same time this is only true until the additional costs exceed the realized marginal benefits.

Aside from companies "not green" respondents, investments in environmental sustainable activities do not go down. The majority of enterprises have been constantly investing on green solutions for energy minimization, materials reduction, and / or pollution prevention. However, more efforts in sustainability do not lead per se to better performance, being reachable only until a certain threshold. Firms like those in cluster 4, taking a very proactive approach in sustainability, tend to overinvest in the green approach and go beyond the optimal effort-performance ratios.

Another interesting point is almost the total lack of government incentives the firms can access in order to obtain additional financing and / or alternative resources. The empirical research shows the need to create and promote public initiatives to support firms on environmental management. In fact, the percentage of enterprises that have not yet begun the process of adopting sustainability practices appears to be quite high for an industry where environmental protection is a fundamental element.

To synthesize, the research confirms the findings of Molina-Azorin, Claver-Cortés, Lopez-Gamero and Tari's work (2009) in which they state the influence of environmental management on financial performance. Although results are not univocal, the authors find a predominance of studies providing evidence for a positive impact of green management on economic performance.

Limits of the research and future developments

The present study presents some limitations. First, the small sample does not allow any statistical representativeness. It is nonetheless a starting point for further investigation. Furthermore, although cluster analysis is a technique based on mathematical and statistical principles, it has a subjective component on the interpretation that the researcher gives to groups.

Besides, the economic sphere from the triple bottom line is mostly taken into account. Environmental and social aspects were not measured through indexes. For further researches it would be desirable to include in a quantitative way these pillars too. It also seems very interesting develop a qualitative research together with the quantitative survey in order to better interpret the questionnaire data and, above all, to highlight some best practices in the mining industry.

Exploring The Relationship Between Green Innovations And Internationalization

Abstract

Consumers, policy makers, NGOs and other stakeholders are increasingly challenging firms to reduce environmental impacts of their products and processes. The fragmentation of production activities among different firms, geographically dispersed and independent one from the other poses peculiar challenges for firms that seek to achieve this aim, especially when they are embedded in supply chains involving countries where environmental standards and consumer awareness are quite different. In this paper we investigate the relationships between internationalization and firms' eco-innovation strategies, considering both for upstream and downstream internationalization. Based on original data on Italian firms specializing in traditional industries, we analyze the relationship between the geography of firms activities – as far as their presence in international markets, development of FDIs and engagement in relationships with global suppliers – and their environmental practices. Preliminary evidence suggest that, when it comes to green firms activities and their supply chains, geography matters.

1. Introduction

The environmental sustainability of firms and economic systems has become a priority. Firms are progressively becoming aware of the environmental implications of their activities of production and distributions and are starting to implement green practices to reduce such impacts. Studies exploring how firms are coping with those issues cover multiple perspectives (e.g. Kolk, Mauser, 2002), from green strategies (Orsato, 2009) to green innovation (De Marchi, 2012), from more focused marketing-based approach (green marketing, Polonsky, 1994) to green supply chain management (Srivastava, 2007). According to most of the contributions, the core idea is that the firm alone cannot effectively and efficiently manage and reduce the environmental side of its economic activities, due to the complexity of the matter as well as the interdependence occurring across actors and processes (also worldwide).

On the one hand, literature has focused on identifying alternative paths toward greening, by considering the pro-active vs. reactive approaches of the firm in adopting more sustainable behavior (Buysse and Verbeke, 2003). In this term it is important to consider the role of the firm within the value chain, where lead firms are usually observed as the actors that push upstream value chain to be greener. From a strategic point of view multiple drivers can affect sustainability strategies (González-Benito and González-Benito, 2006), combining regulation, technological improvement as well as market changes. On the other hand, studies have explored the processes and the functions more interested by sustainability initiative, by emphasizing the marketing side (green marketing), the innovation side (eco-innovation) or the side of operations (eco-efficiency) and supply chain management (green supply chain management). The firm can invest in developing capabilities in one or more of the mentioned areas (Hofmann et al., 2012) as starting point for increasing its environmental sustainability, with hopefully also positive implications on firm's performance (Hitchens et al., 2004).

Despite this growing body of literature, scholars have instead given less emphasis on the relationship between greening and internationalization. While the attention for the geographical dimension of economic activities and its impacts on sustainability is generally considered, many studies focused on the role of proximity among actors to control and manage properly the environmental side of firms' behaviors (i.e. eco-industrial parks) (Roberts, 2004). Minor attention is devoted to explore in details the link between the degree of firm's internationalization and firm's greening strategies (Aguilera-Caracuel et al., 2012). The paper aims at shedding light on the connections between the level and characteristics of a firm' internationalization approach and its greening orientations. In this paper we investigate the relationships between internationalization and firms' greening activities, considering both for upstream and downstream internationalization. While the existence of a positive link between internationalization and the diffusion of environmental compliant behaviors and the development of environmental innovation is pretty established within the developing countries setting, on the contrary evidence on the developed country context is rather scarce and mixed. Based on original data on Italian firms specializing in traditional industries, we investigate the relationship between the geography of firms activities – as far as their presence in international markets, development of FDIs and

engagement in relationships with global suppliers – and their environmental practices, considering both big and small firms. Furthermore, we investigate how firm's innovativeness and marketing strategies is related to firm's environmental orientation.

2. Greening Strategies And Internationalization: Theoretical Framework

2.1 Firms And The Greening Of Economic Activities

According to Orsato (2009) firms have alternative strategic options to be green, on the basis of the focus of their competitive strategy (cost or differentiation) and the orientation of their environmental sustainability (process or product). Among the four directions, the two more interesting and polarized strategies are eco-efficiency, on the one hand (cost leadership/environmental processes), and on eco-branding on the other hand (differentiation, green product). The former asks for a business process reengineering (i.e. lean production, Dües et al., 2013) of internal activities, while the latter requires strong and marketing capabilities in order to convey the green meaning attached to the product to customers (Ginsberg and Bloom, 2004; Grant, 2007; Albino et al. 2009). The firm can position its product or the organization through Corporate Social Responsibility (CSR) initiatives (Porter and Kramer, 2006). In addition, especially when green-to-be products are concerned, innovation capabilities become also significant (i.e. internal R&D functions), since a continuous research on new materials, new design, or new components to be used can further contribute to reach the goal. Despite the opposite starting points, however, an overlap between the greening of products and processes emerge over time and the firm can increase and complete its transformation into a more sustainable firm through further improvements on both sides. To sum up, the firm has to develop dynamic capabilities that allow the organization better achieving its environmental goals (Berchicci et al., 2012; Castiaux, 2012).

Studies on eco-innovation have highlighted the characteristics and differences of such form of innovation compared to others (e.g. De Marchi, 2012, Wagner and Llerena, 2011), where firm's networking is crucial in order to gather key knowledge to be applied for greening purposes (van Kleef and Roome, 2007). On the one hand, eco-innovation is effective according to the level of absorptive capacity a firm has compared to the specialized environmental-related knowledge that has to be transferred (acquired). On the other hand, eco-innovation requires the development of relationships with a large and differentiated set of knowledge providers. Eco-innovation is not driven only by technological improvements (or leapfrogs) but is also related to institutional pressures (i.e. toward certifications) or market-driven (Rennings, 2000).

From a different perspective, studies on outsourcing (Oshri et al., 2011) and (international) fragmentation of production (Feenstra, 1998) have shown through multiple angles a progressive enlargement of manufacturing and distribution processes among different actors. Consequently, a more complete achievement of a firm's greening strategy can be obtained only by involving all the actors in the value chains – from suppliers, to distributors, to customers (e.g. Helg and Hultman, 2011). Compared to the downstream of the value chain, scholars have dedicated larger attention on upstream greening transformations of economic activities (Seuring and Müller, 2008). According to Srivastava (2007) green supply chain management (GSCM) means “integrating environmental thinking into supply-chain management, including product design, material sourcing and selection, manufacturing processes, delivery of the final product to the consumers as well as end-of-life management of the product after its useful life” (p. 54-55). Studies stressed the role of leading firms in pushing environmental improvements of suppliers (e.g. Kogg, 2003). Scholars suggests that, in order to change suppliers' attitudes and behavior toward sustainability, those nodal firms develop specific mechanisms of knowledge transfer and technical cooperation, by changing the mechanism of governance of supply chains from market to more relational-based forms (Geffen and Rothenberg, 2000; Simpson and Power, 2005; Tseng and Chiu, 2013; Chan et al., 2012).

2.2. Exploring The Link Between Greening And Internationalization

The geographical scale of economic activities is a crucial issue from a sustainability point of view. Spatial proximity among actors involved in the manufacturing processes can reduce environmental related costs and impacts (i.e. lower carbon footprint) and increase the effectiveness of firm's green strategies. The more fragmented and dispersed the productive process, the higher the potentially negative environmental consequences.

Few studies have highlighted the role of spatial agglomeration as a crucial element to consider in order to evaluate the scale of environmental impacts. Moreover, territories in which the economic activities are carried out can influence the firm's orientation toward sustainability (Clini et al., 2008). From this point of view, some scholars have focused their attention on the promotion of sustainable economic activities by applying the principles of industrial ecology to economic systems, specifically through the promotion of eco-parks or eco-clusters (e.g. Coté and Cohen-Rosenthal, 1998; Dimitrova et al., 2007; Wallner, 1999). "Industrial ecology offers unique opportunities to add value to manufacturing firms located in a cluster. The clustering of firms with similar waste and by-product streams create opportunities to concentrate and minimize the collection costs of waste in one location. [...] Industrial ecology thus has the potential to create opportunities to add value to industrial production through synergies and business networks that form naturally in clusters" (Roberts, 2004, p. 999). Other studies have discussed about the environmental transformation of industrial districts (Becattini et al., 2009) as important contexts where to test and promote green initiatives, due to the high concentration of firms specialized in the same industrial activity in a delimited area, also socially cohesive (Battaglia et al., 2010).

An opposite perspective explores the global dimension of economic activities, taken for granted the spatial dispersion of production and consumption. Studies on global value chains (e.g. Gereffi, 2005) explored the international organizations of industries and how lead firms – either producers or buyers – drive those processes in a global setting, with also environmental implications (Handfield et al., 1997; Jeppesen and Hansen, 2004; De Marchi et al., 2013). Studies on large global buyers (i.e. IKEA, see Ivarsson and Alvstam, 2010) for instance show how the global production and sourcing strategy of large corporations can impact on the environment in positive or negative terms, where low-income countries (and captive suppliers) may be affected by the detrimental aspects of such strategies (Ehrgott et al., 2010). However, few studies highlighted also the positive consequences on firms and economic systems of emerging countries in terms of spreading of environmental practices among local firms (Sandhu et al. 2012; Zhu et al., 2012).

Studies on sustainable global supply chain management (Reuter et al., 2010; Carbone et al. 2012) explore how to select and manage suppliers at the international level to cope with environmental requirements. Specifically, in order to face the growing orientation toward sustainability (environmental and social one) of consumers and stakeholders in Western markets (e.g. Buysse and Verbeke, 2003), Western companies have to set up appropriate GSCM strategies such as certification requirements of suppliers or external audit (Reuter et al., 2010).

Despite those studies we think that further theoretical research is needed in order to describe the link between the environmental proactivity of a firm "understood as the voluntary implementation of practices and initiatives aimed at improving environmental performance [...] manifest through different strategies, each characterized by a series of environmental practices" (González-Benito, González-Benito, 2006, p. 88) and the firm's degree of internationalization, with specific attention to eco-innovation practices.

In addition to external drivers, according to González-Benito and González-Benito (2006) there are different company features that affect environmental proactivity: company size and resource availability, internationalization, position in the value chain, managerial attitude and motivations, and finally strategic attitude. Concerning internationalization, a multinational firm can benefit from being located in many countries (both for production or commercial purposes, i.e. through foreign direct investments, FDI) in terms of new knowledge inputs as well as regulatory or other market constraints that push the firm to increase its environmental standards also at the entire organizational level (see also Peng et al., 2009).

Aguilera-Caracuel et al. (2012) studied the relationship between the firm's international experience and its impact on environmental strategies. The authors focused specifically on export activities measured in terms of number of years a firm is exporting – to capture how knowledge and capabilities the firm has acquired and developed abroad can increase its response to international demand for environmental products, processes (services) or technologies (eco-innovation) - and the degree of export diversification – to capture how the firm can replicate and exploit knowledge and experience about environmental related practices across markets (countries). They found that only export diversification impacts on the firm's probability to adopt environmental strategies.

Kennelly and Lewis (2002) explored the relationship between the firm's degree of internationalization and environmental performance, by obtaining positive results. Cainelli et al. (2012) couple the analysis of spatial proximity and agglomeration economies (characterizing cluster-related literature) with internationalization strategies and their

implications on firms' environmental innovation. By exploring a sample of Italian small and medium enterprises located in industrial clusters, they did not find a direct and clear connection between internationalization of a firm and its environmental innovation activities, both considering export propensity and the presence of (inward) foreign direct investments. Similar results emerge in De Marchi and Grandinetti (2012), which, using data on the Italian community innovation survey, find evidence that firms that do export at least part of their products abroad are not more likely to introduce green practices but firms part of a foreign group does.

Based on these theoretical premises our hypotheses are as follows:

H1 – Firm's local sourcing is positively related with the eco-innovation practices of the firm

H2 – The firm's export intensity is positively related with the eco-innovation practices of the firm

H3 – The presence of firm's FDI is positively related with the eco-innovation practices of the firm

H4 – Multinational ownership of the firm is positively related with the eco-innovation practices of the firm

3. Going Green Means Also Going Global? Evidences From The Italian Firms

3.1 The Empirical Context

In order to test the hypothesis on the relationships existing between the eco-innovation attitude of firms and their internationalization strategies, we use data from an original dataset gathered from the TeDIS Center within a survey aimed at monitoring the evolution of competitive strategies of Italian companies. We will focus on a sample of 684¹ firms randomly selected from the population of the companies with a turnover higher than 1 million Euros (2009 last balance sheet available), belonging to the so called Made in Italy sectors (primarily fashion, home products and furniture, mechanics, but we also include electronics, plastics and rubber) and stratified by industry and size. Companies have been extracted from the AIDA database (including 51.048 companies with the mentioned characteristics); the survey was conducted during May-July 2011 through phone interviews on a structured questionnaire addressing the entrepreneur, the general manager or a sales manager, according to the size and internal organization of the firm contacted.

3.2 The Variables For The Analysis And Descriptive Statistics

The dataset employed allows to adopt a subjective approach to the identification of environmental innovations, similar to what has been employed in several of the most recent analysis on environmental innovations based on community innovation survey (CIS) data (see e.g., De Marchi, 2012; Borghesi et al 2012; Horbach et al. 2012). In other words, the identification of green innovators is based on self-reported information. The questionnaire included two questions useful for the identification of such firms. The first asked firms to report if they have introduced any process innovation aimed at improving environmental sustainability and was used to build the dependent variable EI-PROC, which is a dummy. The second question used to build the dependent variable asked firms about the attributes that make their product new, in case they reported to have introduced a product innovation. Firm could select all the attributed that apply among the following: a) aesthetical design, b) material employed, c) embedded technology, d) functionality, e) service, f) reduced environmental impact. Given the low number of firms reporting that their products were new for their environmental characteristics (58 firms, representing the 8.5% of the sample), we did not perform the analysis just on environmental product innovators but considered them through the variable EI-PRODPROC. The variable EI-PRODPROC is a dummy valuing one if the firms have introduced any product innovation whose novelty was the reduced environmental impact or any process innovation with environmental benefit (EI-PROC).

To test hypothesis 1 on the role of local sourcing for firm's environmental innovation propensity we include in the analysis the variables LOCALSUPP and OUTSOURCING. OUTSOURCING values 1 if the firms outsource at least part of their manufacturing activities and rely on suppliers: LOCALSUPP, instead, is a continuous variable reporting the share of suppliers of the firm, if any, that are located within the industrial district, local labor system or region the firm is located in. In order to understand if firm's export intensity is positively related with its eco-innovation practices (Hypothesis 2) we employ a question of the questionnaire asking interviewees to report the share of their turnover done on foreign markets. The dummy EXPORT50 captures if the firm has a strong export propensity: it values 1 if more than half of its turnover is done serving non-Italian customers. The dichotomous variable FDI has been introduced to test Hypothesis 3 on the role of foreign direct investments and consolidates information coming from

different questions. More precisely, it indicates if the firm has a) fully owned or participated investment for manufacturing; b) commercial branches; c) franchising store, or d) proprietary store. Finally, to verify the hypothesis on the existence of a relationship between the introduction of environmental innovative practices and the participation to a multinational group (Hypothesis 4) the variable FOREIGNFIRMS was introduced, valuing 1 if the firm is part of a group whose headquarters are abroad or if the group is Italy-based but includes firms located abroad.

In addition, we include a number of control variables regarding structural characteristics of the firms and their innovation strategies. Several studies reported the positive role of the presence at firms of environmental management system (EMS), including the EMAS or ISO14001 certification schemes, on their attitude toward environmental innovations, especially those regarding the production process (e.g., Wagner, 2007). We therefore include the dummy CERTIFIED, which values 1 if the firm has obtained or is in the process of obtaining any environmental certifications. Considering that the literature reports that size affects eco-innovation propensity (see e.g., Del Rio Gonzalez, 2005, 2009; De Marchi & Grandinetti, 2012), emphasizing the difficulties of small and medium enterprises in facing the complexity of environmental innovations and the investments needed to switch to greener technologies, we include in the analysis the dummies MICRO and SMALL, equal 1 if the firm has less than 10 employees or more than 10 and less than 50, respectively. Moreover, we control for the innovative strategy of the firms with the variables R&D and COLLABORATION, the first measuring the existence of internal inputs of the innovative activities (in terms of presence of a structured R&D internal activity), the second to external ones. The questionnaire has a question asking respondents to report if they cooperate on innovative activities with any of the following knowledge partners: a) Italian universities; b) foreign universities, c) scientific parks; d) Italian research centers; e) foreign research centers; f) local service centers; g) other (including consultants, certification agencies and the like). COLLABORATION is a measure of the openness of the firm in its innovation activity: it is a count variable reporting how many of those knowledge partners the firms cooperate with, taking on values from 0 to 7. Finally, we control for industry specialization – including four industry dummies² – capturing the impact of different policy restrictions and consumers’ awareness in different sectors. Table 1 lists the definition and the descriptive statistics of the variables used in the analysis and Table 2 below report the simple correlations among the regressors.

[1] TABLE 13: DESCRIPTION AND DESCRIPTIVE STATISTICS OF THE VARIABLES USED

Name	Description	Mean	S.D.
EI-PROC	Green process innovators	38.16%	48.61%
EI-PRODPROC	Green process or product innovators	41.08%	49.23%
LOCALSUPP	% supplier from the district or region	41.74%	45.46%
OUTSOURCING	Firms outsourcing at least some activities	63.89%	48.07%
EXPORT50	Firms exporting more than half of their turnover	29.51%	45.64%
FDI	Firms having FDI	18.42%	38.79%
FOREIGNFIRMS	Firms part of a group affiliating foreign firms	19.74%	39.83%
CERTIFIED	Certified firms	22.37%	41.70%
MICRO	Firms with less than 10 employees	10.43%	30.59%
SMALL	Firms with less than 50 employees	53.20%	49.93%
R&D	Firms implementing R&D activities	50.29%	50.04%
COLLABORATION	Number of knowledge partners the firms cooperate on innovation with (0:7)	0.462	0.976
FASHION	Fashion industries	17.54%	38.06%
HOME	Home furnishing industries	16.37%	37.03%
MECH-PLAST	Mechanics, electronics, plastics	59.50%	49.13%
OTHER	Other industries	6.58%	24.81%

As reported in Table 1, firms that have introduced any process innovations that reduce environmental impacts represent the 38.16% of the sample. Environmental product innovations are much less diffused, being introduced just by 8.48% of the interviewed firms. It is interesting to notice that the great majority (65.52%) of firms that have introduced product innovations have introduced also process ones, suggesting that the development of product with environmental features implies changes in the production processes. This overlap between the two approaches toward the reduction of environmental impacts – those targeting the product and the process – explains why the incidence of firms that have introduced one or the other (EI-PRODPROC) is just slightly bigger than that of firms introducing just process ones (EI-PROC), being 41.08% and 38.16% respectively. The diffusion of certifications among the firms part of the sample is lower (29.51%) but in line with evidence coming from other empirical contexts (see e.g., Gonzales et al. 2008)

The majority (63.89%) of firms part of the sample outsource at least part of their production activities: 10.23% of the firms reported to be responsible just for the logistic activities, being neat examples of the so-called “manufacturers without factories”, whereas 53.65% focus on some activities and rely on suppliers for others. On average, a great part of such suppliers (41.74%) are local, being located within the same region or even the same industrial districts, whereas foreign suppliers represent still a minority (on average, 11% of the total number of suppliers): 72.66% of the firms do not have any supplier outside the Italian border. On the contrary, firms are quite open to international markets: 75.23% of the firms do export and export amount to 32.60% of the overall turnover, on average. The share of firms that earn the majority of their turnover in such markets (EXPORT50) is 29.51%. Almost one firm out of five has foreign direct investments (FDI), being them productive or commercial, and a similar incidence describes companies part of a group that affiliate firms located abroad (FOREIGNFIRMS).

The majority of firms of the sample are small, which is coherent with the distribution of firms in the empirical setting considered: Italy. 63.63% of interviewed firms have less than 50 employees, among which 10.43% can be defined micro firms, having less than 10. However, the sample includes also bigger firms, mainly medium-sized firms, namely companies with more than 50 and less than 250 employees, which represent the 30.85% of the sample. As far as their innovative activities are concerned, half (50.29%) of the firms interviewed have an internal R&D capacity whereas just 26.32% of them cooperate with any knowledge partners on innovation. 15.35% cooperates with just one typology of the partners listed; on average they cooperate with 0.46 partners. It is interesting to notice that Italian universities are by far the partners they cooperate more likely with, among the ones listed. Table 1 reports also the firms’ industry specialization: 59.50% of the firms work within the mechanics, electronics or plastics industries, followed by firms specialized in fashion industries, represented the 17.54% of the sample and in the home-furnishing (16.37%).

3.3 Green Process And Product Innovators And Internationalization

Since the dependent variables of our model are dummies, we implement a logit regression, which identifies the relationship between the measures of internationalization and the controls we used on the probability to introduce an environmental innovation with respect to not introduce it. Table 3 reports the results of such regression considering environmental process innovation (EI-PROC) and product or process innovation (EI-PRODPROC) as dependent variables.

[2] TABLE 3: LOGIT REGRESSION, EXPLAINING THE PROPENSITY TO INTRODUCE PROCESS EI (EI-PROC) AND PROCESS OR PRODUCT EI (EI-PROD)

	EI-PROC		EI-PRODPROC

We find strong evidence that firms that, when outsource part of their manufacturing activities, rely on local suppliers are more likely to introduce environmental innovations; the coefficient of LOCALSUPP, in fact, is positive and highly significant. Interestingly, the coefficient of OUTSOURCING is significant but negative, meaning that firms that perform internally all the steps needed to produce their product have higher probabilities to introduce products or processes that lower the impact on the environment. If we found evidence to support Hypothesis 1, the contrary is true for Hypothesis 2 that suggests the existence of a positive relationship among firms' export propensity and their attitude toward sustainability. Actually, the coefficient of the dummy we use to proxy export (EXPORT50) is negative, even if it is significant just at the 10% level. It is worth reporting about the results that we obtained when regressing different variables capturing export strategies, including the incidence of foreign markets on total turnover and a dummy reporting firm's export propensity. The coefficient of such proxies, in fact, were negative even if not significant, which is in line with results proposed in other analysis on similar empirical contexts.

As far as hypothesis 3 is concerned, which postulate the existence of a positive relationship between the firm's eco-innovation propensity and its direct investment in foreign countries, we find no support. The same result was found when controlling just for FDI regarding manufacturing activities or commercial ones, and also when considering just those targeting emerging economies, which suggest the robustness of this evidence. Being part of a group composed of firms located abroad (FOREIGNFIRMS) is positively correlated with the introduction of both process and product innovations, giving support to hypothesis 4. The participation in multinational groups may represent for firms a fruitful occasion to learn about new eco-innovation possibilities or about best practices characterizing other countries³.

Results presented are consistent across the two models – the one measuring just process EI propensity, the second both product and process EI propensity – except for control variables. Interestingly, size appear to be a matter

especially when product innovations are concerned, whereas there are not significant differences between micro firms and medium or big ones when it comes to process EI introduction. This evidence is consistent with the fact that product innovations are more complex and may therefore benefit from the existence of a larger stock of resources at the firm, being them financial or technological. Moreover, bigger firms may experience higher incentives to introduce green products, either because they are better able to exploit their potential on the final markets, thanks to their brand and communication effort, or because they are willing to avoid reputation risks, higher for more visible firms. On the contrary, process EI results often in the application of end-of-pipe technologies or the implementation of eco-efficiency measures, which are practices that are nowadays accessible (if not compulsory) even to smaller firms. Another interesting result emerging from the analysis of the coefficients of the dummies capturing the size effect regards the fact that returns of size to EI propensity seems to be not linear: in fact, in the model using EI-PROC as a dependent variable, the coefficient of SMALL is significant, whereas that of MICRO is not. Such analysis may be interpreted as evidence that also very small firms may be proactive in considering environmental sustainability issues in their activities or, in other words, that sustainability is not a matter just for big firms. As far as control variables considering for the firms' innovative effort are concerned, the coefficient of R&D is not significant, whereas COLLABORATION is, even if just at the 10% level in the first model presented. Finally, results support the existence of differences in EI propensity across sectors, which varies when considering process or both process or product innovations.

4. Conclusions And Future Research

The aim of this paper is to investigate the relationship between internationalization and environmental innovation of firms, both in terms of process and product innovation. The internationalization processes going on downstream and upstream suggest that a firm's greening strategy needs the involvement of the whole value chain. However, the literature is quite controversial about the impact of the internationalization on the environmental companies' proactivity. On one side, spatial proximity among actors can reduce negative environmental impacts and increase the effectiveness of green innovations; on the other, multinational with dispersed locations can access multiple sources of knowledge and be stimulated by different regulations to improve environmental standards. Besides, while some studies have found a positive relation among international experience and environmental strategies, other give less straightforward results.

Our results show that in our sample of Italian firms specialized in traditional manufacturing industries the probability to invest in product or process environmental innovation is higher when the company does not outsource the production or the suppliers are mainly local, within the same cluster or region. This could be interpreted as a need to strictly govern the environmental innovation in order to get results on the market. An environmental innovation is more effective when it involves the whole value chain and it is positively perceived by the final customer. Hence, this is feasible when the suppliers are close (also from a cognitive point of view), but it could be very difficult to carry out eco-innovation practices if they are geographically dispersed and the company does not have enough market power. Otherwise, vertical integration allows being more independent in developing eco-innovation strategies.

On the downstream side, we find a negative correlation between export propensity and environmental innovation. Confirming other researches (see e.g., De Marchi, 2012, De Marchi and Grandinetti, 2012; Borghesi et al., 2012), while the export performance is usually positively related with the more general innovation effort of a firm (e.g. Roper and Love, 2002), it seems not to be compatible with innovation strategies aimed at reducing the environmental impact of firm's activities. One reason, in our case, could be the fact that Italy is considered among the countries with a high environmental propensity being part of the EU, becoming an ideal market for green firms, compared to other markets. Being characterized by a level of consumer awareness and of policy stringency similar to that of the most advanced markets, as for environmental practices, firms based in Italy do not find additional incentives to introduce product or process innovations entailing lower environmental impacts when exporting.

Finally, belonging to a multinational group reinforces green strategies, both because the group becomes a crucial source of knowledge and the company can take advantage of intra-group synergies. Three are the only structural firm variables of those included in the analysis that seem to be related to the environmental proactivity as

far as eco-innovation is concerned: a) the presence of an environmental certification; b) the size, and c) the propensity to innovate within a network of collaborations, especially when product innovation is concerned.

Summing up, our results offer interesting insights on the link between the firm's internationalization and its environmental attitude, by stressing a twofold path in this direction. On the one hand, the less internationalized the production value chain, the higher the probability to invest in green processes or products. On the other hand, the opposite relationship appears when considering the *knowledge* value chain. In fact, the company benefits from being inserted in an international group and being open in the process of innovation development, cooperating with national and international research partners.

We think these results can contribute to the stream of research about the determinants of environmental innovation, that is still young especially when the focus is the impact of a firm's internationalization. Nevertheless, this study suffers some limits due to the definition of process and product innovation, that was considered only in general terms and that do neither control for the intensity of the eco-innovative effort, nor distinguishing between firms introducing a high or a low number of EIs, which can lead to very different results (see e.g.. De Marchi and Grandinetti, 2013). Future research is needed to better analyze the role of internationalization, going more in depth in investigating if the geography of exports (countries served) is related to different green strategies impact of firms propensity to include environmental concerns in their innovation activities. In fact, our analyses indicate that the relationship between the environmental innovation and export may not be linear and straightforward and encourage to further the analysis considering for different market destinations' characteristics and to interact such variables with other characteristics of the firm's strategy.

End Notes

¹ From the 718 firms initially included in the dataset we excluded firms that declared that their main activities is to produce services and which were not specialized in Made in Italy sectors, which amounted to 34 firms.

² Based on the ATECO Italian classification, the following industries have been considered: fashion (13 textile, 14 clothing, 15 leather), home products and furniture (16 wood, 31 furniture, 23 products not based on metals), 25 mechanics, 26-27 electronics, 22 plastics and rubber, other manufacturing industries (17 paper, 28 machinery, 29 automotive, 30 transportation).

³ This result is driven by the multinational dimension of the group and not by the participation to the group itself: we performed the above presented analysis including a variable capturing this second effect and its coefficient was not significant, whereas that of FOREIGNFIRMS was still positive and significant.

Dynamics of Corporate Social Responsibility in Albanian Joint Stock Companies

Abstract

As an important component of “good” Corporate Governance (CG), corporate social responsibility (CSR) boosts foreign investment opportunities, which are of crucial importance in transitional economies such as Albania. For this reason, and based on an application of the Delphi technique, this paper aims to analyze the evolutionary patterns of CSR in Albania. In spite of the panel members’ good knowledge about the rights of other stakeholders, such as employees, creditors and suppliers, the results of our 2-year study demonstrate that the participating Chief Executive Offices (CEOs) did not consider these other stakeholders, and thus CSR, crucial in terms of CG practices. In light of the results, we recommend companies to implement a permanent dialog with these stakeholders in order to further improve their long-term performance. The Albanian government should also be more active in supporting companies and promoting the development of CSR policies, which are determinants of market opportunities and economic development.

Keywords: *Corporate Social Responsibilities, Development Prospects, Sustainable Growth, Albanian Joint Stock Companies, Delphi Technique.*

Introduction

Commitment to Corporate Social Responsibility (CSR) means rehabilitating corporate image on the market and involvement of all the interested stakeholders. Several studies have shown that companies have faced over the years substantial financial losses as a result of social and environmental problems or incidents. From this premise, firms all over the world are increasingly incorporating social strategies and CSR initiatives into business strategies, giving a positive response to the citizens’ demands (Fernández and Souto, 2009). According to Van Dijken (2007) and Rezaee (2009) among others, CSR can influence “values” by reaffirming the need to have codes of conduct and ethical standards in place. CSR is therefore an important component of conceptual value added and can shape the mission and vision of companies beyond shareholder value maximization (Gyves and O’Higgins, 2008). Furthermore, the positive attitude of foreign and domestic business investors towards socially responsible projects is becoming part of “good” CG practices. In this sense, CSR mechanisms implementation may be seen as a long run intangible asset, linked with reputation risk, and an opportunity to attract potential foreign investors, which have particular importance in transitional economies such as Albania.

Based on this initial background, and grounded on the outcomes of a panel of Albanian Chief Executive Offices (CEOs), this paper aims to analyze the evolutionary patterns of CSR practices in Albania and to provide development prospects. In particular, in order to identify and compare CSR practices in Albania before and after the 2008 financial crisis, we have identified the Delphi technique as an appropriate methodology for studying the level of CSR acknowledgment and practices used by Albanian Joint Stock Companies (JSCs). The investigation was conducted during 2 years (2012-2013), in the most representative cities in Albania, where the greatest number of Albanian JSCs are. In particular, this choice was supported by the lack of historical data and the absence of prior research using the Delphi technique to analyze the level of knowledge and implementation of CSR mechanisms in Albania. In this sense, the study contributes to current research by offering empirical results related to the application of the Delphi technique and forecasting CSR evolutionary trends.

The remainder of this paper is structured as follows: section 2 presents the literature review highlighting the most recent trends in CSR; section 3 presents a brief methodological background of the Delphi approach and justifies its application in the context of the present investigation; section 4 presents the results of our study; and section 5 concludes the paper.

Literature Review and Recent Trends on Corporate Social Responsibility

CSR is spreading globally as a new management concept. The term CSR came into common use in the early 1970s, after many multinational corporations were formed (Pop *et al.*, 2011). Following this, and according to the literature, there have been many attempts to define the CSR concept. CSR is a form of corporate self-regulation mechanism and/or a business model by which firm monitors ensure its compliance with the law, ethical standards and international norms (Pop *et al.*, 2011). According to Garay and Font (2012: 329), CSR is “*a complex term broadly defined as the active and (sometimes) voluntary contribution of enterprise to environmental, social and economic improvements [...]*”.

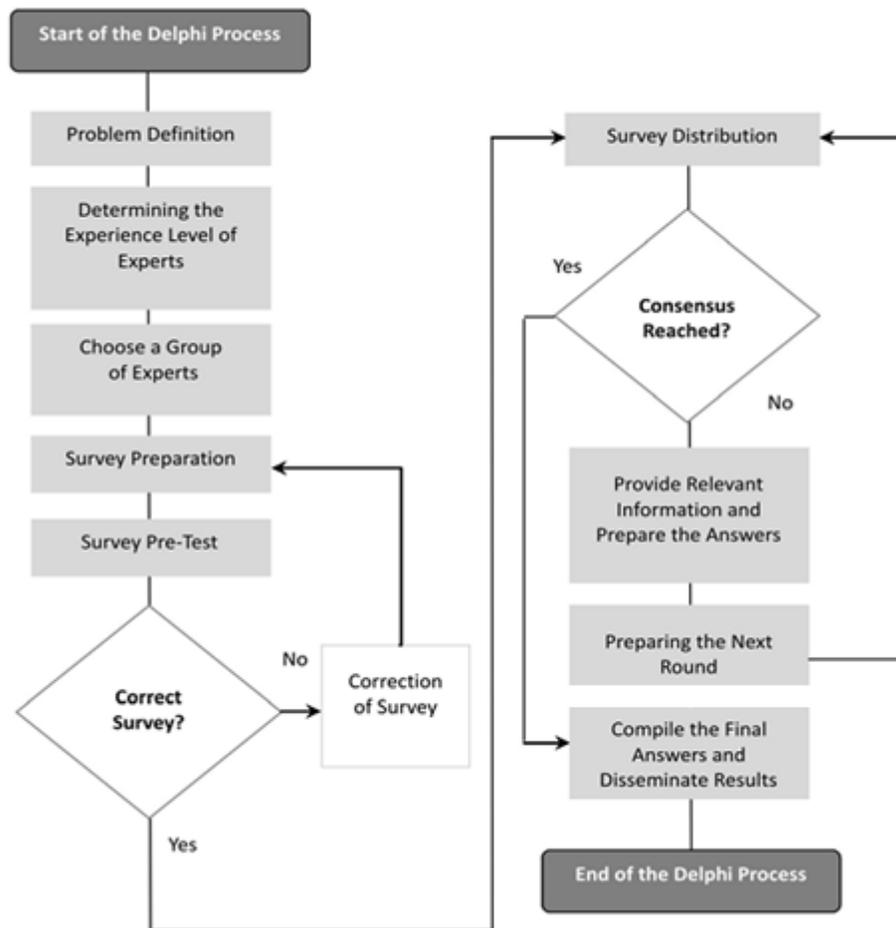

Commitment to CSR is seen as a path to a wide range of benefits. Specifically, these benefits can be classified into *monetary* (*i.e.* direct financial effects) and *non-monetary* (*i.e.* do not directly lead to cash flows but can be measured in monetary terms) benefits. In this sense, and based on the contribution of several authors such as Aguilera *et al.* (2006), Crowson (2009), Duhé, S. (2009), Fernández and Souto (2009), Ammann *et al.* (2011), Chen (2011), Green and Peloza (2011), and Garay and Font (2012), who investigated the relationship between social and financial performance, there are six main areas of CSR business benefits: (1) *company image and reputation as a responsible business*, linked to increased market share and maintenance of key personnel, directing investors’ confidence towards CSR, namely because many investors consider the manner in which a company manages its social, environmental and ethical challenges as indicators of management quality; (2) *enhanced positive effects on employee retention, motivation, productivity and recruitment*; (3) *cost savings* (*e.g.* re-designing processes with CSR green parameters or reducing waste – actions that often simplify operations and save money); (4) *revenue increases from higher sales and market share* (*e.g.* CSR creates emotional, social, and functional value for consumers), thus enhancing firm value (*i.e.* revenue increases can be achieved indirectly through an improved brand image or directly; *e.g.*, by CSR-driven product or market development or selective election by consumers); (5) *risk management and reduction* (*e.g.* negative press or customer/NGO boycotts); (6) *strengthen company market position and competitiveness*; and (7) *changing relationships all along the value chain*, based on trust and doing things the right way with suppliers and customers. From this premise, even in scenarios of economic adversity, and despite the cost associated to CSR implementation, CSR can be seen as a fundamental opportunity and/or a tool in developing and redefining winning strategies (*e.g.* innovation, comfortable atmosphere and deep internal reflection) and overcome turbulent situations (Fernández and Souto, 2009).

Based on the discussion presented herein, we can conclude that CSR will be an ever evolving proactive concept and will be influenced by differences in national background, stakeholder requirements, customer and business emerging needs and ever-changing business environment, which in turn is being faced with irresponsible business practices (*e.g.* the sub-prime lending crisis). In this sense, one may assume that the implementation of CSR standards may be seen as a tool to create competitive sustainable advantages for Albanian firms both in the region and in the European market. Furthermore, while Albania continues its path to the European membership, the integration of economic, environmental and social issues is a very important commitment for the business community and the society at large.

The next section presents the background of the Delphi technique, which is important to understand how the application of this technique can assist the analysis of the evolutionary patterns, and to provide development prospects for CSR practices in Albania.

Methodological Framework: The Delphi Technique

The Delphi technique was originally developed as a tool, in the 1950s at the *RAND Corporation*, Santa Monica, California, in order to foresight warfare decision making problems (*cf.* Dalkey and Helmer, 1963; Hsu and Sandford, 2007). According to Linstone and Turoff (2002), Ferreira and Monteiro Barata (2011), Von der Gracht (2012), Ferreira *et al.* (2013) and Worrell *et al.* (2013), among others, anonymity, controlled feedback and statistical treatment of group responses characterize the overall Delphi process. The method’s operational structure is shown in *Fig.1*.

(Source: Zapata in Ferreira *et al.*, 2013, adap.)

FIG. 1 Operational Structure of the Delphi Technique

The overall Delphi investigation begins with the problem definition and the selection of an expert panel. It then continues with the development of a structured survey, which implies the use of a series of questionnaires (in each round) to collect data and judgment from the panel. This iteration procedure, associated with the statistical feedback on the group responses, provides the experts with the opportunity to revise their views until a group consensus or stability in the responses is reached. As argued by Dalkey and Helmer (1963), the object of Delphi is to “*obtain the most reliable consensus of opinion of a group of experts [...] by a series of intensive questionnaires interspersed with controlled opinion feedback [...]*”. This procedure continues until the research question under discussion is answered or an adequate amount of information has been exchanged (Skulmoski *et al.*, 2007) (further details can be found in Dalkey and Helmer, 1963; Dalkey, 1969; Hsu and Sandford, 2007; Ferreira and Monteiro Barata, 2011; Ferreira *et al.*, 2013; Çipi *et al.*, 2014).

The Delphi method works particularly well in situations where there are no historical data or relevant information available about a problem or research phenomenon and that problem cannot be resolved by precise analytical techniques (Ferreira *et al.*, 2013; Çipi *et al.*, 2014). In this sense, it seems plausible to assume that the Delphi method suits the circumstances of the unexplored topic of CSR practices in Albania, regarding which there is very

little research and information. Furthermore, to the best of our knowledge, there is no prior research using the Delphi technique to analyze the level of knowledge and implementation of CSR mechanisms in Albanian JSCs. Following this, there is considerable scope to explore this methodological approach in the Albanian context. From a methodological perspective, a questionnaire survey was developed to determine the current level of CSR practices used by Albanian JSCs, to identify possible changes as a result of 2008 financial crisis and, finally, to forecast future trends. The results of our study are presented in the following section.

Analysis of the Results

Taking into consideration the aim of this study and the Albanian context (*i.e.* low number of CG experts), it was decided to include in the initial Delphi panel 80 JSC CEOs from Tirana, Durrës, Fier, Vlorë (where the greatest number of Albanian JSCs is concentrated), Shkodra, Tropoja, Elbasan, Gjirokastër, Lushnje and Saranda. The panel companies represent different types of JSCs (*i.e.* banking, insurance and other financial services). Also, some of them represent private JSC, while others stand for state-owned JSCs (established as such from the beginning or generated from special laws). The overall investigation lasted 2 years (2012-2013). After the first round, the number of panel members was reduced to 53 and, after the second round, only 37 members responded to the survey. Nevertheless, it should be emphasized, that there is no “ideal” or “exact” panel size for the application of the Delphi technique (Ferreira and Monteiro Barata, 2011). Therefore, responses from the 37 members in the final round assure the basis of our survey.

Sample Characterization

The characterization of the panel members (*i.e.* the 37 respondents of the 2nd round) is provided in *Table 1*, which shows that most respondents are *male* (70.3%), and between 43-47 years old (40.6%). As for qualifications, most of them hold a *higher academic degree* (67.6%), predominantly in *economics or management* (67.6%).

TABLE 1: CHARACTERIZATION OF THE RESPONDENTES [second round]

Delphi Panel		N	%
Gender	Female	11	29.7
	Male	26	70.3
	Total	37	100.0
Year of Birth	1952-1956	3	8.1
	1957-1960	3	8.1
	1961-1965	8	21.6
	1966-1970	15	40.6
	1971-1976	8	21.6
	Total	37	100.0
Qualifications	4-Year diploma	12	32.4
	MSc, MBA	20	54.1
	Ph.D.	5	13.5
	Other	0	0.00
	Total	37	100.0
Area	Economics/Management	25	67.6
	Engineering	8	21.6
	Other	4	10.8
	Total	37	100.0

A summary of data regarding the firms’ ownership structure is presented in *Table 2*. As can be seen, they are mostly controlled by individuals, foreign shareholders or domestic societies or state, indicating that the panel

companies have a concentrated ownership structure. This evidence was predicted by IFC (2008) and confirmed by Çipi *et al.* (2014).

TABLE 2: THE OWNERSHIP STRUCTURE (ownership of shares) OF PANEL FIRMS [n=37]

	Responses	N	%
Administration	0%	26	70.3
	10–50%	6	16.2
	100%	5	13.5
	Total	37	100.0
Employees	0%	34	91.9
	3–6%	3	8.1
	Total	37	100.0
Individuals	0%	11	29.7
	19–50%	3	8.1
	51–87%	6	16.2
	100%	17	46.0
	Total	37	100.0
Foreign investors or domestic society	0%	24	64.9
	40–76%	5	13.5
	100%	8	21.6
	Total	37	100
State	0%	25	67.6
	5–27%	4	10.8
	100%	8	21.6
	Total	37	100.0

Furthermore, ownership by administration or company employees is less common, indicating low incentives to distribute stock options among these stakeholders. However, having this type of incentives in place is necessary to effectively motivate workers and make them real stakeholders. *Table 3* provides a general overview of the companies' supervisory/administrative board dimension. As can be seen, boards have a relatively small number of members in their composition.

TABLE 3: THE BOARD SIZE AND COMPOSITION [n=37]

	Number	%
Total number of supervisory/administrative board	3–5	62.2
	6	21.6
	7–15	16.2
	Total	100.0
Number of company employees	1–2	68.2
	3–4	31.8
	Total	100.0

In particular, 62.2% of the panel members indicated that their company boards have 3-5 members; 28% indicated 6 members; and the remainder 16.2% indicated that the board has from 7 to 15 members in its composition. Additionally, the number of company employees as member of the board seems to be low, registering only 68.2% and 31.8% in the ranges 1-2 and 3-4 members respectively, indicating the relatively little “voice” given to these stakeholders

in the supervision/administration process of the company (according to the Albanian Company Law, the presence of employees in the boards is not mandatory, but it is seen as a “good” CG practice). The data obtained according to the structure of the questionnaire are presented in the next subsections.

Current Situation

The objective of this section was to determine the *level of acknowledgement of some important CSR mechanisms and their benefits*. Respondents were first asked to rank, by order of importance (*i.e. 1 = most important; 3 = third most important*) the three factors that they considered most important to affect the firm performance. According to *Table 4*, the majority of responses focused on *CEO’s power over the supervisory/administrative board* (with 48 points), followed by *stronger shareholders’ right* (40 points) and *quality of company’s regulations* (39 points). It is interesting to note that *Corporate Social Responsibility practices, other stakeholders’ rights and transparency issues*, as part of “good” CG practices, were given almost null importance as far as CG benefits go, possibly indicating a relative lack of relative importance attributed to such issues.

TABLE 4: BENEFITS PROVIDED BY THE IMPLEMENTATION OF CG MECHANISMS [n=37]

Benefits	Points
CEO’s power over the supervisory/administrative board	48
CEO’s reward	11
Composition and size of the supervisory/administrative board	35
Degree of ownership concentration	23
Implementation of corporate social responsibility practices	1
Number of independent members in the supervisory/administrative board	13
Quality of company’s regulations	39
Stronger shareholders’ rights	40
Taking into consideration the rights of the other stakeholders	5
Transparency and disclosure of the company’s information	8
Total	223

The establishment of a clear code of conduct and ethical standards may be a clear indicator for CSR measurement in Albania. In this sense, we tried to collect the information on the *availability of a code of conduct*. As can be seen in *Table 5*, most of the respondents affirm the *existence of the code of conduct* (75.7%), although 24.3% affirm the contrary.

TABLE 5: AVAILABILITY OF CODE OF CONDUCT [n=37]

	Responses	%
Availability of code of conduct	Yes	75.7
	No	24.3
	Total	100.0

The next question was based on a Likert scale from 1 to 5 (*1 = strongly disagree; 5 = totally agree*). Respondents seem to be favourably disposed toward corporations pursuing the interests of all stakeholders in addition to those of shareholders (*Table 6*).

TABLE 6: THE COMPANY GOAL IS TO ACHIEVE THE WELFARE OF ALL STAKEHOLDERS [n=37]

	Mean	Median	Standard deviation	Coefficient of variation

Besides making profit for shareholders, the company has the goal of achieving the welfare of various stakeholders, such as employees and customers	4.38	5.00	0.721	0.165
--	------	------	-------	-------

As can be seen, the results obtained are interesting, in particular given the apparent lack of importance given to the other stakeholders in terms of CG benefits mentioned before (see again *Table 4*, where the option *taking into consideration the rights of the other stakeholders* received 5 points).

The next question aimed to collect the opinion of the respondents about the recognition of creditors, employees, local community and suppliers. According to *Table 7*, and using a Likert scale from 1 to 5 (*1=inadequate level; 2=somewhat; 3=intermediate level; 4=good; 5=very good*), the panelists affirm to have a *good* recognition of the rights of those stakeholders.

TABLE 7: THE LEVEL OF STAKEHOLDERS RIGHTS [n=37]

	Mean	Median	Standard deviation	Coefficient of variation
Creditors	4.22	4.00	0.821	0.195
Employees	4.22	4.00	0.917	0.217
Local community	3.86	4.00	1.004	0.260
Suppliers	4.27	4.00	0.769	0.180

Comparison Between Two Periods

The objective of this part of the survey was to evaluate possible changes occurred to CSR mechanisms, as part of “good” CG practices used by the Albanian JSCs, as a result of the 2008 financial crisis. In this sense, the next question aimed to analyze the companies’ attitude toward CSR expenses. Most of the panel members (64.9%) pointed to a *reduction in the CSR budget*. However 27.0% argued *no influences on the company’s CSR budget* and a few of them indicated *increments to the company’s CSR budget* (8.1%) (*Table 10*).

TABLE 8: THE INFLUENCE ON THE COMPANY’S CSR BUDGET [n=37]

Responses	%
Has increased the budget	8.1
Has reduced the budget	64.9
Has no influence	27.0
Total	100.0

For the next question, we tried to understand the panelists’ opinion about what corporate governance mechanisms have changed as a result of 2008 financial crisis. On a scale from 1 to 5 (*1 = strongly disagree; 3 = neither agree nor disagree; 5 = totally agree*), *amount spent on CSR, board design* and *board tasks* received the highest punctuations. Still, it is worth noting that all items were punctuated with low scores, meaning that the changes occurred as a result of the global crisis are not as significant as one could initially think (*Table 9*).

TABLE 9: MAJOR CHANGES TO CG MECHANISMS [n=37]

CG Mechanisms	Mean	Median	Standard Deviation	Coefficient of Variation
Accounting standards	1.84	1.00	1.259	0.684
Amount spent in corporate social responsibilities	2.84	3.00	1.236	0.435
Board design	2.16	2.00	1.214	0.562

Board tasks	2.14	2.00	1.251	0.585
CEO evaluation and compensation	2.05	2.00	1.268	0.618
Concentration of ownership	1.62	1.00	1.037	0.640
Law and regulation (the company's statute)	1.84	1.00	1.302	0.708
Percentage of shareholders present in the meetings	1.59	1.00	0.985	0.619
Role of minor shareholders	1.32	1.00	0.915	0.693
Role of other stakeholders in decision making	1.84	1.00	1.191	0.647

Future Developments

This part of the survey sought to analyze the future perspectives of Albanian CEOs regarding the implementation of CSR. We tried to understand the panelists' opinion about what CG tasks can be the most effective in providing high-quality CG practices in Albania. Panelists were asked to rank, by order of importance (*1 = first most important; 3 = third most important*), the CG mechanisms that will mostly affect the effectiveness of CG in Albania. *Table 10* presents the aggregated scores.

TABLE 10: FUTURE GOALS OF CG PRACTICES [n=37]

Priorities	Points
Improved market position	67
Increased annual turnover	45
Increased of the outcome	38
Attraction of investment	18
Improved decision making	14
Improvement of the company reputation	14
Increased efficiency in the company operations	14
Lower cost of capital	9
Increase the firm activity transparency	4
Protection of stakeholders rights	2
Improving coordination between shareholders and administration	1
Total	226

As can be seen, the majority of responses focused on *improving the company's market position* (67 points), followed by *increasing the annual turnover* (45 points), and *increasing the outcome* (38 points). On the other hand, advantages receiving the fewest votes were *protection of the shareholders' rights* (4 points) and *coordination improvements between shareholders and administration* (1 point). It should be noted that *attraction of investment*, especially foreign investment, accumulated only 18 points – a notable difference from the three top CG future goals, indicating a low level of knowledge of the real long-term benefits of the best CG practices. Furthermore, the *protection of stakeholders' rights* as a good CSR practice is given null importance (only 2 points), indicating again a low level of knowledge on stakeholders long-term role as a “good” CSR practice.

The next question asked the panelists to rank by order of importance (*1 = first most important; 6 = sixth most important*) the actors that can influence the improvement of CG in Albania. According to *Table 11*, the majority of responses focused on the *financial supervisory of financial agencies or fair trade commission* (221 points) as the most influential actor in improving CG in Albania, followed by *professional associations such as accounting and audit* (201 points), and ranked in the third place *external members of the board* (172 points). Next, we have *universities* (130 points), *financial press* (128 points), *court* (125 points) and, ranked in last place, *civil activists* (57 points).

TABLE 11: INFLUENT “GROUPS” IN IMPROVING CG IN ALBANIA [n=37]

Influential Actors	Points
--------------------	--------

Financial supervisory of financial agencies or fair trade commission	221
Professional associations such as accounting and audit	201
External members of the board	172
Universities	130
The press (Financial)	128
The court	125
Civil Activists	57
Total	1034

Final Conclusions and Recommendations

In the era of globalization, there is an increased awareness on the importance of CSR. The global economic crisis emphasized more than ever the commitment to sustainability, responsibility and disclosure in order to create economic (*e.g.* by attracting institutional investors) and social value. In this sense, the use of CSR places business in a better position to survive economic and social difficulties, and to better meet the customer needs by creating an intangible asset known as “good reputation”. This reports evidence that the role of CSR can be more important in transitional economies such as Albania, as it serves as a feature in attracting foreign direct investment and rehabilitating the corporate image by improving CG practices.

Despite the general benefits and the potential implications of implementing CSR mechanisms as “good” CG practices, there has been little empirical research related to CSR in Albania. Furthermore, there is a lack of knowledge and appreciation on the role that CSR issues may have on firm performance. As such, our investigation aimed to understand the degree to which Albanian firms pay attention to CSR issues even in periods of economic difficulties, forecasting developments based on an application of the Delphi technique (*i.e.* considering the perceptions of a panel of JSCs CEOs). As previously stated, we know of no prior work using the Delphi technique to analyze the evolutionary patterns and provide development prospects for CSR practices in the particular context of this study. Thus, the study contributes to current research by offering empirical results related to the application of the Delphi technique and forecasting CSR evolutionary trends.

According to the analysis of our results, it is quite clear that the first step towards the development of CSR practices has already been given, but the level of knowledge on the benefits and the implementation of best practices is still a challenge. More specifically, our investigation showed that JSC directors seem to believe in the rising importance of employees for corporate success without being overly concerned about the low level of participation and voice in the decision making process of companies’ employees (indicated by the low level of representation in the firms’ boards of directors). Their concern about the weak participation by these stakeholders does not seem to be significant although there are a lot of factors contributing to a favourable environment for employee participation in the decision making process such as high level of employees’ educational background (especially in the bank sector), and the availability of other mechanisms such as ownership of stock options which really make them company stakeholders. In contrast, they should view the role of stakeholders rather positively, especially to prevent the abusive actions of controlling shareholders. Indeed, our questionnaire survey shows that concentrated ownership is predominant in all the panel firms. Furthermore, in some of them, the state is still one of the largest shareholders. These types of Albanian JSCs are more likely to strongly focus on a stakeholder approach to CG than a shareholder approach. Financial regulatory and supervisory agencies may be directly involved in setting and enforcing the rules for business conduct, for the purpose of protecting not only possible investors but also company stakeholders. They can motivate politicians, controlling owners and managers, who are concerned about their reputations, to adopt more effective CSR related laws, policies and practices. While stakeholders, especially employees, appear to play only a small role in the firm decision-making process, this may not be the case in the future. In general, panel CEOs view stakeholders broader role favourably (*i.e.* they strongly agree that a corporation has the goal of enhancing the well-being of various stakeholders in addition to making profits for its shareholders).

In light of the results, we believe that this study can raise awareness among managers and policy makers, in order to give greater attention to CSR mechanisms in the future. We strongly recommend companies implement a

permanent dialog with these stakeholders in order to further improve their long-term performance. Furthermore, companies should develop their own codes of ethics in terms of CSR, as well as embracing the principles and guidelines of the CG code and they should publish annual reports regularly updated with CSR projects or initiatives. Business owners need to be more proactive and take the opinion of their community's needs. This issue becomes even more important for the Albanian European integration process. For this reason, the Albanian government should also be more active in supporting companies and promoting the development of CSR policies, which are determinants of market opportunities and economic development. They can initiate the publication of a CSR national action plan and CSR indicators, and strengthen infrastructure services to facilitate CSR practices and reduce costs of doing business. The government should encourage and assist businesses to achieve CSR standards and to create additional competitiveness' opportunities to compete.

Attitude and perception towards green products in Macao: An exploratory study

Abstract

This paper reports on the attitude and perception towards green products among Macao residents. Renowned for its prosperous casino industry, the ex-Portuguese colony in the South China Sea is currently at a growth stage with investments to develop mega-resorts and gaming facilities in the coming years. The booming economic growth has brought an unprecedented well-being and also put severe strain on the region's limited natural resources. In spite of the recent efforts to address the issue, limited research has been published with reference to attitude and perception of the local population towards environmentally friendly purchases. To address this gap in literature, a questionnaire distributed to 203 Macao residents is analyzed. The result suggests that when it comes to choose green products over non-green products consumers in Macao feel they do not have many choices in local shops. The attitude of the residents towards the environment contributes significantly to the intention to purchase green products and pay higher prices for the sake of the environment, but their willingness to pay a premium for going green varies by product category. This study also provides basic consumer insights to firms wishing to introduce and market eco-friendly products in the Territory.

Keywords: green products, green marketing, Macao

Introduction

The past decades have seen an increase in environmental consciousness all over the world. Firms, organizations and consumers worldwide are more and more focusing on the necessity to live in harmony with the surroundings and reduce their environmental footprint. Consequently company have introduced a range of products such as those that are reusable, energy efficient, made with recycled materials, manufactured with minimal environmental impact, or delivered in eco-responsible packaging or containers. Consumers can substantially influence the environment with their purchasing behaviors, but the environmental consequences that purchasing decisions are responsible for are often difficult to recognize, and knowledge about the issue may be limited. Orange (2010) explains that in spite of the growing interest in green purchases (such as organic food, energy-saving lights, or hybrid cars) people have become increasingly closed off to genuine environmental messages, and skeptical of the claims that products are making. Research suggests that despite positive forecasts, demand for green products didn't grow as expected and both attitude-behavior and intention-behavior gaps emerged (Wong, 1996; Ginsberg & Bloom, 2004; Sachdev, 2011); that is shoppers are thinking green, but not always buying that way. Even if consumers are conscious about their environmental impacts, they may be reluctant to change their behaviors because they may perceive such change as being too costly or troublesome. According to Ginsberg and Bloom (2004) when consumers are forced to make trade-offs between product attributes or helping the environment, the environment almost never wins, as most consumers simply will not sacrifice their needs or desires just to be green. Thus, consumers are unlikely to compromise on product attributes such as convenience, availability, price, quality and performance to buy green products.

In the wake of growing environmentalism, a substantial body of literature has come up over the years examining various aspects of green issues (Jain & Kaur, 2004) thus providing managerial insights to green marketers and policy makers to promote products and ideas more effectively. Such studies, however, remain absent with reference to Macao, a special administrative region of China (SAR) that has become well known in recent years for the prosperous casino industry, a sector that is responsible for the unprecedented well-being of the region.

Macao Case Study

Macao is a limited territory with a population of 607,500 (DSEC, 2014) that, unlike Hong Kong or China, has maintained a distinctive multi-cultural identity (Lampo & Lee, 2011) and is regarded as a unique and fascinating case study of economic growth and development (Lee, 2011) to the extent that industry observers acknowledge that what we are seeing today is a confluence of events that will never again be seen in our lifetime (Kale, 2006). A Portuguese colony for over 400 years, Macao returned to the People's Republic of China on December 20th 1999, but the real fortunes of the territory started only in 2002 with the liberalization of the gaming industry. In 2006 Macao's gaming

revenue surpassed the Las Vegas Strip to become the world's biggest gambling center, and in 2013 revenue grew to the amount of US\$45 Billion. Today the economy of the territory is fueled by the increasing number of visitors that every year sets new records. With the vast majority of visitors from Mainland China and Hong Kong, in 2013 the total arrivals were 29.32 million, a number that nearly tripled the 11.53 million visitors registered in 2002 (DSEC, 2014.)

To meet the increasing tourist demand the territory is continuously at a growth stage, with investments to develop mega-resorts and gaming facilities year by year. The most visible consequence is that the need for the hospitality industry to rapidly expand has put severe strain on the region's limited natural resources. In recent years land reclamation projects have transformed the landscape of the territory from natural water and green land to buildings and roads. Because everything happened so fast, the environment has been threatened. Therefore, the increasing population and visitor number mean that waste generation, electricity consumption, greenhouse gas emissions, and water consumption will continue to rise. To address the evidence of environmental problems, the Government invested in the 2014 Macao International Environmental Co-operation Forum and Exhibition – MICEF - US\$ 3 Million in a series of activities with the purpose of creating green opportunities for the business community, and to advertise the concept of "thinking green, going clean and living cool". But while the local industry (casino and resorts) has made great strides toward sustainability (Lampo et al, 2012), limited information is available with reference to attitude and perception on green products among Macao residents, a gap that this study wants to address. Thus this paper is essentially exploratory in nature and focuses on the attitude and perception of a sample of Macao residents towards the purchase of green products. Additionally this paper offers basic understanding on the subject to firms and organizations wishing to promote environmental products and policies. The following section provides an essential theoretical background and the relevant literature.

Literature Review

This literature review provides the context for the study by introducing the concept of green marketing and green products. In recent years "green" is the buzzword that has gained popularity among market players, but is not a new concept. The term "green marketing" first appeared in the late 1980s as an extension of what the American Marketing Association (AMA) in 1975 referred to as "ecological marketing". Although there is no single definition universally accepted, Polonsky (1994) stated that green or environmental marketing consists of all activities designed to generate and facilitate any exchanges intended to satisfy human needs or wants, such that the satisfaction of these needs and wants occurs, with minimal detrimental impact on the natural environment. Green marketing is a part of marketing and therefore shares a number of aspects with traditional marketing such as price, promotions, products and place (Cherian & Jacob, 2012). Polonsky (1994) also argued that green marketing incorporates a broad range of activities, including product modification, changes to the production process, packaging changes, as well as modifying advertising. Put simply, green marketing comprises all those marketing activities which the firms undertake to create a positive impact or lessen the negative impact of their products on the environment (Jain and Kaur, 2004). According to Ottman et al (2006), green marketing must satisfy two objectives: improved environmental quality and customer satisfaction. Since the 90s the enthusiasm around green marketing has dampened over time, among others factors, due to the behavior of enterprises whose interventions were based on a tactical rather than a strategic approach (Lampo et al. 2012). Today green marketing is a vital component of marketing research which began due to increasing media exposure and pressure on firms to present eco-friendly behavior (Cherian & Jacob, 2012).

In spite of the growing interest in green products, the concept boundaries are poorly defined and the literature still lacks a commonly accepted definition. Durif et al (2012) identified 35 definitions of green product, and combined them so to define green product as a product whose design and/or attributes use recycling resources and which improves environmental impact or reduces environmental toxic damage throughout its entire life cycle. Although no consumer product has a zero impact on the environment, in business, the terms "green product" and "environmental product" are used commonly to describe those that strive to protect or enhance the natural environment by conserving energy and/or resources and reducing or eliminating use of toxic agents, pollution, and waste (Ottman et al, 2006). According to Ottman et al (2006), successful green products are able to appeal to mainstream consumers or lucrative market niches and frequently command price premiums by offering "non-green" consumer value (such as convenience

and performance). Traditionally, consumers have resisted green products, distrusting their claims or believing that they are not as effective as “non-green” products (Stafford, 2003). Perhaps the most convincing evidence supporting the growth of ecologically favorable consumer behavior is the increasing number of individuals who are willing to pay more for environmentally friendly products (Laroche, 2001). A recent report showed that a significant minority of committed and proactive green shoppers are willing to pay more for green products, however, the larger potential population of shoppers that lean towards green want price and performance parity for sustainable products because it is not their dominant purchase driver (Deloitte, 2009). Laroche et al (2001) found that about 13% of consumers are willing to pay more for green products, and these consumers are more likely to be female; additionally they reported that 73% of consumers are undecided about whether they will pay more for green products. Having outlined the essential review of literature, the next section introduces the methodology followed for this report.

Sampling and Procedure

A structured questionnaire was developed for collecting attitudinal and behavioral data from the respondents. Both open-ended and closed-ended questions were employed for eliciting desired information from respondents. A five-point Likert scale ranging from 1 (strongly agree) to 5 (strongly disagree) was used for obtaining responses. A few open-ended questions were added to the questionnaire for ascertaining respondents’ perceptions about the possible role of government, companies/manufacturers, individuals and others in resolving the environmental problems; and in identifying obstacles that respondents perceive to come in the way of alleviating environmental problems. The target population for the purpose of this study was restricted to Macao residents only. The questionnaires were administered by undergraduate students from a private university in Macao. Respondents were selected from the researchers’ personal network and by making use of the snowball method (Flick, 2009). The questionnaires were administered in Chinese and English, depending on the choice of the respondent. Participation was voluntary and no remuneration was offered. A total of 203 questionnaires were obtained and deemed sufficiently complete to be useable. The majority of the respondents are aged between 18 and 27 years old (60.1%) and nearly half represented by female (52%). Most of the sample (53.9%) is represented by students whereas 35.8% is employed. A large part of the interviewees preferred not to disclose their annual income (38.1%), while 28.2% indicated an annual income to be lower than MOP 80,000 (US\$ 9,850) and consistent with the status of student, 18.2% reported their income to be between MOP 80,000-239,000 (US\$ 9,850 -29,450), 10.5% reported MOP 240,000-479,000 (US\$ 29,450 - 59,000) and only 5% reported their income to be over MOP 480,000 (US\$59,100).

Discussion

This section reports about the attitude and perceptions of Macao residents with reference to green products in Macao and follows the structure that was used during the administration of the questionnaire.

Meaning of “Green Product”

The survey attempted to investigate what is the meaning of “green product”; the majority (45.1%) of the sample answered that a green product is something related to “environmental protection”; other provided meanings included a product that is “clean and not harmful” (8.0%), a product that is “healthy” (7.4%), a product that helps to “save the earth” (6.9%), a product that helps to “reduce pollution” (5.7%), a product that is generally “good or significant” (5.1%), a product which is related to “recycling” (3.4) and a product that helps to “save money” (3.4%).

Past purchases and Reasons to Resistance to Buy Green Products

The survey recorded whether the respondents had purchased any green product in the recent past, and 54.0% answered positively to this question, while 23.3% reported that they did not make any green purchase. Noteworthy is that 22.8% of the respondents are not sure if the products they had purchased in the past can be categorized as green products, thus signifying a general lack information about their purchases. The respondents were then asked their opinion about

what factor may discourage people to buy green products. The majority of the respondents (39.4%) thought that the main reason is that green products are over-priced. Other reasons provided by the respondents included the fact that green products “lack of advertisement or promotion” (13.7%), and that consumers may ignore or may lack information about what green products are (13.7%), for some (9.1%) there are not many choices of green products to choose from in Macao, and green products are difficult to find in shops in Macao (6.9%).

Questions about the Respondent’s Environmental Concern

In this section the interviewees were asked their level of agreement to a set of questions measuring their concern on the state of the environment in Macao, as well as the role of the government in dealing with environmental issues. As such, 84.7% of the respondents considered environmental issues to be very important on a personal level, with 12.2% of the sample undecided. Preserving and protecting the environment in Macao is the priority for 77.7% of the sample, with a 19.8% that is neutral. For a relevant segment of the sample (42.8%) the government is doing enough to enforce environmental rules and regulations, but on this issue it has to be mentioned the relevant part of those who do not have a clear standing, accounting for 22.8% of the respondents. The analysis shows that there is correlation between the respondents’ values on environmental protection and intention to purchase. For instance, in this study respondents who felt environmental issues in Macao to be very important ($r = -.209, p = 0.01$), and those who perceived that preserving and protecting the environment should be one of the top priorities ($r = -0.222, p = 0.01$) tend to have positive intention to purchase green products in the near future, while those respondents who agreed that the Government is doing enough to enforce environmental rules and regulations, are those more willing to pay a higher price for a green product ($r = -.254, p = 0.01$).

Questions about Characteristics of Green Products

A section of the questionnaire intended to capture the opinion of the respondents concerning a series of different characteristics of green products. When asked whether green products are good for the environment 80.9% of the respondents agreed with the statement. The majority of the respondents (58.2%) think that using green products communicates to other a positive image. More than half of the respondents (57.4%) agree that green products have better quality or performance compared to standard product, while 31.5% is neutral. When it comes to price 2/3 of the respondents (66.5%) of the respondents agreed that green products are more expensive than conventional products. With regard to availability, 1/3 of the sample (32.9%) reported difficulties in finding green products in shops and supermarkets, while a significant part of the sample (29.0%) kept neutral. Half of the respondents (50.0%) stated that green products lack of promotion in Macao, with 30.9% of the sample not sure about promotional initiatives.

Intention to buy and willingness to pay higher prices

The questionnaire then captured the intention of the respondents to purchase green products within the three months to come. Less than half of the respondents (44.8%) expressed positive intention to purchase green products, whereas 19.2% reported that they do not intend to make any purchase. A significant segment of respondents (36.0%) was not sure about their future intentions. When asked about their willingness to pay higher prices for green products, the largest segment of the respondents (44.6%) stated that their intention to purchase a green over a conventional product mostly depends on the product under consideration, whereas 22.3% of the respondents are definitely not willing to pay higher prices for going green. Over one third of the interviews (33.2%) are instead willing to pay higher prices for the sake of the environment. There is correlation between the respondents’ perceptions about green products and their intention to pay higher prices. In fact the analysis show that those who felt that green products deliver a good image of the user ($r = -.215, p = 0.01$), and those who stated that green products have a better quality or performance than conventional products ($r = -.212, p = 0.01$) are less sensitive to the higher prices.

Limitations and Further Research

As with any survey-based study, consumer attitudes and responses to survey items may not reflect their actual purchase behavior. However, several findings of this study are consistent with previous research. A limitation is that this analysis may not be representative of the whole population in Macao, and does not compare the interviewee’s

responses according to their profession. As further research it would be interesting to investigate what drives local consumers to purchase green products and what categories of products are less sensitive to price premium; these insights would eventually benefit firms that want to emerge in the green market or promote green initiatives. In any case, this study provides a foundation for more research within this area.

Conclusion

The purpose of this this paper was to explore attitude and perception of a sample of Macao residents towards green products. No significant difference was found between male and female population. The respondents gave different definitions of what “green product” means to them, that is something related to “environmental protection” (45.1%). The large majority of the sample (84.7%) showed high concern for the environmental issues in Macao, and agreed that green products are beneficial to the environment (80.9%). The green versions of conventional products in Macao are perceived to be overpriced (66.5%), however most of the respondents (54.0%) stated that they had purchased green products in the past, although such products often lack of promotion (50.0%) and are not always available (32.9%) in local shops. While the tendencies reported by other studies related to attitude and perception were here too noticed, this study offers new elements of interest. Noteworthy is that a relevant segment of the sample (22.8%) is not sure whether the products purchased in the past can be considered green products, additionally, some of the respondents (13.7%) thinks that consumers may not be clear about what green products really are. This is an important result that indicates how some consumers segment may lack basic knowledge about the environmental friendliness of their purchases. When it comes to price, as mentioned earlier, 66.5% of the respondents agreed that green products are more expensive than conventional products, yet 44.8% of the sample expressed positive intention to purchase green products in the near future. Unlike similar studies where the consumer is asked the intention to buy or not green products, this research has included the possibility that the paid premium may depend on the product itself. As such, when asked about the willingness to pay higher prices for a green product, a large part of respondents (44.6%) stated that their intention to purchase depends on the product under consideration. Another important outcome relates to the availability of green products in the territory. As such, 32.9% reported difficulties in finding green alternatives to convention products in shops and supermarkets; noteworthy is that 29.0% of the sample is not sure whether green products are currently available in local stores. When it comes to promotion, as noted, 50.0% of the respondents stated that in Macao green products lack of advertising campaigns; and an additional 30.9% of the sample is not sure about promotional initiatives.

To conclude, consumers in the ex-Portuguese colony generally show positive attitude towards the environment and exhibit positive intention to make environmentally friendly purchases. They think that the local market currently doesn't offer many green alternatives to conventional products; consumers also perceive green products to be high-priced but still, they are willing to pay a premium for going green although this premium varies by product category. Thus, the results of this study lead several conclusions regarding the pricing of green products, results that would be of interest to organization promoting green initiatives and products in Macao. Thus, by being sensitive to the specific attitude towards green purchases, organization would be able to better predict the behavioral patterns of the local consumers.

Private Ordering and Sustainability Goals: Concrete Sustainability Deliverables (CSDs) and Virtual Proximate Communities (VPCs) as Pathways Toward Effectiveness

Abstract

Based on voluntary acceptance by interested parties, private ordering – distinct from public ordering or the law – is founded in consensus built by active players in a supply chain, setting up social norms for the self-regulation of activity by the participants involved. This paper provides a strong basis for the adoption of private ordering as a means of achieving sustainability goals. Following a discussion of issues surrounding the definition and implementation of sustainability programs, we suggest the use of private ordering as a mechanism in achieving sustainability goals. Specifically, we discuss variations of ethos-based private ordering and their limitations in the sustainability arena. Alternatively, we suggest ways in which private ordering integrates inter-organizationally the mode of behavior of stakeholders that potentially leads to effective sustainability programs even across national boundaries where legal means would likely fall short. We conclude with opportunities and challenges of private ordering in the sustainability domain.

1. Introduction

Sustainability movements often focus their efforts on initiating positive changes through legislation or through charitable efforts. NGOs have been particularly influential in bringing change through environmental, health, and human rights initiatives. However, profit-seeking firms are also important participants within the sustainability movement. By tapping into a growing consciousness among consumers, investors, and employees, firms are adapting their business models to take into account environmental, cultural, and economic factors that are intended to improve the wellbeing of others.

This attention to the wellbeing of others often allows these firms to enhance their own economic wellbeing. Sustainability demands can be initiated from different locations within the commercial ecosystem, and meeting them offers a possibility for different kinds of economic benefits. On the supply side, sustainability concerns may provide an advantage in the capital markets. Some investors are using sustainability practices as screening criteria for capital allocation, although sometimes they may describe this screen under the broader rubric of social responsibility (Singer and Tonello, 2013). Firms might also realize a labor market advantage for sustainability practices, as some employees prefer to work at firms with sustainability commitments (Berger, Cunningham, and Drumwright, 2007). On the demand side, customers¹ are also impacting the content of the marketplace by making purchasing decisions informed by values that transcend traditional economic considerations of quality and price.

A growing body of experience with profit-seeking firms seeking to embrace sustainability goals suggests that their role is becoming quite substantial. However, ambiguities in the parameters of sustainability present significant challenges for defining and measuring sustainability targets, whether in the public sphere or through private ordering efforts. This article seeks to explore that ambiguity and outline some significant implications for the efficacy of achieving sustainability goals. Private, profit-seeking firms are indeed valuable and probably indispensable partners in the pursuit of sustainability goals through private ordering. Among other things, private ordering through profit-seeking firms has the potential to diffuse conflicts that make rulemaking impractical, overcome jurisdictional boundaries that make rulemaking ineffectual, and create economically viable outcomes that might not result from purely charitable activities.

The article is organized as follows. Part II explores the ambiguous nature of sustainability claims and the implications of that ambiguity toward the pursuit of sustainability goals. Because sustainability concepts often entail tradeoffs about wellbeing that also include predictions about the future, they often raise conflicts between interest groups (e.g., environmentalists vs. employees displaced by stricter regulation). We argue that private ordering approaches are particularly useful because they avoid the need to resolve political conflicts over competing value

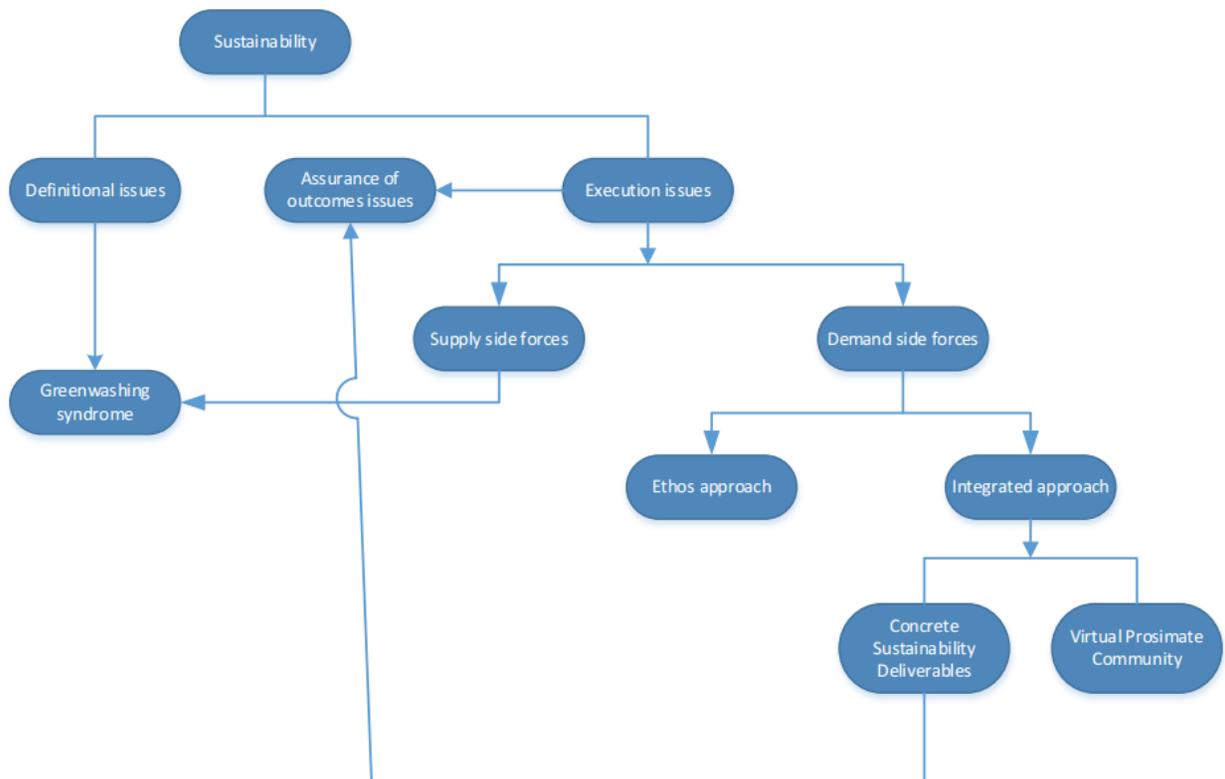

¹ We use the term “customer” here as a more inclusive term that encompasses consumers and industrial purchasers, as decisions from both types of purchaser can impact the market for goods that incorporate sustainability goals.

propositions. They also offer other advantages in a global marketplace, including overcoming jurisdictional and practical barriers to legislation and flexibility to adapt to local conditions, thereby avoiding unintended consequences that likely follow rule-based solutions.

In part III, we categorize and explore two different models that for-profit firms use to capitalize on sustainability concerns. One model focuses primarily on ethos (reputation) through charitable deeds or other contributions to sustainability goals (such as reducing outputs of pollutants, recycling, etc.), which can be marketed to important constituencies. The other model focuses on integrating specific sustainability claims into their products or services being sold, usually through branding recognizable by consumers that reflects values transmitted through the supply chain. The latter approach tends to closely align the interests of the firm with the interests of its customers, which we deem more likely to achieve sustained impacts. When this alignment does not exist, we argue that competitive forces create incentives for divergence from the firm’s commitment to sustainability goals, which can be overcome only through particularly strong internal commitments reflected in the corporate culture.

Finally, part IV concludes with a brief discussion of some closing observations, including other challenges presented by private ordering regimes that may limit their achievements. These include the possibility that private ordering solutions involving collective action may inject competitive concerns impacting smaller firms, which also deserve consideration. Private ordering approaches are no panacea, but those committed to sustainability issues would do well to recognize the potential to achieve real progress through these nimble channels, even though they may fall short of systemic solutions that some may ideally prefer. Figure 1 presents an overview of issues and sustainability approaches we discuss in this paper.

FIGURE 1: AN OVERVIEW OF SUSTAINABILITY ISSUES AND APPROACHES

2. Defining Sustainability: The Ambiguity Problem and the High Stakes for Legislated Solutions

Variable parameters for sustainability claims present a fertile field for disagreement that is not easily mapped. Sustainability involves a broad range of impacts, including environmental, cultural, and economic considerations.² Each of these impacts potentially involve normative claims that must also be placed within a temporal context that includes predictions about the future, as those impacts are evaluated in relation to human wellbeing.³ As will be discussed below, private ordering approaches offer advantages over legislative approaches for pursuing sustainability interests, including the diffusion of conflict over competing value propositions, as well as a reduction in negative externalities that frequently accompany rule-based solutions.

a. Definition and Measurement

Sustainability has crept into our common language, but precise definitions are hard to come by. As one commentator has observed:

In modern political discourse, the term “sustainability” is frequently used, but lacks a common definition. The lack of shared meaning likely results from confusion as to whether it is possible to give an empirical scientific or economic account of sustainability (for example, can we prove, as an objective matter, that a policy or practice is not “sustainable”?) and because there is widespread disagreement on the potential normative accounts (Tsosie, 2013).

On the economic front, some commentators argue that sustainability ultimately must involve making a profit (Inglis, 2013). Profitability considerations undoubtedly constrain the pursuit of sustainability goals; in the long run, businesses without profits fail. An external “market for virtue” is one way of conceptualizing the economic realities of the demand for attention to sustainability concerns (Vogel, 2005). But variability in this demand explains differential practices among firms. It is likely that some markets are more sensitive to sustainability concerns than others, making it possible for firms targeting them to profit from their behavior (Berger, Cunningham, and Drumwright, 2007). For these firms, profit seeking and sustainability goals are complementary goals, rather than competing ones. For firms in other markets, the ability to pursue sustainability commitments requires more careful assessment of their impact on the firm’s competitiveness in serving both external and internal markets. For example, industries with significant environmental impacts may face severe competitive pressures, perhaps even from international sources, that make it costly to depart from standard practices.

Although some firms claim to be led by their social commitments, thereby adopting a so-called “social values-led model”, those firms must ultimately find a viable market for its products or services. As Berger and her colleagues (2007, p. 142) observed, “The primary challenge of the social values-led model was to establish the authenticity of its business purpose and goals. It had to survive, find a segment, and invent or develop a product or service so as to prosper and advance its noneconomic mission.” In contrast to the social values-led model, Berger and her colleagues characterize firms that find a way to successfully integrate sustainability commitments into a profitable and enduring business model as adopting a “syncretic stewardship model”, which reflects their ability to balance the sometimes competing demands between profitability and the needs of other constituencies (Berger, Cunningham, and Drumwright, 2007).

Although profit is clearly important, critics have pointed out that conventional financial accounting models fail to encompass all of the costs associated with an activity. If firms are permitted to externalize some costs, such as pollution, this overstates profitability measures based on traditional financial accounting principles (White, 2009).

²See Gwendolen B. White, SUSTAINABILITY REPORTING 5 (2009) (“The definitions of corporate sustainability have in common the long-term focus on an organization’s environmental, economic, and social impacts.”)

³ See id. (“The movement to incorporate sustainability into business practices is a response not only to counter the negative environmental effects of industrial and commercial activity, but also to evaluate the economic and social effects of industrial and global population growth.”)

Consequently, these firms are allowed to continue operations based on a false sense of reality, in which all costs of continuing them are not being borne by the owners.

Rewriting laws to require firms to internalize these costs is an ideal that has broad appeal within the sustainability movement. NGOs have invested considerable sums in lobbying efforts. However, that approach is fraught with difficulty, as problems of definition and measurement must be resolved, which involve significant normative judgments and commitments. For example, the act of defining or classifying an output as pollution can be far from straightforward, as illustrated by the recent case within the United States over whether carbon dioxide could be considered a pollutant subject to regulation by the Environmental Protection Agency under the Clean Air Act. Once a pollutant is defined, the extent to which it is tolerated or the practices for managing it involve significant normative considerations, as these matters involve balancing various human goods (e.g., environmental quality and threats to human health vs. economic development and its accompanying benefits for wellbeing). Environmental laws and the vigor of their enforcement vary considerably among sovereign nations and even among localities within nations; different normative commitments and different competitive positions in the global economy contribute to these variations.

In an influential report entitled “Our Common Future” by the World Commission on Environment and Development (WCED, 1987), “sustainable development” is defined as “development that meets the needs of the present without compromising the ability of future generations to meet their own needs.” This concept bears some resemblance to the approach in the Hicksian definition of income, which reflects the notion that what you can draw out cannot exceed the corresponding growth in value if one is to maintain the store of capital for the future.

The physical environment and human culture are repositories for past social commitments and practices that are transmitted across generations. Ideally, those practices should allow human flourishing and wellbeing over a longer-term horizon. To be sure, these commitments reflect strategic considerations and investments that transcend current demands for consumption, and which look to the needs of the future. That may indeed require attention to data that extend beyond the boundaries of profitability measurements that are based on financial accounting concepts applied in quarterly or annual assessments. However, we also know that judgments about the future often prove to be inaccurate; even so-called experts are not immune to the challenges of predicting the future, which are discussed below.

b. Perils of Predicting the Future

The focus on “the ability of future generations to meet their own needs” in the WCED definition above potentially embraces a broad range of topics, some of which are unknown. The availability of material resources can certainly affect the viability of future generations, but cultural and developmental aspects of human thriving in the present also count heavily in any realistic calculus of future demands. Current champions of corporate sustainability, such as the Conference Board, also view sustainability as embracing a strategic, long-term perspective about the future in formulating relevant factors, which span a broad range of topics.

But predicting future impacts and designing strategic responses to address them are activities fraught with uncertainty. Changes in technology, consumer preferences, and other factors can have transformative effects on the future demand for resources. In turn, newly formed demands may also be met by previously unimaginable changes in the form or even the supply of raw materials. Focusing only on current assumptions about limited supplies will likely miss important changes arising from human creativity, innovation, and research, which can expand those supplies either through new discoveries, new technologies, or both.

For example, aluminum was once viewed as a rare element, more valuable than gold. Scientific discoveries made it possible to extract aluminum from bauxite, an abundant material that can easily and efficiently be converted into pure aluminum metal (Waller, 2007). As a result, that metal has become widely used for industrial and consumer applications.

Artificial lighting presents another powerful example. In his recent book, *KNOWLEDGE AND POWER*, George Gilder (2013) recounts research by Yale Economist William Nordhaus that shows how technological advances have reduced the cost of lighting our homes a million-fold between the mid-18th century and today. As Gilder observes, “The labor cost of light plunged, with gas light costing one-tenth as much as candlelight and kerosene light one-tenth

as much as gas light. Fossil fuels were the salvation of the whales. The arrival of electricity in the 1880's produced another thousand-fold drop."

As a result of these cost savings, the demand for artificial lighting has grown significantly, and with it new expectations of the requirements for human thriving. Prior generations could not have conceived of the extravagance of light available at will throughout the night. Even if they could have imagined it, they might not choose to fund the desires of a future generation at the expense of their own wellbeing.

The role of whale oil in the evolving history of light production provides useful illustration of difficulty of applying sustainability considerations in a technologically dynamic environment. Whales were originally viewed as a significant resource for food (which continues today in some cultures), and their oil was desirable for making light. If harvested responsibly, whales could also be viewed as a sustainable source for these human demands because they are renewable.

But if whales are over-harvested, sustainability would be threatened and this resource would not be available to meet future human needs. If human populations and/or their demands increased at a faster rate than the whale population, this would present a grave challenge for humanity to consider. As we know, the impetus for change can be difficult to realize. Predictions of dim prospects for the future (both figuratively and literally) may not be sufficient to change laws or regulatory policies in order to reduce whale harvests, which would likely involve adverse effects to our current wellbeing. Those effects would likely involve rising costs, with those humans who are less-well-off spending more time in the dark. This, in turn, might have other negative consequences, including lower educational outcomes for poorer citizens, leading to greater social divisions. Geographic and cultural differentials might also emerge, since equatorial regions with uniform days could enjoy an advantage over higher latitudes required to endure seasonal disadvantages in daylight.

Visionary beliefs about future human satisfaction from communications and other sensory enjoyment of whale communities would, as a practical matter, be hard to sell to political decision makers faced with a populace unhappy about looming darkness. And many within that population might not be in an economic position to hold out for those future benefits, if indeed they did materialize.

Other practical problems would also abound in addressing this problem by conserving the whale supply. Even if one could successfully influence his or her own government, firms from other countries may still overharvest the whales, as this activity occurs in the global commons beyond the territorial waters of sovereign nations. A whaling moratorium treaty is only as effective as the sovereign power to enforce it. It is easy to anticipate the policy arguments: domestic firms will complain that the moratorium only hurts the domestic economy, as whale oil customers will choose to import from foreign suppliers to keep their lamps from going dark. Those concerned about distributive justice will worry about the disproportionate impact on the poor, who must pay even more for this scarce commodity. Proactive international cooperation can take years to achieve, and even when a treaty is enacted, enforcement still presents a continuing challenge, not only for signatory nations, but also for those nations who do not sign.⁴ Short of a crisis to induce change, powerful inertial forces favor the status quo.

Significantly, this potentially disastrous scenario was not averted by protests leading to government intervention. A whaling treaty was not enacted until 1946, many years after whale oil was a dominant fuel or food item (Darwahl, 2013). As Gilder (2013) notes, the entrepreneurial development of substitute goods – in this case, fossil fuels -- saved the whales. This solution came from sources we now consider to be nonrenewable, and which contributes other negative environmental impacts along with many human benefits as a source of energy.

Conservation practices are particularly urgent when the future of animal life is involved. The possibility of losing a resource for posterity, particularly when we may not know the future value of that resource, merits serious consideration. Taking precautions reflects an appropriate humility about our current state of knowledge. Thus, the difficulty of predicting the future cuts both ways, as it includes an understanding of our future sense of loss over a part

⁴ See the International Convention for the Regulation of Whaling (1946), which is administered by the International Whaling Commission. See <http://iwc.int/convention.htm>. Some countries continue to allow whaling, though in limited quantities. Even in the United States, Alaskan indigenous communities are permitted to whale. [Add cites to the International Whaling Commission.]

of the created order. But choosing fossil fuels to meet the human need for light was arguably better than the alternatives of living in darkness or killing whales or perhaps harvesting other mammals for this purpose. Nonrenewable resources can become a bridge to better solutions in the future that depend on human creativity. That kind of creativity is often positively connected to the kinds of human growth opportunities that wealth creates, such as education and leisure. Decisions to sacrifice current wellbeing thus present serious matters indeed, as the current sacrifice could also affect the viability of the seeds of future creativity, which are needed to solve the problem of scarcity.

c. Other Value Conflicts (and Hazards of Legislation)

Even when future predictions are not so difficult (e.g., when we know that a practice will harm some human good, causing damage or death), choices under the sustainability umbrella can also involve value judgments that are highly contestable. The fruits of this contest can be seen on the international stage, where conflicts among developed and developing nations arise in standards for environmental quality, workplace safety, and even human development, all of which impact sustainability goals.

For example, adopting air quality standards suitable for firms in the United States or the European Union might prove disruptive and debilitating to a developing country. When faced with the immediate prospects of unemployment, the marginal cost of additional respiratory disease on account of factory effluents might seem like a tolerable price to pay in the short run, if the alternative is a lack of resources needed to sustain basic human needs. Environmental regulations in the United States are consciously designed based on considerations that include tradeoffs between the costs and benefits of regulatory action, including economic considerations on profits and employment (Masur and Posner, 2010). Those regulations include difficult problems of monetizing harms, which can vary significantly across cultures. Ultimately, the decision to stop at any point where a risk is above zero will present a matter for human judgment, which is not easily resolved.

Centralized decision makers drafting rule-based solutions cannot comprehend the full impact of coercive measures on human wellbeing. Granularity problems abound in all rulemaking efforts. Laws designed to prevent environmental harms can easily be overbroad, preventing desirable activities, too. For example, legislation targeting reductions in greenhouse gas emissions or encouraging renewable sources may raise the price of electricity, adversely impacting industrial production and employment (Castle, 2014). Government policies favoring the conversion of food sources like corn into renewable biofuels has likely raised food prices, having a particularly detrimental impact on the wellbeing of the poor (Dharwal, 2013). Conservation measures to protect fish species may deprive farmers of water needed for irrigation, putting them out of business and impacting the human food supply.⁵ What may be viewed as a sustainability measure directed toward one good could thus threaten another good in unintended ways.

This problem is not limited to environmental regulations; economic legislation also has unintended consequences. For example, minimum wage laws may help raise current income for those who have jobs, but they may also reduce the supply of jobs available.⁶ Younger, inexperienced workers may also suffer due to the increased difficulty of getting on the proverbial employment ladder, thereby losing opportunity for valuable training or experience that is critical to future advancement.

From the lofty seats of government policymakers, those collateral effects may not be fully known until they work their way through the mechanisms of the marketplace, which include the particular knowledge of its individual participants. Even experts may disagree on the predicted outcomes (Samuelson, 2014). But because they are imposed by legal coercion in a manner that is not tailored to address all potentially relevant factual variations, collateral effects are unavoidable.

In addition, legal coercion is effected by jurisdictional limits. A legal change implemented in one jurisdiction may create a competitive disadvantage to the extent that it is not applied elsewhere (Belleville, 2013). Legal coercion

⁵ See, e.g., California's Man-Made Drought, Wall Street Journal, Sept. 2, 2009 (discussing water reductions rooted in the Endangered Species Act affecting irrigation water for farmers in the San Joaquin valley).

⁶ See Congressional Budget Office, The Effects of a Minimum-Wage Increase on Employment and Family Income at 9 (Pub. No. 4856, Feb. 2014) (estimating increased income but 500,000 lost jobs from proposed minimum wage increase), available at <http://www.cbo.gov/sites/default/files/cbofiles/attachments/44995-MinimumWage.pdf>.

may be well suited to solving a “tragedy of the commons” where the harms are diffused, and where collective response through agreement is impractical. But that “tragedy” needs to be well comprehended and understood, along with the consequences of averting it. This is no mean feat. In contrast, voluntary solutions focusing on cooperative private ventures can also contribute to sustainability goals and practices, while simultaneously lowering the high risk associated with legislated solutions.

d. Private Ordering as Diffusing Mechanism

Private ordering presents a promising alternative to this all-or-nothing, high stakes regime of legislating change. First, private ordering does not require control of the legislative or bureaucratic apparatus within the government – which is a formidable obstacle for most kinds of legal change. In the business context,⁷ a private ordering solution may simply involve a cooperative venture between two or more parties who share a particular sustainability commitment, or for whom the commitment is at least not objectionable.

Second, in a system based on private agreements, the effects of those agreements can transcend jurisdictional boundaries in a manner that the laws and regulations of a sovereign nation cannot.⁸ That cross-border potential is not unlimited and should not be overstated. For example, a potential for breach by one of the parties in a supply chain may disrupt its effectiveness; addressing that breach may entail access to foreign laws and/or government institutions. Even private adjudication or arbitration may ultimately depend on legal institutions of the sovereign state for enforcing that judgment against a recalcitrant defendant. Thus, law and government involvement still serves as a boundary on the edge of private ordering; the threat of escalating government regulation or intervention may also serve as an additional force to encourage parties to avoid and resolve conflicts (Morse and Raval, 2012). Nevertheless, economic incentives to comply are often much more powerful than these coercive threats, particularly when ongoing relationships are contemplated, thus producing continued cooperation apart from the law.

Third, the voluntary nature of private agreements increases the likelihood of beneficial outcomes for both parties to the agreement, as their voluntary exchange fuels mutual benefits for them. They can be tailored to meet the needs of individual participants and circumstances in a manner that codified rules cannot.⁹ Of course, private ordering is not without unintended consequences – voluntary participants can sometimes face adverse consequences because they have imperfect knowledge (Haight, 2011). But private ordering typically allows agreements to be modified much more rapidly and efficiently than through more cumbersome processes of legislative or regulatory changes – and this differential grows if the consent of multiple nations might be required. The limited and voluntary nature of the private ordering relationship reduces the risk of harmful outcomes to others based on these judgments; people get to assess the tradeoffs for themselves and participate when it is useful to them.

This approach may not produce the kind of collective changes that some might desire, but it can make a positive contribution toward achieving sustainability goals. Its importance is demonstrated by the extent to which for-profit firms are paying attention to environmental, social, and community obligations that extend beyond those otherwise imposed by law.

3. Private Options for Pursuing Sustainability Goals

The above description of private ordering presents a sketch of key advantages. However, approaches toward private ordering can be as variable as the creativity of its human participants. A closer examination of some of these

⁷ Of course, charitable organizations also operate within a private ordering model when they also engage in good works funded by private donors. Such activities may contribute to sustainability goals, but they continue only as long as they can generate new inputs from benefactors.

⁸ For example, in response to recent tragedies involving textile workers in unsafe foreign factories, textile firms have recently joined together to provide for enhanced safety standards in factories used by their suppliers.

⁹ See *The SEC v. Goldman Sachs: Reputation, Trust, and Fiduciary Duties in Investment Banking*, 37 J. Corp. L. 529, 548 (noting that “regulations may codify rules for market exchanges that, while detailed and enforceable, fail to account for all the subtleties and nuances of real transactions”)

approaches might yield greater insights into their efficacy in pursuing sustainability goals, as well as some significant problems arising in this context. An extensive literature already exists about the role of charitable organizations and NGOs devoted to sustainability causes, which also utilize private ordering. However, in the discussion below, we focus primarily upon for-profit firms and their strategies for pursuing sustainability goals, and we identify two general approaches: (1) an ethos-building approach, which is rooted in top-level disclosures about sustainability commitments, and (2) an integrated approach, which attempts to incorporate sustainability commitments directly into the product or service the firm is selling.

Although an “ethos-building” approach is quite common, we argue that its utility is limited by competing concerns that are likely to arise within the firm, particularly when the firm is a late-adopter rather than an innovator when it comes to sustainability commitments. If sustainability commitments are ultimately viewed as a cost incurred to please a stakeholder, rather than as a source of profit or other economic benefits, there are likely to be significant pressures to reduce or constrain those commitments. Moreover, ethos approaches that are rooted in formal disclosures face a crowded marketplace, which make it difficult to achieve any distinctive advantages from sustainability behaviors.

Integrating sustainability features into goods or services offers comparatively greater potential. By incorporating what we call “concrete sustainability deliverables” (CSDs) into a product, firms are able to provide a direct link to customer-based support for defined sustainability practices, thereby aligning their interests with the commitments of their customers. Further, by linking the interests of individual firms into “virtual proximate communities” (VPCs) through another private ordering tool -- independent certification programs – this approach leverages the collective ability to tap altruism and conscientiousness in the consumer marketplace through branding, which thereby enhances the quality of sustainability outcomes.

A. Ethos-Based Private Ordering

For some business firms, a commitment to sustainability is an important part of their reputation and identity. As noted above, that commitment may be generated from many different social, economic, and/or cultural forces, including advantages from attracting investors and employees who share similar commitments or from tapping into positive demands from consumers or customers. Moral, religious, or social influences, including peer pressure from others, may also serve as catalysts to induce leaders within the firm to pursue sustainability goals (Berger, Cunningham, and Drumwright, 2007) or to at least maintain an appearance of doing so in order to avoid negative pressure or publicity (Delmas and Burbano, 2011).

Traditional corporate governance models tolerate considerable discretion in pursuing activities that may not necessarily maximize short-term profits. By focusing on the long-term implications of decisions to the wellbeing of the company, directors and managers have flexibility in choosing to do sustainability-related activities affecting other stakeholders in the enterprise, including labor, environmental, or community interests. Lynn Stout (2012), an ardent proponent of managerial flexibility and corporate autonomy concerning the expenditures of corporate resources, asserts that a putative duty to maximize shareholder value to the exclusion of other considerations is a myth:

The notion that corporate law requires directors, executives, and employees to maximize shareholder wealth simply isn't true. There is no solid legal support for the claim that directors and executives in U.S. public corporations have an enforceable legal duty to maximize shareholder wealth. The idea is fable.

But in most cases, one need not accept Stout's assertion to justify the pursuit of activities such as charitable giving, community engagement, and sensitivity to environmental and human rights concerns. Often, a plausible claim can be made that doing good allows the firm to do well. Giving to local charities, engaging with the community, treating employees well, and being a responsible steward of the environment engenders goodwill, affecting not only the market for customers and employees, but also government regulators who influence the environment in which the firm does business. As long as these activities are pursued on a modest scale and do not substantially affect the firm's ability to generate positive returns for its investors, developing a positive corporate ethos committed to sustainability practices can simply be good for business. Unfortunately, perceptions are not always rooted in objective reality, which creates a serious vulnerability for the ethos-based approach.

A.1 Growing sustainability commitments in the midst of ambiguity

Ambiguities in the parameters of sustainability discussed above in part II also present a formidable challenge for those seeking to define and measure progress on sustainability targets and goals. Comparisons among firms are also problematic without adequate means to measure the strength of that commitment and its effectiveness, which can span a wide variety of factors. Even if the disclosure address specific commitments, it can be difficult to assess the overall impact of those commitments. A recent study funded by the Conference Board identified 76 environmental and social practices as potentially connected to sustainability (Singer and Tonello, 2013), which suggests a broad range of commitments indeed.

Nevertheless, an increasing number of firms are referencing some kind of sustainability-related commitments in disclosures that supplement more traditional financial information. As of 2009, more than 75 percent of S&P 500 companies had some discussion of environmental and social policies on their corporate websites (Delmas and Burbano, 2011). Globally, a study by KPMG in 2008 reported that almost 80 percent of the “Global 250” issued some form of sustainability reporting (White, 2009). According to a recent paper by Ioannou and Serafeim (2011), the number of firms using the Global Reporting Initiative guidelines to report sustainability information has grown from 44 in 2000 to 1,973 in 2010. As of March 5, 2014, the Global Reporting Initiative database includes reports from 5,971 organizations, reflecting a dramatic growth from the figures reported in 2010.¹⁰ Although some of these organizations are nonprofits, public agencies, or universities, it appears that the vast majority are for-profit companies.

Efforts to enhance accuracy and consistency of such reporting are also underway. As White (2009) discusses in her book, *SUSTAINABILITY REPORTING*, private ordering provides one approach to developing and implementing guidelines for reporting, including the SIGMA project, the International Federation of Accountants Sustainability framework, and the Global Reporting Initiative. In some cases, companies are also assessed as to the measure of their conformity to these guidelines, which generally reflect voluntary commitments.

A.2 Greenwashing

Disclosure is only part of the equation, however, as there is a further question whether that disclosure is accurate. The term “greenwashing” has emerged as a catch phrase to describe this problem of accurate disclosure in various contexts affecting sustainability claims. Clark (2013) has explained this concern as follows:

As consumer demand for socially responsible products and companies is increasing, consumer trust in corporations is decreasing. Marketers use the term “green,” “responsible,” “sustainable,” “charitable,” and words like them on a daily basis to describe their products or their companies. However, the more these terms are used, the less meaning they have because there are no standards to back up the claims. This problem, often referred to as “greenwashing,” is misleading for consumers and frustrating for businesses that try to distinguish themselves based on their social and environmental business practices.

Although “greenwashing” potentially encompasses a variety of sustainability claims, environmental considerations have played an important role in discussions of “greenwashing” behavior. Those most concerned about “greenwashing” are concerned about eroding markets for “green” products and the socially responsible investment market because the participants no longer trust in the validity of distinctive behavioral claims by firms in these markets (see Delmas and Burbano, 2011).

Allegations of “greenwashing” also illustrate the importance of properly defining the terminology for screening this kind of behavior. For example, Delmas and Burbano (2011, p. 66) claim that a firm-level example of greenwashing behavior can be found in General Electric’s “Ecoimagination” advertising campaign, which it used to promote the company’s positive contributions in the environmental arena at the same time it was lobbying to fight “new clean air EPA requirements.” But if this counts as “greenwashing”, it suggests that a firm has to support every environmental regulation in order to be “green” and that other efforts, no matter how constructive, are effectively valueless. It might be appropriate for an NGO or private monitoring and advocacy group to use such a lens or filter

¹⁰ See <http://database.globalreporting.org/search> (March 5, 2014).

to criticize a firm's behavior, but it is hardly self-evident that they should be entitled to a monopoly on the use of the "green" label. The definitional problem runs both ways, affecting both monitors and the firms, who presumably engage in public relations ca.". However, the absence of regulations in this area may be attributed to the difficulty of regulating in an environment mpaigns over these labels and practices.

Delmas and Burbano (2011, p.69) argue that a "lax and uncertain regulatory environment" is a primary driver of "greenwashing in which consensus is still emerging. In the United States, the Federal Trade Commission exercises broad authority to address matters of "unfair competition", which sometimes extends to matters involving environmental product representations. In October 2012, the FTC issued administrative guidelines to interpret terms that are commonly used in marketing products to consumers. However, the FTC cautions that these guides "are administrative interpretations ... [that] do not have the force and effect of law and are not independently enforceable." Moreover, those guides do not attempt to address "sustainable" claims.

The content of these guidelines illustrate the practical difficulty of regulating commercial disclosures, including the contestable value judgments that they reflect. Some of these guidelines require manufacturers to label products based not only on their inherent characteristics, but also on the customs and usages for the consumers who ultimately use them. For example, claims concerning recyclability must be restricted depending on whether recycling facilities are available "to a substantial majority of consumers or communities where the item is sold". Likewise, "degradability" claims must also contemplate the time frame in which breakdown will occur, which can vary based on the "customary" approach to disposing of the item. According to the guidelines, "Unqualified degradable claims for items that are customarily disposed in landfills, incinerators, and recycling facilities are deceptive because these locations do not present conditions in which complete decomposition will occur within one year."

In fairness to manufacturers, customary treatments may not be conveniently known for all locales in which a product may be sold. Moreover, practices may change in some locales based on such events as a recycling plant shutting down. For firms that use independent distributors, the locations in which a product may ultimately be distributed are not only uncertain, but changeable over time. If a disclosure becomes deceptive because of the conduct of others, does that tilt the firm's incentive away from making any such representation? After all, making no representation would avoid a costly and disruptive FTC challenge. But is that outcome good for achieving sustainability goals? And does it really serve environmental interests to find a firm guilty of deceptive labeling because consumers choose to recycle or dispose of a product in a landfill instead of composting it?

The FTC guidelines address misrepresentations made to consumers in connection with product labeling, but they do not necessarily cover sustainability claims made in other contexts. Although an expanded role for government in regulating disclosures concerning sustainability could have positive effects on practices connected with sustainability,¹¹ definitional problems remain. At the governmental level, these acts will involve political judgments about the nature and extent of disclosures that are necessary and appropriate in order to achieve some level of consistency. However, most importantly, the significance of those disclosures must ultimately percolate into the marketplace if they are to become meaningful drivers of sustainability practices.

A.3 Limited utility of disclosures

Even if corporate disclosures are improved, the realities of the marketplace limit their utility in driving enhanced sustainability practices. First, one may legitimately question how deeply corporate disclosures ultimately reach into the minds of the public who might be influenced by these practices. It is highly likely that only experts such as academics or activist groups will be expected to scour these reports, and thus their effectiveness in channeling corporate behavior will as a practical matter be limited by the type of reaction that those experts can produce in the marketplace (see Delmas and Burbano, 2011).

Market fatigue can also become a reality. If, as it seems from the data suggested above, almost everyone is talking about sustainability, conformity becomes the new norm. As a result, any market advantage from disclosing sustainability practices can be expected to diminish over time. Data from a KPMG study suggests support for this outcome: ethical considerations, not economic advantage, became the most important driver of reporting among G250

¹¹ See generally Ioannou & Sereafeim, *supra* note 49, whose research suggests that required disclosures produce a strengthening of sustainability in certain categories, including corruption and certain environmental practices.

firms in 2008; economic reasons for sustainability disclosures dropped to only 68% in 2008 as compared with 74% in 2005 (White, 2009, p. 47).

A.4 Benefit corporations: another alternative?

As a partial response to “greenwashing” concerns, corporate reformers have proposed a new kind of corporation known as a “benefit corporation”, which expressly embraces the creation of public benefits as part of its institutional mission. These corporations pursue profits and returns for their investors, and thus differ significantly from charitable nonprofits that have tax-favored status on account of their commitments to public welfare. However, in their pursuit of profit, they are also obligated to create “general public benefits”, which are defined as a “material, positive impact on society and the environment, taken as a whole, as assessed against a third party standard, from the business and operation [of the corporation]” (Clark, 2013, p. 16). Clark further asserts that they may also pursue “specific public benefits,” which are defined nonexclusively to include such matters as “providing beneficial products and services to low-income individuals, promoting economic opportunities beyond the creation of jobs in the ordinary course of business, preserving the environment, improving human health, and promoting arts, sciences, and the advancement of knowledge.”

The obligation to create these kinds of benefits arguably could be satisfied by most publicly traded companies with at least some level of commitment to sustainability or social responsibility. However, the benefit corporation is also required to deliver a narrative description to shareholders, which is also made available to the public, which describes the company’s progress in pursuing the general public benefit and/or any specific benefits it embraced. This report must also include an assessment based on overall social and environmental performance against a third-party standard, thus creating the foundation for independent assessment of sustainability claims.

Although the development and application of a third-party standard would indeed bring some additional credibility to the firm’s claims, the model legislation only defines the standards for selecting a qualified third party, rather than designating particular standards or assessors. Many third-party standards organizations are already in place to meet these selection criteria, including the Global Reporting Initiative (used by the Conference Board), GreenSeal, Underwriters Laboratories (UL), ISO 2600, and B Lab. This flexibility reflects the power of private ordering, as the marketplace is likely to reward expertise in different areas of emphasis among these private assessment firms. These assessors will presumably develop their own reputations for quality, as evidenced by a “rate the raters” report published by the consulting firm, SustainAbility.

Proponents of benefit corporations are optimistic about the effects of this kind of information assessment and disclosure model:

By assessing and disclosing the benefit corporation’s overall social and environmental performance against an independent third-party standard, shareholders and the public are provided an easy way to evaluate the company on these criteria, which for typical companies, is otherwise almost impossible to determine. [I]t is anticipated that this simplified “due diligence” tool will facilitate greater investment in benefit corporations and improve customer loyalty by enabling consumers to differentiate good deeds from merely good marketing. Over time, this has the potential to create market-driven positive feedback loops rewarding companies that adopt this higher standard of corporate governance and demonstrate higher levels of overall social and environmental performance.

The benefit corporation approach ultimately depends on private ordering for the details of a firm’s commitment, thereby avoiding government involvement in the contentious normative debate about what counts as sustainable. However, the prospects for a differential benefit from required disclosures against a third-party standard may not be so easily realized. First, as discussed above, disclosure does not easily translate into consumer goodwill. Other marketing efforts will be required, which are unregulated. As a practical matter, it seems reasonable to ask whether there will be any significant impact on consumers based on the fact that the supplier is a benefit corporation? Although a benefit corporation could add an independent assessor to provide an attest function, this option also exists for traditional corporations (see Yockey, 2014).

Second, claims of investment dollars flowing to benefit corporations (or their less-attractively named relatives, the “low-profit limited liability company” or “L3C”) must effectively be predicated on strong demand for

investments oriented primarily toward social benefits rather than returns for investors (Pearce and Hopkins, 2013). Even if benefit corporations ultimately become publicly traded, it is doubtful that the benefit corporation ultimately gives an investor more than they can already obtain through traditional sources. Investors following socially responsible investing models already have access to voluntary corporate disclosures from traditional corporations, some of which also utilize private forms of standardization and even attestation. Thus, the private ordering solution embraced by a so-called benefit corporation – disclosure and assessment against a third-party standard, developed and administered by an entity other than the government – already works for the traditional corporation, too. If more traditional corporations see the value in third-party assessment, the marketplace will likely respond, thereby further minimizing any differential benefits offered from choosing a benefit corporation.

Ultimately, this means benefit corporations are likely to resemble their traditional counterparts that are based on an ethos-driven model. Delivering on a sustainability promise through the ethos-based model could mean nothing more than giving a portion of profits to charities or the arts, funding scientific research, recycling some of the waste the business may generate, becoming more energy efficient, or reducing greenhouse gas emissions.¹² Those are all good things to do, but for an investment manager entrusted with the pension funds of retirees, those goods simply cannot be pursued at the expense of generating a return for the pensioners he or she represents. “Greenwashing” in traditional firms that claim a profit motivation may thus suit these investment advisors just fine, as it provides cover for applying their investment screens and running their sustainable investment funds.

Intermediaries such as NGOs or other watchdog groups may cast light on incongruities, but the marketplace is crowded and the claims may be dismissed because the firms and the critics are using different standards that could each be defensible. The channel for this information is thus noisy and risks becoming ignored. Ethos-based sustainability marketing may reach some consumers, though likely through channels other than the firm’s annual reports – and this is true for both benefit corporations and traditional corporations. Ethos-based marketing efforts impacting consumers are thus likely to be pursued through the same channels as the marketing of the products themselves.

Moreover, if the ethos-based approach becomes widely adopted among competing firms, the economic significance of sustainability commitments – however defined – becomes diluted. Sustainability commitments that distinguish a firm from its competitors may be capable of delivering value through tapping into the conscientious behavior of those who demand those commitments. But if most competitors say “me too”, the sustainability commitment diminishes in its utility as a tool for leveraging customers, suppliers, or employees.¹³

When it comes to making decisions about purchasing goods and services, consumers can be expected to consider characteristics of the goods and services – including features like price and quality – which they are in a position to evaluate. To the extent ethos-based claims are located remotely from the product and they fail to connect to a contribution made by this product, it stands to reason that sustainability practices will be less impactful on those consumer decisions. In contrast, firms who are able to integrate sustainability claims into their products are most likely to leverage the power of those commitments, thereby achieving genuine sustainability gains. That approach is discussed below.

B. Integrating Sustainability: Concrete Sustainability Deliverables (CSDs) and Certification Within Virtual Proximate Communities (VPCs)

Some firms have been able to develop products that integrate their sustainability commitments in a specific manner. Rather than relying only on claims which are rooted in practices with an attenuated connection to products, such as

¹² See, e.g., Conference Board 2013, *supra* note 2.

¹³ See Berger et. al., *supra* note 11, at 140, who notes that the business case model, which adopts sustainable policies when it is in their economic interest to do so, jealously guarded their market advantage: “Having realized a differential advantage in delivering virtue, business case companies were not eager for their competitors to follow them and worked to protect their advantage in the external market. On informant noted this explicitly: ‘We are trying to keep our competitors out.’” On the other hand, the firms adopting a social values-led model or a syncretic model both welcomed competitors to join in their commitments. Presumably, the syncretic model (which reflects most ethos based firms) would not mind only if they saw no real threat to their profitability.

charitable giving, supporting their communities, or recycling waste, these firms have managed to incorporate specific sustainability claims into the definition of their products.

Branding or third-party certification generally plays a significant role in that integration process. Some common examples of certifications may include Energy Star, Fairtrade, or Marine Stewardship Council certifications. These brands or certifications reflect a particular commitment to a sustainability practice that is directly related to the product sold by the firm.

Research shows that a significant number of consumers recognize these branding efforts. For example, Fairtrade International, which is the umbrella organization behind the global FAIRTRADE certification mark, reported that “nearly 6 in 10 consumers have seen the FAIRTRADE mark, and of those, 9 in 10 trust it.”¹⁴ Other market research in Canada has shown that 70 percent of consumers believe that third-party certification is the best way to ensure that a company’s claims about its products are trustworthy.

As consumers become aware of these brands and what they stand for, they become able to implement their personal support for sustainability goals through channeling their purchases toward products that bear these brands. A growing number of consumers are willing to pay a price premium for sustainability, as measured by fair trade certification. When asked to assess agreement with the following statement, “Fair trade or fair trade food and beverages are worth paying a little extra for”, participants in the United States responded as 34% (strongly agree or tend to agree) vs. 29% (tend to disagree or strongly disagree) in 2011.¹⁵ These response rates show significant growth in that willingness to spend for sustainability over 2009 figures, which showed only 17% (strongly agree or tend to agree) vs. 33% (tend to disagree or strongly disagree).¹⁶

This trend provides a strong signal to firms interested in following a sustainable path. To the extent that a significant number of consumers prefer products that reflect sustainability commitments – and they are willing to pay for that commitment – meeting that demand becomes a viable path for profit, not merely a cost that must otherwise be justified in the larger assessment of financial performance.

Consumer trust is an important component in this purchasing decision. Private branding may provide a means for making claims from sellers directly to consumers, and some firms have implemented this strategy successfully. In the case of Starbucks, for example, a general claim for “ethically sourced coffee” is followed by measuring and reporting the percentage of coffee ethically sourced during the reporting period. Starbucks thus reports on its progress toward a goal of ensuring that “100% of our coffee is ethically sourced by 2015.”¹⁷ This appears to be an example of a “concrete sustainability deliverable” (CSD) that is meaningful to its customers.

Although Starbucks will purchase some coffee that is certified as FairTrade, the “cornerstone” of its approach is “Coffee and Farmer Equity (C.A.F.E) Practices”, which it jointly developed with Conservation International to positively affect workers and environmental improvements on the farms that produce its coffee. However, even Starbucks depends on a third party – SCS Global Services – to provide verification services for compliance with its C.A.F.E. practices, rather than relying solely on its own representations. By fusing the Starbucks’ supply chain with sustainability practices, customers get some assurance that they are contributing to a “better future for farmers and a more stable climate for the planet” through buying Starbucks coffee. Another self-branding example is TOMS Shoes,

¹⁴ Fairtrade International, UNLOCKING THE POWER 3 (2012-13 Annual Report), available at http://www.fairtrade.net/fileadmin/user_upload/content/2009/resources/2012-13_AnnualReport_FairtradeIntl_web.pdf (September 3, 2013).

¹⁵ See Agriculture and Agri-Food Canada, International Markets Bureau, SOCIALLY CONSCIOUS CONSUMER TRENDS[:] FAIR TRADE, Figure 4, page 7 (April 2012), available at http://publications.gc.ca/collections/collection_2012/agr/A74-2-2012-7-eng.pdf

¹⁶ See id. It should be noted that there is wide variability among different nations in the survey. The average level of agreement (i.e., strongly agree or tend to agree) was 38% in 2011, but China (51%), India (60%), Saudi Arabia (52%), and U.A.E. (53%) were all way above this average, while nations including Japan (22%), Korea (30%), Canada (27%), and South Africa (30%) lagged significantly behind the average. However, even in these lagging nations, the total expressing agreement would still represent a significant market force to be reckoned with.

¹⁷ <http://www.starbucks.com/responsibility/sourcing/coffee> (visited September 3, 2013).

which uses its registered trademark, “One for One”, to ensure purchasers that “with every product you purchase, TOMS will help a person in need.”¹⁸ TOMS coordinates with partner organizations helping the poor across the globe and gives them shoes to assist in their missions. Each pair of shoes purchased by a consumer effectively delivers another pair to a person in need.¹⁹ Similarly, each purchase of TOMS eyeglasses results in a contribution to assist partner organizations with vision services for those in need. Here, a fused CSD is presented for the consumer, who is not merely buying shoes for herself, but also buying another pair delivered to a needy person.

While the vision contribution is not specified in TOMS published giving report, the shoe concept is particularly innovative. The style and quality of the other pair of shoes may not be identical to the pair you are buying, as TOMS focuses on matching the local needs (i.e., sport shoes rather than high heels for children), the apparent appeal involves efficiency for the consumer in integrating a sustainability goal with a purchase: buying a shoe gets you seamlessly into the company’s internal supply chain directed toward helping others. Although a customer could conceivably buy shoes cheaper somewhere else and donate the difference, TOMS provides a one-stop, seamless means to deliver this contribution that is effectively integrated into their product. Unlike the ethos-based approach, these contributions are specific and, at least in the case of the shoes, measurable in terms of their impact in a manner that makes sense to the consumer.

In contrast, consider a message that a firm gives a percentage of its net profits to a worthy cause. Endangered Species Chocolate, sold in Whole Foods markets, advertises on its product label that “We Donate 10% of our net profits to environmental groups that are FOCUSED on wildlife consideration and habitat preservation.”²⁰ Although this might be concrete, in the sense that it is measurable, the magnitude of the impact is not as readily apparent to the consumer. The net profits are determined after such costs as executive salaries and bonuses are deducted, and they are ultimately limited by the economic success of the firm in marketing its product. However, a percentage of profits might nevertheless be viewed as a CSD to some consumers who are motivated by endangered species concerns and buy the product because this claim is associated with the purchase.²¹

Other firms don’t rely on their own brands, but instead focus on external brands that reflect certification by a third party of the bona fides of their sustainability commitments. As noted above, Fairtrade certification presents a common example of this kind of external brand adoption. A small coffee vendor may lack the ability of a multinational corporation like Starbucks to partner with a conservation organization in developing its own sustainability standards and commitments, but it can deliver a product with similar sustainability traits by relying on a familiar brand from a third-party certification. That certification entails support for specific claims, such as an organic pedigree or a commitment to paying prices to producers that support sustainable production practices.

The seller may initiate the demand for certification as a means to reassure his customers that he shares their sustainability commitments. The local reach of many firms provides an effective constraint on their ability to enforce agreements with others remote from them, particularly when those agreements reflect characteristics that may not otherwise be detected in the quality of the goods. By partnering with third parties who certify compliance, the local seller is able to appropriate the trust associated with a global brand, while potentially still holding out the possibility of developing local goodwill and otherwise retaining its own business autonomy, features that otherwise would likely be compromised through a franchise or dealership arrangement.

Thus, private ordering in this context shows its strength by allowing local firms to cooperate, scaling international borders, bypassing entrenched government powers, and bridging the gap between consumers and their sustainability goals without losing their business autonomy. Through the power of contract, the attestation of a trusted intermediary, and the mutual incentives created by cooperation, a virtual proximate community is created for the limited purpose of cooperative production of a desirable good using agreed-upon metrics for sustainability. That good, along with the associated sustainability commitments, becomes the natural output of these ventures.

¹⁸ <http://www.toms.com/our-movement/>

¹⁹ http://www.toms.com/media/TOMS_Giving_Report_2013.pdf

²⁰ Label on file with authors. For further information, visit the company website, ChocolateBar.com.

²¹ To some extent, the fact that the package is sold by Whole Foods, which also has a reputation for concern about environmental and social issues, may reinforce the consumer’s willingness to act upon this representation.

This virtual proximate community has several relevant characteristics that make it effective. First, it avoids some of the burdens associated with obligations from competing sovereigns seeking to control transnational operations. Unlike the multinational corporation, which may face complexity from competing obligations to pay taxes or satisfy regulatory burdens in multiple jurisdictions, this form of cooperative venture leaves certain production or service responsibilities to local firms, thereby avoiding the encumbrances of additional compliance burdens. The primary international actor, the certification intermediary, is likely a nonprofit organization that avoids international tax burdens and engages only in assembling and assessing information, rather than the sale or distribution of goods.

Second, this virtual community should be open to new firms who share these commitments. Unlike a cartel, in which participants exclude others in order to reap consumer surplus for themselves, this approach should reject a monopoly power over virtue. By willingly adding new firms who embrace the brand, this injects new competition into the marketplace, benefitting consumers. However, while the brand is small and unknown, it also has the salutary effect of increasing awareness among consumers and growing that demand. Although this might mean that other firms may be competing in the local marketplace, all participants may expand access to customers attracted by the sustainability component of the product. Apart from banding, it may be difficult to reach those customers through other means, including ethos-based marketing.

Third, this virtual community is responsive; stakeholders can agree upon new or revised requirements as they relate to targeted sustainability goals in the changing world, and they can implement them in a manner that can be measured and scaled to achieve those goals effectively. These virtual communities provide a laboratory for experimentation which allows mistakes to be corrected and learning to improve the ecosystem.

By combining voluntary participation and somewhat predictable forces of competition, private ordering may bring about transformations that might otherwise not occur if one waited for the government to intervene. Those transformations may be limited – they may not help all children needing shoes (TOMS), small farmers needing better prices or workers needing higher wages (Fairtrade). But such is the nature of progress: incremental change in the right direction is better than hoping for comprehensive change that may not materialize at all. Figure 2 places the two approaches in context and Table 1 summarizes characteristics of the two approaches.

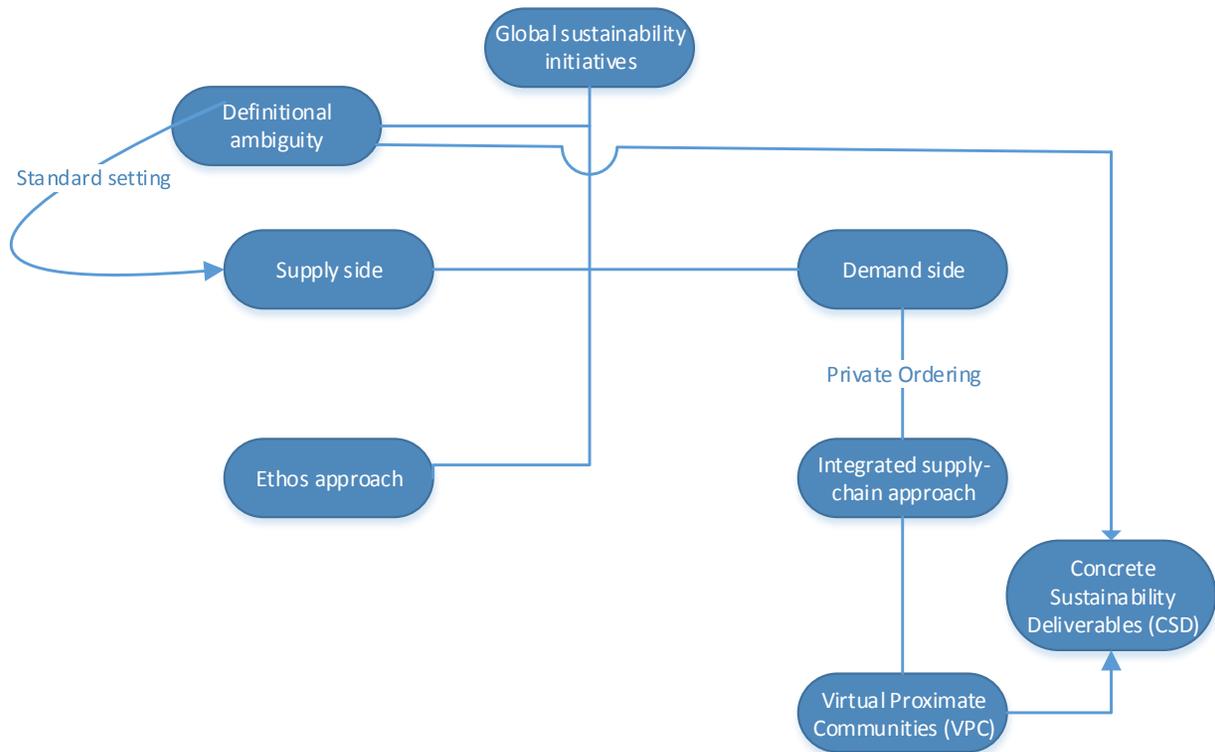

FIGURE 2: AN OVERVIEW OF SUSTAINABILITY APPROACHES

TABLE 1: A COMPARATIVE VIEW OF THE TWO APPROACHES

	Ethos approach	Integrated supply chain approach
Drivers	Legal, political	Market forces
Value proposition	Additional cost to the firm	Value to the society, now and in future
Key players (locus of control of the movement)	Investors	Consumers (Internal and external)
Flexibility in casting influence	Limited	Significant and pervasive throughout the ecosystem
Sustainability total costs	Sustainability compromises are externalized; losses stay outside the measurement metric	Treatment costs are internalized; become a part of the value proposition
Adaptability to change	Low. Delayed correction, if any.	Dynamic

Opportunities and Challenges: Moving Forward

Private ordering approaches described above offer significant potential for positive contributions toward sustainability goals. By tapping into a growing consciousness about the impacts that purchases of goods and services have upon the wellbeing of others, for-profit firms are making important strides toward positive changes in environmental, economic, and social preservation. Rather than relying upon coercion or threats, these approaches depend on developing market-

based incentives that cause participants in the supply chain to deliver the sustainability results that matter to the purchaser.

The effectiveness of these private, market-based approaches starts with consumer demand. Unless consumers become educated about the importance of sustainability practices, that demand will not materialize. The sustainability marketplace therefore requires more than mere legal structures to support trade; it also requires social capital that is grown through a variety of sources, which are not necessarily restricted to direct market participants. Non-profit organizations, religious communities, and other concerned individuals all play important roles in communicating about the significance of individual choices in progress toward sustainability commitments, as well as in translating and scrutinizing the commitments of market participants (see Vogel, 2005). They may also do important structural work in creating bases for knowledge and.²²

That communication occurs through different channels, but the Internet has obviously become an important channel because of its ubiquity and utility for economical and effective communication. Maintaining free and open access to the Internet may thus be an important commitment for all who care about sustainability issues, and particularly those who wish to pursue them through private trading channels. To the extent this freedom is threatened, it represents a significant challenge for all who are concerned about sustainability (refer to Meltzer, 2013).

Market participants also have an interest in communicating directly with consumers, who have limited capacity for digesting information from detailed disclosures made for the benefit of experts. As discussed above, branding efforts become an important part of this communication strategy, as a strong brand becomes an effective vehicle to communicate qualities of products, as well as the strength of sustainability commitments used to produce them.²³ Although some firms (like Starbucks) have sufficient resources to develop their own brands, smaller firms may find it more economical to adopt third-party brands. The Fairtrade movement provides a prominent example of a brand that appeals broadly to consumers, who associate this brand with trust that their purchase will reflect their sustainability commitments.

The efficacy of branding ultimately depends upon trust, which can be reinforced by third-party certification and assessment practices. Government can become involved in branding efforts, too. Brands that confirm geographical locations of origin, which might reflect distinctive cultural or crafts associated with a particular region, have been touted as one way to honor sustainability commitments through market channels (Aylwin and Coombe, 2014). But the efficacy of private branding often depends upon some combination of third-party verification of standardized commitments throughout the supply chain. This can be expensive, but this investment to confirm compliance builds value for the brand. For example, consumers who purchase Fairtrade products want to be sure that the premium price they are paying is ultimately benefiting a small producer somewhere, not just the seller or intermediaries in the supply chain.

The complexities of sustainability commitments that transcend economic, cultural, and social conditions necessarily require balancing and adjustment. For example, imposing new standards and practices through a private ordering approach can also have negative impacts on local culture. Some commentators have observed that an “NGO-Industrial Complex” is emerging, which despite good intentions for improving social and environmental barriers, can in some cases lead to unintended consequences of concentrating production in the hands of larger local companies, thereby excluding poorer producers (Perez-Aleman and Sandilands, 2013). Others have argued that approaches like the Fairtrade movement may not be as effective at delivering benefits to low-earning laborers, as the “small producers”

²² See, e.g., Kevin McKague & Christine Oliver, *Enhanced Market Practices: Poverty Alleviation for Poor Producers in Developing Countries*, 55 *Cal. Mgt. Rev.* 98 (2012) (discussing NGO efforts to improve the lot of poor milk producers in Bangladesh by education, enhancing collective efforts to achieve economies of scale, and internalizing marketing functions to better serve their local market). The approach that McKague and Oliver identify reflects the fact that not all sustainability efforts have to involve global trade.

²³ See Vogel, *supra* note 97.

to which it channels benefits are landowners, who pay their laborers minimum rates based on local laws (Haight, 2013).²⁴

Such criticism of sustainability claims and commitments is a necessary component of the marketplace for these consumer-driven purchases. It reinforces the value of robust freedom regarding exchange of information about sustainability claims and goals, which are important for any functioning market. Firms will have to adapt their products and business models to address valid criticisms or face losing their market advantage from their branding efforts.

Consumer-driven approaches for pursuing sustainability are not perfect, but they offer real opportunities to make progress toward sustainability goals. Their utility is limited only by the creativity within the marketplace, which permit a variety of different approaches to pursuing sustainability goals. Their success depends on shared commitment through purchases, reflecting a democratic form of power that is not constrained by political boundaries or the required approval of elites from governing majorities of NGOs, multinational companies, or states.

Assurance on Sustainability Reports: why and who?

Abstract

Sustainability reports (SR) are a useful tool for companies to communicate their performance in the Corporate Social Responsibility (CSR) arena. Because SRs include mostly voluntary disclosures and only limited standards exist, the inclusion of Assurance statements (AS) provides credibility to the information included in the report. Previous literature has studied the variables that affect the existence of assurance and the profile of the assurator at two different levels: the characteristics of the reporting company, and the country where the company is located. Factors that have arisen as explanatory of the dependent variables are generally the result of linear regression models, considering only the fixed effects of the factors. Thus, the objective of this paper is to analyze the factors that explain the decision of a company to assure their SR and the choice of the assurator, using a novel statistical approach, generalized mixed models.

Keywords: Corporate social responsibility, assurance, sustainability report

Introduction

Sustainability reporting is a natural output of Corporate Social Responsibility (CSR). Companies with a CSR strategy should be willing to disclose their social, economic and environmental performance (Hubbard, 2009) given that it showcases their activities in the area. Sustainability Reports (SRs) are the best tool for this communication. Because SRs include mostly voluntary disclosure, and there are only limited standards, the inclusion of an Assurance Statement (AS) adds an additional layer of credibility to the report. From an economic perspective, the demand of assurance of a SR is justified as long as the benefits obtained in terms of credibility are higher than the cost of the assurance service. The 2013 KPMG survey (KPMG, 2013) indicates that less than 60% of the largest 100 companies around the world present assured information, which might indicate a high cost of the assurance service or the perception that it does not add value to the report.

Previous literature has studied the variables that affect the existence of ASs at two different levels: the characteristics of the reporting company (Mock et al. 2007; Perego, 2009; Sierra et al., 2013a) and the country where the company is located (Kolk and Perego, 2010; Simnet et al., 2009). To the best of our knowledge, previous research has considered only the fixed effects of the explanatory variables, analyzing simultaneously variables at the country and company level. However, when conclusions using variables at the company level in international samples are reached, the so-called *atomistic fallacy* error may occur. Conversely, when analyzing data at the country level, and concluding about variables at the company level, there is a risk of the so-called *ecological fallacy* effect (Hox, 1998; Goldstein, 2003, Torrecilla, 2008). Therefore, when data are nested or when there are repeated measurements for one unit of observation, it is recommended to use multilevel modeling techniques (Peugh and Enders, 2005 Pinheiro and Bates, 2000). These techniques improve the understanding of the relationship between the response and the explanatory variables, when the interrelations among the latter are identified. The use of mixed models makes it possible to assess simultaneously different aspects of a dataset. Our contribution in this paper is the use of generalized mixed models, to investigate the factors that explain the decision of a company to assure their SRs and the choice of the assurator. We contrast the results of previous literature in sustainability assurance, using an alternative statistical analysis based on mixed models. In order to define the model, the candidate explanatory variables are selected from previous literature. We then explore the bivariate associations between the identified candidate variables to select the explanatory variables to be included in two generalized mixed models. The first model is set to explain the decision to assure the SR while the second one intends to explain the choice of the assurance provider.

The paper continues as follows: after the literature review, the hypotheses are developed and the methodology is introduced. To finalize, the results, discussion and conclusions are presented.

Literature Review and hypotheses development

Theoretical framework

Institutional theory emphasizes the social context within which firms operate. Bansal (2005) posits that institutional theory is relevant to CSR due to three factors: (1) individual values and beliefs judge a firm's commitment to sustainable development, affecting perceptions of the firm's acceptability and legitimacy; (2) discussions among people with different opinions result in common beliefs and norms; (3) sustainability issues become institutionalized and regulated. Hence, even if the corporation has no marginal return from their sustainability practices, it might still decide to engage in sustainability due to regulation or social pressure. Legal system has been used as institutional factor to explain the decision to assure the SR (Kolk and Perego, 2010; Simnett et al., 2009) and the choice of a Big4 as assesor (Perego, 2009, Simnett et al., 2009). In this setting, a company might decide to assure the sustainability reports as a demand from its stakeholders who expect to receive transparent reports. This notion is enforced when considering stakeholder theory. Freeman (1984) posits that different factors such as stakeholders, values and societal issues have to be analyzed to establish the foundation of enterprise-level strategy. He indicates that the distinguishing feature of CSR is that it applies "the stakeholder concept to non-traditional stakeholder groups usually thought as having an adversarial relationship with the firm," and that "less emphasis is put on satisfying owners and comparatively more emphasis is put on the public or the community or the employees" (p.38). Based on this idea, stakeholder pressure is expected to determine the assurance of SRs and the selection of assesor. Previous literature has stated that this pressure is associated to industry membership (Kolk and Perego, 2010; Mock et al., 2007; Sierra et al, 2013a) and also with the company size. For example, companies with activities that have a major environmental impact, or companies with high visibility for being well known to the general public, will try to reduce risks, giving more confidence to their stakeholders through CSR assured information (Fernández_Feijóo et al., 2013).

Finally, legitimacy theory is based on the idea that there is a "social contract" between a company and the society. This theory assumes that companies will behave in such a way that makes them recognized by society as socially responsible (O'Donovan, 2002). The disclosure of CSR information through SRs legitimizes the role of the firm within the society (Deegan, 2002) given that when the society perceives that company's behavior is not adequate, a legitimacy gap may develop (Branco and Rodrigues, 2006). In those situations, the existence of assurance reinforces social behavior by adding credibility to the report.

According to these previous findings, determinants at the country and company levels may explain the existence of the assurance statement on the SR and the choice of the assesor.

Country level: Legal/institutional environment

Previous international research on determinants of assurance of SRs dealt mixed results. Simnett et al. (2009) classify countries according to their legal system tradition. They distinguish between common law, associated to shareholder-oriented countries, and code law, related to stakeholder-oriented countries (Ball et al., 2000). They also consider the enforcement mechanism, measured by the rule of law, which was developed by the World Bank. The rule of law is a measure of the "...perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence" (Kaufman et al, 2010). These authors use an international sample of 2,113 companies that published SRs in the period 2002-2004. They do not reach a definitive conclusion in terms of the legal tradition when evaluating the decision to assure the SR, because the results vary if companies from US are included or excluded from the sample. They find that companies in countries with a strong legal system are more likely to have their sustainability reports assured. Nevertheless, their results support that the choice of an accounting firm as assesor is higher in companies in stakeholder-oriented countries, regardless of whether or not the sample includes US. Perego (2009) studies the choice of the assurance provider using a data set collected between 1999 and 2005 from companies in Australia/New Zealand, Hong Kong, Ireland, Malaysia, North America, Pakistan, Singapore, South Africa, Sri Lanka, United Kingdom and other European countries. At the country level, he uses different indexes as proxies for the quality of governance and legal country regime. He finds that the choice of a large accounting firm as assesor of the SR is positively associated with countries with weaker enforcement, and negatively associated with the level of litigation risk in the country, measured by a Liability

Standard Index developed by LaPorta et al. (2006). He also tests company level variables such as size, industry, and profitability, and finds no conclusive results for any of them.

Country-level determinants of the existence of AS are also analyzed by Kolk and Perego (2010), who use three institutional factors: legal environment, defined as common law vs. civil law, enforcement mechanisms (strong vs. weak) and the pressure toward sustainability (higher vs. lower). They use a logistic regression with fixed effects to analyze the likelihood that a SR has been assured. Their sample includes 341 companies in 20 countries for the years 1999, 2002 and 2005, resulting in 636 observations. They find a positive association between the response variable (existence of AS) and the stakeholder orientation of the country, as well as the pressure towards sustainability. Furthermore, they conclude that companies in countries with weak enforcement mechanisms are more likely to assure their SRs. Their study shows a significant association between existence of assurance and concrete industries: companies in oil, chemical and manufacturing industries; and no significant association between existence of assurance, and the explanatory variables size and capitalization rate. These researchers also analyze if the aforementioned determinants are significant in the choice of the assurance provider. For that purpose, they use the SRs in their sample that were externally assured (98 SRs). They find that neither country-level determinants nor size of the company are significant; and that companies in the financial sector are more likely to hire a big accounting firm as assurance provider. Another interesting finding is that companies in the USA present lower proportion of reports with sustainability assurance than companies in other countries in the world, which might be related to the high risk of litigation. Japan and most of the European countries have the highest rates of assurance of SRs. The authors conclude that country-level factors are significant drivers of sustainability assurance, and highlight the need of future research to analyze country-level and firm-level factors concurrently.

These results suggest that companies in stakeholder-oriented countries, with weak enforcement and high pressure towards sustainability are more likely to have their SR externally assured, and that they will hire a Big-4. Our H1 is stated as follows.

H1.a. Legal environment affects the decision to have the SR externally assured.

H1.b. Legal environment determines the choose of the assuor

Starting in 2001, the European Commission has developed a strategic policy to promote CSR. One of the main effects of this policy is the rise of companies that prepare and disclose their SRs according to the Global Reporting Initiative (GRI) framework, from 270 in 2006 to over 850 in 2011 (European Commission, 2011). The preeminence of Europe in the sustainability assurance market was highlighted by Mock et al. (2007), evidenced by observations on a sample of 130 companies that published assured SRs in the 2002-2004 period. They also observe that companies in utilities, mining and oil sectors (environmental and economically more sensitive industries) are more likely to assure their SRs. Afterwards, in a comparative study with data from 2006-2007, Mock et al (2013) confirm the leadership of European companies in sustainability assurance. As a consequence of the institutional pressure from the EU, on April 15, 2014, the European Parliament approved the Directive on disclosure of non-financial and diversity information by certain large companies and groups (http://europa.eu/rapid/press-release_MEMO-14-301_en.htm?locale=en). European public policies promote the quality of the Sustainability disclosures but do not set rules on the selection of assurance providers. Hence, we hypothesize that countries in EU are more likely to have SR externally assured. Our second hypothesis is:

H.2.a: European companies are more likely to have their SRs externally assured.

H 2.b: Being a European or a non-European company has no effect on the choice of the assuor.

Company-level determinants

Sierra et al. (2013a) study the factors that influence the decision to have the SR externally assured, as well as the choice of the assurance provider, considering only firm-level variables. The sample includes 133 Ibex-35 Spanish companies with SR, and the variables under consideration are industry, size, profitability and leverage. They conclude that the decision to externally assure a SR is positively associated with size and ROE, and negatively associated with ROA and leverage. The authors, use a second sample of 163 companies issuing SRs (with and without AS), and, find a relationship between the financial audit market and the market of SR assurance. Finally, using a third sample of 135 companies with SR and AS, they conclude that companies in oil and energy, basic materials and financial industries are more likely to have their SR assured by a Big-4 auditing firm. Zorio et al

(2012) find similar results using a sample of 130 companies listed at the *Bolsa de Madrid* in the period 2005-2011. The authors highlight that Big companies, those that belong to the oil and energy industry, as well as companies that are listed at IBEX-35 are more likely to have the SR assured. They also find that the decision of hire an auditor as opposed to a consultant depends on industry, size, and the inclusion on the IBEX-35.

As observed in previous literature, the decision to assure the SR and the choice of the assurance provider can be affected by industry membership, company size and the shareholders' pressure due to the visibility of large companies and the relationship between financial auditors and SR assurance providers. According to that, we state our third hypothesis as follows:

H.3a: Company features (size, industry membership and ownership structure) affect the decision to assure the SR.

H.3b: Company features (size, industry membership and ownership structure) affect the decision to hire a Big-4 assurance provider.

Finally, at the company level also, there are two additional determinants linked to the company strategy reporting. We expect that the commitment to CSR, represented by higher levels of CSR disclosure, or by the assumption that integrated reports provide enhanced communication with stakeholders, will affect the existence of assurance and the quality of the assurance provider.

Up to date, the International Integrated Reporting Committee (IIRC), created by the Prince's Accounting for Sustainability Project, the GRI and the International Federation of Accountants (IFAC), is working on a framework to provide the wide range of information that investors demand. According to the IIRC, an integrated report should identify the financial and non-financial connections between the following elements (IIRC 2011): Organizational overview and business model, Operating context (risks and opportunities included), Strategic goals and the strategies to achieve those goals, Governance and remuneration, Performance, and Future Outlook. There is little research on the determinants of integrated reports mainly focused on country level determinants (Frías-Aceituno et al., 2013a, García-Sánchez et al., 2013; Jensen and Berg, 2012; Sierra-García et al., 2013b) but also including characteristics at the company level (Frías-Aceituno et al., 2013b, Sierra-García et al., 2013b). Sierra-García et al. (2013b) find that the likelihood of presenting an integrated report is significantly and positively associated to having the sustainability report assured.

Thus, our fourth and fifth hypotheses are stated as follows:

H.4a: Companies that disclose SR with the highest level of application of the GRI guidelines are more likely to have their SR externally assured,

H.4b: Companies that disclose SR with the highest level of application of the GRI guidelines are more likely to hire a Big-4 assurance provider.

H.5a: Companies that issue integrated reports are more likely to have their SR externally assured,

H.5b: Companies that issue integrated reports are more likely to hire a Big-4 assurance provider.

Research Method

Sample

Data are collected from the GRI website. This dataset includes 8,332 companies with SR registered in the period 2011-2013 in more than 80 countries. We use two samples. Sample 1 includes 3,706 company-year observations, from 2,220 companies that voluntarily decided to register their SRs in GRI. Our sample includes 22 countries in different regions in order to achieve a worldwide representation from countries with and without mandatory CSR reporting, and in developed and developing economies. For companies in each of these countries, we remove all the SRs that did not follow the GRI guidelines or the SR classified as GRI content index, to eliminate the effect of information that is not homogeneous. Duplications are excluded and data completed with information hand collected from the corporate websites, when needed. Sample 2 derives from Sample 1, and it includes only the assured SRs, dealing a total of 1,491 observations from 874 companies.

Methodology

We start our analysis with a bivariate test of the explanatory variables selected from the literature review, in order to exclude those with no statistical association with the response variables. When the variables are

categorical (e.g. size), we use a cross tabulation analysis; when the variables are continuous, we calculate the correlations.

As a second step, we analyze the likelihood of a company to have the SR externally assured, using Sample 1 (3,706 SRs). For this purpose, we run a generalized linear mixed model to analyze jointly the legal characteristics of the countries in which the companies operate and other variables at the company level (Model 1). Finally, we analyze the factors underlying the choice of the assurance provider using Sample 2 (1,491 SRs with AS). For this purpose, we run a generalized linear mixed model to analyze jointly the legal characteristics of the countries in which the companies operate and other variables at the company level (Model 2).

Generalized mixed models are used in literature to analyze nested data structures (Peugh and Enders, 2005, Pinheiro and Bates, 2000). The model establishes a hierarchy in the data. In our sample, companies (level 1) are nested in countries (level 2); hence, data at the company level is not independent within each country given their common country characteristics. We assume country of origin is a random effect, because it is a grouping factor.

Variable definition

In Model 1, the response variable is ExtAssurance. This dichotomic variable adopts a value of 1 if the company has its SR externally assured, and 0 otherwise. Big4 is the response variable in Model 2. Big4 adopts a value of 1 if the SR is assured by a Big-4 firm, and 0 if it is not.

The explanatory variables are the following:

a) At the country level:

- *Country* is a nominal variable that adopts 22 values, representing the 22 countries in the sample. We use this variable as grouping factor (random effect).

- *NCRI* (National Corporate Responsibility Index) is used as proxy for institutional pressure towards sustainability (Kolk and Perego, 2010) and calculated by Zadek et al. (2005). NCRI refers to three dimensions: internal (corporate governance, ethical practices and human capital development); external (civil society context) and environmental management.

Regulatory enforcement is measured by the rule of law developed by The World Bank Group (2013). We use the last year's information available, 2012.

Law origin is defined according to Djankov et al (2008). It has a value of 1 if common law and 0 if civil or code law.

EU identifies companies in European Union countries.

b) At the company level:

Industry of the company issuing the SR. The GRI database classifies 38 industries. We group them into 10 values according to its nature using previous classifications (Amran and Haniffa, 2010; Deegan and Gordon, 1996; Wilmshurst and Frost, 2000; Fernandez-Feijoo et al., 2014). Energy and Chemicals (Chemicals, Energy, Energy utilities); Construction (Construction, Construction materials); Consumer goods (Consumer durables, Food and beverages, Healthcare products, Household and personal products, Retailers); Transportation (Aviation, Logistic, Railroad); Finance (Financial services); Primary sector (Agriculture, Forest and paper, Mining); Manufacturing (Automotive, Equipment, Metal products, Textiles apparel, Tobacco, Toys); Services (Commercial services, Healthcare services, Media, Non Profit / services, Public agency, Real state, Tourism/leisure, Universities, Waste management, Water utilities); Technology (Computers, Technology hardware, Telecommunications) and Other (Conglomerate, Other). We use the same classification in Sample 2.

Size has a value of 1 if the SR is published by a large or multinational company and 0 if the company is small or medium.

Listed has a value of 1 if the SR belongs to a company publicly traded, and 0 otherwise.

App-level is a nominal variable that indicates the level of application of the GRI guidelines. Two guidelines (G3 and G4) were issued by GRI in the period of analysis. 99.7% of the sample of 3,706 SR follows the G3 guidelines. G3 distinguishes between three levels (A, B and C) from higher to lower, which indicates the level of information disclosure in the report. The remaining .3% is prepared according to the G4 guidelines that establish two levels of disclosure (In Accordance-comprehensive and In Accordance-core). GRI has defined no association

between G3 and G4 guidelines. This variable adopts a value of 1 if the SR has level A or In accordance-comprehensive and 0 otherwise.

Integrated indicates how sustainability information is disclosed by the company. This variable adopts a value of 1 if the company issues an integrated report and 0 if it issues a stand-alone report. According to Sierra et al (2013a) there is a positive association between the decision to assure the SR and the likelihood of issuing an integrated report.

We also use the variable *year*, because we have repeated observations in the period of analysis from each company.

Results

Descriptive analysis

The distribution of the sample by country is shown in Table 1.

TABLE 1: SAMPLE DISTRIBUTION BY COUNTRY

Country	Sample 1		Sample 2		Proportion of SRs with AS
	Freq.	%	Freq.	%	
Argentina	96	2.6	20	1.3	20.83
Australlia	159	4.3	85	5.7	53.46

Total	3,706	100	1,491	100	40.23

Table 2 presents the distribution by industry. The 87.2 % of the reports in Sample 1 are from large or multinational companies; 57.3% belong to listed companies and 40.9% of the SRs have an AS. This last group forms Sample 2. In this second sample, 90.3% of the reports are from large or multinational companies, 61.4% from listed companies and the 61.4% were assured by a Big-4 auditing firm.

TABLE 2: SAMPLE DISTRIBUTION BY INDUSTRY

Multivariate results

Model 1

We design a generalized linear mixed model with a binomial probability distribution and a logit link function. It is structured in two levels: country and SR. Country is used as random effect; the variables with significant correlations in the bivariate analysis are the fixed effects. The Model 1 test has a good fit (overall percent correct of 72.6%).

Table 4 shows the estimations of the parameters associated with the random effects. We calculate the *Intraclass Correlation Coefficient* (ICC) for each year based on those estimations. ICC represents the variability of the *ExtAssurance* variable among countries with respect to the total variability. In 2010, the country factor contributes 19.43% (.219/(.908 +.219)). This means that almost 20% of the total variability of the dependent variable (*ExtAssurance*) is due to differences in the proportion of SRs assured in each country. For 2011 and 2012, the ICC is 17.06% and 16% respectively. Therefore, the likelihood of having the SR assured is not the same in all

countries (Z Wald test Sig = .011), and country can be used as random effect. This result also shows that most of the variability of the dependent variable (more than 80%) is explained by differences within the country, e.g. company level factors.

TABLE 4: COVARIANCE PARAMETERS

Var.	Estimate	Z	Sig.
Subject: country	.219	2.542	.011
Residual (year1)	.908	28.222	.000
Residual (year2)	1.065	23.844	.000
Residual (year3)	1.150	21.143	.000

Covariance structure: variance components

Fixed effects are shown in Table 5. Our results do not support H.1a because legal system (*LawOrigin*), enforcement (*RuleofLaw*) and pressure towards Sustainability (*NCRI*) do not have a significant effect on the response variable; however, the EU variable is significant, which can be explained by the specific public policies on CSR promoted from the European Commission. H.2a is therefore supported. At a company level we observe that the *Industry*, *Size*, *Listed*, and the fact of presenting the sustainability information in the highest level of application determine the existence of assurance of the SRs; on the contrary, the existence of integrated reports, is not a significant factor. Hypotheses H.3a and H.4a are supported but H.5a is not.

TABLE 5: FIXED EFFECTS

Source	F	Sig.	Source	F	Sig.
Correctedmodel	29.738	.000	Size	15.475	.000

EU	5.407	.020	Integrated	.006	.938

- Table 6 shows the exponential coefficients of the significant fixed effects. The results are the following:
- the odds for companies in non European countries having the SR externally assured are .509 times the odds for European companies, all other things being equal;
 - in SME companies, the odds are .602 times the corresponding odds for large and multinational enterprises, all other things being equal;
 - in non-listed companies, the odds are .755 times the corresponding odds for listed ones, all other things being equal.
 - for Industry, we use companies in financial industry as reference. We find that, all other things being equal:
 - the odds of having the SR externally assured in companies belonging to the construction industry are .421 times the corresponding for companies in the financial sector;
 - in Consumer Goods the odds are .454 times;
 - in Primary sector the odds are .538;
 - In Manufacturing, .467 times;
 - in Services, .523 times;
 - in Technology, .675 times;
 - in Others, .620 times.
 - the odds of having the SR externally assured in companies that issue SR with the lowest levels of disclosure is 0.161 times the corresponding for companies that issue the SR with the highest levels, all other things being equal.

TABLE 6: FIXED COEFFICIENTS

AppLevel = Highest	.000 ^a		

^a This coefficient is set to zero because it is redundant

** Significant at the .01 level

* Significant at the .05 level

In sum, the likelihood of having the SRs assured is higher in companies from Europe, large or multinationals, listed, as well as those that present the SR with the highest level of sustainability disclosure, according to GRI. We also find that companies in the Finance industry are more likely to have their SRs externally assured than companies in Construction, Consumer goods, Primary sector, Manufacturing, Services, Technology, and Other. We find no evidence for Transportation, and Energy-Chemical, meaning that these sectors have no significant differences compared to Finance.

Model 2

The second model analyzes the choice of a Big-4 firm as provider of the SR assurance. Similar to Model 1, Model 2 is a generalized linear mixed model with a binomial probability distribution and logit link function. Data are nested within two levels, Country and AS. Country is used as random effect as in the previous model. Model 2 has an appropriate goodness of fit test (overall percent correct of 74.4%). The estimations of the parameters associated with the random effects are included in Table 7. In 2010, the differences between countries explain 47.17% (.891/ (.998+.891)) of the variability of the response variable, *Big4*. ICC has similar percentages in 2011 and 2012, 46.70% and 45.98%, respectively. The likelihood of having the SR assured by a Big4 is not the same in all the countries (Z Wald test Sig = .012).

TABLE 7: COVARIANCE PARAMETERS

Var.	Estimate	Z	Sig.
Subject: country	.891	2.512	.012
Residual (year1)	.998	16.696	.000
Residual (year2)	1.017	15.418	.000
Residual (year3)	1.047	14.381	.000

Table 8 presents the explanatory variables of this model: Size, Listed, Industry and existence of an integrated report, which supports hypotheses 4b, 5b and 7b. Similar to Model 1, legal system (*LawOrigin*), enforcement (*RuleofLaw*) or pressure towards sustainability (*NCRI*) do not have a significant effect on the decision

to have the SR assured by a Big4, which does not support H.1b. Finally, EU membership does not affect the dependent variable, which supports H2.b. These results suggest the existence of other effects at the country-level that explain the selection of a Big4 as an assurator. At the company level, H.3b and H.5b. are supported.

TABLE 8: FIXED EFFECTS

Source	F	Sig.	Source	F	Sig.

Our results show that the likelihood of hiring a Big4 auditing firm as SR assesor is higher in listed companies, and in companies that present the sustainability information in an integrated report. Regarding industry, the likelihood of choosing a Big-4 as assurance provider is higher in the Finance industry than in Construction and Primary Sector, and for Consumer goods, Manufacturing, Services and Others.

Discussion and Conclusions

The aim of our paper is to investigate the factors that explain the decision of a company to assure their SRs and the choice of the assesor, under the assumptions of institutional, legitimacy and stakeholder theories. We contribute to existing literature by using a new methodology (generalized mixed models) that considers the effect of randomness produced by hierarchical grouping. We test the hypotheses using two samples. Sample 1 includes 3,706 company-year observations from 2,220 companies in 22 countries. Sample 2 includes only the assured SRs of the sample 1, dealing a total of 1,491 observations from 874 companies, also in 22 countries.

We find that the decision to assure the SRs and the choice of the assesor depends both on differences between countries and differences within each country.

In contrast to Kolk and Perego (2010), Perego (2009) and Simnett et al. (2009), we do not find that legal system of the country measured by the origin of the law, the legal enforcement and the pressure towards sustainability, affect significantly the decision to externally assure the SR or the choice of a Big4 as an assesor. As a consequence, our results do not support the first hypothesis. Also, at the country level, we find that companies from EU are more likely to have the SR assured than companies in non-EU countries, however they do not hire more Big-4 than companies in other countries. This result can be explained by the existence of specific policies for sustainability in the EU that promote the assurance of the SR as a tool to improve its quality, but do not put restrictions on the selection of assesor. Our results support the second hypotheses. Further research is needed to study determinants of assurance of SRs at a country level, which might be related to regulation.

At the company level, similarly to Simnett et al (2009) and Sierra et al. (2012) we find that large and multinational companies are more likely to have their SR externally assured. We also find that the likelihood of hiring a Big4 as assurance provider is higher in large companies than in small and medium ones, which confirms the results from Simnett (2009). Comparably to Mock et al. (2007, 2013) and Kolk and Perego (2010), we find that companies in Energy-Chemicals are more likely to have their SR assured. We also find that the odds of having the SR assured instead of not having it are higher in Finance and Transportation industries. Furthermore, as in Sierra et al. (2013a) and Kolk and Perego (2010), our results show that the likelihood of choosing a Big-4 as assurance provider is higher in the Finance industry than in Construction and Primary Sector, and for Consumer goods, Manufacturing, Services and Others. Our results support the third hypotheses.

The level of application of the GRI guidelines is found to be a measure of commitment to transparency, because it affects the decision to have the SR assured, but not the choice of the assurance provider. According to this, H.4a is supported and H.4b is not. Unlike Sierra et al. (2013b) we do not find evidence that the likelihood of presenting an integrated report is significantly and positively associated with having the sustainability report assured. However, companies that present their SR in an integrated way are more likely to hire a Big4 as assesor than companies that issue a non-integrated report. According to this, H.5b is supported while H.5a is not. While firm-level variables such as industry or size have been tested in existing literature, other determinants such as those related to the level of commitment to CSR by the reporting company have not, and our results contribute to the existing literature by providing evidence to this matter.

We are aware that our findings can be generalized to the population from which the sample was obtained, i.e, companies that register their SRs in GRI, therefore, they can not be extrapolated to the whole market of the sustainability assurance. Despite this limitation, we believe that these results can be useful to regulators and also for companies that offer the assurance of the SRs service.

Knowledge Inequality, Entrepreneurship, and Agricultural Transformation – A Conceptual Framework and Lessons from Rural South India

Abstract

In this paper we develop a conceptual model for identifying the indicators and causal factors of knowledge inequality in agrarian economies. We apply this framework to study the issues, constraints and challenges that smallholder farmers face in improving the business-orientation of their agricultural enterprises in rural South India. We use a recent technological innovation that is promoted among rice farmers called the System of Rice Intensification (SRI) as a case study to test this framework. Using primary data collected from the farming households on their engagement in the input and output markets and through focus group discussions in 27 villages we find that knowledge inequality matters for not only productivity differences but also for the nature and intensity of business orientation in agriculture. We use a recent technological innovation that is promoted among rice farmers called the System of Rice Intensification as a case study to test this framework. The paper concludes that reducing the knowledge inequality crucially depends on assessing the current knowledge bottlenecks and designing programs that can address them in a context specific manner and that in addition to knowledge constraint, the resource use and entrepreneurial constraints need to be addressed for effective transformation of agriculture.

Introduction

Economic growth of nations is driven by the productivity of various sectors of their economies. . Productivity levels depend on the knowledge and skills of the production agents. The paper begins with a premise that knowledge and the skills to apply that knowledge are basic inputs into any production process [11]. Agriculture production is becoming an increasingly knowledge intensive activity. Farmers acquire knowledge through various sources and some farmers have access to more knowledge and skills through early experimentation, better connection, higher education and greater ability to pay for knowledge services.

Recent challenges in achieving the millennium development goals of reducing hunger and poverty by half by 2015 highlight the problems of low productivity and poor management of natural resources by the smallholder farmers in the developing countries [9]. Increasing the ability of the smallholder farmers to obtain and use the knowledge related to production techniques and other knowledge related to marketing and processing has been suggested as one of the means to increase productivity. In essence the programs that attempt to increase the knowledge base of the farmers are focused on reducing the knowledge inequality among the farmers so that every farmer could achieve the maximum production levels that could be achieved in a given set of farming and resource conditions. However, reducing the knowledge inequality among the farmers depends on matching the knowledge gaps by identifying the knowledge needs that are context and agro-ecology specific [3]. Yet, very little is known about the knowledge base of the farmers and how effective use of such information to design programs that could reduce the knowledge inequality among the farming community [16]. Through focused group discussions with the farmers in 27 villages of south India complemented by series of interviews with selected farmers and farm level surveys, this paper attempts to identify the factors responsible for the knowledge inequality among the farming community and recommends possible programs that could be effectively used to reduce such knowledge and skill inequalities in farmers.

Study of knowledge inequality in the context of agricultural transformation requires addressing the following fundamental questions: How do farmers acquire information and convert it into knowledge base useful for production and business processes? Who are the players and actors in the information value chains? What constraints and challenges these actors face in sharing knowledge? What mechanisms - public, private, and farmer to farmer exists in strengthening the process of knowledge sharing at the community and individual levels? How does one measure knowledge inequality in the context of technological innovation? What policies and programs needs to be in place to reduce the knowledge inequality? Addressing these questions, this paper develops a boarder conceptual framework and uses it in a context that can help in the process of reducing knowledge inequality.

The paper is organized as follows: the next section develops a conceptual framework for studying knowledge flow and accumulation in agrarian economies. Section three describes the methodology and data used in the study. The fourth section describes the study area and gives an overview of the survey results. Section five presents the results with respect to knowledge variations and knowledge is shared in the context of the technology adoption-the system of rice intensification. Section six discusses the results, and the last section presents the conclusions.

Conceptual Framework for studying the Knowledge Inequality, Entrepreneurship, and Agricultural Transformation

Agricultural transformations happen when available knowledge is accessed, applied and aligned with action on the ground. Actions depend on translating the knowledge which further depends on the institutional and systems capacities that bring the knowledge to action. However, the access of knowledge by institutions and delivery systems is also constrained by the knowledge base. Social scientists have explored how knowledge is generated, absorbed and used for productive purposes for quite some time [12]. The role of knowledge in agricultural production and entrepreneurial activities is recognized for some time and has been organized through extension and rural services. In much of the developing countries, public extension system remains the main source of knowledge and there is an increasing call for their reform to increase the knowledge content and its effective use by the farmers [8]. Role of leaning and search for knowledge by economic agents in effective use of knowledge in productive activities has been recognized [6]. Following [4], several studies have developed theoretical and empirical approaches to learning and knowledge accumulation among productive economic agents [1]. Recently, knowledge sharing through the formation of social capital has been given importance in the development literature [14] and researchers have attempted to model the factors that contribute to accumulation of social capital [10]. The level of social capital the economic agents have and the level of inequality due to their networking skills could explain knowledge inequality and their entrepreneurial ability. Recently aspirations of the economic agents have been studied for their influence on knowledge accumulation and use [15]. Farmers, as any other group of economic agents differ in their ability to access and use knowledge in the production process. The farmers' access to information and their ability to transform such information into knowledge towards, production, processing, and marketing of agricultural produces depend on several factors: their age, education, experience in farming, their financial status, type of farm enterprise and distance to other knowledge farmers [7].

The conceptual framework presented in fig.1 identifies knowledge inequality as a key determinant of effective use of knowledge by farmers to increase their productivity. It begins with societal challenges such as high level of poverty and hunger among rural agrarian societies. Low productive agrarian systems could be transformed into high productive systems through effective use of knowledge. The first row highlights the societal challenges and the need for increase the total factors productivity of farming systems. In the second row a set of possible solutions and expected outcomes are identified. The third row shows the levels and results of interventions. Collectively these factors and interventions move a low productive agrarian system to a higher level of productivity resulting in higher incomes for farmers and better standards of living. Moving along the first row, increasing total factor productivity will require bringing up all types of farms to a higher productivity frontier. This can be achieved through strengthening the research and innovation system at the national level. Innovations, intensification, and knowledge access depends on the improved extension and rural advisory services. This requires understanding of the knowledge challenges, the needed knowledge intensity and the current levels of knowledge inequality. Addressing them through policy, institutional, and market support can reduce knowledge distortion among the farmers and increase their productivity. In order to develop effective policies and programs that will increase the access of knowledge to farmers, and reduce knowledge inequality among them, factors associated with farmer's behavior to search and use knowledge needs to be fully understood. In what follows we apply this conceptual framework to the System of Rice Intensification (SRI) in rural South India to explore the issues, constraints, and challenges farmers face in the access and use of knowledge to increase their productivity.

A Case study of System of Rice Intensification in Rural South India

Agriculture is increasingly becoming a knowledge intensive activity. The intensity of knowledge use increases with the need for the making agriculture more business-oriented. Policy makers in India face several challenges in increasing food production. First, given the reduction in availability of land and water resources increasing crop productivity becomes a major imperative. In the context of rice cultivation for example, there is a call for increasing the average yield of rice from the current 2.5 tons per hectare to 5 tons per hectare. Second the use of natural resources such as irrigation water has to be made more sustainable. This calls for water conservation technologies in all the cropping systems particularly in the rice and wheat production systems where water is used inefficiently due to flooding system of irrigation. In addition, due to poor and unreliable supply of free electricity to rural areas, the pumping of ground water has been unsustainable. Third, there is an increasing need to reduce the cost of cultivation by optimizing the input use such as labor, fertilizer, plant protection chemicals, and seeds. Fourth, by improving quality of harvested produces through quality control and improved storage methods, farmers could increase the profitability of crop production. Fifth, by increasing the prudent use of chemical inputs, the environmental contamination from agriculture and the associated health risks could be reduced. Finally, increasing the speed of transformation of agricultural sector from a subsistence-orientation to business-orientation requires increasing the knowledge base of the farmers in rural entrepreneurship. In the context of rice production in the study area the system of rice intensification provides an opportunity to achieve these objectives. In this paper we use SRI as a case study to explore the knowledge needs, gaps, and inequality and their effects on the entrepreneurship of the smallholder farmers in rural south India.

Data and methodology

Farmers access to knowledge needs to be determined based on the specific set of activities involved during the production cycle or along their commodity value chains [2]. This study uses qualitative methods to understand knowledge access behavior of the farmers. Twenty-seven focus group discussions (FGDs) were conducted between March and May 2011. This was followed by a farmer group discussion of the farmers in 5 focused clusters in January 2014. The latest round of FGDs related to knowledge levels on the system of rice intensification. In addition to farmers several key informants were interviewed including researchers from agricultural universities, extension workers and other officials of the state department of agriculture. The FGDs were carried out in randomly selected villages. The results of FGDs were summarized and analyzed for trends in the qualitative response of the participants regarding their ability to access knowledge and its effective use in agricultural production.

Results and Discussion

In order to understand the knowledge inequality in agricultural development, we use a major technological innovation in rice production introduced in the last 15 years in several parts of the developing world. The system of Rice Intensification (SRI) is a unique approach and does not involve any new seed variety which is a traditional approach to productivity increase. While SRI remains controversial among scientists and extension workers, its adoption continues and in some areas farmers seem to be abandoning the innovation after trying for a few years. Knowledge inequality among the farmers is hypothesized in this paper as a major cause for such “adopt-abandon” roller-coaster phenomenon of technological innovation and spread. We do not attempt to evaluate the technological impact of this innovation, but use SRI to understand the constraints to technological and innovation adoption mainly arising from the unequal distribution of knowledge. We begin with looking at the information needs of farmers as major entry point to this analysis. Results of a recent survey [5] on the information needs, their importance and access showed much of the knowledge base needed for SRI falls in the average importance and access. This could partly explain the adoption challenge faced by SRI. Other information needs and SRI related information also falls under neutral or below in the level of importance. However, their information needs analysis presented in [5] does not specifically address the package of practices identified and prompted under SRI. We look at these in the context of knowledge inequality below.

Innovation is crucial to increase the productivity of rice farming systems. We choose SRI to study the interaction among knowledge intensification, knowledge inequality and entrepreneurship, all of which are needed

for and part of any agricultural transformation process. The analyses of such interactions are given in three subsection. Based on the expert consultation with the research committee, extension officials and farmer focus group discussion we bring out the salient characteristics of technological innovations and how such innovations introduce inequality of adoption knowledge. The characteristics that are further analyzed relate to knowledge intensity, resource use intensity and entrepreneurial intensity.

Knowledge Intensity of Technological Innovations

Table 1 presents the principles and practice of SRI technology and the knowledge challenges and knowledge intensity as identified by the expert and focus group discussions. Although SRI brings in additional knowledge for crop intensification, the traditional package of practices that farmers are supposed to implement still hold for SRI. For example, researchers say the initial preparation of land, selecting the right variety of seed for the agro ecological zones and water and soil conditions, seed treatment, and other plant protection measures are still to be adopted to the highest standards as recommended. SRI brings in additional agronomic efficiency. However, the key question to the research and extension community is at what cost. For example, in preparation of nursery, farmers are asked to plant the seeds in rows so that individual seedling could be pulled out for transplanting. This is a major shift in the way the nursery is normally raised and requires high knowledge intensity. Transplanting using single seedling per hill increases the labor needs. But more importantly the need for extension personnel to educate the laborers who transplant rice seedling, who are mostly women, increases multifold. Due to deterioration of public extension services, the number of farmers reached out by extension agents have dramatically reduced. During this period of decline, more than 50 percent of farmers reported not to have met an extension agent in the previous year [13]. The skills needed for single seedling planting on the grid will result in high knowledge intensity and poses formidable knowledge challenge for the extension workers, farmers, and farm laborers. The knowledge intensity of water management (a key SRI principle related resources conservation) is further compounded by other resource use challenges. For example, depth of water to be maintained in the rice fields is not within the control of individual farmers. In addition, farmers lack skills to measure the depth of water stagnation in the rice fields. Since the farm laborers are not used to manage water depth of individual farms this principle introduces high knowledge intensity at all levels, of knowledge value chain. The principle on soil aeration introduces similarly a higher level of knowledge intensity. There is a confusion on this principle among farmer's focused group discussion since the objective of soil aeration is often mixed up with weed management as both are simultaneously achieved using high intensity labor involvement. Farmers in the study area would rather submerge their fields to control weeds. Farmers reported that SRI increases the need for chemical application of weedicides to control weeds under SRI mainly due to labor scarcity in the area. This increases the knowledge intensity as a wide range of weedicides are promoted by the chemical companies and farmers due to low access to extension system are under the mercy of the input dealers who push the chemicals that are in stock at the time farmers require them. In fact one expert claimed that the chemical companies promoted use of chemical weedicides under the labor scare conditions. "The addition to the weedicide knowledge, farmers who have access to laborers have to educate them in the use of the mechanical weeder. The manufacturers of the weeder have not been fully responsive to the needs and low physical ability of farm laborers. Even with government of Tamil Nadu providing subsidy to adopt the mechanical weeder, most farmers consulted said that they have abandoned its use.

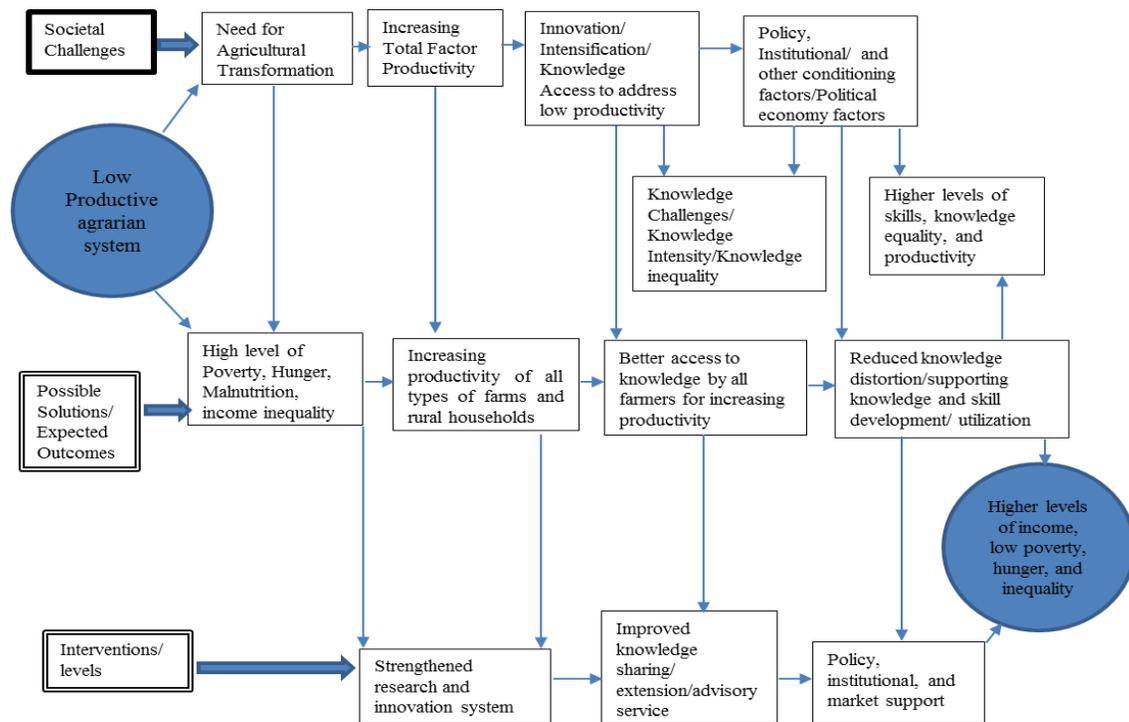

FIG. 1: CONCEPTUAL FRAMEWORK FOR STUDYING KNOWLEDGE INEQUALITY AND ITS IMPLICATIONS

Addition of organic matter to rice production is promoted as a principle under SRI. This traditional practice followed by the study area farmers has been under low level of adoption ever since the advent of chemical fertilizers introduced during the green revolution period in the 1970s and 1980s. Since then the ease of obtaining subsidized fertilizers reduced the need for organic manure application and due to increased level of mechanization, the livestock population have come down along with the availability of animal manure. The organic matter through green manure could only be applied when grown between seasons and in-situ ploughed in. Yet due to poor soil testing infrastructure, the optimal combination of organic and inorganic levels of fertilizer use remains a major knowledge challenge for the farmers. Thus farmers report that they continue the blanket application of nutrients NPK as they would under the traditional approach.

Resource Use Intensity

Table 2 presents the resources needs arising from SRI principles, the resource challenges traced by the farmers in adopting each of the SRI principle, the resource use intensity and the interaction and of resource intensity with knowledge intensity in generating challenges for reducing knowledge inequality. The data compiled based on the focused group discussions with farmers and experts involved in SRI promotion, have implications for the “adoption / abandon” process seen in the study area. While SRI adoption reduced seed rate, cost of seeds, and the number of seedling needed, the labor resources needed for planting in square grids and the associated supervision costs takes away this savings from the farmers. In addition, water management, weed management and inter-cultivation operations along with the organic matter build up recommended under SRI requires additional labor and other resources. Collectively these additional set of resources place a higher level of resource use challenges than the traditional farming practice. Due to labor shortages from the government policy of guaranteeing 100 days of assured employment to anyone needing a job in rural areas has presented enormous challenges to the adopters of SRI. Farmers

of the study area generally refer to SRI as a labor and management intensive innovation, the cost of which outweighs the increased yields that may be obtained. There was generally no negative reaction about the potential and real benefits of SRI when it is adopted fully.

The resource challenges arise generally from not just the availability of quantity of labor but the quality and skills that are needed due to increased resources use intensity involved in every SRI principle (see Column 4, Table 2). Thus, even when the knowledge is fully accessible to every farmer at the same levels, which is still a basic challenge due to poor organization of the public extension system, a high degree of resource use intensity may prevent farmers from fully adopting the SRI. When the agronomic practices are not fully followed, as suggested by SRI package, the benefits to farmers may not be significantly different from a farmer who follows less resource intensive traditional package of practices. Farmers of the study group reported that the hurdles in obtaining labor needed throughout the crop season and in increasing the quality of such labor, largely prevent them from continuing with SRI method even if they have adopted for one or two years. One farmer said “I am willing to train my labor force one year in the details of SRI, but since there is no guarantee that I would get the same labor next year, I have to train the laborers every crop season which becomes highly time consuming and may not be rewarding”. Thus, knowledge intensity and the resources use intensity combined produce high level of knowledge inequality among the farmers which result in the eventual abandonment of SRI method in the study area.

Entrepreneurship and Knowledge Intensity

Farmers who continue to adopt SRI despite the knowledge and resources challenges, tend to have higher level of entrepreneurial and managerial ability. In addition, higher social networking with the labor groups, input providers, local water management associations and with public extension workers tend to increase the adoption and continued adoption of SRI. Table 3 summarizes the interrelations of knowledge and entrepreneurial intensities in the adoption of SRI. As shown by the discussions, entrepreneurial and social management skills could help in better adoption of SRI among farmers. Farmers who see their farming as a business enterprise are likely to seek more support from various sources to reach higher productivity of rice that is possible under SRI approach. Yet for the average smallholder farmers who own less than 5 hectares of land and farmers who see rice cultivation as more of a “way of life” additional efforts to increase their entrepreneurial and management skills may not be worthwhile. But SRI introduces new entrepreneurial challenges to the traditional farming system. For example, production of seedlings in a cost effective manner requires collective action at the village level. However, collective action also requires convincing other farmers in the village to adopt the SRI approach which is a challenge since not all farmers are willing to jump in early and SRI adoption essentially depends on “seeing is believing” approach. Mobilization of skilled labor at various stages of crop production particularly during the transporting and weeding requires high level of negotiating skills mainly due to labor scarcity that prevails in the study area. Addressing labor scarcity through mechanical means requires collective action and investment from few farmers to purchase the transplanting machine, maintain it and rent it out. Thus, new innovation such as SRI, needs additional investment in improving social entrepreneurship for effective use of knowledge and application.

Concluding Remarks

Agricultural transformations require optimal use of knowledge by the society. In this paper, we have tried to develop a framework towards understanding how knowledge inequality is influenced by the nature of innovation and identified factors – knowledge, resource use, and entrepreneurship intensities. The results from the farmer group discussion indicate that policy, institutional, and market interventions may be needed to reduce knowledge inequality in addition to sharing knowledge with the farmers. The results also indicate that higher the intensity of knowledge needs, given high inequality of human capital, the inequality of knowledge is likely to be exacerbated. Knowledge sharing and distribution mechanisms determine the level of inequality of the knowledge among rural entrepreneurs. Knowledge inequality increases with knowledge distortions, mismatch of policy and institutional interventions and low incentive for collective action at the village level. Finally, knowledge intensity of innovations along with resources use and

entrepreneurial intensities need to be addressed for effective translation of knowledge into production activities. Agricultural transformations crucially depends on such translation.

TABLE 1: THE SYSTEM OF RICE INTENSIFICATION – PRINCIPLES, PRACTICE AND KNOWLEDGE INTENSITY

S. No	Principle of SRI	Actual practice	Knowledge Challenge	Knowledge intensity (rated between 1-5)
1	Very young seedlings should be used, to preserve the plant's inherent growth potential for rooting and tillering	8 – 15 day old seedlings with 3 leaves are grown in a raised-bed nursery	Moving from traditional broadcast method of nursery beds to row sowing of seeds	Raised nursery bed, maintenance of single seedlings and keeping track of age of the nursery requires knowledge intensity of 3
2	Transplanting single seedling per hill should be done quickly, carefully, shallow and skillfully, in order to avoid any trauma to the roots, which are the key to plants' success	Single seedlings are planted with a minimum time interval between the time they are taken out from the nursery and planted carefully at a shallow depth (1-2 cm)	Teaching farm labors about trauma free transplanting requires knowledge of skills transfer at farm level farmers need to train their labor force	Nursery needs to be raised next to main field, multiple nurseries needed to avoid time delay, high skilled labor force to maintain the depth of planting requires knowledge intensity of 4
3	Reduce the plant population radically by spacing hills widely and squarely, so that both the roots and canopy have room to grow and can have greater access to nutrients, sunlight, etc.	Planting at grids of either 20 x 20 cm or 25 x 25 cm (or 30 x 30 cm or even wider if the soil is very fertile) using a rope or roller marker to achieve precise inter-plant distances (to facilitate inter-cultivation)	Change from random approximate bunchy planting to single seedling planting with precise grid distance maintenance	Knowing which type of soil requires what type of grid spacing; maintenance of row spacing for inter-cultivation requires more labor and skill guided by supervision, require knowledge intensity of 3
4	Provide growing plants with sufficient water to meet the needs of roots, shoots and soil biota, but never in excess, so that the roots do not suffocate and degenerate	Up to panicle initiation: Irrigate to 2.5 cm depth after the water ponded earlier disappears and hair-line cracks are formed on the soil surface. (Heavy clay soils should not be permitted to reach the cracking stage, but still are issued less water than with usual flooding.) After panicle initiation : Irrigate to a depth of 2.5 cm one day after the water ponded earlier disappears	Gracing the soil moisture and water required by farmer/ labors, control of water movement among farmers varying sowing and planting dates, constant monitoring of water levels in the flooded zones, uncertainty of rainfall, electricity availability labor availability reduces water control	Knowledge on water needs is different cropping stages, measuring moisture levels to protect crop from wilting and from over irrigation is simply not part of extension or farm level 4 practice. This is not only new but the adoption of water management as prescribed by SRI is considered high knowledge intensity activity at (4)
5	Active soil aeration improves rice crop growth by benefiting both roots and beneficial aerobic soil organisms.	Inter-cultivation with a mechanical weeder at intervals of 10-12 days, starting 10-12 days after transplanting and continuing until the canopy closes, passing between the rows, and	Knowledge and use of mechanical weeder, interaction of weeds and crop depends on the level of water. Effective use of mechanical weeder depend on the soil and water properties	Weeding and weed management is an additional requirement that is a result of principle 4 recommended above weeding is also recommended as a practice that can help in soil aeration. This is again high knowledge intensive activity since usually weeds are killed in the

		making perpendicular passes across the field		traditional system by submerging them under water (4)
6	Augmenting organic matter in soils, as much as possible, improves performance of the rice crop, by improving soil structure and functioning and supporting beneficial soil organisms.	Application of cattle manure, green manure, bio-fertilizers, and vermi-compost is recommended. Chemical fertilizer can be used, but it does not have the same beneficial effects on soil systems	More than knowledge, availability of biomass for organic names is a constraint; production requires additional farming chemical fertilizers/ organic resources substitution requires soil testing and knowledge to use soil testing results.	Knowledge of what to apply as nutrients and in what form requires understanding of what is in the soil. Soil testing infrastructure remains poor. Even if the results are available recommendations and known, availability of inputs in time is critical for effective use of knowledge. Farmers are 5 at most disadvantage when using optional level of nutrient, leave alone the right combination of organic and inorganic fertilizers

TABLE 2: INTERACTION OF KNOWLEDGE AND RESOURCES INTENSITIES UNDER THE SYSTEM OF RICE INTENSIFICATION

SRI Principle	Resource need	Resource challenge	Resource use intensity	Implication / Interaction with Knowledge Intensity
Young seedling	Resources saving in terms of seed quantity cost reduction	Sowing seeds in the row requires high labor quantity and quality	Management and nursery is high, handling requires skills, time consuming	Skill requirement of labor is high; high knowledge intensity resulting in higher investment in knowledge value chain
Single seedling per hill	Resources saving in terms of seedling requirement	Cost of labor increase with splitting seedling and delicate transplanting	Labor intensity is high. The sill to plant single seedling is more than traditional approach	Knowledge and skill interact at the labor level who are often not convinced of single seedling approach
Planting in square grids	Planting in square grids increase the labor resources requirement and supervision resources	Labor availability, willingness to learn and implement the instructions correctly is challenge	Planting in square grid increases knowledge needs and skill intensity multi-field compared to traditional approach	Availability of labor during key operations combined with knowledge and skill intensity exacerbates knowledge inequality in adapting SRC
Water management	Field laborers with high level of experience in water control management	Water control is major challenge due to erratic rainfall, water availability and water flow	High level of resource use management crop loss could be high when water is mismanaged	Knowledge on water management is limited even among the experts. The knowledge intensity is high due to context specific resources use needed at farm level
Weed management and inter-cultivation	Labor use for weeding/weedicide use increases the cost	As in other operations labor availability / skilled labor are a challenge	Weeders need to be made available to farmers. In the absence, farmers do not have incentive to adopt this principle which renders other principles waste	SRI encourages more weeds compared to submerged cultivation of rice. Either mechanical weeder or weedicide need to be used to control weed which requires additional cost
Soil fertility management	Organic manure is needed for	Availability of organic manure is a	Organic manure needs to be applied as a substitute and a	Although application of organic manure was not

through increased use of organic manure	improving the soil structure and humus content of the soil; their production, transporting and application increases labor needs	challenge, reduced ownership of cattle of farm level due to mechanization and cost of transportation increase the cost of production	complement for inorganic fertilizers/complement for increasing soil structure/ substitute to reduce chemical nutrients requirement; a highly skilled operation at the farmers and farm labors level in the absence of soil testing information and timely availability of inputs	entirely a new technology the practice has been declining due to unavailability, bulkiness, transport cost, labor to apply all have become constraints. While it is less knowledge intensive than other elements of SRC practice resources in availability makes it resource intensive
---	--	--	--	--

TABLE 3: INTERACTION OF KNOWLEDGE AND ENTREPRENEURIAL INTENSITIES UNDER THE SYSTEM OF RICE INTENSIFICATION

SR & Principle	Entrepreneurial need	Entrepreneurial challenge	Entrepreneurial use intensity	Implication / Interaction with Knowledge Intensity
Young seedling	Common/ collective nursery requires bringing farmers together/ for collective action	Investment for the whole community or village level requires investment upfront which is not often available	Mobilizing labor and bargaining for improving their skill without increasing the labor cost requires extra entrepreneurship skills	Developing highly skilled labor without cost increase remains a challenge. Support to train laborers on a collective basis requires public extension support which is missing currently
Single seedling per hill	Mobilizing labor during the peak transplanting period competes with traditional planting	Farmers are often not trained in collective action or negotiating labor groups for transplanting rice is an entrepreneurial challenge	Quantity of labor needed is less but negotiating to access quality and skilled labor increase entrepreneurial intensity	Poor entrepreneurial skills thwarts wants effective use of knowledge gained by farmers. Knowledge transfer to laborer requires supervisory intermediaries
Planting in square grids	Hiring labor and supervising them	Negotiating with labor groups	Impart high skills year after year	Knowledge transfer is highly engaging and need hiring of extension staff which farmers cannot afford
Water management	High entrepreneurial need for negotiating with neighboring farmers water harvesting and marketing water culturing farmers do not pay for water	Culturally farmers do not pay for water given by neighboring farmers. Creating market for resource use and management remains	Managing water resource has implication for other package of practice recommended	Forming and operating water user associations hiring water management expertise and negotiation water use with neighbors all increase entrepreneurial intensity and highly sensitive to the differing knowledge of the farmers
Weed management and inter-cultivation	Organizing labor for weeding negotiating for weedicid application requires entrepreneurship	Dealing with input suppliers and managing the quality of weedicides that are applied to the field when there is competing suppliers	Organizing local artisans for manufacturing weeder suitable for local soil increase intensity of entrepreneurship. In either case making optional soil fertility management choices requires high level of recourse use skills	Weeding, improving the aeration of soil and other inter-cultivation of operations further increase the need for organizing labor and building their skill. Interacting with input dealers who often sell spurious

				chemicals increase the cost for the farmers
Soil fertility management through increased use of organic manure	Some farmers have taken up production of vermi-compost to meet this technical requirement. Production and marketing organic measures could be an profitable activity if SRI is adopted in large scale	Availability of animal manure which competes with fuel making for cow dung cake/ and the technology and investment farmers need to make vermi-compost increase the entrepreneurial challenge	Farmers have to mobilize adequate quantities of organic manure during the land preparation period which requires collective action. Increasing the number of entrepreneurs who can supply organic manure will be effective	Lack of entrepreneurs to supply organic manure to farmers, indicates high entrepreneurial intensity involved

Some Considerations on Fiscal Problems of Eurozone Countries

Abstract

In the relationships between countries wars and invasions are less and less a situation of present times. Countries now win or loose by means of their economy, and particularly their fiscal standing. This is even empowered with the existence of Regional Groupings like the EZ (EUROZONE), which brings (a) the advantage of a large common market, based on a common currency. The disadvantage (b) is based on the fact that the single countries loose on independence in the fiscal realm. They must start to stick to rules. But the growth of the countries is based on the existence and growth of sound companies. The advantage of the EU (EUROPEAN UNION) and EZ for single enterprises is given by the large market space created, where to strive and in which they may develop their growth potential. Examples of three companies are made, the Italian born FIAT, now becoming Dutch and English, and the Czech born Bata, which already years ago became Brazilian and Canadian, thus shifting the paradigm of globalization from the fiscal plane to the enterprise level, plus the famous German VW (VOLKSWAGEN), with its curious story. Easy explanations for success often defy common wisdom. The catchword “innovation” is nowadays often used, but none of the examples is based principally on it. Some of the reasons of success remain hidden to common rationality and are based on individual aspects.

Keywords: relationship between countries, globalization, firm performance, eurozone countries

Democratic governance and the Accumulation of Sovereign Debt

Democracy, i.e., “rule of people”, existed also in the past, but at that time it was a rather rare form of government, an example thereof is given by Classical Athens. But there it was restricted only to proven citizens, i.e., not encompassing the entire population of the city-state (Kagan, 1998). It became more diffused in modern times, with the introduction of nationwide elections and the extension of information and voting rights to everybody.

In general, humanity longs for democracy, as it consents even to the humblest human being, to have a say in running the public affairs, the so called “res publica”, which is important, if one doesn’t want to be confined to mere private existence. It is a form of government, which, we are convinced, is spreading step by step to the borders of earth. But there are still nowadays many areas and population pockets, where local politics resists to the advancement of democratic ways and behaviour.

How can we judge if democracy is present and functional in a given country (Bartels, 2008)? Its presence can be affirmed, we may guess, if the entire population has the chance of electing representatives staying at government for the period forecast by law terms, plus descending from their positions at deadline. If such elements are lacking, the suspicion of undemocratic behaviour becomes strong.

But democratic governance has also its pitfalls, the main of them connected with the fact that incumbents, in order to be elected, make a lot of promises to would be voters, out of the real possibilities of the country (Osterkamp, 2011). These promises have almost always a financial lapel, as almost everything what is realizable on earth is connected with some cost burden. In advance, it is difficult to establish the limit to which one can go with his promises, the trend very often being, especially in less experienced democracies, to advance vows, with the hidden idea, that after election it will be possible, somehow, to manage the occurrence for the best, counting also on the fact that people are forgetful. In Italy, for instance, a former prime minister, in order to be elected, pledged in several electoral occasions, the cancellation of the tax on the first home, even if Italy is the country with the 3rd highest public debt in the world. A bit of caution would have suggested maintaining the tax revenues versus expenditure, not to risk the increase of the budget unbalance (Cameron, 2010).

A similar situation is easier to avoid by non-democratic governments, as there is no need to make promises to stay on power: the top person or persons do not need the popular selection in order to stay on their positions, having so the chance of controlling better the financial balance of the country, like it happens in some countries of the Middle or Far East (Lesch, 2005).

Therefore, very often democratically elected rulers find themselves in the circumstance of accumulating expenses and costs, which tend to exceed the budget balance of the state, trying to equilibrate revenues and expenditures and creating a, so called, sovereign debt, typical for nations, which are considered to have few bridles in handling their finances (Brender, 2012).

Sovereign Debt and other fiscal Data of the Countries considered

In Table 1 are shown the 2013 data of the Public Debt as percentage of GDP, PD %, for the countries of the EU (EUROPEAN UNION), the EZ (EUROZONE) and a collection of other countries chosen with the idea of enticing comparisons between different countries. It is shown also the Fiscal Deficit, also as % of the GDP, FD%, the GDP at the official exchange rate, the GDP per capita and the growth rate of GDP, for every country listed. The data of the Table make possible to carry out comparisons between the countries listed, on the basis of the parameters considered. The countries with the highest GDP from top down are US, China, Germany, France, UK, Italy and others following. But if we consider the EU as a country, than the order changes and the EU is first, US second and EZ third. A listing based on the sovereign debt, public debt (PD) %, gives as first Japan, second Greece and third Italy. The best fiscal surplus/deficit, foreign debt (FD) %, is given by Qatar, followed by Malta and Montenegro. Most countries have a negative fiscal balance, worst of all Japan, followed by Ireland and Spain. GDP per capita is highest for Luxembourg, followed by Qatar and Switzerland. GDP growth is pretty feeble for almost all the countries considered, the only exceptions being, from top down, China, Qatar and Latvia.

A particular situation is that of the ex-communist countries, which entered into the market economy with a non existent public debt, $PD\%=0$, as this kind of economic parameter was not contemplated by the communist system of governance, but we can observe from the table, that in the short period of presence in the market economic system, things changed a lot and most of those countries exhibit now a pretty high value of the PD%, worst of all Hungary, which crossed the 60% limit given by the Maastricht standard, followed by Slovenia and Serbia. It is, as we explained before, a consequence of the introduction of democratic methods of government: the ex-communist rulers were not pressed by would-be voters to promise spending, whereas the democratic incumbents have to do it, if they want to be elected.

3. Solutions of the Debt Problem

In a debt situation, there are always at least two parts involved, the debtor and the creditor, this last one offering the financial means demanded by the debtor, so that despite its sovereignty, the receiving entity is never completely free to deal with the debt, like it would prefer, and is pressed to manage it somehow. In case of default, i.e., the impossibility to repay the debt, the consequences for a given state could be difficult: loss of credibility, skyrocketing costs for debts to come, inclusion in the list of bad behaviour and banning the possibility of using the domestic currency for debt nomination. If more debt is needed, the creditors will be asking therefore only affirmed international currencies, some of the so-called, strong ones. Therefore, it is wiser for such culprit states, if possible, to find other solutions, than mere default. To that regard, consider, for instance, the vicissitudes of Argentine in the last decades, and other similar cases (Wiggin, 2010).

If a country is totally sovereign and independent, a possible solution to the debt problem may be given by printing money, provoking inflation, which is then step-by-step denting at the debt. But this is possible only if the debt is nominated in the domestic currency. But, as mentioned, this becomes, difficult, if not impossible, for countries demonstrating low credibility. Very soon they fall in the category of rogue or less reliable states and then it becomes more and more difficult to handle the occurred situation in an acceptable manner. The debt situation of a given state cannot therefore be handled in a superficial way. The high a debt is always a problem: the solution must be found in the realm of reducing the expenditures, and re-entering into the limits given by the state revenues. In order to obtain such a result, it is also thinkable to increase revenues, in particular, rising taxes, but in that case there will be the domestic electorate, hit by heavier burdens, to protest against the measures. Politically it becomes a mess: originally, the population elected the representatives, on the basis of pledges advanced by them, afterwards, it became clear, that

it was a joke, the same representatives are charging more impositions to save the situation on the field. Often, in such situations, the political team must be changed and substituted with a new one (Buttonwood, 2011).

TABLE 1: Public Debt (PD), Fiscal Deficit (FD) to GDP Ratios, GDP (official exchange rate), Population, GDP per capita and GDP real growth rate for the EU countries, the EUROZONE and several other Countries in 2013

Number	Country	Public Debt as percentage of GDP PD%	Fiscal or Budget Surplus or Deficit as percentage of GDP FD%	GDP (official exchange rate) in billions of USD	Population in millions	GDP per Capita in USD	GDP real growth rate in %

4. The Problems of the EZ

A better solution of this situation we find in the EZ (EUROZONE), where the member states share a common currency, the EURO, which may be labelled as a strong currency, guarded by the ECB (EUROPEAN CENTRAL BANK) and by the tradition of states like Germany, with past unfavourable experiences of unbalances and hyperinflation. At the beginning, the EURO was considered as a foolhardy experiment, because of the wide variety of economic performances of the member countries: some of them good, like Germany, Nederland, Finland, or Austria, some dire, like Greece, Cyprus, Ireland and some states of Eastern Europe. The engineers of the EURO understood fully this aspect; therefore, they obliged the members of the EZ to sign a commitment looking for convergence in the real economies of the single members; but this is a task, which is again easier to promise than to perform. Therefore, a lot of traditional economists forecast that the EURO experiment was going to fail and that some states will have sooner or later to be expelled of the EZ, not being able to comply with the common currency regime, because of the difficulty in keeping their accounts in a sound fashion (Martin, 2011).

What happened afterwards, in the reality, was that the EU, by creating particular funds (ESM, EFSF and EFSM, 2010) had to help several states of the EZ, such as Greece, Ireland, Spain, Cyprus and others, financing rescue operations. Every country of the EZ had to contribute with its money to the existence of such funds. At the beginning many states wanted to abandon that kind of operation, asking their money back. But at the end, after a lot of meetings and discussions, the operation succeeded and until now, we can observe, no state decided to abandon the EURO. Having at disposal a strong currency like the EURO represents a stress, but also an advantage, even for the weaker economies, like the fathers founders of the EURO forecast.

5. EURO Disadvantages and Advantages

The disadvantages and advantages of the EURO can be listed as follows:

The main disadvantage is connected with the strength of the currency: it is rising prices for the products exported, making the goods of the country less price competitive on foreign markets.

But there are also advantages, the main of them being the following ones:

1. The use of a strong currency, which does not lose value in time, or even gaining it, in comparison to the competitive currencies, eases domestic economic performance and trade, reducing domestic prices; at income parity everybody and every company is able to buy more goods. More buying has the consequence of also more selling and hence keeping the economy on the run.
2. The interest amount for the debt to be paid by the debtor is lower, freeing monetary resources for other development scopes.
3. The common currency, extending over several countries, facilitates trade between them, making possible international price comparisons for goods and services and cancelling currency exchange costs.
4. There is a lower cost for materials and commodities imported from outside the EZ.

Let's consider this last aspect; it is an advantage, in particular, for transformation economies: raw materials and/or commodities are bought at lower prices on the international market; moreover, manufactured products, if they

are finished in the given country, and they are at a higher quality level, find a market, because of their sophistication, not only because of their price convenience. We can make an example from a simple economic area: naturally untreated oranges can be sold with the label of environmental high quality. They require, during the growing season, a lot of work with agricultural process, needing fuel for working the ground and pumping water for irrigation, which is both cheaper having at hand a strong currency, whereas, the final products fetch higher prices on the market, due to their qualitative excellence.

6. Generalization of this Concept to the Economy as a Whole

This aspect can be generalized: in an economic environment where there exists a strong currency, companies must tend to improve their performance by innovation of products or improved management, in order to face, from one side, the bigger abundance of production factors, expressed by their lower price level, and on the other, the bigger selling effort of finished products on the market. If they don't change anything, at parity of conditions, they will loose in competitiveness, falling under the menace of national and international competitors. Hence, the stronger currency is going to press companies and single citizens to change, seeking for important improvements. But not every company is able to perform such improving changes: under hardship the best survive and thrive, ascending to a higher level of life, whereas the less good, submerge and often also drown. Some politicians condemn the membership in the EZ for this kind of hardship, but manifestly they mostly represent companies not able to change and improve their performance in order to overcome the EZ hardships. Companies, which are able to solve the described problems by themselves stay on their own legs and do not resort to politicians for help, whereas the opposite is true for companies, being stuck in their performance improvements. Some Italian politicians declared recently the EURO as being a "criminal" currency, used by the stronger members of the EZ, aiming at destroying their weaker competitors. It is true that politicians have the task of welfare, i.e., taking care of the weak, but if they are honest, they have to consider also the quality of the companies issuing such help cries.

The economy is a strange reality: economic conjuncture, positive or negative, doesn't explain everything about the success, or failure of companies and even of whole economic systems. Some companies emerge in difficult times and circumstances, where the mediocre ones disappear. Nowadays there is a tendency to explain everything with conjuncture and innovation, or lack of them. But examples, which I would describe, show that success in the reality has often not much to do with these both aspects. In the extended abstract I quoted some cases, which I resume at this point.

7. Some Cases of successful Companies regardless of economic conjuncture

The Czech company Bata, selling shoes, a rather conservative, standard and not very innovative area of production, reached nowadays the goal of a quarter million of employees in the whole world, certainly a remarkable level. In order to understand how they mastered the difficulties, which have arisen in the operating environment during their growth, we can shortly tell the history of the Bata family: the Batas were a traditional family of shoemakers, originating from Prague. They were active in the area already from 1600. What propelled them forward, were orders for large amount of shoes, needed by the Austro-Hungarian army during WWI (WORLD WAR I). But after war finished, a wider economic crisis hit Europe and the world as a whole, pushing to low levels the demand for everything, also for shoes. Many shoe producers in such circumstances collapsed, and had to shut off their activity, but not the Batas. In that particular difficult moment they resorted to a kind of cheap rubber shoe, which became fashionable with customers, being sold at lower price to the impoverished but needy clients. So, the Batas remained alive, and between the two wars their situation improved quickly, consenting them, by picking up some Socialist and Scientific-Managerial (Taylor, 1919) ideas, even to invest heavily not only in the management of the company, but also in the city of Zlin, building factories and apartments for employees, so that Tomas Bata, the boss of the company, won the position of Zlin's mayor. But another hit pounded the company: Tomas suddenly died in a plane accident during landing. A third blow happened after WWII (WORLD WAR II), when Czechoslovakia entered into the communist economic system, inimical to free enterprise. The son of the company's founder understood in time the political danger

and shifted the assets at first to Brazil and later to Canada, from where he ruled the enterprise also after WWII, developing it to the present global size. It is an example of how the owners and managers were able to keep alive a company during economic and political hardship and even to enhance it to the successful global level of nowadays.

The Italian company FIAT was founded in Piedmont, the region from where Italy's unification started. It was able to exploit very much the creation of the Italian market, much bigger than the small market of Piedmont, thriving particularly during WWI and WWII, when Italy embarked in remarkable war adventures, needing the cars, trucks, guns, tanks and planes, produced by the company. After WWII the company was able to exploit the Italian economic miracle and the following trend to mass motorization. A difficult situation arose when Italy became member of the EZ, also because the previous owners became old, sick and passed away. It took several years for the new generation to come to power and in the meanwhile there were doubts about the survival of the company. The German weekly *Der Spiegel* published an article labelling the company as "Der marode italienische Autohersteller", "The ailing Italian car maker", speculating even that the company would be sold to Chinese buyers. But then came a turn for the best: a new general manager was appointed, Sergio Marchionne, and FIAT started with a new flare. The company was even able to acquire the American Chrysler, previously discarded by the German company Mercedes Benz. Recently it changed the name signalling the new global allure, shifting its seat from Turin to Holland and London and looking optimistically forward to the goal of becoming the 7th biggest car company in the world, giving jobs to some quarter millions of employees.

Another company, which went through lots of interesting shifts and shocks, was the German VW (VOLKSWAGEN). It is renowned that VW was a direct creation of the Hitler era. Between his terrible deeds, the "Führer" realized also some, few, positive ones: the invention, of double lane highways, subsequently copied by the whole world. Another one was the founding of the car company VW. In his mind, the highways and VW were connected, as they had a role in the imagination of Hitler's paradise on earth: the highways to connect all the corners of the immense Arian empire, which he planned to build in Europe, after his conquest wars, and the VW, as a car where to find place the typical Arian family like imagined by him: a tall, fair hair father at the steering wheel of the beetle, the typical and standard car of the VW beginnings, a mother with a yellow bride, seating nearby him, and on the back seats a son and a daughter, all of them riding gloriously along the highways to the Ural border of Great Germany. The war collapse impeded the realization of such dreams. After WWII the employees of VW were asked to carry out their jobs devoid of wages for some years, in order to reset the factory. In the middle of the twentieth century, the son of the first Nazi director Piech, became, at first general manager, and later owner of the company, which reached the employment level of more than a half million workers, engineers and clerks. It is, considering also all its affiliates, the first, or the second car factory in the world, and one of the biggest companies worldwide, a difficult but successful itinerary in modern history, going through areas, which are surprisingly different from the modern usual and standard historical narrative.

8. Conclusive Remarks

Much more examples could be narrated, but these few ones are shown in order to extrinsic, how economy is based on life, efforts and experiences of people, who are daily facing high steps to be overcome, difficulties and problems. Some of them, the best ones, are able to do it with ingenuity, common sense and courage, reaching a higher economic and/or managerial level, others, like already told, collapse and disappear. It is a reality, which is not possible to describe using mathematical, statistical and econometrical models, like some economist would like to do, but much more by a narrative telling the difficulties and successes of real life struggles. Economy and Management own a deeply human lapel, being an essential part of the survival history of the human race.

Once the subject "Economics" was called "Political Economics", in order to stress out its deep ties with human behaviour and policies. More recently, scholars preferred to mimic the so-called exact sciences, using formulas and aspects from mathematics and statistics, but in the end, if we are culturally honest, they never succeeded introducing exactness and scientific accuracy in the economic and managerial realms. Recently Elizabeth, Queen of England, asked in an interview: how is it possible, that so many economic and managerial scholars were not able to forecast the recent fatal economic crisis? The answer is simple: in exact sciences it is possible to forecast what is going

to happen with the phenomena observed, but not so in Economics and Management, which is a different kind of knowledge, much more connected with human life, even if economic scholars do not like this aspect, preferring a different version of their area of interest, based on mechanisms, like they exist in physics, astronomy, or even chemistry, with exactly, or close to exactly, predictable outcomes. In Economics and Management a lot depends on human beings, their virtues and failings, which are much less predictable. Some scholars affirm that exact sciences are based on experimentation carried out in laboratories. Laboratory work was hence introduced also in Management and Economics by means of the so-called entrepreneurial incubators, where future entrepreneurs would have a favourable terrain to put their seeds. It is an idea, cursing already for some decades: incubators were proposed and tried all over the world. But how many real managerial successes, like the three, described above, were realized until now on the basis of an incubator start up? As far as I know, not even one. Mostly such incubators start with money offered by the public hand and when that money is finished, also the incubating businesses are mostly closed. Experience, not experiments, show that successful entrepreneurs grow by themselves, pounded and resisting fate and if they are able to overcome all the vicissitudes posed by life and environment, they come out as victorious, reaching also a higher level of economic existence.

The Effect of Board Election and Corporate Governance on the Earnings Quality and Value Relevance of Earnings and Book Value

Abstract

This study examines the moderating impact of board of director elections and corporate governance on (a) the relationship between discretionary accruals and earnings quality, and (b) the relative value relevance of earnings and book value on stock valuation. The importance of effective mechanisms monitoring management is well-known, with monitoring mechanisms including the board of directors and other aspects of corporate governance. We used a sample of Taiwanese firms whose board was elected every three years from 2003 to 2013. While elections led to lower earnings quality, having better corporate governance led to greater earnings quality. Our results show that earnings have reduced value relevance, while book value had increased value relevance in the presence of board elections. Finally, given board elections, the relative value relevance of EPS and BV on stock price was not fully moderated by strong corporate governance.

Introduction

The importance of having effective governance mechanisms to oversee the activities of upper management has long been well-established in the accounting and finance literature (e.g., Jensen and Meckling, 1976). Management, left to its own devices, or subject to inadequate monitoring mechanisms, has long been considered prone to pursue its own ends, even at the expense of the stockholders of the company (e.g., Chin, Kleinman, Lee & Lin, 2006). The importance of effective monitoring mechanisms is highlighted in this literature. One such monitoring mechanism is the board of directors of the organization. Boards of directors are typically charged with representing the shareholder interest with respect to the safeguarding of corporate—ultimately shareholder—assets and with assessing the performance of management. Typically, members of the boards of directors are elected by shareholders. These electoral arrangements may vary based on country company law, and - consistent with country company law - based on corporate choices consistent with that law. A perceived failure of the board to effectively represent the shareholders may impact the probability that particular members of the board of directors may be reelected to his/her post. If so, then the monitoring mechanisms over management itself may be perceived to have failed and the credibility of corporate financial statements may be damaged. The success of corporate governance in managing management is, in part, reflected in the financial statements themselves. As International Accounting Standards (IAS) 1.9 states, “Financial statements...show the results of the management’s stewardship of the resources entrusted to it.” Thus, poorer results, other things equal, suggest poorer management stewardship.

Researchers have examined whether better corporate governance reduces the proclivity of managers to manipulate earnings. The general conclusions are that better corporate governance does dampen the propensity of managers to manipulate earnings (Duh et al. 2009; Peasnell et al. 2005; Klein 2002; Beasley 1996; Agrawal and Knoeber 1996). Prior literature, however, does not examine whether the impact of board elections and, separately, other aspects of strong corporate governance, will affect the relationship between future earnings and discretionary accruals.

In this study, we used Taiwanese firms to examine the relationship between board elections and other elements of corporate governance (e.g., CEO duality) and (a) earnings persistence on the one hand and (b) the value relevance of earnings and book value on the other. Article 195 of Taiwan’s Company Law stipulates that the term of a board director in the publicly-listed firms must not exceed three years, although a board member whose three year term is expiring is eligible to stand for reelection¹. In Taiwan, the three year terms for board members are uniform. In addition, all members of the board are elected at the same time. Unlike the United States, for example, there is no practice of staggering board member elections, a practice in which one-third of the board is elected each year, with the other two thirds of the membership not standing for election in any particular year. Accordingly, using Taiwanese

¹ The weblink of Taiwan’s Company Law is <http://eng.selaw.com.tw/FLAWDAT01.asp?LSID=FL011292>

data permits a study like this to be undertaken. Further, unlike other venues, in which staggered board elections may be held, the Taiwanese practice of placing the entire board of directors up for election at the same time heightens the importance of convincing voting shareholders of the worthiness of the members standing for election. One way to do so, of course, is to present a picture of the firm as performing well financially. This may be done through providing excellent board oversight of managerial decisions with the result that the firm does, indeed, perform very well, or by fostering the use of accounting practices that present the firm as performing better than it actually does. The latter can be accomplished by using discretionary accruals to boost reported net income. Using a sample of 7,456 Taiwanese firm-years whose data was available from 2003 through 2013, we examine the impact of board elections with broader corporate governance measures on (a) earnings persistence and (b) on the relative importance value relevance of reported earnings per share and book value of assets on the stock price of sample firms. We find that poorer corporate governance is associated with greater use of discretionary accruals, as calculated using the modified Jones Model (e.g., Dechow et al., 1995; Martin, 2013) and that both poorer corporate governance and greater use of discretionary accruals is associated with reduced earnings persistence. This finding is consistent with the hypothesized link between the need of firms to improve financial appearances in the face of an election that might be of consequence to both the running members of the board of directors on the one hand and consequently to management of the firm on the other. The presence of board elections changes the relative value relevance of earnings and book value. Investors seemed to give greater value relevance to book value in stock valuation. Better governance lead to greater value relevance of earnings increases but decreased the value relevance of equity book value. This finding is consistent with corporate governance mechanisms perceived to be better at providing more credibility to reported financial statement information (DeAngelo, 1988). But, in the presence of board elections, the relative value relevance of earnings and book value on stock price was not moderated by strong corporate governance.

There are two contributions of this study. First, the study supports the notion that boards of directors, like senior firm management, have incentives to allow the use of income-manipulating tactics such as making discretionary accruals in order to foster their own well-being. Boards, of course, receive both emoluments, prestige and enhanced contact networks from their service, and therefore have incentives to perform—or be perceived to perform—their oversight role well. Second, the results of this study also support the importance of the board of directors being perceived as performing an effective monitoring role since the failure to perform that role undermines the credibility of the financial statements, as represented here by the earnings and book value numbers.

In section II, this paper presents a literature review and hypotheses. In section III, the methodology and data sources are presented. In section IV, the results are described, and in section V, the conclusions drawn from the study are presented, along with suggestions for further research.

Literature Review and Hypotheses

Earnings are a key signal of corporate success that managers provide to investors. Firms can manage earnings to convince investors that the corporation is doing better than it actually is. DeGeorge, Patel and Zeckhauser (1999) believed earnings management arises from the game of information disclosure that executives and external investors have to play: investors make decisions on the basis of financial statements provided by managers. This provides an incentive to managers to manipulate earnings to influence outsiders to invest, even if managers have to give away earnings. Besides, the compensations of managers (including salary and bonus) are closely associated to earnings performance. This is another incentive for managers to distort accounting records and manipulate earnings (see also Collins and DeAngelo, 1989). In general, there are two different perspectives for discretionary accruals. First, managers use discretion to disclose private information to investors, which is known as signaling discretion. The second view is that managers will use discretion to manipulate financial reporting systems to enhance personal welfare at the expense of shareholders. This is called opportunistic discretion (Watts and Zimmerman, 1986).

When a company is sending signals, discretionary accruals help to increase earnings persistence and value relevance, improving earnings quality. On the other hand, when the company tries to conceal information, discretionary accruals will reduce earnings persistence and value relevance, thus hurting earnings quality. During board elections, incumbent boards of directors or managers may have the intention of signaling the company's value

as they may face a battle to retain their board seats. They tend to signal the company's value through the use of discretionary accruals. Such manipulation is indicative of earnings management, where earnings quality is demonstrated through the use of discretionary accruals. Earnings quality is enhanced in situations where such accruals tend to make the reported earnings better reflect the long term underlying capacity of the firm to generate earnings. Also, though, discretionary accruals can be utilized by managers to conceal poor operational results or even illegal conduct. In this case, the use of discretionary accruals reflects opportunistic earnings management. The result is manipulations that will lower earnings quality.

DeAngelo (1988) demonstrated how proxy contests for board of director seats may be impacted by the firm's failure to maintain acceptable earnings levels, as opposed to stock prices. DeAngelo found that pre-proxy contest accounting returns were beneath the returns for the market itself. This was not true of the pre-contest stock returns. DeAngelo (1988) notes that during the election contest, managers tended to use their powers over the accounting system to present a more positive portrait of the firm, in the process providing stockholders with a more favorable impression of the incumbent management's performance. DeAngelo (1988: page 4) writes that "these findings indicate that corporate earnings performance plays a role in the process through which alternative managers compete for stockholder support." Our first hypothesis is presented below:

H1: *In the presence of board elections, managers are more likely to exercise their discretion in ways that reduce earnings quality.*

Given that an owner may effectively control a firm, he or she also controls the production of the firm's accounting information and the choice of its reporting policies. Accounting has a different role in a concentrated ownership context as opposed to a diffused ownership context. The accounting literature contains extensive research and theorizing on how the agency problem between owners and managers affects the role of accounting in management compensation contracts and how the reporting incentives of managers affect a firm's accounting information quality (e.g., Jensen and Meckling, 1976). Will improving the monitoring system, as exemplified by using a better corporate governance regime, decrease the likelihood of managerial use of discretionary accruals to affect reported earnings during board elections? Better corporate governance should result in a company using discretionary accruals more prudently, inhibiting the use of accruals to cover poor operational results. A reduction in inappropriate or problematic discretionary accruals should have a positive influence on earnings quality. To answer the question above, good corporate governance can change the degree to which a company uses inappropriate discretionary accruals, and thus positively influence earnings quality. Therefore, we develop the following hypothesis:

H2: *In the presence of board elections, manager's actions that may reduce earnings quality will be moderated by strong corporate governance.*

A key indicator of the value of a firm investment to stakeholders is the price of the firm's shares. Much else about a firm is opaque. Accounting numbers are produced by accounting systems whose operations are cloaked in the mystery of accounting rules, compounded by accounting practices that may stretch or even violate the rules. Thus, the usefulness of reported earnings in affecting the level of a firm's stock price may be problematic. Nevertheless, the operations of firms have been found to impact the value relevance of accounting information. For example, Hu, Qi, Tian, Yao and Zheng (2013) found that ineffective internal controls had a negative impact on the value relevance of earnings. If internal controls are weak, then the likelihood of a material misstatement entering the financial statements is stronger. The authors specifically found that, in the presence of ineffective internal controls, the value relevance of earnings per share and book value was reduced. Well-designed and implemented internal controls, of course, have the capacity to bind the actions of all organization members but those whose organizational position places them above the internal control system, viz., top management and the board of directors. Accordingly, when the board of directors and management have incentives to manipulate the financial statements, even a very strong internal control system will not stop them. Bae and Jeong (2007) investigated the relationship between corporate governance systems in South Korea and the value relevance of earnings and book value to stock prices. The authors found that in cases of cross-ownership, there was a reduced value relevance of earnings and book value to stock prices. In the presence of foreign ownership, however, there was greater value relevance of these items. Bae and Jeong regarded cross-ownership as a proxy for the conflict between controlling and minority shareholders. Bae and Jeong's (2007) findings suggest that less immediately-interested ownership interests, such as foreign ownership, may act as a brake on the propensity of management and the board to manipulate the financial statement accounts.

Marquardt and Wiedman (2004) studied the impact of earnings management under circumstances wherein management had the incentive to engage in opportunistic earnings management. The authors noted that prior literature has established that financial statement information becomes less value relevant in circumstances where the managers have incentive to manipulate earnings because management is participating in secondary market sales of personal shareholdings. Specifically, the authors note that in these circumstances, the value relevance of earnings declines relative to the value relevance of book value. Marquardt and Wiedman (2004) note that prior literature (e.g., Burgstahler and Dichev, 1997) hold that there is a complementary relationship between earnings and book value in the determination of the price of the stock. When the earnings calculations cannot be trusted due to earnings manipulations via discretionary accruals, the investor is forced to rely more heavily on firm book value.

The findings of Marquardt and Wiedman (2004), Bae and Jaeong (2007) and Hu et al. (2013) argue for the importance of understanding the relationship of a firm's control structure to the value relevance of earnings and book value. While the previously cited studies looked at internal control system weaknesses, controlling versus minority shareholders, foreign stockholdings, and management having incentives to behave in self-serving ways, the studies did not look at the relationship between the boards of directors elections and more generalized measures of corporate governance on the one hand and the value relevance of earnings and book value to share prices on the other. We address these latter issues here.

Fischer, Gramlich, Miller and White (2009) study the relationship between uncontested election votes for boards of director members and investor reactions to subsequent events. In their study, they tabulated the percentages of votes actually cast for members of boards of directors in uncontested directorship elections. They then compared these vote percentages with stock price reaction to such subsequent events as managerial turnover. The authors found that when high percentages of eligible votes were cast for director-candidates, there was a smaller stock price reaction to managerial turnover than when lower percentages of eligible votes were cast for director-candidates. Further, Fischer et al. (2009) found that relatively lower percentages of votes cast for board candidates were associated with greater board turnover, CEO resignation, reduced CEO compensation, etc. Collectively, Fischer et al.'s results suggest that boards of director votes meaningfully impact the future behavior of the board, the CEOs, and acquisition and divestiture behavior. Given the likelihood of such outcomes, then, boards of directors and the managements which, in theory, serve at investors' discretion have important reasons to foster investor confidence in the incumbent boards by, for example, manipulating earnings performance as portrayed in the DeAngelo (1988) study. Therefore, earnings quality is likely to be lower because of higher discretion exercised by firms when managers expect the boards to be elected. The likely reduction in earnings quality is likely to reduce the relationship between earnings and stock prices. The relationship between book value and stock prices, however, is less likely to be affected since book value, on a percentage basis of a firm's net worth, is less likely to be pronouncedly affected by discretionary accruals than earnings are. Accordingly, our two alternative hypotheses are presented below:

H3a: *In the presence of board elections, the value relevance of earnings decreases.*

H3b: *In the presence of board elections, the value relevance of book value increases.*

Researchers sought to examine whether higher levels of corporate governance positively influenced stockholders' perceptions of a firm and hence firm value. The general conclusion is that a higher level of corporate governance does have a positive influence on firm value (e.g. Lins, 2003; Yeh et al, 2001; Core et al., 1999). The work of Marquardt and Wiedman (2004), Bae and Jaeong (2007) and Hu et al. (2013), described above, is supportive of this as well. Hence, our hypothesis is presented below.

H4: *In the presence of board elections, the value relevance of earnings and book value on stock price will be moderated by strong corporate governance.*

Methodology and Sample Selection

We follow prior research (e.g. Sloan, 1996; Xie, 2001) in exploring the relationship between board elections and corporate governance and earnings persistence and discretionary accruals. Further, we extend the valuation framework developed by Ohlson (1995) to explore the impact of board elections and corporate governance on the relative value

relevance of earnings and book value. We employed multiple regression analysis to evaluate the hypotheses. These regression models are described next.

Regression models of board election and corporate governance on earnings quality

In this study, earnings quality is measured by earnings persistence as suggested by Sloan (1996) and Xie (2001). Discretionary accruals estimated by the modified-Jones model are employed as proxy variables for the degree of earnings management. The model is further modified by cross-sectional industry-specific data input (different companies in the same industry during the same time period). The following regression models are used to examine the impact of operating cash flows (OCF), nondiscretionary accruals (NDA), discretionary accruals (DA), corporate governance (CG), and board election (BD) measured at time t on earnings deflated by beginning total assets (EARN) at time t+1. There is a possibility that year effects and/or industry effects may have an impact on the results. Accordingly, we control for year and industry affects here as well.

$$EARN_{it+1} = \alpha_0 + \alpha_1 OCF_{it} + \alpha_2 NDA_{it} + \alpha_3 DA_{it} + \text{Year} + \text{Industry} + \varepsilon_{it} \quad (1)$$

$$EARN_{it+1} = \alpha_0 + \alpha_1 OCF_{it} + \alpha_2 NDA_{it} + \alpha_3 DA_{it} + \alpha_4 BD_{it} + \alpha_5 (DA_{it} \times BD_{it}) + \text{Year} + \text{Industry} + \varepsilon_{it} \quad (2)$$

$$EARN_{it+1} = \alpha_0 + \alpha_1 OCF_{it} + \alpha_2 NDA_{it} + \alpha_3 DA_{it} + \alpha_4 CG_{it} + \alpha_5 (DA_{it} \times CG_{it}) + \text{Year} + \text{Industry} + \varepsilon_{it} \quad (3)$$

$$EARN_{it+1} = \alpha_0 + \alpha_1 OCF_{it} + \alpha_2 NDA_{it} + \alpha_3 DA_{it} + \alpha_4 BD_{it} + \alpha_5 (DA_{it} \times BD_{it}) + \alpha_6 CG_{it} + \alpha_7 (DA_{it} \times CG_{it}) + \alpha_8 (DA_{it} \times CG_{it} \times BD_{it}) + \text{Year} + \text{Industry} + \varepsilon_{it} \quad (4)$$

The coefficient of the interaction term $DA \times BD$, α_5 , is used to test the impact of board elections on the contribution of discretionary accruals to earning persistence. If the interaction term coefficient (α_5) is significant, then the first hypothesis, H1, will be deemed to be supported. In Model 4, the coefficient of $DA \times CG \times BD$, α_8 , is used to examine whether strong corporate governance will alleviate the relationship between earnings persistence and the combined effect of board elections and discretionary accruals. If the interaction term coefficient α_8 is significant, then the second hypothesis, H2, will be deemed to be supported. Table 1 summarizes the definitions of all variables employed in the current study.

TABLE 1: VARIABLE DEFINITION

Symbol	Variable	Measure
EARN	Earnings	Earnings from continuing operations, divided by total assets at the beginning of the year
OCF	Operating cash flows	Cash flow from operations, deflated by total assets at the beginning of the year
NDA	Non-discretionary accruals	Non-discretionary accruals were estimated by using modified Jones model as stated in the methodology section.
DA	Discretionary accruals	Discretionary accruals were calculated by using modified Jones model as stated in the methodology section.
BD	Board election	A dummy variable for the board reelection. The firm with board reelection is denoted as 1, otherwise 0.
CG	A composite variable of various corporate governance measure.	The composite measure includes board size, independent directors, independent supervisors, CEO and board chair duality, institutional investors' shareholding, foreign institutional investors' shareholding, and the difference between control rights and cash flow rights.
P	Stock price	Stock price per share at the due day of releasing annual financial report, mandated by the article 36 of Taiwan's Security and Exchange Act.
EPS	Earnings per share	Annual reported earnings per share
BV	Book value	Book value per share at the end of the fiscal year
LEV	Leverage	The ratio of total debts to total assets.

SIZE	Size	Natural logarithm of total assets
ROE	Return on equity	Ratio of income before interests and taxes to common stockholder's equity
LOSS	Profitability indicator	A dummy variable for the firms with negative earnings. The firm with negative net income is denoted as 1, otherwise 0
YEAR	Year dummies	Years 2004 thru 2009 are included in the regression models
INDUSTRY	Industry dummies	There are eighteen industries included in the dummies, such as cement, foods, plastics, textiles, electric & machinery, electric, appliance & cable, chemicals, glass & ceramics, steel & iron, rubber, electronics, construction, transportation, tourism, wholesale & retail, etc.

Discretionary accruals are estimated using the modified-Jones model (e.g. Dechow et al., 1995; Martin, 2013). The model used is further modified by cross-sectional industry-specific data input (different companies in the same industry during the same time period). In the first step, total accruals are estimated and these are represented by the difference between net income from continuing operations and operating cash flows:

$$TA_{it} = NI_{it} - OCF_{it}$$

where,

TA_{it} = total accruals for firm i in year t,

NI_{it} = net income from continuing operations for firm i in year t,

OCF_{it} = operating cash flows

The modified Jones model for estimating the parameters of non-discretionary accruals is expressed as follows:

$$\frac{TA_{it}}{A_{it-1}} = \gamma_0 \frac{1}{A_{it-1}} + \gamma_1 \frac{\Delta REV_{it} - \Delta AR_{it}}{A_{it-1}} + \gamma_2 \frac{PPE_{it}}{A_{it-1}} + \varepsilon_{it}$$

where

TA_{it} = total accruals for firm i for year t,

A_{it-1} = total assets for firm i for year t-1,

ΔREV_{it} = change in net revenues for firm i for year t,

ΔAR_{it} = change in accounts receivable for firm i for year t,

PPE_{it} = gross property plant and equipment for firm i for year t,

ε_{it} = error term for firm i for period t.

The non-discretionary accruals (NDA_{it}) are calculated after incorporating the parameters of nondiscretionary accruals as following:

$$NDA_{it} = \hat{\gamma}_0 \frac{1}{A_{it-1}} + \hat{\gamma}_1 \frac{\Delta REV_{it} - \Delta AR_{it}}{A_{it-1}} + \hat{\gamma}_2 \frac{PPE_{it}}{A_{it-1}}$$

As the last step, discretionary accruals (DA_{it}) are calculated by using the parameters estimated in above equation:

$$DA_{it} = \frac{TA_{it}}{A_{it-1}} - NDA_{it}$$

where DA_{it} represents the discretionary accruals for firm i at the event year t.

In this study, we used a number of variables to capture corporate governance based on prior literature. These include board size (Beasley 1996); number of independent directors and supervisors (Peasnell et al. 2005; Klein 2002; Cho and Rui 2009; Core et al., 1999); CEO is the board chair (Chen and Jaggi 2000); number of independent supervisors (Cho and Rui 2009); number of institutional investors (Koh 2003; Bushee 1998); number of foreign institutional investors (Haat et al. 2008); and the difference between control rights and cash flow rights (Claessens et al. 2000; Chin et al. 2009). These variables are measured as follows:

Board size (B_SIZE) is measured as the total number of directors on the board. Independent directors and supervisors (IND) is an indicator variable equaling one if none of the directors and supervisors is an insider of the company and holds more than one percent of the firm's stock and zero otherwise. Duality of CEO (Dual) is an indicator variable equaling one if CEO is not the board chair, zero otherwise. Institutional investors' shareholding (%INST) is the percent of shares held by institutional investors. Foreign institutional investors' shareholding (%FORE) is the percent of shares held by foreign institutional investors. The difference between voting rights and cash flow rights (VC) is computed as the percentage of voting rights minus the percentage of cash flow rights. Higher values for B_SIZE, IND, %INST, %FORE, and lower values for VC represent more effective corporate-governance mechanisms. This is consistent with the belief that insiders will have greater difficulty controlling boards that are larger, more independent, have greater external (i.e., domestic institutional and foreign institutional) ownership as well as more widely distributed voting rights, as measured by a decreasing distance between voting and cash flow rights.

Following Bushman et al. (2004) and Duh et al. (2009), we first sort B_SIZE, %INST, and %FORE in ascending order and VC in descending order before computing percentile values such that each variable can be transformed into a scale between zero and one. We then compute a composite variable by adding up the percentile values of B_SIZE, %INST, %FORE, and VC plus IND and Dual to capture the strength of corporate governance (CG). Hence, a high value of CG is deemed representative of more effective corporate governance mechanisms.

Regression models of board election and corporate governance on the value relevance of earnings and book value

Corporate governance which is perceived to be of better quality may also impact investor perceptions of the quality of a firm's reported earnings and its asset book values. There may, that is, be less suspicion of the firm's earnings and book value reporting in these circumstances. Therefore, it is critical to examine whether board elections will have an impact on the value relevance of earnings, as proxied for by earnings per share or EPS, and book value or BV. We carry out these analyses via Models (5)-(8). Models 5 through 8 are presented as follows:

$$P_{it} = \beta + \beta_1 \text{EPS}_{it} + \beta_2 \text{BV}_{it} + \beta_3 \text{ROE}_{it} + \beta_4 \text{LEV}_{it} + \beta_5 \text{SIZE}_{it} + \beta_6 \text{LOSS}_{it} + \text{Year} + \text{Industry} + \varepsilon_{it} \quad (5)$$

$$P_{it} = \beta + \beta_1 \text{EPS}_{it} + \beta_2 \text{BV}_{it} + \beta_3 (\text{EPS}_{it} \times \text{BD}_{it}) + \beta_4 (\text{BV}_{it} \times \text{BD}_{it}) + \beta_5 \text{ROE}_{it} + \beta_6 \text{LEV}_{it} + \beta_7 \text{SIZE}_{it} + \beta_8 \text{LOSS}_{it} + \text{Year} + \text{Industry} + \varepsilon_{it} \quad (6)$$

$$P_{it} = \beta + \beta_1 \text{EPS}_{it} + \beta_2 \text{BV}_{it} + \beta_3 (\text{EPS}_{it} \times \text{CG}_{it}) + \beta_4 (\text{BV}_{it} \times \text{CG}_{it}) + \beta_5 \text{ROE}_{it} + \beta_6 \text{LEV}_{it} + \beta_7 \text{SIZE}_{it} + \beta_8 \text{LOSS}_{it} + \text{Year} + \text{Industry} + \varepsilon_{it} \quad (7)$$

$$P_{it} = \beta + \beta_1 \text{EPS}_{it} + \beta_2 \text{BV}_{it} + \beta_3 (\text{EPS}_{it} \times \text{BD}_{it}) + \beta_4 (\text{BV}_{it} \times \text{BD}_{it}) + \beta_5 (\text{EPS}_{it} \times \text{CG}_{it}) + \beta_6 (\text{BV}_{it} \times \text{CG}_{it}) + \beta_7 (\text{EPS}_{it} \times \text{CG}_{it} \times \text{BD}_{it}) + \beta_8 (\text{BV}_{it} \times \text{CG}_{it} \times \text{BD}_{it}) + \beta_9 \text{ROE}_{it} + \beta_{10} \text{LEV}_{it} + \beta_{11} \text{SIZE}_{it} + \beta_{12} \text{LOSS}_{it} + \text{Year} + \text{Industry} + \varepsilon_{it} \quad (8)$$

The β_3 and β_4 in Model 6 are used to test whether board elections will affect the value relevance of EPS and BV. If the interaction term coefficient for $\text{EPS} \times \text{BD}$, β_3 , decrease the value relevance of EPS by having a negative coefficient whereas EPS itself had a positive coefficient (β_1) then H3a will be deemed to be supported. Further, if the interaction term coefficient for $\text{BV} \times \text{BD}$, β_4 , has a positive coefficient, and thereby positively contributes to the value relevance of BV, which also has a positive coefficient (β_2), then H3b will be deemed to be supported. In Model 8, the three-way interaction terms of $\text{EPS} \times \text{BD} \times \text{CG}$ (β_7) and $\text{BV} \times \text{BD} \times \text{CG}$ (β_8) are employed to examine whether strong corporate governance can enhance the value relevance of both EPS and BV in presence of board elections. If the coefficients, β_7 and β_8 , for the two named interaction terms are positive, then the fourth hypothesis, H4, will be deemed to have been supported.

This study also includes various variables to control the possible effect on stock price (Fama and French, 1992; Barth, Beaver and Landsman, 1998; Collins, Pincus and Xie, 1999; Burgstahler and Dichev, 1997; Aboody et al., 2004; Becker et al., 1998), including firm size (SIZE), debt level (LEV), return on equity (ROE), and profitability (LOSS). Again, the definitions of all variables utilized above have been included in Table 1.

Sample Selection

Our sample includes Taiwanese publicly-listed firms. The sample years ranged from 2003 to 2013 inclusive. The corporate ownership structure, financial and stock data were collected from the Taiwan Economic Journal (TEJ) database. Our sample firm-years had to meet the following requirements. First, the TEJ database had to contain the required financial data for all necessary variables. And, second, none of the sample firms could be in the finance and banking industry since these are heavily regulated. None of the firms were utilities. Finally, observations accepted into the sample had to have their annual meetings in the period from April 15 through June 30th. These requirements resulted in a final sample of 7456 firm-years for testing stock price relevance of board election on earnings and book value. Because one-year ahead earnings were required for testing earnings persistence in the models (1)-(4), but 2013 reported earnings are not available when current research is conducted. Therefore, 785 observations had to be dropped. The sample for testing earnings persistence equaled 6,671 firm-years. Sample selection process is provided in Table 2.

TABLE 2: SAMPLE SELECTION

All firms with stock prices available from the beginning of January, 2003 to April 30, 2013 (excluding firms in finance and banking industries)	8,140
Less:	
Firms whose shareholding meetings were earlier than April 15 (because the stock price used in our sample was that of April 30).	(136)
Firms whose shareholder meetings were later than June 30	(477)
Firms with data missing	(71)
2003-2013 Value-Relevance observations in firm-years	7,456
Less: 2013 observations for testing earnings persistence	(785)
2003-2012 Earnings Persistence observations in firm-years	<u>6,671</u>

Empirical Results

Descriptive statistics for the dependent and independent variables of the 6,671 firm-years used in testing earnings quality are provided in Table 3.

TABLE 3: THE DESCRIPTIVE STATISTICS OF VARIABLES FOR SAMPLE FIRMS (N=6,671)

Variable	Mean	Median	Std. Dev	Min	Max
EARN	.055	.045	.096	-0.363	0.967
OCF	.075	.071	.129	-1.960	1.271
NDA	-.019	-.026	.069	-1.239	1.565
DA	-.001	-.002	.105	-.909	1.811
BD	.334	.000	.472	0.000	1.000
CG	2.721	2.726	.882	.207	5.503

See Table 1 for variable definitions.

One objective of this study is to examine whether firms with current board elections will have greater earnings persistence given discretionary accruals and other governance mechanisms than do firms whose boards are not being elected in that year. Table 4 presents a test of differences between firms undergoing the mandatory, every third year, board election and firms not undergoing the mandatory, every third year, election required under Article 195 of the Taiwan Company Law.

TABLE 4: MEAN DIFFERENCE BETWEEN FIRMS WITH BOARD ELECTION AND NON-ELECTION

	Election (n=2,229) Mean	Non-election (n=4,442) Mean	Difference	t value	Sign. level
EARN	0.051	0.050	0.001	.570	.569
OCF	0.074	0.076	-0.002	-.611	.541
NDA	-0.018	-0.020	0.001	.620	.535
DA	-0.001	-0.001	0.000	.120	.904
CG	2.714	2.725	-0.011	-.497	.619

See Table 1 for variable definitions.

Table 4 shows that the two groups of firms, with the grouping by whether a board election was taking place or not taking place, did not differ on variables pertinent to the study.

Table 5 demonstrates that during board elections, companies tend to conduct opportunistic earnings management. As a result, the contribution of discretionary accruals to earnings persistence is reduced. The following models, previously presented in the equation (1)-(4), underlie the results in Table 5.

See Table 1 for variable definitions.

Several conclusions can be drawn from Table 5². First, the positive coefficients for OCF, NDA and DA show that all three positively contribute to earnings persistence. Second, In model 2, α_4 , the coefficient of BD, is insignificantly negative. This suggests that board elections have no significant impact on earnings persistence. However, α_5 , the coefficient of the interaction term DA×BD is significantly negative. This shows board elections significantly decrease the contribution of discretionary accruals to earning persistence. In other words, during board elections, earnings management is opportunistic. These results support H1 that in the presence of board election, managers are more likely to engage in opportunistic discretionary accruals that reduce earnings quality. In Model 3, α_4 , the coefficient of the corporate governance variable, is significantly positive. This shows that better corporate governance is able to enhance the earnings persistence of a company. However, the coefficient of DA×CG, α_5 , is insignificantly negative. This finding shows that the quality of corporate governance has no impact on the contribution of discretionary accruals to earnings persistence. In Model 4, the coefficient of DA×CG×BD, α_8 , is significantly positive, and the coefficients of α_4 , α_5 , α_6 , and α_7 align with those in Model 1-3. This finding shows that good corporate governance will alleviate the negative relationship between earnings persistence and the combined effect of board elections and discretionary accruals. In other words, good corporate governance helps to cut down opportunistic earnings management and alleviate the situation wherein board elections decrease the contribution of discretionary accruals to earning quality. Thus, H2 is supported.

Overall, Table 5 demonstrates that during board election years, earnings persistence is negatively related to the occurrence of discretionary accruals itself, and the interaction between director elections and discretionary accruals. However, better corporate governance arrangements moderate the relationship between discretionary accruals and director elections on the one hand, and earnings persistence on the other.

Next, we explore the impact of board elections on the value relevance of earnings and book value. Corporate governance was significantly and positively related to earnings persistence, as shown in Table 5, whereas discretionary accruals were negatively related to earnings persistence. The interpretation of these findings is that better corporate governance leads to higher quality managerial behavior, which helps assure better earnings from year to year. On the other hand, as noted, discretionary accruals are rife for manipulative managerial pursuits and, in a board election year, may lead to higher earnings. In a board non-election year, however, the firm may find itself unable to continue managing earnings via discretionary accruals. Accordingly, earnings should be less persistent. An investor expectation of greater earnings persistence, based on perceived high quality corporate governance, should impact the price at which the investor will buy shares of stock since greater earnings persistence implies a greater likelihood of continued earnings returns. Accordingly, we would expect the earnings measure EPS to interact positively with the corporate governance measure CG, with the result that this interaction term would be positively related to the firm's stock price. Board elections were shown to have no impact on earnings persistence, but did have a negative impact when the interaction of BD and discretionary accruals (DA) was tested. It was only when BD was paired with CG and DA that a positive result was found. This result suggests that CG stands as a surety of sorts that earnings calculated by these firms would persist due to the positive governance affects, as measured here. A follow up question then becomes, if corporate governance helps support earnings persistence, will firms whose EPS and BV are calculated by firms with better corporate governance routines be associated with higher value relevance? These issues are explored in the empirical testing of hypotheses H3a, H3b and H4. The results of those tests are shown in Models 5 through 8.

Descriptive statistics for the variables used in Models 5 through 8 are presented in Table 6. Table 7 presents a t-test comparing the means of firms that had a directors' election with those that did not have a directors' election.

TABLE 6: THE DESCRIPTIVE STATISTICS OF VARIABLES FOR SAMPLE FIRMS (N=7,456)

² In all regressions reported, we conducted multicollinearity diagnostic tests by computing the variance inflation factors (Kennedy, 2000) for all variables used in the regression analyses. None of these factors displayed a value greater than 10, thus indicating a lack of multicollinearity. This held true in all regressions.

Variable	Mean	Median	Std. Dev	Min	Max

See Table 1 for variable definitions.

The results in Table 8 show that, first, β_1 and β_2 , the coefficients of variable EPS and BV are both positive in all four models, thus indicating that EPS and BV are both positively related to share prices. Second, the coefficients of the interaction term in Model 6 show that board elections will decrease the value relevance of EPS ($\beta_3 < 0$) and increase that of BV ($\beta_4 > 0$). This indicates that in the presence of board elections, when valuing a stock, investors seem to decrease their reliance on earnings information and rely more on book value. This makes sense given that, on a percentage basis, an increase (decrease) in DA will have a heavier percentage increase (decrease) on EPS than on BV, given that EPS represents a flow concept, while BV largely represents a stock concept whose value fluctuates less from year to year in both absolute and percentage terms than does EPS due to discretionary accruals. These findings support both H3a and H3b.

Third, Model 7 shows the impact of corporate governance on value relevance of EPS and BV. The interaction of EPS and CG (β_3) and the interaction of EPS and BV (β_4) show that when valuing a stock, investors will increase their reliance on earnings information, which increases the value relevance of EPS, if good corporate governance is in place, and relatively reduced reliance of investors on equity information. As Table 5 demonstrated earlier, the board election decreases the contribution of discretionary accruals to earnings quality and good corporate governance alleviates opportunistic earnings management.

In Model 8, we also find that the interaction of EPS and BD (β_3) is significantly negative at the one percent level, while the interaction of BV and BD (β_4) is positive at the one percent significance level. Thus, in the presence of board elections, the value relevance of EPS declines, but the value relevance of BV increases, consistent with earlier finding in Model 6. However, the three-way interaction terms of EPS×BD×CG (β_7) is positive and BV×BD×CG (β_8) was negative, but both of them are statistically insignificant. Therefore, better corporate governance may still enhance

the value relevance of EPS, but does not significantly increase too much the reliance of investors on financial accounting information for firms in which director elections were held. This finding does not fully support H4.

Conclusion

This study explores (a) the impact of discretionary accruals, given the potential moderating effect of board elections (BD) and corporate governance (CG), on earnings quality and (b) the value relevance of earnings (i.e. EPS) and book value (BV) on the firms' stock prices, given the potential moderating effects of director elections and corporate governance. We find that the use of discretionary accrual activity in the presence of directorship elections leads to reduced earnings persistence, thus indicating that the discretionary accruals used represent poorer quality additions to earnings. Given that the presence of better corporate governance regimes reverses this effect, it seems that the discretionary accruals signaled better quality earnings in the presence of better corporate governance regimes. Accordingly, managements should realize that better corporate governance arrangements provide stockholders with greater assurance as to the quality of earnings.

We also found that the value relevance of both EPS and BV are positive when their values are tested against stock prices. This should be expected. A more interesting finding is that we found a negative relationship between the interaction term for BD and EPS on the one hand and stock prices on the other. This indicates that directorial elections reduce the value relevance of EPS. Once, however, we created the three-way interaction term, including CG, EPS and BD, the result turned positive, if insignificantly so. Consistent with our earlier results, these results argue for the importance of good corporate governance in *perhaps* helping assure the credibility of accounting numbers. Further, we found that BV as a separate variable in the value relevance regression is very strongly and positively related to stock price. As noted, the interaction of BD and BV was also positively related to stock prices. Since BV is more of a stock than a flow concept than EPS, BV carries over value from not only the two previous years, years in which directorial elections were not held, but also value from the beginning of the firm itself. It is less surprising, therefore, that the interaction term for $BV \times BD$ was positive while the interaction term of $EPS \times BD$ was negative. For investors, the implication of these findings are that BV is a better guide to corporate value than EPS in situations where corporate governance is of questionable quality given the presence of board elections. For investors, an implication of these findings is that BV is a better guide to corporate value than EPS in situations where corporate governance is of questionable quality. For managers, a clear implication is that attempts to manipulate earnings are of doubtful utility without taking the perceived strength of corporate governance into account. Improving corporate governance enough, of course, may obviate the ability of management to engage in such manipulations at all.

The results presented here indicate the importance of better corporate governance in diffusing suspicions of management occasioned by the use of discretionary accruals in years in which board elections take place. Better corporate governance regimes led to a more positive relationship of discretionary accruals to earnings persistence, even in the presence of directorial elections. Similarly, better corporate governance regimes led to a more positive relationship between EPS and stock prices.

In order to obtain these results, we used Taiwanese data since the Article 195 of Taiwan's Company Law requires triennial board of director elections, and staggered voting is not allowed. This restriction of testing locale is a limitation of this research. Certainly, this research could not have been taken using many US companies since the use of staggered elections of board of directors' members is typical. It may be argued, therefore, that our results reflect the relationship between the variables tested as found within a particular locale. Taiwan is heavily integrated into the global economy, however, with Taiwanese firms having—and being exposed to—business and corporate governance practices across the globe. Nevertheless, in the wake of the corporate scandals that have rocked the globe since the fall of Enron and Worldcom in 2001, we believe it is important to examine whether the relationships found here also exist in other nations.

Similarities and differences in the capital structure of the transformation industry and commerce in Mexico

Abstract

The purpose of this research was to determine the mathematical relation between, the financial country factors and the financial enterprise factors incorporating debt in the enterprise capital structure, used for the transformation and commerce companies sectors that quoted on the Mexican Stock Exchange in 2000-2011 periods.

The long term debt was the dependent variable and through the E-views 7.0 program, the panel data technique was applied in order to determine the mathematical relation between the independent factors.

The mathematical model and the factors for this empirical study were identified and used in the research as discussion into the theoretical framework

Keywords: Capital structure, Factors of the company, Factors of the country

Introduction

The research, is motivated because of the absence of policies, rules or models into the real life of the enterprises to generate their own capital structure, implying the reviewing of theories, the empirical studies, the existing hypotheses, the major postulates, to determine their its mathematical relationship between debt and the capital structure. Thus, we established a solid foundation to the problem, the questioning and the established objectives. The studies of the capital structure in Mexico are fundamental, because the lack of a robust model to explain the financial decisions in the Mexican organizations, particularly in the transformation and commerce companies sectors, justify this research.

Theoretical framework

The existence or not of an optimal capital structure for the companies, as well the way it should be determined, has been one of the most controversial topics of financial literature since Modigliani and Miller (1958), published their article and showed their propositions of the irrelevance of the capital structure to the value of the enterprise. It has been 56 years since the publication of the seminal work that gave origin to corporate finances as we know nowadays and at the same time caused that capital structures studies caught so much attention from the economy and financial areas. However, the broad research done on the capital structure theory, to this day, is no conclusive in answers. The theoretical models developed during the last years, have tried since to validate and generalize sometimes, the thesis of the irrelevance of Modigliani and Miller (1958); other times, the models have been tried to adjust the thesis of maximum indebtedness of Modigliani and Miller (1963). From the convergence of both lines of research on the decade of the 60's emerged a renovated theory of the capital structure postulating the existence of an optimal structure to the proposed problem. In this research were reviewed the following theories: optimal capital structure, Theory of the Fiscal Tax Base, Theory of the Asymmetric Information, The Theory of the Agency Costs, The Free Cash Flow Theory, The *Pecking Order Theory* (POT); This last theory was formally proposed by Myers (1984), based in the preliminary work of Donaldson. (1961).

The empirical studies that support all the above mentioned theories, were also reviewed, highlighting among others, the studies done by Rajan and Zingales (1995), and the study of Wald (1999), these studies offered empirical evidence for G-7 countries. They were analyzed some institutional factors of the company, such as: The total assets (size of the firm), profit, sales (growth rate), and the capital (risk).

In the empirical studies, as well as the financial theories, the knowledge has increased and evolved; however, in the different researches done hasn't been achieved the construction of a model that includes jointly all the factors considered capital structure determinants, among the published investigations, we can mention the ones made Filbeck and Gorman (2000), Bradley, Chung (1993), Van el Der (1989), Kester (1986), Harrel and Kim (1984).

The empirical evidence suggests that besides the specific factors of the company also the macroeconomic factors or institutionals of each country are important of the capital structure (Booth L., Aivazian, V., Demirguc-Kunt, A. and Maksimovic, V. (2001), Antoniou, Guney, and Paudyal (2008), Gaytan and Bonales (2009), Dias, Thosiro and Cruz, (2009), Dias and Toshiro (2009). Nevertheless, the most part of the theoretical debate and empirical about the incorporation of the debt in the capital structure, has stayed conditioned by well-developed the capital markets and with a financial architecture well structured, Singales (2000).

Arias, M., Arias, L., Pelayo and Cobián (2009), argued that is necessary to do an specialized research about this matter in the Mexican companies with the purpose of achieving a better understanding about their contracting and debt decisions, in order to design financial instruments adequate to their financial needs and to facilitate and support their growth.

The capital structure and the macroeconomic or institutional factors of the country

The recent empirical evidence suggests that the specific factors of every country are important aspects in forming the capital structure in the company of emerging markets, (Booth, Aivazian, Demirguc-Kunt and Maksimovic, (2001); Antoniou, Guney and Paudyal, (2008); Gaytan y Bonales (2009); Dias, Thosiro and Cruz, (2009); Dias y Toshiro (2009). Suggest that the specific factors in the explanation of decisions of contracting debt of the company are related to the economic environment and institutional mechanisms of each country, as the financial sector, the tax system, the legal system and the accounting practices.

In the studies done about the main factors of the country, considered as determinants in building the capital structure of the companies, has been found that they have a significant impact, among others the following factors: i) The Fiscal tax rate), ii) la inflation, iii) the interest rate and iv) the exchange rate. For that reason of the investigation of the commercial sector the four macroeconomic and institutional factors were considered.

Capital structure and the microeconomic factors of the company

It has been looked for to identify the specific factors of the company that could be relevant aspects forming their capital structure, with the purpose of proving the validity of the theories supporting them. Among the factors of the company that can act as significant in forming the capital structure, in the empirical studies done by Dias, Toshiro and Cruz. Gaytán and Bonales (2009), Dias and Toshiro (2009), it has been found a significant evidence incorporating debt in the capital structure, in the following factors: i) Total assets, ii) operation profit iii) capital, and iv) net sales. For that reason the 4 factors were also considered.

Hypothesis

The fiscal tax rate, the interest rate, the operation profit, the exchange rate and the capital are factors that are negatively related; on the contrary the inflation, the total assets and the net sales are factors that are positively related, incorporating debt in the capital structure used by the companies of the transformation and commerce sectors in Mexico.

Methodology

The econometric model of the panel data was chosen and used to calculate the mathematical relationship of the factors, the sample of the factors was used for the period from 2000 to 2011, the technique of this model combines data of temporary dimension and cross-section cut. The model is also known as longitudinal joint, gathered data, times series and cross-section, micro-panel data, history analysis and peer analysis. (Gujarati, 2003).

The technique of the panel data can develop and test complex models, According to Carrascal is applicable to the following areas a) Sales prediction, b) Cost studies, c) Financial analysis, d) Macroeconomic prediction, e) Simulation, f) Analysis and evaluation of any type of statistical data. Also allows to observe the causal inferences of the independent and dependent factors, these inferences of causality would be difficult to understand if only applied in isolation technique of "cross-sectional data" or the technique of "time series data". The analysis of panel data,

simultaneously gathers the study of the cross-section cut and the times series studies capture the heterogeneity and the economic agents incorporating the dynamic analysis. (Rivera, 2007)(Mayorga & Muñoz, 2000).

The fundamental characteristic of the panel data is the fact of monitoring the same companies in a continuous period of time. (Wooldridge, 2001).

The analysis of the panel data studies the data set, putting together the cross section cut and the time series. The available information is processed and presented in two dimensions, generating multiple observations for each economic unit, enriching the empirical analysis. (Rivera, 2007), (Mayorga and Muñoz 2000), (Gujarati, 2003), (Mur and Angulo, 2006), (Rivera, 2007).

The model recognizes two effects, on one hand the effects that are unequally affected to each of the study agents contained in the sample, on the other hand, the temporary effects that equally affect all individual units of study that do not vary over time, allowing to study changes in the benefits of a single company over a period of time and the variety of benefits of several companies. (Pindyck, 2001).

Source and data collection

The specific variables of the companies were obtained from the financial statements published in the financial yearbook of the Mexican Stock Exchange, the source is very reliable, according to the specific laws, the companies listed on the Stock Exchange have the obligation to generate reports at the end of each quarter (Schneider, 2001). The macroeconomic data were obtained by databases and publications made by the Bank of Mexico.

The study sample was not probabilistic, because all the companies from the transformation and commerce sector that were listed in 2000-2011 periods were considered. According to the stratification of the Official Journal of the Federation of Mexico, published in June 2009, for its size, all are classified as large companies.

This research considered the dependent variable: The Long-Term Liabilities. We also considered eight independent variables, of which four are company-specific variables: Total Assets, Net Sales, Operating Income and Capital, and the other four are the country's macroeconomic variables: Tax Rate (ISR), Interest Rate, Inflation and Exchange rate.

Analysis and interpretation of results

After applying the multivariate technique of panel data, that involved the dependent and independent variables, the economic model showed the existence of a high correlation between the independent variables, causing multicollinearity. Is, some independent variables showed a significance greater than 5%. So the null hypothesis was not rejected. The null hypothesis for each complementary hypothesis was defined as: $H_0: B_i = 0$, where i is the independent variable to the level of significance of 5%.

Stepwise Method. The application of the method allowed us identifies the variables that improve the levels of adjustment and models explanation. The redefined model to commerce sector only included the following independent variables: Total Assets, Operating Income, Interest Rate and Inflation. The redefined model to transformation sector only included the following independent variables: Sales, Capital, Income Tax.

Test (VIF). The inflation factor of the variables variance must be less than 10. The (VIF) result showed 12.05, being outside the range.

The test was repeated, considering only the variables of the redefined models after applying the stepwise method. The result showed a decrease in the average variance inflation factor to 3.14, for the commerce sector and 3.38 for the transformation sector which are within the acceptable range test. (Table 1).

TABLE 1

Commerce Sector (VIF) With significant variables			Transformation Sector (VIF) With significant variables		
Variable	VIF	1/VIF	Variable	VIF	1/VIF

Total Assets	4.36	0.229298			
Operating Income	4.24	0.235796	Sales	4.57	0.218794
Interest Rate	2.01	0.497772	Capital	4,52	0.221061

The multivariate regression of panel data (fixed effects), shows that the sales and the income tax have a positive correlation and the capital have a negative correlation incorporating the long term liabilities; the model shows an explanatory capacity of 0.9442.

TABLE 4: FACTORS THAT HAVE MATHEMATICAL RELATION, INCORPORATING DEBT IN THE CAPITAL STRUCTURE OF THE COMMERCE SECTOR COMPANIES

CONCEPT	TOTAL ASSETS (+)	PROFIT (-)	INTEREST RATE (-)	INFLATION (-)
SIGNIFICANCE	***	**	**	**

Source: Own elaboration with the results of the STATA-11 program, (table 2)

Total Assets. In the commercial sector, we obtained a positive mathematical relationship of total assets with long-term liabilities. The total assets seem to be the most important factor in financing, especially for long-term debt, (Vigrén, 2009). This result agrees with the results shown in the classic article on this issue at the international level of Rajan and Zingales (1995), who researched the fundamental aspects of the capital structure of the company for the (G-7) countries during the period 1987-1991, finding that the total asset is a factor to incorporate debt, arguing that large companies tend to have a higher level of indebtedness. Other researchers like Frank and Goyal (2009), as well as Dias, Toshiro and Cruz. (2009) and Dias and Toshiro (2009), who obtained evidence in Latin American companies, including Mexican, agree with Rajan and Zingales.

The Profit. In the commercial sector, the result shows that operating income as a factor in the inclusion of debt, to form the capital structure has a negative relationship, this result agrees with those obtained by (Jordan, Lowe and Taylor, 1998), (Philosophov and Philosophov 1999), who found, the profit is negatively related to the debt.

Risk Free Interest Rate. In the commercial sector, the result shows that Risk free interest rate is negatively related with the incorporation of liability (debt or leverage), matching the results of studies conducted by Barry , Mann, Mihov, and Rodriguez (2008), who found that firms issue more debt when interest rates are lower than historical levels.

Inflation In the commercial sector, the result shows that inflation has a positive mathematical relationship with the incorporation of liability (debt or leverage), this result coincides with the result obtained by Gaytan and Bonales (2009), the study of multinational companies belonging to the electronics industry, established in the state of Jalisco, Mexico, they also found that the inflation rate has a positive relationship to incorporate debt in capital structure.

TABLE 5: FACTORS THAT HAVE MATHEMATICAL RELATION, INCORPORATING DEBT IN THE CAPITAL STRUCTURE OF THE TRANSFORMATION SECTOR

CONCEPTO	SALES (+)	INCOME TAX (-)	CAPITAL (-)
SIGNIFICANCE	***	***	***

Source: Own elaboration with the results of the E-Views 7.0 program, (Table No.3)

Capital. The application of the statistic proves the affirmation that the formulated hypothesis holds, the countable capital is related in a negative way in the decisions that incorporate the debt of the transformation companies. Those results, agree with Mason’s job (1990), Friendly Lang (1988), the important founds that they got from the United States, match with the obtained results in this empiric study, showing negative meaning related to the passive long term.

Income tax. Statistical results, indicates that Income Tax Rate is positively, confirming that tax advantage of the total financing cost through borrowing has been exploited by companies transformation sector. The results confirm that the traditional approach to the tax advantage or trade-off between equity and borrowed funds, suggesting an optimal or equilibrium relationship between them, has lost ground to other theories as he states in his research (Myers 1984).

Sales. Transformation industry has a positive mathematical relationship that this study determine yet. It coinciding with the results obtained Hall, Hutchinson, and Michaelas (2000), who studied 3,500 small and medium enterprises (SMEs) in the UK unlisted Stocks, and using the percentage increase in sales volume growth as an indicator variable, found that the level of short-term debt is positively related to growth of the company. It also coincides with the results of other authors such as Rajan and Zingales (1995) and Myers (1977).

Conclusions

The research reached its purpose to identify the positive or negative relationship of the quantitative factors between the debt and the capital structure into transformation and commercial companies sectors and they are participating in the period 2000 to 2011 Mexican stock market. The model of the transformation companies was proved with the statistical technique of "panel data", and was adjusted means of the dependent variable: The Long-Term Liabilities and as independent variables: Sales, Capital and Income Tax.

The model of the commerce companies was proved with the statistical technique of "panel data", and was adjusted means of the dependent variable: The Long-Term Liabilities and as independent variables: Total Assets, Operating Income, Interest Rate and Inflation.

The results are useful for generating standards and guidelines, facilitating decision-making by incorporating debt in the capital structure of companies in the transformation and commercial sector in Mexico. The results will decrease uncertainty and support decisions in tangible and intangible assets of investment projects done by companies in the transformation and commercial sector.

Factors emanating from the qualitative characteristics such as culture, power, country risk, and personal values, are aspects that can influence and change the results, which is why we suggest to be included in future research.

Economic tools induced by real estate development process in Visegrad Countries

Julius Golej, julius.golej@stuba.sk

Institute of Management, Slovak University of Technology in Bratislava, Slovakia

Abstract

Economic tools induced by real estate development process are principally additional fees from development projects realized in particular land. These charges reflect the inducing costs that are directly associated with the development process and exceeds the scope of realized projects. This issue is related particularly the distribution of costs and benefits from development activities. This paper is focused on economic instruments in real estate development process in selected Visegrad countries of Central and Eastern European region – Slovakia, Czech Republic, Hungary and Poland.

Land plays a key role in development projects. Conversely, land use plans and development process significantly affect the monetary value of land. Price and value of the land is differently perceived by developer or investor and otherwise is perceived by the landowner. With increasing value of land, owners can through higher prices for their subsequent divestiture anticipate their further increases. If the land owner does not take any capital appreciation on their property, the profit from the resale of property may be regarded as purely speculative profit. Such activity of owners should be at least partially controlled by the public sector in order to prevent unhealthy influencing of the land market.

Key words: real estate development, Visegrad countries, development fees, induced costs.

Introduction

The main objective of this paper is to pointing out to weaknesses and critical assessment of the legislative environment, economic, planning and executive instruments relating to land in real estate development processes in Visegrad countries - the Slovak Republic, the Czech Republic, Hungary and Poland. At the outset, it should be added that the situation on this issue in these countries is very similar.

The methodology of this paper is based on an analysis of the theoretical bases of economic instruments related to real estate development in the area.

Research Method of the contribution is based on empirical research - gathering information for analysis of the current stage of issues. It is also based on collection of primary and secondary data about the economic and legislative instruments which are relating to development process and land development in selected countries. These analyzes were performed on available publications of foreign and domestic authors that relate to the research problems.

A Brief overview of the real estate market in Visegrad Countries

The real estate market in Visegrad Countries for the last more than twenty years has developed and undergone a long period of change. From the collective ownership of land, which was one of the main factors of production and the main idea of communist ideology through privatization and restructuring has passed on personal ownership of the land. However, this process has many shortcomings, such as the problem of identifying the original owners, whom the land had been unjustly taken and insufficient records in the land cadastres. Nevertheless, the last 20 years in Central and Eastern Europe there was a huge real estate boom, as evidenced by the amount of development projects both domestic and foreign companies.

In the early nineties, in the former socialist countries have become real estate development very disorganized and often reckless real estate competition. Commercial real estate transactions were primarily the result of direct

negotiations between buyer and seller, which is increasingly more carried out with the contribution of lawyers, because these operations have become much more complicated.

Land plays a key role in real estate development projects. Differently is perceived the price and value of the property by the developer or investor, and differently is perceived by the landowner. This raises for instance problems arising from the two values of land, but only one price. Therefore it is necessary the importance of coordination objectives of public and private sector in the development of a land use plan and development activities in the area.

Global land use and tax issues in recent decades have become much more complex. The introduction of breakdowns, planning and permitting system created ambiguity in the definition of private and socially created land values (Connellan, 2004). In other words, difficulties arise in separating and measuring of public and private components of land value. It may even be impossible to completely separate these two components of values, because of the changing technology and social norms create new property forms (Malme, Youngman, 2001).

Development process and any real estate development in the area implies a certain burden for a given land with which it is closely linked inducing additional cost to the developer beyond these processes. In contrast, the view of the municipality, these costs can be described as conditional investments or brought investments. There are various forms how investor should co-finance brought investments or related investments of public sector, or how he shall pay a tax or fee for improvement the creditworthiness of the property from public investment. A similar principle existed in Slovakia until 1989, when it was necessary for the larger investments to define, quantify and appreciate conditional and related investments for transport, technical equipment and community amenities (Nižňanský, 2013). Precisely this issue is very actual and need for its solution is more than necessary.

Development fees in Visegrad countries

Among the most common brought investments (or conditional investments) may include, for instance expansion or reconstruction of: transport infrastructure in the area of implemented a development project; the technical infrastructure (utilities - water networks, electricity networks, gas networks, waste management networks, etc.); the immediate surroundings of the project (playgrounds, sports fields, parks, benches, etc.).

Realization of those investments is shifting on the shoulders of public institutions, from which is expected that it will be covered from their budgets or possibly by means of loans, or in transition from EU funds. However, this approach burdens of all urban residents while benefits from the investment have only developers or limited range of living or new urban residents (Nižňanský, 2013).

Debate about what costs the developer must be added to the basic project usually takes place in the preparatory phase of the project. This issue in a concrete form enters when the application for planning permission is realized and when government gives binding statements. At this stage both parties must reach a consensus how to deal with and brought investment. Especially nowadays at the time of the real estate crisis and weakened interest in apartments or office spaces and increased price sensitivity of buyers is the debate considerably more difficult. Developers are pushing for even greater cost reduction of their projects.

Officially, there are formal and informal instruments which the municipality has available when dealing with the developers. Among the formal instruments include the local plan, including land use plans of zones and regulatory plans of municipality in which are specified limits concerning the maximum building-up of land, buildings distance from the road (street line), number of storeys of buildings, fence heights, greenery, slope of roofs, colour of roofs, etc. Binding regulations defining the future shape of urban and architectural division of new locations - e.g. minimum width and shape of roads, emphasis on clearance limit of streets (during winter maintenance), etc.

On the contrary among informal instruments can be included negotiations between the municipality and the developer about the design of new construction; about brought investments related to the planned development project - specifically the construction of new transport and technical infrastructure, the extension of existing transport and technical infrastructure, about realization of public buildings (schools, parks and other green spaces, public spaces, etc.) (Temelová, Puldová, 2010).

It should be added that, as well as in Visegrad Countries there is an absence of a set of informal planning tools at the local level, abroad known as Land Management. Land management it is perceived as system of informal land use and executive instruments, which is a comprehensive tool for guiding spatial development and also information platform for achieving consensual as well sustainable solutions in cross-sectional wide range of demand for land.

In general we can say that local authorities currently do not have any instruments that would enable effective negotiation with investors or developers. One of the reasons for this unsatisfactory situation in relation to local authorities and developers in the Czech Republic, Slovakia, Hungary and Poland is legislative environment of these countries and legislative tools that municipalities and local authorities have or rather they don't have available tools for effective negotiation with developers. The only tool at present by which consensus can be reached between municipalities and developers' regarding reimbursement of costs for technical infrastructure and public facilities associated with new construction is negotiation.

This has resulted in some negative aspects, such as, persuading investors to the realization of investments that often are not related to development activities. This often leads to attempts to influence municipal authorities in case of remission of additional investment and to corrupt practices. On the contrary, investors and developers are often pushed to absurd expenditure in case of disagreement with the requirements of municipalities (Nižňanský, 2013).

One possible solution offers the opportunity to draw inspiration from countries where the mentioned instruments are sufficiently developed. In Western European countries such as the Netherlands, Great Britain and Germany, the situation is vastly different. There are ongoing extensive discussions to individual developer's intention between local authorities and representatives of investors, which are governed by the nationwide rules. This concerns in particular the philosophy of a consensus in the rules towards to both negotiating parties succeeded as accurately as possible quantify external costs incurred in land as a result of realized investments.

Local politicians set the general rules how high developer contributions to infrastructure are expected to receive and officials shall be responsible for the negotiation with investors about these contributions. For example, in the Great Britain without the conclusion of a legally binding contract between the developer and the local authority investor does not get building permission, which obviously is not sufficiently effective mechanism to negotiate terms that are advantageous for the local authority. Thus, the negotiated conditions shall not apply to only to an investor who is committed to them, but it concerns to the land upon which the investment is realized. So if investor sells the land, the commitments remain valid also for the new owner. In case the investor tries to ask for some mitigation of obligations under the Contract with the local authority, the local authority may consider his request (Lepš, 2010). However, it is important to mention that there is also significant passivity on the side of developers in area for further development of the land (brought investments) where the activity is often postponed only to the municipality or to the network administrators.

In Slovakia is currently preparing forthcoming proposal of Act on charge for real estate development and amending and supplementing Act no. 583/2004 Coll. about financial rules of local governments and amending and supplementing certain laws, as amended, of which the proposer is The Union of Towns and Cities of Slovakia. This proposal is based on the concept of development fees (also exists e.g. in the UK and the Netherlands), which determines the participation of stake-holders in land development through the construction of technical and social infrastructure.

The creators of this proposal recommend implementing the issue of development fees into the law, instead of leaving the powers of this issue only in the negotiations between the municipality and the investor, despite the fact that this method is most often applied in other European countries. As reason for recommendation they referred the definition of clear rules for the main stakeholders: the municipality - the investor; acquisition of private resources for the execution of conditional and brought investment; and reduce corruption.

Development fees represent local taxes paid by investors, undertaking the construction of a particular object in the issuance of building permits. The fee is designed to cover capital costs due to investments related with a particular building, concerning the subsequent increased demand for services for which it is responsible government, therefore to build up, modernize or capacity expansion of local transport infra-structure, technical and social infrastructure. Within the structure of fees are distinguished the individual purposes, so that the payer knows how much of the total amount of paid fee applies for a particular purpose. By fees are charged housing and investment construction, with the general exceptions for: hospitals; religious buildings; construction of buildings associated with agriculture; expansion of industrial buildings with a floor area not exceeding 50% of the existing floor area (Nižňanský, 2013).

In the Czech Republic the existing instrument of Planning Agreement was introduced in "new" Construction Act (Act no. 183/2006) three years ago and allows to avoid mentioned problems. Planning agreement is a legally binding agreement about the participation of the applicant to build new or modifying old public infrastructure (Fibiger, 2009). Planning agreement closes municipality (or region) with the applicant for the purposes of implementation of regulatory plan. Current legislation allows in the zoning plan defining the areas for which is the processing and issuance of a regulatory plan is necessary condition for making decisions about changes in the land and at the same time condition of realization plan by entering into a planning agreement. So the developer can be force to land development in relation to the size of the planned project to build adequate public infrastructure of sufficient quality and in a reasonable period. There is no reason to believe that the planning agreement may only be used in case of lucrative sites where the developer is negotiating with municipalities and he is more willing to accept the conditions. Municipalities should use this planning instrument in all larger housing projects. It is necessary to avoid then a number of undesirable consequences of new construction, whether on physical, social and natural environment. Planning agreement may municipality enforce even without regulation plan within the process of zoning proceedings on the basis of § 88 of the Building Act, which says: "Building Authority interrupts zoning proceedings, except for reasons stated in the Administrative Regulations, also if the task puts such requirements for public transport and technical infrastructure that cannot be realized without the construction of new buildings and facilities or modifications of the existing, and also request the applicant to submit a planning agreement" (Macešková, 2009).

In Hungary, is not implemented any development fee to developers or investors. According to the Act LXXVIII of 1997 on the protection of the built environment, the municipality has the right to sign a contract with the owner of the future property. In competitive procedures could be established agreements in what proportion of costs will investor participate in the investment implications.

In Poland there are no specific fees for investors on sharing of costs from the investment construction, except fees from building permits and construction project. Owners should participate only in the costs of public infrastructure developed by local authorities. The public infrastructure fee is calculated on the basis of the increase in the value of a property due to the development of infrastructure and a percentage rate adopted by the city council (not to exceed 50%). The payment of the fee may be imposed by the city council within 3 years following the development of the infrastructure. The decision imposing the fee may be appealed against to the appeal committee and further to the administrative courts.

It is worth noting that the holders of the perpetual usufruct right do not participate in these costs. It is deemed that the perpetual usufruct fee covers the costs of public infrastructure (CMS Cameron McKenna, 2005).

Conclusion

The Visegrad model suffers from many infirmities such as lack of regulation in the form of spatial plans of zones; deficiencies in land cadastres; absence of cadastral information and publicly available information about market property prices; lack of economic instruments; weak planning system towards the protection of the public interest; lack of levers and rules which would allow local authorities to effectively negotiate with investors and the existence of a huge space for a backroom deals or even corrupt behaviour.

The aim, therefore, is to achieve a state in which local authorities would have been able to consistently quantify the external costs of the development project - the necessary investment to transportation, education and other services and to have effective tools to transfer these costs to the investor. Above mentioned principles are only the basics, which by per se cannot solve the existing problems. With legislative and other instruments is inseparably connected the level of political culture, the way of public discussion on planned development projects and land-use planning or methods to ensure the accountability of politicians and officials to the public.

Local Supporting Industry Linkages from Japanese FDI in Mexico's Western Region

Abstract

Foreign Direct Investment (FDI) may benefit host countries by creating linkages with local suppliers and facilitating the transfer of knowledge, technology and know-how from foreign to domestic firms with eventual productivity enhancements¹. Using a logistic model and unpublished data from Japanese firms in Mexico's Western Region, this paper analyses the degree and factors that determine the usage of local suppliers. Econometric results show certain factors that determine the degree of linkages² between Japanese multinationals and endogenous suppliers. Specifically, supplier quality and production capacity are determinant for linkages in the short-term³. Also, Japanese firms that were established prior to the Mexico-Japan Economic Partnership Agreement are more likely to use local suppliers both in the short-term and long-term⁴.

Introduction

FDI has grown in importance to developing economies since the 1980s. Between 1970 and 1999, according to data from UNCTAD (2014), FDI inflows to developing countries represented between 22% and 25% of total FDI inflows. However, from 2000 to 2009 the share was increased to almost 50% of total flows, and in 2012, FDI inflows were concentrated primarily in developing countries representing 58% of total FDI. This has been achieved due to the attractiveness of developing countries for long-term investment projects and their active policies to relax restrictions on foreign capital. Developing economies have pursued to attract FDI expecting in return economic development through export growth and through "spillovers" generally associated with FDI (Carkovic & Levine, 2002).

According to Reganati and Sica (2007), spillovers from FDI can be either to firms in the same industry (horizontal spillovers) or to firms in linked industries (vertical spillovers). Javorcik (2008) mentions that spillovers are expected to be larger in vertically related industries due to the fact that foreign firms have incentives to create linkages with local suppliers and facilitate the transfer of knowledge and technology. This in turn benefits the multinational company by cost reduction and improvement of suppliers' processes and product quality. In this sense, it becomes relevant to analyse linkage creation from FDI to local suppliers in developing countries.

The study is focused on Japanese FDI in Mexico due to the fact that both countries signed an Economic Partnership Agreement (EPA) in 2005, and increases in FDI inflows from Japan have been observed⁵. Also, the Mexico-Japan EPA has a section regarding bilateral cooperation where emphasis is placed on local supporting industry linkages and small and medium size suppliers for Japanese multinationals. The increases in Japanese FDI inflows to Mexico were expected to be a source of linkages to Mexican suppliers, which would improve their productivity and competitiveness. However, it seems that linkages between Japanese companies and local suppliers have been scarce due to a limited local supplier base with quality and technological restrictions that inhibit their entrance to Japanese production chains (Tokoro,

¹ This has been extensively reviewed in the FDI literature. For example, see Balasubramanyam, Salisu, and Sapsford (1996), and Javorcik (2004).

² These results are in accordance with previous studies in Mexico in different industries such as electronics (Padilla, 2008; Dussel, 1999; Rivera, 2002; Rivera y Regino, 2004), televisions (Carrillo, 2002) and automotive (Lara, García & Trujano, 2004; Peres, 1990).

³ Tokoro (2006) mentions that limitations in terms of quality and required technology in Mexico's supporting industry has affected the possibility of linkages with Japanese companies.

⁴ Theoretically, as mentioned by Javorcik (2008), supplier relations take time to develop, so new FDI projects are less likely of using local suppliers.

⁵ According to data from Mexico's Secretary of Economy, FDI inflows from Japan were 139 million dollars in 2003 and by 2012 the inflows were increased to 1,812 million dollars.

2006). In this study analysis is focused on Japanese companies established in Mexico's western region and in the main factors that contribute to the existence or lack of linkages with local suppliers.

The paper is organized as follows: the second section presents the main theoretical arguments regarding linkage creation between foreign companies and local suppliers and the main empirical findings for Mexico; the third section depicts the data used in the analysis and the empirical methodology applied in the study; the fourth section presents the results obtained; finally the fifth section ends with some concluding remarks.

Theoretical Background and Empirical Findings

According to Javorcik (2008), several factors determine the presence and intensity of backward linkages. First, foreign firms determine the degree of local input usage depending on the openness of the economy, local customs system and transport costs. A more open economy enables foreign firms to import inputs from other countries. Also, low transport costs and an efficient and certain customs system will increase the usage of foreign suppliers as well.

Another determinant is the employment of a centralized supplier system by the foreign firm. If this is the case, local firms will have limited opportunity to insert themselves in production chains since supplier usage decisions are made at headquarters. Rivera (2002) found this to be true for the case of the electronic industry in the city of Guadalajara, Mexico. Results showed that U.S. multinationals followed input buying agreements negotiated at the headquarter company; creating an international supplier network that eliminated the possibility to incorporate or develop local suppliers.

Also, the need for customized inputs will determine the degree of local supplier inputs. The extent of local supplier development and the need for technologically advanced inputs will also decide the amount of linkages with local firms. In this sense, Padilla (2008) found very little evidence of linkage creation between foreign firms and local suppliers for the electronic industry in the states of Baja California and Jalisco, Mexico. Linkages between foreign and domestic firms were confined primarily to indirect inputs with low technological content. Similar results were reported by Dussel (1999) and Rivera and Regino (2004) for the state of Jalisco. Carrillo (2002) also found limited linkages from foreign firms with local suppliers for the T.V. industry in Baja California, Mexico.

An important determinant for linkages is the time that the foreign firm has operated in the host country. New FDI projects are less likely to use local inputs since it takes time to create client-supplier relations. This was empirically confirmed for Japanese firms by Kiyota, Matsuura, Urata and Wei (2008) in East and Southeast Asia, where using local suppliers was positively related with the time of operation in the host country by the Japanese affiliate, especially in China. Similar results were found in Belderbos, Capanelli and Fukao (2001) for the case of 272 Japanese subsidiaries in 24 countries. Belderbos et al. (2001) also found that certain factors from the host country increase linkages with Japanese firms. For example, infrastructure quality and size of the component supporting industry were significant. Restrictive trade policies diminish linkages, while local content regulations create linkages but not with local suppliers. Also, the fact that Japanese multinationals have time established in the host country and have joint ventures with local companies with lower levels of Research & Development (R&D) contribute to more vertical linkages. These results seem to indicate that for Japanese multinationals, time is needed to build linkages with local suppliers. For the case of this analysis, it is important to point out that Japanese FDI flows to Mexico have sharply increased since 2010. From 2010 to 2011 Japanese FDI flows increased 67%, and from 2011 to 2012 the percentage increase was 93%. This might indicate that since investment projects from Japan are primarily recent they probably have not yet developed linkages with local suppliers.

Finally, even if a foreign firm uses suppliers in the host country, these might be of foreign origin as well. It is common for suppliers of parts and components to follow a multinational company in the countries where they establish. In this case, FDI flows stimulate linkages with supporting industries, but practically no benefit is observed with local suppliers. Belderbos et al. (2001) found that Japanese multinationals vertically linked in industrial groups (*keiretsu*⁶) acquire most of their inputs from Japanese suppliers from the same cluster in the host country, eliminating

⁶ The Keiretsu represents a group of companies with interlaced business relations and sometimes shared stock participation.

the possibility for linkages with local suppliers. For the case of Japanese firms in the automotive industry, Smith and Florida (1994) found that suppliers of parts and components used in Japan by a multinational or in other countries have a tendency to follow car assemblers to new investment locations. If this tendency is observed for Japanese firms in Mexico, limited linkages are to be expected with local suppliers⁷.

Data and Empirical Model

The data used in this analysis was taken from a survey applied in 2013 to a universe of 68 Japanese firms in Mexico's Western region⁸ by the "Mexico-Japan Studies Program" at the University of Guadalajara, Mexico. In total, 50 valid answers were obtained, resulting in a response rate of 74%. The firms surveyed were concentrated primarily in Aguascalientes (37% of total valid answers), and in manufacturing activities with 74% respectively.

The survey included a section regarding linkages with local suppliers. Descriptive statistics showed that Japanese firms in terms raw materials, inputs and components, use mainly other foreign suppliers (73%) than local suppliers (63%). This difference is increased in technologically advanced activities, where foreign suppliers are used by 55% of Japanese firms surveyed and local firms only by 8%. Question regarding obstacles to linkages with local firms and qualification of local and foreign suppliers were also included.

Since the variables obtained from the survey are ordinal or categorical in nature, a logistic regression model is proposed to estimate probabilities of short-term and long-term linkages with local suppliers given certain characteristics perceived of the local supplier base by Japanese multinationals. We expect certain characteristics from suppliers such as quality, just-in-time delivery and productive capacity to be significant in explaining vertical linkages with Japanese firms. Also, certain characteristics of the Japanese firm might influence the existence of linkages, for example, the time of operation in Mexico or the fact that Japanese firms follow a centralized supplier system determined at headquarters. Finally, the location might also determine the existence of linkages and is included as an additional variable. The logit model can be expressed as:

$$P(Y_i = 1|X_i) = \log[P(Y_i = 1)/1 - P(Y_i = 1)] = \alpha + \beta_i X_i + \varepsilon_i \quad (1)$$

Specifically, the model proposed is as follows:

$$Y_i = \alpha + \beta_1 Quality_i + \beta_2 Costs_i + \beta_3 TimeDelivery_i + \beta_4 Obstacles_{ij} + \beta_5 EPA_i + \beta_6 State_i + \varepsilon_i \quad (2)$$

Where:

Y = Binary response variable that takes the value of 1 if the Japanese firm i uses a local supplier in the production process and a value of 0 if it doesn't.

Quality = Perceived quality of local suppliers by Japanese firms surveyed, values are ordinal and range from 1 to 3, where 1 represents "good quality", 2 represents "regular quality" and 3 represents "bad quality". We expect significant results for values of good or regular quality since this seems to be a determinant factor for vertical linkage creation with local firms for Japanese firms.

Costs = Perceived qualification of costs for local suppliers by Japanese firms surveyed, values are ordinal where 1 represents "competitive costs", 2 represents "regular costs" and 3 represents "uncompetitive costs". Competitive or regular costs are expected to be determinant for linkages with local firms.

Time Delivery = Qualification of local suppliers in terms of in-time delivery by Japanese firms, values are ordinal where 1 represents "good in-time delivery", 2 represents "regular in-time delivery" and 3 represents "bad in-time delivery". Since most Japanese firms follow a Just-in-time delivery system, this variable is expected to reflect the impact of in-time delivery systems from local firms on vertical linkages with Japanese firms.

Obstacles = Several obstacles might limit the linkages with local firms. In particular, three are explored all with binary values. First, the obstacle "policies from headquarters" takes a value of 1 if Japanese firm follows a centralized supplier system decided at headquarters and a value of 0 otherwise. Second, the obstacle "lack of interest from local suppliers" takes a value of 1 if Japanese firms believe local suppliers don't show interest to be part of global

⁷ Limited linkages with local suppliers in the Mexican automotive industry have been reported by Lara, Garcia and Trujano (2004) and Peres (1990).

⁸ The states included in the survey were Aguascalientes, Guanajuato, Jalisco, Queretaro and San Luis Potosi.

production chains and 0 if they do. And finally, the obstacle of “production capacity” where 1 represents that local suppliers meet production capacity requirements and 0 that they don’t according to surveyed firms.

EPA = Binary variable that is equal to 1 if the firm was established in Mexico prior to the Mexico-EPA agreement (2005), value is equal to 0 if establishment was post EPA agreement. We expect that firms established before the Mexico-Japan EPA to be more likely to have vertical linkages with local suppliers since they have had more time to build supplier-client relations in the host country.

State = Categorical variable representing the state in Mexico where the firm is established. States included in the survey were Aguascalientes, Guanajuato, Jalisco, Queretaro and San Luis Potosi. This variable controls for state-level characteristics that might affect the vertical linkages with local firms.

An additional model is explored to estimate probabilities of linkages in the future. A specific question in the survey asked if local suppliers were planned in future production processes (within a year of the survey) with a binary response of 1 if the answer was “yes” and 0 if response was “no”. This variable was included as response variable in an additional model. Explanatory variables were same as mentioned in model (2)

Estimation Results

Results from short-term linkages from Japanese firms and local suppliers are presented in table 1. From the predictor variables, it is shown that quality is a determinant factor for linkages. When quality of local suppliers is considered regular, the odd-ratio is 14.97 times higher than when quality is bad in terms of using a local supplier. When good quality is achieved, the odds-ratio is 57.65 times higher in terms of using local suppliers in the production process. These results seem to support those mentioned by Tokoro (2006) for the case of Japanese firms, which consider that quality of the Mexican supplier base to be the main factor to explain the existence or lack of linkages with local firms.

Other variables that showed interesting results were production capacity and the arrival date of the Japanese firm. Results show that when local firms show a desirable level of production capacity, odds ratio is increased 19.78 times. Similarly, when a Japanese firm arrived prior to the EPA odds ratio of using local suppliers is increased 8.52 times. These results show the importance of local firms in achieving a productive capacity that meets with Japanese firms’ standards to be able to enter these production chains. Also, another factor of importance is the arrival date of the Japanese multinationals, where firms that arrived prior to the EPA are more likely to create linkages with local firms since they probably have had the opportunity to create supplier-client relations with local firms.

An additional model was estimated to search for long-term linkage factors between Japanese and local firms. Results are presented in table 2. In the estimation results, the EPA variable showed that Japanese firms that arrived prior to 2005 have an odd ratio 13.9 times higher to create linkages with local firms in the long-term. These results seem to corroborate the theoretical contribution from Javorcik (2008) and the empirical findings from Kiyota et al. (2008) and Belderbos et al. (2001) regarding time as an important factor that determines linkages between multinationals and local suppliers.

TABLE 1: ESTIMATION RESULTS (SHORT-TERM LINKAGES)

Predictor	β	$SE\beta$	z	p	e^β
Quality (good)	4.05	2.62	1.55	0.12	57.65

Conclusions

FDI and its effects on local economies have been widely debated without a clear consensus. Special attention has been focused on linkages that multinational firms may create with local suppliers, especially since it is argued that vertical linkages create the conditions for spillovers to occur. Using survey data from Japanese firms located in Mexico's western region, this paper analysed factors that determine the usage of local providers in the short and long-term.

Results showed that quality is a determinant factor for local input usage in the short-term. Specifically, when local firms transition from a bad to a regular quality, the odds of using local suppliers is 14.97 times larger for regular quality suppliers than for bad quality suppliers. When a supplier exhibits good quality, then the odds ratio is 57.65 times larger. Another determinant factor was production capacity, where local firms that exhibit an adequate production capacity have an odds ratio 19.78 times higher than firms that don't. Finally, time of arrival was also significant for short-term linkages with local firms. Japanese firms that arrived prior to the EPA agreement have odds 8.52 times higher of creating linkages with local suppliers.

In terms of long-term supplier usage, the time of arrival showed to be a determinant factor. Specifically, a firm that arrived prior to the EPA 13.9 times more likely to create linkages with local firms in the long term.

The results reported here show that quality is a determinant factor for vertical for linkages from Japanese firms with the local supporting industry in the short-term and support those reported by Tokoro (2006). Local governments must not only generate conditions necessary for local supplier development but local firms must also increase the quality of inputs to be able to enter Japanese production chains. Also, production capacity was significant for short-term linkages. Finally, the arrival year of Japanese firms, specifically firms that were established prior the EPA agreement increase probabilities of using local suppliers both in the short and long-term. These results confirm the theoretical contributions from Javorcik (2008), where time is a determinant factor for linkages with local suppliers, and support those results reported by Kiyota et al. (2008) and Belderbos et al. (2001) for the specific case of Japanese firms.

Towards A Stakeholder Model of Risk Governance

Abstract

Today's businesses face risks in intangible areas such as governance, ethics and reputation which prompt the establishment of a sound system of risk governance to sustain the company's survival. The success and failure of a company has direct and indirect impact on both shareholders and stakeholders. The stakeholder theory postulates that business can both create and destroy values for stakeholders. It has been advocated that the term CSR is redundant as the societal responsibility envisaged in it is already well-captured in the stakeholder theory. A new concept of CSR translates as Company's Stakeholder Responsibility which embraces the concept that all businesses despite size and wealth must consider stakeholders' interests and thus establish risk governance that transcends beyond shareholders' interests. Nevertheless, stakeholders other than the government generally lack the *locus standi* to monitor or enforce a company's risk governance despite being the ones most affected by its failure. This paper discusses the conceptual prospect of having a model of risk governance in Malaysia that facilitate stakeholders' interests and participation. The corporate governance in Malaysia is largely modelled on shareholder's primacy. Consequently, risk governance is predominantly concerned with the interests of the company and the shareholders. In aligning the interests of the company towards both shareholders and stakeholders, it is submitted that a stakeholder-oriented model of risk governance could serve the purpose based on two grounds; (1) shareholders are also stakeholders and (2) safeguarding stakeholders' interest through a sound system of risk governance resolves the question of how much attention a company should give to stakeholders as opposed to shareholders.

Introduction

The activities of the modern corporations have permeated all level of society bestowing opportunities for economic growth and subsequently raising the living standards in society. The stakeholder theory postulates that business can both create and destroy values for stakeholders (Freeman et al, 2010). All businesses create further business opportunity for suppliers, transporters, manufacturers and creditors. In turn, all these entrepreneurial activities provide gains in form of employment prospects, products and services for customers and the development of facilities and infrastructures that are mutually beneficial. At the same time, these activities can bring jeopardy in terms of health, safety and environmental risks that could threaten society for many years to come. Instances like the Bhopal plant disaster in India in 1984¹ and the Chernobyl nuclear disaster in Russia in 1986² highlight the grave impact of

¹ The disaster killed about 2,000 and injured more than 200,000 people, leading to numerous litigation processes in India and the United States. Peterson, M. J. (2009). ² The accident caused the deaths of 30 workers and radiation injuries to over a hundred others. Large areas surrounding Belarus, the Russian Federation and Ukraine were contaminated with radioactive materials and more

businesses that had poor risk governance. Risk governance is therefore an important aspect in corporate management and has become an accepted practice in most companies in Malaysia with risk management becoming the popular catchphrase of today's business environment. Although the concept of risk management encompasses all types of risks, its implementation has been mostly focused on shareholder's interest and business risks that could prejudice shareholders. This paper advocates the establishment of risk governance that addresses the interests of stakeholders as a means of safeguarding the corporate entity as well as its shareholders and stakeholders. This could be accomplished through a stakeholder-oriented approach that recognises the potential impact of corporate activities on the lives of the public and hence requires that corporations carry out their activities with regard to the well-being of these groups.

Definition of risk governance

Risk governance is normally discussed as a concept instead of a definition. Thus the International Risk Governance Council mention that better risk governance implies enabling societies to benefit from change while minimising the negative consequences of the associated risks.³ Risk governance focuses on applying the principles of sound corporate governance to the assessment and management of risks to ensure that risk-taking activities are aligned with an institution's capacity to absorb losses and its long-term viability.⁴ Risk governance consists of the process of identifying and managing risks in the form of internal controls. It is basically a mixture of governance, risk management and internal control integrated into a single management concept.

Intangible risk in the corporate sector

Businesses encounter risks which are less tangible than physical risk; the less tangible areas of business operation includes ethics and governance and the protection of corporate reputation.⁵ Companies face risk of litigation when shareholders and third parties suffer losses and harm due to commercial activities and these litigations can translate into liability risk and subsequently reputational risks regardless of whether the firm was in the wrong or not as media coverage can cause substantial doubt and damage. The bad publicity generated may last for a long time and will take much effort and costs to rectify as can be seen by the examples of lawsuits against Shell and Chevron for human rights violations in Nigeria (Millon, 2012). These types of risks can affect the long-term survival of a company and consequently the livelihood of numerous stakeholders who depend on the company for survival. It is thus imperative that companies allot sufficient attention to the management of these intangible risks through a robust and effective risk governance system that safeguard both the company and its shareholders while at the same time giving due recognition to the interests of stakeholders who might be affected.

The Stakeholder Theory

The agency theory highlights the main facet of today's corporation; the separation between ownership and management. This has led to questions on the role of management in making decisions for the company; whose interest should the management serve? For decades, it has been argued that companies should be run with the sole objective of maximising shareholders' wealth and that any decision that goes counter to shareholders' interests are bad and invalid decisions (Friedman, 1970). This was epitomised in the US case of *Dodge v. Ford Motor Co.* (170 N.W. 668 (1919)) where shareholders challenged the company's decision to use corporate funds to advance the interests of employees instead of paying dividends to shareholders. In upholding the shareholders' claim, the court declared that a company exists for the creation of its shareholders' wealth and thus the board must formulate its decision around this consideration. This decision seems to endorse the points made in the theory of the firm that shareholders being the residual claimant of a company's assets are entitled to expect that the company's activities are designed for their well-being.

On the other hand, some scholars have criticised this view and emphasises the position of stakeholders who are affected by corporate decisions and have a stake in a company's success or failure. These stakeholders have legitimate interests in a company's activities and hence should not be left out of management's deliberation when making decision. Dodd (1932) observed that although companies are required to pursue profit for their shareholders, it does not preclude management from considering social responsibility that may serve the company's benefit in the long term. He proclaimed that "Business - which is the economic organization of society -is private property only in a qualified sense, and society may properly demand that it be carried on in such a way as to safeguard the interests of those who deal with it either as employees or consumers even if the proprietary rights of its owners are thereby curtailed."

Freeman further promoted the stakeholder theory with his idea that stakeholders are an integral part of a business and should be included in a firm's strategic decision-making process (Freeman and Reed, 1983). The idea centred on the concept that stakeholders have a stake in the activities of a firm and thus their input should be solicited before the firm embarks upon an enterprise that may either positively or negatively affect the stakeholders' interests. Stakeholder theory is primarily rooted in moral theory as it underlines the obligations of businesses towards their stakeholders (Freeman et al, (2010). This can be translated as a moral rather than legal obligation and is premised upon the voluntary effort of a firm's management to include stakeholders in their spheres of consideration.

The view taken by stakeholder's theorists naturally collided with the opposite view exhibited by those who champion the shareholder's primacy theory (Berle, 1931, Goodpaster, 1991). The latter criticised the former as being unrealistic for its inability to foremost determine the definition and scope of the populace who qualifies as stakeholders and the difficulty of ascertaining and resolving the competing interests of various different stakeholders. The tension created between the two viewpoints reached a kind of apex with the publication of an article by Hansmann and Kraakman in 2001 which was provokingly titled "The End of History for Corporate Law". The article posited that worldwide recognition of shareholder primacy has led to its acceptance as the foundation for corporate function and thus rendered other competing hypothesis as superfluous. Rotman (2011) however contended that the Enron and WorldCom mishap which took place within months of the article's publication had irrefutably rejected the idea of shareholder primacy as the superior theory in corporate law by showing the disastrous result of concentrating on maximising short-term shareholder values that was engineered by management in both companies. Enron and other corporate calamities that ensued in the following years were often quoted as examples of corporate governance issues that were related to the pursuit of short-term strategies aligned with shareholders' short-term interest in seeing share prices soar. This led to some unreasonable and excessive risk-taking that appeared successful in the short-term but proved to be disastrous in the long run and had distressed more than the shareholders. In other words, stakeholders suffered in the quest for shareholders' interests. This led to doubts on the shareholder primacy concept and renewed the search for a better alternative with stakeholder theory being one of its main contenders. This paper nevertheless recognises that there are merits to the arguments propositioned by both opposing sides to the debate and does not attempt to resolve the issue.

Instead this paper will discuss the possibility of using some elements from the stakeholder theory to devise ways to strengthen stakeholders' interests in the face of potential risks generated by corporate activities.

Despite its promise, stakeholder theory is subject to some difficulties that may detract from its potential. The wide class of population that can be categorised as a stakeholder results in a huge and confusing pool of individuals who do not stand on equal footing and may have contradictory interests to one and another. This would cause considerable difficulty to managers and may dissuade them from pursuing a stakeholder-oriented policy. The multiplicity of constituencies to consider may also result in directors being less accountable as there would be no identifiable yardstick to determine how directors have performed their duties (Hampel Committee, 1998). In the event the company favours a particular class of stakeholders, the opposing side may turn hostile and create more problems for the company. Secondly, the law and the courts are not capable of dealing with stakeholder theory as legal decision is an exercise in making choices of winners between competing parties where *rights* will always prevail over *interests*. The wording of stakeholder in terms of interests rather than rights constitutes ambiguity and uncertainty on how to treat these constituencies and hence will impede stakeholder's claims in court. (Vasudev, 2011) Within the current legal regime, only creditors and employees have clear established rights that may hold sway in corporate purpose. Although the law can protect other stakeholders such as customers and suppliers through contracts, torts and consumer law, these are in the form of remedial measures and do not incur a legal obligation on the part of the company to consider them in decision-making. Consequently, the legal position of stakeholders is relatively weak and it is rare for stakeholders to triumph in a legal battle with businesses.

The law in Malaysia have generally not accorded recognition of stakeholders' interests as part of a company's management priority. Section 132(1) of the Companies Act 1965 states that "A director of a company shall at all times exercise his powers for a proper purpose and in good faith in the best interest of the company." The best interest of the company has been understood to mean the collective interest of the company's shareholders. Courts have generally adopted the common law principle enunciated in *Greenhalgh v Aderne Cinemas Ltd* ([1951] Ch 286) which interpreted the term 'in the best interest of the company' as something that cannot be considered in isolation from the interests of a company's shareholders. In their review of the Companies Act, the Corporate Law Reform Committee (CLRC) reiterated that the shareholders theory is the law where directors' duty and accountability are concerned. Although the CLRC espoused the idea that a company should cultivate a good relationship with its stakeholders, it was of the view that a company's social obligations should not be included in the Companies Act. The law nevertheless gives an implicit acknowledgement of stakeholders' interests through the use of the business judgment rule as justification or defence for management decision that favours stakeholders over shareholders. Under the business judgment rule, courts would not interfere with the business decision of a company's board as long as it is made in good faith and for the interest of the company. A company may thus justify consideration of a stakeholder's interest such as an employee, as being in the interest of the company.

Stakeholder theory and CSR

Stakeholder theory has often been associated with Corporate Social Responsibility (CSR) as justification for the call that companies concern themselves with social issues and accountability to the general public. CSR is however, mostly concerned about the social impact of corporate activities and tends to treat business and social responsibility as a separate concept in contrast to the stakeholder theory which is founded on an integration of business and societal concerns. As can be observed in many company's annual report, most companies view CSR as an add-on value that demonstrate the company's civic awareness and helps to enhance the company's image and generate free publicity. CSR is rarely shown to be a genuine engagement with stakeholders but more of a charitable and recreational exercise that allows a company to assuage stakeholders' concern and indirectly promote the company's business (Barraclough & Morrow, 2008). Freeman himself has expressed a sense of unease with the perception that CSR is an enhancement tool that companies should have for an added value (Elms et al, 2011). It has thus been advocated that the term CSR is now redundant as the stakeholder theory has already captured the societal responsibility envisioned in it (Freeman & Moutchnik, 2013). Instead a new proposed concept of CSR is labelled as 'Company's Stakeholder Responsibility'

and embraces the notion of a company's responsibility to stakeholders in a wider sense and focusing on all companies irrespective of size and wealth.

Elements of CSR can nonetheless be seen in the Malaysian corporate governance code which encourages companies to consider the interests of stakeholders.⁶ The code itself defined corporate governance as "The process and structure used to direct and manage the business and affairs of the company towards enhancing business prosperity and corporate accountability with the ultimate objective of realising long-term shareholder value, *whilst taking into account the interests of other stakeholders*"⁷ [emphasis added]. Consequently, the corporate landscape in Malaysia is shaped by shareholders' primacy along with a moral obligation to consider stakeholders' interest albeit in a manner that is skewed toward CSR than a genuine engagement with stakeholders.

The approach towards risk governance in Malaysia

Risk governance in Malaysia is regulated by the Malaysian Code on Corporate Governance 2012 through a 'comply or explain' approach similar to the one employed in the United Kingdom. All companies are expected to apply the recommendations contained in the code. Listed companies are required to report the state of their risk management and internal control system in their annual reports. On the other hand, unlisted public companies are mandated to set up an internal control system under section 167A of the Companies Act 1965. Although the section does not mention anything about risk management, the concept of risk governance can be implied from the setting up of internal control. There are also other legislation which do not use the term risk management but nonetheless prescribes businesses to assess risk and provide preventive measures such as the Occupational Safety and Health Act 1994, the Petroleum (Safety Measures) Act 1984 and the Atomic Energy Licensing (Basic Safety Radiation Protection) Regulations 2010 to name a few. These legislations address specific risk issues in a particular industry and are generally aimed at the protection of workers and consumers. Consequently, there is a mix of legislation and self-regulation in the regulation of risk governance in Malaysia.

The approach to risk governance in the Companies Act 1965 and the corporate governance code is geared towards shareholders interests where risk management and internal control are conceived as mechanisms to protect the company in the interests of shareholders and investors. Principle 6 of the Malaysian Code on Corporate Governance 2012 states that "The board should determine the company's level of risk tolerance and actively identify, assess and monitor key business risks *to safeguard shareholders' investments* and the company's assets" [emphasis added].⁸ A similar provision could be found in the previous versions of the code.⁹ Some references to stakeholders could be seen in the code's proposition that a company's strategies should include attention to sustainability which comprised of environmental, social and governance aspects that needed to be balanced with the interest of various stakeholders.¹⁰ The company is advocated to disclose the policies adopted and their implementation in the company's annual report and corporate website. Although the code encourages communication with both shareholders and stakeholders, more focus is given on the views and feedbacks from shareholders. Overall, the basis of risk governance is on the survival and continuity of the company which indubitably champion shareholders' cause and indirectly contribute to stakeholders' interest as the quest for the long-term survival of the business is a goal common to all stakeholders (Speckbacher & Wentges, 2009) but this may not necessarily favour stakeholders.

Risk governance in Malaysia is mainly effected through disclosure and self-reporting. Companies are required to report their risk management and internal control practices in their annual reports. Although guidance is

⁹ The initial corporate governance code of 2000 provided that a company should have a sound system of internal control to safeguard shareholders' investment and that the system should include financial, operational and compliance controls as well as risk management as these are areas of potential threats to shareholders' investment; Malaysian Code on Corporate Governance 2000 at page 20

¹⁰ Recommendation 1.4 and its commentary, Malaysian Code on Corporate Governance 2012 at page 1-3

available on the format and content of the report, companies are generally at a liberty to determine what to include in their report. It has been observed that some company's report simply gloss over the information relating to their risk governance practices while some companies employ technical terms and intricate jargons. While investors may not find the latter difficult to comprehend, stakeholders might encounter some problem in understanding them and subsequently failed to grasp the crux of the information. Companies have also not been forthcoming about information relating to CSR and other stakeholder-related issues. Most reports depict welfare and charitable causes and social activities within the community. Although there are references to safety and health and the environment, these are cursory statements that are devoid of specific details and mostly reaffirm the company's legal obligations. Most reports also do not specify the actual and potential risks represented by the company's activities. Reading these reports, stakeholders would not find much to alert them on the potential risks from the company's activities.

A Stakeholder-based model of risk governance

There are two kinds of risk failure events contemplated in this paper. The first is where a company suffers financial difficulties and the second is where a company's activities caused losses or harm to a third party. Both situations would occur as a direct or indirect result of risk governance failure and in both situations, stakeholders including shareholders will bear some of the loss or harm. Consequently, a stakeholder-based risk governance approach attempts to protect the interests of the relevant stakeholders through mutual participation by the company and its stakeholders.

Why risk governance must consider stakeholders

It is not disputed that shareholders are potential victims of risk governance failures; if companies suffer financial losses, shareholders will certainly share the losses. Nevertheless, a shareholder's loss is limited to financial losses and most shareholders have diversified investment portfolios so that the loss in one company may be off-set by the profits in another company (Bodnaruk et al, 2008). The situation is different for some stakeholders. An employee for instance, is committed to a single employer and cannot easily off-set the damages caused by the loss of employment with another job. The employee might have invested in special skills and knowledge that are specific to that particular employer and thus cannot obtain a similar opportunity elsewhere. Some businesses may be the driving force of economic development in a particular region or locality. If such businesses fail, suppliers and independent contractors may also suffer financial losses and collapse resulting in more loss of employment and consequently weakening consumer buying power which will ultimately weaken the region's economy. Shareholders can also cut their losses by selling their shares in the company when they are unhappy or not satisfied with the company's decisions. On the other hand, stakeholders cannot easily choose to disassociate themselves from the company's activities and its impact. Furthermore, stakeholders may have implicit claims on the firm that should be honoured after explicit claims have been met (Speckbacher & Wentges, 2009). For instance, training and further education opportunities for employees and charitable donations and welfare programs for the community may be withdrawn or reduced in order to compensate for earnings loss or to meet external claims on the firm or simply to increase profits.

More importantly, a shareholder's loss is confined to financial losses while stakeholders may suffer more than financial difficulties when risks are not properly managed. Employees may be injured by poor safety measures; consumers may be harmed by unsafe products or services and the surrounding community may be exposed to hazardous substances emitted by a company's factory. This threat to the stakeholders could be more damaging than the financial losses suffered by shareholders. For instance, the displacement of several indigenous native villages in Sarawak, Malaysia for the construction of the Bakun Dam project¹¹ and the evacuation of residents in Seveso, Italy following the dioxin contamination at the ICMESA chemical plant in 1976 (Centemeri, 2009). In addition, stakeholders bear some of the financial losses suffered by companies when government orchestrate bailouts with taxpayers' money usually on the pretext of protecting stakeholders such as employees, creditors and the economy. Such bailouts divert funds that could have been used for socio-economic projects that helps the public and it is done without the consent and blessing of the taxpayers. It goes against all principles of morality that a company should be

¹¹ At <http://indigenouspeoplesissues.com/> accessed on 22 May 2014

allowed to structure its activities for the good of the shareholders alone but is entitled to public money in the name of safeguarding stakeholders' interests when it runs into trouble. It could thus be argued that stakeholders have a greater stake than shareholders in the well-being of a business.

The opposing interests of competing stakeholders

In practice, the attention to stakeholders' interest must of necessity be limited; there is simply no way for management to identify all stakeholders and consider the interests represented by each and every one of them. The company may attempt to communicate with all of them and offer to hear their views but it would be absurd to expect a company to be able to satisfy everyone especially when there are competing interests. Examples of competing interests can be seen when a business has decided to relocate its operation to third world countries for cheaper costs; it has clearly benefited shareholders, customers and probably creditors by selling goods at cheaper price and thus increasing sales and profit but it had also resulted in harm by causing the closing of factories in the host country that led to unemployment and loss of business to suppliers and contractors which in turn created socio-economic problems to the surrounding community that depended upon the business. In this situation, the stakeholder theory could be either the supporting or opposing philosophy as both approaches favour the interests of some group of stakeholders over another. The conflicting needs and interests of different stakeholders may also burden companies that are genuinely interested in doing the right thing. Unfortunately, doing the right and responsible thing involve costs and stakeholders might not be willing to bear the costs. For instance, producing eco-friendly goods require new technology and materials that may be more costly to consumers. If only a small group of consumers are willing to pay the price for protecting the environment, the business would lose its customers and profits and subsequently close down (Minoja, 2012). In this situation, a few stakeholders (customers, environmental activists, the environment) would win but more stakeholders (employees, suppliers, contractors, the community) would suffer the consequences. There is thus a need to balance the interests of these competing stakeholders in a practical and realistic way. This paper concedes that this is not an easy task and that this requires further research. Therefore this paper focuses on only one part of the problem that is the competing interests in risk management determination.

Stakeholders' engagement is important to determine the level and extent of a company's attention to risk governance issues. For a start, stakeholders must be willing to accept a 'loss some, gain some' situation as any decision taken by a company would result in some winners and some losers. Thus the issue relates to what and who to sacrifice and whether that constituent is willing to be sacrificed. For example, Minoja (2012) recounted the decision of an Italian firm Sabaf to reject the prospect of a contract with a customer who was not willing to bear the costs of installing safety features in gas ovens to be sold to consumers in Brazil. It instead focused on consumers in Europe and elsewhere who were willing to pay a higher price for safe and environmentally-friendly products. By advancing the interest of some stakeholders i.e. the safety and environmentally conscious and better-off consumers, Sabaf has rejected the need of another stakeholder i.e. the underprivileged section of the community. This illustrates the reality of choosing between competing interests where a company must determine which stakeholders and interests to prioritise and which to pass over. It must however be noted that where a company's decision involves the risk of harm to others, there might not really be much of a choice despite the costs and business opportunities to be sacrificed. For instance, contractors cannot use low-quality materials to construct a building if the materials are known to be unsafe even when the choice of using better materials would incur more costs. In such a situation, the interest of safety must prevail over other interests and guide the company's decision.

Risk governance may be able to address the problem of who is a stakeholder by identifying and assessing stakeholders according to the scope and level of risks posed to each and by prioritising preventive measures based on this assessment. The exclusion of certain class of stakeholder can be readily justified by the risk assessment process and thus lessen the possibility of hostile reaction. The definition of stakeholder in risk governance derives from the second part of Freeman's definition – those who are affected by a firm's activities. This definition of stakeholder implies references to risk governance as stakeholders can be affected by many of the firm's activities such as safety risks to workers and unsafe products used by consumers. The process of risk management allows identification of stakeholders according to the situation and relevancy and thus resolves the problem of who is a stakeholder for that purpose. This would be the second group of stakeholders in Freeman's definition; those who are not necessarily part of the value-chain of the business but can be harmed by the firm's activities and therefore the firm owes a moral

obligation to safeguard them from foreseeable harm. This definition of stakeholders does not encompass society as a whole arbitrarily; society may be a stakeholder but only in a limited and identified manner. Hence, if a business activity releases noxious substances that seep into soils and water that is used by the public, society inevitably becomes a stakeholder by default but otherwise stakeholders are those individually identified by the risk management process. The identification of stakeholder is thus according to the risk identified which would allow the prioritisation of stakeholders and the resolution of competing interests.

Legal constraint faced by stakeholders

While shareholders may bring up their grievances in the company's meetings, stakeholders technically have no avenue to do so except through complaints and public demonstration. Among the group of stakeholders, the government is the only one who can take action to compel companies to manage their risks through legislative schemes or regulatory action. The only exception is when a particular stakeholder suffers loss or injury from corporate activities and sues under negligence or nuisance but this is purely a corrective post-action rather than a preventive one. Stakeholders also have no access to corporate information that can impact their interests as some company's reports are not available to the public.¹² Businesses also tend to favour communication with customers only which is targeted for profit enhancing objectives (Spitzeck & Hansen, 2010). Consequently, stakeholders might not even be aware of the potential threats posed by a company's activities and hence failed to take the necessary precautions that could have safeguarded their interests. Stakeholders' engagement in Malaysia can be considered to be at its infancy; members of the public are generally unaware of corporate activities and their impact unless disaster strikes and media coverage amplify the event and its consequences such as the recent disappearance of the MH370 flight and the collapse of bridges and buildings around the country. But such news are usually forgotten soon and whatever protests or dissatisfaction that were raised would also be soon forgotten. It is usually NGOs who continue to pursue social and public-interest issues but their activities are generally limited to members only and their views only sought when some tragedy occurs. Consequently, businesses are able to operate with minimal interruption from the public. Matters are aggravated by the large presence of cheap foreign labours that are usually the ones involved in the work operation and are the ones who affect and become affected by the activities carried out by the business. This under-privileged group is unlikely to be too concerned about risk governance issues and would be justifiably hesitant to report risk-laden practices by their employers. Consequently, stakeholders are vulnerable to the possibility of harm by corporate activities that poorly or irresponsibly managed its risks.

It is neither reasonable nor prudent to expect that shareholders shoulder the task of safeguarding stakeholders' interests even if those interests might coincide with shareholders' interest. Shareholders might not be interested in information that has no direct bearing to their investment and hence ignore corporate information that relates to stakeholders interests. Hence, there must be some kind of avenue which allows stakeholders to safeguard their interests and risk governance can conceivably fulfil some of this need.

Stakeholder participation in risk governance

A stakeholder model of risk governance attempts to address the gap in the current regulation that places a heavy reliance on shareholders' interest and on business and financial risks to the extent that companies appear to unconsciously neglect the interests of stakeholders. This model envisions the role of stakeholders in risk governance considerations through participation in decision-making and risk preventive mechanisms. Public participation is especially important where the business activities involved innovation and scientific technology as most members of the public are unable to comprehend the terms and concepts used and hence are not able to gauge the potential impact of those activities on their interests (Marchi, 2003). Inviting stakeholders' participation would likely persuade stakeholders to co-operate with the company and subsequently offer assistance in the event of an adverse event (Ahrens & Rudolph, 2006). This consultation-like meeting should be made obligatory but the mode and frequency of the meeting left to the discretion of the company. The mode of participation can be both formal and informal depending on the type of audience. The objective would be to allow stakeholders to know about the potential risks of the

¹² The annual reports of public listed companies are available on the Bursa Malaysia website but those of public unlisted companies can only be accessed through the Companies Commission with the payment of considerable fees

company's activities and the precautions taken to prevent the risks from materialising. This affords stakeholders with the opportunity to voice their concerns and make their views known to the company. It does not advocate that stakeholders have a right to interfere in a company's decision-making process. Instead stakeholders would occupy a similar position to shareholders whereby their views may be put forward to the company for deliberation but the company's board would still retain its authority to make the final decision. Although companies are not compelled to abide by the stakeholders' view or demand, there is an implied obligation on part of management to satisfy at least some of the demand in order to maintain the company's image and to maintain the support from stakeholders. In return, a company gains a chance to elicit information that could assist in its decision-making and enhance its operations. Many man-made disasters have been attributed to the failure of identifying risks or assessing the magnitude of the risks (Gibson, 2010) and one reason for this is the lack of information available. It is thus in the company's interest to acquire information from stakeholders that might impact its risk governance decisions. Another obvious benefit to this is that companies and stakeholders can interact in a non-hostile environment and therefore prevent unnecessary altercation that could prove costly to both parties. A company might also be persuaded to enter into stakeholders' engagement voluntarily in an attempt to prevent a move by the government to introduce legislation or more prescriptive regulations to compel better risk governance practices in the corporate sector.

A possible drawback to this suggestion is the determination of the relevant stakeholders to participate in the meeting. The company might unintentionally overlook certain stakeholders whose views and positions are important to the decision-making. This would not only result in an imperfect decision-making but would also generate unwarranted hostility from the overlooked constituent and alienate them. On the other hand, the participation of too many stakeholders might dilute the engagement process and create unnecessary conflict between the company and the stakeholders. It is therefore important for the company to realistically conduct its risk assessment process in order to identify the relevant stakeholders affected by those risks. This would necessitate the establishment of a sound risk management system in line with the requirement in the corporate governance code. The company must also be clear and consistent on its policy and philosophy for dealing with stakeholders' interest to avoid cases of misrepresentation or misunderstanding that could negatively affect the company-stakeholders relationship.

Stakeholders' participation in risk governance can also equip them with the necessary knowledge and information to safeguard themselves from threats emanating from the company's activities. This is important in two ways; firstly, a company's business may be so vital to the country that despite the risks that stemmed from its activities, its continued operation cannot be hindered. Secondly, every individual is to a certain extent, responsible for his/her own well-being and hence must take the necessary precautions to protect him/herself. An individual should not be permitted to wholly put the blame on others, in this case the company, if he/she had not taken some form of precautions. This is contrary to the notion of justice and self-determination (Ryan & Deci, 2000). For example, in *Froom v Butcher* ([1976] 1 QB 286), a passenger who was injured by the reckless driving of the driver was considered to be contributorily negligent by his failure to wear a seat belt. He had the duty to safeguard himself by taking the practical and legally mandated precaution of wearing a seat belt and cannot fully blame the driver for his injuries although this does not absolve the driver from his negligence. In the same way all individual have the duty to protect himself from foreseeable harm by taking reasonable precautions. In order to do so, information is important so that the particular individual is able to comprehend the risks that he/she face and subsequently, ascertain the safety measures to be adopted. This can only be accomplished through the dissemination of relevant information from companies to stakeholders (Ahrens & Rudolph, 2006). This can be made possible through communications in the corporate website, the company's annual report and brochures. The company could also pursue a more aggressive strategy through dialogue with stakeholders, organising seminars and talk, awareness campaign and having a demonstration on safety measures and emergency procedures. The company could also demonstrate its goodwill by organising site visits to its work premises to provide assurance to stakeholders that its risk governance practices are reasonably adequate to deal with any potential threats. This kind of concession would not only convey the company's commitment to good risk governance and enhance its reputation but also avert unnecessary confrontation with ill-informed persons.

Keeping in mind the absence of a legal authority to expound the notion that a company's management should consider the interest of non-shareholders, it would require legislative initiative to compel companies to contemplate stakeholders' interest in their decision-making. The industry has already indicated its preference for non-legal

measures in regulating businesses as evidenced by the adoption of the 'comply or explain' approach in the corporate governance code which was led and supported by the private sector. CLRC had also decided to not legislate on company-stakeholder relations in their review of the Companies Act 1965. Consequently, it is submitted that a non-prescriptive approach such as the one advocated in the corporate governance code would be more suitable and practical. Freeman et al (2010) insists that the stakeholder theory can be employed without changing the law and it has often been expounded that soft law might achieve better results than a rigid 'command and control' approach in soliciting compliance from businesses (Ribstein, 2002). Accordingly, this model of risk governance should adopt a non-prescriptive approach that encourages companies to voluntarily structure their risk governance to accommodate stakeholders' interests. It is felt that such an approach would elicit a better reception than a prescriptive one as it offers flexibility to companies to work out the strategies that would best serve their interest. It also provides continuity with the current regulation that is based on the 'comply or explain' approach. The obvious benefit to this approach is that companies and stakeholders can interact in a non-hostile environment and therefore prevent unnecessary altercation that could prove costly to both parties. The company also gains an additional benefit through the boost to its reputation when it voluntarily solicits stakeholder's participation and translates them into company's policy or decisions. In the event the initiative failed to achieve its target, compulsory regulation can later be introduced as an alternative. As companies have more to gain from voluntary stakeholders' engagement, it can be predicted that the corporate sector would be less likely to oppose this suggestion and may be persuaded to comply.

Conclusion

Risk governance is an important part of the management of a business. The consequences of a risk governance failure have been magnified through the scores of man-made disasters throughout the years whether in the form of financial catastrophes, human casualties or environmental calamities. In all cases, there are victims who suffer direct or indirect harm. In most situations, these stakeholders were never accorded the choice to accept or reject the risks and are powerless to avoid the harm that ensued when those risks materialised. It is therefore important that stakeholders be given a say in something that gravely affects them so that they may exercise some kind of autonomy and devise ways to safeguard their interests. A stakeholder-based model of risk governance can help to achieve this objective by giving stakeholders the opportunity to participate in the decision-making process of a company's risk governance exercise. In order to do so, the corporate governance code would need to be amended to incorporate stakeholder consideration and participation in a company's risk governance determination through best practices and recommendations in the code. These provisions should be able to steer companies into making a serious effort to take into account the interests of stakeholders when they evaluate the risk profile of activities within the company. Companies should disclose their strategies to identify stakeholders that may be affected by their activities and their efforts to deal with those risks. Although risks to stakeholders might never be fully avoided, it would allow a better possibility to prevent the risks from materialising and mitigate the impact on the stakeholders concerned.

International Trade and Entrepreneurship – Why Germany is so overwhelming among EU-27-countries?

Abstract

Clustered Multinational Corporations (MNCs) own elements of trustified capitalism in terms of Joseph Schumpeter. MNCs invest heavily in global R&D and marketing, and they signal market power in the markets and countervailing power in politics as John Kenneth Galbraith noticed. Because MNCs dominate the global commodity markets, they can collectively determine the rules of the game in the global economic evolution or revolution. The dilemma in most EU-27-countries is that they have not been able to develop their own management doctrines. They apply the U.S. Harvard-Chicago Industrial Organization (IO) model without critics. The most influential writer has been Michael Porter. His models of competitive strategy or national diamonds, clusters are far too trivial to be applicable in EU-27-countries that have a long history as the civilized nations compared with the U.S. Germany is an exception. Germany and the German speaking Europe has their own management doctrine initiated by Friedrich List and modified by Joseph Schumpeter. List argued that economic policy had to be adapted to the needs of specific nations to create the National System of Innovation for Germany. Schumpeter gave micro level advices of economic incentives for entrepreneurs. The third economic miracle (Wirtschaftswunder) in Germany since 1990s is a combination of List's and Schumpeter's thinking. Germany's global success recipe is more useful for EU-27-countries than Harvard-Chicago IO model.

Keywords: Entrepreneurship, Multinational Corporations (MNCs), Innovation, International Trade, Hidden Champions (HCs)

Introduction

The key concept propagating openness in international trade is comparative advantage (Ricardo, 1817), which can be found in the accumulation of the factors, where the nation has the most favourable comparative costs. Since the mid 1990s, when the WTO was established, the industrialized countries oriented towards absolute advantage (Smith, 1776). An indicator of that is the rapid adoption of Porter's (1990) cluster model in the EU countries. The term diamond refers to that fact that the home country of the cluster is permanent. Porter's cluster hypothesis is not unique. Regional agglomeration is the central topics in the New Economic Geography (Krugman, 1991). Porter believes that localization economies, not urbanization economies, draw on information flows. Being near competitors suppliers, a firm enhances its knowledge of industry operations.

Porter's approach for clustering is relevant to the U.S. in which most companies are domestic-market-oriented. German companies are international. Transnationality Index (share of foreign operations in sales, personnel and assets) is for ABB and Linde over 85% and for famous U.S. companies much lower: General Electric 52% or General Motors 48%. In the U.S. only some SMEs are internationalized, e.g. Gibson Guitars and Harley Davidson (Schuman and Himmelreich, 2011). In Germany there are about 340.000 international SMEs (Mittelstand) and about 100.000 of them have FDI-operations (Venohr and Meyer, 2007). They are architects of German regional clusters by bottom-up-approach. Even Canada is far more international than the U.S. (Rugman, 1991). Canadian companies are integrated with the U.S. and, the home-market-based clustering is not valid.

Clusters are far from being permanent. Substituting labor with capital and technology, along with shifting production to lower-cost regions has resulted in waves of firm downsizing throughout the EU and the US. The impact of relocation of industrial activities out of the home-base is called Wintelism (Hart & Kim, 2002). The critical skills of industrial districts (Marshall, 1920) become commodities, and multinational corporations (MNCs) relocate their production units globally. Germany is an exception among the EU countries. Germany's national system of innovation is a major competitive advantage. The geographical proximity seems to matter in 16 Länder. The Chinese "Dragon" and the Indian "Tiger" are crossing many EU-companies except German ones. Vehicles, machines, electronic devices and chemicals account for more than half of Germany's exports. Germany is dependent on import energy. Germany's trade balance is negative with oil and gas importers. Holland is the petroleum center of Europe. The former East

Europe is important for Germany as a part of subcontracting systems e.g. in the auto industry. Germany has about 100 billion export surplus with ten biggest trade partners that are the most serious competitors in international trade (Table 1). Germany has succeeded to win its best or worst competitors. This is a convincing evidence of the export power of Germany as the most diversified economy in the world. Germany is competing with top product quality and process efficiency, e.g. the high energy efficiency of industrial firms and traffic infrastructure. In relation to high efficiency German labor costs are low although German competitiveness cannot be identified in low wages. Hans-Werner Sinn is deeply concerned by the inability and unwillingness of most politicians to look at basic economic issues, face up to economic realities and translate them into the right policies (Sinn, 2012). Germany is highly dependent on the EU economy. The growing performance gap between Germany and big EU-countries, such as France and Italy e.g. in the car industry might have political consequences and even jeopardize the future of the European integration.

In WTO Doha trade negotiations Germany has been actively working for eliminations of non-tariff barriers that mean 5-10% extra costs (relation to the trade value) for partners of international trade¹. Germany is not yet a fully open global player. Germany has still its "protected islands" e.g. in the banking and finance sector. Germany promotes sustainable development, healthcare and consumer protection. Germany's competitive edges are openness, predictability, and fair legislation. Germany pushes forward trade negotiations between the EU and Asian and South American nations to make market entries for companies easier. Over 5,000 foreign companies operate in Germany and employ over 3 million persons. In 2007-2011 there were 3.535 FDI-projects by 3,000 foreign companies in

¹<http://www.bmwi.de/DE/Themen/Aussenwirtschaft/handelspolitik-eu-wto.html>

Germany. Most of FDI operations established service units, only few production units, in 39 various sectors in Germany².

The German success recipe I – National System of Innovation

Friedrich List (1841) argued that economic policy has to be adapted to the needs of specific nations. He was a member of the German historical school of economics. His main concept is National System. List argued that a nation's true wealth is its productive power, rather than its current exchange values. During his carrier, List advised Germany and the U.S. to develop education, railways and technology. Contrary to Smith (1776), List argued that private economic interests must be subordinated to the strengthening of the nation. List's ideas have been the basis for three economic miracles (Wirtschaftswunder) in Germany: (1) Zollverein 1834–1919, (2) West German from the 1950s to the 1960s and (3) globalization of Germany since 1990s, and for the completion of the vision of European economic integration by Bundeskanzler Konrad Adenauer (1949-1963).

Joseph Schumpeter (Lintunen, 2000) was a well-known member of the German historical school of economics. He modernized List's doctrine as the Harvard professor. He proposed that an entrepreneur, as innovator, creates profit opportunities. An entrepreneurial discovery occurs, when an entrepreneur makes the conjecture that a set of resources is not allocated to its best use. The temporary monopoly profit rewards entrepreneurs on innovations that are the major source of evolution in a whole society. Schumpeter's dynamic view of List's doctrine is based on a good balance between MNCs and innovative companies:

1. Creative destruction is associated with radical or drastic innovations of entrepreneurs entering unexplored market where there are low entry barriers for new entrants utilizing the common pool of knowledge stock. Creative destruction is a microeconomic process by its nature but has macroeconomic implication for economic growth (Agion and Hovitt, 1998).
2. Creative accumulation is associated with institutionalized innovation by MNCs that carry out innovation along established technological trajectories. MNCs dominate R&D investments and commodity markets worldwide, and they impact on industry life cycles and market structures (Scherer, 1999). Kenneth Arrow, the Nobel Prize-winner, claimed that a market leader in oligopoly is not ready to take the risk of radical or drastic innovations (Arrow and Hahn, 1971).

German companies innovate and try to maintain their differentiation positions by customer-orientation. They are highly Schumpeterian of their business thinking. German MNCs will be unique and differentiated to avoid the devastating oligopoly power games. Siemens and Bosch are global market leaders in their niches. In WIPO statistics of 50 biggest PCT-applicants³ there are in 1978-2011 Siemens (19,719 PCT-patents) and Bosch (17,197 PCT-patents) are at the top with Philips (24,966). A strong evidence of Germany's technology excellence is Fraunhofer-Gesellschaft that is the second among science communities after the U.S. University of California (3,555 PCT-patents). German MNCs are internationally oriented – even earlier state-owned companies, e.g. Deutsche Post. They finance their domestic investments by incomes from international operations. As Venohr and Meyer (2007) estimate, there are over 340,000 export companies in Germany is and over 100,000 German companies are active in FDI operations. Germany's National System is not power-oriented as the Harvard-Chicago-IO-model (Scherer and Ross, 1990) widely applied in other EU countries where big companies are stacked in devastating domestic oligopoly power games.

Germany consists of 16 Laender that are independent states although their historical status varies as the current economic performance (Table 2). Three of states are “free” (Freistaat): Bayern (since 1919), Sachsen (1990) and Thüringen (1994). Two are city-based states (Stadtstaat) and “free” (Freie und Hansestadt): Hamburg (1806) and

² http://www.gtai.de/GTAI/Content/EN/Invest/_SharedDocs/Downloads/GTAI/Brochures/Germany/economic-overview-germany-market-productivity-innovation.pdf/

³The Patent Cooperation Treaty PTC) signed in 1970, provides a unified procedure for filing patent applications to protect inventions in each of its contracting states. In 2008, there were 139 contracting states to the PCT that constitute the International Patent Cooperation Union.

http://www.wipo.int/export/sites/www/freepublications/en/patents/901/wipo_pub_901_2012.pdf

Bremen (1806). Laender have their own legislation, constitution, parliament and government. At the federation level Laender use their constitutional power in parliament (Bundesrat) in which the voting power is related to the number of people. History matters! Differences in economic performance between regional states are major. Germany's successful reunification has reduced differences. Germany has still its core states, e.g. Bayern, and its periphery, the earlier East Germany. The Harvard's top-down methodology (Scherer and Ross, 1990, 5) is too static although widely used. The Schumpeterian methodology is compatible with the dynamic nature of German historical school of economics.

TABLE 2: GNP (NOMINAL, BILLION EUROS) IN 2011/ 2012
Source: http://www.statistik-portal.de/statistik-portal/en/en_jb27_jahrtab65.asp

Laender	GNP 2011	GNP 2012	Change %

Thüringen	48	49	1,4
Germany	2.592	2.643	1,9

Germany's economic geography is based on urbanization economies that Porter excludes of diamonds. Inside and between regional states there are urban networks of small cities/ towns that constitute unique metropolises. In Germany there are only 14 cities with over 500,000 inhabitants, and only one mega-sized metropolis (over 10 million inhabitants): Rein-Ruhr metropolis-region (biggest cities Köln, Düsseldorf, Essen and Dortmund), 9 medium-sized metropolis-regions, and 4 million-cities: Berlin, Hamburg, München and Köln. These diversified metropolis-regions are the economic engine of Germany's third economic miracle (Wirtschaftwunder). Germany (Reichskirche) was one of the most civilized nations already in the 800s when the U.S. or America was populated by wild Indian tribes. Germany's identity cannot be captures by trivial top-down clustering of companies and other economic actors.

TABLE 3: GERMAN CITIES AND THEIR ECONOMIC REGIONS (AGGLOMERATION) AND METROPOLIS-REGIONS

(10) Leipzig	0,53	1,21	2,40
(10) Dresden	0,53	0,75	2,40

Kenichi Ohmae (1995, 1996) predicted that the collapse of nation states is to be expected. Region states with sound socio-cultural structure are the winners of regional agglomeration. Region states constitute fertile ground for stimulating innovations and competitiveness of existing firms, encourage entrepreneurship and attract inward investments. Economic activities are concentrated geographically. Most people in core countries, and a growing number in periphery countries, live in large, densely populated metropolitans. Ohmae refers to his home country, Japan, where the Tokyo metropolitan, a region state, totally dominates the Japanese global business. Metropolis-regions in Germany are exiting or emergent winners as region states. John Dunning (1993, 1997) has proposed that the domestic influences on the diamond should be considered as a specific case of the global influences.

In Germany there are 140 universities of which 11 have been named Elite-Universitäten⁴. The EU Commission has selected 10 top universities; 4 of them are in Germany. German universities have a glorious history of genius scientists. 34 Nobel-prize winners are related to Ludwig-Maximilians-Universität, München: e.g. Wilhelm Röntgen (physics, 1901), Max Planck (physics, 1918), Werner Heisenberg (physics, 1932), and Otto Hahn (chemistry, 1944); and 29 to Humboldt-Universität, Berlin: e.g. Albert Einstein (physics, 1921) and Max Planck (physics, 1918). Germany has 2.4 million students (42% universities)⁵. Germany has a well-organized exchange of students: 115,000 German are studying abroad and 264,000 foreign students in Germany. 31% of German students have as their area of specialization mathematics, computer science, engineering, etc.⁶ In 2012 R&D-investments were 1,469 billion dollar worldwide⁷. Germany dominates the EU with 91 billion dollar (26% of EU). Research-intensive industries accounted for 12.4% of gross value added in Germany (high-tech 9.5%; cutting-edge technology 2.9%. Germany is the number one worldwide⁸. Germany focuses 15 top clusters (Spitzencluster)⁹ and 12 core technologies (Schlüsseltechnologien)¹⁰:

1. Biotechnologies (Biotechnologie)

The German success recipe II – Realistic view of global competition

Thanks to Schumpeter and his followers, Germany is at least one step ahead other EU countries in competition policies. Schumpeter was well aware of the monopolistic power of big firms. Schumpeter (1942) made his famous prediction of the transition from competitive capitalism to trustified capitalism. Schumpeter shared Marx's conclusion that capitalism will collapse, although from various reasons. Schumpeter predicted that the success of capitalism will lead to a form of corporatism and to fostering of values that are hostile to entrepreneurship, especially among intellectuals. John Galbraith (1956) shared the same views. His countervailing power concept, the collusion between large firms and the government, is a parallel concept to Schumpeter's trustified capitalism. Like Schumpeter Galbraith found that the static economic efficiency was a barrier to innovate, because only through the accumulation of monopoly profits could innovations be financed.

In his life's work, Schumpeter not only recognized the need for a theory of economic development, but also came to understand that such a theory would have to deal with the impacts of transition from individual to collective entrepreneurship in the process of technological change (Lazonick, 1991). Although economists would agree with the judgment that an entrepreneur is a central figure in economics, Schumpeter's writings were, at least temporarily, ignored by many brilliant Nobel prize-winners, economists like John Maynard Keynes, Wassily Leontief, Milton Friedman and Paul Samuelson that represent the British-American Economic School. The ignorance for Schumpeter's writings is the major reason why the British-American Economic School, the dominant doctrine of neoclassical economics, has been and still is separate with the German Historical School.

Schumpeter introduced the concept of temporary monopoly profit as the lifeblood of innovativeness. There was another professor, Edward Chamberlin (1933), who also opposed the neoclassical Walras-Marshall price theory that solely relied on two theoretical models of competition (perfect competition and monopoly) and excluded the reality of imperfect, monopolistic competition. Chamberlin contributed the concept of differentiation that is a parallel concept of Schumpeter's concept of innovation. Chamberlin's work can be considered revolutionary, in the sense that he conceptualizes a market structure characterized by both competitive and monopoly elements, and that is the point that makes his work so important to the modern microeconomic theory. Differentiation through innovativeness (economies of scope) is an entrepreneur's best strategy in competition against the market power of multinationals (economies of scale). A modern interpretation of Chamberlin's analysis of competitive models can be summarized in figure 1.

Chamberlin's major target was to modernize the neoclassical theory. Schumpeter shared the same interest. Both failed in that. However, they have laid down a more realistic approach to study oligopoly which is the dominant type of competitive relations. Most of the leading schools of economics have their focus on the industrial organization economics (IO) that is built on Chamberlin's model of oligopoly market(s) with relatively permanent market structure (Bain, 1956). In the global markets, the offerings of firms are heterogeneous and differentiated. The two of competitive models that are practical are:

1. Heterogeneous oligopoly is the core area of Harvard-Chicago industrial organization (IO) doctrine. IO-doctrine is the theoretical construction on which extensions of managerial economics are built and later, strategic management doctrine. Oligopoly, as Chamberlin interprets it, is accountable to the mutual dependences between few competitors that are positioned in the same industry or markets.
2. Monopolistic competition is the core content of the marketing doctrine. When the number of competitors is sufficiently large, the mutual dependences of competitors are relaxed and the marketing tools, like advertising and selling, are important to differentiate a firm's offerings from market average offerings. However, because the number of competitors is large, monopolistic competition embodies elements of perfect competition in addition to monopoly. But as long as a firm can maintain its differentiation strategy, features of monopoly are dominating, since for differentiated products the demand curve is negatively sloped.

The dilemma of most EU-27-countries is that they have not been able to develop their own management doctrines. They apply the U.S. model Industrial Organization (IO) without critics. During the 1980s, the most influential book was undoubtedly Michael Porter's (1980) Competitive Strategy. In a remarkably short time, Porter's writings on mobility barriers or generic strategies became broadly used in teaching, consultation, and research projects. Indeed, Porter moved economics closer to the strategic management and is the author of influence in the topic as the huge number of citation reveals. Porter's model in figure 3 that divides a company's market scope in two ones: industry wide and particular segment only. Anyone who has read Porter's dissertation (Porter, 1973) could recognize that this is the same division into big (industry wide) and small (particular segment only) companies.

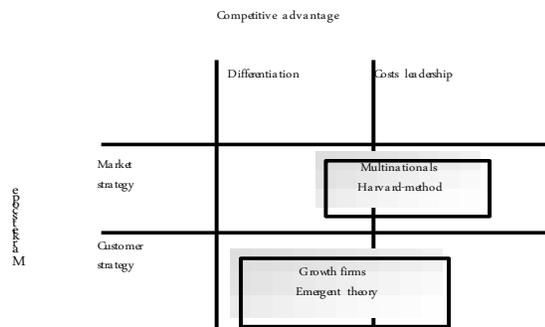

FIGURE 3: A REINTERPRETATION OF PORTERS GENERIC STRATEGIES

Porter relies on abstract oligopoly model. He is not willing to accept the fact that his generic are not theoretical but empirical. Oligopoly is accountable to the mutual dependences between few MNCs that are positioned in the same market and try to dominate markets by internalizing them. MNCs take advantage of homogenous segments in global markets. Serving these segments with standardized products offers economies of scale for MNCs. Aggregated preferences for certain product can emerge simultaneously worldwide which provides huge prospects for certain commodities (e.g. Nokia's mobile phones in the 90s). Germany has a large population of MNCs of which many are

market leader in their segments, e.g. Volkswagen. German MNCs have the well-trained management teams who are able to win by their global market strategies.

Hidden Champions has applied to conquer global markets as Hermann Simon describes in his excellent book (Simon 2009). Hidden Champions are best in the world in monopolistic competition. They have collectively constructed the emergent growth theory for highly innovative and customer-oriented companies. The empirical facts are unbelievable. Venohr (2010) has estimated that there are in German 1500 companies that are world-market leaders (among three best) in their own segments. About 1350 of them are Hidden Champions (HD). About 90% of HD companies act in B2B-markets and the most important industry group is the Machinery & Equipment industry.

HD companies have a unique idea for market definition. They prefer to specialize in globally heterogeneous and marginal market segments that multinationals use to avoid because of low growth prospects and high customer-specific transaction costs. One of the major reasons is that NMCs, through strategic entries, build-up overseas capacities in order to stop potential rivals from entering the most potential market segments. NMCs attempt to establish market power through strategic alliances, joint ventures and collaboration over R&D and make portfolio investments abroad to increase and obtain control of critical resources (Cross, 2000). HD companies have succeeded to win by complementary business strategies and, thereby avoided the competitive power of NMCs. In 1994-2004 HD companies succeeded to grow by 8.4% when German DAX companies (NMCs) grew by 4.9% (Venohr and Meyer, (2009). There are about 2710 HD companies worldwide and about one half of them in Germany¹¹.

The German management method is based on training inside companies. Therefore, German managers know their companies in-depth. The German apprentice education system is certainly the best in world to train humble managers who are really interested to serve their customers worldwide.¹² Strategic marketing emphasizes that strategy development needs to be externally oriented, towards customers, competitors and markets. David Ricardo's comparative advantage concept highlights the important differences between country-specific resources and firm-specific resources. Germany is the best home market for B2B products and services. Service business has been growing 1.428% (Table 4) during the two decades of globalization in 1990-2011. Germany is the third in service exports after the U.S. and the UK. German B2B export companies are mainly providing integrated B2B services to their global customers. Germany is certainly much bigger service exporter than to official WTO statistics demonstrate, perhaps the number one as global service exporter.

The customer-focused marketing concepts, such as segmentation, positioning and the product-life cycle, have also influenced thinking in strategic management (Day, 1992, 1993). Product/brand positioning is a core strategic marketing activity and firms can seek to adopt a number of distinct positions in the marketplace. These may involve positions based on price, premium quality, superior service and innovativeness. The major paradox is that Porter's generic strategies dominate the SMEs literature in most of EU-27-countries when German Mittelstand/ HD companies are utilizing German doctrine of strategic marketing. A good summary of key points is given by Simon (1996, 2009) and Venohr and Meyerr (2007, 2009):

1. They strive for market leadership worldwide in their markets/ segments.
2. Market definition (Abell, 1980) is narrow from customer and technology perspectives
3. They serve the target markets through their own subsidiaries and do not delegate the customer relationship to third parties.
4. They close to their customers in particular to their top customers. They are value, not price oriented.
5. They are innovative in both products and processes. Innovation activities are globally oriented and continuous.
6. The overall company orientation is technology and market driven.
7. They are close to their top competitors and defend their position actively. Competitive advantages are product quality and services.
8. They rely on their own strengths. They mistrust strategic alliances and outsourcing. They see the foundation of their competitive superiority in things which only they can do.
9. They have strong corporate cultures associated with excellent employee identification and motivation. Selection for jobs is sharp.
10. Their leaders are strong and stay at the helm for decades.

George Day (1990) argues that winners (1) are guided by a strategic vision and (2) responsive to markets and customers. This is the method that German HD companies have developed during two past decades. Following their integrating model of marketing HD companies develop their own resource configuration models that are oriented toward customer needs and wants. The key issue is the humble choice of markets segments, to make good business of any kind of goods and articles, not to follow trends or hit lists. Product differentiation is the key of German businesses. It means a long run commitment to serve customers and to invent better products for them. So simple to be true! Marketing channel is the third element of German success receipt. German companies prefer to internalize their marketing channels to keep customer secrets in a strict control. So simple to be true! Germany's customer-specific differentiation is not well known since global gurus dominate the English literature and media. The paradox is that German companies have made a better version of the U.S. industrial method that helped the U.S succeed for about hundred years until the 1980s. Alfred Sloan (1963), the famous CEO of GM was one of the first managers that utilized Chamberlin's product differentiation in positioning. Now German companies are in the top positions. HD companies are in the top (figure 4).

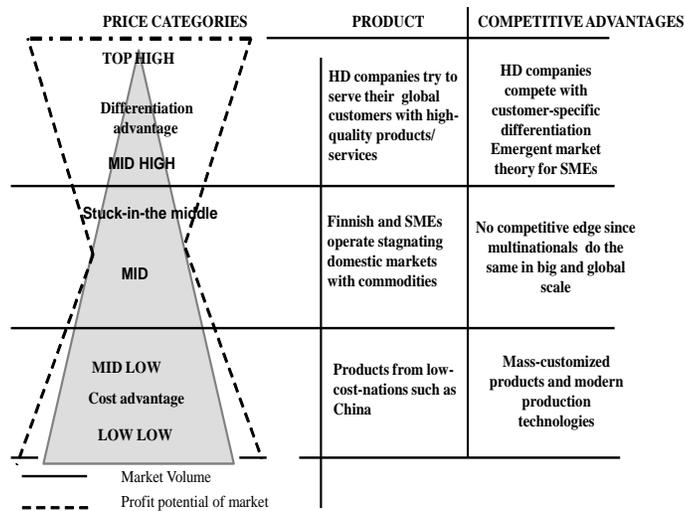

FIGURE 4: THE NORDIC NICHE-STRATEGIES

Conclusion: What is wrong with the EU’s SME policy?

As to SMEs internationalization, Finland is in marginal position as it was during 1970s when I started my carriers as an industrial economist in the Federation of Finnish Technology Industries. Olavi Punakivi is finishing his dissertation about the theme “Investment and profitability of SMEs in Finnish technology Industries”. He has a large data-base of SMEs in technology Industries. The EU Commission (2003/361/EY) defines SMEs so that the main factors determining whether a company is an SME are: number of employees and either turnover or balance sheet total. According to this definition, there are about 23 million SMEs in the EU area and they employ about 100 million persons¹³. In Germany Mittelstand is a broad category of companies including about 99% of 3.7 million companies in Germany, and about 95% Mittelstand-companies are controlled by families¹⁴.

TABLE 5: THE EU COMMISSION (2003/361/EY)SMES DEFINITION
 Source: <http://ec.europa.eu/enterprise/policies/sme/facts-figures-analysis/sme-definition/>

Company category	Employees	Turnover	or	Balance sheet total
Medium-sized	< 250	≤ € 50 m		≤ € 43 m
Small	< 50	≤ € 10 m		≤ € 10 m
Micro	< 10	≤ € 2 m		≤ € 2 m

Punakivi adapts the German broad definition of Mittelstand so that he has six categories of SMEs (number of persons):

1. Early-stage growth companies (10-19 persons)
2. Mature growth companies (20-49 persons)
3. Small medium-sized companies (50-99 persons)
4. Big medium-sized companies (100–249 persons)

¹³http://circa.europa.eu/irc/opoce/fact_sheets/info/data/policies/smenterprises/article_7312_fi.htm

¹⁴German Mittelstand: Engine of the German economy, sivut 3-5.

5. Internationalizing medium-sized companies (250–499 persons)
6. Globalizing medium-sized companies (500–999 persons).

This kind of definition of SMEs is useful (Figure 5). The six size categories comprise a pattern of growth for SMEs. In the figure there is one indicator of the pattern (Value added per person). As shown in the figure, companies in five categories are about the same level in value added per person. Some of these SMEs are already investing intensively in internationalization. Only one category (Global medium-sized companies, 500–999 persons) had a high return on investment in internationalization as Hidden Champions in Germany.

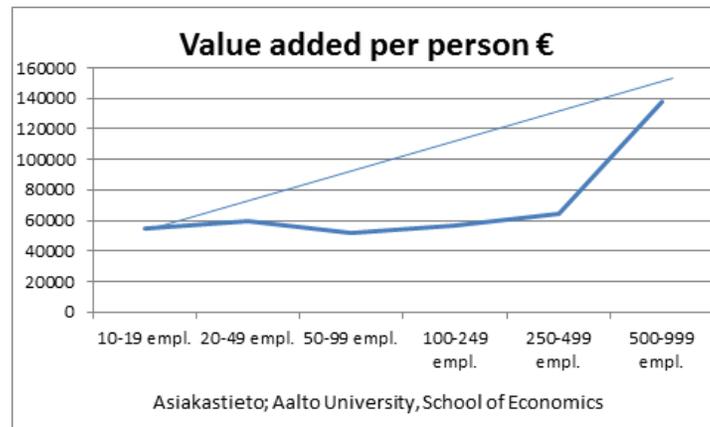

FIGURE 5: VALUE ADDED PER PERSON. SOURCE: OLAVI PUNAKIVI

The EU's SME concept is misleading. It is built on the implicit assumption that small and medium-sized companies are isolated from the global competition. This is not the truth. The German SME concept is not a static one relying solely on company size. Germany SMEs or Mittelstand is globally oriented. They are aware of the fact that when markets are open their only success recipe is to grow quicker than NMCs. During two past decades they have succeeded to do that.

The Harvard-Chicago-IO-doctrine is solely relying on top-down-approach. The European and German bottom-up approach is important to take into account (McGee and Thomas, 1986). This approach is verified in Finland by 4 dissertations: Lahti (1983), Salimäki (2003), Killström (2005), and Luukkainen (2012). Lahti's model of strategy and performance are used as the main framework model (figure 6). Lahti's model links the 'Realized and Intended strategy making' to the 'Firm performance' in the within-industry approach. The learning aspect is essential to innovative growth firms with idiosyncratic resources and continuous performance variations according to the life cycles of innovations (Lawless, Bergh, and Wilsted, 1989). A balance between innovativeness and process efficiency or market efficiency (differentiation) is needed.

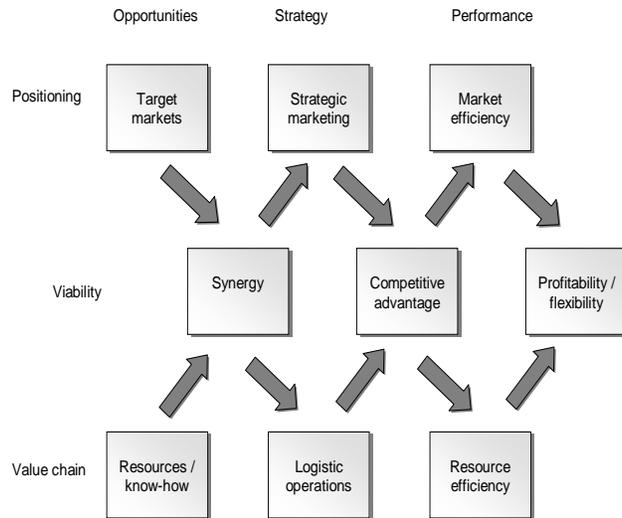

FIGURE 6: LAHTI'S MODEL: STRATEGY-PERFORMANCE MODEL

This model has been widely used in many research projects¹⁵. The model is Schumpeterian in its nature. The starting point of temporary monopoly profits is the 'Opportunities'. The 'Strategy' is Schumpeterian in its nature, since strategy making is targeted to find new business prospect. Temporary monopoly profit, the 'Performance', is the result from the fit with opportunities and strategy. Edith Penrose's (1959) hypothesized the firm's ability to grow depends on the management's learning capacity. Therefore, the "within sector studies" are needed to find out the "Substantive measures of performance", as Pitt and Thomas convince through table 6. Lahti (1983) is one of the first dynamic studies of strategic groups in a whole industry composed of firms with different size (small, medium sized and big) and performance models (high performers/ innovator and low performers/ conservative) (Pitt, and Thomas, 1994, 93). The "across sector studies" have had the major emphasis since they are useful to identify the current and potential clusters according to Porters' (1990) contribution. Although clusters are always useful to know, small and medium sized firms cannot base their strategy making on cluster concept. They need more robust concepts and methods (Lahti, 2010).

TABLE 6: STUDIES TESTING THE ROBUSTNESS OF GROUPINGS

¹⁵ There are about 300 case analyses of growth firms, from Nordic countries, Italy, Benelux-countries, Estland, Italy, Spain, France and Scotland.

Prior classification was via:

	"Substantive" measures of		"Perceptual" measures of	
	Structure / conduct	Performance	Group structures	Patterns of conduct

Founding Family CEO Pay Incentives and Investment Policy: Evidence from a Structural Model

Abstract

This paper examines how CEO compensation influences the relation between family involvement and corporate investment policy in a structural framework. Our study focuses on one pay incentive, option portfolio volatility sensitivity vega. Consistent with the risk aversion hypothesis, we find that vega is lowest in active family firms, which allocate less capital to R&D projects. In contrast, pay incentives and families are not associated with capital expenditures. Vega increases M&A activities which are not affected by family presence. Interestingly, despite family preferences for lower firm risk, active family firms diversify less than firms run by outsiders. Overall, our empirical results suggest that CEO pay incentives induce investment policy contingent on firm risk. CEO incentive pay in family firms manifests the risk aversion preference. Nonetheless, after replacing family CEOs with outside professionals, investments in risky R&D projects increase, consistent with the horizon hypothesis.

1. Introduction

It has been well-established that two types of agency costs exist in modern corporations. Firstly, one type of agency problem, prevalent in closely held firms, lies in the conflicts of interests between large owners and minority shareholders. Prior research notes that large and undiversified shareholders might adopt investment policy based on their own risk preferences and/or their own investment horizons rather than those preferred by other well-diversified shareholders (e.g., Fama and Jensen, 1985; Shleifer and Vishny, 1986; Gompers and Lerner, 2000). Alternatively, some academic scholars argue that blockholders can mitigate managerial incentives to adopt myopic investments (e.g., Edmans, 2009). Anderson et al. (2012a) study the relation between family ownership and investment policy from the perspective of different preferences between family and nonfamily shareholders. They find that family firms devote less capital to long-term investments and that market seemingly discounts below-industry investment levels. They argue that their empirical evidence indicates that family firms affect corporate investment policy by their preferences for lower risk rather than efficient monitoring or longer horizon.

The other type of agency problem, prominent in a diffusely held firm, arises due to the conflicts of interests between managers and shareholders (Jensen and Meckling, 1976; Fama and Jensen, 1983). To alleviate such “classic owner-manager conflict” (Villalonga and Amit, 2006), firms should adopt incentive compensation systems that make managerial wealth sensitive to both risk and performance (Jensen and Meckling, 1976; Guay, 1999). Two pay incentives, delta (i.e., option portfolio price sensitivity which motivates managerial effort) and vega (i.e., option portfolio volatility sensitivity which induces risk-taking behavior), are expected to affect investment policy that impacts firm risk and performance as a result. Extant literature shows that, on the one hand, delta may induce CEOs to make positive net present value (NPV) investment choices despite its implications on risk-taking is ambiguous theoretically and empirically (e.g., Hagendorff and Vallascas, 2011). On the other hand, vega may make risky investments more tolerable to risk averse CEOs so that they are more willing to undertake risky projects (Coles et al., 2006; Hagendorff and Vallascas, 2011). Cadenillas et al. (2004) present a model showing that higher managerial effort and project risk are associated with higher firm value.

Granted, agency problems intertwine, such that family firms are not entirely free of owner-manager conflicts, and diffusely held firms are not entirely free of the expropriation by large shareholders. Investment decisions, essential for firm performance, are subject to both types of agency problems. In this paper, we examine how families influence corporate investment policy through the incentives provided by CEO compensation in a structural model framework. We focus on four types of corporate investments including capital expenditures, research and development (R&D), mergers and acquisitions (M&A) and corporate segments, which reflect varying degrees of riskiness and different value-enhancing sources (e.g., Coles et al., 2006; Hagendorff and Vallascas, 2011, Kothari et al., 2002). We adopt a structural framework for analysis because it enables broad data-analytic modelling that could evaluate multi-equations and address

some endogeneity issues better. Lastly, unlike the two-type categorization commonly adopted in the literature, similar to e.g., Villalonga and Amit (2006) and using hand- collected data, we classify our sample firms into active family firms (run by family member CEO), passive family firms (run by outside CEO), and non family firms.

The remainder of this paper proceeds as follows: Section 2 describes our main testing hypotheses. Section 3 describes the data collection and sample formation. Section 4 illustrates the model specifications. Section 5 shows our empirical results. Section 6 summaries the findings and concludes.

2. Hypotheses

Anderson et al. (2012a) argue that risk aversion and extended investment horizons of families lead to differences in investment policy between family and nonfamily firms. Risk aversion of families potentially results in fewer risky projects due to substantial and undiversified ownership. Nevertheless, their long-term commitment likely mitigates this risk aversion and allocates capital to investments with long-term horizons. Furthermore, the informational advantage in monitoring of families helps alleviate risk aversion derived from the opaque nature of R&D process (Anderson and Reeb, 2003b). Therefore, both long-term investment horizon and efficient monitoring arguments indicate an opposing effect of family firms on risky projects. Their empirical results show that family firms invest less in risky investments, which suggests that risk aversion is the dominant effect. Based on the risk aversion hypothesis and given that vega induces risk-taking, we hypothesize that CEO pay in active family firms is associated with a lower degree of vega. In addition, CEO pay in passive family firms has higher vega because family ownership in such firms is typically lower than active family firms, and thus we expect the horizon and monitoring arguments to dominate. Since the effect of delta on risk-taking is ambiguous, we use it as a control variable in our analysis. Note that delta in active family firms is expected to be highest because of the significant equity-based holdings.

3. Data and Sample

Our sample construction starts with companies in the S&P600 SmallCap Index between 2001 and 2005. We study small firms because small firms have less aggregation bias, i.e., the aggregation of asynchronous actions across business units can smooth firm-level investment (Whited, 2006). Moreover, according to the 2009 OECD report, Small and median-sized enterprises account for more than 99% of all enterprises in the European Union, and more than half of labor force in the private sector in the OECD area. Other than their economic significance, family influence is more prominent and effective in small firms compared with their more established counterparts. We exclude non-surviving firms during this period, firms in the utility and finance industry, and spin-off firms. To identify family firms, following Anderson and Reeb (2003) and Villalonga and Amit (2006), we manually check the proxy statements and other sources. We form a dataset on identity, ownership, tenure, and biographies of founder(s), board members, blockholders, and the top 5 managers. Because the vast majority of the families identified in our sample are in fact founding families, we focus on founding family and thus family refers to founding family in the remainder of the paper. We match our sample with available accounting data, CEO compensation, and governance characteristics. In the end, we have 1,756 firm-year observations that correspond to 362 unique firms. Table 1 describes the variable definition and data source used in this paper.

TABLE 1: VARIABLE DEFINITION (ALPHABETICALLY)

Variable	Definition	Data Source
Asset tangibility ratio	Total property, plant and equipment scaled by total assets	Compustat item <i>ppent/at</i>
Board Size	Number of directors on the board	RiskMetrics Directors Directors Legacy

Capital expenditure/total assets	Capital expenditures scaled by total assets	Compustat items <i>capx/at</i>
Cash ratio	Cash scaled by total assets	Compustat item <i>ch/at</i>
CEO duality	Binary variable that equals one when the CEO serves as company chairman	ExecuComp item <i>titleann</i>
Delta	The change in the value of the CEO's stock holding and option portfolio in response to a 1% change in the firm's stock price	Following Core and Guay (2002) and Brockman et al. (2010)
Dividend ratio	Firm's annual cash dividends scaled by total assets	Compustat item <i>dv/at</i>
Entrenchment index	Follows Bebchuk, Cohen, and Ferrell (2004)	RiskMetrics Governance Legacy items <i>cboard+supermajor+ppill+goldenparachute+lachtr+labylw</i>
Executive age	Age of the CEO	ExecuComp item <i>age</i>
Firm age	Difference between the founding year and the data year	Online sources (e.g., www.funduniverse.com)
Firm risk	Standard deviation volatility over the past 60 months	Compustat item <i>bs_volatility</i>
GIM index	Follows Gompers, Ishii, and Metrick (2003)	RiskMetrics Governance Legacy item <i>gindex</i>
Leverage ratio	Year-end long-term debt scaled by total assets	Compustat items <i>dltt/at</i>
M&A number	Firm's number of M&A deals	
M&A value ratio	Sum of the M&A deal value scaled by the firm's market value of equity	
Ownership	Percentage of CEO shareholding, including the holdings of family members, if applicable	Proxy statements
R&D expense/total assets	R&D expenditures scaled by total assets	Compustat items <i>xrd/at</i>
Return on assets	A ratio of earnings before interest and tax scaled by total assets	Compustat items <i>ebit/at</i>
Segment HHI	Segment HHI follows the calculation of Herfindahl-Hirschman Index by using the sales of corporate segments as weights	
Segment number	Firm's number of corporate segments	
Share ownership	Percentage of executive shareholding (excluding options)	ExecuComp item <i>shrown_excl_opts</i> scaled by Compustat item <i>shrsout</i>
Tobin's Q	Market-to-book ratio, defined as total assets plus the market value of common stock less the sum of book value of common equity and balance sheet deferred taxes scaled by total assets	Compustat items $(at+csho*(prcc_fbkvlps)-txdb)/at$
Total assets	Year-end book value of total assets	Compustat item <i>at</i>
Total sales	Annual total sales	Compustat item <i>sale</i>
Vega	The change in the value of the CEO's option portfolio in response to a 1% change in stock return volatility	Following Core and Guay (2002) and Brockman et al. (2010)

4. The Model

To estimate the impact that families have on corporate investment decisions through their pay incentives, we deploy a structural equation model (SEM) that encompasses a wide range of models by considering various paths (causality) and correlations between variables, both dependent and independent variables. Therefore, relevant to our purposes, the structural equation modelling, when setup properly, can address endogeneity issues and also give estimates similar to seemingly unrelated regression or simultaneous equation analysis, among other desirable features (Tomarken and Waller, 2005). The path diagram in our structural model is displayed in Fig. 1.

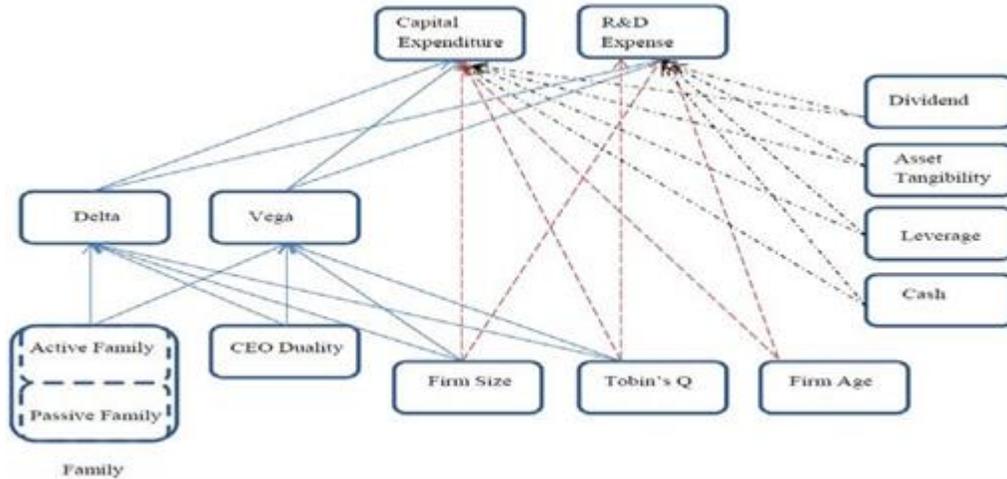

FIGURE 1: SIMPLE ILLUSTRATION OF BASELINE STRUCTURAL EQUATION MODEL

A path is typically shown as an arrow, drawn from one variable to another, and establishes the relation (causality) between these two variables. As shown in Fig. 1, there are four sets of linear regressions in the model. Two are related to investment choices, and in the meantime, two are for the decisions of pay incentives that are allowed to further affect investment choices too. We also specify variables to be correlated (based on the correlations between variables of interest) and include industry and year dummy variables in the two linear regressions of investment choices (not shown in the path diagram for simplification). Standard deviations are clustered on the firm-level.

Specifically, the model specification is as follows,

$$\text{Investment Policy} = \beta_1 * \text{Incentive Pay} + \sum \beta_i (\text{Firm-Specific Control Variables}) \quad (1)$$

$$\text{Incentive Pay} = \gamma_1 * D(\text{Passive Family Firm}) + \gamma_2 * D(\text{Active Family Firm}) + \gamma_3 * \text{CEO Duality} + \sum \gamma_j (\text{Firm-Specific Control Variables}) \quad (2)$$

The indirect effect of family presence on investment policy is $\beta_1 * \gamma_1$ for passive family firms and $\beta_1 * \gamma_2$ for active family firms. Note that, to test our hypothesis properly, family presence impacts investment decisions through pay incentives only. Therefore, the indirect effect of family presence on investment policy is the total effect.

5. Empirical Results

5.1 Primary Results

First of all, we find that 48.46% of the sample observations have family influence within the firm. This is consistent with the notion that family control is common in small firms. On average, CEOs have 18.9%, 3.2% and 4.33% of equity stakes in active, passive and non family firms. As expected, the level of delta is highest for active family CEOs

despite not significantly different between passive and non family firms. As for vega, non family CEOs have highest level. Active and passive family CEOs have similar levels on average despite the median is relatively higher in passive family firms.

After controlling for firm size and growth opportunity, as shown in Table 2, our regression analysis shows that active family firms have lowest level of vega and highest level of delta while the passive and non family firms have similar levels of both measures. Moreover, active family firms commit less capital to R&D expenditures, whereas there is no significant difference in R&D between passive and non family firms after controlling for important firm-specific characteristics such as financial constraints and industry orientation. Family presence and/or CEO pay incentives seem not able to explain capital expenditures, inconsistent with Coles et al. (2006). This might suggest that capital expenditures, although generally viewed as a type of less risky investments, and R&D are not necessarily substitutes. Furthermore, following Anderson et al. (2012a), we conduct similar analysis based on the classification of high and low firm risks. Interestingly, the negative association between active family firms and R&D is driven by high risk firms, and the R&D investment patterns are similar irrespective of family presence in low risk firms. This is consistent with the findings in Anderson et al. (2012a) and their risk aversion hypothesis. Moreover, the negative relation between delta and R&D is driven by high risk firms while the positive relation between vega and R&D is driven by low risk firms. It thus suggests that these incentives seem to induce investments to maintain proper firm risk based on existing firm risk

With regard to M&A activities, as shown in Table 3 Panel A, on the whole, we find that M&A activities are not affected by family presence. Although the related coefficients are negative, they are not statistically significant. Vega increases both the number as well as the value of M&A deals. Delta seems irrelevant in the decision to make M&A deals. The results regarding incentives are mainly driven by high risk firms, as shown in Models 3-6. For low risk firms, neither family presence nor pay incentives affect M&A activities. Similar to capital expenditures, as shown in Table 3 Panel B, corporate diversification is not affected by family presence and pay incentives as a whole, although active family firms have fewer segments than passive and non family firms. Therefore, this finding suggests that the number of corporate segments is not a proper indicator of riskiness. Having more segments does not necessarily mean to reduce firm risk, at least for families. This might explain that families prefer not to diversify even when facing

higher firm risks. Delta also decreases diversification in high risk firms. For low risk firms, neither family presence nor pay incentives explain either diversification choice. Notice that the relation between family presence and pay incentives remains regardless of firm risks.

This table reports structural equation model estimates (total effects) of M&A activities (Panel A) and corporate segments (Panel B) on founding-family CEO pay sensitivities/presence. Z-Values are in parentheses and are corrected for serial correlation and heteroskedasticity by clustering on the firm-level identifier. All specifications control for industry (1-digit SIC codes) and year fixed effects. The symbols *, **, and *** represent statistical significance at the 0.1, 0.05, and 0.01 levels, respectively.

Our main results hold when we replace (family) firm type dummies with (family) ownership and also when we use several alternative estimation methods (to address sample selection and endogeneity issues), e.g., OLS, Tobit,

and Heckman models. These results are not displayed in the paper due to limited space and are available upon request. In summary, our study shows that active family firms tend to have lower vega and higher delta relative to passive and non family firms alike. Delta decreases while vega increases riskier R&D investments, while the former is driven by high risk firms and the latter is driven by low risk firms. Vega seemingly motivates M&A activities, driven by high risk firms. Families diversify less and allocate less capital to R&D projects in active family high risk firms in particular. Overall, by a structural model, consistent with our conjectures, our findings support the risk aversion hypothesis for active family firms and show some evidence for the horizon hypothesis for passive family firms. Our estimates further indicate that CEO pay incentives induce investments with varying degrees of riskiness and investment policy appropriate to firm risks. When facing riskier business environment, active family firms prefer less risky investments. Yet, inconsistent with the risk aversion hypothesis, they tend not to pursue risk reductions through corporate diversification, consistent with Anderson and Reeb (2003b). It can be that these families regard diversification as losing control or business focus instead of reducing risk.

5.2 Discussion: firm age and vega in active family firms

Our paper studies the two hypotheses of family risk profiles by examining their investment decisions. We focus on the pay incentives that motivate the decision to allocate capital to risky investments. This is one innovative element of our paper. In this section we look closer at the relationship between family presence/ownership and vega, the main incentive variable of interest. Because of risk aversion, (very) high ownership is hypothesized to be associated with low vega. Nevertheless, we expect that firm age to be critical in vega conditional on ownership. For instance, an old firm typically faces scarce growth opportunities and might need to have high vega to motivate managerial efforts on long-term and risky investments that ensure prosperity of the firm. We find supporting evidence from three contour plots of firm age, family ownership, and vega in three types of family firms (not displayed due to limited space and are available upon request). For each type of firms, there are areas of high vega located on the middle-right side of the plot. Hence, high vega (together with substantial ownership) is provided by some old firms despite less so in active family firms, which suggests the risk aversion hypothesis. Interestingly, for active family firms, there is one area of high vega located on the bottom-left side of the plot. This indicates that high vega is provided by some young active family firms, which supports the horizon hypothesis. In addition, the relation between firm age and ownership is positive (slightly concave) active family firms, although there seems no relation in passive and non family firms. This indicates that ownership accumulates over time for family CEOs only. Consequently, for active family firms, in their early stage of business, delta is not very high because of (relatively) lower ownership, but vega can be very high due to their risk seeking preferences (e.g., entrepreneurship). Over time, when firms age and thus lack growth opportunities, vega can be high to induce CEOs to engage in long-term investments. However, there are fewer such cases in active family firms due to high levels of risk aversion.

6. Concluding Remarks

Anderson et al. (2012a) document that families prefer to allocate financial resources to capital expenditures relative to risky R&D investments. They argue that this is because risk aversion of these families outweighs their longer investment horizon for their long-term commitment. Another line of research on family firms shows that these firms have different CEO pay structure compared with their non family counterparts. Since pay incentives potentially induce managerial behavior that enhances firm performance from different perspectives, and investment decision is one of the important observable decisions that CEOs make, it is plausible that family presence affects investment policy through pay incentives, in particularly option vega. Based on the two hypotheses, risk aversion and investment horizon that have opposing effects on risky and long-term investments, we predict that vega has to be low enough in family firms so that risk aversion can dominate because vega motivates risk-taking behavior. Otherwise, family firms should prefer more risky and long-term investments, and the horizon hypothesis dominates. Using a sample of 1,756 firm-year observations that represent 362 small U.S. publicly traded companies between 2001 and 2005, our structural equation model estimates show that active family firms have lowest vega and highest delta. They prefer to devote less capital to risky R&D projects, especially for high risk firms. Our results also show

that passive and non family firms are similar, in terms of their pay incentives as well as their choices of investment policy. So, risk aversion effects dominate horizon considerations for firms owned and run by families. Capital expenditures, usually viewed as less risky with a short-term feature, are not affected by family presence. This suggests that capital expenditure and R&D might not necessarily be substitutes. We do not find significant differences in M&A activities between different types of family firms. Active family firms facing high risk seem to diversify less in spite of their preference for low risk. Apparently, families do not think that having more business segments is able to reduce risk. More segments might lose focus and ownership, which these families value greatly.

Overall, our paper provides evidence that incentive pay is one mechanism that influences the choices of investment policy in (active) family firms. Furthermore, our study shows that firms owned and run by families are considerably different from the others. Our robustness tests show that outside CEOs in passive family firms tend to invest more in risky R&D projects relative to those in non family firms. So, replacing a family CEO with an outside professional seems to encourage some risk-taking initiatives, which is consistent with the horizon hypothesis, to a lesser extent though. This also indicates that, to avoid spurious relations, the classification of family firms should consider not only the ownership but also the control of the firm.

We make several contributions to the literature on family firms. First, to our best knowledge, this paper is the first to analyze how family presence or ownership affects the choice of investment policy through CEO pay sensitivities. There have been a number of studies that examine the CEO pay (incentives) in family firms (Gomez-Mejia et al., 2003; Li et al., 2012) as well as their investment patterns (Anderson et al., 2012a), but none attempts to consider these simultaneously. It is plausible that the differences observed in CEO pay structure in family firms might explain the differences in investment policy in these firms. Our study fills the gap with better analytical modelling that potentially addresses issues such as endogeneity and/or missing values. Our empirical evidence supports the notion that active family firms have different pay incentives from the other types of firms that affect their choices of investment policy. Second, we refine the typical categorization of "family versus non family" firms in terms of degree of family ownership. Similar to e.g., Anderson and Reeb (2003a) and Barontini and Caprio (2006), we classify firms into three different types that reflect varying degrees of family involvement both in ownership structure and in the management. We argue that the CEO's identity matters as well. Indeed, we find that the incentives and the investment patterns appear to differ significantly in active family firms as opposed to passive and non family firms alike, a result which could not be captured by the traditional family firm categorization. Hence, a CEO's family affiliation is a valid and important criterion to classify family firms. This also suggests that replacing a family CEO with an outside professional means not only the transition to non family firms but also different corporate behaviour from the past.

Finally, previous work on the corporate investment literature usually focuses on firm-specific characteristics. Several studies explore how managerial incentives influence observable operations and policy choices, as well as the implications (e.g., Guay, 1999; Coles et al., 2006; Hagedorff and Vallascas, 2011). Our analysis incorporates the aspect of organizational structure by considering ownership (founding family presence/ownership) and control (CEO pay incentives) at the same time. In line with Anderson et al. (2012a), we demonstrate that owner preferences matter in the choice of corporate investment policy. Besides, our results provide evidence that the influence of family ownership is beyond that of typical concentrated ownership. Therefore, research on incentive compensation and firm valuation without considering family presence could result in spurious relations and false implications.

Credit quality, bank provisioning and systematic risk in banking business

Abstract

Based on a sample of 59 European banks over the period 2006-2011, we investigate the impact of the loan loss provisioning (LLP) together with a wide array of credit-risk exposure and performance variables on systematic risk measured by betas. We develop a model for assessing whether management behaviour, accounting policies, such as LLP, and the quality of loan portfolio play a significant role in explaining the banks' systematic risk exposure. Our results suggest that financial performances do not have a direct significant relation with betas; rather measures of risk exposures (risk weighted assets on total assets) substantially affect systematic risk. During crisis systematic risk significantly responsive to provisions and their impacts on performances.

Our study has several implications, in particular at light of changing European regulation on non-performing exposures reporting and forbearance practices alongside with regulators forcing banks to strengthen their capital base.

Introduction

Managerial behaviour and accounting policies have a huge impact on corporate earnings and their information content. Reporting of non-performing loans and loan loss provision (LLP) practices are among the major concerns in the banking industry. Asset quality, exposure to credit-risk and provisioning bear great implications in relation to earnings volatility and capital adequacy. Managers may rely on discretionary provisioning as a mean of smoothing earnings. While there is a large debate in literature about the incentives to discretionary LLP, there's no doubt that such a practice might hinder the true riskiness of the bank and distort market perceptions. On the same vein, discretionary provisioning may be regarded as a tool for optimizing bank's capital. The aim of the paper is to investigate the impact of the loan loss provisioning and other significant credit-risk exposure variables on the banks' cost of capital proxied by betas. The issue is of great interest at least for three reasons. The first is that international competition, differences in the economic cycle and various industrial arrangements might be accountable for differences the cost of capital across countries. The third reason is tightly related to the new proposed EU regulations referring to LLP and non-performing loans reporting. Our paper makes an important contribution in this field, as there is a lack of literature assessing the impact of LLP on the cost of capital. Our study has several implications, in particular considering the change of European regulation on non-performing exposures reporting and forbearance practices, the adoption of Basel III capital accord and at light of regulators forcing banks to substantially reinforce their capital base. The paper is organized as follows. Section 2 defines the theoretical framework with reference to the determinants of betas. Section 3 describes sample, data and methodology. Section 4 summarizes the main results while section 5 discusses policy implications. Section 6 concludes.

Determinants of beta and hypothesis development

Risk assessment and management are two of the major building blocks of finance in general and banking business in particular. In today's banking industry banks are required to strengthen their core capital base either for complying with regulatory requirements and as a result of supervisory pressures. These capital needs cast two main problems: that of the cost of rising new equity funds and that of the relative convenience of alternative sources of funds such as subordinated debt. The cost of capital and its determinants have been widely investigated either in corporate finance and bank specific literature. The idea that the cost of capital is to a large extent determined by the value that the stock market assigns to corporate's earnings is well established. By the way, the topic of bank's earnings quality is of great

interest at light of accounting policies, in particular regarding the use of loan loss provisions (LLPs) and incentives that banks face.

The topic of loan loss provisions (LLPs) has been broadly investigated in the literature, but a consensus on whether banks' managers use LLPs for income smoothing, capital management or with a signalling effect still lacks. The rationale for the income smoothing hypothesis lies in the fact that LLPs can be used to reduce the volatility of earnings. The early studies in the income smoothing literature date back to the end of the 1980s and the first contributions were those by Greenawalt and Sinkey (1988) and Ma (1988), who find evidence of earnings management in the U.S. banking industry. Greenawalt and Sinkey (1988) find that banks' managers effectively tend to use LLPs to reduce reported earnings through an increase in LLPs when income is high, while they tend to reduce LLPs when earnings are low. Ma (1988) finds a strong evidence of banks' managers using LLPs to reduce (raise) their earnings when the operating income is high (low). Wahlen (1994) tests the income smoothing hypothesis on a group of 106 commercial banks for the period 1977-1988 and finds that when future cash flows are expected to be positive, banks' managers increase LLPs. On the contrary, Wetmore and Brick (1994) find no evidence of income smoothing practices in the analysed sample of 82 US banks for the 1986-1990 period. Bhat (1996) tests the income smoothing hypothesis for 148 U.S. large banks in the period 1981-1991 and finds that income smoothing is typical of small, badly capitalized and with poor financial conditions banks.

According to the CAPM the cost of capital is function of a market risk premium according to the firm's beta where the latter is determined regressing stock returns on market returns. A growing body of literature develops alternative methods for determining betas against firm's fundamentals. The rationale laying behind fundamental betas is to use financial data in order to capture systematic risk. A plenty of contributions (among others see Rosenberg and McKibben, 1973; Fama and French, 2004; Chance, 1982; Dyl and Hoffmeister, 1986 and Gahlon and Gentry, 1982) advocates the merits of fundamental betas over historical betas arguing that the latter provide better indications of the sources of systematic risk. Prominent contributions find significant correlations between β 's and *pay out ratios*, financial leverage and earnings yield volatility (Beaver, Kettler and Scholes, 1970); other studies account for a significant explanatory power asset size and profitability (Logue and Merville, 1972). Such studies, in particular, conclude for a negative relation between profitability and systematic risk which is coherent with the idea that successful firms reduce the chance of systematic risk. While such an intuition might make sense in general, there are good reasons for arguing for an inverse relation in certain industries. Borde *et alri* (1994) found a positive relationship between profitability and systematic risk in insurance companies.

Our study is grounded on standard corporate finance theoretical models and bank specific research as well. We try to capture the influences of both systemic factors and firm specific variables on the cost of capital.

Although one could attempt to find the most significant macroeconomic variables for capturing the exposure of banks to systemic risk, almost all the possible measures are potentially subject to criticism and fallacies. For example, a useful proxy of pro-cyclical behaviour is given by the credit-to-GDP ratio. However, what the most appropriate GDP measure for an internationally active banking group is, could be a matter of debate. A feasible way to overcome this problems is determining banks' betas against an average sectorial beta and investigating which risk factors differentiate each bank from the sectorial average.

Several market-based and corporate-risk based variables might be assumed as determinants of betas and, in particular, to explain heterogeneity among banks. Market-based variables are related to trends in share prices. Aggressive stocks could be deemed as having higher sensitivity to systematic risk. Corporate-risk based variables could be grouped in several blocks of variables a plenty of which characteristic of banking business or, at least, have paramount implications for banks.

Dependent on the business model there are, then, a variety of variables capturing the exposure on credit risk. Good indicators of risk could be found in the balance sheet, income statement and other disclosures (i.e., disclosure on asset quality), such as ratios in different asset categories and margins. Relevant categories (Rosenberg and Perry, 1978; Di Biase and D'Apolito, 2012). Given the aim of our study, we are in particular interested in investigating betas against the quality of loans portfolio with a wide array of specifications regarding in particular the provisioning behaviour, the riskiness of loans and the impact on performances.

Managers have some discretion in provisioning and they use discretionary provisioning as a mean of income smoothing as recognised in literature. Some author argue (see Kanagaretnamet et al., 2005) that managers have the

incentive to adjust banks' current performance to an average performance of a group of benchmark banks. Should this hold, we would expect pricess volatility of banking institutions converging toward sectorial volatility with differences being due to specific characteristics of each institutions, in particular business models. Arguably, while such form of "benchmarking" could make sense during normal times, it would prove more difficult for banks to track an average sectorial performance during crisis.

However, the pro-cyclical behaviour of banks casts the question of whether betas are actually responsive to performance measures or, rather, they are reactive to risk taking behaviour, which affects future losses and performances. LLPs plays a relevant role within this framework. Since they represent provisions set aside to cover expected losses (which represent the cost of lending) an underestimation of the expected losses during benign times will lead to an increase in profits and lending activity due to overconfidence. Provisioning, together with capital requirements, has to do with the coverage of credit risk. Capital requirements themselves, which are designed to cover unexpected losses, are expected to have an impact on systematic risk and this might be particularly true during crisis given the shortage of reserves which is due to the pro-cyclical behaviour of provisioning. We develop the following hypothesis.

Hypothesis 1 – Betas are responsive to risk exposure and risk-coverage policies rather than current performances. Specifically, on loan loss provisioning behaviour.

Hypothesis 2 – The relation between bank's betas and sectorial betas weakens during crisis periods as the impact of bank's fundamentals is expected to increase and widely affect volatility.

Hypothesis 3 – In crisis times, capital adequacy turns to assume a significant role in driving betas due to increasing concerns as of bank soundness.

Data and methodology.

1.1 Description of the sample and variables

Our study is based on a sample of 59 major European banking groups covering 10 countries. Our selection strategy is based on a total asset criteria. More precisely, for each country we select those groups above 10 billions in total assets. In order to avoid duplications we rely on consolidated financial information. We collect consolidated balance sheet data form the Bankscope database on a timeframe spanning the period 2005-2011. We have, therefore, a total of 413 observations. Table 1 summarizes our sample. It reports the number of banks for each country and the average total assets over the selected time span. Unfortunately, not all the banks in our sample are listed. On balance we have 38 listed banks for which betas are available.

TABLE 15 – THE SAMPLE

Country	Number of banks	Total assets 2011 (bn €)
Italy	12	197,120,225
Germany	7	560,840,714.3
Spain	11	233,697,909
Portugal	4	84,310,175
France	6	932,250,483.3
Netherland	2	1,005,446,500
Belgium	2	349,070,500
Austria	3	88,489,400
UK	9	824,654,733.3
Ireland	3	115,690,667
Total	59	

We, then, collect from the Bloomberg database the betas for each bank in our sample. Since we are interested in testing the impact on bank's betas of macro factors, we relied on Bloomberg database to calculate sectorial betas. Instead of

collecting banking sector betas we had to rely on the broader financial sector beta for each country under investigation. Such a simplification is due to the fact that we weren't able to find the narrower banking sector beta for all the countries in our sample. We get for each year the betas over a 2-year time horizon. Sectorial betas are derived from each country MSCI indexes.

We predict bank's betas across a set of basic variables describing various bank's profiles of performance and risk exposure and, namely, credit-risk exposure and risks associated with financial fragility. Contrary to other studies we employ also sectorial betas in our model (see discussion in the previous section). We also employ a set of control variables. Table 2 describes our variables together with the respective predicted sign of the relation with betas.

Profitability variables (ROE and PIMOPTA) are expected to be positively related to betas. We recall the discussion in the previous section for such a relation. For similar reasons we expect there should be a positive relation of RWATA, ECAPTE and IMPLGL to systematic risk and a negative relation of RILGL and RILIMPL to systematic risk. Higher risk taking behaviour, in fact, leads to higher risk weighted assets, higher economic capital and, potentially, a higher fraction of impaired loans on gross loans which is a measure of the magnitude of non-performing loans. In particular, a higher ECAPTE implies tensions in capital adequacy and, therefore, a greater exposure to risks. We expect a negative relation with RILGL and RILIMPL. The former, in particular, is a significant ratio for banks as it represents the so called coverage ratio measuring the ability of banks to absorb potential losses from non-performing loans. Related to the riskiness of the credit portfolio is the ratio of risk weighted assets on total assets for which we expect a positive relation with betas. By the way, such a relation has been already investigated (although in the opposite way) in other studies (Beltratti and Paladino, 2013).

TABLE 16 – DESCRIPTION OF THE VARIABLES

Category	Variable	Description	Predicted sign
Market-based risk	P/BV	Price-to-book value	(+)
	GL/TA	Ratio of net loans on total assets	(+)
	IMPL/GL	Ratio of impaired loans on gross loans	(+)
	LLP/GL	Ratio of loan impairment charges on gross loans	(-)
	RIL/GL	Ratio of reserves for impaired loans on gross loans	(-)
	RIL/IMPL	Ratio of reserves for impaired loans on impaired loans	(-)
	LLP/IOL	Ratio of loan impairment charges on interest on loans	(+)
Credit risk variables	LLP/PIMOP	Ratio of loan impairment charges on pre-impairment operative profit	(+)
	RIL/TE	Ratio of reserves for impaired loans on total equity	(-)
	ECAP/TE	Ratio of economic capital on total equity	(+)
	LLP/IMPL	Ratio of loan impairment charges on impaired loans	(-)
	RWA/TA	Ratio of risk weighted assets on total assets	(+)
Liquidity	DMMS/TE	Domestic money market an short term funds on total equity	(+)
Performance variables	ROE	Net income on total equity	(+)
	PIMOP/TA	Pre-impairment operative profit on total assets	(+)

We, finally, assume the Tobin-q (PBV), which underpin the convenience of an aggressive behaviour in issuing loans and lead us to predict a positive sign of the relation with betas, and the GLTA (assumed as a proxy of the business model) as main control variables. Finally, other control variables are the magnitude of LLP on pre-impairment operative profit (LLPPIMOP) and on interest on loans (LLPIOL).

3.2 Descriptive statistics

Table 3 reports the main descriptive statistics (i.e. the mean and the coefficient of variation calculated as the ratio of mean on the standard deviation) for each variable and for each year under investigation.

Descriptive statistics reveal a plunge in PBV and profitability measures with high coefficients of variation. As regards credit-risk variables what emerges is an increase in loan impairment charges on gross loans over time, in particular during the peaks of the financial crisis (although with a reversion of the trend in the latest year of observations). However, not surprisingly, there emerges great variability especially in 2009 and 2010 unveiling a certain heterogeneity in provisioning behaviours across the European banking industry during the crisis. By contrast, the incidence of impairment charges on impaired loans shows a decreasing trend but with higher coefficients of variation during pre-crisis years while variability has been declining starting with 2008. What is worth to be pointed out are the high levels of economic capital relative to total equity during the pre-crisis periods and the sharp decline in the ratio which reflects the efforts of the banking industry to strengthen capitalization. Concerns, then, arise looking at the ratio of impairment charges on the interests on loans which shows a sharp upward trend during the crisis years.

TABLE 17 – DESCRIPTIVE STATISTICS

The table reports the mean and the coefficient of variation (standard deviation/mean) of the variables for each year within the time span 2005-2011.

1.3 Methodology

When testing the impact of both sectorial betas and loan quality on bank's betas a concern comes to the forefront, having to do with potential autocorrelation and endogeneity. Endogeneity, in particular, occurs when the dependent variable while being responsive to an independent variable affects the latter itself. In our setting the candidate variable to produce endogeneity is SECTBETA. Another variable which arguably can display endogeneity is ROE. Higher performances are expected to affect betas but can be themselves affected by systematic risk, to the extent that higher risk exposure lead to higher costs of external funds. Finally, there could be exogeneity with risk weighted assets (see Beltratti and Paladino, 2013). To address some concerns we start with a static approach. We start by employing a GLS fixed effects panel data model for predicting our dependent variable. The general model we employ is as follows:

$$\beta_{i,t} = \alpha + b_1 \text{sectbeta}_{i,t} + b_2 \text{llpgl}_{i,t} + b_3 \text{rilimpl}_{i,t} + b_4 \text{roe}_{i,t} + b_5 \text{ecapte}_{i,t} + b_6 \text{rwata}_{i,t} + b_7 \text{llpimpl}_{i,t} + b_8 \text{llppimop}_{i,t} + b_9 \text{dmmste}_{i,t} + b_{10} \text{glta}_{i,t} + b_{11} \text{rilgl}_{i,t} + b_{12} \text{llpiol}_{i,t} + b_{13} \text{pbv}_{i,t} + b_{14} \text{pimopta}_{i,t} + b_{15} \text{rilte}_{i,t} + v_{i,t} \quad (1)$$

Where i denotes the i -th bank and t identifies time.

In order to investigate the impact of the crisis we then introduce a dummy (CRISIS) which take value 1 for years 2008-2011 and 0 for others. We test for the effects of the interaction of such variable with LLPGL (CRISIS*LLPGL) and LLPPIMOP (CRISIS*LLPPIMOP) in order to assess whether the crisis alters the riskiness of the loan portfolio and hurdles financial performances. We test, moreover, an interaction of CRISIS, LLPGL and LLPIMPL (CRISIS*LLPGL*LLPIMPL) together.

After that, we control for endogeneity and run an instrumental-variables regression model which is generally employed in econometrics for dealing with endogenous variables. In order to check for endogeneity we follow Wooldridge (2002) and estimate a fixed effect version of equation 1 that includes future values (i.e., we create leading variables) of some regressors (see next section). We, then, run an Instrumental Variable regression for dealing with endogeneity and check for differences with the GLS model.

Results

In a static approach we explain bank's betas in our sample and for the reference time frame on the basis of a set of variables including the sectorial betas and other variables capturing bank's fundamentals. Table 4 presents the results. Column 1 summarizes the results including our base variables. Column 2 adds the effect of financial fragility (DMMSTE); column 3 adds the effects of interactions while column 4 comprises control variables. We apply a GLS paned data model with fixed effects. Evidences are quite mixed. The first model shows a positive and significant relation between bank's betas and sectorial betas. The relation between betas and ROE is significant at 10% level however, unexpectedly, the sigh of the relation is negative, meaning that higher profitability reduces exposure to systematic risk. It is possible that the sign is strongly influenced by the trends during the crisis, characterized by sharp increases in betas and plunges in bank's profitability. Eventually, this could explain the "absorption" in betas of wider macro risks captured by the sectorial index. The relation of other regressors (in particular those referring to loan quality) with betas is not significant and opposite to what expected implying that risks were not factored in balance sheets in the years preceding the crisis. The inclusion of DMMSTE do not alters significantly the outcomes of the model.

When we investigate the effects of impairment charges in the period 2008-2011 (see regression 3 in Table 4) we find that the sign of the coefficient CRISIS*LLPGL turns negative, coherently with prediction, and significant at 5% level meaning that the market factors an improvement in systematic risk exposure as banks increase impairment charges on their loan portfolio. Surprisingly, however, the sign of RILIMPL turns to be positive. Finally, the sign of CRISIS*LLPPIMOP is positive and significant at 1% level. The sign here is coherent with the negative sign attached

to ROE. It is interesting to see, however, that LLPPIMOP turns to be negative and significant at 1% level. The interaction CRISIS*LLPGL*LLPIMPL is negatively related to beta. When introducing the control variables we find a positive and 5% significant relation between GLTA and betas implying that systematic risk is responsive to the business model and increases with the exposure of banks to credit risk. The Durbin-Watson statistic reveals the existence of autocorrelation.

We then, check whether and to what extent things change when dealing with autocorrelation and endogeneity. In table 5 we check for strict exogeneity running a fixed-effect version of equation 1 introducing leading values of sectorial betas, ROE and RWATA. While the former are not significant, return on equity and risk weighted assets are significant. We, therefore, reject strict exogeneity of such variables.

We employ an Instrumental variables regression for dealing with endogenous variables. Table 6 summarizes the results of our regressions, whose design is the same as in Table 4, on basis of an Instrumental Variables model estimation. The only difference is that we treat control variables as instrumental variables for endogenous ones.

TABLE 19 – TEST OF STRICT EXOGENEITY

The table below reports the results of running a GLS-fixed effect version of the panel model in equation 1 including future values of SECTBETA, ROE and RWATA.

As in the previous regression analysis, we find a significant impact of sectorial betas on bank's betas. Controlling for CRISIS variable, we find that the significance of sectorial betas is weakening a bit but remains strong while fundamental factors becomes significant. More in depth, we find significant differences when introducing the CRISIS variable compared to the basic case where the impact of crisis is not taken into account. In particular, in the basic case we find, as expected, that risk weighted assets on total asset have a positive relation with betas at a 5% significance level. We find, therefore, support to our hypothesis 1 that risk exposure plays a significant role in explaining systematic risk while performance measures do not play a significant role. Dealing with endogeneity bias, therefore, things change.

LLPGL, RILIMPL, LICHIMPL and LICHPIMOP enter the relation with the expected sign. However, nor loan loss provisions or reserves are significant in explaining systematic risk. Our results suggest that while risk exposure

significantly and positively affects beta, risk-coverage policies (through loan loss provisions and reserves) do not have such a significant impact, arguably due to the fact that in good times loan losses are not a great concern. Bank's soundness measures have a negative relation as in the previous GLS model with betas. Again, however, the relation proves not to be significant.

In a CRISIS environment, fundamental factors gain relevance in explaining systematic risk as stated in our hypothesis 2 (column 3 in Table 6). Actually, traditional performance measures such as ROE again do not are significantly related with beta. Rather, we find that a significant role is played by loan loss provisions and, in particular, the ratios of provisions on gross loans and on pre-impairment operative profit.

The significance of LLPGL and LLPPIMOP resembles the results we found with our GLS model. Like in table 5, LLPGL enters with a negative sign which, as noted, is contrary to the predicted sign. The change in sign could find a possible explanation in the backward-looking behaviour of banks when dealing with provisioning, relating provisions to problem loans. Underestimation of losses during benign times naturally lead to overcharging when non-performing loans increases and the magnitude of the effect would be particularly strong during a financial turmoil. Therefore, a positive impact of LLPGL might be due to the failure of provisioning policies as a tool of smoothing earnings volatility. Apparently, we do not find support to our hypothesis 3 predicting the significance of the ratio of capital requirement on total equity (ECAPTE) in a crisis environment. In that, capital adequacy obviously becomes a concern. Looking at p-values of Hansens's test, we do not reject the null hypothesis. Therefore, our test hints a proper specification.

Discussion and implications

Our analysis has several implications at light of the extant literature on bank's earning quality, managerial incentives and the current debate surrounding the soundness of the banking industry. We find a positive relation between betas and RWATA. Such a relation has significant implications. It obviously implies the incentive to optimize risk exposure in order to economize in the cost of capital. At this regard, banks adopting an IRB approach for determining the regulatory capital might benefit of the advantages of a more precise alignment of regulatory capital to economic capital. Moreover, the relation we found between betas and RWATA might hinder an incentive for bank's managers to dampen the magnitude of risk on total assets should the bank have future growth opportunities to exploit. Moreover, we found a possible explanation to our finding in an underestimation of losses during benign conditions which would lead to overcharge provisioning in bed times. Should this hold banks would lack flexibility when growth opportunities would emerge. We feel, then, our results having significant implications as regards the impacts of different pieces of regulation and, namely, prudential capital adequacy regulation and accounting standards on managerial behaviours. Banking supervisors favours the use of accounting approaches based on conservatives valuations while IFRS counting standards are supportive to an incurred-loss approach. We found that the impact of LLPs proves to be significant in determining betas and, therefore, the cost of capital and such a relation is, arguably, particularly concerning during periods of distress.

Following the crisis supervisors have been requesting banks to increase their capital base. The latter are concerned with a potential increase in the weighted average cost of capital following a strengthening of the capital base due to higher levels of Tier 1 capital, supposedly more expensive than other sources of funds. While many theorists stress the fallacy of such an argument claiming that higher capital base reinforce bank's financial strength and, therefore, would imply a lowering of the cost of capital we put to the forefront another argument. We feel that our result of a positive and significant impact of loan loss provisioning in a crisis environment is an indirect argument in support of the income smoothing incentive. Rather to track an average benchmark-banks performance, such a behaviour should be targeted at dampening the volatility of betas and alleviating the impacts on the cost of capital during distress periods. Our results goes in favour of reducing the cyclicity of capital requirements through a system of dynamic provisioning such that experienced in Spain. In fact, where capital requirements are designed to cover unexpected losses, provisioning policies would be able to dampen the pro-cyclicity of the former. Finally, our results casts significant concerns as regards different forbearance behaviours and heterogeneous definitions of non-performing exposure across countries. As regards asset quality assessments different countries draw different lines between performing and non-performing loans. Apart hinder a proper assessment of asset quality by regulators, a lack of consistency in forbearance and non-performing loans definitions might have serious drawbacks for the market assessing the real soundness of banks across Europe. To the extent that such heterogeneity leads to biased systematic risk assessment it would imply distortions in accessing equity capital by banks, which is a major concern in the current environment of persisting uncertainty surrounding the banking industry.

Conclusions

Based on a sample of European banks we test for the determinants of bank's systematic risk in order to add evidence to extant literature and shed light into whether and to what extent betas respond to fundamentals. Our work is also another way to approach the issues relating to incentives to earnings management which have been widely analysed in literature. Our main findings are that bank's betas, apart being responsive to sectorial betas, are affected by the exposure to credit risk which could be measured as the ratio of risk weighted assets on total assets. Current performances are not significant in explaining systematic risk. Fundamentals become a significant factor in crisis periods. In particular, the magnitude of loan loss provisions plays the most significant role. By contrast we do not find evidence of a significant relation of banks' soundness measures with betas. Our work has several implications, in particular at light of current debate on banks recapitalization and supervisors' efforts to strengthen bank resilience. Other relevant implications, in particular across European countries, are related to the efforts of the European Banking Authority to harmonize the regulatory framework of forbearance practices and non-performing loans definitions. There remains room for future research investigating the impact of new pieces of regulation on capital requirements (Basel III) and forbearance practices on systematic risk assessment.

Does the volatility of interest rates affect the value of investment projects? A real option investigation

Abstract

One of the most challenging issues in management is the valuation of strategic investments. Indeed, there are several kinds of projects, for example those concerning brand extension, R&D and IT, that are strongly affected by uncertainty, see e.g. Santos et al. (2014), Kalhagen and Elnegaard (2002), Charalamopoulos et al. (2011), Manley and Niquidet (2010), Bernardo et al. (2012) and Baldi and Trigeorgis (2009).

When undertaking projects such as the aforementioned ones, which are characterized by a long-term horizon, a firm has also to face the risk due to the interest rates. In fact, interest rates do not remain constant over time but experience up-and-down movements and volatility that may become significant especially in the long run. In this work, we propose to value investments subject to interest rate risk using a Real Option approach, see, e.g., Schulmerich (2010). In particular, we model interest rates according to a stochastic process of Vasicek type and we calibrate it to the Euribor/Eurirs indexes. Such a process is then integrated in a Black-Scholes framework, which allows us to obtain an explicit formula for valuing various kinds of investment strategies (such as option to defer and option to expand). A numerical application is presented that illustrates the proposed real option approach from the practical point-of-view.

1. Introduction

Real options represent a tool for valuing investment projects that offer the managerial flexibility to postpone the decision to invest at a future time, see e.g. Santos et al. (2014), Kalhagen and Elnegaard (2002), Charalamopoulos et al. (2011), Manley and Niquidet (2010), Bernardo et al. (2012), and Baldi and Trigeorgis (2009).

As decisions made at a future time depend on market conditions that could be significantly different from the current ones, when valuing investments characterized by a long term horizon it is important to take into account the presence of stochastic interest rates. This topic has raised increasing interest especially in the last years, when, due to the financial crisis, interest rates have become very volatile. The issue of real option pricing under stochastic interest rates has also been considered in Schulmerich (2010), where a numerical approximation method based on a binomial tree is proposed.

In the present work we assume that interest rates evolve according to one of the most popular stochastic interest rate models in finance, namely the Vasicek model. This allows us to price real options by means of an exact analytical formula, so that the use of numerical approximation can be avoided.

Moreover, we calibrate the parameters of the Vasicek model to the Euribor/Eurirs indexes and we analyze the effect of the stochastic interest rates on a benchmark real option problem, see Kumar (1996). Our analysis reveals that the influence of the stochastic interest rates on the investment valuation strongly depends on the correlation between the interest rates themselves and the net present value of the cash inflows, on the time to maturity and on the volatility of the future cash inflows. In particular, the stochastic interest rates can substantially change the real option value when the correlation parameter, the time to maturity and the volatility of the future cash inflows are large.

The paper is organized as follows: In Section 2 the real option pricing models under both constant and Vasicek interest rates are described; in Section 3 an application problem is considered and the effect of the stochastic interest rates is analyzed; in Section 4 some conclusions are drawn and the main future directions of research are outlined.

2. Option pricing under constant and stochastic interest rates

Valuing investment decisions requires us to calculate the expected net present value of the future cash inflows S_T , minus the investment cost C_T . Therefore, if we take into account the possibility of not running the project if the economic conditions at maturity T are not favorable, we have to compute:

$$E \left[e^{-\int_{t_0}^T r_t dt} \max(S_T - C_T, 0) \right]. \quad (1)$$

The above expected value can be calculated using the Black-Scholes model (Black and Scholes (1973)), according to which the future cash inflows resulting from the investment to be valued follow the geometric Brownian motion:

$$dS_t = \alpha S_t dt + \sigma S_t dZ_{1,t}, \quad (2)$$

where α and σ are the (constant) drift and the (constant) volatility of the future cash inflows, respectively, and $Z_{1,t}$ is a standard Wiener process. In addition, the spot interest rate, which we denote r_f , is assumed to be constant. Moreover, let C_T be the cost of the investment to be made at a future date T , so that $\tau = T - t_0$ represents the so-called time to maturity, t_0 being the current time. Then, under these assumptions, the expected value (1) is given by the popular Black-Scholes formula:

$$V_{BS}(\tau, S) = S_{t_0} N(d_1) - C_T e^{-r_f \tau} N(d_2), \quad (3)$$

where

$$d_1 = \frac{\ln\left(\frac{S_{t_0}}{C_T}\right) + \left(r_f - \frac{1}{2}\sigma^2\right)\tau}{\sigma\sqrt{\tau}}, \quad (4)$$

$$d_2 = d_1 - \sigma\sqrt{\tau}.$$

Let us observe that in (3) $e^{-r_f \tau}$ is equal to the price P_{BS} a bond that pays one Euro at the future time T , i.e. under the assumption of constant interest rates, we have

$$P_{BS} = e^{-r_f \tau}. \quad (5)$$

Nevertheless, the dynamics of the interest rates in the last decade suggests that they may experience significant random variations and volatility. Therefore, in order to perform an accurate investment valuation in a world dominated by turbulent financial markets, it is essential to take into account the stochastic dynamics of interest rates, which is done in the present paper. In particular, we assume that the spot interest rate follows a mean-reverting process of Vasicek type:

$$dr_t = q(m - r_t)dt + v dZ_{2,t}, \quad (6)$$

where q , m and v are the so-called speed of mean reversion, long-run mean and instantaneous volatility, respectively (q , m and v are assumed to be constant), and $Z_{2,t}$ is a standard Wiener process having a constant correlation ρ with $Z_{1,t}$.

Based on the geometric Brownian motion (2) and the Vasicek process (6), the expected value (1) can be determined using the closed-form solution as obtained in Rabinovitch (1989):

$$V_{RAB}(\tau, S_{t_0}, r_{t_0}) = S_{t_0} N(D_1) - C_T P_{RAB}(\tau, r_{t_0}) N(D_2), \quad (7)$$

where

$$\begin{aligned} D_1 &= \frac{\left(\ln \left(\frac{S_{t_0}}{C_T P_{RAB}(\tau, r_{t_0})} \right) + \frac{\mathcal{G}}{2} \right)}{\sqrt{\mathcal{G}}}, \\ D_2 &= D_1 - \sqrt{\mathcal{G}}, \\ \mathcal{G} &= \sigma^2 \tau + \left(\tau - 2B + \frac{(1 - e^{-2q\tau})}{2q} \right) \left(\frac{v}{q} \right)^2 - \frac{2\rho\sigma(\tau - B)v}{q}, \end{aligned} \quad (8)$$

and $P_{RAB}(\tau, r_{t_0})$ is the price at time t_0 of a bond that pays one Euro at time T computed based on the stochastic process (6). The value of $P_{RAB}(\tau, r_{t_0})$ has been obtained by Vasicek (1977):

$$P_{RAB}(\tau, r_{t_0}) = A e^{-Br_{t_0}}, \quad (9)$$

where

$$\begin{aligned} B &= \frac{1 - e^{-q\tau}}{q}, \\ A &= e^{k(B-\tau) - \frac{v^2 B^2}{4q}}, \\ k &= m + \frac{v\lambda}{q} - \frac{v^2}{2q^2}, \end{aligned} \quad (10)$$

and λ is the market price of risk. For the sake of simplicity, following a common approach, in the present work we set $\lambda = 0$. It is worth noting that formula (7) differs from the Black-Scholes one as the term \mathcal{G} takes into account not only the volatility of the future cash inflows, but also the volatility of the interest rate and its covariance with the future cash inflows (compare (4) and (8)).

3. Effect of the interest rate volatility: An empirical analysis

In this section we consider an application problem and we examine the differences between the case of constant interest rates (formula (3)) and the case of stochastic interest rates (formula (7)).

To perform an accurate analysis of the effect of the stochastic interest rates, the parameters of the Vasicek model are calibrated to real market data. Specifically, we have considered the Euribor/Eurirs indexes in a time period ranging from one month to thirty years, and we have obtained:

$$r_{t_0} = 0.0013, \quad q = 0.41, \quad m = 0.0094, \quad \nu = 0.0123. \quad (8)$$

In order to compare the project valuation obtained using the Black-Scholes formula with that obtained using the Rabinovitch formula, we impose that (5) and (9) yield the same bond value. By doing that the interest rate to be

used in the Black-Scholes formula is obtained as $r_f = -\frac{\ln\left(P_{RAB}(\tau, r_{t_0})\right)}{\tau}$, where $P_{RAB}(\tau, r_{t_0})$ is the bond price calculated according to (9).

The real option parameters are taken from Kumar (1996):

$$S_{t_0} = 20000, \quad C_T = 15000, \quad \tau = 5, \quad \sigma = 0.4. \quad (9)$$

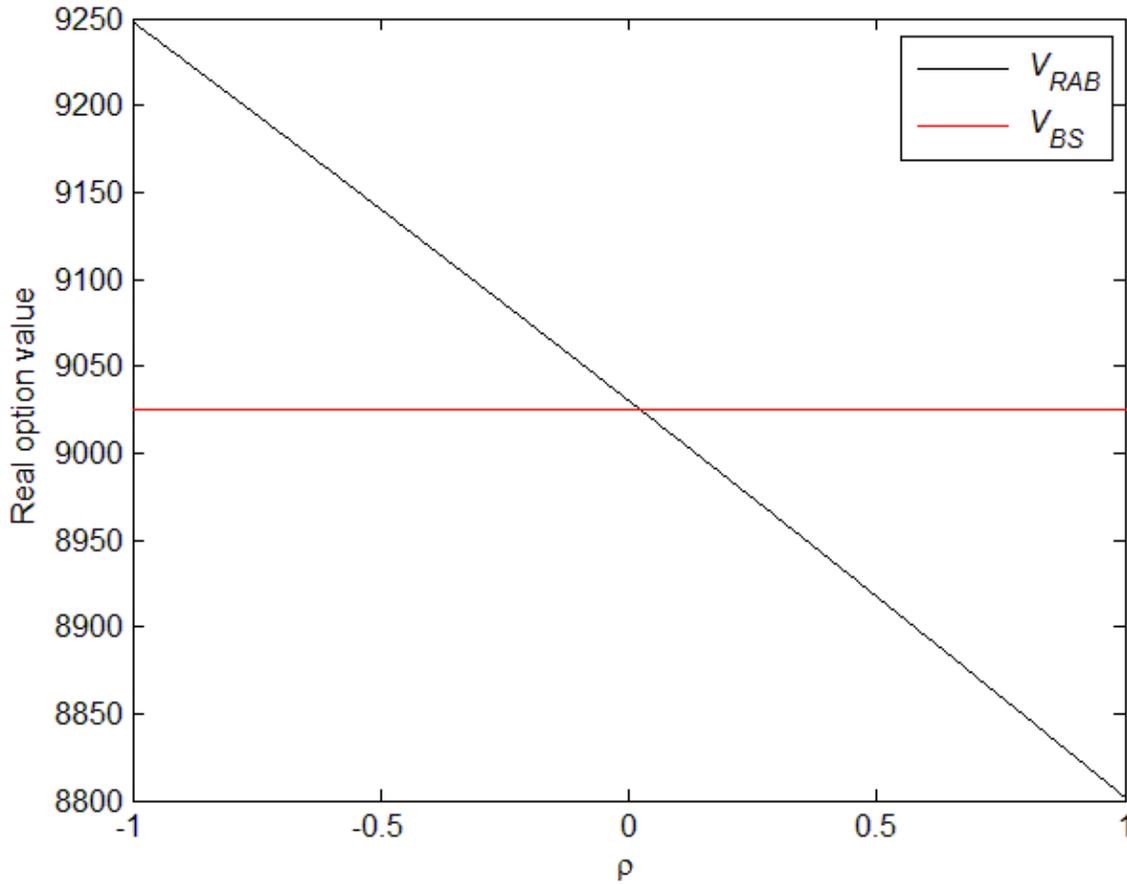

FIGURE 1. EFFECT OF THE CORRELATION COEFFICIENT ON THE REAL OPTION VALUE.

Figure 1 shows the real option price for different values of the correlation coefficient. We note that for values of ρ that are small in magnitude (say, approximately, $-0.1 < \rho < 0.1$) there is not any significant difference between the Black-Scholes formula and the Rabinovitch formula. Instead, for values of ρ that are negative and large in magnitude (say, approximately, $\rho < -0.75$), the Black Scholes formula significantly underprices the real option, i.e. $V_{BS} < V_{RAB}$, whereas for values of ρ that are positive and large in magnitude (say, approximately, $\rho \geq 0.75$) the Black Scholes formula significantly overprices the real option, i.e. $V_{BS} > V_{RAB}$.

This fact has the following economic explanation: if ρ is negative and large in magnitude then to the higher values of S_T (those that are bigger than C_T and hence concur to determine the option value, see (1)) correspond lower interest rates and therefore the present value of the investment tends to be higher.

Let us now vary the time to maturity. The results obtained are reported in Figure 2. Again, as experienced before, for values of ρ that are small in magnitude there is not any significant difference between the Black Scholes formula

and the Rabinovitch formula. Instead, for values of ρ that are negative and large in magnitude we have $V_{BS} < V_{RAB}$ and the relative difference increases as τ increases, whereas for values of ρ that are positive and large in magnitude we have $V_{BS} > V_{RAB}$ and the relative difference decreases as τ increases. However, we can see that the differences between V_{BS} and V_{RAB} are appreciable only for times to maturity larger than approximately four years (we are assuming that the relative difference between V_{RAB} and V_{BS} is appreciable only if it is greater than 2% in magnitude).

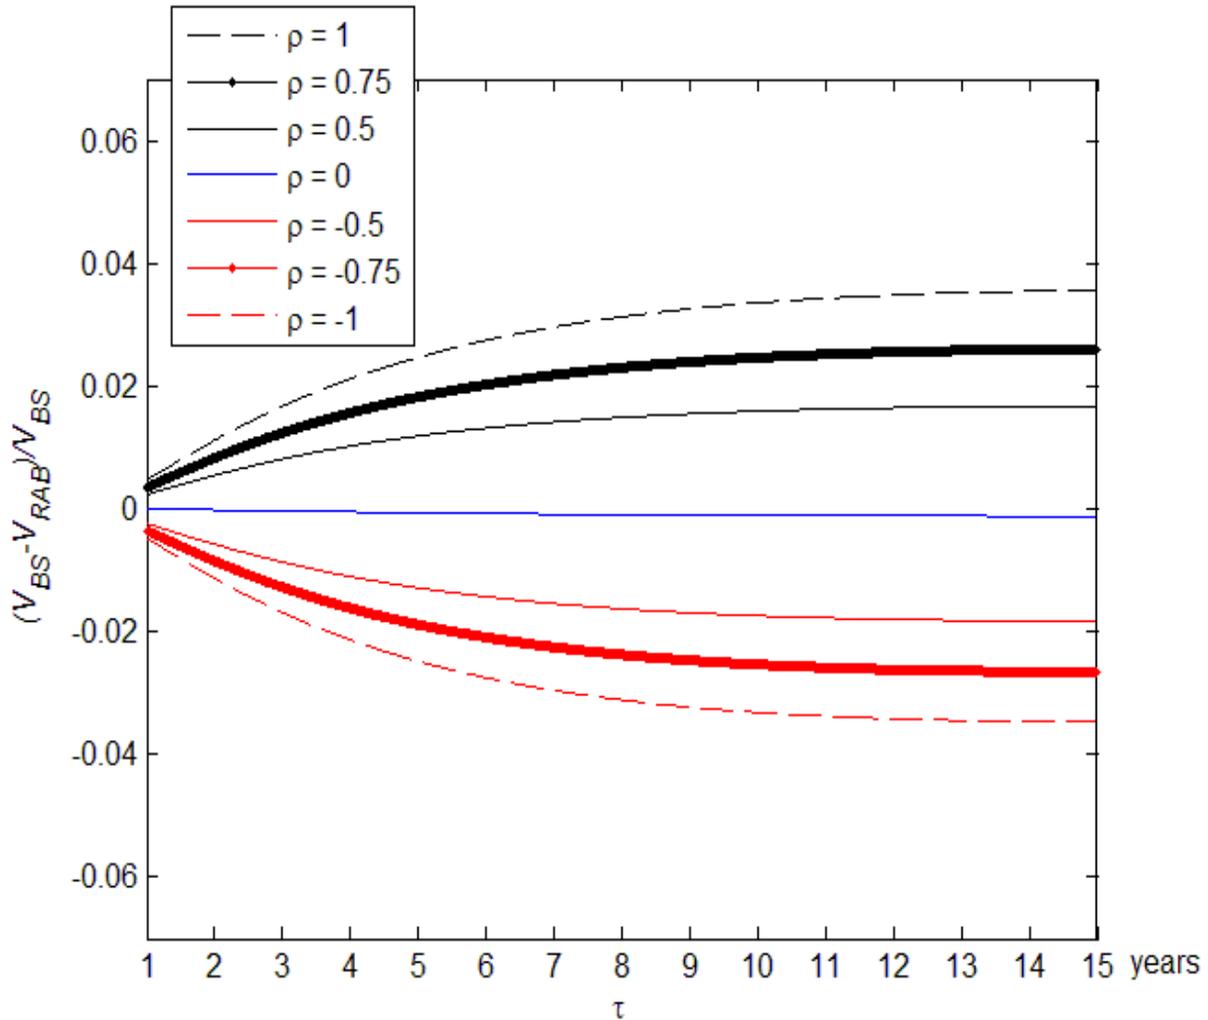

FIGURE 2. GAP IN THE VALUE OF THE REAL OPTION BETWEEN THE BLACK-SCHOLES FORMULA AND THE RABINOVITCH FORMULA AS A FUNCTION OF THE TIME TO MATURITY.

Let us conclude the sensitivity analysis by varying the volatility of the future cash inflows. This is an important aspect as σ is a characteristic parameter of any project and it is not easy to determine.

As we can observe by comparison of Figure 3, Figure 4 and Figure 5, the qualitative shape of the curves obtained does not significantly depend on the time to maturity. On the contrary, the time to maturity can significantly affect the value of the relative difference between V_{BS} and V_{RAB} . In particular, if $\tau = 1$ and $|\rho| = 1$ the relative difference between V_{BS} and V_{RAB} has a maximum equal to approximately 0.005 and a minimum equal to approximately -0.005 , whereas if $\tau = 15$ and $|\rho| = 1$ the relative difference between V_{BS} and V_{RAB} has a maximum equal to approximately 0.06 and a minimum equal to approximately -0.06 .

However, the relative difference between V_{BS} and V_{RAB} are significant, i.e. greater than 2% in magnitude, only for values of τ , ρ and σ which are large in magnitude, say $\tau \geq 5$, $\rho \leq -0.75$ or $\rho \geq 0.75$ and $\sigma \geq 0.15$.

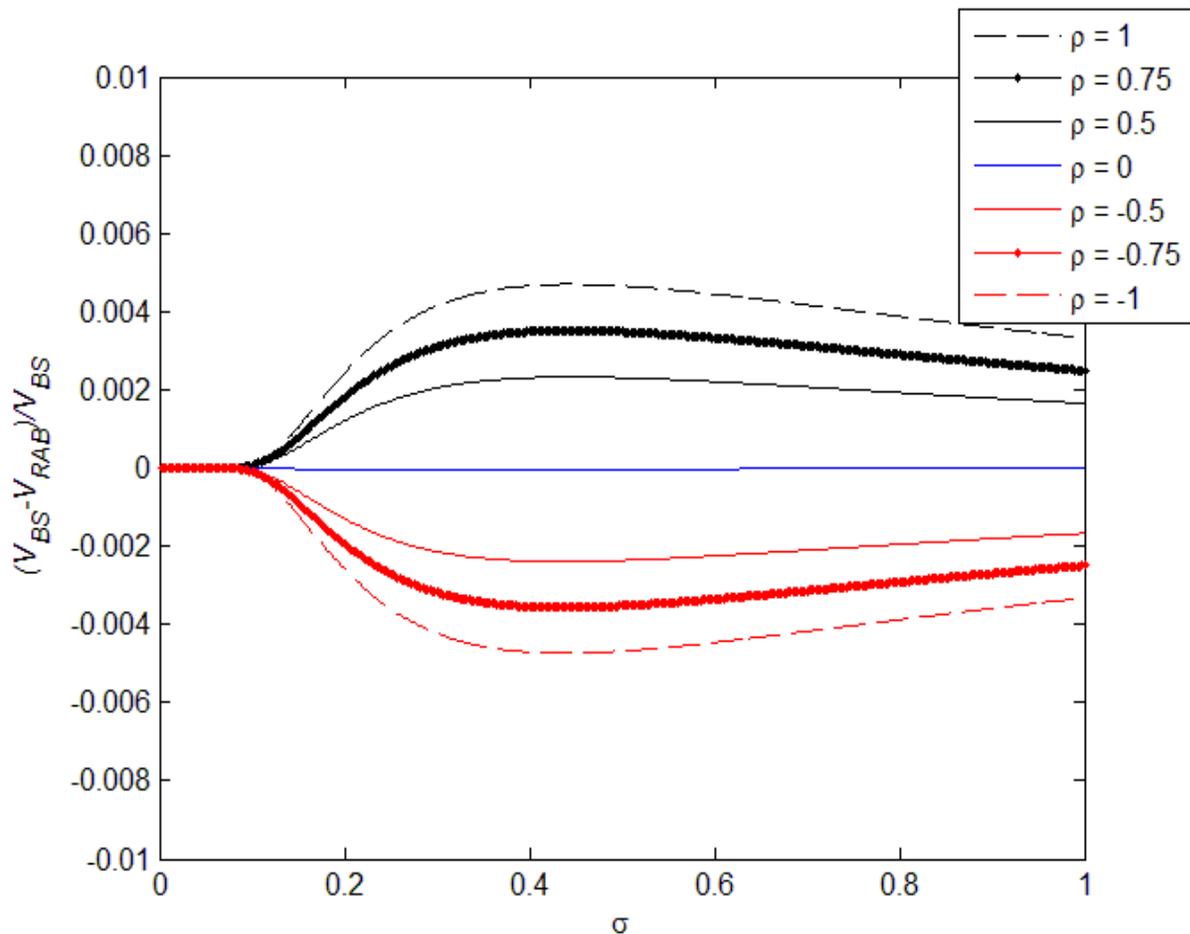

FIGURE 3. GAP IN THE VALUE OF THE REAL OPTION BETWEEN THE BLACK-SCHOLES FORMULA AND THE RABINOVITCH FORMULA AS A FUNCTION OF THE VOLATILITY OF THE FUTURE CASH INFLOWS, $\tau = 1$.

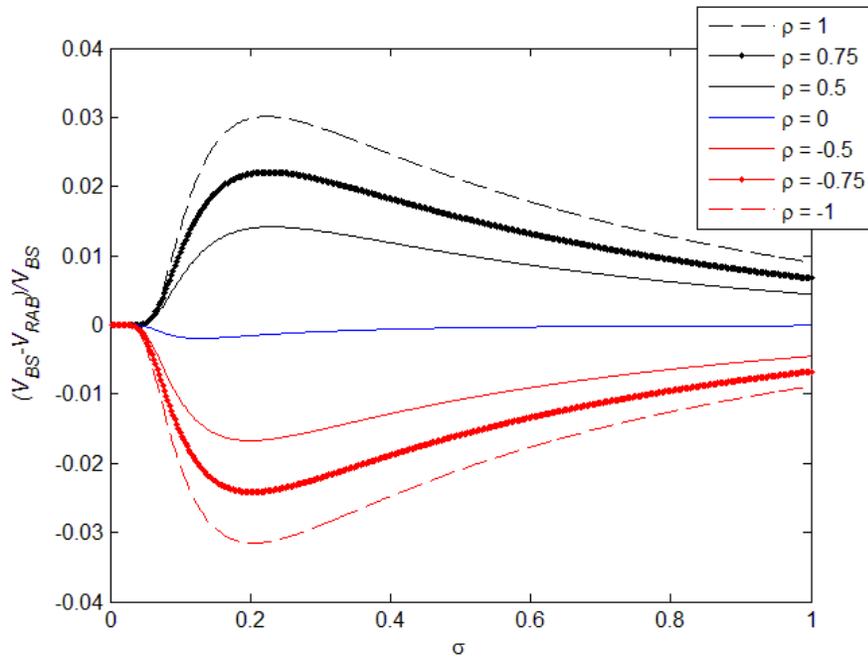

FIGURE 4. GAP IN THE VALUE OF THE REAL OPTION BETWEEN THE BLACK-SCHOLES FORMULA AND THE RABINOVITCH FORMULA AS A FUNCTION OF THE VOLATILITY OF THE FUTURE CASH INFLOWS, $\tau = 5$.

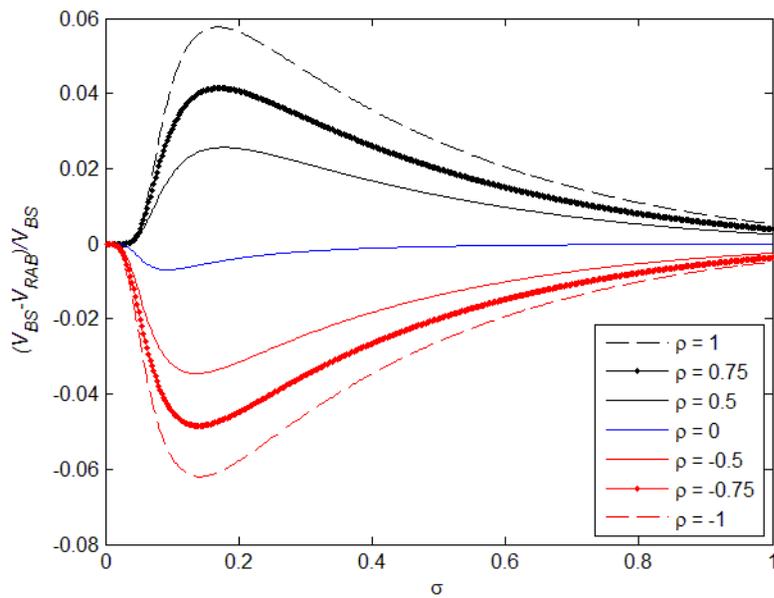

Figure 5. Gap in the value of the real option between the Black-Scholes formula and the Rabinovitch formula as a function of the volatility of the future cash inflows, $\tau = 15$.

4. Conclusions

In this paper, we propose a real option approach which also takes into account the uncertainty due to the interest rates.

In particular, by employing the popular Vasicek model, which allows us to use the closed-form solution obtained by Rabinovitch (1989), we investigate the effect of the interest rate volatility on the valuation of investment projects. This analysis is done by considering an application case related to the problem described in Kumar (1996).

The results obtained reveal that the stochastic interest rates can substantially affect the project valuation when the correlation between the stochastic interest rates themselves and the net present values of the cash inflows, the time to maturity and the volatility of the future cash inflows are large.

These findings indicate that a deeper analysis of the effect of the interest rate volatility on the value of strategic investments is worth to be done. In particular, it could be interesting to investigate how stochastic interest rates impact the valuation of projects different from the one considered in this paper. This will be the subject of a future work.

Empowerment through E-Governance in Developing Economies: The Case of India

Abstract

This paper focuses on strategies undertaken in India and other developing economies to achieve empowerment of all stakeholders, particularly the rural poor through context oriented policies of e-governance. With a strong emphasis on principles of governance, the government's involvement in the implementation of information and communication technology in all levels of central and state governments is analyzed. The goal of the digital economy is to have a universal reach. Additional reforms are suggested for the limitations in the current measures.

Introduction

The exponential growth of technology, internet, and mobile connectivity has prompted businesses and governments to offer their services with increased efficiency while their customers and citizens have started demanding enhanced output and value. The information age has paved the way for emphatic democratic participation and requirement of information with full disclosure cum transparency. India's information technology (IT) sector employs more than a million people with \$17 billion revenues per annum but, yet the benefits of the *digital economy* are somewhat limited to select urban areas. So, the other areas particularly, in poor states have not derived any such advantages. This results in not only a rural-urban digital divide but also a new urban-urban digital divide among different states [Das and Narayanan, 2005]. The United Nations (UN) ranked India as having minimal E-government capacity with a meager score of 1.29 in 2001 but considered the country to have a promising interactive presence. The UN observed that India had benefited from the combination of political leadership and professional civil service¹. The study also identified the enormous infrastructure and human capital challenges for India as it continues to lose qualified personnel to other countries. The need for e-governance stems from its potential benefits such as, efficiency, improved services, better accessibility of public services, and transparency [Gajendra, Xi, and Wang, 2012].

The United Nations Educational, Scientific, and Cultural Organization (UNESCO) defines governance as "the exercise of political, economic and administrative authority in the management of a country's affairs' and e-governance as "the performance of this governance via the electronic medium in order to facilitate an efficient, speedy and transparent process of disseminating information to the public, and other agencies, and for performing government administration activities". The concept of e-governance emphasizes governance and not technology. Therefore, India desires to maintain 20% of its efforts in technology while the remaining 80% would involve management. Estimates indicate that 35% of e-government projects are likely to be total failures, 50% to be partial failures and the remaining 15% will be successful [Heeks, 2003]. The reasons for such failures are attributed to direct and indirect financial costs, opportunity costs, political costs, beneficiary costs, and future costs. This paper focuses on strategies undertaken in India to achieve empowerment of all stakeholders, particularly the rural poor through context oriented policies of e-governance. With a strong emphasis on principles of governance, the government's involvement in the implementation of information and communication technology in all levels of central and state governments is analyzed. The goal of the digital economy is to have a universal reach. Additional reforms are suggested for the limitations in the current measures.

Literature Review

Traditional businesses and industrial houses are embracing the digital economy with alacrity thus redefining the business landscape forthwith to create new markets and sectors for the existing business line. They are ready to reap the benefits of lower inventory costs, instant access to distributors and suppliers, faster response time, and, greater

¹ Benchmarking E-government: A Global Perspective – Assessing the Progress of the UN Member States, May 2002, Page 28

customer satisfaction [Sharma, 2000]. The customer-centric digital economy needs business leaders and strategic thinkers to develop a new skill-set to recognize the evolving future and make critical decisions for the organization [Srinivasan and Balasubramanian, 2003]. Governments in developing economies are vastly encouraged by the advent of technology-based banking services round the clock in industrialized societies. Even weaker economies such as Ghana, Tanzania, and Kenya have introduced national clearing house, decentralized district governance, and reduction of corruption respectively through enabling information technology in their operations [Backus, 2001]. Reforms at the grassroots level in local administrations in India have created both direct and representative democratic channels that place administrative and fiscal development power in such individual village administrations have been deemed Empowered Deliberative Democracy (EDD) [Fung and Wright, 2001]. In general, public governance revolves around social, economic, cultural, political and legal dimensions of the environment. The technology conditions have helped India reach beyond the common parameters. The paradigm shifts in public organizations by the application of e-Government technology are ultimately aimed at improving functional efficiency and effectiveness of the government organizations [Haque and Pathrannarakul, 2013].

After a comparative analysis of key policy statements on e-government reform made in the US, British, and EU initiatives, Chadwick and May cite the marginalization of the internet by the government use of technology and conclude that “an executive-driven, “managerial” model of interaction has assumed dominance at the expense of “consultative” and “participatory” possibilities” [Chadwick and May, 2003]. Definitions of e-government, e-administration and e-governance are wide-ranging. The importance of distinguishing between e-government and e-governance for both scholarship and practice is addressed in depth [Bannister and Connolly, 2012]. E-government is narrow in scope as it points out to a government offering its services and functions to its citizens through technological platforms and may be seen in e-tax and e-health. E-governance is broad in approach as it deals with the use of technology to manage resources in the implementation of policy and directed towards all stakeholders.

The majority of functions of an e-government revolve around inter-organizational relationships covering policy coordination, implementation, and public service delivery. E-administration describes intra-organizational relationships that govern policy development, organizational activities, and knowledge management. E-governance focuses on the interaction among citizens, governmental institutions, and the bureaucracy and thus is based on a democratic process, openness of the government, and the transparency in decision-making at all levels. The relationship between e-government and e-governance rests on static, dynamic and integrated strategy clusters and so, are supply-based, demand-driven and interactive respectively [Haiyan, 2011]. Human factors unfortunately act as hindrances in the adaptability of e-governance initiatives in the public sectors of India and so considering those factors before implementation is critical to reap the benefits of good governance [Mishra and Sharma, 2013]. The view of treating e-government projects as opportunities for innovation must extend to wider innovation to create more democratic forms of governance [Navarra and Cornford, 2012].

The Indian Context

India has about 150 million fixed broadband internet subscribers for a penetration of just over 10% which is dwarfed by 80% penetration in the United States. The country makes up for that lapse with more than 865 million mobile phone subscribers which accounts for a penetration of about 70%. Two-thirds of the population being in its thirties, the digital revolution is transforming the society at a fast pace [Dahiya, 2013]. This has led to the government implement its citizen-centric initiatives through computerization of all its departments with a sense of service orientation and transparency. The evolution of e-governance has brought all the services offered by the central and state governments closer to all citizens alike with a collective vision and shared cause. The gap between a developing economy and an industrialized society with regards to e-government is shown in Table 1.

A series of broad steps taken by the government in the past four decades for a better and efficient use of technology is listed in Table 2. The main thrust for e-Governance was provided by the launching of the National Satellite-based Computer Network (NICNET) in 1987. NICNET was extended via the State capitals to all district headquarters by 1990. In the ensuing years, with ongoing computerization, telephone connectivity, and internet connectivity, the government established a large number of e-Governance initiatives, both at the central and state levels. The Department of Electronics and Information Technology formulated the National e-Governance Plan (NeGP) in 2006 to boost the e-Governance process and offer citizen services, business services, and government services. All public services are delivered through electronic platforms thus getting the name e-transaction.

TABLE 2: MAJOR INITIATIVES IN INDIA FOR ICT PROLIFERATION

Year	Steps / Establishment of Unit	Objective(s)
1970	The Department of Electronics	Increasing importance of technology
1977	The National Informatics Centre (NIC)	First step toward e-governance Focus on information and communication
1980s	Use of computers	Manage databases and process information
1987	National Satellite-based Computer Network (NICNET)	Main thrust for e-governance
1987	District Information System of the National Informatics Centre	All district offices linked
1990	Extension of NICNET to State capitals and district headquarters	
1998	National Task Force on IT and Software Development	Assimilate and process all spheres of knowledge
1999	Union Ministry of IT	
2000	12-point agenda for e-governance identified	
2006	National e-governance plan (NeGP)

They use information and communications technology (ICT) tools to improve access, enhance transparency, and reduce response time. They provide visibility for the national and state level services of e-governance projects and present status on actual utilization of various systems at various locations. Service is requested through electronic means (self-access or assisted access) including mobile devices, workflow and the approval process is electronic, database is electronic (digitized), and service delivery is electronic. The purpose and scope of the e-transactions are to improve access, enhance transparency, and reduce response time. In the recent two months of January and February of 2014, there have been 162 million e-transactions at the central level (286 million at the state level) with 8,200 per each 1,000 population. This is a clear evidence of the mammoth success that the e-transactions have generated. The categories of e-transactions span over the major categories of statutory and non-statutory services, utility bill

payments, business-to-citizen (B2C) services, informational services, social benefits and mobile governance. Table 3 indicates the degree of reach of such e-governance services to the population through the availability of mobile connections along with a comparison to select markets. The status of India in a growing global mobile market is captured in Figure 1.

ICT governed programs and initiatives are intended to curb, cut, mitigate, and control corruption [Ionescu, 2013]. Citizens have overcome the perils of bribes and corruption prevalent in the bureaucracy at all levels. They may now use e-transactions for obtaining certificates, licenses and permits, collect land revenue, participate in integrated finance management services, make payments for residential tax, commercial tax and utilities, receive social welfare and pension, use passport & visa services, derive benefits from financial inclusion, and apply for skill development, and state specific services. Such expanded services from a country ranked seventh in the world behind major industrialized countries has accomplished improved planning, monitoring mechanisms, cost savings through rationalization, and effective administration and delivery of a wide variety of public services. This is the true empowerment of all citizens especially, the rural poor.

TABLE 3: INDIA COMPARED TO SELECT COUNTRIES FOR MARKET PENETRATION (%)

Ratio of Mobile Connections to Population			
	2010	2011	2012
Bangladesh	48.82	61.19	70.09

National E-Governance Plan

The National E-Governance Plan (NeGP) is an integration of a collective vision and shared purpose. It takes a holistic view of diverse e-governance efforts undertaken and highlights the central and state governments making a combined effort to implement major initiatives. They may be broadly classified into three categories, namely, government to citizen (G2C), government to business (G2B), and government to government (G2G) initiatives. The G2C initiatives comprised of computerization of land records and service delivery thereof for establishing ownership, title, transfer, and tenancy besides offering solution to grievances and complaints. Some of the G2B initiatives were intended to provide congenial legal environment, expedite processes and provide relevant information to businesses. E-procurement and e-filing of statutory documents fall under this category. G2G initiatives are meant to increase the efficiency with which internal government processes share information among themselves to assist in the decision-making. The government has identified 31 projects as Mission Mode Projects (MMPs) where each one focuses on one key aspect of e-governance. Banking, agriculture, pension, immigration, foreign direct investment for e-trade, and insurance are some examples of MMPs. Some of the key benefits of e-governance accomplished through these measures are shown in Table 4.

Challenges, Suggested Reforms and Conclusion

According to the UN, for the majority of Asian countries, the e-government environment is weak and addressing the infrastructure gaps should be their top priority². The major reason for individual projects' failure is due to the gap between the design of technology and the reality of its context of application [Dada, 2006]. Certain e-governance applications have failed as they have been implemented with a techno-centric bias instead of governance-centric initiative [Saxena, 2005]. Failures also stem from the use of existing technology from the industrialized societies in developing countries whose needs are vastly different [Brewer, 2005]. There are numerous criticisms against such e-governance initiatives. First, skeptics raise questions as to whether e-governance can eradicate poverty, reduce inequality and satisfy basic human needs in a poor country like India [Haque, 2002]. The government may overcome such criticisms by suitable reforms. Secondly, critics stir up a fear that information technology may end up creating the equivalent of India's deeply divisive caste system in the 21st century [Hariharan, 2002]. Internet connectivity and mobile connectivity are tools to accomplish true success of democracy as both are above economic status and social conditions. Adopting a centralized approach for the management of knowledge, documentation, grievances and human resources, and a decentralized approach for core applications such as property transfer cum registration, vehicle registration, and building approval is suggested to form a unified digital framework for effective e-governance operation [Rao, 2013]. Public sector managers are challenged to perform a balancing act between maintaining openness as demanded by e-governance and also achieving private-sector efficiency. There is thus a need to develop theoretical frameworks, models, and training to help managers accomplish the dual goal [Halachmi and Greiling, 2013].

TABLE 4: CONTRIBUTION TO E-GOVERNANCE BY ICT-ENABLED GOVERNANCE

Internal Benefits	External Benefits
Avoidance of duplication	Faster service delivery
Reduction in transaction costs	Greater efficacy
Simplified bureaucratic procedures	Increased flexibility of service use
Greater efficiency	Innovation in service delivery

Better coordination and communication	Greater participation
Enhanced transparency	Greater citizen empowerment
Information sharing by agencies	Citizen participation
Security of information management	

Source: "Promoting e-governance: The Smart Way Forward", Chapter3, Government of India, Second Administrative Reforms Commission, 11th Report, December 2008

The success of any e-government relies upon its sound principles of e-governance. The initial success of the industrialized societies is presently being emulated by developing nations as well. E-governance has a wide appeal among all classes of the country and widespread use of the technology applications would lead to success in the modern era. Implementation of e-governance initiatives are subject to obstacles from (human factors such as computer literacy, technological factors such as infrastructure deficiencies, and other factors that would include cost, systems, and legal infrastructure [Sharma, Mishra, and Mishra, 2011]. The benefits of e-filing income tax returns in India are exclusive to select salary earning stakeholders and so do not appeal to all sections of the society [Singh and Singh, 2013]. The evaluation results of e-governance projects in select regions highlight the need for addressing policy gaps. They also suggest improvements required in capacity building, development of common standards, instituting security guidelines, ensuring quality, completeness, depth and spread of services, coordination and change of mindset [Kalsi and Singh, 2013]. Similar conclusion is drawn in the context of countries in the United Arab Emirates where the low score in e-participation reflects a gap in the mindset of policy makers in government and stakeholders, and the absence of effective application of the principles of good governance [Al Athmay, 2013].

The Government of India has identified that the success of some of the pilot projects were not properly replicated and the need for projects to be context-oriented. Some of the policy recommendations under consideration include building a congenial environment, creating the institutional framework for coordination and sharing of resources and information, identification, prioritization, implementation, monitoring and evaluation of e-governance projects, business process re-engineering, capacity building and creating awareness, developing technological solutions.

End Note

A Review of Theories on Foreign Direct Investment

“Aleksander Moisiu” University, Durrës, Albania

A Review of Theories on Foreign Direct Investment

Abstract

Many researchers have studied foreign direct investments (FDI) due to the nature that have. Many authors have expressed their convictions about FDI in host countries due to the effects that have. In many studies, it is noticed that researchers treated the effects of FDI in host countries, which made them focus more on developing the theories of FDI. Why foreign direct investment are increased in recent years? Which are main priorities that require foreign investors? Which countries choose to invest? What determinants should have countries to absorb FDI? The answers of these questions can be found in the theories of FDIs, some of which are presented in more detail in this paper. Some of the theories that will be treated in the paper are the product cycle theory, the internalisation theory, the eclectic theory etc.

Key words: FDI, theory of FDI,

Introduction

Foreign direct investment is dedicated importance nowadays, due to the role they play. Most governments of developing countries compile stimulatory policy to attract more foreign investors. To understand the complex nature of FDI, it is important to treat some of the main theories. In the first treatment, it is noted that researchers have been critical for the effects of FDI on host countries. In various publications, we find different opinions about foreign direct investment due to the impact they have had, but, in all recent works, we see that FDI affects positively on the economic growth of host countries.

In this paper will be treated several theories, such as product cycle theory, internalisation theories, eclectic theory etc. Because there are many theories and explanations for FDI, it is impossible to identify a single theory to them.

Product cycle theory

The product cycle theory of (Vernon, 1966) explains the interactions between the ownership-specific advantages and location-specific advantages. According to Vernon, the product life cycle passes through these stages: introduction (new products), maturity, standardization and decline. The product life cycle theory describes best the role of technology in international trade. This theory treats the role of US multinational enterprises in the 1950s, which given the fact that owned advanced technology started to enter even in European markets.

According to this theory in the first stage, companies own a more advanced technology. Such technology is viewed as one of the main advantages for them, as they can launch new products in the market with a lower cost. Such products appear initially in the developed countries, as only these countries have advanced technology. The increase of production of such products can be offered to foreign markets through exportation. When production starts to expand due to an increase of demand by consumers, the product has entered the maturity stage. In this stage, there is an increase in the number of manufacturing firms which influence the increase of competition and in the decrease of the product price in the market. In the standardization stage, all firms try to offer products the cheapest possible. Such products can be manufactured at this moment not only in the developed countries (where such products were introduced) but also in other developing countries. In this way European firms started to produce products similar to the American products (Vernon 1966).

Under the hypothesis of the product life cycle, the firms wanting to operate in foreign markets should possess monopolistic or oligopolistic advantages. Otherwise, firms should possess other advantages competing with the domestic firms in order not to operate in insecure conditions in foreign markets. The product cycle starts with the proposal that firms should offer products that are not manufactured in the host country economies. At the same time, foreign firms can exploit the natural resources available in the host countries. The host countries can play a double role, since they serve not only as a stimulation source for new firms, but also they can be more favourable for further development and expansion of investing. (Vernon R. , 1979)

Kojima's Macro-economic Approach

In his macro-economic approach (Kojima K. , 1973) tried to identify the main characteristics of two different types of FDI: pro-trade oriented (or Japanese type) and anti-trade (American type). He argued that FDI play an important role in creating competition in market factors by improving the production process in the host country.

Later on, (Kojima & Osawa, 1984) tried to create a model which dealt with international trade and foreign direct investments. According to this, FDI take place if a country has some comparative advantages in producing a product, while international trade is based on the comparative advantages.

However, Kojima's macro-economic approach faced a lot of critics. Such critics were mainly related to the differentiation he made between Japanese FDI or pro-trade oriented FDI and US FDI or "anti-trade-oriented" FDI. Kojima supported the idea that US FDI in advanced technology industries were premature and harmful¹.

Aliber's theory

(Aliber, 1970) tried to explain FDI through the financial markets relations. His model can be viewed as a suggestion to the foreign investment firms which are about to face the capital market imperfections and exchange rates².

(Aliber, 2003) treats a new approach on multinational corporate. He was one of the first authors to explain the afflux of FDI in the '80 towards US. In addition, he suggests that changes in the relative norms of a country's economic development have an important influence in the decisions and practices of investing firms. He argues that during the period that the real norms of interests are high the profits that firms receive are high as well. During this period, also the currency of the host country is appreciated. In his study, he dealt with the conflict between host countries governments and multinational enterprises.

(Buckley dhe Casson, 1976) as (Kusluvan, 1998) cites, criticise the theory of Aliber that FDI have a tendency to flow from the countries with a strong currency to the countries with a weak currency, as such theory does not explains the increase of European and Japanese multinational enterprises.

FDI internalisation theories

(Buckley dhe Casson, 1976) in their study on "The future of multinational enterprise" analysed the growth of multinational companies and their incentives to attract foreign direct investments. For these companies to maximise their profit while reducing manufacturing costs, they should create an internal market.

(Buckley & Casson, 1985) were among the first authors who introduced the internationalisation specific advantage in their FDI analysis. In that time, FDI were increasing in high technology production industry, where integration of research and development with marketing was crucial. (Buckley & Casson, 1985) emphasized the importance of imperfections in intermediate product markets, in particular of the patented technical knowledge (know-how) and human capital (Sezer, 2006).

(Buckley dhe Casson, 1976)³in their study went further with the industry orientation and the main determinants of international investments flows. Such determinants can be classified into three main groups:

- Maximisation of profit in imperfect markets;
- Creation of internal domestic markets for intermediate products
- Internalisation of markets across national borders

As a precondition for the creation of internal markets (Buckley dhe Casson, 1976)⁴defined four main factors:

- Industry- specific factors related to the nature of product and the foreign market structure;
- Region-specific factors, such as geographical distance and social and cultural aspects;
- Nation-specific factors, such as political and fiscal factors;

⁴Buckley dhe Casson, 1976 p. 74

- Firm-specific factors, such as leadership, management, organization.

In addition, (Buckley dhe Coasse, 2009) analysed the progress of their research on “*The future of Multinational Enterprise of 1976*”. This study analysed the concept of multinational enterprise, foreign market entry modes, and the impact of innovation on corporate expansion and the role of culture in international business. This theory is combined with the market theory and organization theory to explain international joint-ventures, and with innovation theory to explain different industry types where a firm would operate. The achievement of these authors with this research was the progress analysis of internalisation theory. This progress covered four main areas⁵:

- Testing of theory;
- Analysis of foreign market entry and development strategies;
- International Joint Ventures;
- Dynamics, innovation and real opportunities
- The role of business culture in international business.

The internalisation theory is appreciated by Dunning as well; his theory is dealt in more detail below.

Eclectic theory of FDI

Dunning is one of the authors who concentrated more on the nature of multinational enterprises and FDI. (Dunning, 1979)⁶ argued that FDI should have three main specific advantages to be successful in the host country markets. The eclectic theory developed by Dunning is otherwise known as the OLI paradigm (ownership, location and internalisation).

1. Ownership advantages

Foreign firms should possess some advantages vis-à-vis the domestic firms. For example, the investing firms should possess a more advanced technology than the domestic firms. In addition, if the foreign investment firms would have advantages in natural resources, capital markets and scale economy then such firms would have greater profits.

2. Location advantages

One of the reasons that foreign companies choose to invest in host economies is because of the advantages they later possess. The natural resources, market size and government policies are the main determinants that stimulate FDI in such countries. In addition to that, salary level makes that FDI is invested in those countries where labour cost is lower.

3. Internalisation advantages

The third advantage is related to the way how a company exploits its own competences when markets are imperfect. Foreign investment companies exploit their power in the market, ownership advantages and control in the host countries. Internalisation advantages are related to the trainings and specialization that investment companies carry out for their staff.

While testing of international product theory, (Dunning., 1980)⁷ treats five main factors. First, he explains the reasons why FDI flows from home countries to host countries. Second, the main factors of market exploitation are defined. Third, both ownership and location advantages are analysed. Fourth, the above factors are included in the internalization theory and last foreign firms are compared with the domestic firms.

(Dunning J. H., 1993), in his book analyses four main factors that host countries should possess in order to stimulate FDI. Thus, FDI tends to invest in those countries possessing unused natural resources. The market size in another factor that host countries should possess. Efficiency, also, motivates firms to exploit those markets where through the economy of scale they could minimize the production costs. And last, FDI searching for strategic assets want to exploit their firm-specific advantages to increase their power in the market.

⁵Buckley dhe Casson, 2009 p. 1575

⁶ Dunning, 1979 p. 275

⁷Dunning, 1980 p. 12

In 2001 (Dunning., 2001)⁸ proposed three main advantages of the eclectic paradigm to explain FDIs.

1. Firm's competitive advantages in comparison to other domestic firms;
2. The extent to which firms perceive to internalize markets;
3. The countries selected to expand a firm's activity.

Although the OLI paradigm has faced many critics, it is still one of the most comprehensive theories which explains the activity of multinational enterprises and analyses the main determinants of international production. That is why (Eden, 2003), for example introduced a development in the eclectic paradigm. In conclusion, he reached in the conclusion that the OLI paradigm is the theory which resisted best to the time, as even today it has values.

Conclusions

The complex character of FDIs makes it difficult to adapt a clear theory as their role has changed through the years. Hence, in different literatures we find different thoughts about foreign direct investments. Perhaps, it happens because in different countries FDIs have had different results. Today, almost in all literature share the idea that FDIs have mainly a positive impact in host countries. Therefore, developing countries try to attract more and more foreign investments through their incentives policies.
