Explicit consolidation methods as inter-unit eliminations, allocations or adjustments could be handled automatically, for conditional methods variety of solutions is available: for instance the treatment of balance differences can be resolved by automated parameterized posting of currency-related variances or by automatic creation of warning e-mails or faxes. The reconciliation between organizational units and version concept allows simulations related to determination of effects of mergers and acquisitions, different currency exchange rates or other changed consolidation rules.

The legal and management consolidations are sourcing the same data basis. Common data foundation synchronizes the legal accounting and management accounting figures. Despite this fact, data structures could be enriched for the management consolidation providing the required flexibility to analyze the consolidated data according to regions, customer or product groups, divisions etc. Moreover, BCS component allows you to provide Economic Profit calculations at the level of internal organizational units, legal entities and or any other additional analysis criteria (e.g. customer group).

The integration within SEM allows you to use consolidated figures as key performance indicator in CPM or use the consolidation engine on the plan data of BPS. Flexible sophisticated reporting in form of analysis of consolidated variances is possible.

Business Planning (BPS)

To operationalize and assess a strategy plan figures in form of targets or forecast/budget figures must be entered for later actual/plan comparisons. The main goal of Business Planning (BPS) component is to provide computer added support of planning processes. Main features are:

- Modeling
- Planning Framework
- Planning Applications
- Link strategy with operative targets and resource allocation
- Simulation

In the strategic loop the BPS component plays important role connecting the ‘Strategy and business management loop’ and ‘Performance management process’. The strategy initiatives are associated with high level figures, the BPS provides functionality to break the high level goals into operative forecasts/budget/business plans. The top-down plans can be compared with aggregated bottom-up figures provided by organizational units.

The article illustrates variety and complexity of the planning process. The nature of planning is diverse, due to:

Timing – at a specific time point spotlight can shift. For example in expansion time sales volume and contribution are the major focus, in difficult times costs are watched closely. However, the software solution should allow change of the focus rapidly.

People involved – The planning process starts at high level involving executives in strategic plan going further to e.g. production planner ordering machines for the future. A company is heterogeneous environment divided into departments following different short term interest in order to achieve long term goals. Therefore a planning software product must comply with dissimilarities caused by different focus of people using it.

The level of the plan is various, but the plans interact with each other. Which figure is planned? Profit or contribution? Costs? Headcount? The actual figures are recorded according to given company structures. The plan figures cannot be entered at such low level for longer time period, because the involved effort is too high and value questionable. Thus alternative higher-level structures (customer groups instead of customer) are used to record plan data. The planned objects are specific, in dependency on planning process the plan application has to cover cost centers, profit centers, machinery, customers, regions etc. Even more the current actual structures do not contain any possible spin-offs or take-overs. The plan structure should allow recording of the plan data on a potential structural change.

Methods – how is planning processed? Is all data entered manually? Are external sources involved? Is prognosis, top-down distribution step of the process? The plan process activities are various again.

In order to cover various planning processes, BPS component supports following requirements:

1. Generic handling of figures: the software product must handle any set of figures, independently on their nature and technical features. BPS can handle various planning processes in generic way – sales volume, cost plan figure or headcount can be modeled.

2. Generic handling of objects, which are planned: flexible handling of plan structures

3. Variable planning levels and planning functions - Combination of figures and plan structures, e.g. planning of profit on division level or cost center level on yearly or monthly basis and generic functions (distribution, allocation etc.) support the planning process

4. Manage the planning process – The single tasks are not executed by single person, team work is necessary for successful plan. Therefore workflow options with visualization of current status of tasks are the essential criteria.

5. Personalized view – Many people, many departments are involved in integrated planning environment. Responsible person should receive personalized view on his/her part of the process. Various front-end technologies (Excel, Java, HTML-Browser etc) should be supported.

6. Integration with operative systems – For instance the high-level budget can be automatically transferred to the Cost-Center system for iterative split to single cost centers.

7. Integration with reporting – The records created in planning process should be available immediately for analytical reporting. The transformation of data should provide the option of plan-actual comparison with variance reporting.

8. Locking – A ‘business process’ lock is disabling data belonging to specific plan object (e.g. version or period), which has been frozen and should not be changed anymore. On the other hand ‘technical lock’ should avoid changing of the same record by another user at the same time.

9. Robustness – The system is expected to prevent any inconsistencies. One example could be a plan against month thirteen.

10. Centralization – master data and plan data should be stored and stored centrally

11. Scalability – The software platform should be scalable in terms of hardware features like hard-drive space or main memory caused by increase number of users and their activities

12. Authorization – Responsible person only should view and change approved data.

13. Performance – The system should deliver user-friendly response and processing times

14. Openness – The open architecture supporting APIs (Application Programming Interfaces) offer integration of the application with front end – Visual Basic or Java Front-End for data collection and function execution can be implemented.

15. Internet Support – The plan process can be operated (data collection and function execution) over web.

Conclusion

SAP offers wide range of products today. In the product portfolio analytical components enhanced operative products. In the management levels variety of strategic and operative methods is being used, however with low assistance of IT-systems. Following table should give the connection among selected significant strategy related methods and tools and SAP products dedicated to support them. Obviously, principal decision as overall direction of strategy (e.g. cost leadership, differentiation etc) cannot be met by any sophisticated computer. However, in more operational steps, analytical components can provide decision support.

TABLE 1

Strategy related method/Tool	Corresponding SAP Product
Environmental/Competition analysis	The collection of macroeconomics factors is a dedicated human interaction task. The SAP can semi-automate the collection in Business Information Collection (see 7.3.1) and provide storage/analysis tool: BW (Business Warehouse, see 7.2)
Shareholder/Stakeholder value approach	Apart from fact, that information technology supports higher productivity leading to higher profits, the communication with shareholder / stakeholder groups can be improved via SEM-SRM (see 7.3.1)
Benchmarking	The collection of competitor’s data must be solved by human beings, SEM-CPM offers interfaces to benchmarking agencies and BW provides reporting capability
Scenario Analysis	SEM-BPS component offers flexible versions allowing storage of various scenarios. BW provides features for analytical reporting.
Portfolio Analysis	SEM-CPM in combination with BW offer collection and visualization elements
Balanced Scorecard	SEM-CPM provides full certified range of flexible components. Cause and effect chains, initiatives, measure catalogue, scorecard with custom

	perspective.
Target Costing	Project system module which is part of R/3
Contribution Calculation	Controlling modules of R/3 system (CO-PA = Controlling-Profitability Analysis)
ABC, XYZ Analysis	Operative movements recorded in R/3, reporting in BW
RFM Analysis	Customer Relationship Management for data collection with reporting in BW
Activity Based Management	CO-ABC module of R/3
Prognosis	Function in SEM-BPS
Simulation	Variable simulation capabilities of SEM-BPS
Consolidation	Legal and management consolidation functionality of SEM-BCS
Forecasting/Budgeting	Sales, Capacity, Capital, Production, Marketing, Headcount, Procurement, Project, Inventory, Zero-Based, Profit, Break-Even, Contribution etc. processes and their modeling, monitoring and reporting is part of SEM-BPS.

Entrepreneurs and competences: the Development of Human Resources in Jalisco, México

*Claudia Verónica Gómez Gómez, claudia7v@prodigy.net.mx
Ricardo Arechavala Vargas, yukoneagle2@yahoo.com
Universidad de Guadalajara, Mexico*

Abstract

The development of entrepreneurial competences in México has recently faced a set of rapidly changing external forces. The main contribution of our paper is to provide data that supports the need for more emphasis in developing entrepreneurial competences that may increase the survival rate of small businesses in Jalisco. Our study is based on data from four hundred small and medium enterprises.

Entrepreneurial competences serve as an important input to the business development process. The development of business competences is evaluated in the firms studied by profiling the skills used in building their business models and operational characteristics as they relate to competitiveness at the international level. The paper concludes with a discussion of educational and policy measures that affect the development of entrepreneurial competences and small firm competitiveness.

Introduction

In a global economy competences and labor markets are more intertwined. As previous research shows (Drejer, 2000) an educational system is traditionally oriented towards the development of professional competences. Some of them are called “hard” competences (reading comprehension, writing, mathematical skills and technological, for example), while “soft” competences (personal, social, emotional) are much less regarded.

Not only in one study area, but particularly in the entrepreneurial domain, it is important to recognize the need for information and knowledge in order to develop the required competences. For entrepreneurs, certain competences are a critical factor for their firm's success in increasingly competitive and global markets. The adoption of a competence development approach is currently assumed to promote the competitiveness of Mexican citizens in higher-skilled positions. This approach is based on the premise that increasing human capital qualifications will have a significant impact in wealth generation, because human resources are a source of value creation and sustainable competitiveness (Huselid & Barnes, 2003).

The paper intends to make two main contributions. The first one is to provide a clearer insight into the skills and competences entrepreneurs use or develop while creating their new firms, whether out of a personal decision, or because they are forced to start their own business as a result of lay-offs (defensive self-employment). We address this issue on the basis of analysis of a set of three hundred and seventy cases in a database on small firms in Western Mexico. Our second aim is to identify the abilities, knowledge, values and attitudes, that ground the entrepreneurial and managerial competences as expressed in a firm's competitiveness and operational capabilities. In the first part the conceptual structure of our approach is explained. In section two a discussion of relevant literature is provided. In section three the methodology is discussed. In the following section the study results are presented and finally the paper concludes with a discussion about the relevance of the competence approach in assessing entrepreneurial and small firms' capabilities in the context of an emergent open economy.

Literature Review

Professional competences are determined by the functional labor and the perspective of technology is very dynamic. Analyzing the development of individual competences they represent a priority individual's needs. The

theoretic aspects of the scientific literature about competences include the methodological foundation of competences (Boyatzis, 1982: and Collin 1997) and the second that is about models on competence development and education systems (Byham, Smith & Pease 2002).

Though the topic of competences according to (Savaneviciene, Stukaite y Shingiene 2008). The hard competences, depending on organizational performance and soft competences depends on the particular relevant competences, the important idea is which competences does the employee has not on their amount. The universal individual competences work in two levels: organizational (company) and individual, the optimal result is combining both. Fig. 1

FIG. 1 INDIVIDUAL AND ORGANIZATIONAL COMPETENCE

According to (Senge, 1990). The special conditions in one organization are necessary to increase the competences and correct their possible mistakes.

The Mexican case.

The competition will increase the professional competences and the employability is at the core of the transformation process. There are no doubts about the importance of entrepreneur competence's development according to Savaneviciene et al. (2008) the employees know what helps to work more efficiently, in other words the organization will be strong in technique .

Mexican small firms must rapidly adapt to open market contexts (Arechavala, 2003). In 2003 there were in Mexico three million enterprises, 99.8% of which are small and medium enterprises (SE, 2011). Jalisco is the third state in Mexico in terms of population with bachelor's degree, with 7.7% of the national total; it is also the main agricultural producer in the country.(PROMEXICO, 2011). To have a better idea about its geographical location see Fig. 2.

In the last years Jalisco had suffered a process of industrial reconversion in (electronic, software and biotechnology), in the generation of qualify workers and try to gain positions with the production of goods with more value add in the international productive chain (Arechavala, Rico, Rodríguez and Huerta 2010). Mexico is in the 14th place of the most powerful economies in the world (IMF, 2010) but the majority of SME's have technological obsolescence, because they do not change their work procedures and their prices level in international market in many cases are lower than their production cost. This is the main reason of many SME's closed operations import and commercialized the foreign products into the country.

It is necessary to add in the internal development of SME's, the effect of global economical situation, the contraction of the internal market, the inflation, devaluation, corruption, legislation and the disposable of raw materials (Arechavala, 2008). The free income of foreign merchandises in dumping conditions and the smuggling have more difficult the internal commercialization of Mexican products.

FIG. 2 MAP OF MEXICO

Methodology and Data

The efficient development of individual competences becomes the competitive advantage as well as economical. The attitude is dominated that competences are universal and not depending on the performance area (Thompson, 1998) guaranteeing long success (Drejer, 2000). Schultz (1993) described of human capital as: “it is necessary to keep in mind all the human capacities, *innate or acquired*. Each person is born with a specific set of genes, which determines its innate capacity. The acquired attributes, which have value and can be increased through an appropriate investment, will be considered as human capital”.

The concept of competence defines the individual abilities, values and knowledge, usually applied and oriented in a working environment. In this case the organization and its needs are important only as a worker with the needed competence. The hard competences are determined by the organization performance and are complemented with a special professional knowledge and skills to understand processes, competitors and technologies. These kinds of competences are necessary and not depending on the position of the people into organization.

The priority changes of competence formation are influenced by the same employees because are able oriented in the new environment, know their value (Dalton, 2010). It is emphasized that the employees, demonstrate loyalty to their activity. Thought there are no doubts about the importance of competence development (Oliver & Kandadi, 2006). The organizations learn individual and collective the managerial style, managerial culture and the relation between employees are an important role of the application of competences, because the learning conduct to behavior change (Gomez, 2010).

In this work we take the most important competences in base on personal attributes, soft skills that help to work with others, practical skills and capabilities to stayed ahead of change (Jurce, Milan and Tominc, 2008). Including professionals and entrepreneurial competences (Tuning Educational Structures in Europe, 2003) because are used the platform to raise their employability. The education are expanding and changing, the entrepreneurs express their individual demands with the expectation that their learning experience prepare them to answer the changes in a business environment. We talk about specific and generic competences such as capacity to adapt to new situations, problem solving, ability to work autonomously, knowledge of a second language, elementary computer skills, capacity for applying knowledge in practice, decision making, creativity, initiative and entrepreneurial spirit,

information management skills, interpersonal skills, will to succeed, teamwork, project design and management, oral and written communication in native language, capacity for analysis and synthesis, leadership, concern for quality, ability to work in international context, capacity for organization and planning, ability to learn, capacity to communicate with expert to other fields, ability to work in an interdisciplinary team, critical and self critical abilities, grounding in basics knowledge of the profession, research skills, appreciation of diversity and multiculturality, basic general knowledge, ethical commitment, understand customs and cultures of other countries.

In order to understand what kind of competences it was possible to find in the IDITpyme the data base we compare the information of competences list.

Competences and skills were understood in three ways How to know, how to act and how to be. We try to manage generic competences which are general to all fields. See Fig. 3

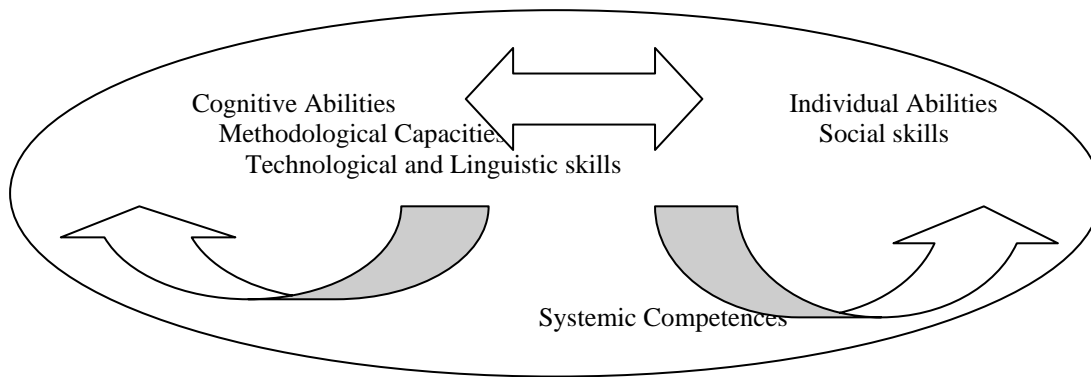

FIG. 3 GENERAL COMPETENCES

The study is descriptive and the main data sources for our empirical research were four hundred enterprises in the data base IDITpyme . This data base have more than 15 years working and it is divided in six sections: Managerial Culture, Management, Commercialization, Finance, Production and Human Resources . For this purpose we have utilized the Managerial Culture results of written and transversal operative data collected through a qualitative survey applied to SME's in different states of Mexico as Jalisco, Michoacán, Guanajuato and Aguascalientes. A qualitative inquiry was used to gain in – depth understanding of phenomena in context specific Savaneviciene et,al (2008). The majority of these enterprises in Mexico are family business of the first generation, in which the entrepreneur/founder still runs the business. We try to identify entrepreneurial competences in the practical observation of the real life. According to the results in study changes in management education in Europe, it is expected that in the future the clients will demand greater quality and service. In this context if we have to be more competitive and to attract international investments, we will be forced to act according international competences standards in order to provide the entrepreneurs with relevant knowledge and skills that will enable them to raise their employability.

One of the most important variables regarding the entrepreneur's profile is his ability to *formulate* and to *implement* strategy in the firm. CEO's personal characteristics influence strategy formulation (which we here identify as entrepreneurial ability) in many ways, and later on in the organization's structure and performance (managerial ability), but this second influence is mediated by the implementation of systems, structures and routines in the firm. Successful development and performance in the small business organization implies skillful use of both entrepreneurial and managerial orientation traits, competencies and skills.

Analysis

The Managerial Culture is divided in five levels and six dimensions (propriety, management, objectives, basic managerial concept, basic outlook and business theory). We decided that, among the thirty competences that have a closer relationship with variables in the data base, there are five which fit our framework well, among them the capacity to adapt to new situations, leadership, initiative and entrepreneurial spirit, teamwork and creativity in the next levels and dimensions. See Table 1.

Competence

Capacity to adapt to new situation
 Leadership
 Initiative and entrepreneurial spirit
 Teamwork
 Creativity

Dimension and Level

B.T. 3 / 4 / 5
 P.M.O.BMC.BR.BT / 1
 P/1
 M/2/3/4/5
 P/ 1

DIMENTION (D)	(L)LEVEL 1	2	3	4	5
Propriety P.	Individual	Individual or not	Family partners F.P.	Not family	Stock market
Management M.	Individual	Family	Family general management	Not family	Chairman board
Objectives O.	Familiar income	Survive	Growth and expansion	Product and market market diversification	Institutional
Basic Management Concept B.M.C.	Quickly and safe	Short time	Medium time invest	Large time	New business and markets
Basic Roll B.R.	Passive	Reactive . adaptation R.A.	Prediction and R.A.	Active adaptation	Environmental control
Business Theory B.T.	Business opportunity	Specialized one product	Understand the Client	New business diversification	Diversify markets

TABLE 1. MANAGEMENT CULTURE. IDITpyme (2010).

Results

The most striking differences are in the dimension of management level 1, which are related with the competences of leadership and teamwork in second place property that are related with initiative and entrepreneurial spirit and creativity. The basic concept is related with leadership as a basic roll and business theory too. The competence to adapt to new situation we will find in business theory. See table 2

DIMENSION / LEVEL	1	2	3	4	5
PROPERTY	99	141	52	39	1
MANAGEMENT	107	81	67	41	34
OBJECTIVES	16	80	175	57	3
BASIC MANAGERIAL CONCEPT	47	63	88	67	59
BASIC ROLL	63	129	51	65	10
BUSINESS THEORY	42	52	161	14	52

TABLE 2 DIMENSION /LEVEL QUANTITY SME's MANAGERIAL CULTURE

One important conclusion was a very high correlation between ratings of competences with levels of SME's development and the competences. In relation to importance we found the next data. See table 3.

The most important competences in Managerial Culture	Dimensions
Creativity	Propriety
Initiatives and entrepreneurial spirit	Propriety
Leadership	P. M. O. BMC. BR. BT.
Teamwork	Management
Capacity to adapt to new situation	BT.

TABLE 3 RELATIONS BETWEEN COMPETENCES AND DIMENSIONS

At the end the importance according with the number of enterprises are the dimensions that show in the next table. See table 4. By comparing the results of our analysis is highly positively correlated ranking in property with the most quantity of enterprises, continue with management , objectives, BMC, BT and the final is BR.

	<i>PROPERTY</i>	<i>MANAGEMENT</i>	<i>OBJECTIVES</i>	<i>BASIC MANAGERIAL CONCEPT</i>	<i>BASIC ROL</i>	<i>BUSINESS THEORY</i>

BASIC MANAGERIAL CONCEPT	-0.223684607	-0.337667013	0.91487502	1		
BASIC ROLL	0.913528317	0.514622325	0.251623824	-0.033351528	1	
BUSINESS THEORY	-0.069660564	0.096647471	0.827047462	0.77787583	-0.147538088	1

TABLE 4. CORRELATION OF RANKS

Conclusions

To be an entrepreneur nowadays is has been faced a big quantity of pressures from internal and external forces. As a result of internal pressures, the entrepreneurs should put more emphasis in the development competences, because they confront a new global situation and they need to start to redesign their strategies and aligning with the requirements on internal and external market. The proposed of this study is to know what kind of influence have the five competences in Mexican SME's.

Competences and employability have especially evolved with entrepreneurs because a competence is a key requirement to confront the new reality for Mexico. The basic concept is transform the skills and abilities of entrepreneurs in designing new environments as a should be taken as a start point for new business capabilities, the professional competences define and develop new teaching and learning new methods in which their acquired skills and competences.

The comparison of our results are important because we tried to find generic competences in Mexican entrepreneurs and also shown the level of achievement of certain important competences that the entrepreneurs used in practice. All these conclusions should be taken into account when the government or educational institutions tried to include or implement to help the entrepreneur capability.

The general abilities, competences and skills should be selected to teach into entrepreneurs and managers because they will be better equipped for the challenges in a dynamic business world reality in the hard labor market.

Microcredit in Italy: Past Present and Future

Pasquale Stefanizzi, pasquale.stefanizzi@unisalento.it
University of Salento
via per Monteroni – complesso Ecotekne,
73100 Lecce, Italy

Abstract

The aim of this paper is to investigate the microcredit offer in Italy with a particular focus on the peculiarities that distinguish the different areas of intervention (microcredit to business and/or social cooperative microcredit). We tried to understand if there is an inclination to generate products specifically targeted to immigrants and to see if there is any other space for intervention for a more balanced development of microcredit within the network of Cooperative Credit banks. We have adopted a statistical approach to this research with a descriptive-explorative approach. We used a questionnaire aimed at the Italian operators in microcredit sector. We studied the work done by such organizations to understand whether there is a common denominator within the different initiatives operated in Italy and the Grameen work. Finally we tried to understand if the current microcredit operators use a similar or different approach to the cooperative credit system when addressed to immigrants¹.

Methodology

The methodology used in this work follows the principles of classic statistical analysis applied to quantitative research, adopting the questionnaire as a data collection tool (Molteni, Troilo, 2003). Such methodology envisages a rational timely sequence of data survey stages, analysis and development and presentation of results. In particular we carried out the analysis of a fraction of the total statistical corpus of data.

With the aim of reproducing a clear picture of what microcredit is in Italy, including the different dynamics operating in the sector, we also decided to adopt and combine different techniques of data collection and the analysis of results such as cluster analysis, historical events analysis and the descriptive-explorative analysis.

In summary, through this research we tried to answer the following questions:

- In Italy is microcredit a phenomenon with a "history" or is it just a fashionable term derived from the high popularity of Prof. Yunus' results?
- Does the high volume of so far generated activity follow an ascending trend to be able to justify a more structured approach?
- Is there a geographical concentration of the so far generated microcredit operations?
- Are the Italian operators going through an experience similar to Grameen? If so what are the common key factors to the various projects?
- Do the bureaucratic-administrative approaches that release the micro finance projects share a common ground among the different experiences?
- Are the immigrants a potential target?
- Can the credit cooperation system develop a structured offer of microcredit in Italy?

Statistical survey

To define the statistical survey plan, given the already mentioned diversification within the Italian sector, we utilized different sources as a data base in particular:

- list of the operators registered with RITMI (Association of microfinance institutions), where the various institutions are classified and grouped together according to the geographical areas of intervention (operational level), typology of the activity (typology distinguishing between No profit organizations, ONG, public body,

financial intermediaries, bank, foundation, other) and legal status (profit and non profit),

- Italian writers (Viganò, 2004; Brunori, 2005; De Bernardo and Pezone, 2008; Eurispes, 2007; Scarpa and Delise, 2007; Sgroi, 2008; Tramonto, 2008; Borgomeo & Co., 2007)² whose work on specific topics, have recalled projects and best practices of real interest and depth with the common aim of launching microcredit and microfinance.

This is how we defined the statistical corpus of data i.e. the universe of microcredit projects/initiatives operating in Italy³, to structure our research (based on the above mentioned questions).

As for quantitative data processing, the statistical literature (Orsi, 1985; Pieraccini, 1991, Posa and De Iaco, 2005), envisages that error measurements and the level of significance of the analysis are established beforehand, in order to obtain a balance between the multitude of the sample and the nature of the operation. Because of the typical limitations of statistical qualitative/quantitative surveys carried out by questionnaires⁴, and with the aim to increase the sample population, this study focussed on the parameters of relevance given by the distribution of the questionnaire to the whole universe of this survey. Overall we identified and contacted 48 microcredit organizations in Italy that operate for the residents (excluding the national institutions working exclusively on projects abroad). Out of these, 19 replied to the questionnaire⁵ and have been adopted as the sample of our research. Therefore the results are valid with a confidence level of 95%, with a confidence gap of 15%. The first step of this analysis shows:

- nearly the total of the projects operate on a local basis, except some rare exceptions⁶,
- similarly to what happens to the rest of the world, microcredit is a phenomenon strictly connected to the social development and human rights environments, campaigns against poverty and, more generally, not for profit,
- the onset of management structures typical of the financial market often derives from the acquisition of levels of knowledge or volumes that can be hardly managed by voluntary assisting bodies (Vikram, 2008).

In Italy, moreover, microcredit has found a stable operational ground amongst:

- the Mutue di Auto Gestione –MAG- (self managed lending operations) are historically renowned for having launched the first microcredit projects in favour of third sector bodies, cooperatives, businesses involved in fair trade and in a few instances, individuals experiencing temporary financial difficulties⁷,
- foundations against “loan sharking” developed mostly by Dioceses or single parish priests and that often have become a point of reference for the entire area and population (De Bernardo and Pezone, 2008).

Main Features of the microcredit initiatives in Italy

The first aim of this work was to understand the position of the microcredit initiatives in Italy and their operatively in the national financial panorama in terms of space, time, volumes and nature of the operations. In other words, we tried to summarize the elements that can offer a critical/constructive reading to the phenomenon.

The first main feature has been the geography of microcredit in Italy. We then moved on to observe the characteristics of the nature of the supplier⁸ and the geographical location (the belonging to the so called Nielsen area) through the development of a location finder to assist in the reading of the data. The country area more keen to use microcredit against poverty is the so called Area Nielsen 2, which is also the one most evidently sensitive area to issues of social support and progress, thanks to the work developed by the operators living in Tuscany (Innocenti and Ortolani and Rizzitiello, 2007; Brunori, 2005; Borgomeo & Co, 2005); followed, with a short gap, by Area 3 and Area 1. The south of Italy ranked as last since the precarious economic and social conditions of a few areas and the high level of unemployment which make the demand of microcredit really high. When shifting the attention towards the nature of organizational structures chosen for the development of microcredit projects and looking at number in distribution, it comes out that the least frequent operations come from Public Bodies, followed by Foundations, Onlus and the financial intermediaries. Amongst the least take part the so called Mag, which are mainly no-profit cooperatives.

Fig.2 shows that microcredit in Italy started clearly after 2000, after the popularity of the Grameen Bank work and various changes that happened within the national context of Italy. On this the following works (Borgomeo C. & Co, 2007) show:

Microcredit institutions	Area 1	Area 2	Area 3	Area 4	Absolute number
Financial Intermediaries	[Dark Blue]				9
Foundations	[Orange]		[Light Blue]	[Orange]	5
Onlus	[Light Blue]	[Orange]	[Light Blue]	[Orange]	3
Public Bodies	[Orange]				2
Absolute number	5	7	6	1	19

Legend	
Numerosity	Color
zero	[White]
one	[Orange]
two	[Light Blue]
three	[Dark Blue]

FIG.1: SPACE/ORGANISATIONAL DISTRIBUTION OF MICROCREDIT INITIATIVES IN ITALY

- the agreement picture amongst the numerous public and private political actors, of national entrepreneurship and associations with the common aim to use, develop and apply preventative Funds against “loan sharking” (law 108/96),
- the transformation of the “National Italian committee for Microcredit” into “Permanent National Italian Committee for Microcredit” with the aim to promote and monitor the ongoing projects and those under “work in progress”.

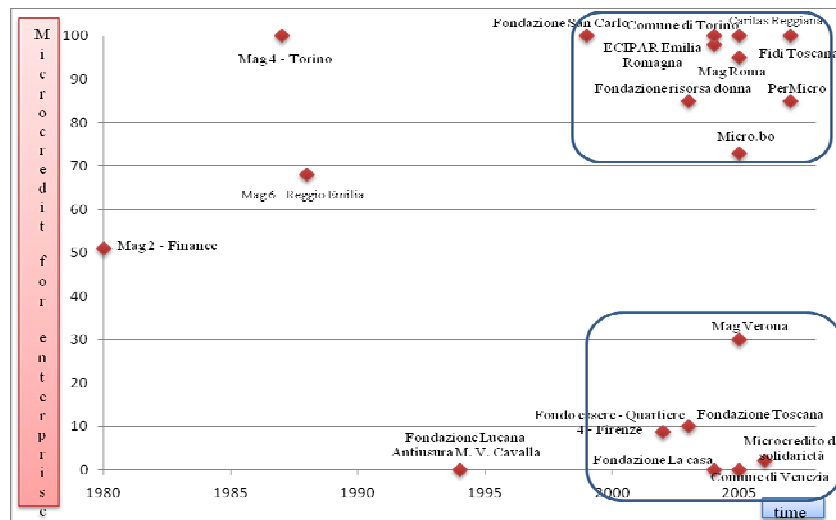

FIG.2: HISTORICAL CONCENTRATION OF MICROCREDIT INITIATIVES IN ITALY

Before the onset of the new century, it is possible to identify only four initiatives of microcredit, three of which developed by MAG. When looking more thoroughly at the objectives achieved by the different projects, except from Mag2 which operates undistiguishly in both sectors, there is a clear difference between the subjects operating in favour of businesses and those operating to support people⁹ or families with temporary lack of cash; hence, microcredit in Italy is increasingly characterised by area of specialisation.

The first part of this paper aimed at identifying the relational positioning of the microcredit organisations. With this aim we suggested a methodological comparison with the recommendations given by the management literature in the life- systemic theory (Golinelli, 2000-2002). Assuming microcredit is a coordinated system of institutions, instruments and resources that need to interact with the connected systems to grow and thrive, we then measured its strength in the relations with the actors that belong to it and:

- themselves, in Italy and abroad. A similar proxy has been recognized in the degree of participation in national and international networks,
- Public Administration we surveyed the existence of strategic relations between public institutions and microcredit operators and the inclination of the last ones to demand/obtain supported sponsorship to launch or develop initiatives,
- the financial intermediaries, through the identification of potential collaboration with the credit/banking brokers

to carry out lending operations,

- their own customers, i.e the inclination to concentrate the efforts towards one target.

The summary shown in Fig.3, concludes that microcredit initiatives do not belong to an initiative of common nature, they rather develop via single actions (operators in the civil sector, public local bodies etc.) and, as stated before, they belong to a very recent past. On this purpose, the establishment of RITMI, a system which includes the major number of surveyed activities, like the European Microfinance Network, should put together the various initiatives aimed at creating a “critical mass” able to retain attention of the Institutions and an increased interest among the potential clients, who often ignore the existence of support tools to their advantage.

The degree of interaction between microcredit organizations and public institutions (in particular when it comes to financial support aimed at start-up as well as development of own initiatives) is are instead working really well. The public bodies involved in the most successful relationships are the borough and counties, followed by the regions and in some cases small business associations, job centres and universities.

FIG.3: SUMMARY OF RELATIONAL POSITIONING OF MICROCREDIT ORGANIZATIONS AND RELATED CHARACTERISTICS

The relationships between microcredit institutions and the financial intermediaries are much stronger compared to what we analysed so far. Strategic partnerships aimed at increasing the knowledge of the potential marginal clients, available resources and organizational structure are working effectively. With specific reference to the business models adopted by the operators working in synergy with the banks, it turns out that the organizational framework (Innocenti and Ortolani and Rizzitiello, 2007) are used to satisfy the specific needs of those requiring them, are often unique and difficult to track down. The interaction between microcredit organizations and financial intermediaries is due to become stronger thanks to the new development of financial activities within the European community aimed at supporting microcredit. In particular we refer to the measures called Jeremie and Jasmine¹⁰. The first aims at improving the financial context of operation for the PMI (small, medium business) at a national, regional and local level. The intention is to facilitate access to financial borrowings and increase the stake of risk capital through the development of warranty instruments. In the specific case of microcredit, Jeremie envisages the creation of a warranty fund aimed at microfinance Institutions. Jasmine is instead a measure for the development of microcredit whose objectives are to:

- improve the legal and institutional context of the member states.
- positively improve the entrepreneurial mood.
- promote best practices.
- provide capital necessary for the so called “unbankable”.

Microcredit organizations seem to have established a strong bond with their own customers. 85% of the activities are aimed at specific targets, generally defined as unbankable. The literature on this topic (La Torre and Vento, 2005) has shown that in the last few years the users of microfinance at a global level have become much more complex compared to the one of microcredit, in shifting the attention from the “poorest amongst the poor” to all those excluded from the financial system (as the victims of loan sharking activities) which can be tracked down into five macro categories:

- *self-exclusion* which derives from self inadequacy of the individual in front of the demands of the financial mediators (poor amongst the poor),
- *access-exclusion* deriving from the lack of financial requisites to obtain credibility of a potential client, further to a risk assessment with negative result,
- *political-exclusion* where the ineptness of the socio-political system that ignores the demands of specific individuals. The immigrants, for example, are a main typology of financial exclusion,
- *condition-exclusion* which derives from the high cost or the narrow conditions to credit access,
- *marketing-exclusion* where the so called "marginal" individuals are considered a low added value to the financial mediators according to the traditional values of customer valuation.

FIG.4: TIME SERIES OF THE NUMBER OF MICROLOANS

FIG.5: TIME SERIES OF VOLUMES OF MICRO LENDING

The progressive involvement of the financially excluded individuals due to the last three points above described, demonstrates a major complexity within the financial architecture and more involvement on behalf of the banks from the traditional schemes of microcredit. This trend should guide the institutions of national microfinance to focus their attention towards specific targets or individuals (in particular the immigrants) and develop synergistic efforts with the cooperative credit system which similarly work with the same principles and values. When looking at the features of areas of specialisation (shown Fig.2) and customer targeting, it emerges that microcredit is addressed still today to a specific target, difficult to be tracked by the classic finance system. The last interesting characteristic investigated through the field analysis is the development of the phenomenon in Italy in terms of volumes and number of operations. The statistical analysis of the data determined by graphic equalization (Pellicciari and Tinti, 1998), that the evolution of the phenomenon is similar to an exponential function like. Its performance shows a peak since 2006, putting more emphasis on the volume variable (see Fig.4 and Fig. 5). In the central phase of the investigated time frame (between 2002-2005), it comes out that microcredit projects have progressively strengthened and consolidated, increasing by number of loans as well as by intermediate volumes despite a lower growth of the same ones (the relative strength of growth in absolute values is smooth compared to the points highlighted by the weighted average).

Since 2006 the number of initiatives, loans and traded volumes has increased dramatically. As for economic returns microcredit offers reasonable areas of intervention. Currently the applied interest rates include:

- between a minimum of 2.5% to a maximum of 12% for microcredit to business, despite there is more attenuation around the median distribution values (the average rate is 6.3% against a variable -standard deviation equal to 3.3),
- between 2.5 and 6% in case of emergency microcredit against an average rate equals to 4,4% and the variable equal to 1.29.

The cost of funding cannot be found to be appropriate to the high degree of risk assumed by the category of borrowers discussed in this paper. This is because of the use of agreements between three parties aimed to reduce the exposure of the lenders by introducing adequate warranty funds, which positively influence the credit recovery rate. Hence the introduction of specific safeguards, reduces the rate of loss in case of default, improves the degree of risk exposure of the borrower and lowers the cost of financing¹¹.

Generally speaking the individuals partaking in a microcredit project are:

- promoting organizations, whose work is to identify potential customers and start up/manage the lending projects,
- public or private bodies of high social orientation, that release unbanked warranty funds of level II (often of rotative nature), which are useful once reimbursement cannot take place,
- partner banks that review practices and operate the loan and are the only counterparties to the debtors because they are the only authorized brokers to the lending activity.

The presence of third structures, overlooking the stages of screening and monitoring of the relationship of trust, also becomes a fundamental element in order to reduce the friction components in the provision of loans (properly highlighted in the position paper work and in order to facilitate the financial intermediation, which would otherwise be impossible. Management schemes of this nature should be activated in the case of structured products offered by microcredit BCC. The location on site and, therefore, the territorial proximity of the bank to potential small entrepreneurs could reduce (but not zero) the distances in the operation of the logical-functional new product financing. The microcredit organisation, as discussed in greater detail below, operate at a strong social level through their own players (usually belonging to voluntary welfare associations located in public or private clinics throughout the areas). To develop this into a banking product and business opportunity in the eyes of the credit intermediaries, it is necessary to shape it into the mentality of privatisation.

In summary, therefore, the intensity and speed of growth of the phenomenon, the attractive rates of financing and the significant community resources to support the development of micro-credit are the economic and financial conditions to support a more stable supply of microcredit on behalf of commercial banks and, specifically, the BCC.

Similarity Between the Italian Project and Grameen Model and Comparisons Between the Different Operating Experiences

The second part of the work aimed to measure the degree of connection between the Grameen experience and achievements in Italy, has also investigated the degree of uniformity in the bureaucratic and administrative path adopted to initiate loans among the different projects in Italy.

At the question “are there common elements between your initiatives and the inspiring values beneath the work of Grameen bank?”, 85% of the organizations sampled responded positively. There seems to be therefore a high appreciation of the initiative that has brought worldwide attention to the existence of micro-credit, re-vamping techniques and tools, as demonstrated in previous work, that have characterized the history of European cooperation credit. It was also investigated which of the elements of the paradigm Grameen characterize more significant initiatives undertaken so far in Italy, the Fig.6 shows, in descending order of importance, these aspects. The first main characteristic of microcredit in Italy is the addressed market (non-bankable) which, as noted, is the essence of many initiatives for the benefit of the weakest. The strength and consistency of the findings of this research leads to the conclusion that in Italy there is a vulnerable area of the population which would not have access to credit, due to the absence of self supporting initiatives hence the inability of the traditional banking system to identify and capture it. These are followed in order of relevance by the principles of compulsory repayment, the elimination of loan guarantees and containment of the amount of the instalments. These elements, although essential, are of lesser

importance compared to the features of the Grameen experience due to the fact that:

- mandatory reimbursement characterizes also any other lending activities,
- the elimination of loan guarantees is often only replaced by the above-mentioned revolving fund made available by organizations of collective interest in case of repayment difficulties by the microcredit users,
- containment of the amounts of the instalments is a technique also used by commercial banks to facilitate the debtor in the regular loan repayments stretching the payback deadline.

FIG.6: DISTINGUISHABLE FEATURES BETWEEN MICROCREDIT IN ITALY AND THE GRAMEEN EXPERIENCE

The distinguishing features that characterize the unique mission of Professor Yunus in Bangladesh are reflected in a minimal number of current experiences in Italy (coloured differently in Fig.6). Currently, some initiatives (very few and of most recent institution) use the community of origin as an instrument of social enforcement at the start of the loans (requesting a letter of moral guarantee) as well as during the monitoring (accompaniment led to reimbursement) by the head of them (usually the pastor of the parishes belonging to the Italian people or the spiritual leaders of different religious communities or representatives of immigrant communities in the case of foreigners).

Even less important are the elements for the establishment of group lending and the nature of the relationship between bottom-up micro-credit institutions and customers. According to the largest number of workers, the difficulties related to the first aspect can be traced back to poor cohesion of the social relationships between people in Italy (or more generally in Western countries) and the consequent reduction of trust and mutual respect amongst Italian people (principle that distinguishes between the so-called active poor in developing countries).

The difficulties related to the second aspect are connected to the scarcity of resources available to the operators (both economically and of staff availability). Often these start working towards the loan admission procedures too late, which creates reimbursement difficulties and the lender becomes insolvent.

The distinction between microfinance and the traditional banking system in Italy when it comes to offering loans to individuals (individual firms) lies on the approach to the issue of the failure to repay and the specific borrowers and micro-organisation meet to identify the causes that led to non-payment and seek ways to overcome the problem via social and operational approaches, recurring to the forced return of the loan as an extreme remedy. With regard to the degree of uniformity of the initiatives, the analysis reveals that all projects are following a standard operational guideline however adapted to the peculiarity of each single case. As noted above, the micro-

credit organization is distinguished by the presence of three subjects:

1. an external body to the financial intermediary (bank): (usually counselling centres, departments for social policies, foundations, associations, non-profit organization) with a co-ordinating responsibility, which starts up the procedure of microcredit, prepares the additional guarantee and monitors the effective repayment of the loan,
2. the financing bank, which expresses the opinion of creditworthiness, and carries out the administrative and bureaucratic procedure at the beginning of the (credit) relationship and during its duration,
3. a guaranteeing body that, when not involved as a third party, is committed to secure the loan by acting with a specific allocation of resources in case of failure.

FIG.7: MEDIA AND THE COMMUNICATION OF MICROCREDIT PROJECTS

A clear exception to the above mentioned structure arises when a financial intermediary intervenes (mainly a Mag), in which case the whole activity is managed by its operators and, in extreme cases, only the activity of customer identification is given to the counselling centres. In some cases, and similarly to what happens in the case of Grameen Bank, the coordinating structure does:

- before or alongside the provision of funding, provide training and education to access the credit to future borrowers,
- in case of rejection of funding by the financial intermediary carry out activities of individual support to overcome weaknesses.

Despite being a financial product in its essence, microcredit (as it facilitates the transfer of funds by persons in surplus to those in deficit), is most of all a social tool to assist; the emergence from poverty and personal depression, lack of liquidity originating from the development of small businesses, satisfaction of basic needs related to housing, work or family.

We investigated on the communication channels used to promote or reinforce new initiatives, amongst the potential customers.

In descending order of importance the commercial channel currently used are the voluntary associations and business services addressed to those in need of help, followed by word of mouth and participation in local markets, festivals and multicultural events. As for the promotional channels, the main attention is given to the press (third channel), followed by internet, various publications and radio and finally mailing list. The last two, being most costly, are used by organizations (financial intermediaries) that deal with bigger volumes.

Microcredit For the Immigrants and the Cooperative System

The last two points of our research focussed on understanding if microcredit organisations view microcredit as a

standard product offered to immigrants (potential demand) by the cooperative credit system (the potential offer). We asked microcredit organizations if the national banking system has any knowledge of microcredit in its operations, and if not how to justify the need of its existence.

When asked “in your personal experience have you ever noticed banking systems that approach a microcredit mentality?”, 36.84% of the sampled population replied yes, 57.89% no and 5.26% do not know.

Reasons given for positive responses are related to the presence of:

- Banca Etica (ethical bank) in the national banking scene is, according to many, the only bank close to the logic of micro-credit,
- the classic banks that, are locally committed to the success of these initiatives. Relevant aspect to the research is that almost all relationships have been closely connected with the BCC.

Operators who have considered the national banks as “close” to micro-credit banking experiences have acknowledged that in the long term, the interest of banks towards microcredit may decrease because of poor guarantee on economic returns and because of the high operating costs to assist the clients and for these reasons they have considered microcredit as an “unsustainable product” when not supported by public assistance funds (although this is at odds with the logic Grameen). Another interesting idea is to be found operating in the “confidi” (trust credits) as a link between the national banking system and micro-credit. The reasons which led the largest share of sampled population to respond negatively to the above question are of course related to the recipients of micro-credit, or the non-bankable, which are not because considered a greater risk, instead because of their inability to provide adequate effective or personal guarantees, hence the need for constant mentoring during the entire duration of the loan (a process which increases costs and decreases the product profitability). The degree of closeness, then, between the traditional micro-credit and credit is, in the opinion of the operators, discriminated by the number and quality of guarantees offered to support loans; therefore to improve the degree of bankability the presence of a third subject with the principal task of guaranteeing the loans (as usually happens, however, already today) seems a necessary step. In terms of cost, what affects the cumbersome operation of generation of a micro-credit is the definition of a “trustworthiness” process based on subjective prerequisites which, however, should be uniquely detectable by different operators of front-office. The standardization of the procedure and the identification of specific tasks to be undertaken by stakeholders, both in start-up phase of the relationship as well as during its duration, lead to useful economies of scale, economies of learning and act to consolidate the competitive advantages (Porter, 1999), which together with a diversified customer base (both in favour of retail and small corporate banks) should reduce the risks from micro-credit (Vikram, 2008). Getting into the heart of the inquiry and examining the nature of the responses to the question “Do immigrants, in your opinion, constitute a privileged target to devote more attention?”, there is a substantial equity between positive and negative responses. To facilitate the reading of the data we built a map showing the relations between the nature of the subject and the result of the response. This shows that within the categories “foundations” and “public bodies” there is an even bipartition between subjects whose privileged target for microcredit operations are the immigrants and subjects with no privileged targets and who think microcredit should be considered an instrument of social emancipation, i.e. for all those who find themselves in difficult situations. Of particular interest are institutions as non-profit organizations and onlus that see immigrants as the prime target customers in a bid to address micro-credit, in contrast with the MAG which disagrees with it.

Deepening the analysis, the reasons that have led the operators to see immigrants as a specific microcredit target, include:

- the strong connection between social integration and credit. Immigrants need access to resources at the arrival in the host country and at a time of family reunion; during the stages the probability of integration increases with the trustworthiness given by their funding agencies (usually specific projects by the municipal social services),
- a critical analysis of the current law (primarily the Bossi-Fini law), according to which the issue of a visa to live in the country relies on the duration of the employment contract. This is often part time and is linked to temporal patterns of mobility which are difficult to reconcile with the need for stability on behalf of the immigrants. This is where microcredit can help to overcome the instability problems and, more specifically, offer the opportunity of a self-starting business to immigrants;

- the presence of stable and well-established networks of relationships between members of specific ethnic groups or religions, which may allow the development of warranty institutions and able to ensure the smooth return of funds through the adoption of principles of social enforcement.

Immigrants privileged target	Foundation	Public Bodies	Enterprise	Onlus	Mag	Total
yes	2	1	3	3	1	10
no	2	1	1	1	4	9
Total	4	2	4	4	5	

Legend 25%<50%<75% ≥ 75% ≤ 25%

FIG.8: RELATIONAL MAP RESULT TO THE QUESTIONNAIRE (IMMIGRANTS AS A PRIVILEGED TARGET)

The last step is to understand the attitude of the operators to consider BCC (within the banking context) as intermediaries to implement new micro-credit projects and / or developing existing ones. The responses indicate a clear preponderance (73.68%) in favour of it. That statement means that the current operators of national microcredit are positive about the principles, objectives and achievements of the credit cooperation system in Italy (see Fig.9). This confirms the assumptions underlying the entire work and is demonstrated by the convergence of theoretical inspirations (identified by a critical analysis of scientific literature on the subject) and operational reality (that of micro-credit organizations in fact).

FIG.9: PERCENTAGE DISTRIBUTION OF INDIVIDUALS WHO CONSIDER BCC AS THE LEGITIMATE SUPPLIER OF MICROCREDIT

The recommendations can be summarized as follows: BCC could operate with the mentality and goals in line with the specific needs of applicants, in order to develop strong and positive micro-credit initiatives, working more effectively at proposal stage and with a greater presence in the network area (currently not fully covered by the structures of ethical finance). The nature of their work being inspired by principles of mutual aid, cooperatives and local authorities (at least on paper). Being banks as such they could then implement a standardized process to identify more beneficiaries, spread the risks and reduce costs.

Particular emphasis needs to be given to the answers offered by two operators who already work in concert with two different BCC and have affected the experience of the national microcredit positively. Specifically, we refer to the experience of 'Fondo Essere'(provision of social welfare) operating microcredit to the family and to cases of emergency, and Micro.bo, an ONLUS association founded to promote, knowledge and practice of microfinance in Bologna and its province (Quarta, Stefanizzi, 2008). From both responses it can be concluded that the partnership with the BCC give positive results both in economic and social terms to all the parties involved in the micro-credit relationship, in fact they are considered as best practice. The first representative of the organization has specifically stated that *"l'esperienza del rapporto con la Banca del Chianti Fiorentino (appartenente al circuito BCC) dimostra che è possibile coniugare le forme di tutela del sistema bancario con gli intenti solidaristici e di attenzione ai "non bancabili" del fondo di aiuto sociale Essere"*. The representative of the

second expressed the following: “l’esperienza di Micro.Bo è sicuramente un esempio in questo senso, infatti le banche che sin dall’inizio si sono dimostrate disponibili a collaborare con l’associazione sono due banche di credito cooperativo. Inoltre tali banche sono caratterizzate da un forte legame col territorio (caratteristica molto importante per il microcredito) e perseguono valori molto simili a quelli sottesi al microcredito stesso”.

Conclusions

The research showed that micro-credit in Italy is a rather recent phenomenon and is strictly related to the work of the Grameen Bank which aroused interest in the whole international arena. Moreover 2005 was recognized as the Year for International Microcredit. The establishment of RITMI, an association with great partnership potential in the cooperative credit system is growing in popularity and impact. This could increase the possibility to create a financial product with a high standardization that could be offered to a wider audience of unbanked individuals. There seems to be a positive relationship between MFI and public institutions, financial intermediaries and customers. Currently the target is very specific and initiatives are divided into specific area sectors. Since the turn of the century the phenomenon has evolved both in terms of number and volume of loans brokered. Its growth is similar to an exponential function, so the annual growth rates are very high.

While most of the initiatives were inspired by the work of Prof. Yunus, the principles that characterize most of the Grameen bank model have exerted little influence on the national operators. This is due to the breakdown of social relations typical of all developed countries and the scarcity of resources (both economic and personal) available to organizations. Consequently, the basis of the distinction between micro-credit and traditional banking lending has been found in the approach to the problem of inability to repay: basically the loaners communicate with the micro credit organizations in order to identify the causes that led to non-repayment and seek social and operational ways to overcome these, recurring to the forced return of the loan only as an extreme solution.

As a promotional channel the national microcredit organizations use regional / social associations and word of mouth as main communication tools. According to businesses and onlus organizations the immigrants represent a potential future target of micro-credit operations, whilst Mag have the opposite view. Finally, microcredit operators have given high recognition to the BCC to act as intermediaries within the banking context since they demonstrated to be highly capable to embrace the principles and pursue the goals of microcredit, thanks mainly to the positive experiences that can be regarded as best practice.

End notes

¹ Other studies have been carried out in Italy, but just at a general level, since no specific topics have been discussed on this. See “Microcredito in Italia: la situazione in Italia e prospettive future”, IV International workshop of Ethical Finance, research carried out by Metamorfosi together with Lunaria e Associazione Finanza Etica (from which we found only a tiny excerpt on the internet: http://equonomia.it/articolo.asparticolo_codice=50).

² The paper on Microcredit, written by Borgomeo C. & Co and edited by Rubettino, reports that since 31/12/2003 103 programs have been surveyed, 77 of which are taking place. While gathering the statistic data, many of these have been grouped according to the organizational body, as it occurred for example to the Ethical Bank, various Mag, Fondazione Compagnia San Paolo Torino, Regione Lazio, etc.

³ Given a real scarcity of initiatives (both in terms of numbers and in terms of volumes), the difficulty to define “micro-credit initiative” and the complex work of collecting these data, the collective statistical corpus, constructed during the research, cannot be considered fully comprehensive.

⁴ In this case presenting the following limitations: abundance of the universe explored, little consideration given to the importance of statistical studies of persons belonging to different organizations, varied nature of the actors.

⁵ Caritas Reggiana, Comune di Torino, Comune di Venezia, ECIPAR Emilia Romagna, Fidi Toscana, Fondazione La casa, Fondazione Lucana Antiusura M. V. Cavalla, Fondazione San Carlo, Fondazione Toscana, Fondo essere - Quartiere 4 – Firenze, Mag 2 – Finance, Mag 4 Torino, Mag 6 - Emilia Romagna, Mag Roma, Mag Verona, Micro.bo, Microcredito di solidarietà, PerMicro.

⁶ In Italy, ethical finance focussed on so called unbanked found hitherto valid national operators in Banca Etica (which is not included in the sample considered, although it's response has been requested several times) and PerMicro.

⁷ MAG initiatives deal to raise money from shareholders in the form of social capital for economic self-managed fund initiatives providing opportunities for ethical and mutual funds, providing loans with interest rates favourable conditions return. An important objective is transparency in the internal management. Social participation is functional to people and not to the capital invested, for which every member has the right to vote and can participate in regular meetings as the meetings of the council. Often working in the cultural field also sponsoring and hosting of a socio-cultural projects at the local level. For more info, see the websites: <http://www.mag2.it/chi.htm>, <http://www.magvenezia.it>.

⁸ RITMI has recorded the different organizations into the following standard categories: financial intermediary, trust, no profit and public entities.

⁹ In this study we thought it was useful to consider “emergency credit” as a product offered by some organizations to address problems related to the loan shark practices. Although this problem often arises from financial difficulties of enterprises, the aim has been to support the individual rather than the company that he himself directed.

¹⁰ The internet website on the above mentioned financial support activities: <http://www.eif.org/jeremie> and <http://www.eif.org/attachments/about/JASMINE/JASMINE%20Flysheet.pdf>.

¹¹ In a nutshell credit risk is influenced by two components: the expected loss and unexpected loss, the latter resulting from the multiplication of EAD, PD and LGD (loss expected LGD = EAD * PD *), where EAD is the credit vulnerability at the time of insolvency, PD the probability of default, LGD rate of loss given default (equal to 1-RR, where RR stands for rate-recovery of the debt in default, positively influenced, as stated in the text, by the presence of guarantees).

Research on the Development of China's Carbon Finance

Kong Shuhong, kongshuhong@vip.sina.com
University of International Business and Economics, China

Abstract

Global warming brought with it the rise of low-carbon economy. Carbon finance received wide attention as it's the key for the promotion of low-carbon economic development. Carbon finance refers to various financial institutional arrangements and financial transactions aiming at reducing GHG emission and transferring carbon trading risks, including not only the trade of carbon credit and its derivatives, investment and financing of the development of low-carbon programs, but also carbon insurance, carbon fund, and institutional arrangements of other relevant financial intermediation and the decision on the currency for carbon trade. Although China is a major supplier in global carbon trade, its carbon finance is still at the early stage due to the short period of development and lack of experience.

This paper analyzes the development of current international carbon finance, and finds out major problems in China's development of carbon finance by relating to the current situation, in order to make relevant suggestions based on our national conditions. The author hopes that the theory of finance could be enriched by analyzing and studying China's carbon finance market, and that this paper could serve as a reference for China's policy makers in practice, so as to promote the fast and sustained development of China's carbon finance market. Therefore, this study is of important theoretical and practical value.

Key words: carbon finance, carbon trade, financial innovation

Introduction

1.1 Background and meaning of this research

In recent years, developing low-carbon economy has gradually become an important strategic choice for countries in the world in pursuing economic recovery and sustainable development. While traditional financial service is facing many constraints and challenges, low-carbon economy is about to become a new profit point of financial industry. With the rapid growth of low-carbon economy, carbon finance—a relevant new type of finance—has also enjoyed fast development.

The rise of carbon finance originates from two important international conventions, namely the United Nations Framework Convention on Climate Change and the Kyoto Protocol. In order to cope with the threat brought by global warming, in June 1992, more than 150 countries formulated the UNFCCC, and set the target of reducing global GHG emission by 50% by the end of 2050. In December 1997, the Kyoto Protocol is a supplementary protocol to the UNFCCC and a concrete implementation guideline. It went into effect on February 16th 2005. Under the Protocol, developed countries (Annex countries) are required to meet the GHG emission reduction target within a certain period of time (2008-2012), that is to reduce their GHG emission by 5.2% from the 1990 level. In addition, the Kyoto Protocol set national targets for different countries, 8% for the EU, 7% for the U.S., 6% for Japan and Canada. The Protocol identified emission reduction obligations for its contracting parties, and defined three coordination mechanisms, namely Joint Implementation (JI), International Emission Trading (IET), and the Clean Development Mechanism (CDM) which is for trade between developing countries and developed countries. According to Joint Implementation, Annex countries could trade and transfer Emission Reduction Units (ERU), International Emission Trading allows Annex countries to trade their emissions (Assigned Amount Units, AAUs). Each country has its particular AAUs targets under the international convention, then they could trade the targets based on their own national conditions, in order to meet the emission standards. The Clean Development Mechanism allows trade between Annex countries and non-Annex countries, developed countries could acquire Certificated Emission Reductions (CER) by making project investment in developed countries or directing purchasing. The above mechanisms help all contracting countries to meet their emission reduction targets in a flexible way, thus giving birth to the booming global

carbon finance market. Countries are gradually building carbon finance policy supporting system, carbon finance market system and carbon finance organizational system.

At present, China's carbon financial market is still at the primary stage when people are not familiar with "low-carbon" and "carbon finance". Many people hold the view that rapid economic growth and the convenience of modern material life conflicts with environmental protection. As the largest GHG emitter and the biggest developing country, China will surely face more and more emission reduction pressure from the international community. Proactive energy conservation and emission reduction might cost more in the short term, but it will result in sustainable development in the long run. The development of carbon finance is receiving more attention from both China and the world at large. Carbon finance is the financial pillar for China's development of low-carbon economy. Developing carbon finance will not only help with China's transformation towards a low-carbon economy, it will also accelerate the economic restructuring. After China made its emission reduction commitment at the Copenhagen conference, different localities in China actively explored ways to develop the carbon emission and carbon trade market, and the banking industry actively studied and innovated low-carbon financial model, used green credit to promote the development of low-carbon economy and accelerated product innovation of the carbon finance market. We are more aware that developing carbon finance is a huge challenge as well as a historic opportunity for China's sustainable economic development and the development of the financial industry. However, China is still at the cognitive and primary stage, therefore, the development of carbon finance calls for the joint effort from all social sectors.

1.2 Literature review

The research and understanding of carbon finance is a gradual process. In 2007, the book *Carbon Finance: the Financial Implications of Climate Change* written by Sonia Labatt and White Rodney became the first book in the world that has a thorough description of carbon finance. In their view, the definition of carbon finance includes: a branch that represent environmental finance; exploration of financial risks and opportunities relating to carbon's restraint on society; expecting a market-based instrument for transferring environmental risks and accomplishing environmental goals. Starting from studying risks, they analyzed the regulatory risks and security risks of industries in coping with climate change, those of energy intensive industries in particular. That is, the carbon emission reduction regulatory policies for coping with climate change would bring corresponding challenges to these industries, thus bringing about image risks, legal risks and competitive risks for business. Carbon finance and services are invented to lower the above risks.

As carbon finance is becoming a hot topic around the world, China is doing more research on the issue of the development of carbon finance from different perspectives. At present, China's research on carbon finance is still at primary stage.

In *Carbon Finance: More Than An Opportunity* (2008), Yuan Ying introduced other relevant financial intermediary activities to enrich the concept of carbon finance. He pointed out that carbon finance refers all kinds of financial transactions relating to carbon emission, including the trade, investment and speculation activities of carbon credit and its derivatives, as well as investment and financing activities of the development of carbon energy program and other related activities such as guarantee and consultancy services.

In *China's Carbon Finance Development and Innovation Strategies of Carbon Finance Mechanisms* (2009), Wu Yuyu summarized four functions of carbon finance in coping with climate change, namely the cost-benefit transformation of emission reduction, the financing of transferring energy chain, management and transfer of climate risks and promotion of international trade and investment. He also pointed out in this paper that the main obstacles to China's carbon finance development lie in the following aspects: governments and domestic financial institutions lack adequate understanding of carbon finance, the intermediary market is not fully developed and there are many risks in the development of CDM projects. It is proposed in this paper that we should step up innovation of the financial market mechanism, including building a better trading platform, formulating effective incentive mechanism and actively promoting the internationalization of RMB.

In *A Bright Future for the Development "Carbon Finance" Commercial Banks* (2010), Ma Xiao pointed out that although domestic commercial banks adopted some actions in terms of carbon finance, they failed to reach the core. The banks lack deep understanding of CDM related professional knowledge, policies, laws and regulations. They are incompetent to carry out investment programs in this field. We have no mature regime, place and platform for carbon trade, no swap transactions, carbon securities, carbon futures, carbon funds and all

kinds of carbon finance derivatives of financial innovation, and no scientific and reasonable interest compensation mechanism. Therefore, China could not contend against international financial institutions, thus we are facing the severe challenge brought by global carbon finance and the lack of its pricing right. In his view, China's commercial banks should expand intermediary services and project development services, play the role of financial consultant and gain commission charges by providing consulting services. In the meantime, we should actively search for target customers suitable for the development of CDM project so as to greatly expand credit services on energy conservation and emission reduction.

The Current Development of China's Carbon Finance Market

2.1 The CDM market is getting mature

At present, China's carbon finance activities mainly refer to financial activities relying on CDM. China has become one of the major countries dealing with CDM project trade. According to the statistics from the website of the UNFCCC (<http://www.unfccc.int>), as of March 31th 2010, 2121 CDM projects have been authorized registration globally; CERs issuance went up to 397 million tons of CO₂ equivalents. China successfully registered 781 projects (see Table 1), accounting for 36.82% of the total (see Fig. 1); China's CERs issuance was around 190 million tons of CO₂ equivalent, and the accumulated CERs issuance accounted for 48.21% of all the CDM projects (see Fig. 2). The International Energy Agency predicted that by 2020, China's potential CO₂ trade will reach 800 million tons, far outperformed other potential suppliers.

TABLE 1 REGISTERED CDM PROJECTS AND CERS ISSUANCE OF HOST COUNTRIES (AS OF MARCH 31TH 2010)

CDM country	host	Registered projects	CERs issuance (CO ₂ equivalent)
China		781	191424332
India		498	78086893
Brazil		171	39775445
Mexico		120	6253753
Malaysia		80	708028
Indonesia		45	325800
Philippines		41	95428
ROK		37	52666789
Chile		36	4702659
Argentina		17	3636822
Others		295	19422274
Total		2121	397089223

Fig. 1 distribution of registered CDM projects in host countries

In addition, in terms of the R&D of carbon structural products, Shenzhen Development Bank of China launched a wealth management product which pegs to CO₂ in both RMB and the US dollar in August 2007, and the basis asset was the CO₂ credit futures contract price of the EU's second commitment period. Beijing International Trust Co., Ltd. set up a low-carbon wealth and circular energy No. 1 collective fund trust plan, in which all the trust funds are used to provide loans to Erdos Tiankehua Energy Conservation Development Co., Ltd. Senior/subordinate structure was set in this trust plan, and various high return expectations were set according to different investment scales and financial management deadlines. In July 2009, Shanghai Pudong Development Bank took the lead in the domestic banking industry to have successfully introduced professional CDM development and trade institutions for two 70,000 kw hydropower programs in Shaanxi Province by using the exclusive financial consultant method. This brings annual extra carbon credit revenue of at least 1.6 million Euros for the owners of the program.

2.2 Trading platform are being built

Environment Exchanges have been built around China since 2008. China Beijing Environment Exchange,

Shanghai Environment & Energy Network and Tianjin Climate Exchange began to take shape, and they have actively explored new ways in terms of VER spot transaction. China Beijing Environment Exchange is a franchised entity whose establishment was approved by the Beijing Municipal Government. Its goal is to become a platform for value discovery and market trade of domestic and international environmental rights and interests. Since its inception, it has launched Panda Standard- the first VER standard in China, and VER trading market. It issued the first low carbon index in China, namely China Low Carbon Index (CLCI), and launched the first China contract energy management investment and financing trading platform in the world. Shanghai Environment & Energy Network is a professional equity capital market service platform which integrates the trading service of real right, bond, equity, IPR and other rights of the environment and energy field. It is committed to carry out broad exchanges and cooperation with abroad companies in terms of contract energy management and emission trading. It also actively built a CDM project information service platform and opened a South-South Global Environment & Energy Trading System. Tianjin Climate Exchange is located in the Binhai New Area of the City of Tianjin, it is the first national comprehensive emission trading institution under the requirement of the development of the CDM and emission trading market. It is committed to do works related to COD, GHG emission trading, energy trading and provide relative consulting service. It is an international trading platform that uses market forces and financial innovations to promote energy conservation and emission reduction.

Apart from these three major trading platforms, other environmental trading platform have also been put into place in other localities in China, such as Hangzhou Property Exchange, Jiaying Emission Conservation and Trading Center and Changsha Environment & Resource Exchange.

2.3 Carbon finance organizational service system is being built

China's carbon finance organizational service system is far from completion yet, however, over the past several years, domestic commercial banks began to develop carbon finance business, and they tried to participate in the carbon trading market. There has been some progress in this regard, mainly manifested in "green credit", CDM financial consultancy and the innovation of carbon finance wealth management products. In May 2006, Industrial Bank Co., Ltd. joined the Equator Principles, becoming the first bank to have implemented green credit service. As of September 30th 2009, 35 branches of Industrial Bank have handled 146 energy conservation and emission reduction loans, with a total value of 9.237 billion RMB Yuan, saving about 6 million tons of standard coal. Besides, China Merchants Bank, Shanghai Pudong Development Bank, China Minsheng Bank and other banks have launched many new green credit business models, mainly including project corporate financing model, financial leasing model, credit model under CDM, production increasing credit model for energy conservation and emission reduction equipment manufacturers, credit model for public service providers. In terms of the innovation of carbon finance wealth management products, Bank of China and Shenzhen Development Bank have made innovative breakthroughs in the wealth management products pegged to carbon emission credit, and issued wealth management products pegged to carbon emission trading. On July 20th 2007, China Green Carbon Fund was founded to promote afforestation activities for CO₂ fixation. This Fund is financed by multiple channels such as the government, multilateral institutions and private sectors. It participates in carbon emission trade and transactions. On November 9th 2007, China Clean Development Mechanism Fund was officially established. It is in charge of the collection, raising, management and use of the fund.

2.4 Policies on carbon finance are being mapped out

Policy support is an important pillar for the development of carbon finance. A policy supporting system for carbon finance should include carbon finance market policy, carbon finance organizational service policy, and carbon finance regulatory policy and so on. The Chinese government has issued pilot policy on national emission trading market and green financial policy for the banking industry. These policies are relatively scattered and lags behind the development of carbon finance, however, the state and local governments are working on the issuance of relative policies.

Major Problems for China's Carbon Finance Development

3.1 Problems in the carbon finance market

China's carbon finance development is still at the primary state. We don't have adequate understanding of the concept of "carbon finance". Many Chinese companies haven't realized the great business opportunities brought by it, and domestic financial institutions are not familiar with the value, operational model, project development and trading rules of carbon finance. At the same time, China's carbon finance trading bodies' bargaining ability is weak. Because Chinese companies don't have pricing rights when negotiating with international buyers, the knockdown price is usually far more less than the price of the international market. In addition, compared with other ordinary investment projects, CDM projects need more complicated procedure for examination and approval, which leads to longer development cycle, more risks and extra trading costs. The development of carbon finance still faces many risks, such as credit risks, market risks and operational risks. The lack of effective risk sharing and aversion mechanism also hampers the development of carbon finance.

3.2 Problems of carbon emission trading

In the past two years, exchange trading platforms have been set up across the country. Given China's current situation, the establishment of environment exchange platforms represents the performance of governments in developing low-carbon economy and potential local and governmental interests. With governmental support, some not qualified localities are also eager to have a try, and set up regional exchange platforms without considering the cost. Segmentation of exchange platforms has become a definite trend. Besides, comparing with the U.S. and the EU, the major Chinese exchange markets lag far behind in terms of both scale and function. The carbon trade carried out by China's environment exchanges has limited number and scale; it is the same with both CDM projects and VER trade. Take the exchanges in Beijing, Shanghai and Tianjin for example; they carried out only a few VER deals one year after establishment, which bear more symbolic meanings. China's carbon trade market is still in an exploratory stage on the whole, without giving full play to price discovery and serving as market trading platforms.

3.3 Problems in the carbon finance organizational service system

3.3.1 Insufficient participation of financial institutions

Although China's financial organizational service system has been well-built, there are still no carbon finance institutions such as carbon banks, carbon funds, carbon asset management companies, carbon brokerage companies and carbon rating companies. In the meantime, China's financial institutions participation in carbon finance is not profound and extensive enough, and the development is too slow. Commercial banks have few cases to consult or finance for corporate with the goal of developing carbon finance. There is almost no financial service in terms of direct financing for carbon emission reduction project, participating in international carbon trade and providing consulting services to corporate CDM projects' recognition of the UN. There are more blanks to fill in various financial derivatives and service support such as carbon swap trade, carbon securities and carbon fund.

3.3.2 Single carbon finance product

Although domestic financial industry has set foot on carbon finance, grasped financial innovation opportunities on climate change, and new achievements have been made in the formulation and implementation of green credit policies, the development of energy efficiency loans and products pegged to carbon emission, the current carbon finance is mainly focusing on developing credit with a small proportion of direct financing. There are rarely other forms of financing besides working capital loans and project loans. When it comes to the fostering of domestic emission trading market, China has already began to adopt domestic carbon trade and other varieties of emission trade, but it covers few varieties and the market scale is small. In particular, restrained by the pollution characteristics of emission trading varieties and the separate model of environmental management system, it is difficult to conduct trans-regional trade. The lack of a sound pollution discharge fee system led to the slow development of environmental trading market. On the whole, these carbon finance products and service innovation only have local significance, and they failed to match the potential of China's carbon market development in terms of depth, breadth and scale.

3.3.3 Incomplete development of intermediary market

Carbon credit under the CDM mechanism is a virtual commodity, which has strict trading rules, complex

development procedures and long contract period, and its sales contract involves overseas clients, therefore, non-professional institutions hardly have the ability to develop and execute such projects. In other countries, the evaluation of CDM projects and the purchase of emission credit is done mostly by intermediary institutions, but in China, since the domestic intermediary institutions are still in the infancy stage, it is difficult for them to develop or take in a large number of projects. Moreover, there is no professional technological consulting system to help financial institutions analyze, evaluate and evade project risks and trading risks.

3.3.4 Shortage of carbon finance talents

The effective promotion of carbon finance business needs those financial institutions with sound and sophisticated departments, so as to do all the necessary preparatory work such as the research and design of carbon finance products and the formulation of business process. Most domestic financial institutions don't have departments specialized in this regard. Compared with traditional financial business, carbon finance business relies heavily on interdisciplinary talents who have the professional knowledge of chemical industry, finance, law, foreign language, management and so on. These people should not only be familiar with basic financial knowledge and its operational rules, but also need to know well the state industry policy, energy policies and laws, energy-using equipment and features, industrial processing technique and technical regulations. Furthermore, they should be familiar with corporate energy audit, project engineering estimate and budget organization, corporate energy-saving projects or energy-saving consultation. At the moment, China doesn't have an adequate reserve and accumulation of such interdisciplinary talents, and the shortage of inner institutions and talents in the financial industry led to less momentum for the promotion of carbon finance business.

3.4 Lack of policy hampers the fast development of carbon finance

For the perspective of policy support, the major problems are as follows. First, in developing low-carbon economy and carbon finance, China faces huge external pressure and little internal dynamics. The promotion of the low-carbon concept in China is top-down, namely the state formulate policies to propel the participation of enterprises, local governments and the general public. However, different governmental agencies and governments at all levels don't pay equal attention to low-carbon economy and carbon finance, and many governmental agencies that provide policy support don't fully understand low-carbon economy and carbon finance. What's more, they don't know when to issue a policy or what kind of policy should be issued. Second, financial policies didn't play a guiding rule. For example, of the 4 trillion RMB yuan investment plan of the state, 210 billion is earmarked to low-carbon economy, only more than 5% of the total investment. As another example, many enterprises with registered CDM projects are asset-light technology service companies with little asset, small operating revenue, weak balance sheet and not no traditional security guarantee conditions. Because there is no relevant incentive policies, and that they couldn't get bank credit or other financing support, they lost development opportunities. Third, financial incentive policies are not in place. Many low-carbon projects are not qualified to get bank credit or investment from private equity or venture capital. To debottleneck the financial problems, the government should provide policy support and financial guarantee support to the tax reduction of relative low-carbon projects. The financial authority should take the lead to boost economic growth. Forth, the government didn't guide the use of public fund. At present, most governments haven't set up governmental guidance fund. The government should guide private capital to make investment in the low-carbon field by means of well-leveraged government mechanisms. Fifth, the government hasn't done research on the regulatory policies of carbon finance. The development of China's carbon finance market will to very fast. Like the development process of any market, a large number of carbon finance risks will be generated. To meet this challenge, the government needs to take precautions beforehand and do research on the regulatory polices of carbon finance as soon as possible.

Strategies and Suggestions on China's Development of Carbon Finance

4.1 Gradually improving CDM trading market and building international carbon trading system

Based on the current domestic carbon finance development, China should build a VER mechanism, vigorously develop domestic VER market, press ahead with emission reduction activities within the system and promote the full use of clean energy, so as to realize effective environmental protection and sustainable economic and

social development. We should first build VER platforms based on local exchanges, and carry out VER pilot to accumulate experience. Subsidies, tax preference, protective price and low interest loans should be given to the emitters voluntarily participated in emission reduction trade in order to low the cost for emission trade. All the qualified emitters could participate in the emission trading market. The vigorous development of the VER market will gather experience for China's transition towards a compulsory emission reduction market with limited total trade volume. In the meantime, China needs to gain more pricing rights in international carbon trade and learn from international carbon trade mechanism to further explore emission quota system and develop emission quota trading market. We should identify the function of price in financial market and adjust the interests of various economic bodies. We should encourage and guide the optimization and upgrade of industrial structure and the transformation of economic growth pattern. We also need to effectively distribute and use national environmental resources to better conserve energy, reduce emission and protect the environment.

4.2 Building trading platforms and integrating carbon trading market

China should build an integrated trading platform and trading mechanism to gradually unify the domestic carbon trading market, and prevent the worsening of the situation caused by exchanges. At the moment, on the basis of the establishment and development of China Beijing Environment Exchange, Shanghai Environment & Energy Network and Tianjin Climate Exchange, we could start to press ahead with the improvement of the exchange system and expand the scope of the participants.

4.3 Drawing on international experience to innovate the carbon finance organizational service system

China need to let banks play the central role to accelerate the development and innovation of carbon finance products. For example, banks could try to launch liquid fund that is pegged to low carbon consumption and environmentally friendly companies, so that investors could follow the performance of these companies in the market. The banking industry could also tray to provide "carbon banking" service to the VER market, which means banks start to register, entrust, clearing and settlement of carbon credit for the development of the VER market. China could draw upon successful experience from the EU, the U.S and other developed countries. We could develop series of financial derivatives to meet the market participants' need of hedging, thus realizing the transition from basic products to derivatives, such as guarantee business (like providing letter of guarantee) and arbitrage trading.

At the same time, China needs to strengthen the building of intermediary institutions and the cultivation of professional talents. On the one hand, the government needs to implement special policies to recruit top-level talents on carbon finance, and pledge to give priority to the introduction of top-level talents needed by carbon finance corporate. On the other hand, together with universities and other research institutions, the government should pay attention to the cultivation and training of carbon finance talents. For example, setting up carbon finance courses or defining research directions, special allocated training fund by the government, organizing professionals to give training courses to government officials, enterprise employees or staff of financial institutions on low-carbon economy and carbon finance. We need a number of comprehensive talents who not only know the operation of carbon finance but also know the Chinese market, in order to meet the needs of international financial institution for such talents in implementing localization strategies.

4.4 Building a supporting policy system for the development of carbon finance and effective stimulate the development of financial market.

The development of carbon finance needs matching legal arrangements, therefore, the government needs to set up a legal framework for the development of carbon finance, which includes full trading system of carbon emission, financial regulatory system and so on, so as to create a stable institutional environment for the development of carbon finance. In the meantime, effective incentive policies are necessary methods of the government to support the development of carbon finance. In terms of financial policies, we could interest subsidize interest payment of green loans for the development of low-carbon industry in need, it could also improve the economic intensity of the projects by reducing tax rate of carbon finance projects and prolong the tax holidays. In terms of monetary policies, we could adopt differentiated regulatory measures such as properly reducing or exempt reserve requirement within the loan limit of carbon finance project, giving more floating margin to the project loan rate and lowering the loan capital fund requirement of carbon finance project, in order

to make the business of financial institutions lean towards carbon finance. In terms of foreign exchange management policy, we should open a green channel for carbon finance, and enlist the free flow of cross-border carbon capital as an antecedent goal for the gradual realization of the convertibility of the capital project, thus to promote foreign capital to flow to low-carbon industry.

Conclusion

Low-carbon economy has become an irresistible trend of the times, and it is also a strategic direction for China to change economic development pattern and realize sustainable economic and social development. Under the framework of low-carbon economy, financial activities related to carbon emission are not only indispensable, but have also become a huge market. As the largest GHG emitter in the world, and with the improving overall national strength, China will eventually take on its due tasks to reduce GHG emission, and play a more important role in the global climate issue.

China's development of carbon finance just took off, and relevant theoretical researches just get to the start. There is a huge gap between us and the EU and the U.S. in terms of developing carbon trading market. To close this gap, Chinese commercial banks need to seize this precious opportunity, and use all kinds of measures to promote carbon finance practice and support low-carbon economic development. The academia needs to step up effort in research and provide great intellectual support for the development of low-carbon economy and carbon finance. What's more, the government needs to actively provide effective guidance, and use legal, economic and social methods to make the concept of low carbon and carbon finance fine their way into people's hearts. The government should also guide enterprises and individuals to be self-disciplined, so as to create a sound market environment for the development of carbon finance.

Carbon finance has become a competition battlefield for international financial institutions. Strengthening innovation of the carbon finance market mechanism is an inevitable trend. The author believe that as long as China focus on cooperation and all-win on the basis of its own economic condition, and form a domestic development strategy, it will surely promote the development of carbon finance, and China will gradually set up a carbon finance development model with Chinese characteristics.

“Japanese knowledge management, culture, standardization and adaptation”

Jeannette Wilhelmy jeannette.wilhelmy@gmail.com

University of Frankfurt, Germany

Abstract

An important competitive advantage of multinational companies is their access to local knowledge through their subsidiaries. However, this advantage goes to waste if the multinational company is unable to coordinate knowledge transfers from the diverse cultures of the local subsidiaries. Cross-Cultural knowledge transfer promises fertile outcomes, yet MNCs need to decide whether to adapt to local knowledge management styles or standardize their knowledge management systems. This paper poses the question of standardization versus adaptation for a sample of Western MNC subsidiaries in Japan. The Japanese culture has been characterized as particularly complicated to match with Western culture regarding knowledge management. This research examines the practices of Western MNCs in Japan. The influence of Japanese knowledge management culture on Western MNCs, whether they adapt to it or introduce standardized mechanisms to avoid deviant methods, is analyzed by processing 40 interviews with employees of 7 Western MNCs in Japan.

1. Introduction

In knowledge management, culture is a fundamental issue. Cultural influences can foster its success or impede it. Although the assumption that national characteristics reflect on knowledge regimes of diverse cultures is not new (e.g. Jin, 2001: 164), there is no agreement about how exactly national cultures influence knowledge management (especially knowledge transfer). This paper aims at closing this knowledge gap to some extent. Ang and Massingham introduced a framework which enables multinational companies (MNCs) to make an informed decision about whether to adapt or standardize their knowledge management and thus improve competitive advantage (Ang & Massingham, 2007: 6). This framework will be applied to MNCs in Japan to analyze how knowledge transfers are influenced by cultural factors in this environment. The Japanese knowledge culture and its type of MNC knowledge transfer has been categorized as a “horizontal collectivistic culture” (Bhagat, Kedia, Harveston, & Triandis, 2002: 213-215). A qualitative study has been conducted with employees of 7 MNCs in Japan to shed light on their knowledge culture (40 interviews), as perceived by Japanese employees as well as non-Japanese employees. Their examples of knowledge transfers give insight into the strengths and weaknesses of the Japanese knowledge culture and how it is embedded in these foreign MNCs in Japan. A decision towards standardization versus adaptation of knowledge management in accord with national cultures is a complex problem. This study focuses on culture as one inhibiting or proffering factor of knowledge transfer in the Japanese context. The results reveal that culture influences knowledge management in various ways. The practices of the 7 MNCs in this study reveal that sharing and transferring of knowledge in Japan does not correspond with common stereotypes of Japanese knowledge styles (for example group/relationship orientation, importance of tacit knowledge).

2. Cross-cultural knowledge transfer, its merits and barriers and the case of Japan

The supposition that culture is an important influence on any action in an MNC is rather trivial. Examples for cross-cultural challenges are plenty (e.g. Nakata, 2009). What is culture in an organizational or MNC context? What does

culture mean for knowledge in MNCs? These questions lie at the bottom of any investigation into the topic of cross-cultural knowledge transfer and thus intra-MNC knowledge management. Indeed, knowledge management must not be restricted to a mere transmission of information, it potentially fulfils a mediating role in connecting organizational context and strategy with organizational effectiveness (Zheng, Yang, & McLean, 2010). Culture in the organization can mean either the organizational culture which has been developed by the MNC itself or the national culture, which influences the diverse subsidiaries of the MNCs. More precisely, one would have to speak of “multiple cultures”, considering the fragmentation and multiplicity of cultures in organizations (Moore, 2009: 201). The overall definition of culture can be phrased as follows: “Culture represents a core set of values” (Lucas, 2010: 423) employees have. But every employee also has a set of values which stem from the national culture. Obviously, multiple sets of values may collide in certain situations. “Culture” has been defined in many ways, stretching the term beyond values (e.g. Taras & Steel, 2009: 40). Culture has other dimensions such as human nature, relations to nature, activity orientation, human relationships, relations to time and space (Möller & Svahn, 2004: 222). The well-known studies of Hofstede have made a set of cultural dimensions popular in the business research canon (Hofstede, 1991). The surveys he and his colleagues carried out in the 1960’s and 1970’s with data from IBM were the first attempts to measure culture in an international business context. Other researchers have also developed cultural dimension typologies (e.g. Hall, Trompenaars), but the most prominent is Hofstede’s (Tipton, 2009: 147). The five cultural dimensions: small/large power distance, individualism/collectivism, masculinity/femininity, weak/strong uncertainty avoidance and short-term/long-term orientation (“Confucian dynamism”) have been used under many aspects in various research projects (for an overview see Fang, 2003). Although Hofstede’s National Culture Dimensions themselves and the research design have been criticized considerably (e.g. Fang, 2003; Tipton, 2009), the Hofstede terminology remains popular. Especially the distinction of individualist and collectivist cultures is well accepted in business literature today, thanks to its adaptability.

Many studies focus on one of the Hofstede dimensions, often in combination with the distinction of horizontal and vertical orientation. This construct originates from the social sciences and is mainly utilized as a pure dichotomy (Triandis & Gelfand, 1998: 118). While this distinction may be disputable (e.g. Kimmelmeier, et al., 2003), this study consents, for the sake of clarity, with the classical understanding of the terms. Societies which emphasize interdependence between the self and the group are described as “collectivist”, whereas societies in which the individual counts more than the interests of the group are “individualists”. “Horizontal” describes societies in which the emphasis on hierarchies is low (for example Australia, Denmark, Sweden), “vertical” describes societies in which hierarchies are very important (for example China, India, Japan) (see Bhagat, et al., 2002; Triandis, 1995). These two orientations combined with individualism/collectivism have resulted in the following typology:

<p>“VI” = Vertical Individualism (France, Germany, United Kingdom, United States)</p> <p>“VC” = Vertical Collectivism (China, India, Korea, Singapore)</p> <p>“HI” = Horizontal Individualism (Australia, Denmark, Sweden)</p> <p>“HC” = Horizontal Collectivism (Japan)</p>
--

TAB. 1 THE VI/VC/HI/HC CATEGORY SYSTEM (SEE MÖLLER & SVAHN, 2004: 223, FIG. 2 CULTURAL PATTERNS)

Obviously, this typology should not be understood as a rigid determinism. The categories represent tendencies of the named societies. It would be mistaken to use these categories for any type of generalistic declarations. Nevertheless,

culture does matter and the VI/VC/HI/HC category system can be useful, especially where knowledge transfers are concerned. The cultural background influences a person's processing of information (Bhagat, et al., 2002: 208). Bhagat et. al. recognized this fact and drew the consequences for multinational businesses. Employees from different subsidiaries will treat knowledge in a culturally affected way. Different kinds of knowledge and information will be treated differently in varying countries. The relative emphasis of different facets of knowledge by people of the four different cultural patterns has been identified as:

Individualist cultures (VI, HI) = tendency towards independent, explicit knowledge
Collectivist cultures (VC, HC) = tendency towards systemic, tacit knowledge

TAB.2 THE VI/VC/HI/HC CATEGORIES AND KNOWLEDGE (BHAGAT, ET AL., 2002: 210-212)

In his study on sectoral patterns and national competitiveness of nations, Jin described these attitudes towards knowledge as “knowledge regimes” (Jin, 2001). The two mirror image nations regarding knowledge and information are the USA and Japan: “[...] because of its penchant for autonomy and independence, the USA values highly explicit, scientific, objective, quantitative, analytic, and professional knowledge. Antithetically, Japan prefers highly tacit, intuitive, inter-subjective, qualitative, synergetic, firm-specific, and relation-specific knowledge” (Jin, 2001: 56). These two antithetic views are the result of the two underlying philosophies. The dominance of separate knowing in Western societies is based on Western philosophy. It emphasizes the disembodiment of mind from body and thus the known from the knower (Jin, 2001: 81). Only independent, analytic, explicit knowledge is seen as valuable. On the other hand, Eastern philosophy legitimizes tacit, personal, contextual, and intuitive knowledge. Disconnected knowledge is not valuable, but rather “connectual” knowledge is emphasized (Jin, 2001: 86).

In an MNC, employees from different cultural backgrounds work together. Knowledge management is one, maybe the most significant function of an MNC, where cultural patterns surface. People from all four categories need to work with one another. Empirical evidence has shown that the compatibility of these cultural patterns varies drastically (Bhagat, et al., 2002: 210-215). Bhagat et al. have ranked the difficulty of cross-border transfers of organizational knowledge as follows:

1 (less difficult to transfer in either direction)	=	VI - HI, VC - HC
2 (more difficult to transfer in either direction)	=	VI - VC, HI - HC
3 (most difficult to transfer in either direction)	=	VI - HC, HI - VC

TAB. 3 THE VI/VC/HI/HC CATEGORY SYSTEM AND MUTUAL TRANSFER DIFFICULTY (SEE BHAGAT, ET AL., 2002: 212, FIG. 2 CROSS-BORDER TRANSFERS OF ORGANIZATIONAL KNOWLEDGE AMONG FOUR CULTURAL PATTERNS)

According to Bhagat et al., four of the couplings are less or moderately difficult. Two couplings are particularly problematic: knowledge transfers between VI-HC and HI-VC countries. These are: Germany/US – Japan and Australia/Denmark – China. This study will now focus on one of the particularly problematic couplings: Germany and Japan.

The emphasis on tacit knowledge in Japan has been confirmed by Japanese authors. Primarily Nonaka has dealt with the phenomenon (see Nonaka, 2004; Nonaka & Takeuchi, 1995; Nonaka & Teece, 2001; Nonaka & Toyama, 2004;

Nonaka, Toyama, & Hirata, 2008; Nonaka, Toyama, & Konno, 2001). Japan has been characterized as a “horizontal collectivist” (HC) country, the only national culture of this type. For a Western MNC, this means that the knowledge from the Japanese subsidiary will be very different from those from other subsidiaries. The potential merits of this knowledge source are palpable. Indeed, several booms of “learning from Japan” came and went in international business literature since the 1980s (e.g. Haghirian, 2010; Schaede, 2008). However, the transferability of this “unique” knowledge base remains doubtful (e.g. Recht & Wilderom, 1998). The question for MNCs in Japan is how to learn from the Japanese staff. Is a standardized system throughout the MNC better apt or should the MNC adapt its mechanisms to the local knowledge regime? When Germans and Japanese work together, a Western knowledge regime and an Eastern knowledge regime collide. Germans tend to emphasize explicit knowledge, such as hard facts. Meanwhile, Japanese tend to favor systemic and relational knowledge. The German style is characterized as “vertical individualism” (VI). They are most comfortable with knowledge which can be easily codified and which stands independently of its context. The Japanese, on the other hand, put emphasis on “ingroup goals and norms”. Consequently, the knowledge they usually transfer and share is interdependent and contextual (Bhagat, et al., 2002: 212). Transferring knowledge between the two groups of VI and HC hence becomes a challenge.

3. Strategies for cross-cultural knowledge transfers in MNCs, adaptation and standardization

MNCs have various means to control knowledge transfers. The knowledge management strategy of an MNC generally boils down to two options: adaptation or standardization of knowledge transfers. Ang and Massingham define the two terms: “Standardization refers to a common approach to business throughout the world, while adaptation requires a different approach in each market”(Ang & Massingham, 2007: 6). If the MNC sees itself as an interorganizational network (Ghoshal & Bartlett, 1990), the consequence will be that every subsidiary is free to adapt to its local market. But if the independence of an MNC subsidiary is taken too far, the connection to the rest of the organization may become loose. Then the whole of the MNC does not profit from the local knowledge this subsidiary has gathered anymore. This threat of separation from the rest of the MNC makes the opposite strategy of centralization and standardization of operations more appealing. Centralization of operations has many positive impacts like synergies and easier coordination. But the downside to centralization is a lowered willingness to share knowledge (e.g. Minbaeva & Michailova, 2004: 663). Subsidiaries may be unwilling to give knowledge to headquarters because they do not see an advantage in sharing for themselves. The adaptation versus standardization decision is important regarding the MNC organization itself (Bartlett & Ghoshal, 1998). But empirical research on this decision for MNC knowledge management is still limited (Ang & Massingham, 2007: 5). Ang and Massingham posed the question how this decision can be addressed effectively by MNCs. They developed a four-step model to identify appropriate decisions for adaptation versus standardization in international knowledge management (Ang & Massingham, 2007: 15). The decision process starts with the examination of local knowledge management activities. If they are effective, they are too valuable to replace with the standardized version. If they are not effective, they will be replaced. The factors affecting knowledge transfer in MNCs can be segmented into 11 categories: cultural factors, organizational factors, leadership, forms of ownership, strategic similarity, incentive based learning capacity, partner protectiveness, human resource management practices, organizational culture, individual factors (absorptive capacity) and knowledge transfer capacity (Ang & Massingham, 2007: 13). Focusing primarily on the cultural factor, a difference in knowledge management can be expected in the case at hand (of VI-HC transfers of knowledge). In either direction, the knowledge transfer is difficult, friction and barriers abound. A standardization or adaptation of the local knowledge management activities may ease the exchange. But which style should be adapted to? German headquarters’ VI-style (standardize) or the Japanese subsidiaries’ HC-style (adapt)? The difficulties of knowledge creation and knowledge transfer do not affect all national cultures in the same way (Ang & Massingham, 2007: 12),

therefore the decision for a whole MNCs can have four outcomes in the subsidiary units: adaptation and success, adaptation and failure or standardization and success, standardization and failure (Ang & Massingham, 2007: 17). Apparently, the combination of national cultures involved in the knowledge transfer is critical for a right decision. While in other business units such as marketing or strategy, this decision is measured by the amount of pressure to either reduce costs or be market responsive, this logic seems inappropriate in the case of international knowledge management. Cultural responsiveness of a national culture and scope economies are proposed by Ang and Massingham to capture the necessities for an international knowledge management decision. The dimension “scope economies” includes an approach to resolve barriers in knowledge management while “cultural responsiveness” addresses the cultural awareness needed. Appropriate and inappropriate adaptations can be analyzed in detail by reviewing the processes and sub-processes of knowledge management. Yet, the deciding parties will always have their personal cultural background influencing their decisions. Voices from practitioners will now be examined to elucidate the case of VI-HC international knowledge management activities.

4. Qualitative interview analysis of Western MNC subsidiaries in Japan

40 interviews are the source of this research. The 40 employees of Western MNCs have been interviewed in 2008 and 2009 in the course of a dissertation project on knowledge transfers in diverse MNCs. The interviewees responded to a semi-structured interview guideline with focus on knowledge management and knowledge transfers in their MNCs (Wilhelmy, 2010). The issue of culture and cultural differences was addressed frequently, especially in connection with knowledge sourcing from headquarters and other subsidiaries. Because the MNCs did not want the interviews to be recorded, the interviewer made handwritten notes. These notes have been entered into the qualitative research software NVivo8 and coded systematically. The following codes have been used:

<p>Japanese knowledge management and culture</p> <p>Japanese KM, Learning from Japan, Japanese Marketing and Market, Working in Japan</p> <p>Non-Japanese knowledge management and culture</p> <p>German KM, U.S. KM, Working with Westerners in Japan</p>
--

TAB.4 FREE NODES USED IN NVIVO8

The interviewees are mainly German (19). But Japanese (16) and other nationalities (5) have also added their views to the topic. The interviews on the topic of knowledge transfers within the MNC in general and specifically in the Japanese subsidiary of a German or U.S. have been analyzed concerning the adaptation or standardization decision and whether this decision was appropriate for this subsidiary or not. In Ang and Massingham terms, the appropriateness of this decision is measured by assessing whether “scope economies” pressures or “cultural responsiveness” pressures are more prevalent. The aim of this research is to show how the VI-HC works, which factor are inhibiting and which factors are positive for knowledge transfers and sharing. In addition, the advantages and disadvantages of the Japanese knowledge management style for Western companies will be identified to finally produce deciding factors for an adaptation or standardization decision. The major observations made in the interviews will now be portrayed with examples.

The general attitude towards knowledge management can be described as a demand from headquarters. The “exchange” of knowledge really is headquarters demanding knowledge in the form of market information, sales reports and other data which subsidiaries have to deliver. Not only Western, but also Japanese and other nationalities mentioned this data delivery as the form of knowledge management which they are most familiar with. In more positive words, this common ground of an identification of the subsidiary colleagues can be interpreted as a step towards a feeling of togetherness enabling knowledge exchange between VI-HC cultures. Especially Western interviewees often described the knowledge headquarters want to source from them as a burden, causing a lot of work. They did not see the reports they have to make for headquarters as beneficial to themselves, only as additional work with no benefits. “Knowledge management” was therefore often viewed negatively, because no benefits of this work were communicated to the subsidiaries.

Relationships and group thinking were characterized as being special about Japan and the Japanese style of knowledge management. Winning the trust of the coworkers was seen as fundamental before one can expect to exchange knowledge with the Japanese workers. This estimation corresponds with the style of knowledge management as described in business literature on the subject. Group thinking and relationship focus in Japanese companies have been identified as features which make Japanese knowledge management superior (e.g. Albach, Görtzen, & Zobel, 1999; Richter, 2000). But in a Japanese subsidiary of a foreign MNC, the affiliation to a group does not happen automatically. The non-Japanese employees described it as a prerequisite of getting any information to win trust and build relationships. After a while, one will be integrated and become part of the in-group in which knowledge is shared. Trust always is an important factor in knowledge transfer (Minbaeva & Michailova, 2004: 667). It is not an exclusively Japanese demand for the transfer and sharing knowledge. However, owing to the group thinking mentality, the issue of trust was mentioned exceedingly regarding the interaction of non-Japanese and Japanese coworkers.

Another big issue and thus important necessary qualification is the Japanese language. Without Japanese language skills, one will be left out of the Japanese in-group. This was not described as a willful ostracism, but rather a consequence of the given situation. Consequently, Japanese coworkers who do not have English skills cannot “climb the corporate ladder”. All higher positions demand a command of English. An interviewee from a U.S. company observed that this and other factors which discern Western MNCs from Japanese MNCs make them less attractive for the classical Japanese work force. Western companies need to turn this disadvantage around and communicate that they are very attractive for Japanese employees who seek to work in a “different” work environment. For example Japanese women in the interviews stated that they liked the special atmosphere in the Western MNCs. Their career options are much more diverse and the chance to work abroad was seen positively. This example has shown that Western MNCs often do not employ a “classical Japanese work staff” in Japan. In terms of their appeal to “non-classical” Japanese workers, knowledge management behavior as expected from business literature must not be expected in these Western MNCs in Japan. The Western MNCs have introduced so called “sandwich” job positions for bilingual staff. This staff acts as intermediates between the only-Japanese and only-English speaking coworkers. Many of the non-Japanese interviewees speak Japanese very well. They hold these “sandwich” positions and claimed to be able to communicate with all staff members. But the typical expatriates do not take the challenge to learn Japanese because they know that they will only stay for a limited time and then move on to another foreign country before eventually returning to German or U.S. headquarters. Oftentimes the so called “third country locals” fulfill these sandwich positions because they are bilingual (English and Japanese). They have been living in Japan for a longer time and are recruited locally.

A German interviewee observed that knowledge management in Japan takes place in “teacher-student”-relationships. As mentioned before, the relationship is at the base of knowledge exchange in Japan. The teaching and learning approach in Japan sometimes collides with the egalitarian knowledge management understanding of the Western staff. Employees are supposed to share interesting information they have for the good of the company. But the Japanese interviewees stated that they are rather uneasy with the idea of inserting information into a database. They were unsure what exactly was expected and how they would discern information which is important and valuable for the knowledge management system from uninteresting information. They wanted to avoid making mistakes and damaging themselves by transferring wrong or unimportant information, so many chose not to transfer anything at all via databases. The headquarters’ idea to encourage knowledge sharing in a very broad sense obviously does not fit to the Japanese attitude towards knowledge. They rather want to talk with a coworker and discuss ideas in groups. The anonymous knowledge database would need to be communicated much better in the Japanese subsidiaries in order to be used properly. The Japanese as “horizontal” are used to sharing knowledge and information on one hierarchy level (Triandis, 1995). It is important that sender and receiver are on the same level. This was not given with the data bases. If the knowledge sharing is supposed to cross group borders, it would probably be effective to enhance the teacher-student relationships outside the groups. The discomfort which Japanese employees described to use the knowledge data bases of the company implies that a standardization decision at this point is inappropriate. Instead, knowledge transfer needs to be encouraged with group activities focusing on concrete topics. This type of activity would match the Japanese knowledge management style. Apparently, regarding knowledge management systems, the pressure to be culturally responsive is high. Western MNCs need to respond to the knowledge management culture of Japanese employees adequately if they expect frugal inputs from them.

Apart from that, the working style of Japanese employees was not always described as one would expect from literature. Although the personal communication was mentioned a lot, Japanese work staff was not described as overlapping their duties. Indeed, one interviewee described Japanese workers as “not looking left or right” from their own work space. It is not easy to imagine an atmosphere of agile intercommunication if workers only focus on their confined field of work. Many Japanese employees do not want to know what is going on around them. They like to focus on their work exclusively. The behavior, as some interviewees described it, could even be called ignorant. The researcher was astonished to hear about such an attitude, which is so contrary to the popular cliché of Japanese workers. An ignorant attitude could rather be expected from Westerners who are usually characterized as less sociable and more individual. But the issue of Japanese staff demanding very detailed information for their work assignment recurred in many interviews. This behavior can be explained with uncertainty avoidance, which has been described by Hofstede as common in the Japanese culture (Hofstede, 1991). The surprising fact was that it expresses itself in the way it did here: that Japanese workers were described as confining to themselves instead of being sociable and taking interest in everything the others are doing. Indeed, the opposite seemed to be the case. Especially German interviewees saw the main difference between Japanese and Germans in dealing with knowledge and information that Japanese like to know as many details as possible to avoid errors and uncertainty. But the Japanese do not take much interest in the work others are doing. This becomes apparent when one worker is missing and nobody can fulfill his duties. The coworkers then admit that they do not know much about what he is doing.

The importance Japanese ascribe to the avoidance of uncertainty and errors also manifests itself in the high quality expectations of Japanese customers. A lot of research which was done in the Japanese subsidiaries had to do with perfecting the products. Safety and quality were recurring motives in the interviews. These aspects have been named as being the most important ones for any kind of production in Japan. “Perfectionism” was brought up frequently. “Everything takes longer in Japan” was claimed by Western interviewees, but also confirmed by their

Japanese colleagues. The long processes were explained by the tendency to include many people into activities. But the perfect outcome justified any extra lengths or costs. Westerners explained that they approve of working with abstract, general concepts and finding the rest “as you go”, Japanese cannot work this way. The “obsession” with high quality was so extreme that interviewees of all nationalities doubted that sharing knowledge of product development and improvement in Japan could be of value in other countries. Most interviewees agreed that the Japanese market is somehow “unique”, that Japan and the Japanese are “different”. As a result, knowledge about successes a Japanese subsidiary had on the Japanese market was seen as uninteresting for other subsidiaries or headquarters. Sharing knowledge like this takes place in international meetings, but even there it is not always helpful for other country managers.

Another deviant factor persisting in the interviews was that tacit or implicit knowledge was not mentioned at all. The interviewees never talked about tacit knowledge creation or sharing. The researcher expected tacit knowledge to be a major source of knowledge in Japan. The literature on tacit knowledge sharing and Japan’s supremacy in the field (Nonaka & Takeuchi, 1995) gives the impression that Japanese employees bring this skill with them. But Japanese interviewees had as little experience with tacit knowledge sharing as their Western colleagues. This does not mean that tacit knowledge sharing does not take place. Its most important characteristic is its unconsciousness (Polanyi, 1966). But it is surprising that the interviewees never mentioned it at all. One would expect the topic to transpire in a country so famous for tacit knowledge sharing. Even when asked for examples of it or experiences with it, the interviewees could not contribute anything. In this regard, the interview data collected in Japan does not correspond with common stereotypes of Japanese knowledge styles. Japanese interviewees gave examples for knowledge management successes, but they were never typically Japanese in any sense. They gave examples for activities where hard facts were sought and found and how those were intellectually transformed into successful products for the Japanese markets. Admittedly, these activities could have taken place in any subsidiary anywhere.

Asking for Japanese strengths, all interviewees agreed that customer relations were exemplary in Japan. Not only in B2B industries, but also in consumer industries, Japanese companies claimed to be very close to their customers. Collecting knowledge and information from their customers was named as a major function of knowledge management. Whereas in the West, many MNCs are only starting to realize the value of marketing knowledge and especially customer knowledge, Japanese employees viewed the customer as the most important source of knowledge. While some German interviewees doubted that a customer can know anything valuable for the development of new products, Japanese interviewees were proud to be in close relationships with their customers. The information from customers was seen as very useful. For example, talking about problems customers had in farming with vermin led to the development of appropriate pesticides. This simple example shows how the customer can inspire a new product development without any technical knowledge. The customer phrases a need, giving the company the possibility to deliver a solution. Simplicity in marketing is what German and U.S. interviewees found as proving Japanese laggardness in the subject. But their successes prove that the Japanese low-tech, non-abstract view of marketing (above all customer relationships) has its advantages, too (high customer loyalty).

5. Discussion and future research

Recapitulating the analysis, it has become apparent that knowledge management in MNCs where VI-HC cultures coincide is possible, but certainly not unproblematic. The verticals and horizontals will be better able to work together if they are trained for cultural awareness (Triandis, 1995: 145-165). This includes knowledge management

attitudes and behavior. Cultural awareness needs to be fostered on both sides. The major pressing issue for the standardization/adaptation decision of knowledge management in a Japanese subsidiary is the knowledge management system. If the MNC insists on using anonymous data bases, it may be disappointed with the results from Japan. The Japanese interviewees claimed to be willing and able to talk to other MNC members. But entering data into an anonymous data base was seen skeptically. The problem lies in the horizontal orientation. It will be much more effective to encourage knowledge sharing and transfer with peers. Some of the MNCs in the survey did this by means of workshops where managers from many subsidiaries get together and present ideas and projects to each other. This more intricate knowledge management seems excessive or extreme (because of its complex planning and high costs). But the results will be much more useful than what can be expected from data bases.

The survey of 40 Western MNCs in Japan has generated interesting results. To some extent, they correspond with the expectations from literature. The Japanese preference to share knowledge in groups of the same hierarchical level corresponds with the characterization of the Japanese culture as “horizontal”. The pressure to adapt to be culturally responsive here is very high for the Western MNCs. The cultural trait of uncertainty avoidance could also be confirmed by the descriptions of both Japanese and Western colleagues. Perfectionism was the key term which describes this phenomenon. The Japanese were described as “detail freaks” which makes working together hard for Westerners. Westerners are satisfied with general concepts and find the search for details in Japan arduous. On the other hand, they are impressed by the high level of Japanese knowledge (for example technical knowledge). Also, the key matter of “relationships” surfaced repeatedly. Especially in connection with customers, both, Japanese and Western interviewees stressed the good work the subsidiary does. Customer ideas and knowledge are always taken seriously. Japanese colleagues maintain relationships with customers in a time-consuming way, but they are rewarded with loyalty. The customer relations and the transfer of their ideas are exemplary. MNCs with a subsidiary in Japan should consider adaptation in the realm of customer and marketing knowledge management. The value of knowledge about the Japanese market does not lie in the details (which are often so special that they are not applicable on other markets). In lieu of trying to collect pieces of information, the Japanese subsidiaries’ real contribution could be the exemplary attitude towards customers. In marketing knowledge, Western MNCs have a lot to learn from Japan.

Two points the analysis brought about are quite unanticipated. First of all, tacit knowledge was not important to any of the interviewees. The researcher expected the Japanese interviewees to be familiar with this concept, since it is well-known in Japan. Apparently, tacit knowledge transfer is just as unconscious for the Japanese workers as for the Westerners. Second, the fact that Japanese workers were described as working alone, confining themselves from the others. This was very astonishing and deserves further exploration. A possible explanation is that Japanese workers did feel as belonging to their group and did their share of work in it. But from the perspective of a foreigner, they appeared as loners, because the Westerners did not interact as in-group members with them.

Future research on the standardization/adaptation decision for international knowledge management should consider the role of Japan in customer and marketing knowledge management and develop techniques for HC-VI cultures to work together more effectively.

Abstract

This paper addresses the issues of knowledge management from practitioner perspectives. In this paper “knowledge management” is defined as: a process that promote identify, capture, processing and transmit knowledge within a company. We consider, from the start, the need for a methodological approach that will allow its application in a practical setting. The authors proposed a methodology using a case study approach to analyze knowledge management in an industry setting.

Keywords: Methodology, knowledge management, systematization of practice

Theoretical considerations

Knowledge Management defined is a discipline that promotes the full use of a process for identification, capture, processing, transmission and evolution of knowledge within a company (Breedt, 1999), the knowledge was introduced to the world of business to help companies create, share and use knowledge effectively (Davenport, 2000). Within our society and at present, knowledge is considered a key resource (Szyperki, 2000). Increasingly, companies are becoming aware of the importance of knowledge in their daily activities, this daily practice has become the largest new form of capital and, as stated by many authors it is the only source of sustainable competitive advantage in the global market (Drucker, 1992).

Most companies that leverage their knowledge do not have to repeat the tasks, or waste time in realizing them; they are ready to show their profitability, to share and not hoard knowledge in the organization (Nieves, 2001), a good application of the model will result in high productivity in various processes and over all, the manager will be able to make a transfer from the traditional capital model to the intellectual capital of the members of an organization (Arteche, 2003), therefore activities that are formerly reserved for staff with many years of experience can be performed without much difficulty by those with little or no experience in the field (Cabins, 2003).

Among all the items that cover knowledge management, intellectual capital is the most important because the knowledge that is transformed into intellectual capital is, along with information theory and the network model, the central structural element of civilization (Vicario, 2006), when these two concepts converge, we say that the organization becomes a learning organization. These theoretical models become a task from individual ideas and knowledge in pure capital, highly exploitable by firms (Boisot, 1995). The need for organizations to maintain and develop in environments that are subject to constant change have been the main concern of theorists of organizational learning (Basque, 2000) the close relationship between knowledge management and intellectual capital makes the main features easily recognizable.

The key differences between knowledge management and intellectual capital are summarized in only three, however, more than differences that mutually exclude concepts, differences that include the benefits of both crops to learning organizations are considered. Nevertheless, saying that the two are linked as a whole, is undeniable, one must also recognize that the processes are independent and that for obvious reasons must be implemented at key moments.

Table 1: Differences in Knowledge Management and Intellectual Capital

Intellectual Capital Knowledge Management	Capital Intellectual
<p>Tries to formalize and systematize the processes of identifying, managing and controlling knowledge.</p> <p>It is a process of organizational management</p> <p>It involves two variables</p> <p>Hard: hard and formalized aspects of management. Includes formal communication systems and computer systems.</p> <p>Soft: soft or less formalized aspects of management, talent identification, formalization of best practices and standardization of skills.</p>	<p>The intellectual capital defines the set of non-material inputs that in the information era are seen as the main asset of companies in the third millennium.</p> <p>Represents the organization's intangible assets (human capital, structural capital and relational capital).</p> <p>It is a soft variable of Knowledge Management: knowledge treasured in the brains of employees, product of experiential learning.</p>

Source: Gopal, G., & Gagnon, J. (1995). Knowledge, Information, Learning and the IS Manager. *Computerworld*, 5 (1), 1-7.

We propose that, knowledge management (KM) will facilitate the generation of intellectual capital, and in turn intellectual capital will intervene in management knowledge control. Thus, the process will become an endless circle that would generate new knowledge as applied to the organization.

In order for all this knowledge to work in an appropriate way, a three area division must be done for the efficient administration (Gopal, 1995), the first area is KM, the second, Information Management and the third Learning Management, this concept is applied in pair with the six-step method for the cohesion of individuals (Nonaka, 1995): construction of auto regulated equipment, increase individual knowledge through knowledge sharing, convert tacit knowledge into explicit, transform the knowledge of a product or system, creating new concepts and integrate new concepts in the knowledge base. These steps permit that the individual reinforce his knowledge through team works and to develop the mind skills to get theoretical knowledge into practical knowledge in order to obtain new concepts, ideas and development of products.

Methodology and Knowledge Management

When one examine the knowledge is acquired, or when trying to find new knowledge, it is possible to come and different approaches used to resolve those issues become a part of the Methodology field.

It will be difficult to define the term “methodology” without alluding to a context to the problem.

This paper is addressing methodological issues from two perspectives: one that addresses how the scholars organize research related to knowledge management, and a second perspective based on a method than links the application of this methodology accepted by the scientific community.

KM involves the identification and analysis of the available and needed knowledge, as well as the subsequent planning and control of actions oriented to develop knowledge assets and as a consequence to meet organizational goals (Kim 2000). For Darroch(2003) Knowledge management is defined as the process that creates or locates knowledge and manages the distribution and usage of knowledge within and between organizations.

There is a new form of Knowledge Management, which is based on the approach to customer; it focuses in the achievement of better results, seeking the increasing of company's revenues. In this sense, KM refers to the process of organization that handles the creation, storage, retrieval and application of knowledge (Alavi and Leidner, 2001).

A Framework of the methodology for systematization of the practice

Briefly stated. A method is a set of procedures that allow the achievement of a particular purpose.

The methodologies proposed by several author are presented in Table 2.

TABLE 2: METHODOLOGY OF KM PROPOSED BY AUTHORS

Relevant Criteria	Identify	Capture	Organize	Apply	Combine	Create	Develop	Distribute
METHODOLOGY (1998) LIEBOWITZ/ BECKMAN	Skills, strategies and knowledge	Formalize existing knowledge	Evaluate relevant knowledge with precision and value	Retrieve and use knowledge to make decisions, solve problems, automating work		Discovering new knowledge through research, experiments and creative thinking	Develop and promote new knowledge	Distribute knowledge automatically to users
METHODOLOGY (1996) MARQUARDT	Acquire knowledge					Create and develop	Use it	Transfer it
METHODOLOGY (1993) WIIG						Knowledge	Develop it	Develop it
METHODOLOGY (1993) VAN DER SPEK AND SPIJKERVET				Develop knowledge	Combine it			Distribute it
METHODOLOGY (1993) RUGGLES		Capture and represent				Creation, acquisition synthesis, fusion, adaptation		Transfer it
METHODOLOGY (1997) HOLSAPPLE AND JOSHI	Extract, Interpret, Transfer	Locate, recover, transfer	Evaluate, deposit object	Apply it		Monitor it, Evaluate it, Produce it, Transfer it		Set goals, produce and transfer it
METHODOLOGY (1998) DATAWARE TECHNOLOGIES	Change issues	Prepare for change	Integrate knowledge management team Show:	Do audits and analysis		Define solution options	Put knowledge together	
METHODOLOGY (1998) VAN DER SPEK AND DE HOOG	Conceptualize: Make an existing knowledge inventory. Analyze		Decide on required improvements Make plans to improve processes		Assure and combine		Develop it	Distribute it

	weaknesses and strengths.							
METHODOLOGY (1996) O'DELL	Conceptualize: Make an existing knowledge inventory. Analyze weaknesses and strengths.	Recollect and adapt	Organize it	Apply it		Create it		Share it
METHODOLOG (2000) LIEBOWITZ	Identify and verify it	Capture and assure knowledge	Organize it	Recover and apply it	Combine it	Create it	Knowledge information	Distribute it

Source: Authors

Based on the framework of methodology presented in figure 1, this paper examines knowledge management using the following criteria:

1. Identify - skills, strategies and knowledge.
2. Capture - formalize existing knowledge.
3. Select - assessing value-relevant knowledge and precision.
4. Store - a repository of knowledge.
5. Share - distributing knowledge automatically to users.
6. Apply - retrieve and use knowledge to make decisions, solve problems, automating or supporting work.
7. Create - discovering new knowledge through research, experimentation and creative thinking.
8. Sell - develop and promote new knowledge.

Research method as applied to the private sector

For this research, the authors have used proposed by Liebowitz (2000) and that of O'Dell (1996) and the approaches used to define the steps to be taken in order to reach or establish an organizational culture where knowledge can be shared.

In order to go on with “identifying and recollecting knowledge”, this case examined a series of characteristics of one or more people in the Systems area of a manufacturing company,. In order to add more realism to this study the data gathered were analyzed and compared with stored data and the study ensured the information gathered synchronizes with the organizational culture.

With the “field study” application, the following survey was performed with a sample of 40% sample of the executive population of a firm used in case study. Knowledge Management survey instrument used in the study is presented below:

KNOWLEDGE MANAGEMENT

1.	Have you ever heard the term Knowledge Management? If so, please describe the concept.
2.	Have you received orientation about places, sites, data bases, etc. where you can consult information necessary to do your job? Explain briefly the way you received it.
3.	Mention at least three specific sources of information/knowledge that you constantly consult and that you consider useful in your job. (Assign priority, 1 first, 3 least).
4.	When having an issue, how do you identify who can help you resolve it? Mention how long you have been working for the company.
5.	In practical terms, what helps you more when you need help? In practical terms, what works better for you? Select your opinions assigning them priority (considering 1 as your primary source, and so on until the one that has the least priority)
	A) Web Pages _____
	B) Books/manuals _____
	C) Intranet _____
	D) Co-workers _____
	E) Data Bases _____
	F) Chat _____
	F) Others: _____
6.	Is information exchange within departments and work teams motivated? Briefly explain.
7.	In new activities, what percentage of your time a week do you dedicate to search information to perform your tasks (requirements, documentation, processes, etc.)
8.	How do you share your knowledge with others? Select your options assigning priority to them.
	Verbally _____
	By e-mail _____
	By chat _____
	Using a forum _____
	Giving a class _____
	Using Data Bases _____
	Other: _____
9.	What kind of technologies, procedures or methodologies do you suggest for the efficient knowledge flow in the organization?

Analysis of the Results of the Surveys

This section presents the results obtained for the questions used in the survey and an in depth discussion of the results will be presented in a later part of the paper.

1. - Have you heard of management and/or Knowledge Management? If yes, please describe the concept.

YES	NO	TOTAL
45	15	60

FIGURE 1. IDENTIFICATION OF THE CONCEPT OF KNOWLEDGE MANAGEMENT.

Source: Authors

As shown in Figure 1 above, the sample of 75% of the population indicated that they were familiar with the concept of knowledge management and also if they were able to give a clear definition of this concept, while the other 15 people said they did not know the concept.

- ✚ The sample's response indicate lack of familiarity about knowledge management and this require better dissemination of information on knowledge management among the employees.

2.- Have you received guidance about the places, sites, databases, etc., where you can check the necessary information to do your work? Briefly explain how.

From the responses to the above question, it noted that some of the respondents received some formal guidance, while others received it informally, which is why the results were classified for the type of "yes" as formal and informal guidance, as shown in Figure 2.

YES (formal)	YES (informal)	NO	TOTAL
32	20	8	60

FIGURE 2 SOURCES OF INFORMATION ON KM

Source: Authors

As it can be seen, a good percentage of sample population received informal guidance on the sources of information they need to do their job: it is important to strengthen this process so that it can gradually become a more formal process within the area and that way we can reach out to those who do not receive guidance.

3.- Mention at least three specific sources of information / knowledge often consulted which you consider are useful for your work (assign priority 1- most used, 3- less used).

Information Sources	Sample population
Internet and Intranet	27
Databases	23
Books	6
Other:	4
Sample Total	60

Based on the obtained data, it is shown that the main source of information is the Internet, where there is information available on any topic, and intranet, where you can find specific information that only applies to the organization and its competence.

In the category of "other" forums and communities of practice were mentioned; these concepts are reinforced later in this case study, shown in Figure 3.

FIGURE 3. INFORMATION SOURCES IDENTIFIED IN THE AREA OF SYSTEMS

Source: Authors

4.- When you have a problem, how do you identify the people who can help you solve it? Mention how long you have been working for the company.

Options	New Member	Non New Member	Sample Total
The expert on the subject is known.	2	20	22
The database is used to identify who can help.	5	10	15
A tutor is assigned.	10	3	13
Cannot identify who can help	8	2	10
Total	25	35	60

FIGURE 4. IDENTIFICATION OF KNOWLEDGE EXPERTS.

Source: Authors

The result of Figure 4 indicates that new members in the area, in most cases, did not identify the experts in the area, but they are assigned a tutor who will help them in their integration process. On the other hand, the senior members in the organization, mostly identify who can help them solve the problem for which they are seeking or needing an expert on the subject.

5.- In practical terms, what works best when you need help? Select your options assigning a PRIORITY (consider as 1 your first source and so on until the lowest priority).

FIGURE 5. INFORMATION SOURCES

Source: Authors

Figure 5 shows the main sources of information which happen to be the direct contact with people either face to face or through a chat that allows the establishment of direct contact. On the other hand, when time-saving for problem solving is a primary issue in the workplace, we can see that books are being consulted less often in cases where people know that someone in the organization has faced a similar problem and already has found the same solution helps in saving time and avoids unnecessary mistakes.

Within the “other” response, the following sources were identified:

- Tools or applications.
- Magazines
- Certifications and/or courses
- Personal notes, and
- Forums

6.- Is the information exchange within departments and working teams motivated?

FIGURE 6. INFORMATION EXCHANGE WITHIN DEPARTMENTS AND WORKING TEAMS.

Source: Authors

The result of Figure 6 indicates that the exchange of information between departments, for some reason do not reach everyone and, perhaps only certain information is shared between departments or between teams working in the same systems area.

- ✚ This approach will search the way information can flow within the department, as well as within departments.

7.- In new activities, what approximate percentage of your time do you spend weekly **looking for information** to do your work (requirements, documentation, processes, etc.)?

FIGURE 7. PERCENTAGE INVESTED IN INFORMATION SEARCH ON A NEW ACTIVITY OR PROJECT.

Source: Authors

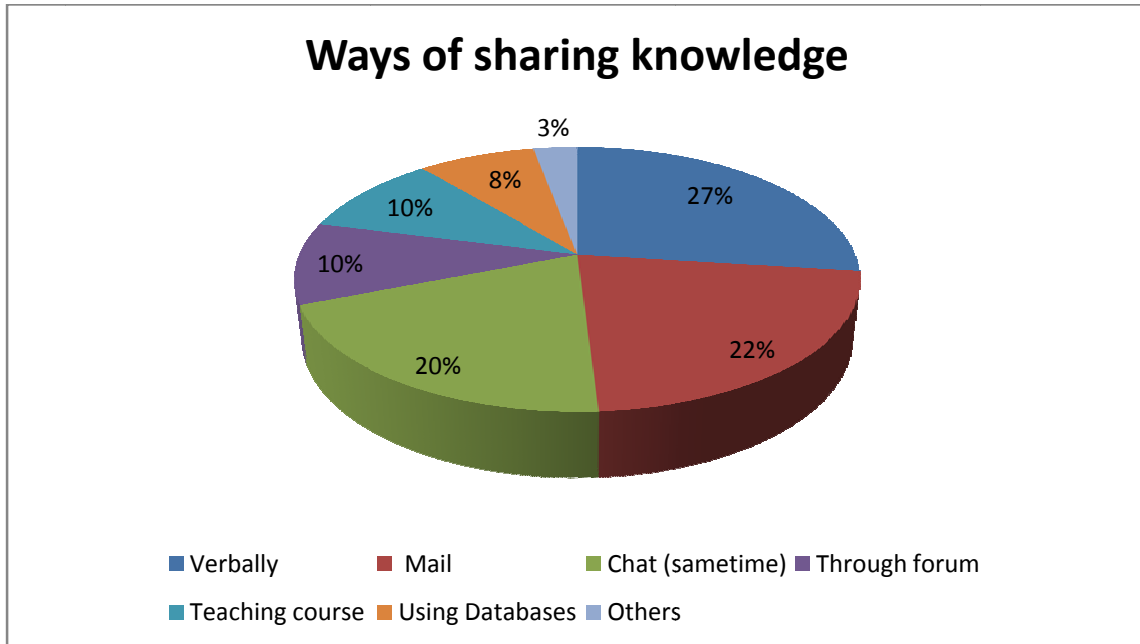

Study Percentage	People
Less than 10%	6
10% - 30%	22
30% - 50%	23
80%- -90%	2

Figure 7 shows that within new activities or projects, people provides between 30% and 50% of their time to seek or receive information to help them carry out new tasks. What makes the other 6 people to only use 10% of their time? Perhaps, they know where to find information more quickly or have identified experts who can help them with their tasks; these, and some other questions are issues for the research analysis.

- ✚ Propose how can new people invest less time in searching or obtaining information for the realization of their tasks.

8.- How do you share your knowledge with your co-workers? Select your options assigning a **PRIORITY**.

FIGURE 8. WAYS OF SHARING KNOWLEDGE WITHIN THE SYSTEMS AREA.

Source: Authors

Figure 8 confirms that the best way of sharing knowledge is verbal and face to face communication.

Within the “other” option, creation of educational CD’s and telephone meetings with all the members involved in the Project – indicate the importance of contact with the experts.

9.- What kind of technologies, procedures or methodologies do you suggest for the efficient Knowledge Management within the organization?

Here the answer was a little more open as to avoid influencing the respondent about the options he/she had. Based on the results, these tools were preferred for effective knowledge management:

- Databases
- Forums
- Teleconferences
- Chat
- Practice communities
- Conferences between business units

Once referred to the results of the case study case in the area of systems, more details about each point of interest in knowledge management will be discussed in the subsequent sections of this paper

TABLE 3 STRENGTHS, WEAKNESSES AND IMPROVEMENT PROPOSALS IN TERMS OF KNOWLEDGE MANAGEMENT

QUESTION	STRENGTHS	WEAKNESS	IMPROVEMENT PROPOSALS
Have you ever heard the term Knowledge Management?		The results show that there is a point to watch as 25% of the sample proved to have little or no knowledge about the concept and all activities that come with handling an efficient knowledge management approach	<ul style="list-style-type: none"> Establish courses and training in the systems area to introduce every aspect involving knowledge management before it is formally institutionalized in the area. To bring experts in the field, whether inside or outside of the organization, to speak about their experiences and all the benefits they have found within an efficient knowledge management.
Have you received orientation about places, sites, databases, etc., where you can consult information necessary to do your job?	The response showed that the majority of the population was given guidance to do their jobs either formally or informally.	It is important to approach the part of the sample who feels isolated from the information needed to perform their tasks more efficiently, as well as to analyze the 34% who are receiving informal guidance, and verify if this information is properly received and how to encourage for it be transferred through one channel, and for it to be measurable for the organization.	Establish an education plan so that the area can be aware on where they can find the information needed to do their work (databases, links, etc.) as well as procedures, methods, best practices, etc.. Assist them in their work. These points will be addressed in detail later.
In the applied survey questions number three and five, it was intended to identify the information sources used constantly in the area, identifying the following as strengths and weaknesses:	<ul style="list-style-type: none"> When people identify that they need help to carry out their tasks, its main source of information used is direct contact with people: <ul style="list-style-type: none"> Seeking help in the co-workers. They have fully identified the expert on the subject and rely on their advice. If they need a far knowledge transfer, they draw upon the use of Chats, notes, teleconferences or directly via telephone. The organization has not only Internet, but also has its own intranet where all information pertaining to each organization can be found and it is very useful when members of the organization are looking for specific topics or tasks that are being performed. There are several query databases to locate specific information to help with different tasks and those who do not know how to exploit this information from them. 	The Practice Communities and the Forums are not institutionalized, so as it has been discussed, is important to identify the information being managed in these groups as well as continue to motivate more people to participate in these activities and tools, but in a way so that the area can take control of the running knowledge.	<ul style="list-style-type: none"> To be certain that the community has a purpose. Setting the resources of the company within a company aligned community. Make it easy for members to remain engaged and involved, and to attract new members to participate. Using known technology easy to use for everyone. Accommodate technology to tasks, i.e. to know when it is more effective making a call rather than holding a meeting. Making an easy entry and exit to the community and their responsibilities and required skills. Help participants understand which of their tasks have responsibilities. Keeping facilitators aware of the efforts of the community to achieve an identity between them and other communities within the company. Make it easy for prospective participants, not only to store information but for anyone who likes to participate and has an understanding of the problems.
When having an issue, how do you identify who can help you resolve it?	<ul style="list-style-type: none"> Members who already have some time working in the area fully identify the subject experts and seek it directly when in need of help. If within the area they do not identify the expert who can help them solve a problem, they know they can make use of the databases or search on the Intranet for an expert that can be reached. 		<ul style="list-style-type: none"> Setting "Home Plans" at the time of incorporation of a new person in an organization means recording many of the keys to the future behavior. A good host plan must determine the values and culture of the organization and achieve shortening of the adaptation period. Encourage experts to share knowledge,

	<ul style="list-style-type: none"> • Include performance factors on the knowledge implementation as part of an annual project, reviewing reports and providing structure recognition to motivate employees to share what they know. • It was identified that there is a Mentari program focused on new members, with this the old master-apprentice relationship is recovered, and it is one of the best ways of transferring tacit knowledge. Similarly, this program does not exclude any member of the area who wants or needs to participate in it. 		<p>not only informally as they currently do, but in a more measurable way for the organization so that it can be profitable for the experts to share their knowledge.</p> <ul style="list-style-type: none"> ○ Institutional awards and recognition programs to demonstrate what the behavior of sharing knowledge brings to the company. ○ To evaluate the behavior of knowledge sharing as part of employee evaluations. ○ Develop internal leaders to share knowledge within a team or individually. <ul style="list-style-type: none"> • Establish a database for general access to all areas and departments within the organization, curriculum staff, so, based on a keyword, the tool may yield the names of those mentioned have that knowledge.
<p>In information exchange within department and work teams motivated?</p>	<ul style="list-style-type: none"> • Most respondents replied that there is no motivation for the exchange of information between departments. 		<p>Put an end to the cultural factors that inhibit knowledge transfer. These inhibitors also called frictions due to the delay or possibly prevention of the knowledge transfer as it tries to progress within the organization. The following proposals are intended precisely to overcome those frictions.</p> <ul style="list-style-type: none"> • Often the sharing of knowledge does not happen because of a lack of confidence; an important thing here is to establish trust relationships between areas and departments so that it can be so easy to share knowledge. These meetings can be called "Knowledge Meetings" where teams talk about what is done in their areas and thus the other groups identify which knowledge can be transferred. • Create a common interest between departments through training, dialogue, publications, work (cross-functional teams) working for the same purpose, job rotation, etc. • Establish times and places for knowledge transfer fairs, break rooms, conference reports. • Evaluate performance and provide incentives based on the sharing attitude. • Educate employees for flexibility; provide time for learning. • Establish within each department someone who will receive education from communities of practice, best practices, lessons learned, etc. and that individual will be responsible for raising the information in his area to other levels so that the information can be shared.

			<ul style="list-style-type: none"> • The area managers will have to submit basic routines as presenting tutors or tutorials and tips for their areas, about the findings and identified information when shared up to another level. • Establish a knowledge sharing team management, in knowledge businesses, self-organizing teams are an essential part of the working method.
<p>In new activities, what percentage of your time a week do you dedicate to search information to perform your tasks (requirements, documentation, processes, etc.)</p> <p>The result obtained here was also dispersed, since people who work or are assigned on a new project, spend most of their time looking for information that helps them in their tasks, while people who already have been working a longer time in the same project, know how and where to locate information quickly to accomplish the tasks.</p>		<ul style="list-style-type: none"> • The staff spends much time looking for information to do their job. 	<ul style="list-style-type: none"> • Establish courses to guide people on the knowledge technologies that exist in the area and that can help them in their activities. • Ensure that every employee has the necessary technology to access these knowledge management systems. • Plan and structure the knowledge in the area, establishing a knowledge map or a database, which are a simple guide and not a repository of knowledge itself. In this map users can search by subject or keyword, making it simpler for the comparison and location of possible sources of knowledge. • Start to develop the Intranet tools for knowledge management systems, which include: lessons learned, knowledge maps, proper documentation of processes, case studies, expertise location, etc. • Establish a portal for "Knowledge Management" in the area, which allows access to all the generated knowledge in other departments and the organization as such. • Be aware that every member of the area has a complete manual of the current processes either via Web, or that can be accessed through the databases where this information is stored. <p>This knowledge portal will be created Intranet / Web so that it can have an entry point for all the different aspects of the knowledge sought, including the location of experts, communities of practices, lessons learned, best practices and eventually technical aspects of the final product deliverables of the organization.</p>
<p>How do you share you knowledge with others?</p>	<ul style="list-style-type: none"> • There are multiple channels for sharing and accessing the knowledge of the organization, mentioning some: the forums, communities of practice, databases, etc. 		<ul style="list-style-type: none"> • Establish rewards and recognition policies. Rewards and recognitions are weapons that have a decisive influence on the behavior of individuals, for example, rewarding teams, not individuals sends a strong a message, as well as surveys by willingness to share knowledge. • Set bonuses and incentives for contributions and participation in forums, communities of practice,

			contributing to best practices and lessons learned, etc.. • Creating career plans within the organization is one of the best ways to retain valuable people, giving important stability to themselves and the organization.

Measurement of the factors that are being used in Knowledge Management

If it is wanted for the high management to get involved in the process of Knowledge Management, it is important to generate measurable data results that reflect how much knowledge management contributes to achieving organizational objectives in a more structured, higher quality, efficient and effective way to create both a knowledge value chain inside and outside the organization.

The way in which achievements are measured, as well as the errors, leads to a decisive impulse to the people. The indicators themselves are pivotal to a change. The elements that comprise knowledge management are rather intangible items or measurements difficult to measure, but it is important to find a measurable factor that can be shown to the management.

One way to provide the measurement of intangible assets to manage them is an important way to explicit the value-generating business. If traditional accounting reflects it, the selection of some indicators would be a healthy organizational exercise.

Some proposals about intangible considerations (Arbonies, 2001) include:

- Identify individual learning
- Identify team learning.
- Identify learning by tutoring.
- Organizational and Cultural Learning
- People Management
- Identification of information systems.
- Identification of knowledge technologies
- Identifying communities of practice

Some indicators for human capital to consider mentioned by the same author might be:

- Middle sized jobs
- Middle graduates and seniors
- Indirect people
- Training hours
- Fidelity jobs
- Performance evaluation
- People satisfaction
- Improvement suggestions.

Customer Satisfaction Measurement

Measuring customer satisfaction besides surveys must enable segmentation, determination of the most valued attributes within each segment and consequently the design of adequate products and services, customer retention and loyalty. Customer knowledge capabilities can awaken many capabilities within the company and break inertia in the organization.

Some identified measurements that can be used based on this study case are:

- ✚ Measuring the success of the program where there has been shared knowledge in the area and use the metric system to gain support of the organization.
- ✚ Measure the time that people spend accessing the databases in search for information.
- ✚ Measure the number of times that a mentor is assigned to the members of the area.

Conclusions for the Knowledge Management applied to the Organization

Based on the case study presented in this paper, we can conclude that knowledge management is not only an important area of research, but businesses are actively involved in implementing knowledge management in an informal and implicit way so that all the people within the organization, at any level in any organization who function, at different levels in an organization may contribute their best to the firm. Firms recognize how important it is to focus, so that it will enrich the intellectual capital of the company.

Types of foreign R&D activity: A transaction-specific costs perspective

Alex Tai Loong Tan, alextan@smu.edu.sg
Wee Liang Tan, wltan@smu.edu.sg
Singapore Management University, Singapore

Abstract

Emerging markets and the growing dispersion and mobility of knowledge have seen multinational enterprises (MNEs) setting up foreign research and development (R&D) centers in more and more locations around the world (Tellis et al., 2009). Foreign subsidiaries perform various types of R&D activity to exploit market opportunities and explore differentiated knowledge resources. But what guides the decision to carry out different types of R&D activity in foreign locations? This paper argues that transaction-specific costs determine the type of foreign R&D activity. Whether foreign subsidiaries conduct R&D in the format of *knowledge incubation*, *technology licensing*, *knowledge transfer*, or *R&D collaboration*, is dependent on the relative efficiency of the different market allocations of proprietary MNE knowledge and complementary local assets.

Introduction

It is widely understood that the *raison d'être* of foreign research and development (R&D) subsidiaries of multinational enterprises (MNEs) is first, to augment home-base R&D by tapping distinctive local sources of knowledge, and second, to exploit home-base R&D by adapting products and processes according to local tastes and resource capabilities (Kuemmerle, 1997). But what remains unclear is a characterization of the specific types of R&D activity that foreign subsidiaries are tasked with, and more importantly, the underlying logic guiding the type of foreign R&D activity, which this paper attempts to elucidate.

Previous literature suggests that the type of foreign R&D activity is determined by subsidiary characteristics (Birkinshaw et al., 1998) in relation to MNE and locational factors (Almeida & Phene, 2004; Cantwell & Mudambi, 2005). But this view is incomplete. The focus on the subsidiary as a unit of analysis detracts from the contributory role of each specific type of foreign R&D activity itself, and does not take into account the reality that knowledge assets in the host country are not freely accessible. For a given type of foreign R&D activity, knowledge exchange between the MNE and local entity incurs costs for both parties. Therefore, we explicitly consider the transaction-specific costs in combining the proprietary knowledge held by MNEs with the complementary assets owned by local entities. The transaction approach provides a microanalysis of the types of foreign R&D activity which need to be internalized, those which do not, and other hybrid governance structures.

Some scholars view the mode of foreign entry as an equilibrium outcome, in which the combination of local assets with MNE assets maximizes the welfare of the stakeholders (e.g., Chen, 2005; Hennart, 1989; 2000; 2009; Mirius & Yeung, 2010). Building on this literature, we developed a framework of the optimal mode of foreign R&D. We show that because the internationalization of different corporate R&D objectives have different transactional requirements for combining MNE and local assets, firms engage in a particular type(s) of foreign R&D activity to minimize costs.

Analysis of the transaction-specific costs of different types of foreign R&D activity offers a fresh insight into the internationalization of R&D, distinct from general notions of home-based augmentation and home-based exploitation (e.g., Archibugi & Iammarino, 1999; Kuemmerle, 1999; Lehrer & Asakawa, 2002). This perspective provides for unequivocal normative criteria for business and public policy pertinent to the internationalization of R&D.

We begin this paper by reviewing the literature on the transaction cost economics of foreign entry modes. Then we integrate insights drawn from this body of work into a matrix model of the optimal types of foreign R&D

activity. We conclude by discussing the policy implications of the model, in particular with respect to the impact of institutional contexts on foreign R&D.

Transaction-specific costs and modes of foreign entry

Transaction cost economics suggests three critical factors—uncertainty, frequency of recurring transactions, and asset specificity determine the alternative use of markets, contracts, or hierarchy (firm) for economic organization, in order to minimize the costs of business transactions over time. The most important investment criterion is the extent to which transaction-specific expenses will be incurred (Williamson, 1979). Because an asset specific to a given transaction has higher value than in its next best use, it gives rise to problems of ‘lock-in’ and opportunism (transaction costs). When transaction-specific costs due to a market or contractual arrangement are higher than coordination costs associated with hierarchy, it explains for the nature of the firm (Coase, 1937).

Extended to the multinational firm, asset specificity is central to the understanding of foreign market entry modes because by definition, the MNE (foreign direct investment) is driven by unique knowledge assets and to a lesser degree, monopoly power (Caves, 1971; Hymer, 1976). The MNE represents a “semi-strong form” of technological determinacy of economic organization (Williamson, 1988). The theory suggests that a firm’s choice of foreign market entry is either a wholly-owned subsidiary or licensing contract in the host country. The decision to establish a licensing contract with local partners versus a wholly owned subsidiary is determined by their relative cost efficiency for transferring competitive assets in the form of proprietary technology and/or tacit know-how into the foreign location (Buckley & Casson, 1976; Dunning, 1980; Hennart, 1982; Rugman, 1981). Where the MNE opts to internalize rather than contract, there are different transaction cost considerations with respect to horizontal and vertical integration (Hennart, 1982; Teece, 1986a). A horizontally-integrated MNE internalizes a demand market for final products that are difficult-to-trade to avoid overhead and bargaining. On the other hand, a vertically-integrated MNE internalizes a supply market for intermediate products with idiosyncratic properties to remove resource dependency.

Chen (2005) extends this classic market versus hierarchy analysis by arguing that licensing is not the only market institution relevant to governing international technology transfer. He presents two alternative market arrangements—co-marketing and contractual manufacture that each combines the MNE’s technology with local manufacturing. In the same vein, joint venture has also been proposed as an optional governance structure for the MNE (Anderson & Gatignon, 1986; Hennart, 1988). The purpose of a joint venture is to combine complementary assets held by the MNE and local owners. The qualification for this mode of foreign entry is when two sides possess transaction-specific assets that are non-marketable (Hennart, 2000). Put differently, a joint venture arises when local assets involved are difficult to replicate internally by the MNE and cannot be procured externally through market contracts (Chi, 1994).

In sum, asset specificity frequently create transaction costs, which discourage market contracting, and leave firms with the decision between collaborative ventures and wholly-owned subsidiaries (Buckley & Casson, 1998; Ingham & Thompson, 1994). Integration is considered more efficient than equity and contractual joint ventures because it allows firms to exert maximum control over the products and marketing processes, in order to combat free-riding and opportunism (Anderson & Gatignon, 1986). Still, local owners do not give up indigenous assets for free, and will attempt to seek reciprocal obligations for some or all of the components of the foreign direct investment (FDI) package through sophisticated contracts (e.g., technology licensing, loan financing, labor hiring and marketing services) (Hennart, 1989). Therefore, in each mode of foreign entry—wholly owned subsidiary, contract and joint venture, because the bundling of assets is necessary, a stable equilibrium is achieved if the welfare of the local owners as well as the MNE is maximized (Hennart, 2009). Given the right set of mutual incentives, it is possible to observe all three types of international operations at the same time and in the same location (Miriuis & Yeung, 2010).

Transaction cost analysis of foreign entry provides a framework for discriminating between cross-border activities which need to be internalized and those which do not. However, existing models, while offering indications of the internationalization behavior of MNEs when they enter foreign markets, do not specifically

address the activity of R&D. They discuss MNE behavior with the underlying assumption that subsidiaries are engaged in fairly invariant foreign production (manufacturing) work. On the other hand, R&D activities have differentiating characteristics that warrant separate and additional considerations. Production and R&D activities both involve assets and the resultant organizational structures or contracts may involve MNE and local firm assets. The difference lies in the nature of the assets and the role that they play. It could be argued that both sets of activities, production and R&D, involve knowledge assets. When MNEs enter foreign markets with the view to manufacture or distribute their products, the type of knowledge assets involved are at the end of the continuum associated with the term 'technology'. These assets are to be used by the local firms. R&D activities could involve less well-defined assets in codified sense and could be in the realm of science. Further, in manufacturing, the assets are usually deployed in the production or provision of services. In the service arena, when a mascot and other trimmings of brand image are licensed for use, the local firms are not expected to work on the assets (as in 'improve') but are to work with them (as in 'use'). R&D activities could involve changes to the knowledge assets with the expected roles of the local firms varying in degrees of active engagement with the assets. The local firms engaged in production activities with the MNEs have a passive knowledge asset role. In R&D activities, their role is active. Accordingly, the transaction costs considerations for R&D activities also differ.

Without taking into account varying knowledge roles of "overseas centers of excellence" which have extensive R&D expertise and capabilities (Birkinshaw et al., 1998), these models do not adequately shed light on the basis for choice between the options when engaging in foreign R&D. A more complete vision must consider individually, the transactional weights associated with subsidiary strategies and mandates to carry out distinct types of R&D activity that exploit and/or augment existing MNE knowledge. This framework should suggest the rationale for each of the R&D activity types.

A framework for types of foreign R&D activity

There are transaction costs on both sides associated with the R&D activities engaged by MNEs in the host country. Extending from the preceding discussion, we develop a 2 x 2 matrix (Figure 1) to address the key considerations of a MNE's R&D unit in a host country and the possible (optimal) types of R&D activities it could engage in that arise from the interaction of the asset factors. We make the assumption that MNEs seek to undertake value-adding R&D activities in foreign markets, and which 'knowledge pertinent to R&D' (knowledge hereon) is the core country-specific advantage that MNEs seek to leverage. We also adopt a broad definition of knowledge, which includes raw ideas, scientific theories, information of various kinds, innovation methodologies, new business models, and new technology products and technology-driven processes.

We begin by developing the basic relationship between the market for the services of knowledge assets and the market for knowledge assets in and of themselves. Interactions between the MNE and local owners for R&D are embedded in two market contexts, either for the services of knowledge assets or for the knowledge assets in and of themselves. First, a MNE can sell knowledge asset services on the market, by licensing a local firm and providing technical support. Second, it can source the market for knowledge assets, by combining its own R&D know-how directly with a variety of local complementary assets available for purchase (e.g., highly-skilled labor, esoteric knowledge, proprietary information), either in whole or part, and integrating all of these into final products and services customized to local tastes or targeted for global markets. Correspondingly, a local entity (firms and public institutions) can sell knowledge asset services which are needed by a MNE, or sell ownership of the assets. MNEs engaging in R&D activities in a foreign country can operate in either markets, or both markets simultaneously, which is common for overseas centers of excellence. However, there are associated transaction costs incurred in selling MNE R&D assets and complementary local assets in the markets, which are represented by the axes in Figure 1. Economic agents on both sides alternate between markets according to the relative costs of transacting. When one market is subject to high transaction costs, agents may switch to the other. Therefore, the type of foreign R&D activity performed in MNE subsidiaries is efficient, insofar that both the MNE and local owners would have higher payoffs than if they would to act unilaterally.

		MNE R&D assets	
		Low costs	High costs
Local complementary assets	High costs	3. Knowledge incubation	2. R&D collaboration
	Low costs	4. Technology licensing	1. Knowledge transfer

FIGURE 1: OPTIMAL TYPE OF FOREIGN R&D ACTIVITY

MNE R&D assets and local complementary assets

The columns in Figure 1 refer to the costs (low and high) of transferring R&D assets from MNE subsidiaries to owners of local complementary assets using various market arrangements. R&D comprises of different knowledge components (activities). Technical knowledge can be patented and made available on the licensing market for others to use when transaction costs are low. Some kinds of knowledge, such as specific drug formulae can be easily transmitted through this mechanism because there is little room for ambiguity and can be efficiently protected by a patent. On the other hand, it is difficult to implement licensing for knowledge assets like general-purpose technologies (e.g., information and computer technologies) or technologies that are in the early adoption stage. In such a case when transaction costs are high for the MNE, specialized and clinical skills required for R&D work can be sourced from the market by directly hiring personnel. Project management skills are also critically needed to design procedures for cross-border R&D, such as workflows, progress monitoring, budget planning and knowledge sharing in order to manage “organizational tension” (Asakawa, 2001) and other coordination issues critical to globally distributed work. Best-practices can be bought from professional management consulting companies, and which the advantages of project management outsourcing include the flexibility to control costs according to the needs and timeline of the project, objectivity and exposure to outside knowledge, and the possibility to negotiate between service providers. However, outsourcing certain auxiliary R&D activities potentially creates vulnerability for sensitive technical data and proprietary knowledge to leak out to competitors that are serviced by the same provider (i.e. high transaction costs). Although access can be restricted, it requires defining the necessary access levels and providing the appropriate permissions, which incurs overhead. Further, outsourcing stymies the development of interpersonal relationships among the scientists, engineers and administrative staff, and more generally, organizational culture, which is crucial to overall R&D success. In sum, there are different channels in which the MNE’s R&D assets can be traded, and the efficiency of its transfer varies significantly according to the nature of the knowledge exchanged.

However, the columns in the matrix have only accounted for the MNE’s perspective. The framework is not complete without considering another perspective—that of the local owners. The point of view from the MNE alone excludes the influence of foreign institutional environments that is derived from availability of high-skilled labor, auxiliary and management services, financing and high quality intellectual property. These complementary local assets are represented by the rows in Figure 1. Contrary to the prior assumptions of OLI and internalization theories (Buckley & Casson, 1976; Dunning, 1980; Hennart, 1982; Rugman, 1981), as discussed in the previous section, local complementary assets that are needed by the foreign MNE subsidiary to carry out R&D are not necessarily freely accessible to MNEs. While contracting for some of these local services and assets themselves is viable option,

others can incur high transaction costs. For example, a public institution like a university can license a particular technology to the MNE, if there is no interest from the inventor to develop it further. The inventor can also provide his expert services by availing herself to the MNE for hire. However, in a situation when a local entity owns knowledge assets that has high scientific significance and innovation potential, it may not be willing to sell it wholly on the market, with the expectation of charging higher economic rents through membership in the R&D process (e.g., partial ownership, knowledge exchange). Therefore, a joint examination of the transactional characteristics of both MNE and local complementary assets is needed to explain the specific type of foreign R&D activity. In a given market transaction, the optimal type of foreign R&D activity is determined by weighing both the MNE's and the local owners' relative costs. We discuss these relative costs considerations in the ensuing paragraphs presenting the cells in the matrix, using the 'voice' of the MNE.

Relative costs of the types of foreign R&D activity

Each cell in Figure 1 reflects the costs MNEs must incur in order to gain access to local complementary assets necessary for incorporating proprietary knowledge into a particular exploratory or exploitative R&D activity, relative to the costs local owners may impose in facilitating this activity. The reasonable assumption is that MNEs will attempt to minimize knowledge spillover and maximize local learning for their R&D activities, and *quid pro quo* local owners will seek the best possible contracts for all the activity markets. Further, if both parties are cognizant of each other's individual strategies and therefore have no incentive to act unilaterally, then the type of foreign R&D activity chosen will be an optimal outcome. Figure 1 shows four clear possibilities.

Consistent with the assumption that the preference of the MNE is to minimize knowledge spillover and maximize local learning, we begin with the bottom right cell (the cell labeled "1. Knowledge transfer"). Where the transaction-specific cost of selling proprietary knowledge held by the MNE is higher than that of acquiring complementary local assets on efficient markets, then the MNE is in a stronger position than the local owner to negotiate. The solution that maximizes the total payoff from the combination of assets is for the MNE to carry out exploitative R&D activity, in the form of *knowledge transfer* (Cell 1), and purchase the complementary assets that support this activity in-house. The central lab at headquarters transfers proprietary knowledge to the foreign site, and R&D is conducted to adapt products and services for local and immediate markets. Production will be transferred to the MNE's wholly-owned plant and supported by the foreign lab in terms of technical knowledge. Marketing and distribution services may be contracted with local firms.

When the MNE possesses R&D assets that can be combined with the local complementary assets, the relative costs of transferring the knowledge assets are high taking into account the similar situation occurring on the part of the local prospective partner. Both parties would have the desire to protect their assets and at the same ensure that any fruits of the transaction would accrue to themselves. In such instances of high MNE and high local partner costs, the R&D activity that is likely to ensue is some form of collaboration, such as a joint venture or contractual co-development with agreement on the ownership of the joint R&D activities. Hence for the top right quadrant (Cell 2), we identify *R&D collaboration* as the R&D activity.

In the top left quadrant (Cell 3), the relative transaction costs are higher on the part of the local partner. Here the MNE may not have the assets it so desires. The local partner with the asset would desire to exploit its knowledge assets. In this quadrant, the foreign MNE finds itself in a diametrically opposite position to that in Cell 1 where it was transferring out. Here it would be the local partner who would be transferring its technology to the foreign MNE and employing its complementary knowledge assets. If the local partner is so willing, the R&D activity that could emerge from the MNE's perspective is *knowledge incubation*. Where the prospective local partner, say a research institute, finds the relative transaction costs unfavorable and chooses not to transfer, other R&D activities are possible on the part of the foreign MNEs. These activities can range from the recruitment of staff from the local research institute, employment of scientists trained by the research institute (which would be possible if the local partner is a research institute at a university), to the sponsorship of research students, personnel or activities at the research institute. This type of R&D activity is closely associated with applied research, which is defined as original investigation undertaken in order to acquire new knowledge, through access and use of some part of accumulated theories, knowledge, methods, and techniques, but which is directed primarily towards a long-term practical target, such as the development of future product technologies (Hamilton, 1992; OECD, 2002). Knowledge

incubation enables the foreign R&D center to over time, acquire new knowledge and R&D know-how, and to augment the MNE's knowledge base at home.

In the final quadrant (Cell 4), the situation may appear to be a reflection of Cell 2, except where Cell 2 covers the 'high, high' transaction costs situation, the parties in Cell 4 are in the 'low, low' situation. While it would be tempting to say that the R&D activity in this quadrant is the same as that in Cell 2, it would be presumptuous. The motivations of the parties in the 'low, low' scenario differ. The parties in Cell 2 face higher transaction costs of transferring their knowledge assets because their assets may be considered to have a higher value due to complexity of multiple embedded technologies or have an esoteric nature, and thereby difficult to implement a licensing structure. The knowledge assets associated with the parties in Cell 4 have a less idiosyncratic nature and lower value, so that the MNE or local owner have the confidence to license for others' use with minimal liabilities and costs. For example, they may be sophisticated process related knowledge assets that are fairly generic, such as innovation management techniques. R&D collaboration between the foreign MNE and the local prospective partner is less likely in this quadrant. It is difficult to imagine two 'weak' parties, here using 'weak' in a comparative sense to the parties in Cell 2, collaborating on a higher order R&D unless there is a strong incentive. As such, the type of R&D activity that arises in Cell 4 is *technology licensing*. This is reasonable because in practice, corporations typically license out more mature technologies or ones which are less significant to them (i.e. low transaction costs). Despite the continuous push to develop institutions for intellectual property protection both within nations and internationally, the significance of IP protection and implementation of laws vary significantly across countries. Further, patents and copyrights are highly subject to technical ambiguity (due to obsolescence) and legal nuance. Even in the patent tripartite bloc of the U.S., Europe and Japan, there are frequently lawsuits disputing intellectual property rights. Nevertheless, here is the quadrant where some policy initiatives to jumpstart technology-driven entrepreneurship, by partnering companies together with university-based student start-ups have borne fruit in some countries, such as Singapore.

Conclusion

We have attempted in this paper to shed light on how different types of R&D activity are carried out by MNE R&D subsidiaries in foreign locations all over the world. We submitted a view that foreign R&D activity is a function of transaction-specific costs incurred by the MNE as well as local owners in transferring knowledge assets related to R&D. Toward international R&D collaboration, host country institutions play a crucial role in attracting inward R&D FDI by MNEs that maximizes net value creation in terms of technology, innovation and enterprise.

Difference between AFHH and DP option values under strategic interactions

Abstract

This paper considers the Arrow-Fisher-Henry-Hanemann (AFHH) value and Dixit-Pindyck (DP) option value under strategic interactions. The AFHH option value has some difficulty under strategic interactions. Then, the expected value of information should be considered under such situations. In a contrast, the DP option value is recently shown to be decomposable as the AFHH option value and the decomposed as the AFHH option value and the pure postponement value by Mensink and Requate (2005, *Resource and Energy Economics*). This paper considers the DP option value under strategic interactions, and discusses the relationship between the AFHH and DP option value. We find that the decomposability à la Mensink-Requate has different meaning under the interactions and show an action value on the information loss.

Introduction

Irreversibility is one of the most fundamental characteristics of the environmental problems we are currently facing. Extinction of an endangered species is one obvious example. Because (at least as of yet) we cannot restore a species that has become extinct, the action that entails a loss of species can be considered irreversible. In the remainder of this paper, we say that an action is irreversible when it is impossible or prohibitively expensive to undo the action.

Because it is expensive or impossible to undo an action, it may appear that an irreversible action should always be avoided. However, in the standard framework of the cost-benefit analysis, such a conclusion is clearly wrong. Irreversible actions may affect future states and possible future actions. However, that alone does not affect the basic principle of project evaluation; even if a species is lost, an action can be justified if there is a sufficiently large gain from that action. When there is uncertainty about future states, project evaluation requires a careful assessment of information as it becomes available. For example, species that have not previously been described might be discovered and found to be economically valuable. If a project drives such species to extinction by, say, clear-cutting a forest, opportunity cost arises due to the loss of that species. However, the economic value of the extinction of an unknown species is typically ignored in project evaluation because of the lack of information about the species at the time of evaluation.

One can appropriately account for the potential loss of species by taking into consideration the quasi-option value (QOV), or the Arrow-Fisher-Hanemann-Henry (AFHH) option value due to Arrow & Fisher (1974), Henry (1974), Fisher & Hanemann (1987), and Hanemann (1989). The quasi-option value can be viewed as the value associated with the mere prospect of obtaining better information in the future. This concept is related to the (unconditional) expected value of information (EVI) but is generally different from it (Conrad, 1980, Hanemann, 1989).

Fujii & Ishikawa (2011) recently consider the AFHH option value in strategic interactions. They highlight some conceptual difficulties with the QOV under strategic interactions. Furthermore, they investigate the potential importance of information-induced inefficiency, and show that everyone could be hurt if everyone knows that everyone will know more in the future. In cases where this applies, the regulator should carefully disseminate information. In particular, they show that sending information about the state asymmetrically across players may be useful for achieving a socially efficient outcome.

In the similar line, Dixit & Pindyck (1994) also propose another option value for investment under uncertainty (henceforth the DP option value). While Fisher (2000) argued that the AFHH value is equivalent to the DP option value, though Mensink & Requate (2005) showed that they are different by the postponement value irrespective of uncertainty. However, when investment faces in a strategic interaction, it is not clear to appear such a difference.

The purpose of this paper is to investigate the deference between the AFHH option value and the DP option value under strategic interactions. The AFHH option value under strategic interactions is considered in Fujii and Ishikawa (2011) in a general strategic setting. They point out some difficulty to consider the value under strategic interactions. Instead, they define the social expected value of information (EVI) under the interactions. This paper also uses that setting, and considers the DP option value under such situation. We relate with the social EVI and the postponement value irrespective of uncertainty.

This paper is organized as follows. In Section 2, we introduce strategic interactions following Fujii and Ishikawa (2011). We revisit the AFHH option value and EVI under the strategic interactions to discuss the conceptual difficulty with the AFHH and to show some result on the EVI. In Section 3, we consider the DP option value under strategic interactions, and decompose it in a different way from Mensink & Requate. Section 4 provides some discussions.

AFHH option values under strategic interactions

Basic setting

We assume that there are two time periods, of which period 1 is the current period and period 2 is the future period. In line with the standard model, we consider the following situation: A forest can be developed in each period. The forest may contain biological resources that will be lost if the forest is developed (clear-cut). A key assumption in the previous QOV literature and in this study is that development is irreversible; forest that has been developed in period 1 cannot be reversed to the original state in period 2 (*i.e.*, the lost biological resources cannot be recovered).

We shall denote by $S \equiv \{s_1, s_2\}$ the set of all possible states; s_1 represents the state in which there are no biological resources, and s_2 is the state in which biological resources exist. Hence, opportunity cost due to the loss of biological resources arises only when the state is s_2 . In period 1, the state is not known. However, it is known *ex ante* that s_1 and s_2 occur with probability π and $1-\pi$, respectively. In period 2, the state may be known before an action is taken because of, for example, (exogenous) scientific research. To keep the model simple, we shall only consider independent learning. That is, the state is learned in period 2 regardless of the actions taken in period 1.

An important difference between this study and previous QOV studies is that we incorporate strategic interactions. We assume that the society has two risk-neutral players, α and β . The value of π is common knowledge to the players. The two players in this setup may be thought of as forest loggers or private land developers.

In each period $t \in \{1, 2\}$, each player $i \in \{\alpha, \beta\}$ chooses an action $d_t^i \in \{0, 1\}$ where 0 represents conservation and 1 represents development. We assume that conservation is always chosen when the decision-maker is indifferent between conservation and development. Because the action to develop is irreversible, we must have $d_1^i \leq d_2^i$. Let us denote $d^i = (d_1^i, d_2^i)$. Notice that modeling the choice between conservation and development as a discrete choice is not as restrictive as it may appear because a corner solution almost always arises when there is a constant return to development, as shown by Arrow & Fisher (1974). Hence, our analysis can readily be extended to a case of continuous development on a unit interval. In this study, we use a discrete-choice model to avoid unnecessary complications.

We make the following assumptions about the distribution of the payoffs from development: When both players choose to develop at the same time, they share the payoffs from development equally. If one player chooses to develop in period 1 and the other in period 2, then the leader in development (*i.e.*, the player who develops in period 1) takes all of the per-period payoffs from development in period 1 and a share $k \in (0, 1)$ in period 2. The follower (*i.e.*, the player who develops in period 2) receives no payoff in period 1 and a share $(1-k)$ of the payoff from development in period 2. We assume that the value of k is common knowledge. The interpretation of the parameter k will be presented subsequently.

We normalize the payoffs so that the per-period payoff from conservation is equal to zero. Further, we assume that the total payoff from development to the society in period 1 is positive. If not, it is always best for the society to wait until period 2 to develop and the problem is not interesting. For a similar reason, we assume the per-period payoff from development in period 2 is negative in one state and positive in the other. Given these assumptions, we can permit the total per-period payoff from development to the society be equal to a in period 1, b in

period 2 if the state s_1 and $-c$ in period 2 if the state s_2 , where a , b , and c are positive constant expressed in present value. We present the per-period payoff matrices in Tables 1 and 2.

AFHH option values and EVI under strategic interactions

Fujii & Ishikawa (2011) discuss some difficulty to define the AFHH option value under strategic interactions. Let us revisit the concepts of the AFHH option value and the expected value of information (henceforth, EVI) following Conrad (1980) and Hanemann (1989). In the literatures, two kinds of information flow are considered: (1) When the state in period 2 is revealed before the beginning of period 2, and (2) when the state is not revealed before the beginning. The standard AFHH option value measures the difference in the payoff of conservation relative to development between the above two scenarios with and without information about the state in period 2. Therefore, to obtain the AFHH option value well as EVI, we evaluate the total payoffs when players take actions 0 and 1 for each scenarios. Then, Fujii and Ishikawa (2011) point out that the AFHH option value is not meaningful under strategic interactions. This is because a pair of players' actions may be supported as an equilibrium.

TABLE 1: The per-period payoff matrix in period 1

	$d_1^\beta = 0$	$d_1^\beta = 1$
$d_1^\alpha = 0$	(0,0)	(0, a)
$d_1^\alpha = 1$	(a , 0)	($\frac{a}{2}$, $\frac{a}{2}$)

TABLE 2: The per-period payoff matrices in period 2 when $s = s_1$ (top) and $s = s_2$ (bottom)

$s = s_1$	$d^\beta = (0, 0)$	$d^\beta = (0, 1)$	$d^\beta = (1, 1)$
$d^\alpha = (0, 0)$	(0, 0)	(0, b)	(0, b)
$d^\alpha = (0, 1)$	(b , 0)	($\frac{b}{2}$, $\frac{b}{2}$)	(($1-k$) b , kb)
$d^\alpha = (1, 1)$	(b , 0)	(kb , ($1-k$) b)	($\frac{b}{2}$, $\frac{b}{2}$)
$s = s_2$	$d^\beta = (0, 0)$	$d^\beta = (0, 1)$	$d^\beta = (1, 1)$
$d^\alpha = (0, 0)$	(0, 0)	(0, $-c$)	(0, c)
$d^\alpha = (0, 1)$	($-c$, 0)	($-\frac{c}{2}$, $-\frac{c}{2}$)	($-(1-k)c$, $-kc$)
$d^\alpha = (1, 1)$	($-c$, 0)	($-kc$, $-(1-k)c$)	($-\frac{c}{2}$, $-\frac{c}{2}$)

Fujii and Ishikawa (2011) therefore consider EVI under strategic interactions. They evaluate the subgame perfect Nash equilibrium under the above two scenarios following Tables 1 & 2 (See Fujii and Ishikawa, 2011, for the details). EVI is defined as the difference between the two scenarios. They obtain the following proposition:

Proposition 1 (Fujii and Ishikawa, 2011): *The (social) EVI under strategic interactions is negative if and only if*
 $k < 1/2$, $a > (1-\pi)c$, & $\frac{2(a-(1-\pi)c)}{1-2k} < \pi b < (1-\pi)c + \frac{2a}{1-2k}$.

When $k < 1/2$, we have a situation where a larger share of the benefits (and costs) will be obtained if the player is a follower in development. Therefore, if $B \equiv \pi b > (1-\pi)c \equiv C$, each player has the incentive to hold back development until period 2 so that he does not have to suffer from the leader disadvantage. Obviously, this point must be weighed against the opportunity cost (a) of conservation in period 1.

When $(1-\pi)c < a$ holds, it is efficient for the society to develop in period 1 because the opportunity cost of conservation in period 1 is large relative to the potential gains from information (C is the expected loss that could be avoided by utilizing the information in period 2). This efficient outcome is achieved in the absence of information in period 2 if development is sufficiently attractive but B is not large enough for the players to try to be followers in development. This occurs when $0 < \pi b < (1-\pi)c + \frac{2a}{1-2k}$. Therefore, the upper bound on πb in the above last condition reflects the condition for the efficient outcome in the absence of information.

DP option value under strategic interactions

Basic scenario

For the DP option value, the basic setting is common to the AFHH option value. The scenario is slightly different because the DP option value is that for irreversible investment decisions. For instance, Pindyck (1991) illustrates the capital investment with large sunk cost by firm or industry specific. In our framework, action 0 is considered as *not to invest*, and action 1 is *to invest* in the previous setting.

Mensink and Requate (2005) pointed out the equivalent result between the AFHH and DP option value by Fisher (2000), and decomposed the DP option value to the AFHH option value and the postponement value. They assume that the default value is equal to zero when a player takes action 0 at both the periods. The DP option value is defined as

$$OV^{DP} := \max \{ \hat{V}(0), \hat{V}(1) \} - \max \{ V^*(1), 0 \},$$

where the arguments in \hat{V} and V^* are a player's action in period 1, $\hat{V}(\cdot)$ is her payoff when information is revealed before period 2, and $V^*(\cdot)$ is her payoff when information is not revealed. Note that $\hat{V}(1) = V^*(1)$ in one-person decision making because she is *locked in* with her decision when taking action 1 in period 1.

Mensink and Requate (2005) assume $\hat{V}(0) > \hat{V}(1)$ and $V^*(1) > 0$ as an interesting case. Then, the DP option value is:

$$\begin{aligned} OV^{DP} &= \hat{V}(0) - V^*(1) = \hat{V}(0) - V^*(1) + [V^*(0) - V^*(0)] \\ &= [\hat{V}(0) - V^*(0)] + [V^*(0) - V^*(1)]. \end{aligned} \quad (*)$$

The first term corresponds to the AFHH option value and the second term was defined as the *pure postponement value* in their paper.

We now extend Mensink-Requate's concept to our case of strategic interactions. Following the payoffs in Tables 1 and 2, we consider the subgame perfect Nash equilibria under the two scenarios. Fujii-Ishikawa show all the equilibria under those scenarios (See Fujii and Ishikawa (2011, p. 28)). Based on those equilibria, we now define the DP option value under strategic interactions as follows:

Definition 1: The DP option value OV^{DPG} under strategic interactions (or *games*) is the difference of total payoffs over the players between (i) when information of the state 2 is available before period 2 and (ii) when no information is available.

The above definition implies that the social EVI in Fujii and Ishikawa is used for the evaluations. By the use of the social EVI, we can avoid conceptual difficulty under strategic interactions as discussed in their paper. That is we need not consider the actions which is not supported in the equilibrium.

Here we consider the similar cases to Mensink and Requate. That is, the equilibrium action is that both the players take action 0 if the information of the state in period 2 is available, and otherwise the equilibrium action is 0. Due to Fujii and Ishikawa, those two equilibria are achieved if and only if either of the following cases is satisfied in the payoffs: (1) $k = 1/2$, $a < C < a + B$, (2) $k > 1/2$, $a + (2k-1)B < C < a + B$, (3) $k < 1/2$, $B - a/(1-2k) < C$, $a - (1/2-k)B < C$, $a + B > C$, where πb and $(1-\pi)c$ are denoted by B and C , respectively. In our definition, OV^{DPG} is obtained in the same manner as (*). Following the definition, we show what range the DP option value is negative in:

Proposition 2: Assume the subgame perfect Nash equilibrium action is 1 when information is available, and the action is 0 otherwise. *The DP option value OV^{DPG} is negative if and only if*

$$k < 1/2, \quad a > C \quad \& \quad \frac{2(a-C)}{1-2k} < \pi b < C + \frac{2a}{1-2k}$$

Basically this result is due to the negative social EVI. That is, the prospect of future information induces a prisoner's

dilemma situation. The difference of the range between Propositions 1 and 2 is due to the restriction to the equilibrium for comparison with Mensink and Requate. This result shows that the DP option value can be negative under strategic interactions and it is equivalent to the social EVI à la Fujii-Ishikawa.

Moreover, we consider the pure postponement value in our setting as well. As seen in (*), Mensink and Requate use the value obtained by action 0 when no information is available before period 2. In our above analysis, we assumed that the equilibrium action is action 1 under no information case. Then, that action 0 is considered under the case means players' deviation from the equilibrium actions. However, what does this deviation mean? In fact we are facing the same difficulty as Fujii and Ishikawa. That is, such deviation is not supported by equilibrium.

Here we try to consider another approach, a *counterfactual approach*. First of all, we consider the parameter range that action 0 with and without information is supported by equilibrium action for both the players. The condition for any k can be show as $a + B < C$ where B and C represent πb and $(1-\pi)c$, respectively. Given Tables 1 & 2 with fixing parameters a , b , and c , we consider the minimum Euclidean norm between the equilibrium supporting actions 0 and 1, respectively. For instance, look at the graph below.

GRAPH: Parameter combination when $k = 1/2$

The light gray is the range that equilibrium action is 1 with no information, and the heavy gray is the range that the equilibrium action 0 with no information. Let a white dot be the given parameters' values. The minimum Euclidean norm is just a length of the line perpendicular to line $C = B + a$.

What does the length mean? It means the value supporting the equilibrium action as action 1. If it at least changes by the length, the equilibrium also changes. The length is corresponding $[V^*(0) - V^*(1)]$ in (*). We can say this value by *an action value on information loss*. Since $[\hat{V}(0) - V^*(0)]$ in (*) is the value of information, the DP option value under strategic interactions consists of the value of information plus to an action value on information loss. The negative or positive value decides the largeness of information value and loss in our counterfactual approach.

Discussions

This paper revisits the AFHH option value à la Fujii and Ishikawa (2011), and defines the DP option value under strategic interactions. We face a conceptual difficulty when considering the DP option value as well as the AHFF value under the interactions. However, we show another decomposition of the DP option value and show an action value on information loss. In our analysis, we focus on an interesting case that action is taken without information. Then, our analysis concentrates on the coordination equilibrium that both the players take the same action. As further research, we need investigate the DP option value when the equilibrium is achieved by different actions of the players.

Implementing Information System Innovations to Manage Biosecurity Issues in Australian Food NetChains

Christine Storer, c.storer@curtin.edu.au

Abstract

Tracking and tracing systems are being demanded by customers such as the major Australian supermarket chains, superior food service chains and globally in export markets such as the European Union and Asia. This includes the ability to track products as they move to downstream customers and to traceback where products have been sourced for feedback and to resolve problems. To continue to access these global premium priced markets Australian food organisations need to ensure they meet changing customer requirements.

Traditionally information communication technologies to provide tracking and tracing systems have been set up for larger businesses and industry sectors that warrant the costs of development. Small business cannot always afford to invest in the infrastructure to establish through chain and industry wide netchain based systems. This problem is compounded where businesses are fragmented and spread over large geographical areas even if they have similar requirements.

An action learning approach was taken to identify what is needed in setting up tracking and tracing systems to address biosecurity issues in three small business based netchains (livestock 'A' and fruits 'B' and 'C'). In the livestock 'A' sector fears of a global pandemic has heightened the need for tracking and traceability processes, combined with preventative actions and rigorous bio-security protocols (e.g. traceability of traffic movements around production areas, contaminants from the wild animals and activities on neighbouring properties). For fruit 'B' and 'C' movements of produce across state and national borders requires phytosanitary certification to provide assurance to minimize or eradicate the spread of diseases and pests. Concerns or delays in tracking and tracing can result in perishable produce becoming unsalable.

A system was identified to suit small businesses and those in niche market industries. The system was based on deployment through the internet. The system had to link in with existing business information systems and business methods, be reliable, able to be tailored to address biosecurity issues and effective in meeting customer requirements.

Results presented compare the use of the tracking and tracing system across the three different sectors (animal and horticultural products) and states of Australia. Findings are presented on what was learnt in the process including: identifying business in chains and networks to work collaboratively with; catalysts needed to get commitment to change; and support systems needed for successful implementation across multiple small businesses linked in netchains.

Introduction

Tracking and tracing systems are demanded by customers such as major Australian supermarket chains, superior food service chains and globally in export markets such as the European Union and Asia. This includes the ability to track products as they move to downstream customers and traceback to where products have been sourced for feedback and to resolve problems (Ra, 'bade, and Alfaro 2006, Smyth and Phillips 2002). Three factors are likely to 'influence the demand for tracability: risk assessment and management; product differentiation ; and productivity gains (Canesis 2006). To continue to access global premium priced markets Australian food organisations need to ensure they meet changing customer requirements.

Traditionally information communication technologies to enable tracking and tracing systems have been established for larger businesses and industry sectors that warrant the costs of development. A recent

Australian Department of Agriculture Forestry and Fisheries (DAFF) study by the researchers (Batt, Noonan and Kenyon 2006) identified that small scale efficient technologies are needed by food industry for food safety systems. Small to medium enterprises (SME's) can't always afford to invest in the infrastructure to establish chain and industry wide netchain (horizontal network links between similar organisations as well as vertical chain links with customers and suppliers) systems. This problem is worse where businesses are fragmented and spread over large geographical areas: even if they have similar requirements.

Australia has a strong record in managing biosecurity and quarantine issues (Nairn, Allen, Inglis and Tanner 1996) and has a multiagency / mutli organization focus on maintaining this status. The ability to track and track via a range of mechanisms – electronic and paper based - has historically been a central component of Australia's capacity to maintain such an enviable position of managing biosecurity issues.

The main aims of the research were to set-up and evaluate the use of emerging technology in track and trace systems for several SME based netchains. The research objectives are specifically to:

1. Identify the issues affecting the uptake of tracking & tracing technologies
2. Trial tracking & tracing systems in several industries
3. Evaluate the systems trialed
4. Determine the problems faced in adopting tracking & tracing technologies
5. Identify possible solutions including support needed initially and on an ongoing basis

Research Methods

Identifying Industries, Organisations and Participants

The first step was to identify organisations to participate in the project. They had to be small to medium sized food organisations where perishability and biosecurity concerns that would provide the motivation to participate. In addition, they needed to be connected in industry netchains. Owners and managers of the business were targeted to participate in the project. Ultimately three netchains have been investigated from three sectors or industries.

In the first industry, livestock 'A' sector, recent fears of a global pandemic heightened the need for tracking and traceability processes, combined with preventative actions and rigid biosecurity protocols. These concerns introduce new areas to trace (beyond normal, through chain considerations), such as traffic movements around production areas (for example, carrying chemicals and stock feeds), contaminants from the wild (e.g. native species and escapees) and activities on neighbouring properties.

In the 'B' and 'C' fruit industries, movement of produce across state and national borders requires phytosanitary certificates to ensure diseases are not spread. Delays in producing phytosanitary certificates to track produce can result in perishable produce like fruit 'B' and 'C' becoming unsalable.

The industries and associated netchains were selected on the basis of advice received from the commissioning research funder, the experience of the research team and contacts within of the netchains.

In addition to the three netchains reported here, honey bee and rambutan netchains were approached for inclusion in the study: due to a range of factors these netchains were not included.

The livestock 'A' netchain is characterized by a group of approximately 20 small, somewhat interconnected and dependent businesses, ranging from breeder and grower operations through to processors and marketers. The direct chain actors form a cluster that operates in concert with a number of infrastructure providers and State and Local Government agencies. There are strong business to business relationships through and within the netchain, with looser arrangements across the netchain. The netchain is primarily based in a temperate Mediterranean type climatic zone in South Central Victoria which is subjected to few major weather related natural events that can compromise biosecurity.

Fruit 'B' is grown in Northern, Central and Southern Queensland (48 identified growers). The sector is characterized by a strong alignment of the growers with a marketing association and its marketer (the principle marketing agent), which is the dominant mechanism by which fruit 'B' is exported interstate and beyond Australia. There appear to be strong symbiotic relationships and cooperation between growers and the

marketing association. It appears that the marketing association and the marketer have a strong interdependent relationship within the netchain. Production is spread across a range of climactic and agro-geographic zones from Tropical to Sub-tropical and has been subjected to more frequent weather related natural events (Tropical Cyclones) that can compromise biosecurity.

Fruit 'C' is grown in Queensland (19 growers) and New South Wales (23 growers) and there are two major market agents. Production is spread across a range of climactic and agro-geographic zones from Sub-tropical to Warm Temperate and has been subjected to less frequent weather related natural events that can compromise biosecurity.

There are some 23 independent wholesalers who service either or both of the 'B' and 'C' fruit industries that were contacted in some way by the project. Business and marketing arrangements are more fragmented and opportunistic in this sector: there appear to be fewer strong inter business relationships in comparison to fruit 'B' and livestock 'A'.

Action Learning to Develop and Evaluate Tracking & Tracing Systems

An action learning research approach was taken where the needs of the industry were identified and systems developed to address these needs at each stage of the research. Industry participants were involved in identifying and evaluating solutions through the research.

Initially, industry members were consulted to determine their requirements for a tracking and tracing system. Part of this stage was the mapping of organisations involved in the chain and how product and information flows between each organisation. The business rules used and biosecurity issues to be addressed were identified as well as the outcomes required. Industry members were then consulted about a proposed tracking and tracing system. During and after implementation feedback was sought with a formal evaluation made after the system had been used.

The netchain management systems deployed for each commercial group had to be customised to the industries requirements and address priority biosecurity issues. The system used needed to fit efficiently into current business methods, as well as be reliable and effective in meeting customer requirements. Technology was found that had been developed by the web based track and trace system provider that suited SME's and those in niche market industries. The system linked existing legacy computer systems across multiple organisations in netchains through the internet. It was able to be developed to address biosecurity issues and link with existing business information systems and business methods.

The specific steps in the system design and evaluation included:

1. Document the chain. Identifying at each point in the chain: all the roles played, interfaces, reporting loops and relationships;
2. Document the physical processes and information flows within the chain;
3. Document the outcomes that are required and the points in the chain that need to have data to make decisions and/or build workflow processes;
4. Prepare a functional specification for the chain - services (data capture by electronic forms and data files, and reports), profile data, roles, business and chain transparency rules (who can see what), data dictionary etc;
5. Netchain to confirm acceptance of proposed system;
6. Build solution;
7. Progressive rollout to each industry netchain - user documentation, training, continuous fine-tuning done as required; and
8. Evaluation

This paper reports on the in-depth interviews conducted with participants in the program after the system installation and the researcher team's interpretations over the period of the project on the implications for implementation in other industries. A total of 29 interviews were conducted - 8 in the livestock 'A' industry; 14 in fruit 'B'; and 7 in the fruit 'C' industry. All businesses were categorised as micro or small business, with an average of 3.4 employees ranging from none to 10 employees for a fruit 'C' grower and 15 for a livestock 'A' meat processor. Employee numbers were stable with only the livestock 'A' growers

increasing staff with increased production and two fruit 'C' growers reducing staff due to poor fruit harvest or removal of trees.

Results

Results presented compare the use of the tracking and tracing system across these different industry sectors (horticultural and animal products) and states of Australia. Findings are presented on what has been learnt in the process including: identifying business in chains and networks to work collaboratively with; catalysts needed to get commitment to change; and support systems needed for successful implementation across multiple small businesses linked in netchains.

The research through the trial and evaluation of tracking and tracing systems across several industry sectors and in several states of Australia provides examples of what is possible for others. Across chain principles can be derived, as well as differences required for horticultural and animal products. It can also facilitate the subsequent adoption by other industry sectors and regions. In addition, the process of businesses working together may facilitate learning in other areas such as joint problem solving.

Livestock 'A' Netchain

In October 2007 a preliminary workshop was conducted with eight industry members representing a breeder, a nursery farmer, growers and processors. A preliminary scoping document outlining the proposed tracking and tracing system was circulated to industry in February 2008. However the scope of the system and participants continued to change until May 2009. The system was developed with pilot roll out and training conducted in August 2009. Only one grower and one processor participated in the training and trialing. Note: it was originally expected to design and trial the prototype system in February 2008 with a revised expanded system trialed in May 2008 and rolled out to others in the industry by August 2008.

Initially the tracking and tracing system was designed for exotic meat animals only. With the sole main stream supplier having concerns about information being shared with customers, it was decided to remove the breeder stage and start the system from the breeders through to customers (retailers or food service). To improve the potential take up by others in the sector, the system was then expanded to add the mainstream grower netchains (finishing meat animals) with potentially 40 growers with three or four facilities each. The expansion however added complexity in trying to link into a larger number of existing systems. Some of the businesses were larger (40 businesses employ 1,412 full time and part time employees) and had well developed systems. There were delays in exchanging details of existing systems with the system developers even when done 'commercial in confidence' (workflow processes, business rules and documentation used). In August 2008 it was suggested the group was not clear on the competitive and collaborative advantages and where competitive information may be passed to others in the industry. In addition, there was not clear target date to get decisions finalised by. Forms and the scope boundaries of the system was not finalised until May 2009.

Concerns were raised by growers that the pilot system did not do all the things they had expected, such as tracking animal growth rates daily and weekly. With the extensive discussion period and changes in system specifications it would seem expectations were not well managed. It is recommended that there needs to be clear communication about compromises made in the final system scoped with details provided of what could potentially be added in the future.

A clear commercial or technical imperative for the system is apparently lacking. It is hypothesised that this may be due to the biosecurity risk of a particularly contagious virulent virus not eventuating as expected. It was suggested this lower perception of risk may be due to the fact that during the same time period humans dealt with the so called 'swine flu' (H1N1) pandemic and the Australian horse industry dealt with equine influenza without the sensational impacts the media had warned of.

The system was narrowed down to focus on the game processor who by the time it was trailed was only operating a day or two per week. As a small business operation that had traditionally operated based on 'memory' the lower volume of production may have meant the system was not seen as necessary.

It is noted that organisations need a clear commercial imperative to set up tracking and tracing systems as well as sufficient volume to make it worth the effort to do so.

Fruit 'B' Netchain

A meeting was held with the fruit 'B' marketer and fruit 'B' growers in November 2007. Training of fruit 'B' growers on how to use the system was then run in North Queensland and then in central Queensland. The training day planned in Southern Queensland did not eventuate. Training was attended by 17 of the 47 growers. With a change in the Board of Directors of the fruit 'B' grower group, support for implementation of the system by most growers was extinguished. The loss of support can in part be attributed to: the role of key influence members in the netchain (gatekeepers – Rogers and Kincaid 1975. and Brown, Malecki and Spector 1976); a desire to protect commercial in confidence information; and information that could be used to extract market intelligence; and the presence of a preexisting information management system.

Fruit 'C' Netchain

After a meeting with the fruit 'C' marketer a prototype system was designed and set up in February 2008. Training was provided to the marketer in March 2008 who provided further training and support for its fruit 'C' grower suppliers. A short time frame was involved to get the system up and working before the season started in March. Some growers had used a similar system for other crops grown in the previous year. Since the roll out in 2008 all growers used the system.

The system provides tracking and tracing of fruit 'C' from growers properties to the marketer and to downstream customers (exporter quality assurance assessors, importers, retailers, food service businesses). In 2009 the system was expanded to generate 'recipient created tax invoices' and payment documents to assist in linkages with financial recording systems. In addition it was expanded to provide reporting of wholesale prices paid to comply with the new Horticulture Code about price communication. In 2010 the system was expanded to provide electronic phytosanitary 'plant health' certificates to give assurances the fruit will not have biosecurity risk such as fruit fly. The electronic plant health certificates ensures there are no delays in accessing other markets such as Victoria, South Australia and Western Australia.

The lessons learnt from the fruit 'C' netchain would be that strong leadership and support by a key customer is needed for successful implementation. There were clear commercial imperatives to participate through system development to solve business problems.

Characteristics of In-depth Interview Respondents

All interviewees had considerable experience working in their current role (average 14 years – fruit 'B' 14 years, fruit 'C' 11 years and livestock 'A' 20 years), in the current organisation (average 16 years – fruit 'B' 17 years, fruit 'C' 14 years and livestock 'A' 20 years) and in the industry more generally (average 15 years – fruit 'B' 14 years, fruit 'C' 10 years and livestock 'A' 24 years). The nature of their experience in the industry was more varied. All had experience as growers although in livestock 'A' they may have been involved in growing breeder animals (3 respondents), conventional growers (5), or game (3). Fewer had experience in marketing (9 respondents), supplying inputs to growers (8), distribution (6), exporting (6), wholesaling (5), processing (4) and retailing (4).

Experience with Quality Assurance, Environmental Management Systems (EMS) and Traceback

Most respondents (22 – 75%) had a quality assurance (QA) system in place although it was more common in the fruit companies (fruit 'C' s 7 – 88%; fruit 'B' 12 – 86%) than in the livestock 'A' companies (3 – 43%). Mostly Freshcare™ for those involved with fruit 'B' and 'C' and Primesafe for those in livestock 'A' - game. In the fruit 'B' organisations three used the marketers QA system, two used ICA13 (EMS), one used SQF2000^{CM} and one used a standalone HACCP certification.

The reasons for using the systems were for customer reassurance or market requirements and traceability. Those that commented on why they did not have QA or EMS said they were setting up their systems in new businesses. The one livestock 'A' organisation that said they were 'too busy' was the owner of a business and had been in working in it 30 years.

QA systems had been operational for an average of 8.3 years but this ranged from two to 20 years. Each industry had organisations with QA systems operational for over ten years (fruit 'B' – 2 for 12 years and 1 for 20 years; livestock 'A' 1 for 10 years and 1 for 13 years; fruit 'C' – 2 for 10 years and 1 for 15 years).

The time to develop QA systems averaged 4.3 months but ranged from 1 to 60 months. The longest time was 12 and 60 months to set up QA systems in the fruit 'B' industry. On the premise that primary producers are often Bayesian (that is accumulators and processors of information over time) (Lindner 1987) in their approach to the acquisition and application of information about new technologies (Noonan and Gordard 1995), that there are a range of factors in the dictate of the time taken to understand and implement new technologies (Marsh 2010), and that there are a number of steps, stages or 'time lags' in the process of adoption of a technology by primary producers (Lindner, Pardey and Jarrett 1982); then the time taken to assess, setup and trial management systems are consistent with a Bayesian model of behavior. The assurance certification approaches used are also consistent with other studies (Batt, Noonan and Kenyon 2006).

Over half (11 – 55%) had experience in setting up information, quality assurance or EMS's with more experience in the fruit 'C' organisations (6 – 75%) than the livestock 'A' organisations (4 – 57%) or fruit 'B' organisations (2 – 14%). Mostly it was Freshcare™ (fruit 'B' and 'C') or HACCP (Hazard Assessment Critical Control Points) with one each involved in setting up Interstate Certification Accreditation (ICA13), ISO9000, export accreditation and livestock 'A' processing licensing systems. All systems were certified against a standard such as State Government and Industry systems like Freshcare™ and Primesafe as well as HACCP (5 organisations), Woolworths QA (4 organisations), SQF2000^{CM} (2 organisations) and ISO 9000 (1 organisation).

While the QA systems in the 'B' and 'C' fruit industries were stable with no changes in the last 12 months, three of the four organisations in the livestock 'A' industry had changed their QA systems. For one a HACCP review resulted in changes in system procedures. For another there was increased customer feedback with a new product. For the other there were new processes to comply with ISO 9001:2008. It would seem that the livestock 'A' industry was undergoing much change in existing QA systems and in the process of setting up QA systems.

Biosecurity Issues

Definitions of term Biosecurity varied depending on the organisation (fruit 'B' organisations were not asked this question). For the livestock 'A' organisations it was mostly about reducing the risk of spreading disease while for fruit 'C' organisations it was more about the control of insects and pest movement and for fewer about the spread of disease. One organisation defined biosecurity in terms of 'biological or chemical hazards to humans and domestic/wild animals' and another as 'disease contamination and interaction with non complying species or environments'. Biosecurity was defined by another as 'chemical and biological safety of food'.

Five organisations said their understanding of the term Biosecurity had changed as a result of involvement in the project. Two changed their understanding due to the 'more in-depth look at inputs' and 'greater observation of the fruit supply chain'. Another saw how 'sensitive certain areas are to foreign insects'. One did not know the meaning before the project.

While two thirds (10 – 67%) had systems in place that complied with biosecurity requirements, there were more biosecurity systems in the fruit 'C' organisations (6 – 75%) compared to the livestock 'A' organisations (3 – 43%). Fruit 'C' biosecurity systems were known as ICA (01, 02, 18 or 21). Livestock 'A' biosecurity systems included the Victorian 'A' code, 'A' bio-security guidelines (Victorian Dept of Primary Industries), Australian Quarantine Inspection Service registered premises and livestock declaration forms.

All fruit organisations had biosecurity systems in place to access interstate markets (Western Australia, Victoria, South Australia, Queensland). Livestock 'A' organisations had biosecurity systems to 'determine where produce originates' and to 'process livestock for export'.

Nearly half the organisations sales (45%) were to interstate markets. Interstate markets were more important for fruit 'B' (62%) and fruit 'C' (52%) than livestock 'A' organisations (10%). The main market for livestock 'A' organisations was local state sales (89%) with it being 100% of sales for some organisations (4/7 livestock 'A', 2/12 fruit 'B' and 2/7 fruit 'C'). International markets were less important (9% – fruit 'B' 17%, fruit 'C' 4%, livestock 'A' 1%).

Attributes Sought by Customers and Consumers

Respondents were asked unprompted what they thought final end consumers and their direct customers were looking for in their products. They thought fruit consumers were looking for taste/ripeness (7/14 fruit 'B' organisation and all 8 fruit 'C' organisations) and appearance (6 fruit 'B' organisation and 4 fruit 'C' organisations) followed by quality more generally (5 fruit 'B' organisation and 4 fruit 'C' organisations). By comparison respondents thought livestock 'A' meat consumers were looking for safe and reliable meat (3/7 livestock 'A' organisations) or quality more generally (2 livestock 'A' organisations) and price/value for money (2 livestock 'A' organisations). Only one fruit 'B' organisation thought consumers wanted quality assured fruit.

Different attributes were sought by direct customers. Fruit 'C' organisations said customers looked for taste/ripeness (3), commitments to supply consistent fruit (3), appearance / presentation (2) and consistent quality (2). Fruit 'B' organisations thought customers looked for appearance, presentation and colour (6 / 8 organisations), quality generally (2) and a long shelf life (2) but there was no mention of taste thought important for consumers. Livestock 'A' organisations thought customers looked for safe / reliable products / clean shed (3 organisations), appearance (2) and general quality (2).

To compare how different issues for customers and consumers were rated, organisations were asked structured questions and rated them on a 1 to 7 scale with 1 not at all important through to 7 very important. The most important issues overall were food safety for final end consumers (mean 6.6) and customers (mean 6.5) followed by company profit margins (6.3), tracking and tracing so customers can manage biosecurity issues (6.1), profit margins for customers (6.0) and the amount of food waste for customers (6.0). Lesser important issues were environmental stewardship for consumers (5.2) and customers (5.4).

There were some differences between the industries, although the small sample size meant statistical significance of differences could not be calculated so care is needed in relying on these results. Compared to organisations in the other industries, fruit 'B' organisations saw food safety being more important for final end consumers (mean 7.0) and customers (6.9) and tracking and tracing so customers can manage biosecurity issues. Livestock 'A' organisations had higher importance ratings on tracking and tracing so consumers can manage biosecurity issues (mean 6.2), competitive prices for consumers (6.1) and environmental stewardship for final end consumers and customers (5.7). The fruit 'C' organisations had higher importance on profit margins for the companies (mean 6.6), amount of chemical or fertiliser run off (6.6) and less importance on tracking and tracing so consumers can manage biosecurity issues (5.0).

When asked how they identified what customer requirements were most got their feedback directly from customers although one livestock 'A' organisation got website statistics, a fruit 'C' organisation got data from industry marketing exercises, a fruit 'B' organisation did research and another fruit 'B' organisation got feedback through quality assurance.

The main organisation influencing product specifications was different for each type of industry. For the fruit 'B' organisations all thought product specifications were influenced by the marketer (13 of the 13 organisations) with one saying there was influence by retailers and another that exporters and their customers were influential. For fruit 'C' organisations there were a range of down stream customers who were influential including the wholesalers (3 of 8 organisations), marketer (2), retailers (2) and other parties (1). For livestock 'A' game meat organisations the most dominant influencer on product specifications was the processor (4 of 7 organisations) as well as the marketer (1), food service (1) and other parties (1).

None of the customers were seen to have changed their product specifications or expectations in the last 12 months with the exception of one livestock 'A' game meat customer wanting higher volumes.

Experience with Tacking and Trace back

All organisations said they could trace their fruit and livestock products back from customers if there was needed with the exception of one fruit 'B' organisation (no response to this question from three fruit 'B' and one livestock 'A' organisation). This was done through identification on cartons, batch codes, serial numbers and delivery documents.

Fewer were able to track all inputs used back to suppliers (18 with two saying no and nine not answering the question). Most not answering the question were in the fruit 'B' organisations (8/9). Tracking of input supplies was done through batch numbers, delivery records, supplier declarations and certification. On average it took fruit 'C' organisations 1.3 hours to track sources of inputs and livestock organisations 35 hours (one organisation said greater than 7 days). The one fruit 'B' organisation who could track sources of inputs said it would take approximately 14 hours and one organisation said they had not been required to do so. There had not been any changes in the systems or time taken in the last 12 months.

One key fruit 'B' respondent was able to cite how at an industry / exporter level a rapid capability to demonstrate compliance with importer country requirements for irradiation of fruit could be demonstrated when live but 'irradiation sterilized' insects were found in a consignment at the receiving port.

Expected Impact of Biosecurity Issues on Business and Industry

Organisations were asked what biosecurity issues they thought may affect their organisation. While few of the fruit 'B' organisations expected any biosecurity issues (4/14 organisations), threats were seen from pests, imports of inferior standard fruit, fruit temperature in transport. One fruit 'C' organisation saw potential biosecurity issues from fruit spotting, bug bites and peach moth grubs. Another was concerned about imported fruit that did not adhere to same systems of pest management and recording/traceability. One livestock 'A' organisation was concerned about introduction of disease from food or new animals. Another was concerned about non-conforming product and being able to prove health history.

When asked to give examples of biosecurity issues that have experienced in the business, only one fruit 'B' and one fruit 'C' organisation could provide an example. They were problems with soft fruit and fruit not arriving in the condition expected. Respondents were able to give more examples of biosecurity issues they had heard of in the industry. One livestock 'A' grower cited a species specific disease closing down production in a region. One fruit 'C' organisation cited poor packing of fruit and another fruit fly in Victoria. Six fruit 'B' organisations had biosecurity examples including: errors in post harvest treatments, heat damage during transport, quality control with imports and issues with exports to China in 2006/07.

Some miss-interpreted the biosecurity issues question thinking it was about the new tracking and tracing system. One fruit 'B' organisation thought the tracking system would make the industry more accountable. One fruit 'C' organisation was concerned about the time taken and duplication of records. A livestock 'A' organisation was concerned about ease of use of the new system.

Organisations were asked what impact the tracking and tracing for biosecurity system may have on their businesses. Most fruit 'B' organisations did not respond to this question (9/14 organisations) and half the fruit 'C' organisations (4/8) did not respond or not able to respond to this question. One fruit 'B' organisation said it would provide a better price due to reliability and another thought it would make growers more accountable for quality assurance of their product. One fruit 'B' organisation thought it would suppress prices and grower returns. Two fruit 'C' organisations thought it would increase costs while another thought it could save time and paper as well as improve record keeping. More livestock 'A' organisations answered this question (6/7) and more positively. Livestock 'A' organisations thought it would provide end user confidence, provide better feedback so problems could be fixed, improve the product so it was safer and there was less risk, secure business continuity and ensure business could continue in the case of biosecurity outbreaks occurred elsewhere. The positive expectations of the livestock 'A' organisations may be due to early stages of QA system implementation.

Organisations were asked what benefits they expected from setting up the new tracking and tracing system. Five fruit 'B' organisations commented on more ease in tracing fruit, getting fruit into China, potentially helping with costing and profit, increased transparency and getting ownership of defects to assist improvements. One organisation only saw data in a digital rather than hard copy format.

Fruit 'B' organisations were further asked what benefits they expected for the industry from setting up the new tracking and tracing system. The seven organisations that saw benefits suggested it would provide better prices, better access to markets, customer satisfaction, helping with marketing estimates and ensuring all growers monitor things like spray programs.

To get a broader picture of the expected reasons for implementing a tracking and tracing biosecurity system organisations were asked to agree or disagree with a range of potential benefits on a scale of 1 to 7 with 1 being strongly disagree to 7 strongly agree (Table 9). There was the strongest agreement that the system would reduce the risk of litigation (mean 6.1), better meet customer needs (6.1), improve performance and profitability (5.9), better understand customers and suppliers (5.9) and to remain competitive (5.9).

Fruit 'B' organisations were then asked what were expected problems and challenges in setting up the new tracking and tracing biosecurity system. Responses varied from poor industry compliance, people not giving all information resulting in missing links, potential conflict with quality assurance systems already in place, computer glitches, lack of broadband internet connections and data entry errors when done by those not doing the task. With only one fruit 'C' grower on a 'dial up' internet connection and everyone else having broadband (ADSL) the internet connection was not expected to be an extensive problem.

Response to the Tracking and Tracing System Trialed

Ten organisations had trialed the new tracking and tracing system – one fruit 'B' organisation, three livestock 'A' organisations and six fruit 'C' organisations. The trial users of the system were asked to agree or disagree their response to the new system on a 1 to 7 scale with 1 being strongly agree to 7 being strongly disagree. There was strongest agreement that the system provided continued access to markets when a biosecurity incident would quarantine other businesses (mean 6.5), enable more equitable sharing of risks and rewards (6.4), reduced the risk of litigation (6.3), enabled secure sharing of confidential information (6.2), reduced time delays (6.1), reduced time to respond to correction action requests (6.1) and improved information flows (5.9). All the negative effects of the system were on the disagree side of the scale including requiring a lot of time to learn (mean 3.8), additional software (3.8), frustration with insufficient training (3.6), distraction from production and marketing activities (3.4), frustration with complicated system (3.2), extra workload (3.1) and additional computer equipment (2.9).

Key Comparisons Between Netchains

The three netchains examined have quite markedly varied adoption and diffusion patterns (Lindner 1987) for the specific tools that they have utilized to enable them to track and trace.

Trial users were asked to assess the future benefits to industry more widely of on-line tracking and tracing systems on biosecurity issue. Livestock 'A' users suggested benefits may include greater security (financial, safe food, well managed), improved information (livestock numbers, areas to start or expand farms) and improved processes (quality, reduced mortality). Fruit 'C' users suggested benefits may include better record keeping, performance pressure, efficiency, uniformity and more reliable product to consumers.

All trial users recommended similar businesses use an on-line track and trace system. Reasons given included benefits already mentioned such as: financial security; improved quality; safer products; risk assessment and easier paperwork; being made to think outside the business; and develop further/better data entry systems. One fruit 'C' organisation commented on getting immediate notification of financial returns on the market and another getting crop analysis data.

The role of gatekeepers (Rogers and Kincaid 1975) in each of the netchains influenced the establishment of working relationships and are key to the success of the adoption and diffusion of track and trace technologies. In one instance a key gatekeeper was instrumental in quickly shifting attitudes of participants away from further participation in the trial.

Conclusions and Recommendations

Across the three networks there is:

- varied ability to respond and provide information to chain partners and stakeholders;
- variable understanding of the need for and role of 'biosecurity'
- a range in capacity and propensity to use electronic systems for track and trace in
- recognition of track and trace capability as critical for ongoing ability to trade at both a domestic and export level and
- recognition that track and trace capability has led to 'biosecurity' 'barriers to trade' being circumvented.

The role of Gatekeepers and the 'Bayesian learning' style of most primary producers must be taken into account when establishing the deployment mechanisms for the roll out of web based integrated information systems. Such systems have the potential to conflict with more conservative approaches of some actors in sharing information and in tightly bound business to business and group relationships.

Acknowledgements

Thanks are provided to the Rural Research & Development Corporation (RIRDC) in Australia for providing funding for the research as well as all the businesses for participating in the project.

Education and Entrepreneurship

Abstract

In the era of globalization and new global type of competitiveness one of the important driving forces is education. Education itself changes its own mission and content and its target includes improvement of skills and building competencies in entrepreneurship. Increased emphasis on education, on entrepreneurial sector has taken place due to two major developments:: the recent problems associated with global economy and economic liberalization and opening up of markets have created more opportunities entrepreneurial pursuits. Therefore education. and business world are working in collaborative manner to nurture entrepreneurial pursuits..

This paper will focus on the cooperation between business and universities from the perspectives of employability, entrepreneurship and innovations.

1. Introduction

In the era of a globalized environment a new type of competitiveness and expectations are forcing higher education to become more relevant to its stakeholders. Therefore education itself is making changes in its own mission and content in response to the change. Liberalized economies and its knowledge based societies demand more expertises and information and also excellence. It is something like acceptance of third mission in education - education starts to play a new role in society. Increased stakeholder involvement and external demand bring new strategic choice- they are creating multiple networks and alliances with multiple actors on various educational levels. These changes bring also new transformation at universities.

2. Universities and New Type of Education

Universities change their production and productivity. Universities lose their monopoly for obtaining knowledge - they start to have more effective position in triple helix, where helices are industry, university and government. - they change the social networking .It starts to be more and more important that type of networking, which changes very often the context of knowledge. One of the possibilities of this case is international networking- the networking of higher education institutions based on notions of learning societies , which are losing its national character, transform themselves into trans-national networks or international organizations providing special research. This social networking accelerates also its own dynamics. And it is linked with the slogan that universities are engines of economic productivity and competitiveness. Universities in this sense develop new training facilities and pedagogical practices.

Their position underpinning competitiveness is also in link with neoliberal theory and support of individualism- “your privileges are your own achievement”- they support also social mobility embracing opportunities to access to middle-ranging position in society as well as to elites. It promotes civic values and develops “meritocratic” selection system, where people can achieve social status by using their own abilities . This social movement reflects very high level of social mobility mediating the relationship between ability and opportunity and systematically prepare pupils for their differentiated position in society.

High education enhances also productivity of society and stirr disparities in society. We need to distinguish between horizontal or functional differentiation and vertical or hierarchical differentiation. Vertical differentiation is very much anchoring in Anglo-American educational systems pointing very strong power of markets[Nelson, Phelps, 1996]. Greater state control is connected with more flattered hierarchies and differentiation in terms of the social and economic roles of different institutional types or sectors. There is also variation of different qualifications regarding obtaining new knowledge.

One of the dangers in this type of education is losing its autonomy from the state higher education system and this is seen vulnerable to , producer dominated interest groups (here academics and scientists) :

government may also face special situations –may exercise countervailing power to champion powerless consumers. From this perspective ,higher education is no different from other publicly funded services (health care etc.) There is a tendency nowadays to shrink public sector and public sphere and that what will have a tremendous impact also on high education vice versa.

Speaking generally knowledge nowadays is characterized by heterogeneity- and it is not exclusivity of universities to offer education and knowledge- it is possible to receive education through other type of education institutions.

3. Enterprise University

We may speak nowadays about universities as about entrepreneurial universities. Different theoretical assumptions characterize higher education institutions as hybrid institutions. A number of universities are trying to organize universities along the lines of enterprises.

The new form of Enterprise University may be described as follows: it has a strategically centralized leadership highly responsive to the external setting, the wide use of corporate and business forms, employing not only academic people. New stakeholders obtain the power to influence the whole education organization in working out cost-conscious operating principles. On the other hand it is necessary to solve the problem of legitimacy of stakeholders with the organization. This legitimacy of their position is connected also with the urgency of the stakeholder's claim for immediate action within the frame of education organization. Those stakeholders create also special mission of education institutions which fulfill community engagement, what is very important for regional policy.

The third mission of high education therefore consists of a knowledge transfer function community engagement function. and supporting local economic growth..

4. Entrepreneurship and Education

Education changes not only due enormous impact of entrepreneurship.

Entrepreneurship is a lively, adjustable, innovative and creative economic branch, which boosts the biggest number of jobs, creates new values, invests money in new products and services. From this point of view is important to include entrepreneurship, academic community ,businessmen, managers, consultants and practitioners in the field of entrepreneurship and understand them as important stakeholders unified with the same interest.

The target is permanent education and improvement of skills and competencies in entrepreneurship. One of the prerequisites how to organize such type of education is a creation of enterprise centres. The centres are envisaged to act as real economic promotion centres in the future - actually connecting academia, the state and business together providing exchange of information.

The orientation of education on entrepreneurial sector is reaction on two substantial problems overwhelming the economic atmosphere in recent global economy and also in economy in the Slovak Republic. First reason represents a need reflecting economic and social change in skills and education- more and more important starts to be permanent education and lifelong learning. It is necessary to upgrade during the whole productive life skills and education of employed people - and for this reason it is necessary to be more entrepreneurial and innovative in education system as such. Second reason is represented by necessity to promote education in technical fields and entrepreneurial sector, because according statistical data there is visible sinking tendency in studying technical issues at universities . There is a decline in studying technical issues at universities- only 27 % of students attended technical schools and universities in 2007 in Slovak Republic as compared to 33% of students attending technical schools and universities in 2000 in Slovak Republic (if we compare this situation with situation of students attending social sciences and humanities- it is a much higher number).

5. New Type of Education

It is necessary to analyze entrepreneurship and new venture technology and innovations. One of such experiments using this approach is University Business Forum.

University-Business Forum represents a physical and virtual platform at European level to promote a dialogue between the different stakeholders, including other levels of education and training, stakeholders from countries outside the EU and specific sectors within higher education. Its purpose is, to disseminate the findings of different entrepreneurial platforms and facilitate access to and the sharing of examples of good practice. In this sense it is important to find cooperation among different stakeholders.

One of the possibilities how to promote this education experiment is through European Credit and Transfer System for Vocational Education and Training.

Recent European Credit System lacks communication and cooperation - it is necessary to find balance between education and training system. It also lacks transparency and portability of qualifications. From this point of view it is important to eliminate barriers between lifelong learning and mobility and promote better match between the needs of labour market and education and training provision.

On the one side, greater awareness of trends in the labour market can help to make learning more responsive to future needs and increase student motivation by providing a clear context for learning. On the other side, collaboration with education and training institutions may help to maintain or foster greater awareness of cultural, ethical, social and environmental issues within the business world. More concretely, such collaboration can also help employers to carry out the increasingly essential task of updating skills and ensuring the professional development of their staff

6. SMEs and Universities

Learning outcomes of this new type of education are new knowledge, skills and competence. The most important is button up relationship between SMEs and university (may be it is more important than relation vice versa between university and businesses).

SMEs and their relationship with universities are influenced by different issues which can also negatively influence their mutual cooperation concerning management, bureaucracy and also an organizational gap and technology and management skills.

The cooperation between business and universities could be focused on different scenarios, focusing on employability and entrepreneurship and innovations. At some universities are funds beings attached to universities which support different type of teaching courses promoting entrepreneurship. Universities can build also business design, measure and document the social and business impact of their strategic efforts.

7. Lifelong Learning

The other important thing in education is lifelong learning, which supportrs education, skills and training. Lifelong learning has become a policy priority in reforms in education, and in training systems in Member States. It aims to increase investment in human capital, facilitate innovation and promote a more entrepreneurial culture

Lifelong learning is important also for adults- increasing the number of participants from 12,5% to 15% by 2020, because only two thirds of EU population have high education and only one third of population has elementary education- from this point of view it is necessary to increase education and mission for adults- it means lifelong learning. The Commission predicts that by 2020, 16 million more jobs will need high education and four million more jobs will need medium qualifications, while 12 million fewer jobs will require low qualifications, points out that by 2015 a large majority of jobs across sectors will require ICT skills and lifelong learning [Report].

From 2007 the proposed new Community Integrated Programme on Lifelong Learning will support innovative projects with a European dimension, aiming to foster entrepreneurial attitudes and skills and promote links between educational establishments and enterprises. The European Social Fund will continue to support initiatives at European, national and local level

The lifelong learning is also promoted by other different type of education as is for instance

- _ Partnership agreements between schools and businesses
- _ Courses in working life knowledge and entrepreneurship (training of teachers)
- _ Intensive courses for potential entrepreneurs

This lifelong learning influenced by different changes in education has direct impact on new organization of work. One of these consequences is appearance of flexicurity in labour market.

8. Lifelong Learning and Flexicurity

How is combined lifelong learning with flexisecurity?ⁱ - first of all with the possibility to offer especially for disadvantage group of employees new education courses- not only courses for requalification, but also for upgrading general knowledge. In this sense are important activated and education measures – motivation for seeking employment and qualification on labour market.

In labour market there starts to be important also negotiating not only wages and working hours, security of employees need not longer to be sought in income security, but also in good position in labour market (e.g. in terms of training, employability, flexible organisation of work etc.).

What concerns labour market policy, important is also active policy of labour market- which relates to legislation, lifelong learning and social system. In this sense are important active and education measures- motivations for seeking employment and jobs and adequate qualification for jobs and qualification for labour market

In Slovak Republic such type of measures are missing - education is understood as requalification. This tendency is accompanied by weak support of active labour market policy and education policy.

9. New Jobs and New Skills

European Commission unified different organisations working together on issues of new jobs and new skills, which are needed in new modern period. One of such organisations is European Centre for the Development of Vocational Training. The Centre provides research results, analyses, policy advice and comparative information.

New skills are linked with incentives, investments, challenges and risks reflecting transition of labour market. This transition of labour market is very important, because it is based on new ideas – for instance on flexicurity. that stresses flexibility and worker's codetermination, and importance of training and education offered to workers by companies and sectors.- this change reflects the shift from jobs security towards employment security. There exist many measures how to strengthen future importance of education as for instance:

-to have provisions of education leave in every collective labour agreement. These provisions are gradually extended. It is to be ensured that all employees –flex workers and part-time workers included- are entitled to education

-to promote a shift from job-related to career-related education

-to conclude agreements of saving time and money for extended educational leave [Wilthagen,1998].

10. Conclusions

As we see education changes also its own mission and forms its new strategies, the importance of new skills related to modern intellectualization of work. It must be understood as new dimension accompanying new character of jobs and new relationship of employed people to their skills (there start to be important not only long-term qualifications, but short-terms skills.)

Education starts to be compulsory engagement obligatory not only for students at schools, but also for many employees in different economic and social sectors. Education itself changes its exclusivity and starts

to have deep contact with social and economical changes.in different sectors of social and economic life. We need to accept these changes and be prepared for them to cope with them too.

Endnotes

ⁱ Flexicurity is defined as a policy strategy that attempts, synchronically and in a deliberate way the flexibility of labour markets, the work organisation and labour relations on the one hand, and to enhance the security - employment security and social security .This combination is very important and is based on work legislation, lifelong learning and social system.

Göteborg University, Sweden

Introduction

The creation of strong and dynamic business networks together with a successful management of relationships have become essential elements for the success of any company aiming to compete in the turbulent and rapid changing international environment. Therefore, collaboration among networked businesses is the new strategy that companies are using in order to differentiate themselves from others and to create a competitive advantage in a global market. For this reason, academic researchers have been constantly attracted to investigate innovative ways to improve the business relationships and networks.

The TOs are essential actors in the international tourism industry and their main task is to get together the components that form a “Holiday Package” and make them available to the retailers, usually called travel agencies (TA). These components are usually a flight on a charter airline, accommodation in a hotel chain, a car from a rental company, and the services of a local representative. Consequently, for the achievement of this purpose, the TO relies on the networks and business relationships that creates with the different set of suppliers who provide the necessary services. The TO manages mainly five different networks, one with each type of suppliers and an additional with the TAs. Additionally, these network participants tend to be embedded in different countries and economically independent. These aspects of the network make its management a very complex task for the TO and object of study for the researchers.

The RTAs are considered a very important participant in the TOs network since they are in charge of “taking care” of the customers, by being the local representatives of the TO in the destinations. They face directly the customers and spend relatively more time with them than any other supplier. A close relationship with the RTAs will give the TO a good knowledge about the services and the abilities of the RTAs. Thus, the quality of the services delivered by the RTAs will directly affect the satisfaction level of the customers. These reasons motivated the election to analyze the TO’s network and business relationships with the RTAs, over the other TO’s suppliers.

Research Methodology

The study is conducted using the *case study* approach. There are two different typologies of case studies, the first is composed by exploratory, explanatory, and descriptive case studies; and the second is composed by single or multiple case studies. Multiple case studies design recommends advantages such as being more compelling and robust (Yin, 2003). The study use the *multiple case studies* strategy because this could better help us to clearly define and understand the existing problem, and provide us with a greater in-depth analysis. This study is also an *exploratory research* since the TO’s executives were interviewed using *qualitative methods* in order to examine how the companies are managing their business networks and relationships.

The type of selection of case companies followed in this research is called *convenience sampling*: based on resources, location, and availability of respondents, among others (Merriam, 1998). The study selected the case companies on the basis of our needs to gather empirical information and answer research questions. Since these questions were about the TO’s business relationships and network with the RTAs, then needed to get information from these type of businesses. Companies involved in these businesses were contacted and requested information about the way they manage their business relationships in the network formed by the TO and the RTAs.

Two TAs from New Zealand, “Flight Centre” and “House of Travel”; and two TOs from Italy, “Hotelplan Italia” and “Alidays”; were willing to cooperate; regrettably none of the RTAs showed interest. The first two companies showed a low level of interest, moderating their cooperation towards the study; the latter two were more interested and willing to cooperate actively, since the research problem was currently concerning them. The interviews with the Travel Agencies of these two companies helped to understand one part of the TO’s network concerning their role viewed from their own perspective. Further, the interviews with the TOs offered a deeper insight about their processes, business relationships, and networks, which helped us to complement the understanding of how the business works in reality. After gathering the needed information, we decided to consider Alidays our main case company since they provided more information that helped us to complete the analysis.

The study conducted interviews in order to better understand the problems existing in the management of the business relationships and the network between TOs and RTAs. These interviews were complementary to each other and each of them had a specific topic to investigate; together they showed the specific problem that needs to be solved by this research. Face to face interviews were conducted with the interviewees. Also open-ended questions were used to look more closely at the company’s operations and to obtain the own ideas of the interviewees. The structure of the interview was such that the interviewees could freely talk about their opinion and arguments about the topics and research problems. Three interviews were conducted at Alidays and the interviewee was Davide Catania. The first interview was conducted to gain ideas about the management of relationships of Alidays specifically with RTAs. The second interview was conducted with an objective of getting detailed information about the different approaches of relationships that the Alidays follows. And the third formal interview was conducted on with the purpose of gathering information about the information technology systems used to communicate and carry the business with the partner companies. The lastly Alberto Alberi, who is in charge of managing the business relationships with the Chinese RTAs, was interviewed from Hotelplan Italia. This interview of benchmarking company gave us the insight about the way they are creating and maintaining their relationships with its international suppliers. Throughout the whole interview process, we tried to achieve the interviewees’ suggestions about the further development of their business processes through the enhancement of the relationship management.

Theoretical Framework

Interorganizational Networks Theory

Interorganizational Networks has become a central issue in the strategic organizational arena because of the clear understanding of the actual business organizations. Networking in business is an essential element because it enables businesses to perform and many times it becomes the reason for their existence in the economic system; in particular, this facilitates the companies to become leaner, innovative and responsive to meet today’s organizational challenges (Yanell and Peterson, 1993). Interorganizational networking can be seen as a cluster of business units held together in network approach by market mechanisms (Zeffane, 1994). The perspective used in this study the understanding of the complexity of the networks and its coordination; this will provide a view through which the reader will be able to understand how the TO is linked and working with other independent organizations.

The complexity of the system

A firm is just one player in a complex system composed by networked networks; these networks are shaped in many different ways as many types of businesses exist in the market. An individual network’s design must solve both: satisfying each participant’s needs and requiring each participant’s collaboration for the well functioning of the system; this means that each organization must fulfill unique obligations placed on them as well as benefits. Therefore, every organization is expected to work beyond its organizational boundaries with other different organizations for its adherence to the system and a proper exchange of assets. Simultaneously an organization must

posses certain knowledge about the other organizations before interacting directly with them because each organization has its own background and socioeconomic environment (Pfeffer, 1972).

An example of an interorganizational network is a multinational company (MNC), which is compelled to work with different organizations located in different countries. These foreign organizations are embedded at the same time in different external networks composed mainly by customers, suppliers and regulators among others. Furthermore, these organizations, besides being embedded in other external networks, are embedded in a different culture, different language and doing business in a different way than the networks located in a single region or country (Tatiana, 1997).

Therefore, a MNC has a difficult task when performing within the network because it must interact and manage its relationships with the other organizations in its business. These relationships are mainly started for economical reasons but through the process of interaction and business performance, the well management of the business relationships would create a different face of the relation, meaning that even if the relation starts been mainly economical, the development of it will make the emotional side more important each time. This is seen when companies have suppliers for years and even if a new supplier comes with a better offer of price and/or product, the company usually stays with the actual one, this being regarded as a non-rational behaviour.

The coordination of the network

The integration and coordination of a network is an essential task for the well performance and competitiveness of the organizations involved. The coordination of a network can only be improved by understanding the process by which each of the participants get involved in the network through relationships. The tracking of how these networks are created, grow, and dissolve over time could provide the necessary insight to understand and begin managing a business network (Van de Ven and Walker, 1984). Also the understanding of the main purpose of the network and the role of each participant empowers the organization to take advantage of this knowledge and pull “triggers” for its own benefit and the benefit of the network. The coordination in the network will be heavily influenced by the relative importance of its participants, there will be leaders and there will be followers; a good relationship with the leaders could represent an asset for any organization working within the network.

Relationships

Conceptualization

In 1990s, the function of relationships was accepted as a marketing strategy in a majority of businesses. Many researchers from different disciplines are showing interest in relationships in businesses and believing that a general shift is taking place within the marketing field focusing now on ‘Relationship Marketing’ (Holmlund and Törnroos, 1997). Academics have faced difficulties trying to define what relationship means, some of them have defined it as mutually oriented interaction between two reciprocally committed parties; it may arise for various reasons between two parties but it mainly occurs because of the interdependence in the desired outcomes (Håkansson and Snehota, 1995). In order to be able to identify how to create, maintain and enhance relationships, it needs to follow the evolution of a relationship and to analyze different stages in that process. Each of the stages should indicate a major transition in how the parties involved are connected to each other and how relationship moves gradually through the exchange process from one phase to another, which depends on parties dealing and behavior of each other (Zineldin, 2002). Thus relationship evolutionary pattern offers a life-cycle model for creating and enhancing a strong relationship. In the relationship cycle, first an infant relationship is born and then it progress through various stages of development, growth, maturity, decline and demise (Zineldin, 2000).

According to stages theory, relationship passes through different phases where the resource-dependent and the inter-dependence are enhanced and which is influence by the above life-cycle model. But this theory questions whether a relationship moves forward in the exact order as shown in life-cycle model. It also criticized that this model does not explain clearly what scenario occurs in the transition period from one phase to another phase. On the other hand, the stages theory explains that relationship is a complex issue and exists and occurs in different states of

initiation, establishment, development, maintenance, dormant and termination. So, it does not progress through a structured way but develops through the environments and opportunities of a specific circumstance (Zineldin, 2002).

Trust and Commitment

Trust and commitment are the two factors that strengthen the relationships and support in achieving positive relational outcomes that is adaptability, cooperation, relational satisfaction and performance (Hausman, 2001). A simple definition of trust is that “it is an expectation that things or people will not fail us” (Nooteboom, 2002)ⁱⁱ. On the other hand from a business relationship perspective, trust is “a firm’s belief that another company will perform actions that will result in positive outcomes for the firm and not engage in unexpected behavior with negative outcomes” (Anderson and Narus, 1990). According to Morgan and Hunt (1994) trust can be defined as willingness to rely on an exchange partner in whom one has confidence. Trust act as a factor which promotes a relationship success through reducing uncertainty and opportunistic behavior (Hausman, 2001).

Trust decides the level to which each party can realize the integrity of promises offered by the other parties and it is also faith that the party will give what they promised (Callaghan *et al.*, 1995). The effective and acceptable ways in doing business that the relational partners follow increases the trust between them. The reliance of trust is the main variable in a relationship exchange. It is also an important factor in business relationship to create the long term stability of relationship (Morgan and Hunt, 1994).

Commitment is another important variable to realize the strength of relationship and useful for measuring relationship loyalty (Gundlach *et al.*, 1995). According to Morgan and Hunt (1994), commitment is a belief by an exchange partner that an ongoing relationship with its partner is so important to guarantee maximum efforts at maintaining it. Commitment depends on the benefits from relationship and decides the length and nature of relationships. The committed party also believes that the relationship is significantly working on to ensure that it continues for an indefinite period. Interaction between commitment and trust is that increased level of trust in the integrity of a relational partner increases the firm’s commitment to the relationship (Morgan and Hunt, 1994). This interaction makes the partner to invest more time and other resources in the relationship if they trust each other (Hausman, 2001).

Relationship Quality

In general, the relationship quality describes the overall depth and climate of the relationship (Johnson, 1999). But from a business perspective, this term is related to how well the relationship fulfills the expectations, predictions, goals and desires of the participants involved in the relationship process (Jarvelin and Lehtinen, 1996). It also creates an overall feeling and impression about the whole relationship with different transaction that the customer has concern about. The two dimensions of relationship that Gummesson, (1987) categorize are professional and social relations. The former relationship is based on the service provider’s demonstration of proficiency and ability and social relations is grounded on the efficiency of the service provider’s societal interaction with the customer.

Relationship quality perceived as trust and satisfaction between the two parties in the relationship process and high relationship quality means customers ability to understand the reliability of the service provider’s integrity and future performance as the past performance has been constantly satisfactory. This relationship quality is an important precondition of a successful long term relationship (Wong and Sohal, 2002). Grönroos states that the service performance has an impact on whether the customer will engage in repeat purchase and also on the customers should not only be satisfied but they should be very satisfied in order to go for repeat purchase and become loyal.

Loyalty

Loyalty, over the past decade has become an important issue in marketing and particularly in relationship management. There is much discussion in the literature about the definition and dimensionality of loyalty. The

definitions of loyalty exist on the basis of attitude and behavioral aspect. Behavioral loyalty is repeated transactions and can sometimes be measured quite simply with observational techniques. On the other hand, attitudinal loyalty is defined as positive affect toward the relationship's continuance and the desire to continue to remain in the relationship (Dick and Basu, 1994).

Loyalty is mainly influenced by the relationship quality rather than service quality. Performance and service quality mainly affect the quality of relationship which has an effect on the loyalty of customers (Robert *et al.*, 2003). Loyal customers therefore engaged in repeat purchase and don't want to move to other service provider. In order to gain competitive advantage the company should achieve the customers' loyalty. Excellent relationship quality directs toward the loyalty which in turn enhances the cooperation between actors in relationship process. Loyalty also increases the level of communication between two parties which help to develop service or products of the company. So loyalty makes possible the high relationship quality to gain competitive advantages and profitability for a company (Wahlby and Lulic, 2003).

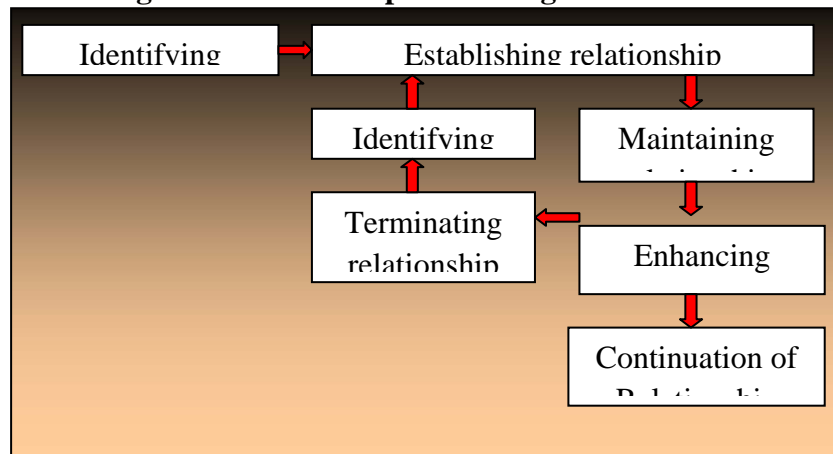

Relationship Marketing

Relationship marketing (RM) can be defined as a procedure of managing the firm's market relationships or as the process of identifying and establishing, maintaining, enhancing and when necessary terminating relationships with customers or other stakeholders, at a profit, so that the purposes of all parties involved are met and this is done by a mutual giving and fulfillment of promises (Grönroos, 2004).

RM is also related with other issues, such as building networks, creating strategic alliances and making partnership agreements, developing customers' databases and managing relationship-oriented integrated marketing communication (Grönroos, 2004). This also explained that a shift of focus is needed to implement RM and for this three areas such as: an interaction process as core of the RM; a planned communication process supporting the development and enhancement of relationships; and value process as the output of RM, are important for the successful execution of a relationship strategy. The relationship management is going through an interaction process where various type of links occur over time among the different actors and the contacts among them differs according to the type of market situation. The contacts can be between people, between people and machines and system or between the system of suppliers and the customers as well. In order to be successful, RM is needed an integration of all marketing communications to support the establishment, maintenance and enhancement of relationships with all parties involved in the relationship network.

According to Gummesson (1990), RM process includes interactions that form relationships which may develop the networks of consumers or end users, suppliers and distributors. RM mainly focused to the management of this relationship and to be successful, the suppliers, partners, distributors, financing institutions and the customers should be included in the management of relationship in a network. It is also important to create more value for the customers or the other parties (such as suppliers) and to perceive and appreciate this value by them that are created in the on going process of relationship which is called value process. If we try to put Grönroos definition of RM as a process into a model it would look like a cycle.

Figure 1 Relationship Marketing as a Process

The impact of RM on Business performance

The RM assists a firm to redefine its responsibilities of each function. It also drives a firm to restructure the organizational system into a boundary-less organization. RM increases a firm's marketing effectiveness through the dedication to customers with long term commitment and early involvement with the customers which give valuable information to the firm. It also arranges resources from outside the firm and involves a firm to team up with other firms to satisfy customers in recent market surroundings. RM has the final impact on firm's financial benefit of increased revenue and lower marketing cost.

RM as a strategic tool

Relationship has become one of the main mantras in business strategy circle (Palmatier *et al.*, 2006). RM strategies have an extensive range of effectiveness to generate strong relationships and to strengthen the specific aspects of a relationship. The three strategic issues in RM strategy were identified as: defining the firms as a service business; managing the firm from a process management perspective; and developing partnership and networks. The prerequisite of customer relationship strategy is that a manufacturer, wholesaler, retailer, a service firm and supplier concern about the long term needs and wants of customers and provides additional value on top of the technical solution related with consumers' goods, industrial equipment or services. But the customers want more attractive service offerings in addition with product or services, like from all information about the product up to correct solutions they have bought. They also demand a friendly, trustworthy and timely manner from the company. Service management, a new approach of management, geared to the demand of the new competitive situation that is service competition (Grönroos, 1996). This competition has become an important factor for the success of almost all the firms and every business has become a service business (Webster, 1994). In order to produce the maximum value in a coordinated relationship with customers and other stakeholders, the firm has to go through a process management approach of the whole operation of the business which will enable and strengthen relationship building and management. RM is based upon cooperation, where the parties will be best off as partners and will form a win-win situation. Sometimes the firm finds it expensive to acquire the required additional knowledge and resources to produce the necessary element of the offerings. The firms need to supply complementary elements of the offerings to create a successful relationship with its customers and for this it will be effective and profitable to find a partner.

Partners and network of firms are structured horizontally and vertically in the distribution and supply channel. To be an effective cooperator in RM, trust between two parties in the network should exist otherwise the parties will not feel mutually committed to each other. The three tactical elements of a RM strategy were identified as: seeking direct contacts with customers; building a database; and developing a customer-oriented service system.

Inter-firm relationship management

Marketing concept is a business philosophy and the market orientation is the implementation of the marketing concept. Marketing has important influences on a company's inter-firms relationship and the supply chain management. The market orientation does not have influence only within the internal environment of the firms but also spread out to inter-firms relationships with customers, suppliers and distributors. An environment is provided by a market orientation where the RM is maintaining. RM established through a market orientation by building up commitment, trust, cooperative norms and reduced conflicts between firms. Market orientation needs close inter-firms relationships because it is an important source of external information for the firm (Kohli and Jaworski, 1990). So, a firm should maintain close relationships with its customers to observe their need and to make sure that the customers is getting what they require from the firm. The firm also needs to maintain close relationships with distributors, suppliers and any other participants in the market to analyze the market position of other market participants on customers' demand. Close and extensive relationships with customers, suppliers and other key constituencies is needed for organizational learning (Day, 1991) and this learning from others includes benchmarking, forming joint ventures, networking, developing strategic alliances and deal with priority customers to understand the market demand before the rest of the competitors and to find solutions for those demand (Webster, 1992).

RM in international B2B perspective

Companies operating in a global competitive market find themselves in aggressive and uncertain market competition and also open to unlimited opportunities. In this situation, the companies have realized that they should adjust and change the strategy in doing business with other companies and they should change and restructure the way they are following for establishing and maintaining the current business relationships with its business partners (Zineldin, 2002).

Compare to consumer market, relationships tend to be longer-term and require a higher level of relationship commitment in B2B market (Ford, 1980). In international marketing relationship creates loyalty, reduces distance and risk between buyer and seller. A company can gain competitive advantage by managing all the relationships between firm and its market environment. The company should build up the relationship as an important part of its transaction process which will differentiate it from the competitors and will help to achieve long term benefits (Melewar *et al.*, 2001).

Analysis of Empirical Findings

The analysis is divided in two parts. In the first, the TO's relationships is analysed with the RTAs, and their existing management process carried by the TO; and in the second, the methods by which the network is being strengthened by the TO together with the role of the RTAs characteristics in this process. This served us as a platform to stand on and from which it could fetch a judgement to propose a strategy capable of improving the management of these relationships and strengthening the TO's network with the RTAs.

Business Relationships and Networks

With regards to the relationships existing between the TOs, Alidays and Hotelplan, and their RTAs and the way these are managed throughout their entire process, both TOs interviewed stated that their objective is to have the best relationship with the best RTAs. But it is remarkable that neither of them have a systematic approach to achieve this goal. Firstly Alidays justifies this objective by saying that the better the relationships with the RTAs the fewer resources will be wasted when solving daily operational problems. Similarly, Hotelplan Italia justifies this objective by claiming that the better the relationships with the best RTAs will help the company to give better offers together with a more efficient tool for solving the daily operational problems.

Existing Relationships

Both case companies, Alidays and Hotelplan Italia, stressed the importance of good communication, friendship and loyalty with the RTAs. First, claiming that once experiencing satisfactory attitudes and services in the relationships, it will be more likely that loyalty amongst the partners will emerge. Communication is also considered essential in the relationships by both companies. Efficient communication is considered a medium to facilitate the expression of opinions about business improvements, feelings, and thoughts, and more important, it helps to avoid misunderstandings. They also point out that, friendship is more important than even the best formulated contracts since problems are more likely to be solved faster by negotiating with friends than with those who are not.

Although the above mentioned three statements are all necessary in the relationships, they are not sufficient. It is also necessary to consider aspects that come before or after, however the order is not relevant since it is the importance of the factors that matters to the development of good relationships. Trust and Commitment, are considered essential elements in any relationships. Trust will give confidence to all participants immersed in the relationship. This element helps reducing the feeling of being “hurt” by the counterpart and increases the participation of everyone immersed. Commitment, on the other hand is about believing that the counterpart will do what it takes to keep the relationship functioning. This is necessary since the perception of long term relationships empower the participants to be more involved in the achievement of the common goal and to work for the team.

Another aspect influencing the relationships worthy of mentioning, relates to the attitude that the TO must have in order to improve the relationships. For instance it must not be too punitive on the other faults, considering limits in the demands to the RTAs. Sometimes, the TO must let go of the RTA’s faults and try to avoid conflicts about minor things. The TO must be charming with the RTAs giving them “some love” so that people working in those companies will work with your company in a better environment. The TO should consider the RTAs as its right arm since it is essential for the existence of TO and will help in achieving its goals. Finally, it is crucial to be explicit in terms of what one expects from the other from the beginning of the relationship so that everything is clear from the start.

Management of the Relationship Process

The process of establishing relationships with the RTAs, known by “Alidays” and “Hotelplan Italia” can be categorised as: starting, enhancing, and maintaining. The breaking-up step only occurs in cases when something goes wrong with the relationship or the services provided by the RTA are not necessary anymore. It is considered that this vision is too narrow and limiting the analysis of the relationship management process to three simple steps.

The study suggests that the process in the relationships management should be more specific and considering each step as a process in itself. In the start-up step, the TO must assure, to a certain extent, that the new RTAs are good and necessary companies; in the improvement step, the TO must plan and implement activities and track their development improving the relationships, and; good relationships need to be maintained by the commitment to the network, close interactions, and delivery of good services. It is important to have a system that enables the TO to track and fully empower these steps.

It is therefore essential that the companies understand all the activities in every step of the relationship process and try to make these activities more efficient. Both companies should try to get the most benefits out of their presence in the international tourism fairs. These represent great opportunities not only in terms of meeting the

RTAs already linked to, but to get to know new ones. This represents an opportunity of dating and relating to RTAs considered bringing potential benefits to the network

The proposed process will then reduce the risk implicit in the activities aiming to create great relationships with great RTAs. The process will consist of independent analysis of all the activities. By doing this, the activities that do not add value to the process can be withdrawn and replaced by activities that are more advantageous. It also makes it possible to find ways to improve the ones that remain in the process. Both Alidays and Hotelplan Italia lack this type of system when managing their relationships with the RTAs. They are potentially wasting resources when performing towards the achievement of this objective. Hence it is not enough to simply be aware of the necessary steps to develop a relationship, essentially the TO needs to analyse and understand all the activities within and manage them in accordance with the objective. The system proposed to solve this problem will be detailed later, that will be the result of our research and the proposition for our case companies.

Creation and Strengthening the Network

A strengthened network will benefit the TO in the sense of gaining competitive advantage and the possibility to exceed the customers' expectations by providing excellent services. Further, it will possess particular characteristics which could be translated into benefits for all the participants. Alidays and Hotelplan Italian do not follow a structured process for the achievement of this objective. They perceive the need to improve the relationships and the network by attracting the best RTAs. But they lack of a plan with delimited objectives and mediums to achieve this purpose. Therefore, their activities are limited to attract as many RTAs as possible without having established a selection criterion. This process is critical since it makes the resources destined this purpose more productive. If resources are used up towards this objective without having a clear plan, there is a big probability that these will be wasted and the results will not appear. Summing up, Alidays and Hotelplan Italia need to design a plan to strengthen their networks which would help them to canalize their resources to the more prolific activities.

The RTAs' Characteristics in the Process of Strengthening the Network

It is important to emphasize that there exist two essential methods, equally important, to strengthen the network. One is by improving the management of the relationships and the second one is by attracting the right RTAs. The second method recommends the TO to establish an unambiguous criteria to evaluate the characteristics of the RTAs and use it when analyzing which of them must be attract them from in and outside the network. Therefore, this method must be encouraged in the case companies when getting involved in the process of strengthening the network.

It is widely accepted that benefits will arise from the ability of the TO to achieve the second method, explained above. Therefore, the suggestion is to implement a system that leads the TO through the process of achieving this objective. In the absence of a system directing the activities of the TO through the building of these type of relationships, the waste of time, resources and efforts destined to this purpose will be bigger than if a system is designed and followed by the company.

Improving the Relationships Management and Strengthening the Network

Based on the analysis, the study now proposing steps of a process that should be followed when aiming to strategically manage the relationships with the RTAs.

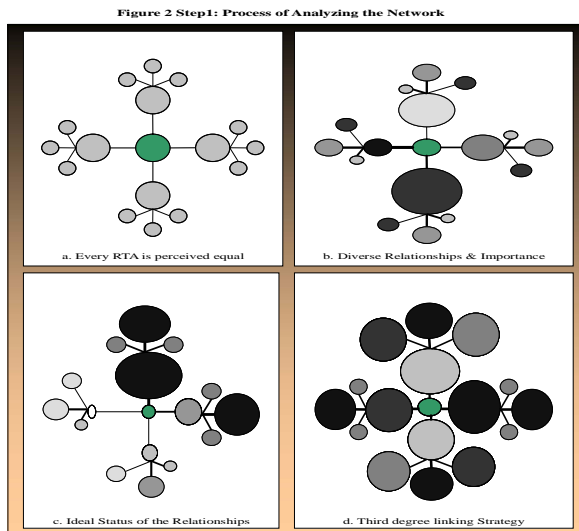

Step 1. General Analysis of the Network

The first step in the RTA Relationship Management Strategy is the execution of an extensive Network Analysis which will be achieved in four stages: the examination of the network components, the study of actual constitution of the network, the analysis of the desired network type and the analysis of the potential benefits the actual and future networks will represent in terms of indirect linkages. This analysis will help the TO to start managing the business network affecting the processes that shape it towards a specific desired model of Network.

First stage: Analysis of Network Components which consists of three elements. First element: *the essence of the network*. The TO must understand what makes the network what it fundamentally is, the necessary properties it must have without which it could not exist. Moreover, the essence of the networkⁱⁱⁱ is composed by an economical and a societal objective present in each of the participants that the TO must understand and consider when performing as a coordinator. Second element: *the network's reason of existence* i.e. why it is created and is kept alive. Basically it is known that any network is created because the scarcity of resources and specialization. Therefore, the task here is to find the complementarities of each participant: what each one gets-from and gives-to the network in terms of exchange of services that otherwise would not be possible. By knowing this, the TO will be able to strengthen these dependencies and make the Network last longer securing the permanency of the participants. Third element: *the reasons to participate in the specific network* i.e. the detection of the aspects considered by the RTAs when evaluating their immersion in a network. If the TO knows which are the ideal characteristics of a network in the eyes of the RTAs, then it will be able to shape it's network in accordance making itself desirable to these. After doing this, it will be the interest of the RTAs to be accepted to participate in the network of the TO.

In Summary, this step will help the TO to deeply understand the essence of its network, the reasons for which it exists and those for which the RTAs crave to participate. Helping the TO to encourage the participant to feel part of the network by remarking its essence; to make the network longer lasting, strengthening the reasons of its existence; and to make it more attractive to the actual and prospective participants by shaping the network in accordance to the desires of the RTAs.

Second Stage: Actual Constitution of the Network. The TO must stop conceiving its network as a group of homogeneous companies working together through homogeneous relationships (see figure 2-a), rather TO should study the constitution of the network in terms of: relationship quality, psychological distance, relative economical independence and importance to the network. This analysis will help them to have a more accurate view of the composition of the network by knowing better the participants and the relationships within.

The Relationship Quality (represented with the thickness of the joining lines in figure 2-b) aims to evaluate the subjective feelings and the objective facts of the relationship between the TO and RTAs. The subjective feelings can refer to the attractiveness of the relationship, how comfortable the parties feel when interacting with each other, and the things that both parts “would love” in their relationships. The objective facts on the other hand, refer to those things that must-be present, and the fitness for use of the relationships; this is concerned more with the excellence and the presence of the necessary elements for those relationships to perform. After this analysis the TO can have a better view on which relationships it can rely more and on which to work towards their enhancement. The better the Relationship Quality the greater the benefits expected and the more contented to work with that partner.

The Psychological Distance (represented with the length of the joining lines in figure (2 – b, c, & d) measures how close or far the RTA is from the TO in each other’s mind and behaviour. Which RTA is contacted more, who is recommended first, who is seen more often, are some of the questions able to answer how far or close is psychologically located an RTA from the TO. Physical distance is not perceived to be heavily affecting the relationships for the reason that this has been reduced by the new transportation and communication technologies.

Relative Economical Independence (represented with the size of the circles in figure 2-b, c, & d) is about the evaluation of how much of the RTA’s business is with the TO in comparison to the others in the network. The greater the relative economical independence of a specific RTA means that, in comparison with the other ones, RTA does not depend as much on the TO and therefore it is not strained to fully satisfy the TO demands. The logic here is that a better relationship with an independent RTA will help to persuade it to satisfy the TO’s demands.

The last variable is Relative Importance, aiming to measure the significance^{iv} that a specific RTA has to the TOs. Therefore, if the Relative Importance of the RTA is high, the TO will be highly interested in that RTA’s services and will have to develop a good relationship with in order to get them.

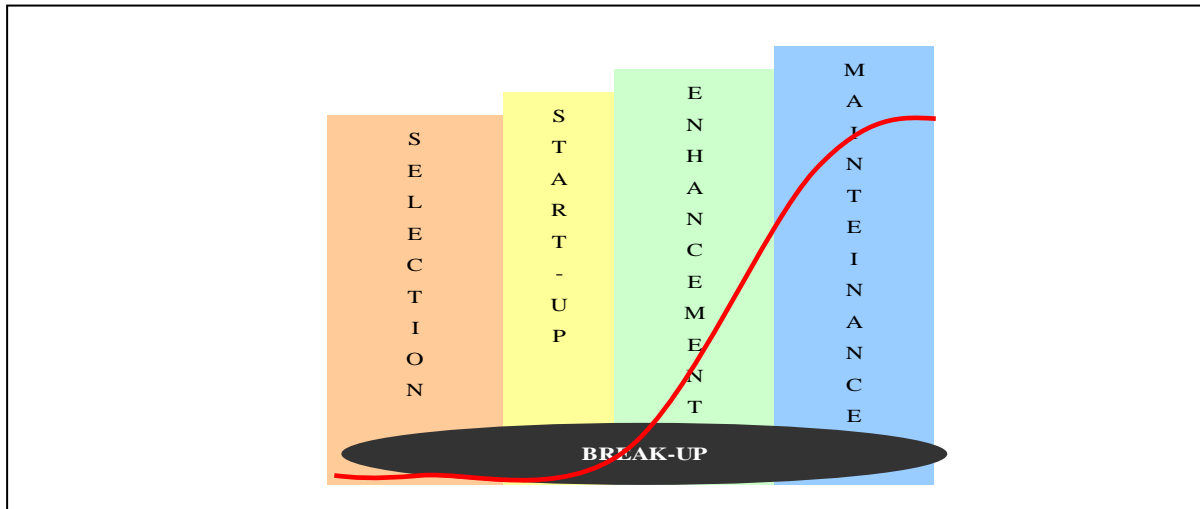

Third Stage: Desired Network. The optimal network’s constitution plan should be in accordance to the TO’s needs. In terms of which RTAs must be psychologically closer and enjoying a better quality in the relationship and which should not be so important to bring closer or improve the relationship. This constitution can be designed only after having analysed the potential benefits of each RTA to the Network. This analysis will tell the TO which RTAs will represent better benefits than others, so to perform and a better informed decision.

Fourth Stage: Indirect Linkage is the study of which actual linkages can help the TO to attract necessary RTAs to the network. The RTAs currently linked to the Network are at the same time linked to others, called indirect RTAs linked through second generation linkages. Sometimes these RTAs are as important or more than those directly linked. Therefore, the TO must perform an analysis of the indirect RTAs, choose the ones more important to the network and investigate the linkages through which they are connected in the network. By doing this, the TO will have a clear view of the linkages it can follow to develop a direct linkage to them and start developing direct linkages through indirect ones.

Step 2. Relationship Analysis

This step is to the understanding of the evolution patterns of the relationships, considering the start-up, enhancement, maintenance and the occasional break up (see Figure 3) and the elements that affect them.

Figure 3 Relationships Evolution

The relationships process suggests five steps; four of them propose a pattern and one is contingent and exists along the entire process. The four steps are selection, start-up, enhancement and, the maintenance; and the fifth one is the breaking-up. The starting step is concerned with the analysis of potential partners; they must have a common vision to the TO, and the people working for the potential partners is also worth of analysis since they are going to be working with the TO customers. The starting step usually takes place in the trade fairs and keeps on going with the evaluation of the services, quality of the services and according to Alidays, their mode of packing the services. After all the analysis is done, the TO decides to contract with the RTA, not before and after contracting the RTAs, developing the friendship must be the next step as this is more important than the contracts because this will help the everyday activities making them easier and leaner to the solution of operational problem.

After contracting the RTAs, a development of friendship must be the next step. This is more important than the contracts because this will help the everyday activities making them easier and leaner to the solution of operational problem. If the destination is new together with the market of the TO, these RTAs must be educated about the nature of the Italian tourists and it will be necessary to work close together with them in order to solve the many problems at the beginning.

The next step after starting is the managing; this is concerned with making them feel part of the company and getting to know them. The TO must let the RTAs express themselves and ask for their full involvement with the network and by doing this they will be committed more to the organization. From the Hotelplan strategy, this step also involves the continual education of the RTAs, and a close “daily” communication, visits, e-mail and tourism fairs, together with meetings at the end of the seasons including brainstorming sessions for ideas to deliver better services and the best way to face the new things coming in the market.

According to The Alidays, a relationship breaks up because of dissatisfying products and dishonesty; the lack of understanding, continual conflicts, and the lack of benefiting each other, one of the partners is having a crisis. The risks of terminating a relationship can be reduced by taking enough time in the starting step to choose the best partners.

There are three essential elements affecting the network relationships: Trust, commitment and loyalty; the lack of one of these would create sustainability problems for the entire network. *Trust* creates the long term stability of the relationship being the foundation of loyalty. This is an element worthy of preaching in any relationship because the lack of it will sooner or later imply acting against the entire network. *Commitment* is important to have a

general feeling that the partners are giving the maximum effort to maintain the relationship. If the participants of the TO network feel and believe that their relationship with each other will continue for an indefinite period, it will be more likely that their actions will be cautious and with good intentions. *Loyalty* helps to remain in the relationship, heavily influenced by the relationship quality. Once the TO has managed to create loyalty from its partners, the relationship between them will be more like the one of a family member, a different phase of the relationship. These terms together will increase the level of communication and reduce psychological distance gaining competitive advantage and profitability for the network and its participants.

In summary, it is important for the TO to understand the environments and opportunities that create reciprocally committed parties.

Step 3. Shaping the Network and Tracking the Relationships

The action in the relationship management is about trying to create and maintain an optimal environment where the relationships can flourish. This is about designing a strategy to create close and strong relationships, passing through the different stages. The main objective of the strategy should be to develop as many relationships with good RTAs as possible. The key to success is to care for every step in the evolution of the relationships because the costs of starting and performing with poor relationships are not affordable. Therefore, it is essential to set an environment that will positively affect the relationships and look to start a relationship with the best possible partners. In this stage, RM takes a major role by suggesting the procedure of managing the firm's market relationships. RM encourages a planned interaction process supporting the development and enhancement of relationships in the networks. The main purpose of this strategy should be to create higher values to the participants and the customers being served by these. are part of it and it will be that searching for the benefit of this new organization is the way they will get their individual benefits, otherwise they would block each other and get no benefits at all.

The environment where the relationships flourish is very important to control it. The environment is provided by a market orientation where the RM is maintaining. This orientation should be building up commitment, trust, cooperative norms and reduced conflicts between firms. Improving the processes of relationships will provide the organization with the necessary tools to cope with the new trends and challenges of the market. These new trends in specific are the increasing demand for alternative types of tourism, for more information and unique packages. And more important for TOs specializing in niche products: health and wellness, young singles; knowledge and advice are difficult over the internet.

Conclusion

Having carried out the analysis the study conclude that it is required to systematize the processes of improving the RTAs relationships management and strengthening the network with the RTAs. Since this was found to be the most suitable way the TO could improve the performance of these activities. The process of managing the relationships should be more specific and considering each step as a process in itself. In the start-up step, the TO must assure, to a certain extent, that the new RTAs are good and necessary companies; in the improvement step, the TO must plan and implement activities and track their development improving the relationships, and; good relationships need to be maintained by the commitment to the network, close interactions, and delivery of good services. It is important to have a system that enables the TO to track and fully empower these steps.

The widely known proverb "It is not what you know, it is who you know" has proven to be incomplete. The reasons are that both, good business relationships and strong RTAs are necessary in the process of strengthening the business network. If a single condition is present in the absence of the second, the process will not be completed because even if good RTAs are located in the TO's network, this will not create strong a network since this requires also good relationships with them. On the other hand, neither a good relationship with the RTAs in the network create by themselves a strong network since the RTAs included may not be the best, and this harms the process. Moreover, sometimes having a bad relationship with someone in the network can be worst than not including the RTA in the network at all. Therefore, the study state that both conditions are necessary and sufficient for the creation

of a strong network, completing the proverb: “It is not what you know; it is who you know and have a good relationship with”.

The process suggested provides the TO with a tool to systematically improve the relationships with the RTAs and the structure of the network. Starting first with an extensive analysis of the network, followed by an analysis of the current status of the relationships laying within these networks and the activities necessary for shaping the network and tracking the relationships. In other words, a set of steps were proposed to be followed when aiming to strategically manage the relationships with the RTAs and shape the network into a stronger position.

Abstract

This paper develops a computer-aided process simulation model (CPSM) to navigate value chain reconfiguration. The model uses a three-layered methodology incorporating the conceptualization of knowledge-integrated traceability (KIT) to create more efficient performance measures and provide a rigorous and stepwise clustered module structure that will act as a guideline for all decision makers involved. The model is based on three types of mature toolsets. First, the experts-consensus cognition makes the architecture of BSC-KIT (Balanced Scorecard) along with AHP (Analytic Hierarchy Process) technique into an integrated AHP-BSC structure. Secondly, internal validation of core propositions during CPSM development is then used to construct an account both qualitative and quantitative decision factors in the best delivery causality diagram of theory-building mode. Defining the KIT of toolset variable into two specific themes: allows a practical hierarchy for AHP-BSC structure to be evaluated without excessive computation barriers; And the systems thinking archetype of strategic activities in the ARIS-EPCs architecture (Architecture of Integrated Information System/Event-driven Process Chains) delivers the validity and reliability of research methodology as validation model of CPSM development. Thirdly, the hybrid ST-ARIS (Systems Thinking) simulation model is constructed based on the feasibility test of strategic decision factors from checking whether or not KPIs (Key Performance Indicators) could be measured. The reconfiguration provides new insights and contribution to the foundations for linking multi-method procedures into the process capability and performance of the value chain, and emphasizes the CPSM development by highlighting a specific approach associated with a conceptualization of KIT.

Keywords: Balanced Scorecard, Analytic Hierarchy Process, Architecture of Integrated Information System, Systems Thinking, Value Chain, Key Performance Indicator, Decision Making, Modeling.

Introduction

Literature review suggests that problem formulation, decision-factor acquisition, decision modeling and strategic decision, among others, are involved in decision making. Most of the literature focuses on how to

incorporate knowledge-base and inference/reasoning mechanism in decision making to form a uni-perspective toolset for the purpose of choosing the best alternative (Huang, 2009). Very often, the perspective chosen was one being extensive within the overall, or one being associated with a key person within the group. Adamides and Karacapilidis (2006) present architecture of information technology which is a knowledge-based system. In their business process modeling, problematic conditions are tested in the modeling process/simulation reality to identify the performance and capability of process of value chain and factor uncertainties, by gathering events, behavioral patterns of aggregated comparison matrix, and the strategic map of non-linear thinking (Adamides and Karacapilidis, 2006; O'Donnell, 2005; Coviello, 2005, Montibeller and Belton, 2009). This model design of virtual necessity is cognizant of the use and capability of clustered perspectives (Huang, 2009; Adamides and Karacapilidis, 2006; Montibeller and Belton, 2009; Han, Kang and Song, 2009).

This paper proposes an approach to solve the not-so-easy implementation of clustered module structure by applying process-driven modeling in clustered perspectives on computer-aided process simulation model (Huang, 2009; Adamides and Karacapilidis, 2006; O'Donnell, 2005). The conceptualization of system dynamics via the interrelationships of AHP technique, systems thinking architecture and ARIS method is vital in validating core propositions (Leea and Kimb, 1999; Wright and Yu, 1998). Navigating sustainability is realized via utilizing clustered process modeling which is constructed to identify the influence of relevant decision criteria on a target KPI setting (Yurdakul, 2004; Wu, Lin, and Tsai, 2007; Wong and Li, 2008; Rabelo, Eskandari, Shaalan, and Helal, 2007; IDS SCHEER, 2006; Ugwu and Haupt, 2007). It is demonstrated that process-driven modeling is an optimized method in constructing such a modeling, and that process technology might be an appropriate implementation toolset for clustered module structure (O'Donnell, 2005; Yurdakul, 2004; Kim and Kim, 1997; Salmeron and Herrero, 2005).

Review of Literature

The formulation of business strategic decision is focused on multi-attribute activity portfolios within the process- and function-oriented strategic planning to identify the definition of strategic thrust and evaluation of specific business action which creates the process-driven capability of value chain (Han, Kang, and Song, 2009; Adamides and Karacapilidis, 2006; Leea and Kimb, 1999; Papazoglou, Ribbers and Tsalgatidou, 2000). Gilmour (1999) develops specific multi-method procedures to apply non-linear value chain improvement techniques to a complete supply chain for improving supply chain performance and evaluating supply networks, from a strategic planning perspective. This method asserts that a screening tool of reconfiguration might provide new insights on the evaluation of performance by the process of value chain, a gap in literature comparison, and provide knowledge-based for the toolset variable to consolidate their analysis and design (Adamides and Karacapilidis, 2006; Leea and Kimb, 1999; Wright and Yu, 1998; Wu, Lin, and Tsai, 2007; Gilmour, 1999). BSC

model has proven to be a powerful toolset for strategic communication that aids in causality-building matrices and scenarios of strategic framework(Huang, 2009;Adamides and Karacapilidis, 2006; IDS SCHEER, 2006; Tsai, Siengthai, Wuwongse and Krairit,2011). Thus, this study proposes an intelligible BSC-KIT for strategic decision success that builds up a system dynamics modeling based on the calculation of AHP-ARIS architecture with target KPIs set to drive a perspective that incorporate both strategic activity and budget developed by this combination (Tsai, Siengthai, Wuwongse and Krairit,2011;Kim, and Kim, 1997; Lee, Chen, and Chang, 2008; Tsai, Siengthai, and Krairit,2010). Expounding on an actual case study, Scheer and Nüttgens (2008)have shown that using ARIS-EPCs architecture in organizational projects or SME and mid-Market can reduce process costs by 40% and time factors by more than 30%(Tsai, Siengthai, and Krairit,2010; Scheer, and Nüttgens, 2008; IDS SCHEER, 2008). Hsi (2001)used a medical center as an example to construct an ARIS process simulation model of electronic procurement that indicates the simulation results of ARIS-EPCs in the inventory control system. Results show that the empirical practice of the average time to complete electronic procurement by the contract is about 10 days as opposed to a non-contract which is about 28 to 33 days. According to the setting of hierarchical structure of distribution decision factors, the average procurement time was reduced by about 53.33%, the average turnover rate of inventory increased 14.28%, and the average inventory cost of hospitals decreased(Tsai, Siengthai, Wuwongse and Krairit,2011; IDS SCHEER, 2008; Hsi, 2001).

CPSM is a three-layered methodology for understanding how differentlystrategic decision factors affect the knowledge-based value(Huang, 2009; Han, Kang and Song, 2009;Tsai, Siengthai, Wuwongse and Krairit,2011).The theory-building cognition is based on the theoretical computation variable in methodological literature on how decision-making strategy reacts to the validating core proposition of exchange value-validated model and on process-driven capability.In addition, it can replicate the strategic managing template-building feasibility, resulting in strategic activities expected under simulation situation(Kim and Kim, 1997; Papazoglou, Ribbers, and Tsalgatidou, 2000). Rabelo et al. (2007) constructed a practical approach of hybrid system dynamics and discrete-event simulation (SD-DES) model with the toolset variable of AHP/SD/DES for identifying two major themes according to multi-method procedures which are recognized as a value chain process analysis associated with simulation (Rabelo, Eskandari, Shaalan, and Helal, 2007).O'Donnell (2005) indicates the system dynamics focused on how the relevant decision criteria linked together to form a holistic network with multi-functional and archetypes-associated control (O'Donnell, 2005; Coviello, 2005; Montibeller and Belton, 2009). Wu et al. (2007)apply the integrated dynamics decision-makingmethod to construct a project management system for improvement in efficiency and synergy of supply chain operations(Wu, Lee, Tah, and Aouad, 2007). Loebbecke and Huyskens (2009) provide a five-stage methodology and a specific software application to develop a model-based decision support system(Loebbeckeand Huyskens,2009). Based on the view of performance evaluation, Han et al. (2009) developed a simulation model, capable of identifying two major themes: macro and micro process analyses.The former, macro, is a process-based performance

frameworkperspective which deals with major business process operation. The latter, micro-analysis, uses simulation mechanism to contribute(Han, Kang and Song, 2009; Leea and Kimb, 1999; Wright and Yu, 1998). Process-driven simulation is a business process re-engineering model in itself(Kwan,Jin, and Minseok, 2009; Jawaharand Balaji,2009). Thus, it seems multi-method procedure brings maximized outcome.

The Three-Layered Methodology

The Conceptualization of Knowledge-integrated Traceability (KIT)

The knowledge-base and inference/reasoning mechanisms emphasize common characteristics and the traceable value of integrated feasibility as two major themes of strategic planning and business process management. These commoncharacteristics are the priority of weighting to explore the critical success factors (CSFs) of publishing industry; hierarchy to construct the conceptualization of systems thinking and AHP-BSC; the KPIs setting and benchmark to identify events, behavioral patterns of aggregated comparison matrix and results sustainability; process decomposition and clustered module process to define the causality between AHP and ARIS, and dynamic situation and performance improvement to achieve the research purpose in cost saving and throughput time. Owing tocommon characteristics being a virtual necessity in method, and then delivers the traceable value of integrated feasibilityfor the statistical description of strategic value-chain implementation (Table 1).

Three-Layered Methodology

BSC-KIT is a validation model that identifies accessibility assessment hierarchy criteria with critical success factors(CSFs). Relevant literature review on multi-method procedures describes process technology as quantifiable decision context and it is consisted of the combination of outcome- and process-driven evaluation. To fulfill this, three layers are involved in designing CPSM.

Layer 1 aims to construct clustered module structure through CSFs acquisition in generically hierarchical structure of strategic decision factors (Fig.1). Three themes were identified in the structure. Theme one was a design of “methodology” view of how decision factor uncertainties and multi-criteria decision-making operated. Theme two was a simplification of “hierarchy” view of how each component of the clustered module structure contributed. Theme three was a process-driven “independence” view. Process-driven modeling was used to conceptualize the integrated feasibility within systems thinking archetypes. KIT is then used as a statistical application for theory-building matrix while aiming at the combination of AHP and ARIS method (Table 1).

Layer 2 highlights important advantages of system dynamics modeling (Senge, Ross, Smith, Roberts and Kleiner, 1994; Fisher and Potash, 2008; IDS SCHEER, 2008): linking process-driven modeling with clustered process modeling to construct a strategic mapping of clustered module structure via systems thinking archetype and feedback-loop system. Thus, it changed a conceptualizing layout of systems thinking archetype into a process simulation model of STELLA-systems thinking (Fisher and Potash, 2008).

Layer 3, simulation results are used to demonstrate the process-driven capability of value chain to replicate management-driven template qualitatively. To carry out the influence of relevant decision criteria on a target KPI test quantitatively (Ugwu and Haupt, 2007; IDS SCHEER, 2006), STELLA-systems thinking of causality diagram is converted into a simulation model using Excel spreadsheet (Han, Kang and Song, 2009; Kwan, Jin, and Minseok, 2009; Jawahar and Balaji, 2009). Then, cross-examination phase of validity and reliability of research is conducted (Tsai, Siengthai, Wuwongse and Krairit, 2011; Scheer, and Nüttgens, 2008).

Figure 1. The CSFs of AHP BSC Structure

The Strategic Managing Template for Developing CPSM

Validity and Reliability

This section discusses validity and reliability in three stages of CPSM three-layered methodology. The first stage is to apply BSC and KIT in two related perspectives on strategic activities that are significant to most industrial value chain structure and to all levels of generically hierarchical structure (Huang, 2009; Coviello, 2005; Tsai, Siengthai, Wuwongse and Krairit, 2011; Bertrand and Fransoo, 2002): (a) constructing decision factors of value chain function deployment from a review of relevant methodological literature and experts-consensus cognition, and then followed by transformation design of BSC-KIT with real-world data; (b) the transferability and feasibility between knowledge-base and reconfiguration mapping tool is tested by applying an in-depth interview to AHP-BSC structure (Table 1).

The validity of the second-stage, research design, consists of the causality of collapse and reconfiguration of three building blocks in graphic value chain. The first building block, macro hierarchy criteria analysis, is conducted to identify the measurement of pair-wise comparison weighting and the consistency of reciprocal judgment matrix as the prototype to model a generic pattern of theory-building matrix. Meanwhile, the statistical results of AHP-BSC structure are used in constructing ST architecture which is a feedback-loop system and strategic mapping of relevant decision criteria (Tsai, Siengthai, Wuwongse and Krairit, 2011). The second building block, a decision-making base characterized by subjective computation, is conducted to model the ARIS House in ARIS-BSC platform. It explores the relationships among decision factors which are gathered from events and patterns of behaviors in ARIS-EPCs architecture. The third building block, micro hierarchy criteria analysis using hybrid ST-ARIS process simulation model, is conducted to predict the performance improvement.

The third-stage methodology is to improve the validity in designing the simulation model during CPSM development (Table 1). First, a pilot study was executed to build a systematization layout of process modeling from the theory-building recognition. Secondly, the in-depth interview and questionnaire approach is adopted as a form of mathematical triangulation that includes a group of experts, questionnaire interview and valid questionnaire response, and quantitative measures. CPSM validation is based on a specific cross-examination format, which is a result of simulation and can be replicated in the management-driven interface activity.

Reliability means the same results can be repeated in data-collection procedure and dependability can be expected under traceable situation. To lower interviewees' absent-minded answers in questionnaires, all interviews were carried out by the first author face-to-face to ensure the reliability.

The Conceptualization and Implementation of Process-driven Modeling in Clustered Module Structure CPSM

The overall structure of CPSM is a clustered module structure that is designed to create a real-accuracy simulation-based design, moving through a series of holistically simplified, consistent and accurate hierarchy modeling phases, and consists of three sub-modules: AHP-BSC structure, strategic mapping of Systems Thinking archetypes, and hybrid ST-ARIS simulation model. CPSM is implemented in this paper (Fig. 2 to 6). This strategic framework is virtually essential in system dynamics. Fig. 2 differs from an operational framework (Mansar, Reijers and Ounnar, 2009). It is designed to provide a conclusive strategic managing template to support managers to strengthen decision-making quality while treating with real situation and integrated feasibility (Fisher and Potash, 2008). Excel spreadsheet, being capable of mathematical computation, is substituted for the inaccessible commercial software, for the purpose. Detailed description of CPSM could be read elsewhere (O'Donnell, 2005).

A series of decision-driven events were evaluated and analyzed. According to model-based generation, the

simulation model could be classified into four views: organizational, data, controlling, and functional (Fig. 2). Events of different attributes were allotted in these views accordingly. Each view had its unique focus. The initial events of strategic activity in organizational view emphasized the effect of different perspectives on clustered module structure in decision-making quality. The data view focused on the flowing of decision-driven events. With Taiwanpublishing industry as an example, it would emphasize the interrelation of transaction manner among publishers, suppliers and customers. The controlling view focused on identifying the level of hierarchical structure of decision factors. The functional view represented the outcome and it focused on validating the core proposition of the implementing efficiency of clustered module structure. Events did not only trigger functions, but also showed the value of functions themselves. More importantly, CPSM stressed the viewpoints that were associated with the implementation of clustered process modeling and process-driven modeling. It extended the function of systems thinking and was capable of representing event-to-event and pattern-to-pattern of behaviors. In this way, variously complex procedures could be decomposed and became process-driven “independence”. In clustered module structure, the priority and causality of relevant decision criteria in process-driven modeling was described. An event might initiate multiple functions at the same time; similarly, a function might result in multiple events.

The process simulation model of clustered module structure was used as the keystone in validating CPSM. It had four parts. The 1st part was the strategic-activity diagram of Process Strategy. It was designed to identify the financial capability of triad-power relationship among resources integration, requesting horizontal cooperation and digital opportunity (Fig. 2). The results of the simulation were shown in Fig. 3. This clustered process modeling focused on the correlation between horizontal cooperation and triangle relationship.

The names of strategic-activity diagrams for part two to four were Process Design, Process Implementation, and Process Controlling, respectively. Similar to the 1st part, each of these three parts had its own special function. Process Design investigated the financial performance of strategic outsourcing between transaction manner and cash-to-cash (Fig.4). Process Implementation evaluated the performance improvement of transaction structure among the portfolio of transaction manner, discount policies and transaction platform (Fig.5). Process Controlling explored the improvement of the business managing operation in financial impetus (Fig.6). The four strategic activity diagrams were interdependently connected to make the decision-making support model with the greatest efficiency.

Case Study: Simulation Trials and Results

In this research, a group of four experts was chosen to identify the CSFs selection of industrial value chain. These experts' consensus was aligned with the event identification phase, and simultaneously, using their consensus to construct AHP-BSC, which is a necessary and important structure of the research. In composing decision elements and designing two questionnaires: AHP and AHP in-depth interview. The statistical results are presented in Fig.1. The ensuing paragraph summarizes the findings.

There are five entities of participants. The first entity is composed of 31 subjects, their average score served as the standard. The 2nd to the 4th entities are publishers A, B and C. The 5th entity is a group of experts. These four entities were targeted population and their performance was compared to the standard. Table 2 shows the comparison of participants' performance in current empirical practice and in CPSM. It reveals that in current empirical practice, process-driven capability of value chain, cost structure budget capability and throughput time controlling are all too weak, which were the reason why Taiwan publishing market collapsed. After simulating with CPSM, results revealed that all the above variables improved. For example, process cost

savings reduced 26.6% and throughput time controlling increased 23.8%. The entity of experts performed very well, just as expected. It proves that CPSM is a well-designed and feasible model.

TABLE 2: THE COMPARISON OF PARTICIPANTS' PERFORMANCE IN CURRENTLY EMPIRICAL PRACTICE AND CPSM

Strategic Decision-Making Success for Value Chain Reconfiguration

The conceptualization of KIT of BSC/AHP/ST/ARIS toolset variable is always changing in dynamic business environment. The changes are driven by the clustered process modeling in objectives of decisionmaking, and results of implementation. It is particularly significant at superior management-levels where decision-making strategies are mostly based on qualitative decision factors, drawn from judgment and computation. The strategic decision-making success of value chain reconfiguration has the finer details and accuracies of value chain components and elements of variation. The CPSM is enhanced by a four-clustered module structure to capture details and accuracies of value chain components and an optimized alternative is expected (Fig. 7). Causalities are listed:

a. value chain reconfiguring components represent the cash-to-cash issue to portfolio of benefit, transaction manner, and financial flow. High turnover rates are expected.

b. value chain reconfiguring elements represent recognition issue to publisher's view, distributor and channel. This would increase the demand-supply accuracy.

c. value chain reconfiguration aims to demonstrated the capability of the process in exchanging the value-validated model. If the goal is accomplished, CPSM would be manifested as a good design.

This implementation enables managers to utilize computational decision-making strategy and CPSM would

increase the managerial value in maximized outcome.

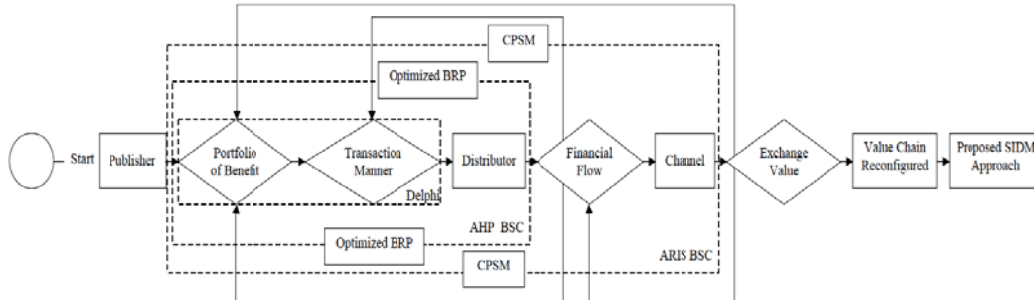

FIGURE 7: THE CPSM FOR DEFINING VALUE CHAIN RECONFIGURATION

Conclusion, Implications and Future Research

CPSM is a dynamics modeling system which applies a three-layered methodology and attempts to identify the events and patterns of behavior of value chain function. The modeling adopts the conceptualization of KIT of BSC/AHP/ST/ARIS toolset variable in examining the virtual necessity through a stepwise clustered module structure. CPSM provides the following insights. First, the case study has demonstrated CPSM is capable of strategic activities of value chain reconfiguration. Secondly, the clustered module structure provides recognition of decision requirement in strategic framework. Thirdly, CPSM allows decision makers to overcome the knowledge regarding the outcome between computational and judgmental application in process simulation models.

To make CPSM the trends of management science, we need to do more researches, for example: implementing CPSM as a stand-alone decision support system in various businesses. It is recommended that the method outlined in this paper be replicated to test its feasibility and effectiveness. Future research should focus on building more complicated decision-making hierarchy with a larger number of decision factors and the consistency analysis of smaller parts along with genetic algorithm (GA), which will enable the strategic planning of CPSM to generate better decision-making quality than the approximation method.

A Comparison of Two Operating Leisure Oriented Mega-Malls and The Xanadu Project: Looking Into the Crystal Ball

*Dr. Jack B. Samuels, jackleisurepro@yahoo.com
Montclair State University*

Abstract

This paper utilizes a case study and secondary data approach to investigating and analyzing success factors of two highly successful Mega-Malls and the possibilities for the future of the financially plagued Xanadu Mega-Mall Project in the New Jersey Meadowlands. The paper looks at propensity for tourists to visit facilities, infrastructure contributions, store mix and other factors that seem to contribute to the success of such facilities. The probabilities for the success of the Meadowlands project are discussed in the conclusion of the paper.

Introduction

In the early late 1970's this author began to write articles about such coined terms as "leisurized marketing" and "leisuremalls". The term "leisurized marketing" was used to define such ideas as selling merchandise in leisure or entertainment environments, corporate sponsorship of events, and leisure themes in advertising. The term "leisure malls" was used to describe a continuing trend toward more and more leisure and entertainment in the shopping mall setting with a continuing emphasis on increasing entertainment and recreational facilities within the mall mix. The ultimate goal was to see if a so called "Shopping Mall" could become predominately a mall that had more entertainment and recreational facility square footage than shopping. These facilities were not necessarily envisioned to be in the mode of theme parks alone, but facilities that offered a large number of recreation and entertainment facilities within an interconnected indoor environment. In 1981 the first such project which had a decidedly leisure bent was the West Edmonton Mall. In 1992 the Mall of America made its debut in Bloomington, Mn. located within an approximately ten minute light rail line from the Minneapolis-St. Paul "Twin Cities" airport. Both of these malls are now controlled by the Triple Five Group although U.S. shopping mall giant Melvin Simon owns an interest in Mall of America and participates in its on site management. These are the only two malls in North America that emulate the "Mega-Leisure Mall Model", but in other parts of the world there are facilities with similar compositions including the Xanadu in the Madrid, Spain area and Lotte World owned by the Lotte Store Chain in the Seoul, Korea area.

This paper examines the dynamics of the new Xanadu project in the East Rutherford, New Jersey (Meadowlands Sports Complex) which is approximately seventy-five percent or more (depending on who you talk to and how you measure completeness) completed as the writing of this paper commences. The project has had a sordid history and it hasn't even opened yet. It was originally supposed to open in 2007 at a cost of 1.3 Billion dollars and was originally developed by the Mills Corporation, a developer of other what would have to be referred to as "leisure oriented" outlet malls in various locations throughout the United States. It's properties included Sawgrass Mills in Florida, Potomac Mills in Virginia, Franklin Mills in Pa., and Ontario Mills in California to name a few. The Mills Company became embroiled in financial scandal and its assets were mostly sold off to the Simon Company, but even Simon apparently knew that Xanadu spelled a web of mystical trouble as they did not acquire the property as part of their deal and as a result it was acquired by another company called "Colony Capital".

Xanadu was in trouble right from the beginning and some think that Xanadu should have never been built. In early 2010 the controversy became very public again with the arrival of a new governor and the transition report from the Corzine to Christie administration stated that the original business plan for Xanadu "had failed" and needed some immediate redress. There was some talk that the project would have to be surrendered to the State of New Jersey which would probably mean that the State would get stuck finishing it and operating it which in itself would be difficult and controversial beyond belief. (1)

The evidence is clear that the Christie transition team is correct because if you read the original article about what was supposed to be at Xanadu and what is now supposedly under lease agreement to be there we can see that the business plan has indeed failed and the project as originally stated is not being delivered. In fact, it has become less and less leisure/entertainment and projected to be more and more shopping. One person who was originally involved with the project confidentially told me even before the project got into trouble that the project would eventually have much more shopping than originally projected. Originally the project was to include: The Snow Dome Snowsports Area, The House of Blues, Cheesecake Factory, UnderWater World aquarium, A PBS Kids Pavilion, Bergen Cliff Hawks minor-league baseball team and the Bergen River Dogs professional lacrosse team, ESPN Skate Park (extreme wheel sports), an indoor surfing wave, a grand movie palace, Wanadoo City (a unique children's interactive theme park) a small format live entertainment venue, a Wildlife Museum, luxury spa, cooking area and the Meadowlands Area YMCA. (2) As it stands at this writing only the Snow Dome, Cheesecake Factory, Movie Palace and Entertainment Venue remain, but to be fair other facilities including Funplex Family Recreation Center, Lucky Strike Bowling Center, Legoland, and The Pepsi Eye Ferris wheel are currently slated to join the mix. Leasing of all retail space was clearly at a standstill and many merchants including a large entertainment oriented sporting goods store chain called Cabella's are reported to have recently pulled out of the project.

The controversy and perhaps the failure of the project were predicted by the mixed opinions and reactions that happened when this project was approved. Two other competing finalists competed very strongly for the nod to go ahead with a project including the "Hartz Mountain plan for a convention center (valued at \$815 million originally) (that) even drew a campaign-style endorsement from the New Jersey Thoroughbred Horsemen's Association, which said its adjacent Meadowlands Raceway would be helped more by a wave of convention goers than by a flood of shoppers". The third finalist in addition to Xanadu (\$1.2 Billion originally and now approximately \$2 Billion) and the Hartz Mountain project was Westfield Corporation a large holder of shopping malls in the USA which proposed a "\$989 million complex of offices, hotels and an "urban village" built around a refurbished arena that would offer entertainment events". (2) This author wrote during the controversial period of consideration for the three projects and stated that although personally I find the Xanadu project thrilling I believed the one that should have been selected due to current market and regional needs was the Hartz Mountain Project. (3) This analysis was due to the fact that it is obvious that we have too much shopping in the region and that we have hardly no large convention spaces in the New York Area where the Javitts Center in Manhattan remains the only larger (and not one of the largest) convention centers in the NYC/NJ metro area and is too expensive for many potential conventions to come to the area. It is believed that the convention center would have been booked solid, open by now, and would have had far less impact on traffic than the Xanadu project will have. This being said Xanadu is sitting there and the general framework of it must now be dealt with, which is why this analysis may prove important. It is believed that with all the right moves and new investment money this project can still be the economic development jewel that it is intended to be and this article is intended to aid in that quest.(4)

Methodology

This paper synthesizes a variety of secondary data and observations by the author in a case study analysis of the potential market and marketing environment for the Xanadu Project. A wide variety of common factors for comparison were developed by the author from the available data, review of various news and scholarly articles regarding these projects, and personal first hand observations by the author due to his life proximity to the project. The author has also visited the Mall of America about six times over the years and the Edmonton Mall once. Data provided by the Xanadu Projects feasibility studies was important to this analysis. In the analysis the first step was to identify factors that can impact the success of such projects. The next step was to score the factors given observations and data regarding each factor. Factors regarding Xanadu seem to be fluid as no one knows as this is written exactly what will end up in the project. This writing is based on the current information available. A ten point scoring system was used for each factor. A composite total score is then generated for each operating project or in the case of Xanadu project still under construction. Conclusions and recommendations for further study are made.

Factors to Be Analyzed Impacting Success or Chances for Success

- 1) A list of 15 factors was developed by the author based on the existing literature and factual observations regarding this project. The factors analyzed are listed (factor name used elsewhere in this analysis is in parenthesis) and described below:
- 2) Proximity and Ease of Use of Public Transport - How accessible and easy to use is the public transportation system in reference to each of these projects. Necessity to use public transit is also considered. (Transit Proximity)
- 3) Cost of Public Transport-Actual costs of public transit (Transit Costs)
- 4) Tourist Environment (Competition)-An analysis of the competitive factors for competing for tourists are made. (Tourist Competition)
- 5) Local Leisure Environment (Competition)-An analysis of the competitive factors for competing for the local leisure/entertainment dollar is made (Leisure/Entertainment Competition)
- 6) Shopping Environment (Competition)-An analysis of the competitive factors for competing local shopping sites is made. (Shopping Competition)
- 7) Ease and Cost of Parking-An analysis of the cost and ease of parking and general accessibility to patrons arriving by automobile. (Parking Costs/Ease)
- 8) Merchandise Store Mix-Variety-Uniqueness. (Merchandise Store Mix)
- 9) Leisure/Entertainment Mix-Mix of the leisure/entertainment facilities offered or proposed is analyzed. (Leisure Entertainment Mix)
- 10) Appropriateness to Regional Goals and Objectives-The appropriateness of the project toward regional development goals and objectives is rated. (Regional Appropriateness)
- 11) Potential Visitor Population Base for Overnight Tourists (Tourist Population)
- 12) Potential Visitor Population Base for Residents (Resident Population)
- 13) Potential Visitor Population Base for Excursionists or Day Trips (Excursionists Population)
- 14) Blue and other Laws (Restrictions on Operations)
- 15) Attractiveness to Investors (Investor Availability)
- 16) Economy at time of inception (State of Economy)

Presentation and Discussion of Secondary Data and Information Utilized or Referred to In This Analysis

There is a variety of information that is useful in this analysis that is presented and discussed below.

Shopping Mall Statistics for North Jersey Region (Table A) (5)

PROJECTS	SIZE (SQ. FEET)	SALES (PER SQ')	% OCCUPIED
Garden State Mall	2,131,059	\$732	99%
Paramus Park	771,255	\$468	96%
Bergen Town Ctr	1,243,000	\$475	100%
Shops at Riverside	745,329	\$425	91%
Jersey Gardens	1,303,916	\$560	97%
Willowbrook Mall	1,516,940	\$545	96%
Mall at Short Hills	1,342,000	\$785	94%
Palisades Center	2,154,545	\$565	97%
Newport Center	1,149,147	\$535	97%

Additional Characterizations/Statistics of Meadowlands Xanadu (6)

- 1) Estimated average attendance 42.7 million annually for Xanadu, half of which are projected to be tourists. (New York City has an estimated total 47 Million visitors per year) (7) 3.8 Million people visit the Empire State Building (8) each year considered to be New York City's #1 tourist attraction and about 4.8 million visit the Metropolitan Museum of Art (9).
- 2) Traffic could be greatly complicated as there will be no major increase in access roads and the predicted attendance is astounding.
- 3) Rail site to property, but it is much more expensive than the Mall of America's rail system and takes around one hour at a cost of about \$25 round trip to get there from Newark Airport and will take about 45 minutes to one hour total travel time.
- 4) Thirty-fourty percent of the visitors are estimated to be tourists, however, given the competition for tourist time in the New York City/New Jersey area it is unlikely that these estimates will occur.
- 5) Mix of space is appears slightly stronger in the recreation/entertainment area than Mall of America, may be equivalent to or slightly less attractive than West Edmonton Mall. Attractions on opening at present include the Snow Dome Snowsports Area, Pepsi Giant Ferris Wheel (Great Views of NYC skyline), Legoland, Lucky Strike Lanes Super Bowling Center, 24 Screen Imax/3D Movie Superplex, Funplex Family Entertainment Center featuring Magiquest (a fantasy role playing game), 3000 Seat Live Entertainment Venue, Live Cooking Stage and Demos, Super Large Big Screen Television with Sports Seating Atmosphere.
- 6) Retailing tenants are currently indefinite, with a lot of space to be leased. The second phase which includes the complex's only large Department Store will not open on opening along with over 100 other potential retail store spaces. Retailing will not come close to Mall of America or West Edmonton on projected opening.
- 7) It is assumed complex will eventually have corporate sponsors but none are known at present.
- 8) Cost of project when fully completed could approach over \$2.5 billion or more.

- 9) Potential population surrounding site is not even comparable to the Mall of America and Edmonton situation. The amount of population to draw from depending on how you measure it is about 15 times larger. The 100 mile radius market for Xanadu exceeds 25 million.
- 10) Shopping competition in the area is intense with such venues as Jersey Gardens Outlet Mall (closer to Newark Airport and much cheaper to get to) and Woodbury Commons (America's most successful outlet mall and a huge tourist draw) and even Palisades Center (which also has an entertainment/mega-mall slant) all competing. This coupled with all the tourist attractions and other competition in the New York/New Jersey market makes the competitive situation severe in comparison to West Edmonton Mall or Mall of America. (See Table A above for complete run down of shopping venues)
- 11) Parking situation is greatly complicated by sports and entertainment events held at other venues at the Meadowlands Complex. It is difficult to park cars at the Mall for free due to the need to control attendees at other events from parking for free at Xanadu. Xanadu will charge for parking for all patrons. It is currently projected at about \$3 for the first three hours with increasing fees after that period of time.
- 12) Xanadu will possibly be forced to close on Sundays due to Blue Laws that do not allow retailing in the county that houses this complex. Governor Christie has said that he will eliminate the Blue Laws in a statement issued in March 2010, however, this will mean all area shopping malls will also be open on Sunday.
- 13) Small number of full service restaurants currently leased.
- 14) Bigger than both Mall of America and West Edmonton Mall when completed at 4.5 million square feet will be the third largest mall in the world and largest in North America.
- 15) Feasibility studies for this project contain demographic projections only and do not consider psychographic tendencies for either tourists or local users to utilize such a facility.

Characterizations/Statistics of the Mall of America (10) (11)

- 1) Approximately 40 million visitors annually.
- 2) 4.2 Million square feet of space built at a cost of \$650 Million.
- 3) 16 Major Corporate Sponsors Signed for Opening which provided an immediate revenue flow
- 4) \$87 per visitor spent per visit.
- 5) 4 Major Department Stores on opening
- 6) Large indoor amusement park in central atrium on opening
- 7) Although the mall contains many restaurants (full and quick service) and recreation/entertainment including an aquarium, the indoor theme park, Lego Imagination Center, A.C.E.S. Flight Simulation, Nascar Silicon Motor Speedway, Dinosaur Walk Museum, Movie Theaters, it's space mix is decidedly more slanted toward shopping with entertainment amenities rather than somewhat of a balance between the two.
- 8) Only two miles to the airport with a direct light rail train line for about \$2.00 each way. Travel time: ten-fifteen minutes.
- 9) Forty percent of the visitors are tourists (Mall is the only really major tourist attraction in the area and also can draw a lot of Canadian drive in tourists due to location.)
- 10) Parking is free of charge
- 11) Mall is open seven days a week
- 12) Access with public transportation and local area roads is excellent. Light rail, bus and limited regular local traffic in immediate area of mall.
- 13) Developed at a recessionary time
- 14) The original funding was provided by \$150 million in public bonds, which paid for the parking, land and infrastructure. Fifty-Five percent of the investment was taken on by the highly conservative Teachers Insurance Annuity Association (TIAA) with the rest coming from two solid Japanese Banks all at the time of going into a recession.

15) Characteristics/Statistics for the Edmonton Mall

- 1) Free parking for all customers with over sixty entrances and exits.
- 2) There is excellent traffic flow in area of the Mall (12)
- 3) The Mall includes over 800 retail stores, six amusement attractions including a large indoor amusement park, movie theaters, super bowling and billiards centers, and large indoor water park and a 335-room hotel, the Fantasyland Hotel, which includes eleven types of themed rooms, from the Igloo Room to the Bridal Suite. In addition to over 100 restaurants, the mall includes themed streets such as Europa Boulevard and Bourbon Street. West Edmonton Mall is anchored by eight department stores. (13)
- 4) Total annual visitors is 28.4 million. (14)
- 5) It is the number one tourist attraction in the area and in many ways the heart of all recreation and entertainment in the region. (14)
- 6) There are only just under one million people living in the Edmonton Metroplex. (14)
- 7) Amount and quality of public transportation to the facility is outstanding (14)
- 8) Local transit fares from almost anywhere in the region are \$2.75 or less including the airport. (14)
- 9) The Mall was developed at a time when the economy was stable and it appeared to be an attractive investment. Noteworthy inflation has taken place since the time of its development.
- 10) The lower drinking age for alcoholic beverages of 18 makes the mall a "place to party"
- 11) The mall cost \$1.2 Billion Canadian to build. This amounted to less than \$1 Billion American and was until 1994 the biggest indoor shopping mall in the world and now ranks #5 with 3.8 million square feet.(15)

Scoring of the Fifteen Factors and Discussion

Key: X=XANADU M=MALL OF AMERICA W=WEST EDMONTON

1. Transit Proximity

X=4-Although public transit is available the ease of use especially from the airport does not compare to that for the Edmonton Mall or Mall of America.

M=10-Best of the three with a light rail line going right into the mall and terminating there.

W=9-Just under the Mall of America

Further Discussion: The transit situation does not come close for Xanadu in comparison to what the other two facilities enjoy. The time it takes to get from the airport to Xanadu may greatly limit brief stopover trips to Xanadu. The short time it takes to get to Mall of America from the MSP airport one of the largest in the USA and a major hub encourages short stopover visits to Mall of America. Many Asian visitors who are primary customers for Mall of America pass through the MSP airport.

2. Cost of Public Transportation

X=2-Cost of regional public transportation is expensive and simply not as plentiful as it is for the other two malls.

M&W=10-It costs less than \$2.50 to get to both malls and in many cases less than that.

Further Discussion: Public transit is expensive to anywhere from Newark Airport to Xanadu. The \$25 round trip cost will deter short trips to Xanadu from the airport. It will also be the same impediment it is to using public transportation for everything in Northern New Jersey.

3. Tourist Competition

X=6-There is so much competition even in shopping that it will be difficult for Xanadu to garner tourists time. It may be noted that the first Xanadu in Spain from which the idea for Xanadu New Jersey was born does not see very

many tourist visits. On our visit there we found that few if any tourists were present and shop owners there were very surprised that we were taking our time given all the attractions in Madrid to go visit Xanadu. With all of the other iconic attractions in the NYC area it does not appear likely that Xanadu will appear on many tourists must see lists, however, being the third largest mall in the world does put it on some people's list of sights to see.

M=10-Mall of America is really the only major tourist attractions in the region. It draws a lot of tourists and is the number one tourist attraction.

W=10-There is not much else to do in Edmonton, the West Edmonton Mall is a must see tourist attraction and is the second biggest shopping center in the world. As such, it is a must see for tourists

4. Leisure/Entertainment Competition

X=9-It is believed Xanadu will fair much better in this area especially with locals looking for entertainment and leisure. It will have a few unique recreation/entertainment facilities and it will have a synergistic relationship with the rest of the Meadowlands Complex which includes a large entertainment arena, race track and the new Meadowlands Stadium home to the New York Giants and Jets professional football teams.

M and W=9-It is believed that these facilities are about the same overall in terms of leisure/entertainment attractiveness.

5. Shopping Competition

X=3-Another area where Xanadu can have trouble. There are so many successful shopping malls in Northern New Jersey and in near by Rockland and Orange County New York, that it is hard to see that this will be a preferred shopping location. Also, one can't ignore the impact of the fact that there is very unique shopping opportunities in New York City. (See store mix comments as well.)

M and W=10-There is really no competition shopping wise for both of these giants. The number and variety of stores at these two facilities are staggering. Although other area malls compete these are the giants.

6. Parking Costs/Ease

X=3-Another troublesome area for Xanadu as this mall is not as conveniently located for many of the more affluent shoppers in the area to go to and the traffic in the area may also be a deterrent. Also, the parking charges for such a facility are problematic and will discourage locals from coming to the facility.

M & W=10-Amazingly noteworthy amounts of free parking at both facilities with easy access.

7. Merchandise Store Mix

X=5-Currently the store mix is indefinite at Xanadu. Xanadu is scheduled to only have one anchor department store (which is supposed to open in phase two and not phase one) compared to Mall of America's four and Edmonton's six. Hopefully there will be better stores coming to the mall. Certainly the design of the facility is a very positive one for retailers. In the final analysis though this Mall may not have a store mix given current plans and restrictions placed on it to draw people to it for shopping alone.

M&W=10-Both malls have amazing amounts of stores and variety that make them the number one places to shop in their regions.

8. Leisure/Entertainment Mix

X=8-This is an area where Xanadu does somewhat better at this look. This is perhaps why in part the retail merchandise store mix seems inadequate. It has some pretty good entertainment and leisure facilities in it and the design itself in the interior is something that people should find enticing. It will undoubtedly have the most exciting shopping mall interior of the three projects. In terms of entertainment and leisure facilities the unique snow dome should be a draw as it does well in Xanadu in Spain (even though it really doesn't make any money it draws a lot of people into the mall). The Pepsi Eye well should be pleasing to tourists as well as corporations and locals that want to use the individual gondola cars for dinners and social gatherings. The question is how long will people walk

around the mall when they are going to the entertainment facilities that are either in Xanadu or in the aforementioned adjacent Meadowlands facilities. Will a charge for parking cause them to go to events and activities in Xanadu and then head to their cars rather than shop?

M & W=9-The leisure/entertainment facilities are somewhat unsurpassed here and balanced and blended into the shopping/retail environment pretty well but they may not appeal to everyone and every age group, so we took off one point.

Additional Comment on Facility Mixes: It is interesting to note that there have been frequent changes in the mix of retail merchandise stores and entertainment in the existing projects. These changes reflect changing merchandising trends as well as leisure and entertainment trends. Planners for Xanadu should not that during the time it was developed trends have changed dramatically and this is why all plans for Xanadu need to be critically evaluated as it moves forward.

9. Regional Appropriateness

X=6-Probably not the best project to have been selected due to the traffic congestion that already exists along Route 3 and Route 120 (Paterson Plank Rd.) which are main routes into New York City for the daily commuter.

Additionally, it does appear that given all the shopping that already exists and the need for convention space one does have to wonder why this project was selected over the convention center project. People may eventually enjoy some of the new leisure/entertainment opportunities that this will provide and uniqueness of the facility.

M & W=9-Big projects like this bring major changes in areas and lifestyles. Overall, it does appear that both of these projects have had positive impact on their surrounding communities and regional economy.

10. Tourist Population

X=6-Although there are many tourists coming to the area it is doubtful that many of them will make this a priority and as such it is unlikely that this will have the tourist draw that some have predicted that it will. The Woodbury Commons Outlet Mall may draw more tourists than Xanadu even after it opens because of the formidable bargains there. Xanadu was not allowed to have outlet stores which would have helped it a great deal with tourists, especially since it does not have the retail shopping mix of the other two Malls in this analysis. Also, the outlet/off price formula is a proven thing in tourist areas. The problem in doing this is that the nearby Jersey Gardens which is another large outlet mall might have been put out of business if Xanadu had outlet stores which perhaps emphasizes why another shopping mall may not have been a good idea. The sheer numbers of tourists in the entire region may help if the Mall management does an excellent job of attracting tours and group business.

M=10-Draws a lot of tourists as the only major attraction in the area and its proximity to Canada. Also, the cold weather environment helps to enhance its attractiveness to tourist during the longer winter periods in this part of the USA. The easy ride from the airport makes it very attractive for short visits from tourists who are even passing through the area.

W=6-Significantly less tourists than Mall of America, but when tourists do come to Edmonton it is a must see and the most major attraction.

11. Resident Population

X=7-On the entertainment side the facility could be a huge draw to residents in the area. The question is whether the lack of free parking, traffic in the area and possibly not the greatest retail mix along with strong competition from other malls will deter locals from coming there.

M=9-Mall of America is a wow for locals looking to cool off in the summer or have a fun day in the artificial outdoors in the winter. It clearly has a great local recreation/entertainment scene, is a place to be seen, and has the most stores of any place in the area. It is easily reachable at cheap costs by locals with public transportation from virtually everywhere in the 25 mile radius.

W=10-Similar conditions exist for this mall like Mall of America, however, the lack of tourists is more than made up by the fact that the Edmonton Mall is the place to be for shopping, leisure and entertainment in this area. There

are less competing factors in Edmonton than Bloomington. The winters are even colder and longer here so the Mall is an Oasis during the long winter days.

12. Excursionist Population

X=8-Hopefully regional daytrips will become popular here and perhaps it may even prove more attractive to those traveling a distance to get here for the day than people who live right on top of it and know the local entertainment/leisure scene better than people who live an hour or more away in more rural areas.

M=8-There is a great propensity to travel a distance to this mall for a day trip, however, it does not have the population around it that Xanadu enjoys.

W=7-About the same propensity to travel here as Mall of America but there is simply far fewer people here than in Bloomington.

13. Restrictions on Operations

X=1-Here is a major problem facing Xanadu. It needs to be open on Sundays. Governor Christie has already said he will remove the Blue Laws that prohibit the Sunday opening. There will be strong countywide and other opposition to this idea. It is necessary to allow Sunday openings for the success of this project. The leisure and entertainment aspects would be allowed to operate on Sunday even under the Blue Law, but the lack of allowing the retail shopping in the facility to operate on Sunday would ruin the synergy in the facility and very much hurt its success. The lower drinking age in Edmonton is also a noteworthy competitive factor that few have mentioned.

M & W=10-No restrictions on operating hours as well as a lower drinking age in Edmonton.

14. Investor Availability

X=4-Currently there is only one suitor, Steven M. Ross, who is known to specialize in bailouts. It is likely that Mr. Ross will want to make major changes to the facility to make it successful which may be an impediment to him making the investment. The shadowed past of the facility to date has become a problem in attracting additional funding. The original suitor the Mills Company was involved in a financial scandal that forced them into liquidating their holdings. It is believed if Mr. Ross or someone else is given freedom to develop and operate the facility as they see fit their will be funding to complete and open the center. That freedom is needed for the long term success of the project.

M=10-Mall of America had a much lower investment cost and received \$150,000,000 million in government funding. The chances for success were so obvious in the investment community that the project drew an investment from the Teachers Insurance Annuity Association one of the best managed and most conservative groups in the world. They took a 55% stake in the initial project. All of this was as the country was going into a recession.

W=10-Projects like this built in Canada especially at this time seem to have had no problem with funding. We couldn't even find any discussion about the funding for this Mall.

15. State of the Economy

X=3-B-Yes, the economy went into a recession, but that did not stop the Mall of America, so perhaps investors are just not as positive about this venture.

M=10-The economy was not great for the development of this facility either, but nothing seemed to deter investors.

W=10-The economic status did not affect the development of this facility.

Composite Scores for the Analysis

The total scores for the analysis were as follows:

Xanadu: 75 out of 150 total

Mall of American: 144 out of 150 total

West Edmonton Mall: 139 out of 150 total

The scores for the Mall of America and West Edmonton Mall are very similar. Obviously, from this analysis there is a great difference in the situation which now exists for Xanadu from these two facilities.

Conclusions

While the Mall of America and West Edmonton Mall are open and successful they do not have many of the development and operational problems that are facing the Xanadu project. The problems facing the Xanadu Project based on this analysis include:

1. Economic and Investment Problems-Yes, the economic situation has hurt the development of Xanadu, but it appears to have hurt the investment market rather than the potential for customers. Although retailing is off it continues to rebound at this writing. With so many financial problems Xanadu may have to go bankrupt and have more cash drained out of it before it can succeed. (The best scenario would not be for the State of New Jersey to take it over as it is hard to conceive of the State running such an enterprise.) Only time will tell. Further, entertainment and leisure especially in terms of local spending seems to flourish in a recession. The U.S. Government actually predicts a 15% (4% above average) growth rate in the employment market for leisure and entertainment oriented employment in the next ten years. It now predicts downturns in employment in many other sectors that it did not predict such downturns in before the current recession occurred. (16) Investors may just be afraid of many of the other observations that are made herein. Many of the factors discussed herein are interesting unknowns or uncertainties that need to be answered, but it is believed all can be addressed and Xanadu can be moved forward to success.
2. Environmental Problems-Xanadu is being built in a highly trafficked area on the daily commute route to New York City. Perhaps not the best example of urban planning. The cost and lack of an extensive and convenient public transportation systems and the need to charge for parking are problematic in the overall environmental framework.
3. Retail Store Mix-The retail store mix is deeply hampered by the restrictions placed on the developers. It is difficult to operate a complex of this scope without freedom to lease as one sees fit.
4. Entertainment Mix-Unfortunately, Xanadu has lost some of its plum entertainment tenants due to the overall situation. The facility must open with a reasonable retail and entertainment base or it may lack the synergy needed to attract local visitors and tourists.
5. Overall Concept-The overall concept here may not fit the overall environment. There is a staggering amount more entertainment, recreation and shopping opportunities in the area of this project than there is in the area of either the Mall of America or West Edmonton Mall.

Recommendations and Recommendations for Future Study

1. Project Mix-The project mix needs to be immediately reexamined and reformulated. Complete freedom should be given to the developers to develop and lease as they see fit. Perhaps an outlet store section with a particular theme(let's say upscale outlets only or those not in Jersey Gardens at present) or more showcase type stores or

merchandising that incorporates entertainment elements like Cabella's does needs to be attracted to the project. Turning the second phase into a convention center should be seriously considered as there appears to be a strong need for convention and meeting space in the region and the synergistic qualities of a convention center with the rest of the project would be excellent. This would also enable the retailing and entertainment facility space to be more valuable and would attract more restaurants to the project and possibly could seed hotels and other economic growth in the area far better than the Xanadu without such facilities would bring.

2. More Research-More research is required to capture the propensity of potential users to come to the facility. Original feasibility studies based on demographic projections and comparisons to the Mall of America and Edmonton Mall are not appropriate to this situation as the market environment as demonstrated by this paper is completely different at these two projects than for Xanadu. There also needs to be research to investigate the calling for a convention center as mentioned above. There is also the possibility of doing further research within the format of this study.
3. Blue Laws-Xanadu must be allowed to be open on Sundays with all facilities and services operating. It is time for Bergen County to give up its Blue Laws. Those that don't want to work on Sunday should simply be given the right not to work on Sunday. New Jersey and Bergen County can not afford to continue to endure the economic losses that occur from the Sunday Blue Laws especially in light of this attraction that could conceivably draw a lot of tourists if it was open on weekends.
4. Parking-Parking needs to be made free. On event days at the New Meadowlands Stadium or Izod Arenas that are adjacent to Xanadu the parking garages should charge for parking for anyone that stays in the Xanadu garages over three hours or some similar scheme that would discourage event attendees from parking in the garages for free. Any parking charge would be a strong deterrent for local visitors who are so used to free parking at all local shopping malls and entertainment facilities.
5. Special Public Transit Ticket-There needs to be a special \$10 or less New Jersey Transit Ticket for people going from Newark Airport to Xanadu for trips of less than five hours total time. This would greatly encourage stopover visitors to hop on the train to visit Xanadu. A free baggage check should be included at Newark Airport for those wanting to engage in this activity or go to the nearby Jersey Gardens Mall. Perhaps the special ticket could also include the bus service to Jersey Gardens to be fair to the competition.
6. Greater Public Awareness-The public needs to be convinced that traffic will flow well around the project and that it will indeed be a great benefit to have this facility in the area.
7. Greater Tourism Promotion-The Meadowlands Chamber of Commerce has already established a Visitor's and Convention Center in part to help promote Xanadu. A strong tourism promotion effort needs to be conducted on behalf of the Meadowlands Region which includes the Xanadu project.
8. Save Xanadu-In the final analysis a \$1.5 billion dollar building is sitting on Route 3 in New Jersey. This project must be saved and must be put on firm footing to succeed. The low scores shown for this project in many of the categories utilized are well stated for comparison purposes using a case study approach. They indicate the current weaknesses of this project. The bright spot is clearly the huge number of possible customers in the area. Xanadu must capture these customers by being all it is capable of being. Xanadu will exist in one form or another. Let's hope the form that emerges will indeed be successful. The investors and the people of New Jersey need to succeed.

Changes in University Governance. An analysis of Italian Universities

Maria Ciasullo, mciasullo@unisa.it

Giulia Monetta, gmonetta@unisa.it

University of Salerno, Italy

Abstract

During recent years radical changes have affected universities in most Western European countries, implying new pressures and demands on the higher education system and deeply influencing the context in which universities operate. The paper attempts to investigate governance issues and the need for new strategic paths emerging as a result of new scenarios. Specifically, the increasing number of stakeholders involved in academic activities requires universities to take into account a variety of social, economic and cultural factors when making strategic decisions. Adjustments in board composition through appointing non-academic members are signals of such trends. Moving from this consideration and relying on data on the governance structures of Italian universities, the paper discusses challenges for academic institutions in terms of change in their strategic management and governance structures as well as the likely directions such change is taking.

Introduction

Since the Bologna Declaration, the competitiveness of national university systems has been top of the academic agenda in Europe. Each Country is pushing in the direction of optimizing performance to avoid marginalisation. In competitive terms, performance is seen as the capacity to attract the most talented young people to their universities not to mention funding for European research Programmes. Consequently, the benchmark will be the efficiency of National university systems as a whole and adequate governance tools.

The European university system in many respects is experiencing what could be called a governance crisis given its shift from closed corporation status to that of exposed Institution encumbered with strategic planning and management remits, basically unknown compared with the past. Accountability, responsibility, efficiency and transparent decision making are the key words underpinning this epochal change combined with the democratic representation of all the members, each in reference to the specific role held in the system. In Italy too, autonomy introduced with the Law no.168/89 has reviewed and modified the relationship between the Ministry and individual Universities. At present, the role of the Ministry involves planning, devising directives and evaluating mechanisms within the university system, taking into account the results obtained in order to allot resources (defining parameters for measuring performance). In the pursuit of high quality training, research and development, the Italian Government is also promoting forms of competition and differentiation between Universities, experimenting innovative models of research and teaching, new curricula etc. At the same time, it is introducing mechanisms to stimulate interest in the internationalisation process of training and research and encouraging teacher and student mobility.

However, autonomy in a university context is not envisaged in individual terms but rather in an institutional sense, at the service of the people and the stakeholders operating in the territory. The Conference of the European Ministries for Higher Education in Berlin in September 2003 emphasized how Higher Education “is a public good and a public responsibility”. In Italy, for many years now, the concept of ‘self-reference’ has been the subject of debate between academics and politicians in that the University is accused of ignoring the needs and demands of its users generally speaking and those of the world of labour and production in particular. The lack of an active role in university governance on the part of the stakeholders is denounced, in particular as concerns the students and their families as well as the business world, the professions and Institutions of territorial governance, underlining how universities rely on the public for their main source of funding. In our view, the way to interpret the principle of

autonomy of university education lies in defining criteria of governance that are valid for every university in order to avoid or banish self referential mechanisms. Unquestionably, representatives of the public in governance structures together with student delegates is a start whereby strategies of development and policy guidelines can be discussed in the light of established goals. In short, the principle of autonomy in the University has to combine with the monitoring and evaluating of such goals, assuming full responsibility towards stakeholders when implementing strategic decision making processes.

Research purpose and structure of the paper

The paper starts from the premise that the recent changes in the European Higher Education system have pushed universities to consider the expectations of their stakeholders (competition and market orientation perspectives). Nowadays, it is widely acknowledged that the university needs a new model of governance, in order to preserve the integrity of its mission as well as to make its strategic decision-making processes more effective, timely and sensitive to strategic stakeholder input. This paper investigates governance issues and the need for strategic change emerging as a result of the new context. By virtue of the large number of interest groups involved in a university's activity and the importance of strategic input coming from the external environment rather than from the organization's internal setting, a shift towards extensive adjustments in university governance structures and management has been noted.

First of all, the paper attempts to describe and explain the recent changes and new trends in the European higher education system, by means of a detailed analysis of relationships between central government, the marketplace and public universities. From an overview of the literature, the study proceeds with a brief description of the composition of governing bodies in Italian public universities, illustrating the modalities and procedures of how they work, their responsibility for determining university strategy and, finally, the relationship between governance and management.

The research question starts from the assumption that to best satisfy stakeholder needs they should be included in strategic decision making processes. Universities that are sensitive and receptive to external stimulus put in place decision making processes that are attentive to input arriving from their many stakeholders. In particular, our research attempts to appraise the following: 1. The number of stakeholders involved 2. The governing bodies in Italian Universities; 3. The number of universities that include stakeholders in their strategic decision making processes; 4. The category of stakeholder involved. In particular, on the basis of findings relative to research questions 3 and 4, a positioning map is devised for assessing stakeholder engagement in Italian universities. Finally, by means of collected data (using secondary sources) findings are presented and the implications for future research underlined.

Recent changes and new trends in the Italian higher education system

In Italy as well as in most European countries, since the beginning of the 90s, a radical process of reform in education systems has taken place, leading universities towards greater managerial autonomy and revolutionizing traditional teaching activities. At the European level, one political initiative is the Bologna process, which has paved the way for the organizing of comparable structures cross cutting national borders in European higher education (Thrift, 2008). At the same time, national political reforms have reduced the coercive impact of governments in higher education, with the effect of increasing autonomy in universities (Hedmo and Wedlin, 2008; Enders, 2004; Kogan and Hanney, 2000).

Changes in the regulatory framework have modified the role of the State in terms of public funding and in formulating the general guidelines of academic activities in a context of more autonomy. One fundamental principle of the Bologna Declaration is that research and teaching in universities must be morally and intellectual independent of all political authority and economic power. In the past, governments have protected their universities from competition on the part of other knowledge organizations. However, the university is not a protected label and trust in academic institutions greatly depends on consensus and government legitimacy (Engwall, 2008). In addition, a

number of signs indicate that universities are also subject to pressures from the marketplace. In fact, a greater pressure on efficiency and effectiveness and differentiation of teaching courses are key elements which characterize the university systems throughout Western Europe (Gellert, 1991; Teichler and Kehm, 1995). In its turn, change has brought about effects consisting in: greater market orientation, with a focus on the needs of students/users as well as other stakeholders, not to mention a managerial focus in approach relative to economic issues and responding to the need for efficiency and effectiveness.

Feasibly, the changing relationships between central government, marketplace and public universities create new pressures upon higher education institutions. Consequently, there is the need for a rethinking of university mission, goal and management practice as well as for change in both governance mechanisms and academic leadership (Henkel, 2002, 2005). Particularly, in Italy, greater convergence with education systems of other European countries is a deeply felt need along with that of overcoming certain national weaknesses. These goals have started a radical innovation process within the university system, summarized in the shift - from a context characterized by scarce attention paid to the economic sustainability of academic activities to greater focus on the relationship with the central government as a main university stakeholder - towards a context characterized by: decentralization of strategic decisions at individual university level; greater emphasis on the efficient deployment of resources and not least, the need on the part of universities to take into account a larger number of social, political and economic stakeholder groups. Consequently, strategic management in universities is becoming more complex and new governance issues are emerging as the patterns of stakeholder interaction are being redefined.

Competition and Market Orientation

The process of change described above has resulted not only in more independent decision making and strategic choice at university level but has also emphasized the shift towards a more competitive environment (Bleiklie, 2005). While in the traditionally static, non-competitive scenario, the State was the main stakeholder, most decisions were centralized and each academic institution implemented locally, choices made at central government level. In the new competitive environment, the role of demand in driving the university's development is much more relevant. The capacity to interpret and satisfy higher education needs in terms of matching the expectations of students and society and transferring knowledge and competencies actually required by the job market, are becoming key elements of the university mission (Chevaillier, 2002). The output of a university is multidimensional (Bear, 1974). In addition, measuring the same is complex and does not reflect wide agreement (Reder, 1974).

Academic activities affect a number of stakeholders. The impact on the students is immediate, however, the effects of academic activity are reflected in different ways on the world of production and work; on the territory where the university is situated. In order to increase the quality of the overall value propositions, researchers in the field of higher education are highlighting the potential benefits of applying marketing theories and concepts that have been effective in the business world (Hemsley-Brown and Oplatka, 2006; Binsardi and Ekwulugo, 2003; Parasuraman et al., 2004). Marketing instruments too, aimed at identifying and monitoring demand are becoming more common: regulations and standards, customer satisfaction tools, etc (Maassen, 1997; Caruthers et al., 1997; Baldwin, and James, 2000; Umashankar, 2001; Mazzei, 2002; Chevaillier, 2002; Pugsley and Coffey, 2002; Bok, 2003). The link between a university's activities and the general performance of the economic system is more evident today. In general, universities create value for public administrations and private enterprise and for employers interested in recruiting personnel who can fill their competence and knowledge gaps. Therefore, teaching activities should be planned in order to suit external pressures and specifically the expectations expressed by enterprise (Carneiro, 2004). Local government organizations that operate in the area where the university is located are important stakeholders seeing as the link between the effect of university's activities and local development is currently widely acknowledged (Etzkowitz, 2003). The presence of a university within a specific area is a driver of the economic and social development of that area. Finally, society as a whole is affected by university activities as the effects of knowledge production and dissemination are public goals the State should achieve.

More efficiency in the deployment of resources (Leifner, 2003) and the adoption of a more outcome-based management style, are further signals of the new pressures and demands on universities. Hence, along with the need

to better address the demands of society, universities are starting to focus on stakeholder expectations. As a result, greater responsibility is needed relative to the effects of new initiatives in terms of resource investments as well as greater risk awareness associated with strategic choices. In fact, emphasis on financial autonomy pushes universities to evaluate more carefully the financial effects within the broader multi-faceted implications of their activities. Such emphasis on economic issues is reinforced by the new mechanisms of resource allocation that have been recently introduced. Public funding is related to a number of parameters of efficiency and effectiveness concerning university activities (McNay, 1995; Lenington, 1996; Clark, 1998; Kogan and Hanney, 2000; Fici, 2001; Huisman and Currie, 2004; Paletta, 2004). In other words, assessment systems combine the principle of autonomy with that of responsibility and supply an effective account of the coherence of the activities undertaken by each university with respect to institutional objectives (Shattock, 2003). In fact, accountability has become a key element in the modernization of higher education systems (Huisman and Currie, 2004). In short, the awareness on the part of universities towards the outside (Foskett, 1999) should not be contingent merely to the phase of evaluation or monitoring of stakeholder satisfaction (Frey, 2009) but on the contrary, be channelled into constructing constant dialogue procedures with the stakeholders even in the defining phase of strategic choice. In other words, stakeholders should be involved *ex ante* in university decision making processes, taking part in defining objectives, devising useful performance measurement indicators for assessment and suggesting corrective action where necessary, in the accountability phase.

Issues of university governance in a changing environment

Increased autonomy, to respond actively to a changing environment and increased competition, is regarded as a core theme by both European Union Commission and OECD experts. The changes in the university environment are resulting in significant momentum in terms of strategic decision making (Compagno, 2001). The fundamental question addressed now is to what extent changes in strategic management are going to affect university governance structures. At the same time, the accountability of universities to their numerous stakeholders has to be emphasized and reflected in the composition of their governing bodies (Raivio, 2008). The involvement of stakeholders it goes without saying, should not be limited merely to the final phase of accountability of academic activity in order to evaluate the same but on the contrary, to offer stakeholders the opportunity of taking part – contributing with ideas and proposals - in university decision making processes. In other words, universities should enlarge the composition of their governing bodies to include stakeholders in order to improve the quality of teaching and to put in place initiatives for disseminating research and development, not to mention the economic growth of the territory of reference. Governance has to do with organization as a whole and in the main, with the devising and monitoring of a strategic plan. The issue of university governance encompasses the composition of governing bodies, how they work, their responsibility for determining university strategy, the relationship between governance and management (Shattock, 2002). In other words, whereas governance is mainly related to the strategic policy of the organization, management relates to the implementation of that policy (Bennet, 2002).

Structures and functions of governing bodies in Italian universities

In order to better understand the issues of governance in Italian universities, it should be pointed out that the roles and tasks of each governing body move from the analysis of regulatory framework. A university's governing body is the ultimate locus of authority (Rochford, 2001) and strategic decision-making centre, where the responsibility for policy is placed. The overall structure of governance envisages the application of a checks and balance mechanism relative to the various entities constituting university governance. Ministerial regulations define the roles and power of each and attribute precise responsibility for decisions made; different functions are attributed to the various bodies, on the one hand those with planning power, defining strategies and verifying performance and on the other, entities charged with coordination functions of the activity necessary for pursuing scheduled plans. The governance structure of Italian universities is composed of: Vice Chancellor, Academic Senate, and Board of Governors.

The Vice Chancellor, the representational nominee of the University, is the official head of the organization, responsible for the definition of strategic guidelines and the achievement of the organization's goals

(Strassoldo, 2001). He has a leading role as president both of the Academic Senate and Board of Governors. As Managing Director of the organization, the Vice Chancellor focuses on the overall strategy of the university and specifically on the strategic aspects concerning research and teaching activities. The Vice Chancellor is furthermore, the guarantor of autonomy as well as the artifice of programmes and goals to achieve, defined in agreement /accordance with the Academic Senate underpinned by an adequate policy for the distribution of resources devised in collaboration with the Board of Governors

The Academic Senate is responsible for planning and coordinating research and teaching activities. On the basis of proposals from the Departments and Faculties, taking into account the input from an internal control Committee (the presence of which is mandatory in any university), the Senate devises a plan for university development and identifies objectives. The Committee is usually composed of the Vice Chancellor (the president) (in whose absence a vice president); Dean of Faculties; all or a quota of representatives of the Research Departments and administrative personnel.

The Board of Governors is responsible for the university management from an administrative and financial point of view and acts on the basis of criteria and guidelines defined by the Academic Senate. Generally, the Board of Governors is described as playing a strategic control function. It represents the most 'open' governance structure within a university as it may include a great number of stakeholder representatives. It is usually composed of the Vice Chancellor (president), (a substitute vice president); the managing Director a small group of representatives of administrative staff; several representatives of lecturers and researchers.

Governing bodies are mainly composed of elective members. Their number is definitely higher compared to that of any private sector firm's governing body. As result, strategic decision making is a complex and slow process. Moreover, in universities decision power is largely diffused within the organization, and risks of overlapping decision competencies are frequent (Fici, 2001). University regulations generally set up Committees and Commissions, which group a lower number of persons with specific competencies and tasks. The Committees have a consulting or support function. Their presence can be interpreted also as a response to the slow and bureaucratic way of working of the governing bodies.

In short, university governance is characterized by highly complex strategic decision making as well as by the involvement of a great number of actors. From a managerial point of view, in a turbulent environment, the traditional way of working of governing bodies is considered inadequate. For example, Senates do not convene frequently and 'too many cooks' contrast with the need for timely and effective decisions. Generally, the governance style is considered incapable of guaranteeing satisfaction of stakeholder expectations.

Empirical research

Changes in demands of higher education and generally speaking, changes in the environment in which the university operates, call for a change in governance structures. In fact, empirical research starts from the premise that the new competitive environment and a greater emphasis on market mechanisms deeply affect the strategies and organization of universities. Consequently, governance style and structures are important areas of change (Shattock, 2003). In other words, in a university context it needs to be appraised whether and to what extent, governing bodies are able to involve stakeholders in strategic decision making processes in order to match the broad range of expectations emerging not only within but also from outside the academic community. In particular, empirical research attempts to respond to the following queries: 3. The number of universities that envisage stakeholder participation in strategic decision making processes; 4. The category of stakeholders involved. From data collected, a positioning map of Italian universities can be plotted/defined in order to measure the level of stakeholder engagement.

Source of data

Analysis was based on the collection and analysis of secondary data (Marbach, 1996; Metallo and Barile, 2002).

Secondary data sources included: *External*, information was gathered from publications and documents available on the Italian Ministry of Education, Conference of Rectors, National Committee for the Evaluation of the University System and National Conference of Italian University Rectors. In particular, in order to define the field of

reference and selected sample, reference was made to the Cineca databank; *Internal*, random sample university websites were consulted. In particular, the documents consulted were: the Statute of Autonomy; Working Regulations; Strategic Plans for Development (relative to each university in the sample) and the Reports of Meetings of the governing bodies.

Data analyses was considered both from the point of view of construct validity as multiple data ensure a more accurate and thorough analysis of the phenomenon and the reliability and completeness of findings (Lazarsfeld, 1967; Chisnall, 1994).

Field of reference and sampling procedure

The field of reference consists of all Italian universities awarding valid legally recognized qualifications. At the date of the empirical survey - 31/12/2010 – universities as a whole, numbered 95.

In the CINECA databank classification, universities are: State controlled and privately run institutions/organisations. The Italian university is a mixed system i.e. both State controlled and privately run, the latter founded and funded by private means. At the same time, they are accredited by the Ministry to award legally recognized qualifications that are in conformity with laws in force.

Differing models of governance applied in privately-run as opposed to State controlled universities merely highlight principles of autonomy and pluralism from which the entire national university system can benefit. Given the different ownership and financing mechanisms, privately-run universities present significantly different governance structures. The boards of all the private universities include what we have previously defined as external members. Their presence on boards is intrinsically related to the funding mechanisms of the universities: firms and institutions which finance universities have representatives on the Board. As a result, in privately run universities the reason for appointing external members is different from that of State controlled universities. As the two groups are not uniform, we have focused on State controlled universities. The sample selected - Italian State controlled universities at the date of 31/12/2010 - consisted of 55 universities.

Processed data and preliminary findings

For each university we collected data on the composition of the Academic Senate and Board of Governors to check for the presence of external members. The cognitive goal of the field research was to investigate universities characterized by the presence of independent members on the Board i.e. external stakeholders or non-academic/administrative members. Categories of the latter included: students; enterprises and delegates of government; the categories reflect the three main functions that the university performs: education and teaching; research and knowledge diffusion; support for the local development of culture and society (Derrida, 2001; Slaughter and Leslie, 1997; Schofer and Meyer, 2005; Brint, 2005; Ramirez, 2006; Frank and Glaber, 2006; Mazza et al., 2008).

The presence of the 3 categories of external stakeholders compared to the total number envisaged in the board of the Academic Senate and in the Board of governors was measured as follows (FIG.1):

FIGURE 1: PROCESSED DATA

Number of external members in the Academic Senate	+	Number of external members on the Board of Governors	=
Total members in the Academic Senate		Total members in the Board of Governors	

The range 0 – 2 envisaged 0 when not even one member of the specific category of external members was present on both boards (Academic Senate and Board of Governors). At the other end of the scale the value 2 results in the unlikely event that all the members of the category of stakeholder considered, correspond to the total number of members of both governing bodies. The value obtained for each category of external member enabled the positioning of the selected universities on a three dimensional diagram (scatter plot) (Diamond and Jefferies, 2001; Molteni and Piccarretta, 2001) using Wolfram Research Mathematical software.

Findings

In this section we provide the results of empirical analysis on the governance structures of Italian universities.

On the basis of the assessment made during the phase of data collection, the universities have been positioned on a three-dimensional diagram indicating (FIG.2): on the x-axis, the ratio of Students involved on the board of both governing bodies; on the y-axis, the ratio of Businesses involved on the board of both governing bodies; on the z-axis, la ratio of Governments involved on the board of both governing bodies.

FIGURE 2: POSITIONING OF ITALIAN PUBLIC UNIVERSITIES

A preliminary consideration emerging from the findings is that academic members are the predominant members of the governing bodies. By comparing the absolute value (2) with measured values (0.6 Students; 0.5

Governments; 0.15 Businesses) a modest presence of external members is evinced, in particular, the low presence of the business world is indicative.

The diagram highlights that: universities (in white) envisaging the presence only of students as external members on the board, number 11; universities (light gray) envisaging the presence of both students and governing bodies as external members on the board, number 31; universities envisaging the presence of all three categories of external stakeholders, number 13. Consequently, it emerges clearly that universities recognize that non-academic stakeholders can play an important role in counterbalancing the policy of the university which typically, is too often focused on “internal affairs” and “political struggles” rather than on expectations on the part of local governments and firms. Furthermore, external stakeholders can prevent universities from making planning mistakes (specifically concerning teaching programs) by pushing the strategy process to take into account expectations from the job market.

Of the 55 public universities, the diagram plots the presence ratio of the three categories of external members on the governing boards. In addition, Table 1 lists the different categories of representatives appointed and the distribution of their presence on the board in the Academic Senate (A) and in the Board of Governors (B) (TABLE 1).

TABLE 1: NUMBER AND TYPE OF EXTERNAL STAKEHOLDERS ON ITALIAN PUBLIC UNIVERSITY BOARDS

Category of External Members	External Members	A) Number of universities	B) Number of universities
Students	Students	51 (93%)	55 (100%)
Businesses	President of the local Chamber of Commerce	2 (4%)	9 (16%)
	Director of the local office of the Ministry of Finance	-	4 (7%)
	Representatives of firms operating in the university area	2 (4%)	12 (22%)
	Representatives of the local firms associations and consortia	-	4 (7%)
	Representatives of banks	-	15 (27%)
Governments	Representatives of Italian Ministry of Education (national/central government)	-	33 (60%)
	Representatives of Municipalities (city government)	3 (5%)	12 (22%)
	Representatives of Provinces (of provincial government)	-	9 (16%)
	Representatives of Regions (regional government)	-	10 (18%)

The category of government mainly present on the Board of Governors is that of representatives of the central government, indicated by the Ministry of Education. Local government is significantly represented on university boards: 15 universities have appointed a representative of the Commune where the university is located (the President of the county and/or town where the university is located). Of these, 9 universities are characterized also by the presence of representatives of the provinces and 10 have appointed a representative of the region. The presence of private institutions such as firms or banks is less significant from a numerical point of view. The entrepreneurial forces are also represented by the President of Chamber of Commerce or by a representative of local associations of enterprises.

This is the overall picture related to appointing external stakeholders on governing board. Concerning the motivations and expected advantages, the following reasons are suggested (on a scale of importance from 1 to 5): to enhance synergies between the universities and the local context (local private and public stakeholders); to render the university development strategy as coherent as possible with needs and expectations coming from the area; to obtain an important contribution in terms of ideas and collaboration from non-academic stakeholders; to strengthen the function of external control over the effectiveness and efficiency of academic activities and finally, to make the university more aware of its responsibilities towards society. However, the presence of external members on their boards could be perceived by universities as a risky presence, described in terms of: constraining university autonomy which is a “value to preserve” and limiting the cultural, economic, and social role of a university to a too narrow perspective. The role of the university has to be considered as far beyond the local context, while non-

academic stakeholders, made up mainly of representatives of local institutions, could attempt to distort the university's proper mission.

Conclusions

University governing bodies have to fulfil an increasingly managerial role. The new environment demands a more 'outward-looking' perspective on the part of university governing bodies. An increasing presence of external members on boards reflects the shift from a governance model entirely focused in the satisfaction of internal pressures (coming from the academic community) towards a model that takes into account a greater variety (in both number and nature) of the stakeholders.

However, even if the presence of external members on a board can be interpreted as a signal of a greater focus on stakeholder management, appointing 'externals' could result merely in a superficial change in the governance style of a university. In fact, the Board of Governors is responsible for the final approval of strategic initiatives; the contribution of 'outsiders' to strategic activity would be merely formal if their decisional powers were not integrated with deeper involvement in the preliminary stages of the strategic decision making. In other words, a substantial change in the university governance style in the direction of greater attention addressed to stakeholder expectations, requires their involvement in the whole strategic process. Such consideration is strengthened by the observation that universities are decentralized organizations in which strategic initiatives are generally formulated and developed at faculty and department levels before they pass for approval to the governing bodies. Therefore, external stakeholders cannot play a full role in the final step of the strategy process if such role is not recognized in all the different phases. Clearly, the question of number is not pertinent. A new model of governance goes beyond membership.

FIGURE 3: UNIVERSITY' PATTERNS OF EVOLUTION ON THE BASIS OF STAKEHOLDER INVOLVEMENT

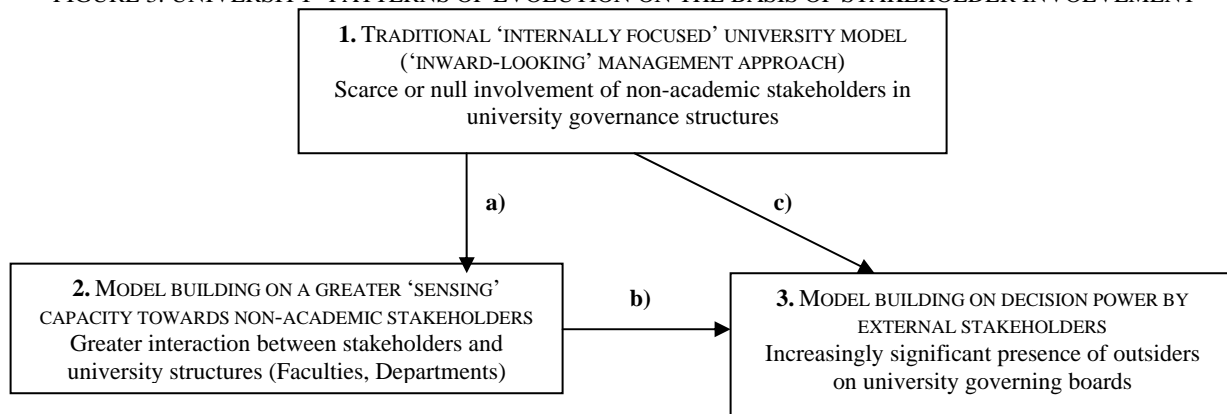

Figure 3 summarizes the possible directions of change in Italian university governance. Three basic stages are identified:

- the first reminds us of the 'old-fashion' traditional university, in which strategic management reflected the classic model of the self-referential organization not drawing any strategic input from outside the university's internal environment (box 1);
- what most Italian universities have started to do after the beginning of the reform process was to show an increasing awareness to the needs and expectations coming from outside the university. Hence, the importance of input for strategic management coming from outside the organization increased and continues to increase. Such awareness is developed at faculty and department level, where generally, pressures for new strategic initiatives emerge. As a result, a stronger link between non-academic stakeholders and the university's operating structure characterizes the model in box 2;

- a further change can be observed at governing bodies level. In fact, a greater emphasis on external demands and non-academic stakeholders find its more evident expression in a revision of the governance structure in the sense of appointing 'outsiders' on the board (box 3).

While in stage 2 the connection with non-academic stakeholders concerns the first phases of the strategic processes and largely relies on a number of informal contacts at the *operating structure* level, in stage 3, the role of non academic stakeholders is formally acknowledged at the *governing board* level. A stronger link between stakeholders and the university's operating structure results in the stimulus and involvement in the development of new initiatives on the part of the former, basically through a set of informal connecting modes (meetings with professors, participation in project planning sessions, providing suggestions – on demand from departments/schools - for critical professional figures). On the other hand, the link between stakeholders and governing bodies is the result of the contribution of external members on university boards. Generally speaking, appointing 'externals' appears to be a significant trend in the composition of university board of governors. 'Outsiders' are considered gatekeepers to the external environment.

Today most universities are in the process depicted by the arrow a). Some (13 Universities) are already in the process depicted by the arrow b). Some universities have already carried out governance changes from the start of the reform so as to signal a greater awareness towards external expectations. However, changes in governing bodies are not enough to guarantee a real change in strategic management and style of governance in the direction of more attention paid to expectations coming from external environment (Judge and Zeithaml, 1992; Ravasi and Zattoni, 2006). As discussed above, appointing outsiders while preserving an 'inward-looking' perspective at an operative- structural level may result in just formal change. Changes in the governing boards do not really affect the style of governance when they are not integrated with greater actual involvement in all the phases of the strategic process (Ayuso et al., 2006; Romenti, 2008). For this reason, the process depicted by arrow c) should be considered a risky change, with no substantial effect on the strategic management of universities. The point is not just to enlarge the board by appointing new members (Compagno 2001), but to develop mechanisms and routines through which entrepreneurial, cultural, social and economic stakeholders are really involved in the strategic processes, both at operative-structural level (when making proposals and contributing to the development of new initiatives) and at governing body level (in terms of decision making power).

Discussion and implications for further research

The changing environment in which the university is managed calls for a response to that change both in terms of management practices and governance structures. While changes in the regulating framework, external environment and (in part) management style, have been the key elements of changing university trends in recent years, the style of governance is scheduled as the "next step" in the process of change.

Concerning management practices, the change can be summarized in the shift from an 'inward-looking' approach to an 'outward-looking' approach. Hence, the main issue is to enhance the university's *sensing* capacity so as to take into account strategic input coming from the external environment. We argue that, in a competitive environment, the sensing dimension of the strategy process is critical. As a result, university operating structures (Faculties, Departments) need to develop of a set of formal and informal mechanisms through which a greater involvement of stakeholders in strategic initiatives can be achieved. In terms of governance structures, the need to match the differentiated expectations of a variety of stakeholders requires that university governing boards become more representative of their interests. Consequently, the presence of outsiders on board, who are representative of various stakeholder interests also having managerial and/or professional skills, is likely to be the main feature of university governing boards in the future. The Italian context already shows signals of such change. Whether and to which extent the presence of outsiders on university boards results in a merely "fashionable" change without any substantial implications for the strategic management or rather, responds to a substantial involvement of non-academic stakeholders in strategic policy-making remains an 'open question'.

Future research should provide empirical evidence relative to the relationship between the changing environment in universities and governance structures. It would be of interest to analyse such a relationship over

time. Moreover, new insights into the working of the modern universities would be provided if research could link university strategies and governance structures. In addition, the analysis of how external strategic issues are processed within universities also deserves attention. Such research could contribute to a better understanding of the strategy processes in universities. In particular, an in-depth field analysis could verify whether the 'more open' universities i.e. 13 universities that envisage in the Academic Senate and on the Board of Governors, the presence of a congruous number of external stakeholders results in improved performance. It should be underlined however, that the mission of universities is more difficult to evaluate and direct comparisons have not been attempted. It goes without saying that none of the three main university functions (research, education and innovation) is a clearly definable "product", and consequently, a transnational comparison of university performance is not feasible.

Abstract

This paper assesses the perceptions of user satisfaction of hospitality industry in the Guadalajara Metropolitan Zone (ZMG), in order to analyze the factors that influence in it. The preference for selecting the Guadalajara hotel industry is due to the conditions of tourism development has Jalisco, as one of the states with more quantity and variety of tourism and its capital Guadalajara, as the second city in economic importance in Mexico.

There will be a review of the literature on the main concepts of study object then design the survey to apply to the hotel guest in categories 4, 5 star and Luxury class, the questionnaire was applied in order to know the relationship between the quality of service, rates, advertising, and food and beverage services, with the level of customer perception and satisfaction in the hospitality industry, to finally present a proposal of customer satisfaction model.

Introduction

This study focuses on assessing the perceptions of user satisfaction of hosting services in the Metropolitan Zone of Guadalajara (ZMG), in order to analyze the factors influencing this is it. The preference for selecting the Guadalajara hotel industry due to the conditions of tourism development that has Jalisco, as one of the states with the largest number and variety of tourism, and its capital Guadalajara, the second largest city and economic importance in Mexico, and placed the state in the first place nationally in the number of lodging establishments, and the second in relation to the number of hotel rooms, and so does (ZMG) has a capacity of more than 16,000 hotel rooms ranging from to economic category and five-star tourism is the most visited state, with important economic, generated mainly by domestic tourism. In the competitive market environment, the success of hospitality services depends heavily on a thorough analysis of customer satisfaction.

Literature review

The satisfaction of customer needs is one of the issues which have awoken most interest in the marketing literature in general and in the sphere of services in particular. However, the variety of approaches indicates a certain amount of confusion which may have arisen due to the dual process-result focus which has marked the contributions in the literature. The lack of agreement on conceptualizing satisfaction creates certain difficulties for researchers when it comes to choosing the most appropriate definition, developing valid measurements and comparing empirical results (Giese & Cote, 2000).

In addition, the conceptualization of consumer satisfaction can be interpreted by focusing on a specific transaction or from an accumulative perspective. Most definitions in the literature correspond to the first approach (Mano & Oliver, 1993; Spreng, Mackenzie, & Olshavsky, 1996) although some of the more recent contributions support the idea that satisfaction is “a global measure of a set of satisfactions with previous specific experiences” (Yu & Dean, 2001:235). According to Jones and Suh (2000), defining satisfaction in this way provides a better explanation for behavioral intentions.

Customer satisfaction (CS) is a central issue in the hospitality field due to its imperative role in organizational performance and, ultimately, in the survival of hospitality companies. While some definitional and technical issues are to be further resolved, most researchers agree that CS is best evaluated on a multi-attribute scale. That is, CS

depends on a number of determinants at an attribute level and measuring CS through attribute-level performance captures the multifaceted nature of consumption experience.

An attribute level of satisfaction measurement captures CS with a specific aspect or dimension and can be aggregated into an overall satisfaction score, thereby providing specific constructive feedback to management for action strategies (Szymanski and Henard, 2001).

CS is an effective response to a purchase, and it is an important goal in consumer marketing. There are two different ways of determining overall satisfaction: the transaction-specific approach considers the emotional response by consumers to their most recent experience with a provider, while cumulative customer satisfaction is based on the customer's overall experience with a particular firm over time.

According to the dominating expectation-disconfirmation paradigm (Oliver, 1980) satisfaction is formed by way of a cognitive comparison of perceived performance of a product or service and the expectations the customer had before the purchase.

Customer satisfaction is central to the marketing concept, with evidence of strategic links between satisfaction and overall service performance (Truch, 2006), and is an important theoretical and practical issue for most marketers and consumer researchers (Goode, 2001); it is a key issue for all those organizations that wish to create and keep a competitive advantage in this highly competitive world. Customer satisfaction which remains in the limelight (Bartikowski and Llosa, 2004), especially in the service field, is typically defined as an overall assessment of the performance of various attributes that constitute a service.

It is well known that service quality and customer satisfaction are distinct constructs (Dabholkar, 2000). Another important question was answered by Oliver (1993), which first suggests that service quality would be antecedent to customer satisfaction regardless of whether these constructs were measured for a given experience or over time. Spreng and Macoy (1996) find empirical support for this model, wherein customer satisfaction is a consequence of service quality, and Dabholkar (2000) proves that customer satisfaction is a consequence of service quality (mediator model of customer satisfaction).

Measuring service quality expectations and perceptions are thus essential in managing customer satisfaction. Regarding the measurement of service quality, considerable progress has been made as to how service quality perceptions in business to consumer markets can be measured (e.g. Babakus and Boller, 1992; Parasuraman, et al., 1985, 1988, 1991, 1994).

After (production and) consumption of the service, the consumer establishes a perception of the quality of the delivered service, which may or may not confirm pre-consumption expectations. However, alternative views on the relationship between customer satisfaction and service quality exist. Anderson and Sullivan (1993) state that CS is a criterion that is used increasingly when assessing product and service performance (which includes quality). Day (2002) states that while both production and service delivery activities are aimed at creating value; for customers, customer expectations affect satisfaction, which in turn influences the assessments of value, rather than that value plays a role in satisfaction assessment of customers. Along these lines, quality could be viewed as a function of, rather than an antecedent to CS.

Understanding the strength and context dependency of this relationship may provide insights into the degree to which employee satisfaction influences customer experiences and how effect sizes vary across service contexts and research designs. We assess the strength and context dependency of relationships linking employee job satisfaction to customer-perceived service quality and satisfaction in a meta-analysis of studies that correlate employee satisfaction data with customer response data. Such insights may provide guidance for managers contemplating actions that affect employee and customer satisfaction.

The nature of interactions between employees and customers differs across service contexts. Lovelock (1983) and Gutek et al. (1999) offer particularly useful classifications of services, which we use to develop hypotheses and a coding scheme for moderator analyses. Given interaction between the customer and the service worker in a service encounter, our thesis is that the service worker's level of physical attractiveness is likely to have an impact on customer satisfaction.

In fact, researchers have demonstrated that customer satisfaction serves as a link to critical consumer behaviors, such as cross-buying of financial services, positive word-of-mouth, willingness to pay a premium-price, and tendency to see one's bank as a "relationship" bank (Winstanley, 1997; Ehigie, 2006; Ndubisi, 2006). Ultimately,

these behaviors proved to have a positive impact on key corporate outcomes, such as retention rates, average deposit amounts, cost to the bank of providing services, and future earnings (Winstanley, 1997). These results are consistent with a broader literature assessing the positive relationship between customer satisfaction and firm profitability (cf. Anderson et al., 1994; Fornell Et al., 1996; Johnson et al., 1996; Eklof et al., 1999; Zeithaml, 2000).

The satisfaction–loyalty relationship

According to Sivadas and Baker-Prewitt (2000), customer loyalty is the ultimate objective of customer satisfaction measurement. It is found to be a key determinant of a brand's long-term viability (Krishnamurthi & Raj, 1991). Moreover, compared with loyal customers, non-loyal customers are much more influenced by negative information about the products or services (Donio, Massari, & Passiante, 2006). If a service provider can satisfy the needs of the customer better than its competitors, it is easier to create loyalty (Oliver, 1999). Fornell (1992) stated that high customer loyalty is mainly caused by high customer satisfaction. Previous studies have demonstrated that customer satisfaction positively affects customer loyalty (Choi, Seol, Lee, Cho, & Park, 2008) or negatively affects switching intention (Walsh, Dinnie, & Wiedmann, 2006).

The nature of customer value, how it determines customer loyalty and how this in turn leads to financial outcomes is the subject of considerable discussion amongst academics and consultants (Payne and Holt, 1999). As with the development of any new area, there is debate about the alternative ways concepts can be defined.

Also, customers' service quality expectations have been found to be positively related to the duration of their relationship with the firm (Heilman et al., 2000). Despite these findings, research directly investigating the differential effects of customer loyalty on fairness perceptions is lacking from the literature. As fairness is antecedent to trust (Buttle and Burton, 2002), which is in turn antecedent to loyalty (Morgan and Hunt, 1994), the practices of retailers seeking to develop and maintain loyal customers should be interpreted as fair among their customers. One of the most prominent practices of retailers is their method of deriving prices. Customers' perceptions of the fairness of prices have been identified as a major area of interest due to public concern over the topic (Xia et al., 2004).

Some researchers view loyalty from an attitudinal perspective with the argument made that loyalty is a desire or intention to repurchase (Czepiel, 1987). Nevertheless, consumers may have a high relative attitude toward a brand that they have no intention of purchasing. For instance, a college student may believe that Ferrari makes the best automobiles in the world, though the student may believe that he or she will never have the funds to purchase one. Thus, relative attitude alone may indicate that only "latent loyalty" is present among customers (Dick and Basu, 1994).

Although numerous definitions of perceived value exist, the definition of Zeithaml (1988, p. 14) is the most universally accepted trade-off definition of perceived value in the literature. The uni-dimensional conceptualization strategy is effective and straightforward, but it cannot discern the complex nature of perceived value. As noted by Sweeney and Soutar (2001), "a more sophisticated measure is needed to understand how consumers value products and services" (p. 207). In fact, it is important to understand the value concept in an integrative approach, because one can understand a given type of value only by considering its relationship to other types of value (Holbrook, 1999).

Obviously, culture affects the manner in which we frame, blame, and attempt to tame conflicts (Le Baron, 1992). Drawing upon the literature on cross-cultural psychology marketing researchers has demonstrated that consumers behave differently according to their cultural values (e.g., Schutte and Ciarlante, 1998). As a specific type of social behavior, consumer revenge may also be influenced by culture, pointing to the need to elucidate the specific patterns of influence. Others, outside the marketing literature, also echo this need.

Few human behaviors are as purposeful as shopping. To understand retailing and consumer experiences, we must realize that consumers attempt to achieve some goal by purchasing and using a particular product or service (Ratneshwar, Mick, and Huffman 2000). Consumers shop for various reasons, which may not include a specific need for a product or service (Tauber, 1972); for example, they may need entertainment, recreation, social interaction, or intellectual stimulation (Arnold and Reynolds, 2003).

However, interest in customer behavior in service co creation has been growing in the literature (Bendapudi and Leone, 2003). More recently, researchers focus on what has become known as service-dominant logic which views customers as a co-creator of value in the service provision process (Vargo and Lusch, 2004). Against this background, various attempts focus more on understanding the role of customer behavior in service co-creation than on customer behavior in buying decision process. Recent literature on customer behavior focuses on the merits of understanding customers as human resources in the firm. The service marketing literature identifies at least two types of customer behavior in service delivery process (Bove et al., 2008; Groth, 2005): (a) customer participation behavior, which is “expected and required behaviors necessary for the successful production and delivery of the service” (Groth, 2005, p. 11) and (b) customer citizenship behavior, which is “voluntary and discretionary behaviors that are not required for the successful production and delivery of the service but that, in the aggregate, help the service organization overall” (Groth, 2005, p. 11).

In a broad sense, customer participation behavior refers to all forms of customer involvement and engagement in the value-creation process. This research uses customer participation behavior in a narrow sense, which includes only required behaviors necessary for the successful service creation. This usage is consistent with previous research on customer participation behavior.

Research Method

A survey was applied to 300 hotel guests who were in any of the establishments selected for this study, in categories 4 and 5 stars and Luxury Class, located in the Metropolitan Area of Guadalajara.

The questionnaire was applied in order to know the relationship between the quality of service, rates, advertising, and food and beverage services, with the level of customer perception and satisfaction in the hospitality industry.

The questionnaire used in this research was adapted with measures from Mohammad, Barker and Kandampully (2005) research about Multicultural student perceptions of fast food restaurant brands: an Australians study and from Fuch and Reichel (2006) research about Tourist Destination Risk Perception: the case of Israel.

Results were analyzed by using Pearson correlation to measure the above mentioned variables. From these variables, we also determined the following hypotheses:

- H¹. The more personal attention, the more perception of satisfaction
- H². The more importance regarding services prices, the more perception of satisfaction
- H³. The more advertising importance, the more perception of satisfaction
- H⁴. The greater importance of food and beverages, higher perception of satisfaction

Results

From 100% of the respondents, 53.3% are male and 46.7% female. (Table 1)

TABLE 1: RESPONDENTS' GENDER

Source: Own elaboration

Regarding age, 58 of them are in the range which goes from 26 to 30 years, followed by the group from 31 to 35, with 46 people, and finally, 44 of the respondents are located in the group which goes from 21 to 25 years.

Analysis of variance (ANOVA) and hypothesis testing.

Once formed the groups and analyzed the process of ANOVA is to analyze hypothesis 1.

- **H1. The more personal attention, the more perception of satisfaction.**

As a control question, also called dependent variable, the following question is stated:

- P2. Am I satisfied with the services which are offered by staff?

The independent question is the number 1.1 which states: The attention of service personnel in hotels is as good as I expect. With this variable the validity of the other will be determined.

TABLE 2: ANOVA FROM HYPOTHESIS 1 Q1.2

	Sum of Squares	df	Mean square	F	Sig.
Between groups	36.517	3	12.172	34.423	.000
Within groups	104.670	296	.354		
Total	141.187	299			

Source: Own elaboration

Hypothesis 1 is approved since F indicator is greater than 0.05, indicating that the correlation measure is within the accepted parameters. Also, the correlation both between and within groups or groups that were based on the commonalities have an optimal level above the minimum range which is 50, indicating that users perceive a good service quality in accordance to what they expect.

As for the second hypothesis: **H2. The more importance regarding services prices, the more perception of satisfaction.**

The controlling question that works as the independent variable is the number 2.5, which states the following: I am generally satisfied with the prices I pay, and the dependent is 2.4 which states: most of the prices are fair.

TABLE 3: ANOVA FROM HYPOTHESIS 2 Q2.5

	Sum of squares	df	Mean square	F	Sig.
Between groups	108.047	4	27.012	59.334	.000
Within groups	134.300	295	.455		
Total	242.347	299			

Source: Own elaboration

Hypothesis 2 is valid since F indicator is 59.33, which exceeds the minimum indicator and also confirms that the guest is completely satisfied with the price which is paid for the service.

As for the third hypothesis: **H3. The more advertising importance, the more perception of satisfaction**

This hypothesis will be tested using the control question 3.3 above which states that most advertising attempts to deceive rather than to inform and it is also considered as an independent variable, meanwhile question 3.1 which states: most advertising is not appealing, is the dependent variable.

TABLE 4: ANOVA FROM HYPOTHESIS 3 Q3.1

	Sum of squares	df	Mean square	F	Sig.
Between groups	48.908	4	12.227	15.977	.000
Within groups	225.758	295	.765		
Total	274.667	299			

Source: Own elaboration

The third hypothesis is not accepted, since the F value turns out to be less than the rate of acceptance, giving as a result a value corresponding to 15.97, indicating that most respondents do not perceive the lodging establishments' publicity as attractive, but uncertain.

As for the fourth hypothesis:

H4. The greater importance of food and beverages, higher perception of satisfaction

As controlling questions, also called dependent variables the following questions are presented:

P4.2 The majority of the experiences when consuming food and beverages have been unpleasant.

P4.3 The majority of staff at my service is very helpful.

And as an independent variable, question 4.1 which states "They attend me nicely everywhere I go"

TABLE 5: ANOVA FROM HYPOTHESIS 4

		Sum of squares	df	Mean square	F	Sig.
P4.2	Between groups	29.229	3	9.743	10.862	.000
	Within groups	265.491	296	.897		
	Total	294.720	299			
P4.3	Between groups	52.573	3	17.524	41.828	.000
	Within groups	124.013	296	.419		
	Total	176.587	299			

The fourth hypothesis is not accepted, due to the fact that the two analyzed variables had an F value under 50, this represents that the area of food is perceived by respondents as unsatisfactory. Apart from that, it also means that the staff is not really into offering a suitable attention to it.

Source: Own elaboration

Proposed Model

Based on the previous analysis' results, a user's satisfaction model regarding hotel services is proposed. It is based on four specific variables which, as a whole, would represent a tool for this process.

The applicable areas are the following: personnel attention, the price of services and advertising, as well as food and beverage service.

The proposed model has its essence in the valuation carried out through the perception of satisfaction expressed by hotel guests, where we suggest implementing various measures in each area involved in the process. (Fig.1)

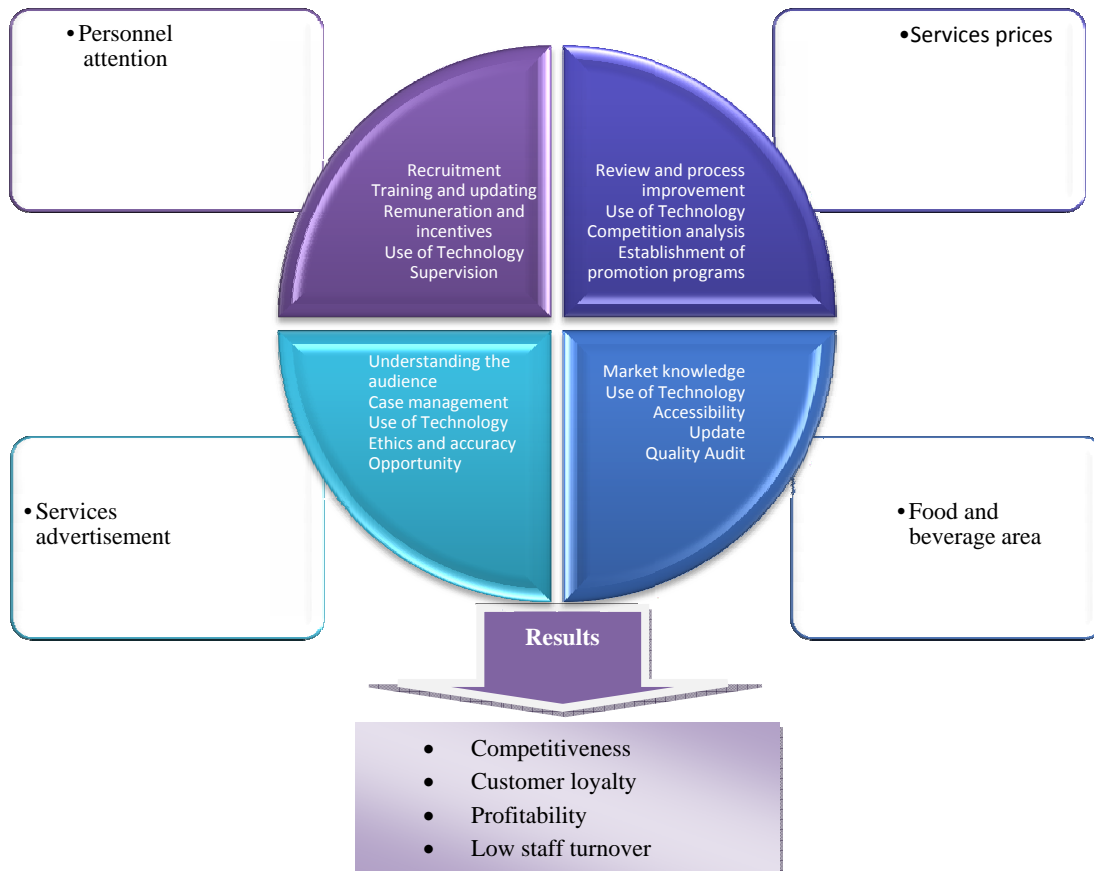

FIG. 1

PROPOSAL OF A CUSTOMER SATISFACTION MODEL IN HOTEL SERVICES

The proposed model has its essence in the valuation carried out through the perception of satisfaction expressed by hotel guests, where we suggest implementing various measures in each area involved in the process.

First, actions for the improvement of the first variable were analyzed, personnel attention, which started from the staff selection process, providing ongoing training and the need to have compensation plans and incentives. Technology plays an essential role for what it is included in the four areas of the model. It should be updated and accessible to the whole staff.

As regards to prices of services, so that they are considered fair by users, it is necessary to maintain a revision and improvement of processes. Apart from that, it is necessary to carry out a constant analysis with the rates offered by competitors, as well as establishment of advocacy programs.

Price promotions are useful tools for capturing consumer purchase; however, in order to satisfy a customer with the purchase on promotion, it is essential that the provided services keep a suitable service quality. Furthermore, it is important not to exceed the prices gap used by the customer for assessing the product's quality.

As for the obtained data, when contrasting the related hypothesis with the services publicity having resulted negative, we propose to emphasize every communication strategy design.

As lodging establishments offer their services to different types of market, you must have a broad knowledge of them in order to have great understanding of the audience and therefore, the messages should include proper handling of arguments, with ethical and truthful, and overall, they should be current and timely. The food and beverage area deserves special attention as it turned out to be the area in which respondents were more unpleasant, having experienced bad situations. Therefore, the model suggests special attention to the knowledge of the market, which means that they should identify tastes, preferences related to food and beverage consumption. It is

worth to implement a service in this area fully accessible, what it means is that there should be a suitable location, innovation with respect to the new trends.

A constant control on the quality turns out to be convenient in every single area of the model, as well as the caution to make sure that they exceed customers satisfaction.

Discussion

Among the most relevant findings it is worth to stand out that the guest has a high perception of satisfaction with the service that provides direct care staff in hotels, in fact, this helps to develop guest loyalty, which is achieved and maintained in the long term.

Nonetheless, it is important to note that one should not miss the fact that the compromise is not generated in isolation, but it is the result of trust built up between client and service provider, which in turn requires a customer satisfactory experience with the service obtained.

The personnel attention itself is not sufficient to achieve customer satisfaction as loyalty, we need to establish strategies to improve consumer perception, with respect to other variables, especially those huge differences between expected and received service. So, it is worthy to take into consideration what has already been stated in the proposed model suggested.

The price effect on the perception of satisfaction plays an important role within it, and this study found out that the user is fully satisfied with the price he or she pays for the service, and it is even considered as reasonable. It is considered in the proposed model, since the price is a variable that mainly affects the purchasing decision. But when the guest evaluates the experience of the stay, and thus generate loyalty, a greater proportion considered the result of stay rather than the expenditure.

Advertising is a tool used to communicate and bring customers to the service; however, this turned out to be seen as unattractive and misleading to respondents, hence, the proposal will suggest several strategies to improve communication.

Finally in the analysis of food and beverage services, it was found to be an area where special attention should be paid, as users report a very low level of satisfaction towards them, since such area represents a basic service in lodging establishments.

Conclusions

It is essential to point out that the results of the current study cannot be extrapolated to all lodging establishments, as they are valid only for the target population, due to their characteristics, category and different services expectancies guests get. Therefore, it is suggested to do further research in order to figure out whether the current model can be applied in some other ones.

The current study focused on the analysis of four variables and their relationship with customer's satisfaction, however, it is recommended for future studies to include other aspects that can be noted, including the valuation of furniture and equipment, importance of internet either as a distribution channel or a communication strategy, and other complementary services.

Furthermore, since predictors of satisfaction were not considered, such as emotions and culture, they could be part of more complex models to propose in the future with variables of different nature.

It is also suggested to replicate the study in other regions or cities both domestically and abroad and use other instruments to perform the evaluation.

Finally it would be beneficial to extend the research and the proposed model to other areas or businesses related to the tourism industry such as food, transportation or related services.

Achieving balance in public-private research partnerships: How challenges in IP management can be faced

*Andrea Hanebuth, andrea.hanebuth@der.tu-freiberg.de

Abstract

Competition in the international research landscape is growing and requires more and more interdisciplinary cooperation. While this is reflected by a rising number of research cooperation between academic and private partners, questions regarding finding an adequate balance of power and regarding effective management of the intellectual property (IP) become more and more crucial especially from a university's point of view. By providing first insights from a longitudinal case study the paper will show how IP can properly be managed along the lifetime of a public-private research partnership (PPRP). Strategies for negotiating a cooperation contract and practical advice for university research managers will be given and complete the study.

Keywords: public, private, research partnerships, Intellectual Property Management

Introduction

Public-private research partnerships (PPRPs) have become more and more popular worldwide in recent years. In Germany, for example, research partnerships between companies and universities or private research institutions have been growing by about 25 percent annually between 2002 and 2008 (ZEW, 2011). In such partnerships, universities usually provide 'fertile ground', i.e., researchers and infrastructure, whereas companies contribute 'seed', i.e., the money for undertaking research. Along such a partnership, both parties try to save as much of the 'harvest', i.e., the intellectual property (IP), as possible for their own use. One of the most important challenges of such research partnerships is hence related to the proper management of IP rights, which are created along the cooperation process. More specifically, the question arises whether and how balance can be achieved between different stakeholder interests in such projects and how such a balanced approach towards managing IP rights could be promoted through effective IP management. Based on case data and interviews from a German PPRP, this paper gives first insights how problems can be faced over the project lifetime and gives recommendation how challenges can be resolved and pitfalls can be avoided especially from a university's point of view.

Research situation in Germany

The scientific landscape in Germany is characterized by increasing expenses for research and development (R&D). In spite or even because of the economic crisis, the overall R&D expenses of the Federal Ministry of Education and Research have constantly been growing over the last 17 years at a compound annual growth rate of 4%, and of even 8% between 2007 and 2010 (BMBF, 2007, 2010). Overall, external funding of German universities, i.e., funding including both governmental and private funds, has been growing with an average rate of 7% over the last ten years (Statistisches Bundesamt, 2010). Despite these numbers, studies indicate a general tendency of decreasing basic funding (Geuna & Nesta, 2006) and increasing topic related competitive funding in most OECD countries (Leitner, Nones, Hölzl & Streicher, 2007). In addition to this, the number of private universities in Germany is rising (Statistisches Bundesamt, 2010). This development basically corresponds with developments towards privatized education in market-oriented countries such as the USA (Hall & Soskice, 2001). As a consequence, universities have

to build up research competences that distinguish them from other competing universities and research institutes (Statistisches Bundesamt, 2009). Moreover, universities are forced to adequately market their “unique selling proposition” and to coordinate externally funded research projects as professional as possible. Amongst other challenges, universities have to cope with the management of IP that is created in research projects. Compared to professional service or industry firms, however, universities have made less efforts to build up and maintain strong capabilities in the management of their IP and, what is more, to take account of developing it further into profit-making patents.

Patent situation in German universities

Although most German universities are still publicly funded, new trends such as a growing number of private universities and a cutback of basic funding emerge and put public universities under pressure to professionalize their functions. This is necessary for keeping up with competitors for obtaining research funding. In the course of this, a further professionalization of functions such as patent and IP management or downstream technology transfer is warranted. Probably as a first result of such efforts, the number of patents of European universities has been growing in the last years (Geuna & Nesta, 2006). However, the number of patents assigned by European universities is still less compared to universities in the USA. In European countries, 60% of the patents assigned by a university belong to large-scale enterprises or big governmental funded research associations like Fraunhofer association. In Italy or France, for example, public-assigned patents owned by universities make just 10% (Lissoni, Llerena, McKlevey & Sanditov, 2008). This is different to the USA where faculties and universities own the majority of patents. There is no doubt that this was caused by the Bayh-Doyle-Act adopted in 1980, which allowed universities to patent and own IP. In Germany, it took over 20 years to attain a similar change by abandoning the “professor privilege”. That is, until that time, professors enjoyed the freedom to assign patents to any juristic person and/or commercialize it on their own. Thus, patent rights were typically assigned to research sponsors rather than to universities (Geuna & Nesta, 2006). With this change of German law in 2002, professors adopted the same position as any other university employee, and the university itself became owner of all IP developed by its professors. As a result, patent applications by universities increased strongly during recent years (Geuna & Nesta, 2006).

However, while the mere number of patent applications increased, the quality of the patents decreased. Hence, a merely increasing number of patent applications cannot be seen as a general positive development per se (Henderson, Jaffe & Trajtenberg, 1998). As a consequence, the selection and application of patents – or, generally speaking, the IP – needs to be managed properly. Another reason for proper IP management is that usually only a few patents of the whole patent portfolio of an organization are valuable in terms of monetary or strategic profit (Ceccagnoli, Gambardella, Giuri, Licht & Mariani, 2005). Moreover, valuable patents occasionally require expensive legal defenses against competitors in order to strengthen their value and position. With this in mind it is questionable whether classical publicly funded universities in Germany can afford intensive patenting and expensive defenses. In many cases the financial background for a legal defense of patents is not given at universities (Singh, 2008). Nevertheless, the growing number of patents puts emphasis on the need for professionalization of processes and decisions on patentable inventions. Consequently, federal governments now more and more support and urge universities in strengthening their IP policies (Bruneel, D’Este & Salter, 2010) as well as regarding the protection and commercialization of their IP. This becomes visible in several appeals (e.g., Wissenschaftsrat, 2007) and initiatives (e.g. Chapple, Lockett, Siegel & Wright, 2005). In Germany, for example, by now over 20 agencies for helping universities and their technology transfer offices to commercialize patents emerged during the last decade (Prognos, 2010). In addition to helping to commercialize and license patents, such agencies also help in founding spin-offs supporting further acquisition of new research cooperation.

Public-private research partnerships and their structure of partners

In the last two decades, a growing number of academic-industrial cooperation appeared. On the one hand, universities and other research institutions are more and more inclined to gather related funding by focusing on specific technological challenges from practice. On the other hand, companies are more and more open for sharing and multiplying their knowledge with academic support (Gassmann & Bader, 2006). In the course of this, the management of IP becomes an important success factor for R&D cooperation (Hertzfeld, Link & Vornortas, 2006). Furthermore, the proper management of IP becomes the more important the more partners are involved in R&D cooperation. With a growing number of partners, the multiplicity of interests grows and makes the management of the R&D cooperation more complex, often leading to high failure rates (e.g., Faems, Looy & Debackere, 2005; Link & Marxt, 2004). Therefore, the different partners and the general structure of multi-faceted public-private research partnerships have to be understood first before focusing on how IP might be properly managed in cooperation like this.

General sources of conflict of interests

In general, all of the partners aim at developing new basic and applied research results on a research subject commonly agreed on. But when it comes to the 'motivation behind', two groups can be identified: Universities and research institutes on the one hand and private funding partners on the other, whereas the funding ministry with its function of an initiator and supervisor plays a rather neutral role concerning IP issues. Additionally because of the Law on Employees' Inventions all the inventions generally belong to the employer, i.e., a research institute, a university or a company. With the IP belonging to different partners with different focus and profit orientation, conflicts can arise.

On the one hand, the group of private partners seeks for IP as much as possible, no matter whether this is developed during the project or before. Ideally, the knowledge can even be used after the end of the project. An additional goal of this group of stakeholders is access to existing knowledge, data and results of all of the research organizations or even other private partners involved, especially if contact has not existed before. In contrast to the group of private sponsors, however, researchers are motivated to publish results and, by this means, to increase their reputation. The research organization itself, however, is motivated to protect the new knowledge even though the long-term goal is an overall transfer of the benefit to society. This securing and commercialization of knowledge represents not only financial income but especially the ability to present reputable research excellence to the industry (resulting, e.g., in more third-party funds) and the scientific community (resulting, e.g., in better recruitment opportunities).

Yet, the development of groups with different motivations does not necessarily have to lead to conflict or even failure of research cooperation. It is rather just a classic case of co-opetition: Organizations cooperate in R&D while making sure that the partners remain competitors in the market place (Porath, 2010), i.e., partners cooperate in research but compete in using and commercializing results and knowledge. Hence, the ownership and distribution of knowledge represent main challenges that need to be solved in research cooperation (Porath, 2010). One possibility is to define a strict set of rules during the first phase of cooperation's lifetime. In this paper, this shall be demonstrated by using data from a real case, which will be introduced in the following.

Member profile and organization of an exemplary PPRP

In this self-observed study, we present case data from an exemplary research project funded by the German Federal Ministry of Education and Research for five years in a program to support innovative research partnerships in East German states. This exemplary character is based on the fact that we include almost all possible partners (Universities, semi-private research organization with non-profit character and private companies) to research cooperation except independent individuals. Numerous research projects are funded by the ministry within the same program for

boasting the innovative strengths and economic success of the East German states by supporting top-level science and research but this is the only research cooperation including private companies. One of the aims of the project is to investigate management principles for these kinds of intersectional and interdisciplinary research cooperation. In addition to governmental funds, the project receives funding from four (one medium-sized and three big) private companies. The medium-sized company is international operating in upgrading lignite. Second is one of the three biggest lignite producers in Germany, also doing business as raw-material supplier and energy supplier. The two further companies are two of the four biggest energy suppliers in Germany running coal power plants amongst others. Among the recipients, there are two public universities and three research institutes. Two of these three research institutes are embedded in mother associations named Helmholtz and Fraunhofer. Both associations enjoy a basic public funding but are required to raise external funds. These associations host numerous specialized research institutes all over Germany, which operate considerably independent within the mother organization. Whereas Helmholtz association is more oriented at basic research, Fraunhofer association focuses more on applied sciences. The third research institute is an independent publicly funded research organization. Among the universities, one of the two is taking the lead and the spatial hosting of the research project.

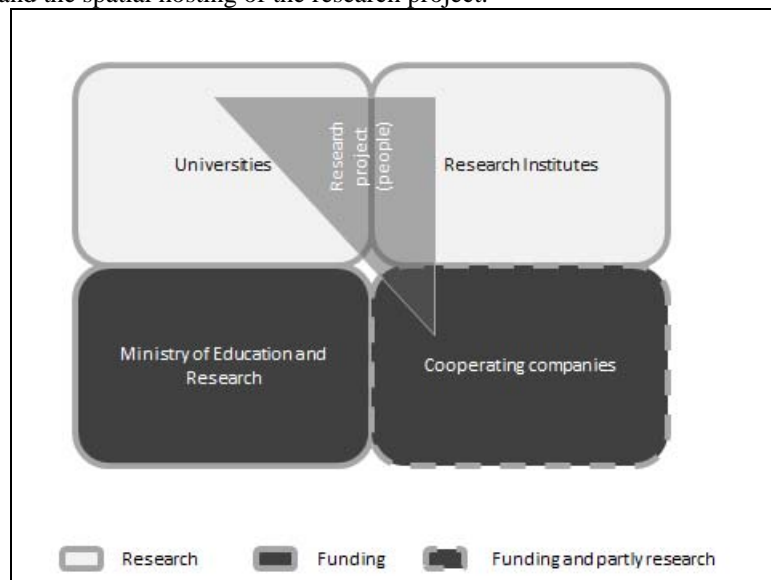

FIG.1: PROFILE OF MEMBERS IN A PPRP

As Figure 1 shows most of the people working on the project are researchers employed by two universities and embedded within specific institutes. The second group contains researchers from research institutes, and the third group researchers from the funding companies. These three groups (i.e., universities, research institutes and cooperating companies) and the Federal Ministry of Education and Research represent the core stakeholders of this research project. With this structure, the project includes nearly all kinds of partners a research cooperation can have (Hauschildt, 2004).

In contrast to the 16 other projects that are sponsored by the same federal program, the project at hand incorporates funding from private companies. This is reflected in the organizational structure and governance system of the project, which contains the following organizational entities:

- A board consisting of one representative of each funding company and of the dominating research organization as well as two professors of the hosting university, who also represent the speakers of the board.
- Two project coordinators referring to the two subject groups of researchers supervising the whole project. Their function is a connecting position between the board and the researchers, which includes

reporting and information sharing with the board as well as sending annual reports to the supervising ministry.

- Subgroups and teams of researchers from universities and research institutes referring to the subprojects.

A special situation in the present case is the prominent role of the companies as co-sponsors of the project. Because of this company representatives are included in the board. Additionally, there are geographic distances between the researchers and there is more the virtual character of the project. From an organizational point of view this can be seen as kind of a matrix organization type. One general problem is the legal difference of the partners, yet another is that the project is not independent from a financial point of view. The patents or other property rights – if they get assigned – belong to the mother organization the employee is working for, but not to the project. For this reason the institute's policy or rather the decision of the head of the institute defines the number of patents to be applied for. Legal reasons defend this to the point that property rights just can be owned by a juristic person, but not by a virtual project.

How to handle IP issues over the lifetime of PPRP

The following model aims to solve the question how to face IP issues arising in a research project especially from a university's point of view. The respective tasks project management has to cope with are structured into different phases along the lifetime of a typical PPRP. From the project at hand, three phases can be identified (see also Figure 2):

- (Pre-) start phase, which starts before the real project gets started;
- project phase, where elaborated strategies, policies and rules become implemented and realized;
- ending phase, which optimally takes place before the official ending of the project.

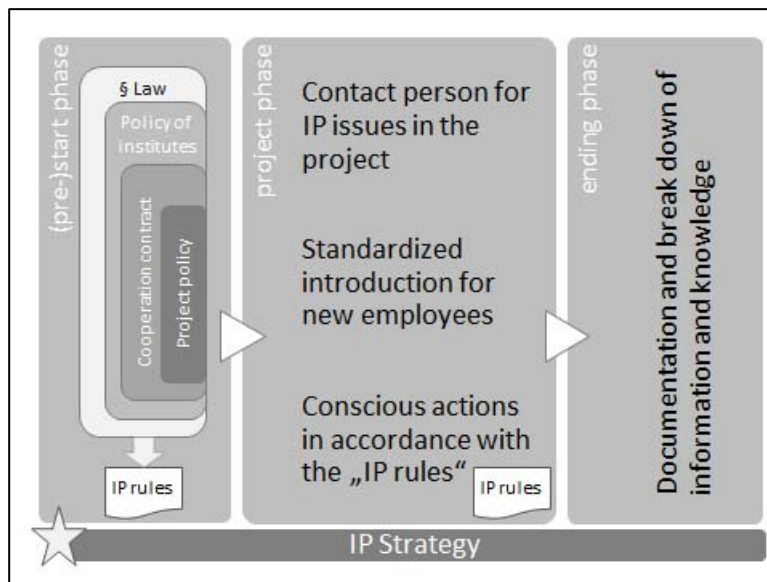

FIG. 2: PHASES OF IP MANAGEMENT IN PPRPs

(Pre-) start phase

The (pre-) start phase includes the beginning and even the time of pre-existence of a PPRP. In this phase, national and regional law sets the frame for the policies and strategies pursued by the initiating research institutes. These may become fixed in the cooperation contract once negotiations among the parties involved are finished. Based on the cooperation contract, project policies including IP strategy and management measures are outlined and may become aggregated in a project handbook or specific “IP rules”. As a matter of fact, project-related IP rules set transparent guidelines for researchers in a specific research project. The earlier this (pre-) start phase is finished and the guidelines are set, the less project time will have passed leaving space for actions which are not in accordance with the guidelines. The constitutive character makes this phase a very important phase of a project. More specifically, in the beginning of a project, some of the conflicts that may possibly emerge during later stages can be avoided by fixed policies and rules that are in line with national and regional laws, that are aligned with the policies of the involved stakeholders, and that are commonly agreed on resulting in a cooperation contract. After fixing this contract the remaining space can be used for project related policies and strategies (see Figure 2). In the following, some possible strategies concerning the negotiation of a cooperation contract will be presented.

Possible strategies for negotiating a cooperation contract

One of the major difficulties when negotiating a cooperation contract is to define solutions for eventually appearing situations which are not foreseeable at the point in time of negotiating and signing the contract. Especially policies regarding the handling of the contributed and resulting data and knowledge have to be clarified in a cooperation contract of research cooperation. In the present case, good practice contracts were used as model contracts which were adjusted to the respective research project.

A tender point in cooperation contracts are clauses which demand a prior agreement before publishing scientific results. This often comes into conflict with time aspects and the personal interests of researchers (Bruneel, et al., 2010). Whereas scientists are interested in prompt publishing in order to improve their scientific reputation, funding companies are more interested in secrecy and protection of the results and discoveries.

However, entering new cooperation contracts might also bear advantages for universities by offering the chance of becoming “relieved” from existing concessions with private partners in former contractual agreements. By this means, the cooperation contract is embedded in the existing (social) environment of a university (Blumberg, 1998). So no negotiation can be undertaken isolated from former negotiations. Existing agreements and concessions in former research contracts are taken as a starting point for the new negotiations. If now changes to existing arrangements are made they can be considered as signal for mistrust. In the worst case this could provoke disclosure of information and knowledge transfer. So, negotiations in this field are very challenging and influencing the future work. But there can be a way to solve this challenge in an elegant way with recruiting new partners in a PPRP.

For example: research institute A has an existing project with scope S1 with company X. The cooperation contract includes concessions that grant X deep insights to A’s results. Now institute A wants to start a new cooperation project with scope S2 and to once again recruit company X as funding partner. In this situation institute A has a hard negotiation position if A doesn’t want to grant as much insights to the results of S2 as for S1. If now institute A additionally finds a new research partner B for research project S2 a new partner is included into the negotiation process. As in general a cooperation contract is a general contract signed by all involved parties, the positions of A and B are equal. In the ideal case the new partner B has no historical contractual background with company X. Now B can start the contractual negotiation from a neutral position and improve the concessions for project S2 from A’s point of view, too. The motivation for A to include B is the improvement of the arrangement with company X, whereas the motivation for institute B is the participation in a new research project. The stronger the strategic importance of B, the stronger is the negotiation position of B and the stronger can be positive spillover effects for A. So, including new cooperation partners can potentially improve the contractual situation with cooperating companies from a research institute’s or university’s point of view.

Another aspect that suggests inviting new research partners is learning. Almost every research organization brings model contracts into new research cooperation, but in many cases those contracts have to be adjusted. Hence,

building on the existing experience and expertise of other research institutes might be profitable. This can help saving time and accelerating the money transfer from the funding partners involved to the research institutes: In the case at hand, no money transfer from the ministry or the involved companies had taken place until the cooperation contract was signed. This issue can become very important if the money transfer is related to expensive research investments that are important for delivering research objectives in time. In our case, the purchase of a research instrument got pushed back because of the late contract signing and money transfer. This led to a delay in research gauging and caused a push back for downstream subprojects that build on the results of the analysis of more than six months. This is just one example of how late contract signing may risk the success of a whole research project.

Possible IP Strategies for the PPRP

With setting a cooperation contract the question for an IP strategy arises. More specifically, “[p]atent strategy for a technology area is the science and art of managing research to meet competitors in the marketplace under advantageous conditions.” (Knight, 2007, p.70) If the marketplace is limited and most of the players are cooperation partners it has to be made clear what kind of patent strategy partners are looking for. According to Harhoff (2005), different IP strategies have to be considered when setting the stage for an industry project. In the following, these strategies will be evaluated as for their applicability for a PPRP:

- **Intensive application and active defending:** This strategy would be of interest in order to strengthen the position in the technological field. Building barriers discourages the entrance to a certain technology area. With numerous costly applications and especially costs of a legal action the costs are very high and usually overcharge the possibilities of universities. If there is no big budget planned and part of the project the realization of this strategy is questionable.
- **Patent nets:** This means building nets with further patents around own patents or restricting the base patent of a competitor with the net. Again, the costs for the numerous necessary applications are heavy and usually public organizations do not have a budget for fulfilling this strategy.
- **Patent maze:** This implies assigning patents which are interwoven with closely related patents. This density raises – akin to the related patent net strategy – the security and therefore the strength of the base patent. As before, all strategies which include the application of numerous patents get expensive and, again, this depends on the budget.
- **Patent flooding/blanketing:** In this case the technology area is flooded by a tremendously high number of patents at one moment. This requires a very high effort and coordination in a short moment of time as otherwise the patents could be used as a source of information for competitors. As this strategy is not only costly but also time consuming, the appropriateness of this strategy for a public university is nonrealistic as well.

To sum this up, all named patent strategies are expensive and more or less time consuming so that conditions to apply the strategies can barely be fulfilled by a public university. In the present case, for example, there was no budget reserved for patent applications at all. What remains for the project itself are strategies with a more “silent” character (Gassmann & Bader, 2006):

- **Secrecy:** This means keeping the results disclosed in the organization. This however is absolutely contrary to the general goal of a university aiming at doing research for some social benefit.
- **Publishing:** This includes publishing new results and knowledge in order to set the standard in the technology area. This brings prestige and additionally prevents patent applications of competitors with setting the standard. Hence, this strategy would be most suitable for a university. However, as some of the researches as well as some of the private partners in a research cooperation project are heading for some patents at the end of the day some individual patents will be at least assigned. In these cases, researchers and especially project coordinators as well as an IP person in charge at the mother organization have to decide how to select and time patent applications. This will be detailed in the following section of the paper.

Project phase

After setting the frame for a proper handling of IP issues within a PPRP, this frame has to be actively used when making IP decisions. This takes place in the project phase, which embraces the biggest part of the project lifetime. There are especially three important points that have to be considered. First, a person has to be defined for acting as a contact person for all IP related issues and for documenting the results. This person has two main functions: Acting as an information desk and as a “sponge”. On the one hand, this person should have a possibly neutral position and should be a confidential person. It can be a dual position in combination with the role of a project coordinator. This person should work as a contact person for all IP related questions and should assist the inventor. On the other hand, the IP person should adsorb all IP related know-how like a sponge and should disperse this knowledge whenever needed. The position of the IP person should best be backed with the necessary authority by the project leaders.

Second, there has to be a standardized introduction (document, presentation, etc.) for every new employee as part of the formal integration process. “IP rules” could be this kind of onboarding document. Third, all actions taken within the project should be in accordance with the IP rules. This last part is most difficult and requires the support especially from the project management team as sticking to the rules becomes the more efficient the stricter the leaders act in accordance with the rules and become “role models”. This could also be improved by further educating the project coordinators in IP related topics.

Ending phase

It is difficult to fix a concrete point in time when the ending phase starts. In general, the more suitable the documentation of results, data and knowledge the easier this phase turns out to be. There are two major challenges that have to be managed: First, the agglomeration of the results and knowledge, and second their documentation and transfer, respectively. These two steps optimally have taken place during the previous project phases, too. But towards the end of a project this is a “must”.

In the course of this phase, the results of the project are summed up as a whole. This means bringing together all reports, databases and further scientific findings down to one master piece, report, etc. The results that will be handed over to the partners have to get defined by the project coordinators so that the final knowledge transfer can take place. From a mere “transfer” point of view it would be advisable to just deliver suitable results to the partners. License incomes can be a nice side benefit for the mother organization.

Another important step is to document the results. As a project itself always has a temporary character by definition it has to be made sure which organization will keep what kind of result. This can be done by the leading institute alone or by the participating partners, which then keep the relevant results within their institution. This would be the case in the project at hand as this was fixed in the cooperation contract.

Additionally, this phase can also initiate applications for follow-up support of the present PPRP or for elaborating new project ideas out of the new findings. In the case of a follow-up support this ending phase runs parallel to the new (pre-) start phase of the next project life-cycle.

Conclusion

By drawing an overall picture of the research situation and the patent situation at German universities and by providing practical evidence from a real case, this paper seeks to close the gap of providing practical advice for research managers in PPRPs. More specifically, the phase model that we created along the lifetime of a real project shall help research coordinators in managing IP concerning issues. In addition, the structure of partners, interests and 'motivations behind' of a real PPRP are presented to show possible means for successful contract negotiation and IP strategies to be adopted in day-to-day IP management practices. Despite of critical views that mainly see universities as contributors to society (Smith, Parr, 2005), others that admit universities to derive extra income from patenting (Geuna & Nesta, 2006) exist as well. In sum, our paper suggests that both roles universities can play can be realized synergistically by adopting appropriate IP management measures.

Nevertheless, our paper as every other has limitations, too. One is that we solely analyzed companies' role as sponsors whereas it is also possible that company partners are just loosely participating in a PPRP, for example, by announcing a letter of interest. Hence, further research should be conducted for cases that contain cooperating companies which do not participate in funding. Another limitation is the fact that the project at hand is still running and that for this reason no statements can be derived for the ending phase yet. As a consequence, further insights into the management of IP at the end of a project needs to be conducted and compared by future research.

Moreover, there are different roles a research coordinator or manager (Kirkland, 2005) can play. In the present case the PPRP coordinator is just responsible for the project at hand, i.e., he is not formally involved in the making of institutional research policies but is involved in their implementation. It would be worth investigating IP management implications for the case of a PPRP coordinator who additionally plays one of the other roles as defined by Kirkland (2005): role as a 'leader' (person who has the authority to make institutional policy), as a 'member' (senior research manager who makes policies alongside academic colleagues in key committees) or as a 'secretary' (research manager who may have token representation on key decision-making committees but their main involvement comes through the provision of advice, reports and data).

This paper has hence to be seen as a starting point for further research. The specific setting of the longitudinal case presented here has to be challenged by other evidence and should be captured in propositions that need to be tested quantitatively.

The Antecedents of affective organizational commitment and turnover intention of academics in selected private universities in Malaysia

*Lew Tek Yew, lew.tek.yew@curtin.edu.my
Curtin University Sarawak Malaysia*

Abstract

This study aims to test the structural model that explains the relationships between career development opportunities, perceived organizational support, felt obligation, affective organizational commitment and turnover intention of academics working for four (4) selected private universities in Malaysia. This study found that the academics' perceived career development opportunities positively influenced the level of POS and POS had a direct positive relationship with affective organizational commitment. Besides, POS has not only a direct influence on organizational commitment, but also an indirect impact via felt obligation, confirming the partial mediator effect of felt obligation. Another interesting finding of the study was that the influence of POS on turnover intention is only through the indirect effect via affective organizational commitment. The results of this study add to our knowledge about the social exchange mechanisms that link HR practices with the employees' affective organizational commitment and turnover intention.

Introduction

Increasingly organizations are interested to develop committed workforce to reduce employee turnover and absenteeism, while improving the employees' performance and job-related attitudes (Mathieu & Zajac, 1990; Meyer & Allen, 1997; Mowday, Porter, & Steers, 1982; Tremblay, Cloutie, Simard, Chenevert, & Vandenberghe, 2010). There is also growing evidence that employees' positive attitudes and discretionary behaviors are important factors affecting organizational performance (Podsakoff & Mackenzie, 1997). Hence, gaining a better understanding of the motivational basis for such work attitudes and behaviors is regarded as an important component of research agendas relating to management practice in the future especially in the context of professional employees (Aryee, Budhwar, & Chen, 2002). Hence, this paper is written to emphasize on the importance of adopting theories from the human resource management (HRM) and organizational behavior (OB) disciplines to understand the process of developing a committed professional workforce in contemporary organizations.

Social exchange theory (Blau, 1964) suggests that the exchange relationship between two parties often goes beyond economic exchange and includes social exchange. Hence, organizational studies argue that employer and employee exchange not only impersonal resources such as money, but also socioemotional resources such as approval, respect, recognition and support (Eisenberger, Armeli, Rexwinkel, Lynch, & Rhoades, 2001). In organizational researches, the social exchange theory (Blau, 1964), the norm of reciprocity (Gouldner, 1960) and the concept of perceived organizational support have been applied to describe the psychological process underlying the employee attitudes and behaviors (Setton, Bennett, & Liden, 1996; Wayne, Shore, Bommer, & Tetrick, 2002). The concept of perceived organizational support (POS) which refers the extent to which the organization values their employees' contributions and cares about their well-being have been used to describe the social exchange relationship between the employer and the employee (Eisenberger, Huntington, Hutchison & Sowa, 1986). Based on the norm of reciprocity (Gouldner, 1960), employees who perceive high levels of POS are more likely to reciprocate the organization with positive attitudes such as higher levels of affective commitment and favorable work behaviors such as commitment to organizational goals and lower intention to leave (Eisenberger, et al., 1986; Eisenberger, Fasolo, & Davis-LaMastro, 1990; Eisenberger, Cummings, Armeli, & Lynch, 1997). The arguments above based on the social exchange theory, the concept of perceived organizational support (POS) which is the commitment of the organization to the employee and the norm of reciprocity is further developed into the organizational support theory (Rhoades & Eisenberger, 2002).

Problem Statement

While committed academics are the key towards the successful private universities in Malaysia (Humphreys & Hoque, 2007) and since academics have a high need for support and recognition, there is very little empirical studies thus far which have been conducted to examine the role of perceived organizational support (POS) to enhance the level of affective commitment of academics using the academics working with the private institutions of higher learning (Rowley, 1996; Capelleras, 2005; Joiner and Bakalis, 2006).

Since the turnover rate of academics in private universities in Malaysia is high (Jantan et al., 2006; Morris et al., 2004) and that the private universities play significant roles towards the development of the higher education industry in Malaysia (BERNAMA, 2009; MOHE, 2009), it is important to examine the antecedents of organizational commitment and turnover intention of academics in private universities in Malaysia. The limited past studies conducted in the context of private universities in Malaysia by scholars such as Ismail et al. (2009); Saad et al. (2008) and Santhapparaj and Shah Alam (2005) provided little insights into the issue of enhancing the level of organizational commitment and reducing the level of turnover intention of academics in private universities in Malaysia. To bridge these gaps in the literature especially in the context of the Malaysian private universities, this study has adopted the Organizational Support Theory (Rhoades & Eisenberger, 2002) which suggests that employees who perceive high levels of POS are more likely to reciprocate the organization with positive attitudes such as higher levels of affective commitment to the organization and favorable work behavior such as lower intention to leave (Eisenberger et al., 1986; Eisenberger et al., 1990; Wong & Tay, 2010).

The Influence of HRM Practices on Organizational Commitment

There is no consensus in the HR literature on which HRM practices is considered appropriate (Mohd. Nasurdin et al., 2008). Despite this lack of consistency, the Social Exchange Theory (Blau, 1964), the norm of reciprocity (Gouldner, 1960) and the Organizational Support Theory (Rhoades & Eisenberger, 2002) suggest that the influence of HRM practices on employees' attitudes and behaviors is significant. Hence, this study use the organizational support perspectives to examine the influence of career development opportunities on employees' perceived organizational support (POS), which in turn will influence the employees' organizational commitment and turnover intention .

A review of the literature suggests the potential effects of several HR practices on employee commitment and motivation. They include selective hiring, appraisal, compensation, training and development activities (Snell & Dean, 1992; Whitener, 2001; Youndt et al., 1996). However, past studies in the area of HRM have been almost exclusively undertaken in the Western world and very few were undertaken in Malaysia (Mohd. Nasurdin et al., 2008).

Providing career development opportunities via training and development of employees is increasingly recognized as an important aspect of best HRM practices. Employees have a desire to extend their potential and capabilities in the organizations, to satisfy their need for growth (Alderfer, 1972; Maslow, 1954). Hence, organizations need to provide employees with career development opportunities that would meet their need for personal growth in order to create employee beliefs in higher POS. Organizations that provide career development opportunities such as recognition, training and promotion indicates that the organizations are concerned for their employees and recognize their contributions to the organization, which contributes to POS (Eisenberger et al., 1999; Rhoades & Eisenberger, 2002). Further, these HR practices are often viewed as discretionary treatment by the organization as it goes beyond normal company policies or any labor laws of the country, which suggests organizational caring and support (Eisenberger et al., 1997).

In Malaysia, the high turnover rate for academics in private universities were mainly due to the limited career development opportunities provided, inadequate support for research activities and teaching in private universities was not perceived as a career of choice (Arokiasamy et al., 2009; Jantan et al., 2006). Thus, it is important to examine whether the provision of career development opportunities would positively influence the level of POS.

Hypothesis 1: Employees' perceived career development opportunities will positively influence the level of POS.

The Role of POS on the HRM-Organizational Commitment link

There are multiple mechanisms that the organization can employ to create employee beliefs that the organization value their contributions and cares about their well-being (Rhoades & Eisenberger, 2002). HRM practices might serve as one means by organizations to show their care and support or commitment to the employees and in turn, foster affective commitment and reciprocal attachment by employees. Specifically, employees may refer the supportive HRM practices as discretionary behavior of the organizational agents to determine how greatly the organization values them (Eisenberger et al., 1986). In addition, HR practices serve as signals to employees about the extent to which the organization values and cares about them as individuals (Wayne et al., 1997). These findings suggest that HRM practices might only contribute to employees' affective commitment if they are viewed by employees as evidence of the organization's commitment to them.

Organizational Support Theory (Eisenberger et al., 1986; Eisenberger et al., 1997; Mohamed et al., 2006; Rhoades & Eisenberger, 2002) also suggests two types of HR practices that are related to POS. First, discretionary practices which the organization is not obligated to offer that imply organizational caring and commitment towards the well being of the employees but not made compulsory by company policy, union contract or laws of the country (for example, career development opportunities and work/family support) and second, organizational recognition for the employee's contribution (for example, pay satisfaction).

Research suggests that employees interpret organizational actions such as HR practices (Ogilvie, 1986; Setton et al., 1996; Wayne et al., 1997) as indicative of the personified organization's support and commitment to them by the organization's high level of caring and concern. In return, employees will reciprocate this kind deed by increasing their own commitment to the organization by being highly involved in the organization and showing their willingness to work hard to accomplish the organization's goals. This stream of thought is in line with the research findings of other researchers (Agarwala, 2003; Whitener, 2001) who argued that how employees interpret and make sense of their employer's HR practices will affect their psychological contract with their employer which in turn, affects their commitment to that employer.

Meanwhile, Eisenberger et al. (2001) examined the reciprocation's role in the relationships of POS on employee commitment and job performance. Hence, future studies on the POS-outcome relationship should examine the role of felt obligation, which refers to an employee's belief regarding whether he or she should assist the organization to obtain its goals (Eisenberger et al., 2001). This is because the Organizational Support Theory (Eisenberger et al., 1986; Gouldner, 1960; Rhoades & Eisenberger, 2002) suggests that employees who perceive that the organization values their contribution and cares about their well-being would develop a feeling of felt obligation to aid the organization to achieve its objectives.

Although POS is likely to induce employee affective commitment to organization, this effect may function through a sense of felt obligation to repay the organization's care for their wellbeing and recognition of their contribution (Eisenberger et al., 1986; Eisenberger et al., 2001). Specifically, Eisenberger et al. (2001) found a partial mediating effect of felt obligation on the influence of POS on affective organizational commitment and explained that since POS fulfils the employees' needs for relatedness and affiliation (Alderfer, 1972; Armeli et al., 1998), POS may increase the employees' identification and involvement with the organization, which is an important dimension of affective organizational commitment (Mowday et al., 1982).

The Organizational Support Theory predicts that POS should decrease voluntary turnover intention via affective organizational commitment by strengthening employees' sense of belonging and identification with the organization (Eisenberger et al., 1990; Meyer & Allen, 1997; Mowday et al., 1982; Rhoades et al., 2001). POS promotes affective organizational commitment via the incorporation of organizational membership as an important part of social identity. The resultant strengthening of the employees' emotional bond to the organization reduces the employees' intention to leave the organization (Rhoades et al., 2001). Recently, a primary survey of 93 music teachers from private music schools around the Klang Valley in Malaysia showed that they were less likely to leave when they perceive their music schools supported them and this relationship between organizational support (POS) and the turnover intention of music teachers was partially mediated by their affective commitment to the music schools (Wong & Tay, 2010). Based on the arguments above, the following hypotheses were tested.

Hypothesis 2: Higher employee perception of POS will positively influence the level of affective organizational commitment.

Hypothesis 3: The positive influence of POS on affective organizational commitment will be partially mediated by felt obligation.

Hypothesis 4: Higher affective commitment will negatively influence the level of turnover intention.

In sum, the proposed model is shown in Fig. 1 below:-

FIG. 1: THE HYPOTHESIZED MODEL

Research Objective

This study aims to test the structural model that explains the relationships between career development opportunities, POS, felt obligation, affective organizational commitment and turnover intention of academics working for four (4) private universities in Malaysia.

Method

Procedures

The target sample for the actual study was the private universities in Malaysia which were registered with the Ministry of Higher Education Malaysia (MOHE, 2009) and rated at the Tier 4 and 5 categories in the SETARA 2009 (MQA, 2009). SETARA is a rating system developed by the Malaysian Ministry of Higher Education to rate the performance of Malaysian universities in the areas of teaching and learning and in the future it will include research and development as well (MQA, 2009). This is to ensure that the private universities included in this study have achieved the minimum quality of 'very good' in the teaching and learning criteria in Malaysia. Thus, a total of fifteen (15) private universities were selected for this study. The private universities include four (4) foreign branch campuses and eleven (11) private universities. Two of the foreign branch campuses are located in the Klang Valley, Peninsular Malaysia while the other two are located in Sarawak. The eleven (11) private universities are located in Peninsular Malaysia.

A total of 1000 survey forms were distributed to the academic staff of the four private universities in Malaysia which have approved this study. In total, 202 employees responded, generating an overall response rate of about 20%.

Measures

Through extensive literature review, the variables of this study were measured based on established instruments which have been used by seminal past studies (the full list of the items of the survey are available upon request from the author). All the variables were measured by the subjects' responses based on the 5-point Likert-type scales (1=strongly disagree to 5=strongly agree). All indicators have standardized factor loadings of more than 0.67, Cronbach's alpha more than 0.70 (Hair et al., 2006) and average variance explained (AVE) of more than 0.50. Hence, convergent validity among the indicators for the respective constructs has been established (Hair, Black, Babin, Anderson, & Tatham, 2006, p.776-778).

Data Analysis Method

The structural equation modeling (SEM) is chosen to analyze the data because it is a popular statistical technique used by empirical journal articles in the social sciences to test the relationships of independent and dependent variables, is powerful to “redesign” the proposed relationships in the hypothesized model to form several nested models and is more effective in finding the “best fitting” model to the data as suggested by the modification indexes (Cheng, 2001; Kline, 2005; Shore et.al., 2006; Tan, 2008).

Results

The statistical output for the structural model for the hypothesized model is represented in Fig. 2 below. In this model, F2 refers to career development opportunities, F4 refers to POS, F6 refers to felt obligation, F8 refers to affective commitment and F9 refers to turnover intention.

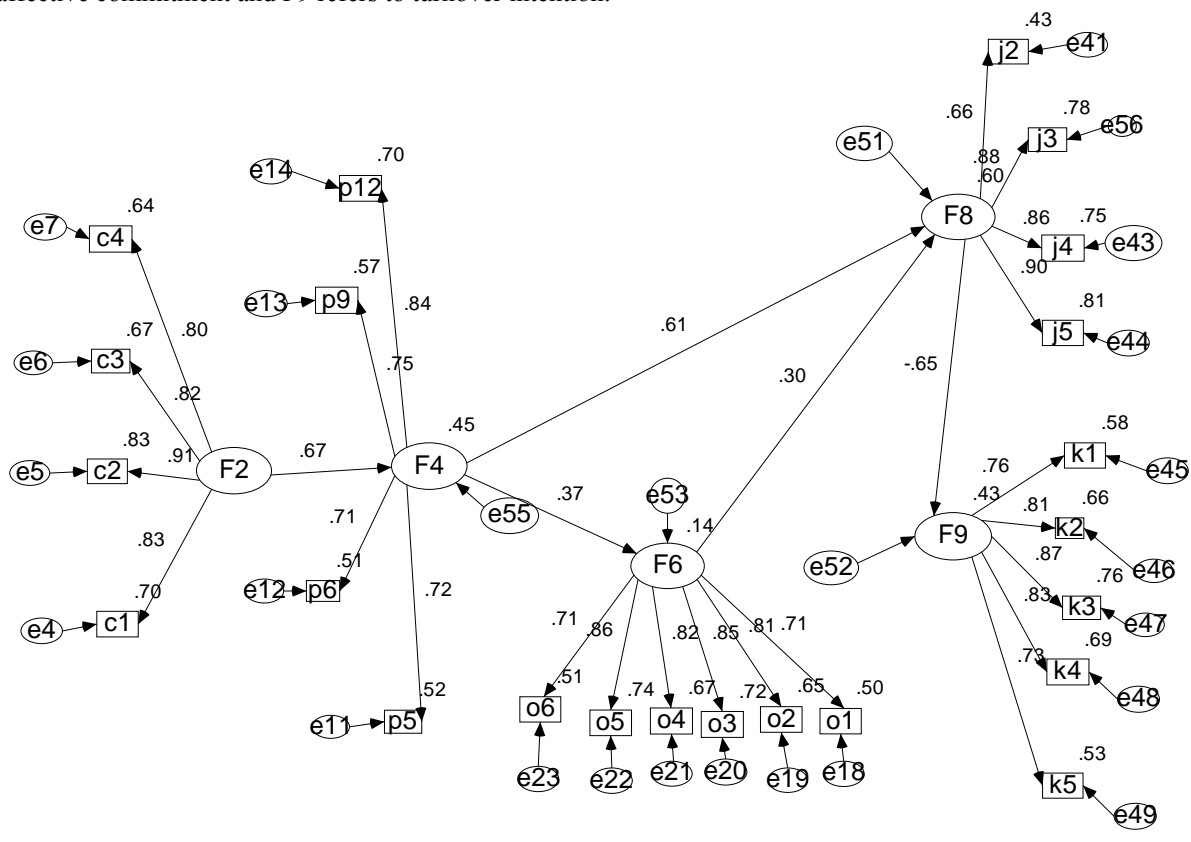

FIG. 2. THE STRUCTURAL MODEL FOR THE HYPOTHESIZED MODEL

In Fig. 2, all paths estimates between the respective constructs were significant at the 0.001 level, indicating that all the hypotheses 1-4 were supported. All the standardized factor loadings of the indicators were at least 0.67 and significant at the 0.001 level. The skewness and kurtosis values for all the indicators were also less than 3.0 and 10.0 respectively, indicating that the data did not demonstrate significant departure from normality.

The model fit indexes for the structural model are $\chi^2/df=1.560$; GFI = 0.872, AGFI= 0.843, CFI= 0.961 and the RMSEA = 0.053. Hence, the $\chi^2/df= 1.560$ has met the recommended cutoff point of less than 3.0; the CFI and AGFI has met the recommended cutoff point of more than 0.8 and RMSEA has met the recommended cutoff point of less than 0.08 (Hair et al., 2006). In sum, the structural model demonstrated acceptable model fit to the observed data.

The model fit indexes for the measurement model for the structural model are $\chi^2/df=1.991$; GFI = 0.839, AGFI= 0.803, CFI= 0.932 and the RMSEA = 0.070. Hence, the $\chi^2/df= 1.991$ has met the recommended cutoff point of less than 3.0; the CFI has met the recommended cutoff point of more than 0.9 and RMSEA has met the recommended cutoff point of less than 0.08. The values of GFI and AGFI were also reasonably acceptable at the level of more than 0.80. In the measurement model, none of the indicators cross-loaded on other factors and all the indicators loaded significantly ($p<0.001$) onto their respective latent factors. As a result, the concern of common method error was minimized. Thus, the 5-factor measurement model is confirmed and the examination of the best fitting structural model is valid and justified (Anderson & Gerbing, 1988).

Discussion

This study supported a best fitting structural model which included the interrelationships between five constructs, namely career development opportunities, POS, felt obligation, affective organizational commitment and turnover intention. Consistent with the results of a few previous studies (Allen et al., 2003; Meyer & Smith, 2001; Wayne et al., 1997), in this study, perception of career development opportunities was found to have a significant positive impact on POS. The magnitude was also strong with $\beta=0.67$. The findings of this study are consistent with the predictions of the Organization Support Theory, which suggest that HR practices such as career development opportunities might only contribute to the employees' affective commitment if they are viewed by the employees as evidence of the organization's commitment to them. Thus, this study suggests that career development opportunities relate to actions that are designed to prepare employees for a future in the organization and organizations that are willing to make a long-term investment in their employees are likely to be judged as caring about their welfare and regard them as long term assets.

In return, beliefs of POS would create an obligation for the employees to "repay" their organization by taking care of its well-being through greater effort, involvement and identification, all of which reflect their level of greater affective commitment. Hence, at the theoretical level, this study has enriched the commitment literature. Specifically, this study has provided evidence for the relationships between HRM practices, POS and affective organizational commitment.

In terms of contribution to HRD literature, this study has enhanced the existing body of knowledge by integrating one particular HRD practice which is, career development opportunities and related OB concepts such as POS, organizational commitment and turnover intention in a single study (Hatcher & Guerdat, 2008). Further, this study found significant and positive relationship between career development opportunities which is an important HRD area and POS, which in turn, influenced the academics' organizational commitment and turnover intention. Since employee development, behavioral change and organizational performance can be influenced by organizational commitment (Meyer & Allen, 1997) and HRD scholars need to understand the process to develop commitment (Fornes, Rocco, & Wollard, 2008), this study has demonstrated how OB theories such as the Organizational Support Theory can be used to enhance the body of knowledge in the HRD discipline in terms of understanding the process involved in the influence of HRD practices on the development of a committed workforce.

POS was found to have both a direct impact on affective organizational commitment ($\beta=0.58$), and an indirect impact mediated by felt obligation. The findings of this study confirm the predictions of the Social Exchange Theory (Blau, 1964) and Organizational Support Theory (Eisenberger et al., 1986) that the academics will

repay the universities which supported them with stronger commitment to the universities and develop a sense of felt obligation to reciprocate the universities' support by caring about the universities' well being and helping achieve its objectives (Eisenberger et al., 2001). As the strength of the relationship between POS and felt obligation is strong with $\beta=0.45$, this study supports the view that the POS-felt obligation association is due to the norm of reciprocity (Gouldner, 1960). This association indicates the academics' acceptance of the reciprocity norm as a basis for employee-employer relationships and provides empirical support to the social exchange interpretations of employee-employer relationships that emphasize reciprocity-based obligations (Eisenberger et al., 2001; Rhoades & Eisenberger, 2002).

Consistent with previous research, this study supported the relationship that lower commitment to the organization may lead to increased intention to quit (for example, Mowday, Porter, & Steers, 1982; Mathieu & Zajac, 1990; Chughtai and Zafar, 2006, Mohamed et al., 2006) with a $\beta=-0.65$. The academics who perceive that the universities were supportive of them would be committed to the universities and as a result, would be less likely to leave the universities. This study provides evidence that POS is important in the turnover process as an antecedent of organizational commitment, which in turn, reduces turnover intention.

Limitations and Suggestions for Future Research

First, this study is cross-sectional in nature. As the data was collected at the same time, definitive conclusions on the relations of causality between the constructs of the study should be made with caution. Second, the independent, mediating and dependent variables were measured simultaneously from the employees, thus raising the problem of common-method bias. Hence, data were collected from four private universities and confirmatory factor analysis was used to test the construct validity of the indicators used to measure the constructs (Pare & Tremblay, 2007). Future studies should study the antecedents and outcomes of POS through longitudinal data. Future research is needed to further understand the influence of other discretionary HR practices on POS such as top-down information, performance feedback and skills development on POS suggested by Tremblay et al. (2010). Besides, future studies should include other mediating variables such as procedural justice and job satisfaction as well as POS, felt obligation, trust in management in a single study to further understand the process of how HR practices influence affective organizational commitment and turnover intention as suggested by scholars such as Allen et al. (2003), Meyer and Smith (2000) and recently by Tremblay et al. (2010).

Conclusion

This study has contributed significantly to management research and practice. By linking employee perceptions of career development opportunities with POS, this study bridges HRM and organizational behavior literature, and provides guidance on how organizations can foster high levels of perceived organizational support via implementation of appropriate HR practices. The findings on the significant effects of POS on important work outcomes such as affective organizational commitment and turnover intention either directly or indirectly demonstrate the importance of POS research and the need for organizations to provide adequate support to their employees. As discussed earlier, this study also points to some interesting directions for future research.

Sustainable development in Higher education: a case study of India

*AninditaChatterjee, anindita.cha@rediffmail.com
ManavRachna International University*

Abstract

The higher education of any country is considered as quality parameter by the international world. The sustainability is in terms of education imparted, the legitimacy of the teaching and research undertaken and the operational aspect which involves a tradeoff between innovation and structured patterns. The corporate India witnessed the retrenchment drive and the business models on which corporate India stood, came under serious debate. The challenge for the Indian organization is to strive for sustainable Indian education industry also. So bridging the gap between the academic and corporate sector is also an important need of the hour to achieve sustainability in higher education. The paper aims at identifying and explaining the various aspects to be considered for achieving sustainability in higher education.

Employability to Sustainability

Higher education of a country has a big role in the development a country. The enigma of India is that our progress in higher education and science and technology has not been sufficient to take 350 million Indians out of illiteracy (Murthy, 2009). The private education industry is in its growth phase. Many business groups are planning to enter into the management education in a big way with the promise to deliver the best. They are investing on building state-of-art campuses to promote learning. They are standardizing the education industry by creating the benchmarks(Chatterjee, 2010). But these education courses designed by the needs of industries have failed to deliver results in terms of quality education.This affects the employability to a great extent. The higher education system produces graduates that are unemployable, though there are mounting skill shortages in a number of sectors. The standard of academic research is declining. The higher education sector is in rigorous development and restructuring. But apart from these concerns there are some more issues such as increasing crime rates, denigrating physical and emotional healthand other socio-economic problem should be addressed by the higher education of country. This would lead towards a sustainable society.

Sustainable development is considered in terms of three i.e. a) environmental sustainability, b) economicsustainability and c) Social sustainability. It must be emphasized that these are interdependent and mutually reinforcing elements of the same integrated process of sustainable development(Inventory of innovative practices in education for sustainable development., 2010).So sustainable development in higher education in the Indian context will bring about a solution to upcoming business problems, will develop an awareness and empathy towards the environment and also lay a foundation towards sustaining the social aspect which is an important characteristic of the Indian society. The key to sustainable future is sustainableruralizationandurban transformationinstead of sustainable urbanization and rural transformation. For attaining these objectives we should promote youth in the area of ecopreneurship (career connected with sustainable development), education and development(www.ceeindia.org, 2005).

Areas under Sustainable development

Rural India-India is an agrarian society with three-fourth of its population staying in rural areas. They depend on farming, livestock and other farming related income for earning their livelihood. The absence of employment and the poor living conditions causes them to migrate to urban areas. In rural India, still the villages have poor living conditions. The government schools and hospitals have no or at most two teachers. It is difficult to imagine 250 million do not have access to basic medical care. 51 percent to country' children are undernourished and 52 percent of primary schools have only one teacher for every two classes. 300 million Indian lives on hardly Rs 545 per month (Murthy, 2009). The higher education should prepare the students to avail entrepreneurship options and generate

employment opportunities for the rural people. New ideas on farming and distribution channels for rural India should be generated.

Hypothesis 1: The academic activities done by the institute makes a significant difference in promoting awareness about the Poverty in rural India.

Hypothesis 2: The academic activities done by the institute makes a significant difference in promoting awareness towards the encouraging Entrepreneurship at the student level.

Public Health

The deteriorating public health is another big problem that India is facing. Rural health conditions needs a lot of improvement. On the other hand, the urban health is the victim of the problems like drug addiction, depression, teenage pregnancy and suicide arising out of debauchery, extra marital affairs, domestic violence, poor sleep and unhealthy eating habits. Invoking the thought process of the students towards this direction can also generate a lot of employment opportunities.

Hypothesis 3: The academic activities done by the institute makes a significant difference in promoting awareness about the Public Health in India.

Hypothesis 4: The academic activities done by the institute makes a significant difference in promoting awareness to curb the problems arising from the Job Retrenchment in India.

Energy

Clean energy initiatives to stop global warming and catering to environment and energy needs of the future is also a new sector with immense opportunities. India with having a lot of natural resource can be used for making up self-sufficient villages by using solar power or tidal power. Education and vocational training to generate employment opportunities in rural India is also the initiative which needs a lot of manpower to bring about a growth in these areas.

Hypothesis 5: The academic activities done by the institute makes a significant difference in promoting awareness about the Clean and Renewable energy activities.

Hypothesis 6: The academic activities done by the institute makes a significant difference in promoting awareness about the Energy Conservation practices.

Values

Increasing number of scams and political instability calls upon for developing integrity through a sound value system and good governance. The education system of any country has a big role to play in integrating values and ethics within the budding managers. A sound value system is the foundation of the sustainable society.

Hypothesis 7: The academic activities done by the institute makes a significant difference in promoting awareness about the Cultural Values of India.

Hypothesis 8: The academic activities done by the institute makes a significant difference in promoting awareness about the Cross Cultural values required in era of globalization.

Hypothesis 9: The academic activities done by the institute makes a significant difference in promoting awareness about the Family Values in India.

Hypothesis 10: The academic activities done by the institute makes a significant difference in promoting awareness about the governance issues.

Gender Inequity

The gender inequity is also a problem which we witness quite often. Efficient and effective female managers have constantly reported the presence of the glass ceiling hindering there development. The plight of the women

denigrates in the case of house wives and women in the rural areas. They are victims of depression, exploitation, domestic violence, sexual harassment, female feticide, bad reproductive health etc.

Hypothesis 11: The academic activities done by the institute makes a significant difference in promoting awareness about the problems related to Gender Inequity in India.

Environment

The knowledge about the environment and performing environment friendly activities should be integrated as the part of the economic activities to reduce global warming and problem of Urbanization. Urbanization of the developing society has also emerged as a big problem. Constant migration of people from the rural parts of the country due to unemployment and poverty is bringing disequilibrium in the growth. The cities are expanding and the slums are increasing which in turn forces these people to live in the poor conditions.

Hypothesis 12: The academic activities done by the institute makes a significant difference in promoting awareness about the Global Warming Initiatives.

Hypothesis 13: The academic activities done by the institute makes a significant difference in promoting awareness about the problems related to Urbanization in India.

The academic activities undertaken by the institute towards affecting the sustainable development initiatives are in the respective forms. Firstly, the curriculum taught within the course of the higher education is one of the institutional activities which can be one of the ways of promoting the education for sustainable development. In an evaluative review of Rhodes university participatory course 1998, Janse van Rensburg and Le Roux(1998) identifies key aspects of the course orientation, which have come to shape the pedagogy and teaching practice in the course. It involved clarification of processes of curriculum deliberation, as a way of orienting community –based adult education (Lotz, 1999). The key features also indicate that curriculum deliberation involves processes that deliberately focused on achieving sustainability goals(Lotz-Sisitka, 2004). Regular Disciplinary reviews can play an important role in promoting the integration of sustainable development in disciplinary education, because of their content, the process of disciplinary analysis, and the emergence of actual and potential disciplinary relationships with sustainable development(Appel, Dankelman and Kuipers,2004). Secondly, the community links established in the form of community service, conferences, and the student/faculty exchange and training programs are the ways by which a university or institute can gain a lot by initiatives of a fellow institute or university. The Community Programs include providing information to new students as part of orientation, fostering environmental leadership with student groups, supporting innovative student projects on campus and in the community, and fostering local and regional business, government and community networks for sustainability(Cladder and Clugston, 2004). Thirdly, in the form the analytical and research work undertaken in form of service learning projects, internship programs and center of excellence on specific sustainable issues.

Theoretical Model

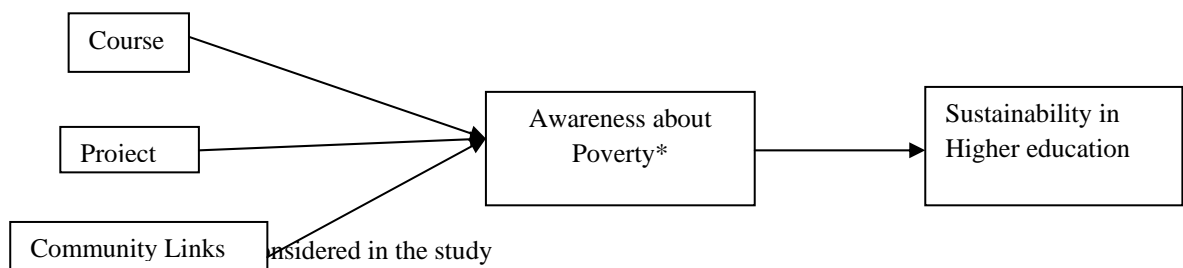

FIG. 1: THEORETICAL MODEL

The model is applicable for all the thirteen sustainable issues which are the part of this questionnaire. The poverty is one of the sustainable issues which need the youth involvement to bring a worthwhile change. The model here tries

to test the awareness level of the student on this issue and the extent to which awareness is contributed by the independent variables i.e the course structure, the project(research) and the partnerships(community links) are able to predict the awareness of the student on the issues relating to poverty. The same model is replicated for other twelve issues. These issues are public health, energy conservation, clean and renewable energy, cultural values, cross cultural values, family values, global warming, urbanization, job-retrenchment, entrepreneurship, governance, and gender inequity. These are the improvement in these areas will bring about economic, social and environmental sustainability. So the higher education should consciously imbibe these issues with the academics to bring out the responsible citizens to take up the challenge of the sustainable development.

Objectives of the Study

- To study the awareness level of the students on the sustainable issues
- To analyze to extent to which awareness on sustainable issues is contributed by the academic activities undertaken by the institutes

Methodology

The study is descriptive in nature. The study has been conducted in natural environment without any interference from the researcher. The data has been collected through questionnaire during regular college hours. All the participants were informed of their rights as participants. The questionnaire consisted of the following items which were considered as the area requiring awareness and participation from youth for attaining sustainable development. . The public health, energy conservation, clean and renewable energy, cultural values, cross cultural intelligence, poverty, family values, global warming, urbanization, job retrenchment, entrepreneurship, governance and gender inequity were the items of the questionnaire on which awareness through education was measured. The questionnaire is divided in three parts. The first part contains the demographic details of the respondent. The second part of the questionnaire is for gathering the information about the awareness of respondents about the sustainable development issues. And the third part of the questionnaire is more measuring the effectiveness of the academic activities in raising awareness of the students on creating employability with sustainability. The responses were collected on a Likert-type scale (1=Not at all to 5= A great deal). About 200 questionnaires were distributed. Out of this only 98 were usable questionnaire. The response rate was 49 % only. Participants were given opportunity to express their feedback on the questionnaire. The reliability coefficient of the instrument measuring the awareness on the sustainable issues was 0.8 for 13 items in the questionnaire. The questionnaire consisted of 22 questions. Data is drawn from population of the students who are using the same syllabi, by using probability random sampling. The population comprises of the management graduates pursuing their Masters in Business Administration. The sample size consists of 98 management graduates of post graduate level. The sample consists of 46 female and 52 male students. The unit of analysis is the individual students. Respondents ranged in age from 21 years to 25 years with mean age of 23 years.

Data Analysis

The data analysis is done in two parts. In the first part, the awareness level of the students on the sustainable issues was assessed and in the second part of the study the awareness created by the academic activities on sustainable issues was assessed. The table 1.1 depicts the awareness level of the students on the sustainable issues. The general awareness level is good from 98 students, 47 students were well informed, 26 students had just informed and 17 has somewhat knowledge on the poverty. About 90% of the sample had an average awareness level on entrepreneurship. The level of awareness about the entrepreneurship opportunities is only 21% contributed by the academic activities. The overall awareness among the student about the denigrating public health was 91% (38 students had a good knowledge, 29 students had average knowledge and 12 students were somewhat informed). The

table 1.1 states that overall awareness of the sampled students is above average to good. The table signifies that the awareness level of the students is highest on energy conservation, development of clean and renewable source of energy and global warming. Above 50 percent of the total sampled students reported that they were informed about this issue to a great extent. About 23% to 29% of the total students reported that they were adequately informed about the above issues. About 43 to 46 students reported awareness of a great extent on the values (governance, cross cultural values, cultural and family), gender inequity and poverty. On issues like Job retrenchment, public health and entrepreneurship the awareness was not as appreciable as 29, 24 and 28 students had “somewhat” knowledge on these issues respectively. Otherwise only a 17% to 18% of the total students reported their awareness to somewhat category for the remaining sustainable issues. The table 1.1 reveals that the students have considerable amount of knowledge on the sustainable issues.

TABLE 1.1: AWARENESS LEVEL

	Great deal	Quite a bit	Somewhat	Unsure	Not at all
Poverty	47	26	17	7	1
Entrepreneurship	30	31	28	4	5
Public Health	38	29	24	5	1
Job Retrenchment	27	32	29	4	6
Clean and Renewable Energy	51	26	17	3	1
Energy Conservation	55	29	12	1	1
Cultural Values	43	33	17	4	1
Cross Cultural values	46	34	16	1	1
Family Values	42	24	23	4	5
Governance	46	26	21	4	1
Gender Inequity	46	30	19	2	1
Global Warming	54	23	18	3	0
Urbanization	39	29	23	6	1

H1₀: The academic activities done by the institute does not make a significant difference in promoting awareness about the Poverty in rural India.

H1_A: The academic activities done by the institute makes a significant difference in promoting awareness about the Poverty in rural India.

To test this hypothesis, multiple regression analysis was done. The results of regressing the three independent variables against the awareness about poverty can be seen in the table. The academic activities done under the project area have facilitated the understanding the students towards rural poverty. But the amount of awareness created by academic activities remains 23% only. The first table 1.2 output list R(.510) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.237). The ANOVA values indicate that F is 11.032 at 0.000 level. The Beta under standard coefficients for course, partnerships and project is -.161, .242 and .413. The significance level for t-test for course, partnerships and project is 0.091, 0.000, and 0.014 respectively. About 23.7 % of variance in awareness about the poverty in rural India is explained by three independent variables. It is a good model. Thus, hypothesis 1 is

substantiated. The activities resulting under the partnerships with various agencies have made a significant difference in enhancing the awareness level of the students about the Poverty in rural India.

TABLE 1.2: POVERTY

R	R ²	F	Sig-level(F)	Sig-level t _(course)	Sig-level t _(Partnership)	Sig-level t _(Project)	Standardized coefficients Beta _(Course)	Standardized coefficients Beta _(Partnership)	Standardized coefficients Beta _(Project)
0.510	0.237	11.032	0.000	.091	0.000	0.014	-.161	-.242	.413

H₂₀: The academic activities done by the institute does not make a significant difference in promoting awareness towards the encouraging Entrepreneurship at the student level.

H_{2A}: The academic activities done by the institute makes a significant difference in promoting awareness towards the encouraging Entrepreneurship at the student level.

To test this hypothesis, multiple regression analysis was done. The results of regressing the three independent variables against the awareness about entrepreneurship can be seen in the table. The first table 2 output list R(.488) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.214). The ANOVA values indicate that F is 9.819 at 0.000 level. The Beta under standard coefficients for course, partnerships and project is .0628, .410 and .122. The significance level for t-test for course, partnerships and project is 0.479, 0.000, and 0.205 respectively. About 21.4 % of variance in awareness about the Entrepreneurship in India is explained by three independent variables. It is a good model. Thus, hypothesis 2 is substantiated. The activities resulting under the partnerships with various agencies have made a significant difference in enhancing the awareness level of the students about the Entrepreneurship in India.

TABLE 2: ENTREPRENEURSHIP

R	R ²	F	Sig-level(F)	Sig-level t _(course)	Sig-level t _(Partnership)	Sig-level t _(Project)	Standardized coefficients Beta _(Course)	Standardized coefficients Beta _(Partnership)	Standardized coefficients Beta _(Project)
0.488	0.214	9.819	0.000	.479	0.000	0.205	.0628	.410	.122

H₃₀: The academic activities done by the institute does not make a significant difference in promoting awareness about the Public Health in India.

H_{3A}: The academic activities done by the institute makes a significant difference in promoting awareness about the Public Health in India.

To test this hypothesis, multiple regression analysis was done. The results of regressing the three independent variables against the awareness about Public Health can be seen in the table 3. The first table 3 output list R(.426) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.155). The ANOVA values indicate that F is 6.953 at 0.000 level. The Beta under standard coefficients is 4.346 for project which is significant at 0.001 level of significance. Only, 15.5 % of variance in awareness about the public health in India is explained by three independent variables. Thus, hypothesis 3 is substantiated. The projects given to the students have made a significant difference in enhancing the awareness level of the students about the Public Health in India.

TABLE 3: PUBLIC HEALTH

R	R ²	F	Sig-level(F)	Sig-level t _(course)	Sig-level t _(Partnership)	Sig-level t _(Project)	Standardized coefficients Beta _(Course)	Standardized coefficients Beta _(Partnership)	Standardized coefficients Beta _(Project)

0.426	0.155	6.953	0.000	.069	0.975	0.001	-.182	-.003	4.346

H₄₀:The academic activities done by the institute does not make a significant difference in promoting awareness to curb the problems arising from the Job Retrenchment in India.

H_{4A} :The academic activities done by the institute makes a significant difference in promoting awareness to curb the problems arising from the Job Retrenchment in India.

To test this hypothesis, multiple regression analysis was done. The results of regressing the three independent variables against the awareness about Job retrenchment can be seen in the table. The first table 4 output list R(.559) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.29). The ANOVA values indicate that F is 14.210 at 0.000 level. The Beta under standard coefficients for course, partnerships and project is -0.019, 0.292, and 0.403. The significance level for t-test for course, partnerships and project is .839, 0.002, and 0.000 respectively. About 29 % of variance in awareness about the Job Retrenchment in India is explained by three independent variables. It is a good model. Thus, hypothesis 4 is substantiated. The project and partnership have a significant difference in enhancing the awareness level of the students about the Job Retrenchment in India.

TABLE 4: JOB RETRENCHMENT

R	R ²	F	Sig-level(F)	Sig-level t _(course)	Sig-level t _(Partnership)	Sig-level t _(Project)	Standardized coefficients Beta _(Course)	Standardized coefficients Beta _(Partnership)	Standardized coefficients Beta _(Project)
0.559	0.29	14.210	0.000	.839	0.002	0.000	-.019	.292	.403

H₅₀: The academic activities done by the institute does not make a significant difference in promoting awareness about the Clean and Renewable energy activities.

H_{5A}: The academic activities done by the institute makes a significant difference in promoting awareness about the Clean and Renewable energy activities.

To test this hypothesis, multiple regression analysis was done. The first table 5 output list R(.186) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.034). The ANOVA values indicate that F is 1.118 at 0.346 level. Thus, hypothesis 5 is not substantiated. Thus, the academic activities done by the institute do not make a significant difference in promoting awareness about the Clean and Renewable energy activities.

TABLE 5: CLEAN AND RENEWABLE ENERGY

R	R ²	F	Sig-level(F)
0.186	0.034	1.118	0.346

H₆₀:The academic activities done by the institute does not make a significant difference in promoting awareness about the Energy Conservation practices.

H_{6A}:The academic activities done by the institute makes a significant difference in promoting awareness about the Energy Conservation practices.

To test this hypothesis, multiple regression analysis was done. The first table 6 output list R(.200) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.040). The ANOVA values indicate that F is 1.308 at 0.277 level. Thus, hypothesis 6 is not substantiated. Thus, the academic activities done by the institute do not make a significant difference in promoting awareness about the Energy Conservation practices.

TABLE 6: ENERGY CONSERVATION

R	R ²	F	Sig-level(F)
0.200	0.040	1.308	0.277

H 7₀: The academic activities done by the institute does not make a significant difference in promoting awareness about the Cultural Values of India.

H 7_A: The academic activities done by the institute makes a significant difference in promoting awareness about the Cultural Values of India.

To test this hypothesis, multiple regression analysis was done. The first table 7 output list R(.388) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.124). The ANOVA values indicate that F is 5.562 at 0.001 level. The Beta under standard coefficients for course, partnerships and project is .391, 0.024, and .216. The significance level for t-test for course, partnerships and project is 0.000, 0.818, and 0.216 respectively. Only 12.4 % of variance in awareness explained by three independent variables. Thus, hypothesis 7 is substantiated. The course inclusion has a significant difference in enhancing the awareness about the Cultural Values of India.

TABLE 7: CULTURAL VALUES

R	R ²	F	Sig-level(F)	Sig-level t _(course)	Sig-level t _(Partnership)	Sig-level t _(Project)	Standardized coefficients Beta _(Course)	Standardized coefficients Beta _(Partnership)	Standardized coefficients Beta _(Project)
0.388	0.124	5.562	0.001	.000	0.818	0.216	.391	.024	.216

H 8₀: The academic activities done by the institute makes a significant difference in promoting awareness about the Cross Cultural values required in era of globalization.

H 8_A: The academic activities done by the institute makes a significant difference in promoting awareness about the Cross Cultural values required in era of globalization.

To test this hypothesis, multiple regression analysis was done. . The first table 8 output list R(.079) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The adjusted R² (0.006). The ANOVA values indicate that F is .195 at 0.900 level. Thus, hypothesis 8 is not substantiated. Thus, the academic activities done by the institute do not make a significant difference in promoting awareness about the Cross Cultural values required in era of globalization.

TABLE 8: CROSS CULTURAL VALUES

R	R ²	F	Sig-level(F)
0.079	0.006	.195	0.900

H 9₀: The academic activities done by the institute does not make a significant difference in promoting awareness about the Family Values in India.

H 9_A: The academic activities done by the institute makes a significant difference in promoting awareness about the Family Values in India.

To test this hypothesis, multiple regression analysis was done. The first table 9 output list R(.313) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.06). The ANOVA values indicate that F is 3.398 at 0.021 levels. The Beta under standard coefficients for course, partnerships and project is 0.011, 0.277, and .076. The significance level for t-test

for course, partnerships and project is 0.915, 0.010, and 0.465 respectively. Only 6% of variance in awareness explained by the three independent variables. Thus, hypothesis 9 is substantiated. The partnerships have a significant difference in enhancing the awareness about the Family Values in India.

TABLE 9: FAMILY VALUES

R	R ²	F	Sig-level(F)	Sig-level t _(course)	Sig-level t _(Partnership)	Sig-level t _(Project)	Standardized coefficients Beta _(Course)	Standardized coefficients Beta _(Partnership)	Standardized coefficients Beta _(Project)

H 11₀: The academic activities done by the institute does not make a significant difference in promoting awareness about the problems related to Gender Inequity in India.

H 11_A: The academic activities done by the institute makes a significant difference in promoting awareness about the problems related to Gender Inequity in India.

To test this hypothesis, multiple regression analysis was done. The first table 11 output list R(.393) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The Adjusted R² (0.128). The ANOVA values indicate that F is 5.740 at 0.001 level. The Beta under standard coefficients for course, partnerships and project is -.025, 0.257, and .241. The significance level for t-test for course, partnerships and project is 0.804, 0.014, and 0.019 respectively. Only 12.8% of variance in awareness explained by three independent variables. The project and partnership has a considerable impact on student awareness about gender inequity. Thus, hypothesis 10 is substantiated.

TABLE 11: GENDER INEQUITY

R	R ²	F	Sig-level(F)	Sig-level t _(course)	Sig-level t _(Partnership)	Sig-level t _(Project)	Standardized coefficients Beta _(Course)	Standardized coefficients Beta _(Partnership)	Standardized coefficients Beta _(Project)

H 12₀: The academic activities done by the institute does not make a significant difference in promoting awareness about the Global Warming Initiatives.

H 12_A: The academic activities done by the institute makes a significant difference in promoting awareness about the Global Warming Initiatives.

To test this hypothesis, multiple regression analysis was done. The first table 12 output list R(.434) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The R² (0.162). The ANOVA values indicate that F is 7.253 at 0.00 level. The Beta under standard coefficients for course, partnerships and project is -.160, 0.217, and .342. The significance level for t-test for course, partnerships and project is 0.107, 0.033, and 0.001 respectively. 16.2% of variance explained by three independent variables. The project and partnership has a considerable impact on student awareness about global warming. Thus, hypothesis 12 is substantiated.

TABLE 12: GLOBAL WARMING

R	R ²	F	Sig-level(F)	Sig-level t _(course)	Sig-level t _(Partnership)	Sig-level t _(Project)	Standardized coefficients Beta _(Course)	Standardized coefficients Beta _(Partnership)	Standardized coefficients Beta _(Project)
0.393	0.162	.5.749	0.001	.804	0.014	0.019	-.025	.257	.241

H 13₀: The academic activities done by the institute does not make a significant difference in promoting awareness about the problems related to Urbanization in India.

H 13_A : The academic activities done by the institute makes a significant difference in promoting awareness about the problems related to Urbanization in India.

To test this hypothesis, multiple regression analysis was done. The global warming is widely debated topic on which awareness needs to be created among the student. But the awareness by the academic activities was only 12% and 16% for urbanization and global warming, respectively. The first table 13 output list R(.385) is the correlation of three independent variables with the dependent variable, all the intercorrelations among the variables are taken in the account. The R² (0.121). The ANOVA values indicate that F is 5.456 at 0.002 level. The Beta under standard coefficients for course, partnerships and project is .042, 0.233, and .225. The significance level for t-test for course, partnerships and project is 0.681, 0.026, and 0.028 respectively. Only 12.1% of variance in awareness explained by three independent variables. The project and partnership has a considerable impact on student awareness about global warming. Thus, hypothesis 12 is substantiated.

Conclusion

The conclusion of this research is listed below.

1. The data on rural India shows that students are very well aware about the problems. The academic activities undertaken in the form of the coursework, community links and research though makes a significant difference but the effectiveness is very low. So the other factors need to be related to academic activities need to be explored or these factors need to be strengthened for explaining the model better. The partnerships and course inclusion can be the improvement areas. There is a big rural urban divide. So these backward areas need to the playground for innovation for the young minds with the enthusiasm to stand as

wealth and job creators. The college should be an agent in the upliftment of the rural people by being a facilitator with the role of exposing and connecting people and ideas.

2. The partnership (community links) has a major contribution in promoting awareness on entrepreneurship opportunities and development. These partnership facilitate networking in form of conferences, workshops and summits to facilitate the exposure on the entrepreneurship avenues. Though course inclusion on this area as a subject and few respective projects as the part of course are present as a practice but these needs to be strengthened in a structured way for increasing the awareness level and creating entrepreneurs.
3. The repercussions of job retrenchment or insecurity are also affecting the emotional and physical health of an individual. The vocational training or incubation lab should be a part of curriculum to deal with the unseen challenge faced by three-fourth of the private sector employees. The awareness is through project followed by the partnership but system of academic activities needs to be developed for searching alternatives so that individuals could lead a secure and healthy life.
4. The awareness related to energy issues are not at all pursued by the current educational set up of management graduates. In spite of good awareness level the educational framework failed to create a significant difference in awareness through academic activities.
5. Awareness about values in three dimensions (cultural values, family values and the governance) is significantly contributed by the academic activities but to a very low extent. More focused things needs to be practiced under the activities in the related area. The imbibing of these values creates a responsible citizen involved in an ethical and clean business activity. The enriched aspects Indian Culture and family traditions should not be the victim of the dynamic social change. The cross cultural knowledge, a very essential need of the present era with a perspective that the student would be part of globalized world in future should be consciously enforced in the form of subject knowledge, projects and partnership areas. So the student should be culturally intelligent.
6. The learning on the gender issue forms the building block of sustainable and developing society. The knowledge and its practice in the business and the social environment should be professed by young generation for creating a sustainable world around. The increasing number of cases of sexual abuse and rape has raised a question mark on the tranquility in the society leading us on an unsustainable path. The acknowledged presence of glass ceiling in the work area again and again and the poor quality of life lead by the women in traditional Indian families need to be improved.
7. The learning about repercussion on the environment as the result of rapid development to accommodate the needs the expanding population needs to be provided to every student in higher education. The economics of rural migration to cities and urbanization should be critically evaluated by the students. The projects and partnerships have promoted learning on this aspects but it should also have a course inclusion as well. But the model is too weak. The academic activities are able to explain the awareness in students to a little extent.

Practical Implication

The academic institutes should not only work with a vision of placing the students and achieving their profit margins. Consistent efforts should be made to bring out responsible citizens. This could be only achieved when the problems of different nature i.e. social, economic and environment are addressed with power of education and mobilization of young minds in the particular direction. Integrated research for designing learning systems and structure to capture the sustainable issues, apart from the curriculum offered in the higher education can be a breakthrough approach for achieving sustainable development of the higher education.

Designing Effective Systems for Transfer of Learning and Outcome Based Evaluation

Vidya Nandagopal, vidya@agu.ac.ae,
Al Ghurair University, UAE.

Abstract

It is being increasingly understood that training success depends upon the individual's readiness for training and the degree of organizational support for training. Characteristics of the individual and work environment are important influences, before, during and after the training event. The organization has a definite role to play in influencing the person's career attitudes and beliefs that he or she can benefit or learn from the training. The prime purpose of management development is effective managerial behavior and not just knowledge and attitude. Thus a model that has individual learning as its main focus is flawed as it ignores the key aspects of organizational context. Another key aspect of corporate training around the world is that even today evaluation of training outcomes is one of the least well conducted aspects of training. Evaluation mostly tends to concentrate on input based metrics that are easy to collect as against outcome oriented metrics. Very often evaluation gets trapped into a low level minimalist regime that often delivers little and yet eats up a lot of resources.

This paper relies on responses of 50 UAE based trainers who have been interviewed in depth on this topic. Also case studies of how organizations have designed effective systems to enable transfer of learning in workplace are included. Two before-after experiments were conducted and their results are also included. Evaluation tests carried out by these practitioners in the UAE currently and their suggestions are also included. The data was analyzed using paired comparison and correlation technique. The study is of particular interest to not just training practitioners but also HR departments of organizations.

Introduction

Anyone who wants to understand training and development needs to understand very carefully the nuances of the process of training. A wide gamut of issues and events that take place before, during and much after the training is over. All of these contribute either directly or indirectly to training effectiveness. The prime purpose of management development is effective managerial behavior and not just knowledge and attitude, though these could be significant contributors to effective behavior. Thus a model that has individual learning as its main focus is flawed as it ignores the key aspects of organizational context in which the learning is translated into effective managerial behavior. An early example in this connection was described by Sykes (1962) who studied 97 supervisors who were trained in the principles of participative management. However when they returned to their workplace their senior managers they found had no intention of supporting their participative management style. After a year most of the line managers left the company. Thus, learning and attitudes are necessary but not sufficient. $\text{Performance} = (\text{some function of}) \text{ability} \times \text{motivation} \times \text{opportunity}$.

It is being increasingly understood that training success depends upon the individual's readiness for training and the degree of organizational support for training. Characteristics of the individual and work environment are important influences, before, during and after the training event. The organization has a definite role to play in influencing the person's job or career attitudes and beliefs that he or she can benefit or learn from the training. With the change in business standards and increased business complexities, organizational processes are being changed very frequently. In order to cope with these processes, employee development becomes very crucial and forms an important route to organizational development. Training, exposure to new processes and preparing employees through performance counseling can add to employee development in a significant way. Essentially there needs to be a willingness to

spend on employee development by the employer and willingness to participate in self development on the part of the employees.

Although managers are not often trainers, they play an important role in influencing employees' readiness for training. Motivation to learn is the desire of the trainee to learn the content of the training program. Various research studies have shown that motivation is related to knowledge gain, behavior change, or skill acquisition in training programs. Managers need to ensure that employees' motivation to learn is as high as possible. They can do this by ensuring employees' self-efficacy: understanding the benefits of training; being aware of training needs, career interests, and goals; understanding work environment characteristics; and ensuring employees' basic skill levels. Many managers send their employees to training and seminars without even a clue of what will be covered and how will it benefit the employees and their dept. and how to reinforce what has been learnt.

Individual factors and workplace factors along with the training process complete the circle of factors upon which training effectiveness depends. While individual and workplace factors have been known to influence training effectiveness, even now very little research is carried out in these areas.

There are many instances in the UAE of trainees not being able to implement what they learnt due to issues or constraints in the workplace. Hence post training, it is very important for the organization to provide a congenial atmosphere that will encourage the participants to apply what they learnt. These could be related to resources availability or in some cases to just projecting the right attitude by superiors, subordinates or colleagues.

According to Martin, Harry J, "Human Resources, Lessons Learnt-The key to effective training isn't necessarily what happens in the classroom: It's what you do afterward", teaching employees new skills is one thing and getting them to apply what they have learnt is yet another. Considering that only 10-40% of training is ever used on the job, there is a lot of wastage involved in training. The author feels that the reason for this is that training involves change which in turn creates anxiety. Hence organizations need to create a work atmosphere that actively encourages people to change. Even simple activities like having trainees write down how they use their skills or having them discuss their progress with peers can help. It has been found that such follow up activities led to trainees initiating projects that resulted in substantial cost reductions in some divisions. A conscious effort to measure effectiveness and that too multiple times is required. As each type of training and training situation requires a unique treatment, it may involve some legwork for the concerned people implementing this part to come out with unique solutions. This is where some creativity and coupled with discipline and a passion to make a difference is required along with a detailed knowledge of the business process as well as human psychology.

Most trainers and training organizations in the UAE are busy making the training happen, and feel drained after that. Mostly no pre training evaluation is done thus making it difficult to know if the changes are indeed due to training or some other reason like a change in management policy, or individual attitude etc.

A National survey in UK showed, only 19% of respondents attempted to assess the benefits of training they undertook. It was found that 4 out of 5 establishments in Britain did not make any attempt to assess the benefits they get from undertaking training. . Although US practices seem more advanced, it is worth noting that a report by Carnesville and Schulz for the American Society of Training and Development (ASTD) on the ROI of training also painted a bleak picture. A 1988 ASTD poll found that only 20% evaluated in terms of training's economic effect on the organization. In other words a lot of subjectivity still prevails in the area of training. Thus even in a global sense we have a long way to go in the area of outcome based evaluation of training. It seems that most training depts. world over end up measuring input while on the other hand as investment in training goes up we need to focus on training outcomes and how they reflect on the bottom line. Surely the UAE has a long way to go in this area. The orientation of the HR professionals towards more subjective ways of doing things rather than work with metrics is perceived as a major obstacle.. This is further compounded by lack of long term perspective among professionals in

the UAE.. Metrics rely on information and history of data all of which requires long term commitment by the organization and HR professionals.

Literature Review

This section has been done through my research with online books, journals like Proquest and published research studies in my area. The literature review supports the view that individual characteristics and organizational climate go a long way in influencing training effectiveness. It also shows how training evaluation still remains an unloved activity amongst trainers and organizations,. The suggestions and recommendations made by these studies are included. My literature review also helped me understand that the process of planning for effective training starts much before the event and ends much after the event. This helped me in designing the methodology of my study. (Refer section on methodology below.)

Cascio, F. Wayne () in “Managing Human Resources Productivity, Quality of work life, profits” talking of characteristics of effective training practice, mentions that he found 4 characteristics that seemed to distinguish companies with the most effective training practices, viz.

- 1) Top management is committed to training and development. Training is part of the corporate culture.
- 2) Training is tied to business strategy and linked to bottom line results.
- 3) Organizational environments are “feedback rich”. i.e. they encourage risk taking and afford opportunity to learn from success and failures of decisions. Thus we can conclude from this article that effectiveness of training is a combination of trainer-trainee-organization related factors.

Many companies are undermining the effectiveness of their own training programs because the organizational environment does not support the newly trained personnel. Minton-Eversole, Theresa, (1994) in “Make Training worth Every Penny-On Target Evaluation”, reviews a book by Jane Halcomb. The article mentions that Jane is amazed at how many managers send their employees to training and seminars without even a clue of what will be covered and how will it benefit the employees and their dept. She feels that coaching and counseling is important as a preparatory before sending employees for training as much as it is crucial to reward and reinforce employee’s progress. Also when employees practice new skills it is important to address environmental barriers that may hinder transfer of learning.

Various studies have found that peer and manager support for training is critical. The key factors to success are a positive attitude among peers and managers about participation in training activities; managers’ and peers’ willingness to tell trainers how they can more effectively use knowledge, skills, or behaviors learned in training on the job; and availability of opportunities for the trainees to use training content in their job. If peers’ and manager’s attitudes and behaviors are not supportive, employees are not likely to apply training content to their jobs. Marla Rosner (2003) in “Making Training Stick” feels that sometimes even the best designed programs may falter because of a top- down approach. Both franchisors and franchisees frequently complain that their investment in training does not produce results. The tendency in such cases is to blame the trainer or the trainee. However in reality one needs to analyze how the training was designed and executed and how well the post training reinforcement has taken place.

Geoff, Anderson (1994), in ”A Proactive model for Training Needs Analysis” in Journal for European Industrial Training, Bradford, feels that if training must be integrated into the normal business activities of an organization , it must be both strategically aligned and collaboratively designed. . Much organizational training till date is based on a traditional mechanistic approach to adult training that received considerable support from the 2 world wars

The author mentions that adult educationalist Stephen Brookfield warns that the insistence of traditional training models that training must be outcome oriented and determined from predetermined behavioral objectives neglects the possibility of unplanned learning occurring and the important roles played by insight, reflection and discovery of adult learners. The author feels that we need to challenge the idea that training exists solely for short term economic reasons. To achieve this we will have to approach the development of training strategies in a more holistic manner. This will involve integrating both individual and business needs within a framework which acknowledges all the contributors to occupational competence as well as organizational success. Paton, Nic (2004) in his article ”Money

Well Spent” in Personnel Today says that in a down turn, training is normally one of the things that get cut. The author feels that measuring the effectiveness of training is a somewhat nebulous process. According to this author, the concern is for e.g., how can you show that training has made a difference to the team’s improved productivity. To know this there needs to be a link between business priorities and the way projects are initiated. Learning objectives need to be tied in and demonstrably delivered. Sindell, T. Milo (2002) reviews a book called “How to make smart decisions about training” in an article by the same name, wherein he mentions a concept called CRI – “Criterion Referenced Instruction.” According to the author of the book, Whitmore, Paul CRI focuses on three areas of training:

- Defining and measuring desired outcomes
- Focusing on performance success
- Designing training that reflects the needs of the learner. Here the author tries to put the performance dimension in every stage of training. Special emphasis has been placed on post training follow up to ensure that skills are applied in the right way. Organizations in future need to take this cue and set up appropriate follow up mechanisms to get more value out of training.

Tate, William (2004) in “Applying Learning in Practice” feels that there is an awkward gap between what the learners learn and what happens when they try to apply their learning in their jobs. The gulf between learning and using that learning clearly indicates that the training and development pipe leaks somewhere along its length. Solutions worth exploring are both tactical and strategic. Tactical ones retain their focus on individual learners, seek to improve the efficiency of what is learnt. It seems appropriate to tackle the leak in the system at the individual’s level as well as the organization’s level. There has to be a quantum jump in the number and duration of follow up post training. To look at problems of transfer of learning and to tackle them as and when they occur and use these to develop a sound methodology for evaluating training outcomes.

Rae, Leslie (1999) in her book “Using Evaluation in Training and Development” talks about the criteria for Evaluation. She observes that info on four criteria is essential as a minimum requirement, viz.

- 1) The level of learners prior to learning.
- 2) The level of the learners post learning.
- 3) Confirmation of the effective implementation of that learning.
- 4) Evidence that the implementation changes were a result of that training.

She sums up by saying that we can feel, suspect or guess that the training or learning has been successful but without an evaluative approach we will never know. Phillip , Lewis and Thornhill, Adrian (1994) in ”The Evaluation of Training- An Organizational Culture Approach feel that there seems to be a widespread proposition that evaluation is the least well conducted aspect of all training activities . A recent study of training in UK revealed that 85% of British employers make no attempt to assess the benefits of undertaking training. According to these two authors, evaluation should embrace an organization wide approach that embraces the culture of the organization. Lovell, Kevin (2007) in his article “Getting the Value out of Evaluation” outlines the process for measuring the outcomes of learning. He feels that evaluation has to be outcome focused rather than activity focused. Most evaluation amounts to nothing more than checking reaction. Organizations wanting to do higher level evaluations need to develop a customized approach. In practice most L&D teams are busy with making the training happen.

Bruce, J. Tracey, Tews and Cornell, J. Michael (1995) in their article “Training Effectiveness: Accounting for Individual characteristics and Work Environment” feel that there are certain individual and work characteristics outside the training environment that affect trainees’ preparation for training, knowledge and skills acquisition during training and subsequent transfer of training on the job. The author and his team conducted interviews with 21 training and HR professionals from 10 diverse service sector organizations of varying size to find out what are these external factors. Research revealed the 2 main factors as

- Individual characteristics
- Work environment.

Kirwan, Cyril () In “Improving Learning Transfer” talking of constraints to transfer of learning, the author mentions that high on the list of constraints to effective application is the lack of spare time for practice and development of new skills. This is seen for example in the case of managers returning to work from a management development program, and then struggling to engage in ‘management’ rather than ‘operational’ activity. The author has taken the following observations are taken from an evaluation report around a range of different training and development programs delivered for a medium-sized public service organization. Participants in the survey reported a wide range of organizational factors that helped or hindered them in applying learning. These factors related to manager, peer and organizational support as well as the climate for change within their work environments. This article also lets us appreciate how so many factors have to be controlled after the training takes place so that the training may be effective

Methodology

It was felt necessary through my review of literature to first and foremost begin by testing the attitudes of trainers in the UAE towards various facets of training effectiveness. This was achieved through 50 in depth interviews of prominent trainers in UAE in 2 categories of Corporate training namely, technical training and soft skills training using a structured interview questionnaire administered face to face. Each interview lasted 40 minutes (approx) Their detailed comments and ratings have been captured in the section that follows. A few before/after studies were also conducted by me between 2009-present wherein participants did an appropriate test before the training event, as well as immediately after and were interviewed after 2 months of training to check how they managed the learning transfer process to the workplace. This was done for 60 participants (Asians).

Interpretation and Findings

Major Findings

72% of the trainers interviewed felt that very few organizations did a serious evaluation of training in the UAE. Furthermore 60% responded that evaluations happened sometimes or rarely. It is also interesting to note that only 30% agreed that lack of evaluating was due to it consuming time and resources. On the contrary 50% felt that it was not such a dreaded task after all and one that clients did value. 86% of participants agreed that end of course smile sheets cannot be confused as evidence of learning. 68% of respondents agreed that off late the learning function is being quizzed about its value add to the organization. 94% of respondents felt that evaluation should be tied to the needs assessment process and that it should use a range of tools to be effective. An overwhelming 96% felt that evaluation should be an ongoing process that needs to be done before and after training as well as after a certain time lapse. Most respondents felt that the follow up on training was not at all enough at the moment. On strategic alignment only 60% felt that if training were congruent with business objectives it would be automatically effective. They felt that was just the start of the process of moving towards outcome based training. Also 78% of respondents agreed that modern day evaluation ends up measuring input rather than output.

Qualitative responses

Despite the below satisfactory levels of evaluation of training happening in the UAE, most respondents felt that evaluating training served as a great source of feedback helping the trainer improve his/her performance, content as well as delivery. They said it gave the trainer valuable insights on what worked and what did not in a given situation. They saw training as a dynamic process requiring continuous improvisation. It apparently helped some of them fine

tune their presentation to real time situation. It also helped them deal with a culturally diverse audience sometimes from different levels of management. Homogeneous groups are far more effective to deliver training to but the groups in the UAE currently are a far cry from this.

On the process of evaluation, many respondents felt the need to have a time gap between training and evaluation to allow enough time for the participants to apply what they learnt. They added that a peer review or an interview with the line manager would be an added bonus giving valuable insights on the transfer of learning process. Many respondents strongly urged the involvement of the line manager and felt that evaluating training is better done through a close knit coordination between the line manager and the HR dept. This is so because after the training, the trainer mostly loses contact with the trainee. While some suggested mystery shopping before and after training, yet others suggested using training score card along with performance indicators. This could be developed by the HR dept in coordination with the line manager by linking the KPI's of the individual and his post training performance. However they felt that all this needed high levels of emotional involvement by the managers doing the monitoring. Together with this they also added the need to engrain in the trainees the urge to improve themselves by applying what is taught. It was also opined that currently in the UAE the practice of doing a TNA did not exist except in few cases.

There were wide variations between respondents on the status and nature of evaluation practices in the UAE. They however agreed that evaluation mostly gets done in technical training areas. While in the Government sector a lot of training happens throughout the year, they were more result measurements done in the private sector largely patronized by expatriates, where being result oriented was an essential thing to keep their jobs. Some qualified by saying that evaluation of training happens but in a very adhoc and rushed manner. One of the respondents gave a very valuable insight when he mentioned that since the organizations in the UAE did not view their employees as their assets, training was done more for employee engagement rather than effectiveness. The most often mentioned measurement methods and those they felt would be useful for their kind of training were first and foremost those related to application of learning like feedback from superiors, measuring ability to apply and explanatory tools. This shows an eagerness on the part of the trainers to move towards more outcome based evaluations. This was followed by quantitative techniques which they felt were more suitable for testing technical and skill based areas like project management etc. As mentioned earlier 94% of the respondents felt the need to use a range of tools to evaluate. They felt that using more than one tool helps overcome individual participant differences.. They also added that when you are serious about the evaluation, you need both qualitative as well as quantitative tools. Most of them as mentioned earlier wanted evaluation to be an ongoing process. They felt that this helped ensure right fitment between the participant and the course. Also pre course measurements helped the trainer to understand the level of the audience and he could then fine tune his presentation to that level thereby automatically improving the effectiveness of the course. They also added that evaluations lend a serious tone to the learning activity by giving the respondents a feeling that we mean serious business and you should also be the same. While technical trainers preferred evaluation on site, they also felt that these assessments helped the participants keep abreast of the latest technology in the marketplace and to know where they stand and to continuously improve themselves. While for soft skills, qualitative tools were considered more effective, for technical skills programs quantitative tools were considered more effective. However they added that choosing the right metric was alone not enough. There had to be a sound structure and methodology for measurement.

In order to achieve outcome based training, several suggestions came forth

- 1) By making training a part of the corporate philosophy so that the organization could create a culture where trainees wanted to improve themselves in their work by applying skills and knowledge and the right attitude in the workplace.
- 2) Involvement and commitment of the top management and particularly the line manager was considered an absolute prerequisite.

- 3) They felt that motivation of the trainees and the relevance and context of the training to the trainee ensured outcome to some extent.
 - 4) A thorough understanding of client needs by the trainer was considered an absolute must.
 - 5) The line manager and the HR manager they felt should be involved throughout in the design , development as well as delivery of training. Only then could the training be effective.
 - 6) A proper training needs analysis and identification was considered a must by most of those interviewed.
 - 7) Some felt that linking the training directly to performance on return to work would automatically make the training more outcome based as the trainer and trainee would work towards focused outcomes
- To sum up it was felt that a paradigm shift in the outlook towards training by all concerned was required. Training according to them should evolve into a process starting with needs and ending in effectiveness.

Footnotes

Although the abstract mentions hypothesis testing we encountered some other related issues and had to stop midway to collect some more data. The process is on and if successfully completed as per our estimate should be able to include it in the final paper. The results of the before /after studies are not being presented now as we have finished only those with Asians. The study with Arabs is still on. There have been delays owing to sudden cancellations of training during the recession period. Now the training activity has again started and this data is being collected and collated. If it is ready before the paper is due it could be included as well.

Endnotes

There are distinct advantages arising out of the evaluation process. However in the UAE most organizations are too busy making the training happen with too little focus on the evaluation component.. The development role of the HR function seems to be underutilized owing to the short term vision of the employers as well as employees. As it is a transitory economy people come here with a short focus and limited perspective. In the UAE most of the training especially in the public sector is done to satisfy the technical requirements of say ISO or other such certifications and hence tend not to be that strategic in outlook.. The potential of training is therefore hidden and unknown to the top management in many cases. UAE needs to develop a strategic vision for training to benefit from this activity.

Training has an important role to play as a motivating tool that can be used by HR and line management to get the desirable benefits. It can be used to help develop a positive attitude in the trainee's mind towards the organization. If handled carefully it can work as a powerful motivating tool. However this trend has not set in so far in the UAE. Training in the UAE tends to be focused on here and now skills – skills that the organization can benefit from rather than the individual in a broader sense. HR depts. and organizations in the UAE need to broaden their vision and move towards more of training of a general nature that will benefit the individual first and then through him the organization. With a slight shift in the outlook of training from short term to long term and from post mortem approach to perspective planning, both individual learning and organizational development can be achieved. Here in the UAE the approach to all business processes including training is short term. UAE needs to seriously shift gears to a different plane wherein much more can be achieved from the training process.

There are significant implications for the training function arising from this study for the UAE and elsewhere.

- People issues are growing in prominence.
- Management is decreasingly seen as a status position, growing number have the authority and require management and interpersonal skills to do their job.
- Organizations are increasingly dependent on self aware, capable individuals and must recognize their aspirations.
- Communication and feedback skills are critical as shared objectives become more important. It is less easy to achieve results through hierarchical control, operation through alliances and coalition is required and appropriate influencing skills are required. As we move towards a flatter organization with taskforces and informal work culture, different kinds of L&D activities especially the soft skills kinds will become more important. Leveraging the complementary skills of culturally diverse and multidisciplinary teams will make training a complex and necessary activity and one that takes cognizance of the changes in the organizational setup in the years to come.

The requirement for reinforcing traditional management principles is replaced by the requirement for the delivery of less specific interpersonal skills to a more amorphous, less acquiescent population. The training manager is himself or herself a participant in the management. In recent times, in the age of mergers and alliances, people are required to be team players. Training also in a way needs to reflect these organizational changes in its content and outlook. The current decade is seeing deep changes in the HR area. This poses a challenge to all working in this area anywhere in the world. Organizations and trainers need to make a strong commitment to evaluate correctly, viz. to evaluate outcomes and not just the training activity which is what the smile sheets do. They need to move to levels 2 or 3 of evaluation rather than being stuck at level 1 which they are in at present. There have to be a complete new branch of activities in the HR dept devoted to post training activities leading to a more proper evaluation of not just

training process but outcomes of training as well. This also needs the line managers and training professionals to work closely and to cooperate with each other. This should be coupled with a system that is transparent. We also need to understand that the attitude of “one size fits all” doesn’t work in setting evaluation methods for training. Each type of training needs to be studied for the desired outcomes and then analyzed and fitted with the best ways of evaluating. This needs to be a customized approach keeping in mind the type of training and the desired outcomes, the type of organization and the type of people getting trained. Consultants or HR depts. working in this area need to be highly experienced to come out with the right methodology for evaluating a certain type of program. We need that all organizations think of evaluation at the Training Needs analysis stage and when planning training itself. It should be an integral part of the training action plan.

In conclusion there are definite pointers for substantial improvements in the training process for organizations in the UAE starting from the training needs identification stage way down to the successful evaluation of training outcomes.

Internationalization of Higher Education in Central Asia

*Jyldyz Aknazarova, akjyldyz@mail.ru
Osh and Osh State University, Kyrgyzstan*

Abstract

This paper focuses on the Bologna Process and its influence on higher education as one of the tools to increase its quality. Quality of education, which is one of corner stones of the Bologna Process, is multivariate concept, which comprises all its functions and types of academic activities. This research enables the author to make the following conclusions: Central Asian higher education institutions need 1) improved university governance and elimination of corruption, 2) developed infrastructure, 3) integration into the international educational space through building innovative higher education partnerships between American, European, and Central Asian universities, 4) introduction and implementation of the main objectives of the Bologna Process with combination of traditional and international experience. These changes will raise the role of universities as innovative engine and the center of knowledge and effect on internationalization of Higher Education in Central Asia.

Introduction

Today politicians of the most developed countries of the world understand the role and significance of education, considering it as the primary factor of social and economic progress. Maintaining a high education level is the major condition of stable development of any country. Experts of the Organization of Economic Cooperation and Development (OECD) emphasize that basic economic growth long-term rates in the OECD countries depend on the support and expansions of knowledge ... For the last two decades in many OECD countries the real growth of the added value in the sectors based on knowledge has stably exceeded economic growth rates. “The process of globalization accelerates these tendencies ... Comparative advantages of the countries are less and less determined by natural resources or cheap labour. They are more and more determined by technical innovations and competitive application of knowledge ... today, the economic growth is in the same process of knowledge accumulation as the process of capital accumulation.”¹

At present, the higher education in the Central Asian countries (Kazakhstan, Kyrgyzstan, and Tajikistan) is characterized by poor quality of education and a sharp increase of the number of university graduates, while half of them are not employed according to their specialties. If there is a common purpose that links the approaches of Central Asian governments, it is that tertiary education should contribute to the consolidation and modernization of their societies. These three nations had reasonably successful education, using quantitative indicators such as literacy, primary and secondary coverage and research, under the Soviet Union and part of this legacy remains. Yet, that legacy is irrevocably part of history leaving the political elite with the task of creating new educational systems for the new countries. Suffice it to say that such a task is likely to involve challenges that go beyond education to include questions of national identity and globalization with responses – though inconsistent or fragmented – driven by different doses of principle and pragmatism. The three countries have not followed the same model, but there is enough similarity between the problems that they face coupled with their geographical proximity, to compare their different responses. While in all countries the rural population tends to be poorer, it is the size of that population and its opportunities for attending schools that define the educational challenges and which are then transferred as policy options into the higher education system.

The challenges facing higher education in Central Asia

The political and socio-economic transformation process that has taken place in the past ten years in Central Asia has set new requirements for the education sector as a whole. It is nowadays widely accepted that education and trainings are key ingredients for modernizing transition economies and that new forms of organization require higher

level skills and an increasingly flexible labour force. Education is a key instrument to maintain stability and social cohesion, to promote economic growth and reduce poverty. It is also accepted that “knowledge-based” economies demand highly skilled and flexible people. Higher education can contribute to reducing unemployment, social tensions and assisting economic integration. High-quality higher education institutions produce well-qualified graduates with the skills and knowledge needed to meet the challenges of the economic and political reforms and guide their countries to enhance living standards. Higher education is under strong pressure to produce the skills required by the new economic conditions.

Higher education systems in Central Asia are faced with the new challenges linked to the transition process: declining quality, dramatic decline in state spending in education, lack of adequacy to the needs of the labour market, excessive regulation, and reduced access to higher education for the poorer layers of the population. Instead of offering a general and broad education, many universities are still trying to equip students with narrow specialties for which there is no longer a demand in the labour market. There is a general mismatch between the number and profile of graduates and the employment prospects available to them. Political statements give high priority to education, but these declarations sometimes remain unsupported by appropriate funding and proper capacity building and staff development. Most universities are aware that they need to develop a modern perception of their role and mission: the prevailing view is often that their main task is restricted to traditional teaching and scientific research. More attention would need to be paid to the need to educate highly qualified people who will have to meet the quickly changing requirements of the labour market and regularly update their skills and qualifications. Employers are generally not involved in the definition of higher education programmes but most universities realize that they need to develop the entrepreneurial spirit and motivation needed to take part in new partnership projects. The mechanisms to ensure the relevance of higher education to the labour market requirements still need to be developed. Higher education programmes must prepare students for lifelong learning, and provide them with the skills that will help them to cope with future changes. To be able to respond flexibly to emerging demands, universities need to be in constant dialogue with the labour market. Because of the lack of communication between universities and the labour market, the market abounds with specialists for whom there are little demand.

An obstacle to the co-operation between universities and the world of work is, in some cases, the absence of well-developed enterprises that have the capacity to establish partnerships with universities. Co-operating with small and micro enterprises that are hardly surviving is almost impossible. A possible and partial solution could be to rely on networks and associations of entrepreneurs rather than on small and scattered individual enterprises. At a time when the education system needs to react sensitively to market needs, more attention should be paid to partnerships between educators and employers.

Teaching is still too often teacher-centred, with lecture-heavy timetables, memorization of facts, little independent work, and students having to be the passive receptors of knowledge. University managers and teachers realize that still a lot needs to be achieved to train students for active learning, which will help them to find a job in the highly competitive labour market. More attention is now paid to the need to increase the overall quality of education, and become more closely involved with the developments of the Bologna process.

The Role of the Bologna Process

The Bologna process aims at establishing a European higher education area. The Bologna declaration accepted by the Ministers of Education almost of thirty European countries in June 1999 is aimed at the formation of the all-European higher education space and securing leading global positions for European higher education institutions. The given declaration says, “We should thoroughly control the rise of competitive capacity of the European higher education system in the world. Vitality and efficiency of any civilization are evaluated, in fact, by attractiveness of its cultural values, i.e. level of impact on other countries. We should be confident that the European higher education system possesses that level of attractiveness in the world that corresponds to the significance of our prominent cultural and scientific traditions.”²

What did the Ministers who signed the Bologna declaration want?
I think that they were looking for the following three things:

1. To start a process of convergence in the structures of higher education, in its architecture;
2. To consider measures that would build trust between their educational systems or create understanding for a start;
3. To build something that would increase the attractiveness of their higher education systems, which would make them understandable for people to come in from other parts of the world and bring their own experience and their own perspective to Europe.

These ideas are about an external dimension to the Bologna process, and a way of making simpler and more comprehensible structures to bring people in. The Bologna Process was not an easy process for Europe. In almost every country there have been difficulties, sometimes-political difficulties, sometimes difficulties with academics, who do not see why they should change the patterns of teaching that they are comfortable with. Difficulties were sometimes with students who do not see as much security in the new structures as in the old ones.

Therefore, the Bologna declaration proclaimed six basic purposes for the creation of the European higher education zone and the promotion of the European higher education system worldwide, namely:

- Introduction of two cycle trainings (bachelor-master);
- Introduction of credit hours to measure working hours spent by students to study educational programs;
- Introduction of the all-European supplement to diplomas for securing employment possibility for European citizens and increasing competitiveness of the European higher education system;
- Education quality control;
- Expansion of students mobility;
- Securing appeal of the European education system.

The introduction and application of the main aims of the Bologna Process, both at the national and international levels, are an essential condition and effective way to form an open all-European educational space. Today, 81 percent of European countries entered the Bologna system.³

The Bologna process involves the adaptation of a common framework of readable and comparable degrees, the introduction of undergraduate and postgraduate levels, the introduction of credit systems, the promotion of a European dimension in quality assurance, and the elimination of remaining obstacles to the free mobility of students and teachers. Most countries in the region are revising the structure of their higher education degrees, to make it compatible with the recommendations of the Bologna process. Quality is becoming a key aspect of the higher education modernization process, with the development of national standards, the upgrading of certification and accreditation institutions, and the training of local staff on new quality assurance procedures.

The mobility of students is an important purpose of the Bologna Process, which creates a competitive environment for higher education schools. It is the academic mobility of students that enables them to easily move from one university to another during their studies, i.e. the student is not so closely attached to the university where they began studying as they were in the past. Higher education institutions have stopped being a monopolist. The key to the successful maintenance and increase of the number of students at a university is the satisfaction of their demands as consumers of higher education services. Undoubtedly, there will be bigger competition between higher education institutions for maintaining or acquiring new clients. The aspiration of students to receive education of international standards promotes the growth of competition, and this, in turn, stimulates the improvement of the quality of curricula. While analyzing the literature on the Bologna Process, one can see that authors frequently express their reservations saying that the matter is not so much about the quality of education, but about “those mechanisms, procedures and technologies, which secure the level of quality for all high education schools and labour markets that produces trust.”⁴ Indeed, in a situation where universities in the Central Asian countries spring up like mushrooms, the inclusion of a bigger number of countries into the Bologna Process brings about a problem of trust in the diploma i.e. the issue of maintaining some formal minimum quality control rather than a problem of education quality.

So, why have the European countries gone through the Bologna process? I think there are a number of things that are driving it, and that they are important for Central Asia as well. First, it is a capacity issue. The European Union is seeking to give experience to a larger percentage of its population. Some have said that 50% of any age group should have higher education experience. That is an enormous number. And it has certain

consequences. If you want to get 50% of your young people into higher education then you have to ask yourself whether a six-year qualification is appropriate. Whether, that is what individuals actually want. Whether there are actual jobs available for so many people with a six-year degree programme. The answer to both those questions is no. There not such jobs available and it is not what most people want. Most people want a greater degree of choice. That is the second element, because our education systems are moving towards the idea that the individual should have a greater degree of choice. This Bologna structure enables individuals to have more choice. Higher education is desirable, but it does cost money. Putting 50% or 35% or 20% of young people through the process of higher education costs considerably more than giving them the choice to opt out earlier if that is what they want. Finally, the EU wanted to align their education structures to the model that was already quite well understood in other parts of the world. The Bachelor, Master, Doctoral systems have provided a way to make their systems more readable, more understandable, and more attractive. The Bologna process contributes to the development of models of higher education. It develops mutual learning and encourages higher education to contribute to the development of societies, not only in Europe but also in societies elsewhere in the world. It also encourages contacts and links between institutions within Europe and elsewhere in the world. When we develop higher education, we develop society as a whole. If we can create links between institutions, which are already built on links between people, then we will find a way of going forward together, not just in education, not just at universities, but also between the countries of Central Asia, and the countries of the European Union.

The importance of the creation of Education Quality Assessment Systems

Two factors still affecting quality negatively are the lack of quality evaluation and corruption, the latter of which is mainly linked to inducements paid to enter university and obtain diplomas. This practice can only undermine the attitude of students and the value of university diplomas, which are no longer seen as the guarantee of academic standards. A number of initiatives have been taken in the modernization of their higher learning institutions. Most governments are, however, committed to education reforms, stressing the fact that education is an important factor of economic and social prosperity.

Most Central Asian countries have taken up these challenges and initiated ambitious education reforms, developed new policy reforms, and started to redefine the missions of their education system to be in line with the requirements of a modern society. However, initial expectations about the transformation of the educational systems have largely failed to materialize. Higher education legislations are being adjusted to the new socio-economic environment, and strongly influenced by developments taking place in Europe. Each country is of course following its own pace: some countries are more advanced and have heavily invested in education and training; some have less resources to invest the modernization of higher education systems. A lot of emphasis has been put on curriculum reform. There is without a doubt a need to modernize curricula, which are rigid, centrally determined, overloaded, not adapted to the needs of the labour market, inflexible and cover a narrow scope. But curricular reform can only be considered as an entry point for reforms, not an end in itself, it has to be accompanied by the proper structural reforms of the systems. This is a considerable challenge.

The problem of the harmonization of national education quality control systems and development of common approaches has appeared to be difficult to accomplish. Educational systems of European countries have too many differences starting from principles of educational management to aspects, which at first sight do not directly concern higher education (for example, national languages, histories, cultures, traditions in teaching and training).

Fundamental differences have developed in a certain groups of countries, which may be presented as the Anglo-Saxon model and the Continental model. The first model includes the education systems of Great Britain, Ireland and partly that of the Scandinavian countries. They may be characterized by a high level of autonomy of higher educational facilities, independence from government controls and also a significant share of private ownership in the education system. The continental model is used in such countries as France, Germany and the Russian Federation, where state ownership prevails in the education system and educational facilities have limited autonomy with governments exercising centralized financial and academic control.

Many European countries have their own traditions and wide experience in the creation of education quality assessment systems (for example, Great Britain, the Netherlands, and France).

The various assessment models differ in purposes, approaches, methods and assessment results. Other countries (for example, Germany, Italy and Denmark) have just started forming such systems under the influence of the Bologna Process.

In some countries, the main purpose of quality assessment is the perfection of educational processes, for example, in France, Great Britain, the Netherlands and the Scandinavian countries; while in other countries purposes may be assistance to the international recognition of programs (Germany), informing the public about deserving educational facilities (Estonia) comparison with other education facilities and programmes (Great Britain, Latvia) and the establishment of accreditation status (Eastern-European countries, including the Russian Federation).

In European countries, approaches to assessment are also different: it may refer to the assessment of an establishment as a whole (institutional assessment), which has been introduced in the majority of countries of Western and Eastern Europe; or the assessment of separate subjects or directions of an educational establishment. Accordingly, assessment systems have different forms: accreditation, audit and higher assessment.

Results of quality assessment procedures may be both confidential and accessible to the public; recommendations for educational establishments on perfection as well as confidential comments and ratings based on assessment results may influence the financing and confirmation of educational establishments, the change of their status and image promotion.

Due to political and economic changes in Europe, a tendency of the integration of educational systems is observed during the last few years. Higher educational institutions, which have been exposed to comprehensive government control, obtain more autonomy (the continental model), and, on the contrary, in the countries with traditionally weak influence of government control (Anglo-Saxon model) independence of higher educational institutions are more and more limited, but these processes are developing slowly.

Simultaneously, under the influence of the Bologna process, accreditation agencies are created in Germany, Austria, Denmark, Sweden and Italy, and the education quality assessment system is being transformed in other countries.

Thus, today education quality assessment systems have been developed in the majority of European countries. However, the integration process does not come with the challenge to unify these systems. On the contrary, in order to effectively apply accumulated experience and available resources, a network structure has been established which unites bodies responsible for external assessment of higher education quality on a voluntary basis – the European Association for Quality Assurance in Higher Education (ENQA). It was created to develop common approaches and conduct joint research on the integration of educational programmes.

All three countries in CA are ready to develop internal and external quality assessment systems in order to develop relevant national standards. Taking the lack of the relevant experience, knowledge, expertise and methodology in QA into account, many universities are highly interested in learning and implementing the best practices of their European Union colleagues and establishing a network for information exchange and recognition.

Quality of education in CA is a major debated issue nowadays. Despite the efforts from Europe, the United States and Russia in providing instruments of co-operation and reform, quality has depreciated in a number of universities since 1991. The importance of the quality of education is specifically stressed by Ministries of Education.

In Kyrgyzstan at present the system of higher professional education unites 47 higher educational institutions (HEI) including 32 state and 15 non-state institutions, 41 independent structural departments, 16 branches of local HEIs and 10 branches of foreign HEI. The total number of students of all HEIs (full-time, distant, and evening) is 236,900 and the number of educators is 13,500. Recently, the enhancement of higher education quality has been one of the most important problems. Within the system of higher professional education there are systems of state certification (attesting) and licensing carried out by the state authority – the State Inspection on Licensing and Accreditation under the Ministry of Education and Science of the Kyrgyz Republic. However, the methods of quality assessment used by this public body are more quantitative than qualitative, lacking the characteristics of an internal system of checking the quality of specialists. As a result, the present external system of QA does not motivate HEIs to establish essential valuable internal systems of quality insurance. Universities are

obliged to introduce QA departments. However, a strategy on improving the quality of education does not exist. This initiative as well as lifelong learning is to be addressed in a new frame of alignment with the Bologna process. The system of government financing has improved dramatically since the introduction of the National Testing System in 2002. The idea is that the system administers a universal admission test in all regions of the Kyrgyz Republic, which is free of charge and is open to all perspective students (high school graduates) willing to apply for a government scholarship supporting their studies. Top scorers are awarded government scholarships (as well as stipends). Before, universities were allocated quotas by the government and independently distributed their shares of government scholarships. Despite the fact that the former system was highly criticized for discrimination, corruption, and ineffectiveness, the National Testing System improved the access of young people from remote districts to free education.

Another latent issue in the world of higher education concerns accreditation. Although the National Strategy for Higher Education Development assumes the creation of accreditation bodies, independent from the government, Kyrgyzstan has never had independent accreditation. There has been a debate about it since 2001, however, nothing has been done to promote independent accreditation yet. The respondents of social surveys have stressed the importance of establishing a branch system of quality insurance of higher professional education, which would be based on common methodological approaches. They also have underlined the necessity of arranging experimental bases to work out and implement the system of quality management on the basis of HEIs and academic and methodological unions. However, there is no methodology on establishing such systems in the national system of higher education at the national or HEI level. At present, HEIs have to work out such systems independently. This outcome turns out to generate financial and time expenses.

Thus, we can observe that the problems preventing the process of implementing the systems of quality insurance in HEIs in Kyrgyzstan and CA are linked to the lack of methodology on establishing the system adopted to the national educational standards; the lack of specialists authors; the lack of financial means and, above all, the lack of knowledge of top managers in the field of quality management in addition to underestimating the practical benefits of implementing the systems of quality management in HEIs.

One of the most important concerns is that curricula in most universities suffer from overloading and an irrational allocation of classes. In many respects they remain poorly structured and do not reflect students' needs. In principle, most existing curricula have not been adapted to the expectations of potential employers at all. With the exception of economics, business, and few others, courses are taught in the same manner as at the beginning of 1991. The contents of courses have undergone little change. As I mentioned before, the labour market and the educational services are in many respects isolated from each other. The existing state educational standards are too rigid and do not allow new approaches to developing academic programs. It is worth mentioning, that the Ministry of Education and Science is flexible and often recognizes academic programmes that although do not conform to state standards, bear real market value. At a time of widening relations with European HEIs, and high desire from students to get a diploma recognized worldwide, HEIs are motivated to establish independent accreditation structures and an external system of quality insurance. This fact has been testified by numerous projects in the data field realized by HEIs and NGOs of the Kyrgyz Republic. Therefore, in 2007 the Education Network Association together with the Ministry of Education and Science of the Kyrgyz Republic and by support from "Soros-Kyrgyzstan" Foundation implemented the project "Higher Education Reforming of the KR" realized by the consortium of HEIs of Kyrgyzstan, Italy and Slovakia on establishing quality departments in HEIs of Kyrgyzstan.

Despite some national specifics, the introduction of contemporary quality assurance systems has many common characteristics within the Central Asian countries. The currently existing traditional systems, methods and criteria of quality assessment and control do not satisfy higher education in most countries of Central Asia. All countries highlight their openness and intention to orientate their higher education system towards European frameworks and standards in QA in particular those set by ENQA, adapted to the specific characteristics of national systems.

In Kazakhstan, great efforts have been made in recent years to reform Kazakhstan's education system to meet the needs of a modern competitive economy. This review considers how far these efforts have succeeded, and what still needs to be done in the higher or tertiary education sphere.

A National Accreditation Center (NAC) has been created by the government of the Republic of Kazakhstan. The mission of NAC is to conduct institutional and specialized accreditation of HEIs, the notification, and recognition of certificates; to make contribution to the development of higher education quality. Today in Kazakhstan the main objectives we can cite include the realization of a programme, according to which Kazakhstan would be among the 50 most competitive countries of the world; the implementation of an accreditation model harmonized with international quality assurance practice; and the approval of the high standards of the quality of education of Kazakhstan, developing educational programmes to increase the competitive capacity of the national system of higher education.

In Tajikistan the reformation of the educational system in general and higher education in particular is under way and the country faces many difficulties relating to its demographics, the financing of the education system, the insufficiency of the legal-normative framework, the conditions of transition to the market economy. The Ministry of Education of Tajikistan has worked out the main priorities in reforming the Higher Education in the Republic of Tajikistan (Strategic Directions of Long-term Reforms of Educational System of Tajikistan for 2004-2015). The strategy identifies education quality enhancement as one of the key priorities. Other crucial strategies are to provide transparency and efficient management in the education and to introduce credit technologies.

For Tajikistan, the emphasis is put on the development of a framework for qualifications.

In general, there is a crucial need in all CA countries for the creation and development of quality assurance systems to enhance the quality of education. Quality enhancement, in higher education in particular, has become official policy declared at the government level in most CA countries. It is included in the country development strategies and is one of the national priorities set up by Tempus for Kyrgyzstan and Tajikistan. Our key focus is on the development of national QA systems (internal and external level to get recognition and accreditation). However, the present challenge of QA system development in CA is that we can find it at different levels across countries. There were several initiatives in CA in the enhancement and assessment of the quality of education with some different approaches and in different areas. These initiatives offered systematic work at the national level and inside universities except for Kazakhstan where the National QA Centre was set up under the Ministry of Education and some legislative basis for the accreditation and QA was developed. In the other CA countries some projects and initiatives formed the basis for the future systematic work at the national and later on at regional and international levels. For instance, in Kyrgyzstan research and preparation work for the development of internal QA system model has been started by the Education Network Association with the support of the Ministry of Education and international partners. In Tajikistan there were several projects that covered some parts of QA but not systematically. In Turkmenistan there is not any information about such initiatives. An important fact is that the levels of QA system development in Central Asian countries are quite different, another one is that a joint Tempus project is being implemented with Central Asian HEIs, hopefully creating adequate and sustainable internal and external QA systems at the national levels and providing exchange and recognition within the network. Despite the fact that the recognition of accreditation agencies and their co-operation with national authorities is yet to come, we believe that the Central Asian Network of Quality Assurance will lay the foundations for an accelerated process of the independent accreditation and recognition of studies and quality assurance by non-governmental agencies.

Conclusions

For many Central Asian higher education schools, particularly for the institutions of Kyrgyzstan, Tajikistan, and Kazakhstan, transition to the Bologna Process represents a number of difficulties connected with the imperfect material base and equipment, the shortage of textbooks and manuals and the low salaries of the teaching staff. The condition of libraries does not correspond to current standards. The old Soviet higher education model is used, which is characterized by the all-embracing role of the government in the education system, an authoritative approach to humanities, a huge choice of various programmes and universities without the guarantee of quality, the lack of critical and independent thinking in humanities, and corruption. Such higher education institutions do not provide quality education, and there is not any demand for such graduates in the labour market. However, those higher education institutions (Kazakhstan, Kyrgyzstan), which have experience in the introduction of the western educational models, can gradually adopt the basic tools of the Bologna Process, for example the introduction of the

two-cycle trainings (bachelor – master), a system of credit hours such as the ECTS (European Credit Transfer System) and others. In our opinion, other universities and colleges of Kyrgyzstan should also progressively transfer to the Bologna process via a pilot scheme as new conditions for the educational process are created that correspond to the international education quality standards.

The inconsistency of the quality and credit systems of Kyrgyz higher education institutions is a significant problem. At present, the majority of lecturers and members of Kyrgyz universities and colleges are not aware of the role of credit hours (such as ECTS) or the principal directions of the Bologna Process. The author believes that it would be advisable to hold a series of seminars, trainings, round-table discussions and international conferences for representatives of universities and colleges to raise their awareness among representatives of universities and colleges the principal directions of the Bologna Process not just in Kyrgyzstan, but also in the whole Central Asian region.

The Bologna Process plays a significant role for higher education schools as it ensures that higher education and scientific research systems will continuously adapt to the changing needs and demands of society and to the necessity of scientific knowledge development. In the near future, this process, as one of the tools for improving the quality of education will promote the increase of international competitiveness of the higher education institutions of Central Asia.

Thus, it is important for higher educational institutions to create favourable conditions for their transition to the European system of transfer of credits, to improve and introduce modern models and methods of university management in the area of the organization of educational processes, personnel administration, financial management and the planning of activities of educational institutions. This research enables the author to make the following conclusions: Central Asian higher education institutions need 1) improved university governance and elimination of corruption (transparency, student's participation in decision-making, creating institutes of independent accreditation agencies), 2) developed infrastructure, 3) access to the European and American electronic libraries and appropriate and sustainable technology, and information, 3) integration into the international educational space through building innovative higher education partnerships between American, European and Central Asian universities, 4) creation of successful models of public-private partnerships, 5) introduction and implementation of the main objectives of the Bologna Process combining traditional and international experience. These changes will raise the role of universities as the innovative engines and centres of knowledge and effect on internationalization of Higher Education in Central Asia.

They will also promote the role of the higher education as a crucial factor in national and global economic development. In fact, maintaining a high educational level is the major condition of stable development in any country.

Medical Tourism Growth Market or Hype?

*Marc Faerber, marcfaerber@t-online.de
Comenius University Faculty of Management*

Abstract

Medical tourism is a vivid discussed topic within not only the healthcare industry, but also the media. Reports about US patients traveling to India for orthopedic surgeries, or British housewives traveling to South Africa for plastic surgery combined with attending a safari are omnipresent in the media. Moreover medical tourism is frequently regarded as a chance for emerging countries like India to establish an industry providing growth and wealth for future generations.

However subliminal doubts in how far medical tourism is really a prospering market do exist. Especially the economic potential which used to be described as a source of endless economic growth seems not to be that reliable. Also the surgery and safari stories do not seem al-ways substantiated.

Yet critical voices start to assume that there is not only a great potential for growth but also for hype. Furthermore doubts concerning patients' real motivations do arise, nourishing skepticism about their attitude towards medical tourism.

Therefore my paper aims to investigate, whether medical tourism is a growth market or hype.

Introduction

Medical tourism is said to be one of the fastest growing and most lucrative forms of tourism, as people travel internationally to gain access to medical care.

In 2003 there were 350.000 medical tourists, by 2010 that number grew to 6. Million and by 2017 the number is expected to grow to 16 Millionⁱ.

Quite similarly Deloitte states that in 2007, 750.000 US patients traveled to foreign countries in search of medical care. In 2008 the number is seen as high as 1.500.000 implicating a growth rate in the amount of 100% and growing on an identical basis with a number in the height of 3.000.000 US medical tourists in 2009, 6.000.000 in 2010, 7.500.000 in 2011 and so on with estimation for 2017 in the height of 15.750.000 US medical tourists in 2017ⁱⁱ.

McKinsey however names a number in the amount between 60,000 and 85,000 US patients per yearⁱⁱⁱ. McKinsey's smaller number is caused in part by its strict definition of medical tourists: "people whose primary and explicit purpose in traveling is medical treatment in a foreign country." McKinsey does not count people who receive emergency care, who travel for massages or acupuncture ("wellness tourists"), expatriates who live in foreign countries, nor those who travel to nearby locations for the closest available care^{iv}.

The report does say that there is a huge potential for growth in medical tourism, particularly for those who travel for lower-cost care. It points out that an aortic valve replacement costs more than \$100,000 in the United States, but about \$38,000 in Latin America and \$12,000 at in Asia^v.

Literature Review

In the current economic crisis these growth rates sound almost gorgeous, however voices raise that there might also be a certain potential for hype^{vi}.

A key for such predictions seems to be certain *ceteris paribus* attitude, since issues like terror attacks, outbreaks of diseases such as the flu, or tense political situations like riots in one of the third world medical traveling destinations do not seem to play any role at all.

The 9/11 attacks for instance, led to a significant shift within the US as a medical tourism destination for Middle Eastern patients. Since obtaining a visa for a treatment in the USA was more than difficult or almost impossible for patients from Middle Eastern countries, led to the fact, that these patients started to travel to Thailand^{vii}. Also the flu has a high potential to have an impact on medical tourism. Since the almost annually repeating news about the flu outbreak in its variety of forms in Asia tourists and naturally medical tourists are likely to have a severe impact on medical tourism^{viii}. Also a change in the political situation has the potential of being vital for a medical tourism location. The countries of the Middle East were regarded as a new hot spot for medical tourism^{ix}. Contemporarily however the medical tourism activities in some of the Middle Eastern countries seem to collapse.

Since most of the studies seem to describe medical tourism as a story of constant growth, and neglect a variety of facts that have a great potential to influence the growth in a very negative way, one can have a doubt in how far the topic is thoroughly investigated, and is likely to be a sort of hype. A contemporary study states, that the number of US medical tourists can be counted in thousands and not in millions^x.

By the end of 2008, the researchers conducted a telephone and email survey of businesses engaged in facilitating overseas medical travel for US residents. They collected information from each company included the number of employees, number of patients referred overseas, medical records security processes, destinations to which patients were referred, treatments offered, treatment costs, and whether patient outcomes were collected. 63 medical tourism companies were selected for inclusion and 45 (71%) completed the survey^{xi}.

The 45 companies involved, had referred an average of 285 patients overseas since start up. The survey recorded a total of approximately 13,500 US medical tourists in total for all 45 businesses since they started in business. The most common overseas countries that companies reported referring patients to were India, Costa Rica, and Thailand though many other countries were mentioned less frequently including Malta, Israel, Spain and Germany^{xii}. The most common medical services utilized by overseas medical travelers were orthopedic procedures, cardiac procedures, infertility treatment, and cosmetic surgery^{xiii}. The authors highlight the significant difference between their grand total of 13,500 US medical tourists travelling via 45 medical travel facilitators and the number of articles, studies, and reports that have suggested an amount between 500,000 and 2,000,000 Americans traveling overseas each year for medical care^{xiv}.

As a conclusion of their efforts, the authors of the study propose, that estimates of much larger US medical tourists numbers were provided by parties with personal and/or financial interests in the overseas medical travel market^{xv}. The study however did exclude Americans traveling for dental care, as well as foreign medical tourism facilitators. Nevertheless they point out that even when patients from group 2 and 3 above are factored in, the market may be somewhat smaller than prior studies have estimated. They also point out that two years after conducting the interviews, 15.6% (7 of 45) of companies that completed the initial interviews no longer had functioning websites and thus were presumed to no longer be in business^{xvi}.

Despite the both limitations like excluding the dental treatment and the neglecting of non US medical tourism facilitators the study is still very important. Even in case the “missing” patients from both groups are mingled into the study, the annual outbound medical tourism patient numbers for the USA are perhaps in the region of 100,000 to 200,000 at best, rather than the millions that have been mooted elsewhere^{xvii}.

Conclusion

These facts lead inevitably to the conclusion, that medical tourism is an existing phenomenon with a very high potential for hype. Especially the large gap between the amounts of traveling patients must not be neglected. The fact, that this study despite its flaws unveiled some fundamental truths and facts about medical tourism and its potential for hype is evident.

Hence, further research about the fundamentals of this topic is necessary in order to create a reliable basis for any related activity, no matter if it is related to scientific or economic activities.

Effectiveness of Health Related Public Service Advertising Campaigns

Amit Jain, amitjain@jklu.edu.in
JK Lakshmipat University, India

Jayesh Aagja, Jayeshaagja@imnu.ac.in.
Assistant Professor Nirma University, India

Abstract

Health Related campaigns are much talked and less researched area in Indian advertising. Being Public sector driven there is inadequate research regarding its worth and effectiveness. Neither scientific need analysis is carried out before launch of the campaign nor its effectiveness judged after launch. Sincere efforts to judge effectiveness and impact can lead to improvement in message to be communicated and increase its acceptability and effectiveness. Efforts to judge effectiveness can put best use of public money as millions are spent on such campaigns every year by the government. Most of the advertisers rely on advertising agencies inputs which often lack research and are driven by gut feel. The basic premise of this study is to judge effectiveness of Health related Public Service Campaigns run by govt. Three widely advertised campaigns were selected for the study. The campaigns selected were related to TB, Malaria and AIDS ailments. To Measure effectiveness a questionnaire consisting of open and close ended questions was used. The questionnaire included scale developed by-Leavitt, Clark. (1970). "A Multidimensional Set of Rating Scales for Television Commercials", Journal of Applied Psychology, 54, 427-429, to judge effectiveness of advertisements apart from other open and close ended questions regarding use of celebrities and other executional aspects of the advertisements. The comprehensive scale gives effectiveness of Advertisements using Forty Five items. The study collected responses of 150 viewers of advertisements regarding effectiveness of the campaigns and advertisements. The data was then subjected to suitable statistical analysis to find difference in perception of different demographic segments regarding effectiveness of advertisements and the campaigns. The analysis reveals perception of respondents towards the advertising campaigns and provides suggestions to the stakeholders for improving the effectiveness. The campaigns are to the great extent successful in raising the awareness regarding the said diseases and its preventive measures. Celebrities were found to be highly effective in increasing the overall effectiveness. The advertisements were found to be informative by the respondents.

Keywords: Advertising Effectiveness, Public Service campaigns, Consumer Perception, and Consumer Segments.

Introduction

The flurry of advertisements associated with public service campaigns raises several questions regarding its worth and effectiveness. Public service advertisements (PSA) or announcements are promotional material that addresses problems assumed to be of general concern to citizens at large. PSA typically attempt to increase public awareness of such problems and their possible solutions, and in many instances also try to influence public beliefs, attitudes, and behavior concerning them (O'Keefe, 1990). Most of the PSA deal with health of personal safety topics, including alcohol and drug abuse, preventive health care, traffic safety, nutrition etc. Some PSA also include environmental issues, educational and literacy issues, consumer issues, and general humanitarian concerns like hygiene and cleanliness issues. Mass media audiences are generally attentive and give positive reactions to such advertisements.

Healthcare in India is the responsibility of constituent states and territories of India. The Constitution charges every state with "raising of the level of nutrition and the standard of living of its people and the improvement of public health as among its primary duties". The National Health Policy was endorsed by the Parliament of India in 1983 and updated in 2002.

Health related public service campaigns are the advertising campaigns that are run by the government to create awareness among public about diseases which are very dangerous. The Government of India has introduced various health programme and policies to improve the Indian citizen's standard of living. Government chooses

number of mediums to reach to the masses. For this the government uses television, newspaper, hoardings and radio. Sometimes rallies are also organized to create awareness among people. The example of these kind of campaigns are AIDS awareness campaign run by the government under the banner of national AIDS control organization (NACO), Campaign for tuberculosis, malaria and polio are other examples. Sometimes famous celebrities are taken in the advertisements to create more impact.

The study has been undertaken with an objective to measure the effectiveness of health related public service advertisement campaigns which are run by the government of India. The study included three campaigns which are malaria, tuberculosis and AIDS,

Over the years, an increasing level of insecticide-resistance has developed in the malarial vectors in many parts of the country, while the incidence of the more deadly P-Falciparum Malaria has risen to about 50 percent in the country as a whole. In respect of TB, the public health scenario has not shown any significant decline in the pool of infection amongst the community, and there has been a distressing trend in the increase of drug resistance to the type of infection prevailing in the country. A new and extremely virulent communicable disease – HIV/AIDS - has emerged on the health scene. As there is no existing therapeutic cure or vaccine for this infection, the disease constitutes a serious threat, not merely to public health but to economic development in the country also. (NHP 2002)

Literature Review

Public service advertising (PSA) campaigns are widespread around the Globe. Public service announcements are a type of advertising, sponsored by either government agencies or other organizations, to promote causes and activities generally considered socially desirable (Garbett, 1981). PSAs use paid as well as donated media for creating awareness for social issues. Such advertising is generally produced and distributed on a cooperative basis by governmental agencies or nonprofit organizations working in cooperation with private advertising and mass media companies. Generally the content or programming, while the participating advertising agency and media companies provide creative services, media planning and dissemination services on a not for profit basis. Studies have found no distinction in the effectiveness with the either type of media. Based on self-reported behavior from sample surveys and official counts of incapacitating and fatal highway accidents, in three market field experiments comparing the effectiveness of Paid versus Donated Media in decreasing youth male drinking and driving, the study found both type of media strategies to be equally effective (Murry Jr., 1996). The placement of PSAs has long been debated and earlier studies reveal that most of the PSAs were being placed during non-prime time especially between 7am to 6pm on weekdays (Hannmen et al, 1973). However recent analysis of advertising pattern indicates more favorable time distribution. Same pattern has been observed in India also.

In a study to explore effects of message framing of health advertisements and individual differences in temporal orientation on consumer risk perceptions, attitude, and behavioral intentions, Consumers' temporal orientation moderates ad-framing effects related to goal pursuit strategies. The study demonstrates that a "fit" between a goal pursuit strategy (GPS) manipulation in the ad and consumers' chronic regulatory focus increases the effectiveness of the advertisement, but the regulatory fit effect is moderated by temporal orientation (Kees, 2010).

Exposure to the PSA had no discernible effects on HIV-related knowledge, but did affect perceptions. Compared with an unexposed control group, students exposed to the PSA estimated seeing more HIV- and AIDS-related PSAs and rated the usefulness of TV PSAs lower, at the same time were more likely to rate their chances of contracting HIV as low or none. The respondents expressed less desire to obtain more information. The use of an all-mnemonic phone "number" resulted in a threefold increase in recall of the CDC National AIDS Hotline phone number, but did not affect intentions to call. Overall, the results reaffirm the importance of deploying strategies that go beyond reliance on either a single PSA or TV PSAs alone to affect knowledge, perceptions, or intentions (Nowak, 1993).

A study to judge effectiveness of PSAs found that it is necessary to conduct empirical research to determine the critical variables influencing a given behavior also there is a need to critically evaluate the potential effectiveness

of a given PSA. As all PSAs might not be equally effective and some even might have negative effect. To be effective the PSA need to provide new information and perceived as realistic (Fishbein, 2002).

Public service campaigns are often developed without prior assessment of target audience felt needs and perceptions; audience are not segmented into subgroups indicated by these characteristics, and message and material development proceeds without pretesting the effect of such factors as message clarity, appeals or presenters with target audience (Bratic, 1981). Although testing message in pre-finished form, the producer can identify and correct, potential weaknesses and corrections would be time and budget affordable. In absence of a standardized Health message testing service, effectiveness needs to be checked through post testing. Studies like this one can offer implications for theory, as well as for creators of public service advertising campaigns. North Coast Area Health Service (NCAHS) conducted a seven week television advertising campaign to raise community awareness of the availability of free adult pneumococcal vaccination and to increase coverage among North Coast residents. Effectiveness of the campaign was evaluated by examining vaccine ordering patterns of North Coast vaccination providers keeping previous year as a base. In the months during and immediately following the advertising campaign, a significantly higher proportion of vaccines were dispatched to North Coast immunization service providers (Wallace, 2008). An intervention approach using culturally sensitive mass media messages to enhance protective beliefs and behavior of African American adolescents at risk for HIV is suggested by Romer, 2009. This approach exploits the potential that mass media messages have and engages the most vulnerable segments of this audience to reduce HIV-associated risk behaviors. This study provides further evidence that if a media campaign achieves high exposure and is developed on the basis of careful formative research; it can be an effective HIV-prevention tool for reaching high-risk youth within communities that need them the most. PSAs containing strong verbal claims are rated as more effective than those with weak claims. Arousing messages with weak claims are perceived as least effective. Surprisingly in this study increasing claim strength increased memory for negative but not for positive messages. It is suggested that the combination of intense emotional appeal and weak claims may be partially responsible for the boomerang effects in antidrug campaigns (Lang, 2008). In a study to investigate the consequences of using national celebrities, local celebrities and disaster victims as spokespersons in a public service radio announcement (PSA) soliciting contributions for victims of Hurricane Katrina, it was found that the hurricane victim was the most credible and believable spokesperson. The national celebrity, Ashlee Simpson, was the least credible and the least believable. The local celebrity was more credible and believable than the national celebrity, but no more so than the hurricane victim (Toncar, 2007). No studies were found in Indian context regarding effectiveness of PSA. An attempt is being made to explore this area through this empirical study.

Research Design

A. Research Objective

To Study the effectiveness of Public Service Awareness Campaigns in diseases such as Malaria , T.B. & AIDS.

B. Methodology

The present investigations were descriptive in nature with survey being used as the major research approach. The study used survey method of obtaining information, which is based on the interrogation of respondents through a structured questionnaire.

C. Scope of the study

Being self-funded the study was confined to Ahmedabad city of India. The city is one of the most important urban centers of country and represents diversity of India.

D. Sampling Plan

The Population: The study is carried out in Ahmedabad city of India. The total urban population of city becomes population for the study.

Sampling Unit: Sampling units for the study is individual. From the above population, all the respondents who have seen any of the selected advertisements for the study were defined as sampling unit for the purpose of the study.

Sampling technique: Non probability convenience sampling was used. Care was taken to make the sample representative of the actual population.

Size of the Sample: Respondents for the study were 150.

E. Instrument for data collection

For data collection a survey using a structured questionnaire was conducted. To Measure effectiveness a questionnaire consisting of open and close ended questions was used. The questionnaire included scale developed by-Leavitt, Clark. (1970). "A Multidimensional Set of Rating Scales for Television Commercials", Journal of Applied Psychology, 54, 427-429, to judge effectiveness of advertisements apart from other open and close ended questions regarding use of celebrities and other executional aspects of the advertisements. The comprehensive scale gives effectiveness of Advertisements using Forty Five items with eight dimensions like Energetic, Amusing, Personal Relevance, Authoritative, sensual, Familiarity, Novel and Disliked.

Results

Recall of the advertisements

Advertisement of AIDS was highest watched followed by TB and Malaria.

Suitable Media

Best suited media for creating awareness through PSAs was found to be Television followed by Print. Road shows or rally were not found to be very effective media for communicating health related social issues.

Impact of Celebrity/ Religious leaders

People strongly agreed to impact of Celebrity and Religious Leaders in creating awareness through PSAs (Mean 3.84). In terms of source credibility i.e. effectiveness of Celebrity endorsers in PSAs, Mean score for Attractiveness (4.50) was highest followed by Trustworthiness (3.93) and Expertise (3.61). It implies that popular celebrities are helpful in drawing attention of masses towards the campaign. Merely appearance in the advertisement increases the recall of the advertisement and thus increasing effectiveness of PSA.

Useful Information Communicated by the campaign

As evident from high mean score (3.37), people do believe that they gain useful information from the PSAs.

Effectiveness of Advertisements

To judge the effectiveness 45 item Levitt's reaction profile was used. The scale has eight dimensions giving effectiveness of the advertisements. Responses were collected on a 5 point scale where 1 indicated does not fit and 5 indicated fits extremely well. The scores for last dimensions were reverse coded to judge overall effectiveness of the advertisements. As can be seen scores for personal relevance, familiarity and disliked (reverse coded) are higher. Thus it can be inferred that the respondents find advertisement to be meaningful and relevant as well as they have seen those advertisements many times indicating familiarity with the advertisements. The score for Disliked dimensions were high (reverse coded) indicating people liked the public service advertisements.

TABLE 1: EFFECTIVENESS OF PUBLIC SERVICE ADVERTISEMENTS (LEVITT'S REACTION PROFILE)

Effectiveness of PSA			
Dimension	Mean score		
	TB	Malaria	AIDS
Energetic	2.48	2.58	2.62
Amusing	2.52	2.43	2.46
Personal Relevance	3.43	3.36	3.46
Authoritative	2.74	2.73	2.85
Sensual	2.53	2.61	2.76
Familiarity	3.10	3.09	3.27
Novel	2.88	2.80	2.82
Disliked	3.65	3.61	3.60
Overall Mean	2.90	2.89	2.96

Factor Analysis:

There are two preconditions for running factor analysis. They are measure of sampling adequacy should be greater than 0.5 and second being determinant value should be non zero. For all the factor models ran as mentioned in table 1, both these conditions are satisfied.

TABLE 2: ALTERNATIVE FACTOR MODELS

Scale	Number of factors	Factor Model	Explained variation
	Number of factors		
TB	12	$e > 1$	76%
TB	08	Eight factors	66.7%
Malaria	12	$e > 1$	75.9%
Malaria	08	Eight factors	65.5%
Aids	12	$e > 1$	76.11%
Aids	08	Eight factors	65.5%

TB

By factor analysis, it is inferred that when we solve for eight factor solution, we are able to deduce eight factors like energetic, mix of amusing and novel, personal relevance, authoritative, sensual, familiarity & disliked factors. When we solve for eigen value greater than one, we deduce 12 factors. The factor structure for eight factor solution is more clean compared to eigen value greater than one solution. But, it is less precise than provided by the scale.

Malaria

Factor analysis was conducted and eight factor solution had a better fit compared to eigen value greater than one solution. The factors deduced from eight factor solution are namely, mix of amusing and dislike, novel, sensual, authoritative, familiarity, energetic, personal relevance & a mix of personal relevance & authoritative dimensions.

Aids

Factor analysis was conducted and eight factor solution had a better fit compared to eigen value greater than one solution. The factors deduced from eight factor solution are namely, Mix of energetic, Sensual, Disliked & Amusing, Energetic, Authoritative, Mix of familiarity & Novel, Personal Relevance 1 & Personal Relevance 2.

Difference in perception of respondents of different demographic segments regarding effectiveness of public service advertisements

As can be seen from table 3, we can infer that for disease TB, the difference in scores for amusing and personal relevance dimensions of Leavitt’s reaction profile scale for respondents across different income levels is statistically significant at 0.05 level of significance. Also, the difference in scores for energetic, amusing, authoritative, sensual, novel and disliked factors of the scale for respondents of different age brackets is statistically significant at 0.05 level of significance. The difference in scores on energetic, amusing and disliked dimensions of the scale is statistically significant for male and female respondents.

Similarly from table 4, we can infer that for disease Malaria, the difference in scores for personal relevance dimension for respondents across different income levels is statistically significant at 0.05 level of significance.

Also, for disease AIDS, the difference in scores for personal relevance, energetic, amusing, authoritative, sensual, novel and disliked factors for respondents of different income levels are statistically significant. The difference in scores on energetic, amusing, personal relevance, sensual, novel and disliked factors for respondents of different age brackets are statistically significant. Also, the difference in scores on energetic, amusing, personal relevance, novel and disliked dimensions for male and female respondents are statistically significant at 0.05 level of significance.

Effectiveness in terms of preventive measures

From the survey it was revealed that people have taken proper preventive measures after watching advertisement of public service campaigns. More than 94% respondents agreed to the fact. As per the survey people think AIDS is the most harmful diseases than T.B. and Malaria. From the survey it can conclude that most of the respondents (57%) have provided BCG & Malaria vaccine to their child but still a good number of respondents are there who have yet not provide these vaccines to their child (43%). It shows that either these diseases are not considered to be as severe by the respondents or awareness for availability of vaccine for these two diseases is low. Majority of

respondents (73%) were found to be are aware of free government services that is run by government in their area for diseases like AIDS, T.B and Malaria.

Discussion

Recall for AIDS advertisement was highest followed by TB and Malaria. Celebrities were found to be effective in PSAs. Celebrities were found to be high in attractiveness and thus adding more credibility to the campaign. Respondents believed that they gained useful information from the public service campaigns. Television was found to be the most effective media for PSAs. Overall effectiveness of all PSAs was found to be high. As evident from the above findings it can be concluded that people have good exposure to the public service campaigns and find advertisements to be relevant. People liked the PSAs. Clear factor structure has not emerged as compared to the standardized scale. Some dimensions were not deduced in case of all three cases. Differences were found amongst different demographic segments of consumers regarding perception towards the advertisements, signifying importance of tailoring the advertisements for different demographic segments. From the survey it was revealed that people have taken proper preventive measures after watching advertisement of public service campaigns. Most of the respondents have provided BCG & Malaria vaccine to their child but still a good number of respondents are there who have yet not provide these vaccines to their child. It shows that either these diseases are not considered to be as severe by the respondents or awareness for availability of vaccine for these two diseases is low. Thus it is imperative for government to promote vaccination for the said ailments. Awareness of free government services run by government in their area for diseases like AIDS, T.B and Malaria was found to be high.

Limitations and Future Research

Limitations associated with non probability sampling techniques go with this study also but due care was taken to make sample representative of the actual population. Further research can focus on lifestyle and personality factors of the respondents that might shape their perceptions towards the public service advertisements.

Decision Support Systems Design and Analysis

James Yao, yaoj@mail.montclair.edu

John Wang, j.john.wang@gmail.com

Montclair State University, USA

Abstract

Since their creation in the early 1960's, Decision Support Systems have evolved over the past decades and continues to do so today. Although Decision Support Systems have grown substantially since its inception, improvements still need to be made. New technologies have emerged. Consequently, Decision Support Systems need to keep pace with them. Further more knowledge tends to play a bigger role in forming today's decision making. In this paper, we will discuss design and analysis methods/techniques/issues related to Decision Support Systems followed by an exploration of three possible ways to enhance Decision Support Systems.

Introduction

Over the four decades of its history, decision support systems (DSSs) have moved from a radical movement that changed the way information systems were perceived in business, to a mainstream commercial information technology movement that all organizations engage. This interactive, flexible, and adaptable computer based information system derives from two main areas of research: the theoretical studies of organizational decision making done at the Carnegie Institute in the 1950's and early 1960's as well as the technical work on interactive computer systems which was mainly performed by the Massachusetts Institute of Technology (Keen & Morton, 1978).

DSSs began due to the importance of formalizing a record of ideas, people, systems and technologies implicated in this sector of applied information technology. But the history of this system is not precise due to the many individuals involved in different stages of DSSs and various industries while claiming to be pioneers of the system (Power, 2003; Arnott & Pervan, 2005). According to Arnott (2006), the DSS field began in the early 1970s as a radical alternative to large-scale management information systems (MIS). Over time, major changes in information technology have enabled new decision support movements. In the late 1980s and mid-1990s, multidimensional modeling, OLAP technology, and advances in storage technology and data modeling led to the deployment of large-scale executive information systems, data warehousing, and business intelligence. Now DSSs have become very sophisticated and stylish since the early pioneering research. Many new systems have expanded the frontiers established by these pioneers yet the core and basis of the system remains the same. Today, DSSs are used in the finance, accounting, marketing, medical, as well as many other fields.

The basic ingredients of a DSS can be stated as follows: the data management system, the model management system, the knowledge engine, the user interface and the users (Donciulescu et al., 2002). The database is a collection of current or historical data from a number of application groups. Databases can range in size from storing it in a PC that contains corporate data that has been downloaded, to a massive data warehouse that is continuously updated by major organizational transaction processing systems (TPSs). When referring to the model management system, it's primarily a stand-alone system that uses some type of model to perform "what if" and other kinds of analysis. This model must be easy to use, and therefore the design of such model is based on a strong theory or model combined with a good user interface.

A major component of a DSS is the knowledge engine. To develop an expert system requires input from one or more experts, this is where the knowledge engineers go to work, who can translate the knowledge as described by the expert into a set of rules. A knowledge engineer acts like a system analyst but has special expertise in eliciting information and expertise from other professionals (Laudon & Laudon, 2005).

The user interface is the part of the information system through which the end user interacts with the system; type of hardware and the series of on-screen command and responses required for a user to work with the system. An information system will be considered a failure if its design is not compatible with the structure, culture, and goals of the organization. Research must be conducted to design a close organizational fit, to create comfort and reliability between the system and user. In a DSS, the user is as much a part of the system as the hardware and software. The user can also take many roles such as decision maker, intermediary, maintainer, operator and feeder. A DSS may be the best one in its industry but it still requires a user to make the final decision.

Power (2003) introduced a conceptual level of DSSs, which contains five different categories. These categories include model-driven DSS, communication-driven DSS, data-driven DSS, document-driven DSS, and knowledge-driven DSS. Defining DSS is not always an easy task due to the many definitions available. Much of this problem is attributed to the different ways a DSS can be classified. At the user level, a DSS can be classified as passive, active, or cooperative.

Essentially, DSS is a computer-based system that provides help in the decision making process. However, this is a broad way of defining the subject. A better way of describing DSS is to say it is a flexible and interactive computer-based system that is developed for solving non-structured management problems. Basically, the system uses information inputted from the decision maker (data and parameters) to produce an output from the model that ultimately assists the decision maker in analyzing a situation. In the following sections, we first discuss design and analysis methods/techniques/issues related to DSSs. Then, the three possible ways to enhance DSSs will be explored. At the end, future trends in DSSs will be discussed.

Design and Analysis Methods/Techniques/Issues Related to DSSs

Design Methods

Today, DSSs hold a primary position in an organization's decision making by providing timely and relevant information to decision makers. It has become a key to the success or survival of many organizations. However, there is a high tally of failure in information systems development projects, even though they are a focal point of industrial concern (Goepf, Kiefer, & Geiskopf, 2006). Designing methods have become an important component that assures a successful information system design. This issue is in relevance to the design of a DSS.

There have been many different strategies employed for the design of a DSS, including the early decision-oriented design approach (Stabell, 1983). Current research on DDS design has witnessed the rapid expanding of object-oriented (OO) approach, which exploits object-oriented software engineering with unified modeling language (UML); knowledge management (KM) approach, which supports end-users by embedding declarative and/or procedural knowledge in software agents; structured modeling (SM) approach, which employs a hierarchically organized, partitioned, and attributed acyclic graph to represent models; and design science (DS) approach, which attempts to create artifacts that serve human purposes and solve organizational problems.

Object-Oriented (OO) approach. The characteristic of OO approach is to use object-oriented software engineering with UML in the design and implementation of a DSS. OO design concepts are based on software engineering in that knowledge encapsulation present in a set of objects in an object-oriented system, where subclasses show inheritance of the properties of the main class, is more compact and yet extensive compared to a logic-based system. Higher order logic is required to duplicate the performance of a simple object-oriented system (Pillutla & Nag, 1996). OO approach is considered a novel way of systems thinking. It provides designers and developers with easy analysis of complex systems and design of suitable software systems. It allows the developers and users to think in terms of objects and their behaviors instead of thinking about processes and process complexities. The main advantages are due to the features like data abstraction, encapsulation, inheritance, and polymorphism of OO approach (Nagarur & Kaewplan, 1999).

OO approach involves basically three major steps (Tian et al., 2005). The user's requirements are first captured by using a set of use case diagrams. These diagrams indicate all the functionalities of the system from the user's point of view. Then classes and their relationships are identified and described in class diagrams. Finally,

sequence diagrams or collaboration diagrams are developed, which describe the interaction between objects (instances of classes). Tian et al. (2005) designed a DSS with the OO approach for an organization, which was implemented successfully.

Knowledge Management (KM) approach. In some environment (non-preprogrammed applications), end-users, especially the less experienced end-users, need to have certain knowledge guiding them how to use the system. The KM design approach supports end-users by embedding declarative and/or procedural knowledge in software agents.

West Jr. and Hess (2002) used KM design approach to support end-users with spatially oriented decision-making by reporting on a specific spatial DSS that uses the approach. Procedural knowledge about performing spatial analysis was embedded in software agents that assist users with difficult and spatially oriented tasks. Because the system used a metadata repository, users were supported in some tasks by using the metadata repository directly and in others by using the software agents that access the metadata. According to West Jr. and Hess (2002), KM design approach provides better assistance to inexperienced users of spatial DSS, which requires a design approach that will prioritize knowledge support of the end-users' decision-making activities, and this approach, with the distribution of knowledge between metadata, agents, and end-users, has similar potential as a determinant of system success in any DSS (spatial or otherwise) where both declarative and procedural knowledge are needed to effectively accomplish the decision-making task. .

Structured Modeling (SM) approach. SM (Geoffrion, 1987) approach "uses a hierarchically organized, partitioned, and attributed acyclic graph to represent models" (Srinivasan & Sundaram, 2000, p. 598). It is a formal framework for describing models. SM identifies the basic components of models, the relationships among these components, and conditions under which a model may be termed structured (Lenard, 1993). It includes a language for describing a model schema and prescribes data tables for capturing the details of model instances.

SM decomposes a decision problem into genera and elements within genera in a hierarchic way, which forms a system that is sensitive to natural definitions of entities and objects in the problem (Pillutla & Nag, 1996). It consists of three levels: elemental structure, generic structure, and modular structure. The elemental structure intends to capture the definitional detail of a specific model instance. The generic structure targets at capturing the natural familial groupings of elements. The modular structure seeks to organize generic structure hierarchically according to commonality or semantic relatedness. The leveled structures allow the complexity of a model to be managed and ranked according to its hierarchies. The graph feature allows modelers and decision makers to understand the model better. A key advantage of SM is the ease with which structured models can be visualized (Srinivasan & Sundaram, 2000).

Srinivasan and Sundaram (2002) propose using SM in the design of model based DSS with the intention of solving existing design problems, such as lack of theory or design principles and domain specific issues, in other approaches. They select object relational database environment to implement SM, to be specific, they propose using SM to provide a systematic general framework for conceptual modeling and an object relational database management system (ORDBMS) to implement it. They believe an object relational platform for implementing structured models offers a development platform that is well suited to their needs. Such a platform is uniquely capable of meeting the conceptual requirements outlined by SM while satisfying many practical design concerns such as performance, persistence, and interoperability. They trust that their proposition of using SM approach for specific problem conceptualization and such a powerful environment as ORDBMS to implement it will provide design ideas that can potentially serve a very useful class of applications (Srinivasan & Sundaram, 2000).

Design Science (DS) approach. Arnott (2006) defines design science as an alternative, or complement, to the natural science approach which has been a dominant research methodology in information systems field. Natural science tries to understand reality, but design science attempts to create things that serve human purposes (March & Smith, 1995). In design science, researchers create and evaluate information technology artifacts that are intended to solve identified organizational problems (Hevner et al., 2004). Design science is especially relevant to information system research because it helps to address the role of the information technology artifact in information system

research and the low professional relevance of many information system studies (Benhasat & Zmud, 1999; Orlikowski & Iacono, 2001).

The functionality of a DSS evolves over a series of development cycles where both the end-users and the systems analyst are active contributors to the shape, nature, and logic of the system (Arnott, 2004). Yet system developers have little guidance about how to proceed with evolutionary DSS development. DSS developers are facing the fact that insufficient knowledge exists for design purpose, and designers must rely on intuition, experience, and trial-and-error methods. Design science approach, on the other hand, can facilitate developers to create and evaluate information technology artifacts that are intended to solve identified organizational problems (Hevner et al., 2004). Vaishnavi and Kuechler (as in Arnott, 2006) proposed a design science methodology with the major process steps of awareness of problem, suggestion, development, evaluation, and conclusion. Arnott (2006) proposed a five steps approach, which was adapted from Vaishnavi and Kuechler, for designing evolutionary DSS: problem recognition, suggestion, artifact development, evaluation, and reflection. A research project by Arnott indicates that design science approach can tackle problems of both theoretical and practical importance.

DSS Design Model: DSS Design Model is the most recent DSS design approach developed by Klashner and Sabet and is worthy of a discussion. According to Klashner and Sabet (2007), DSS Design Model differs from any other models and approaches in that it is a more comprehensive design approach to address domain and nondeterministic complexities arising from real-world decision-making requirements. Incorporating morphogenetic principles, the model reflectively and concurrently informs its own evolution and directly impacts the design of the proposed DSS under development “although this new DSS Design Model appears simple and straightforward” (Klashner & Sabet, 2007, p. 991).

The model consists of three major components: theory and analysis, simulation, decision/design. Within the theory and analysis component, multiple data from system domain are fed into theory and analysis. A relation between the theory and domain is maintained to continuously exchange synchronous data and update the theory. The simulation component interacts with the theoretical components to integrate the data feed. As to the decision/design component, the design decision-making process will inevitably be influenced by the effect of theoretical analysis and simulation combined to the degree of not violating the decision-makers’ shared understanding of the design goals. Then the newly integrated design decisions immediately act on the relationship between the system domain and information infrastructure, thus completing the first full iteration since the general iterative flow of data.

Klashner and Sabet (2007) argue that in early years of DSS research design choices were intuitively understood in most cases because of the straightforward nature of the stakeholder’s requirements. But today because stakeholder decisions have become highly subjective and complicated due to the increased problem complexity arising from various semi- to ill-structured problems (Nemati et al., 2002) a more comprehensive systems design approach is needed. Thus the new DSS Design model has been developed to address this issue. At present, the model application is domain specific, but it is currently being applied to another mission critical infrastructure design effort to test its generalizability to other domains where DSS plays a key role in daily operations (Klashner & Sabet, 2007).

Design Techniques

As we are advancing in information technologies, business decision makers can now have access to vast amount of information. On one hand they may gain necessary and important information for making informed decisions, but on the other hand they may also become overloaded by the information irrelevant to what they need. Thus, there is a pressing need for decision aiding tools that would effectively process, filter, and deliver the right information to the decision makers. Proper combination of DSSs and agent technologies could prove to be a very powerful tool for rendering decision support (Vahidov & Fazlollahi, Winter 2003/2004).

A software agent performs interactive tasks between the user and the system. The user instructs the system what he/she intends to accomplish. The software agent carries out the task. By analogy, a software agent mimics the role of an intelligent, dedicated and competent personal assistant in completing the user’s tasks (Bui & Lee, 1999). In the DSS environment, software agents have been more formally described as autonomous software

implementations of a task or goal that work independently, on behalf of the user or another agent (Hess, Rees, & Rakes, 2000). As the traditional, direct manipulation interface of our computing environment is much limited (Maes, 1994), software agents would seem to be a suitable and most needed solution for providing procedural assistance to end-users (West Jr. & Hess, 2002). "These 'robots of cyberspace' can be effectively utilized in automating many information processing tasks" (Vahidov & Fazlollahi, Winter 2003/2004, pp. 87-88).

In some DSS environment, such as spatial DSS (Sikder & Gangopadhyay, 2002; West Jr. & Hess, 2002), Internet-based DSS (Bui & Lee, 1999), and Web DSS (Vahidov & Fazlollahi, Winter 2003/2004), a multi-agent system should be designed and implemented in the DSS to facilitate the decision makers since decision making involves complex set of tasks that requires integration of supporting agents (Bui & Lee, 1999), and these agents should have behaviors to work in team (Norman & Long, 1994). Vahidov and Fazlollahi (Winter 2003/2004) developed architecture of multi-agent DSS for e-commerce (MADEC), in which Intelligence Team (Agents); Design Team (Agents); and Choice Team (Agents) were composed. The multi-agent system was implemented in a prototype of MADEC, which received higher user satisfaction.

Three Possible Ways to Enhance DSSs

Creating Knowledge Warehouses (KW)

Nemati (2002) proposed that a new generation of knowledge-enabled systems that provides the infrastructure required to capture, enhance, store, organize, leverage, analyze, and disseminate not only data and information but also knowledge (Nemati, 2002). Expanding data warehouses to encompass the knowledge needed in the decision making process is the creation of knowledge warehouses (KW). An important component of KW is a very complex process known as knowledge management. Knowledge management allows for knowledge to be converted from tacit to explicit through such processes as filtering, storing, retrieving, etc., thus allowing it to be utilized by decision makers.

The goal of KW is to give the decision maker an intelligent analysis standpoint that enhances all aspects of the knowledge management process. The main drawbacks of KW are the amount of time and money that need to be invested as well as some of the same problems that are found in successfully implementing DSSs. Among these factors are the users' involvement and participation, values and ethics, organization and political issues within the company, and other external issues. The development and implementation of KW still has much work to be done, however, DSSs seem to be headed toward knowledge enhancement in the future and KW looks to have a promising outlook in the upcoming years as a result.

Focusing on Decision Support

While knowledge management systems seem like a logical way to advance the shortcomings of DSSs, another view also exists. By removing the word "system" from DSSs and focusing on decision support, decision making might cause some interesting, new directions for research and practice. Decision support (DS) is the use of any plausible computerized or non-computerized means for improving sense making and/or decision making in a particular repetitive or non-repetitive business situation in a particular organization (Alter, 2004).

DS embodies a broader perspective that seems logical in environments where the user does not necessarily need the technical aspects of DSSs. This is based on the belief that most work systems of any significance include some form of computerized support for sense making and decision making (Alter, 2004). The difference between DSSs and DS is not too drastic but DS is a sensible option for many companies due to the increase in technology since the creation of DSSs; DSSs may not fit the needs of a business as it had in the past.

Integrating DSSs & KMSs

In line with Bolloju (2002), integrating decision support and knowledge management may correct some of the deficiencies of DSSs. The decision-making process itself results in improved understanding of the problem and the process, and generates new knowledge. In other words, the decision-making and knowledge creation processes are

interdependent. By integrating the two processes, the potential benefits that can be reaped make the concept seem more worthwhile.

Integrating DSSs and KMSs seems to be the best choice out of the three possible ways to enhance DSS. The reasoning behind this selection is that integrating the two seems to provide a way for including both options without sacrificing one for the other. More importantly, while KW appears to have a very bright future, KW currently requires a great amount of time and money. The combination of both areas allows for a better overall utilization in the present. In time, KW may not be as time consuming and costly as it is now. However, to achieve a better balance of usefulness and efficiency, the integration of DSSs and KMSs appears to be the smartest choice.

Future Trends

DSS in Business Analytics

The future of DSSs, Angus (2003) argued and supported by SAS (2004), is in the field of *business analytics* (BAs). BAs differ from that of the recently and previously more common business intelligence (BI). With the fast pace of business and life today it would only make sense for a shift to BA because it does focus on the many possibilities and the future outcomes for production and service.

BAs focus on the future of operations. Opposed to that of BI where it focuses on the past and what can be done to change the past if things were done wrong or repeat if things were done right. However, BAs let managers center on what future trends are developing, which allows them not to accumulate a surplus of inventory of outdated products. It also enables managers to change their prices before the market does, or introduce their new product before anyone else gets the chance to. This is known as first-to-market (Gnatovich, 2006). BAs give the companies that use it a tremendous advantage over their competitors in the market place.

Power-Hungry DSS

As everyone can see, the computing power is still accelerating. With its plan of “Itanium” processors, Intel is rushing towards its upcoming generation of 64 bit chips to support power-craving applications. Without any doubt, the power-hungry, large scale, integrated DSS application with dynamic calculation, background data mining, and high-end data visualization falls right into this end of the spectrum (Thomsen, 2003).

Web-Based DSS

The fast growing Internet and e-commerce have greatly impacted the way we conduct business. With the support of intelligent agents, DSS has been implemented for aiding decision makers in e-commerce. E-commerce combines transaction and decision support within an e-framework. Ultimately, the e-world is just another channel (Thomsen, 2003). If we can use the e-channels appropriately, integrate text engines within an overall DSS architecture and provide for interoperability between DSS components, we may actually learn a few things about all this data we are collecting and make better decisions – without losing our humanity (Thomsen, 2003).

DSS in Retailing Business

In the retailing business sector, the competition over customers grows fierce. A customer’s decision of buying from one retailer over another becomes the dividing factor in competition. Additionally, product mix between general and specialty retail is becoming homogenized. This expands the growth for more sophisticated and accurate decision support technology in the business (Rowen, 2005).

A few other trends in the retail business also call our attention. According to Rowen (2005) decision support solutions must interact with forecasting, allocation, and many other demand-chain applications from disparate vendors to increase margins. Additionally, we are being confronted with the coming onslaught of customer, events, and transactional data. Retailers are generating information at a volume that few can find significant use for today. Finally, forecasting and tracking anticipated sales has become another decision support

trend within retail. Such technology enables a retailer to investigate the situation at hand, determining if a product is available.

Research in DSS

In terms of trends in DSS research, in the late 1980s and early 1990s, data warehouse and data mining was one of the focuses of research in DSS field. Since then software agents, also known as intelligent agents, emerged as an interdisciplinary area involving researchers from such fields as expert systems, DSS, cognitive science, psychology, databases, etc. (Eom, 1999). Citations relevant to software agents in this paper support such a proposition.

Studies of design science have shown a significant number in recent years in DSS research (Arnott & Pervan, 2005). This research stream has been rapidly expanding with a range of new topics encouraged by technological advances, methodological innovations, and increased expectations for theory development and empirical analysis of the new artifacts (Banker & Kauffman, 2004), such as the design of auction mechanisms (Bapna et al., 2003; Kelly & Steinberg, 2000) and optimal strategies for investment in knowledge by using a market mechanism (Ba et al., 2001). It is likely that it will remain as a major topic in years to come.

According to Eom's (Eom, 1999) study, Web-based DSS is another emerging topic in the DSS area. Sikder and Gangopadhyay (2002) identified research issues on the design and implementation of a Web-based collaborative spatial decision support system. Vahidov and Fazlollahi (Winter 2003/2004) proposed architecture for a multi-agent DSS for e-commerce and described a prototype system for making online investment decisions with such a Web-based multi-agent DSS. In the pre-web era, DSS was primarily used in an "island" mode. In e-commerce applications today, DSS can be an integral part of the digital environment and directly support the actions of the involved parties (Vahidov and Fazlollahi, Winter 2003/2004).

Conclusion

Since their creation in the early 1960's, DSSs have evolved over the past four decades and continues to do so today. Although DSSs have grown substantially since its inception, improvements still need to be made. New technology has emerged and will continue to do so and, consequently, DSSs need to keep pace with it. Also, knowledge needs to play a bigger role in the form of decision making.

Shim (2002) emphasized that DSSs researchers and developers should (i) identify areas where tools are needed to transform uncertain and incomplete data, along with qualitative insights, into useful knowledge, (ii) be more prescriptive about effective decision making by using intelligent systems and methods, (iii) exploit advancing software tools to improve the productivity of working and decision making time, and (iv) assist and guide DSSs practitioners in improving their core knowledge of effective decision support.

The prior statement sums up the courses of action that need to be taken very well. The successful integration of DSSs and KMSs could revolutionize DSSs and propel it to even greater heights in the future. In closing, DSSs have a storied history that spans the course of four decades; however, the greatest mark may be made in the not so distant future as DSSs continue to evolve.

Abstract

E-Commerce in Slovakia, as well as throughout the world, has undergone many changes since its inception. The main objective of the article is to present Slovak Internet market situation and display cross-section of the most successful companies, which operate on it. Further it reveals some specifics and shortcomings that define trends and future of E-Commerce in Slovakia. The paper then shows how companies are trying to attract the attention of Slovak consumers, what items are purchased the most in Slovakia and what the average price per order is. Summarized advantages and disadvantages and statistics obtained in it will serve as comprehensive view of Slovak Internet market.

Introduction

E-commerce and e-business are sometimes misinterpreted as synonyms. “E-commerce (EC) is the process of buying, selling, transferring, or exchanging products, services, or information via computer networks, including Internet. E-business is a broader definition of EC that includes not just the buying and selling of goods and services, but also servicing customers, collaborating with business partners, and conducting electronic transaction within an organization” [1]

Pioneer in e-commerce is of course the well-known American e-shop Amazon.com. It was created in by American Jeff Bezos in 1994. Due to his idea not to show profit for the first 4 or 5 years it helped him survive the bursting of the dot.com bubble. Bezos comprehended several benefits of online shopping that are very well-known nowadays.

E-commerce allows consumers exchange goods and services via internet with no barriers of time or distance. On the Internet it can be purchased almost everything, online sellers have pushed prices to a level where local shops cannot compete, fixed costs are close to zero, offers of online stores are virtually inexhaustible, the demand has been constantly rising. Lack of confidence in online shopping almost completely disappeared and companies that were the biggest opponents to the Internet a few years ago are now shedding in such trading. Online shopping has become an integral part of the life of Slovak households.

Shopping on the Internet is certainly popular; E-commerce has grown into a huge industry world widely, also in Slovakia it is progressing rapidly. It has many advantages for businesses as well as for customers, therefore more development of this form of commerce can be assumed. Like all forms of commerce also E-commerce has its own risks, however, with application of the E-commerce principles they can be eliminate almost to zero values. [2]

In our article we would like to focus primarily on E-commerce in Slovakia. According Economist Intelligence Unit data (The Economist) E-commerce sector in Slovakia ranks in the top half of European countries in terms of companies and citizens using different types of e-business and e-government services: B2B and B2C. E-commerce is common among Slovaks.

The paper describes situation and specifics of Slovak E-commerce. At first we investigate this concept from historical overview till current situation, point out the most popular and most visited e-shops. We would like to verify credibility and popularity of online shopping among Slovaks according to various statistics, online researches, scientific reports and articles, observation and interviews with people involved in this sector.

In our research we examine attitudes, behavior and preferences of Slovak customers towards e-shops and their products and the whole process of online shopping. Based on research we will draw conclusion and mark some trends in online shopping to the future.

Specifics of E-Commerce in Slovakia

History of E-Commerce in Slovakia

The first Slovak commercial online projects were dated between the end of 90thies and the beginning of the new millennium. The very first e-shop was Dunaj.sk, it started with selling books and later it added music, perfumes, films, tours and other products in 1996. For many years it was number one among e-shops in Slovakia. Others had emerged very slowly. First serious competitor became the online bookstore Martinus.sk, founded in 2001. Since its inception, it has experienced rapid growth and in recent years it is regularly placed on the highest positions in ratings of popularity. However, it has not diversified as majority of other Slovak e-shops, over 90% of its offer are still books.

In 2003 other e-shop Hej.sk became the biggest direct competitor of Dunaj.sk. Hej.sk offers all categories of possible goods, from household appliances, audio / video, up to the perfumes, products for household and garden. Rapid growth and development of Internet helped of course the first start-ups e-shops in Slovakia. Nowadays they are the largest and the most successful Internet companies with annual increase achieved in tens of percent. Current development of E-commerce in Slovakia is supported by the media, that show various examples of success stories of Slovak Internet companies and many people searching for quick profits are establishing e-shops. Unfortunately, many of these projects are ending within the three years. [3]

Current situation and overview of the largest e-shops in Slovakia

In recent years there is noticeable increase in interest in online shopping. Increasing Internet population in Slovakia and increased confidence in online shopping is due various certificates. There are various umbrella organizations for the quality of e-shops and consumer protection. One of them is the SAEC (Slovak Association for Internet), which grants the e-shops with security certificates to their website. At the present, 49 e-stores own the certificate of the association SAEC. Another organization is AZIO (Association of Internet and mail order business).

Success and progress of E-commerce in Slovakia is supported by the fact that during this year's ceremony, Ernst & Young Entrepreneur of the Year 2010, Gramblička Alexander, co-owner of e-shop InterStore.sk, received award "Start-up Entrepreneur of the Year". Currently the company is the broadest Internet Slovak hypermarket, offering 1,500 brands from more than 300 suppliers. [4] In the Top 5 Finalists for 2010 were also placed another e-shop - Martinus.sk. The positive trend in Slovak Internet situation was confirmed by other representatives in TOP 5 - companies AZET.sk and Monogram - creating also websites for e-shops. Managing director of Monogram, Ján Jenča, became entrepreneur of 2010 in terms of innovation. In 2009 Táňa Kyselová from e-shop Pelikan.sk received the prize "Emerging Entrepreneur of the Year".

Besides the above mentioned companies, among other major players in the Slovak E-Commerce belongs Mall.sk which came to Slovakia from neighboring Czech Republic and on its site also offers specialized shops of different kinds of goods. Gorila.sk is the second largest Internet portal selling books and movies, aimed mostly at younger consumers. Among the strong companies operating on the Internet we can also include Nayelectrodom.sk, which offers a wide range of household appliances and electronics. Besides it has the largest network of brick & mortar stores selling electronics in Slovakia. In recent years comes to the forefront another company focused on almost the entire range of goods – Alza.sk.

Slovak e-shops are now using different types of marketing activities to acquire customers, which include primarily direct mail (Newsletter), banners on different web portals, Google Ads and AdWords, as well as various actions on social networking site Facebook. The ads are recognized nearly by two thirds of Slovak buyers on the Internet, mostly just in the form of banners, contextual ads, email advertising, or newsletter. [5]

Comparing with countries of V4

Survey E-commerce 2009, focused on the V4 countries – Slovakia, Czech Republic, Hungary and Poland, showed that the most internet users from these countries had heard about the possibility of shopping via internet. In Slovakia, even 100% of respondents, and many of them have already purchased online. Regarding the number of online shoppers, the survey showed that leaders are Czech Internet users: 81% of respondents from the Czech Republic states that have purchased on the Internet yet, followed by Slovaks (76%), Poles (69%) and Hungarians (66%). The survey results showed that all four nationalities have rather positive attitude for online shopping and they are attracted mainly by low prices and convenience of online shopping. In addition, some respondents from the V4 countries also have some difficulties with online purchasing and the highest percentage of people who have negative experiences with buying over the Internet are from Poland. [6]

Objective and Methods

The aim of the article is to analyze the situation and specifics of E-commerce in Slovakia from the development of this concept to present. In the research part we would like to examine the views and opinions of Slovak customers on online stores.

Information used in this article came from professional books and scientific articles, from unstructured interviews with managers of online shops who have their own observation and experiences from the business in this area. In the quantitative research were gathered information from news agencies Mediaresearch, TNS, SAEC, from professional journals and articles on the Internet. We used information from marketing surveys of currently available resources. A survey "E-Commerce 2010" of the agency Mediaresearch was conducted by questionnaire technique via Internet, collecting answers from a sample of 1011 respondents of Slovak Internet population older than 15 years. Quantitative Internet ad-hoc research "Internet and Shopping" of the agency TNS was created by a sample of 1113 respondents Internet population older than 18 years. Both surveys represent approximately 2.2 million citizens of Slovakia. From association SAEC were used press releases of the years 2009, 2010 and the 2011.

Gathering of information lasted from October 2010 until February 2011, inclusive. Conclusions were based on evaluation of the whole survey compiled by the authors of the article.

Results and Discussion

In this section we would like to describe E-commerce situation in Slovakia and draw some trends and recommendation to the future. This part primary focuses on four areas: How Slovak consumers buy on the Internet; Online stores vs. Brick&mortar stores; Where and which goods Slovaks purchase on the Internet; Trends in E-commerce in Slovakia.

How Slovak consumers buy on the Internet

World economic crisis did not cause a reduction of Slovak's interest in online shopping. On the contrary, from the survey we can state that crisis had an impact on Internet users in the form of an increase in the number of items purchased on the Internet – mainly due to lower prices offered on Internet portals. The biggest potential of increase in consumption over the Internet is just in goods that are not used for everyday consumption. [7]

Several e-shops recorded a triple increase in sales during the Christmas season. For some stores that period of year means one third of annual sales volume. In 2010, pre-Christmas shopping spree was higher still for more than 20% than in year 2009. 26% of Slovak Internet users purchased the gifts on the Web. [8]

Slovaks prefer to shop online from the comfort of their households. Up to 84% of consumers with online experience have purchased from their home. On the other hand, just 8% of people is shopping while they are at work. Slovaks buying on the Internet from home frequently make their orders from the living room (38%), followed by a workroom (30%) and then bedrooms (14%). Regarding the time of shopping, half of consumers do not prefer any particular part of the day, but over 30% indicate the evening as an ideal time for online shopping. The night was represented by 6%. The weather plays an important role in Slovak Internet population's spending. Especially on

weekends. At the sunny weekend people usually do not tend to buy a lot, they rather go to the nature. On the other hand, rainy weather helps to increase sales by 15 to 20%. [9]

Average order value

Slovak Association for Electronic Commerce (SAEC) publishes the results of its members (certified e-shops) in sales of goods and services via the Internet every year. Results from previous periods proved that neither the adverse effect of financial and economic crisis did not stop the gradual growth of sales in this distribution channel, statistics from 2010 indicate further positive changes in consumer behavior and a gradual return to high growth of Internet purchases.

Total turnover of the online stores - SAEC members, reached at the specific period the value of €35.77 million and it is 24.9% more than a year ago. The average purchase amount was reduced from €166 to €125. This reflected the increasing convenience of e-shops, when delivery costs or burden for lower value purchases in a way that would disadvantage them in comparison to shopping in stores. Higher amount of money than the average was spent by entrepreneurs, people with higher education, from large cities, the younger age group.

While talking about the amount spent on the Internet in the past 12 months, the interesting fact is that almost half of consumers (45%) spent more than 200 Euros. 10% of them spent even more than 1000 Euros. Less than 100 Euros spent about one third of buyers on the Internet. [10]

Methods of payment and delivery of orders

Cash on delivery prefers more than half of consumers (52%), almost a quarter uses payment by bank transfer (23%). The remaining methods are payment by card via Internet, payment when taking the goods personally in the store and so on.

For 38% of consumers, the most used method of delivery is courier service, 37% use a services of Slovak Post Office and for almost a fifth of people a mail order / delivery service. Every tenth person picks up the good personally. For 43% of those who purchase on the Internet, the tolerable delivery time is 4 – 6 days, up to 3 days represent 35%. 21% of shoppers do not mind waiting for more than a week. [10]

Frequency of shopping

As we can see from the Fig.1, over the past 12 months, 34% of consumers made 5 or more purchases at the online stores. One fifth of those buying at e-shops made 2 purchases over the last year. Most of Internet population purchased goods (98,7%) and 4 of 10 consumers purchased services.

FIG. 1: FREQUENCY OF SHOPPING AT ONLINE STORES

It is evident that 95% of the Internet population purchases at online stores, only 5% of it does not. Men buy in e-shops more often than women. Also better educated people, people with higher income and from bigger cities make orders at e-shops more often. The most frequently purchase people aged 25 – 34 (60% at least once a quarter),

the least often buy older people (aged 45+). The group of those who have never purchased on the Internet is made of people with low income and people over 45 years-old. [10]

Online stores vs. Brick&mortar stores

Purchasing at brick&mortar stores prefer more women than men, older people and people living in villages or small towns. At the online stores prefer to buy younger people, better educated and entrepreneurs.

For the Internet stores the good news is fact that 23% of customers, who have already made a purchase on the Internet, have the best experience and 72% of Internet population indicates that the experience of shopping at e-shops were good and met their expectations. On the contrary, bad experience with online stores has had just over 2% of consumers. Also, 95% of customers considered the level of e-shops as good, very good respectively.

Short shelf life products, consumer products and those that the should be tried on personally people buy more at brick&mortar stores than on the Internet – those products are food / beverages, alcohol, medicines, newspapers / magazines, flowers, clothing / footwear and products for beauty, cosmetics, drugstore products, fragrances. Food, beverages and alcohol people almost do not purchase on the Internet.

Goods that people rather bought on the Internet than at brick&mortar stores in the last 12 months: flight tickets, tickets to events, books and erotic equipment. The following statistics show the reason why the most of the Internet population prefers shopping at e-shops than at brick&mortar stores.

Fig. 2 shows, what customers think about these two different types of purchasing goods. Most of the Internet population claims that online stores often offer better prices and wider range of products than brick&mortat stores have. 77% of customers consider purchasing on the Internet as more comfortable and a tenth has no time to go to brick&mortar stores. Preferences of people meet with the fact that they can choose from the comfort of their home and purchased goods can be delivered to their households. [10]

FIG. 2: RELEVANCY OF STATEMENTS ABOUT ONLINE STORES VS. BRICK&MORTAR STORES

Disadvantages of online shopping

The reasons why people are afraid to shop on the Internet, respectively they are dissatisfied with it, are failure to deliver goods in the declared period (63%), followed by th lack of ongoing communication on the status of orders (37%), inaccurate or false information about products (33%) and poor quality of the delivered goods (21%).

According to survey of a portal Heureka.sk (29.000 participants) 32% of respondents do not purchase goods on Internet because they fear problems with a guarantee and claims, and 42% of buyers are afraid of complicated claims process. The largest e-shop in Slovakia, HeJ.sk, deals with approximately 3000 claims a year. The most claims are recorded in the first month and 2 month after the purchase of goods, only 2% of buyers are

giving claims one year after purchase. The survey showed that 27% of all product failures are apparent within the first month of purchase. In 2010 Slovaks returned to portal Hej.sk about 1.7% of goods purchased in e-shops, in Martinus.sk there are just about 0,6% claims - it should be noted that the book is a product that essentially can not be broken. Reasons of claims, however, in the majority of cases were not damaged goods, respectively wrong delivery, but the fact that customers for example returned cloths due to bad estimation of size, or not compatible electronics. According to these findings, claims should not be the reason for low confidence in online shopping, but 57 % Slovaks have no confidence in shopping online because of claims. In Slovakia, possibility of returning of the product is 7 days. [11]

Where and which goods Slovaks purchase on the Internet

On the most consumers' top of mind – the first brand the customer recognizes - is internet shop Hej.sk (14%), followed by Martinus.sk (12%) and then Aukro.sk (4%). Hej.sk is set to the first place mainly by men, people with primary and secondary education and in the age group 25 – 34 and 45 and more years-old. On the contrary, Martinus.sk as the first report women and the youngest users of Internet. Nayelectrodom.sk win in the minds of university graduates and people from 35 to 44 years-old.

Table 1 shows that the total spontaneous knowledge won Hej.sk, (one third of respondents). In second place there was Martinus.sk (30%), in the third place was Nayelectrodom.sk (21%).

TABLE 1: TOTAL SPONTANEOUS KNOWLEDGE OF INTERNET STORES

TOP of Mind + Other Spontaneous Knowledge	
Hej.sk	33%
Martinus.sk	30%
Nayelectrodom.sk	21%
Gorila.sk	13%
Quelle	13%
Pixmania.sk	11%
Alza.sk	11%
Aukro.sk	10%
Mall.sk	10%
Datart.sk	9%

In case that customer recognizes the company and even shops in it, the highest position has Martinus.sk (35%). It is followed by Ticketportal.sk (32%) and Hej.sk (22%). Slovaks who shop at online stores, make the most orders at Martinus.sk, which has 13% lead before second Hej.sk (7%) and third Gorila.sk (4%). The next Fig. 3 shows that among the most visited and relatively the best rated Internet stores belong: Martinus.sk, Hej.sk, Neckermann.sk, Ticketportal.sk and Alza.sk.

FIG. 3: THE MOST VISITED AND THE BEST RATED INTERNET STORES

Criteria and preferences in the selection of e-shop

The most important criterion in selecting e-shops is the price. Consumers in Slovakia are more aware of different prices in e-shops and more often compare offers. This result is from the last survey of portal Pricemania.sk, which dedicates the online shopping and gives consumers the possibility of price comparisons for particular goods from e-shops. Its database currently contains over 500,000 products offered over 900 e-shops. Price comparators are used by 27% of people in almost every search on the Internet, approximately 50% consumers use them sometimes and only 24% of Internet population do not use them, nor recognizes these services. The most important elements of e-shops are well-described product information, quality visualization of goods and previous good experience with that e-shop. For people is important a wide range of goods, the lowest prices, product in stock and free shipping. [12]

The most purchased goods

Among the three most frequent purchased products for the last 12 months are books (41%), clothes and footwear (34%) and ticket for events (29%), displayed at Fig. 4. Books are bought primarily by women and by university educated people. The most frequently men buy books (33%), tickets for events (32%) and computers / notebooks, hardware (30%). Women buy books (50%), clothing and footwear (44%) and cosmetics perfumes (31%).

FIG. 4: THE MOST PURCHASED GOODS AT ONLINE STORES

Frequently missing products and services

Approximately 40% of Internet shoppers mention at least one type of product or service e-shops lack. Most often: food, clothes (luxury, outlet), furniture and textiles. 2,1% of consumers declare they do not miss any products or goods in the range of goods at online stores. Fig. 5 shows also other lack of goods at Internet stores.

FIG. 5: FREQUENTLY MISSING PRODUCTS AND SERVICES

Trends in E-commerce in Slovakia and recommendation

In the last year Slovaks bought and spent more money in e-shops than in 2009. From the Slovak Association for Electronic Commerce (SAEC) information e-shops Cetelem.sk, Hej.sk, Hop.sk, Mall.sk, Martinus.sk, Obchodny-dom.sk and Pelikan.sk had together 586 000 orders, it was an increase of 46%. Trend of online shopping is that in the next year there will be an increase in the number of orders. 29% of the online population said they will buy more, while only 17% will buy less and 9% is not going to shop online next year.

There is estimated growth in online shopping in Slovakia especially for mobile phones, laptops, flat screen TVs, cameras and compact cameras, but also for hobby products, garden and sport. Customers will prefer product of technological innovation which are the latest models of mobile phones, laptops and 3D TVs. However, interest will

also be in the latest news of electronic appliances that were very popular during Christmas season 2010. [13]

Among the major trends for the future is clearly necessary to include the fact that customers want small local stores of Internet companies. Customers have started to feel really great disadvantage that they cannot physically try the product. E-shops are therefore forced to give customers a new kind of shopping - mashopping, which is the name for a combination of virtual and physical shopping. Slovakia has a number of online shops with a local store, but they mostly serves to customers as the place, where they can only pick their goods up. But consumers also need "physical" contact with the shop. One of the few Slovak Internet players, who understands the up-coming trend, is also Martinus.sk.

Slovaks particularly feel the absence of food in the offers of e-shops. Rest of the world suggests that there will be a great boom in this product range. For instance, in Britain there is expected doubling of turnover by 2015. [14] Slovak customers (6.7%) are missing food in e-shops, but there are few shops, (Potraviny.sk, Berkana.sk) already operating also outside the capital Bratislava, offering this kind of goods. There is ever-increasing supply and goods are changing their character to day-to-consumer items, e.g. not only tea, coffee, but also meat and bakery products.

Power of Internet is comprehended also by the biggest companies, hypermarket chains like Tesco Stores and Makro (in Slovakia under name Metro). Online sales through its own e-shop chains are planning to run in the neighboring Czech Republic later this year or next (Tesco-shop.cz). According to the companies, opening such channels is the only way to increase sales. Basics range will form mainly on the Internet lack of food supply and drugstores. Of course, this trend can be expected after the Czech Republic also in Slovakia.

In the recent months, group shopping has become a hit in Slovakia – very interesting and among people very popular discounts on certain goods. People have the opportunity to try services and attractions in the surroundings of their towns, which they normally can not afford, for the prices roughly 40 – 90% lower. In Slovakia, there is over 10 such websites focusing on group shopping – Zlavovekupon.sk, Zlavenky.sk, Zlavadna.sk. They are bought by 20 – 40 years-old Slovaks who use social networks Facebook and Twitter. [15]

Conclusion

The results from research confirmed that E-commerce in Slovakia has a great potential and Internet market is still growing. Even the world economic crisis did not cause a reduction of Slovak's interest in online shopping, but Slovaks shop on Internet even more. Constantly increasing number of orders suggests that customers are profiting from lower prices, conformability to shop from their living room. Internet stores has begun to understand all the needs of its customers, they have started increasing their quality and offered range of goods. Findings and facts suggest that the Internet population in the near future will increase, the number of orders will grow, but the average value of orders decline - due to more common day-to-consumer goods offered by online stores. It can be seen constantly increasing confidence in online shopping, and because of mobile operators offering Internet services, online shopping can even try people from the smallest villages in Slovakia. Gradually, also Slovaks older than 45 to 50 years will use Internet more and more.

The big players have become even bigger, but they could be threatened in the case of a well thought out project with a large capital input and strongly marketing support. Based on all the statistics and results, the largest companies on the Slovak Internet market are Martinus.sk and Hej.sk. Many small "garage" sellers can keep their services on Internet, because the Slovak market is not so small that it could be fully filled only by large firms. However, they will still serve their customers from their living room and dispatch from their garage, with no major ambitions to expand. In the case of large expand, the 5-6 biggest players will forced them to end their operation or acquire them.

In the method of payment, there is a space for improvement of the payment in advance via Internet banking, although surveys indicate that the Slovaks apparently still have some doubts and want to pay up when they get the goods into their own hands. Slovaks also like to use the payment option for cash on delivery because they do not have to pay shipping and try to avoid any increase in price of order.

The reason why a part of Slovak Internet population does not shop on the Internet is because they need physical contact with the product, respectively they are sufficient with shopping in brick&mortar stores. In a very

high level they have fear of complications with complaints and return goods, although there are relatively good statistics online stores. Goods, that online shoppers miss, indicate that those shoppers are trying to avoid going local shop, which they had to visit when they wanted to obtain a product, as much as possible. This trend may cause that some types of brick&mortar shops completely disappear. Almost all the factors favor E-commerce business.

A Factor Analysis of the tourism in the mexican province of Michoacan

Dr. José César Lenin Navarro Chávez, cesar126@hotmail.com
Dr. José Carlos RodríguezChávez, rodriguez_ininee@hotmail.com
MC. América Ivonne Zamora Torres, americazt@hotmail.com
Universidad Michoacana de San Nicolás de Hidalgo, México

1. Introduction

In Mexico, tourism has been a leading industry in the service sectors since 2009. It ranks third among the sources of incomes (\$9.221 million of dollars). However, oil exports and remittances rank first and second, respectively (\$30.901 and \$21.181 million dollars) (BANXICO, 2010). Tourism represents higher incomes for workers that on average they are paid 30% higher wages than in other sectors of the economy (Carral, 2006). In Michoacan, as in many provinces of Mexico, tourism represents a significant percentage of its gross domestic product (GDP) (17.2% in 2006) (Secretaría de Turismo, 2006). The evolution of economic indicators, geographical location, diversity of attractions, the history and culture, cultural heritage and the magical towns (declared by UNESCO), make the province of Michoacan an important case of study in relation to tourism where its competitiveness constitute a priority when identifying its advantages and disadvantages at national and international levels.

Due to the diversity of variables that impact on tourism, it is needed analyses of alternative effects of tourism on the economy and a detailed study of competitiveness. In this sense, 41 variables were selected to analyze the degree of competitiveness of tourism in the most important municipalities of Michoacan. The variables used to measure the competitiveness of the sector were grouped into six dimensions: cultural resources, tourism infrastructure, natural resources, people flow, additional services, economic indicators and social welfare this last one dimension with the objective of link tourism competitiveness with their impact on this essential part of any society. Dimensions with their corresponding variables are as follows:

- a. Cultural Resources: library number, number of historical monuments, temples and shrines number with tourism potential, traditional festivals number, number of museums and houses of culture.
- b. Infrastructure: lodging establishments, lodging establishments with a five star category, lodging establishments with a four star category, lodging establishments with a three star category, lodging establishments uncategorized, total rooms, total hotels, total motels, total units of accommodation, total alternative suites, total inns, total trailer parks, other units of accommodation, rooms per 1000 habitants, and occupancy rate.
- c. Natural Resources: jungle surface area per hectare, and forest surface area per hectare.
- d. Flow of People: total visitors, domestic visitors, and foreign visitors.
- e. Additional Services: number of travel agencies, and restaurants.
- f. Economic Indicators: GDP in dollars, GDP at current prices, GDP per capita, GDP per capita at current prices, percentage of workers in the tertiary sector, percentage of male workers in the tourism sector, and percentage of female workers in the tourism sector.
- g. Social Welfare: total population, men and women, PEA and Human Development Index (HDI).

2. Correspondence Factor Analysis

In this research, the study of the competitiveness of tourism was conducted through the correspondence factor analysis, a multivariate statistical analysis that solves the problem of structure analysis of the interrelationships (correlations) that exist in a large number of variables and cases. In this approach, the

correspondence factor analysis defines a number of common underlying dimensions known as components. The objective of this technique is to represent the underlying structure characterized by a set of variables through the analysis of dependence between variables and the association between attributes that lead to get insight on the intensity of attraction and repulsion that express the behavior of these variables. One of the advantages of correspondences analysis over other methods is the not imposition of initial parameter values. Actually, it is not needed in advance any kind classified information that results from the formation factor. Information itself is given, so we can get the maximum reliability of the information processed, as well as the conclusions that emerge from the analysis.

In this sense, the analysis of similarity (proximity) between the modalities of an attribute (variable), represented by the respective frequency distributions, are conditioned by the distribution of the forms of other attribute allowing to analyze the homogeneity of these two different spaces (p and q dimensions). This analysis is introduced using the Benzecri distance approach which is a balancing of the points in inverse proportion to their frequencies. The analysis of the association between patterns of two different attributes will be the result of connecting these two spaces and, therefore, projecting a three-dimensional common space where proximity is interpreted as an attraction and repulsion away as applying for this Analysis Principal Components (Kruskal & Wish, 1981).

2.1. Commonalities and sedimentation chart variables

The next step in the Factorial Analysis of Correspondences is a table of commonality. This is a useful tool that shows the degree of dispersion of each variable under analysis. This step allows us for identifying the validity they have in the study. If the level of extraction that shows the table of communalities is less than (0.500) means that the variable to study is not explained well within the model, because it does not have a significant level of representation, the closer-to-one variable is best represented (Navarro & Zamora, 2009).

The present study shows that the extraction column has a significant degree of representation for each of the variables. The variable that has a lower level of representation is PERCENTAGE OF MEN PEA with a value of (0.683). While having a greater degree of representation is the occupancy rate with a number of (0.997).

2.2. Sedimentation chart

The second measure of reliability performed in this analysis is the number of components or dimensions to be considered. Each dimension shows a percentage of the variables, being that the first dimensions always will have a greater degree of representation, these is expressed in the screen plot as a greater distance on the vertical axis to zero. The screen plot -originally proposed by Cattell- showsif you are leaving out some important component (Cox & Cox, 1994). The number of components that will be considered for this work is eight, because the sum

represents a cumulative value of 90.39 percent of the total variance. The first dimension has a value of 51.557 percent, the second dimension or factor the 15.86 percent, the third factor the 6.813 percent, the fourth dimension 4.223 percent, 3,523 percent the fifth, sixth 3,069 percent, seventh the 2,796 percent and finally the eighth dimension has a value of 2,548 per cent (see chart 1).

CHART 1: SEDIMENTATION CHART

Source: Authors' calculations based on the results of the Factorial Analysis of Correspondences.

2.3. Rotated component matrix

The first results of Correspondence Factor Analysis are in the Matrix Components and Matrix of Rotated Components which indicate the direction in space where the variables, the positive and negative signs that show the space dimension, are positioned variables, as well as correlation levels (Navarro & Zamora, 2009). In the rotated component matrix is take the data from the matrix of components and applies a process of standardization by the Varimax method, which allows a better representation of variables. The effect of rotation is to redistribute the variance to obtain a pattern of factors or components of greater significance. Varimax rotation criterion focuses on simplifying the maximum column vector of factors (components), the maximum simplification is achieved by reaching values as +1 or -1 and other charges close to 0, which contributes to a better understanding of the variables. The values will show a positive or negative association between the variables and the component or a lack of association if the number thrown is zero (Santos, Muñoz, Justice, & Curtis, 2003).

Once each variable is located in a dimensional space, we can appreciate the degree of correlation of each of these variables in relation to others. So, the first component variables that best explained are: number of temples and shrines, many museums, total visitors, national visitors, foreign visitors, agencies, restaurants, lodging establishments, lodging establishments five stars category, lodging establishments four stars category, lodging establishments three stars category, total rooms, number of hotels, number motels, total units of alternative accommodation, guest houses, suites, total population, men, women, PEA, GDP and GDP at current prices.

For the second component variables that better explain are uncategorized lodging establishments, rooms per 1000 habitants, occupancy rate, percentage of the economically active men in the tourism sector, and percentage of the economically active women in the tourism sector, Human Development Index (HDI), and GDP per capita.

3. Scoring charts by municipalities and variables

The Factorial Analysis of Correspondences is interdependent, i.e. all variables are considered simultaneously, the variables are interrelated and form factors that maximize the explanation of all the variables, identifying the structure that exists between them (Santemas, 1998). The scores plot shows (in a plane with two axes) is precisely the space where each case is at a point given by coordinates (X, Y) of the two dimensions represented. These coordinates are influenced by the proximity or remoteness to the variables, so this figure expresses the correlation of the cases (municipalities) with the variables; if the cases are affected or benefited by these variables, if the variables are opposed, juxtaposed etc.

3.1. Tourism sector competitiveness and social welfare in Michoacan

From the score plot can be seen as each of the municipalities is projected into a multidimensional space as a point given by the coordinates of the X, Y. In Figure 3 are projected along the analyzed variables and cases (municipalities), in order to understand the position of the municipalities for variable. The X axis shows the variables corresponding to the dimensions: tourism infrastructure, flow of people, and complementary services. While in the Y axis the dimensions considered are the economic indicators, and social welfare.

Municipalities with more tourist infrastructure, visitors, and great number of complementary services are positioned to the right of the axis of X. While the municipalities that account for the economic indicators and improved social welfare in tourism will be located at the bottom of the Y axis (see Figure 3).

FIG. 3: SCORING CHARTS

Source: Authors' calculations based on the results of the Factorial Analysis of Correspondences.

Taking disaggregated data, we can identify the location of the variables of each respective dimension, as well as the position of the municipalities under study (Figure 4). Municipalities associated with tourism competitiveness are Morelia, Uruapan, Patzcuaro, Lazaro Cardenas, Angangueo and Zamora. These municipalities are placed on the right side of the X axis. The towns associated with social welfare are Morelia, Patzcuaro, Angangueo, Hidalgo, Uruapan, Lazaro Cardenas. Therefore, the dimensions that account for tourism competitiveness are associated with the dimensions of social welfare, where the occupation generated in this sector is an expression of these trends.

FIG. 4: SCORING CHARTS

Source: Authors' calculations based on the results of the Factorial Analysis of Correspondences.

4. Conclusions

Factor Analysis is a multivariate statistical technique whose goal is the definition of an underlying structure in a data matrix. Factor analysis can solve the problem of analyzing the structure of interrelationships in a large number of variables and cases, define a number of common underlying dimensions known as components. One advantage of this approach is that the researcher does not preset the relationships expected but on the contrary, the variables and cases converge consistent with the attributes of each case—municipalities—.

The results of these correlations are reflected in the rotated component matrix, which shows the dimension of each variable, as well as the direction into space that is projected. Finally the score plots show in the two-dimensional analysis of the axes (X, Y) demonstrates that the variable located within the tourism infrastructure, flow of people, and complementary services are directly correlated. On the other hand, the dimensions and economic indicators of social welfare interrelate with each other, as is expressed by the factor 2.

In the Cartesian plane, competitiveness of the tourism sector is explained by the aforementioned dimensions and is given by those cases-municipalities- , which are located in this space, where the variables that stand out are: restaurants, lodging with five and four stars category, visitors foreign share of the EAP in the tertiary sector, percentage of EAP women, percentage of economically active men and GDP per capita.

The analysis of the Human Development Index (HDI) is not associated with tourism variables because even though the sector accounts for variables referenced in this case, the HDI affects all economic sectors. Within municipalities associated with tourism competitiveness are Morelia, Uruapan, Patzcuaro, Lazaro Cardenas, Angangueo and Zamora. Place them on the right side of the axis of X. While in the towns associated with social welfare are products of the tourism sector to Morelia, Patzcuaro, Angangueo, Hidalgo, Uruapan to Lazaro Cardenas and are at the bottom of the axis Y. The study reflects the importance of tourism in the state sector since the spill generated by the concept of job is outstanding; in addition to that there are several municipalities that have a substantial infrastructure around it and thus are benefiting from it. On the economically active population (EAP) dedicated to the tourism sector points out that women are more dedicated to this area than men. It should be noted that tourism generates over 2.5 million jobs, in addition, Mexico is the first recipient of cruise tourists worldwide, with an economic flow that reaches 600 million dollars.

Although tourism is an important economic source for many municipalities the lack of tourism infrastructure is obvious, because while Morelia is the municipality with the highest level of infrastructure indicators, municipalities as Angangueo despite having a strong sector of the population working in this area do not count on these variables. The tourism competitiveness asymmetries that reflect the municipalities in the province of Michoacan such as Tourism Infrastructure, Flow of People and Complementary Services contrasted with the dimensions of Social Indicators and Welfare through correspondences analysis, lead to the immediate need to move around more effective public policies to enhance the province in tourism.

Making a difference: Combating the critical shortage of GPs in rural & remote Australia

Prikshat Verma, prikshat.verma@rmit.edu.au

RMIT University, Melbourne

Abstract

The rural medical workforce is short of at least 1800 doctors according to the latest report (Feb 2010) of Rural Doctors' Association of Australia based on doctor to population ratios. Despite a 20% increase in the medical workforce overall there is still a significant shortage of GPs in rural and remote Australia. Rural Clinic Schools Program (RCS), University Department Rural Health Program (UDRH) & GP Super Clinics program were designed during last decade to address the shortage of health practitioners within rural and remote Australia. These programs have some evidence of directly improving the range or quality of health care services in rural & remote areas; however, a continuing workforce shortage is predicted despite these initiatives. The shortage of intern places and teachers due to 'intern tsunami', which is expected to hit the class of 2008 graduates – in 2012, is another concern. Further criticism of Section 19AB (10-year moratorium) and existing division of responsibilities between different levels of government in Australia breeds resentment among professional associations representing doctors. This paper briefly synthesises the literature on the above said initiatives of Australian government, their evaluation and the discussion regarding how these programs can combat the critical shortage of GPs in rural & remote areas and make a positive difference.

Introduction

The rural health workforce in Australia is decreasing and remains in a state of overall shortage. A continuation of national trends, such as a decline in the provision of generalist, procedural and small-town services, solo practices, and a reduction in the clinical hours worked per week, add to discouraging projections suggesting that, by 2012, the shortfall of doctors in rural and remote areas could reach 1182 (MDS-National Minimum Data Set Report 2006). In 2007 it was estimated that 59 per cent of Australians live in an area with a shortage of available doctors. Workforce shortages are most acute outside Australia's major cities. The number of GPs per 100,000 head of population varies from under 60 in very remote Australia through to almost 200 GPs per 100,000 people in major cities (NHHN Report-2010).

Source: Australian Institute of Health and Welfare, Health and Community Services Workforce 2006, 2009.

FIGURE 1: GENERAL PRACTITIONERS PER 1, 00,000 POPULATIONS

Public and private hospital combined admissions have risen by 16% since 2004-05 to over 8 million admissions in 2008-09, according to the Australian hospital statistics 2008-09 annual report on hospitals released on 17th June 2010 by the Australian Institute of Health and Welfare (AIHW). It estimated that potentially preventable hospitalisations represented 9.3 per cent of all hospitalisations in 2007-08. This equates to around 441,000 potentially preventable hospitalisations in public hospitals. The average cost of a hospitalisation in a public hospital is around \$4,230 per episode of care. Because people cannot always access GPs and primary health care, many of these end up as patients in hospital, when this could have been avoided with better care in the community. This paper highlights major initiatives and programs which were implemented and the issues which affect the healthcare reforms scenario during the last decade followed by a discussion regarding their subsequent impact on combating the critical shortage of GPs in rural and remote Australia.

University Departments of Rural Health Program (UDRH) and the Rural Clinical Schools Program (RCS)

A student's rural background has been found to be one of the strongest factors to influence in beginning a rural career (Lee & Mackenzie, 2003; Heaney, Tolhurst & Baines, 2004; Devine, 2006; Harding, Whitehead, Aslani & Chen, 2006; Playford et al., 2006; Dalton et al., 2008;). However, undergraduate rural fieldwork placement has been reported to have a positive effect on students from urban backgrounds (Dalton et al.). Rural and remote health education during undergraduate training is a strategy to tackle the shortage of rural health professionals (Causby, 2003; Devine, 2006; Dalton, Routley & Peek, 2008). This undergraduate rural exposure has been found to be beneficial in improving students' perceptions towards rural and remote practice as well as students' decisions to work in these areas (Russell, Clark & Barney, 1996; Veitch, Underhill & Hays, 2006; Dalton et al., 2008). The UDRH Program and RCS Program were designed in 1997 and 2000 respectively as workforce strategies to address the shortage of health practitioners within rural and remote Australia. Their separate but parallel development in the late 1990s followed a growing recognition of the worsening shortage of medical and other health practitioners in rural Australia. These Programs have established significant infrastructures in rural settings, comprising national network of academic centres, ICT and infrastructure to implement innovative solutions to health workforce education and training, creating and driving solutions to meet different levels of health service demand. These two programs also drive and support e-Health, e-Learning and e-Research through a number of training opportunities and programs, in which to provide a high level of training and support to health students and health professionals.

UDRH Program

At present, there are eleven UDRHs across Australia. Each UDRH is a member of the Australian Rural Health Education Network (ARHEN), which operates as a peak professional body.

TABLE 1: UNIVERSITY DEPARTMENT OF RURAL HEALTH SITE NAMES AND ACRONYMS

The UDRH Program aims to encourage future health professionals to consider practising in a rural area through providing short placement and training opportunities for health science students from the nursing, medical and a range of allied health disciplines. The Program also provides support to health professionals currently practising in rural settings. In general, the UDRH Program has a greater multidisciplinary focus than the RCS.

UDRH objectives are as follows:

- (i) Endeavour to progress the rural health by increasing and improving rural experiences for undergraduate students in the health professions by creating innovative service delivery models in rural and remote health ;
- (ii) Undertake research into rural and remote health issues through collaborations with universities, health services and professional and community organisations, including Indigenous communities;
- (iii) Provide training and support for rural health professionals;

According to the Evaluation of the UDRH Program and the RCS Program Final Report (November 2008) all UDRHs are currently meeting their objectives as required in their contractual arrangements with the Commonwealth; regular three-year funding agreements and their corresponding reporting mechanisms have ensured that key performance indicators (KPIs) are monitored.

The Following table summarises the extent to which the collective UDRHs are addressing their key result areas, and shows selected performance indicators. The table provides a snapshot of the level of activity undertaken by the UDRHs and the increase in volume of activity over the years 2004-2007.

TABLE 2: UNIVERSITY DEPARTMENT OF RURAL HEALTH PERFORMANCE INDICATORS

S.No	Key Result Area	Selected Performance Indicators	2004	2005	2006	2007
------	-----------------	---------------------------------	------	------	------	------

1	Increase and improve rural experiences for health science students	No. students (undergraduate postgraduate) undertaking placements	3,529	3,817	3,856	4,398
		Total no. student weeks	14,427	16,675	18,451	17,663
2	Expand educational opportunities that are relevant for rural and remote practice	(i) Vocational units or course; total no. of enrolments	390	768	723	1,198
		(ii) Undergraduate units or courses; total no. of enrolments	2,422	2,080	1,623	4,021
		(iii) Postgraduate units or courses; total no. of enrolments	830	672	1105	661
3	Undertake research and related activities in rural and remote health issues	No. of new research and developmental projects	106	97	109	122
		Value to UDRH(\$)	2,652,308	9,685,272	7,871,614	9,237,275
4	Support for rural health professionals, consumers and communities	Total no. Participants in development activities	9,755	13,045	13,924	14,537
5	Contribute to innovation in education, research and service development through collaborations	Total no. collaborations in which UDRHs were actively engaged during the July to December reporting period of a given year	396	399	500	464
6	Embrace a strong public or population health focus; and contribute to the development of innovative service delivery models in rural and remote health	Increased workforce capacity increased training and support for the rural health workforce	NA	NA	NA	NA
7	Endeavour to progress the rural health agenda within the medical and other health sciences faculties or departments	Increased rural health research capability and output & relations with other initiatives and with key stakeholders.	NA	NA	NA	NA

Source: Evaluation of the UDRH Program and the RCS Program Final Report 2008

There is anecdotal evidence that rural student placements reinforce student intentions to practice rurally, and also evidence that some practitioners have been recruited to rural practice because of the presence of the UDRH. There is also evidence that the UDRHs have influenced rural and remote practitioners to remain in practice, through providing additional professional and personal networking and support, professional development opportunities, access to university resources, and incentives to undertake research. (Urbis Final Report June 2010)

Overall, UDRHs have demonstrated strategic leadership and vision in creating a rural university infrastructure which can influence the development and improvement of rural health services, and have increased communication and knowledge transfer through increased information technology. Challenges to the

Program include funding constraints, disciplinary silos, and difficulties in recruiting staff and ensuring the capacity for clinical placements. However, each UDRH has sought to minimise these limitations and to maximise their capacity to strengthen the rural health workforce.

The Rural Clinical Schools Program (RCS)

The Rural Clinical Schools (RCS) Program was launched in 2000 to improve the supply of medical professionals to non-metropolitan Australia by creating medical education infrastructure in rural and regional centres, and by providing 25% of Australian Government-supported medical students with a rural focus for at least one year of their clinical training (Eley et al 2008).

The RCS Program complements other placement programs which provide students with short-term opportunities to experience rural medical practice, and in many instances students who have undertaken short-term placements have been inspired to apply to an RCS for part of their training. The development of the Rural Clinical Schools Program has allowed construction and furnishing of teaching and learning facilities and student accommodation in dozens of rural and regional locations across Australia.

According to Evaluation of the University Departments of Rural Health Program and the Rural Clinical Schools Program 2008, rural clinical schools exist to:

- encourage medical students (and medical professionals) to take up a career in rural and remote practice;
- encourage rural health professionals to take up academic positions;
- improve the range of rural health care services in rural communities across Australia; and
- strengthen the health workforce in rural communities across Australia

Of the 14 rural clinical schools across Australia, 10 were established between 2000-2001 and another four were launched in 2006-2007. This second round of RCS funding (including additional funding for the older RCSs) occurred in the wake of the 2006 announcement from COAG (Council of Australian Governments) that 25% of all Commonwealth-funded medical students are to undertake at least one year of their clinical training in rural and regional communities. This decision recognised the influence of rural exposure during medical training upon students' decisions to undertake rural medical practice. A majority of medical schools in Australia are now in receipt of RCS funding.

TABLE 3: RURAL CLINICAL SCHOOL SITE NAMES AND ACRONYMS

UNIVERSITY	RCS SITE LOCATION	RCS SITE NAME	RCS SITE ACRONYM

Source: RCS-UDRH Final Report Nov 2008

The numbers of students studying in the Rural Clinical School have grown significantly since its commencement. In 2009, there were a total of 115 students across Years 4, 5 and 6 at the rural campuses. 52 students entered Medicine through the Rural Student Entry Scheme in 2009, and 4 students entered through the Indigenous Pre-Medicine Program. Of graduating students, 46 had spent a year or more studying at a Rural Clinical School campus. Eight of these students stayed at a rural campus for one year, 25 for two years, and 13 for three years. During 2009 there was 16.7 paid FTE academic staff, 21.5 paid FTE general staff and 131 conjoint staff. Registrars in hospitals also provided valuable teaching for students. (Rural Clinical School Annual Report 2009)

The UDRH and RCS Programs have been described as part of a 'rural health education revolution' (Wing 2007:344). The result of this 'revolution' has been the creation of a rural health infrastructure where none existed, with resulting opportunities for students, academics, and clinicians to contribute to improving rural health services. Evidence is mounting of the positive impact of UDRH and RCS on the health workforce. For example, academic performance among students studying in rural and urban settings is comparable, (Worley P, Strasser R, Prideaux D. 2004; Waters B, Hughes J, Forbes K, Wilkinson D. 2006; Young L, Rego P, Peterson R., 2008) and increased interest in rural health careers as a consequence of the rural clinical schools program (Eley DS, Baker PG 2007) and UDRH rural health modules. (Critchley J, DeWitt DE, Khan MA, Liaw S., 2007) are reported. Likewise, increasing numbers of graduates are choosing non-metropolitan teaching hospitals for their intern year. (Wilkinson D, Birks J, Davies L; et al. 2004; Eley D, Baker P., 2006).

The benefits which have accrued can be summarised broadly as the following:

- (i) Increased number of health students gaining exposure to rural health services and rural health issues;
- (ii) The establishment of educational infrastructure, with facilities which are available to a range of health providers and community groups as well as teachers and students;
- (iii) Some recent nursing and allied health graduates choosing to take up rural employment as a result of their exposure through a UDRH, and some medical students seeking rural internships or vocational training placements as a result of their exposure through an RCS;
- (iv) Some clinicians – nursing, allied health, and medical – choosing to relocate from the city because of the opportunity to accept a joint academic and clinical position; and

- (v) Enhanced visibility of rural health and its challenges within the university environment and increased number of publications with a rural or remote focus.

GP Super Clinics

Partnerships between rural health services, universities, governments and communities are the key to more equitable and sustainable health service delivery. Whereas, UDRH & RCS initiatives are to revolutionise rural health education, the Australian government has invested in the establishment of GP ‘Super Clinics’ to improve the rural hospital infrastructure which is poor and the lion’s share of infrastructure funding has been allocated to metropolitan hospitals.

The concept of GP Super Clinics was first articulated by the Australian Labour Party (ALP) in its health policy paper in August 2007 when it was in Opposition. Upon winning the federal election in November 2007, the newly elected government set about implementing the GP Super Clinics program by allocating \$242.1 million to establish 31 clinics over four years in the 2008-09 budget.

The number of clinics to be funded under the program was subsequently expanded in the latter half of 2009 to 36 with a total funding commitment of \$275.2 million (Department of Health & Ageing; 2007-08 GP Super Clinic Commitments). In the 2010-11 Budget the Australian Government committed a further \$370.2 million to improve the quality and accessibility of primary health care services by supporting the establishment of 28 new GP Super Clinics and providing funding to upgrade and extend around 425 general practices, primary care and community health services, and Aboriginal Medical Services to improve access to integrated GP and primary health care (Department of Health & Ageing; 2010-11 GP Super Clinic Commitments).

GP Super Clinics around Australia has as one of its core objectives to support the future primary care workforce by providing high quality education and training opportunities supported by infrastructure for trainee consulting rooms, teaching rooms and training facilities to make general practice attractive to students, thus removing shortage of GPs in Australia. GP Super Clinics main aim was to provide GPs with more flexibility in their career and working conditions than traditional models of general practice, particularly in regional areas.

There are currently eight GP Super Clinics in operation:

- in Ballan (Victoria), which commenced operations on 14 September 2009;
- in Strathpine (Queensland) which opened on 29 January 2010;
- in Port Stephens (NSW), which was officially opened on 17 May 2010;
- in Devonport (Tasmania) which was officially opened on 22 July 2010;
- in Geelong (VIC), which commenced operations on 30 August 2010;
- in Palmerston (NT), which commenced operations on 4 October 2010;
- in Ipswich (QLD), which commenced stage 1 operations on 18 October 2010; and
- in Southern Lake Macquarie, which opened on 15 December 2010

General practitioners enjoy teaching; a report from the Australian Institute of Health and Welfare, General practice activity in Australia 2009–10, showed that 65% of GPs taught medical students and 91% worked in an accredited practice. Though GP Super Clinics will provide some additional space for teaching in general practice through explicitly identified building and infrastructure funding for new teaching space, including extra consulting rooms for students and trainees, and seminar rooms, but with only 31 GP Super Clinics, less than 1% of nearly 5000 general practice clinics in Australia, this space may not make a significant difference to teaching capacity across the country. Currently, there are no alternative funding streams within the GP Super Clinics program to support an expanded teaching role and provide protected time to teach.

10-Year Moratorium (Section 19AB)

This section of the Health Insurance Act came into force through an amendment made to the Act in 1996 to influence distribution of the medical workforce in rural and remote areas of Australia; ensuring communities in remote locations have access to a GPs. This is commonly referred to as the '10-year moratorium'. At that time it was assumed that there were too many doctors when in fact shortages were emerging. In 1996 when the Howard government came to power, it set out to correct those problems and section 19AB was one of the changes implemented. The change meant that overseas trained doctors who started work in Australia from 1 January 1997 and who wished to access Medicare benefits for their services needed to practise in rural and remote areas, areas of health workforce shortages, for a period of 10 years.

The 10-year moratorium proved to be an effective mechanism in ensuring that overseas trained doctors provide services to those communities in greatest need, which tend to be rural and remote. Because of this policy the proportion of overseas trained doctors increased in rural and remote areas. In fact, 41 per cent of all doctors in these areas were trained overseas, but it was ineffective in attracting sufficient Australian graduates to rural practice (Second Reading - Roxon, Minister for Health and Ageing, Health Insurance Amendment - New Zealand Overseas Trained Doctors Bill October, 2009).

Under this amended Act (1996) New Zealand citizens and permanent resident doctors from other countries practising in Australia were subject to the above mentioned restriction. The main drawback of the Act was that overseas trained doctors may be granted an exemption from these restrictions if they are working in a district of workforce shortage (DWS). With staffing crises reaching into the suburbs, more and more Australia was classified as DWS, and Section 19AB exemptions were considered vital to filling outer metropolitan GP vacancies. The number of exemptions under section 19AB rose to 4381 for the 12 months ended October 31 2009, as compared with 2718 for the same period four years earlier. During that time, the percentage of the population and land area deemed to have a doctor shortage remained relatively steady, indicating overseas-trained doctors are still being used to fill gaps in the medical workforce, if only to prevent the problem from getting worse (Sean Parnell, *The Australian* newspaper, April 03, 2010).

New Amendments (October 2009) in Section 19AB

A report commissioned by the DH&A (Department of Health & Ageing) in year 2006, which was never made public, laid emphasis upon the need for attention to the factors leading to shortages, and how the department should assess District of Workforce Shortages and applications for an exemption from Section 19AB. In Oct 2009, the Health Insurance Amendment (New Zealand Overseas Trained Doctors) Bill 2009 was proposed to streamline the operation of section 19AB of the Health Insurance Act 1973 (the act)

The bill proposed to lift restrictions of 10-year moratorium on New Zealand citizens and permanent resident doctors who obtain their primary medical degree from an Australian or New Zealand medical school. The bill also proposed that the 10-year restriction will commence from the time the medical practitioner is first registered as a medical practitioner in Australia, and will cease after 10 years, provided that the medical practitioner has gained Australian permanent residency or citizenship during that period. As part of \$134 million rural package in the 2009 budget, it was further proposed that the 10-year moratorium would also be scaled, so that the more remote GPs go, the shorter would be the moratorium. The proposed bill came into effect in April 2010 and was assumed to complement the workforce reforms already underway at that time —making the system more transparent, fairer and consistent with government policy.

Medical Intern Tsunami

Currently Australia is training more students than it has intern places for. The 'intern tsunami' is expected to hit as the class of 2008 graduates – in 2012, and continue with each and every year of graduates. The Australian Medical Association said last August 2010 the situation had reached a national crisis point. The following figure shows the dramatic rise in the number of medical school graduates that we are seeing in Australia. While the upsurge in graduates is one of the key issues the medical education system needs to address, it is worthwhile recognising that the graph also shows the previous chronic undersupply of clinicians to the Australian public.

FIGURE 2 - MEDICAL SCHOOL GRADUATES

This is of concern to Commonwealth, because as the medical student numbers are growing rapidly, the number of supervisors in Australian public hospitals remains relatively static and the time allocated for teaching, training and assessment activities remains unchanged. Going by the current trends in 2014, the number of domestic graduates from medical schools will grow to 3108 per annum – which compares to 1287 per annum in 2004. Taking into account international full fee paying students, the total number of graduates from Australian medical schools in 2014 will be 3786. This presents Australia with a real opportunity to not only reduce overall medical workforce shortages, but to also address more specific workforce issues such as the lack of access to medical care in rural and remote areas (Medical Training Review Panel, Thirteenth Report , April 2010).

An increase in student numbers (both graduates from Australia & IMGs), while the supply of clinical teachers and patients for teaching remains static, challenges the traditional apprenticeship model for learning medicine. Coupled with this is the requirement of medical schools to provide compulsory rural clinical placements for all students under the Rural Undergraduate Support and Coordination (RUSC) program. The situation is further compounded by the proliferation of long term rural, state and federal bonded scholarships, and the eventual increase in the number of postgraduate trainees.

The number of training medical students has increased commendably, and that's needed and that's great, but Australian government hasn't indulged in efforts to commensurate improvement in the ability to train the increased numbers of students coming through the system. Increasing the number of medical school places will be ineffective in addressing medical workforce shortages unless there is a coordinated increase in:

- clinical training places for medical students;
- intern and prevocational training places; and
- Vocational (specialist) training places.

The current problem can be attributed to the dysfunction that have been created due to the - the split responsibilities between the Commonwealth and States – it has meant that Australian healthcare has got a complete dislocation between the number of medical students that are being trained in universities and the facilities and infrastructure which is available to train them once they graduate and get into the hospitals. Moreover, existing mechanisms to allocate intern numbers across the country are inefficient and often

result in medical graduates applying for positions in multiple states. Under these arrangements some states have difficulty filling all the intern positions that they offer, while others are unable to provide enough places for all applicants.

Some steps have already been taken towards meeting these challenges. In 2008 the Council of Australian Governments (COAG) announced a \$1.64 billion package to support undergraduate clinical training for the health workforce. More recently, the Commonwealth committed \$640m to support a significant expansion in prevocational and vocational GP training positions as well as additional specialist training positions in the private sector. There has also been a commitment to increase training positions in Emergency Medicine. The need is for a really good fundamental sit-down with all the players around the table, recognising that there's a split responsibility between the Commonwealth and States, and to have a coordinated strategy to make sure that the effort is now put in to train these doctors and nurses that will be coming through.

The Blame Game

The existing division of responsibilities in health in Australia creates the potential for cost-shifting between different levels of government, and gives rise to frequent claims of blame-shifting and buck-passing. In 2007, Kevin Rudd, as the newly established Labour leader, staked his reputation on his commitment to eradicating the "blame game" on health. He assured that the endemic blame-shifting and cost-shifting between the government and the states would become a thing of the past.

On 9th March 2010 he proposed a National Health and Hospitals Network (NHHN) for Australia's future healthcare reforms. This reform policy aimed at one level of government — the Commonwealth — will be responsible and accountable for the strategic direction, planning and public funding of primary health care, as recommended by the National Health and Hospitals Reform Commission (NHHRC). The main focus was to reduce duplication of services, improving efficiency and thus providing a commendable solution to shortage of GPs in Australia. To give it credit, various healthcare organisation and clinicians felt that the federal government has recognised the importance of primary health care, for example training more GPs and other health workers, and proposing Medicare Locals. It was hailed as a bold blueprint to take Australia's health system forward.

But on 13th Feb 2011, after 12 months of wrangling with the states and the signing of a historic health funding agreement in Canberra last year, prime minister Julia Gillard discarded Kevin Rudd's historic reforms and put pen to paper at Council of Australian Governments (COAG) meeting with state and territory leaders with a national agreement in place for a health reform plan under which Federal and State Governments will contribute money on equal basis into a national funding pool to pay for the health system. The funds will then be paid out to the states and territories on the basis of how many operations or procedures they perform. The new health reform deal with the states abandons its bid to take on full responsibility and 100 per cent funding of primary healthcare. This loses the crucial opportunity to create a single (more rational and fair) primary health care system.

Critical Analysis

There is anecdotal evidence, from the Evaluation of the UDRH Program and the RCS Program Final Report 2008, regarding workforce benefits from the RCSs& UDRHs through the attraction and retention of clinicians involved in teaching and supervision. .In summary, there are some promising signs but no definitive answers to whether RCSs& UDRHs in Australia have (or have not) yielded higher rates of rural practice among participating students and in a way combated critical shortage of doctors in rural and remote Australia, however, there is evidence of positive attitudinal shifts towards rural training and practice . A continuing workforce shortage is predicted despite these initiatives and the early indications of their success. Some studies have suggested that an increasing number of students are seeking rural internships (Playford et al 2008, Wilkinson et al 2004), although these figures should be approached with caution as it is not clear to what extent this will translate into career decisions.

GP Super Clinics also have been put down by load of criticism with most of the professional association representing doctors, arguing if there is a place for Government funding of clinics to provide GP services to communities then Super Clinics should be set up in areas where there are not existing general practices, and that there is no way that the existing general practices, if they are there, could meet the needs of the community. As shortage of GPs and a rapid increase in the number of medical students has accentuated the education and training gap for clinical placements and the time available for GPs to commit to teaching (Australian Government Productivity Commission, 2006; Thistlethwaite JE, Leeder SR, Kidd MR, Shaw T, 2006), the GP Super Clinics should have been equipped with providing solutions to this problem. Currently, there are no alternative funding streams within the GP Super Clinics program to support an expanded teaching role and provide protected time to teach.

Whereas Section 19 AB according to Australian Medical Association (AMA) president Andrew Pesce, who initially supported the moratorium -- joined other groups (RDAA, RACGP) in condemning the Act and terming it as a form of conscription affecting people who don't have professional support, political clout or community sympathy. They believe this rule is unjust and have called for the scrapping of the 10-year moratorium. The reason being that IMGs or OTDs don't necessarily have to work in a rural/remote or regional area. There are plenty of DWS in inner city areas/outer metro areas to make the mockery of the demarcation. With a better knowledge of geographical demarcation and through doctor connect website the doctors can easily find those DWS areas. There are areas outside large metros that are classed as in need. If they want to get a particular area as classed in need the practice simply applies to the DH&A (Department of Health & Ageing) and it can be done quickly. But it would be difficult to overturn Section 19 AB without massive ramifications. Potentially, it could deplete rural and remote Australia of large number of IMGs who are only working there because of this section. If the Section 19AB is withdrawn, most of the IMGs may abandon the rural and remote areas for a metropolitan suburb and create an even bigger workforce maldistribution than currently exists.

With the implementation of historic health funding agreement, on 13th Feb 2011 at Council of Australian Governments (COAG) meeting, under which Federal and State Governments will contribute money on equal basis into a national funding pool to pay for the health system, the ambitious health reform policy's bid by NHHN to take on full responsibility and 100 per cent funding of primary healthcare was defeated. Thus losing the crucial opportunity to create a single (more rational and fair) primary health care system.

Improving delivery of primary care is the linchpin of any health reform advance and this policy is not actually a health reform. This agreement will not do more to prevent people getting sick, and they will not do more to treat people early and support them with their chronic diseases in the community. Such moves would have decreased the number of people needing to go to hospital. That would have been health reform. Further it would have impacted the chronic problem of GPs shortage in rural and remote areas, especially for marginalised populations. The increase in hospital funding will make a small but welcome dent in this overall, but there is no funding formula to place money where it is most needed.

Conclusion

That is where Australia find itself on health reform regarding combating critical shortage of doctors in rural and remote areas.. Rudd's crusade of 2007 to create a new, more accountable system of health delivery - which he messed up after his initial pronouncements - concluded in incremental, rather than revolutionary, policy improvements via a deal driven by various political needs.

The need of the hour is to develop an effective mechanism to ensure that the number of medical school places across the country is determined by robust workforce modelling and a proper assessment of the resources that will be needed to provide not only the required undergraduate clinical training places, but also sufficient downstream prevocational and vocational training places. This process should be undertaken in full consultation with medical schools and other stakeholders. It should be ensured that the funding provided to the states and territories for teaching includes a component that specifically recognises the costs of protected teaching time for clinicians and requires the states and territories to set aside quarantined funding to support hospitals to meet appropriate benchmarks in this regard. Moreover a nationally consistent intern allocation processes has to be developed which should allow jurisdictions to share information on intern applications and acceptances in order to better inform the recruitment and selection processes in each state/territory. This would include a national “wash-up” process that identifies those graduates that accept more than one offer of an intern position and asks them to confirm a final choice to free up places that can be accessed by other applicants.

New models for funding teaching are required to free up more GPs to teach. Teaching capacity in general practice could be increased by the establishment of dedicated teaching practices funded to ensure financial sustainability while still operating clinically under the fee-for-service model. Remuneration of teaching doctors with salaries, supported by additional funding to education providers, such as universities or regional training providers, is another alternative to afford protected time to teach. GP Super Clinics will need adequate recurrent funding if they are to play a lead role in the establishment of better teaching practices. A responsive and flexible workplace culture, improved payment, and targeted resources and support are needed to make a positive difference and combat the critical shortage of doctors in rural and remote Australia.

Measuring Regulatory Restrictiveness on Mobility of Human Capital in Healthcare (Nursing) Services

*Pralok Gupta, pralokg07@iimb.ernet.in ; pralokgupta@gmail.com
Indian Institute of Management, India*

Abstract

Services are the fastest growing sectors of the Indian economy. From services export perspective cross-border movement of human capital to provide services is very important for India, given its large skilled/semi-skilled workforce and English speaking population. The export performance, however, depends upon restrictions imposed by its major trading partners. This paper focuses on regulatory barriers affecting cross-border movement of Indian human capital in Healthcare (Nursing) services to selected developed country markets. This research contributes to the existing body of literature by developing a template to quantify the qualitative nature of regulatory barriers, by constructing restrictiveness indices for the pre and post recession periods and by assessing the post recession changes in regulatory environment affecting such mobility. It finds that the selected developed country markets have become more protective after current global slowdown. The empirical estimation also suggests that qualification related recognition barriers are very important contributor towards regulatory restrictiveness affecting such mobility.

1. Introduction

Services sector is one of the fastest growing sectors of the Indian economy. India has witnessed rapid growth in its services sector output as well as exports during the last two decades. The contribution of services in India's GDP is continuously increasing and it has risen from about 43% in 1990-91 to more than 60% in 2009-10 (Ministry Of Finance, Government of India, 2010). During the same period, the share of services in total exports has grown from 20% to 36% (UNCTAD Handbook of Statistics, 2010) and is likely to surpass merchandise exports by 2012 (FICCI Survey, 2007). From the services export perspective, Mode 4¹ of service delivery, i.e., temporary movement of human capital to provide services, is very important for India as India has a comparative advantage in contrast to other countries given its large skilled and semi skilled human capital and English speaking population. One of the key drivers in India's enhanced services export performance is its ability to provide highly skilled services such as Healthcare (Nursing) services, IT and IT enabled services, etc. at a low cost viz-a-viz other developing and developed countries. Indian export performance, however, depends upon protection and regulatory barriers imposed by its major trading partners on movement of Indian human capital for delivering these services in the concerned markets.

This study identifies the nature of such regulatory restrictiveness affecting temporary movement of Indian human capital in Healthcare (Nursing) services to its major destination markets. It quantifies the incidence of such regulatory restrictiveness and makes a cross country as well as pre and post recession comparison to identify the main regulatory barriers hindering free movement of Indian nursing professionals.

This research study contributes to the existing body of literature in many ways. Firstly, it originates and develops a template to quantify the qualitative nature of regulatory barriers affecting movement of human capital, i.e., Mode 4 of service delivery in international trade. Most of the existing studies on Mode 4 had a qualitative description of various regulatory barriers and there are as yet no noteworthy studies to quantify restrictiveness in Mode 4. Secondly, this research study constructs trade restrictiveness indices for the pre and post recession periods to assess the effect of the recent recession on protectionism affecting cross-border mobility of human capital. This is particularly important at this point of time as the recent recession has compelled many countries to impose stricter regulations on temporary and permanent movement of foreign professionals in order to protect their domestic markets. Lastly, as Mode 4 is one of the main export and revenue generating modes in services trade for developing countries like India, this study is likely to help the policy makers by bringing forward the real nature of regulatory barriers and by suggesting policy prescriptions to enhance trade and welfare of the countries involved.

The rest of the paper is structured as follows. The next section outlines the scope and motivation for this research. Section 3 presents the literature review and the conceptual framework for understanding various types of regulations affecting mobility of human capital. Section 4 provides an overview of the methodology sources of information. Section 5 provides empirical results and estimated indices for each of the overseas markets and discusses the main findings based on these restrictiveness indices. Section 6 discusses the post recession changes in existing regulatory environment in these countries. Section 7 provides some broad policy insights for the policy makers. Section 8 bring forward some limitations of the study and concludes the paper.

2. Research Scope and Motivation

This research study focuses on barriers faced by Indian nursing professionals in overseas markets, i.e., barriers affecting India's Mode 4 (movement of human capital) based services exports for nursing services. It involves a detailed examination of regulatory barriers in selected OECD countries which are host to Indian service providers. It quantifies the incidence of these regulatory barriers and their likely impact on the movement of Indian nursing professionals to these countries. The choice of this service sector is motivated by the fact that for nursing services, Mode 4 of service delivery, i.e., movement of human capital is very important as provision of these services require some kind of direct client interface. Nursing being a labour intensive activity requiring personal care of patients, the movement of either service provider or consumer is must.

Apart from it, there are huge shortages of nursing professionals in the developed world and there is known migration from India to serve overseas markets. According to the American Nurses Association, in the year 2004, 3.5 percent of US nurses are foreign born and out of these foreign born nurses, half were from Philippines and 1.3 percent have an Indian diploma (Pranav and Simi, 2008). Khadria (2007) reported in his study that India was ranked 6th in terms of the number of registered nurse applicants aspiring for the US licensure. However, it has improved its ranking after 2003 onwards and has been ranked 2nd after the Philippines. He also reported that record 10,000 Indian nurses were reported to be in the process of applying to migrate to the USA in 2004-2005. Similarly, there is a continuous increase in Indian trained nurses registered per annum in the UK. The following table shows this trend for the period 1998-2005. Precise data is not available for other developed countries but informal estimates suggest that these countries also have significant number of Indian trained nurses working there in different capacities.

Table1: Indian trained Nurses Registered per annum in UK for the period 1998-2004

Year	No. of Indian trained Nurses registered in the UK
1998-1999	30
1999-2000	96
2000-2001	289
2001-2002	994
2002-2003	1833
2003-2004	3073
2004-2005	3690

Source: Nursing and Midwifery Council (NMC), UK as cited in Pranav and Simi (2008)

Developed countries are facing severe demand supply gap for nursing services and the demand is continuously outstripping supply of nursing services. This is primarily due to ageing of population, ageing and retirement of presently working nurses and low student enrolment for nursing studies in these countries (American Association of Colleges of Nursing, 2010).

This study considers USA, Canada, UK and Australia as the host countries to identify the regulations on movement of Indian nursing professionals. These countries are considered for the analysis as they are facing severe shortages in the selected service sectors. The expected shortage and the foreign nurses' contribution in the selected countries' workforce are given in the following table.

Table2: Employment of Registered Nurses (RNs), Predicted Shortfall and Foreign Nurses' Contribution

Country	No. of RNs in the Workforce (Year)	Predicted Shortfall (Shortfall Year)	Foreign Nurses as percent of Workforce
Australia	179,200 (1999)	40,000 (2010)	@
Canada	230,300 (2001)	78,000 (2011)	6
UK	500,000 (2001)	53,000 (2010)	8
USA	2,202,000 (2000)	275,000 (2010)	4

@ Data not available

Source: Author's compilation from Exhibit-1 (Host Country Registered Nurse (RN) Workforce and Foreign Nurses' Contributions) of paper "Trends in international nurse migration" by Aiken LH, Buchan J, Sochalski J, Nichols B, Powell M published in Health Affairs 2004, 23(3):69-77

This country choice is also motivated by the fact that these countries are facing severe public discontent over working of Indians in their domestic markets as their unemployment level is rising after the recent global financial crisis. As a result, these countries have imposed stricter regulatory barriers to curb number of Indian service providers entering their territories in spite of having acute shortages.

3. Literature Review and Conceptual Framework

Winters (2003) found that as population in advanced countries is ageing and there is no substitute for human labour, at least in some occupations, the demand for movement of human capital, i.e., Mode 4 of service delivery in these countries is high and likely to remain high over time. The ageing of the population in OECD countries and the resulting shortage of healthcare workers is creating new opportunities in healthcare sector for countries like India. This ageing has resulted in a huge demand for nurses in OECD countries, giving opportunities to developing countries to supply such professionals (Pranav and Simi, 2008). In a recent report on health systems, the OECD highlighted increasing concerns about nursing shortages in many of its member countries. Some recent examples of OECD country assessments of nursing shortages include Canada, where the shortfall of nurses was quantified at around 78,000 nurses by 2011ⁱⁱ, and Australia, which projected a shortage of 40,000 nurses by 2010ⁱⁱⁱ. Although the Philippines is considered as the main source country for nurses, India is fast emerging as another important source country to fulfill the rising global demand of nurses (Matsuno, 2008).

Chanda (1999) and Mattoo (2003) had discussed the regulatory barriers applicable for Mode 4. These regulatory barriers fall into three categories. The first type of barriers falls into the broad category of 'Immigration Barriers'. As Mode 4 of service delivery only includes temporary movements of natural persons, it comes under the purview of immigration authorities and labor market policies rather than purely international trade. These immigration barriers can be in the form of quantitative restrictions on movement of natural persons like H1B Visa regulations in USA, economic needs tests, wage parity requirements etc.

The other category of regulations is related to 'Discretionary Treatment' of service providers in these host country markets. These regulations may range from citizenship or residency requirements to social security contribution and double taxation. Discrimination may also take the form of preferences in government procurements granted to domestic service providers over foreigners.

The third category of regulatory barriers relates to 'Recognition of Qualification'. Inadequate recognition of professional qualifications, post and pre qualification experiences, training etc. are likely to impact services like healthcare and the movement of professionals in this sector. Though, sometimes the higher standards for qualifications and experiences are imposed to meet certain public policy objectives, they may also become prominent tool for protectionist purposes.

Thus, there are different types of regulatory barriers on movement of professionals (Mode 4). Hoekman and Braga (1997) and Mattoo and Stern (2008) also highlighted the importance of regulatory measures such as licensing and qualification requirements; standards; codes of conduct; and registration, approval, and authorization requirements. These studies also note that although many regulations in services are aimed at realizing certain public policy objectives, they often become impediments to trade in services due to their onerous nature and the way in which they are administered and implemented.

Liberalization of these regulatory barriers can lead to significant welfare gains. Robinson et al (2008) estimated the potential welfare gains from even a 50 percent reduction in barriers affecting services trade to be five times larger than the gains from non services sector trade liberalization. Winters (2003) argued that the liberalization of regulatory barriers may lead to significant gains for the world economy which can be shared among economies. He estimated that an increase in quota equivalent to 3 percent of their work force on inward movement of skilled and unskilled temporary workers by industrial countries would increase global welfare by around US\$150 billion a year.

4. Methodology and Data Sources

The methodology for this research relied on the collection and analysis of primary and secondary data and construction of some empirical indices. Primary data was obtained through interviews with different stakeholders in nursing services. This helped in incorporating their viewpoints regarding how domestic regulatory barriers in the selected developed countries are affecting the flows of Indian nursing professionals to the countries under consideration.

Secondary data sources included information and published reports by government authorities and multilateral, regional and country agencies. These reports were sourced of various Government publications and policy documents, information from immigration authorities and licensing bodies of the countries selected, Trade Policy Reviews available on the WTO website and information available at websites of various immigration help and placement agencies in India and outside.

4.1 Primary Survey

A primary survey was conducted of various stakeholders during the period of July-September 2010. The survey was conducted by having face to face interview and in-depth discussions with the respondents and also through web by generating an electronic version of the physical questionnaire. The questionnaire was a semi structured one with both close and open ended questions. The respondents were based at Bangalore, Chennai, Delhi and Mumbai. The respondents included senior officials in nursing section of hospitals, the nurses who actually had worked for sometime in these countries and immigration firms dealing with overseas placements of Indian nurses. The details of respondents are given in the following tables.

Table3: Profile of Respondents Surveyed

Organization	Respondent's Designation	Remark
Apollo Hospital	Nurse In-charge	Worked temporarily in these countries
Apollo Hospital	Director Nursing	
Apollo Hospital	Nurse	Worked temporarily in these countries
Apollo Hospital	Staff Nurse	Worked temporarily in these countries
Colombia Asia	General Manager (Nursing Education & Training)	
Fortis Hospital	Nurse In-charge	
Immigration Firm	Director	

Source: Based on Primary Survey Conducted by the Author

The basic aim of conducting this primary survey was to get industry insights and feedback on various regulations affecting temporary movement of Indian nursing professionals to the selected developed country markets. It also helped in weighing various regulatory barriers imposed by these countries as not all regulatory barriers affect such movement equally.

A two stage method was used for weighing various regulatory barriers. In the first stage, all the regulatory barriers were classified into three broad categories, namely, 'Immigration Barriers', 'Discriminatory Treatment barriers' and Recognition of Qualification Barriers'. The respondents in were required to rank the three kinds of barriers according to their "relative importance" in determining overall restrictiveness on movement of Indian nursing professionals on a scale of 1 to 3, 1 being the least important and 3 being the most important. The sum of all respondents' score for each of these broad categories was divided by the aggregate score of all three broad categories. This gave the relative weights for these three categories of regulatory barriers with a sum total of one for all three categories.

The second stage consisted of weighing individual regulatory parameters within each of these three broad types of regulatory barriers. The respondents were confronted with specific regulatory barriers and were required to rate these regulatory barriers according to their importance in determining overall restrictiveness affecting such movement using a 5 point Likert's scale (1 being the least important and 5 being the most important). The total of all respondents' score for each barrier was divided by the aggregate score of all barriers within that category across all respondents. These weights had been further scaled down so as to make the sum of all weights within each individual category equal to the relative weight of that particular category as obtained in stage one of the weighing process.

4.2 Secondary Data Sources

The secondary data sources included published reports and information available at websites of immigration and licensing authorities of the selected developed country markets. A list of various organizations referred to for getting secondary data is given as below. Apart from these organizations and websites, other industry bodies and immigration organizations working in India were referred to for getting information about prevailing regulatory barriers affecting professionals' movement in these two services. These included VFS Global, Indian Nursing Council, nurses-career-abroad.com etc.

Table4: Data Sources

4.3 Construction of Empirical Indices

As mentioned earlier, this study develops a template for measuring and quantifying the incidence of regulatory restrictiveness prevailing in each of these countries. This template is constructed after carefully evaluating all the relevant regulations applicable for movement of human capital by having literature search, in-depth discussions with various stakeholders and referring to immigration authorities for prevailing regulations. It constructs a '**Mode 4 Total Restrictiveness Index**' and also calculates separately the restrictiveness arising out of three broad categories of regulatory barriers used in survey method for classifying these barriers by constructing '**Immigration Restrictiveness Index**', '**Discriminatory Treatment Restrictiveness Index**' and '**Recognition of Qualification Restrictiveness Index**'. The information for constructing indices is updated till September 2010.

The following steps have been followed for constructing restrictiveness indices for the selected services.

- **Step 1.** Collection of information from different government agencies and regulatory bodies for various regulatory barriers pertaining to nursing services in different countries.
- **Step 2.** Collection of information from various other sources such as study reports of WTO, OECD, independent research organizations and different immigration organizations.
- **Step 3.** Construction of template using all these regulatory barriers and defining sub parameters for each barrier indicating its intensity and severity.
- **Step 4.** Assigning scores to each type of regulation based on prevailing regulatory environment. Scores range from a minimum of zero for the least restrictive to a maximum of one for the most restrictive.
- **Step 5.** Constructing indices by multiplying scores arrived at in step 4 with the weights obtained from the primary survey with the relevant stakeholders in that service sector.

5. Empirical Results and Analysis

This paper focuses on regulatory barriers imposed on Indian nurses going overseas as 'Independent Professional'. The reason for choosing this category is that corporate movement of Indian nurses to overseas countries is very insignificant and most of the nurses go abroad through private placement agencies by putting their own efforts.

The table below provides information about the visa types available for nursing professionals going to these countries.

Table5: Visa Types Available For Nursing Professionals

Country	Visa Category
Australia	Visa 457
Canada	Temporary Foreign Worker Program
UK	Tier-2 (General)
USA	H1B*

Source: Author's Compilation

* HIC visa was available for temporary movement of nurses till December 2009.

The following paragraphs discuss and analyse the results of empirical estimation of regulatory barriers imposed by the selected developed country markets on movement of Indian nursing professionals.

Table 6: Mode 4 Restrictiveness Indices for Nursing Services

Country	Mode 4 Total Restrictiveness Index	Immigration Restrictiveness Index	Discriminatory Treatment Restrictiveness Index	Recognition of Qualification Restrictiveness Index
Australia	0.591	0.103	0.181	0.308
Canada	0.419	0.102	0.111	0.206
UK	0.682	0.169	0.254	0.259
USA	0.660	0.120	0.291	0.250

Source: Author's Calculations

Graph 2: Different Types of Barriers in Total Restrictiveness for Nursing Services

Source: Author's Calculations

The UK is the most restrictive country and the restrictions come from all three broad types of barriers, i.e., immigration, discriminatory treatment and recognition of qualification barriers. It imposes a very restrictive environment due to health concerns raised by National Health System (NHS), professional bodies and the common public. These restrictions are related to their ability to speak English, to have adequate maintenance funds, health examination including chest X-ray, minimum wage requirements, etc. The US is the second most restrictive country. It also imposes strict qualification-related recognition barriers as in the case of UK, except for minimum experience requirements. Australia is the third most restrictive and the restrictiveness comes primarily from recognition of qualification and discriminatory barriers. Canada is the least restrictive country but here too qualification barriers are the most important.

To work in Australia, nurses need to be registered or enrolled by the nurse regulatory body in the State or Territory in which they want to work. Nurses need to be in good health and have a certain level of education and experience. Canadian health care employers are facing an ever-growing shortage of health professionals and

this is perhaps the reason for relatively low value of the restrictiveness index. However, recognition requirements are very important even for Canada. To be eligible for providing nursing services, all candidates must possess a Bachelor of Science in Nursing (BSN) Degree from a recognized educational program, minimum of two years current work experience in a hospital setting, current PRC Registration, a clear criminal record and good health, as a mandatory physical examination is required for immigration purposes. In order to be eligible to practice as a Registered Nurse in Canada, foreign nurses must write the Canadian Registered Nurses Examination (CRNE). The CRNE can only be taken in Canada.

In order to practice as a nurse or midwife in the UK, one must be registered with the Nursing and Midwifery Council (NMC) and have the necessary visa/work permit. The Nursing and Midwifery Council (NMC) is the regulatory body and competent authority for the register of nurses, midwives and specialist community public health nurses. All overseas nurses who are trained outside the EU, EEA and Switzerland have to sit for the International English Language Test (IELTS) before they start the NMC application process. They have to achieve a score of at least 7.0 in the listening and reading sections, at least 7.0 in the writing and speaking sections and an overall average score of 7 (out of a possible 9). One must be practicing as a registered nurse or midwife for at least 12 months (full-time or the part-time equivalent) after qualifying before applying to NMC for registration.

The H-1C non-immigrant temporary worker classification was for foreign nurses coming to the United States temporarily to perform services as a registered nurse in a health professional shortage area as determined by the Department of Labor (DOL). However, this visa category was terminated in December 2009 and now the nurses are required to apply for H1B visa to move to the US on a temporary basis. To qualify, a nurse must have a full and unrestricted nursing license in the country where the nursing education was obtained, or have received a nursing education and license in the United States, must be authorized by the appropriate U.S. State Board of Nursing to practice within the state, have passed the examination given by the Commission on Graduates for Foreign Nursing Schools (CGFNS), or have a full and unrestricted license to practice as a Registered Nurse in the state where he/she will work, or have a full and unrestricted Registered Nurse's license in any state and have received temporary authorization to practice as a Registered Nurse in the state where he/she will work and have been fully qualified and eligible under the state laws of the state of intended employment to practice as a Registered Nurse immediately upon admission to the United States.

The contribution of qualification related recognition barriers varies from 38% in the case of the US and UK to 52% for Australia. Indian nurses are required to pass additional exams in the host countries. In addition to this, they have to be members of professional associations in the respective countries which is generally obtained by paying a discriminatory (higher) fee as against domestic nurses in the host country. They are also required to have a very high score in IELTS exam, which is used for English language proficiency. The contribution of various barriers is shown in Table 7 and Graph 3.

Table 7: Percentage Contribution of Different Types of Barriers in Total Restrictiveness

Country	Immigration Restrictions	Discriminatory Treatment Restrictions	Recognition of Qualification Restrictions
Australia	17%	31%	52%
Canada	24%	26%	49%
UK	25%	37%	38%
USA	18%	44%	38%

Source: Author's Calculations

Graph 3: Percentage Contribution of Different Types of Barriers in Total Restrictiveness

Source: Author's Calculations

The preceding table and graph show that immigration barriers are contributing the least towards total restrictiveness in nursing services in each of these countries. Discriminatory barriers are relatively more important and for the US and the UK, they contribute around 40%. These discriminatory barriers are imposed in the form of compulsory social security contributions, levies on employers for employing foreign professionals, preference in government procurement, etc. These regulations are so severe in the US that they contribute more than qualification-related barriers in the total restrictiveness index. Australia has the highest score for qualification related barriers both absolute and percentage terms. Canada has the lowest absolute qualification related restrictiveness score among these countries but in percentage terms, it is second highest, which implies that immigration and discriminatory barriers are not very severe in Canada.

6. Post-Recession Changes in Regulatory Environment affecting Mobility of Human Capital in Nursing Services

The recent recession and consequent global slowdown has compelled many countries of the world to protect their domestic markets and impose severe regulatory barriers on foreigners. This study also constructs a Mode 4 Regulatory Restrictiveness Index for 2007, a pre-recession period, to assess whether recession has made these four selected countries more protectionist as compared to the pre-recession period. It is to be noted that while the 2007 index value reflects the prevailing regulatory restrictions at that time, the 2010 index value reflects all the policy and regulatory changes that have occurred during 2007-2010 period. Thus, the 2010 data shows changes not only in 2010 but during the aforesaid period. This is not a serious issue as firstly the aim of this exercise is to compare the pre-recession period with the post-recession one and hence it hardly matters whether the change has occurred in 2010 or in 2009. Secondly, policy changes, by their nature, are discrete in time and so any analysis of policy changes has to take this fact into account.

The incidence of protectionism has also increased in nursing services. The subsequent paragraphs discuss the underlying factors behind this enhanced restrictiveness and the possible consequences for the movement of Indian nursing professionals to these countries.

Table8: Pre and Post Recession Mode 4 Restrictiveness Indices for Nursing Services

Country	Mode 4 Total Restrictiveness Index		Immigration Restrictiveness Index		Discriminatory Treatment Restrictiveness Index		Recognition of Qualification Restrictiveness Index	
	2007	2010	2007	2010	2007	2010	2007	2010
Australia	0.513	0.591	0.083	0.103	0.181	0.181	0.250	0.308
Canada	0.433	0.419	0.116	0.102	0.111	0.111	0.206	0.206
UK	0.538	0.682	0.095	0.169	0.184	0.254	0.259	0.259
USA	0.582	0.660	0.112	0.120	0.221	0.291	0.250	0.250

Source: Author's Calculations

Graph 4: Pre and Post Recession Mode 4 Restrictiveness Indices for Nursing Services

Source: Author's Calculations

As shown in Table 8 and Graph 4, the selected developed countries have witnessed an increase in protectionism in the post-recession period except Canada. There is a slight decrease in regulatory restrictiveness for Canada in the post-recession period as compared to the pre-recession period. This is primarily because of an increase in the initial and total duration of the visa in 2007. Previously, those under the program were required to leave Canada after a 12 month period with the requirement of waiting four months before re-applying. Under the new changes, they are allowed to stay for two years before being required to request an extension. But it is to be noticed that this liberal environment is going to end soon as the Canadian government has recently announced that there will be tougher regulatory requirement for this type of visa starting April 2011. There will be limits to the length of a Canadian work visa and a worker who has already been in Canada for four years would not be eligible to work in Canada for six years.

Australia has imposed requirements of paying market rate salary and a minimum score in IELTS exam to prove English language proficiency. The UK has seen many changes in the regulatory environment affecting movement of nurses post-recession. The important ones are the recent introduction of annual numerical cap on the number of visas, introduction of an Economic Needs Test (ENT), changes in advertisement requirements, permanent residency and maintenance funds and imposition of levy on employer in the form of a licensing fee. It is to be noticed that previously nursing was in the 'Shortage Occupation List' (SOL) and most of the different categories of nurses were included in this SOL. Hence, the employers were not required to conduct Economic Needs Test and prior adequate search for employing foreign nursing professionals. However, this SOL list has been curtailed drastically and as per the SOL released in August 2010, there are only a very few nursing categories which are exempted from ENT. These exempted categories of nurses are specialist nurse working in operating theatres, operating department practitioner and specialist nurse working in neonatal intensive care units. All other categories of nurses are subject to ENT and prior adequate search before employing foreign nurses.

The US is different from other countries in the sense that it has changed the entire visa category applicable for granting visa to foreign nurses for working temporarily. Previously, a specialist visa category H1C was dedicated for the nursing profession. However, this visa facility was terminated in December 2009 and now the only visa option available for temporary movement of nursing professionals is H1B visa. A comparative study of these two visa categories reveals that H1B is more protectionist than the H1C category of visa. This increased protection is due to an increase in the visa fee, condition on re-entry after a maximum allowable period, and levies on employers applying for H1B visa.

As the regulatory environment is very strict, particularly in the UK and the US, and it has become more protectionist over the years, a new trend is emerging among potential nurses desirous of going to these countries. They go on student visa to study nursing education in these countries, do some part-time work and after getting the required qualifications and degrees, take full time jobs. Another important aspect is that due to severe regulatory restrictiveness in these countries, most of the working nurses prefer to go to Gulf region either on government contracts or in their private capacity. The nurses, who become successful in getting visas to work as nurses in these developed countries, generally settle down there permanently unless they are compulsorily asked to go back or other personal reasons.

Based on the above discussion and analysis, it can be said that there has been an increase in the incidence of protectionism in all these countries, except Canada, in the post-recession period. However, this increased protection and highly regulatory environment is contrary to the existing realities of these economies. The enhanced protectionism is primarily due to political reasons and not for economic reasons as there is an acute shortage of nursing professionals in these countries. There may be an increase in the general unemployment rate in these countries after the recent slowdown but this general unemployment is not relevant

for nursing services. The unemployment rate in this sector is either very low or in some specialist occupations, there remain actual shortages. However, the governments are reluctant to accept this reality due to political compulsions and are imposing stricter regulations to demonstrate that governments are concerned with domestic conditions and are protecting home markets.

7. Policy Implications

As the incidence of restrictiveness increases, the businesses tend to seek innovative methods to cope with the new regulations. However, there are transaction costs and deadweight loss associated with increased government intervention. This is likely to reduce welfare of the nationals of the host country as it is they who are the final victims of increased costs and lower productivity. The public policy objectives may compel some regulations to be imposed but other barriers which are imposed with the primary intention of restricting foreign professionals to protect domestic markets should not be imposed.

As India is negotiating with these countries in various bilateral, plurilateral and multilateral discussions for opening up Indian market, the policy makers may ask for removing those barriers which are not intended for serving public policy objectives thereby allowing greater freedom for movement of Indian nursing professionals. This study suggests the following points which can be put forward by the negotiators while having discussions with these countries.

There are some barriers which are common to all these countries and hence may become common to all negotiating discussions. On the other hand there are country specific barriers which need to be negotiated with the individual countries while opening up Indian market to them. The prime example of the former is the compulsory deduction of social security contributions from salaries of Indian service providers. Indian nurses temporarily working in these countries are paying heavily for social security contributions. These nurses are not able to avail the benefits of social security contribution as there is a minimum period of 10 years after which only can these benefits be availed. These countries impose restrictions on permanent residency after temporary work visa. Therefore, these nurses have to come back compulsorily after their visa duration is over and have to sacrifice a significant part of their income once they return. Therefore, the government should negotiate with these countries to have social security contributions exemption treaties for visits of short durations, say up to 4-5 years, along the lines of treaties signed with Switzerland and some other European countries. The government is already having discussions with the US and Canada for such totalization agreements.

The IELTS score should be valid for a period of minimum 3 years. At present, if a nurse is not able to get a visa in one particular year and he/she applies again next year, he/she has to appear once again for the IELTS exam. This induces an extra financial burden on the nurses. As the nursing profession is not a highly paid profession in India, any extra financial burden is likely to affect the nurse's ability to move to the foreign country.

The government should also negotiate to have Mutual Recognition Agreements (MRAs) with these countries to accept Indian qualifications and do away with the requirement of passing an exam before practising nursing in these countries. If they are required to write additional exams, efforts should be made to conduct these exams in India. Another important issue is that Indian nurses are required to pay a higher fee to become a member of licensing authorities in these countries as compared to fee applicable to the host country nurses. This is a discriminatory practice. The government should have discussions with the concerned authorities in the respective countries to eliminate such discriminatory practices.

As far as country specific barriers are concerned, there is an urgent need to negotiate with the US and the UK for the removal of many of the recently introduced regulatory changes as most of these changes are introduced more for protecting their markets. For the US, three major negotiating points could be increase or eliminate the annual numerical limit on H1B visa, reintroduction of H1C visa category, specifically meant for the temporary movement of foreign nurses, and improved certainty of the visa processing time.

For the UK, there are differences in gross wages paid to Indian nurses and host country nurses in the UK. The host country nurses are entitled for other benefits and allowances, such as housing allowance etc. whereas Indian nurses are being deprived of such extra benefits. Such discrimination should be eliminated.

As far as Australia is concerned, the emphasis of negotiations should be on the creation of a separate class of visas for nursing services. At present, there is no specific category for nursing services in Australia. The rules and regulations should be tailored according to the profession instead of having one class of visas for all professions.

Thus, this paper is likely to provide certain policy directions which could be useful for India's discussions with the selected developed countries with regard to facilitating the temporary movement of Indian nursing professionals. The analysis of post-recessionary changes in the regulatory environment in these countries provides further evidence which can help designing India's negotiating strategies with these countries in the post crisis period.

8. Conclusion

This study quantifies the qualitative nature of regulatory barriers affecting mobility of human capital in nursing services. The quantification exercise highlights some important aspects of the prevailing regulatory environment in Australia, Canada, UK and USA affecting temporary movement of Indian service providers in nursing services. These countries have a restrictive environment stemming mainly from qualification related recognition barriers. The recent financial crisis and consequent increased unemployment has further enhanced the level of restrictiveness in these countries affecting the temporary movement of Indian nurses to these markets. The severity of barriers jeopardises the movement of Indian nurses to these countries and at present, most of the movement by Indian nurses is to the Gulf countries probably due to the less severe regulatory environment in the latter and also due to the foreign government sponsored visa available to Indian nurses in these markets. On the contrary, the selected developed countries have a very restrictive environment in spite of having a huge shortage of nurses. There are some barriers which may be accepted due to public policy objectives, yet, there is ample scope to liberalize on some others. For instance, the requirement to pass a qualifying exam only in the host country severely restricts the decision of Indian nurses to move on a temporary basis to these countries as not all nurses have the financial and other resources to go and appear for qualifying exam in these countries.

This study is subject to certain limitations. The primary limitation of the study comes from weighing of various regulations which is the usual limitations for any quantification exercise of qualitative data. Though, the weights are obtained through expert opinion by conducting primary survey and thereafter performing statistical analysis, some degree of subjectivity cannot be denied. The study considers various regulatory policy changes at a particular point of time though it may not have occurred in that year rather immediately preceding year. As explained earlier, policy changes are discrete in nature and the purpose of this study is not to analyse yearly changes rather to assess post recession period effect on protectionism, therefore it very well captures these 'over the period' changes in the construction of restrictiveness indices.

Conclusively, there is scope to relax the regulatory environment affecting mobility of human capital in nursing services prevailing in these countries. Easier movement is likely to benefit not only India but also increase productivity and efficiency in these countries. Negotiations with these countries could focus on removing those restrictions which do not directly cater to public policy objectives, such as having to take qualifying exam only in the host country, discriminatory fees for becoming member of professional bodies, in exchange for greater access to Indian market for these developed countries.

ⁱAs per the WTO classification, international trade in services can occur via four modes: cross-border trade, consumption abroad, commercial presence, and presence of natural persons. **Mode 1 or Cross-border supply** is defined as services flows from the territory of one Member into the territory of another Member (e.g. banking or architectural services transmitted via telecommunications or mail); **Mode 2 or Consumption abroad** occurs when a consumer (e.g. tourist or patient) moves into another Member's territory to obtain a service; **Mode 3 or Commercial presence** occurs when a service supplier of one Member establishes a territorial presence, including through ownership or lease of premises, in another Member's territory to provide a service (e.g. domestic subsidiaries of foreign insurance companies or hotel chains); and **Mode 4 or Presence of natural persons** consists of persons of one Member entering the territory of another Member to supply a service (e.g. accountants, doctors or teachers). The Annex on Movement of Natural Persons specifies, however, that Members remain free to operate measures regarding citizenship, residence or access to the employment market on a permanent basis. Governance of Triple Helix Relationships: Principles of Intermediation, or Who is in Control When the State, the University and the Industry Interact?

*Dr. Emanuela Todeva, e.todeva@surrey.ac.uk,
School of Management, University of Surrey, UK*

Abstract

This paper introduces the concept of intermediation and its role in the political realm of Government intervention with the economy and the university sector. Urgent issues of sustainability and growth and stimulation of innovation have exposed the lack of scientific knowledge within the governance literature that can support and justify the government involvement. Corporate governance theory addresses issues of control of private production assets. The innovation literature reflects on financing innovation and the restructuring of the University sector. The emerging literature on Triple Helix relationships has generated multilayered accounts and cases of dyadic and multilateral interactions between the state, the industry, and the university sector. However, none of these knowledge fields has addressed the fact that governance requires multiple intermediaries. This paper aims to review the literature on intermediation and governance at the intersection between the public and the private sector and the literature on the triple helix model and governance of innovation.

Introduction: Challenges to Governance of Innovation

The literature on sustainable growth and development of knowledge-base economy has recognised the critical role of university links and active transfer of knowledge and technology. Innovation takes place both in the public (university) and in the private (industry) sectors. The competitiveness and performance of firms is increasingly dependent on successful R&D collaboration with universities and on sharing knowledge and technology outputs, or absorbing and commercialising knowledge and technology, generated by public sector research establishments. A new knowledge-based economy results from the evolution in the university-industry-government relationships, where knowledge is the main pillar for the success of the economy itself and contributes to the development of new technologies disseminated through commercial enterprises. These new trilateral relationships are represented by a model defined as Triple Helix, which is characterized by complexity of interactions and interdependencies between actors and a high flow of knowledge from one actor (university) to the other (industry), and vice versa, called Knowledge and Technology Transfer (KTT).

The KTT process raises significant governance questions and is increasingly associated with intermediation and facilitation by a variety of organisational establishments. The intermediaries emerge to facilitate communication between different parties, or to translate messages from one economic actor to another, and to facilitate partner searching and matching as well as negotiations across the public and the private sphere of the innovation process. Examples of such intermediaries are law firms, facilitating in contract agreements, consultants, assisting public and private sector organisations (and the Government itself) in procurement, financing, and assessment of innovation capabilities of firms, universities, or other organisations. Finally, intermediaries are various service firms, including business and legal services, accounting and management, or communication and representation services. Service outsourcing from the public and the private sector has created a large pool of intermediaries that are actively delivering intermediation and facilitation services, and yet, the literature on intermediation is extremely scarce.

This paper aims to review the literature on intermediation and governance at the intersection between the public and the private sector and the literature on the triple helix model and the role of government. We present a theoretical model that incorporates intermediation into the dynamics of Triple Helix interactions and offers a framework for the analysis of the boundaries of governance, coordination and control.

Corporate Governance, Public Governance and the Role of Government

The literature on governance comes from two streams of thought – corporate governance and public administration and regulation theory. There have not been many attempts to integrate these two streams. The discussion on corporate governance has been driven by scholarship research that focuses attention on the Anglo-American corporate system based on publicly traded assets, distributed ownership, separation of ownership from control at corporate level, and the distribution of rents among investors and other residual claimants. The discussion has been dominated by concerns with the effectiveness of the Boards of Directors that represent shareholders' interests, and exercise a monitoring and control function against the opportunistic behaviour of managers (Todeva, 2005)

Corporate governance in this literature refers to: a process of supervision and control over company management; economic agents giving overall direction to firms; the sum of control and co-ordination activities that compose of the internal regulation of business in compliance with external obligations; the system by which companies are directed and controlled; the system of external and internal checks and balances that ensures companies discharge their accountability to shareholders and stakeholders (Tricker, 1984, The Cadbury Report, 1992, Cannon, 1994, Parkinson, 1994, Solomon, *et.al.*, 2004). There are more integrated definitions that describe corporate governance as a system / mechanism for allocation of capital and corporate resources and for co-ordination and control of economic activities at firm level that facilitates strategic direction, accountability, transparency and wealth creation (Todeva, 2005).

The *corporate governance* literature has focused on structures that substitute or compensate for the inefficiencies that emerge from the separation between the ownership and control of assets, and the agency costs associated with this. Hill & Jones (1992) summarise three sources of agency costs from the perspective of agency theory: a) principal's monitoring expenditure (including the design and management of corporate governance system, appointment and running of Board of Directors, and all types of shareholder activism); b) agents' bonding expenditure (managing the intra-corporate accounting process, plus all risks of managing relationships with the other stakeholders); and c) residual loss (supplementing for risks, taken beyond the home market, or beyond the home corporate governance system and contract enforcement practices. Contract enforcement is seen as the remedy to all agency problems. Exit strategies by customers, suppliers, employees, or indeed investors are discussed as sanctions that complement contract enforcement.

This literature ignores two major issues. These are first, that corporate governance involves coordination and control not only of resources (assets and capital), but also of relationships and production activities. Second, governance involves facilitation of relationships and activities, and not merely control. Fligstein and Freeland (1995) stylise from the literature a number of internal control problems and external control issues that are associated with coordination and control of relationships: 1) the control relationships between management and workers; 2) relationships between management and shareholders; 3) division of labour and the subsequent division of power and responsibilities within the corporation or intra-corporate intra-management relationships; 4) relationships with investors and capital markets; 5) relationships with suppliers; 6) relationships with competitors; 7) relationships with the state, with governments and other public institutions. If we look at the corporate governance as a mechanism for allocation of resources in the corporation and the economy and as a mechanism for wealth creation and generation of value-added, then we need to consider all relations between economic agents that are critical in determining productivity and efficiency. Facilitation and coordination across these relationships is critical.

Regulation theory, on the other hand, promotes the idea that regulation of a socio-economic system requires a legitimate government that has authority and power, as well as the capacity and capabilities, to generate the rules that govern economic behaviour within the system of their jurisdiction. Regulation via rules and laws is seen as an effective coordination of behaviour of economic actors. The rules and the laws are facilitating mechanisms enabling governments to distribute incentives and sanctions across the entire system of economic actors.

There is a shared view among many theoretical perspectives that public administration is simultaneously: a) governance of the society and economy within national boundaries; b) management of the resource allocation process; and c) institutionalisation of justice in the public domain, where public administrators are seen as agents carrying out the public interest with their authority (Wamsley, 1990, pp. 21-29). The leading public administration theories that aim to explain the functioning of public organisations, and the relationships that emerge in relation to the definition and fulfilment of public interests, are: the *public choice theory*; the *social contract theory*; and the *principle-agent theory* (Todeva, 2010).

The *public choice theory* infers that the public chooses the type of the system of governance and mode of regulation through voting the agents that can deliver such system and hence granting power to these agents while in government. The theory advances the discussion on innovation support vs. bureaucratic authoritative allocation of resources, where it is assumed that bureaucratic government is based on hierarchy and command in regulation and decision making, while the innovation in government implies experimentation and the working of a 'free market' (Russell and Waste, 1998; McNutt, 2002; Mueller, 2003). Changing government during elections is seen as bringing innovation in the governance process, rather than as bringing populism and short-termism in the coordination and control of resources, relationships and activities in the economy and society.

The *social contract theory* reflects on the agreement between the public and the government as enacted through democratic elections. Government efficiency in fulfilment of the social contract is measured in terms of democratic accountability (Wilson, 1987). Again, contract enforcement is executed via democratic elections, but there is a substitution in the theory between effective contract enforcement practice and effective and efficient governance of the economy and society.

Principle-agent theory is an extension to the behaviourism in public administration and advocates that the government is composed of elected officials as 'principles', and appointed administrators as 'agents'. Issues of accountability, communications and interactions between 'principles' and 'agents', as well as the role of political incentives and information asymmetries in decision making, are discussed within this theoretical perspective. Researchers are convinced that the policy choices of the 'principles' are 'framed' by the information provided by appointed and entrusted administrators (acting as agents), alongside with the bureaucratic discretion of the latter (Hill, 1985; Bendor, 1990; Selden, et. al., 1999). Authors conclude that change of policy direction by the 'principles' is constrained by the monitoring and control costs, associated with a particular structure of principle-agent relationships. The real representation of public interests appears to be driven by the bureaucratic 'agents', rather than by the democratically elected 'principles' in government. The concept of agents is the first recognition that the execution of governance requires certain level of intermediation.

While regulation implies intervention activities at system level, governance, implies intervention at the level of individual economic actors. Governance involves design and implementation of incentives and constraints in order to manage the motives and strategic behaviour of actors. Economic governance is a system/mechanism for allocation of resources, control and co-ordination of economic activities at firm level that facilitates strategic direction, accountability, transparency and wealth creation (Todeva, 2005). The effectiveness of governance depends on solving the agency problem or the problem of intermediation in control and depends on clear allocation of rights to individual agents clear rules establishing rights and responsibilities, and rewards for compliance with these rules.

According to Frances *et.al.* (1991) co-ordination implies the bringing into a relationship of otherwise disparate activities or events. Co-ordination therefore aims at making compatible the efforts of actors that are involved in competitive or co-operative economic activities. Leading questions are *who decides* on the rules and regulations that establish the co-ordination mechanism, *how* this mechanism is *implemented* in a society, *what range of activities* are externally co-ordinated, and which activities are left under *self-co-ordination*, or who are the coordinating agents and the capabilities they require in order to execute effective coordination (Todeva, 2010).

Here we would like to distinguish between external co-ordination, which implies agency, power, and politics, vs. self-co-ordination, which is an expression of the free choices of economic actors, and is interpreted as a spontaneously emergent agreements, compliance practices, or rules and principles that facilitate impartial economic transactions between autonomous and free economic actors. Economic actors in self-coordination enact self-constraints based on their relationships, values, and mutual agreements. The two forms of external governance and internal self-coordination may be congruent within a socio-economic system when one is an extension of the other (Todeva, 2010).

Overall, there are many possible scenarios of coordination mechanisms in the literature - markets, hierarchies (bureaucratic co-ordination), networks, community (ethical co-ordination), self-governing co-ordination, family co-ordination, political coordination, or any combination between them (Levacic, 1991; Todeva, 1998; Todeva, 2010). These mechanisms evolve during the phase of their implementation and practice, and their design is not the ultimate end of the policy and governance process, as they are 'means-to-an-end', where the end is represented by political objectives. Each mechanism implies a different logic of co-ordination and leads to a variety of outcomes and costs. Each mechanism can be implemented by variety of rules and

practices, which can lead to different sets of incentives and constraints, and hence, limiting the actors in their free choices (Todeva, 1998). The governance of innovation hence can employ multiple mechanisms for allocation of resources and coordination and facilitation of behaviour of innovation actors.

Financing Innovation and the Role of Government and Industry

Most of the literature on governance, regulation and public administration refers to coordination of incentives and constraints in the private, commercial sector, or the industry. There is little of this theoretical contribution that is applicable to the governance of the public sector, such as the universities, the health care and social care systems, or the so-called ‘public-private-partnerships’ (PPPs), all of which require finance by the government. Universities need finance to carry out their mission for knowledge creation and knowledge dissemination, to lead students towards academic progression and development, to develop new research ideas and technologies, to provide knowledge solutions to industry and society as a whole, and to increase the knowledge transfer and collaboration with public and private sector organisations. Industries, on the other hand, need financial support for risky R&D and for innovation that is directed towards serving public needs, as well as to interact and collaborate with universities, or to invest in exploitation of fundamental and basic research. Models of financing innovation focus on the balance between the public and the private sector contributions, as well as the allocation and the direction of R&D in the universities and industry.

Previous work has identified four potential sources of financing R&D: The *government*, which has multiple motivations (knowledge benefits, wealth creation, national development, etc.); Independent *foundations* and charity organisations that receive funds from private citizens, from the government, or from industries; *Banks*, which offer loans and credits for R&D activities; *Venture capital organisation* (VCs), which provide funding for new firms such as spin-offs from universities or large corporations (Kolfsten et al., 1999). It is widely recognised that these alternative funding agents have preferences in their financial practices.

Most of the *basic or fundamental research* is essentially undertaken in universities and public sector laboratories and is financed by the government or by foundations, given that it has low market potential and requires risk-free money. The goals and incentives of government and foundations are equally aligned, as they are not for profit organizations aiming at carrying out activities for public benefit. *Applied research* is undertaken both in universities and public sector laboratories as well as in private sector establishments, and it is predominantly financed by foundations, specialised charity organisations and the government, where all actors are sharing the risks. Banks and VCs are very unlikely to invest money in applied research in universities and other research institution, as they tend to be risk-averse. Experimental and developmental research is carried out mainly in private sector laboratories and is financed particularly by banks and VCs organisations with a significant contribution from government (Rebecca Henderson, MIT, 2002).

The role of government has been acknowledged no only in relation to financing innovation and R&D in the public and the private sector, but also in the areas of policies, support infrastructure, and facilitation for the diffusion of innovation. The innovation policies of government are broadly divided into *infrastructural policies*, *diffusion and technology transfer policies*, *mission policies*, and developing *technological districts and clusters*.

The *infrastructural policies* have played a central role throughout the history of the debates on ‘National Innovation Systems’ (NIS) and the role of Government. In addition to direct investment in technical infrastructure for universities, Justman and Teubal (1996) have described the role of government in the technological development process through its role in building technological capabilities in the university sector and making them available for a variety of applications by companies or other public institutions. In the more advanced countries, this has led to the creation of a wide structure of education services and technological services at the interface of three types of protagonists: the producers of innovation (universities and research laboratories); the collective users of innovation (economic organizations, chambers of commerce, industrial associations); and the autonomous institutions created specifically for dealing with technological transfer (agencies, information centres, incubators).

The *diffusion and technology transfer policies* are the most traditional initiatives by governments. They have been based initially on grants (through subsidies or tax credits) for the purchase of new machinery or equipment incorporating innovations. Throughout the 1980s the emphasis was shifted on measures aimed at favouring the transfer of knowledge with particular attention to small firms. Dodgson and Bessant (1996) point out that these policies may be of little use, if the capability gap that often prevents the smaller companies from making use of external know-how is not filled. For this reason the most recent objectives of these policies have

become to promote research within the universities and the small firms; the collaboration between companies and between companies and universities, and the creation of new technology-based firms.

Mission policies consist of setting priority targets and offering financial support for research (grants and funds) into cutting edge technologies, whether carried out by research institutes or firms. The principal objectives of these initiatives are to concentrate State financial resources on both fundamental research and on applied research at a pre-competitive level.

A recent line of support has focused on the development of *technological districts and clusters*. The main target for these initiatives have been technology-based SMEs, where government finances co-location, networking and explicit R&D activities. The formation of regional clusters and networks between private and public bodies, firms and universities, has been the main way to stimulate innovation in SMEs and to extend the dissemination of R&D outputs (Antonelli, 1999).

All four government policies require financial support for their implementation. However, their implementation goes beyond the allocation of resources for innovation. The implementation of innovation policies requires vast facilitation, collaboration and coordination, demanding the involvement of a wide variety of intermediary actors that assist in this implementation process. In addition to finance, the governance of innovation, requires facilitation and intermediation of the knowledge-creation, and the knowledge-transfer, diffusion and commercialisation. Managing complex knowledge-based relationships between the university sector and the industry has been critical both for the rate of innovation, and for the scale and scope of diffusion and transfer of knowledge and technology across public and private spaces. The literature on innovation and KTT explicitly focuses on the motivations of actors and their absorptive capacity to translate and acquire tacit knowledge. Institutional intermediation is seen as the main support mechanism in the KTT process.

The innovation process itself is very diverse with multiple heterogeneous steps. Throughout the innovation process, individual steps have different requirements of time and resources that can not be fully met by individual firms. Between the beginning of innovation (a product research) and the end of it (a product commercialization) the long process requires multiple competences at the level of basic and fundamental research, through applied research, through concept testing, and then through product testing and market testing. This process goes beyond the university sector or the commercial sector by themselves, requiring various forms of collaboration and resource and activities links. Different policies are suitable for different stages and different actors, so there could not be any prescriptive rules and regulations on managing such process. The role of government hence, is evolving and encompasses prescribed roles of executing all four types of intervention described above. Such dynamic and complex regulatory presence is described in the current thinking of Triple Helix interactions, or co-evolving behaviour of the industry-university-government actors.

Triple Helix Theory and the Role of University, Government and Industry Interactions

In the Triple Helix model, the main domains of the knowledge-based economy have been defined as university, industry, and government (Etzkowitz & Leydesdorff, 1995). The model is represented by an expanding network system of interactive spirals generated by the university, industry, and government interactions that promote economic development and innovation in the economy. The mission of economic development is increasingly associated with the reproduction of the knowledge base and the systematic production of scientific novelty (Etzkowitz and Leydesdorff, 1995), as well as with the knowledge flows and the transfer of knowledge and technology in the system. In the context of the Triple Helix constellation, the universities adopt a new and third entrepreneurial role that transcends from the previous academic mission of education and research. This role requires an active participation not only in the innovation and KTT process, but also in the association with these market process and political process, whereby successful commercialisation of university technologies is seen as governments and public institutions meeting their political objectives and performance targets..

The Triple Helix model was developed to reflect on the complex university, industry, and government relations and to offers a new organizational paradigm for the analysis of innovation and new business formation and the expansion of the role of knowledge in society and of the role of universities in the economy (Lissenburgh and Harding, 2000). The triple Helix model induces a new role of government for the creation of new boundary-spanning mechanisms, that facilitate academic-industry relations and bridge across the public and the private domains. Such boundary spanning mechanisms facilitate interactions between reflexive and academic sciences and commercial technology, where university and industry begin to be in a continuing flux,

assuming tasks that before were largely the province of the other side and with ever increasing quantity and quality of the knowledge exchanged and interactions.

While the whole knowledge-based system of developed market economies can itself be considered as an outcome of interaction among different social elements (market, knowledge production, and public/private governance), the Triple Helix model of university-industry-government relationships provides a heuristic model for studying these complex dynamics. We use the Triple Helix model as a foundation for our discussion of intermediation and its representation in Fig. 1. This interpretation of the Triple Helix model is co-aligned with previous work on the knowledge-based economy, and the three essential components of geography, economy and knowledge, whose interface creates wealth and economic growth. The interactions between these dimensions generates knowledge infrastructure that supports innovation, which supports sustainable growth in the political economy (Leydesdorff, 2006).

The Triple Helix model brings dynamics and complexity into previous innovation models, such as the 19th century idea of linear relationships between the academia and the industry, or the later '*etatistic*' model of the government embraces academia and industry with its regulatory role, directly managing the relations between the knowledge and the commercial sector. The Triple Helix model differs also from the '*laissez-faire*' model, where the university-industry-government relations consists of separate institutional spheres with strong borders and highly distant relations (MacLane, 1996; Leydesdorff and Etzkowitz, 1998).

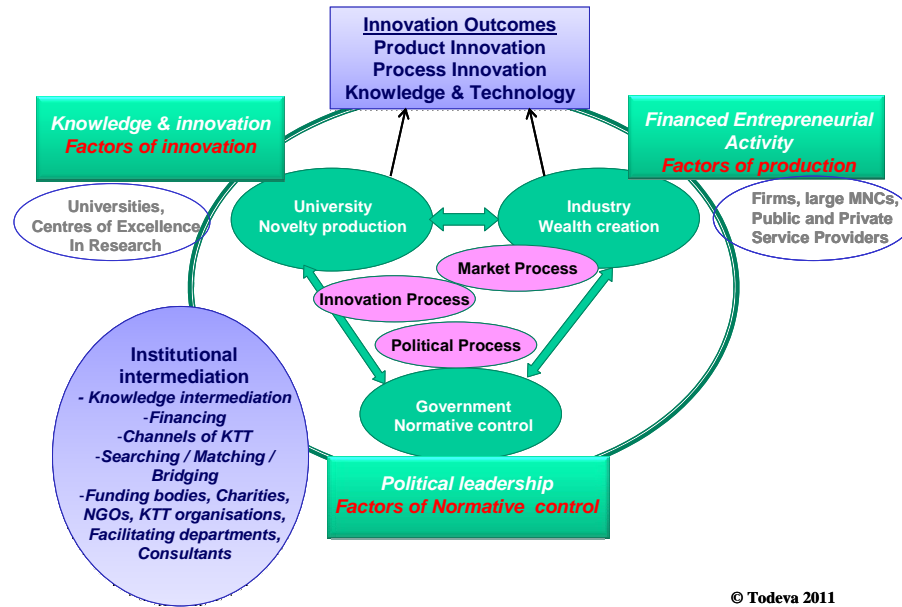

The Triple Helix model focuses on the knowledge infrastructure of overlapping institutional spheres, with each institution taking the role of the other and with hybrid organizations emerging at the interface. Thus, universities start to hold roles which previously were strictly tied to business (such as new entrepreneurial tasks, marketing, company spin-offs, licenses, and registration of patents), while firms move closer to universities, developing an academic dimension, sharing knowledge, engaging in collaborative projects with universities, involving managers in university's activities, and co-training university's graduates or employees at higher practical skill levels inside their businesses. Finally, government is more and more engaged in universities and business activities, with the aim of facilitating their success.

The literature on the Triple Helix model has contributed to the development of an heuristic model that explains the emerging structure of governance for a new mode of production and diffusion of scientific knowledge. Among the main advantages of this model are the following:

- The arrangements between industry and government no longer need to be conceptualized as exclusively between national governments and specific industrial sectors. Strategic alliance can cut across traditional sectors and countries (Frenken, 2000).
- The driving force of the interactions can be identified with the expectation of benefit / or profit, which can have several meanings: knowledge, money, employment and economic growth (Leydesdorff and Van Besselaar, 1998).
- The foundation of the model in terms of expectations gives a strong idea of uncertainties and the role of chance in the iteration of links between actors (Bruckner et al., 1994).
- The expansion and improvement of the higher education sector have provided society with a realm in which different representations of sustainability can be entertained, whereby optimisation of profits and benefits across the system and continuous improvement are required (Etzkowitz and Leydesdorff, 1995).
- The tensions in relationships between university-industry-and government need not to be resolved, given that the source of life is in the perturbations and interactions among actors (Etzkowitz and Leydesdorff, 1995).
- The helices communicate recursively over time in terms of each other's own code, where economic expectations (such as profit, growth) and scientific expectations (such as knowledge and publications) have to be related and have to convert into one another. Moreover, they can also take the role of each other, to a certain extent (Cowan and Foray, 1997).
- The model is consistent with the neo-institutional model of stakeholder arrangements and can be used as a methodological framework for case study analysis. Given the new mode of knowledge production, case studies can be enriched by raising the relevance of the three major dimensions of the model and various subdynamics stemming from their interactions.
- The model also can be informed by the increasing understanding of complex dynamics and can be utilised by simulation studies, or by evolutionary economics (e.g., Malerba *et al.*, 1999; Windrum, 1999).

- The model is represented as a meta-biological model and induces evolutionary thinking to the economic and sociological notions of governance, innovation, interaction, facilitation and the transfer of knowledge among different institutional agents (Luhmann, 1984; Leydesdorff, 2001).

FIG. 1. INTERMEDIATION OF TRIPLE HELIX RELATIONSHIPS

© Todeva 2011

In our extension to the Triple Helix model, we have put emphasis on four additional aspects. *First*, this is the fact that the dynamics in the Triple Helix interactions stems from even deeper interaction and overlap between the market process of competition and competitiveness, the political process of priority setting, defining missions and political objectives, or allocation of resources, and the innovation process of invention, creativity and exploitation of new knowledge and technology (indicated on Fig. 1. by the small spheres inside the Triple Helix). The outcomes from the simultaneous enactment of these processes result in complex motivations and complex behavioural orientations of all actors. *Second*, this is the interpretation of the three helixes in terms of factors of production (industry), factors of innovation (university), and factors of normative control and regulatory activity (government). Economic growth and sustainable development requires utilisation of all three factors, where factors of production change under the influence of factors of innovation, factors of innovation are enabled by factors of production, factors of normative control are employed for the management of both factors of innovation and factors of production, while the latter underpin the very existence of government. *Third*, the dynamics of the Triple Helix generate innovation outcomes (product and process innovation, or knowledge and technology transfer), which further feeds into subsequent circles of change and interaction across the Helix. Finally, the *fourth* extension to the Triple Helix model, is the role of intermediaries, or these agents that help university-industry-and government to perform their role, and translate the message from one helix to another, while helping them to engage in direct knowledge and technology transfer, or to finance the interim steps of it. Overall the model induces assertions about complex and indirect influences between multiple agents representing heterogeneous types of institutional formations, which require multi-layered facilitation and intermediation for their interactions.

Intermediation, Facilitation and Accountability

Intermediaries are actors that place themselves in the middle of relationships between other actors (i.e. university-industry-government) and facilitate the whole process of interaction. Historically, intermediaries, such as wholesalers, retailers and financial institutions have emerged because they reduced search and other

transaction costs for sellers and buyers. Intermediated markets, where intermediaries purchase products from sellers and sell them to buyers have demonstrated higher efficiencies, compared with search markets, where sellers and buyers meet and negotiate directly (Gehrig, 1993). Although intermediaries charge a fee for their services, they can reduce the transaction costs associated with search and bargaining. Several other aspects of intermediation are also discussed in literature. For example, Garella (1980) emphasizes the role of a middleman in mitigating market failures caused by asymmetric information. Rubinstein and Wolinsky (1987) analyze the function of intermediaries, using a search-theoretic model, where intermediaries are viable when they increase the chances of a seller finding a customer. Agrawal (2001) specifies the meaning of search and bargaining costs as the time and other resources necessary to search for potential collaboration partners and the costs associated with the negotiation and the coordination with potential partners, where it is often necessary to deal with asymmetric information and other transaction costs related to motivation and incentive problems with regard to each of the collaborating agents. In other words, intermediaries are entities that facilitate the university-industry links (UILs), reducing the individual search and bargaining costs for each collaboration partner, creating opportunities for meeting potential partners, and directly coordinating joint research projects or other collaborative activities through management and consultation. Intermediaries, such as banks, also are engaged in financing activities, which contributes directly to the integration of factors of production of innovation, and of normative control and the mitigation of risk and uncertainty about future results from the joint projects.

Intermediaries may initiate relationships and facilitate the creation of links between a university and a company. They may finance the KTT channels and they promote the innovation that emerges from this interaction. Intermediaries are vital to reach for possible partners and to offer a third-party evaluation of their capabilities or the potential synergies. Various classifications of intermediaries refer to a number of types: 1) *institutional intermediaries* are public agencies that offer finance and incentives to encourage knowledge transfer; they offer also a variety of services in order to facilitate interaction among researchers and firms, to stimulate new market entries by leveraging IP from universities, and to promote the circulation of tacit knowledge by placing university graduates in SMEs; 2) *general purpose intermediaries*, such as legal firms that facilitate patent protection and licensing, or other private sector consulting organisations that specialise in evaluation, research and intermediation; 3) *specialized intermediaries*, such as the university Technology Licensing Office (TLO) or Technology Transfer Office (TTO), that seeks out internal innovations, and helps to codify research outputs via patenting, and licence agreements to commercial users; 4) *financial intermediaries*, such as, Venture Capital organisations (VCs) or Business Angels that supply risk capital to commercial establishments that employ research active staff (Yusuf, 2008). Frequently, such a provider brings additional tacit knowledge in the form of managerial know-how, contacts, troubleshooting skills or risk assessment skills, which can assist start-ups (Hellman and Puri, 2002).

All of these types of intermediaries differ substantially from one another in terms of facilitation initiatives, knowledge and technology transfer channels, purposes, activities, and the kind of knowledge they facilitate (tacit or codified). The differences between intermediaries relate to three issues: the type of activities, type of channels for knowledge transfer, and the type of knowledge. There are several channels through which knowledge and technology are exchanged between partners and each channel requires different type of intermediation. The main channels described in the literature through which knowledge is transferred from one partner to another are: patents, licensing, collaborative and contract research, scientific publications, consultancy, co-operation in graduate education, and the creation of spin-off companies from the university sector.

Patents enable a firm to exploits invention developed by academic researchers, or by a commercial firm. The commercial outcomes from this innovation are expropriated by a particular actor. Patenting scientific discoveries assist scientists to push their discoveries to the business sector. The business sector, however, has to come across this information, which requires additional resources for search and evaluation. Among the effects of university patents are: a major source of income for the university and growth of the stock of knowledge that can be used in future education programs (Jensen and Thursby, 2004). *Licensing* enables the use of a technology or a new process by a company. Licensing has been traditionally the most popular way of university technology transfer and involves limited transfer of tacit knowledge (Siegel et al., 2003). There are two main outcomes from licensing: the growth of new knowledge - stored and available for future research projects, and a source of income from royalties (Thursby et al., 2005). Authors argue that patenting and licensing are not the main channels of university-industry knowledge transfer and contribute for a small proportion of public-private interactions if compared with other formal arrangements such as contract research and joint research agreements (Roessner, 1993; Schartinger et al., 2001; Agrawal and Henderson, 2002; Levy et al., 2009).

Collaborative research involves design and conducting R&D projects jointly by industries and university/science institutions, either on a bi-lateral basis or on a consortium basis. Most benefits for industries from interaction with universities come from formal research collaboration rather than from knowledge exchange (Earlier Swann, 2002; Monjon and Waelbroeck, 2003). According to the literature, collaborative research is the most widespread form of knowledge transfer, and this has a strong positive effect on industry performance (Zucker et al., 1998; Meyer-Krahmer and Schomoch, 1998). *Consultancy & contract research* represent research commissioned by industry, and refer to scientists' interactions with the private sector which include funding and sponsorship, institutional affiliations, tenure status, support of students, reputation or other scientific values. The combination of in-house research, networking with industry and capacity to organize conferences and meetings, enables the university to bring together entrepreneurs and professionals for face-to-face encounters that can forge university-industry links enabling partners to gain contacts and innovation ideas (Bramwell and Wolfe, 2008). Schartinger et al. (2002) observed also that collaborative and contract research are used by industry in an opposite way - when an firm uses more of one form, it tends to use less the other form.

Scientific publications are a method for knowledge transfer used both by researchers from the academia and from the industry. Industries consider codified output, such as publications, as the most important channels to transfer knowledge and academic publications account for more than 73% of the citations in the US industry patents (Narin et al., 1997). Moreover, Cohen et al. (2002) find out that the most important channels for the universities to have an impact on industrial R&D are published papers and reports.

Co-operation in graduate education involves advanced training for enterprise staff and exchanged of research staff between universities and industries (such as PhD students). Authors argue that the employment of university researchers is a way to effectively transfer knowledge from university to industry, especially in technological and knowledge intensive sectors, such as chemistry and biotechnology (Meyer-Krahmer and Schomoch, 1998; Zucker et al., 2002; Gubeli and Doloreux, 2005). Schartinger et al. (2001) argue that the mobility of human capital, both via employment of skilled people and via co-supervision of PhDs is the most frequent and most beneficial channel for knowledge transfer. Examples of such practices are also student placements and exchanges, or internships that have an impact on university curriculum and at the same time allow firms to tap into the latest thinking in university research labs and arrive at a sense of how science is evolving and the possible implications for production technologies. Argote and Ingram (2000) argue also that an important way in which knowledge is transferred from the higher education sector into industry is through the skills and experience gained by graduates and researchers. The founding of *spin-off companies* from universities represents a major innovation in the economy, where technology-oriented firms that employ researchers from the science-base generate innovation and income to the economy. Spin-off companies provide benefits in terms of: (1) access to new technology and technical know-how; (2) access to markets; and (3) competitive positioning (Hladik, 1988).

Each of these modes of knowledge transfer are associated with different forms of intermediation. Hellman (2005) has developed a formal theory about the seeking and matching process between university's researchers and the industry, called 'science-to-market gap'. In this theory there are two possible scenarios. On one hand, researchers and inventors rarely know what kind of industrial applications may exist for their scientific discoveries. On the other hand, industries are often unaware which scientific discoveries might help them to solve their problems and address their needs. In this model, the intermediaries are bridging the gap between the science and the market through additional value added by searching for innovations and translating their findings into business opportunities for firms. Intermediaries that bridge the 'science-to-market gap' can be either individuals, or organisations from the private and the public sector, offering communication and consultation services.

A series of informal contacts between industry and university can emerge also during meetings and conferences in which researchers, managers and boundary-spanning agents can meet together and form relationships. In technology intensive sectors science exhibitions and PhD research are the principal channels through which new knowledge enters the commercial domain (Zucker et al., 1998; Shane, 2002).

Hussler and Ronde (2007) show that University Industry Linkages (UILs) based upon proximity arise from epistemic knowledge creation oriented networks and communities of practice sharing tacit knowledge. The co-location of firms around universities is also facilitated by the existence of a host of supporting intermediaries providing technical support and other services (see Robinson et al., 2007).

Conclusions

The locus of innovation is to be found in networks and partnerships and not in individual firms (Powell et al., 1996). Intermediaries facilitate this innovation and the KTT activities by the virtue of their specialised resources. Intermediaries exist to provide specific resources and to play specific roles that individual members either cannot provide, due to a lack of possessing the necessary resource(s), or are unwilling to provide, because of the negative economic costs associated with obtaining and deploying the necessary resource(s) Johnson (2008). Some Knowledge intermediaries are better at dealing with codified knowledge, others with tacit knowledge, and some intermediate both kinds.

This facilitation provided by intermediaries in KTT activities requires absorptive capacity of the firms that represent the recipients of knowledge. The concept of absorptive capacity was introduced by Cohen and Levinthal (1989, 1990) and it refers to a firm's ability to recognize, assimilate, and apply new scientific information for the purpose of innovation and new product development. Intermediaries assist firms in complementing their absorptive capacity by adding knowledge or financial resources. Agrawal's studies on university-industry linkages underline the particular importance of absorptive capacity with respect of tacit knowledge. He points out that the transfer of tacit knowledge is a central issue, in that it accounts for the majority of the variance in terms of the relative abilities of firms to utilize university inventions effectively. Gertler (2003) also argues that the absorptive capacity must first be established to absorb tacit and codified knowledge in the right balance, and then to enable intermediaries to help create more fruitful university-industry linkages.

Mediating Effect of Job Satisfaction on the Relationship between Perceived Transformational Leadership Style and Commitment to Service Quality among academic staff in Malaysian Universities

Abstract

This paper discussed the mediating effect of job satisfaction on the relationship between perceived transformational leadership style and commitment to service quality among academic staff in Malaysian Universities. Total useable questionnaires were 387 with a response rate of 36 percent from both private and public universities. The result revealed that job satisfaction only partially mediates the relationship between transformational leadership and academic staffs' commitment to service quality. This study implies to the policy makers and academic leaders at the universities that there is need to focus in developing their academic staff, by tapping their potentials, inspiring them, promoting collaboration, motivating and reinforcing positive attitudes towards commitment to service quality. Future study should consider inclusion of other the mediating variables, alternative modes of enquires and a nationwide survey covering samples from the whole population of the higher institutions of learning in Malaysia that would be more significant in making generalizations.

Introduction

Malaysia's economy has undergone a transformation from that of a production based to that of a knowledge-based economy (k-economy). There has also been a call for some restructuring to tackle critical issues such as demand for more professional and skilled labour to manage the capital intensive, high technology and knowledge based industries (Mustapha & Abidin, 2008). By the end of 2010, Malaysia will need both policy makers' with partnership with the universities' community to materialize this transformational plan. Only through solid education and training systems can this transformation process into becoming a developed nation become a reality (Mohamad, 1991). However, there is an acute shortage of qualified academicians and high turnover especially with those with doctoral qualification. The turnover rate among doctorate holders at the Private Higher Education Institutes (PHEIs) in Malaysia was reported at 12 percent (National Higher Education Research Institutions, 2004). Huge investments in both the public and private universities have been carried out mainly to attract foreign students and retaining nationals but how do they prevent the academic staff from leaving. To encourage retention and eventually attained a high level of performance, especially for academic staff, it is important that academic leaders understand the aspects of professional job satisfaction that the academician would have derived from their duties and responsibilities at the university (Kuska, 2003). Nevertheless, past studies conducted on job satisfaction have been varied in terms of subject matter and also in the research frameworks (Tsai, 2008). For instance, there is a dearth in the past findings on the relationship between job satisfaction and commitment to service quality.

Past researchers were seen to adopt an attitude that displayed affective commitment to organisation as synonym to commitment to service quality. However, there have been some disagreements among scholars on how best to describe these relationships. Porter, Steers, and Boulian (1973) were convinced that organizational commitment is interrelated to job satisfaction but they have asserted that job satisfaction had to come first. Recent finding by Silva (2006) is in agreement with Porter, Steers, and Boulian's (1974) proposition that job satisfaction is interrelated to organisational commitment. Huang and Hsiao (2007) on the other hand, accepted that the relationship

between job satisfaction and organisational commitment was reciprocally related. Studies on commitment to service quality are important and necessary but unfortunately there is still little research progress in this area despite past researches have also suggested that some universities in Malaysia were losing students because their standard of service quality was not up to the expectation of the students (Jain, Abu, Akhbar & Sapuan, 2004; Firdaus, 2006; Latif, Sungsi & Bahroom, 2009). However, what really motivates commitment to service quality among academic staff at the universities remains unanswered. Past leadership literatures have associated transformational leader to organizational commitment, such as to service quality delivery (Jabnoun & Rasasi, 2005); building relationships with customers (Liao & Chuang, 2007); students' engagement with schools (Leithwood & Jantzi, 1999) and towards school reforms (Geijsel, Slegers, Leithwood & Jantzi, 2003). Some of the benefits of transformational leadership style based on job satisfaction have been realised, such as the reduction in work environment pressures and stress that is the cause of low turnover (Berson & Linton, 2005; Nielsen, Yarker, Randall, & Munir, 2009).

Only of recent, researchers have begun to be aware of the missing mediating links between leadership styles and organizational outcomes. For example, Politis (2006); Griffith (2003); Yousef (2002) have reported the existence of a possible mediator, such as job satisfaction that may account for the significant linked between leadership styles, organizational behaviour, commitment and performance. Although empirical findings have advanced the understanding of these links, little is known about the mediating role of job satisfaction in the relationship between leadership styles of transformational leadership on the academic staff commitment to service quality. However, there still exists a vague support that indicates a direct relationship between the variables. The question of whether the transformational leadership style as perceived by the academic staff would directly or indirectly affect their job satisfaction which eventually will lead to the commitment to service quality remains unanswered. Given the salience of this issue, more evidence is required. Therefore, the main purpose of this study is to elucidate information on the mediating effect of job satisfaction on the relationship between perceived transformational leadership style and commitment to service quality of the academic staff in their respective universities.

Literature Review

Commitment to Service Quality

Studies on the commitment to service quality in education literatures follow the same footpath as the general definition of affective commitment. Affective commitment is defined by Meyer and Allen (1991) as "an employee's emotional attachment to, identification with and involvement in the organization". Commitment to service quality is defined and understood as "conformity to a specification" (Martin 1986; Witt & Steward, 1996; O'Neil & Palmer, 2004) and in achieving "excellence" (Peters & Waterman, 1982). It is also about commitment to meet the students' needs and their expectations (Witt & Steward, 1996), and about building relationships between a customer and the organisation (Kandampully, 2002). Accordingly, the most important basis for the assessment of quality is the individual's experience of a service that comes from the internal quality service of the internal customer (all the organization's employees). Their commitment and willingness to serve is in the best interest of the customers, which incidentally is a prerequisite for achieving service quality (Kandampully, 2002). Clark, Hartline and Jones (2009) defined commitment to service quality as "dedication of employees to render service quality and the willingness to go beyond what is expected of them".

Past findings have also established that employees who are committed to the organization will remain loyal and are inversely related to turnover (Hartline, Maxham & McKee, 2000; Clark, Hartline, & Jones, 2009; Elmadag, Ellinger, & Franke, 2008). In such conditions, employees were known to spend more time and energy in assisting the organization realize its goals and they also put their own self interest aside (Porter, Steers & Boulian, 1973; Tsai, 2008; Sohail & Shaikh, 2004; Yiing & Ahmad, 2008). They would subscribe to the idea of being a citizen of the organisation and be fully committed to the goals of the organisation (Rashid, Sambasivan, & Johari, 2003). O'Neil (2000) in his study in higher education concurred on the importance of internal customer commitment to service quality as a means of gaining competitive advantage. Satisfied external customers, for example the students, were reported to spread by "word of mouth recommendations", which is a powerful tool in marketing (Cuthbert, 1996). Commitment of the highest level would mean emotional attachment to the organisational and this bondage is synonymous to "partnership" with superiors and colleague who would tender the academic staff's intention to continue their tenures at the university (Narimawati, 2007; Rego & Cunha, 2008).

Transformational Leadership

Leaderships can be of many facets and visages and they differ in effectiveness in terms of consequences of their actions towards internal and external stakeholders. Since organizations today are faced with many challenges, especially with the constant changes in technology, economic, social, political and legal conditions and internal processes, flexibility is required in resource utilization and in the promotion of continuous learning (Horner, 1997; Christie, 2002; Hashim & Mohmood, 2010). Therefore, there is a need for leaders in organizations to contribute not only in terms of knowledge or ideas but also in making right the decisions and responding to the changes. According to Bass and Avolio (1990), transformational leaders will focus on developing their followers by tapping them of their potentials, inspiring them, promoting collaboration, motivating them and by reinforcing positive behaviours. Bass (1990) argued that transformational leaders were pertinent especially during turbulent times when rapid changes and globalization takes place. Barnett, McCormick & Connors (2001), Antonakis, Avolio & Sivasubramanian (2003) and Kirkbride (2006) preferred to delineate transformational leadership based on five factors, which is an adoption from Bass and Avolio's (1995, 1997) studies. The five components as suggested by Barnett, McCormick and Connors (2001), Antonakis, Avolio and Sivasubramanian (2003) and Kirkbride (2006) are: individualized considerations, intellectual stimulation, inspirational motivation, idealized influence (attributes) and idealized influence (behaviour). Other authors like Kent, Crotts and Aziz (2001), and Nemanich and Keller (2007) preferred to characterize transformational leadership into four factors based on the original studies by Bass (1985a, 1985b). The difference lies in the idealized influence factor that is being theorized into the dual theory consisting of behaviour and attributes (Barnett, McCormick, & Connors 2001; Antonakis, Avolio & Sivasubramanian, 2003).

Transformational leaders in the education industry were also seen to be responsible for laying the foundation for changes in the organizational culture, strategies and even structures that are similar to any other corporate setting (Yu & Jantzi, 2002). Strategies may include development of employees to attain a higher professional level that will directly increase their capabilities, innovativeness and give more empowerment to their subordinates to shape initiatives that will bring about the much needed changes (Clark, Hartline & Jones, 2009). It is also interesting to note that in his study, Leithwood (1994) indicated the importance of transformational leadership that indirectly promoted students' achievements through their leaders' abilities to promote the school vision, and provide the much needed intellectual stimulation through the introduction of the best educational practices which fostered a high performance culture. Bess and Golman (2001) who studied leadership in American universities also supported the notion that transformational leaders are not likely to be found at universities where the heavy emphasis is on teaching and decentralization of authority. However, in this turbulent and ever changing environment, transformational leaders are much needed, especially the educational leaders who experience threats of mergers or a total collapse and in need of drastic changes in order to survive.

Job Satisfaction

Job satisfaction has been defined as a single globe concept referring to the overall satisfaction levels (Ying & Ahmad, 2009) or a multiple dimensional concept that refers to the psychological or sociological factors. Multiple dimensional concepts have been applied to discover how employees are affected by for examples, intrinsic and extrinsic elements of their jobs (Ssesanga & Garret, 2005; Lacy & Sheehan, 1997). Generally, academic researchers would prefer to define job satisfaction based on the dual theory of Herzberg et al. (Lacy & Sheehan, 1997; Ssesanga & Garret, 2005; Rad & Yarmohammadin, 2006). As such, job satisfaction studies were based on the notion that the academicians' source of satisfaction comes from intrinsic factors which are related to job content and extrinsic factors that are associated with the working environment

Previous studies have indicated that the link between job satisfaction and leadership styles has not been consistent (Tsai, 2008; Nemanich & Keller, 2007). One such finding by Evans (2001) has reported that there is no direct link between the academicians and their leaders' motivational support in ensuring that their subordinates' were satisfied with their jobs. To a certain degree, the study revealed that the academician's nature of job, such as academic freedom, being independent and generally low in accountability has to a certain extent resulted in such outcomes. Later study by Griffith (2004) had resulted in similar observations and concurred that job satisfaction had an indirect relationship with transformational leadership style in speculating staff performance and turnover in schools. However, reviews of past studies have also demonstrated some support on the link between leadership styles and job satisfaction. Nielsen, Yarker, Randall and Munir (2009) for example, conceptualised the importance of health care providers in serving senior citizens in a pressured environment and leaders especially transformational leaders were seen to have a direct link to the employees' job satisfaction and their well being.

Therefore, due to the inconsistency in the result of the findings, it has lead to some researchers to suggest that a strong indirect link through job satisfaction exists between the leadership styles which in turn influences an array of other variables such as school performance, organizational commitment, team performance, organizational citizenship behaviour and work outcomes, (Yousef, 2002; Griffith, 2003; Cheung, Wu, Chan & Wong, 2008; Chui & Chen, 2005). Chui and Chen (2005) for example presented a strong case of the mediating effects of job satisfaction in twenty four electronic companies in Taiwan, and have found that intrinsic satisfaction mediates the relationship between job varieties, job significance and organizational citizenship behaviour. However, the study did not find any support for extrinsic satisfaction but it was known to have important managerial implication. Another review of literature which linked the role stresses variable and organizational commitment indirectly through job satisfaction was conducted by Yousef (2002). He was concerned about the mediating effect of job satisfaction on role stresses particularly the role conflict and role ambiguity among employees in various organizations in United Arab Emirates. However, the findings indicate that job satisfaction mediates the influence of role conflict and role ambiguity on both affective and normative commitment with the exception of continuance commitment. The result indicates that employees were less willing to remain in the organization if they perceived they are less satisfied with their jobs because of the high level of job stress that they have to face. The lack of opportunities to move due to the scarcity of jobs was the only the reason for them to

remain in the organization.

Politis (2006) conducted a study in Australia among the manufacturing organizations with the objective of testing the mediating effects of job satisfaction in relationship to self leadership and team performance. By using a structural equations modelling, the study provides full support for job satisfaction through the effects of self leadership behavioural-focused strategies which is based on team performance. Another study by Lok and Crawford (2004) obtained a totally different result. They concluded that job satisfaction only partially mediated the effects of leadership styles, organizational cultures and subcultures on commitment among nurses in seven large hospitals in Australia. Similarly, research in the school setting has also produced the similar results which pointed out the importance of indirect effects of job satisfaction on organisational commitment and citizenship behaviour (Nguni, Slegers, & Denessen, 2006). On the other hand, studies by Salam, Cox and Sims (1996) reported that leadership according to transformational and authoritarian styles are related to team anti-citizenship, which is fully mediated by job satisfaction in a large defence firm located in mid-Atlantic United States. This study does not seem to be consistent with past studies such as those by Podsakoff, MacKenzie and Bommer (1996) who found a significant relationship between transformational leadership behaviour and citizenship behaviour through mere trust and job satisfaction. Given that most of these studies were conducted in affluent societies and that there are inconsistencies in the findings which may be due to the context, conducting more empirical studies and tests will provide more insights into the mediating variables of job satisfaction on the relationship between perceived transformational leadership style and the academic staffs' commitment to service quality in a developing country such as Malaysia.

Methodology and Research Design

This study was based on a descriptive correlation research design and cross sectional survey methodology. The target population for this study consisted of academic staff from two public universities and four private universities. Their perception of their immediate superiors such as the deans or heads of department or heads of schools were closely studied to identify their commitment to service quality. Using a 5-Point Likert-type scale, the respondent indicated their intensity of agreement anchored by 1, "strongly disagree" through to 5, "strongly agree" with items phrased. For this study, the researcher adapted a later version of MLQ instrument commonly known as MLQ 5x-short-forms to rate transformational leadership. Although the factors that measure transformational leadership styles were distinctive, (5 factors measuring transformational leaders) in this study a single dimensional construct for transformational style was adopted. This is in line with past empirical studies by Walumbwa, Wang, Lawler and Shi (2004) and Walumbwa, Orwa, Wang and Lawler (2005) on transformational leadership construct. A recent modified version by Clark, Hartline and Jones (2009) was adapted in this study with slight modifications made in order to complement the study context for measures for commitment to service quality items. Finally, the instrument to measure the mediating variable of job satisfaction components was adapted from Ssesanga and Garrett (2005) and Mertler (2001). For this study a combination of on-line and self administered questionnaires were distributed to collect individual data on the respondents. Overall the response rate was 36 percent which was slightly better than what was reported generally in the Malaysian context (Othman, Ghani, & Arshad, 2001).

Discussion of Findings

A total of 387 academic staff participated in this study. The sample indicates that female respondents represented a slightly higher percentage of total samples (59%) when compared to the male respondents (41%). The majority of the respondents possessed Master degrees or others of similar level (71%) while 29 percent had completed their doctorate degree. Majority of the respondents were middle age of between 30 to 40 years of age (43%) followed by those between 40 to 50 years old (25%). About 18 percent of the academicians were from the younger group age of between 20-30 years. With reference to their experience in teaching, the sample showed a balance between those who had teaching experience of between 1 to 5 years (33%), 5 to 10 years (28%) followed by 10 to 15 years (17%) and above 20 years (14%). More than 47 percent of the respondents were from business faculty followed by faculty of information technology (12 %).

Table 1 below presents the mean and standard deviation of all the variables under study. All the variables were measured on a five (5) interval scale. All the variable means were higher than three (3). It ranged from 3.36 to 4.04. This suggests that the perceived leadership style of the transformational, job satisfaction and academic staff commitment to service quality were at moderate to high levels in importance. All the standard deviations were below one (1) which indicates the variability in the data (Sekaran, 2005). Results of the correlation analysis indicate no violation of the assumption as the absolute value is between the ranges of 0.43 to 0.55 which is lower than the acceptable cut-off value of 0.8 (Benny & Feldman, 1985). Commitment to service quality was found to have a moderate positive correlation with the variable of transformational leadership ($r = 0.430$, $p < 0.001$) and a strong positive correlation related to job satisfaction variable ($r = 0.551$, $p < 0.001$). For transformational leadership, strong positive correlations were also observed with job satisfaction ($r = 0.533$, $p < 0.001$). The variables for this study were also reported to have an excellent reliability with a coefficient of more than 0.7 (Nunnally & Berstein, 1994; Nunnally, 1978). For this study none of the item- to-total correlations values were removed since they have values of above 0.3 (Tabachnick & Fidell, 2001).

TABLE 1: MEANS, STANDARD DEVIATIONS AND INTERCORRELATIONS OF VARIABLES OF INTEREST

Variables	CSQ	TLF	M	SD	Reliability coefficient
Commitment Service Quality (CSQ)	1		4.038	0.509	0.846
Transformational Leadership (TLF)	0.430***	1	3.356	0.714	0.96
Job Satisfaction (JS)	0.551***	0.533***	3.607	0.592	0.911

To investigate the mediating effect of job satisfaction on the relationship between perceived transformational leadership styles on the academic staff's commitment to service quality, Multiple Linear Regression (MLR) assumptions were conducted and were reported to have no serious violations. The tolerance statistics revealed that the entire variables under study were in an acceptable range (cut off of .10 as suggested by Tabachnick and Fidell, 2001). The stepwise regression analysis was then employed and the three guidelines for the mediation analyses established by Baron and Kenny (1986) procedures were followed. The guidelines that must be upheld are: i) the independent (predictor) variable should make significant contribution to the dependent (criterion) variable; ii) the independent variable should make significant contribution to the mediating variable; iii) the mediator should make a significant contribution to the dependent variable. Perfect mediation holds when the independent variable no longer relates to the dependent variable after mediator is included and regression coefficient is reduced to non significant (near zero) level. Partial mediation is when the beta coefficient of the independent variables value is reduced but still statistically significant after the inclusion of the mediator (Lok & Crawford, 2004).

Table 2 below reports the results of the analysis that was carried out. In Step 1, perceived transformational leadership style was used to predict the mediator variable of job satisfaction and was found to be significant at $p < 0.001$, ($r^2 = 0.284$) contributing 28 percent of variance in job satisfaction. Therefore, condition one was supported where perceived transformational leadership was positively and significantly correlated to commitment to service quality ($\beta = 0.533$; $t = 12.35$; $p < 0.001$). In the second step, the mediating variable of job satisfaction was entered to predict the level of commitment to service quality. The result revealed it to be significant at ($\beta = 0.551$; $t = 12.94$; $p < 0.001$) which in turn supports the second condition. 30 percent of the variance in commitment to service quality is contributed by job satisfaction. The results also revealed that before the inclusion of the mediator, as indicated in Model one, the R-Squared was at 0.185 which was significant at 0.001 level. Previously, it was found to be significantly correlated at ($\beta = 0.430$, $t = 9.334$, $p < 0.001$). However, in the third step, after the inclusion of the mediator variable of job satisfaction, as shown in Model Two, the previous significant relationship does not reveal

any insignificant relationship to account for the third support for the perfect mediator. The strength of relationship indicated a decrease ($\beta=0.190$, $t= 3.853$; $p<0.001$). The R –Squared was 0.329 significant at 0.001 level. When the mediator was included, the equation for R-Squared revealed a significant (F change = 0.001) increase from 0.185 to 0.329, indicating an improvement of 14 percent in the variance of the commitment to service quality (r^2 change =0.144). As indicated, the beta coefficient of the independent variable value was reduced but still was statistically significant after the inclusion of the mediator. Therefore, it can be concluded that job satisfaction only partially mediates the transformational leadership and commitment to service quality relationship.

TABLE 2: TRANSFORMATIONAL LEADERSHIP STYLE AND COMMITMENT TO SERVICE QUALITY MEDIATED BY JOB SATISFACTION

	Variables	r ²	β	t	Sig	F-value	Sig F change	Tolerance
	Transf L	0.284	0.533	12.35	0.001***	152.533	0.001	1
	Job Satis	0.303	0.551	12.94	0.001***	167.441	0.001	1
Model 1	Transf L	0.185	0.43	9.334	0.001***	87.118	0.001	1
Model 2	Transf L	0.329	0.19	3.853	0.001***	94.152	0.001	0.716
	Job Satis		0.449	9.094	0.001***			0.716

*** $p<0.001$, ** $p<0.01$, * $p<0.05$ DV: Commitment to Service Quality,Transf L: Transformational Leadership,Job Satis: Job Satisfaction

The finding indicates job satisfaction as being partially mediated the relationship between perceived transformational leadership on commitment to service is a step forward in uncovering the process through which both this leadership style influence one’s commitment to service quality. This finding seems to complement other relevant research as that been conducted in non educational settings (Lok& Crawford, 2004) and in school settings (Nguni,Slegers, & Denessen, 2006) which demonstrates how leadership behaviour indirectly influences its followers’ organizational commitment through job satisfaction. Based on the present findings, there seems to be some confirmation that the academic leaders may have an indirect effect via job satisfaction on the attitudes of academic staff such as commitment to service quality.Thus, with the paucity and inconsistency in past findings which may be due to the context of the study, it is hoped that this study will provide sufficient support and insights into the mediating variables of job satisfaction on the relationship between perceived leadership styles of transformational leaders and the academic staff’s commitment to service quality in a developing country such as Malaysia.

Conclusion and Implications

This research has its theoretical implications on the key area related to addition of new knowledge in integrating two disciplines which are: organizational behaviour and service quality management in education in Malaysia. Although empirical findings have advanced on the mediating role of job satisfaction, little is known about employing this mediating role of job satisfaction into the relationship between transformational leadership style and commitment of the academic staff towards service quality. The results from the findings have revealed that the outcome of the study was further enhanced by the mediating factor of job satisfaction. Therefore, this study provides more support theoretically of its importance in the education industry. Ignoring its importance may have an impact on the degree of the academic staff’s commitment to service quality.From the managerial perspective, this study implies to the policy makers and academic leaders at the universities that they need to focus in developing their academic staff, by tapping their potentials, inspiring them, promoting collaboration, motivating and reinforcing positive attitudes towards commitment to service quality. They should also seriously consider benchmarking their compensation system and practices with the best practices of other educational institutions or with other service industries. This study also has its share of limitation in the sampling frame which only considers a particular group of institutions of

higher education (selected universities only) and therefore the results cannot be generalized to the whole education industry. Future studies should also consider inclusion of other variables such as conducive climate that supports research and development, creative thinking and goal clarity emphasis or elements of trust as the mediating effect so as to gain better insights. Future studies should also consider alternative modes of enquires such as employing the longitudinal method of data collection design (e.g. experiments, archival data, observations or interviews) and a nationwide survey covering samples from the whole population of the higher institutions of learning in Malaysia.

Abstract

E-business has been proven to be an effective and successful concept of developing business and has been practiced globally in fact it has been used as one of the medium to enter international markets. Despite this fact, research involving e-business appeared to have been viewed less important. The literature showed that e-business has received relatively limited theoretical and empirical attention from social scientist as an important area of research. Based on the researchers own literature review of past studies, this study attempts to provide an insight into e-business – specifically focusing on identifying and discussing the elements contributing to the success of e-business that have yet to be explored rigorously – that could be benefited by prospective micro-entrepreneurs, small and medium-size enterprises, future researchers, government, and private agencies.

Introduction

The term business model is often mentioned in print and business executives. Based on existing term, a business model is a method an organization sustains itself in the long run and includes its value proposition for stakeholders and its revenue streams. A business model does not exist in vacuum, but relates to strategy in that a firm will select one or more business models as strategies to accomplish business goals. For example, if the firm's goal is to position itself as a high-tech, innovative company, it might decide to use the Internet to connect and communicate with its stakeholders, as does Dell Computer Company, Intel, Cisco and many more. How does a firm select the best business models? As suggested the components as critical to appraising the fit of a business model for the firm and its environment including: customer value, scope, revenue sources, connected activities, implementation, capabilities, and sustainability. Traditional business models such as retailing, selling advertising, and auctions have been around ever since the first business set up shop. What makes a business model an e-business model is the use of information technology (Strauss and Frost, 2009; Baltzan and Philips, 2009; Afuah and Tucci, 2001). This study, therefore, focuses on e-commerce which was first emerged during dot-com boom. The research is exploratory and descriptive in nature.

Literature Review

In 2003, Tom Anderson and Chris DeWolf started MySpace, a social networking Web site that offers its member information about the independent music scene around the country representing both Internet culture and teenage culture. Musicians sign up for free MySpace home pages where they can post tour dates, songs, and lyrics. Fans sign up for their own Web pages to link to favorite bands and friends. As of February 2006, MySpace was the world's fifth most popular English-language Web site with over 60 million users ("A Site Stickier," 2005). According to Stair and Reynolds (2010), one of the biggest benefits of the Internet is its ability to allow organizations to perform business with anyone, anywhere, and anytime. E-business is the conducting of business on the Internet, not only buying and selling, but also serving customers and collaborating with business partners. E-business also refers to online exchanges of information. For example, a financial institution allowing its customers to view their banking, credit card, and loan accounts or manufacturer allowing its suppliers to monitor production schedules. In the last few years, e-business seems to have spread to every single part and aspect of our daily activities. In order to enhance productivity, maximize convenience, and improve communication globally both individuals and organizations have

embraced Internet technologies. From banking to entertainment to shopping, the Internet has become necessary to our daily life activities (Baltzan and Philips, 2009; Mahajan, Srinivasan, and Wind, 2002; Brynjolfsson and Smith, 2000).

E-Business Model

A e-business model may be defined as the utilization of information and communication technologies (ICT) in support of all business activities (Strauss and Frost, 2009) or is an approach to conducting electronic business on the Internet (Baltzan and Philips, 2009; Bulkeley, 2001). E-business transactions take place between two major entities – businesses and consumers. All e-business activities happen within the framework of two types of business relationships: (1) the exchange of products and services between businesses (business-to-business, or B2B) and (2) the exchange of products and services with consumers (business-to-consumer, or B2C). The major difference between B2B and B2C are the customers; B2B customers are other businesses while B2C markets to consumers. On overall basis, B2B relations are more complex and have higher security needs; plus B2B is the dominant e-business force, representing 80 percent of all online business. Table 1.1 illustrates all the basic e-business models: Business-to-Business (B2B), Business-to-Consumers (B2C), Consumer-to-Business (C2B), and Consumer-to-Consumer (C2C) (Kotler and Armstrong, 2010; Hanson and Kalyanam, 2007; emarketer, 2006).

TABLE 1.1: BASIC E-BUSINESS MODELS

E-Business Term	Definition
Business-to-Business (B2B)	Applies to businesses buying from and selling to each other over the Internet.
Business-to-Consumers (B2C)	Applies to any business that sells its products or services to consumers over the Internet.
Consumer-to-Business (C2B)	Applies to any consumer that sells a product or service to a business over the Internet.
Consumer-to-Consumer (C2C)	Applies to sites primarily offering goods and services to assist consumers interacting with each other over the Internet.

According to Baltzan and Philip (2009), in order to stay competitive and being more effective, a business must master the art of electronic relationships and really look into the electronic medium as an additional channel to conducting and growing the business. The major business areas or activities taking advantage of e-business include: marketing and sales, financial services, procurement, customer service, and intermediaries (“Business Week,” 2000). The following Table 1.2 presents the specific list of potential e-business models for micro entrepreneur to embark on.

TABLE 1.2: THE SPECIFIC LIST OF POTENTIAL E-BUSINESS MODELS

E-Business Models	Descriptions
Content Sponsorship	An e-commerce business model that involves companies selling online Website space or e-mail space to advertisers.
Infomediary	An online organization that aggregates and distributes information.
Intermediaries	A firm that appears in the channel between the supplier and the consumer, and specializes in performing functions more efficiently than the supplier could such as online

brokers, online agents, and online retailer.

Online Brokers An intermediary that brings buyers and sellers together but does not represent either side. Like agents, brokers are paid by either the buyer or the seller e.g. online exchange and online auction.

Online Agents An intermediary who represent either the buyer or the seller, does not take title to the goods, and makes a commission for work completed e.g. selling agent (affiliate program), manufacturer’s agent (catalog aggregator), shopping agent, reverse auction, and buyer cooperative.

Online Retailer Use of digital technologies such as the internet and bar code scanners to enable the buying and selling process. E-commerce is about transactions through distribution channels and e-tailing e.g. digital products, tangible products, and direct distribution.

Advantages and Disadvantages of E-Business

E-business has drastically changed the way businesses function in today’s global economic marketplace. The technological development and advancement in the past few decades have given businesses the opportunity and ability to grow as well as expanding beyond their local and existing market territories. The Internet became a medium or channel for businesses to reach global consumers with their products and services, increasing their revenue and profits (Vitez, 2010; Hagel and Armstrong, 1997a). With all these benefits that e-businesses possess, there must be advantages (pros) and disadvantages (cons) of e-businesses as presented in Table 1.3.

TABLE 1.3: ADVANTAGES AND DISADVANTAGES OF E-BUSINESS

Advantages of E-Business	Disadvantages of E-Business
Global presence and worldwide market Multiple market segments Cost effective/low business costs for marketing and promotions Competitive advantages Business 24/7 and 365 days Speed in customer service Self freedom Keeping the Cash Open up opportunity Minimum risk Tax advantages Spending more time with family Minimum stress Maximize productivity Opportunities for professional growth Develop own creativity	Sectoral limitations Costly e-business solutions for optimization Stiff competition Difficult customer relationship High maintenance costs Security and privacy issues Virus threat Physical products constrain Perishable goods Payment issues Identity issues Contract issues Governing laws

--	--

It's evident that the advantages clearly outnumbered the disadvantages of e-business. Thus, every business has to change its business processes or practices or formats and adopt e-business practices in order to ensure survival, sustain and success in long run (Iyer, 2011; "Business Resources," 2011; Vitez, 2010; Williams III, 2010). Thus, e-business is a method by which the organization sustains itself in the long run using information technology, which includes its value proposition for partners and customers as well as its revenue streams. For example, the Internet allows education, music, and software firms to deliver their products over the internet, therefore, creating a new distribution model that cuts costs and increase value (Strauss and Frost, 2009; Metz, 2004; Seybold, 1998).

E-Business Contributions

As shown in Table 1.4, e-business strategies help firm to decrease internal expenses, often improving the value proposition for consumers and business associates. They can also increase and strengthen the enterprise revenue stream, an important part of the e-business model (Stair and Reynolds, 2010; Strauss and Frost, 2009; Hanson and Kalyanam, 2007).

TABLE 1.4: THE CONTRIBUTIONS OF E-BUSINESS

Increases Benefits

- Online mass customization and personalization.
- 24/7 convenience store.
- Self-service ordering and tracking.
- One-stop shopping centre.
- Learning from customers on social networking sites.

Increases Revenues

- Online transaction revenues such as product, information, advertising, and subscription fees; or commission on a transaction or referral.
- Adds value to products/services and increase prices (e.g., online FAQ and customer support).
- Increases customer base by reaching new markets.
- Builds customer relationship and, thus, increases current customer spending (share wallet).

Decreases Costs

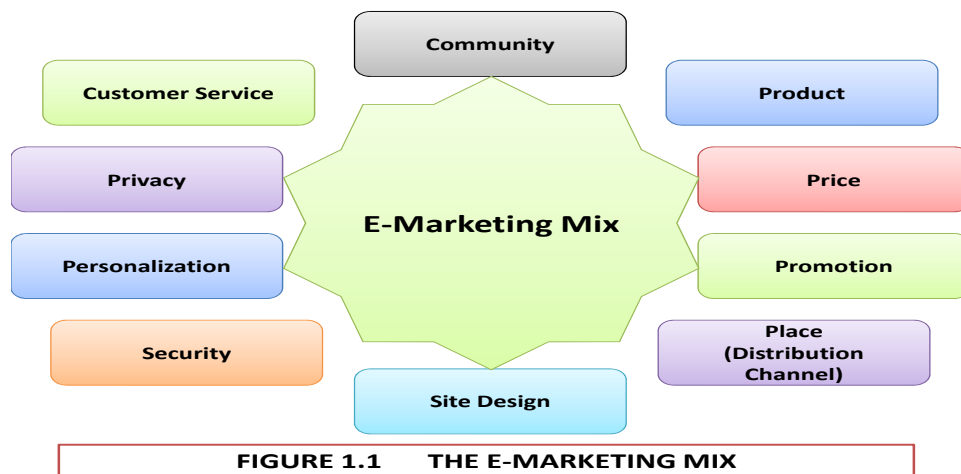

- Lowers distribution costs of communication messages (e.g., e-mail).
- Lowers distribution channel costs for digital-based products or services.
- Lowers transactions processing costs.
- Lowers knowledge acquisition costs (e.g., customer feedback and market research).
- Develop efficiencies in supply chain (through communication and inventory optimization).
- Reduce the cost of customer service.

Source adopted from Strauss and Frost, 2009

Elements Contributing To E-Business Success

The well known marketing mix has been in existence for more than 40 years as the 4Ps of Product, Price, Place, and Promotion (Kotler and Armstrong, 2010; Kalyanam and McIntyre, 2002). But, in the post dot-com boom era, marketers and marketing managers, managers are learning to manage with a whole host of new marketing elements that have emerged from the online world of the Internet. In some ways these new marketing elements have close analogs in the off-line world, and yet from another perspective they are revolutionary and worthy of a new characterization into what we coin as the E-Marketing mix. Today, few if any business plans can be completed without a blending of the E-Marketing mix into the traditional marketing mix to form an effective business strategy (Kalyanam and McIntyre, 2002).

Here, we find it worthwhile to characterize the E-Marketing Mix using a 4Ps + S2P2C2. In other words we keep the original 4Ps (which have been discussed in great details by many marketing scholars) and add Site Design, Security, Personalization, Privacy, Customer Service, and Community to characterize the E-Marketing Mix (see Figure 1.1) (Kalyanam and McIntyre, 2002). The review of past research data and as reported by the United States Department of Commerce (1996), only about 23 percent of small businesses survived to their fifth year. As far as business success is concerned, a business does not guarantee a success to its owner. However, the success of a business depends on various internal and external elements. Among the most critical elements contributing to the success of e-business model depends largely on the following e-marketing elements as depicted in Figure 1.1 (Azahari and Abd. Razak, 2010).

Product

The aspect of the E-Marketing mix has many similarities to the assortment selection practices of retailers. Given these similarities, we only focus on some of the more unique capabilities in the online environment. *Merchandising and Recommendation* - once the assortment has been selected, it is a common practice in the retail industry for the merchant to provide some creative expression for the product. For instance, retailers often display the merchandise in some specific context, perhaps with accessories, or against the backdrop of a particular environment. Online, these merchandising practices can be enhanced by using the multi-media audio and visual aids. The context and the accessories that are highlighted in the merchandising can form the basis for recommendations. The recommendations can be made accessible to the consumer using buttons for recommendations, callouts, accessories or suggested use. These recommendations are based on the expertise of the merchant. In contrast to these expert recommendations, in the online world, one can provide recommendations based on a data mining techniques that has been popularly referred to as collaborative filtering. Collaborative filtering forms the basis of a well known

recommendation engine on Amazon. In this approach, recommendations are generated by comparing the purchase patterns of past customers to the preference patterns of the current customer based on their similarities. For example, if Mr. Lee is on the site and has purchased 9 books in the past, he can be compared to other customers who also bought those 9 books and what else those other customers have purchased. Those other purchases would become natural recommendations for Mr. Lee (Stair and Reynolds, 2010; Strauss and Frost, 2009; Hanson and Kalyanam, 2007; Kalyanam and McIntyre, 2002; Poon and Joseph, 2001; Smith and Brynjolfsson, 2001).

Price

We will focus our discussion on the online pricing techniques, particularly those that are substantially new including: *Dynamic pricing* – refers to changing prices on continuous basis in order to meet the characteristics and needs of individual customers and situations. *Forward auction* – sometimes called English Auction, as popularized by eBay. In this approach the seller places an item for auction. The item is available over a pre-specified time interval. The seller may or may not stipulate a minimum reserve price. The interested buyers bid on the item until the auction closes. *Reverse auction* refers to an exchange arrangement in which individual buyers enter the price they will pay for particular items at the purchasing agent’s Web site, and sellers can agree or not (Strauss and Frost, 2009; Kalyanam and McIntyre, 2002; Smith and Brynjolfsson, 2001).

Promotion

We will focus our discussion on the promotion techniques, particularly those that are substantially new including: *Banner ad* refers to rectangular space appearing on a Web site, paid for by an advertiser, which allows the user to click-through to the advertiser’s Web site. *Sponsored Links* refers to integration of editorial content and advertising on a Web site, the sponsor pays for space and creates content that appeals to the publisher’s audience. *E-mail* refers to Internet-based direct marketing is the use of personalized e-mails. Given database of prospects and customers e-mail messages can be highly targeted. E-mail campaigns can rely on “opt-in” or “permission marketing” to be sure that respondents do not receive unsolicited message. Apart from text, emails include video, audio and web pages. *Viral marketing* refers to online equivalent of word-of-mouth and referred to as word-of-mouse, which occurs when individuals forward e-mail to friends, coworkers, family, and others on their e-mail lists. *E- coupons* refers to traditional coupons, but Internet users’ “point and clip” these electronic coupons (Strauss and Frost, 2009; Hanson and Kalyanam, 2007; Kalyanam and McIntyre, 2002; Smith and Brynjolfsson, 2001).

Place (Distribution Channel)

We will focus our discussion on the place or distribution channel techniques, particularly those that are substantially new including: *Remote Hosting* refers to using a technology called remote merchant hosting the portal can host a mirror image of the site. Retailer can rent space on these shopping sections and the portal take the order and forward it to the retailer. *Affiliates* refer to a link to an e-tailer’s Web site, put in by firms to make a commission on all purchases by referred customers (Strauss and Frost, 2009; Hanson and Kalyanam, 2007; Smith and Brynjolfsson, 2001).

Site Design

A well develop and appealing website can be considered as a potent online portfolio of a company or an individual engaged in online business. A well designed, easy to navigate and search engine friendly website will obviously rank high in search engine result page resulting more traffic to the website. A website is an online identity of a company or of an individual involved in Internet business. The task related with the website is to represent a company, attract more visitors, sell company’s name, promote more sale of company’s products and services, generate more business leads and ultimately, help to gain more return on investment. In this era of advanced technology, electronic commerce have highly dominated the business practice, and due to easy availability and

affordability of the Internet, people are running after it and making a lot of profit at the comfort of their home. As a serious e-business person, what is important for our business is, to prepare a website that is well designed, attractive, easy to navigate, highly usable, good content, full of relevant information, enough functionalities and are capable of retaining visitors for long and make them come back again (Stair and Reynolds, 2010; Strauss and Frost, 2009; Hanson and Kalyanam, 2007; Kalyanam and McIntyre, 2002; Smith and Brynjolfsson, 2001).

Security

Along with personalization and privacy a related concern is with the Security of the web site itself. Specific issues of concern include whether someone can intercept the transaction and the credit card information and how easy it would be for a hacker to enter the web site. Sites address these issues with a security policy that addresses among other issues including: (1) what aspects of the site and the transaction are secure, (2) what technology is being used, and (3) what the liability of the customer is if a credit card number is stolen or there is a security breach (Kalyanam and McIntyre, 2002 and 2001; Smith and Brynjolfsson, 2001).

Personalization,

Personalization refers to methods of individualizing an impersonal computer networked environment such as web sites that greet users by their name, providing personalized information. In an analogous way, Personalization in the online world is a term used to connote any aspect of a web-site or web service that is tailored individually in response to a returning customer. Usually users register with a site and create a profile. When the users return they only shown the information that they signed up for or find relevant. Personalization on the web can be widespread compared to what a traditional storekeeper could achieve. For example, personalization at Amazon.com takes place in the form of personalized book recommendations for well over 30 million shoppers (Strauss and Frost, 2009; Hanson and Kalyanam, 2007; Kalyanam and McIntyre, 2002 and 2001; Hagen, Howe, and Berman, 1998; Smith and Brynjolfsson, 2001).

Privacy

A topic of much debate, including issues of the Warren and Brandeis concept of a right to be left alone, often referred to as the seclusion theory; access control, which places its emphasis on laws and standards that enable persons to reasonably regulate the information that they are giving up; and autonomy that identifies private matters such as those necessary for a person to make life decisions. A typical privacy policy addresses what information is being collected and how it will be used and whether the information will be sold or shared with third parties and if so in what context (Kalyanam and McIntyre, 2002 and 2001; Smith and Brynjolfsson, 2001).

Customer Service

We will focus our discussion on the customer service techniques, particularly those that are substantially new including: *Frequently Asked Questions (FAQ's) and Help Desks* refers to link which leads to a help desk or a support page that provides users with links to specific customer support tools. A very common customer support tool is a frequently asked questions (FAQ) list. This list is usually reflective of the most common types of customer support issues. *E-mail Response Management* refers to an automated response management system which responded immediately with an acknowledgement or thank you for the sender's inbound e-mail query. *Chat room* refers to virtual space where Internet users can communicate in real time using special software (Strauss and Frost, 2009; Kalyanam and McIntyre, 2002; Smith and Brynjolfsson, 2001).

Community

In term of an e-marketing tool, “community” means getting customers to interact with one another in a way that increases the benefits of coming to the sponsor’s web site. A virtual community is also a location on the Internet where individuals interact with one another. For example, chat rooms where people discuss specific stocks, automobiles, or buy and sell goods and services through auctions like eBay are all of virtual communities. Internet technologies have enabled, in a very cost effective manner, the building of communities that are at the same time very narrow in terms of their focus while geographically broad in terms of their reach. In some cases the purpose of the interaction is to conduct transaction as in the case of an online auction or a gift registry (Strauss and Frost, 2009; Hanson and Kalyanam, 2007; Kalyanam and McIntyre, 2002; Smith and Brynjolfsson, 2001).

Conclusion And Future Research

This paper attempts to provide some useful insight into e-business. Based on the literature reviews, the researchers highlighted as well as discussing the important elements contributing to the success of e-business. In particular, the researchers suggested that any newly set-up or existing entrepreneurs should carefully study and analyze the e-marketing elements before making any investment decisions in e-business activities. With regard to this, it is imperative that entrepreneurs seeking professional advice regarding any concerns and questions before making any commitment in this type of business model.

A primary limitation of this study is that the E-Marketing Mix framework has yet to validate as a “valid” framework. After all, others might come up with alternatives frameworks or different classifications. Therefore, this is only a starting point and should be viewed as exploratory. This suggests that the first line of empirical research might be to validate this particular framework and categorization. Such an empirical validation of classification could be done with experts in the form of knowledgeable E-Marketing managers or successful e-business entrepreneurs. It is hoped that this study would not only increase the entrepreneurs understanding of e-business, but also generate more interest in this type business model.

Abstract

Nowadays the roll Public and Private Universities has evolved and now they are considered an important instrument in the economy. This essay will give a totally objective approach to the enterprising Universities, describing and analyzing the most important factors that are used for the creation of new companies having as a theoretical framework the Institutional Economy Theory of North (1990). The Enterprising University has changed its paradigm of forming professionals and is currently directed at generate new knowledge, the university has changed its traditional paradigm of training professionals and is currently aimed at generating new knowledge, manage and commercialize their research results either in the form of patents, licensing or strategic alliances with companies, which leads University to be the cornerstone in the knowledge economy. At present time, enterprising universities manage themselves entrepreneurially, commercializing their research results either in the form of patents, licensing or through strategic alliances with companies.

Entrepreneurial universities.

At the beginning of XXI century, a wide discussion has taken place on the evolving role of the university in the regional context, in science and the new mission in the past decades only dedicating to teaching, research and extension. Nowadays, a fourth and a fifth functions are taken place, encompassed with the mission of entrepreneurial, innovation and social responsibility. Corti and Riviezzo (2008) mention about:

"A 'second academic revolution' which involves the assumption of a mission of economic and social development is transforming the traditional university teaching and researching into an enterprising one.

Corti and Riviezzo, which in turn cite Clark (2004), Gibb (2005). Etzkowitz (2004) concluding that the entrepreneurial university is:

"It has been argued that universities are entrepreneurs when they are not afraid to maximize the marketing potential of their ideas and create value in society and do not see this as a major threat to academic values (Clark, 2004). Behind this is the recognition of the need for diversified funding base that involves obtaining a high percentage of their income through non-public sources (Gibb, 2005). Etzkowitz (2004) describes the enterprising university as a university that has "a proactive stance in putting knowledge in use and application of the result as an input for the creation of academic knowledge. " Thus, the enterprising university operates on an interactive innovation model, that begins with the problems in the industry and society and seeks solutions in science, instead of a linear innovation model, which begins with the investigation to proceed to use "

Since the appearance of the university substantive functions were assigned to it such as teaching, according to the evolution research and extension join. But in recent decades they are increasingly important other basic functions since it is the diffusion of the knowledge and the transfer of research results that are developing internally.

"The concept of entrepreneurial university includes universities with the ability to transform the knowledge produced within the university in an economic and socially useful

result. There are universities whose research results are analyzed for their economic and commercial potential, and develop the internal capacity to translate research results into intellectual property and economic activity according to previously established goals, for this effect see the case of Universities Harvard, Cambridge, among others "

Institutional economic thinking began in the last decades of the nineteenth century in America. American institutionalisms' were the first to highlight the economic importance of the habits of behavior and thinking of human groups and try to analyze and understand the complex social institutions. Were influenced by Marxism, the German historicist, psychology and Darwinian evolution. In general, were highly critical of both economic theory and the capitalist system of his time.

Its founder, the economist Thorstein Veblen, was inspired largely in cultural anthropology. According to him, economics is the study of material aspects of human culture. In this sense, the economic system is a cultural product subject to constant evolution and transformation. For Veblen, human action in all its facets is the proper field of economics, not only the structure and organization of economic life, but the entire social behavior.

Thus we see that currently the public and private universities have evolved and are now considered as an important tool in the knowledge-based economy. The paradigm shift within universities arises from the demands of globalization, competitiveness, market economy, the change of laws on education. According to Bramwell& Wolfe (2008) universities have emerged as central actors in the knowledge-based economy, hoping to play an active role in promoting technological change and innovation. Knowledge economy

The exchange of knowledge, rather than transfer between academia and industry, is a key factor for increasing Europe's competitiveness within a knowledge-based economy overall. In the light of experience and more effective models existing in the EU in general and in regional and national levels is necessary to examine more thoroughly the possible ways to improve the exchange of knowledge between academia and business, and the role that universities play in this process of innovation.

Veblen (1965) developed his own concept of social development and economic thinking incorporated a complete theory of social change and institutions, giving much importance to historical studies and research on the relations between social groups in the course of history. According to Veblen (1965) "The institutions are as common and predictable patterns of behavior in society, including the habits of thought and action generally shared." Saying of another way, an institution would be a kind of habitual behavior and widely accepted (Rutherford, 2001)

Entrepreneurs are, in the most wide sense, individuals with vocation to promote new projects based on a strong motivation and perseverance. A narrower definition is used to refer to the ability to create companies, but this article will use the most wide sense of the word. To summarize, being an entrepreneur involves:

1. be prepared to hear and identify what society and the market demand
2. be innovative and imaginative in responding to those claims
3. mobilize and manage resources appropriately, and whole teams of people
4. Create networks and strong partnerships with key players in the environment that provide the resources.

Ultimately, we speak of a special spirit that involves ambition and passion for challenge, risk taking, commitment, tolerance of failure and leadership, traits attributed not only to individuals but also organizations that demonstrate continuous action following those principles.

One of the most common aspects for the study of entrepreneurial universities is the influence of environmental factors. In this investigation we have selected as the theoretical framework for the North's Institutional Economic Theory (1990).

The main function of institutions in society is to reduce uncertainty by establishing a stable structure (but not necessarily efficient) of human interaction (North, 1993, pg. 16). According to Guerrero *et al.* (2006), in this context, the theory proposed by North tries to explain how institutions and institutional change contribute to economic and social development, but only presents the analysis of economic change based on three pillars:

belief -institutions-economy. From this perspective, to understand how the economy works, it is necessary to know the political, social and cultural institutions to establish the dynamics and one way is to study the system of beliefs and decision-making process (North, 2005).

North (1993) tells us that institutions include every type of limitation that humans create to shape human interaction. States that institutions can be formal, it is to say written rules and laws, regulations and governmental and informal procedures, which are the unwritten rules, such as beliefs, ideas and attitudes, so the effect of both institutions must be taken into account, as they may influence or condition the functioning of an entrepreneurial university¹.

Through the selection of the Institutional Economic Theory and having it as a theoretical framework in this research, we want to analyze whether universities as well as entrepreneurs are raised North (1990) where we talk about formal and informal institutions and whether they are suitable for study and subsequent analysis. The author believes strongly that the variables and dimensions of environment factors such as formal and informal institutions are the reason for the one that was chosen to establish a relationship with the institutional economic theory, one can cite the triple helix model that establishes the relationship university-industry-government, so that is in line with North (1990).

For this investigation a review of the literature on the topic of entrepreneurial universities through the ISI database Web of Knowledge. The study focused on eleven of the international journals of greater importance, belonging to the JCR (Journal Citation Reports), of which six of them are in the field of entrepreneurship and the others are generic. The selected study period was from 1999 to 2009 inclusive, then there is the following Table 1 of the journals used for this study.

TABLE 1: REVIEW MAGAZINES

As shown in Table 2, most of the scientific production (40%) took place in 2007 and 2008 (12 items the 30 analyzed belong to two years), we note that the years with lower scientific output was in the period from 1999 to 2002 with 10% (3 articles of the 30 analyzed belong to this period of four years), so as we see in this review of literature that speaks more entrepreneurial universities during the period from 2003 to 2008, this is 90% of the articles surveyed.

In Table 3 we see a predominance of articles written by two or more authors (63%), which would provide as a result conclude that networks have done research on the topic tried to obtain value for money and perhaps the one hand, higher productivity by the authors, and that peer collaboration can improve this. Also we can see that only 8% of the authors analyzed more than one article published on the subject of entrepreneurial universities in the study period examined, a factor that was discovered is that 77% of the analyzed studies are studies empirical. Items are analyzed as one of its main pillars the influence of environmental factors, therefore, which fell within the proposed framework, the 'institutional economic theory. "

This research analyzed could be classified in different fields of study:

Autor	Description of Study:
Rosa, (2003), Pittaway & Cope, (2007), Peterman & Kennedy, (2003), Toledano & Urbano, (2008), Frank, Lueger, & Korunka, (2007)	They describe the issues related to the perceptions and attitudes of students of both business careers as others on the propensity and intention towards entrepreneurship by analyzing characteristics such as personality, family background, educational environment, work environment, among others.
Allen, Link, & Rosenbaum, (2007), Rosa & Dawson, (2006), Rothaermel & Thursby, (2005), Powers & McDougall, (2005), Pirnay, Sulemont, & Nlemvo, (2003), (Meyer, (2003), Youtie & Shapira, (2008), Klofsten & Jones-Evans, (2000), Huggins, (2008), Grandi & Grimaldi, (2005), Martinelli, Meyer, & von Tunzelmann, (2008).	The main issue that these authors talk about is that investigating teachers are likely to be linked with industry, either by creating them their own business or working in addition to the university in a company, analyzing the characteristics of teaching experience and research, building licenses, patents, personality, age, category, among others.
Bramwell & Wolfe, (2008), De Zilwa, (2005), Mueller, (2007), Youtie & Shapira, (2008), Watkins-Mathy & Foster, (2006), Allen, Link, & Rosenbaum, (2007), Baldini, Grimaldi, & Sobrero, (2006), Klofsten & Jones-Evans, (2000), Huggins, (2008), Horowitz, (2007), Fukugawa, (2005), Martinelli, Meyer, & von Tunzelmann, (2008)	These authors address the issue of research and external activities linking universities with companies such as: patenting, licensing, strategic alliances, networks, contracts, transfer and commercialization of knowledge, seeking these final objective regional economic development and attracting external funding.
Etzkowitz, (2003), Meyer, (2003), Etzkowitz, Webster, Gebhardt, & Cantisano, (2000)	They analyze the changing role and functions of universities in socio-economic context, highlighting issues within the mission of universities such as: teaching, research and finally, economic development and regional thus linking the university-industry-government relationship.
Powers & McDougall, (2005), Rosa & Dawson, (2006), Rothaermel & Thursby, (2005), Aidis, Estrin,	Studies are about the creation or the development of

& Mickiewicz, (2008), Pirnay, Sulemont, & Nlemvo, (2003), Nicolau & Birley, (2003), Meyer, (2003), De Zilwa, (2005), Klofsten & Jones-Evans, (2000), Huggins, (2008), Grandi & Grimaldi, (2005), Frank, Lueger, & Korunka, (2007), Martinelli, Meyer, & von Tunzelmann, (2008),	university spin-out, university spin-offs leading to changes in the organizational structure of universities and technology transfer offices, patenting, networking, among others.
Pittaway & Cope, (2007), Kuratko, (2005), Etzkowitz, (2003), Klofsten & Jones-Evans, (2000), Katz, (2003),	These authors make a review of literature on the current state of academic research on <i>entrepreneurship, entrepreneurship education, and academic entrepreneur.</i>
Shane, 2004), (Pittaway & Cope, 2007), (Youtie & Shapira, 2008), (Watkins-Mathy & Foster, 2006), (Allen, Link, & Rosenbaum, 2007), (Baldini, Grimaldi, & Sobrero, 2006), (Bramwell & Wolfe, 2008),	Studies are about studies (dealing with the impact of the creation and / or amendment of legislation in patenting, licensing, research contracts in the universities.
(Peterman & Kennedy, 2003), (Bramwell & Wolfe, 2008), (Toledano & Urbano, 2008)	Studies, are about the impact of entrepreneurial education programs in universities on the enterprise, either as subject or as a complete curriculum.

We wanted to advance further in the study, carried out in Table 4, a classification of formal and informal factors obtained by analyzing the articles following the approach of the Institutional Economic Theory.

Formal factors grouped into five groups:

- Public Policy (egDohle Bay-Law, Italian Law on IP)
- Start-ups, universities, university spin-offs
- Entrepreneurial Education Programs
- Organizational Structure: Liaison Offices (patenting, licensing, strategic alliances, contracts and transfer of technology and knowledge.
- University government and organizational structure, diversified funds (public support mechanisms and lincnt structures)

Informal factors grouped into three groups:

- Attitudes and perceptions about entrepreneurship by students (factors of personality, family role, etc.).
- Attitudes and perceptions about entrepreneurship on the part of teacher-researchers (expertise, teacher status, age, personality)
- Culture

CONCLUSIONS

Based on this article we seek that managers, politicians and university managers discuss the advantages of developing an Entrepreneurial University and thereby generate the commitment of regional economic and social development, in order to have new pictures academics, scientists and business managers and developers of social development strategies towards forming networks of cooperation with the Entrepreneurial Approach.

It is important that if you take the step to be an Entrepreneurial University to reconsider the mission and vision of it, is how Etzkowitz (2003) mentioned us in his article about the mission of the college, having gone through several evolutions.

In the articles analyzed is observed that the most studied is the start-up university and the spin-off university, other issues also highlights the organizational structure, such as liaison offices (patent, licensing, strategic alliances, contracts and transfer of technology and knowledge, and other theme is the same enterprise by teacher-researchers (expertise, teacher category, age, personality), another area with smaller publications, but not least important is the entrepreneurship education programs and / or business, as indicated (Pittaway& Cope,

2007) education for entrepreneurial formation causes a great impact on the propensity and intentionality of students. What is unclear is how such education has an impact on the level of training graduate business or allows graduates to become entrepreneurs more capable.

An article which we consider as a starting point for this work, though in principle it is about entrepreneurship education is the work of Katz (*The Chronology and Intellectual Trajectory of American Entrepreneurship Education: 1876-1999*) published in 2003, because it is a chronology of the intellectual trajectory of American entrepreneurship education based on the most relevant publications over time.

Drawing on institutional economic theory proposed by North (1990), we note that in the case of entrepreneurial universities, formal institutional factors seem to have a greater influence on the entrepreneurial university, judging by the number of items (27 items out of 30 analyzed, representing 90% of total), compared with articles examining informal institutional factors (16 articles on the 30 analyzed, representing 53.33% of total).

The limitations they found was that the article will be confined to the journal found in the U.S. and Europe. In Latin America there is a very important job on the training of entrepreneurs in the countries of Brazil, Argentina, Colombia and Mexico, among others. I think it is important to analyze each country, each region and to differentiate the various factors that are predominant in the training of entrepreneurs the external or internal.

It will require detailed studies of the effect of formal and informal factors in the field of entrepreneurial university and the comparison between universities in the same region, same country or another country. This would give us a clearer idea about the viability of universities to migrate or evolve its organizational structure and more easily fulfill its mission of regional economic development agents, thereby becoming entrepreneurial universities.

Wine Tourism Development of the Territory: A Comparative Analysis of Destinations of Excellence.

*Paola Scorrano, paola.scorrano@unisalento.it
University of Salento*

Abstract

The tourism sector is characterized by the growing development of new market niches and new segments of offer to meet the pressing needs of the international tourist movement. The world of wine-related tourism represents by far one of these most popular new niches although it does not exist as a segment of the market, but is just characterized by the presence of high quality products able to build the image of a geographical location and therefore become the main motivation of the trip. Therefore the mix of culture, landscape, wine, cooking, art, food products, quality craftsmanship do contribute significantly to the economic value of an area, especially if supported by appropriate territorial marketing policies. This paper focuses on identifying and comparing the wine tourist destinations of excellence and their main features in order to determine the elements that establish a wine touristic area in an international context.

1. Wine Tourism and Regional Development

Recent years have witnessed a transformation in the ways and forms of the use of tourism due to the joint action of different elements that characterize the phenomenon of tourism. In particular, there seems to be an "explosion" of the tourist experience in a variety of forms of so called "authentic" touristic experience, where the main elements are represented by the link with the territory, culture, traditions, the lifestyles that characterize it. These changes in the demands of touristic experience have a significant impact on tourism supply system. The touristic products are infact more and more evidently turning into an emotional type of experience goods (Pencarelli and Forlani, 2002).

In this context, wine is conceived less and less as a food component (nutritional function), instead more increasingly as an opportunity to improve the style and quality of life, therefore becoming the reason to discover territories, visit wineries, taste local delicacies, and socializing with food. More than any other food products, wine attracts the attention of the consumer to the territory of its origination and, therefore, is directly involved in the virtuous cycle aimed at promoting the area through the dissemination / promotion of their own products (Bilkey and Nes, 1982), environmental compliance, research and quality of health *latu sensu* (Mastroberardino, 2002).

The contribution of wine tourismⁱ to the economic exploitation of the territory is also facilitated by policies aimed at a regional marketing of destination managementⁱⁱ able to translate in a touristic package the elements of wine territory, the geography and business of the product, establish an appropriate touristic offer balance potential and actual demand to supply (Maizza and Rosato, 2008; Vrontis and Thrassou and Czinkota, 2011).

In this perspective, it is easy to see that the large and diverse presence of "territories" can represent at the same time, an opportunity and also a constraint on the development and diversification of the wine of a nation. On the one hand, the search for the peculiarities in grapes and wines that distinguish one wine area from another is an attractive that on the other can have a negative impact if it is not communicated and promoted effectively. It is well known that communication policies of niche products (Mattiacci, 2000) are not effective due to modest financial resources available. Therefore the intervention of a comprehensive regional policy can facilitate the enhancement of the touristic value, ensuring the achievement of critical mass necessary to obtain useful synergistic action taken jointly by a number of territories within the area. In this perspective, the wine tourism represents an opportunity as well as being an element of diversification that allows the implementation of joint actions carried out by the various players together with the other players in the area and its governance. Ultimately the success of a wine touristic location is based on the ability to communicate effectively the diversity in a given geographic area, not only through appropriate promotional campaigns, but also through the

establishment of actions with a single common denominator (such as, for example, wine and the set of elements related to its territory of origin, and history, traditions, art, culture, gastronomy, landscape) through the presence of a general action of protection and monitoring (Antonioli Corigliano, 1996). For this purpose it might be useful to create a public-private metamanagement as a tool to enhance the potential role of food and wine resources and establish the typologies of tourism based on the choice of a destination (Rosato and Scorrano, 2010).

For these reasons, the wine and the food in general can represent a significant component in the overall value proposition when choosing a touristic destination (Howley and van Westering, 2007; Weston, 2003)ⁱⁱⁱ. In this perspective, the precise definition of the target audience is a central and defining element of the overall process of developing wine tourism in an area.

2. Features of the Wine Tourist

As previously stated, a region that aspires to rise as a wine tourism destination should direct the offer primarily to the tourist "gourmet" and, secondarily, to a tourist who does not take food and wine as a primary reason for the trip but who also recognizes the trip as a significant additional component to enrich his/her whole experience.

Wine tourist and, more generally, the food and wine tourist is characterized by the search for a "real" interaction with the territory, with the traditions, customs, habits of the local community through the typical food and wine tradition (Charters and Ali-Knight, 2002)^{iv}. The significant element in this type of touristic demand is, therefore, represented by the combination of "wine / food - land / place of production", in a process of interaction where the tourist gets to discover, experiences, tastes and appreciates the food and wine products, the place of production, the traditions and peculiarities of the land, through an enriching touristic experience.^v The moment of wine and food tasting triggers access to a larger system of relationships that the tourists should be able to start with a process of discovery and enjoyment of the visiting country: (visit - tasting - participation in the production process) to finally come into direct contact with the wine and food producers of the visited area. Over time, the demand for wine tourism has experienced an evolution that can be summarized in the following three stages^{vi}:

- *Introductory*: the consumer looks for good quality and affordable wine; enjoys the friendly welcome in the cellars;
- *Evaluative*: The consumer is able to recognize and choose (thanks to the presence of guides and articles in the trade press) the names and most famous wineries;
- *Tertiary*: the tourist is also seeking for services such as wine tastings, wine shops, restaurants;
- *Experiential*: the tourist wants to participate to specific, unique events
- *Authentic*: the tourists refuse predictable, and crowded tourist attractions sites.

Over time, the wine and food tourist, therefore, has become the one who always had a desire to "taste in a conscious way" because of the opportunity to learn everything about wine and food resources (ingredients, special flavors, production techniques and / or preparation, associated with local traditions, recipes, etc.). Thus, it assumes the two characteristics of an experienced and demanding consumer, or a curious and eager to learn consumer.

A possible classification of the types of wine tourist can result from the combination of variables (table 1):

- "wine culture", understood as knowledge of the product and its history;
- "relevance assigned to the resources of the territory", understood as natural, cultural and historical sightseeing, touristic facilities (hotels, leisure etc.).

TABLE 1: WINE TOURISTS

<i>Relevance of the land resources</i>	high	<i>Wine fans</i>	<i>Wine-taster</i>
	low	<i>Wine-discoverers</i>	<i>Wine-professionals</i>
		low/medium	high
		<i>Wine culture</i>	

Source: our elaboration

The rectangle characterized by low wine culture and a low importance given to the resources of the area represents the *wine-discoverers*, i.e. those who have an initial approach to the field (induction phase), have limited knowledge but a high interest in making short trips to events that relate to the wine. This category consists mainly of young people, couples and families.

The category of *wine tourists* qualified by a modest wine culture, but a high importance assigned to the area's resources can be called wine fans (evaluation phase). They have a keen interest in the sector, have a good basic understanding of products and places (usually resulting from reading magazines and guides) and are keen on trips and courses. These individuals aged 35-40 years, are quite wealthy, and excellent wine cellars visitors. For these individuals wine is a central element of the trip, but they are also interested in other local resources (natural, historical and cultural elements, etc.) which are a main factor in the choice of destination.

The food and *wine professionals* are characterized by wide and diverse product knowledge, a developed travel culture of places and routes in the sector (tertiary stage). They know labels, vintages, prices, auctions, wine combinations and are very good buyers. Wine is the exclusive reason for the visit. In this category are the managers of wineries, restaurants, etc.

The rectangle characterized by high culture of wine and high importance of land resources represents the *wine tasters* (experiential stage and phase of authenticity), that in addition to those who possess a wealth of knowledge similar to wine professionals, are also characterized by the search for identity in products and places, really keen to make wine culture a chance to live the authentic experience^{vii}. This is the highest form of experience and awareness of use of resources, food and wine, an expression which we refer to a variety of activities including, for example: (a) the tasting of traditional local food, (b) the purchase of these products on site, (c) learning the techniques of production, (d) the observation of the areas and places of production and processing, (e) participation in some of the processes of production. This type of wine tourist is therefore satisfied if he/she can combine the pleasures of learning and exploring the territories with the acquisition of the cultural identity of a community through its local products.

3. The Main Wine Tourist Destinations in the World: Success Factors

3.1. Research Methodology

The objective of this analysis is, as mentioned above, to provide a listing and analysis of the major wine tourist destinations of excellence. The most critical step of this survey was the identification of a source of information to identify a list of those destinations. This is due to the difficulty to infer with certainty what may be regarded a wine tourist destination of excellence: the absence of an identification element for wine-tourism and the lack of data concerning the flows of specific wine tourist destinations. An alternative approach was to use the Web as an information source on the assumption that the players in the tourism industry (both as demand as supply) are

frequent internet users^{viii}. The research therefore used the information from the various sites/blogs^{ix} specialized in tourism and/or wine tourism, collecting the opinions of experts and wine fans.

Given the large number of Internet sources devoted to wine tourism it was necessary to establish some selection criteria to limit the scope of the survey only to some websites/blogs^x. Their identification was made following the instructions shown below^{xi}:

- identification of the most widely known search engines worldwide, namely: www.google.com and www.yahoo.com;
- choice of key words to be included in the search engines, namely: "best wine tourism", "excellent wine tourism", "best wine destination", "excellent wine destination";
- Selection of sites/blogs to draw upon the information: after entering the chosen keywords in the search engines we made a comparison between the first two pages of those engines^{xii} to identify the main sites/blogs about wine tourist destinations worldwide. Ultimately the sites were: www.travelblog.it, viaggi.virgilio.it, www.winenews.it, www.simonseeks.com, vino24.tv, opentravel.com, www.helium.com, www.ehow.com, www.squidoo.com, www.chicagotribune.com;
- determination of wine tourist destinations of excellence: an analysis of the content of these sites has resulted in identification of targets that have a higher recurrence and therefore are considered excellent by industry experts or perceived as such by wine fans.

3.2 Results

Below are the results of what are considered the wine destinations of excellence in the world (table 2):

TABLE 2: WINE DESTINATIONS OF EXCELLENCE

Nation	Number of presence of the touristic site
France	Bordeaux 7/10 Champagne 4/10
California (USA)	Napa Valley 8/10 Sonoma Valley 6/10
Italy	Tuscany 9/10 Piedmont 2/10 Umbria 1/10
South Africa	Stellenbosch 9/10
Australia	Barossa Valley 6/10
New Zealand	Marlborough 6/10
Spain	La Rioja 5/10
Chile	Valle Central 4/10

Source: our elaboration

The characteristics of each wine destination described on at least three websites are the following^{xiii}:

- *Bordeaux (France)*: Known for its charming old town, in the 2007 Bordeaux was classified World Heritage by UNESCO. This recognition is a tangible sign of the asset value and unit of the city that has evolved over the centuries without ever betraying its harmony and its architectural wealth. The city is worldly renowned for its production of wine in the wine lands along the rivers Garonne and Dordogne. Bordeaux wines can be red, dry white or liqueur, or rosé. The grapes from which it derives are: Cabernet Franc, Cabernet Sauvignon, Merlot for red wines, Sauvignon, Sémillon and Muscadelle for white wines.
- *Champagne-Ardenne (France)*: The term takes a champagne appellation of origin that refers to a territorial area in northern France, the region of Champagne-Ardenne. This area is unique in France, to have a single appellation, specific terroir and cru classified, for a total of 34,000 hectares of vineyards. Champagne-Ardenne has 5 sites classified as World Heritage by UNESCO. With over 5,000 miles of trails and walking routes, this region offers a wide range of opportunities for hiking, horseback riding and mountain biking

(there are 450 km of greenways to explore by bike or on rollerblades). Champagne-Ardenne is also equipped with a large number of amusement parks and offers opportunities for events throughout the year.

- *Napa Valley* (California): Known for its wine production began in the sixties, the County of Napa Valley is now one of the best wine regions, like France and Italy, with nearly 400 wineries in surplus. The Mediterranean climate makes this Napa Valley considered the birthplace of American Cabernet Sauvignon and Zinfandel, the American version of Italian Primitivo. The Napa Valley Wine Train offers an unusual way to enjoy the scenery and vineyards. A significant amount of thermal spas and mud baths and the Old Faithful geyser are the attractions in Calistoga, famous tourist destination in Napa Valley.
- *Sonoma Valley* (California) home to some of the first vineyards and wineries of the state, offers a wide range of festivals and events throughout the year including the prestigious Sonoma International Film Festival and wineries with good touristic facilities. Today, the wines of this small valley are protected by the federal government of the United States of Sonoma Valley and Carneros AVAS (or American Viticultural Areas). The most common varieties are Zinfandel, Carignan, Petit Syrah, Pinot Noir and Merlot from those black grapes, Chardonnay, Sauvignon and Colombard among the white grapes.
- *Tuscany* (Italy): Tuscany has a basket of world-class wines: 6 DOCG - Carmignano (Prato Province), Brunello di Montalcino Chianti (with its sub-8), Morellino di Scansano (since 2007), Vernaccia San Gimignano and Vino Nobile di Montepulciano - and 34 DOC. The region also, with its ancient and defined identity, is one of the most celebrated places for Italian history, art, economics, culture, landscapes and beauty. Tuscany is among the Italian regions with the largest number of sites classified by UNESCO World Heritage Site: Historic Centre of Florence, Piazza del Duomo in Pisa, the historical center of San Gimignano, Siena's historic center, historical center of the town of Pienza , Val d'Orcia. Tourism (art, beach, rural, mountain and spa) is a major economic resource of Tuscany.
- *Stellenbosch* (South Africa): The valleys of Stellenbosch, Paarl and Franschoek are the central part of the Cape Winelands region, the larger of the two wine regions of South Africa. The wine industry in South Africa produces about one million liters of wine annually. Stellenbosch is also the primary location for research in wine (prof. Perold was the first professor of wineculture in the Stellenbosch University). Very famous is the "Stellenbosch wine route", born in 1971. The Stellenbosch Cabernet Sauvignon is emerging as a high quality wine. Stellenbosch is renowned for its Cape Dutch-style architecture, the main street, Dorp Street, contains many historic buildings and this is a national monument. A tour of Stellenbosch also typically includes some visits (with tasting) to wineries. Among the most features one can mention the Meerlust which is located in a prestigious house in 1693.
- *Barossa Valley* (Australia) is the largest wine-producing region and the first tourist destination of South Australia (60 km from Adelaide). Renowned for the Shiraz (red wine), this is used to produce the most famous Australian wine, the Penfold Grange. Other types of grapes grown are Riesling, Semillon, Grenache and Cabernet Sauvignon. Every two years to celebrate the success of the wine industry they organize the "Barossa Valley Vintage Festival", a week of street parades, concerts and gourmet dining offered to visitors from around the world.
- *Marlborough* (New Zealand) can boast of having the most modern wine industry of New Zealand. At the end of 1970, Marlborough has produced, among other varieties, the first Sauvignon Blanc that has generated confidence in the potential of foreign wine in New Zealand, now considered the world's best by many critics. The wine region of Marlborough is 62% of the total land area planted, the vines are: Sauvignon Blanc, Pinot Noir and Chardonnay. Equally important is the production of sparkling wine using the *Method Traditionelle* with, in particular near Renwick, derived vines of Riesling, Pinot Noir and Chardonnay.
- *La Rioja* (Spain) La Rioja is the most famous wine region in Spain. Divided into three sub-regions (Rioja Alta, Rioja Baja and Rioja Alava), giving their name to the wine produced there: Rioja, a wine to "calificada Denomination de Origen"(DOC). There are numerous attractions in the area: highly renowned are, in particular, the Camino de la Lengua, the Camino de Santiago, the many monasteries, the opportunity to retrace the footsteps of the dinosaurs that inhabited the area and even castles, archaeological sites and museums.
- *Valle Central* (Chile) is the main area of Chile in terms of both wine production and reputation. It matches with the historic site of the Chilean Central Valley, an area lying between the Andes and the Pacific. Within the valley there are four wine-producing sub regions: the Maipo Valley (most cultivated and best known for

Cabernet Sauvignon), the Rapel Valley (in Colchagua Province and famous for the Cabernet), the Curicó Valley (characterized by the variety of red wine and planted white, best known for Chardonnay), and the Maule Valley (which still has large plantations of Pais local, but it is undergoing a change in favor of agricultural varieties of high quality, with better varieties of red wine).

4. Conclusions

the wine tourism system can be broken down into four different categories of macro elements (Franch, 2002):

1. the set of specific resources (natural, cultural, architectural, artificial food and wine, etc.) that characterize the destination;
2. the set of resources so called "generic" (physical infrastructure and / or technological, environmental protection, quality of life and hospitality of the resident population, etc);
3. the variety of touristic services "qualified" to meet customer expectations;
4. the set of "intangible" resources (the image and reputation of the destination, the skills and expertise of different business and institutional actors who insist on the destination, the relational capital) (Iazzi and Rosato, 2009).

Each of the above four categories of resources plays a crucial role for the competitiveness of a tourist destination and this induces them to work in coordination and integration (Getz and Brown, 2006). In the case of wine tourist destinations, it seems clear that the inclination of the territory to the production of wine is not in itself a determining factor for success in wine tourism. The wine tourist, while selecting a destination, prefers the combination of "wine-land" because the joint research of the traditional presence of attractors and wineries are able to guarantee an adequate level of service.

The success of wine tourism destination must therefore be able to build a value proposition of the specific supply system based on the following characters:

1. Integration of local resources. The need is to build a supply system that integrates the use of the resources of traditional gastronomic destination with the exploitation of natural resources, cultural landscape of the territory to strengthen the perceived link between territory and resources by the tourist food and wine.
2. Authenticity. It is necessary to build an integrated supply system in which different components can be an expression of traditions, customs, and culture of the area.
3. Experiential. A wine tourism destination that aims to ensure the success patterns with the different components of the supply system based on interaction with the host community, with the system of tourist attractions and, more generally, with the various components of 'tourism.

The analysis of the characteristics of the wine tourist destinations can be summarized as follows:

- Relevant and valued resources of enogastronomy typical throughout the area (which also include extra forms of accommodation - hotel "authentic" and strongly typical gourmet^{xiv});
- Significant brand awareness in international territorial markets;
- Appropriate skills training on the themes of food and wine tourism;
- Good attitude of a growing number of enterprises engaged in different food chains in the definition of tourist accommodation and hospitality services (tastings, visits, etc..)
- Presence of significant land resources (environmental, cultural, scenic, architectural) complementary to the gastronomic motivation.

Opportunities for future growth of wine tourism destinations are:

- Growing attention of international markets to the wine tourist destinations;
- Growing importance of experiential forms of tourism related to the authenticity of local resources;
- Possibility to build a system of a target product able to diversify the supply and the seasonal variations in tourist flows.

^{VII} On the importance of authenticity of land resources to make a competitive tourist destination see Ferrari, S., & Adamo, E.G. (2005). Autenticità e risorse locali come attrattive turistiche: il caso della Calabria. *Sinergie*, n.66.

^{VIII} In the last five years wine blogs/sites have increased up to 700 worldwide.

^{IX} A blog is a website, managed by an individual or a company, where the blogger publishes online his/her own comments, opinions, judgments, recommendations accompanied by video clips, pictures.

^X This study does not give sample results that can be applied to a whole corpus of reference since this is unknown, it rather focuses on the specific area of this study

^{XI} Considering the modern techniques utilized to improve internet positioning and the related web search sites ranking, this approach was carried out only in one day (15 February 2011).

^{XII} Websurfers rarely visit the second page of a search engine.

^{XIII} Source of information comes from above mentioned internet websites and from the official web site of the Tourism Board of each of these wine destinations.

^{XIV} For the sake of brevity we omitted to report the type and quantity of accommodation and food present (indeed in large numbers) in each of the destinations considered.

A case for Employee Empowerment as a Strategy to promote Competitive Advantage: the hotel industry in Guadalajara

Jose Sanchez-Gutierrez, jsanchez@cucea.udg.mx

adairgutierrez-govea, adair430@hotmail.com

Juan Antonio Vargas-Barraza, mniudg@gmail.com

Antonio De Jesus Vizcaino

University Of Guadalajara, Mexico

ABSTRACT

Most Mexican businesses recognize the importance of employee empowerment as a strategy to promote competitive advantage in the marketplace and it is more so with the hotel industry that replicate the success of leading multinationals. Employee empowerment is expected to play a significant role in promoting participatory management, team building, job enrichment, total quality management and reengineering and hence strengthen competitiveness of firms.

This research aims to find the most representative variables that endorse empowerment in organizations of the Hotel Industry. The present study included a sample of 119 hotels in Guadalajara, Mexico. The results were examined with factorial analysis and consequently a regression model.

Theoretical Background

Guadalajara is popularly known as the “Silicon Valley” of Mexico. Guadalajara in particular and the state of Jalisco have attracted considerable amount of foreign investment (1970 million dollars in 2010, SEIJAL 2010) and several multinational companies have invested in technology intensive industries in Guadalajara.

With increased investment by multinationals service sector, especially the hotel and hospitality industry have become an important segment of business in the region. Despite lack of official data on the industry, the estimate indicate that this sector employ more than half the country's working population (18 million workers) and generate over 70% of total revenue and is therefore the most dynamic sector of the national economy (Coll, A., Córdoba, J. : 2006).

Besides technology-intensive manufacturing, Guadalajara is also known for its tourism, as it is identified by the important Mexican symbols such as Tequila and Mariachi. In tourism, Jalisco is ranked No.1 nationally in the number of lodging establishments, in terms of total passengers of different airports in the country, both domestic and international; Jalisco accounts for 12.28% in tourist arrivals and ranked second in the country. The Metropolitan Area of Guadalajara has a capacity of over 16,000 rooms and based on standards they vary from Economy to Five Star and Luxury Class accommodations. Several hotels in Guadalajara have established facilities for conventions and expositions and offer most modern and advanced technology to organize major international events.

The hotel industry is highly complex and requires constant personal attention; perhaps the hotel industry is one of those sectors that continue to adapt to changes in the demographics of tourist population and macroeconomic changes. In order to increase competitiveness and fulfill the expectations of customer demand for quality, flexibility and low costs, hotel industry in Guadalajara as anywhere else are pressurized to generate different business models and one of those models include "Empowerment" of employees.

The concept of "Empowerment" could be treated as a philosophy and a style of management. Several authors have defined the concept of "empowerment" and contributed to a very broad spectrum of literature on the subject.

World Bank (2009) offered a more comprehensive definition as: "Empowerment is the process of enhancing the capacity of individuals or groups to make choices and to transform those choices into desired actions and outcomes. Central to this processes are actions which both build individual and collective assets, improve the efficiency and fairness of the organizational and institutional context which govern the use of these assets."

In the context of employment in an organization, many authors have described the concept of empowerment in different ways. For example, Borade, G. (2008), considers "empowerment" is meant to give power to the individual and as a consequence, the selection, involvement and responsibilities are expected to make employees more efficient and sensitive to customer expectations. Greasley, K. (2007) states that the true meaning of empowerment is to provide authority to an employee.

Conger J. and Kanungo, R. (1998) proposed that the empowerment should be perceived as a motivational concept, which denotes allowing an employee to deal with a situation or a task in an appropriate and professional manner.

Somech, A. (2005) states that : "empowerment is a process of strengthening employees' motivation to accomplish job-related tasks". Basically, this construct is based on two main interpretations (Conger, J., Kanungo, R.: 1988). Therefore, empowerment as a relational construct is the process by which a leader or manager shares his or her power with their subordinates."

In management literature empowerment is described as delegation, devolution, sharing of power, and authority by those higher up in the organizational structure to those at the lower levels of the organization (Olshfski, D.; Cunningham, R., 1998).

Thus empowerment, substitutes the old hierarchy of self directed teams, wherein information is shared with each person. Employees have the chance and responsibility to do their best.

Spreitzer, G., (1995) presented the following assumptions while discussing empowerment:

1. Is not general across situations, it depends on the characteristics of the work environment and people's perceptions.
2. Is variable; "people can be viewed as more or less empowered, rather than empowered or not empowered"
3. Is not a global concept in all life situations and roles, varies according to work areas.

As it's shown, most authors suggest that employees are expected to be highly motivated and committed to their occupation.

Spreitzer, G., (1995) mentioned two main consequences of empowerment: effectiveness and innovative behavior. Empowerment will improve also concentration, initiative and resiliency and thus heighten managerial effectiveness.

Despite the benefit of empowerment as discussed in management literature, there exist a number of disadvantages and limitations, as well. Because empowerment is a never-ending journey and takes time to be effective, employees and leaders may feel impatient. As employees continue to learn on the business, leaders will feel more comfortable entrusting them with decision making powers and a sense of autonomy and making employees feel more comfortable assuming greater responsibility. Bell, C. (2003) noted that as long as companies have workers at distinct levels, empowerment will be a challenge. For Manville, B. & Ober, J.; (2003) employee empowerment has a limited scope as workers are able to make decisions about their immediate jobs or to participate in somewhat broader decisions about their own units, but they still have little or no voice in decisions about the direction of the overall company."

Argyris, C., (1998); noted that while managers expect the participation of everyone in order for empowerment to exist in an organization, "in the principle the answer is "yes"; in reality, it is a "but." The author alluded that it "is unrealistic to expect management to allow thousands of employees to participate fully in self-governance."

Employees instead of feeling more empowered, they feel more trapped and less able to talk openly about what's really going on. Although managers share some of the responsibilities for undermining internal motivation in

their organizations, the change programs that could create high levels of internal commitment and empowerment in corporations do not yet exist (Argyris, C., 1998).

In general, empowerment is likely impress on the employees that they are trusted, their experience is valued and sought after. It allows good workers to become excellent employees who are personally invested in the team as they are implementing their own plan, rather than one foisted upon them by the organization. For empowerment to be successful employees must be entrusted to make organizational and operational decisions. But to do so, they need to be properly trained (Greisman, B., 2009).

Hypothesis

H1. Constructive and helpful attitudes from leaders constitute a significant variable to endorse an empowered environment.

H2. Clear objectives from leaders constitute a significant variable that endorse empowerment.

H3. Recognition from leaders to subordinates constitutes a significant variable that endorse empowerment.

Research Method

The methodology used in this study was adapted from Murrell, K. L., & Meredith, M. (2002). A questionnaire was applied to directives, managers and supervisors from the hotel sector in Guadalajara, Mexico. In total 119 questionnaires were made.

Questionnaires were distributed personally and participants were invited through a personal invitation in order to achieve 100% rate response. Since this research was not experimental or quasi experimental, this means, it is expected association rather than causality; random sampling was not an issue (Kerlinger, F., Lee, H. :2004).

The questionnaire consists of an introductory statement, with five possible answers and two final statements. It is comprised of thirty questions. The survey questions were classified into six different areas, in order to relate the variables, based on aMurrell & Meredith's questionnaire.

As well, the questionnaire consists of an introductory statement, with five possible answers and two final statements. It is comprised of thirty questions, as follows:

	AREAS
--	-------

	Area 1. Information: Communication* and learning**
Q1	Level of information provided to employees.
Q2	Level of access to the information in a system
Q3	Aperture to free discussion among colleagues about work
Q4	Level of confidence to express opinions to superiors.
Q5	Ensure that all information reaches the right people.
	Area 2. Decision making: Action* and Transformation**
Q6	Making and implementing decisions considering the interests of all people involved.
Q7	Promptness and consensus about decision-making
Q8	Relevance of individual decision making and teamwork.
Q9	Implementation of delegated tasks to ensure success.
Q10	Level of stimulation to promote teamwork.
	Area 3. Planning: Organization* and service**
Q11	Planning of activities involving subordinates.
Q12	Organization and allocation of the activities of subordinates.
Q13	Planning activities for the completion of a work project.
Q14	Level of work of work as team of subordinates and the leader when facing a very complicated project.
Q15	Organizational design involving subordinates to encourage the delegation of authority and power.
	Area 4. Evaluation: Control* and Liberation**
Q16	Evaluation of subordinates seeking feedback and right of reply.
Q17	Frequency and objectivity of the feedback received by subordinates about their performance.
Q18	Type of control approach of subordinates seeking to increase the levels of responsibility.
Q19	Monitoring progress of projects and reward management and deadlines.
Q20	Discussion and search for solutions when having problematic employee.
	Area 5. Motivation: Leadership* and Mentoring**
Q21	Role of the leader to lead a team and knowledge of the employee's activities in order to retain the leadership role.
Q22	Motivation focused on the type of work and the situation in which the employees can give their best performance.
Q23	Types of motivation for employees oriented at recognition and satisfaction.
Q24	Leadership position designed to demonstrate what is known and blindly trust in self opinions.
Q25	Effective collaboration through knowledge-building with unmotivated employees.
	Area 6 Development & Selection: Assignment * and Creation**
Q26	Employee selection discarding conflicting, lazy and difficult to control.
Q27	Feedback and solutions when subordinates when they do not do their job properly.
Q28	Levels of consciousness and learning capabilities that can be achieved when working in teams
Q29	Existing developed level of recognition and importance of subordinates with several years in the company.
Q30	Support to the subordinate who is not developing their work through comprehension and support within the capabilities of the leader.

*Basic Skills

**Competence of empowerment

Once the data collection phase, the coding and tabulation items was proceed by recording the data in each of the questionnaires considered valid. This was done using SPSS (Statistical Package for Social Sciences).The results were examined with factorial analysis and consequently a regression model, under the method “step-wise”.

Results

The table 1 shows the frequency and percentage of women and men. Corresponding to the Feminine gender, there were 71 questionnaires, which makes a total of 59.7%. Finally, regarding the Masculine gender, there was a total of 48 questionnaires; corresponding to 40.3% of the total.

TABLE 1. GENDER FREQUENCY AND PERCENTAGE

Gender		
	Frequency	Percent
Feminine	71	59.7
Masculine	48	40.3
Total	119	100.0

TABLE 2. MANAGERIAL LEVEL FREQUENCY AND PERCENTAGE

Level		
	Frequency	Percent
Link	72	60.5
Manager	29	24.4
Submanager	18	15.1
Total	119	100.0

Table 2 shows that frequency and percentage of each managerial level. Submanagers have 15.1% of the total, which is 18 questionnaires; Link employees have 60.5% corresponding to 72 questionnaires and finally Managers have 24.4% of the total, corresponding to 29 questionnaires.

The maximum, minimum, mean, standard deviation, kurtosis and skewness statistics for each question reach the criteria of normality (moderate in this case). Factor analysis was used to analyze the data obtained. Values also were analyzed with the Cronbach's Alpha, where factors 1, 2, 3, 4, and 6 are valid according to acceptable internal Cronbach's Alphas values (over 0.6). In addition, results showed that Adjusted R Square value of 0.123 demonstrates that approximately 12.3% of the variability of the variable Q9 (Level Empowerment) is explained by the variation of the independent variables "Communication with peers" (Q3) "Attitude of Leadership" (Q21) and "leadership targets "(Q24).

Subsequently, a regression model was obtained with the dependent variable "Level of empowerment (Q9) and variables "Communication with peers" (Q3), "Attitude of Leadership" (Q21), "Leadership targets"(Q24) as independent or explanatory. The independent variables were determined under the method "step-wise".

Table 3 ANOVA (Analysis of Variance) demonstrate that the regression model is statistically significant at least at a level of 99% (See A. Significance value). Therefore, it is rejected the null hypothesis on all the estimated parameters are zero.

*Significant at .05; **Significant at .01; ***Significance at .001

Source: Own elaboration

Based on the results of Table 4, all coefficients of the variables Q3, Q21 and Q24 are statistically significant because T values (in absolute value) are above 1.96. Similarly, Q values are less than 0.05 and confidence intervals do not that the estimate value is 0. As a result, H1 & H2 are accepted, since variables Q21 and Q24 are statistically significant. The variables Q21 and Q24 show a negative effect on the dependent variable. These variables are related to leadership. While P21 represents the role of the leader and the ability of learn more of the employee's jobs than themselves in order to maintain the leadership status quo, Q24 represents the position of leader to display his/her knowledge and the imposition of his/her ideas. If the leader care less about his/her status quo and allow employees to do their job independently, a higher level of empowerment will be achieved. The finding results consistent with the literature since the leader should collaborate and set an example for employees to achieve success and power. Supporting this claim, Rapp, A., Ahearne, M., Mathieu, J. & Schillewaert (2006) indicate that managers should do a better job of demonstrating the meaningfulness of work; allowing workers contribute in decision making, removing bureaucratic constraints and expressing confidence.

Additionally, H3 is rejected given that it was not significant. In contrast, communication with peers about work is positively associated with the level of empowerment. This variable that represents the free discussion between colleagues about the job leads to a new statement: Whether there is more communication and free discussion about work among employees, there is a higher level of empowerment and vice versa.

Even though literature states “communication between employees and managers” as a variable that contributes to enhance the empowerment level, little or nothing has been study about communication and free discussion on work among the employees and leaders. Few authors, like Kieslinger, B., Pata, K. & Fabian, C. (2009) denote the importance of collaborative learning among workers. Communication would consequently result in feedback and mutual support between employees and therefore more autonomy supported on the exchange of information that helps the decision making of the employees. An employee may be benefited from the experience of another.

Conclusions

The observed results are not favorable in terms of empowerment level of employees who were ranked in a low to medium level. Therefore it is suggested that companies in the hotel industry generate a plan of action to achieve the transformation needed to increase the level of empowerment, which is relevant and appropriate for the institution to acquire the fundamental soundness and credibility to operate efficiently and effectively and thus achieve full customer satisfaction and international competitiveness.

A significant result in this research is that the communication level and free discussion about work among employees or participative collaboration is the most representative and positive variable of empowerment, even more important than other variables such as mentoring. Communication can be comprehended as an indispensable element of an organization and it should be considered as a function that concerns to the entire company since it directly influences its daily operations and goals (Malmelin, N., 2007). Hence, it is recommended to managers to establish an organizational environment that endorses communication and feedback between employees, enabling them to learn from their pals and support each other. Significant participation by individuals who have unique and noteworthy experience can foster strategic decisions and commitment to execute those decisions effectively (Vroom, V.H., Jago, A.: 1988).

In addition, it was found that significant variables that influence the level of empowerment of employees are associated to leadership. The leader must assume a collaborative role and supply all essential information to employees so they can perform their activities in an autonomous approach. The commitment of the leader will allow the employees to achieve higher levels of empowerment and consequently, to maintain or increase competitiveness in the company.

Finally, empowerment has been proved to be a successful providing autonomy to employees, working as tool for information and experience learning exchange and improving job performance. For hotel Industry, the improvement of quality in processes and activities is valuable, since employees are the most important asset (Hamidi, Y., 2009).

Employees become reliable and therefore their experience is appreciated and significant. Moreover: good workers become excellent employees.

Limitations and Research Recommendations

In order to lessen limitations, it is recommended additional researches using different samples in other industries, regions or countries in view of the fact that research focuses only on the Hotel Industry in Guadalajara, Jalisco.

Furthermore, as quantitative data rather than qualitative data were gathered, the research does not exemplify the particular work conditions of participants to further examine our hypothesized relationships.

Abstract

This paper investigates the use of e-learning in a marketing perspective. This topic seems to be interesting according to the researchers in management mainly because could represent an useful “tool” for companies in order both to develop “knowledge” and in carrying out training activities. Unfortunately do not appear faced the study of “e-learning” from a marketing perspective.

As a consequence we propose an Italian case study about the development of an e-learning platform aimed to develop the relationships between the company and market influencers; therefore, the main purpose of the paper is to understand how a company could improve its intangibles resources (i.e. intellectual capital).

Introduction¹

Interest in *e-learning* has been growing steadily for some time now, due to the considerable advantages this type of training imparts. As a matter of fact, through the use of ICT it is possible to multiply the opportunities for learning and to expand the usability of “knowledge” thus achieved. These aspects take on particular significance, considering the fact that the demand for continuing training becoming ever more widespread; it is a given, in fact, that individuals and organizations need to constantly renew their own knowledge and competencies, so as to improve their ability to interact with more and more dynamic and complex environments.

With specific reference to business enterprises, it is believed that e-learning can play an important role in their growth. The high degree of flexibility that characterizes e-learning means, first and foremost, that it facilitates access to education and training for companies, even of modest size, allowing them to augment their internal competencies and to sharpen their competitiveness. Furthermore, e-learning can contribute to enhancing and increasing the organization’s cognitive assets by stimulating the creation and diffusion of new knowledge, starting from the existing base; in this sense, an integration between e-learning and knowledge management systems is, in many cases, observable.

Moreover, it is worth mentioning the merits of e-learning used in the area of customer service or consulting services; for example, it is possible to “teach” clients and/or users how to use a product properly or how to get the most out of a given service, in order to help them achieve a positive experience and therefore, increase their sense of satisfaction. The development potential for similar services appears particularly interesting, in light of the popularity of mobile terminals for web access, such as cellular phones and palmtops.

Thus, it can be said that the different possible applications for such a tool could prove to be a support for a company’s intellectual capital growth (Stewart, 1997).

In the present paper, e-learning is analyzed from a marketing perspective. Specifically, the case studied is iGuzzini, a company operating in the lighting sector, which has developed an e-learning platform called *Lightcampus*, dedicated to the world of light and lighting techniques. This technological framework makes it possible for anyone interested in this field to obtain free training, managing their learning pathways in an autonomous fashion. The basic idea underlying the project is that, by making available its own knowledge – and increasing it through the interactions with users on the platform – the company can:

- increase awareness of its brand and the products it offers;
- come into contact and build relationships with existing and potential clients, while gathering important information and carrying out targeted communication activities;
- acquire and retain the loyalty of market “influencers” (architects, lighting technicians).

Therefore, the project aims to gain several advantages, from the standpoint of image, of communication and of relationship development; thus, it can be said to be an example of enhancement of company “knowledge” for marketing purposes.

The main objectives of the study can be summarized as follows:

- identify the possible role played by e-learning in marketing and communication strategy development;
- highlight both the positive and the negative aspects of its use in managing marketing knowledge;
- emphasize e-learning's function as regards the growth of relational capital;
- evaluate the long term advantages to the company.

As concerns the methodology adopted, this paper will examine some of the principal theoretical contributions made regarding the relationship between marketing and new technologies, as well as on relational marketing (Costabile, 2001; Gummesson, 2006). Moreover, personal interviews will be made to the heads of marketing and communication of the company under study, as well as the people involved in managing the e-learning platform.

It is to be noted that this is a work in progress and therefore, some of the results that have emerged are only partial; more thorough and extensive analysis of other aspects will be carried out in a subsequent phase.

Knowledge and relationships as sources of competitive advantage

A number of analytical studies have looked at the importance of intangible factors in determining competitive advantage, and in particular, of knowledge and relationships.

In the past, Vicari (1992) looked at a business enterprise from an autopoietic point of view, observing the circular process whereby resources such as trust and knowledge are created and which, in turn, become sources of value creation. In line with this perspective, Rullani (1993, 59) stresses the value of knowledge, maintaining that the business enterprise can be conceived as a cognitive system which generates "differential value" with respect to its competitors, by mobilizing the specific knowledge assets passed on through the generations or acquired externally to design, build and sell products, processes and relationships that "incorporate" that knowledge, making it available to the clients the company serves.

Such reflections are even more relevant today, considering the impact that intangibles have on production and consumption methods, as well as on business strategies (Prandelli and Von Krogh, 2000; Valdani, 2002).

In a *knowledge-based* economy, some known growth factors appear less significant, while other growth drivers gather strength (cognitive abilities, experience). In evaluating the competitive position of a company, therefore, some traditional parameters (size, market share, etc.) assume less relevance². On this point it is further observed that, in the age of knowledge, it has become evident that economic growth and competitive positioning, in truth, are the result of other factors, such as, for example: the quantity and quality of the *learning* processes achieved, the degree of *access to available knowledge* on large reliable networks made up of external specialists and *strategic partners*, and finally, the capacity to *propagate* the knowledge acquired in larger and larger catchment basins so as to *extract* from it, the greatest possible value (Rullani, 2004, 43).

If cognitive resources constitute an important source of competitive advantage, it becomes patently clear that attention must be placed on the way said resources are to be managed. In this sense, the relationships forged with external subjects reveal themselves to be a useful means of fostering the growth and enhancing the value of same; in fact, it has been observed how, in more and more complex work contexts, there is a greater need to interact with the outside, so as to acquire knowledge and competencies that complement what is already part of one's own domain (Lanza, 2000). As pointed out by Golfetto (2000, 62), relationships represent a way of accessing resources that are not available on the market, thus constituting factors which can establish a unique competitive advantage tied to specific agreements or even, merely be the outcome of a bond of trust that has been built up over time and which cannot be replicated by competitors.

The limited "openness" of companies and their reluctance to share the knowledge they possess can, however, pose an obstacle to the development of relationships. The search for "trusted partners" appears to be a difficult, but necessary path to take, seeing as material goods wear out with use, whereas knowledge, on the contrary, when shared and re-used, is multiplied (Rullani, 2004). This, then, is the reason why it becomes paramount to be able to evaluate the growth potential of any given relationship, taking into account the resources needed and the results that can be expected; those companies that can establish stable and profitable relationships with strategic partners, come out considerably ahead of the game in an environment that is in perpetual motion and increasingly complex, compared to those who face that same environment following a prevalently individualistic approach. In this regard, what is emphasized is that marketing activities can be useful for understanding the complexity of the relationship network and also for defining the proper management of those relationships (Turnbull *et al.*, 1996). What is known as relational marketing has taken on a certain degree of significance, by virtue of the fact that an important evolution

has taken place, as attention has extended its scope from B2B to B2C relationships and beyond, also involving a company's various stakeholders; so much so that Gummesson (2006) has identified 30 different types of relationships, thus pointing to the need for a company to develop trust relationships with a variety of subjects. The element of trust is, in fact, the cornerstone of the process involving exchanges of information and knowledge, geared towards developing profitable relationships with the market.

Thus, it is made manifest how central a role it is, that played by the interactive relationships between a company and the outside environment, to the point where they become the pivotal elements in which to invest, so as to achieve and consolidate business objectives and performance in the long term.

With particular reference to those trust resources based on the client's cognitive system ("marketing resources"), Bertoli *et al.* (2000, 145) defines them as being made up of:

- knowledge of the brand or the company, measurable in terms of fame, image and reputation;
- relationships with those segments of the demand served, measurable in terms of behavioral faithfulness, cognitive faithfulness and loyalty.

As concerns such resources it is possible to discern a circular process that is fed reciprocally, such that: customer satisfaction generates trust resources which enhance the relationship with the company through the perception of a positive reputation and image, as well as through faithful behavior shown by "commercial preference"; the on-going relationship further nurtures and builds up client loyalty (with the possible development of a collaborative relationship) and, at the same time, it represents a source of learning for the company, thereby allowing it to increase its marketing resources. It must be stressed that the same process can be observed vis-à-vis other categories of stakeholders.

Thus, the opportunities that present themselves in connection with the use of new technologies in the fields of ICT and communication cannot be overlooked.

The role of e-learning in company growth

In recent years, the growing interest shown for e-learning can be tied into the importance assumed by "knowledge", from both an economic and social standpoint, and by lifelong learning.

In fact, the knowledge and the competencies owned by individuals and organizations are characterized by shorter and shorter "lifecycles"; hence, it becomes all the more necessary to constantly update that knowledge so as to be able to interact and deal with environments that have become increasingly more dynamic and complex (Sharples, 2000; Fatiguso, 2003; Rullani, 2008). Particular attention is therefore turned to the solutions offered by technological innovation in the field of learning.

E-learning, which can be defined very succinctly as a method of learning based on the use of ICT³, is appreciated for certain advantages it offers, of which:

- the access to learning and training "anytime and anywhere". ICT tools make it possible to benefit from courses regardless of the territorial location of participants; furthermore, the so-called non-simultaneous tools (e-mail, discussion forums, etc.) allow for access to the training activities at more "favorable" times;
- the option to design and follow a highly personalized course, including the length of time each user needs to complete it;
- the opportunity to develop teaching methods based on both cooperative and collaborative learning.

The fact that e-learning also presents certain disadvantages⁴, has contributed to forming the widely shared opinion that it cannot be considered a substitute for traditional learning, but rather, that it is a useful support for improving and "enriching" learning processes. This would point to the wisdom of sidestepping the debate centered around pitting the one against the other and concentrating instead on what combination of the two is most effective.

In Italy, e-learning is being used by a growing number of people in such areas as Public Administration, Healthcare, Education and Business, as well as by private individuals. Based on the results of the latest report published by the industry observer, Osservatorio Anee/Assinform (2006), companies represent the sector with the highest demand for e-learning in Italy, with an investment share of nearly 92%⁵. It bears noting, on this point, that the companies that do invest in this type of learning method are primarily the larger-sized ones, driven mostly by the savings in terms of average cost per person trained. Another aspect to underline is the fact that SMEs tend to engage in only limited use of the Internet⁶ and generally, do not use e-learning as a training method. And yet, the latter represents an extremely interesting training methodology for this typology of business, in that it can well suit needs like flexibility and immediacy that are most often encountered (Attwell, 2003). E-learning does, in fact, allow for

greater compatibility and, in some cases, more integration between training activities and work activities⁷; furthermore, the so-called “e-learning on-demand” solutions make it possible to utilize these services in a less rigid way – from needs analysis to the evaluation of results –, and can include a “pay-per-use” option, in which only what is actually used is paid for. Access to training is therefore facilitated; this could have a determining effect on some critical factors, such as the development of managerial capabilities, for example, of the smaller-sized enterprise.

It would seem logical, then, to intervene, so as to remove those obstacles of a technical and/or cultural nature which limit the spread of e-learning in SMEs (Gregori and Temperini, 2009), with the awareness that the continual enhancement of “human capital” is a condition that is becoming more and more pressing, if companies are going to be able to successfully face the new challenges brought by the technological, organizational and market changes that are taking place (Angotti, 2004; Trabucchi, 2004).

With reference to e-learning, another facet to point out is its contribution to the on-going growth of an organization’s intellectual capital (Stewart, 1997).

On this subject, there is a growing convergence between e-learning and knowledge management; indeed, the development and implementation of e-learning solutions are carried out in a way that is more and more often dovetailed to the knowledge management system of an organization and in particular, to firms.

KM is defined as that complex of organizational, managerial, ICT and communication systems through which an organization appropriates itself of the knowledge of individuals and groups, assimilates it and provides a fertile ground for generating new knowledge which it then transfers, disseminates, capitalizes on and incorporates into products and services, thus realizing profits and gaining a competitive advantage over time (Tonchia, 2003, 84).

In analyzing this definition, some features that are common to both KM and e-learning can be deduced:

- both processes have the same general objective, i.e. to augment the knowledge owned by individuals and foster its use within organizations;
- both are based on the use of IT systems;
- both tend to enhance human resources;
- both aim to promote re-use of knowledge;
- both emphasize the value of shared knowledge.

The information and knowledge “capitalized” by the KM system form the basis for the creation of educational content that can be imparted via e-learning. The latter’s function is to spread and make available to others the knowledge that derives from company processes and experience, but also to foster new forms of knowledge from that which already existed. The KM system must, in turn, be able to “capture” the new knowledge that is generated, so as to increase the organizational knowledge base.

E-learning provides an important tool to promote organizational learning and to improve knowledge management. Several advantages associated with it are outlined below.

- a) *Development of new knowledge.* In addition to being a fundamental instrument in the search for knowledge outside the company (Bonani, 2002, 209), the Internet also represents an opportunity to create new knowledge through the processes of sharing, simulation, animation and interaction. In particular, by using ICT it is possible to develop networks and communities that bring together people interested in the exchange of knowledge so they can expand their cognitive assets; hence, it is possible to further amplify the knowledge that is owned, by combining the knowledge of single individuals who are interacting in the virtual learning environments.
- b) *Overcoming some problematic aspects associated with KM.* Often, barriers to the real sharing of knowledge arise spontaneously within an organization⁸. In some cases these limitations could be overcome by turning to e-learning which, besides facilitating the learning process of individuals, can also help to create informal environments that are suitable for promoting cooperation and transfer of knowledge (Rollet, 2003).
- c) *Improved usability of knowledge.* E-learning can make it possible to obtain information, knowledge and contextualized, just-in-time instructions (Dose-Patano-Vaciago, 2002). In other words, it can encourage the sharing and use of certain types of knowledge when it is actually needed. With reference to *marketing* knowledge, Troilo (2001, 176) makes the observation that what is important is not so much maximum sharing, but rather the sharing and use of specific marketing knowledge useful to specific activities⁹.
- d) *More effective internal communication.* E-learning can render an organization’s internal communication more effective concerning, for example, safety regulations in the workplace, certain procedures or concerning the company objectives and strategies to be shared in order to achieve greater coherence and therefore, greater force of action (Iacono, 2001)¹⁰.

The solutions that integrate e-learning and KM therefore appear advantageous, both to develop the cognitive assets of an organization and to better respond to outside changes and demands; indeed, they allow an organization (Dose-Patano-Vaciago, 2002) to:

- enrich the content of the training modules with specific information (or best practices) regarding either the activity being carried out, the problem being dealt with or the decisions to be taken;
- reduce the time needed to gather and put together the information required for the training modules;
- optimize the technological infrastructure, part of which is common to both systems, and improve the efficiency of its management.

An important point to make is that in order for either or both systems to be used effectively, it often becomes necessary to encourage a mind-set change. In fact, it can be said to be definitely short-sighted or wrong to expect technology, alone, to provide a ready-made solution to the problem of knowledge management...many companies have invested considerable resources in applications for knowledge management, thinking that the change could be driven exclusively by technology (Mainetti, 2003, 37). Thus, it becomes essential to create a knowledge-oriented culture (Turati, 2002) within an organization, so as to enhance the knowledge regeneration-reutilization cycle.

Finally, the role played by the Internet, in the field of marketing, leads to a reflection on the possible applications of e-learning in that context. It could be a useful tool for:

- managing market knowledge;
- creating selling power;
- communicating with clients;
- offering services;
- spreading knowledge about products or services offered (also aimed at their proper use and at creating a positive experience);
- promoting the brand;
- increasing relational capital.

All of this, in consideration of the interesting possibilities for increasing the potential demand for e-learning, tied to the following tendencies:

- a) the growing popularity of personal computers and the steady increase in the number of Internet users. In 2009 it was estimated that 298 million PCs were sold worldwide (Assinform, 2010); in 2008 and 2007 the figures were, respectively, 287 and 258 million units sold. Further estimates show that from 2007 to 2009, Internet users, worldwide, went from 1.32 to 1.8 billion (an increase of 36.4%).
- b) The increased use of “wide band” technology which makes it easier to use services available on the Net. From 2007 to 2009 the number of wide band users went from 350 to 462 million (an increase of 32%).
- c) The development of “new terminals” (cellular telephones equipped with UMTS technology, “palmtop” computers) which use special systems (Wi-Fi, Bluetooth) that increase the options for Internet access and therefore make it possible to take advantage of e-learning services “anytime and anywhere”. From 2007 to 2009 mobile telecommunications users increased from 3.3 to 4.58 billion (an increase of 38.8%).

An example of convergence between e-learning and relational marketing: the “Lightcampus” case

The *Lightcampus* e-learning platform was launched in 2002 by iGuzzini, a Marche-based company that produces light fixtures (table 1), and it is the fruit of the company’s rethinking of its presence on the Web; starting from 1998, the company had its own site, but it later felt the need to change the way it communicated on-line, both in form and in content.

TABLE 1 – PRINCIPAL FEATURES OF IGUZZINI¹¹

Based in Recanati (MC) and operating in the lighting sector, the iGuzzini company was founded in 1958, originally under the name of Harvey Creazioni, as a manufacturer of lamps and chandeliers. With a turnover of 167.7 million euros in 2009 and over 1,200 employees, today, this business enterprise is one of the most important in Europe and number one in Italy, for its sector. It is remarkable that this family-run business has established a sales network in over 70 countries of the world and has opened 16 subsidiaries abroad. Currently, it is part of FIMAG (the holding company, Finanziaria Mariano Guzzini, named for the company founders’ father), co-owned by Mariano Guzzini’s six children, which controls the companies in the Guzzini Group:

- 1) Fratelli Guzzini S.p.A., for household goods;
- 2) iGuzzini illuminazione S.p.A., for light fixtures and lighting systems;
- 3) Teuco Guzzini S.p.A., for kitchen sinks, bathroom fixtures and cabinets.

The Group also manages Gitronica, an advanced technology center for research and application of electronic technologies which develops innovative solutions for the components industry as well as for digitally controlled light systems.

The iGuzzini company collaborates with some of the world's most famous architects and lighting designers, among which the name Renzo Piano stands out.

The attention paid to all aspects concerning the quality of the lighting environment has attracted the collaboration of numerous researchers, doctors, sociologists and physicists belonging to research organizations both national and international, including prestigious U.S. universities such as Harvard and M.I.T in Boston.

The range of lighting products includes several lines, subdivided by principal areas: a) interior lighting systems; b) exterior lighting systems; c) light management systems; d) special products (e.g. direct light systems for urban areas or professional fluorescent light systems and suspensions).

The lighting solutions are devised for urban areas, the tertiary sector, museums, commercial space and hospitality facilities. Worthy of note is the 1997 project for the renowned archaeological area of Luxor, in Egypt and, more recently, the lighting project for the 'Dot Baires Shopping', Buenos Aires' biggest and most modern shopping center. The list of big name clients carries those of Armani, Bulgari, Deutsche Bank, Deutsche Post, Ferrari, Hilton, McDonald's, just to name a few.

The many awards earned over the years testify to the quality of iGuzzini solutions. The latest, for the "Archilede" ("ArchiLEDs") LED street lighting system, earned a "CityBuild Abu Dhabi Excellence in Construction Award 2010" given to companies in recognition for their contribution to progress in key areas of the Middle East.

iGuzzini's strengths lie in its attention to the requirements of the spaces to be illuminated; this focus led the company to set up a Center for Studies and Research in 1995 with the objective of fostering an open debate regarding all topics having to do with light; this has involved architects, designers, researchers and the public in general. Also, activity geared towards promoting a lighting 'culture', is undertaken out in collaboration with regional schools and universities and includes educational seminars. Moreover, knowledge is constantly exchanged with the academic world.

In particular, it was felt that there was the need to differentiate the methods of communication, according to the different interlocutors being targeted; redesigning the site therefore also served to make it more dynamic and so, it was reorganized into the following three main areas:

- a) *institutional area*, which contains references to the most important projects or to the company partnerships, for example;
- b) *on-line catalog area*, where information about products is available;
- c) *educational area*, which concerns the whole theme of lighting and is primarily geared towards people on the outside of the company.

The third area was added with a view to promoting the company and its products by disseminating the concept of lighting culture, as well as raising awareness of the role and the impact a proper lighting solution can have on quality of life.

On this point it should be added that iGuzzini has, for some time now, been following a communication strategy focused on 'teaching', in the sense that the communication activities tend to be centered around educational themes of interest for the recipients. Already back in 1982, the company distinguished itself by launching its first advertising campaign, called "illuminareitaliani" ("Illuminating Italians"), on a well-known national magazine; the innovation lay in the fact that the content of the communication was not the light product itself, but the quality of the light. Appearing in the general press meant that the company could reach, not only the public at large, but other potential clients as well (regional authorities, companies, restaurateurs, etc.) by means of "fragments of knowledge".

The strategy aims, not so much to promote the product *per se*, but to offer advice on the choosing the type of lighting that is most suitable for the requirements and the context in which it will be used. The two main foundation points are:

- on the one hand, there is the opportunity to compensate for the lack of education and limited information on the topic of lighting which, *à propos*, is evolving rapidly, thanks to technological innovation;
- on the other hand, there is the need to attract and retain brand loyalty from certain key subjects in the buying processes.

As concerns the second point, it should be noted that there are generally three main figures involved in the decision to purchase a lighting solution (see figure 1):

- a) the *project designer*: prescribes a specific product and *brand* to be installed;
- b) the *installer*: can decide to install the product recommended by the project designer or may choose a product of a different *brand*;

- c) the *customer*: can decide to follow the advice of the other two, or not.

FIG. 1- KEY FIGURES IN THE CHOICE OF A LIGHTING SOLUTION¹²

These figures, depending on the case, can carry more or less weight in the final decision and may have differing requirements concerning the products to be used; for instance:

- the customer could be interested in the lasting quality of the light fixtures and in the energy consumption data;
- the project designer could look at the overall effect, how the products fit into a certain context or ambience, also in terms of their aesthetic value;
- the installer is usually more concerned with ease of installation and durability (so as to reduce the likelihood of repairs and maintenance).

Offering differentiated learning pathways is therefore a useful way to “interfere” in the “purchase order chain”, so as to win the preference of the most influential figures when it is time to buy.

As concerns the so-called market “prescribers”, in this case the project designers and the installers, the company has been organizing training courses on how to light different settings, for example, both in-house, where a special area specifically created for this purpose can host up to 2,500 participants a year, and in foreign subsidiaries. In addition to this, the company also offers information and consulting services (on lighting products/solutions, on available technology) which consists in providing technical support personnel to follow the design phase of the project in order to help overcome any particular lighting problems that might be encountered.

It is plain to see how such initiatives can grow exponentially with the use of ICT tools which make it possible to reach far greater numbers of users than the more traditional education and training methods.

Along these lines, it is noteworthy that approximately 8,000 “students” per year attend the training courses loaded onto the *Lightcampus* platform. These are mostly made up of people already working in the sector, professionals with different competencies (from architects to lighting technicians), who are interested in staying up-to-date through continuing education; some of the users are also regular students. There are basic courses which start at the beginner level and others that have been added from time to time, which deal with a variety of general topics; the courses are taught in two languages, Italian and English, and it is interesting to note that there is a slight preference shown for the second. Access is free, once the user is registered by providing basic personal data and an e-mail address for communications (e.g. company newsletter). The service is advertised primarily on the website and traditional press.

In 2006 a major updating of the platform was carried out in collaboration with Nautes¹³, in order to make it more interactive; some activities were added to foster the creation of a virtual community of shared interests revolving around the theme of lighting. This was done with the knowledge that such communities can play a significant role, not only in spreading awareness about the company, about its values and in reinforcing brand loyalty, but also in helping to develop the offer itself; in fact, as stated by Andersen (2005, 296), «when customers with specialist knowledge discuss product features among themselves, industrial marketers may listen and learn». Thus, there is the chance to garner an important contribution to the development of ideas to improve existing products and services or to come up with innovative ones.

In order to encourage greater participation and involvement of users, the section labeled “To Apply” was added; it is dedicated to real-life success stories of iGuzzini projects and to virtual experiments with the theories acquired and is subdivided into two areas:

- a) a “Case Study” area: where information and knowledge can be obtained about some of the most interesting projects carried out by iGuzzini, with an emphasis on learning about the techniques and tools used.
- b) A “Laboratory” area: where a series of virtual laboratories or workshops are set up; each one allows the user to work in a simulated environment with 360° vision and, once the space, the furnishings and the materials have been studied, to apply some parameters (fixtures, sources and optical angles) to build the lighting system for the setting. As users progress through the creation process, they are instructed to follow some

guidelines and systematically receive feedback information on the outcome of their choices, by seeing the effect produced.

Such tools, besides being testimonials for an organization with a new approach to education and training which encourages a more active participation by users, also allow the company to obtain more information that is useful for tracing user profiles and for implementing more targeted action to ensure brand loyalty (Bauer *et al*, 2002). As stated previously, the ultimate objective is to maintain contact and build a lasting and fruitful relationship with key subjects in the buying process, especially with installers and project designers¹⁴. The company's goal is to establish a positive professional relationship with these subjects who enter into a sort of consulting partnership as they work in tandem with iGuzzini's own technical specialists who, through the company intranet, use the platform to achieve a degree of expertise, not only on iGuzzini products, but on the field of lighting in general¹⁵.

It is worth underlining how the e-learning platform fits in with the company's CRM system¹⁶. The contacts obtained from the platform and the information generated by its users are managed by the CRM software, in order to carry out a variety of relational marketing activities, matched to the various individual profiles, such as, for example¹⁷:

- sending invitations to events (e.g. new showroom openings);
- sending brochures on new products;
- organizing visits to the company;
- offering personalized sales promotions;
- sending greeting cards, and so on.

Another important function of the CRM systems is that of measuring the economic returns of such activities; on this point, the relationship with the project designers is evaluated on the basis of the recommendations made in favor of iGuzzini, whereas for the technical installers, the evaluation criteria is the number of projects where the products were actually installed.

On the matter of using these parameters and other aspects pertaining to measuring the project results from a marketing perspective, this will be looked at in greater depth during the subsequent phase of the study. For the time being, suffice it to say that the project has been seen quite positively by company representatives; nevertheless, some problems have been encountered in developing the virtual community as there have been only a limited number of users willing to share their knowledge with others. It would therefore be appropriate to analyze the reasons for such widespread diffidence, so as to work on finding solutions that could encourage greater interaction.

The case highlights an interesting use of e-learning as a marketing tool and adequate actions aimed at enhancing the company's technical knowledge, with a view to developing important competitive advantages.

Non conclusive observations

Knowledge and relationships are resources that are seen as more and more important for the growth of business enterprises; careful attention must therefore be placed on the methods and on the tools used to manage said resources. In this sense, one cannot overlook the opportunities provided by new technologies in the fields of ICT and communication. The present paper has focused on the role played by e-learning. This area is one which represents an interesting way to improve and enhance the quality of education and training activities, by fostering the development of a company's human capital; it would also seem appropriate to integrate it with knowledge management systems, in the aim of managing and building up a company's knowledge assets.

In the case study in question, for example, an interesting application was found in the marketing area. By offering a free continuing education/training course on an e-learning platform and by creating a virtual community centered around specific themes, the iGuzzini company is able to pursue its aim to promote awareness of its brand and products and to develop relationships with some particularly influential subjects ("tutors") in the buying process. Knowledge acquired through the technology platform makes it possible to activate specific CRM actions. This becomes an interesting example of enhancement of company knowledge and of a possible convergence between e-learning and relational marketing.

In the next phase of the study an in-depth analysis and discussion, from a marketing perspective, will be made of the project results.

End Notes

¹ Even if the research work and paper have been conducted on the basis of a close collaboration between the authors, the introduction is attributed to S. Cardinali, the first paragraph to A. Perna, the second and third paragraphs to V. Temperini, the non conclusive observations to all the three authors.

² Nova (2000, 107) remarks that the traditional approaches to analyzing the profitability of a company are represented by a *static* view which considers the different factors (structural and managerial) that determine/generate profit and evaluates their weight in quantitative terms, thus losing sight of the dynamic processes involved in explaining the company's market position. In this sense, attention should be placed on the capacity to generate and accumulate knowledge and competencies necessary to developing the best combinations of tangible and intangible resources.

³ There exist several acceptations of e-learning, but this paper does not purport to delve into these aspects. For some definitions, see ANEE (2003), Esposito-Mantese (2003), Trentin, (2004) and Bielli (2005).

⁴ The main disadvantage lies in the physical "non presence" in the same classroom of the various participants, along with the impossibility of engaging in the "usual" human interactions which, in many cases, make learning more effective. Consequently, there may be less committed involvement on the part of either the learners or the instructors.

⁵ In 2006 it was estimated that approximately 479 million euros were invested in e-learning, compared to 53.6 million in 2001.

⁶ Cf. results of the direct survey conducted in the footwear industry (Temperini, 2005).

⁷ A fairly common problem, in fact, is the interference of the training activities with work-related activities.

⁸ Such barriers can be found at either the source or the recipient of the knowledge, within the transfer context and even within the knowledge to be transferred itself. Clear examples are given by the limited capacity for interpretation on the part of the receiver or by the inability of the source itself to transfer the knowledge (Azzariti-Mazzon, 2005).

⁹ The fact that e-learning can make it easier to share market knowledge within a company, makes such a means an interesting support tool for the important, inter-functional coordination activity carried out by the marketing function (Cozzi-Ferrero, 2004).

¹⁰ It is observed that a common vision within an organization is considered indispensable for *change management* (Gabrielli, 2006).

¹¹ Source: our data.

¹² Source: our data.

¹³ *Nautes* is a company located in Jesi (AN); it was founded in 2001 as a University of Ancona spin-off by a group of researchers, experts in knowledge engineering and long-distance learning; its core business is finding solutions for knowledge management.

¹⁴ This confirms what is stated by Gruen *et al.* (2000, 34), and that is, that «...the perspective that customers are an asset to be managed is applicable to a broad range of customer relationships»; in this case, the concept of customer extends to a special category of subjects, the so-called market “influencers” or “prescribers”, who can play a significant role, especially in certain sectors.

¹⁵ *Lightcampus* is, in this sense, a useful tool for implementing a certain sales strategy.

¹⁶ The integration between Customer Relationship Management and Knowledge Management, of which e-learning can be considered a manifestation, has been the object of a study conducted by Bueren *et. al* (2004). Along these lines, the authors have underlined the concept of Customer Knowledge Management, pointing to three types of knowledge to take into consideration in CRM processes:

- “knowledge about customers”: necessary to understand clients’ needs so as to then be able to meet those needs;
- “knowledge for customers”: refers to information that clients ask for when interacting with the company;
- “knowledge from customers”: comes, specifically, from clients’ perceptions and opinions about the products and services purchased, which must be internalized by the company.

In light of the considerations exposed thus far, it cannot escape notice that e-learning is a useful tool to be used in developing those processes.

¹⁷ As observed by Geiger and Martin (1999, 26), «...the internet makes it remarkably easy to capture up-to-date customer information at an often unprecedented level of detail, to store and retrieve this information in databases or data warehouses and to update it on a regular basis. More than other modes of communication, the internet can therefore play a focal role in a company’s customer intelligence machinery, which in turn allows the company to develop a better understanding of customer requirements».

From Patient to Guest: Current trends in the German health care industry and their impacts on the tourism sector

Abstract

Fuelled by demographic and psychographic change, the German health care system has been under increasing pressure over the past decades to a point where the system has been seen as no longer economically viable. This has set in motion a string of reform measures which have aimed to reign in the spiralling costs. Now, with a much greater focus on prevention, competition within the health care system and more personal responsibility, the German health sector is by many no longer perceived as a burden on the national economy but rather as an opportunity for future economic growth. One important reason for this development has been an expansion in what is known as the second health care market. This paper outlines the shift from a public health insurance system to a modern health economy by focusing on the health tourism sector which has experienced a boom in recent years, driven particularly by strong demand in the senior market segment.

Introduction

Since the 1990s Germany's health care system, particularly its care structures and financing, have been in a process of fundamental change. Carried by a wave of reform measures aimed at reigning in spiralling costs, a paradigm shift from a 'cost factor' health insurance system to a 'growth sector' health economy, which is built on the creation and marketing of goods and services which are conducive to the preservation and restoration of health, can be noted (Klinkmann, 2005). The implementation of economic and market-based elements has brought about modernisation and rationalisation in the way medical care is organised, the liberalisation of many health services as well as the privatisation of certain treatment costs. This shift towards greater personal responsibility was argued to not only cut costs in the country's public health insurance system, but ultimately also to lead to greater commitment towards health and wellbeing across all sectors of society. As Gerlinger (2010, p. 119) points out, "[t]he justification for this privatisation mechanism was that it would increase citizens' own sense of responsibility for their health, because greater participation in the costs would give them more incentive to lead a healthier life". Known as psychographic change, a greater health awareness amongst all age groups has indeed been noted over the past two decades, but has registered particularly strongly in those aged 65 years or older (Sylt Marketing GmbH, 2009).

In this paper we will first highlight the challenges of demographic change as an important driver for reforms in the German health care system, since the country's aging population has contributed significantly to escalating health care costs over the past decades. The ensuing reform agenda, which ultimately transformed Germany's traditional public health insurance system into a competitive health economy, is reflected in the increase in privately financed health expenditure. In the context of this so-called 'second (privately funded) health care market' we will then examine the role health tourism plays as a growing dynamic sector of Germany's health economy.

Demographic Change in Germany

On a global scale the world's population is predicted to continue to grow steadily reaching almost 9 billion people by 2050 (UN, 2004). This development is, however, not mirrored in all countries but is mainly concentrated on developing nations. Population numbers in highly developed countries, in contrast, are expected to fall. Since 2003 the German population, for instance, has been in continuous decline (Petermann, Revermann, & Scherz, 2006) and it is

forecast that its population of 82 Mio (2008) will decrease to between 65 and 70 Mio by 2060 (Statistisches Bundesamt, 2009a) (Fig. 1).

But this decline is cushioned by a steady increase in life expectancy, which has been evident for a number of decades and is predicted to continue well into the future. In 2008, for instance, 5% of the country's population were in the 80+ age bracket, but this segment is projected to increase to 14% over the next 50 years. By that time the

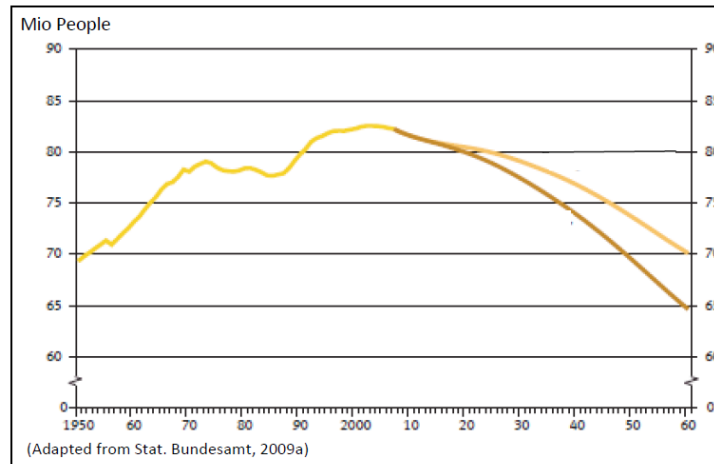

FIG.1: GERMAN POPULATION 1950-2060

number of people 65 years or older will have almost doubled from 20% (2008) to 34%. How significant these developments are is aptly illustrated in an analysis of Germany's old-age dependency ratio, which expresses the number of people in the 65+ age bracket for every 100 persons aged 20 to 64 (i.e. working age). It is predicted that this figure will increase from 32 in 2005 and 34 in 2008 to between 63 and 67 in 2060 (Statistisches Bundesamt, 2009a). Coupled with a steady decline in the country's birth rate, this trend obviously will markedly change the shape of Germany's age pyramid in the years ahead (Fig. 2).

FIG.2: CHANGES IN GERMANY'S AGE PYRAMID

These demographic developments impact on all aspects of Germany's society and economy but resonate particularly strong in the country's social insurance system. It comprises schemes for health, retirement, accidents and unemployment which have been key constituents of the German welfare state since the late 19th century. A characteristic feature of the public health insurance system, which covered in 2006 88% of the population and

approximately 57% of all health related expenditure (Robert Koch-Institut, 2009), is its financing in the main by (until recently equal) employer and employee contributions based on taxable income which tend to be around 15% of the employee's gross salary. Obviously a decrease in Germany's working population poses a significant threat to the financial viability of the country's traditional approach to health care.

But not only from a labour market perspective does the ageing German society challenge this system. Almost half of health expenditure in Germany is linked to the 65+ age bracket (Statistisches Bundesamt, 2008), thus to only about 20% of the population (Statistisches Bundesamt, 2009a). Fig. 3 illustrates the significantly higher *per capita* health expenditure for the older segments of the German population (Statistisches Bundesamt, 2008).

FIG.3: HEALTH RELATED EXPENDITURE (2006)

In combination with advancements in medicinal technology and rising costs for health care services, these demographic developments undermine the traditional German health insurance system. Between 1995 and 2008 health expenditure increased by 31.3% (Robert Koch-Institut, 2009; Statistisches Bundesamt, 2009b) and over the past twenty years between 10 and 11% of Germany's Gross Domestic Product have consistently been spent on health related expenses (Robert Koch-Institut, 2009). It has thus become obvious that Germany's health care system with its traditional funding approach and operations is no longer viable. In an attempt to ensure a fair and sustainable financing of the health care system within the parameters of cost capping and quality assurance a number of reforms were therefore introduced since the late 1980s. Initially, the obvious need for change was addressed by rising premiums but it became soon clear that in the long term this measure was not sufficient to resolve the system inherent problems. More radical change ultimately saw the German health care system departing from being an important column of the German welfare state and develop into a significant and dynamic factor for new economic and social growth (Fretschner et al., 2002).

In past economic and labour market discourse, Germany's health economy was considered mainly a burden on the country and its financing by employer and employee contributions was seen as a significant impediment on the country's international competitiveness. Since the mid-1990s, however, this negative perception has started to change (Fretschner et al., 2002). As a labour intensive sector, the health economy's positive contributions to Germany's employment figures and also its future growth potential are acknowledged in public debate and have helped to highlight the sector's increasing significance in the country's economic development (Fretschner et al., 2002). Today, it constitutes an important plank of Germany's economic activities, taking a share of almost 15% of the country's employment market (Hilbert & Kluska, 2010).

Germany's Second Health Care Market

These developments in Germany's health economy are, however, not only a result of demographic shifts but have also been driven by psychographic change since good health and wellbeing have developed into core values for all sectors of society (Forschungsgemeinschaft Urlaub und Reisen, 2008). Thus, the fundamental reforms in Germany's health care system that have placed much greater emphasis on higher individual co-contributions have gone hand in hand with a stronger preparedness amongst Germany's population to take greater personal responsibility for their own health and wellbeing. Ultimately, these trends have led to a marked expansion in what is known as the 'second health care market' which encompasses privately funded health related products and services such as wellness and fitness offerings, over-the-counter medication, alternative medical treatments, preventative health measures, healthy nutrition, spa treatments, health tourism and cosmetic surgery. With about 64 billion Euros in 2008, for example, this private health-related expenditure provided significant input into the German health economy (Karte & Neumann, 2008). On average Germans spend about 900 Euro annually on additional health related products and services, a figure that is predicted to grow even further in the future (Focus, 2007). It therefore comes as no surprise that until 2020 the second health care market in Germany is projected to grow annually by 6% (Statistisches Bundesamt, 2009b). It is particularly this growing second health care market that has ensured that the German health economy, despite the various reform agendas over the past thirty years or so and their declared objective to cap or even cut costs and decrease health related expenditure, remains a significant growth industry (Kliegel, 2007).

The complexity of Germany's health economy is captured in the multi-layered so-called 'onion model' (Fig.4) developed by the Institute for Work and Technology (Institute for Work and Technology, 2010). This cluster model is not focused on a traditional classification of health related products and services into either preventative, curative or rehabilitation measures. Rather, it adopts a 'value chain' perspective and illustrates how products and services on its periphery, for instances tourism, wellness or sport and leisure activities, benefit from cross-sectoral expansion into the health economy and ultimately lead to much more diverse products and services on offer (Fretschner et al., 2002). Hence, when taking this perspective, the health care industry adopts a more holistic view of health, incorporating products and services outside the traditional core primary health care sector. This reflects an understanding of health as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity" (WHO, 2010).

FIG.4: GERMANY'S HEALTH ECONOMY

Health Tourism in Germany

As is the case in any industry sector, increased demand, fuelled by a broader health policy shift in combination with psychographic change, has thus led to a marked expansion in the supply of a great variety of health related goods and services. The continuing growth in health awareness in industrial societies is evident in more emphasis on prevention, but also greater interest in complementary and alternative medicines. The desire for a healthy lifestyle has also created ample opportunities for new health services in a leisure setting as well as new products and services specifically geared towards the tourism market (Hall, 2003). This trend has created new prospects for the health and wellness tourism industry which has developed into an increasingly important constituent of Germany's health economy. In 2009, 'health' was, for instance, an important aspect during their holidays for 36% of the German population, which translated into 4 Mio health related holiday trips in that year. By 2020 this figure is estimated to almost double. A survey has confirmed the increasing importance of 'health' for the travel sector with 19% of the population considering taking a wellness holiday within the next three years and 9% planning holidays with a particular focus on fitness (Forschungsgemeinschaft Urlaub und Reisen, 2010). Referring to a recent study conducted on health tourism in Germany by the Institute for Leisure Economics, Dörpinghaus (2009) highlights that the interest in health tourism has between 2002 and 2007 risen by 31% with a further increase of 82% forecast until 2020.

The blending of health with tourism is, however, not a new phenomenon but can be traced back to the 18th century. In the context of coastal tourism, Wesley and Pforr (2009, p. 17), for instance, highlight that "at first, the seaside attracted visitors for the perceived medicinal properties of sea water and sea air". Lohman (2010) goes even further in stating that health tourism constitutes the roots of modern tourism. Today, the sector's popularity is thus only a recurrent trend but, as Bennett, King, and Milner (2003) predict, the health tourism market is likely to experience continued growth well into the future.

In the light of this rapidly expanding market, which is fuelled by a great range of different needs and expectations, it is obvious that health tourism does not constitute a homogenous market segment, but serves as an umbrella concept integrating different traditions. According to Rulle, Hoffmann, and Kraft (2010) these range from leisure activities that are geared towards mental and physical wellness and indulgence to preventative treatments and medical tourism for the purpose of essential or elective hospital treatments or surgery (Fig. 5). Consequently, the health tourism market is commonly considered a continuum ranging from medical tourism to wellness tourism spanning across spa treatments, spiritual retreats, sport holidays, medical wellness or 'Kur' visits. The latter is a particular nuance of health tourism which is very popular in Germany's more than 300 officially recognised spas and health resorts. The term 'Kur' refers to a specific medical prevention, convalescence and rehabilitation program or treatment for a particular chronic disease by highly qualified health professionals. About one third of all visitor nights in Germany are spent in its spas and health resorts (Deutscher Heilbäderverband, 2009) which highlights the importance of this particular health tourism segment for the country. In 2010 about 1 in 7 Germans planned a Kur treatment during the next three years (Forschungsgemeinschaft Urlaub und Reisen, 2010). At present, also almost half a million international tourists visit Germany 'as the land of spas and thermal baths' for health related holidays. Health tourism will also feature prominently in the German National Tourist Board's 2011 tourism campaign (www.germany-tourism.de), which will put the country's health tourism products and services under the spot light.

Kaspar (1996, in Mueller and Lanz-Kaufmann, 2001: p. 7) highlights the broadness of the concept 'health tourism' with the understanding that it is "the sum of all the relationships and phenomena resulting from a change of location and residence by people in order to promote, stabilise and, as appropriate, restore physical, mental and social wellbeing while using health services and for whom the place where they are staying is neither their principle nor permanent place of residence or work". Adapting this definition, Voigt (2008, in Voigt et al., 2010: p. 8) then considers wellness tourism to be "the sum of all the relationships resulting from a journey by people whose primary motive is to maintain or promote their health and well-being and who stay at least one night at a facility that is

specially designed to enable and enhance people’s physical, psychological, spiritual and / or social well-being”. In contrast to this, medical tourism is “the sum of all the relationships and phenomena resulting from a journey by people whose primary motive is to treat or cure a medical condition by taking advantage of medical intervention services away from their usual place of residence while typically combining this journey with the consumption of tourism products and services” (Voigt et al., 2010: p. 8). The motivation for this type of health tourism is often the outlook of cheaper medical treatments abroad, for instance for cosmetic and dental surgical procedures or for physiotherapy (Bushell& Sheldon, 2009).

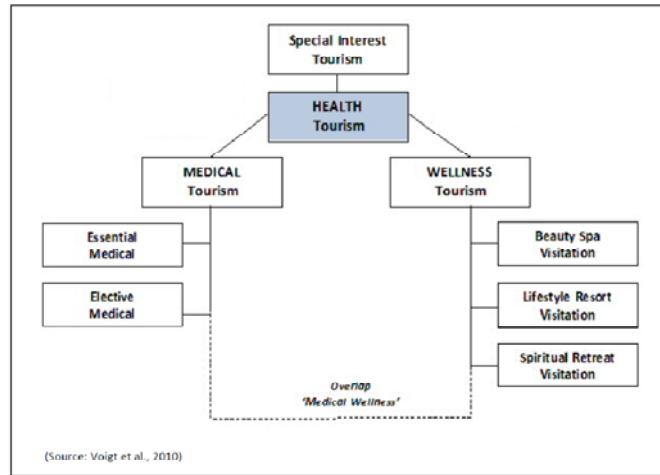

FIG.5: CLASSIFICATION OF HEALTH TOURISM

The Senior Market

What is common to all these nuances of health tourism is that the emphasis on the aspect of ‘health’ grows with the age of the traveller. With this in mind it is no surprise that in 2008, for instance, the 60+ age bracket constituted 35% of the wellness tourism market, a remarkable 75% increase since 1999 (Fig. 6)(Forschungsgemeinschaft Urlaub und Reisen, 2008).

FIG.6: WELLNESS TRAVELLERS BY AGE GROUPS

Today, 75% of Germany's wellness tourists are 40 years or older, 62% of those participating in health tourism activities are in the 60+ age segment, amongst 'Kur' guests they take even 70% of the market share (Lohmann, 2010). Taking into account the earlier discussed demographic change and the significant shifts it creates in Germany's age pyramid, Opaschowski's assessment (2007) that health tourism will develop into a future 'mega market' does not seem to be too far stretched. Already it appears that over the past 30 years or so Germany's seniors have been a main driver of tourism demand. A 29% market share in 2007 illustrates this trend (Forschungsgemeinschaft Urlaub und Reisen, 2008) as does the increase in travel propensity of those in the 60-69 years age segment by 85% in the period 1972 to 2003. During the same time for those 70 years or older this figure was even higher, reaching 91% (Grimm, Lohmann, Heinsohn, Richter, & Metzler, 2009). A direct comparison of travel propensity across different age segments in the years 1990 and 2004 also highlights this remarkable trend in Germany's senior population (Fig. 7).

FIG.7: TRAVEL PROPENSITY 1990 AND 2004

The 'senior' market is, however, not a homogenous group but a diverse mix of people with rather different economic, social and health characteristics. This heterogeneity is also reflected in the wide range of age groups often covered by the term 'senior', ranging from 50+ to the 80+ age bracket. Most commonly, however, the term senior appears to be reserved for those 60 years or older (Petermann, Revermann, & Scherz, 2006). Due to substantial gains in post working life leisure time coupled with more disposable income and higher levels of education as well as improved and prolonged levels of physical and mental mobility, long term growth prospects in the senior travelers market segment can be expected (Petermann et al., 2006; Forschungsgemeinschaft Urlaub und Reisen, 2004). Already between 1993 and 2007 a 40% increase in the number of tourists within the 60+ age group and an even higher percentage increase in the number of holiday trips undertaken by this age segment was noted (Grimm et al., 2009). Demographic change certainly contributes to these growth figures since statistically an increasing number of people join the 60+ age category every year. However, they are also seen to reflect continued tourism habits as these seniors have been enjoying travel and related leisure activities for many years (Grimm et al., 2009).

The implications of demographic change for tourism have been frequently highlighted in academic debate (e.g. Arnaschus, 1996; Danielsson & Lohmann, 2003; Dann, 2001; Haehling von Lanzener & Klemm, 2007; Hensel, 1988; Javalgi, Thomas, & Rao, 1992; Lohmann & Danielsson, 2001) and it appears that high expectations on the quality of tourism products and services, price consciousness, experience and well informed decisions

characterise the senior tourism market (Grimm et al., 2009). This is certainly also true for the health tourism sector, where the demand for health and wellness related goods and services by the 60+ consumer generation when on holidays or even as a motivation for particular travel choices, is seen as an important driver for the sector's impressive growth over the past 20 to 30 years (Opaschowski, 2007; Fontanari & Partale, 2004). These seniors tend to value health and wellness particularly highly. Often referred to as 'best agers' they bring to their statistically increased life expectancy the desire to age well and, as much as possible, healthily.

Attracting a wide range of health conscious consumers, traditional 'Kur' destinations, spas, health resorts and hotels with a range of fitness and sport offerings, beauty care services, relaxation and meditation activities, healthy lifestyle and weight loss programs as well as other health and wellness related products will therefore constitute important columns of Germany's tourism sector in the years to come.

Conclusion and Future Outlook

As outlined in this paper, after decades of stringent reforms the German health sector is no longer necessarily perceived by many as a burden on the national economy but rather as an opportunity for future economic growth. This shift from a public health insurance system to a modern health economy is based on the country's emerging second health care market with its stronger focus on (privately funded) preventative measures complemented by greater health awareness across all sectors of society. These developments have led to growth opportunities for a range of health related products and services including those in the tourism sector. The industry has benefited from a more holistic understanding of health with a shift in focus away from the treatment of a patient towards accommodating the health related needs and expectations of a paying guest. These include, for instance, privately funded wellness and fitness offerings, spa treatments, healthy lifestyle programs and preventative health measures as part of a health tourism experience. One of the drivers of this extraordinary development is demographic change in form of an increasingly ageing society. As was highlighted in the paper, it is particularly the senior market that offers the greatest growth potentials for the health tourism sector. The needs and expectations of health tourists are, however, rather diverse and expressed in a range of different health-oriented tourism segments. These span from a strong emphasis on relaxation, wellness and pampering to curative or preventative medical services. At the same time excellent quality at a reasonable price is highly sought after so that in the future suppliers of health tourism related products and services not only need to be able to respond to increasing demand for highly individualised and specialised packages. Rather they will have to pay particular attention to the quality of their offerings to maintain a competitive edge in an expanding market. This could be done, for instance, with the introduction of particular quality labels, accreditation programs and associated quality control. In this context, a stronger local and regional collaboration amongst various health tourism providers will become a crucial prerequisite for the future development of the sector (Lohmann, 2010; Pforr, Pechlaner, Locher, & Jochmann, 2011).

The Application of Leadership Styles and Organizational Behavior in the Hotel Sector in Indonesia

*Andreas Wahyu Gunawan Putra gputra_andreas@hotmail.com
Trisakti University, Indonesia*

ABSTRACT

The service industry particularly the hotel sector is known as an industry which has a perishable product as its main product and is based on the employees interaction with the guests. The research objective is to find out the impact between work value, employee autonomy and work setting to leadership styles and organisational citizenship behaviour. This arguably could drive the hotel comfort working condition to generate a great service quality. This research was done in a hotel in West Jakarta. Data was collected through interviews and questionnaire and analysed by statistic descriptive and structural equation modeling method using AMOS 16.0. Of 258 employees were given questionnaires and only 172 were returned. The questionnaire was adopted from Wright (2000). The findings indicate that work value and employee autonomy have significant effect on leadership. Furthermore, work setting has no effect on leaderships and leadership has no effect on organizational citizenship behaviours.

Keywords: work value, employee autonomy, work setting, leadership styles, organizational citizenship behaviour

Introduction

Hospitality organisations appears receive growing pressure to improve their performance, to anticipate change, and possibly develop new structures. One possible way of doing it by having an effective leadership to ensure that change leads to increased efficiency and profitability (Erkutlu & Chafra, 2006). Leadership skills can arguably be able to assist organisations to make use of the available of human resources more effectively and to deal with environmental pressure successfully.

Literature review

This section provides a brief outlines of the literature on which this study was grounded, beginning with the thought work value, employee autonomy, work setting, leadership styles, organizational citizenship behavior.

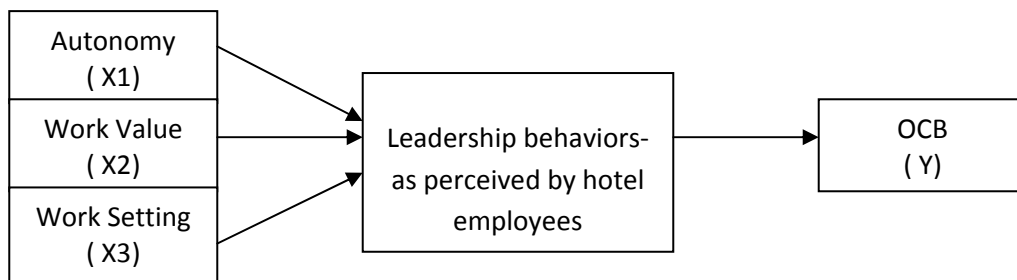

As stated ealier, the hospitality industry, particularly the hotel sector, tends to be labor intensive and has increasingly harsh environmental demands imposed upon it. Leadership skills may help organizations to utilize the available human resources more effectively and to deal successfully with environmental pressures. According to (Erkutlu & Chafra, 2006) leadership can be defined as a social influence process. Further, Erkutlu and Chafra say it involves determining the group or organization's objectives, encouraging behavior in pursuit of these objectives, and influencing group maintenance and culture. Effective leadership is therefore essential to ensure that change leads to increased efficiency and profitability (Erkutlu & Chafra, 2006). In line with this concept is stated by Yiing and Ahmad (2009) defined leadership as an influence relationship among leaders and followers who intend real changes and outcomes that reflect their shared purposes. Furthermore, a investigation in nursing research studies conducted by Murray (2002) emphasized that leaders must be willing and able to address the issues in organisations with proactive, innovative, yet realistic answers to complex problems such as job stress, workplace conflicts. The degree to which conflict is dysfunctional or functional correlates to the effectiveness of communication, willingness to resolve conflict issues, and intra-group relationships (Wright, 2000). Indeed, Wright (2000) says organisational leadership holds the key to creating a balance in the workplace between meeting the needs of the organization and meeting the needs of a changing and very diverse workforce and also to emphasized that leader awareness of generational differences in work values and respect for those differences are critical aspects of effective communication that addresses the needs reflected by those diversity. According to Dea (2009) work value is defined as a global aspects of work that are important to a person's satisfaction, including achievement, independence,

recognition, relationships, support and working condition. Moreover, such values related to “altruism of helping behaviors in organizations” (Arciniega & González, 2005: 128). It can be argued that any work values in organizations may increase to employees work autonomy. Dea (2009) describes employees work autonomy as a capacity to take charge of, or take responsibility for, or control over your own learning which consists of employees abilities and attitudes that people posses, and can develop to various degree in organisations. This perspective suggests that employees work autonomy could be shaped in desired directions through a careful design of the organisational work setting (Robertson, 1994). Organisation members are confronted with a variety of stimuli, generated by their work setting, that they take into account in decisions regarding how to act. Thus, their work behaviours and attitudes can be shaped fairly powerfully if one controls the appropriate stimuli and reinforcers (Robertson, 1994). According to Robertson (1994) work setting is a set of features that are often being a target of intervention activity-goals, managerial behavior, and job designs. All these factors is believed to influence organisational citizenship behaviour in the workplace. As indicated by Salamon and Deutsch (2006) organizational citizenship behaviors (OCBs) refer to discretionary behaviors that are not explicitly recognized by the formal organizational reward system and that, in aggregate, promote the effective functioning of the organization. Additionally, Wright (2000) states that many factors contribute to changes in OCB such as job satisfaction (related to opportunities for professional development and identification of positive patient outcomes), job stress (related to long work hours, lack of autonomy, or patient-nurse ratios), and management of intergenerational work values conflict. Several research studies examined the influence of leadership support and management of work-related conflict on employee actions that reflect OCB (Wright, 2000). Findings indicate that OCB is affected by job satisfaction, by employee perceptions of leadership support and encouragement of individual work (performance, potential, and aspirations), and by perceived fairness in the management of job conflict (see Wright, 2000; Stamper and Dyne, 2001; Salamon and Deutsch, 2006; Lester, Meligno and Korsgaard, 2008; Paille’, 2009).

The concept explored in this research is to find out the work autonomy, work value, work setting which influences leadership styles and how effective leadership styles are in influencing OCB. It can be said the work autonomy appears to have an influence on leadership styles and the same other variables are arguably to have an impact upon leadership styles which in turn create OCB in the hotel sector. As a result, the anticipation of this research is that:

-
- H1 Autonomy will be related to Leadership
 - H2 Work Value will be related to Leadership
 - H3 Work Setting will be related to Leadership
 - H4 Leadership will be related to Organizational Behavior Citizenship (OCB)
-

The conceptual framework as follow:

Methodology

Samples and procedures

This research was undertaken from a study done by Wright (2008) consists of dependent variables and independent variables and taken place in Grand Tropic Hotel, Indonesia. The sample was drawn using Simple Random Sampling. The participants were operational employees and given a questionnaire. Of 172 questionnaire were returned. However, there were some difficulties in getting the data, for example, to distribute the questionnaire was done in a single visit that had impacted upon the employees time to fill out the questionnaire at the same time of their duty. Employees were gathered during work time in one room where a six page questionnaire was administered. Further, employees completed the questionnaires in different time on the day and were told that the study was designed to collect information on the work value, employee autonomy, work setting, leadership styles, organizational citizenship behaviour in the premises. Even more, employees were given confidentially assurances and told that participation was voluntary. The questionnaires were collected immediately. The sample comprised from 31 per cent who had an age of between 26 – 30 years. As for educational qualifications, 48 per cent were high school graduates who used to have done internship programme and 16 per cent were graduate diploma in hotel management school. The reason for having a great number of high school graduates was to minimize the salary. The tenure was in between 1 until 7 years.

Measures

Independent variables: all questionnaires are using a five point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). Cronbach's alpha > 0.60 = constructs reliable (Sekaran, 2003)

- Work autonomy was measured by using Wright (2000). Sample items include "employees are assigned important responsibilities, employees have a great deal of freedom to do as they like" (Cronbach's alpha = 0.709).
- Work value was measured by using Wright (2000). Sample items include "there is generational diversity in my organization, diversity in the workplace represent a different set of work values and behaviors" (Cronbach's alpha = 0.623).
- Work setting was measured by using Wright (2000). Sample items include "there is constant pressure to keep working, nobody works too hard" (Cronbach's alpha = 0.712).

Intervening variables: the questionnaires are using a five point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). Cronbach's alpha > 0.60 = constructs reliable (Sekaran, 2003)

- Leadership behavior measured by using Wright (2000). Sample items include "supervisors tend to talk down to employees, supervisors really stand up for their people" (Cronbach's alpha = 0.634).

Dependent variables: this study used a a five point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). Cronbach's alpha > 0.60 = constructs reliable (Sekaran, 2003).

- OCB measured by using Wright (2000). Sample items include "I feel this organization provides a sense of meaning and belonging for me, I am willing to help orient new employees even if it is not required" (Cronbach's alpha = 0.866).

Content validity test was completed and shown the p -value = 0.000. Product movement correlation was applied to undertake the validity test and shown the score > 0.030 (Sekaran, 2003).

Analyses

The hypotheses were tested employing structural equation modeling (SEM). SEM was used to portray the causal relationship of latent constructs thus asserting the hypothesis (Hair, Anderson, Tatham and Black, 2006). AMOS ver 16.0 was used to analyse the data. Descriptive statistical analyses was employed to assess the demographic of the hotel employees of their age, educational background and tenure (length of working in the hotel).

Results and conclusion

Tabel 1
Descriptive Statistics

Variabel	N	Mean
Work Value	172	3.5186
Leadership	172	3.5497
Autonomy	172	3.2868
Work Setting	172	4.4864
OCB	172	3.4767

Table 1 summarize the descriptive statistics can be seen that work value, leadership and work autonomy, work setting and OCB shows the mean of above 3.5 meaning the employees agree with items in the questionnaire.

Tabel 2
Testing hypothesis

	Hypothesis		Std.Estimate	<i>p-value</i>	Result
H1	Work_Value	→ Leadership	.529	.034	H1 accepted
H2	Work_Setting	→ Leadership	.110	.483	H2 rejected
H3	Autonomy	→ Leadership	.262	.008	H3 accepted
H4	Leadership	→ OCB	.300	.281	H4 rejected

Table 2 shows work value is related to leadership styles behaviour which can be seen from the *p-value* is < 0.005. The result confirms the hypothesis 1 where work value is related to leadership styles behaviour. However, work setting is not related to leadership styles behaviour and the finding shows the *p-value* is > 0.005. Thus the research rejected the hypothesis 2. On the other hand, the result of work autonomy is 0.008 which is less than 0.005. Therefore work autonomy is related to leadership styles behaviour and supported hypothesis 3. It surprisingly to depict leadership styles behaviour is not related to OCB which can be seen from the *p-value* > 0.005. The testing hypothesis support Wright's study.

When there is a work value in Grand Tropic hotel, every employee appears to support such leadership behaviour style that is resulted of a diversity in the workplace (Wright, 2000). This diversity may lead to create innovation, increase quality enhancement and could lead to bestow good service quality. On the contrary, Front liners tend to disagree with pressure they have received in the workplace. This could hinder their creativity and produce job stress which might create conflict between employees and their employers. Consequently, the result has no effect on leadership behaviour style. Meanwhile, having autonomy in the workplace is imperative due to employees have a freedom of accomplishing tasks. It is no wonder the result support the leadership behaviour style. The finding is surprising where leadership behaviour style is not related to OCB. It could be employees do not receive support as they expected from their leader. The findings suggest that employees in Grand Tropic hotel tend to expect having work value and work autonomy to increase their level of service to its guests.

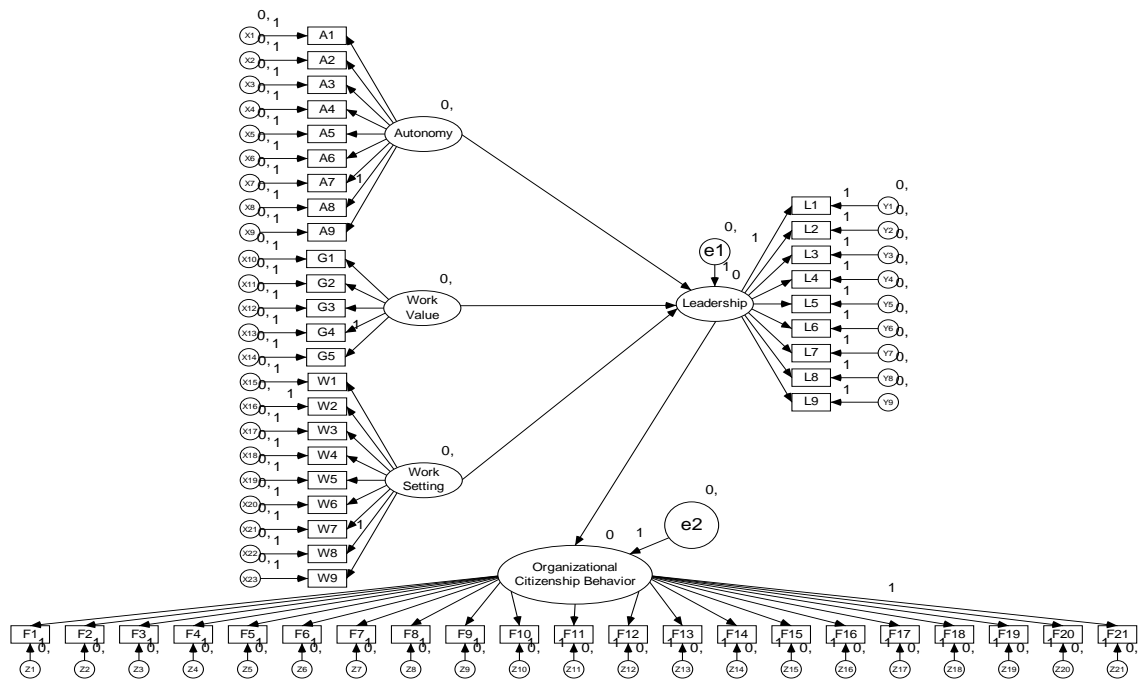

Future research should include work culture, employees commitment, employees job satisfaction and service quality in relation to OCB that take place in the work context which seems essential at Grand Tropic Hotel. It is hoping the subsequent research will spark further investigations into the mechanisms of adding new variables that influence OCB in different research settings.

Benefits and Barriers in Mining the Healthcare Industry Data

John Wang, wangj@mail.montclair.edu
Montclair State University, USA

Abstract

In this paper we will discuss how successful data mining and knowledge management can offer significant benefits to multiple aspects of the healthcare industry by both reducing costs and increasing customer relations. In particular we will be focusing on the importance of data mining in the health insurance industry as a whole, its relevance in detecting healthcare fraud and abuse, its applications and uses in clinical care, as well as its importance in maintaining a successful healthcare industry administration.

Keywords: Data mining; Healthcare; Clinical care; Patient profiling; Treatment Effectiveness; Fraud detection; Disease management

Introduction

The progress of data mining has been around for decades. Although data mining is an evolution of a field that can be traced back many years ago, the terminology itself has been only been introduced in the 1990's. By using pattern recognition technologies and statistical and mathematical techniques to sift through warehoused information, data mining helps analysts recognize significant facts, relationships, trends, patterns, exceptions and anomalies. The use of data mining can advance a company's position by creating a sustainable competitive advantage. Data mining is the science of managing and analyzing large datasets and discovering novel patterns (Ngai, Hu, Wong, Chen, & Sun, 2011; Davenport & Harris, 2007; Olafsson, 2006).

The workflow of healthcare organizations involves the generation and collection of various kinds of data relating to clinical practices, clinical trials, patient information, resource administration, policies and research. Traditionally, statistical techniques are used to derive some operational information from the data. Data mining provides the opportunity to derive, in an exploratory and interactive manner, valuable healthcare knowledge in terms of associations, sequential patterns, classifications, predictions and symbolic rules. Such inductively derived healthcare knowledge can provide strategic insights into the practice delivery of healthcare.

As the medical field expands, it is the duty of each physician to evaluate and protect each patient from diseases, side effects and medical mishaps. Armed with a scalpel, stethoscope and other accrements, physicians are now armed with data mining as a tool for expanding their knowledge base. Data mining is available to every aspect within the healthcare industry. It is multifaceted and used in areas like insurance to detect fraud, the pharmaceutical industry to evaluate side effects of drugs and even detection of certain diseases based on genetics.

Healthcare has a diagnosis for its ailments: inefficiency. But the cure is not so straightforward. While organizations are becoming information-rich, they remain knowledge-poor, without the tools to better integrate information across their clinical, operations, research and financial systems. But rather than focus on what is wrong with healthcare, it would be more productive to imagine how we might make a smarter healthcare system. Connecting doctors, patients and insurers to share information seamlessly and securely should be the ultimate goal. That means that providing a smarter healthcare system is optimized around the patient to increase efficiency, reduce errors, to achieve better quality of clinical care and ultimately save more lives. (Christensen & Oldenburg, 2009).

The growth in data mining and its advantages over the traditional methods of collecting data in the industry, both for reducing costs and providing patient care will be discussed. The bulk of the material focuses on various applications of data mining in the health care industry under three major areas. These areas include: data mining in health insurance plans; data mining in clinical care and data mining in health care administration. Also, emerging future trends in data mining in the health care industry will also be explored.

We will demonstrate the importance of data mining in the healthcare industry in the form of a secondary study of previous research and observations found in a variety of reputable sources. In particular, it focuses on the importance of data mining applications throughout the different aspects of the industry and the unique benefits that can be achieved through the interpretation of sector relevant data.

Data Mining In Clinical Care

Data mining provides the ability to correlate differences in treatment with significant impact on the clinical outcomes. These tools can automatically identify the sub-group within a population, and provide descriptive statistics regarding how each sub-group compares with the population as a whole or with other sub-groups. Data mining applications help significantly reduce medical errors, duplicate services, and unnecessary hospital admissions. The main strategy is to intensify physician to patient communication, better disease management, and to improve administrative workflow.

Disease Management

Data mining is used to analyze treatments for particular diseases in order to visualize its possibility for further clinical enhancement. One scenario where data mining techniques could be applied would be a study of the relationships between two ailments and finding the most effective treatment. For example, a given health care provider could set up a regional test to examine all occurrences of asthma and allergies, find the connections between these two diseases, and look for the most efficient and effective way to combat them. The data which would be collected, studied and compared could include types of over-the-counter (OTC) drugs or prescription medication such as antihistamines, as well as more holistic treatments such as taking a spoonful of honey daily, while carefully taking into consideration the placebo effect. In line with Borok (1997), monitoring environmental factors such as pollution, pollen count, and airborne microorganisms, to name a few, would also be crucial to the study since they are also causes of the specified ailments. A thorough examination of these factors and their relationships to the different treatment regimes (pattern recognition), data mining could render an accurate analysis of which courses of treatment prove to work best and are most cost-effective.

Data mining could also be used in preventing the spread of a contagious ailment and in forestalling the diffusion of an impending epidemic. According to the *Centers for Disease Control and Prevention*, the recurrence and resurgence of a disease which otherwise would have been completely eradicated stems from the tendency of patients to discontinue medication (even though the dosage hasn't been completed) the moment symptoms of the illness cease to exist (Srivastava and Singh, 2004). Through a rigorous analysis and careful monitoring, data collected from the study can be used to graphically represent the spread and progress of the disease. Hence, researchers would be able to discern patterns of the illness and take the necessary actions to address them.

Milley (2000) pointed out that along with the prevention of diseases, data mining can also be used to minimize the effect of many diseases before they progress further. For example, if there is a strong correlation between people with high blood sugar and blindness, doctors could require more frequent exams of those patients with high blood sugar level and check for blindness, then for those other patients who do not have high blood sugar level. This predictive model will keep doctors ahead of the disease and improve the overall quality of life for most patients.

Improving and Saving Patient Lives

The purpose of the advanced diagnostic tests is to detect the illness and identify potential health risk of the patient. Data from these tests are valuable information not only for the patient, but most of all for the clinicians. It is critical in patient care that physicians are able to analyze data from many resources and make informed judgment and decisions in treatment of the patient. Patients taking multiple medications, along with an aging population across the globe, represents challenges for the healthcare system. Scientists and mathematicians are using data mining to build systems that will help doctors to better understand the use and most of all the drug reaction in the patient care (Meiller, Bureau, Zhou, & Piramuthu, 2011). Veluswamy (2008) said, "As physicians, we know how challenging quality improvement in the acute care setting can be. Each year a staggering average of 71,000 people die in U.S. hospitals from medical error, making our \$2 trillion health care system one of the leading causes of death in this country" (p.49).

From experience to date, many hospitals and physicians do not have much knowledge what data mining is all about, how it can affect their work, uncover specific result, improve patient care and in many cases spot and predict situations that could save a patient's life (Michelman, 2009). The quality of patient care relies on value of information available at the point of care. The clinical data can directly improve the outcome of a patient visit. North Texas Specialty Physicians (NTSP) have invested 10 million into development of health information exchange system and transformed the patient care from paper based patient care into electronic model (Choudhry & Deas, 2010).

Infection Control

In 2009, *Association for Professionals in Infection Control and Epidemiology* collected information from 2000 members. The result showed that only 20 percent of U.S. hospitals currently use electronic surveillance and data mining to monitor the Healthcare Associated Infections (HAI). Data mining systems provide information without which hospitals must perform manual surveillance and look for device-related infections. Genotyping is one of the information technology methods that are very helpful for hospitals to better measure the infection control. Multi Care Health System which operates in four hospitals in Tacoma, Washington, uses mining system across the four hospitals and shares information from the departments as microbiology, admissions and finance. The hospitals are informed as patient test positive for bacteria in first 48 hours of admission, which indicates that patient most likely entered the hospital with the infection. The data can be used to improve the care in every unit and drastic reduce the infections (Page, 2010).

Using automated surveillance technologies in the healthcare industry is essential part of infection prevention. These systems are designed to collect infection data which leads to protection of patients by identifying and investigating of potential clusters of HAIs in real time. Automated surveillance technologies provide a larger amount of information, rapid identification of outbreaks, expanded and better defined infection prevention activities, improved response to public health issues and reduce the staff time spent on surveillance and clerical tasks (Anonymous, 2009). Certainly, as Veluswamy (2008) claims, "Data mining is an extension of statistics, but like statistics, it is not a business solution but a technology. It is what one does with the data collected from the mining effort that is important" (p.50).

Cancer Treatment

Cancer research has been clinical and biological in nature; however, in last couple of year's data -driven analytic studies have become common complement. The *Dana-Farber Cancer Institute* in Boston has gathered complex, scattered data to better treat the patient and work toward a cure of this disease. The physicians and researchers are working together on complex calculations to find connections between data from tumor biopsies and other clinical samples and spread all this information among three massive public-domain databases. The vital connections between patient samples and analytical data are proving that both are effective in patient treatment. The data the physicians needs are very complex and often divided into different subsets and groups. "A single gene may be represented by several different name sequences...To gather all of the information on any one particular gene, a researcher must look at many sources and different expressions for the gene" (McAdams, 2008, p.35).

People facing cancer are concerned about their lives, what the future holds, they want to know their prognosis. The research in the field of cancer detection and treatment helps to give an idea of the course and outcome of this disease. "Complementing these biological and clinical studies, data mining, as a powerful tool that can be used to discover patterns in medical data repositories, is finding its way into the analytics driven medical research arena" (Delen, 2009, p.102). Very popular data mining techniques like decision trees, artificial neural networks (ANNs) and support vector machine (SVMs) along with the most commonly used statistical analysis technique logistic regression were used in prostate cancer study to develop prediction models for survivability and variable explanation. The data used in this study come from the SEER (Surveillance, Epidemiology, and End Results) Program (2004), where SEER is one of the largest and most comprehensive sources of information on cancer incidence and survival in the USA. The final result indicated that SVM's are the best predictor with test data accuracy of 92.85%, followed by ANNs with and accuracy of 91.07%, followed by decision trees with an accuracy of 90.00% and logistic regression with an accuracy of 89.61%. American Cancer Society estimated that one man in six will be diagnosed with prostate cancer in his lifetime, but only 1 man in 32 will die of this disease. The data mining methods are able to extract patterns and relationships that are hidden deep in large data set; however, without the cooperation and feedback from the physicians, the result would be useless. The purpose of data mining is not to replace the professional physicians but complement their efforts and save more human lives (Delen, 2009).

Data Mining in Health Insurance Plans

The use of data mining and analysis offers many benefits to health insurance companies. These benefits include the enhanced diagnosis and repair of administrative errors, a better understanding of existing insurance plans, and insight into customer's needs, profitability and loyalty factors. Data mining is increasingly important for modern healthcare insurance companies to transform data into information advantage to improve profits, service, consumer's

satisfaction and discovery of new drugs. In healthcare industry every piece of information about current or potential customer information is crucial to a successful business plan for every insurance company on market. Health insurance plans, their costs, and service and innovations are strictly based on data mining therefore it is crucial for insurance companies to have the best interest of discovering every piece of valuable information.

Policy Holder Acquisition and Retention

Data mining currently is used very broadly to attract new consumers as well as keep current ones. Data mining can also be used to help identify potential new customers. By using historical data to predict future behavior, the marketing departments of insurance companies can determine potential policyholders whose behavior will be less risky than others. These high value, low risk potential policyholders can be approached with special packages developed for them in the hopes of attracting these customers from other companies.

In order to sustain desired revenues, programs desired to retain current members are vital to a medical insurance organizations. A significant threat to the insurance industry is a reduction in the number of policy holders. It's been recognized that retention of existing customers is about 5-10 times more cost effective than acquiring new ones (Haux, Elske, Werner, and Knaup, 2002). Therefore, it is considered wise for insurance companies to distinguish members who are at risk of switching their membership to another provider.

Consumer satisfaction is very vital because companies care for every single end user by lending a hand on their success currently and in the future. Every insurance company cares about the number of the policy holders and put all effort to gain new ones. Insurance companies take step forward and offer many extra services to consumers like discounts on gym memberships and healthy life tips to attract new consumers, because word of mouth is the best form of advertising. Data mining is also used to detect possible switch from one insurance provider to another that can be prevented by rapid reaction on the part of the insurance provider and with special offers to try and keep the customer. Databases possess valuable information like patterns, ages, gender, occupations, risks, and geographic areas which might be used to discover many criteria of current and potential consumers. New policy holders might be identified as less or more risky by expertise reading of historic data. Data mining in healthcare industry is very complicated, however at the same time very powerful, knowledgeable and requires well experienced analysis to discover useful data (MacSweeney, 2003).

Data mining can be used to identify the potential loss of clients switching to other companies. Historical data contains usage patterns and other important customer characteristics that when discovered can be used to identify satisfied or unhappy policyholders. These correlations between historical data values are very complex. Predicting policyholders who are at risk of changing their service to another provider with a high level of accuracy is extremely complicated, and it requires a lot of experience. These, nonetheless, are very powerful profiling techniques.

Understanding Insurance Plan Costs

One significant benefit of using data mining in the insurance sector of the healthcare industry is the development of a better understanding of existing health insurance plans and the costs associated with them. According to Kaplan (2007), data mining can be used by health plan trustees and plan administrators to better understand and control the true drivers of health plan costs. Health insurance companies can benefit greatly by better understanding and controlling the aspects of their policies that are directly influencing their costs. Data mining uses advanced computer programs to interpret raw data about insurance claims to uncover insightful information and relationships that benefit the understanding of their implementation and use. Once this understanding is formed, it can be used to make decisions that will increase plan attractiveness to potential policy buyers by increasing the effectiveness of the benefits they receive and maximize their health. The successful understanding of cost allocation and distribution requires a careful consideration of many factors associated with health insurance.

Specific preventable conditions that demand significant resources can also offer insight into proper adjustment of tactics and plans. Understanding which, if any, preventable illnesses are demanding an abnormally large portion of the resources allocated to the medical plan is important. Organizations would be able to determine which proactive communication efforts should be implemented in order to reduce the number of policy holders who contract this ailment. This serves two positive functions as it reduces costs and improves the overall health of the client. Plan reimbursement organization and implementation is a large factor in the overall profitability of a health insurance company. It is important to understand if the plan in effect encourages policy holders to make use of options that would both support their overall health and the lowest possible cost.

Overall, acquiring and analyzing relevant information through data mining can generate a plan to increase the efficiency of current healthcare plans. Use of data mining can save health insurance companies significant resources by eliminating waste, increasing effective consumption, and determining how policy holders can use cost-effective treatments to improving medical outcomes and client health (Kaplan, 2007).

Reduction of Rework

Globally there has been an increase of the costs associated with a health insurance organization. A large percentage of this increase can be attributed to the increase in the administrative costs of most insurance providers. According to estimates by an Accenture study, 11% of the administrative workforce is directly or indirectly related to rework processing. These statistics make the problem of rework prevention extremely important and valuable to the healthcare industry (Mohlt, Rayld, & Zhu-Song, 2005).

Traditional methods at reducing rework have been random audits on claims. These are not overly efficient as they do not focus solely on auditing works that definitely have errors. The work that is done on auditing correct claims is in itself a waste of work and therefore a waste of money. Rework prediction therefore would serve as an effective method in identifying and dealing with problem claims (Mohlt, Rayld, & Zhu-Song, 2005). Data mining can be useful in reducing health insurance waste associated with rework by developing a method that will help auditors minimize the number of correct claims audited and perhaps flagging questionable claims prior to payment. This can be done by developing a trend or pattern in past claims that required rework. Once a trend in misfiled claims is established, a computer system could be put into place that identifies them and takes preventative actions. Successfully implementing this system could stop payment on flagged claims, reducing the amount of mistakes prior to payment. This would reduce the amount of rework required by employees and also increase the effectiveness of the auditing process already in place. This result would reduce the amount of money wasted by insurance companies and would be a significant benefit to all parties involved.

Liability Profiling

Being able to predict the payout amounts that insurance companies would have to make is extremely important for both the long term financial health of the company, as well as being able to pay the company's current obligations. By predicting policyholder's behavior and risk, insurance companies can use these data mining models to construct the overall risk of a policyholder. Once the policyholder has a risk rating, the appropriate premium can be charged and the fee can be collected. Also, if the insurance company determines that the company, as a whole, will be paying out more than originally estimated, the company can adjust rates and assets to avoid any capital short fall.

Data mining is used to predict when the call center will experience an increase or a decrease in volume. This allows for better staffing and better allocation of resources. Data mining is also used for the planning of resources when certain scenarios occur. For example, after an earthquake or wild fire, the insurance company can increase the call center staff to handle the increase in the volume caused by the disaster (Silver, Sakata, Su, Herman, Dolins, O'Shea, 2001).

Once an insurance company has a profile on a customer, they often use the information to market other products that the insurance company provides, to the same customer. For example, once an insurance company provides health insurance for a customer, the company will often try to sell life insurance to the same customer. Data mining allows for greater predictability of the client's future needs.

Conclusion

Over the past couple of years, healthcare has improved greatly because of data mining. It helps improve patient care and more and more hospitals are realizing this. There is only so much a doctor can learn in medical school, but the real test is experience. When doctors' experiences are collaborated in a system they provide help for the future of proper surgeries and treatments and improving the efficiency of hospital care. "Not only are [data-mining] capabilities now both technically and financially feasible, but in a world that demands quality, patient safety, efficiency, productivity and service, healthcare organizations will soon realize the need to use data mining as an essential tool for meeting a multiplicity of needs" (Fickenscher, 2005).

Data mining plays an incredibly important role in today's healthcare industry. In health insurance plans it is used for fraud detection, retention of, and seeking new policy holders, liability profiling, customer service, and gross product marketing. In clinical care, it is used for epidemiology, patient profiling and disease management. Data mining is also used in health care administrations in managing its functions, such as staff recruiting and retention,

inventories and available beds. Despite its already broad array of applications within the industry, the future is promising.

Data mining has definitely made an impact in the healthcare profession. Through the many data mining techniques discovered, medical experts have been able to improve the quality of care and service they provide to their patients. Data mining has become so popular that it can be used on the business side of healthcare to help reduce costs as well as the theoretical side in finding hidden knowledge in medical records. Experts have identified future trends and what needs to be done in order for them to be realized.

With data mining, hospitals would be able to monitor the data in a more sophisticated and intelligent way so that they can look at events that are occurring and find things they might not have thought of before. This new way of tracking data is more advanced than traditional analysis because they can find patterns that indicate problems to come. Hospitals have the chance to stay one step ahead of problems. Moreover, if they can be proactive, hospitals can avoid bigger problems. After all, timely information and early intervention is the key for preventing diseases. Considering the vast progress data mining is already responsible for in the medical field, one can only be excited to wonder what other great benefits will come about because of it.

Sustainable Development and Business Strategies: An International Higher Education Experience

*Theodora Issa, Theodora.issa@cbs.curtin.edu.au
Curtin University, Australia*

Abstract

This paper reports on development and facilitation of a unit (course) on 'Sustainable development and Business Strategies' (SDBS). SDBS was developed in Australia for delivery to international students originated from different countries gathered in Europe. SDBS allowed students to cultivate a new perspective towards change, outlining a new strategy through innovation in an ever changing, uncertain and contemporary 'risk society' (Beck, 2002). The topic of sustainable development and business strategies has gained momentum at governments, international organizations, business and higher education levels. To understand the multidisciplinary nature of this vast topic, which, in part, touched on ethical issues, sustainability and strategic development in contemporary business; SDBS was designed to allow students the engagement in class discussions, arguments and debates, sharing their unique international experiences, throughout which transformation and modification in their mindsets was witnessed. This was measured through class discussions and assessments that were designed in consultation with the European partners. This paper starts with literature review on the concepts under study, an insight into SDBS's development and concludes with analysis of some of the quantitative and qualitative data collected from 51 students over two periods. This is coupled with facilitator's personal reflection. Though this paper has its limitations, yet it is a small step forward towards developing an international perspective for teaching these rather importance issues to business and management students.

Introduction

Daly (1990) established a comparison between two terms 'sustainable development' and 'sustainable growth' which were considered vague. He adopted the dictionary distinction between 'growth' and 'development'. To grow means 'to increase naturally in size by the addition of material through assimilation or accretion'. To develop means 'to expand or realize the potentialities of; bring gradually to a fuller, greater, or better state' (Daly, 1990 p. 1). In short, growth is quantitative increase in physical scale, while development is qualitative improvement or unfolding of potentialities. Thus, an economy can grow without developing, or develop without growing, or do both or neither. Since the human economy is a subsystem of a finite global ecosystem which does not grow, even though it does develop, it is clear that growth of the economy cannot be sustainable over long periods of time. Concluding, Daly contended that the term 'sustainable development' is much more apt, with Ekins (1993) advocating a strategy for sustainability that principally involves differentiating between North and South of the globe and forging new economic relations between them.

Cannon and Sheth (1994) argued that criticism of relevance and process of business school education and research continues to mount, simultaneously, academics and practitioners have become increasingly dissatisfied with traditional theories and practice. Thus, an understanding of the importance of more holistic models and theories that would expand to include relationships between businesses and their stakeholders would be more appropriate, especially in this time that is considered uncertain ambiguous and risky as in 'risk society' as famously identified by (Beck, 1992). An understanding of how to transform contemporary businesses to be more sustainable, not only by scholars, academics and theoreticians but by practitioners, is deemed essential. Indeed, such understanding might assist in the transformation of individuals to develop and ultimately modify their mindsets, transforming these mindsets into ethical. This understanding would generate higher impact if it is planted within higher education curriculum, rather than postponing such understanding to the time those students have become corporate leaders and employees. In this respect, Nijhof and Rietdijk (1999) contended that increasingly and progressively companies are now taking an active interest in the encouragement of ethical behaviour and discouragement of unethical behaviour among their employees including the enhancement of their understanding of the need to being more ethical and more sustainable to face the uncertainties of this world.

Undeniably, having an ethical behaviour in an organization or a company would simply mean being able to look on how to sustain this business for the long run through the development and implementation of sustainable development strategy. Sneddon, Howarth and Norgaard (2006) argue that the concept and practice of sustainable development as guiding institutional principle, as concrete policy goal, and as focus of political struggle—remains salient in confronting the multiple challenges of this new global order. Werhane (2008) concludes that in today's

expanding global economy, there is a need to revisit individuals' mindsets to incorporate what will be new kinds of free enterprise that are at the centre of change in the corporate world. With regards to change, Werhane (2008) argues that in a global world where companies are exploring as well as exploiting new markets, such globalization requires new ways of thinking, which she describes as systems thinking. Werhane contends that the use of moral imagination helps individuals. Imagination has also been regarded by Bruch and Ghoshal (2004) as one of the two keys that will assist in transforming businesses into becoming more immersed in values, system thinking and moral imagination bringing change that might assist in the sustainability of the limited sources of the planet earth. Neu (2008) concludes that certain types of business and management education are demanded; however, it is education that is practical, concrete, delivered at the worksite, and scheduled around the constraints of production. While changes have been witnessed in higher education towards the increased emphasis on internships, critical thinking and business ethics that might lead to transformation into becoming more sustainable (e.g. Brady, 1999; Cameron, Bright, & Caza, 2004; Cowton & Cummins, 2003); the role of educational institutions in fostering sustainable development, through a framework based on the integration of the economic, social, and environmental dimensions (Vargas, 2000), moral imagination and beyond materialism (e.g. Hood, 2006) sustainability (e.g. Stubbs & Cocklin, 2007), values and capitalism (Cavanagh, 2010), yet there continues to be a need for further enhancement of these efforts and on global basis to really witness a change and transformation in the minds of students that would have its effect extended to reach the corporate world locally and globally.

Literature Review

Sustainability, ethics and global business

Bradbury (2003) argues that sustainability issues are not just 'out there' in the external environment. Discussing the issue of the incorporation of sustainability in curriculum Bradbury states students benefit from questioning what is it that sustains their own lives, the lives of those they care about, and the organizations in which they work. If encouraged to do this, students become better systems thinkers as they link their external and internal worlds, thus increasing their knowledge and appreciation of their surroundings, reflecting and applying their critical thinking, ethical lens, and moral imagination. Such an exercise would allow them to develop strategies that will assist in enhancing the sustainability of their businesses.

Teaching sustainable business development and strategies would be incomplete if such curriculum did not include a reference to ethics and ethical theories, and their application to business. White and Taft (2004) argue that whether teaching organizational behavior, business and society, business ethics, human resources management, or general management, educating management and for that matter business students involves providing frameworks to approach ethical issues and dilemmas. White and Taft provide a summary of ethical theories which they divide in two main categories teleological (Consequentialist) which includes utilitarianism, egoism, and care, and deontological (categorical imperative or non-consequentialist); whereas rights, justice (distributive, retributive, compensatory), truth-telling, virtue and ethics of care, all are deontological forms of ethical reasoning. These would be considered the western approaches, yet there are the eastern approaches such as Confucianism and Buddhism, with the strong return of the Native American ethical perspectives (Newton, 2003; White & Taft, 2004). These seem to be very comprehensive, yet worth to be re-introduced to our global and contemporary society. This Native American perspective, for example, covers issues such as moral virtues: generosity, kindness, caring, compassion, understanding, restraint, honesty, mindfulness, non-harming, equanimity, forgiveness, concern for continuity of relationships and strength of community, preference for harmony over truth, peace over justice, and justice through cooperation, connection and interdependence with all living things; consequences to self, others, and community. (White & Taft, 2004 p., 471).

Nonetheless, with the global nature of the contemporary business world, and as highlighted by White and Taft (2004) and Fisher and Lovell (2009) there is a need for more guidelines. These guidelines were always in the form of voluntary codes, such as the United Nations Declaration of Human Rights, The Coalition for Environmentally Responsible Economies (CERES) principles, The Caux Round Table, known as the CAUX principles, the global Sullivan Principles, amongst others including the corporate codes of ethics. Yet, and despite all these theories, guidelines and principles, we still witness transgressions by businesses that in many instance ill-treat and exploit the resources that are at hand, yet borrowed from the future generations.

In this regard, Jones, Caton, DeWitt, Stubbs, and Conner (2007) posit that sustainability has become a key issue for organizations in the twenty-first century as they increasingly acknowledge that their policies and practices have social and/or environmental consequences. Accordingly, many companies are implementing elements of sustainability into their business practices. In step with this trend is the increasing recognition that sustainability-related subjects need to be included in the curricula of business courses, particularly at the postgraduate level.

Reflection and critical reflective thinking

Mahin (1998) argues that business communication uses causal analysis, classification, process analysis, evaluation - as other forms of composition and that the very act of communicating in the social context of a business culture implies an ethical basis, a respect for persons. More recently, business students were urged to think in a critical and reflective manner. Rogers (2001) argues that despite the widespread adoption of reflective practices across many fields of study, a critical analysis of the concept of reflection and its application within higher education has been lacking. While Tranter and Warn (2003) is of the opinion that generic competencies, including critical reflective thinking are currently widely recognised as being essential for an individual's integration into a rapidly changing workplace. In order to respond proactively to change, one needs to be able to critically consider one's own worldview and its relationship to the world views of others. Higher education endeavours to develop such competencies required for successful adaptation of graduates to the workforce. In management and business education, it seems that these competencies are in demand, and the development of such competencies is given higher priority.

Reflective activities, including critical reflective thinking play a major role in adult learning, yet it is considered one of the most challenging exercises (Thorpe, 2000). While the development of generic skills might prepare students to their next phase in life (i.e. career), yet these students continue to face more challenges as they go into the workforce. Watson (2006) states there would be three things that are deemed necessary for effective management and effective business as a whole: (1) the general intellectual skills produced by a good liberal higher education, (2) technical knowledge about organizations and the environment in which they have to function, and, (3) the specific skills of managing. These can be enhanced through the enhancement of the critical reflective thinking amongst students. This was part of the assessments designed for this unit that was developed in Australia for delivery and facilitation to students from different parts of the world who gathered in Europe.

Methodology and discussions

Denscombe (2008) argues that the mixed-method approach has emerged as a 'third paradigm' for social research. It has developed a platform of ideas and practices that are credible and distinctive and that mark the approach out as a viable alternative to quantitative and qualitative paradigms. This paper adopts this approach by using a combination of qualitative and quantitative techniques.

Teaching methods, recommended reading sample and discussions

SDBS was designed with emphasis on extensive participation from students. As the assessments were all on individual basis, the design took into account the inclusion of group work. Discussions became alive, as students became aware of the latest issues in the market. Therefore, the more informed of the current issues and challenges that face businesses that are exerting every effort the more students become active in their discussions, arguments and debates in the class. Students were exposed to different peer-reviewed journal articles, books chapters and extracts, videos, DVDs, and case studies.

SDBS had no text book, but instead, and in the syllabus that became available to students one month prior to start, students were urged to search the online databases for some articles that would discuss the latest in relation to sustainable business development, talent management, leaving a legacy and strategy in the corporate world. The students were warned that the topic is so broad, and the readings will be of diverse types and from different disciplines. Nonetheless, the students were provided with key areas to search for and topics that would be addressed in this SDBS. From these topics and issues, stewardship, living, environmental ethics as virtues, the responsible person, building competitive advantage through integrated talent management, responsibility for the self, community and nature, strategic thinking, formation, change, and content, sustainable business development, innovation and management thinking, enterprise thinking and the strategic logic of strategic business development, and being responsible for all (community, nature – thinking about the triple bottom line).

This data was collected from fifty one international master students over a period of two years 2010-2011. This data was collected through records provided by the European School and the administration of ice-breaker questionnaire, daily reflections, final reflections and evaluations of the teaching and the course itself. The ice-breaker contained fifteen questions, of which eight questions related to sustainability and the sustainable business development course. While the remaining questions were merely simple questions to generate discussions in the groups. For example, 'name three ways to learn things'.

While the daily and final reflection requested those students to reflect on what they learned. Students were specifically warned not to outline what they have learned but rather to reflect on what they have learned. Table 1 provides some pointers as to where students were originated.

Table 1: Students numbers and the countries originated from

Country	# and percentage of students			
	Year 1		Year 2	
France	11	52.38	4	13.33
Taiwan	1	4.76	0	
Italy	1	4.76	1	3.33
Morocco	3	14.29	1	3.33
India	2	9.52	14	46.67

SDBS development and discussions

Predan, Azapagic and Clift (2000), involved in teaching sustainable development to engineering students in the UK, consider that sustainable development is a complex concept which concerns a wide range of social, technological and environmental issues. Without addressing all these dimensions, teaching of sustainable development would not be complete. This is one of the challenges. Another challenge was location of unit developer/facilitator and the school (Australia and Europe), which added to the complexity. However, technology, which once was described as one of the major risks of our society (Beck, 1992; Beck, 1999, 2002), yet in the development of SDBS played a positive role. It was through e-mails that communications were established with the European school and their personnel; also it was possible to liaise with the students prior to meeting them face to face, which assisted in breaking the ice. In addition, Predan, Azapagic and Clift (2000) highlighted the importance of tackling the teaching of such unit (course) through the application of multidisciplinary approach, and this what was considered when developing this unit (course).

Syllabus for the unit was prepared in consultation with the European school identifying the outcomes. Upon completion of this unit would have achieved the following outcomes: (1) demonstrate awareness and sensitivity to the importance of sustainable development, talent management and business strategies in such a crucial time for us as humans worrying about the next generations and our environment. To try to understand how we in 'business people and leaders' can assist, (2) apply conceptual tools and frameworks for the critical analysis of business decision-making practices and policies, (3) apply the frameworks, perspectives and skills of critical analysis to contemporary business issues tackling holistic issues rather than concentrating on economics and finance, And, (4) translate the theories, concepts and analytical techniques learned into practice. These outcomes have been achieved. This is supported by comments from the students on their anonymous evaluation:

'I felt this unit really enhanced my knowledge with respect to the non-economic issues at hand for any business.' (Anonymous Evaluation_Student 1).

'I feel that [lecturer] has helped me to understand the more grave issues for a business in today's world and really opened my eyes to the sensitivity of the situation.' (Anonymous Evaluation_Student 2)

In addition to the outcomes, it is evident that it is not only the resources provided, or the discussions facilitated, but rather the knowledge and passion of the lecturer that counts in delivering such a complex and holistic topic as sustainable business development and business strategies.

'The [lecturer] was very passionate about teaching... communication [developed] and fruitful discussions followed.' (Anonymous Evaluation_Student 3).

'[lecturer] well organized and involves the class in the subject through games and debates as well as extensive case discussions. Learning this subject under [lecturer] effective teaching was a great experience.' (Anonymous Evaluation_Student 4).

Thus, it is not only the material, the design, the assessments design, but rather the lecturer's passion towards the concepts that were under study.

SDBS Delivery mode and discussions

SDBS was delivered over a period of five days. Six hours of seminars per day, with the exception of Thursday, when it was only three hours, providing students time to work on their 'vision and mission assessment'. The delivery was in the form of seminars. In these seminars the lecturer played the role of facilitator. SDBS started with the introduction of issues and challenges that currently face the business world and the global world as a whole, then moved to introducing issues and case studies, which were derived from the latest literature from books and peer-reviewed journal articles.

The first run of SDBS in 2010 covered issues derived from specific articles and books (e.g. Demuijnck, 2009; Lopez-Gamero, Claver-Cortes, & Molina-Azorin, 2008; Teece, 2009; Tyler Miller & Spoolman, 2009; Woodbine, 2008). Through facilitation and group discussions, looked at 'setting up the scene: growth, strategy, values and value systems, environmental ethics: business sustainable development, world risk society, terrorist threat, reflexive modernization, ethics and sustainability, dynamic strategies and strategic management, strategy tools, sustainable development business success, and corporate governance and ethics – impact on strategy. These topics were mainly discussed through brief presentations followed by readings by groups, and case studies analysis, which sometimes were debriefed through debates or further arguments.

The second run in 2011 expanded on these sources and included some more of the latest sources including some of the latest publications of the European Foundation of Management Development. In addition to the sources mentioned above others were introduced (e.g. De Wit & Meyer, 2004; Duane Ireland, Hoskisson, & Hitt, 2008; Galavan, Murray, & Markides, 2008; Jacobides, 2010; Newton, 2003; Rainey, 2006; Silzer & Dowell, 2010). Based on these sources and others, especially with the first day of the course in 2011 coinciding 'Valentine Day' it was felt prudent to relate 'love to business', thus the first session following the ice-breakers and introductions including the examination of the European Foundation of Management Development 'EFMD' publication on issues facing the responsible manager in the twenty first century, moved into 'Love, does it apply to business and global business'. Students appreciated this gesture:

The way people interpreted love and tried to connect it to organizations was quite interesting too. It was a really light, yet important topic which kept us involved even at the fag-end of the day.' (Reflection_Student 1)

Thereafter, and through the facilitation of group discussions, group work, debates and arguments covered the other topics which were conveyed under the titles: (a) making the case for sustainable business, (2) is our society risky - What a Question?, (3) reflexive Modernization - influence on sustainable business development, (4) strategic thinking and ethics - What a match?, (5) business processes and global market collapse, (6) strategy Tools for Shifting Landscape, Values? (7) would they make a difference when it comes to Strategy?, (8) strategy and Society - Why the change of heart?, (9) sustainable development and business success, (10) strategic Thinking - Corporate Governance - a relationship?, (11) current Status - where are we heading? What is needed?, (12) thinking sustainably - does it need ethics?, (13) so... What is the solution? (14) an example from the IT Industry, Strategy? (15) but how - introducing tools and frameworks. In addition, the lecturer shared with students a presentation on 'Australia - Figures and Numbers' highlighting to them what sort of data would be important to make a decision to expand globally. This was very well received by the students:

'Finally, the closing presentation on Australia and the way you tried to sell the country was not only informative but also very interesting.' (Reflection_Student 2).

Though extensive material was provided to allow the overall coverage of the different topics, students appreciated this fact:

'The learning experience of this unit was good, the resources were extensive and induced further thinking and overall I enjoyed this course.' (Anonymous Evaluation_Student 5).

'... it was good to move on from just theory to the application...' (Anonymous Evaluation_Student 6)

Assessments and discussions

Assessments of students teaching and learning were in three fold: (1) class participation – face-to-face – including a daily reflection (with very strict guidelines) to be submitted electronically to the lecturer, (2) students' vision and mission to a non-governmental organization (NGO), which forms the base for their final report, and (3) final report and presentation on the strategy as how they wish to implement this vision (if they wish to be innovative and creative they might record a video selling their idea to the board of directors of the organization of their choice). As for the first assignment, and to initiate students' participation, they were required to complete an 'ice-breaker' sheet that contained fifteen questions; eight of these questions were to identify the level of students' knowledge in sustainable developments and business strategies. Looking at the students responses it became apparent that the unit (course) was an elective course for the majority (i.e. 95%), and they had minimal understanding of strategy. This exercise took longer than anticipated, yet students were full of praise of the way this opening activity was administered, as they reflected on saying:

'Today the class started with an ice breaker session wherein we had to answer a questionnaire. After answering these questions when we discussed them in groups, we found that we had common answers for many general questions. Thus despite our cultural differences we had many things in common. I found this exercise very interesting.' (Reflection_Student 3)

Further, in a way to expand students' participation in discussions and problem solving deriving from the literature (e.g. Jaworski, 2008; Weber, Radu;, Mueller, Powell, & Maher, 2010) students were asked, and at the beginning of each class to select either a green, orange or red sheet of paper indicating their preparedness for discussions. The first day no sheets were selected, yet this has improved, when students selected the 'orange' sheets indicating that they were somehow prepared to engage in discussions, arguments and debate, however, it was noticed that students did not select the 'green' sheets throughout the unit (course). This might be attributed to the fact that they were over-whelmed with the vastness of topics covered in this unit (course). Despite this, and as students were given the chance to read in their group meetings, they were able to participate in class discussions, arguments and debates. As for the daily reflection students were urged to indicate to the lecturer what they learned each day – what did they see good, bad and fascinating or interesting. Some of the comments:

'... as the class progressed we discussed the Alfabem of a responsible manager.' (Reflection_Student 4)

'This is the first time I'm studying sustainable development although I have acquired some knowledge about this topic through interaction with people in the industry. The major gains as far as I was concerned were a few concepts in the ABC manual to sustainable development [alfabem]. I did not really know that concepts such as Article 13 and Agenda 21 existed. I gained a better knowledge about few other terms such as labels and negative growth too.' (Reflection_Student 5)

'As I said in the class that I have studied mostly ethics here thus far. So, today's session provided [me] with an idea of how to implement your ethical philosophy towards building a sustainable business. It also opened my eyes to the notion that we all know but care little about ,i.e., while making profits in the short-run, one also has to keep a tab at the sustainability of the business logic and ideals that you are following.' (Reflection_Student 6)

Whilst the following extract from students' reflection is rather descriptive, yet it provides an overall coverage of what was covered in the first two seminars of this unit (course), especially the final part where the student would argue shareholder and customer value maximization:

Some words were quite interesting and new like global security, paradigm, agenda 21 while some concepts although previously known had new definitions which provided a new learning experience from the

sustainable development point of view. ...Then we did two case studies. An argument mentioned in that article is that the two goals of shareholder value maximization and customer value maximization cannot be achieved together, though I disagree with it since shareholder value maximization can very well be a by-product of customer value maximization. (Reflection_Student 7)

SDBS Facilitator found the class setting inappropriate and might discourage group interactions, thus requested students to join in changing the set up. This had attracted positive comments from students:

Another interesting [thing] was the sitting arrangement. It's always to have a freedom of choice to sit the way you want to and feel relaxed in the classroom. (Reflection_Student 8)

Having six hours of seminars, and active workshops had its toll on students. One of the comments in the daily reflection highlighted this:

I guess the students were looking exhausted and tired because the previous subject was comparatively lighter. But I have no complaints towards that personally. To sum it up, I quite enjoyed the experience today and look forward to tomorrow's session. (Reflection_Student 9)

While other students took the chance of the first reflection to provide the lecturer with their expectations which was a great idea:

Since today was the very first lecture I really can't comment or say much. But I would just like to share what my expectations are there from the course. Firstly as an exchange student I would really like to see the approach that is there in formulating strategies in India and globally (as I am here for an international exposure). Understand the very meaning of sustainability apart from the textual meaning. Secondly, I expect to see a lot of real time examples of strategies with the frameworks that are taught. (Reflection_Student 10)

While for the final reflection shared the same first question another question was added: You might recall at the beginning of the week you were asked (in the ice-breaker document) whether you were required to provide data or get involved in coming up with a strategy for your workplace (or might be with family)? And which frameworks you used for your strategy before (if you have done one) Now, following this unit (course) how would you improve on the choices that you have taken and reported on earlier, and what sorts of frameworks you would be using. From their comments:

'The week of sustainable development class was very enlightening.' (Reflection_Student 11)

'Teaching process was really interesting as it was always two ways in the form of presentations or debates or group work. It was a place where I learnt a lot in a short period of time.' (Reflection_Student 12)

'Something that is quite remarkable is that I actually now realize the importance of being sustainable in one's approach and not only that but it can actually increase the profits of a company in the long term. I thank our [lecturer] for 5 enlightening days and the class will truly miss you' (Reflection_Student 13)

'In an overall view, I feel that I have improved myself during this week. As on Monday, I just had some vague ideas on sustainable development and CSR, relating those concepts mostly to green business, I am finishing this class with a quite bigger picture of the topic.' (Reflection_Student 14)

The above comments reveal the students' transformation, indeed, using the expression 'enlightenment' reveals how vast the change was.

As for the second assessment, this was an assignment for them to form a vision and mission to an organization, their assignment would be based on (1) to identify an industry of your interest, (2) identify a major challenge that you feel is affecting this industry, (3) to identify a company (preferably global 'NGO') within that industry that might be faced with this major challenge, and (4) come up with a mission statement and a vision that they wish to see implemented for this organization. While their final report would allow them to develop and provide a 'sustainable business development strategy including talent management' that would allow this NGO to survive and serve the 'Seventh Generation' a phrase invented by Newton (2003). At the start students were over-whelmed with the nature of the assignments, yet as the time went by, students and in their reflections were able to see the bigger picture and were able to imagine their assignments including the final report:

Today, I have got some idea about sustainability development in real company. This help me to doing the assignment more easier. (Reflection_Student 15)

Facilitator's personal reflection

The development and facilitation of SDBS had its challenges. The course was prepared in Australia, yet delivered to students from different parts of the world and in Europe, which added to the complexity of the material to be covered. The diverse landscape (European School, Australia and students from different parts of the world) has provided a complex road map for SDBS development and facilitation. Nonetheless, through technology it became much easier to liaise and communicate.

In this respect, international networks are important, especially with the international fabric of the students who were originated from different parts of the world, seeking education in some other parts of the world. In case of Australia, Curtin University is considered a melting pot of different nationalities from different parts of the world that are keen to expand their knowledge, even well away from their homeland. This also what was witnessed when visiting and teaching in the European School of Management. Indeed, both share the same aim of developing students from different parts of the world displaying their global citizenship.

Reflecting on this exercise, it has definitely enhanced the SDBS developer's knowledge, simultaneously having the honour to share knowledge including the latest ideas and research in relation to sustainable business development and strategies with students from different parts of the world, who had and through their reflections displayed appreciation of being exposed to such knowledge.

'... So far, I mean, before listening [to] this class, I thought that sustainability related to business is just "green". But, now I know what sustainable business is and what corporate social responsibility is. That is not only just about green and environment problem but also business in the community. I learned that the responsible manager consider all stakeholders- employees, customers, government, suppliers, local communities, shareholders, international organizations, non government organizations, etc.'

(Reflection_Student 16)

'... this sustainable business development course has awakened me to protect the environment in my personal life as well as business. I am impressed with current status of our society. The presentation about current risk and 2011 Harvard business agenda is meaningful for me. Those alerted me that sustainability is needed.'

(Reflection_Student 14)

Limitations and Implications

Despite its limitations, the small sample size, this paper has provided evidence that teaching sustainable business development to students would transform and shift their mindsets towards becoming more aware of the dangers of being fixated only on profit rather than looking at the big picture first, then profit can be a by-product, especially when businesses aim at the long-term rather than the short term. This paper provides an example of co-operation through an international network in higher education between Australia and Europe, which might have its shortcomings, yet with patience and eagerness to help and assist students in their endeavours have become easier.

It is worthwhile to note here deriving from the students comments in their daily, and final reflections and evaluations that students were looking at analyzing the lecturer's level of knowledge, way of teaching and dealing with students, strongly agreeing to the items in the evaluation of SDBS that the facilitator appeared knowledgeable in the subject area and enthusiastic in teaching such a unit being an effective lecturer. This is a key area, whereas those who are keen to teach across borders and across disciplines need to be aware of the developments in their disciplines and the countries they are involved in. Though, this is not an easy topic yet, when developed properly and through co-operation between all parties involved it will be for the benefit of students, academics and practitioners in the long run. Simply, such an investment, though huge, is worth the work exerted.

Further, through the daily reflections, it became evident that in the future students need to be asked of their expectations from the unit; this might be done in co-operation with the European School. In addition, the lecture room set-up is changed to accommodate group work in a better fashion.

Conclusion

In conclusion, this paper, though has its limitations, had provided an Australian-European perspective on international networking and co-operation in higher education. Through examination of students' reflections throughout the time SDBS was run, it became evident that theoretical reflection, when employed, and executed properly by students, is an important instrument that allows students through their reflection to make a better sense of the vast and multidisciplinary material given in a short period of time (i.e. five days). The data collected provided evidence that teaching such comprehensive, multidiscipline units would transform the students mindsets, indeed, it enlightens these mindsets. This can only be possible provided the lecturer/facilitator has the necessary knowledge and enthusiasm to develop and facilitate such a complex multidimensional unit (course). This paper highlighted the importance of such international and academic network of like-minded academics. It is the strength of such networks that allowed the author to liaise with a European School of Management, develop a unit and facilitate this unit for the second year to students who are originated from different parts of the world. This paper provided a step forward in the road-map to having such a unit (course) become a core rather than elective unit for the business and management students. Further research is anticipated when SDBS is run again, whereas further developments would deem necessary bearing in mind the ongoing changes in strategy, policy, and any other issues relating to sustainability and business development.

Managing Internationalisation In Tertiary Education: A South-African – Swaziland Comparison

*J.W. De Jager, DeJagerJW@tut.ac.za

*M. Dodourova, m.dodourova@hert.ac.uk
University of Hertfordshire, United Kingdom*

Abstract

The increasing competitive and internationalised tertiary education environment has over recent years introduced a commercial focus to the sector. Although this allows universities to tap into an increasingly larger and potentially more lucrative market, it simultaneously ups the ante in respect of course quality and addressing student preferences. Overall tertiary institutions do not have a clear picture of what attracts students, particularly international students. Although there is consensus that ‘internationalisation’ adds to the marketability in the education environment more clarity is needed on the nuances of the concept and indeed the value these carry amongst students in terms of decision making. This paper considers responses of four hundred and six students in South-Africa and Swaziland in relation to the importance of academic and non-academic aspects of internationalisation of the institution. Overall, students are influenced in their choice decision by reasonable class fees, and courses offered of an international standard.

Introduction

International education has developed over time in a commodity that can be purchased by students as ‘consumers’ that subsequently demand quality standards. More often than not, students enrolling in education, and more particularly international education, are financially privileged which further contributes to the exclusive and competitive character of the industry (Stephenson, 2006). Ongoing budget cuts in domestic markets around the world have driven universities to consider ‘exporting’ their educational programs, primarily to secure additional revenue.

Meares (2003) argues that universities often consider internationalisation as a strategy that enables expansion and a solution for the increased financial pressures experienced due to limited government funding. Apart from raising additional and often lucrative income, an international presence simultaneously facilitates an expanded profile. The position that ‘internationalisation’ and international students are predominantly seen as income generating entities by universities is enhanced by financial cutbacks to higher education and a global commercialisation of the education industry. International education involvement is predominantly driven by commercial drivers leading to initiatives to getting larger, more lucrative and more competitive all the time (Stephenson, 2006). From this perspective it is important for education providers to manage the internationalisation while understanding what students’ value and understand this to be. This paper is attempting to throw light on aspects of internationalisation that is regarded as important by South African and Swaziland students to play or to fulfil a role in the international market.

Internationalisation in higher education – global perspective

Universities have emerged as key players in the new global knowledge-based economy as growing segments of the workforce require the advanced education offered in post-secondary institutions. The key drivers of the academic revolution have been identified as the rise of the knowledge economy and globalization, massification of tertiary systems everywhere, and the impacts of information and communications technology (Altbach et al., 2009).

While the idea of massification of higher education has been promoted since the first half of the 20th century, its realization on a global basis is a recent phenomenon. And although some developing countries still

have relatively low rate of the post-school age group in higher education, almost all countries have dramatically increased their enrolment rates (Glakas, 2003). Furthermore, the application of new information and communication technologies has altered our very perception of how the education product is delivered and has contributed to the massification of higher education.

While initially higher education systems struggled just to cope with demand, in the past decade they have begun to struggle with the implications of massification. Major changes to funding have emerged in most countries where higher education has traditionally been considered a state responsibility that benefits the individual but also society through enhanced productivity among other things. Financial pressures from massification have resulted in a need for re-allocation of the funding responsibilities and shaped the view of higher education as a 'private good' thereby contributing to the rise of private higher education worldwide and to the privatisation of public universities (Glakas, 2003).

Consequently, traditional universities across the world have started losing their monopoly over the production and dissemination of knowledge through teaching and research. They have to compete with multiple stakeholders and providers of higher education, including the corporate and non-state sector. Although public universities still dominate in the North America, European Union, Africa and South Asia, in Latin America and East Asia private sector accounts for the major enrolment into higher education and professional training. Hence, a new kind of institution of higher learning has emerged, which cater directly to the market and expands as demand for its services increases. This is very different behavior from that of the traditional university, which responds to increases in demand by becoming more selective.

In addition to the financial pressures exerted by the massification of higher education, the growing impact of globalization and the evolution of the knowledge-based economy have generated pressures for nation states to improve their competitiveness in the sector. Schools and universities in different parts of the globe have been under tremendous pressures from government and the general public to restructure and reinvent themselves in order to adapt to the changing socio-economic and socio-political environment. Education reforms have been common agendas in the advanced industrialized countries since the 1980s (OECD, 1997, 1998, 1999, 2001), driven by growing expectations and demands of different stakeholders in society.

The changing character and function of education in most countries around the world have significantly affected educational governance. Higher education institutions have been increasingly following the example of business by adopting policies of decentralization and marketization, corporate decision-making and planning strategies, as well as using economic measures of productivity (Mok & Welch, 2002). The major shift from elite to mass education systems has challenged higher education institutions to re-evaluate both the quality and the market value of their courses and programs in a customer-oriented and market-driven environment.

Hence, in the context of increasing global competition and ever more forceful financial pressures, educational institutions now recognise that they must equip themselves with the necessary marketing intelligence and information that would enable them to face the challenges imposed by this new environment (Binsardi & Ekwulugo, 2003). Yet, despite the rapid development of the higher education international market and the existence of substantial literature on the marketisation of higher education, evidence of the marketing strategies implemented by higher education institutions remain limited. Much of the interest in research in marketing of higher education has been stimulated by increasing competition for overseas students.

However, while the transformation of student population into a more international crowd has been identified as a key demographic trend, higher education remains essentially a national phenomenon with institutions still functioning within national boundaries and serving local, regional and national interests. Indeed, while a truly global market for students exists today and private higher education is growing worldwide, it has been reported that the curricular change displays major variations at the socio-cultural and national levels. Moreover, following the global economic crisis, fears of economic competition have intensified resistance to immigration and inhibited ease of movement across national boundaries.

In other words, while the higher education sector should not be commoditised, domesticating our approach to higher education marketing and focusing on the curriculum, institutional positioning, internationalization, pricing, reputation management, and enrolment management, is the first step to nurturing the development of relevant and meaningful marketing practice for higher education.

CHALLENGES IN THE HIGHER EDUCATION SECTOR IN AFRICA

African countries face major challenges that promote and hinder the development of the students, institutions, the respective countries and their ability to compete regionally and globally. In view of the challenges, there is need for re-strategising to help counteract potential problems of poor service delivery, declining standards, offering of irrelevant or outdated programmes; and marketability of the institutions' products and their students because of deficiencies experienced in various programmes' offerings. The strategic process entails overhauling the institutional environment to embrace all the critical major influences on the institutional and student's development. In Tisdell's (1995: 7) view, creations of an enabling inclusive learning environment should:

“ reflect the diversity of those present in the learning activity itself in the curriculum and pedagogical/ andragogical style; attend to the wider and immediate institutional contexts in which the participants work and live; and in some way reflect the changing needs of an increasingly diverse society (De Jager & Joubert, 2007).

This view emphasises the need for various institutions to ensure that the programmes offered and the institutional context reflect the values of the learners and that of the end-users of the universities products. A similar view was expressed by other researchers (Brown et al., 1988; Wilson, 1993; Anderson et al., 1996) who noted how institutions should realize the link between knowledge, its by-products and context. The by-products refers to the translation of knowledge and skills to socio-economic and other developmental goals. Nkomo (2006) indicated how they are translated to the enhancement of the various communities quality of life and their standards of living. In these roles, higher education promote national development, foster national unity and minimize the potential for conflict as a result of varied cultures, enhance individual talents and enhance opportunities for people's meaningful participation in their socio-economic goals, foster positive attitudes among each other and hence promote social justice and morality (Emenyonu, 2006; Mungai 2002). Kargbo (2002) acknowledges how African universities are a major element in development; at the apex of the educational system is a place for the pursuit and dissemination of knowledge and playing a pivotal role in the onward struggle for national development. To effectively pursue this vital role, universities have to be provided with essential resources for improvement and upgrading of their infrastructure and to also enable them to attract highly skilled personnel for the purpose (De Jager & Joubert, 2007).

Over the past few years, higher education institutions in South Africa have experienced dramatic changes, in their structuring, funding and student numbers. The Tertiary education sector faces many new challenges, including more recently various mergers and the transformation of technikons into universities of technology. This transformation has not only brought about a change of status in these institutions, but also the mergers of intrinsically different institutions. The broadening of access to higher education in South Africa under the present government policy has seen a growth in the number of applications to tertiary institutions (Bunting & Cloete, 2004). The transformation of higher education institutions in South Africa is one of the concerted efforts to provide fertile ground for the empowerment of previously disadvantaged groups. This process is one of the numerous efforts geared towards ensuring that higher education institutions respond toward national imperatives for redress, in areas of employment equity and skills development (Diale, 2006). According to Cooper and Subotzky (2001), South Africa has experienced a “revolution” regarding the increase in proportion of African student enrolments in tertiary education thus they have constituted the majority since the middle 1990's. This consequently calls for re-assessment of the needs of current students in higher education.

Similar to South Africa, Swaziland is transforming its education system in institutions of higher education in response to developments regionally and globally. It regularly reviews its programs to meet the demands of contemporary society but its efforts are hampered by shrinking funding as more funds are diverted to the funding of orphans and vulnerable children as well as addressing the socio-economic development issues of HIV/AIDS, shrinking inward investments and the associated high unemployment and poverty issues (Joubert et al., 2006). De Jager and du Plooy (2006) noted how the downward trend in the economic situation and the resultant decline in public finances since the 1980's onwards led in governments' inability to continue to meet the financial needs of higher education whereas a growing demand for access continued. The resultant constraints for higher education institutions manifest themselves in political upheavals that involve students, brain drain of the limited country's think tanks and eventually the quality of education will be hampered and hence, hindering the country development. Drastic measures are thus needed to circumvent the effects; that is

partly why this study is being undertaken. A key solution to these problems is addressing the quality and national relevance issues through extensive consultation with key stakeholders and implementation of response action programmes. Proponents of the social-action approach argue for getting solutions from those directly affected by the problem (Burrell & Morgan, 1985; Hammersley & Atkinson, 1983; Goldthorpe et al., 1968). Other researchers have also highlighted that learning institutions cannot be separated from the world of action but exist in robust, complex social economic environments made up of actors, actions, and situations (Wilson, 1993; Anderson et al., 1996; De Jager & Joubert, 2007).

PROBLEM STATEMENT

Higher education is facing increasingly more challenges on the global arena. As institutions of higher education compete for human and financial capital it is equally important to understand and address the demands of students and industry. This is even more so as universities increasingly develop an international presence and seek to attract international students. Overall the problem is a lack of information to enable institutions of higher education to identify and adhere to students needs in order to attract them from the global market.

OBJECTIVE OF THE STUDY

The primary objective of the study is to identify the most important service quality variables related to selection of a university in South-Africa and Swaziland. A secondary objective is to determine whether there are significant differences between South-African and Swaziland students when deciding on an educational service provider.

RESEARCH METHODOLOGY

Conceptualising the purpose of the investigation

In order to achieve the primary objective of the research the service quality variables related to internationalisation were grouped into academic, non academic issues.

The following secondary objectives were formulated:

- To evaluate the expressed levels of importance of South-African and Swazi students with regard to these internationalisation variables;
- To determine the existence of significant differences between the South-African students and Swazi students with regard to their expressed levels of importance with the internationalisation variables.

Research hypotheses

With regards to the objectives the researchers formulated the following hypotheses:

- Ho: There exist no significant differences with regard to the importance of the service variables related to the internationalisation variables between the South-African and the Swazi sample.
- Ha: There exist significant differences with regard to the importance of the internationalisation related service variables between the South-African and Swazi students.

The sample framework

A sample of 407 students at the management faculties at two universities in South-Africa and a university in Swaziland were chosen at random. Two hundred and thirty two of the respondents were students from a large South-African University while one hundred and seventy four of the respondents were student from a University in Swaziland. The sample comprised of 49.6% male and 50.4% female students. The attitudes of the two student samples were tested regarding the importance of pre-identified service quality issues related to internationalisation issues when selecting a specific tertiary institution. The list of variables was based on an

extensive literature research and the findings of focus groups consisting of students and lecturers. The questionnaires were distributed to randomly selected students in pre-determined classes.

The measuring instrument and reliability measures

A structured questionnaire was developed to measure the preferences of students when deciding on a specific institution of higher education. For the purpose of this paper only the variables related to internationalisation issues were included in the study. The questionnaire addressed the following issues.

- (1) Section A: Biographical information of the students including their location
- (2) Section B: Seventeen service quality variables to determine the level of importance on internationalisation aspects of a higher educational institution. This section included:
 - Academic Internationalisation
 - Non-academic Internationalisation

Section A utilised nominal scales whilst a five-point Likert-type scale was used for Section B to measure the levels of importance with regards to these internationalisation variables at two institutions of higher education in South-Africa and Swaziland. The scales were categorised as 1=very important, 2=important, 3=not important nor unimportant, 4=not important and 5=not important at all. The inputs for section B was gathered through an intensive literature study on the topic as well as focus group discussions with students enrolled at institutions of higher education. In addition the perceived performance of these two institutions were also measured on a five point Likert scale similar to the measurement of the importance of these variables.

Data collection and analysis

The data was gathered and captured by trained field workers over a period of six months during the second semester of 2008. The SPSS version 17.0 statistical package was utilised to analyse the data. For this analysis the Kolmogorov-Smirnov Test was employed based on the assumption that if the significant values exceeded 0.5, normality could not be assumed and the researchers had to rely on employing non-parametric analysis techniques. As normality could not be assumed after applying the Kolmogorov-Smirnov Test the researchers employed the Kruskal Wallis test to test the null hypothesis and the alternative hypothesis that there exists no significant difference between the levels of importance between the two groups and there exists significant differences between the groups (South-African & Swaziland students).

An item analysis was carried out to test the validity and the reliability of the questionnaire and an overall Cronbach's alpha of a 0,915 was obtained.

FINDINGS

Table 1: Respondent profile

		No	%
Age	16 -17 years	3	0.5
	18 -19 years	79	19.5
	20 - years	92	22.5
	21-22 years	112	27.5
	22+	118	29
Gender	Male	199	49.6
	Female	204	50.4
University	South Africa	232	57
	Swaziland	174	43
Total		406	100

Selected demographics summarized in Table 1 indicate a different student composition in the South-African and Swaziland sample, particularly in terms of age, gender and respondents per university. While motivation for studying is in both groups driven by better job prospects the influence of friends studying forms a significant notion of the decision making activity.

According to table 2 reasonable class fees is overall regarded as the most important variable in the non academic Internationalisation category. It was also rated first by the South African sample and second by the Swazi sample. Significant differences were measured between the two groups with South African sample rated it significantly more important. Hostel accommodation was overall rated second most important variable. The Swazi sample rated this most important while the South African samples rated it in fourth place.

Significant differences are measured between the two groups with the Swazi sample rated it significantly more important than the South African sample. The overall third most important variable is participation in student and staff exchanges. The South Africa sample rated it third while rated by the Swazi sample in fourth place. Although no significant differences between the two groups were measured, the South African sample rated it slightly better compared to the Swazi sample.

The overall least important variable in the non academic Internationalisation category is private accommodation on campus. Although no significant differences were measured between the samples, the South African sample rated it slightly more important.

Table 3 indicates the level of perceived performance of the non academic internationalisation variables. The overall best perceived variable in this construct is an effective induction program. Although it was rated first by both samples, significant differences were measured between both samples. Reasonable class fees were overall rated second. It was rated second by the Swazi sample but fourth by the South African sample. Statistical significant differences were measured between the two samples. The overall third best perceived variable in this construct is private accommodation near the institution. Although it was rated in third position by the Swazi sample and fifth by the South African, no statistical significant differences were measured between the two sample groups.

The variable that was perceived worst in this construct was the international culture of the institution. Although the South African sample rated it as the worst perceived variable, the Swazi sample rated it in fourth position. In terms of the means the sample rated it significantly lower in terms of perceived performance.

Table 4 indicated the level of importance regarding academic internationalization issues. The overall most important variable is that the institution should offer courses that is of international standard. This variable was rated most important by the Swazi sample and second by the South African sample. However, statistical significant differences were measured between the two sample groups. The overall second most important variable is that the qualification should be internationally accepted. Although no statistical significant differences were measured between the two sample groups, it was rated it was rated first by the South African sample and third by the Swazi sample. The overall third most important variable is the admission requirements of a university. Significant differences were measured between the two sample groups.

The least important variable in this construct is that the university has internationally acclaimed staff or a faculty. Although no significant differences were measured between the two groups, the South African sample rated it less important compared to the Swazi sample.

Table 4: Level of importance – Academic Internationalisation

Table 5 indicated the perceived performance of the universities. The best perceived variable in the academic internationalization construct is admission requirements. Although no statistical significant differences were measured between the two groups, it was perceived slightly better by the Swazi sample. The second best perceived variable in this construct is international accepted qualifications. Statistical significant differences were measured between the two samples. The Swazi sample rated this variable second while it was rated third best perceived by the South African sample. The third best perceived variable in this construct is courses of international standard. Statistical significant differences were measured between the two sample groups with the South African sample rated it significantly better compared to the Swazi sample. The overall least best perceived variable in the academic internationalization construct is international competitive research outputs. The Swazi sample rated this variable statistical significantly lower in terms of perceived performance compared to the South African sample.

CONCLUSION AND RECOMMENDATIONS

Institutions of higher education are currently under considerable pressure to recruit the most promising students in order to increase retention and throughput rates. While overall the student market is homogeneous, institutions of higher education should satisfy the needs of a diversified group, both local and from abroad.

Students on the other hand have to cope with a large variety of inputs before making a final decision with regard to a particular institution of higher education. Despite this complexity the researchers have focused on aspects related to internationalization of higher education in South-Africa and Swaziland. Two components of internationalisation were identified and investigated in terms of importance when already enrolled at a institution of higher education. These components are academic internationalisation and non-academic internationalisation.

In the **non academic internationalisation** category reasonable class fees and hostel accommodation on campus were overall identified as most important and second most important issues respectively although significant statistical differences amongst the two groups exist. Regarding the most important variable, the South African sample regarded it more important while the latter was regarded more important by the Swazi sample. On the performance of the institutions, an effective induction program was overall best perceived by both samples as well as individually. Reasonable class fees were overall and by the Swazi sample perceived second best but fourth by the South African sample. Private accommodation was overall and by the Swazi sample perceived third best and fifth by the South African group. It was noted that significant differences were measured between the importance of all the variables and the perceived performance thereof which resulted in dissatisfaction.

In the **academic internationalisation** category, courses of international standard was overall and by the Swazi sample rated most important variable in this construct. The South African sample rated it second while statistical significant differences were also measured between the two sample groups. Overall this variable was rated third in terms of perceived performance of the universities. While the South African sample rated second in terms of perceived performance, it was rated fourth by the Swazi sample. Significant differences were measured between the importance and perceived performance of this variable tested. The overall second most important variable is international accepted qualifications. It was however rated most important by the South African sample and third by the Swazi sample. No significant differences between the groups were measured. This variable was also overall rated second in terms of perceived performance. However, significant differences were measured between importance and perceived performance which resulted in dissatisfaction.

The findings of this study reinforce the importance of measuring service quality offered at an institution of higher education. Various challenges arise from this study that should be addressed by management in order to ensure that these findings are dealt with. Educational administrators should note that all the identified attributes in the study are considered fairly important and should be taken into consideration when targeting and promoting services to students from other countries but also to local students in order to establish and maintain a competitive position in the international higher educational arena. From a practical point of view however it has to be taken into consideration that students should be subjected to a selection process before being accepted by the institution.

LIMITATIONS OF THE RESEARCH.

The study was conducted in one institution of higher education in each country and thus cannot be regarded as representative of institutions in South-Africa and Swaziland.

SME Development Based on Financial Strategies and Their Internationalization

Dr. Jesús Salvador Vivanco Florido. svivanco@correo.uaa.mx

Dr. Luis Aguilera Enriques. laguiler@correo.uaa.mx

Dr. Martha González Adame. mglezadame@correo.uaa.mx

Universidad Autónoma de Aguascalientes México.

ABSTRACT

The paper examines strategies that are likely to increase yield and development of SMEs. The paper considers financial strategies such as liquidity and good accounting, as well as the internationalization as strategies that can help the development of the SME's and strengthen their sustainability in the market. Since most SMEs fail to overcome the barrier of two years, examines the longevity of SMEs based on an empirical study of a sample of SMEs using statistical models like linear regression and ANOVAs and examined the relationship between financial aspects such as liquidity and leverage and internationalization.

The Singular Dimensions of Social Entrepreneurship: Toward a Conceptual Model

*Ram Subramanian, subramanianr@mail.montclair.edu
Montclair State University
C. Jayachandran, jayachandranc@mail.montclair.edu
Montclair State University*

Abstract

Background

The recent times has seen an increasing interest in social entrepreneurship. Social entrepreneurship is a much newer concept than traditional commercial entrepreneurship and this sub-discipline has been defined in various ways. While definitions have varied, the domain of social entrepreneurship feature the following unique dimensions (Brooks, 2009):

- Social entrepreneurship addresses social problems or needs that are unmet by private markets or governments
- Social entrepreneurship is motivated primarily by social benefit
- Social entrepreneurship generally works with – not against – market forces.

Being a subset of traditional commercial entrepreneurship, social entrepreneurship starts with opportunity identification and proceeds with coming up with ways to exploit the opportunity. However, as Neck, Brush, and Allen (2009) point out, social entrepreneurship is different from traditional commercial entrepreneurship on three fronts: the nature of the opportunity, the importance of stakeholder relationships, and the uniqueness of the performance measures used.

Objectives

The objective of this study is to examine the above mentioned three salient distinctions of social entrepreneurship. The goal is to provide a more fine grained perspective (than what is currently in the literature) on the three factors with examples of ventures that exhibit these features. The outcome of this process will be a conceptual model of social entrepreneurship that will help drive future research in this area.

Significance of the Study

It is clear that governments and traditional business enterprises alone cannot address all of society's pressing needs. Given the increasing interest in entrepreneurial activity around the world, social entrepreneurs can find solutions to a number of unmet problems. However, to do that, the field of social entrepreneurship has to advance in the theoretical perspective. The current study seeks to fill this important gap. By developing a unifying model, the current study hopes to stimulate further activity in this field.

Creative Accounting: How Lehman Brothers Used Repo 105 to Manipulate Their Financial Statements

*Agatha E. Jeffers, jeffersa@mail.montclair.edu
Montclair State University, USA*

Abstract

During the Bankruptcy Trial of Lehman Brothers in April 2010, Mr. Dick S. Fuld, Jr., the former chief executive officer was questioned about the accounting technique that helped Lehman Brothers mask billions of dollars of troubled assets on its books. It allowed Lehman to temporarily appear less leveraged and healthier in the eyes of investors, creditors and other interested parties. This technique was known within Lehman as “Repo 105.” Essentially, Repo 105 was an aggressive accounting off-balance sheet device which was used to temporarily remove troubled securities from Lehman’s balance sheet, usually for a period of seven to ten days to create a materially misleading picture of the firm’s financial condition. These transactions were booked as sales. Hence, on the financial reporting date, Lehman would show less risky assets, less debt and possibly more cash. This resulted in the appearance of healthy financial statements and the related healthy leverage ratios. Armed with this favorable financial picture, Lehman would then go into the open market and secure loans. A few days after the reporting period, the proceeds would then be used to repurchase the assets (securities) at 105 percent of their value. Additionally, these were material transactions and had the ability to affect the decision of a prudent person. Nevertheless, Lehman failed to disclose these transactions in the notes to their financial statements or in their filings to the Securities & Exchange Commission.

These Repo 105 transactions raise a host of questions. The primary questions are: 1) Should Lehman’s transactions have been recorded as sales or were these transactions simply financing arrangements? 2) If they were financing arrangements, then should they have been recorded as loans and shown on Lehman’s balance sheet? This paper attempts to answer these questions by using an examination of the GAAP rules. In addition, an examination of Lehman’s responsibilities to its investors, creditors and the general public will be undertaken and a determination made as to whether these responsibilities were met. Additionally, Lehman’s CEO denied any knowledge of these material transactions, yet he signed off on Lehman’s financial statements. Hence, an examination of the responsibility of the CEO in relation to the Sarbanes Oxley Act of 2002 will be undertaken. Further, Lehman’s behavior in relation to the standards prescribed by the Institute of Management Accountants (IMA) will be examined and a determination made of whether Lehman manipulated their financial statements and behaved unethically by using Repo 105.

Financial Crisis Impact and the Regulation:India's scenario

*D.H. Malini SrinivasRao, srimalini2010@gmail.com
Pondicherry University, India*

Abstract

The global recession caused increased rate of unemployment, downturn of business and shrinking government revenues. The financial crisis in global context hit South Asia at a time when it had barely recovered from severe terms of trade shock resulting from the global food and fuel price crisis. The food and fuel price shocks had badly affected South Asia, with cumulative income loss ranging from 34 percent of 2002 GDP for Maldives to 8 percent for Bangladesh. Current account and fiscal balances worsened sharply and inflation surged to unprecedented levels. The current financial crisis has spread around the world and no business sector has stayed untouched. While companies in some sectors have been forced to close down or lay off employees, companies in the food retail sector mainly have to adapt to their customers' preferences, which according to Ang, Leong & Kotler (2000) change in times of financial crisis. Almost all the developing countries are taking enough measures to recover from the crisis by introducing financial Sector rescue packages, such as the American Recovery and Reinvestment Act of 2009 (P.L. 111-5). The purpose of this study is to highlight the hit on Indian market during financial crisis. The present study is qualitative in nature. The effort has been taken to study the different sector of the consumer durables, FMCG and automobile sectors. The findings show that the sectoral impact and process to make necessary changes in the financial system to reduce recession risk and prevent future crises. There is a need to undertake certain changes in policy, regulations, oversight, and enforcement. The study concludes with policies and measures which are planned during the course of time to reduce the risk of financial crisis and to strengthen the present and future financial system.

Green Global Supply Chain: A Stakeholder Analysis

Anthony Ndiege, ndiege1@mail.montclair.edu

Montclair State University, USA

ABSTRACT

Excellence in supply chain management is increasingly being recognized as a strategic competitive differentiator among firms. Globalization of supply and demand, centralization of supply chain structures, compression of product life cycles and recognition of long-term shareholder value are among the factors driving the strategic shift to competing on supply chain excellence (Kerr 2008). As a sustainable development mode for modern enterprises, Green Supply Chain Management (GSCM) is drawing increased attention with several major enterprises such introducing key initiatives. The green principles that have been linked with efficiency include using environmental friendly raw material, reducing the usage of petroleum power, and using the recycle papers for packaging. The green principles have been expanded to many departments within organization, including the supply chain. This is a meta-analysis in attempting to understand the effects of sustainability to supply chain management of organizations.

Riding the Wave of Sustainability

*Patrick Chan, patrick.chan@sbf.org.sg
Director, Singapore Business Federation,*

Abstract

Sustainability, together with other megatrends such as demographic change, urbanization and globalization, are not only influencing the way we live today, but their impact will increase substantially in the decades to come. By identifying such market specific forward-looking trends and drawing the strategic consequences, a company will be able to bundle its business activities into areas which can demonstrate high potential of business growth and offer attractive investment opportunity for local and foreign investors.

Yet, despite a clear understanding of the multiple challenges that sustainable development could pose to the competitiveness and viability of an enterprise, there are many sustainability measures implemented by management which are falling short of strategic planning and long-term goals. To many, sustainable development is still a journey through the uncharted territory, one without a clear roadmap to navigate.

The Singapore Business Federation (SBF) has initiated the Singapore Sustainability Awards (SSA Awards) to honour and give recognition to Singapore enterprises with outstanding sustainable business practices. In partnership with KPMG, the awards knowledge partner, SBF has developed a strategic framework that will help guide our Singapore enterprises navigate the route towards an outstanding sustainable business enterprise, which will be highlighted at this presentation.

WELL ADJUSTED EXPATRIATE:

Guidelines for an Expatriate doing business in Israel

Nadeem M. Firoz. irozn@mail.montclair.edu

Montclair State University, United States of America

Abstract

Going global and entering international business markets has become a trend of this economic and political world. We are driven by money. We are beyond just buying and selling resources with foreign nations. Now, we make direct investments into complex operations that include both goods and services. Reasons to engage in this expansion include the want to increase markets, to diversify, to obtain raw materials, to research technology, to master productive efficiency, to be politically friendly, and to reduce the cost of labor and overall generate a larger profit. Although, the globalization wave has taken over the business world, cultural context is still well defined. Small or multinational corporation have been forced to explore the real world context in order to correctly approach each customer. This report will provide a guide of Israeli culture and etiquette.

The Role of Sustainability and Inclusive Growth in SMEs' International Performance and Competitiveness. Evidence from the Timber Sector in the Democratic Republic of Congo

Abstract

This paper investigates on the role of sustainability and inclusive growth issues on firms' international performance and competitiveness.

The role of the environment as an important factor of the firm performance, both at domestic or local and international level is well known. The environment of the firm refers to institutional, political, economic, financial, social, cultural and natural issues.

Over the last twenty years, sustainability and inclusive growth are becoming key determinants of firms' competitiveness since climate change awareness is considered a major issue receiving growing recognition at the international, national and local level.

To compete both at national and international level, firms are facing more and more sustainability and inclusive growth problems. Managers have then to integrate environmental and social responsibility issues in organizational and strategic plans.

The forest sector is poised to contribute positively to mitigating climate change and sequestration of carbon in forests and wood and paper products. Environmental awareness and the need to halt deforestation and illegal wood trade have a decisive impact on the competitiveness of the timber sector worldwide. In this respect, firms operating in the timber sector have to fulfil forest certification criteria. Main aspects of certification criteria are: low environmental impact on the forest, social helpfulness for communities and economical viability (Villazon, 2009).

The present paper focuses on the importance of the forest sustainable management as a key determinant of the competitiveness of the timber sector in the Democratic Republic of Congo (DRC).

Accounting for Inventories: The FASB/IASB Convergence Project and the Future of LIFO Method

*Ramesh Narasimhan, narasimhanr@mail.montclair.edu

Abstract

The Securities and Exchange Commission (SEC) has proposed to allow U.S. public companies sometime after 2015 to use International Financial Reporting Standards (IFRS) as an acceptable alternative to U.S. generally accepted accounting principles (GAAPs) for financial reporting purposes. The Financial Accounting Standards Board (FASB) and the International Accounting Standards Board (IASB) are working on a convergence project to minimize the differences in U.S and International GAAPs. One issue that has not yet been put in the agenda of the convergence project is the LIFO method of accounting for inventories which is permissible under U.S. GAAPs but not under IFRS. In this paper, we explore the impact elimination of the LIFO method will have on U.S. companies' financial position using Sears Corporation as an example.

Achieving Excellence in Sustainability: A Case Study of Grand Valley State University

Norman Christopher chrisfn@gvsu.edu
Jaideep Motwani motwanij@gvsu.edu
Wendy Wenner wannerw@gvsu.edu
Olwen Urquhart urquharo@gvsu.edu
Grand Valley State University, Michigan, USA

Abstract

Today, GVSU is nationally and internationally recognized as a leader in the area of sustainability. Their unique grass-roots approach to sustainability over the past decade has earned those laurels and top rankings. In this paper, by means of an extensive case analysis, we will demonstrate how sustainability became valued at GVSU and how it is now engrained in the University's culture. In our analysis, by means of an integrated diagram, we will address all the major areas, accomplishments, and savings that GVSU has achieved through the application of sustainability principles in the areas of campus operations, educational curriculum, student involvement, and community engagement. We will clearly illustrate how our faculty and students are engaged with the community through sustainability projects organized through the Sustainability Community Development Initiative. We hope that the systems, processes, and tools that we discuss in our paper will benefit other educational institutions that are planning to or are currently in the process of embarking on sustainability. In order to help other institutions, we will present a road map that clearly depicts processes, milestones, and challenges that need to be addressed for success.

Secondary Education, Entrepreneurial Science: Meaningful learning through cross-cultural experiences

KulpreetChilana, VarshaSubramaniam, Winnie Lau, Rebecca Raub, ArianaAimani
Bergen Academy, New Jersey, USA

Abstract

Though they come from incredibly different cultures, high school students from the Bergen County Academies in Hackensack, NJ and River Valley High School in Singapore have come together to collaborate in developing ideas and learning about science from an entrepreneurial standpoint. Both schools had established ideas- Coagula, a drug targeting hemophilia by Bergen Country Academies, and a hand sanitizer that is able to more effectively kill bacteria as compared to a major commercial brand by River Valley High School- and sought ways to effectively market them. The two schools manage their own companies and products, but come together to offer advice and critique each other's ideas. The partnership started in an effort to offer students a new global perspective on business and science.

Many high schools have curriculum that introduce the concepts of the global economy and workforce. What makes this high school program so unique is that it focuses on real world opportunity in the here and now, while simultaneously giving students the opportunity to gain business experience and international collaboration. Students have learned how the worlds of business and science come together and how a real company works. By establishing International partnerships and creating cross-cultural connections, the students come away with valuable communication and cooperation skills: both cornerstones of a successful partnership. This curriculum model is real world exposure for high school students who will eventually live, learn and lead in a global community.

Presentation Points:

- **Needs/Reasons**
 - Science and Entrepreneurship
- **Aims of the Program**
 - Allow students to gain an understanding of how the business and science worlds come together, and allow students to gain confidence in what they are doing
 - Schools in the US currently teach towards a typical career in the job market, whereas Entrepreneurial Science aims to give students a taste of developing a concept into reality
- **Challenges**
 - Cultural Differences
- **Learning Aspects**
- **Promotion of Program**
 - Promote program through government?
 - Have the government help back the program and spread it through different school systems (willing and able to participate in the project)
