Repeatedly in March, April and May 2007 the FCIC report (2011) claims major regulators were at odds with the reality of the situation as the contagion spread, like a feeding frenzy by sharks in the bay of plenty. The FCIC (2011) says that the regulators responded in an ad hoc basis with various programs to reduce the impending surge: “putting their fingers in the dike” is the actual term used (refer FCIC 2011, p. xxi). ‘There was

no comprehensive and strategic plan for containment, because they lacked a full understanding of the risks and interconnections in the financial markets' (FCIC 2011 p. xxi).

...the record reflects that senior public officials did not recognize that a bursting of the bubble could threaten the entire financial system. Throughout the (US) summer of 2007, both Federal Reserve Chairman Ben Bernanke and Treasury Secretary Henry Paulson offered public assurances that the turmoil in the subprime mortgage markets would be contained. When Bear Stearns's hedge funds, which were heavily invested in mortgage-related securities, imploded in June 2007, the Federal Reserve discussed the implications of the collapse. Despite the fact that so many other funds were exposed to the same risks as those hedge funds, the Bear Stearns funds were thought to be "relatively unique." Days before the collapse of Bear Stearns in March 2008 SEC (U.S. Securities and Exchange Commission) Chairman Christopher Cox expressed "comfort about the capital cushions" at the big investment banks.

This was an example of blind faith in a capitalist structure. In August 2008, a few weeks before the US government takeover of Fannie Mae and Freddie Mac, the FCIC (2011) considers that Treasury Department were able to finally comprehend and quantify the bleak financial circumstances of those two institutions. But the regulators had failed in appreciating the extent of exposure until a month before Lehman's collapse in 2008. The 'Federal Reserve Bank of New York was still seeking information on the exposures created by Lehman's more than 900,000 derivatives contracts' (FCIC 2011 p. xxi). The regulations and the regulators, it could be argued, were tardy and should have had the finger on the pulse to monitor and insist on audited reports of these major institutions. Major financial institutions do not have stained glass windows.

The FCIC (2011) argues that the regulatory stewards within the US government inflamed panic and uncertainty through inconsistency with major financial institutions. At the zenith of the crisis Bear Stearns was rescued and Fannie Mae and Freddie Mac were placed under a custodian within conservatorship arrangement with the Federal Housing Finance Agency (FHFA). Lehman Brothers was sacrificed but AIG was saved — increasing tension in the market (FCIC 2011).

...the failures of credit rating agencies were essential cogs in the wheel of financial destruction. (FCIC 2011 p. xxv)

The FCIC 2011 on this issue does not pull any punches and firmly apportions a very high level of blame at the doors of the credit rating agencies as 'key enablers of the financial meltdown. The mortgage-related securities at the heart of the crisis could not have (legally) been marketed and sold without their seal of approval (FCIC 2011 p. xxv).

This crisis could not have happened without the rating agencies. Their ratings helped the market soar and their downgrades through 2007 and 2008 wreaked havoc across markets and firms. (FCIS 2011 p. xxv)

Investors depended, at times, with blind confidence on the rating agencies and in certain instances were under regulatory constraints and therefore obligated to use them (FCIC 2011). Basically regulatory capital practices and standards were formulated upon their advice.

The FCIC (2011) researched Moody's performance and the results were appalling. 'From 2000 to 2007 Moody's rated nearly 45,000 mortgage-related securities as triple-A. This compares with six private-sector companies in the United States that carried this coveted rating in early 2000. In 2006 alone, Moody's put its triple-A stamp of approval on 30 mortgage-related securities every working day. The results were disastrous: 83% of the mortgage securities rated triple-A that year ultimately were downgraded.

... there were three rating agencies which were private companies; Moody's, Standard & Poor's, and Fitch, which were responsible for giving AAA or AA or A or B or BB and so forth ratings to bonds. These companies have existed for many decades. What's much less well known even than the fact that the rating agencies were being paid to rate the bonds is that the reason that they were in the position to

demand that payment is that they had been protected by the Securities and Exchange Commission regulations since 1975 in the US that made it very difficult for anybody to compete with them. So they were pretty much free to do whatever they wanted to. There are many regulations that have been issued over the years, even before 1975, requiring institutional investors to get various levels of grades of bonds that they hold in their portfolios from these three companies. (Friedman in Duffy 17 August 2009).

Many other problems in terms of the regulators are available in the FCIC report 2011. Unfortunately the examples are too numerous to include in this paper. That said briefly the regulator failed to address serious systemic faults that included extensive fraud perpetrated by the finance firms and their clients, flawed computer models, pressure from financial organisations that paid for the ratings, the relentless drive for market share, the lack of human and physical resources within financial companies to work properly - despite record profits, and the absence of meaningful public oversight. To use an academic term to state the situation succinctly – it was and is a shameful mess.

Conclusion

Greed played a large part in this history of economic saga with bonuses. To Hooper (in Doogue 4 December 2010) the financial sector considered they should be ‘uncapped and unlimited.’ This particular view of how capitalism should operate is riddled with greed and has simply permitted financial services to simply do what it did, to make money out of money and to detach itself completely from the real economy, to turn a blind eye to the most outrageous conflicts of interest, the most outrageous fee structures, the most outrageous compensation, the most outrageous growth of bank balance sheets with ever-less capital underpinning it, which led to these colossal remuneration and the distortion of people going into banking because salaries were so high there, leading to this enormous debt overhang which is crushing the potential of the Western economy to recover’ (Hooper in Doogue 4 December 2010) CEOs demanding greater risk .

The salary of CEOs is an area that needs added research. The statistics of an outgoing CEO of a Macquarie’s bank in Australia as one example shows the stratospheric salaries. Hopper and Hopper (2009) express significant concern about CEO salaries or ‘packages’ in the US as well.

In Australia Curtin (19 May 2007) added an interesting insight into the dimension of a salary of \$33 million. Moss’s salary (outgoing CEO of a prominent Australian bank) ‘equalled 108 prime ministers, 335 doctors, 446 builders or 669 teachers.’ Curtin drew on other observations by readers further stating that this salary level also matched ‘the combined salary of 250 professors...more than 2400 disability support pensions’ and a teacher named ‘Irene Buckler calculated she would have to work for 471 years, or about nine working lifetimes, to match Moss’s payout. Ms Buckler (in Curtin 19 May 2007) further adding notions of incredulity that ‘Allan Moss works 471 times harder than I do or that shuffling money to make massive profits for a small group of shareholders is 471 times more important than educating children to ensure a better future for us all.’

This figure comes from a country like Australia that has a population of 22 million people. The salaries of CEOs and the type of people being recruited. The rewards received is an issue that needs to be examined

In 2008 Moss departed from Australia’s ‘largest investment bank with an estimated \$100 million “swag” of cash, shares, options and bonuses’. While home owners struggle to pay their mortgages, this company boss needs to work out what to do with ... \$100,000,000’ Lekakis (7 February 2008).

As early as September 2004 Countrywide executives recognized that many of the loans they were originating could result in “catastrophic consequences.” Less than a year later, they noted that certain high-risk loans they were making could result not only in foreclosures but also in “financial and reputational catastrophe” for the firm. But they did not stop.

No one said “no.”
(FCIC 2011 p. xxii)

There many case studies of CEOs that warrant further investigation. Former Chair and CEO of Lehman Brothers Richard Fuld would be a good starting point as a case study. The lingering question is how a 158 year old

investment firm whose 2008 bankruptcy was the largest in US history, was so distracted, deaf and blind to an obvious array of economic alarm bells that their company was in severe strife (Ward 2010)? According to Ward (2010) the clues lies in the Lehman's culture which operated like in toxic Taylorist mode where intimidation was rife cowering those who should have questioned Fuld but did not - as though he were a king.

The FCIC (2011) reported that major financial institutions knew many of the loans they offered did not meet their own underwriting standards or those of the originators. 'Nonetheless, they sold those securities to investors. The regulators failure to realise that corporations are comprised of humans with weaknesses such as greed, "mistakes, misjudgements, misdeeds, irresponsibility" combined with will to take risk for self interest for quick financial return no matter what the cost, and blind faith like a born again disciple of corporatism is at the basis of this crisis (FCIC 2011). Not all were at fault and many innocent people with years of dedicated service lost their jobs.

When General Douglas MacArthur effectively became the "ruler" of Japan following World War II, 'he arranged for 1,937 incompetent senior executives in 154 leading companies to be replaced by competent managers drawn from the ranks of middle management.' (Hopper and Hopper, 2009 p. xv). The rest is history in relation to Japan and the question remains whether the right people are leading given the overwhelming evidence that the right people were not leading but many people are still in their positions. A person with the power of MacArthur is not a realistic proposition in western democracies but nevertheless what MacArthur did was look to the middle ranks of organisations and find people with the right attitude and promote them to senior positions and with development and training Japan emerged as an economic powerhouse (Hopper and Hopper 2009). The US has declined Hopper and Hopper 2009).

So this is what occurred. The downturn global economy experienced a massive downturn. The crisis was fuelled by sub-prime mortgages, multiple investment bank failures, the collapse of home prices, and the advent rigid as opposed to ridiculously easy credit, all combining with unbelievably appalling management and regulation pushing the US and many countries on the globe, with few exceptions (like Australia and Singapore, and China) into a deep recession by mid-2008. This for the US was the deepest and longest downturn since the Great Depression (FCIC 2011). To facilitate financial markets stability the US Congress established a \$700 billion relief program (bailout) in October 2008. The US government used a proportion of these funds to purchase equity in US banks. In some cases this impacted on innocent shareholders but significant returns to the government by early 2011 have occurred (CIA 2011). January 2009 saw the US Congress an additional \$787 billion fiscal stimulus bill signed into law to alleviate the collateral damage of the crisis with additional spending, tax cuts and job creation.

But trouble lies ahead for an economy allowed to get out of control by disastrous regulation.

The US debt has now exceeded \$14 trillion with the US government expecting a federal deficit in 2011 of \$1.6 trillion with the state and local municipal levels of government debt soaring to \$2.4 trillion (Mann Washington 26 February 2011 p. 14). At least 46 states have been forced to cut public services therefore spending in state services, 'including healthcare (31 states) and services to the elderly and disabled (29 states). At the same time, a swath has been cut through education, the sector that President Barack Obama nominates as critical to America "winning the future" in an increasingly competitive global economy: 35 states cut their kindergarten to year 12 funding, 43 cut into higher education' (Mann Washington 26 February 2011 p. 14). It gets worse as 'most of the \$180bn of federal stimulus money made available to the states will run out in August, increasing pressure on state budgets (Mann Washington 26 February 2011 p. 14).

Finally the problem of establishing who should be punished for the immense financial failures as well as a clear definition of 'a financial crime' signifies an added dimension of failure. This seems to be too hard and the research indicates little action. So what of the future? Unless ethics, corporate social responsibility, respect for customers and the public returns.

Abstract

The Foreign Direct Investment (FDI) has followed a general increasing tendency worldwide during the last decades. In the case of the emerging countries, such as, Brazil, Russia, India, China and Mexico, the behavior has been almost the same. In fact, these countries are getting more important on the attraction of foreign capitals and the outward of direct investment. In terms of the Investment Development Path, the emerging countries are in the third stage (It has five). Thus, it provides a measure of the degree of multinationalization of the countries enterprises. Therefore, the aim of this paper is to analyze the behavior of FDI (inward and outward) of these countries taking into account their structural variables. This includes a static analysis, a dynamic analysis and the development of outward performance index for each country. The results showed the relationship that the structural development has with the inward and outward FDI.

Keywords: Foreign Direct Investment, Emerging Countries, Investment Development Path, Structural Factors, Economic Development, Multinationalization.

Introduction

The present research is an analysis of the foreign direct investment behavior (inward and outward) of the emerging countries (Brazil, Russian Federation, Indian, China and Mexico) taking into account their structural factors and relating them with the economic development. All this explained by the Investment Development Path, design by Dunning in 1981 and modified in later years. This theory classifies the countries into 5 stages depending of the structural factors. The first three stages correspond to the emerging countries and the last two of the developed countries.

The rest of the paper focuses in a theoretical revision of the Investment Development Path and the description of each one of the stages on it. Also, the evolution of the foreign direct investment in Brazil, Russian Federation, Indian, China and Mexico is analyzed. A methodological proposal is made with its subsequent implementation, and the conclusions that were reached.

Investment Development Path (IDP)

The Investment Development Path (IDP) is a model that relates the close linkage between the economic development of a country and the foreign direct investment (FDI) that emits and receive considering that this development can generate some advantages to the ownership of the local enterprise thereby benefiting multinationalization process. This also increases the attraction of FDI due to the impact that it has on the generation of new locational advantages and improving the existent ones. In other words, the economic development, according with the structural evolution of an economy, is related with the multinationalization. This situation impacts on the reception and emission of FDI. In this way it is possible to observe the dynamic interaction of the FDI that relates the economic development of a country generated by the economic structure and the entrance and emission of FDI.

The model of the IDP was developed by Dunning (1981), and modified several times mainly by Dunning (1986, 1993), Dunning & Narula (1996), Durán & Úbeda (2001), y Durán & Úbeda (2005). It is a process integrated by 5 stages. In stage 1, the inflow of FDI is very low and practically it is directed to the primary sector, to the exploitation of natural resources (Dunning & Lundan, 2008). In this stage are the less developed countries, within its the main advantages that they have is the cheap labor force. In stage 2, the

reception of FDI increases due to the improvement in the structural factors of the country, such as the infrastructure, transportation, communications and qualification of the labor force. Also, the local markets grow in size or in purchasing power. However, the emission of FDI is still low. The emerging countries are classified into the third stage and one of their main characteristics is that they are important destinations for the FDI worldwide. Besides that they generate FDI towards other countries, which begin to be noticeable. All this, because there are several improvements in the activities related with innovation, infrastructure, technological capabilities, a higher education level, among others.

By and large, the first three stages of the IDP belongs to the developing countries, which are characterized because they are big receptors of FDI, with a low emission of FDI.

The last two stages correspond to the developed countries. In the stage four, are the countries newly developed. One of their main characteristics is the high level of emission of FDI to other countries, which are mainly investments in goods and services of high added value. So these countries have become leaders in the generation of technologies. Finally, the stage 5 is integrated by the developed countries, the ones that has more time in this classification; besides they have a higher quantity of intangible assets in comparison with the countries of the four stage, even though they have a similar structure (Durán & Úbeda, 2005). It is possible that the countries in this stage present positive and negative quantities of net investment with a trend to the equilibrium. Therefore the emission and reception of FDI keeps increasing, which is a natural and predictable process (Dunning, 1993).

The IDP is idiosyncratic, specific for every country and it has its own development path determined by the degree and nature of its assets, natural and created, its strategy of economic development and the government role. (Dunning & Narula, 1996). These factors determine the operation of the foreign and local enterprises in a region, where the proper interaction of the advantages of the enterprises and the countries make a virtuous circle in which one advantage drives the other (Bonaglia & Goldstein, 2006).

It is also worth to mention that according to the stage of develop of each country, it is the level of FDI that it should receive and be able to assimilate the potential benefits that come with the FDI (Dunning & Lundan, 2008) and stimulate a continuous economic growth. Whereas the larger the technological gap between the countries, the lower the internalization of benefits the recipient country of FDI (Dunning & Narula, 1996).

The IDP in BRICs countries and Mexico (BRICs+Mex)

As it was mentioned before, the IDP relates the economic development of a country with the entry and exit of FDI, divided into 5 stages. The third stage corresponds to the emerging countries. Within which Brazil, Russia, India, China and Mexico can be found (UNCTAD, 2010), theoretically considered in the third stage of the IDP. In fact, some authors have previously identified the evolution of some countries through other stages and the position of the emerging countries in the third stage. Among these authors we can mention Dunning (1981), Dunning & Narulla (1996), Tarzi (1999), Durán & Úbeda (2001), Dunning, Kim & Lin (2001), Kalotay (2004), Divarci et al (2005), Bonaglia & Goldstein (2006), Boudier-Bensebaa (2008), Sathye (2008), Gorynia et al (2009), Molina & Alcaraz (2010). Hence, it is possible to realize the interest and the importance of these countries and its research for academics and entrepreneurs.

A first approach to the identification of the appropriate stage in terms of the IDP of the countries that was mentioned before is by the observation of its behavior of inward and outward of FDI. In this regard, we can realize that China is the country with more amount of investment received, and it is much greater than the rest of the group. The FDI inflows to these countries began to increase more significantly during the decade of the 90's, which is comprehensible since in this period there were several changes worldwide, such as processes of reform, liberalization of trade, privatization of public companies, global economic expansion, economic deregulation, deregulation of financial markets and the easing of the requirements for foreign direct investment. This has promoted that the emerging economies receive greater amounts of foreign investments.

Russia, India, Brazil and Mexico make a relatively homogeneous group in terms of receiving FDI (stock), and remarkably away from China. The growing trends, according to what has been reviewed about the IDP, is an indicator of the evolution through the path described for these countries which allows to imply the stage in which they are, the third stage of the IDP. Another feature of these countries and that also is specific to the third stage is that they are important receptors of FDI worldwide.

In Chart 1 it can observe that, particularly in two occasions has suffered sharp falls in the inwards of FDI that refer to 2001-2002 and 2007-2008. In the first case may be due to the unfortunate events of 11/01 in the U.S.; and in the second case, by the global economic crisis originated in the U.S. in late 2007.

CHART 1. FDI STOCK INWARD

Source: Own elaboration based on UNCTAD data

In the Chart 2, it can be observed the emission of FDI of the countries under study. The behavior of the countries is very similar to what has been reviewed and explained with the inward of FDI. However, it is important to mention that the increase in the outward of FDI of one country is another characteristic of the countries that belong to the third stage of the IDP.

CHART 2. FDI STOCK OUTWARD

Source: Own elaboration based on UNCTAD data

Moreover, the outward of FDI of these countries is very important because it represents the generation of Multinational Enterprises (MNE's). In this respect, it is possible to say that the MNE's of the emerging economies are having a greater participation in the international markets, according to Vives & Mendoza (2008). That is the case of China and the worldwide participation of its enterprises, which is completely coherent with its high outward of FDI.

Likewise it is important to note that the multinational enterprises of the emerging countries seek for developed economies to establish and perform their activities (because of the advantages of their location) as countries with the same economic and structural development (Bonaglia, Goldstein, & Mathews, 2007).

In the described paths of the different countries, when the domestic gross product is related with the Net Outward Investment (NOI), defined as the outward stock of FDI minus the inward stock of FDI, we can

realize the evolve that these countries have followed between 1990 and 2009 (with the exception of Russia, due to the lack of data for the years 1990, 1991 y 1992) according to the IDP model. Comparing this relationship for each one of the countries under study in this paper (appendix 1), and according with the diagram of Dunning & Narula (1996) we can mention again that the 5 countries (Brazil, Russian Federation, India, China and Mexico) belong to the third stage of the IDP. However, although all belong to the third stage, each one has its own particular path and specific development, just as was mentioned by Dunning & Narula (1996).

According to Appendix1, in the first decade of study it can be observed an irregular behavior, this reflects the large number of changes that occurred worldwide. However, the data are adjusted more to what is in the theoretical papers

In terms of the IDP, the country that has a higher development is China. This according to its path which place it on the last part of the third stage, very close to the fourth stage, which is the stage of the newly developed countries. Russia shows a development very similar like China, and according to the information reviewed, it would also be close to the next stage.

According to the path outlined, the country that is after China and Russia is Brazil, then India, and finally Mexico, the three classified in the third stage of the IDP.

This is an approach to economic development of a country, generated by its structural development and related to both, inwards and outwards of FDI. However, it is necessary to conduct a more detailed study, for which a methodology is proposed and presented below.

Methodology

The methodology that is proposed consists of three parts. The first is a static analysis, then a dynamic analysis and finally the development of an index that will show the degree of multinationalization of each country, on the understanding that the outward of FDI is determined by the structural development of the country and in some way it is a measure of development of an economy.

For the static and dynamic analysis, we follow the methodology proposed by Duran & Ubeda (2001) and Duran and Ubeda (2005), and it is shown below:

- a) A factor analysis in order to identify the factors that will define the structural development of the countries.
- b) A multiple regression analysis to observe the behavior of the variables that define the structural development in relation to the inward and outward of FDI.

The other two analysis that the methodology of Duran & Ubeda (2001) and Duran and Ubeda (2005) considers, are a cluster analysis, to group the countries according to their structural characteristics and from that classify them according to their stage of development the IDP; and a variance analysis. These last two tests will not be made, due to we assume that the countries under study all belong to the emerging countries and therefore they are classified in the third stage of IDP. With this consideration, both the cluster analysis and the variance analysis would have no sense.

The following variables were used to make an approximate measure of the degree of structural transformation (Lall, 1996; Narula, 1996; Durán & Ubeda, 2001, 2005):

- a) The GDP per capita and GDP growth were used as an indicator of market potential.
- b) The CGF per capita (capital gross formation) as an indicator of the accumulation of physical assets.
- c) For the measurement of technological endowment, namely the strategic assets, were used the number of researchers engaged in research and development, the expenditure on research and development (R&D), the patents application by residents, the number of articles published in scientific journals. The expenditure on education was also included.
- d) To measure institutional development we used spending on health.

The dynamic analysis, consist of a panel data study to see if the development that the countries have had during the period of 1990-2009 has made an homogeneous path for both inward and outward of investment in these countries.

Finally, we obtain the multinationalization index from the methodology proposed by Gorynia et al (2009). This index reflects two groups of factors determining the outward of FDI by the multinational enterprises in a particular country. The differences in the index values between countries, shows the difference in these two groups of factors, which determines the outward of FDI by MNE's to other countries. The group of

factors that were used are the advantages of ownership (innovation, brands, management skills, access to information, etc.) and location factors (market size, production costs, infrastructure, technology, etc.)

The analysis of the Outward FDI Performance Index (OPI) shows the magnitude of the outward of FDI is issuing on the potential size of its economy, and indirectly would indicate which country has a better capacity to evolve through the stages of the IDP (Gorynia, Nowak, Tarka, & Wolniak, 2009).

Analysis of results

Before commenting the results, it is necessary to emphasize that the variables used have been relativized to avoid bias in the measurements. Once mentioned that, the first analysis that were performed is the static one, through a factorial analysis which allowed us to obtain the structural development factor for the countries under study.

Only one factor was obtained by this analysis, integrated by the GDP per capita, education expenditure per capita and the health expenditure per capita. The best results were obtained with the interaction of these three variables as a development factor. In this regard, although the R&D expenditure is very important, the results were not optimal so it was not considered.

The reason why the R&D expenditure does not appear as variable in the development factor, may be explained because, according to the IDP model, a main characteristic of the countries in the fourth stage is the generation of new technologies and the leadership that they have in this field. By contrast, in the emerging countries, according to the IDP model, the generation of new technologies is not a characteristic that defines them. Therefore it is possible that the R&D expenditure does not appear in the factorial analysis.

TABLE 1. RESULTS OF THE FACTORIAL ANALYSIS

Variables	Communalities	Factor
GDP per cápita	.991	.995
Education expenditure per cápita	.986	.993
Health expenditure per cápita	.962	.981
Measure of sampling adequacy of Kaiser-Meyer-Olkin.		0.724
Test of Bartlett sphericity		15.718
Sig.		0.000

Source: Own elaboration based on the results from SPSS

The second part of the static analysis was a regression analysis. The structural factors identified by the factorial analysis were used as independent variables relating them to both, income and emission of FDI as dependent variables. The outcome was positive and consistent with the inward of FDI. This means that the development factor promotes the attraction of foreign capitals in the emerging countries analyzed.

However, there is no relationship between the development factor and the outward of FDI, which means that the structural development of these countries is not enough to explain the multinationalization of FDI from these countries abroad.

TABLE 2. REGRESSION ANALYSIS RESULTS

	Model	
Constant	639 (5.512), (.012)	R ² = .799 F = 11.931
Development Factor	448 (3.454), (.041)

In the dynamic analysis we conducted a panel data analysis applied to Brazil, Russia, India, China and Mexico in the period of 1993-2009. In this analysis were used logarithms of the stock of the foreign direct investment for both inwards and outwards for a better adjustment and to eliminate problems of heteroskedasticity and

nonlinearity. In the process of determining the model with the best adjustment, problems of autocorrelation were also present, which were eliminated by the use of lags. It is also important to mention that the analysis was performed with fixed effects. The models used are:

$$\begin{aligned} LOGFDI_{pc}IN_{it} &= B1_{it} + B2 LOGFDI_{pc}IN_{it}(-1) + (B3 LOGGDP_{pc} - B4 LOGGDP_{pc}(-2)) + \delta_t + \varepsilon_{it} \\ LOGFDI_{pc}OUT_{it} &= B1_{it} + B2 LOGFDI_{pc}OUT_{it}(-1) + (B3 LOGGDP_{pc} - B4 LOGGDP_{pc}(-2)) + \delta_t + \varepsilon_{it} \end{aligned}$$

where:

- LOGFDI_{pc}IN_{it} = Logarithm of the inward stock of FDI per capita in each country i at time t
- LOGIED_{pc}OUT_{it} = Logarithm of outward per capita stock of FDI in country i at time t
- LOGGDP_{pc} = Logarithm of GDP per capita
- δ_t = Standard error
- ε_{it} = Error term.

The results in Table 3, shown that a country's economic growth, generated by a structural transformation will promote growth in both inward and the outward of foreign direct investment. This is consistent with the revised theory. Specifically in the obtained models can be observed that in the case of the BRIC+Mex the FDI not only depends on the current GDP, but also from earlier periods.

TABLE 3. TEST RESULTS WITH FIXED EFFECTS

Variables	Model FDI inwards	Model FDI outwards
<i>LOGIED_{pc}IN (-1)</i>	0.822568* (13.61544)	0.932794* (22.79519)
<i>LOGPIB_{pc} - LOGPIB_{pc} (-2)</i>	1.145635** (2.387799)	1.814775** (3.382428)

* Statistically significant at 1% ** Statistically significant at 5%.

The Outward FDI Performance Index relates the degree of development of an economy. So indirectly it indicates which country has a bigger trend to multinationalization. The interpretation of the OPI is as follows when the index value approaches to 1 or more, the greater its behavior toward the integration of its enterprises to foreign markets. In terms of the IDP it means evolution in the path described.

In the following table it is clear that China is the country with the highest values of the OPI even though in the last decade they have been declining, it still being the country with a greater trend toward multinationalization.

After China, comes Russia, for which the years 1990, 1991 and 1992 are omitted because there is no information available. This country shows a certain behavior to the outward of the FDI. However, the index shows some changes, i.e. increases and decreases significantly. This could possibly be explained by the outward of FDI from multinationals rather than a constant and increasing evolution of the index of this country.

Brazil is third country in importance according to the OPI (in regard with the emerging countries that are under study). Particularly from 1995 to 2009, unlike Russia, Brazil shows an almost steady behavior during that period.

Finally, the other two countries, Mexico and India, have the lowest levels of performance. In the case of Mexico, it can be observed that there has been a gradual and steady growth. In the case of India, the growth practically began in 2006 with a considerable increase in comparison of 2005 and continuing with a slight increase in the years 2007, 2008 and 2009, growing even more than Mexico.

TABLE 4. OUTWARD FDI PERFORMANCE INDEX

Conclusions

In this paper we have observed the relationship between the structural factors of Brazil, Russia, India, China and Mexico and the inward and outward of FDI. This means that in order for a country to receive and emit more FDI, it needs to improve its structural characteristics.

The static analysis has allowed us to identify that the variables that integrate the development factor are the GDP per capita, the education expenditure per capita and the health expenditure per capita.

In other papers (Duran & Ubeda, 2001 and Duran & Ubeda, 2005), the degree of technological development is a very important variable for countries that belongs to stages 4 and 5 of the IDP. Nevertheless, in this study the degree of qualification of human capital produce better results than other technology assets as the number of researchers, R & D expenditure, inter alia. This behavior is completely consistent with the theory, since the countries of the third stage of IDP are not characterized as generators of new technologies. This situation will change as countries increase their level of structural development, as China in this paper.

The dynamic analysis allows us to observe from the models obtained that the FDI not only depends on the current GDP, but also from earlier periods in the case of the countries under study.

The results reached with the Outward FDI Performance Index are consistent with those obtained in previous analysis because the level of development is determined by outward FDI. This can be seen clearly in the case of China, since it is the country with the highest level of participation of investments in foreign markets and therefore more prone to multinationalization, then find Russia, Brazil, Mexico and India, countries with a lower level of development.

The fundamental factors effect on extensiveness disclosure of financial reporting through company's website

Emmy Indrayani, emmy@staff.gunadarma.ac.id
Delvita Dita Putri Anggrayni, dita_bubble90@yahoo.com
Faculty of Economics, Gunadarma University, Indonesia

Abstract

The aim of this study is to analyze the influence of company characteristics which reflected in company size, level of profitability, level of liquidity, level of leverage and the company age on the extensiveness disclosure of financial information in manufacturing and services company's website which registered on Indonesia Stock Exchange (IDX). The sample that used in this study is 60 manufacturing and services companies which registered in Indonesia Stock Exchange on the year of 2008-2009. Purposive sampling method were used to get the samples. The Hypothesis analyzed by multiple linear regressions. The results of this study show that the company size gives the significant influence toward the extensiveness disclosure of financial information on manufacturing and services company's website. While liquidity level, leverage level, profitability level and the company age give no influence on the extensiveness disclosure of financial information in the websites of manufacturing and services companies.

Keyword: Company Characteristics, disclosure of financial information, website

Background

Each year, 'go public' companies published reports concerning its financial audited by independent public accountants. This financial report is an information that allows the parties outside the company's management to determine the condition of a reporting period. Hertanti (2005)^[11] in her study states that the financial statements are the main tool for managers to demonstrate the effectiveness of achieving objectives and to carry out the functions of accountability within the organization. Meanwhile, according to Pernyataan Standar Akuntansi Keuangan (PSAK) (IAI, 2002)^[12], the objective of financial statements is to provide information regarding financial position, financial performance and cash flows of the entities that give a benefit to the majority of the users of financial statements in making economic decisions.

An adequate disclosure of information in the financial statements can be done in the form of a description of the accounting policies that are taken, contingencies, inventory methods, the number of shares outstanding and other alternative measures. A survey by the AICPA special committee of financial reporting in 1994 stated that there are various information that needed by the users of financial reports, so the changes in business approach with emphasis on user needs is essential. Companies must be transparent in revealing financial information to help decision-makers and other users of financial information in anticipation of an increasingly changing in economic conditions.

Internet Financial Reporting (IFR) is a phenomenon that is currently booming. Agustina (2008) in her study states that the worldwide companies especially the company that has been go public through the Internet have been displaying its financial information, includes complete financial information or a summary of the financial report using the IFR. The format of the internet financial information used are also varied, such as using HTML format (Hyper Text Markup Language), pdf, word or excel.

The usage of company's website for financial reporting is still voluntary, so the company can still be experimenting. The application of Internet used in companies have an important role and it can become the center of business strategy to gain advantage in competition. Research on disclosure of financial information via the Internet is still important to do to find out what the factors affecting the company's extensiveness disclosure of financial informations.

Theoretical Framework

Disclosure in Financial Information

Disclosure is defined as the provision of information needed for optimal operation of an efficient capital market (Hendriksen, 1996)^[10]. In a broader interpretation, disclosure related to information contained in financial reports and also in additional communications (supplementary communication) which consists of footnotes, information about the incident after the date of reporting, analysis, management of the company's operations in the future, the financial forecasts of operations, as well as Other information (Widiastuti, 2000, in Hertanti,2005)^[11].

A disclosure in this case is the completeness of financial information that is displayed by the company in company's website in HTML format or other downloadable document format. Recently, IFR remains a component of the practice of voluntary disclosure by the Company (Ashbaugh et al, 1999)^[4]. There are currently no laws governing the company to report financial information company through website.

Agency Cost and Signalling Cost

Disclosure of financial information through the Internet Financial Reporting (IFR) is closely linked with agency theory and signaling theory. In Signaling Theory said that large companies will need much of external funds. To obtain these funds, the company will give a signal about the quality of corporate financial disclosure through the company's website. Lang and Lundholm (1993) in Agustina (2008)^[1] explained that there is a perception that a well performing management will be more open about its information then the poorly performing management so Agustina (2008)^[1] explained that in such situations, management will be more active to increase shareholder confidence and support the management contracts.

While in Agency Theory expressed by Jensen and Meckling (1976)^[14]; the agency relationship arises when one or more persons (principal) employ another person (agent) to provide a service. At the time of granting authority, the agency relationship emerged. In the contract between management and investors, management as the agent while investors regarded as principal who delegate the authority to the agent. Therefore, the manager of management must be able to prepare the financial information as a means of accountability of agent to principals. Principals have to give their attention to their agent and the Agent will try to fulfill the desire of principal as a form of accountability through the extensiveness disclosure of financial information, one through the company's website.

Research Framework

The practice of disclosure of financial information via the Internet is indispensable to the agency theory and signal theory. In signaling theory states that the company will give positive signals to its investors to obtain an external funding. While in agency theory, an agent must be responsible to the principal. One way to give a positive signal and obtain funds from outside parties is to use the Internet Financial Reporting (IFR). IFR is also a way for company management as the agent to be responsible to the investors who act as principals.

The phenomenon of financial disclosure through the IFR does not necessarily make all companies willing to disclose their financial information through its personal website. There are various factors that influence companies to do the Internet Financial Reporting practice or not. These factors show the characteristics of the companies that can influence the conditions in the company. Hertanti (2005)^[11] in her research said the company will be revealing its financial information in accordance with the condition of the company. In this study, the factors are reflected in company size, profitability level, liquidity level, leverage level and the company age.

a. The influence of company size toward the IFR practice

Several previous studies such as conducted by Ismail (2002)^[13] and Agustina (2008)^[1] argues that firm size give an influence toward the disclosure of financial information via the Internet. This is caused by large companies usually have many number of shareholders and its scattered. Large companies must pay large agency cost to distribute financial information to their shareholders. With IFR practice, companies will be able to reduce its agency costs. Thus, the hypothesis proposed is:

H₁ : The size of the company significantly influences the extensiveness disclosure of financial information via the company's websites

b. The influence of profitability level toward the IFR practice

Signaling theory states that when a company has a good performance, management has a strong incentive to disseminate financial information to improve the confidence of the investors Debreceeny (2002)^[7]. This is very different from the companies that have poor profitability. The Company will not use the IFR for the company to hide its bad news.

Companies with high profitability will easily attract the attention of investors with the extensive reporting of financial information using IFR practices. Thus, the hypothesis in this study proposed is:

H₂ : The level of corporate profitability affects the extensiveness disclosure of financial information via the company's websites.

c. The influence of liquidity level toward the IFR practice

Erlina (2002)^[8] states that the liquidity ratio is a ratio measuring company's ability to meet its short-term financial liabilities to short-term creditors. Illiquid condition of the companies could cause the company went bankrupt. Liquidity is seen as a form of company ability to meet payments to smooth their business. Company with high liquidity level tends to do the IFR practice so many parties will know about company's financial information.

There are several previous studies such as the study done by Lestari and Chariri (2005)^[15], and also Agustina (2008)^[1] argues that the level of liquidity significantly influences the practice of IFR. Thus, the hypothesis proposed is:

H₃: The level of liquidity affects the extensiveness disclosure of financial information via the company's websites.

d. The influence of leverage level toward the IFR practice

Leverage ratios can be interpreted as the use of assets or funds to close the company flat fee or pay a fixed expense. Leverage can be used to view the risk of uncollectible debt. The practice of disclosure of financial information via the Internet can help companies to remove doubts from the shareholders of the fulfillment of their rights as funders.

Ismail (2002)^[13] in his research stated that the level of company leverage influence the disclosure of financial information via the website associated with agency costs. Thus, the hypothesis proposed is:

H₄ : The level of leverage affects the extensiveness disclosure of financial information via the company's websites.

e. The Influence of company age toward the IFR practice

According to UU No. 8, 1995, the company will be listed or already listed on stock exchanges have a mandatory to do a financial reporting. Companies listed on the Stock Exchange that has more experience in the annual report will provide more complete financial information compared to other companies (Lestari and Chariri, 2005)^[15].

Companies that have been listed for long time in Indonesia Stock Exchange has a tendency to change the method of reporting its financial information in accordance with technological developments in order to get the attention of their shareholder through the company's website using the IFR. Thus, the hypothesis proposed is:

H₅: The Age of company listing affects the extensive disclosure of financial information via the website.

Research Method

Population and Sampling Method

The population used in this study was financial information that published through the website of manufacturing and service companies listed in Indonesia Stock Exchange. Total manufacturing company that listed

on the Indonesia Stock Exchange (IDX), about 132 companies and the services company that listed in the Indonesia Stock Exchange is about 68 companies.

The sampling method that used in this study is *Non-probability sampling using purposive sampling* so that the selected samples for this study are 36 manufacturing companies and 24 services companies.

Research Variable

The dependent variable in this research is the extensiveness disclosure of financial information on the website of manufacturing and services companies that listed on Indonesia Stock Exchange. This variable was measured by using the index of disclosure methodology, the index Wallace in Nugraheni et al (2002)^[16].

$$\text{Wallace index} = \frac{n}{k} \times 100\%$$

While the independent variables that will be tested in this research are: Company size, Profitability level, Liquidity level, Leverage level and Company Age

Data Collection Method

Data used in this research is secondary data obtained using the method of documentation. This method is used to acquire data on company size, level of corporate profitability, the company's liquidity level, the level of companies leverage, company's age and the extensiveness disclosure of financial information in the company's website.

The secondary data that used in this study is the company's financial statements obtained from each website of manufacturing and services companies. Data collection method is done by downloading via the Internet. While the *website* of each company searching method is done by using search engine (Google and Yahoo!).

How to search the website above is like the way that has been done by previous researchers. If in this way *Website Company* cannot be found, the company is considered not to have *website*.

Analysis Method

In this research, a method of data analysis is data normality test, classical assumption, multiple regression analysis, and hypothesis testing.

Multiple regression analysis (multiple regression analysis) is a method of analysis used to test the influence of variables firm size, level of corporate profitability, the level of the company's liquidity, the company's leverage level and the company age to the extensiveness disclosure of financial information in the manufacturing and services companies websites.

The multiple regression models indicated as follows:

$$Y: a + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5$$

Where:

Y : The extensiveness disclosure	X3 : Levels of Liquidity
X1 : Company Size	X4 : Leverage Level
X2 : Level Profitability	X5 : Company's Age

Hypotheses in this research tested by F test and t test.

Result and Discussion

Based on descriptive statistics table 1., the minimum value of the extensiveness disclosure on the website by the company in 2 years is 45.59% obtained by PT Nippon Indosari Corporindo. While the maximum value of the extensiveness disclosure on its website by the company is 83.82% obtained by PT Multipolar. The average value of the extensiveness disclosure made by manufacturing and services companies via the website is 66.2257%.

Source: secondary data processed (2010)

In the variable firm size measured by the natural log of total assets, the company that has a small size in a 2 years period is PT Merck Indonesia with the calculation result of Rp 433.970.635. While companies that have large size within 2 years period is PT Bristol-Myers Squibb Indonesia at Rp 3.226.563.264.000.000. The average size of manufacturing and services companies in the year of 2008-2009 is Rp 40.000.000.000.000.

In the profitability level variable, company that has low level of profitability in the year 2008-2009 is PT Asia Pacific Fiber at -43.16%. While companies that have a high profitability level is PT Unilever Indonesia at 40,67%. The average level of profitability is at 6.7316%.

On the liquidity level variable, the company that has a low level of liquidity with the calculation result of 0.09 times in the year 2008-2009 is PT Asia Pacific Fiber. While companies that have a high level of liquidity at 9.84 times is PT Mustika Ratu. The average value of liquidity level of manufacturing and services companies is 1.7101 times. This result indicates that every Rp 1 of current liabilities owned by manufacturing and services companies secured by Rp 1.71 of its current assets.

In the leverage level variable, the company that has low leverage level at -1.55 in year 2008-2009 is PT Asia Pacific Fiber. While the company that has high leverage level at 77.46 is PT Adhi Karya. The average value of company leverage level is 2.6508. This indicates that the average debt of manufacturing and services companies of its equity is about 2.6508 times.

At the company age variable, the company that has the lowest age in 2009-2008 was PT Indopoly Swakarsa Industry and PT Inovisi Infracom by 5 month because they are new companies that listed its shares on the Stock Exchange on years of research. While the companies that have the highest age is PT Holcim Indonesia is 400 month or 33 years. The average value of age in manufacturing and services companies is 172,5833 month.

Based on the results above, it appears that the extensiveness disclosure of financial information via the website has a minimum value of 51.47% and the maximum value of 83.32% with an average of 66.2257%. This indicates that not all financial information required under *Surat Edaran Ketua Badan Pengawas Pasar Modal on December 27, 2002* expressed by both industry types the company websites. This thing occurred because of the disclosures done by the company in its website is still a voluntary. It's important for companies to be more aware in providing the extensiveness disclosure in the financial information on the company's website that can provide benefits to the user.

Hypothesis Test

Before testing the hypothesis, performed the classic assumption test. Classic assumption test results showed that all variables are qualified normality, and multicollinearity, heteroscedasticity and autocorrelation did not occur. Then performed multiple linear regression test, with the following results showed in table 2 and table 3.

TABLE 2: MULTIPLE LINEAR REGRESSIONS

a. Predictors: (Constant), Age, Size, Leverage, Liquidity, Profitability

b. Dependent Variable: Disclosure

Source: secondary data processed (SPSS, 2010)

The results of multiple regression by using $\alpha = 5\%$ are, adjusted $R^2 = 0.104$, calculated F value = 3,753 with a significance level of 0.003. This can be the basis that the null hypothesis (H_0) is rejected, it means that together the company size variable, profitability level, liquidity level, leverage level, and company age make a positive influence on the extensiveness disclosure of financial information on the websites of manufacturing and services companies in 2008 - 2009.

The first hypothesis result shows that the company size has a significant influence on the extensiveness disclosure of financial information on the manufacturing and services company's websites. This can be proved that the bigger a company, the company will likely do the disclosure of financial information via its website.

The result could be explained by the agency theory. Large companies will get more attention from society when compared to small companies so that large companies will tend to make disclosure of financial information through the company's website with hopes to be able to reduce the agency conflict associated with printing and delivery of financial statements. Large companies also have a greater incentive to show the quality of his company through the website. Thus, large companies can use innovative ways to disclose financial information in accordance with the development of technology and information. This result is consistent with the research conducted by Oyelere et al. (2000)^[17], Agustina (2008)^[1], Gunawan (2000)^[9] and Hertanti (2005)^[11].

The second hypothesis result shows that the profitability level has no influence on the extensiveness disclosure of financial information on the company's websites.

The result may indicate that companies disclose financial information on the website and that they ignore the information about the profitability of financial reporting via the Internet. This is thing happens because of the economy after the global crisis in 2008 which last less stable and cause a lot of companies that experienced a decrease of profitability so that information about the profitability level get less attention in financial reporting through the website. Based on the minimum value of profitability (-43.16%) can be seen that not only companies with high profitability are doing disclosure of financial information via the website, but also the companies that have low profitability are doing the disclosures in its website. This indicates that the companies have responsibility awareness in all investment which shareholder has invested in the organization. This result is consistent with the research conduct by Agustina (2008)^[1], and also Lestari and Chariri (2005)^[15].

The third hypothesis result shows that the liquidity level has no influence on the extensiveness disclosure of financial information on the company's websites.

The result indicates that even if a company has low liquidity levels, the company still makes a disclosure of its financial information via the website. Wallace in Hertanti (2005)^[11] states that companies with low liquidity will tend to disclose more financial information to external parties to explain the poor performance of its management in managing the company. This result is consistent with the research conduct by Fitriani (2001) in Almilia and Retrinasari (2007)^[2].

The fourth hypothesis result shows that the leverage level has no influence on the extensiveness disclosure of financial information on the company's websites.

The result indicates that low levels of leverage do not necessarily make the company hide financial information from the public. It is seen clearly at the minimum level of leverage indicated by PT Asia Pacific Fiber at -1.55 but the company has the extensiveness disclosure of 70.59%. In addition, the leverage associated with corporate debt. Most debt comes from banks that rely more on direct access to financial information from companies that have debt than using such indirect access using the company's websites. This result is consistent with the research conduct by Oyelere et al. (2003)^[18] and also Prabowo and Tambotuh (2005) Based on the results of ANOVA test between company size (X_1), profitability level (X_2), liquidity level (X_3), leverage level (X_4) and also the company age (X_5) toward the extensive disclosure of financial information on the website of manufacturing and services companies (Y) on Table 7 above, known that the value of calculated F is 4.255 > the value of F table (1,898) with a significance of 0.01 (significance level $\alpha = 0.1$). This indicates that the company fundamental factors reflected by above variables give significant influence together on the extensive disclosure of financial information on website.

TABLE 4: ANOVA TEST (F TEST)

ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	873,229	5	174,646	3,753	.003 ^a
	Residual	5304,641	114	46,532		
	Total	6177,870	119			

a. Predictors: (Constant), Age, Size, Leverage, Liquidity, Profitability

b. Dependent Variable: Disclosure

Source: secondary data processed (SPSS, 2010)

The fifth hypothesis result shows that the company age has no influence on the extensiveness disclosure of financial information on the company's websites.

This result proves that the company age is not taken into consideration for investors to invest in a company. The investors pay more attention to the items in the disclosure made by the company. This will further raise awareness for companies to disclose its information, both financial and non-financial information through the company websites. These results also prove that it is not the age that causes a company to do the disclosure of financial information via the websites but that is because the companies want to follow the development of technology information used by other companies. In addition, Lordanita (2006) in Agustina (2008)^[1] also states that the more experienced companies, their management will doing more disclosure through the companies websites to attract its investors. This result is consistent with the research conduct by Prabowo and Tambotuh (2005)^[19].

The result of ANOVA test between company size (X_1), profitability level (X_2), liquidity level (X_3), leverage level (X_4) and also the company age (X_5) toward the extensive disclosure of financial information on the website of manufacturing and services companies (Y) on Table 4., show that the value of calculated F is 4.255 > the value of F table (1,898) with a significance of 0.01 (significance level $\alpha = 0.1$). This indicates that the company fundamental factors reflected by above variables give significant influence together on the extensive disclosure of financial information on website.

Conclusion, Implication and Limitation

Based on the results of data analysis and discussion conducted previously, can be conclude as follows:

There is positive influence among the company size, profitability level, liquidity level, leverage level and the age of the company to the extensiveness disclosure of financial information in the manufacturing and services company's websites. However, partially, only the size of the companies that have positive influence on the extensiveness disclosure of financial information in manufacturing and services company's websites, while the level of liquidity and leverage has no significant influence toward the extensive disclosure of financial information in manufacturing and service company's websites just like profitability levels, and age did, in line with the result of Amalia (2005) ^[3] and Celik et al. (2006) ^[5] research.

Based on the result above, the company need to raise an awareness of the importance of full disclosure of financial information on the company's website which will provide benefits to those who use financial reports as well as society at large.

This research has several limitations. First, the population used in this research is relatively small and not represent all company that listed in Indonesia Stock Exchange. The next limitation is the assessment of the extensiveness financial information on the company website is determined on the basis of interpretation of the researcher after reading the contents of corporate financial statements issued through the website, so there will happens a difference in assessment because of author subjectivity.

Accounting Disclosures of Corporate Social Responsibility: An Exploratory Case Study of a Conglomerate in Sri Lanka

*Anil Jayantha, p.anil.jayantha@gmail.com,
University of Sri Jayewardenepura, Sri Lanka*

*I.M. Pandey, impandey@gmail.com,
University of Delhi, India*

Abstract

The purpose of this study is to explore, how Corporate Social Responsibility (CSR) is undertaken and disclosed. With the help of an exploratory case study, we intend to create a platform for discussion on enhancement of the CSR disclosures and its usefulness. We have examined annual reports and held several interviews. We used Global Reporting Initiatives (GRI) G3 sustainability reporting guidelines as the benchmark to analyze CSR disclosures. We find that CSR engagement and disclosures are mainly focused on education, health, environment, community and livelihood development, arts and culture, and disaster reliefs. The quality of reporting has been affected due to poor interpretation of the materiality and deviation from neutrality, comparability and accuracy. It can be argued that the company is engaged in CSR as advocacy advertising to enhance its image as a good corporate citizen and to minimize the risk of sustaining commercially in a globally competitive business environment.

Introduction

As per Global Reporting Initiative's (GRI), sustainability reporting or CSR reporting is the practice of measuring, disclosing and being accountable for organizational performance while working towards the goal of sustainable development. Financial reporting now goes beyond the traditional mode of providing only financial information (Gray, Owen, & Maunders, 1983) and includes Corporate Social Responsibility (CSR) reporting or sustainability reporting. CSR is simply regarded as a good practice which is now on the top of the corporate agenda.

We do not have adequate evidence on the level and quality of CSR disclosures in emerging markets. Therefore, the need arises to study the CSR engagement and reporting in emerging markets. The intellectual questions to be asked in this regard are: What is the real purpose and use of CSR disclosures in emerging markets? Do firms make CSR disclosures symbolically to enhance the corporate image? Do firms use CSR disclosures as a strategic weapon or a tool to minimize their risk of survival? Do CSR disclosures help improve future earnings of firms? Do CSR disclosures really meet the information needs of stakeholders? To answer these questions, we have selected the largest Sri Lankan conglomerate, John Keels Holdings Plc (JKH) for our study. This company had started CSR reporting from the year 2004/05 in the annual report itself and expanded its disclosures by issuing a separate sustainability report in the year 2008/09 based on GRI G3 sustainability reporting guidelines.

Literature Review

CSR disclosures are continuously and tremendously increasing (Adams & McNicholas, 2007; Bebbington, Higgins, & Frame, 2009). Accountability of a firm has now crossed the boundaries of traditional role of doing businesses economically to achieve good financial performances for its owners (Gray, et al., 1983). However, firms are not legally responsible for contributing towards social and environmental sustainability and rather they are supposed to conduct business operations to maximize shareholders wealth (Jensen, 2000).

On the other hand, it could be argued that spending on CSR would enhance the value drivers of a firm (Sen & Swierczek, 2007) and it might generate more profits in the long run in a sustainable manner even though it reduces the current year's profits. Many firms tend to behave in an ethically and socially responsible manner, thus assuring the safeguard of the society and environment at large (Tinker & Niemark, 1987). Despite the fact that CSR is a voluntary and a systematic process by which firms attempt to integrate social, environmental and economic

aspects when conducting business operations while recognizing the interests of stakeholders, it can be argued that a firm has an obligation to deliver societal values and objectives (Bowen, 1953).

CSR definitions mainly include economic, environmental, and social activities that a firm can engage in (Deresky, 2000; Epstein & Roy, 2001; Haugh, 2003; Maignan & Ferrell, 2003) and CSR has become an institutionalized practice to assure social and environmental performances in addition to economic performances (Naylor, 1999; c.f. Douglas, Doris, & Johnson, 2004). The Scope of CSR has been broadening over the time and being influenced by the nature, complexities and expectations of the society (Carnegie, 1900, c.f. Dunne, 2009).

The breadth and scope of the definition of CSR and varying socio, political, and environmental factors make stakeholders hard to understand what the firms are really doing in the name of CSR (Freeman, 1984). It is extremely difficult to find a compact and comprehensive definition of CSR and to determine its scope and practice (McWilliams & Siegel, 2001) owing to contextual differences (Meehan, Meehan, & Richards, 2006). The scope of CSR generally ranges from philanthropic to sustainable development programs interwoven with corporate strategies. Everything that a firm can do for the betterment of the society and environment in any forms is considered as CSR (Barker, 2009; Sethi, 1975). The definition by Gray, Owen, and Maunders (1987) uses this broader view and emphasizes the importance of CSR engagement as a process of communicating the social and environmental outcome of organizations' economic activities and operations to interested parties and to the society at large.

CSR is also viewed as a process of aligning organizational values and behaviors with the expectations and needs of stakeholders including the society as a whole (Network, 2008) in order to achieve a sustainable development. Hence, both external and internal variables and distinct expectations of stakeholders are likely to determine the need, practice and disclosures of CSR (Carroll, 1979) and as a result CSR reporting has become highly a subjective practice (Churchill, 1974).

Legitimacy theory argues that any business organization has implicit or explicit social contracts which hold it responsible towards the society to carry out its activities in a transparent manner while contributing towards social development. Campbell, Graven and Shries (2003) found that CSR disclosures were in line with legitimacy theory. Adams and McNicholas (2007) found that most of the senior managers were of the view that the primary motive for sustainability reporting was to enhance corporate legitimacy. Stakeholder theory also argues that CSR practice would help win the support of stakeholders so that managers can run the business operations while managing the series of connections among stakeholders (Freeman, 1984). Both legitimacy theory and stakeholder theory focus on what companies ought to do in the course of CSR engagement. Many research works suggest what the firms are supposed to do in CSR rather than exploring what they are really doing (Blum-Kusterer & Hussain, 2001). Milne (2001) argues that it is possible for companies to use CSR disclosures indirectly as advocacy advertising. Political economy theory suggests that corporations tend to carry out CSR campaigns in the media to avoid any political costs that may arise in a political economy. From the institutional theory perspective, CSR can also be viewed as a well-accepted institution (Dacin, Goodstein, & Scott, 2002) despite the fact that CSR disclosure is not mandatory.

AA1000 series of principle-based standards covering Accountability, Assurance and Stakeholder Engagement, Social Accountability International's SA8000 standards to improve workplaces and communities, ISO 14000 environmental management standards, the United Nations Global Compact, (UNGC) and Millennium Development Goals (MDGs) and Global Reporting Initiative's (GRI) Sustainability Reporting Guidelines mainly associate with responsible and ethical conduct of operations of organizations. GRI has been able to incorporate the essence of most of guidelines referred above and as a result, it is generally referred to sustainability reporting standard around the world (*Survey of best practices, trends and benchmarks in Sustainability reporting*, 2010).

There is an increasing tendency for CSR (Harte & Owen, 1991) and as a result non-financial reporting has developed with gradual transformation in relation to the purpose, content, structure and the readership of reporting (White, 2005). However, due to contextual and other reasons, companies still show a reluctance to contribute for CSR (Ofori & Hinson, 2007) and disclose them. Does CSR help in improving the corporate performance? With respect to the relationship between CSR reporting and company performance, mixed results were found (McWilliams & Siegel, 2000). Aupperle, Carroll, and Hatfield (1985) and Walter and Monsen (1979) found that there were no relationship between CSR reporting and profitability. On the other hand, it has been found that CSR has potential to increase the profitability in the long run and has some association with sales increase and the value

of equity (Zairi & Peters, 2002). In addition to the financial performance, the age of firms was found to have positive correlation with CSR (Cochran & Wood, 1984).

Companies in Germany and Sweden tend to report more environmental information whereas companies in France disclosed more employee related information (Roberts, 1991). Similarly significant differences in perceptions of managers on CSR practices have been found among UK, Europe and China (Hind, 2004). Malaysian companies with significant holding of shares by directors disclosed less CSR information, while companies in which the government is a major shareholder disclosed more CSR information (Ghazali, 2007). Further, large and value driven companies were found to have given prominence for making CSR disclosures (Owen & Swift, 2001). There is hardly any research evidence available on CSR disclosures by companies in emerging economies like Sri Lanka. We attempt to fill this gap in the case of Sri Lanka.

Methodology

Since the organizational culture and behavior is said to influence CSR practice and disclosures, the study was limited to one company to examine how best it makes CSR disclosures rather than surveying on many. Therefore, exploratory case study approach was used. On the ground that large firms are on top in CSR practices and disclosures (Owen & Swift, 2001) JKH was chosen as the unit of analysis since it is the largest conglomerate in Sri Lanka.

Sustainability reports for last five years starting from the year 2004/05 were examined in addition to the information gathered from interviews. Interviews were conducted with the CSR manager, two volunteers who regularly involved in CSR programs and two staff from accounting department, who deal with preparing annual reports and sustainability reports. All the interviews were audio recorded with the consent of interviewees and played back for summarization and analysis and to explore how CSR projects are initiated, approved and implemented.

Data analysis is mainly qualitative involving content and interpretative analysis and it deals with comparison of CSR disclosures with GRI G3 sustainability reporting guidelines. UNGC and the MDGs were also perused since JKH referred them as well for sustainability reporting. A content analysis (Brockhoff, 1979) which mainly deals with word count, page count and analysis of images and reporting structure was also done for the reason that help better understanding of the magnitude of CSR disclosures.

JKH: History and Profile

John Keells Holdings Plc. (JKH) is a highly diversified conglomerate consisting of 80 companies in the group. It started business operations in 1870 and went public in 1974. The company was incorporated in 1986 and then acquired the controlling interest of the entire group. JKH was listed on Colombo Stock Exchange (CSE) and then on Luxemburg Stock Exchange with Global Depository Receipts (GDR). Thus, it became the first Sri Lankan company listed on a foreign stock exchange. Business operations include transportation and ports, leisure, property development and management, consumer foods and retail, financial services, information technology and plantation. JKH held number one position in terms of market capitalization (about 9% of total) by 31st March 2010. Share ownership of JKH is highly concentrated and about 85% of total shares was held by just 1% of total shareholders. Total assets as of 31 March, 2009 amounted to Rs.92, 216 million (US\$811.67 million) which included shareholders' equity of Rs.50, 542 million (US\$444.86 million). Group revenue has increased over last five years from Rs. 23,232 million (US\$204.48 million) to Rs. 41,023 million (US\$361.08 million), by accounting for an average growth of 10% per annum with significant fluctuations as high as of 27% and as low as of negative 2% during the period of study.

Gross profit margin has dropped from 29% to 24%, while the profit margin on revenue ranged between 12% and 13% during the same period. Profits for the year ended 31st March 2009 amounted to Rs.4, 974 million (US\$431.94 million), thus registering a 10% return on equity and a 5% return on total assets. Low percentages of returns on total assets indicated low efficiency levels of asset utilization characterized by the asset turnover ratio

which had gone down to 0.44 times from 0.60 times. However, JKH has been maintaining a steady payment of dividends.

Case Analysis

The content analysis revealed that the structure and content of CSR reporting were changing over time. Number of words and pages used for CSR disclosures gradually declined until the year 2007/08 and then increased again. A lot of images were used for reporting but many of them were not referred to corresponding CSR projects, thus reducing the relevance of those images. A fairly large space in the annual reports has been allocated for non-financial disclosures though the proportion of financial information has gradually declined. A summary of content analysis is given in Table 1.

TABLE 1: SUMMARY OF CONTENT ANALYSIS

Year	2005	2006	2007	2008	2009
No. of pages	65	18	16	18	52
No. of words	20,814	9,587	8,198	9,260	21,756
No. of images	17	22	15	6	21
Major Disclosure Categories	3	5	5	4	5
Financial information (Pages)	54(25%)	58(32%)	65(36%)	59(36%)	82(41%)
Non-Financial information (Pages)	160(75%)	124(68%)	115(64%)	105(64%)	116(59%)

CSR disclosures were found to have been grouped into three major categories of economic, environmental and social. No details of the measurable outcomes of CSR projects and direct and indirect costs involved in administering CSR projects and making sustainability reporting were disclosed.

Third party sponsored money for social works has been disclosed as if they were incurred by the company. For instance, JKH and its employees had spent only 6% of the total amount for tsunami relief projects in the year 2005/06, which had been mainly sponsored by major shareholders, donors and other business partners. Table 2 gives the summary of spending by each party with respect to those projects.

TABLE 2: SUMMARY OF SPENDING BY EACH PARTY FOR TSUNAMI RELIEF PROJECTS

TRI Fund as at 31st March 2006	Rs.	US\$	%
Contribution by John Keels Group & Employees	13,438,511	118,380.45	6%
Contribution by Other Donors	20,533,214	180,878.00	9%
Disbursed and Committed	33,971,725	299,258.45	14%
Additional Partner Contributions (Direct)			
DHL - Relief Supplies	37,000,000	325,934.66	15%
Schenker - Relief Supplies	30,000,000	264,271.35	13%
Livelihood Toshiba - Photocopiers at Concessionary Rates to Affected Small Businesses	2,300,000	20,260.80	1%
Housing Galleon Fund - The 100-House Project in Monrovia, Galle	59,800,000	526,780.89	25%
OSDP France - Funds for Housing via Kelaniya MahaViharaya	900,000	7,928.14	0%
Galleon Fund - The 50-House Project in Siribopura, Hambantota	35,700,000	314,482.90	15%
Galleon Fund - The 50-House Project in Rassandeniya, Matara	30,000,000	264,271.35	13%
Other International Finance Corporation - Funding for 7 TRI Projects (50% share)	4,817,194	42,434.88	2%
Jet Airways - Cash Contribution to President's Fund	5,000,000	44,045.22	2%
Sub Total	205,517,194	1,810,410.20	86%
Total Amount Spent	239,488,919	2,109,668.65	100%

Reconciliation of CSR Disclosures with GRI G3 Sustainability Reporting Guidelines

GRI G3 sustainability reporting guidelines (GRI G3) is the latest version which comprises of “Reporting Principles and Guidelines”, and “Standard Disclosures”. There are two sets of principles. The set one covers the aspects of defining the content namely *materiality*, *stakeholder inclusiveness*, *sustainability context* and *completeness* of the report. The other set refers to quality aspects of *balance reporting*, *comparability*, *accuracy*, *timeliness*, *reliability*, and *clarity* of the report. *Guidelines* refer to the report boundary which explains the range of entities whose performance is covered in the sustainability report. *Standard disclosures* cover ‘Strategy and Profile’, ‘Management Approach’ and ‘Performance Indicators’.

Declaration of GRI G3 Application Level

JKH has declared level C application which is for the ‘beginners’ and enhanced it to be C+ level by obtaining a third party assurance. The application level A is for ‘advanced reporters’ while the level B is for the reporters in between ‘Advanced’ and ‘Beginners’. However, no reference was given in the sustainability report with regard to the meaning of C+ application level. Had it been disclosed, the level of understandability of the report could have been increased.

Reporting Principles of Defining the Report and Content

The content index gave the corresponding page numbers of all the standard disclosures and reference to the annual report where necessary except the reference for sustainability web page. The names of major stakeholder groups were disclosed but the company failed to describe the mechanism used to identify stakeholder needs for

sustainability information. *Materiality* which refers to the importance of disclosures to stakeholders was not adequately explained. *Sustainability context* included only 37 companies out of 80 in the group. This is a deviation from the disclosed sustainability policy which stated that all the entities over which JKH has the control, adhere to the same sustainability policy.

Reporting Principles of Quality Aspects

Neutrality

Only positive aspects of CSR engagement have been disclosed. Evidence was found on negative incidents taken place. For instance, Lanka Marine Services (Private) Limited (LMSL)- a subsidiary of JKH - was ordered by the Supreme Court to vacate and return the land occupied by them to the government on the ground that it had been acquired by violating the constitution of Sri Lanka ("S.C (FR) 209/2007," 2008) and to pay Rs. 375 million (US\$3.30 million) to the government as compensation. The same case further revealed that huge tax exemptions had been obtained in false and illegal manner (Samarajiva, 2009) and, the Bribery Commission of Sri Lanka was ordered to carry out a full investigation. Subsequently LMSL deposited Rs 153,228,593 (US\$1349797.56) with a bank as a security, ordered by the Commissioner General of Labor to pay compensation to employees. These incidents seriously questioned the ethical practice, sustainable policy and compliance with UNGC in relation to corruption. In another incident, the second largest shareholder of the company for many years was arrested on the charges of insider trading in New York in 2009. Subsequently the shareholder disposed significant stake (28 million shares) in equity but no single disclose was made in this regard in any of the public documents released by the company.

Comparability, Accuracy, Reliability and Clarity

Comparative information was provided only with regard to few items. Awards received, total energy consumption, land utilization, employee population by grade, nature of employment, gender and geography relating to employment and details of collective bargaining agreements can be highlighted as items for which comparisons were not given.

Accuracy of information disclosed had been affected due to non-disclosure of references, tools and bases used. Significant discrepancies were also observed between numbers shown under economic performance in the sustainability report and in the annual report under the same headings. Assurance taken from a third party on compliance has increased the reliability in general but it too has failed to identify those differences. The clarity of the report was at a high level and the report was attractive. Figures, tables, images and summarized texts were used to present information in a clear manner in addition to a summary of abbreviations provided.

Standard Disclosures

Profile Disclosure

The chairman/CEO's message identified seven key priority areas for sustainability strategies namely, products and services, environment, employee health and safety, labor and human rights, society and stakeholder engagement, technology and economic. Targets to be achieved within the next 3-5 years were disclosed but they were not linked with long term strategies. It is unknown how the environmental scan was done and macro-economic and political trends were identified in determining sustainability priorities. Key events, achievements and failures and the chairman's views on the performances achieved against the targets during the year and a projection of the organization's main challenges and targets for the next year were also not disclosed.

Organizational Profile

Name and operational structure of the organization, location of organization's headquarters, nature of ownership and legal form of the company were properly disclosed. However, the information pertaining to what measures have been taken to improve the efficiency of delivering products and services to customers and the degree to which outsourcing was done was not disclosed.

Only the names of countries with which JKH has major operations were disclosed but the materiality and the relevance of such operations to the sustainability issues were not disclosed. Employee details and net sales were also disclosed. No disclosure was made with regard to any of the changes in operations, size and ownership structure of the company despite the fact that such significant changes in the capital structure had taken place during the reporting period.

The number of awards disclosed during the year was 50 and majority of them were for financial performance while six were for environmental concerns and only one for research and development activities.

Report Parameters

Proper disclosures were made with regard to the reporting period, including the date of most recent report, reporting cycle and contact point for queries on the report. However, no reply was received for the email sent to the given address in the report by inquiring the discrepancies found in the numbers referred earlier. When defining the report content, identified key stakeholders, report boundary, the basis of reporting on subsidiaries were properly disclosed.

Governance Guidelines, Stakeholder Engagement

Only a very short description about the main responsibility of the board was disclosed on the ground that full disclosure has been given in the annual report. Contrary to the best corporate governance practices, the offices of chairman and CEO are held by one person without giving any explanation.

It is not clear if the voice of minority shareholders and employees on any of the strategic or policy level issues were considered as the sustainability report is silent on the matters of communication between stakeholders and board of directors. Further, it is not clear as to how performance indicators and standard disclosures were determined and stakeholder engagement was carried out.

Performance Indicators

JKH is required to disclose a minimum of 10 core indicators including one from each category in order to comply with level C application. But it disclosed 12 comprising two economic indicators, three environmental indicators and seven social indicators.

Economic Performance Indicators

The first indicator (EC1) revealed direct economic value generated and distributed by revenue, operating costs, employee wages and benefits, community investments, retained earnings, and payments to providers of funds and governments. The other indicator (EC3) covered defined benefits plan obligations towards employees. However, these defined benefits are mandatory contributions and therefore cannot be considered as additional benefits provided to employees in the purview of CSR.

Environmental Performance Indicators

Direct energy consumption (EN3) and indirect energy consumption (EN4) by primary energy source and the location and size of land owned, leased, managed in, or adjacent to protected areas and areas of high biodiversity value outside protected areas (EN11) are the three indicators disclosed.

As per disclosed policy on energy management practices periodic reviews and audits on energy consumption and primary utility systems are carried out. In addition, training is given to all the employees and workshops are conducted to create awareness and to promote the responsibility on energy saving among employees. The total energy consumption for the year ended 31st March 2009 was 616,058 gigajoules but the significance of energy consumption could not be ascertained due to non-availability of comparatives.

Social Performance Indicators

Total workforce by employment type, employment contract, and region (LA1) and number of employees covered by collective agreements (LA4) were disclosed with appropriate classifications under the category of Labor Practices and Decent Work.

HR policies, pay systems, training and development, recruitment were disclosed in previous years but the content of disclosures was gradually reduced over the same period. The disclosures of employee age analysis and number of employees have been removed from the sustainability reporting from the year 2006/07. It was revealed that collective agreements with employees covered only 29% of the total workforce and the work force has significantly declined by the end of year 2008/09.

Operations identified as having significant risk for incidents of child labor, and measures taken to contribute to the elimination of child labor (HR6) and Operations identified as having significant risk for incidents of forced or compulsory labor, and measures to eliminate them (HR7) have been disclosed under human rights category. However, management did not rule out the fact that hotel operations of the group might give opportunities for teenagers within the ages between 14 and 18.

Society Performance indicator comprising of programs or practices for assessing and managing the impact of operations on communities including entering, operating, and exiting (SO1) and the total number and percentage of business units analyzed for risks related to corruption (SO2) were disclosed.

It was revealed that English Language programs, HIV and AIDS and other health camps and the village adoption project with a building of a tank in Halmillawa are top among other projects in terms of popularity, success and involvement of community. JKH policy on anti-corruption stated that it places the highest value on ethical practices and promulgates a zero tolerance for corruption and bribery. Further, JKH has introduced its own code of conduct for executives, which encompasses rules regarding bribery and corruption. However, the Supreme Court judgment given against the company seriously questions the above policy against corruption. None of the managers involved in this transaction was removed from the office on those charges. Hence, it could be questioned whether the said policy on anti-corruption practice is merely a buzz word.

Type of product information required by procedures, and percentage of significant products subject to such information requirement (PR3) was disclosed under the product responsibility category. The disclosed policy reveals that JKH strives to maintain products and services at the highest standards through embracing industry and corporate best practices and compliance with all relevant local and international statutory and regulatory requirements in the markets they serve.

Conclusion

More descriptive disclosures covering economic, environmental and social aspects were made over the time until a separate sustainability report based on GRI G3 sustainability reporting guidelines was issued in the year 2009. Being the largest conglomerate in Sri Lanka with the highest market capitalization and having the experience of making sustainability disclosures, JKH declared the lowest application level for sustainability reporting with respect to GRI G3. This declaration has created a comfortable platform for JKH to make CSR disclosures with minimum effort and fewer requirements to comply with GRI G3 while claiming that it complied with international benchmark for sustainability reporting. Further, it appears that the needs of stakeholders for sustainability reporting have not been considered when setting disclosure priorities though it claims that stakeholder engagement was carried out. Sustainability reporting boundary was limited to 46% of the entities over which JKH had the controlling interest.

The quality of reporting has been affected in several cases. Accordingly, *materiality* was not defined and not referred to the information needs of stakeholders. The principle of *balance reporting* has been violated by not disclosing material negative incidents; *Comparability* of the report was also not maintained except in few cases and the stakeholder engagement was not adequately explained. Significant differences were found between the numbers reported in the sustainability report and in the financial statements have reduced the qualities of *accuracy and reliability* of information. Non response from JKH to the email sent inquiring such differences casts a serious doubt on the genuineness of the disclosed policy of keeping close dialogues with stakeholders.

However, the clarity of reporting was maintained throughout the report whereby summaries, tables, figures and images have contributed to increase the understandability. More emphasis was given on environmental disclosures and pictorial presentations given on bio diversity hotspots were attractive. However, the measurement unit such as gigajoule used to present energy consumption cannot be understood and compared due to the absence of explanations.

Standard disclosures included CSR strategy and group profiles with significant areas of financial performances, financial position and future prospects and 12 performance indicators. The fact that whether and how short term, medium term and long term strategies were integrated with overall sustainability strategies was not disclosed. JKH had a greater flexibility of choosing performance indicators to comply with the application level C. When disclosing social performance indicators, JKH did not make any statement when corruption charges were leveled against the company and proven in the court.

It was found that direct and indirect media coverage had been used for CSR engagement to enhance the image of JKH as a good corporate citizen. The “Red Bag Campaign” is a clear example of this motive to win the public attention in guise of addressing environmental issues. Therefore, the conduct of CSR programs and the disclosures made can be seen as a means of advocacy advertising.

On the other hand, CSR engagement of JKH is seen to have covered up bad consequences arising from socially unwarranted and unethical business practices and helped avoided political costs and risks. This is evident from the fact that there was no influential public protest against the company on the adverse verdict given on corruption charges. Had these incidents not been challenged in the court, JKH could have easily enjoyed such benefits and rather spent part of that money on CSR projects as a good corporate citizen. Non-disclosure of negative incidents can be considered as an evidence of concealment of information and might cast doubt over the credibility of CSR reporting and the quality of ethical business conduct and obligations towards the society at large.

Positive relations were seen between CSR engagement and company performances as well. Steady rates of return on sales, on equity and on total assets with annual revenue growth of 10%, an increase in gross profit by 45% and significant improvements in both operating cycle and cash cycle have been reported. However, return on net operating assets significantly fluctuated during the same period and raise a doubt if JKH has engaged in income management practices.

Operating cash flows were also found to be relatively constant irrespective of decline in cash flow adequacy and cash flow efficiency ratios mainly due to large investments. The market performance of JKH equity remained relatively steady and gained significant returns despite some occasional fluctuations. The fluctuations might have been caused by negative impact of company- specific reasons, including litigations against the company, changes in macroeconomic variables and poor market performances.

It was observed that CSR practices and sustainability reporting at JKH has become an institution and a part of corporate culture embedded at reporting level. Hence, prominence has been given for CSR disclosures despite the fact that such disclosures are not mandatory. In Sri Lankan context, even a small social work is highly regarded as a contribution to the society and therefore, JKH could engage in philanthropic nature of social works while reporting the same in line with international benchmark of reporting. The prevailing conditions and practice have created the opportunity for JKH to engage in such a broad concept of CSR as a socially responsible and ethical person by making minimum disclosures as per GRI G3 rather than exploring the ways and means of contributing to the society in a sustainable manner.

All in all it could be seen that JKH is engaged in the process of CSR programs and disclosures with a view to increase the public image of the company as a good corporate citizen and to reduce the corporate risk while operating in a highly dynamic business environment to win the consent of stakeholders.

Additional Evidence on Audit Delay in Malaysia

Wan Nordin Wan-Hussin., wannordin@uum.edu.my

Rohami Shafie

Mohamad Naimi Mohamad-Nor

Universiti Utara Malaysia, MALAYSIA

Abstract

This study examines whether audit committee effectiveness, auditor remuneration and auditor business risk are associated with audit report lag. It extends the audit delay literature by providing evidence that audit delay is negatively associated with audit committee financial expertise, and positively associated with statutory audit fees. Diffused ownership, a proxy of auditor business risk, delays the issuance of audit report. However, this study fails to document significant relationship between non-audit fees and audit delay.

Key words: Audit delay; Auditor fees; Non-audit fees; Audit committee financial expertise.

JEL classification: G34; M42

1. Introduction

Delivering timely information to investors and capital markets is an important goal of policymakers (Krishnan and Yang, 2009). As audit delaysⁱ exacerbate information asymmetry between management and investors, regulators are interested to ascertain the effectiveness of board, particularly its subcommittee that is responsible to monitor the company's accounting and auditing process namely audit committee, in ensuring the completion of audit on a timely basis. In 1999, the capital market regulator in Malaysia namely the Securities Commission shortened the time period for companies to release audited financial statements from six months to four months. In 2001, Bursa Malaysiaⁱⁱ amended the Listing Requirements requiring a listed company to make a mandatory statement in the annual report on the extent of compliance with the best practices in audit committee as set out in the Malaysian Code on Corporate Governance (2000) and reasons for non-compliance. We capitalize on these significant regulatory initiatives to assess the role of audit committee in promoting audit report timeliness.

Given the importance of audit timeliness to investors, recent studies on audit delays by Lee, Mandé and Son (2009), Pizzini, Lin, Vargus and Ziegenfuss (2010), Mohamad-Nor, Shafie and Wan-Hussin (2010) and Habib and Bhuiyan (2011) incorporate new audit delay determinants that have not been examined before such as auditor tenure, internal audit function, audit committee characteristics and audit firm industry specialization respectively. Although Mohamad-Nor *et al.* (2010) show that audit committee size and diligence shorten audit delay in Malaysia, however, they fail to find significant relationship between audit committee financial expertise and audit report lag, and their results could be influenced by omitted variables. We extend this line of research by examining the role of audit committee financial expertise, audit firm remuneration and ownership structure on audit delay.

A comprehensive review of the literature on audit committee and financial reporting by Bedard and Gendron (2010) indicates that the association between audit committee and timeliness of financial reporting is rarely investigated. Although existing studies document that audit committee financial expertise enhances the various indicators of financial reporting quality, however, the evidence that audit committee financial expertise enhances audit report timeliness has not been previously documented. Our study also contributes to the audit delays literature by examining the association between auditor remuneration and audit delay, using data outside the US. Prior studies on the association between audit fees and audit delay are all conducted in the US (Ettredge, Li and Sun, 2006; Lee *et al.*, 2009; Pizzini *et al.*, 2010). Ettredge *et al.* (2006) and Pizzini *et al.* (2010) show that audit delays are increasing in the level of audit fees scaled by total assets. Lee *et al.* (2009) document that audit report lag is significantly higher for companies with larger abnormal audit fees. However, they show that non-audit fees reduce audit delays,

which implies that the provision of non-audit services increases auditor learning, thereby enabling the auditor to complete the audit more quickly. A final contribution of this study relates to the recent debate on the convergence of international corporate governance, and provides evidence to what extent mimicking the best US practices on audit committee promotes efficiency of the external reporting process in Malaysia (see, for example, Yoshikawa and Rasheed, 2009; Bedard and Gendron, 2010).

Our results based on a sample of 324 companies publicly traded on Bursa Malaysia for financial year ended 2002 indicate that audit committee financial expertise shortens audit delay. Our result extends the previously documented benefits associated with audit committee financial expertise such as constraining financial misstatements and earnings management (Xie, Davidson III and DaDalt, 2003; Abbott, Parker and Peters, 2004; Bedard, Chtourou and Courteau, 2004; Dhaliwal, Naiker and Navissi, 2010) to include audit report timeliness. We also show higher audit fees are associated with lengthy audit delays, consistent with Ettredge *et al.* (2006) and Pizzini *et al.* (2010). However, in contrast to Lee *et al.* (2009) we fail to find any evidence to support the knowledge spillover effect of non-audit services in reducing audit report lags. We also find firms with concentrated ownership have shorter audit report lag, consistent with Bamber, Bamber and Schoderbek (1993), but in contrast to Habib and Bhuiyan (2011).

As for the control variables, we find larger firms have shorter delays. Firms receiving going concern uncertainty audit report require more audit effort, as measured by audit delay. Companies audited by large international firms take less time to release their audited financial statements. Finally, audit delays are decreasing in the audit committee size, but increasing in the number of audit committee meetings and board size.

The next two sections develop our hypotheses and present our empirical procedures. Section 4 discusses our results, followed by the concluding remarks in Section 5.

2. Theoretical background and hypotheses

The revised Malaysia Code on Corporate Governance (2007) recommends that all the audit committee members should be financially literate. Aside from this, the Bursa Malaysia Listing Requirements stipulate that at least one of the audit committee members must be a member of the Malaysian Institute of Accountants. Krishnan and Lee (2009) define audit committee as possessing financial expertise when the members have working experience that are directly associated with accounting and auditing specialty (e.g., financial controller, internal auditor). Thus, members that have experience that are not directly involved in financial matters, such as chief executive officer (CEO), is not considered as a financial expert.

According to the Bursa Malaysia Corporate Governance Guide (2009), experience in accounting and auditing is important in monitoring the financial reporting process, analyzing critically the financial statements and understanding internal controls system. By having members who possess financial expertise, the committee can discharge their duties efficiently and providing high quality financial and non-financial information in a timely manner.

Basioudis (2007) argues that the appointment of expert in accounting-related matters enhances the quality of financial reporting. He also claims that the appointment of such expert leads to improvement of client's management image (e.g., objectivity, expertise, competence of management). Such improvement is most welcome by the auditors since they will receive a better quality and reliable accounting information from their client. This leads the auditors to rate the client's inherent risk as low. It is also consistent with the argument that audit committee expertise would enhance the committee's monitoring role (Krishnan and Visvanathan, 2009). This would reduce audit risk assessment and audit effort.

There is ample empirical evidence consistent with the intuition that having financial expertise in the audit committee is associated with high quality financial reporting. For instance, audit committee financial expertise minimize incidence of financial restatements (Abbott *et al.*, 2004). Further, the financial experts are more proactive in their duties, where it is found that firms with higher number of financial experts dismiss the audit firm Andersen

earlier (Chen and Zhou, 2007). Also, companies that are involved with fraudulent financial statement have fewer members who are expert in accounting (Beasley, Carcello and Hermanson, 1999). This may also explain why high litigation risk companies have more financial experts in their audit committees (Krishnan and Lee, 2009). The presence of expert will minimize audit failure and reduce the possibility of company being sued by shareholders. Thus, it is not surprising that after the introduction of Sarbanes-Oxley Act in 2002 (SOX) companies have given more emphasis on the appointment of members with accounting expertise in audit committees (Beasley, Carcello, Hermanson and Neal, 2009). In tandem with this, Naiker and Sharma (2009) document that firms with audit committees that have former audit partners are less likely to have internal control deficiencies. Likewise, Dhaliwal *et al.* (2010) provide evidence that audit committee accounting expertise is positively associated with accruals quality, and Carol Liu and Zhuang (2011) show that audit committee expertise strengthens the association between management forecast accuracy and analysts' forecast accuracy.

In Malaysia, a study by Rahmat, Iskandar and Saleh (2009) show that financial literacy of audit committee is negatively associated with financial distress. They argue that financially literate member is more effective in monitoring operational and financial process as compared to less financially literate member. Another Malaysian study by Ismail and Rahman (2011) indicates that audit committees with two or more financial experts are less likely to restate the quarterly reports. This implies that the existence of knowledgeable audit committee members contributes to betterment of financial reporting and high quality audit. Since the preparation of financial statements is monitored by accounting expert, it would help to reduce financial misstatement risk. As for auditor, the presence of the expert in audit committee will minimize their workload and in turn, expedite financial information release. Hence, the following hypothesis is proposed:

H1: There is a negative relationship between audit committee financial expertise and audit report lag.

The amount of audit fee charged is an indicator of audit effort and the extent of client riskiness. Client riskiness and the audit effort are closely related as, in general, risky clients demand extensive audit. The purpose of extensive audit is to ensure that the audited accounts are free from any material misstatements. This explanation indicates that audit fee is a potential determinant of audit report timeliness.

Lee *et al.* (2009) show that abnormal audit fee is positively associated with audit report lag. They argue that higher fee reflects the complexity and scope of the audit task, and the additional audit task required affects audit duration. Therefore, audited financial statements for client with high audit fees need longer time to be issued as compared to lower audit fee clients. In a related vein, Ettredge *et al.* (2006) document that audit fees is significantly and positively associated with audit delay. These findings contradict the argument that by charging higher fees, auditor can allocate more resources for audit engagement and reduce delay. Instead, higher audit fees imply the comprehensiveness of auditor's job in facing complex/risky client, which leads to longer delays. Putting additional effort is important, because Caramanis and Lennox (2008) posit that companies are prone to engage in earnings management when there is low audit effort. Hence, based on the prior discussion, the following hypothesis is proposed:

H2: There is a positive relationship between audit fees and audit report lag.

One of significant issues in auditing research is the amount of non-audit fees paid to external auditors for the provision of non-audit services such as taxation advice, information systems design and management consultancy. From the regulators' perspective, it has been argued that non-audit fees paid would impair auditors' independence, or their appearance of independence. The lucrative non-audit fees paid to the external auditor make auditors overly dependent on non-audit fees rather their core business, i.e. providing auditing services. This "loss leader" explanation predicts a negative association between non-audit fees and audit fees. The lack of independence, arising from stronger economic bond to the client may also manifest itself in reduction of qualified audit reports (Firth, 2002).

As for the relationship between non-audit fees and audit lag, two possible arguments can be put forward. A positive relationship between non-audit fees and audit delay might arise due to the reason that non-audit services are usually purchased by clients who are involved with corporate restructuring such as mergers and acquisitions, or facing financial difficulties (Firth, 1997). These corporate changes are accompanied with rationalization of operations, reorganization of marketing strategies and brand management, integration of information systems and implementation of workable turnaround strategies. All these create demand for external consultancy services, and

possibly additional audit effort. Knechel and Payne (2001) find a positive relationship between non-audit fees (tax fee) and audit lag. They explain that the tax services are potentially purchased to sort out contentious tax issues which must be resolved before audit opinion can be produced.

However, in the case of management advisory services, Knechel and Payne (2001) observe a negative relationship between non-audit fees and audit delay, consistent with the knowledge spillovers effect (Simunic, 1984; Clatworthy, Mellett and Peel, 2002). The spillovers effect enables the external auditors to have better understanding of the clients' overall business and their information systems, resulting in reduced audit effort, as measured by audit delay. Lee *et al.* (2009) provide evidence in support of the knowledge spillovers from the joint provision of non-audit services and audit services which enhance audit efficiency, leading to shorter audit delays. Given the two opposite predictions, our second hypothesis is non-directional:

H3: There is a relationship between non-audit fees and audit report lag.

Bamber *et al.* (1993) and Henderson and Kaplan (2000) argue that in companies with dispersed ownership, there are many shareholders that rely on the financial statements. Reliance of many people on the statements would increase auditor's litigation risk or put auditor's reputation in danger, and thus, increase auditor's business risk. Auditor business risk is "the risk that the audit firm will suffer loss resulting from the engagement" (Johnstone, 2000). The losses can be in the form of the monetary amount and reputational damage. In addition, dispersed ownership companies demand extensive audit in order to assure the shareholder's on the credibility of financial statement (Leventis and Caramanis, 2005) and consequently it takes longer time to audit this type of companies (Al-Ajmi, 2008). In contrast, companies with concentrated ownership have fewer shareholders and consequently auditor business risk is expected to be low.

In line with the above argument, empirical studies indicate concentrated ownership has influence on audit timeliness. For instance, the number of shareholders is negatively associated with the frequency of issuing interim report and timeliness of corporate internet reporting (Abdelsalam and Street, 2007; Al-Ajmi, 2008). Similarly, Bamber *et al.* (1993) show that audit lag or the amount of audit work is negatively related to ownership concentration. In a similar vein, Jaggi and Tsui (1999) reveal that family ownership is inversely associated with delay, even though the result is insignificant. According to Jaggi and Tsui (1999), in the case of family owned companies, auditor's liability is restricted to this group of shareholder (i.e. family members), and the resulting low auditor business risk leads to less audit effort and timely audit report. Hence, based on the prior discussion, the following hypothesis is proposed:

H4: There is a negative relationship between ownership concentration and audit report lag.

3. Empirical tests

3.1 Sample selection

The annual reports of Malaysian public listed firms on the Main and Second Board are utilized in the study. The year 2002 is selected for two reasons. Firstly, it is the first full year that listed firms have to disclose the extent of compliance with the Malaysian Code on Corporate Governance (2000) when the Code became an integral part of the revamped Listing Requirements (2001) under the "comply or explain" regime. Secondly, in 2002, listed firms need to disclose non-audit fees in their annual reports. Although there were 856 firms listed on the Main and Second Boards of Bursa Malaysia in 2002, by 2010 a large number of these companies are no longer active. Removing inactive or dead companies, newly listed companies in 2002, financial institutions and other companies with missing data, we are left with 324 companies, as shown in Table 1.

TABLE 1 SAMPLE COMPANIES

SECTOR CLASSIFICATION	BOARD		Total
	MAIN	SECOND	
Consumer Product	33	28	61
Industrial Product	53	53	106
Construction	19	7	26
Trading and Services	36	19	55
Properties	32	1	33
Plantation	14	2	16
Others	23	1	24
Practice Note 4	3	0	3
Total	213	111	324

* Others include Hotel, Infrastructure Project Companies, Mining and Technology.

Only three Practice Note 4 (PN4 or financially distressed) companies are included in our sample. During the study period, there were almost 100 companies categorized as financially distressed and by 2010, most of these PN4 companies were delisted. We believe our sample is more representative of the audit report lag phenomenon among non-financially distressed Malaysian companies. Information obtained from the annual reports is supplemented with other financial and ownership information from Datastream.

3.2 Measurement of variables

We model audit delay as a function of audit committee financial expertise, audit fees, non-audit fees, ownership concentration and a set of control variables that are widely used in prior studies (Knechel and Payne, 2001; Lee *et al.*, 2009; Krishnan and Yang, 2009; Mohamad-Nor *et al.*, 2010), as follows:

$$AUDLAG = \beta_0 + \beta_1 ACEXP + \beta_2 LNAFEE + \beta_3 LNNASFEE + \beta_4 OWN + \beta_5 LNASSET + \beta_6 ADJSALES + \beta_7 SUBS + \beta_8 FOREIGN + \beta_9 DEC31 + \beta_{10} LOSS + \beta_{11} LEVE + \beta_{12} INVREC + \beta_{13} GCOPIN + \beta_{14} BIG4 + \beta_{15} ACIND + \beta_{16} ACMEET4 + \beta_{17} ACSIZE + \beta_{18} BSIZE + \beta_{19} BIND + \beta_{20} CEODUAL + \beta_{21} EI + \beta_{22} ZFC + \square. \quad (1)$$

where

AUDLAG = a continuous variable representing number of days from fiscal year end to the date of audit report, or a dummy variable = 1, if audit lag exceeds three months, 0 otherwise.

ACEXP = proportion of audit committee members who have accounting or related financial management expertise.

LNAFEE = natural log of audit fees paid to external auditor.

LNNASFEE = natural log of non-audit fees paid to external auditor.

OWN = proportion of closely held shares, taken from Datastream.

LNASSET = natural log of total assets.

ADJSALES = sales/total assets.

SUBS = square root of number of subsidiaries.

FOREIGN = 1, if company has foreign operations, 0 otherwise

DEC31 = 1, if fiscal year ends at 31 December, 0 otherwise.

LOSS = 1, if ROA (profit after tax/total assets) is negative, 0 otherwise

LEVE = total debt/total assets

INVREC = (inventories and receivables)/total assets

GCOPIN = 1, if going concern uncertainty audit opinion is issued, 0 otherwise.

BIG4 = 1, if the auditor is PricewaterhouseCoopers, Ernst & Young, KPMG or Deloitte, 0 otherwise.

ACIND = proportion of independent nonexecutive directors on audit committee.

ACMEET4 = 1, if more than four audit committee meetings are held during the year, 0 otherwise.

ACSIZE = number of audit committee members.

BSIZE = number of board of director members.

BIND = proportion of independent directors on board.

CEODUAL = 1, if CEO and Chairman is the same person, 0 otherwise.

EI = 1, if firm reports extraordinary items, 0 otherwise.

ZFC = financial condition as defined by Zmijewski's financial condition index; and

□ = error term

We include several control variables which have been found to be associated with audit delays such as audit firm size, client size, audit complexity, financial performance, and other corporate governance mechanisms. We expect that clients audited by large international audit firms (*BIG4*) have shorter audit lag. In addition, we predict smaller firm (measured by total assets and total sales), firm with greater audit complexity (as proxied by subsidiaries, inventory and receivables, extraordinary items, and widespread international business), poorly performing firm (represented by negative earnings, high Zmijewski's financial condition index, high leverage and going concern uncertainty audit opinion) and firm with poor corporate governance mechanisms (less independent audit committee members, smaller audit committee size, less frequent audit committee meetings, larger board size, less independent board members and existence of CEO duality) has lengthy audit delay (Ng and Tai, 1994; Jaggi and Tsui, 1999; Geiger and Rama, 2003; Lee *et al.*, 2009; Mohamad-Nor *et al.*, 2010). Finally, audit delay is expected to increase with busy season (Knechel and Payne, 2001).

4. Results

4.1 Descriptive and univariate tests

The results in Table 2 indicate that the mean of audit report lag for our sample firms is 97 days which is similar to Mohamad-Nor *et al.* (2010), but about two weeks shorter than the audit delays (116 days) documented by Che-Ahmad and Abidin (2008) in Malaysia during 1993. However, audit delay in Malaysia is 40 days longer than that documented by Lee *et al.* (2009) in the US over the same period. The minimum audit lag in our sample is 23 days, while the maximum audit lag is 123 days.

On average, 38 percent of the audit committee members are considered as financial experts. The average audit fees and non-audit fees for our sample are RM187,000 and RM85,000 respectively. In addition, on average, 49 percent of shares are closely held i.e. shares held by insiders which include (but not limited to) shares held by officers, directors and their immediate families, individuals who hold 5 percent or more of the outstanding shares and pension plans. Firm size ranges from the smallest with total assets (revenue) of RM25 million (RM0.5 million) to the largest with total assets (revenue) reaching RM57 billion (RM15 billion). On average, board and audit committee have 7.9 members and 3.6 members respectively. Interestingly, only 15 percent of the board chairs dominate the firms by simultaneously holding the CEO positions. Prior to the introduction of the Code, Abdul-Wahab, How and Verhoeven (2007) document nearly 30 percent of Malaysian companies have CEO duality. This reduction in the incidence of CEO duality might be caused by the Code on Corporate Governance (2000) which recommends both roles to be separated. On average, two thirds of audit committee members are independent, and slightly more than one third of board members are independent, although there are companies who fail to comply with the 50 percent audit committee independence and 33 percent board independence requirements as stipulated in the Code. Only seven percent of the audit committees in our sample companies are fully independent (not tabulated). Nearly 60 percent of firms have more than four audit committee meetings during the year.

<i>ZFC</i>	-5.58	23.38	-3.07	2.05

Note: All the variables are defined in the Measurement of variables' section.

In addition, 75 percent firms report extraordinary items, while 74 percent firms are audited by *BIG4*. Only six percent of our sample firms received going concern uncertainty audit opinions. This percentage is considerably lower than the incidence of audit qualifications recorded in previous studies over the same period by Ali, Kadir, Yusof and Lee (2009) and Mohamad-Nor *et al.* (2010) because our sample excludes financially distressed firms that subsequently became inactive. Nearly half (45 percent) of our sample firms have foreign operations and 21 percent report negative earnings. Inventory and receivables, on average, constitute 28 percent of total assets.

As slightly more than one-third of our sample companies issue the audit reports within three months, we also partition the sample according to audit lag exceeds three months ($n = 213$) and within three months ($n = 111$), as shown in Table 3. The *t-test* on means difference indicates that companies with audit delays exceeding three months have significantly lower audit committee expertise (37 percent vs. 43 percent), ownership concentration (45 percent vs. 55 percent), total assets and revenue, and incidence of employing *BIG4* (68 percent vs. 87 percent). However, companies in the longer audit delay group have significantly higher number of subsidiaries, incidence of losses (26 percent vs. 11 percent), financial leverage (24 percent vs. 18 percent), inventories and receivables (30 percent vs. 25

percent), occurrence of going concern issues (9 percent vs. 1 percent) and likelihood of conducting more than four audit committee meetings (63 percent vs. 44 percent).

* $p < .10$, ** $p < .05$, *** $p < .01$, based on one-tailed results. In Model 1, the dependent variable is number of days from fiscal year end to the date of audit report. In Model 2, the dependent variable takes the value of 1, if audit lag exceeds three months, 0 otherwise. All variables are defined in the Measurement of variables section.

Out of 22 variables tested in Model 1, ten of them are significant at the conventional level. The sign of the coefficients for the hypothesized variables are in predicted directions and three of them are significant. They are *ACEXP*, *LNAFEE* and *OWN*. Results from both models show that these three variables have strong relationship with audit lag. Controlling for the other factors that influence audit delay, we find that financial expert on the audit

committee is associated with shorter delay. We also document that audit delays increase with audit efforts, as measured by audit fees. Moreover, we find that concentrated ownership promotes audit timeliness.

However, in contrast with Lee *et al.* (2009), we fail to find any significant relationship between *LNNASFEE* and *AUDLAG*. We can provide two possible explanations for the lack of association between non-audit services and audit lag. Firstly, as elaborated in section 2 earlier, different types of non-audit services may influence audit delay in different ways. Although our sample firms disclose non-audit services fees, however, we are not able to ascertain the different types of services (tax, accounting information system, management consultancy, etc) they purchase from the incumbent auditors. The lack of publicly available data on the different types of non-audit services purchased prevent us from performing a meaningful analysis on the role of non-audit services, as observed by Beattie and Fearnley (2002). Secondly, given that our sample period is the first full year of the implementation of the Listing Requirements on non-audit fees disclosure, the likelihood of non-compliance with this new regulation may introduce measurement error in the non-audit fees variable.

As for the other corporate governance variables, consistent with previous study by Mohamad-Nor *et al.* (2010), we find that audit delay is decreasing with audit committee size. However, unlike Mohamad-Nor *et al.* (2010), we show that smaller board size reduces audit lag. Surprisingly, we also document that firms with more than four audit committee meetings have longer delays, which suggests that the delay could be caused by debate on financial reporting issues. Although, this new finding contrasts with Mohamad-Nor *et al.* (2010), it is consistent with Goodwin-Stewart and Kent (2006) and Naiker and Sharma (2009) who show that firms that conduct more frequent audit committee meetings are more likely to demand higher quality audit and report internal control deficiencies.

As for the other control variables, in line with our expectation, larger firms have shorter audit delays. Our evidence also indicates that firms with going concern audit opinion and non-*BIG4* auditor have longer audit delay. In economic terms, firms audited by *BIG4* release their audited financial statements six days earlier than their non-*BIG4* counterparts, and firms receiving going concern uncertainty audit opinions take 14 days longer to issue audited financial statements, compared to firms with clean audit opinions.

The adjusted *R-squared* (26.4 percent) that we obtain for the Model 1 is higher compared to previous Malaysian studies by Mohamad-Nor *et al.* (2010) and Che-Ahmad and Abidin (2008), and comparable with Pizzini *et al.* (2010) and Habib and Bhuiyan (2011). This might be due to the inclusion of the new hypothesized variables plus other control variables such as sales to assets ratio, extraordinary items, financial condition index, leverage, inventory and receivables, foreign operations and negative earnings. In addition, as mentioned earlier, unlike Mohamad-Nor *et al.* (2010), our sample is arguably more representative as it excludes financially distressed companies that were subsequently delisted.

When we rerun the regression using dichotomous dependent variable, the results are qualitatively similar, except for the variable *LOSS*. In the logistic regression, firms that do not report losses are more likely to issue the audited financial statements within three months compared to their counterparts who tend to take longer than three months.

5. Summary and conclusions

This study examines the relationship between four hypothesized variables namely audit committee expertise, audit fees, non-audit fees and ownership concentration, and audit report lag. The results based on a sample of 324 Malaysian firms in the year of 2002 show that out of four hypotheses, three are supported. Firstly, we find a negative relationship between audit committee expertise and audit delay. This shows the important role of audit committee financial expertise in facilitating timely audit reporting in Malaysia. Consistent with Raghunandan and Rama (2007), Krishnan and Visvanathan, (2009), Naiker and Sharma (2009), Dhaliwal *et al.* (2010) and Ismail and Rahman (2011), we provide strong evidence on the positive impact of audit committee accounting experts on financial reporting quality. Thus, the evidence seems to support the regulatory stance taken by the Malaysian Securities Commission which requires all audit committee members to be financially literate.

Secondly we find a positive significant relationship between audit fees and audit lag, consistent with Ettredge *et al.* (2006) and Pizzini *et al.* (2010) who use US data in the SOX era. Moreover, we find a negative relationship between ownership concentration and audit lag. This result is consistent with the argument that

companies with dispersed ownership have many shareholders who rely on the financial statements. Consequently, it would increase auditor business risk, and the amount of work to be done. Other studies by Bamber *et al.* (1993) Abdelsalam and Street (2007) and Al-Ajmi (2008) provide similar empirical evidence supportive of this argument.

We find no evidence to support our intuition that the purchase of non-audit services reduces audit report lag, in line with the knowledge spillovers effect. Other salient factors that explain the cross sectional variations in audit delay are audit committee size and board size. Larger audit committee promotes speedier completion of financial statements audit, in tandem with Pucheta-Martinez and Fuentes (2007), whilst larger board delays the audit reporting process. Yermack (1996), Loderer and Peyer (2002), Beiner, Drobetz, Schmid and Zimmermann (2004) and Ahmed, Hossain and Adams (2006), among others, show that there is a lack of monitoring role if a firm has larger board size.

Going forward, our study provides useful benchmark for comparison with future studies on audit delay using recent data after the establishment of the Malaysian Securities Commission's Audit Oversight Board in 2010. The recent requirement for Malaysian companies to disclose publicly the annual expenses incurred by the internal audit function also provides an interesting avenue for future research to examine the contribution of internal audit function in shortening audit delay.

Could FDI Really Enhance Technological Capability and Economic Progress?

Tung-lung Steven Chang, tchang@liu.edu
Hyun Sang Shin, Hyun.Shin@liu.edu
Long Island University, USA

Abstract

This paper investigates the interdependent, dynamic relationships between technological capability (embodied vs. disembodied technology), FDI (inward vs. outward), and economic progress (GDP) by examining six nations in three clusters. We use Vector Autoregressive modeling to analyze quarterly time-series data between the Asian Financial Crisis of 1997 and the Subprime Mortgage Crisis of 2008. We find that: 1) inward FDI doesn't affect GDP of our sample countries; 2) outward FDI has a positive long-run impact on GDP of Frontier countries (Canada and US), but not the other countries; 3) embodied technology position does not affect GDP of Frontier countries, but it positively affects GDP of Brazil and Taiwan; 4) disembodied technology position doesn't affect GDP of Catching-up countries, but has a positive long-run impact on GDP of Korea and Canada; and 5) US's GDP benefits from outward FDI only. These findings provide insightful policy implications for countries at different development stages.

Introduction

A nation's technological capability (TC) can be enhanced through R&D spillovers (e.g., Coe and Helpman, 1995, 1997; Eaton, and Kortum, 1997; Keller, 2004; Narula, 2001; Shih and Chang, 2009). From the perspective of a recipient country, the benefits from foreign R&D include learning about new product and process technologies, management know-how, organizational methods and the import of technology-embedded goods and services. The enhancement of TC is thus critical for countries striving to catch up with technologically advanced nations (Benito and Narula, 2007; Coe, Helpman and Hoffmaister, 2009). Previous studies have suggested that countries take advantage of foreign R&D efforts and acquire proper technologies from abroad for further productivity gains. However, actual productivity gains depend on a country's efforts to accumulate absorptive capacity in order to effectively utilize its stock of knowledge and cumulative R&D outcomes (Coe and Moghadam, 1993).

Absorptive capacity, as a core competence, has been proposed for examining knowledge diffusions and R&D spillovers at country-level (e.g., Borensztein, De Gregorio and Lee, 1998; Coe, Helpman and Hoffmaister, 2009). Criscuolo and Narula (2008) suggested that countries upgrade absorptive capacity through foreign direct investment (FDI) in order to increase knowledge accumulation. In addition, they pointed out that a country must have a minimum level of absorptive capacity in order to effectively acquire exogenous technologies that could benefit its domestic production and contribute to its economic growth. As indicated in previous studies (e.g., Borensztein, De Gregorio and Lee, 1998; Xu, 2000), such a threshold is a necessary condition for nations to accumulate knowledge at the catching-up phase. The learning-curve effect of such a knowledge accumulation process is expected to take off after the absorptive capacity threshold is obtained. As a country improves its TC and reduces the technological gap between itself and the frontier nations, however, its rate of learning tends to decrease due to the increasing complexity of exogenous technology. Moreover, the decreasing quantity of available exogenous technologies makes it difficult for a country to keep the same progress for TC enhancements. As such, the varying absorptive capacity conditions of each country may result in asymmetric effects of R&D spillovers, thus calling for multiple TC-related policy recommendations to fit different countries' needs.

Consistent with this notion, Shih and Chang (2009), by using network analysis, suggest two strategies: 1) a "development-oriented" strategy focusing on embodied technology, and 2) a "research-oriented" strategy focusing on disembodied technology, for nations requiring upgrade of their TC for further economic growth during the catch-up process. More specifically, the development-oriented strategy is recommended for the catching-up countries with insufficient absorptive capacity so that they utilize new knowledge learned through the spillover of technology embodied in capital goods to enrich their national technological base, and subsequently perform patent-related

innovations in the form of disembodied technology. In contrast, the research-oriented strategy is better for countries with sufficient absorptive capacity that possess high TC in disembodied form, and then perform further innovations via the embodied forms of product engineering and development to achieve an enhanced status in international technology diffusion networks. However, due to the lack of a performance-related assessment in Shih and Chang's study, it is still unclear whether the research-oriented or the development-oriented strategy can perform better than its alternative at different developmental stages.

To address this question, three methodological issues should be considered. First, our focal variables, i.e., TC, FDI, and economic progress, are interdependent. For example, FDI can help a country to achieve economic progress, but a country with economic success may also attract more FDI, suggesting reverse-causality. Second, the focal variables affect each other over time, meaning that the relationships among them are inherently dynamic. Thus, time-series data analysis is required. Third, the effect of one variable on another may vary across countries in different conditions with respect to absorptive capacity. For example, the impact of FDI on economic progress may differ for a high absorptive capacity country such as USA vs. for a low absorptive capacity country such as Brazil. Thus, analysis should be performed at a country level, and policy recommendations should be made accordingly.

In this paper, we propose a new approach, vector autoregressive (VAR) modeling, to investigate the interdependent, dynamic relationships between TC, FDI, and economic progress, using quarterly time-series data (1998:1Q-2007:4Q). Specifically, we try to answer the following: 1) If technological change is a good source of productivity growth, what would be the relationship between technological capability and economic progress of our sample countries with different absorptive capacity conditions? 2) Since it is not clear that the motivation of FDI activity could necessarily result in greater national economic development, could we justify the relationship between FDI activity and economic progress of our sample countries? 3) If FDI spillovers do exist, what would be the relationship between inward/outward FDI flows and technological capability of our sample countries?

Literature Review and Research Issues

International R&D Spillovers and Productivity Gains

The endogenous growth theory postulates that economically motivated R&D activities are the fundamental source of sustained economic growth and that such sustained growth is made possible by sufficient spillovers of R&D results (Grossman and Helpman, 1991). Such an innovation-driven perspective suggests that a country's productivity gains could be increased through both domestic and international R&D efforts. Coe and Helpman (1995) were among the first to show that international R&D spillovers exist and are trade related. However, their work was limited to the relation of R&D spillovers and total factor productivity (TFP), which does not distinguish between technological change (innovation) and efficiency change (catch-up) as suggested in the literature (Fare, Grosskopf, Norris and Zhang, 1994; Perelman, 1995). When the two aspects were examined, it is found that technological change appears to be the greater source of productivity growth in OECD industrial activities (Perelman, 1995).

Although the existence of international R&D spillovers was verified in subsequent studies (e.g., Keller, 1998; Lichtenberg and van Pottersberghe, 1998), the technology diffusion across countries was found to be heterogeneous. Frantzen (2000), for instance, pointed out that the influence of foreign technology diffusion upon a nation's productivity is more important than domestic efforts in R&D. This is especially true in smaller economies (i.e., non-G7), which are more open and form a majority within OECD. Kim and Lee (2004) revealed similarly that TFP growth is mainly attributable to international R&D spillovers for low R&D-intensive countries, while domestic R&D efforts are more important for high R&D-intensive countries. Kao, Chiang and Chen (1999) discovered that smaller OECD countries benefit more from international R&D spillovers than larger countries. As other nations gain more international R&D spillovers from the major countries such as the US and Japan (Kao, et al., 1999), the US seems to be the net loser as its worldwide market shares of high-technology output continue to be challenged (Luintel and Khan, 2004).

FDI and Economic Growth

FDI has been considered as a crucial factor attributable to improving economic growth in host countries (e.g., Grossman & Helpman, 1991; Hanel, 2000; Hermes and Lensink, 2003; Batten and Vo, 2009) for catching up technological capability through technology diffusion (Wang and Blomstrom, 1992) and R&D spillovers (Wang and Yu, 2007) resulted from MNE activities. The literature of FDI-assisted economic development has viewed FDI as a means for nations to acquire needed technology for advancing economic growth (e.g., Grossman and Helpman, 1991; Borensztein, De Gregorio and Lee, 1998), to obtain R&D spillovers for productivity gains (e.g., Coe and Helpman, 1995; Perelman, 1995), and to cultivate and source innovations of multinationals (MNEs) for improving competitive advantage (e.g., Dunning and Narula, 1996; Porter, 1990). However, due to the heterogeneity of technology diffusion across countries, the learning effects of technological capability and R&D spillovers that accompany FDI inflows may not always result in desired economic growth in host countries, nor do high levels of FDI sustain economic growth equally across countries in different development stages (Narula and Dunning, 2000; Narula and Dunning, 2010). Thus, it is not clear that the motivation of FDI activities could necessarily result in greater national economic development.

Narula and Dunning (2010) postulate the framework of an Investment Development Path (IDP) to study the relationship between FDI and economic growth of countries during various development stages. According to IDP, inward FDI precedes outward FDI which yields a negative net outward investment (NOI) flow at the early development stages (from Stage I to III) of the host country. In general, the pace of inward FDI tends to increase quicker than that of outward FDI, resulting in more negative NOI, as the GDP increases at Stages I and II. A turning point occurs at Stage III when the pace of the two FDI flows reversed, narrowing the FDI deficit of the host country. Ideally, this trend will continue into Stage IV when NOI becomes positive and increases until the host country enters Stage IV when a declining of positive NOI is observed. Although IDP depicts a general relationship pattern between FDI and a nation's economic development, it is suggested that any development implications of cross-country comparisons be undertaken with caution.

The focus of technology gap and absorptive capacity is thus suggested for examining the effect of FDI on knowledge accumulation that could lead to desired economic growth of the host country (Crisciolo and Narula, 2008). It is important to match FDI with domestic capacity building during the IDP process in order to prevent the crowding-out effect from happening as observed in Latin America in the 1970s and in Africa in the 1990s (Agosin and Machado, 2005). Crowding-out effects could occur in the host country when domestic firms are displaced or pre-empted by foreign-owned MNEs through inward FDI. Foreign MNEs may out-perform domestic firms due to ownership advantage in the form of brand names, technological assets, or knowledge of networks that are difficult to be replicated (Mody 2004). In addition, crowding-out effects are likely to predominate if the technology gap between foreign MNEs and their domestic counterparts is large (Narula and Dunning, 2010). Therefore, a host country's absorptive capacity accumulated by local firms plays a pivotal role in acquiring international R&D spillovers through FDI related activities that are affiliated with foreign MNEs (Blalock and Simon, 2009).

FDI and International Technology Diffusion

As discussed previously, International technological diffusion between firms can be disembodied or embodied in nature. Embodied technology can be acquired through international trade of intermediate goods (Grossman and Helpman 1991; Eaton and Kortum 2002). It is commonly seen that intermediate goods such as equipment goods and components are imported by domestic firms and foreign affiliates in the host countries. When foreign intermediate goods are used in the production process for final products, it involves the implicit usage of the technology in embodied form. Disembodied technological diffusion consists of pure knowledge spillovers. Typical channels are the publication of ideas in the scientific literature, the mobility of qualified personnel and, most important, reverse engineering. Such knowledge spillovers represent externalities to other firms, which could be realized by inward FDI activity (Frantzen, 2000). It has been noted that the growth of productivity capacity is attributable to FDI activity. When domestic firms have the capacity to internalize these externalities usefully, the industrial development and economic growth will then be possible (Narula and Dunning, 2010).

FDI has long been viewed as an important channel for international technology diffusion. Governments all over the world commit large amounts of incentives to attract FDI of foreign MNEs to their jurisdiction. It has been noted that FDI spillovers are significant and economically important (Keller, 2004). Previous case studies have shown that FDI by foreign MNEs could trigger and widespread changes for technological advancements in relatively small countries such as Costa Rica and

Tanzania (Larrain, Lopez-Calva and Rodriguez-Claré, 2000; Portelli and Narula, 2006). Some recent micro-level productivity studies also support the existence of FDI spillovers. Zhang, Li, Li and Zhou (2010), for example, found that the variety of technologies and management practices brought by foreign firms through FDI positively increase the productivity of domestic firms in China, and that the positive relationship is relatively strong when the firm size and the technology gap are significant. Supporting evidences are also found in the US. For instance, Xu (2000) discovered that there is a positive relation between FDI and productivity growth based on the time series data of U.S. outward FDI into forty countries; while Keller and Yeaple (2003) found that FDI spillovers are positive and large by examining FDI activity in the United States. In addition, vertical FDI spillovers may spread to other players in the value chain within the host country (Blalock and Gertler, 2002). It has been observed that foreign subsidiaries have an incentive to provide technological knowledge to their suppliers (Keller, 2004). As a strategy for sustaining competitive edge, MNE subsidiaries tend to establish a long-term relationship with local suppliers for sourcing needs. The knowledge transfer between MNE subsidiaries and upstream suppliers may strengthen technological capability of the whole value chain. A crowding-in effect is likely to happen if promising business opportunities in the upstream supply chain are observed by existing firms or new entrants. Cumulatively, such vertical FDI spillovers could outweigh the loss of local competitors that produce the same products in the host country due to a crowding-out effect.

Methodology

The Sample

As previously discussed, the learning effects of technological capability and R&D spillovers that accompany FDI inflows may not always result in the desired economic growth in host countries due to the heterogeneity of technology diffusion consequences. We presume that the effect of FDI may not result in the same level of economic growth across countries in different development stages. In order to draw possible policy implications of motivating FDI activities for the host governments, we focus on six countries to investigate the relationships between FDI, technological capability, R&D investment, and economic growth. The six countries are selected based on: 1) their relative economic development stage in the world development system, and 2) their relative positions in the international diffusion networks in terms of both embodied and disembodied technology. As a result, we select six countries including the US, Canada, Korea (South), Taiwan, Brazil and Mexico. According to the IDP and the knowledge accumulation stage (Narula and Dunning, 2010; Criscuolo and Narula, 2008), the US and Canada are the frontier-sharing nations; Korea and Taiwan are the pre-frontier-sharing countries; while Brazil and Mexico fall behind as catching-up nations. As shown in Shih and Chang's study (2009), both the US and Canada are the "source" countries that possess the leading position in disembodied as well as embodied technology; both Korea and Taiwan are the "intermediate" countries in terms of disembodied technology but with a leading position in terms of embodied technology; while Brazil and Mexico are "beginner" countries that are catching up their disembodied and embodied technology in the international diffusion networks.

Variables

Technological Capability:

Technological Capability (TC) of a country is measured by its technological positions (i.e., betweenness centrality scores) in the international technology networks (ITD) proposed by Shih and Chang (2009). In network analysis, the betweenness of a node measures the extent to which it can play the role of a gatekeeper or broker with a potential for control over the interactions between pairs of others (Marsden, 1982). Betweenness centrality is an appropriate indicator measuring the extent to which nodes broker indirect connections between all other nodes in a network. In the context of international technology diffusion, a particular country with higher betweenness centrality represents more opportunities to broker the flows of diffusion among other countries since most technology diffusion will pass through this country, and thus it should possess competitive advantages in terms of brokerage opportunities. This study uses the betweenness scores that are calculated according to Shih and Chang's ITD analysis (2009). To capture TC, we use two variables, EMB and DISEMB, representing the ITD positions of our sample countries in terms of embodied and disembodied technology, respectively. A brief explanation of such calculation is discussed in the Appendix.

FDI and Economic Progress:

Two types of foreign direct investment (FDI), i.e., inward FDI (IFDI) and outward FDI (OFDI) of a country are obtained from the IFS monthly reports of IMF. In addition, economic progress of a country is measured by its GDP reported in the IMF Database. Table 1 illustrates descriptive statistics of our focal variables, i.e., TC, FDI, and GDP. Interestingly, when we look at the ratio of EMB to DISEMB, Mexico, Brazil, and Taiwan reveal more orientation toward EMB, while US, Canada, and Korea reveal more orientation toward DISMEB. In addition, when we look at the ratio of IFDI to OFDI, Mexico, Brazil, and Taiwan show higher focus on IFDI, while US, Canada, and Korea show higher focus on OFDI. As such, Mexico, Brazil, Taiwan focus more on EMB-IFDI, while USA, Canada, Korea focus more on DISEMB-OFDI.

Control Variables:

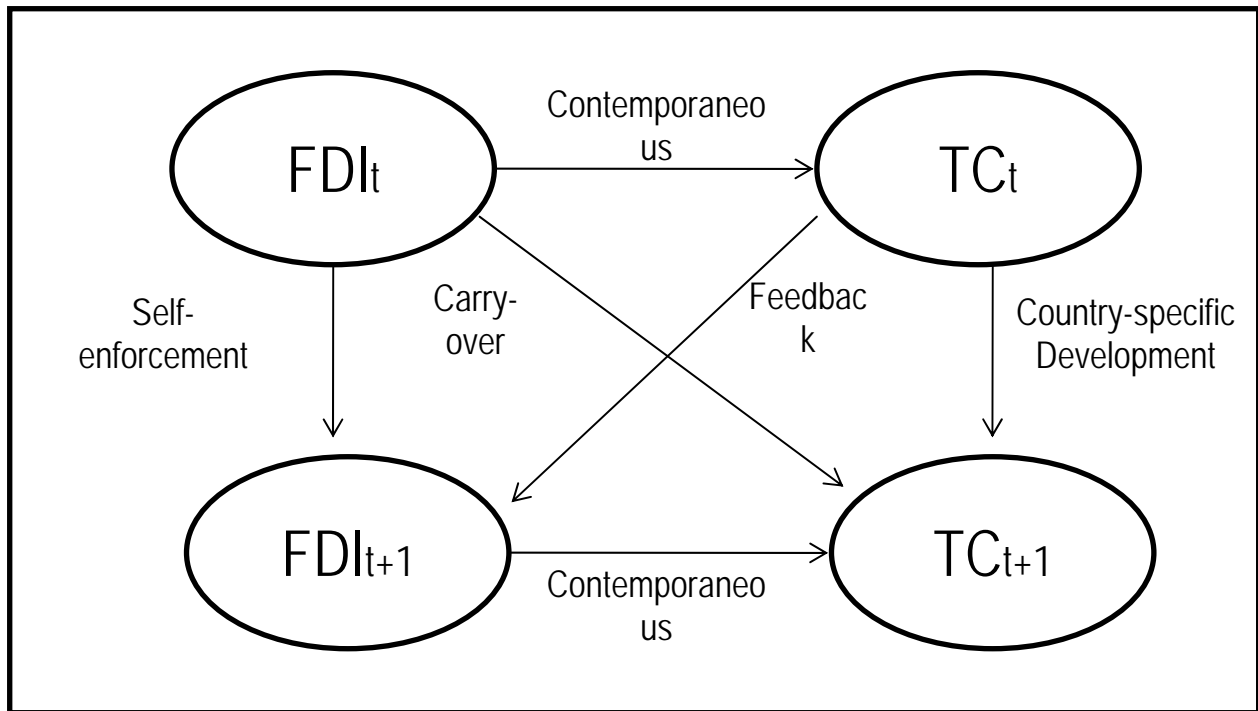

Firstly, a nation's absorptive capacity (AC) is used as an endogenous control variable. AC has been viewed in the literature as a mediating factor that determines the knowledge accumulation resulting from international R&D spillovers and FDI activity in host countries. Thus, it is important to examine the relation between TC, FDI, and economic growth after controlling for the mediating effect of absorptive capacity. We use the number of patents divided by the number of R&D personnel as a proxy of absorptive capacity, which captures the quality of R&D personnel or R&D Productivity of a country. Secondly, the exchange rate (vs. US Dollar) of a host country is included as an exogenous control variable, since FDI can be affected by exchange rate which is set by the foreign exchange market. Thirdly, time trend and seasonality dummy are also used to control for potential trend and seasonality, which is inherent in the quarterly-level time series dataset.

Overview of VAR Modeling

The issue of how to deal with endogeneity should be one of the central issues for empirical researchers when examining the relationships among TC, FDI, absorptive capacity and economic progress. Specifically, FDI can increase current TC (contemporaneous effect) and future TC (carry-over effect) of a country, while its TC may influence the current and future FDI decisions toward the country (feedback effect). In addition, there may be strong autocorrelations in TC (e.g., country-specific development path) as well as in FDI (e.g., self-enforcement path). Such dynamic, interdependent relationships among variables (see Figure 1) may result in "chain reactions" in the system (Dekimpe and Hanssens, 1995). Thus, ignoring the simultaneity among discretionary spending and financial performance measures may result in biased and inconsistent estimation results (Hayashi, 2000).

One way of dealing with the simultaneity problem is to use instrument variables (IV) method (Hayashi, 2000). Even though the bi-directional relationship between two variables (e.g., FDI vs. TC) can be examined by using a set of separate simultaneous equations, the possible dynamic interdependence (i.e., chain reactions) among focal variables cannot be fully explored. In addition, heterogeneity bias (or aggregation bias) problem cannot be resolved even with IV method in a dynamic linear panel model setting (For the proof regarding heterogeneity bias, see Pesaran and Smith, 1995, pp.103-108). For instance, if there exists heterogeneity across countries with respect to their TC positions (e.g., US vs. Brazil), then same FDI may yield different economic outcomes. If this is the case, as far as we include dynamics in the model (e.g., lag terms in FDI, we are doomed to obtain biased estimates even when we use instrument variables. Accordingly, Pesaran and Smith (1995) propose the MGE (Mean Group Estimator), the key idea of which is to estimate parameters for each individual unit (e.g., a firm or a country) when there exists heterogeneity across individual units.

Figure 1. Chain Reactions between FDI and TC

Another way to address simultaneity bias is to apply the Vector Autoregressive (VAR) specification. VAR, originally designed by C. Sims (1980), is an N-equation, N-variable linear system of equations in which each variable is explained by its own lagged values, plus current and past values of the remaining N-1 variables. This simple framework provides a systematic way to capture rich dynamics in multiple time series. By applying innovation accounting techniques such as Impulse Response Function (IRF) analysis, for instance, one can fully examine the impact of one endogenous variable on the other endogenous variable in the system. In particular, IRF analysis systematically traces the incremental effect of a one-unit shock (i.e., unexpected change) in an endogenous variable on other endogenous variables, capturing the consequence of chain reactions among variables (Enders, 2004).

Originated in the field of economics, VAR modeling has been used in diverse management disciplines including accounting (e.g., Bar-Yosef et al., 1996), finance (see Campbell et al., 1997, pp.279-286 for a review), marketing (for a review, see Dekimpe and Hanssens, 2004), and strategy (e.g, Nair and Filer, 2003). In fact, VAR modeling would be particularly useful to examine intriguing issues in international business such as the development of TC through FDI, long-term impact of FDI on economic progress, and dynamic relation between TC and economic progress, to name a few.

VAR Model Specification

Before specifying our VAR model, we first perform the Phillips-Perron panel unit root test to see if our focal endogenous variables (i.e., EMB, DISEMB, IFDI, OFDI, AC) are stationary (Maddala and Kim, 1998). If some variables are non-stationary, then one should test for the presence of cointegration, which represents a long-term equilibrium among non-stationary variables (Enders, 2004). Depending on the results of unit-root and cointegration tests, VAR models are specified in the levels (no unit roots case), in the differences (unit roots without cointegration case), or in error-correction format (cointegration case), respectively (Dekimpe and Hanssens, 2004). The Phillips-Perron panel unit root test results suggest that all variables are stationary at $p < 0.05$ for all 6 countries.

As a result, we set up our *VAR model in level* for each country. Note that we do not perform cointegration tests since there is no non-stationary variable.

Next, we specify our structural-form VAR model then multiply both sides of the model by B^{-1} and obtain the reduced-form VAR model as shown in Figure 2. Note that the coefficient matrix in Figure 2 represents the dynamic, interdependent relationships among endogenous variables in the system. For example, an increase in current TC in terms of EMB due to an increase in the last period's inward FDI (IFDI) would be captured by the coefficient π_{13}^p for $p=1$.

Figure 2. Reduced-form VAR Model

$$x_t = \Pi_0 + \sum_{p=1}^P \Pi_p x_{t-p} + e_t, \quad e_t \sim N(0, \Sigma_e)$$

$$\text{where } x_t = \begin{bmatrix} EMB_t \\ DISEMB_t \\ IFDI_t \\ OFDI_t \\ GDP_t \\ AC_t \end{bmatrix}, \Pi_p = \begin{bmatrix} \pi_{11}^p & \pi_{12}^p & \pi_{13}^p & \pi_{14}^p & \pi_{15}^p & \pi_{16}^p \\ \pi_{21}^p & \pi_{22}^p & \pi_{23}^p & \pi_{24}^p & \pi_{25}^p & \pi_{26}^p \\ \pi_{31}^p & \pi_{32}^p & \pi_{33}^p & \pi_{34}^p & \pi_{35}^p & \pi_{36}^p \\ \pi_{41}^p & \pi_{42}^p & \pi_{43}^p & \pi_{44}^p & \pi_{45}^p & \pi_{46}^p \\ \pi_{51}^p & \pi_{52}^p & \pi_{53}^p & \pi_{54}^p & \pi_{55}^p & \pi_{56}^p \\ \pi_{61}^p & \pi_{62}^p & \pi_{63}^p & \pi_{64}^p & \pi_{65}^p & \pi_{66}^p \end{bmatrix}, e_t = \begin{bmatrix} e_{EMB_t} \\ e_{DISEMB_t} \\ e_{IFDI_t} \\ e_{OFDI_t} \\ e_{GDP_t} \\ e_{AC_t} \end{bmatrix}$$

Estimation & IRF Analysis

We estimate the reduced-form model using the Ordinary Least Squares (OLS) method, which provides us with consistent and asymptotically efficient estimates (Enders, 2004). All variables are measured by taking the logarithm, which is useful to derive the elasticity of any innovation (Nijs et al., 2001). We also include exogenous control variables such as exchange rate, time trend, and seasonality dummy. As for the number of lags (p), we use Schwarz's Bayesian Information Criterion (SBC), following a conventional procedure (Nijs et al., 2001; Enders, 2004). As a result, we choose one lag for US, Canada, Taiwan, and Korea; two lags for Mexico; and three lags for Brazil.

Next we perform Impulse Response Function (IRF) analysis, which is a useful tool to quantify the dynamic effect of a focal variable on the other endogenous variable. IRFs describe the response of endogenous variables to the shocks on other endogenous variables over certain time periods. Following Koop, Pesaran, and Potter (1996), we derive Generalized Impulse Response Functions (GIRF) using the estimated residual matrix as well as estimated coefficients matrices from the reduced-form VAR model in Figure 2. Specifically, we compute two forecasts on a focal variable (e.g., TC), one based on information set without a shock in the other focal variable (e.g., IFDI), and another with a shock. Then the difference between the two forecasts captures the incremental effect on TC of a shock or unexpected increase in IFDI over time (Enders, 2004). Different from conventional Choleski decomposition method, GIRF method is known to be insensitive to the ordering (Pesaran and Shin, 1998; Nijs et al., 2001).

We compute impulse response functions up to 20 periods, i.e., 20 quarters or 5 years in our data. Specifically, we regard the sum of IRF values as the long-run effect. We compute standard error of IRF using Monte Carlo simulation (# of iterations = 1000). Then we apply a ' $|t\text{-stat}| > 1.28$ ' criterion to identify statistically significant IRF values, which means that we sum all the IRF values whose significance is greater than this cutoff.

Concluding Remarks

Summary of Findings

The research objective of this study is to investigate the interdependent, dynamic relationships between TC, FDI and economic progress by using 1998-2007 quarterly time-series data between two imperative global economic events, i.e., the 1997 Asian Financial Crisis and the 2008 Subprime Mortgage Crisis. We selected six nations in three clusters: 1) US and Canada (Frontier/Source), 2) Korea and Taiwan (Pre-frontier/Intermediate), and 3) Brazil and Mexico (Catching-up/Beginner) according to their IDP stage (Narula and Dunning, 2010) and their ITD position in terms of embodied and disembodied technology (Shih and Chang, 2009). By using

TABLE 1. IRF ANALYSIS RESULTS

Effect on log(GDP) of	Mexico	Brazil	Taiwan	Korea	Canada	US
log(IFDI)	0	0	0	0	0	0
log(OFDI)	-0.014	0	0	0	0.011	0.006
log(EMB)	0	0.037	0.009	0	0	0
log(DISEMB)	NA	NA	0	0.021	0.005	0
Effect on log(EMB) of	Mexico	Brazil	Taiwan	Korea	Canada	US
log(IFDI)	0.511	-0.198	0.111	0	0	0
log(OFDI)	0	0.241	0	0	0	0
Effect on log(DISEMB) of	Mexico	Brazil	Taiwan	Korea	Canada	US
log(IFDI)	NA	NA	-0.063	0	0.019	0
log(OFDI)	NA	NA	-0.101	0	0	0

TABLE 2. SUMMARY OF FINDINGS ON FDI, TC, AND ECONOMIC PROGRESS

Effect on Economic Progress	Mexico	Brazil	Taiwan	Korea	Canada	US
of IFDI	0	0	0	0	0	0
of OFDI	(-) ***	0	0	0	(+) **	(+) ***
of EMB	0	(+) **	(+) **	0	0	0
of DISEMB	NA	NA	0	(+) ***	(+) *	0

*: Statistically significant when $|t| > 1.28$ criterion is applied;

**: Statistically significant when $|t| > 1.645$ criterion is applied;

***: Statistically significant when $|t| > 1.96$ criterion is applied.

VAR modeling, we examine the endogenous relationships among our focal variables, including IFDI, OFDI, EMB, DISEMB, and GDP. As shown in Table 2, our empirical findings reveal that: 1) during the period of 1998-2007, inward FDI does not affect GDP of our sample countries; 2) outward FDI positively affects GDP of Frontier/Source countries (Canada and US), but not the other countries; 3) EMB does not affect GDP of Frontier/Source countries, but it positively affects GDP of Brazil and Taiwan, who show more orientation toward IFDI-EMB (see Table 1); 4) DISEMB does not affect GDP of Catching-up/Beginner countries, but positively affects

GDP of Korea and Canada, who show higher focus on OFDI-DISEMB (see Table 1); and lastly, 5) US's GDP benefits from OFDI, but not by other factors such as EMB and DISEMB.

Contributions, Limitations, and Future Research

As aforementioned, VAR modeling is attractive for the following reasons: 1) *dynamics*: long-run effect of one variable on another can be quantified, 2) *no endogeneity bias*: reverse-causality relationship between focal variables (e.g., FDI vs. TC) can be easily incorporated, and 3) *no heterogeneity bias*: through unit-by-unit analysis (instead of conventional panel design) different condition across countries can be considered and asymmetric policy recommendation can be made. Another unique methodological contribution of this paper is to combine network analysis and VAR modeling approach. By using network analysis, we obtain TC position in terms of EMB and DISEMB, and then, we analyze long-term implications of TC position on economic progress. To our knowledge, this paper is the first one to use VAR modeling, coupled with network analysis, to address ITD issue associated with FDI and TC.

Our work suggests two strategic implications for the countries that aspire to upgrade their TC for further economic progress through international R&D spillovers and FDI activity. First, our findings recommend that countries at the Catching-up stage focus first on EMB position for economic progress; countries at the Pre-frontier/Intermediate stage may want to focus on EMB or DISEMB position, depending on their situation and countries at the Frontier/Source stage may want to focus on DISEMB. Second, countries at the Frontier/Source stage may benefit from outward FDI considering their high internal R&D costs. As such, our findings provide insightful policy implications for countries at different development stages.

However, there are certain limitations inherent in our study, which we leave for future investigation. First, VAR modeling is a reduced form approach, which is regarded as less reliable than the structural modeling approach for policy simulation (Stock and Watson, 2001). Future study may impose more 'structures' based on further economic assumptions to construct Structural VAR modeling (Enders, 2004). Second, one may want to apply fixed- or random-effect dynamic panel specification with IV/GMM method to investigate the research questions raised in this paper. In this case, however, the heterogeneity across countries should be considered. When the heterogeneity problem across units exists, instrument variables cannot resolve the endogeneity problem as long as we estimate dynamic panel model with lag terms (Pesaran and Smith, 1995). This could be problematic when a researcher needs to specify lag terms in order to capture the chain reactions among economic progress, FDI, and TC.

In spite of the limitations, this study provides a new methodology to analyze the interdependent, dynamic relationships among FDI, technological capability and economic progress. Our findings provide insights for policy makers to determine whether to focus their limited resources on achieving certain technological position or on attracting/stimulating certain type of FDI in order to compete successfully in the international technology network.

Factors Influencing Individual Investor Behaviour: An Empirical study of the Indian Financial Market

Abstract

The Indian capital markets have witnessed unprecedented activity in the last few decades, especially after the economic liberalization. The capital markets, which were the exclusive, preserve of a few traders operating from regional stock exchanges like Bombay Stock Exchange has since 1980's become more broad based and inclusive. A large number of retail and small investors have entered the stock markets primarily through the Initial Public Offer (IPO) market. International studies have shown that the increased participation of the investors in the stock market is a reflection of the general growth in the economy and people with increased income tend to invest it in equities and debt instruments to realize higher returns. In that sense the growth of the stock market is also vote for positive economical fundamental in the economy. In this scenario it is important that we try to understand the attitude and behavior of the players in the capital market, more particularly the individual investors who are perhaps the most vulnerable players in this huge market. The individual investors who enter the market are not always well informed and it is quite difficult to predict their behavior. During the past few decades, there has been an intense debate about the dynamics of stock prices and investor responses. The prevalent theory has been the Efficient Market Hypothesis (EMH) by Fama (1970), which stipulates that stock prices move in accordance with the change in valuation. In recent years, a new set of ideas, known as Behavioral Finance (BF), has gradually provided an alternative to EMH by stipulating that systematic biases exist in market dynamics. One aspect of this is that individual investors as well as experts are subject to the behavioral biases. The present paper tries to examine the economic and social utility derived by the individual investors. It also Studies the influence of psychological factors on the individual investors investment behaviour and risk perception. We find evidence to the effect that investment decisions are not always rational psychological factors like fear of loss, overconfidence and anchoring effect investor's ability to optimize his/her investments. Similarly investors in the study area showed a marked aversion for risk.

Introduction

The Indian capital markets have witnessed unprecedented activity in the last few years. After the economic liberalization initiated in 1991, the stock markets, which were the exclusive, preserve of a few traders operating from regional stock exchanges like Bombay Stock Exchange became broader based and inclusive. A variety of new investors entered the market attracted by the investment opportunities. A large number of retail and small investors have entered the stock markets primarily through Initial Public Offer (IPO) by companies. The business organizations have also realized the potential of generating funds from the relatively cheaper equity route rather than through debt. Today it is common to find new as well as established players tapping the capital market for their funds. The growth of the equity cult attracted people from all walks of life and there was a sea change in the attitude of the middle class towards stock market trading. Some international studies have revealed that the increased participation of the investors in the stock market is a reflection of the general growth in the economy and people with increased income tend to invest it in equities and debt instruments to realize higher returns. In that sense the growth of the stock market is also a vote for positive economical fundamentals in the economy. However, recent studies have touched upon the fact that the reverse is also true.

The financial markets the world over have been a source of great interest to the investors as well as researchers. The markets are an enigma and attempts to unravel the behavior of the markets and its participants have always been a challenging task. Over the years many attempts have been made to develop a model which could predict market

behavior but most of the theories of traditional finance and economic theories have either failed or if at all only partially succeeded in describing the market behavior. For a longtime economic thought was dominated by the notion of a rational economic man who makes informed decisions so as to maximize his expected utility. However various studies have conclusively proved that man is anything but rational in his actions. Thus the quest to identify and explain how the investors in the financial markets behave continues. The so called irrational behavior of these individual investors can be to a large extent be understood by the help of Behavioral finance (Peters, 1996). Behavioral finance is a relatively new field which draws upon theories of Psychology and social sciences. Advocates of behavioral finance believe that investors are not rational and are influenced by the information structure as well as their own unique personal characteristics. The aversion of the traditional approach to understand and explain the decision processes of investors was the main reason to trigger the emergence of behavioral finance as an approach which tries to identify and understand the meaning of psychological decision processes for financial markets (Ricciardi and Simon, 2000). It is also true that traditional literature tends to focus more on the institutional investors and less on the individual investor in describing the aggregate market behavior. But no study to understand the financial markets can be complete without an attempt to understand the individual investors who as individuals may be too small a unit of the market but together they carry a lot of weight and tend to punch much above their weight. Since the 1990's the investor interest in Indian financial market has grown manifold. Consequently it attracted many new investors which lead to the democratization of the Indian financial markets. As the market became more inclusive it brought with it the need to understand, educate and protect the interests of the large number of small individual investors who could be and were unduly influenced by unscrupulous operators. Thus the opening up of the economy was duly followed by some of the biggest securities scams witnessed in the country. One underlying truth about all these scam was that while it did affect institutional investors who it could be argued were often willing participants but the brunt of the aftershocks was felt by the gullible lay investors. The need to identify the investment behavior of these individual investors assumes urgency as the Indian Financial system has been slowly integrating itself to the international markets. The attitude and beliefs which influenced the decision process of individual investor needs to be understood. It will be interesting to know how the individual investor's attitude and behavior is formed and the influence of various factors.

The study of the attitude and behavior of investor is based on two fundamental assumptions that an investor is rational and predictable and that their behavior can be influenced. It is often argued that the stock market investments are based on risk-benefit analysis. But "Psychologists have theorized that a person's attitude and behavior are not always consistent with efficient market theory or the maximization of expected utility- Wayneryd (1999).

Understanding investor's behavior and knowing investor's motivation are never simple. Investors may state their intentions but act contrary to the stated intention. They may not be in touch with their latent drives and they might respond to stimuli that change their mind at the last minute. Nevertheless an understanding of investors and investment process will provide researchers with a theoretical base from which to analyze the investors.

The present study on investor's behavior throws light on the various dimensions of investor's behavior like socio economic factors, market information and personality. The first section of this paper is the introduction, the second section is the literature review, the third section establishes the methodology and hypotheses of the study, the fourth section presents the stud results and the fifth section is the conclusion and recommendations.

Review of literature

For decades, economists have speculated theorized and argued about the rational actor-a completely logical creature who always makes the sensible financial choice. Now psychologists are weighing in and they are finding that real people often do not act that way. Irwin (1993) viewed that, "Behavior is in which the outcomes remain uncertain with the possibility of an identifiable negative outcome". Bebchuk and Stole (2003) have shown that, when shareholders cannot observe the level of investment in long-run projects, under-investment may result because the increased long-term investment will not be factored into the share price as much as the actual increase in net present

value would imply. The standard finance theory has for long relied upon the belief that investors are rational and efficient processors of information. Therefore their decisions are efficient and well thought out one's. This outlook has been influenced by the Modern Portfolio theory (Markovitz, 1952) and Capital Asset Pricing Model (Sharpe, 1964). It is assumed that the market participants (investors) will maximize their expected utility and the stock prices change is unpredictable as it only responds to genuinely new information. The price prevailing at any point will have already discounted already know information.(Shiller, 2000). However research has increasingly shown that investors are not always rational and that they are not efficient in the way they process information. Many a time investor's bias, cognition and emotions influence the accuracy of their judgment. Kahneman and Tversky (1979), Shefrin and Statman (1994), Shiller (1995) and Shleifer (2000) are among those who have used psychological and social sciences theory to explain the financial markets and its less than perfect behavior. Traditional finance theorists believe that the mis-pricing created by the noise traders (irrational investors) will be corrected by the rational investors, who sense an opportunity to maximize their utility. But in practice as shown by Shleifer and Vishny (1997), it is often costly to correct the mis-pricing. This is so because as they pointed out, arbitrageurs — the people who are supposed to buy low and sell high — need capital to do their jobs. And a severe plunge in asset prices, even if it makes no sense in terms of fundamentals, tends to deplete that capital. As a result, the smart money is forced out of the market, and prices may go into a downward spiral (Krugman, 2009). There are quite a few instances of the anomalies in the Indian markets that cannot be explained by traditional finance theory. For example the Securities Scam of 1992 was a classical case of rogue traders taking the investors for a ride by manipulating the pricing of certain stocks. This was followed by the scam in what came to be known as the KP stocks after the rogue trader Ketan Parekh. In most of these cases the investors were attracted by the high price differentials but they invariably lost out when the bubble burst. All though it can be said that the institutional investors as well as the individual investors suffered but the institutional investors failed in spite of their experience and expertise but the individual investor often did not have these privileges. These only reinforce (Case and Shiller, 1989) the need to explore other models of human behavior to explain the actions of the investor. A seminal and perhaps one of the most quoted works which is used to contradict the standard financial theory is the Prospect theory (Kahneman and Tversky, 1979). The prospect theory explains that contrary to the Expected Utility theory, people are not often looking to maximize their utility rather often they are more interested in cutting their losses. Kahneman and Tversky, (1979) attribute it to the fact that the pain of loss often outweighs the joy of gain, this is often referred to as loss aversion in behavior finance literature. Shefrin and Statman (1985) refer to this tendency of realizing gains easily and holds on to the losses as the 'Disposition Effect'. In the behavioral finance literature the disposition is explained by decision maker's framing of choices in times of potential gain and losses as also the fact that investors tend to be risk averse in gains region and risk seeking in the loss region of the S-shaped value function (Hens and Vlcek, 2005). This tendency of investors to defer selling stocks which has gone down and selling stock which has risen can also be explained by "Regret Theory". Investors are likely to sell stocks which are gaining prices and hold on the stocks which are going down so that they can avoid experiencing regret for losing money or not booking profits when the stocks were rising. In other words the fear that the prices may fall in future prompts selling while the hope that losses can be recovered in the future leads to investors holding on to loss making stocks. Kahneman and Tversky (1979) have shown that individuals tend to see events with extremely low probability as impossible which events that have high probability of occurrence are considered as certain. Kahneman and Tversky call this as "the certainty effect", certainty effect is a major foundation of prospect theory. The prospect theory also makes a distinction between "value function" and "utility function" as exposed in expected utility theory. Loss aversion is also a function of the framing of the choices. Framing is the notion that how a concept is presented to individuals influence their decisions (Ritter 2003). People make different choices in situations with identical final wealth levels due to the effects of problem description, or of framing. There are numerous demonstrations of a 30 to 40% shift in preferences depending on the wording of a problem. No normative theory of choice can accommodate such behavior since the first principle of rational choice is that choices should be independent of the problem description or representation (Barberis and Thaler, 2003). For example marketers often use "free gift" along with a purchase worth certain amount/units as an attraction to push up sales. But the customer does not realize that probably they could be better off buying the "free gift" instead of buying larger units of a product being promoted. While framing deals with how the problem is presented to the decision maker (Barberis and Thaler, 2002) the opposite is also true. The method by

which individuals define and understand such problems is termed as “Mental Accounting” (Thaler, 1999). Mental accounting can explain why investors are likely to refrain from adjusting their reference point for a stock (Shefrin and Statman, 1985).

Heuristics are another major aspect of human cognitive process which has a profound influence on investor behaviour. Heuristics is used to reduce the cognitive dissonance experienced by an individual investor. Cognitive dissonance was proposed by Leon Festinger (1957) where he explained cognitive dissonance as a state when two subjective beliefs of the individual are not in agreement with each other. This is a fluid state and the individual tends to restore equilibrium by either modifying information or refusing to acknowledge certain information which does not confirm to their belief systems. Heuristics can be defined as the process of learning through trial and error. Each individual develop their own “thumb rule” based on their experiences. Overconfidence is the tendency for people to over-estimate their knowledge, abilities and the precision of their information [Bhandari and Deaves,(2005)]. Studies have shown that people attribute higher values to their abilities than is warranted and this often leads to what is known as “self attribution bias” (Miller and Ross (1975)). Over confidence manifests itself in many ways including trading behavior. Barber and Odean (2001) found that the more people traded, the worse they did, on average. And men traded more, and did worse than, women investors. Representativeness is another aspect which tends to influence the investors behavior. Khaneman and Tversky (1974) show that when people try to determine whether a particular object A belongs to the class B they will try to access the degree to which object A reflects the essential characteristics of B. While it is often beneficial to use representative heuristics it can often lead to people under weighing long-term averages. People tend to put too much weight on recent experience. For many investors, investing constitutes more than simply weighting the risk and expected returns of various investment assets. Or, as in the words of Fisher and Statman (1997: 48): "... some - perhaps most - investors have preferences that go beyond expected turns and risk. A preference for stocks of socially responsible companies is one example."Recent literature in behavioral finance, in which marketing and consumer behavior theories and concepts are applied to distinguish between utilitarian and expressive characteristics of investing. Investing in the stocks of specific companies can offer utilitarian benefits like low risk and high returns, but also expressive benefits. For example, investments can help investors to demonstrate their feelings of patriotism, social responsibility and fairness or convey a position of high status to other investors (Statman, 1999; 2004). Hoffman(2007) argue that "...investors - like consumers - may sometimes also deliberately want to signal to outsiders, by displaying and discussing about their investments with other investors in their social networks." This may be in order to attain or maintain status; i.e. investments as a form of conspicuous consumption (Janssen & Jager, 2003; Veblen, 1899). Or this may be to satisfy other, more socially oriented needs, like the need to participate in investment related conversations or to affiliate with other investors. Behavioral finance scholars (Statman, 2004), and even Fama and French (2005) - two proponents of traditional finance - have often called for a greater acceptance of the link between decision-making processes for investments versus consumption goods. (Statman, 2004: 154) have argued that finance journals which are mostly confined to the utilitarian benefits of low risk and high expected returns should go beyond it and address the question of social utility derived by investors.Hirschleifer and Teoh (2003: 25) endorse this view, stating that: “We are influenced by others in almost every activity, and this includes investment and financial transactions”. Shiller (1984: 457) joins Hirschleifer and Teoh, characterizing investing in speculative assets as “a social activity”. Stock trading may even offer an investor so-called ‘flow experiences’ (Csikszentmihalyi, 1997; Statman, 2002: 17). This feeling comes close to that of ‘getting a kick’ as uttered by the investor quoted above and is related to the feeling of camaraderie day traders may experience when they come together in trading rooms like players in a casino (Statman, 2002).

Methodology

Participants and Design

The data for this study was collected through a survey using an interview schedule directed at active individual investors. Before using the questionnaire to collect final data, it was pilot tested amongst 100 Bachelor and Master level business management students in Srinivas College, Mangalore.The final questionnaire was distributed to

clients of 4 well-known stock brokering firms in Mangalore. The investors were approached in person and via e-mail and they were asked to fill up the questionnaire. The four stock brokering firms offer a wide range of investment-related services, as e.g., analysts' reports on overall market developments or individual stocks, financial news items, stock tips, Demat services and such other investor services. This makes the clients of these brokering firms appropriate respondents group. Incomplete questionnaires were deleted, after which 400 questionnaires remained for further analysis. After the data were collected, diverse descriptive statistical techniques were used to get an insight into the characteristics of the respondents. The survey study as described above was capable of greatly improving our knowledge of micro level investor behavior.

Hypothesis

1. Economic needs and social needs influence the behaviour of investors in the Indian Financial Markets.
2. People tend to take risk when they believe that the potential for higher returns on their investment is greater than the loss they might incur by investing / speculating in the share market.
3. The role of market knowledge and information in influencing investment behavior is highly significant as investors with greater knowledge and information tends to make better investment decisions.
4. There is a positive co-relation between the investors' income and the investment behavior.
5. The psychological and personal characteristic of an investor determines the level of risk he is willing to take.

Results

The behavioral finance literature argued that investors may care about more than risk and returns. Investing may offer expressive benefits like status and feelings of social responsibility besides utilitarian benefits like low risk in combination with high returns. Tastes differ and different investors like stocks for different reasons as they try to satisfy different needs with their investments. We have performed an empirical study on the different social, economical and psychological needs the investors aim to satisfy by investing. Our investment survey made a distinction between these different needs and showed important differences for male and female, old and young investors, and investors with a high level of investment-related knowledge and experience and investors with a low level of investment-related knowledge and experience. Some of the major findings of the study are :

1. We found the seventy six percentage of the total respondents where male and twenty four percentage where female investors. This confirms to the findings of Barber and Odeon (2001) who found investing to be a traditionally masculine task in the US, and therefore, as a group, men can be considered to be more in tune to investing than women.
2. The age group of the investors in the study area plays an important role in their investment decisions and objectives. People in the age group of 45-55 years were more averse to risk taking and preferred to invest in government debentures and other debt instruments. In the study Thirty two percent, that is one-third of the respondents where in the age group of 25-35 years. Twenty percentage of the respondents where in the age group of 35-20 years, eighteen percent where below 25 years of age and twelve percentage where in the age group of 45-55 years. The average age of the respondents was 40.8 Years and the standard deviation was 15.73. The average age reflects the fact that young adults and middle aged players tend to be more active in the share market. The average income of respondents was 36,800 rupees per month.
3. The education level of the investors also determines their awareness of investment avenues as well as their preference for certain type of investment avenues. Investors with little or no education made investments which are more emotionally driven while more educated investors made their investments after careful study of the market conditions and often based their investments on the advice of experts. To study the impact of education levels of investors on investor awareness and preference, the sample respondents were grouped in to four categories based on their qualifications, namely, Post graduate, Graduate, Intermediate, and no formal education. 24.3 percentage of the respondents where Post-graduate, 39.9 percentage were graduates, 35.7 percentage were intermediate. The absence of investors with no formal education is a reflection of the high level of literacy in the study area.
4. The marital status of the investors is another influencing variable of investors attitude and behaviour. The study found that married investors tend to be more interested in investing avenues as they were more

worried about savings for children's education, future medical expenses and retirement benefits. The married investors are more conservative in their choice of investment avenues and showed a market preference for debt instruments, government bonds and mutual funds. In the study 86 percentage were married, 12 percentage were unmarried while 2.1 percentage were widowers.

5. To study the awareness of investment avenues among the investors, the respondents were asked to rate their awareness about investment products like bank deposits, company deposits, small saving schemes, life insurance schemes, mutual funds, real estate, corporate securities bonds, equity shares and preference shares. Majority of the sample investors expressed their awareness (know well) of investment avenues, which included equity shares (47%); preference shares (39%) and company deposits (39%). Most of the investors also displayed high level awareness of bank deposits (87%), Life insurance policies (39%) and small saving schemes (35%). It can be inferred that majority of the investors in Mangalore are quite aware of corporate investment avenues like equity and preference share, mutual funds, corporate debt securities and deposits.
6. The study found that the attitude of full-time salaried persons is significantly different from the other occupational categories of respondents, namely, retired persons and self-employed persons. The percentage of responses of attitude about various investment channels among salaried persons is significantly higher than that of persons of other occupational categories. This leads to a conclusion that the occupation of the investor is a factor influencing attitude about an investment avenue.
7. To ascertain the investment objectives influencing the investor attitude and their investment behaviour, sample investors were asked to indicate their choice for various investment objectives in the descending order of their preference. A majority that is 63 percentage indicated that "potential for financial gain" as their first objective, 49 percentage indicated that "safeguarding their retirement" as their second objective, while 45 percentage indicated "tax savings" as their third objective where as 30 percentage indicated "identifying with peer group" as their fourth objective for investments.
8. To ascertain the frequency of the investment, the sample investors are asked to indicate their investment activities in terms of time- daily, weekly, monthly, quarterly, half-yearly and yearly. It was found that 43 percentage preferred to do weekly investments, 23 percentage preferred to do investments on a monthly basis, 12 percentage preferred to trade daily, 10 percentage of sample respondents traded on a quarterly basis, 8 percentage preferred to invest every six months and 4 percentage invested on a yearly basis. The findings reflect the fact that people are more active in the share market and monitor their investments regularly.
9. It is always important to know the persons, who actually participate in the decision making process while investments are made. In this context, the sample investors were asked to identify the persons, who normally assisted them in the investment decision making. It was found that 24.9 mentioned that they took their own decision, 43.9 percentage were helped by family members, 13.9 percentage were advised by professional investment consultants while 17.3 percentage depended on their friends for their investment advice.
10. To study the investment monitoring behaviour of the sample respondents they were asked to indicate the steps they take to monitor the performance of their stocks. It was found that 41.4 percentage of them monitored their profit making investment regularly, while 25.1 percentage had a long term perspective and hence monitored their investments periodically, 22.1 percentage of the respondents said they preferred to monitor the overall performance of their portfolio rather than the performance of individual stock and 11.4 percentage of the investors said they monitor their poorly performing stocks. This clearly shows that investors derive greater satisfaction when their investments are doing well as it helps to avoid regret in the future. Similarly those who look at their gains and losses over all the investments are astute investors who are following the concept proposed by Khaneman and Tversky (1974) in their prospect theory.
11. To ascertain as to whether the investors like or dislike risk while making investments, a statement reading "I dislike risk when it comes to investing" was placed before them and their responses were collected. It was found that nearly 36 percent of the respondents agreed with proposition while only 25 percent disagreed with the statement. It indicates that investors in the study area are risk averse in their investment

decision. Further the investors in the study area were asked to place themselves on a risk rating scale starting from Very Low to very high based on their tolerance levels of investment risk. It was found the most respondents; nearly 40 percentage said they are moderate risk takers. Low risk takers preferred security over returns, while High risk takers tended to be more aggressive in their portfolio formation. There was a clear negative correlation between age and risk preference as youngsters tended to be more aggressive in their risk appetite.

12. To ascertain as to whether the investors were willing to take a calculated risk while making investments, a statement reading “I take calculated risks” was placed before them and their responses were collected. It was found that only 9.9 percentage of sample respondents strongly agreed while 36.9 per cent of them just agreed with the statement indicating that they were willing to take calculated risk while investing. Nearly 32 percentage of the sample respondents took a neutral stand while 21 percentage of the respondents disagreed with the statement.
13. To ascertain whether the investors are willing to accept greater degree of risks to earn higher returns, a statement reading, “I accept greater degree of risk to get higher return” was placed before the sample investors and their responses were recorded. It was found that nearly 57 percentage of the sample investors are willing to accept greater degree of risk provided that they are compensated with higher returns on such investment. Around 20 percentage of the sample have maintained a neutral stand. It was also seen that 23 percentage of the respondents disagreed with the statement meaning that they are not at all willing to accept higher risk for higher returns. From this we may come to a conclusion that some of the investors may be willing to accept higher risks if they feel that they are adequately compensated.
14. To ascertain whether the investors had any experience with investments that fluctuate in value, a statement reading “I have experience with investments that fluctuate in value” was administered to the respondents. It was found that only 4.9 percentage of the respondents strongly agreed while 50 percent of them just agreed with the statement. This indicated that 55 percent of the sample investors had experience with investments that are volatile. 25.7 percent of the investor was not sure of their experience with such investments. It is also observed that around 20 percentage of the respondents disagreed with the statement meaning that they had no experience with such type of investments. From this we may come to a conclusion that some of the investors are familiar with the investments that exhibit volatility in its value.
15. In order to assess the feelings of the investors when the value of their investments actually declined, a statement reading “If my investment value declined, I would be worried”, was placed before the sample respondents. It was found that 13.7 percent of the sample respondents strongly agreed, while 25.7 percentage of them just agreed with the statement. This indicated that around 39 percentage of the sample investors worry much about the decline in the value of their investments. Around 28 percent of the sample respondents are not sure of their position in such a case. It was also seen that around 33 percent of the respondents disagreed with the statement meaning that they do not worry even when their investments lose their value in the market. From these observations one may come to a conclusion that some of the investors react very much to the decline in the value of their investments.
16. To know the investors' preference to low risk investment, a statement reading “I prefer low risk investment with a known yield as opposed to an investment with more risk” was placed before the sample investors and their responses were recorded. It was found that 12.4 percentage of the investors strongly agreed with the statement, while 49.2 percentage agreed with the statement. This means that majority of the investors prefer to invest in those investments with low risk and with known yield as opposed to investments with high risk.
17. The study found a positive correlation between investor's income and investment behaviour or more precisely the propensity to take risk. It was found that people with higher income were more willing to take risks compared to those with lower income; it is due to what is called “Income Smoothing” effect. The effect states that with higher income people tend to smooth their income as they become more confident of sustainability of their income.
18. In the study the sample respondents were asked to predict the behaviour of the stock market given that the stock market had moved in a particular direction in the past three days. When they were presented with a

situation that the market has increased in the last three days the average increase predicted by the respondents was 31.2 percent whereas when they were asked to predict the movement of the market following consecutive decrease in value they answered it as 28 percent. This behaviour can be explained by what Kahneman and Tversky (1974) call as representative heuristic where people often neglect the base probabilities.

19. The study finds support for the view that investment decisions are not always a rational decision taken by an individual. Psychological factors like fear of loss, overconfidence and anchoring effect investor's ability to optimize his/her investments.

THE EURO CRISIS: GREECE IS DEFINITELY NOT THE MAIN CULPRIT BUT RATHER A VICTIM OF THE EU “DOUBLE STANDARDS” POLICIES

*Dusan Soltes, dusan.soltes@fm.uniba.sk
Faculty of Management, Comenius University, Slovakia*

Abstract

The paper deals with some experiences as gathered from our research in the area of the European Integration within the EU in general and with the current handling of the ongoing global economic and financial crisis in particular. That in addition to various other negative impacts on the Internal market of the EU has brought with itself also a direct threat to the very existence of its common currency Euro. The paper in more details presents some of the main reasons for these negative development and impact on Euro as well as analyses the reactions and measures as taken by the EU institutions in order to save its common currency from a total collapse and/or its splitting into two “sub-currencies” as a stronger north and weaker south Euro currencies.

Some key background information on reasons why especially Euro has been so negatively effected by the ongoing global economic and financial crisis

In this respect it is important to realize that the entire process of preparation and implementation of Euro has been a long term process that has originally started as an integral part of the process of the development of the European Economic and Monetary Union (EMU). In view of this relatively complicated inception of Euro as a common EU currency it is important to take into account that the first initial steps towards future common currency have been laid down by the so-called Werner Plan yet in 1971 in order to overcome at that time threatening currency crisis that led to abolition of until that time existing a system of stable exchange rates among major world currencies. As a result, finally a ECU – European Currency Unit was introduced as a special currency unit that was not existing as a real currency but was serving as a kind of some financial and accounting and non-cash unit. However, only after 17 years in 1988 the European Council has adopted a strategy of gradual introduction of a true and real common European currency within the framework of the Economic and Monetary Union and on the basis of the so-called Delors’ Report in three relatively independent stages:

- 1) This first stage of 1 July 1990 – 31 December 1993 was marked by an abolition of any limitations on the free movement of capital within the EU. During this period on 7 February 1992 also the so-called Maastricht Treaty on the European Union has been signed that among others adopted also the famous Maastricht convergence criteria that are serving as the basic criteria for EU member states to become eligible for entering into the European common currency that at that time had not yet had its official name.
- 2) Again with some delay the second stage 1 January 1994 - 31 December 1998 has introduced some institutional provision for the future common currency viz. the EMI - European Monetary Institute. During this stage also the name of the future common currency i.e. Euro has been approved in December 1995. After another year in December 1996, the design of future Euro banknotes and coins has been approved and in June 1997

the so-called Stability and Growth Pact has been adopted as the necessary precondition for adoption of the future common currency.

However, the most important outcome of this stage has been the decision made by the Council of the EU that on the 2nd May 1998 has - although unanimously - adopted for the fate of the future Euro a rather controversial decision that altogether 11 EU member states are “meeting” the Maastricht convergence criteria and thus they are eligible for adoption of Euro since 1 January 1999. With the effect of 1 June 1998 the EMI has been replaced by the ECB – European Central Bank as the central institution being responsible for Euro as the new EU common currency.

3) The third, last and the most important stage in Euro preparations and implementation started on 1 January 1999. On that date, the mutual exchange rate system among the particular currencies has been unchangeably fixed up. What as it has been proved later was not the most favourable decision for the new common currency as it has thus fixed up also some differences in economics of the member states and thus putting some of them into somehow permanent disadvantageous position. Since that date, also the Euro has become the official “common” currency of the EU for 12 EU member states that adopted the new common currency Euro on 1 January 2002. On that date also again by a certain paradox - with the three years delay after the date when the Euro has become the official currency of the EU - also the new Euro banknotes and coins have been put into real circulation and practical utilization.

Summary of some key problems and weaknesses of the Euro preparation and implementation that made it so volatile vis-a-vis the current global crisis

In a brief summary, the main problems and weaknesses of Euro due to its above complex and long preparation and many surrounding controversies have been as follows.

The entire process of preparation and implementation of Euro as a common currency has been too long lasting for more than 30 years since inception of the Werner Plan so the momentum of the new currency has been during those years to some extent lost especially as far as the citizens of the EU are concerned with a quite natural question – if it is so complex and complicated and with so many compromises what is it all good for

In spite of such a long preparation, one of the biggest systems shortcomings of the new common currency has been the fact that due to above longevity and complexity of its inception, it has been prepared only as a special currency in the form of common banknotes and semi-common coins but without any harmonization in the fiscal and other related policies. So from the very beginning it was only a common currency in circulation but not in any of at least elementary fiscal especially taxation common policy. Due to this fact the Euro in different member states countries has very different “value” so to achieve one of its main objectives i.e. mutual comparability of prices in different countries is absolutely impossible

Another important negative aspect of the new currency has been an unclear and confusing institutional provision and responsibility for the new currency. In addition to the ECB – European Central Bank as the main regulating and control authority for Euro it is also the shared responsibility of all central banks in all Euro-zone member states what in practice means that there is a natural space for a kind of irresponsibility in taking a due care for their common currency. This inconsistency has come up and been manifested in full only since the beginning of this crises when all countries instead of their common approach to protect Euro started mainly to protect their own national interests through various national “initiatives” like e.g. a “scraping car bonus”, etc. And it has been so since the very beginning of Euro although not so much demonstrated as after the outbreak of the crisis. Otherwise it could not happen that the catastrophic situation with public finances in Greece

has been “discovered” only after more than 10 years since introduction of the Euro as a common currency and after “permanent and systematic ” monitoring of the Maastricht criteria strict observance . And this is not only the grave mistake and irresponsibility of the ECB but also all other institutions that are responsible and/or co-responsible for controlling macroeconomic performance and in particular Maastricht criteria like it is in case of the European Commission but also the Eurostat and to some extent also the European Parliament,

The Maastricht Treaty has had at least on “paper” very demanding, strict and obligatory so-called Treaty obligations i.e. criteria to be met not only by applicant countries in order they could become eligible for becoming the Euro club and/or the Euro Zone members but also by permanently by all Euro zone members. In failing to do so it has been possible to punish the particular country by adequate fines as applied towards violators of any part of the treaty or any other part of the EU legislation. But unfortunately from the very beginning the interpretation of the Maastricht criteria in practice and requirements for their permanent observation has been very controversial, full of double standards etc. What finally led to the current deep crisis of Euro not because the global crisis but mainly due its internal controversies we have just presented.

The Maastricht criteria – originally only three countries met them in full - as one of the main reasons for the current critical problems with Euro

As mentioned in the end of the previous part, one of the main deficiencies of Euro as a new common currency of the EU has - in addition to some others as described above - been not a very systematic handling and application of the so-called Maastricht convergence criteria. As the key selection criteria on eligibility or non-eligibility of the applicant country for joining the Euro Zone they were supposed to play the key role in selecting future Euro Zone countries and also in achieving a permanent stability and strength of Euro . Basically, those criteria as the Treaty duties and obligations should not allow any different interpretation and/or derogations in case of the Euro zone applicant countries.

Finally, the following specific convergence criteria (in addition to some more general criteria on macroeconomic stability, etc.) have been adopted and have become a part of the Maastricht Treaty:

- the price stability and/or inflation – not more than 1.5% above the level of three best performing EU member states
- the state budget and/or government deficit – not exceeding 3% of the GDP
- the ratio of total government debt to the GDP shall not exceed 60%
- the interest rate should not exceed by more than 2% those of three best performing countries in the above inflation for at least one year before the examination
- participation in the exchange-rate mechanism of the EMS for at least two years without any fluctuation above or below that mechanism.

As usual in the EU by a certain unwanted paradox, the biggest problems to meet these criteria had had those countries like Germany or France that were most demanding in their most tough and demanding formulation. In order to meet them, finally they had to resort to various (temporary) not-so-clear measures in order to pass through them and qualify themselves for becoming future Euro Zone members. Although it had to be clear for them that such their “successful finish” could not on a long term basis secure their non-problem participation in the Euro Zone as according to the Treaty terms all these criteria must be met on a permanent basis otherwise, the violating country will be severally punished by a high financial penalty to be paid for the entire period of non compliance.

Finally, in spite of all various measures often being on the threshold of unfairness, eleven EU member states “met” these criteria but...

The detailed analysis of their performance in the decisive period before the adoption of Euro shows that in full these criteria were met only by 3 (three!?) out of “eligible” 11 EU member states:

- France but it had also some big problems and needed some “innovative” solutions in valuation of their gold reserves in order to meet the criterion on the budget deficit but finally has not succeeded in their sustainability
- Finland
- Luxemburg.

Again by a certain paradox we may see that among those three countries meeting the Maastricht criteria in full was missing also the country considered to be a main economic engine of the EU and the proponent of the most though formulation of these criteria!

It is evident that such a composition of three only member states – moreover two of them too small for being considered even as a representative sample or prototype of any future common currency - could not represent the first group of the users of the future EU “common” currency. Hence, in interpretation of individual criteria were finally and again as usual in the EU adopted such various supporting clauses existing in the Treaty as the last resort that made them eligible in even cases that their total debt (on these criterion otherwise failed altogether 7 out of 11 “eligible” countries) exceeded the limit of 60% of the GDP by almost 100% and was hovering on the levels of 113-116 % like in case of Italy and Belgium! But could one imagine that the top representatives and thousands of well paid employees of the most important EU institutions stationed in Brussels would be paid in Belgian Franks instead in their ”own” new common currency – Euro?!

Hence, finally the selection of eligible countries was a process of various politically and otherwise motivated compromises that enabled to choose those 11 “eligible” countries that “met” Maastricht criteria or as one of “saving” clauses stated “demonstrated that any exceeding above the reference level was only exceptional and temporary and the ratio remains close to the reference value ...”.

With the difference of more than ten years since those “temporary... exceptional...close to be...” exceptions were used, we could state that most of them remain until now almost on the same high levels as when their were approved. What has changed it was the fact that some additional problems with other criteria have just appeared. Hence for some time there was the strong general tendency to soften some criteria as they are too tough, rigid and as such “breaking” any sustainable economic development in the Euro Zone member states. These tendencies have intensified especially when also France and Germany started to have serious problems with keeping their budget deficits within the required limit of 3% of the GDP. As it was already problem of two main engines of the EU it is not surprising that finally not those two “EU engines” were punished by the severe financial penalties but... the particular criterion was... somehow softened exceptionally for them but not e.g. for new applicants for Euro from the NMS – New member states?! They have to meet original Maastricht criteria in full and on permanent basis.

In order to finish this part on some different application of the Maastricht criteria – otherwise typical approach in the EU - we dare to add only that: only Greece originally was used as an example that the EU authorities concerned were very consequent in demanding the meeting of the Maastricht criteria. Thus in this only case, they clearly demonstrated that Maastricht criteria are not a rubber ones that could be somehow adjusted to any not properly performing countries.. Therefore, later on, Greece had to meet all criteria in full in order to become the 12th member of the first Euro group of states that introduced the “real” Euro on 1 January 2002, This Greece case is a difference to some other much bigger states that even until now have not managed to reduce their enormous exceeding of their total debts as it is in the case of Italy or Belgium, but...Also now during the critical situation with Euro mostly only Greece is singled out as an example of a country that has

not been respecting its obligations towards Euro. As the only country that has been carelessly manipulating with the indicators on the Maastricht criteria and with other important macroeconomic indicators while some other countries not being much better than Greece like e.g. Italy, Spain, Portugal, but also Ireland are mostly not mentioned at all or only very marginally. Although for example according to the latest available statistics Italy has a higher total debt of 115.8% of the GDP than Greece with 115.1%. It means that in ten years Italy has practically not managed to reduce its total debt at all. Although it has been accepted to the Euro zone on the basis that it has been showing a positive development in this respect?! But where has been that positive development is not clear even until now! Hence there is an immediate question where have been all those already mentioned regulatory and control institutions of the EU like the ECB, EC, EURSTAT, EP that they in 10 years have been unable to discover violators of Maastricht criteria not only in case of Greece but also all other?! But unfortunately also in the EU it is true that we all are equal but some are just more equal especially if you are big and strong enough country. These and various other criteria and “criteria” for Euro are on the other hand in some sharp contrast with the real situation in using Euro, that in addition to the EU member states has already been used instead of national currency in numerous states that are not EU members and have not met any Maastricht or other criteria as e.g. it is in case of Monaco, Andorra, San Marino, Vatican (even with a special privilege to mint its own coins?!) and also some other countries that are even not EU neighbours like Montenegro or Kosovo in order to mention just Euro “users” in Europe. All these and some other cases have of course nothing to do with any monetary or other common policy of the EU, it is just a politics and towards a tourism business oriented tolerance if we realise that the set of Vatican coins with the face value of 3.88 Euro is possible to buy in the souvenir shop for only not less than 400-500 Euro?! Quite a good business isn't it?!. However, definitely it is unfair and discriminatory towards the EU own especially new small members that have to meet without any derogations all Maastricht criteria and prove also its sustainability while its own big members did not need that and the same also those external states-users of Euro like e.g. Kosovo or Montenegro. Although in some respects they are bigger than some of the smallest Euro zone member states like Malta, Cyprus but also Slovenia.

Current situation and problems of Euro vis-a-vis the ongoing global economic and financial crisis

After such a complicated and often controversial development, a careless regulatory and control mechanism from the side of the particular EU institutions led by the ECB and EC it is no surprise that the Euro has been so negatively effected by the ongoing global economic and financial crisis.

At at the outset of the crisis there was existing quite an indifferent and critical only approach towards the Euro crisis that has been most dangerously presented in Greece. On one side especially from the side of Germany there was originally no intention to help Greece to get out from the crisis under the slogan that German workers would be not working till the age of 65 in order the Greeks could retire as before at the age of 55 with many extra benefits, perks, etc. There was forced an opinion that the EU is a market economy with the rules also for bankruptcy that should be applied not only in the case of unsuccessful companies but also of states. But soon after when it has been finally discovered or at least publically admitted that Greece is not the only member state of the Euro zone on the verge of bankruptcy and that most of so/called “toxic” loans to Greece were quite logically from big German and French banks also the general strategy of the EU towards Greece has completely changed.

The saving Greece and thus also Euro and Euro zone has become a case of the EU solidarity and mutual help as it has been enshrined in the basic Treaties. It is pity that it is applied only mostly in case when big members feel to be threatened and not also towards small new member states regarding e.g. a free movement of their citizens, CPA – Common Agricultural Policy subsidies, etc. And so forth.

Finally after many heating debates the EU leaders have come to the plan to save and help to Greece and to prevent anything similar in the future by adopting to main instruments in this respect i.e.:

- A massive loan to Greece
- A so-called “Euro wall” i.e. a large fund that in the future could be used immediately in similar cases to help to any Euro member states in case of similar crisis.

But again it would not be the EU if again also this plan would not be creating some controversies. The first is that the sources for both of them were sought not where the problems were made but under the false and often otherwise overlooked principle of “solidarity” it was sought within all members of the Euro zone and of course without any kind of direct accountability for this disastrous situation of Euro. Only in such a way could happen that e.g. for particular “Euro wall” the countries have to contribute by the following per cents of their GDP:

- | | |
|--------------------|-----------------|
| - Slovakia 6.50% | - Spain 4.81% |
| - Germany 4.78% | - Greece 5.16% |
| - Luxemburgh 2.80% | - Belgium 4.44% |
| - Italy 5.02% | - France 4.60% |

What is on these figures interesting it is several facts:

- Slovakia that is the far poorest country in the Euro zone with only the GDP per capita 21,245 USD has had to contribute by the highest percentage of the GDP although it has been in the Euro zone only a little longer than one (!) year so much damage in this respect could not be made
- Luxemburgh as the richest member with the GDP per capita 78,395 USD has allocation only 2.80%
- Even more interesting are the cases of those who on the long-term basis were violating the Maastricht criteria without any punishment so one would be expecting that at least in this case they would be allocated by a proportionally high contribution to this fund that to the large extent has to be created mainly due to their irresponsibility but... As we may see the contributions of Greece, Italy, Belgium, Spain as the main culprits in this respect but also France and Germany as the main architects of the Euro are only between 4.44 – 5.02%. By a certain paradox these limiting figures are of Belgium and Italy who for more than 10 years since inception of Euro have been violating the total debt within the Maastricht criteria by almost 100%! And of course they GDP per capita is between 29.109 in case of Italy to 35.422 USD in case of Belgium.

What is even more interesting, it is the fact there was taken no action in this respect towards the EU institutions that are paid by EU citizens/tax payers like the EC, EP, ECB, EUROSTAT etc. as they have directly been responsible for controlling member states regarding their meeting of Treaties obligations and the EU legislation requirements in full and without any derogations. If this has been the case also regarding Euro and the Maastricht criteria there would not be needed any Euro wall and loans from the Euro zone member states! Such and really a huge Fund of collected fines from the violating member states would have been completely full after the ten years of irresponsible disrespect to the Maastricht criteria. But it could not be the case of the EU being infamous for its special

interpretation of the Treaty duties, responsibilities, expected solidarity and generally applied “double standards”, etc.

As a result all above EU institutions have not been anyhow negatively effected by their irresponsible behaviour towards Euro. There have been taken no personal consequences towards e.g. the European Commission and it is still led by the same President whose first term in years 2004 – 2009 was the most important for successful implementation of Euro. And it is absolutely true that in this respect it has totally failed in protecting interests of the EU regarding its common currency what is its main Treaty obligation. The same is regarding the ECB. What consequences have been taken against its top executives that they let Euro to slide into such a deep crisis threatening the very existence of the Euro. And of course there have been so far no financial cuts to the budgets of these and all other EU institutions for their complete failure towards protecting Euro from its current crisis that is still not over and it really could happen what has been predicted by many experts that sooner or later the Euro could really demise

Conclusions

In conclusion we could state that Euro even after more than thirty years of its preparation and more than decade since its introduction as a “common” currency of the EU has not yet become for various reasons truly and fully a real common currency for all its current 27 member states and its citizens. On the other hand as a consequence also of this its internal position, Euro has not yet become an international currency that would be on par with its main competitor on international markets i.e. the US\$. It will need many more years and mainly more systematic and consequent policies and not only monetary to make Euro what it has originally been intended i.e. a common EU and internationally highly recognized currency. The current Euro crisis as we have at least partially presented it in the previous parts of this paper has definitely not contributed to the respect, prestige and confidence towards this very special “common” currency and it is really a question what will be its future development, “enlargement” and position in the world. It is more than clear that Greece is not the last country that has been so negatively effected by the current Euro crisis. There are several more EU countries as potential candidates to follow the problems of Greece. And there exist even an opinion of many experts that perhaps there will if not a total demise of Euro as a common currency then at least its split into two categories, etc.

The New Regulatory Concerns and Regulatory Management

Gouher Ahmed, gouher@agu.ae; gouher@usa.net

Al Ghurair University, UAE

Abstract

The global financial crisis of 2008 originating in the United States of America is spreading to other countries following the collapse of the mid-19th century financial giant on the 15 September of the year and other big banks also on the verge of collapse has raised concerns across the globe, especially in the United States of America ,and also started the search for some unfailing financial regulations and financial authorities or regulators , but even amidst the countries like UAE and India were noted to be of comparative calm because of their principled banking and central banks. It is mostly a failure of bank leadership, specially of central banks like the US Fed. It is unprincipled banking which is at the back of the crisis, and also ineffective central banking. The regulatory search is led to central banking and dynamic regulatory management (DRM).

Introduction

When the world was thought to be advancing well under the new market ideology of the west, of which the USA is supposed to be the main proponent- in the 21st century, it was struck in 2008 by financial crisis of the magnitude of the Great Depression of the 1930s, strating with the No.1 economy of the world of the USA spreading to the rest of the world like a wild-fire, from the devastations of the US and the rest of the world have yet to recover .For example, the rate of unemployment in the US is said to be running at the yet un-maintainable level of 10% (Business Standard, 2011), not to say of the other less ‘robust’ countries and economies. Democratic India too has yet to hit its pre-2008 near to double digit growth rate of 9 per cent plus, notwithstanding its self-acclaimed prudential financial management of the crisis and its international economic good behavior according to principles of ‘free & fair trade’, unlike some nouveau riche countries aggrandizing themselves.

What is more, it is feared whether the Great Recession, a great calamity in itself would slide into a far great calamity of Great Regression , according to some straws in the wind. “After the Great Recession, Europe has embarked on a Great Regression. Wages, Pensions, unemployment insurance, welfare benefits and collective bargaining are under attack in many areas as governments struggle to reduce debt swollen partly by the cost of rescuing banks during the global financial crisis” (Taylor, 2011). So, it is banks at the centre of the crisis, calling for not only rescue but also regulation , to see that such crises do not take place hence after. But, before the future, the present crisis is to be fought-off. Following this concern exercising G-20, IMF, IBRD, banking and academic circle too , this Note is addressed to the new financial regulatory concerns, regulations and regulatory management that appear to be eluding a consensus. It is in the nature of the crisis the regulatory remedy or remedies lie. The big crisis itself after so much experience and expertise of running the financial institutions and regulation appears to have no cause when everything appeared to be running well under the new international economic order of globalization, privatization, competitions, free and fair trade, etc. (Paul, 2008). However, the free-market ideology, which calls for a lot of self-discipline and self or voluntary regulations on the part of all its players, should not be interpreted to do anything in pursuit of profits. Accordingly, the new regulatory concerns assume importance for an academic investigate, with the objective of unraveling the nature of crisis and whether right remedies are being sought in the new regulatory searches. The exercise may start with a note of the objectives and methodology of this modest exercise.

Objectives

- i. To understand the nature of the great crisis,
- ii. To know whether the regulators were helpless against the crisis and its alleged authors or perpetrators,

- iii. To fathom the new regulatory concerns and regulatory remedies,
- iv. To outline the nature of Regulatory Management that would take care of Great Crisis and their formidable players, and
- v. To draw lessons from crisis, of policy and Regulation.

Methodology

In the first place, it is the free market ideology giving a freehand to the market players as the benefactors of mankind which is at stake and is to be examined. Does it mean regulatory helplessness? This question is addressed. Next, it is the question of banking, particularly big banks, which is said to be at the heart of the crisis, but banking is well established economic setup which is the guardian of public money which should be the last or never to stray away from the path of trusteeship. So, along with the free market ideology, the question of banking and banking standards are also gone into, in the breach of which the whole problem of the crisis appears to lie and the failure of central banking to uphold the principles of banking. Also, whether the big banks means no principles of banking to follow. Then the Great Crisis itself is examined and the efforts at warding it off and the cost of the crisis in human and materials terms.

It is also well known that there is a crisis—within the crisis, debt crisis, under which government after government are reeling under and being bailed out by the IMF and follow government movements such as that of the EU, quite reluctantly, and these and many are running budgetary and trade deficits, including India. There are regulatory concerns on this bigger score also (Krugman, 2011).

As such, regulatory concerns, arising out of the Great Crisis-2008, are very much in the air not only at the national but also international level of which a view is taken, as also of attempts at new regulatory bodies or super or unfailing regulators that would make the world safe from big or great financial or banking and debt and budgetary crisis. Not the least is the Regulatory architecture or management (RM) that is to emerge from the new regulatory concerns and regulations.

Finally, the method of the study is to see whether the new regulatory concerns remedial concerns and measures and architecture meet the basic problem of the crisis which appears to be the regulatory failure itself, self and of the regulatory authorities. Why, for example, entities like the UAE are free from the regulatory concerns' show they could have a safe sail through the crisis? The case of India is not different, where there are no regulatory concerns. It is a different thing that the Government of India, for no reason but just to assert itself unnecessarily and against a good working central bank, appears to be thirsting for a regulatory concern or two. Indian's is a case of petty political over lordism in the crisis to rule over a good working central bank. The roots of the crisis are deep and abutting that need to be taken a view. Why, again the US neighbor Canada has no regulatory concerns and appears to be a calm amidst the raging financial storm just in the neighborhood. In the light of this, the new regulatory concerns, may appear panic reactions, which, in retrospect, may seem unmissed for.

Market and Banking Ideology

There is no doubt the winds of change blowing across the continents and countries, bringing the countries together, the winds of globalization, marketization, privatization, enterprise, innovations, mobility, internet, mobile phones, international business, travel, tourism and education, free trade, consumerism, advertisement, enterprise, rising aspirations, environmental concerns, space exploration, etc. The economic dictum of this new world economy is the rule of the invisible hand or price mechanism, an all time and seemingly an ever alluring accept of Adam Smith (1723-1790), the author of the foundational classic of the science of economics as well as business *The Wealth of Nations [1776]* (Smith, 1776). Notwithstanding its critics, the ideology, by and large, continues to dominate the domain of economic policy and practices (Economist, 2001). It needs no saying that the market ideology is for high growth, greater trade and more welfare, for ushering in, in short, an era of global prosperity. It

is well known that the late Prof. C. K. Prahalad, the management doyen, had called upon the business in general and MNCs in particular to advance their footsteps towards the bottom of the economic pyramid (BOP) made up of the world's poor and produce goods and services for the poor by somewhat lowering their high profit expectations (Prahalad, 2004). Prof. Prahalad's is a great innovation in economic and business with a great humanizing effect, lending the new market ideology a human face and a concern for the welfare of humanity at large. The market theory is for unleashing enterprises and innovations. It has brought, among other things, mobiles at a cost of Rs. 500 or \$ 11 a piece within the reach of the common man in India, a country of great poverty numbers. The Crisis raises doubts concerning the free market ideology (Economic & Political Weekly, 2009) whether it is time for a counter-revolution is a different thing. There is, however, no doubt about the crisis raising regulatory concerns. One thing overlooked concerning the free market ideology by all the players is self-discipline and Umpiring, and nobody big enough to break the market code. In fact, the bigger enterprises have greater responsibility thrust on them. They are the uncrowned market leaders who set example in good business behavior for the rest. They are economic lighthouses who should strike a right path for themselves and the rest. They are business leaders. No business or profit at the cost of the public good and general welfare, which is not philosophy or ethics but fundamental market and business principle. Banking, especially, should be the embodiment of this all time principle. No tampering, hanky-panky. The foundation of banking is PUBLIC TRUST. They should set financial standards and norms of good financial behavior. There is an unbreacheable banking code. If anything, the crisis appears to teach that the bankers, especially the so-called big bankers, need to taught the banking principles. It is an unfortunate situation that even the great central bankers appear to be in need of learning the banking principles and the principles of central banking. There is no such thing as free-for-all-banking.

Banking Principles

It may seem belaboring the obvious to talk about the banking principles to the management community, but it is the breach of these age-old, trusted principles which is the heart of the big or the first big financial turmoil of the 21st century and all efforts at the national and international level are being expended to invent a financial regulatory Holy Grail (s) alin to a wild-goose chase. For, after all, all these years, especially in the greatly inventive 22nd century, the world has not been living in financial regulatory dark times. The world had lived through the far greater financial crisis of the Great Depression. It's now only Great Recession, somewhat a lesser calamity. Eternal vigilance, they say, is the price of democracy, the winds of which appear to be blowing across the seemingly democratically arid Arab World. Free market ideology and system is alien to economic democracy that needs, to be eternally guarded. But, the Guards, the bankers viz. the central bankers appear to be off-the duty-the mighty Fed, the historical and imperial BOE and the no less distinguished BOJ, which, it appears, need to learn from their lesser brethren like the Reserve bank of India (RBI) that had stood tall and firm during the Crisis. No less is the role played by central banking in the UAE, entity of about four decades. They are examples of good banking.

Whatever it may be, no sub-prime loans, at the heart of financial crisis banking calls among the banking principles-nor putting all investment eggs in one basket-In the crisis in housing (Sowell, 2009)-nor passing the buck on to the unsuspecting public around the world in the form of mortgaged back (un) securities or derivatives. "The 'creative' financing of home mortgages and the marketing of financial securities based on American mortgages around the world are part of the story of how a financial house of cards was built up and then suddenly collapsed." (Financial Express,2009).

Banks should reach out to the general public and make them partner in their business, of which the first is mobilization of deposits-the stock-in trade of banks. The need, it is needless to say is for the BOP or inclusive banking or banking inclusive of the common man saving, Deposits, as such, are the first principle of banking (The Penguin Dictionary of Economics, 1972), from which the rest of the banking principles follow-Liquidity, Security, Prudence, Economy, Reserves, Sound Investment, Due Diligence, Trusteeship, Public Confidence, Low Profile, Productivity, Credit creation, Monitoring, Mortgages, Credit Counseling, Recoveries, Deposit and Interest Rates,

Profit Margins, CEO Pay and Bonuses and Perks. The Golden Rules of Banking are liquidity, Security, Profitability and Public Trust.

Above all, the central banks should stand tall and see that their constituent banks however big and trying to be forbidding on the right lines and are not an authority and law unto themselves. The real regulatory measure in the given circumstances would be to create a Regulator of Central Bank, say, Fed Regulator or Regulatory Authority, a ridiculous proposition. The mandate of central banking is banking governance beyond all hum-drum politics and politicking. Central Banks are begin banking rulers and overlords with carrot-and-Stick. The Fed should have heard quite in advance the tolling of the bells of the impending crisis.

Here is what the great economist the late Prof. Samuelson has to say about the Fed-Federal Reserve System, the US Central Bank, generally acknowledges to the first of the Central banks of the developed world, where decisions have world-wide repercussions. The Fed is said to be interested in the interest of the American public and always acts in their favor (Samuelson, (1980). But it appears to have failed in the present crisis daily costing huge to the US public.

“In 1913, Congress created a Federal Reserve Act, signed by President Wilson. The reform sprang from the panic of 1907, with the alarming epidemic of bank failures. After half a dozen years agitation and discussion by both parties, the Federal Reserve System was formed-in face of strong banker opposition” (p.275) So any banking reforms and regulations are not easy.

The Fed is a public agency, its role has expanded over the years (MacDonald & Koch; 2006), but its primary focus has remained the same, and the Fed is directly responsible to Congress, and whenever any conflict arises between its making a profit and the public interest. It acts according to the public interest without question. It's in fact, one of the most eminent public institutions of the US. Although the President appoints the Board of Governors and considers its allegiance is primarily to congress and not to the executive branch.

This is not intended to be an easy on Banking and Central banking, but on the big financial or banking crisis of 2008 and the regulatory concerns raised by it and the search on for new regulations and regulatory bodies, which even if necessary are not going to be an easy sailing in the light of the seemingly 'sovereign' Big Banks and their Rightist or ultra Rightist political pals. The battle for any regulations or regulatory bodies is most likely to be lost, at the very thought stage. It is not the intention to paint a dark or darker picture of the troubled situation, but to bring home human and leadership failure(s). There is no lack of 'weapons' of bank and credit regulation-both major and minor. There is the minor but powerful weapon of "Moral suasion" to make the banks see reason and the writing on the wall, from indulging in any unbanking practices. This does not appear to have been used by any during or after the present crisis. It is the weapon of last resort, a powerful weapon which puts the guilty and the culprit at the bar of public opinion and makes the things known to the banking and the general public and all stakeholders. As it is, the bank CEO's appear to be in low public estimation. The general consensus is that the crisis is owing to the bankers 'greed' and unbanking practices. Both CEO royalism doesn't seem to impress the general public.

The Big Crisis

Among the results of the Crisis is the output of large 'crisis literature, which is not to be at an end for quite some time to come. "The economic recession that the world stumbled into seems to have caused larger damage to the forests than banks. .. the "recession literature" itself.. is already packed to rafters" (Jagannath, 2011). There may be a larger picture involved in the crisis, as the crisis may be depicted as the crisis of capitalism. There are for ever capitalism bashers, but the system instead of collapsing or exhibiting any signs of collapse even getting back to its feet. The over-riding factor or the factor of the factors in all the exercise regarding the crisis is sub-prime or bad or un-maintainable or ineligible loans quite overwhelmingly to the single sector of housing from

the start of the 21st century in the United States of America and elsewhere. This breaches the banking rule of not putting all eggs in one basket, so theoretically and practically quite an untenable banking proposition for any good length of time. It's a case of infirm or bad credit management. Sub-Prime loans are not at all in the banking lexicon. Do the banks need to be told this basic principles of banking in India, the RBI- Reserve Bank of India-cautious the banks to be wary of real estate loans. Then, during the Crisis, the RBI has had the good fortune of a good leaders or Governors, D. Subba Rao and his predecessor Y.V. Reddy. Dr. Reddy was taken to be a crisis averting central banker by no less than an authority than Prof. Stiglitz, an Economics Nobel Laureate. Then the crisis boils down to the crisis in central banking leadership. It is Prof Krugman's constant thesis and refrain that the crisis is entirely the work of the big US bankers. He has very strong words for them, such as looters. His almost seemingly single-point programme of banking reform and regulation is banker's compensation (Krugman, 2009). Prof. Krugman too is an Economics Laureate and a people's economist whose opinions cannot be brushed aside as partisan or ideological. The Fed and its leadership are not spared. In his view, the Fed is awakening from its slumber and thinks that the bankers compensations too falls within its regulatory purview as a measure of preventing reckless banking. For, 'royal' pay and perks, bonuses, house furnishings, paid holidays, private jets, etc., also, it needs, no elaboration, do not fall within the principles of sound banking, The US public appears to be palpably furious about the banking royalty. The fury is directed against the presidency and Fed for not disciplining the big businesses.

From the first (Semmler, Bernard,2009) to the latest (Bartirromo, 2011) stories of the crisis point to the deliberate breaking of the banking principles as the proximate cause of the crisis, starting with the lack of saving drive to excessive leveraging, non-prime or subprime loans, heavy housing loans, heavy risk taking, complex securities, the outsourcing of risk, fat pay packs and large bonuses, poor CRM deception, cut throat competition and bad leadership worse are the accusations of fraud against the big Businesses of the United States of America, the banking of which should set a model not of democratic banking, the United States of America standing for the cause of democracy world over and which is the bond of affinity between the US and India There is reported to be a big public furor and wrath against the banking bigs of America from their own people which should be an enough cause for deep introspection and self reform and regulations, beyond any government regulatory concerns, reforms and measures. The public appears to be equally or palpable against, the great Fed and its celebrity leadership. The great Greenspan, the ex-Fed, head appears to be no more a national icon, and the current head Ben Bernanke, an academic, just scraped through the senate for his second term. The role of the fellow bankers in the collapse of the 19th century origin Lehman 15th September 2008, heralding the financial crisis of nearly a century is claimed to be no less than that of the Richard Fuld, Lehman CEO, rated No.1 among the worst American CEOs. The crisis sounds a great human drama disappointment with the charismatic President Obama seems to be no less, with his putting of health reforms as No.1 program of his Administration amidst the big crisis. For, while the importance of a public health program cannot either be discounted or ruled out, the crisis should have been addressed first. That is, first things first. The president, it seems was vetoed down in the Massachusetts senate election in Jan 2010 wherein democratic stronghold, the democratic candidate, a lady, had to give - in to the Republican one, spurring the president to financial regulatory concerns and reforms after nearly 1 ½ years of crisis, during which time massive bailouts were being handed over to the 'too big to fail' (too big to reform and regulate too?) banks by the Fed and the Treasury, denting a big deficit hole in the budget to be called a bailout budget, bailouts 1.25 tr. and deficit 1.35 tr. (Financial Express, 2010). The crisis is compounded by the budgetary and trade deficits.

The US macroeconomic fundamentals are indicative of policy shifts that occurred just after the turn of the century toward fiscal and monetary excess. "Twin deficits" have characterized the US economy after 2001. The current account deficit reflects the imbalance between US national savings and investment, which takes into account both government and private saving and investment balance.

The twin deficits as well as banking lapses, by and large, point to leadership failure for which there cannot be any regulatory remedy, leaving the lapses of political or presidential leadership aside for the time being, before, during as well after the crisis lapse of central banking leadership is most telling, especially in the light of the well

known Davos or WEF consensus for strong, proactive central banks or more appropriately central bankers. Hence, the lament of D. Subbarao, Governor, Reserve Bank of India over the loss of creditability of central banks during the crisis (Subbarao, 2010). Hence any number of regulatory concerns arising out of the crisis (Reddy, 2011), from capital base to the quality of credit, quite understandably, but all falling to the lot of any central banks. Any financial regulations are sure to be met with stiff bankers's opposition as opposed to their freedom of enterprise. The crisis-born Reforms or Regulations, after a lot of deliberations and compromises also fall short of popular expectations, as, for example, leaving the crucial issue of banker's pay to the share holders (Financial Express 2010). Hence what appears to be called for is central bank Dynamic Regulatory Management, the IMF, also failing to throw any light in the troubled situation (Economic & Political Weekly, 2011). The consequences of which are expected to be lost for quite some time.

Dynamic Regulatory Management

So, the ball of crisis management and crisis prevention is thrown into the court of the central bank. It cannot abdicate its natural banking authority and responsibility to any other body. It is the public representative. Big banks should be model banks, as the SBI-State Bank of India, the biggest of all Indian banks and other nationalized and private and foreign banks of India, because the Reserve Bank of India is forever monitoring the situation.

Economic and business situation is ever changing, even keel through this changing situation by an appropriate and dynamic, democratic and progressive regulatory management that is promotive of growth with equity. There should not be duplication of banking regulators or authorities. The principles of management are as much applicable to central banking as to business bodies. However public welfare replaces profit motive.

Conclusion

The Global financial Crisis of 2008, signaled by the fall of Lehman Brothers on 15 September of the year 2008, has many lessons to impart to the politicians, policy makers and bankers and central bankers, to the last, mainly. The crisis, called Great Recession, falls within the domain of central banking. It is the result of breaking all banking principles, with unbridled competition and a seemingly insatiable thirst for profits and fat pay, bonus and perks that do not fall within the ambit of democratic banking. The crisis has raised regulatory concerns and search for unfailing banking regulations and regulatory authorities. The search leads to good old central banking and a dynamic regulatory management (DRM) by it.

Is the Proposed Direct Tax Code a Boon or a Burst to FII's in India

*P. Srinivas Subbara, o ss_pasumarti@yahoo.co.in
M.R.P.G. College. India*

Abstract

Foreign Institutional Investor (FIIs) plays a dominant role in flourishing of the Indian Capital Market. For the first 25 days of October 2010 FII's have invested \$6.11 billion in Indian capital market and the net invested reached a record of \$24.48 billion in the whole year of 2010, which is the magic figure of above Rs.1-trillion mark (\$22 billion) by overcoming the 2007 peak of \$17 billion. This is due to the Government's assurance to continue with the liberalization of foreign investment policy. In this juncture the Government of India is planning to replace its 50 years old Income Tax Act with Direct Tax Code (DTC) which will to be implemented by 2012. The DTC has proposed to tax the income of FIIs from the sale and purchase of securities as capital gains. This paper explains the existing status of taxation of FIIs in Indian capital market and the effects of proposed DTC on the important issues of investments like taxation, capital gains, country of residence, and General anti-avoidance rule (GAAP), etc.,.

Introduction

India is one of the most accepted destinations for overseas portfolio investors to park their fund in the Asian region for 2010. It may be an indicator of increasing confidence in the Indian growth story, when the rest of the world is struggling to fight the recession. According to analysts, the upward revision of economic growth from 5.8 per cent to 6.1 per cent, better-than-expected performance of companies in the quarter ended-June 30,2010 and the trade policy with an ambitious target of US\$ 200 billion exports for 2010-11 have all revived the confidence of FIIs investing in India.

Government of India is planning to replace its 50 years old Income Tax Act with Direct Tax Code (DTC) which will to be implemented by 2012. The DTC has proposed to tax the income of FIIs from the sale and purchase of securities as capital gains. DTC released in August 2009 had threatened to bring all foreign investors under the tax net by overruling bilateral tax treaties signed with other countries.

About FIIs – its role of in Indian economy

Foreign institutional investors have gained a significant role in Indian capital markets. Availability of foreign capital depends on many firm specific factors other than economic development of the country. In this age of transnational capitalism, significant amounts of capital are flowing from developed world to emerging economies. Positive fundamentals combined with fast growing markets have made India an attractive destination for foreign institutional investors (FIIs). Portfolio investments brought in by FIIs have been the most dynamic source of capital to emerging markets in 1990s. At the same time there is an unease over the volatility in foreign institutional investment flows and its impact on the stock market and the Indian economy.

Growth in FII investments in Indian capital Market

TABLE 1: TRENDS IN FII INVESTMENT FROM 1992-93 TO 2009-10

Year	Gross Purchases (a) (Rs.Crore)	Gross Sales (b) (Rs.Crore)	Net Investment (a-b)	% Increase
1992-93	17	4	13	
1993-94	5593	466	5127	39338.46154
1994-95	7631	2835	4796	-6.456017164

Apart from its impact on the market, their holdings will influence firm performance. For instance, when foreign institutional investors reduced their holdings in Dr. Reddy's Lab by 7% to less than 18%, the company's share dropped from a high of around US\$30 to the current level of below US\$15. This 50% drop is apparently because of concerns about shrinking profit margins and financial performance. These instances made analysts to generally claim that foreign portfolio investment has a short term investment horizon. Growth is the only inclination for their investment. Their strategy is –'Why take risk when you are not in profit-exit'. According to the industry experts, hedge funds played a very active role in Indian stock market since 2003 by entering both Indian cash and derivative market. The upward trend in the domestic market is due to hedge funds and regular long-term FIIs. Thus the foreign portfolio investments are found to be very volatile in nature.

Despite these observations, countries and firms are interested in attracting foreign capital because it helps to create liquidity for both the firms stock and the stock market in general. This leads to lower cost of capital for the firm and allows firm to compete more effectively in the global market place. This directly benefits the economy and the country. Availability of foreign capital depends on many firm specific factors other than economic development of the country.

Literature Review on FIIs impact

As the Indian equity market is growing, the trend and future prospects in foreign institutional investments has become a topic of great concern. A recent research survey by Japan Bank for international operation (JBIC), shows that in the next 3 years, India will be the third most favored investment destination for Japanese investors. A Smith Barney (a CITI group Division) study says estimated market value of foreign institutional investment in the top 200 companies in India (including ADRs and GRDs) at current market prices is US\$43 billion. This is 18% of the market capitalization of BSE 200.

It is established in literature that block shareholders influence the firm performance (Cho & Padmanabhan, 2001). Governance of listed companies plays an important role in foreign intuitional investment decisions. Further

more management of businesses run by family groups plays a distinctive role. When governments become block shareholder their objective will be quite different from those of private investors.

Douma, Pallathiatta and Kabir (2006) investigated the impact of foreign institutional investment on the performance of emerging market firms and found that there is positive effect of foreign ownership on firm performance. They also found impact of foreign investment on the business group affiliation of firms. Aggarwal, Klapper and Wysocki (2005) observed that foreign investors preferred the companies with better corporate governance. Investor protection is poor in case of firms with controlling shareholders who have ability to expropriate assets. The block shareholders affect the value of the firm and influence the private benefits they receive from the firm. Companies with such shareholders will find it expensive to raise external funds. Yin-Hua and Woidtke (2005) found that when company boards are dominated by members who are affiliated to the controlling family, investor protection will be relatively weak and it is difficult to determine the degree of separation of management from ownership. They also observed that firm value is negatively related to board affiliation in family controlled firms. Li (2005) observed that in case of poor corporate governance the foreign investors choose foreign direct investment (FDI) rather than indirect portfolio investment. It is generally believed that FDI could be better protected by private means.

Dahlquist et al. (2003) analyzed foreign ownership and firm characteristics for the Swedish market. They found that foreigners have greater presence in large firms, firms paying low dividends and in firms with large cash holdings. They explained that firm size is driven by liquidity. They measured international presence by foreign listings and export sales. They reiterated that foreigners tend to underweight the firms with a dominant owner. Covrig et al. (2007) concluded that foreign fund managers have less information about the domestic stocks than the domestic fund managers. They found that ownership by foreign funds is related to size of foreign sales, index memberships and stocks with foreign listing.

Li and Jeong-Bon (2004) found that foreign investors tend to avoid stocks with high cross corporate holdings. They suggested that FII are likely to be efficient processors of public information and are attracted to Japanese firms with low information asymmetry. Morin (2000) explored the influence of French model of shareholding and management on FII. They commented that France has undergone rapid change from a financial network economy to a financial market economy. The new pattern has broken the traditional system of cross holding and facilitated the arrival of FII who bring with them new techniques and demands efficient corporate management. What could be firm level factors that influence foreign capital from an economic standpoint is the question yet to be answered. Outside investors will lower the price they pay if they fear consumption of private benefits of control family. Choe, Kho, Stulz (2005) found that US (United States) investors do indeed hold fewer shares in firms with ownership structures that are more conducive to expropriation by controlling insiders. In companies where insiders are dominating information access and availability to the shareholders will be limited. With less information, foreign investors face an adverse selection problem. So they under invest in such stocks.

Leuz, Nanda and Wysocki (2003) further asserted that the information problems cause foreigners to hold fewer assets in firms. Firm level characteristics can be expected to contribute to the information asymmetry problems. Concentrated family control makes it more likely that information is communicated via private channels. Informative insiders have incentives to hide the benefits from outside investors by providing opaque financial statements and managing earnings. Haw, Hu, Hwang and Wu, (2004) also found that firm level factors cause information asymmetry problems to FII. Their paper found evidence that US investment is lower in firms where managers do not have effective control. Foreign investment in firms that appear to engage in more earnings management is weak in countries with poor information framework.

There is a growing literature on the determinants of global investment flows and allocations. Most of these studies have analyzed global and country level factors that influence investment allocations. This paper investigated empirically the different specific variables like taxation, capital gains and GAAP which influence the investment decision of foreign investors.

About DTC

The draft Direct Taxes Code (DTC) along with a Discussion Paper was released on 12 August 2009 for public comments to simplify the direct tax legislation in India. Subsequently, comments were solicited from the public and examined by the Government. A Revised Discussion Paper was issued on 15 June 2010 to respond to the major concerns and comments of stakeholders. On 30 August 2010, the DTC Bill 2010 was presented in the lower house of the Indian Parliament. Presently, the Income-tax Act, 1961 (the Act) governs the taxation of income earned in or from or with India. The Direct Tax Code, 2010 is proposed to replace the Income-tax Act, 1961. It is proposed to come into force from the financial year beginning 1 April, 2012.

The revised paper of the DTC has retained the clause directing foreign institutional investors to classify income from investments as capital gains and pay tax on it. “The majority of FIIs are reporting their income from such investments as capital gains. However, some of them are characterizing such income as business income and consequently claim total exemption from taxation in the absence of a Permanent Establishment in India. It is, therefore, the revised discussion paper state that the income arising on purchase and sale of securities by an FII shall be deemed to be income chargeable under the head capital gains.

This would simplify the system of taxation, bring certainty, eliminate litigation and is easy to administer, the paper said. The capital gains arising to foreign institutional investors will not be subjected to TDS and they will be required to pay tax by way of advance tax on such gains. But the draft code has created confusion among FIIs in the following aspects and some of them are:

Impact of DTC on FII’s– Taxation

While the draft DTC released in August 2009 had threatened to bring all foreign investors under the tax net by overruling bilateral tax treaties signed with other countries, the Discussion Paper recognizes that this is not feasible. Clarifications have also been issued on a number of ambiguous aspects such as determining if income was capital gains or business income, test of residence, and so on.

DTAA (Double taxation avoidance agreements)

The initial draft had proposed that neither the tax code nor double taxation avoidance agreements (DTAAs) shall have preferential status if litigation arose. It had further provided that the one that is later in point of time shall prevail. This had led to fears that bilateral treaties could be overruled and large number of FIIs which were not paying any tax in India, as they were purported to be paying tax in their country of incorporation, could now be brought into the tax net.

This proposal was not feasible since no country could unilaterally negate a treaty that was entered into by two countries bilaterally. The Discussion Paper therefore proposes that in case of litigation, the law that is more beneficial to the taxpayer — between domestic law and DTAA — shall prevail.

India has bilateral tax treaties for double taxation avoidance with more than 60 countries and a significant chunk of the FII funds flowing into the stock market are estimated to be routed through tax havens, such as Mauritius, that are covered by the DTAA.

FII’s covered by DTAA

According to the Discussion Paper, foreign investors utilizing the double taxation avoidance rule to avoid paying capital gains tax in India can now continue to enjoy this benefit. They would neither have to pay short-term nor long-term capital gains tax under the revised proposal as the tax rate on capital gains in countries of their incorporation is almost zero.

However, the tax authorities have the power to invoke GAAR (general anti-avoidance rule) where they think that the DTAA provisions are being misused. In such instances, the Discussion Paper states that domestic laws will prevail over DTAA and the FII can be made to pay taxes it was avoiding.

Since SEBI is already attempting to plug the inflow of money from unwanted sources into the Indian stock market, through various measures such as asking for greater compliance with disclosure norms in participatory notes and banning FIIs with multi-layered opaque structures, it would not be surprising if the tax authorities also follow suit and invoke GAAR where the source of funds is not apparent.

FIIs not covered by DTAA

Foreign investors not covered by any DTAA will face higher capital gains tax outgo if the proposals in the revised DTC are implemented. They are now only paying short-term capital gains tax at the rate of 15 per cent and no long-term capital gains tax.

According to the changes proposed, short-term capital gain will be added to the income of the taxpayer and taxed accordingly.

Capital gains on assets held for more than one year from the end of the financial year in which the investment is made, will now be added to the income and taxed albeit after deducting a specified percentage of the capital gains that will vary according to the taxpayer's tax slab.

This can have the negative effect of removing the incentive to hold stocks for longer periods, maybe resulting in greater churn in FII portfolios. Some external investors who are contemplating booking profit on investments held over many years might now rush to do so prior to implementation of the DTC on April 1, 2011. This factor could contribute to volatility in the first quarter of next year.

Business income or capital gain

The Code has now clarified that income that FIIs make from buying or selling shares will be treated as capital gains and not business income.

While majority of foreign investors prefer to pay short-term capital gains tax at 15 per cent, there are some who claim that it is business income and avoid paying tax in the absence of a permanent establishment in India. This has led to long-drawn litigations with tax authorities for proving the place of residence. Taxing all FIIs' income from stocks has simplified the issue.

The exchequer is not losing any money by asking all FIIs to declare their income as capital gains, as short-term capital gains is anyway taxed as part of income. Thus FIIs who are predominantly trading in cash or derivatives will anyway pay tax at a higher rate. The need to distinguish between trading and investment gains of FIIs is no more relevant.

Test of Residence

The revised DTC has also made the determination of the residence of a company that is incorporated outside India easier. It proposes that a company will now be considered resident in India for taxation purpose if its board of directors or executive directors make or approve decisions in India. This means that irrespective of where the executive board meets or the number of times they meet, the place out of which they function would now be considered the country of residence.

Controlled foreign company (CFC) rules:

As indicated in the revised discussion draft, CFC rules have been incorporated to provide for the taxation of income attributable to a CFC to be taxed in the hands of the resident. A foreign company would be considered as a CFC which

- ❖ For the purposes of tax is a resident of a country or territory with a lower rate of tax
- ❖ The shares of the company are not traded on any stock exchange
- ❖ One or more persons individually or collectively exercise control over the company
- ❖ It is not engaged in any active trade or business
- ❖ The specified incomes exceed INR 2.5 million.

Rules pertaining to the computation of the income attributable to the CFC which would be required to be added to the income of the resident have been provided.

General anti-avoidance rule (GAAR)

In addition to clarifying on test of residence, the modified GAAR lays down that income-tax officers can determine the tax consequence to assesses by disregarding the arrangement (such as DTAA) where the transaction lacks “commercial substance or is carried on in a manner not normally employed for bona fide business purpose.”

This means that tax authorities can now invoke GAAR with respect to the shell companies formed for routing money from tax havens into Indian equities and make them pay capital gains tax as per Indian laws. Such companies would have to prove that they had commercial substance. It might not be possible for such offshore companies to take refuge under the tax treaties as the revised Code lays down that domestic law will take precedence over bi-lateral tax treaties when GAAR is invoked.

Conclusion

The stock market is booming. The discriminating observer will know that this is attributable to heavy influx of funds into the stock market by foreign institutional investors (FIIs). They find the Indian market attractive on many counts, one being the liberal tax regime in operation. It has always been a matter of controversy whether stock market gains should be taxed as capital gains or business profits. Tax law makes a distinction between investment asset and business asset. Gains on investment assets are taxed as capital assets. The government should keep in view of the role played by FII's in Indian economy and compare the tax laws applicable in different other competitive countries before imposing any tax on the FIIs.

Portfolio optimization using PCA

Mária Bohdalová, *maria.bohdalova@fm.uniba.sk*
Michal Greguš, *michal.gregus@fm.uniba.sk*
Comenius University in Bratislava, Slovakia

Abstract

In these times of high volatility and market uncertainty, statistical factor models are becoming increasingly popular as useful tools for asset managers. Principal component analysis is a statistical tool with numerous applications to market risk analysis. In this paper, we apply method for portfolio optimization and risk measurement of the portfolio. PCA is derived from an eigenvector analysis of a very large returns covariance matrix. The aim of the paper is to show how it is possible to decompose total risk of the fictitious portfolio using PCA factors and how to construct optimal portfolios.

Key words

Principal components analysis, risk factors, portfolios, statistical factor models

Introduction

In this paper we are interested in modeling the returns on portfolios. The important role in portfolio selection has the study covariance structure of a vector return series. We use statistical factor models that may be applied to assess portfolio risks. These statistical factor models for portfolios are based on factors that have no economic or financial interpretation. A principal component representation for the percentage return on each asset in the investor's universe is derived from an eigenvector analysis of a very large covariance matrix, based on the returns on all the assets in the portfolio. Each principal component represents the percentage return on a statistical risk factor and, by choosing the number of principal components in the representation for each asset returns, the investor can adjust the asset's specific risk. Then optimal portfolios are constructed by adjusting the weights to match the systematic risk, systematic return and specific risk characteristics desired by the investor¹. PCA has a huge number of financial applications, in particular to term structures of interest rates, forwards, futures or volatility. This paper was motivated by case studies presented in Alexander (2008). In the section Method we provide a review of PCA and we introduce statistical factor model for stock returns. In section Result is presented Wolfram Mathematica case study based on 20 stocks in the DAX index (Deutscher Aktien Index). Section Discussion summarizes and presents some conclusions.

Method

Principal Component Representation

Consider a set of n log returns $R_{j,t}$ on stock j at time t , for $j=1, \dots, n$ and $t=1, \dots, T$. These time series data are summarized in a $T \times n$ matrix X and V let be the covariance matrix (or correlation matrix) of X . If X denotes the daily log returns of n assets, then PCA can be used to study the source of variations of these n asset returns.

The principal components of V are the columns of the $T \times n$ matrix P defined by

$$P = XW, \tag{1}$$

where W is the $n \times n$ orthogonal matrix of eigenvectors of V . Thus the original system of correlated returns X has been transformed into a system of orthogonal returns P , i.e. the system of principal components. We can turn (1) around into a representation of the original variables in terms of the principal components. Since W is orthogonal, $W^{-1} = W^T$ and so

$$X = PW^T \tag{2}$$

A major aim of PCA is to use only a reduced set of principal components to represent the original variables X . For this purpose W is ordered so that the first column of W is the eigenvector corresponding to the largest eigenvalue of V , the second column of W is the eigenvector corresponding to the second eigenvalue of V , and so on.

The m -th principal component is the m -th column of P , i.e. the column that is derived from the m -th column of W . When we order the columns of W , as above then the sum of squares of the elements in the m -th principal component is the m -th largest eigenvalue of V , denoted λ_m . The total variation in X is the sum of the eigenvalues of V , $\lambda_1 + \dots + \lambda_n$, and the proportion of this total variation that is explained by the m -th principal component is

$$\frac{\lambda_m}{\lambda_1 + \dots + \lambda_n} \quad (3)$$

So between them the first k principal components of the returns capture a proportion

$$\frac{\lambda_1 + \dots + \lambda_k}{\lambda_1 + \dots + \lambda_n} \quad (4)$$

of the total variation in the system.

Now we can choose k as follows. Either:

- adjust k to capture a certain fixed proportion of the variation, such as 90% or 95%; or
- set the number of principal components, such as $k=3$ or $k=5$, and then find how much of the variation is being captured by these components.

When the first k columns of P are used as the columns of a $T \times k$ matrix P^* we adjust (2) into an approximation of the original returns, in terms of the first k principal components only:

$$X \approx P^* W^* r \quad (5)$$

where W^* is the $n \times k$ matrix whose k columns are given by the first k eigenvectors. This approximation can be made as accurate as we please by increasing k .

The principal component approximation (5) is a very powerful statistical tool that works best on a highly collinear system, where n is very large and $k \ll n$. This is because there are only a few important sources of information in the data, which are common to all the variables, and the PCA allows one to extract just these key sources of variation from the data^{ii,iii}.

Statistical Factor analysis

One of the main problems of the portfolio allocation is high dimensionality. For serially correlated data, the number of parameters of a parametric model often increases dramatically when the order of the model or the dimension of the time series is increased. Additionally, multivariate data often exhibit similar patterns indicating the existence of common structure hidden in the data. Statistical factor analysis is one of those simplifying methods available in the literature^{iv}. The aim of statistical factor analysis is to identify, from the observed data, a few factors that can account for most of the variations in the covariance or correlation matrix of the data. Traditional statistical factor analysis assumes that the data have no serial correlations. This assumption is often violated by financial data taken with frequency less than or equal to a week. However, the assumption appears to be reasonable for asset returns with lower frequencies (e.g., monthly returns of stocks or market indexes).

Statistical factor analysis based on the orthogonal factor model is the model:

$$R_{j,t} = \alpha_j + \sum_{i=1}^k \beta_{i,j} P_{i,t} + \varepsilon_{j,t} \quad (6)$$

and the estimated model provides the return on each stock that is explained by the factor model as

$$\hat{R}_{j,t} = \hat{\alpha}_j + \sum_{i=1}^k \hat{\beta}_{i,j} P_{i,t} \quad (7)$$

The principal components are based on a covariance or correlation matrix, so they have zero mean and $E(P_i)=0$. Thus the expected return given by the factor model is

$$E(\hat{R}_{i,j}) = \hat{\alpha}_j \quad (8)$$

Taking variances and covariance of (7) gives the systematic covariance matrix of stock returns, i.e. the covariance that is captured by the model, with elements

$$est.V(R_{j,t}) = \sum_{i=1}^k \hat{\beta}_{i,j}^2 V(P_{i,t}) \quad (9)$$

$$est.Cov(R_{j,t}, R_{m,t}) = \sum_{i=1}^k \hat{\beta}_{i,j} \hat{\beta}_{i,m} V(P_{i,t}). \quad (10)$$

That is, using matrix notation

$$est.V(X) = B^T \Omega B, \quad (11)$$

where $B = (\hat{\beta}_{i,j})$ is the $k \times n$ matrix of estimated factor betas and Ω is the covariance matrix of the principal components. Since the principal components are orthogonal, the covariance between any two principal components is 0 and so their covariance matrix Ω is a diagonal matrix. And, since the sum of the squares of the elements in the m -th principal component is λ_m , the m -th largest eigenvalue of V , the covariance matrix of the principal components is very straightforward to calculate.

The asset manager can form portfolios with weights $w = (w_1, \dots, w_n)^T$ using these factor models and explore stock risk and returns characteristics, as captured by the statistical factor model. This helps the manager to match the objectives of their investors, e.g. to find portfolios that are expected to return a given target with the minimum possible risk and that may also be subject to allocation constraints. The portfolio alpha and betas are just the weighted sums of the stock alphas and betas, i.e.

$$\hat{\alpha} = \sum_{j=1}^n w_j \hat{\alpha}_j \quad \text{and} \quad \hat{\beta} = \sum_{j=1}^n w_j \hat{\beta}_{i,j} \quad \text{for } i=1, \dots, k \quad (12)$$

The systematic variance of the portfolio is

$$\sum_{i=1}^k \hat{\beta}_i^2 V(P_i) = \hat{\beta}^T \Omega \hat{\beta}, \quad \text{where } \hat{\beta} = (\hat{\beta}_1, \dots, \hat{\beta}_k)^T. \quad (13)$$

Subtracting this from the total variance of the portfolio, $w^T V w$, we derive the specific risk that results from using the factor model, i.e.

$$specific\ risk = (w^T V w - \hat{\beta}^T \Omega \hat{\beta})^{\frac{1}{2}}, \quad (14)$$

when measured as a standard deviation. This can be converted to an annual volatility using the square-root-of time rule with annualizing factor determined by the frequency of the stock returns.

Results

The aim of this paper is show how can be used statistical principal component factor analysis for optimization and risk measurement to the returns covariance matrix of all the assets in the investor's universe. For purpose of this paper we used daily data on the selected 20 DAX stocks form 1 January 2003 to 30 December 2010. The data has been transformed into log returns. We build a PCA factor model and we use this model to analyze the total, systematic and specific risks of an existing portfolio. The data were downloaded using procedure FinancialData of the Wolfram Mathematica software and the names and symbols for each stock are shown in TABLE 1.

TABLE 2 EXPECTED RETURNS, VOLATILITIES AND COEFFICIENT OF VARIATION OF THE DAX STOCKS

We performed a PCA on the equally weighted correlation matrix of the daily returns of these stocks. The principal components were calculated by using (1). The eigenvalues and (normalized) eigenvectors of this correlation matrix are shown in appendix. The proportion of variation explained by each principal component is given by (3). The cumulative variation explained by principal components is shown (TABLE 3), and we see that a principal component representation (5) with five components would explain 66% of the variation of the whole system over the period. As usual the first principal component explains the most variation (33.9%) and the first eigenvector is fairly constant, except for its weight on Commerzbank (CBK). This stock was much more volatile than the others during the data period: its volatility was over 48% and this stock produced negative expected return.

TABLE 3 CUMULATIVE VARIATION EXPLAINED BY THE PRINCIPAL COMPONENTS

For purpose of this paper we use only first five principal components in the factor model. This allows us to explain only about 66% of the total variation. We estimate a linear regression of each of the stocks' returns on the principal component factors, using ordinary least squares, to obtain each stock's alpha and factor betas. The estimated coefficients, t -statistics and R^2 of the regression are reported in TABLE 4. The first component is always the most significant variable in these regressions, since it captures a common trend in the stock's returns. This is usually but not always followed by the second component. The regression R^2 ranges from 17.2% for Merck (MRK) to 99.4% for Adidas (ADS), Beiersdorf (BEI) and Fresenius (FRE). Using more components in the model would increase the explanatory power of these regressions.

Now we consider the following portfolios of DAX stocks:

1. An arbitrary funded portfolio with long or short positions in any of the 20 stocks (see TABLE 5);
2. A portfolio with equal weights in each of the 20 DAX stocks.

The amount that we consider is 200 EUR.

<i>Residual Variance</i>	0.0001	0.01316	<i>Residual Variance</i>	0.0000	0.00000
<i>Specific Risk</i>	12.83%	25.65400	<i>Specific Risk</i>	1.50%	2.99720

TABLE 6 PORTFOLIOS BETAS FOR THE PRINCIPAL COMPONENT FACTORS, AND SYSTEMATIC, TOTAL AND SPECIFIC RISK

For arbitrary portfolio, the total risk is 26.40% (total amount in risk is 52.80 EUR), the systematic risk is 23.08% (or 46.15 EUR) and the specific risk is 12.83% (or 25.65 EUR). For equally weighted portfolio, portfolio betas are just the average of the stock betas. The systematic risk of this portfolio is approximately equal to the total risk and the specific risk is 1.5%. The equally weighted portfolio is the market portfolio corresponding to a PCA factor model based on stock's return.

Discussion

In this paper principal component factor model has been provided for portfolio optimization and risk measurement. PCA was applied to the returns covariance matrix of all the assets in our portfolios. Principal component factor models are much easier to estimate than fundamental factor models because there is no possibility for multicollinearity between the explanatory variables. Principal component factor models are uncorrelated by construction. Statistical factor models are becoming increasingly popular as useful tools for asset managers.

Family Finances

Abstract

The existence of a state directly depends on many factors which include its budget. The more “healthy” the budget, the better the state functions. We can use this rule about family as well, where the quality of budget belongs among the most important factors of its satisfaction and existence. Financial products which make up a part of the family budget must maximally support regular and stable growth of financial resources in the family and optimize expenses. Through a balanced financial portfolio more than 10% of family financial resources can be saved and assets may be created which will bring long-term and regular profit.

The aim of the article is to define the system of creating the financial portfolio of an individual client and suggest the theoretical ground for the composition of products in the portfolio. Universal principles for financial portfolios can be widely used and will be especially used by financial advisors who will thus have a specific framework for projecting the client’s portfolio.

Introduction

The financial and economic crisis was caused by a few factors among which also belongs an excess indebtedness of the population. Citizens whose installments exceeded their abilities stopped repaying their loans and suddenly the truth about global indebtedness appeared in the markets, which was covered by banks because of legal measures and better rating. The mortgage bubble burst very quickly and it was almost fatal for the world economy.

As we can see, one of the main factors of the break out of the global crisis was unhealthy family budgets. Thus one possible solution for creating a stable economy is to teach people what a healthy family budget should look like and motivate them to implement such a budget.

This article talks about the basis of a family financial portfolio which is inevitable for the non-problematic functioning of a family. The portfolio of products of a client directly influences his financial situation and in some cases it is financial products which will decide if the individual or family will have sufficient financial resources to cover their needs.

1. Principles of creating a financial portfolio

A financial plan is a system according to which a client manages his financial resources. This system is like a directive whose aim is to guide the client to maximize his finances. The main characteristic of every directive is being clear and understood by the user.

“Capital house” (CD) (e.g. Fig. 1) is an aid for the client to better understand the system of creating a financial plan. Through visualization of portfolio we can help the client to identify with products and to know exactly the purpose of each product and thus to understand the steps in creating a financial portfolio.

The capital house is of even greater importance for financial advisors and mediators than for a client. CH is a simple illustration for the advisor of the steps of offering financial products, of financial priorities of a portfolio and the most important; using a logical example of building a house he can explain the system of creating a financial plan.

According to the capital house, the construction of a financial plan is like building a house in which we have to start with building the foundation. The red pointer shows the sequence of the construction and at the same time shows the sequence in creating a financial plan. At first, the foundation needs to be built, which has to be strong to keep the weight of the whole house and at the same time resist inevitable weather difficulties. The same is true about a financial plan. At first we have to secure an income for the client, so that he has financial resources at all times and then we can build the rest of the portfolio.

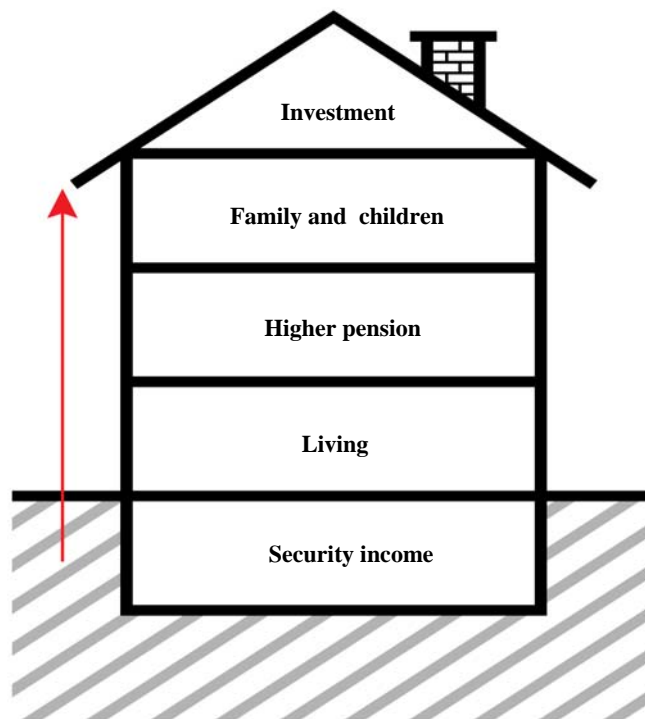

FIG. 1: CAPITAL HOUSE

2. Securing income

Every financial portfolio must have a stable foundation which will provide the client with financial security. **Financial security means such a state of family budget that income is secure in every situation in life.** (for example when the client is ill for a long time or loses his job). Even though it is not possible to foresee all possible situations which could jeopardize income, the financial portfolio must aim at maximizing the security.

The most common cases when there is a risk that the client will lose a part or even the whole of his income are:

- Permanent effect of injury
- Severe disease
- Disablement
- Loss of employment
- Death

All of these risks must be minimized by products in the category securing income. In all of these situations, the stability of a client is imperiled and it is of greatest importance to counteract all risks and then do the next steps in building the portfolio. It is most common to use insurance to cover these risks but there are other methods which are more effective in certain cases.

In Slovakia it is becoming more and more relevant to secure income through life insurance. Unlike Germany where the ratio of life versus non-life insurance (expressed by the sum of premiums) 46 to 54, in Slovakia

the ration is 37 to 63. That is why it is most probable that the insurance sector will expand in the field of life insurance or in the boundaries of securing income. The key determinant of the growth of insurance demand is the growth of the average pension of the population, which is another proof of the rise of overall premiums in life insurance.

2.1. Securing income in the case of permanent effects of injury (PEI)

According to many insurance experts this is the most dangerous risk not only for the health of a client but also for his purse. The main reason is the permanency of the risk, when the client will never again be able to work fully if his body has been permanently damaged, and thus it is clear that his income will be permanently low.

To illustrate this, an example of a truck driver will be used. The truck driver has had an accident and his spine has been permanently damaged. The specialist physician determined that he will never again be able to walk and he started receiving a disability pension. His expenses (mortgage, food, cell phone bills, etc...) are set for his income before the accident. After the accident his income dramatically decreased yet expenses remained almost the same (he has to continue paying his mortgage) or they have even gone up (medicines, therapies). If he had not created a financial reserve or did not have a life insurance, this man would have got into existential problems which may in certain cases have ended up in loss of housing.

A solution for such a situation is to create a sufficient financial reserve to cover times without an income. In this case the time period could be a few decades. If the driver needed to draw from his reserve 500 Euros during 20 years, he would need a reserve of 120,000 Euros. It is almost impossible for an average family to save a sum of money like this. That is why it is a better solution in such a case to have insurance which will cover the client with an annuity.

This form of coverage is the most common solution for permanent effect of injury. It is important that in case of PEI the client receives the same financial sum every month, which will compensate his lost income. In the above case it means that the driver should receive a sum every month which he stated is optimal when he signed the insurance policy.

Example No. 1:

The driver stated that he needs to spend 800 Euros a month for his personal everyday expenses. The height of coverage is set according to the following formula

$$HC * i / 12 = R_{im}$$

HC – height of coverage

i – interest rate

R_{im} – monthly annuity with the given interest rate

If a reportable event takes place, the insurance company will pay a client a HC, which will receive an annual yield when deposited in a bank account with the interest (i). When the annual yield is divided by 12 (the number of month in a year), the result is the monthly annuity.

To count the height of coverage, we will use the following formula:

$$HC = R_{im} / (i / 12)$$

If our client demanded an annuity of 800 Euros a month and the interest rate is 4%, using this information in the formula, the result is 242424.24 euro. This sum represents the height of coverage in the insurance policy which the client is signing to be covered from PEI.

This means that when a client invests 242424.24 Euros with a 4% interest rate, he will be receiving an annuity of 800 Euros a month.

It may seem that the sum from almost 250,000 Euros is too high, but in our above described case it is optimal. On the other hand, one can be covered for a high coverage for a monthly premium of 35.75 Euros.

Financial mediators or advisors can also invest financial resources for a higher interest rate than 4%. If we used example No.1, and raise the interest rate to 5%, the height of coverage would yield a profit of 195,121 Euros. In this case the premium should not exceed 25 Euros a month. When investing financial resources it is necessary to consider a risk which is usually greater than 4% with a yield of 5%.

A problem appears when there is PEI which represents less than 80% of damage to the body. In reality this means for instance such a case when a client damages his arm and he permanently becomes unable to move it, the insurance company will only indemnify him with a certain percentage from the agreed height of coverage. If the insurance company pays 30%, this is not enough for coverage by annuity and the client has to work. If his work demands usage of arms (for example if he worked in a factory manually), he would have to be retrained and find a new job. Financial resources obtained from the insurance policy should be used for getting over the time period between the two positions and for treatment.

This kind of security is the highest priority when creating a family financial plan (FFP), where the main reason is higher everyday expenses than with individuals. As children grow, the expenses of a family are greater which needs to be taken into account when setting the HC in the case of permanent effects of injury.

Many times we think: "This could not happen to me", however according to statistics, 1 out of 7 employed persons will suffer from effects of injury and will be unable to work for 5 and more years. This statistic is the evidence of the seriousness of the given risk.

2.2. Securing income in the case of severe disease

In this risk we talk about serious illnesses, which need a longer time for treatment. This includes: cancer, heart attack, stroke, blindness, etc. With these diseases quick and effective treatment is the most important which either saves the life of a patient or will prolong his life.

Financial resources, which the client will receive when such an illness is diagnosed, will firstly be used for financing his treatment. The client himself sets the height of coverage of the risk of severe diseases (critical diseases), even though the sum should not be lower than 5,000 Euros.

Severe illnesses can considerably impact the family budget in case the person who suffers from a severe disease is the main income holder of the family. This is a common example when a family is self-employed or one of the members is in a respectable position in society or politics.

"Additional insurance of severe diseases is linked to diagnosing one of the selected most severe civilization illnesses such as:

- heart attack,
- surgery on aorta and bypass of coronary arteries,
- cancer, sudden vascular episode, kidney failure, organ transplants,
- loss of functional coordination of one or more limbs after becoming paralyzed,
- blindness,
- sclerosis multiplex, Parkinson's disease, Alzheimer's disease,
- infection by HIV virus during transfusion."

2.3. Securing income in case of disablement

Disablement of an employee is such a state when the employee is not temporarily able to work from reasons which are regulated by the Labor code.

The reasons are the following:

- disease
- injury (no matter if the injury happened at work or not),
- possibly commanded quarantine measures.

This inability to work which will be stated by a specialist doctor, can be called work disablement of an employee. The proof of a temporary work disablement is a form written out by a doctor.

It is clear from the Slovak law that an employee receives a maximum of 55% of daily basic salary during his work disablement, unless collective contract states otherwise. The task of financial insurance is to compensate the employee for the remaining 45% of his income and thus prevent his budget being disturbed. In other countries this ratio might be different but the principle of insurance is the same.

It becomes problematic with clients whose income and expenses are on the same level. In their cases a small decrease of income will be critical for the family budget which is why they need to create a financial reserve or have insurance against work disablement.

2.4. Loss of employment

Loss of employment is a common reason for family budget to be in “the red” and the family is forced to take a loan or even heads for bankruptcy. Financial and economic crisis has shown how tragic the consequences can be in situations when both members of family loss their jobs.

In case of loss of employment, insurance is only effective if the contract was void by the employer. The insurance company will not settle a claim if an employee breaks off the contract for any reason. In such cases it is necessary to create a financial reserve in the amount of three months salary to minimize the risk. Of course if the region in question is such that there are less work opportunities the reserves need to be more than three monthly salaries.

2.5. Securing income in case of death

The financial budget of a family is imperiled not only by an illness or injury of a family member but also by death. The difference between the risk of illness and risk of death is that a parent who brought money into the family budget can never again bring these resources because he has died and thus the income of a family is permanently disturbed.

If we want to minimize the risk of death we will adhere to the same principles as in minimizing risks of permanent effects of injury (chapter 1.2.1). It is most important to cover the time period until children have grown and will be able to take care of themselves.

The cases when a family loses both parents and children are left without any income is a major problem. So that they do not remain dependent only on government support it is important to insure both parents for a sum, which will not only cover their basic life needs, but also studies, sport activities, etc....

ICAAP – Challenges and Opportunities for Slovak Commercial Banks

Anna Pilková; anna.pilkova@fm.uniba.sk

Peter Králik; pkralik@vub.sk

Comenius University in Bratislava, Slovakia

Abstract

Internal Capital Assessment Process (ICAAP) is a concept introduced by Basel II regulation. The key reason for its introduction was to overcome the shortcomings of Basel I by forcing financial institutions to develop a comprehensive tailor-made risk management system as a component of Pillar 2. However, the idea of regulators also was to implement ICAAP as a consistent component of the bank's internal managerial processes (both at strategic and short-term levels). This paper focuses on identification of the level of implementation of ICAAP, challenges and opportunities of this process at main Slovak banks. Our key findings are based on analysis of results of a survey which we ran in cooperation with the Slovak Banking Association among a majority of Slovak banks (respondents represent 86% of banking sector assets). We found out that although all Slovak banks have already started with ICAAP implementation, its level is not adequate. Key drivers for ICAAP implementation are risk management and regulation but not changes of the management of the bank. ICAAP is also not part of an integrated performance measurement system at banks. The highly conservative approach of the Slovak banks towards economic capital calculation for risks identified under Pillar 2 contributes positively to banking sector stability, but it is questionable how much it has contributed to shareholders' value creation. The final conclusion is that there are more challenges and less use of opportunities by Slovak banks at the present stage of ICAAP implementation in their managerial processes.

Introduction

The bank risk management systems, and financial institutions regulation, have been identified as the key issues of the last global financial crisis. However, John Hamptonⁱ stated that “Many business people pay lip service to Sarbanes-Oxley, Basel II, and ERM. In their hearts, they believe the processes, required by all three, were designed by bureaucrats, professors, or regulators, who do not really understand risk”. In our opinion, in spite of fact that the last financial crisis discovered serious weaknesses of Basel 2, one of the positive sides of this regulation is that in addition to its intent to motivate banks to apply more sophisticated approaches for capital requirements calculation in Pillar 1, regulators also “legally” forced financial institutions to develop and introduce a comprehensive risk management system (or enterprise risk management system) through ICAAP (Internal Capital Adequacy Assessment Process) implementation as a Pillar 2 component. This system, if is fully developed and implemented, creates a reasonable framework for assessment, evaluation, and mitigation of the bank risk position commonly expressed through economic capital requirements during a crisis period, too. Pillar 2ⁱⁱ puts pressure on commercial banks to develop a tailor-made risk management system (if they already don't have it in place) following key principles formulated by Basel 2 documents and relevant EU Directives.

However, developing a tailor-made risk management and ICAAP systems in a way that would satisfy both regulator's requirements and banks' internal managerial needs is a long-term process during which a lot of open issues should be resolved. In their issued documents, regulators only defined the principles and broad framework that banks should apply in the ICAAP process implementation. Each bank should decide independently its own internal capital assessment process and use it not only to satisfy regulator's requirements, but also as part of its operative, and strategic management processes. The ICAAP should be embedded in the institution's business and organizational processes; it is not to be regarded as an add-on that permits the bank management and supervisory bodies to “tick a box” and think that they completed the tasks of the regulator – approach that the Basel I regulation allowed. There are few books whose authors focus on looking at ICAAP from the bank management point of view as whole. Andrea Resti is one of these authors. In the Introduction to the book Pillar II in the New Basel Accordⁱⁱⁱ, he formulated encouraging, practical thoughts on this topic. As Michael B. Cordy wrote^{iv} in the Preface to this book – Andrea Resti invites bank management to embrace Pillar II as an opportunity to make strategic investments in the risk management processes and tools that can deliver value to shareholders, rather than as an exercise in regulatory

compliance. In accordance with Resti's opinion appeared in the Introduction, Pillar II is seen as a unique opportunity to narrow the gap between two different definitions of capital (regulatory, and economic), mitigating the "managerial squint" of bankers, having to keep under control two different targets at the same time: the capital constraint imposed by regulators, and the risk-taking capacity shareholders provide to the bank (and that managers are expected to reward). In addition to his first implication of the ICAAP (shareholders approach), he formulated two additional characteristics of ICAAP towards bank management as whole, as follows: 1.. ICAAP is not to be just a technical, methodological issue to be addressed mostly by the risk management and planning department. The owner of such a process should be the bank's top management. In accordance with his opinion ICAAP would build the backbone of a modern value-based performance measurement system and 2. Pillar II and ICAAP would trigger some processes and tools which are not strictly part of the tasks imposed by Basel regulators. One, of such processes, are the capital allocation policies. Resti claims: "Through capital allocation, economic capital estimates become more useful because, when the bank's total capital is distributed across all risk taking businesses and units it is easier to check whether each of them adequately rewards shareholders' capital".^v To look at Resti's opinions on ICAAP from the value-based management point of view, we can say that ICAAP is one of its key components for the bank.

How involved are the Slovak banks in ICAAP implementation? What are the key challenges and opportunities that Slovak banks in this process have to cope with? Has Pillar 2/ICAAP already changed banks (particularly from the bank whole management point of view) in Slovakia? To answer these questions and to get a more complete picture of the status of ICAAP implementation in Slovakia, we have done a research with the support of the Slovak Banking Association involving key banks in Slovakia. The research is the first of its kind among Slovak banks. The results can serve to the Slovak Banking Association to identify key weaknesses in researched field and promote actions to mitigate them with shared resources.

ICAAP – Legal and Theoretical Review

The internal capital adequacy assessment process as a key component of the second pillar of the Basel 2 has its roots in A New Capital Adequacy Framework, released in June 2004 (Basel Committee on Banking Regulation). The key role of the Pillar 2 processes is to enhance the link between an institution's risk profile, risk management processes, risk mitigation systems, and its capital management. Key principles and guidelines on second pillar contained in A New Capital Adequacy Framework had been transferred to the EU Directive (Directive 2006/48/EC). In this Directive (CRD) the following five key components can be identified^{vi}: 1. Supervisory Review Process (SRP)^{vii}. The purpose of the SRP is to ensure that banks have sufficient capital to support all material risks to which they are exposed. SRP achieves this through ongoing supervisory monitoring of banks. 2. Internal Governance^{viii} aims at ensuring that an institution's management body is explicitly and transparently responsible for its business strategy, organization, and internal control. It is mainly related to setting the institution's business objectives and its appetite for risk, how the business of the institution is organized, how responsibilities and authority are allocated, how reporting lines are set up, etc. 3. Internal Capital Adequacy Assessment Process (ICAAP)^{ix} is a process within the internal governance framework that ensures that the management body: a/ adequately identifies, measures, aggregates and monitors the institution's risks, b/ holds adequate internal capital in relation to the institution's risk profile, c/ uses sound risk management systems and develops them further. 4. Supervisory Review and Evaluation Processes (SREP)^x. An essential element of the SREP (and of the Risk Assessment System) is the ability to assess qualitatively each type of risk and its management, within the overall context of the institution's internal governance. 5. Risk Assessment Process (RAS). RAS is the supervisor's tool for organizing the use of supervisory resources, and performing and managing the supervisory risk assessment.

The recent financial crisis also discovered Pillar 2 shortcomings. In March 2009, the Basel Committee promptly reacted and issued the document "Range of practices and issues in economic capital frameworks"^{xi} that contains ten recommendations to improve the economic capital process. In addition, in May 2009, the next document focusing on the very important ICAAP issue "stress testing" was issued: Principles of sound stress testing practices and supervision.^{xii} Finally, in December 2010 two principal Basel III documents have been issued:

Basel III: A global regulatory framework for more resilient banks and banking systems^{xiii}.

Basel III: International framework for liquidity risk measurement, standards and monitoring.^{xiv}

Documents issued by Basel Committee are the basis for changes in key CRDs: Proposals for a Directive of the European Parliament and of the Council amending Directives 2006/48/EC and 2006/49/EC, 2008, 2009, 2010.

During the implementation process of Basel 2 the Committee of European Banking Supervisors played a very important role and issued many guidelines that contributed to a better understanding of complex Pillar 2 issues.^{xv}

The Slovak national regulator – National Bank of Slovakia – implemented CRDs at the full extent into its legal acts and norms, too^{xvi}.

There are already many books on the market that deal with the particular Pillar II or ICAAP topics either specialized on economic capital modeling or, a part of the book dealing with risk management in the financial institutions.^{xvii} However, the literature dealing with specific topics of ICAAP implementation in the management of financial institutions is still rare.

Empirical Research

The Faculty of Management of the Comenius University in Bratislava initiated a survey and prepared a questionnaire on the status of ICAAP implementation in Slovak banks. The survey was undertaken by the Slovak Banking Association. It is the first survey which was run on this topic in Slovakia. In this survey 22 respondents, members of the Committee for Regulation in Slovak Banking Association, were selected. All fully licensed banks and the most significant branches of foreign banks operating in Slovakia^{xviii} were represented. In total 14 institutions participated in the survey, representing 86% of total assets of the banking sector in Slovakia.

A structured pre-coded questionnaire (web-site application) was used. Expert survey had been organized in the last quarter of 2010.

There were forty five questions covering the following topics from bank and ICAAP areas:

- Basic information about the responding company (1 question)

- Basic information about the respondent (1 question)

- Basic information about the ICAAP framework, and governance overview (11 questions)

- ICAAP framework overview (29 questions)**

 - Risk identification, quantification, and aggregation (5 questions)

 - Available financial resources (3 questions)

 - Stress testing (5 questions)

 - Use test (integration of ICAAP with related functions and processes, risk performance parameters used, etc.) (12 questions)

 - Disclosure and reporting (4 questions)

- Documentation (1 question)

- Training and awareness (2 questions)

The results have been analyzed both on the aggregated bank level and rank by size: small (5 banks), medium (5 banks) and large (4 banks)^{xix}.

A majority of respondents (43%) were ICAAP specialist, followed by risk managers (29%), financial management/accounting (14%), and others (14%).

Analysis of the Survey Results and the Key Findings

The survey results are analyzed and its key finding is presented with reference to blocks of questionnaire.

Basic information about ICAAP framework and governance overview

In this part of the survey we learn about the main reasons for ICAAP implementation, the current status of implementation, governance structure, staffing, costs spent on ICAAP and interactions with regulators (SRP) and their current and expected impact on the banks.

Almost eighty percent of respondents use ICAAP for risk management purposes. No respondents declared that ICAAP implementation afforded a competitive advantage or business benefit to them. The second most stated reason was regulatory requirements and the third overall management of the bank.

No banks has declared not to have ICAAP implemented, although 50% are still on borderline and not being fully in line with use test principles^{xx}. 79% of the respondents perceived their ICAAP implementation to depend on the parent company (partly or fully). These results are then reflected and explain the amount of investment that Slovak banks

spent on ICAAP implementation. Banks spent a maximum of € 100.000, but the majority of the respondents stated it was between € 10 to 50 thousand. It is clear that in accordance with the shareholder structure (98% of the Slovak banks are owned by foreign investors) the transfer of know-how and methodology from the parent company to its subsidiary takes place.

Regarding the governance point of view ICAAP is considered to be a shared responsibility, as more than 57% of the banks have a committee for providing inputs and assistance in ICAAP implementation, evaluation and periodic revision. **Coordination is usually the responsibility of Chief Risk Officer of the bank.**

As for **staffing**, a maximum of two FTEs are allocated directly to ICAAP activities, while more than 31% of the banks do not directly allocate any resource. Furthermore, only 53% of banks did allocate other resources to the process (controlling, planning, strategy, etc.).

Regarding interactions with regulation and regulators, differences in amount of needed capital identified within ICAAP in comparison to amount identified within Pillar II (SRP) by regulators, were considered by more than 58% as of little, or no significance.. However, 42% of respondents identified them as significant.

Upcoming changes in regulation (known as Basel III), are expected by a majority to have only a partial impact on the framework. Current relationships between regulators (home-host) and their impact on the framework, is perceived neutral by almost 55%, and positive by 33%.

ICAAP framework overview

In this part of survey we collected and analyzed data on key ICAAP processes, economic capital, available financial resources, stress test, use test, disclosure and reporting, documentation.

Risk^{xxi} identification, quantification and aggregation

Regarding risk types: Almost all banks consider risks managed under Pillar I (e.g. credit, market and operational risk) within Pillar II as well. Other risks of significance are interest rate risk of banking book, liquidity risk, reputational and strategic risk. More than 64% of all banks separately evaluate

What were the main reasons of ICAAP implementation in your company?

Risk types evaluated within ICAAP

concentration risk with credit risk. Other, less significant risks evaluated under ICAAP, are real estate, equity, model and business risk.

Within risk quantification (economic capital calculation), which in most cases is carried out with quarterly or even monthly frequency (38%), more than 92% of respondents stated that credit, operational and interest rate risk of banking book are considered, while almost 72% quantifies market, and 50% of banks liquidity risk. Business, strategic and reputation risk are quantified by 36% and 29% respectively. Real estate, model and securitization risk comprise the smallest share.

A majority of banks (77%) do not consider the diversification effect within the risk aggregation (total economic capital calculation). This indicates that banks follow more a conservative approach in risk quantification, by using only a simple sum-up of different capital requirements calculated for each risk type, considered within ICAAP framework.

Available Financial Resources (AFR)^{xxii}

Progress in ICAAP implementation is evident also by the fact that a majority of banks (85%) consider, within Pillar II framework, resources which are different from regulatory capital within Pillar I, while in 81%, reconciliation of both resources is implemented.

The conservative approach of the Slovak banks, under Pillar II, is visible also through the AFR calculation e.g. resources management, where hybrid capital is considered by small number of banks, and a similar conservative approach is expected in the future.

Stress testing

All banks carry out stress testing of internal and external factors. Among the most significant risks considered within the stress testing framework is the interest rate risk of banking book, market risk, liquidity, and operational risk. Less frequent is stress testing of equity, business, strategic and reputational risk. **The frequency is relatively high, ranging from quarterly to monthly.**

Stress testing of Available Financial Resources is less frequent (31%).

Only 69% of the banks uses the results of stress testing in ICAAP. This supports the already mentioned observation in the first block that **implementation of ICAAP is still under way.** It's also evident that banks put more emphasis on stress testing key risks rather than the resources they have to cover them.

Use test

Results of the use test reveal that the process of ICAAP implementation, and its usage, is just partial, rather formal, and more oriented toward risk management, as such, than on management of the bank

As for integrating ICAAP with various process and functions of the bank, results of the survey indicate that **it is not fully integrated with strategic management, since almost 70% of the respondents claim partial or**

total absence of integration. Similar results could be seen in the integration with the planning and budgeting process, e.g. operative and short term management.

The integration with capital allocation is even rarer, where more than 80% banks stated that the integration is partial or non-existent, while allocation is predominantly done on segments, followed by less frequent allocation on products and single transactions.

An even worse situation is when the ICAAP and integrated performance measurement is considered, since only 1 bank stated a full link between ICAAP and the related performance measurement **processes.** The most common performance indicators used are RAROC, RORAC, and EVA, followed by less the frequent indicators such as RORAA or RAROA.

The integration with product pricing is similar, where only 46% of the banks have partial integration. The rest have no the integration at all.

More than 84% do not have full integration of ICAAP with internal limits setting and monitoring.

As for the integration of ICAAP with a **risk appetite definition, 46% of the banks claim full integration,** while the rest perceive partial or no integration. Similar results can be seen in integration **with the capital planning and internal control system (almost 50% full integration).**

More than **69% of the banks do not use ICAAP in employee evaluation and remuneration.**

Disclosure and reporting, Documentation, Training and awareness

Recipients of internal ICAAP reports are usually the top and middle managers (86%), other positions (junior management, non-managers, specialists) are rarely included.

Within Pillar III^{xxiii} banks tend to disclose qualitative information (92%) to the market more often, while quantitative information is less present (33%), and as well the same fraction of banks intend to disclose quantitative information in the future.

Majority of banks (77%) disclose information about ICAAP in their annual report. The rest do not, but plan to do it.

Almost all banks have formalized their ICAAP process in their internal procedures – documentation (92%). This is also a regulatory requirement. **Almost 50% of banks do no trainings and/or workshops for their employees. Those that do so include top and middle management.** The topics covered are the results obtained during risk assessment exercises, methodology overview and identification of weak points that should be addressed by process improvements.

Conclusion

The Internal Capital Adequacy Assessment Process (ICAAP), if implemented in line with the original regulator's intentions, belongs to the most challenging areas in current banking practice. In our research we desired to get answers to the following questions:

How have the Slovak banks come in ICAAP implementation? What are the key challenges and opportunities that Slovak banks in this process have to cope with? Has Pillar 2/ICAAP already changed banks (particularly from the whole bank management point of view) in Slovakia?

Based on a survey in which 14 banks representing 86% of the total assets of the Slovak banking sector participated, we can make the following conclusions from which answers to our questions can be derived:

a/ All Slovak banks have already started with ICAAP implementation. The level of implementation can be considered as inadequate, although ICAAP as such represents a unique system adding visible value to the risk management of each institution. In this process, Slovak banks are very much dependent on their parent companies – which are foreign banks – both as far as investment costs, and know-how sharing, are considered.

b/ The key drivers for ICAAP implementation are risk management and regulation; and not changing the management of the bank as whole – either general or strategic management. In spite of the fact that ICAAP is primarily considered as a system influencing risk management, there still are challenging areas that deserve particular attentions such as limit setting, monitoring, and risk appetite definition.

c/ The results further confirmed that the level of implementation is rather formal, and ICAAP is not a significant part of the risk-based decision making process in any of the following areas: planning and budgeting, capital allocation, capital planning. The most severe situation is in applying ICAAP as an integrate part of performance measurement (only one bank claimed full integration). A very similar situation is also in the product pricing area and in employee evaluation and remuneration.

d/ Based on the previous findings we can conclude that Slovak banks haven't seen Pillar II/ ICAAP as a significant opportunity to make strategic investment in the risk-management process and use tools that can deliver value to shareholders. Rather it is seen as an exercise in regulatory compliance. The conservative approach of the Slovak banks to economic capital calculation (lower level of diversification and aggregation of capital, stress testing frequency etc.) is definitely positive for the banking system stability, but should be further studied from the evaluated perspective of value-based management. The conservative approach is also apparent in the banks' considerable effort to quantify economic capital for risk types which are difficult to quantify – such as liquidity risk, even reputational risk etc. Another dimension of the conservative approach can be the willingness to share/disclose quantitative and qualitative information to the market. Banks are not willing to share quantitative information, only qualitative.

e/ Prevailing regulatory requirements approach to ICAAP implementation contributes positively to banking system stability. It controls minimum capital requirements as stated by regulator within SRP for the banks in accordance with their risk profile and forces them to adjust their risk profile to their level of available financial resources.

Our findings show that there are still more challenges and underused opportunities particularly from the shareholders' value-based management perspective. However, further research needs to be done to draw conclusion what is best for shareholders; very conservative banks and a stable system, or an aggressive approach to ICAAP.

Share of top 6 banks on total sector	73,19%	73,11%	76,51%	-	-	71,29%	-

* Numbers in mln EUR

^{xix} For the purpose of this questionnaire, small banks are considered as companies with total volume of revenues €0 – 50mio, medium banks €50 – 200mio, large banks €200 mio and more.

^{xx} Use test (internal use) represents the actual usage of bank's risk management and measurement systems for internal purposes. In the Methodological Instruction of the Financial market Supervision Section of the National Bank of Slovakia No. 1/2007 on the Internal Capital Adequacy Assessment Process for Banks it is stated that: The ICAAP should be an integral part of a bank's culture, the bank's overall risk management process, and everyday business, organizational, and decision-making processes at the bank.

^{xxi} Methodological Instruction of the Financial market Supervision Section of the National Bank of Slovakia No. 1/2007 on the Internal Capital Adequacy Assessment Process for Banks states: The classification of risk used by the bank should correspond to the bank's size, nature, scale and complexity of activities and should be used consistently in all the bank's business, activities, processes and systems. The bank should be able to identify risks and to include them in the ICAAP according at minimum to this risk classification: a/ pillar one risks (credit, market and operational), including main differences in the approach of calculating capital requirements under the first pillar and the treatment of these risks in the ICAAP b/ risks not fully captured under pillar one (in particular residual risk and securitization risk, underestimation of credit risk in using the standardized approach, underestimation of operational risk in using the basic indicator approach and the standardized approach) c/ pillar two risks, all material risks to which the bank might be exposed, particularly interest rate risk in the banking book, concentration risk, liquidity risk, reputation risk and strategic risk d/ risk resulting from external factors, in particular from the economic and business environment that were not included in the preceding categories.

^{xxii} Available Financial Resources shall mean the capital elements that the bank feels it can use to cover Internal Capital. Internal capital is defined as total capital need for coverage of risks, the bank is exposed to at execution of its activity. It is expressed as the summary of aggregated economic capital adjusted by diversification effect and capital cushion. Capital cushion might be used to cover risks as cyclicity, model risk etc.

^{xxiii} According to CEBS: Revised Guidelines on Supervisory Disclosure, supervisory disclosure is defined as a comprehensive policy of transparency. Its aim is to make information related to prudential supervision available in a timely manner to all interested parties, including credit institutions, investment firms, other market participants, other supervisors, and consumers. The framework for supervisory disclosure is meant only to provide information. It is not meant to limit in any way the ability of individual national supervisors to act in a flexible, timely and independent manner, when required.

Relationship between Asian stock Markets: A co-integration Approach

Noheed Khan, noheed_khan@yahoo.com

Awad Raheel, Awad_shah@hotmail.com

The University of Faisalabad, Pakistan

Abstract

Today world financial markets have become more closely interdependent over the time. This paper examined the interdependency and long term relationship among 5 Asian financial markets. The result indicates investor can become his investment portfolio between these financial markets because risk can be diversified in these financial markets. Granger causality test result indicates SSE, HSE and BSE have interdependency on KSE but CSE has not interdependency on KSE. KSE has not interdependency on SSE and BSE but KSE has interdependency on HSE and CSE. Cointegration result indicates KSE has long term relationship between BSE, HSE, CSE, and SSE.

KEYWORDS: Granger causality, Co-integration, Asian markets, Integration

1. Introduction

Globalizations in capital markets decrease the limitation of international cross listing. It enhances the capital flow between the economies and easier ownership and trading in securities around the world. The present world market has become to be more strongly correlated and jointly dependent ultimately. The linkage information and correlation between the markets are significant for decision making about the investment and risk management, fund managers and policy makers. The occurrence of low correlation among the different national stock markets has been used usually to defend the international diversification of portfolio. Another foundation for investor to think about the global investment is return improvement.

Securities are announced by the countries with increase growth rates are projected to high rate of return. A number of studies (Copeland and Copeland 1998, Janakiraman and Lamba 1998, Jeong 1999) detail significant correlation among international stock market are known leadership role of the United States (US) equity market on the other market. Login at all (1995) create covariance of returns by markets is more visible throughout down periods.

This suggests the striking activities in one market could have strong impact on markets of different size, structure and geographical location across the world. In 1997, the balanced of the Thai baht led to the financial shrink in Thailand, and started a wave of contamination effects, scattering quickly to its neighboring countries in the East Asian region. Stock markets in the area declined strictly and then partially rebounded. This type of event affect the portfolio allocation and risk evaluation based on historical prediction of relevant returns and variance-covariance matrix. Speedy economic development in some East Asian economies before the Asian currency crisis in 1997 brought enhance grouping to countries in the South-east Asian section and Strengthened its. The report of the World Bank in (1993) declared that from 1965 to 1990 the eight high performing Asian economies, namely Japan Hong Kong, South Korea, Taiwan, Singapore, Malaysia, Thailand and Indonesia had established more than twice as fast as rest of East Asia, usually three time as fast as Latin America and south Africa and twenty five time earlier sub-Saharan Africa position in the world economy.

The south Asian region is the fourth trading region in the world. It has market volume of 568 million people and combine gross domestic product of US\$ 1073 billion. 2 Asian was recognized in 1967 to promote the economic, social, cultural, collaboration and to defend economic and political constancy in the region. The agreement was established in 1992 related to Asian free trade area expected to increase Asian volatile edge in the global market for remove the intra-regional trade barrier to promote the better economic integration among member of economies.

For increase the direct investment in this region. A study established the out put growth responds

Extensively unexpected changes in the domestic and foreign market return (Hassapis and Kalyvitis, 2002). It would be important for the financial institution and policy makers to recognize how shocks are transmitted across markets. Stock markets are initiated to react differently to good and bad news and a harmful shock to one country could have a negative impact to other nearby countries such as the 1997 financial crisis. Using weekly and monthly data from January 1988 to February 1999, Manning (2002) establish convergence of the South-East Asian equity markets from 1992 to mid-1997 and divergence occurring during the financial crisis. It would be valuable to observe if there are signs of improved correlation between stock markets in the area after the financial crisis by means of more fresh data sampled at different frequency. This is mainly significant as estimates of correlation coefficients be apt to increase and may be biased rising during the crisis when markets are more volatile.

This study examined the Asian stock market relationship between five stock exchanges. Reason for selecting these stock exchanges that investor can access easily due to geographical area.

2. Methodology

In this paper five Asian stock exchanges namely Karachi stock exchange (KSE), Bombay stock exchange (BSE), Shanghai stock exchange (SSE), Hong Kong stock exchange (HSE), and Colombo stock exchange (CSE) are selected for checking the linkage between stock market. For this purpose ten years data is collected from different websites. This data is used for analysis with the help of EViews 6.0. Three different time series analyses are used to test the linkage between Asian stock market. The first method examines the direction of granger causality between return of two countries, the second method applies a simple statistical test for market index trend, while the third method applies unit root test, co integration and error correction to the market index series.

Granger Causality Test:

The Granger (1969) approached to the question of whether x causes y is to see how greatly of the current y can be explained by past values of y and to see whether adding lagged values of x can get better the details. The y is supposed to be Granger-caused by x if x helps in the forecast of y , or consistently if the coefficients on the lagged x 's are statistically significant. Note that the two-way causation is frequently the cases; x Granger causes y and y Granger causes x .

$$y_t = \sum_{i=1}^p \alpha_i \cdot y_{t-i} + \sum_{j=1}^q \beta_j \cdot x_{t-j} + u_t \quad \text{-----(1)}$$

$$y_t = \sum_{i=1}^p \alpha_i \cdot y_{t-i} + \sum_{j=1}^q \beta_j \cdot x_{t-j} + \bar{u}_t \quad \text{-----(2)}$$

Where u_t is white noise, p is the order of the lag for y , and q is the order of the lag for x . The null hypothesis that x does not Granger cause y is that for $j=1,2,\dots$ is that for $i=1,2,\dots,p$. q . Likewise, the null hypothesis that y does not Granger cause x

Cointegration Test:

Empirically, testing for convergence and ordinary trends in a co integration framework requires the individual market index series to be integrated of order one. The following augmented Dickey-Fuller (1981) (ADF) test is functional to conclude the order of integration for market indices in the ASEAN-5 countries

$$\Delta p_{i,t} = a_{0i} + a_{1i}t + \beta_i p_{i,t-1} + \sum_{j=1}^n \delta_{ji} \Delta p_{i,t-j} + \varepsilon_{i,t} \quad \text{-----(4)}$$

where $\Delta p_{i,t}$ approximates the rate of return on stock market, t is the deterministic trend, n is the order of the autoregressive process, and $\Delta p_{i,t-j}$ is included to contain (possible) serial correlation in the errors. The rank of the co integrating matrix in a multivariate framework can be estimated using the following VAR representation (Johansen, 1991):

$$\Delta Pt = \Gamma L \Delta Pt + \Pi Pt - k + \mu + \varepsilon t \quad \text{-----(5)}$$

where Pt is a $n \times 1$ vector of the logarithms of total market indices for n ASEAN-5 countries, Π represents the long-run relationships of the co integrating vectors, $\Gamma(L)$ is a polynomial of order $k - 1$ to capture the short-run dynamics of the system, and εt are independent Gaussian errors with zero mean and covariance matrix Ω . The reduced rank ($0 \leq \text{rank}(\Pi) = r < n$) of the long-run impact matrix is formulated as follows:

$$\Pi = \alpha\beta' \quad (6)$$

Where β is the $n \times r$ matrix of co integrating vectors and α is the $n \times r$ matrix of correction coefficients. Applying the Johansen maximum likelihood estimation method, convergence in multivariate market indices, as defined in equation (6), would require $r = n - 1$ co integrating vectors for n ASEAN-5 countries of the form $[1, -1]$ (i.e. one common long-run trend for the individual market index series in Pt). The Johansen procedure permits hypothesis testing of the co integrating associations and their modification coefficients, using the likelihood ratio test which follows a chi squared distribution. This method is essential to conclude whether the r co integrating vectors are of the form $[1, -1]$, which requires a unit restriction applied on all the coefficients of the r co integrating vectors.

3. Empirical Results:

This paper is consisting of time series tests on monthly return of the stock market indices. Five Asian stock exchanges data is collected of different websites and yahoo finance from 1st January 2001 to 4 April 2011. All estimation result are derived from EViews 6.0 software.

Summary of Statistics:

TABLE 1

	KSE	SSE	BSE	CSE	HSE
Mean	0.020845	0.007003	0.015267	0.026457	0.00529
Std. Dev.	0.086289	0.087287	0.077371	0.079732	0.063461
Jarque-Bera	46.67003	3.808281	7.694466	3.576919	11.34749
Skewness	-0.49919	-0.22478	-0.23788	0.364499	-0.41623
Kurtosis	5.847735	3.735505	4.129167	3.408041	4.233347

Table#1 shows the summary of statistics KSE and SSE standard deviation is greater than other three stock exchanges. It means KSE and SSE is high risk as compared to other three stock exchanges and HSE standard deviation is low as compared to other four stock exchanges. It means HSE is lower risk as compared to other four stock exchanges. KSE mean return is high as compared to four stock exchanges and SSE standard deviation is high as compared to the KSE but return of the SSE is low as compared to KSE. It means investor can make portfolio in which five stock exchange and diversification can be possible in these stock exchanges..

Comparison Of Asian Stock Exchanges

GRAPH 1

Graph#1 gives the information about means and standard deviation between five Asian stock exchanges in which SSE has high risk with low return. KSE has low risk as compared to the SSE but has high return as compared to the SSE. CSE has high risk as compared to BSE but has high return as compared to the risk. HSE has high risk with low return.

Granger Causality Test

Testing the direction of Granger causality between return of five Asian stock markets.

TABLE 2

Pair wise Granger Causality Tests		
Null Hypothesis:	F-Statistic	Prob.
SSE does not Granger Cause KSE 0.001	7.32316	
KSE does not Granger Cause SSE 0.8265	0.19083	
Null Hypothesis:	F-Statistic	Prob.
HSE does not Granger Cause KSE 0.0059	5.37166	
KSE does not Granger Cause HSE 0.0078	5.06049	
Null Hypothesis:	F-Statistic	Prob.
BSE does not Granger Cause KSE 0.1749	4.10219	0.019
KSE does Cause BSE not Granger	1.77008	
Null Hypothesis:	F-Statistic	Prob.
CSE does not Granger Cause KSE 0.1257	2.11164	
KSE does not Granger Cause CSE 0.0046	5.64954	

Note=Denote at 5% significant level

Table#2 shows the Granger causality test result between the five stock exchanges. There is SSE, HSE and BSE has Granger causality on KSE but CSE has not Granger causality on KSE. It means SSE, HSE and BSE has interdependency on KSE but CSE has not interdependency on KSE. KSE has not Granger causality between SSE and BSE but has Granger Causality between HSE and CSE. It means KSE has not interdependency on SSE and BSE but KSE has interdependency on HSE and CSE.

6. Co integration:

Before testing the co integration it is compulsory to establish the order of integration for each market index series. ADF test are performed to test the presence of unit root logarithms of total market indices of five Asian countries. Detail results are not reported to save space. The ADF test statistics do not reject the null hypothesis. It is applied of all five stock exchanges data then result indicates each is not stationary. Upon taking first differences of the series which indicate stationary of the transformed series, the ADF tests indicate all series are integrated of order one.

TABLE 3

KSE, HSE	Eigen value	Trace Statistic	Critical Value(0.05)	Prob.**
None *	0.204418	44.1891	15.49471	0
At most 1 *	0.135672	17.20472	3.841466	0
Unrestricted Cointegration Rank Test (Maximum Eigen value)

At most 1 *	0.154131	19.75217	3.841466	0
Unrestricted Cointegration Rank Test (Maximum Eigenvalue)				
None *	0.198977	26.18014	14.2646	0.0004
At most 1 *	0.154131	19.75217	3.841466	0
KSE CSE				
None *	0.189586	42.17398	15.49471	0
At most 1 *	0.136875	17.36914	3.841466	0
Unrestricted Cointegration Rank Test (Maximum Eigen value)				
None *	0.189586	24.80484	14.2646	0.0008
At most 1 *	0.136875	17.36914	3.841466	0

Table#3 shows the Johnson cointegration test between KSE and other four Asian stock exchanges. KSE is co integrated with HSE because Trace statistics is greater than Critical Value and Max-Eigen value is greater than critical values. It indicates KSE Has Long term co integrated with HSE. KSE has cointegrated with SSE the result shows the trace statistics is greater than critical value and Max-Eigen values is greater than critical values it indicates KSE has long term co integrated with SSE. KSE has co integrating with BSE and CSE because the trace values is grater than the critical value and Max-Eigen value is grater than critical values. It means KSE has long term co integrating with BSE and CSE. After taking the cointegration then Vector error correction model is applied

co integrated stock exchanges. Detail results are not reported to save space. The result shows long term relationship at equilibrium point.

4. Conclusion

This paper indicates the vibrant interdependence and long term relationship between Five Asian stock markets. The summary of statistics indicates KSE and SSE risk is high as compared to the other stock exchanges but HSE risk is low as compared to other four stock exchanges. KSE mean return is high as compare to SSE but risk is high. In which five stock exchanges diversification is possible it means investor can make investment portfolio between five stock exchanges. Granger causality result indicates SSE, HSE and BSE have interdependency on KSE but CSE has not interdependency on KSE. KSE has not interdependency on SSE and BSE but KSE has interdependency on HSE and CSE. Co integration result shows KSE has long term relationship between BSE, HSE, CSE, and SSE.

International Marketing & Supply Chain Management

An Empirical Study on the Relationship between Total quality management, ISO9000 and Performance

*Peng Du, dragondoggyao@yahoo.com.cn
ZhongNan University of Economics and Law*

Abstract: Records the research on the relationship between TQM, ISO 9000 and business performance improvement. The research is based on a survey conducted in China Mainland which finds that the TQM criteria such as quality leadership, human resource development, quality information, etc. contribute to the improvement of customer satisfaction and business performance. However, none of these TQM criteria can guarantee enhanced performance. It is these criteria as a whole that contribute collectively to the improvement of performance. The study also finds that ISO 9000 are partially related to the implementation of TQM and the improvement of business performance. The recommendation is that ISO 9000 should be incorporated with the philosophy and methods of TQM.

Keywords: TQM; ISO 9000; Performance improvement

Introduction

It is reported that TQM started in Japan in the 1970s, spread to the USA in the 1980s, and was expected to spread to Europe in the 1990s (Munro-Faure and Malcolm, 1992). ISO certification, on the contrary, started in Europe and was spread to North America, Japan, and the rest of the world. Total quality management (TQM) and ISO 9000 standards have become the two main streams of quality management. The two methods and their impacts on business performance have attracted the interests of researchers all over the world. In the past ten years, research on quality management increased dramatically (Filippini, 1997)^[1]. However, there are still many questions about quality management, left unanswered - for example, the impact of quality management on performance and the relationship between TQM and other theories/methods such as ISO 9000 (Filippini, 1997). A recent literature review (Terziovski et al, 1997)^[2] reveals a major gap in research focusing on the relationships among TQM, ISO 9000 certification, and performance. This research aims to empirically investigate such relationships. It is based on an empirical survey in Norway. The research questions include:(1)Does a TQM program contribute to the improvement of business performance?(2)Does the ISO 9000 certification program contribute to the improvement of business performance?(3)Does ISO 9000 influence the implementation of a TQM program?

This article is structured as follows. The first section provides an introduction. In the second section, relevant literature will be reviewed and hypotheses reflecting the research questions will be formulated. In the third section, the research design and empirical data will be introduced. In the fourth section data analysis will be reported. The last section contains the main conclusions and implications for research and practice.

Literature Review and Hypothesis

TQM

TQM provides a generic concept for continuous improvement in quality and other performances. Researchers agree that TQM is a philosophy that stresses a systematic, integrated, and consistent perspective involving everyone and everything. However, the definitions of TQM vary a lot. Quality awards models provide a general framework for quality management. The questionnaire in this study was designed mainly after the US Malcolm Baldrige quality award model (Hart and Bogan, 1992). The criteria include: quality leadership;humanresourcedevelopment;qualitystrategy;informationresources;qualityassurance in process and product; people satisfaction; customer satisfaction; social and environmental impact; and the results (i.e. performance).

Although TQM has been widely regarded as a tool for improving quality and other performances such as profit and market share, the success rate is not high. For example, a survey of 500 companies found out that less than 1/3 of the respondents have achieved something and about 2/3 of the TQM programs have ground to a halt (Ahire et al., 1995)^[3]. To understand the success of TQM, many studies have been conducted to investigate the impact of TQM on performance. However, more research looks at the relationship between, for example, quality and productivity (Huff et al., 1996)^[4]. In this article, the impact of TQM implementation on the overall performance of an organization will be investigated. A hypothesis regarding the relationship between TQM and business performance is formulated as follows:

H1. TQM has a positive impact on the improvement of business performance.

ISO 9000 certification

ISO 9000 refers to a series of standards for quality management systems. Its core module, ISO 9001, provides quality systems for design, development, production, installation and services. It is a comprehensive model of quality systems. A global survey (Ho, 1997) in 80 countries reveals that the number of ISO 9000 certificates in 1996 (160,000) more than doubled the number in 1994 (70,517).

However, ISO 9000 standards seem to be controversial. On the one hand, it is argued that the quality management system based on ISO 9000 standards is a necessary foundation for other quality methods under TQM (Taylor, 1995)^[5]. Mo and Chan (1997)^[6] claim that a number of variables in ISO 9000 standards are somewhat related to TQM. Ho (1997) says that ISO 9000 certainly belongs to the TQM process. Many people believe that, in the future, ISO 9000 will be necessary to stay in business.

On the other hand, other researchers strongly criticize ISO 9000. Reedy (1994)^[7] claimed that ISO 9000 is not focused on the control of product quality. The quality assurance rules established in ISO 9000 have been used in the USA for more than 25 years with little, if any, improvement in quality and safety. Reedy (1994) even believes that ISO 9000 does not help at all if not properly implemented. Avery (1995) reported that many industry people think that ISO 9000 is not the ticket to quality or competitiveness that its supporters claim. Taylor (1995) found that very few companies view ISO 9000 registration as part of the TQM plan. ISO certification started in Europe. However, European firms are not sure whether these programs are helping them to infuse quality into their organizations.

To clarify the controversial comments on ISO 9000, the following two hypotheses are formulated and will be tested:

H2. ISO 9000 certification has a positive impact on the improvement of business performance.

H3. ISO certification has a positive impact on the implementation of TQM.

In summary, the research recorded in this article aims to investigate the relationship between TQM, ISO 9000, and business performance. The variables and their hypothesized relationships are illustrated in a conceptual framework as shown in Figure 1.

Research Design and Empirical Data

Survey design

This study is based on a survey. The first version of the questionnaire was designed by researchers from Toledo University (Rao et al., 1997)^[8]. The questionnaire covers the nine criteria mentioned in the literature review section. Corresponding to the nine criteria, there are nine groups of questions for measurement. Each group contains ten to 17 questions. All the variables in these criteria are measured on a scale of 1 to 5. An additional choice is provided for situations that are not relevant. The numbers represent the strength or degree of participants' assessment, agreement, perception or opinion, as the case may be, to the question item. For example, if a question asks to what extent the managers participated in TQM training, "5" represents very much while "1" represents not at all. Background information on the company such as size, ISO certification, and years of practicing quality management is also covered by the questionnaire.

This survey was conducted in Beijing, Shanghai, Guangzhou, Wuhan, Chengdu and Shenzhen. Questionnaires

were sent out to 900 companies. All the informants are quality managers in these companies and 363 replies were returned. The return rate is about 40%. In this research, only the 316 private companies are used. The 316 sampled companies include manufacturing companies (57%), service companies (27 %), and other types of organizations such as research institutes and foundations (16 %). The company sizes range from fewer than 150 employees (51 %), 150-500 (31%) and more than 500 (18 %).

Validity test

The research uses multiple-item measurements. Each criterion in the questionnaire covers ten to 17 individual questions (or items). Do those questions belong to a criterion as theoretically proposed? This issue refers to construct validity in research methodology. Factor analysis has been widely used to test the construct validity of multiple-item measurement of a concept (or construct) (O'Leary-Kelly and Vokurka, 1998)^[9].

Factor analysis groups variables (i.e. single questions) into factors based on their common correlation. Those variables that are correlated with each other will be grouped together. Such a group of variables is called a factor. The grouping is based on the rotated loading coefficients. The rule of thumb goes as follows (de Vaus, 1993). If its rotated loading coefficient is more than 0.30, then a variable will be included in the corresponding factor. As the sample size of this study is 180, with a 95 per cent confidence level and an effect size of 0.3, the statistical power of this sample is larger than 0.95 (Cohen, 1988,) which is high enough to identify any inherent statistical relationships.

If a variable's loading coefficients for all the factors are more than 0.3, then the variable will be grouped according to the largest coefficient. Those variables in a factor will increase or decrease simultaneously. Instead of looking at all the individual variables, data analysis will look at the factor.

Performances include customer satisfaction, people satisfaction, business performance, and impact on society and environment due to a quality management program and Baldrige quality award model. In the questionnaire, there are 13 individual questions that are related to performance. Factor analysis groups these 13 questions into four factors (see also Table I):

- Factor I (F71): product quality and customer satisfaction. This factor covers reduction of defects, rework, and warranty cost and customer complaints.
- Factor II (F72): productivity and profitability. This factor covers cost reduction, productivity increase, the shortening of through-put time, and profitability increase.
- Factor III (F73): market position and competitiveness. This factor covers the increases of market share, competitive position, and the capability of staying in its business.

The last factor contains employee satisfaction and environment protection. However, common sense can't tell us that the two variables do not have much relation with each other. The correlation between them must be a pure coincidence. Therefore they are separated. As a result, the following two factors are identified and named:

Table I. Factor analysis of performance

Performance variable s	Factor I	Factor II	Factor III	Factor IV
V7B: rework levels reduced	0.82	0.25	0.17	0.14
V7A: scrap levels reduced	0.80	0.19	0.21	0.24
V7C: warranty costs reduced	0.69	0.33	0.30	-0.01
V7D: customer complaints reduced	0.69	0.26	0.34	0.05
V7K: costs reduced	0.37	0.77	0.09	0.10
V7I: manufacturing time reduced	0.13	0.75	0.27	0.22
V7J: profits increased	0.33	0.73	0.32	0.13
V7H: productivity increased	0.27	0.71	0.33	0.22
V7F: market share increased	0.22	0.31	0.81	0.11
V7E: competitive position enhanced	0.27	0.14	0.79	0.17
V7G: keep your company in business	0.30	0.32	0.77	0.13
V7N: improve environment protection	0.07	0.18	0.17	0.90
V7M: employee satisfaction improved	0.37	0.42	0.16	0.54
Eigenvalues	6.80	1.10	1.00	0.80
Variance explained	2.95	2.88	2.49	1.36
% of total variance explained	22.69	22.15	19.15	10.49

- Factor IV (F74): employee satisfaction.
- Factor V (F75): environment protection. This factor represents a company's ability to preserve global resources, and reduction of waste and pollution.

Five performance factors are thus identified. Second-level factor analysis groups these five factors into a new factor that is named as the performance index, represented by PI. The index is an average of all the five result criteria. The performance index is a comprehensive measure of the result increase due to the TQM program that a company implemented. The analysis of performance will be based on both the identified five criteria and the performance index.

In a similar way, the eight criteria of TQM enablers 'are tested by factor analysis. The loading coefficients for each test are omitted due to page limitation. The first three criteria are tested to be valid and all questions in the three criteria are included. However, the other five criteria cover one concept more than theoretically proposed. For example, the training of employees and other development activities are theoretically grouped into one criterion named human resource development. Factor analysis separates training in statistical methods from the rest of the development activities, so two criteria are identified. For another example, the quality assurance of products and processes is also separated according to factor analysis. The 14 criteria identified are listed in Table II. The analysis will be based on these 14 criteria.

Data Analysis

In this section, the relationship between TQM, ISO 9000 certification, and the improvement of business performance will be investigated by testing corresponding hypotheses.

Table II. The empirical TQM criteria of the sampled companies

Code	Criteria identified according to factor analysis
F1	Quality leadership
F2	Quality information
F3	Strategic planning of quality
F41	Human resource development
F42	Training in statistical methods
F51	Quality assurance of process
F52	Quality assurance of product
F61	Co-operation with suppliers
F62	Suppliers' direct involvement
F81	Consideration of customers' satisfaction
F82	Benchmarking
F83	Close co-operation with customers
F91	Consideration of employees' satisfaction and wellbeing
F92	Consideration of social and environmental impact

TQM and business performance (H1)

In this section, the contribution of the 14 enablers to the result increase will be examined. Correlation analysis shows that all the 14 enablers are significantly correlated with the performance index (PI) as shown in Table III. This means that these enablers do contribute to the results. However, the degrees of correlation vary quite a lot, ranging from a maximum of 0.59 to a minimum of 0.35. According to the degree of correlation, the top five enablers are quality leadership, strategic management of quality, human resource development, close co-operation with customers, and consideration of customers' satisfaction. However, companies pay less attention to leadership (ranked No. 5), quality strategy (ranked No. 7) and human resource development (ranked No. 11). Consideration of employees' satisfaction and wellbeing and quality assurance of process ranked very high (No. 1 and No. 2) according to the average of the enablers. This means that companies pay a lot of attention to the two issues. However, their contribution to the increase of the result is not so much as that of other enablers like leadership and human resource development.

Although correlated, none of these enablers are strongly correlated with the performance index. The correlation coefficients range from 0.35 to 0.59. The square correlation ranges from 12 per cent to 0.35 per cent. Such correlation coefficients can only be interpreted as slightly or substantially correlated, not strongly related. According to Miller (1991), strong correlation should be more than 0.6. That means that each of the enablers can only explain a smaller part of the result increases. If one of the enablers increases, the result may not necessarily increase. However, multi-regression analysis reveals that correlation between the performance index and these 14 enablers is strongly correlated ($R = 0.91$, $R^2=0.82$). That means these that enablers contribute to the result collectively, instead of individually. This finding supports the argument that a TQM program must be complete in terms of the content, the extent (i.e. fully implemented), and perhaps also the area (i.e. company-wide).

ISO 9000 certification and business performance (H2)

The ANOVA analysis reveals that there are differences in performance between those companies with and without ISO 9000 certification, as shown in Table IV. Some aspects of performance, including reducing product defect, rework cost, warranty cost, and customer complaints, are significantly different between companies with and without ISO certification. However, there is little difference in market position and competitiveness. Furthermore, there is no significant difference in employee satisfaction and environmental protection.

ISO 9000 certification and TOM implementation (H3)

This study found that ISO 9000 certification is related to some TMQ enablers, as illustrated in Table V. In those companies with ISO 9000 certification, the availability of quality information, quality assurance of product, quality of processes, and co-operation with customers are significantly higher than those companies without ISO

9000 certification.

However, ISO 9000 certification does not have much relation with strategic plans regarding quality, employee participation and human resource development. This is consistent with what Juran and Gryna (1988) pointed out in the 1980s. They said that ISO 9000 failed to include some essentials for achieving world-class quality, such as:

- quality goals in the business plan;
- quality improvement at a revolutionary rate;
- training in managing for quality; and
- Participation by the workforce.

Discussion and Implications

The findings of this study and a discussion of these findings are summarized hereafter.

The components of TOM

Fourteen TQM criteria/enablers are identified according to the Norwegian empirical data. The criteria are not exactly the same as those proposed in the US Baldrige and European quality award models. The US Baldrige model is evaluated and modified every two years (Bemowski, 1996). Although the 1997 version still covers seven categories, the seven categories are broken down into 20 examination items, down from 24 in 1996 and 33 in 1990. The European quality model was also modified in 1997 (European Foundation for Quality Management, 1996; 1997). For one thing, private companies and public companies are separated in the 1997 manual. The Australian quality award model treats small businesses separately from larger ones (Australian Quality Council, 1996). Even after their modifications, the models in different countries - for example, Japan, USA, Canada and Europe - are not exactly the same (Laszlo, 1996)^[10]. Conti (1997)^[11] believes that the model for evaluating quality management in a company should not be the same. The quality award model of a country or region should be geared to a business model that integrates the quality concept and organizational concepts and managerial practices. Laszlo (1996) claimed that the application of TQM tends to vary with location. Examples of successes in TQM cannot be copied and strictly followed as recipes. The quality award model, especially those designed for several countries and regions can only be used as a guide rather than a model for copying.

TQM and performance

It was found that all the TQM enablers contribute to an increase in customer satisfaction and business performance. Human resource development, quality strategy, and quality leadership are predominant in terms of contribution. However, none of the enablers can guarantee improved performance. It is these enablers as a whole that collectively contribute to the results. If a company only implements one or a few of the enablers, its performance is unlikely to be improved. That is why a quality program is called "total" quality management. The key to TQM is its holistic approach to the organization. Companies must implement TQM to its full extent in order to obtain its full benefits. The study also finds that human resources and the strategic management of quality are significantly correlated with an improvement of performance. However, the averages of these two criteria are lower in many companies. This implies that companies should pay attention not only to visible methods, but also to the development of human resources and strategic issues.

ISO 9000 certification, TOM and performance

This study also finds that, in the sampled companies, companies with ISO 9000 certification perform better in the reduction of bad products and customer complaints, profitability, and productivity. However, it has little influence on market position and competitiveness, and no influence on employee satisfaction and environmental protection. The standards are not related to some TQM criteria. In addition, a causal relationship is still not clear. The ISO 9000 standards may directly contribute to performance. They may also indirectly contribute to performance by improving other TQM enablers. It is difficult to judge the direction of impact. However, ISO 9000 certification does not have significant impact on the strategic management of quality and human resources development. These two criteria are significantly correlated to performance improvement.

A danger for ISO 9000 certification is that a company may regard ISO 9000 certification as a substitute for

TQM and does not continue the journey after being registered to ISO 9000. Even though some companies do plan to implement TQM, the program is not viewed as the continuation of ISO 9000 registration. How to combine ISO 9000 and TQM and bridge the gap between them will be an important issue in the future.

It all depends on how a company would like to use ISO 9000 standards. If it is only for the purpose of getting a certificate and an advertisement, the documents and procedures will destroy the normal business process and will not contribute to the improvement of performance. In this case, the ISO 9000 certificate is unlikely to contribute. The implication is that a company must integrate ISO 9000 procedures with the philosophy, human resource development, and strategic management in TQM. ISO 9000 is not a substitute for TQM. Companies should not just satisfy the certification of ISO 9000.

The final conclusion is that TQM and ISO 9000 standards must be completely and systematically implemented and integrated. How can an organization know that its quality program is complete? Self-assessment (Conti, 1997) according to a quality model provides a systematic and comprehensive evaluation of the TQM program. However, self-assessment is still not widely practiced. Training, seminars, books, etc. are needed to disseminate the benefits and knowledge of self-assessment. Self-assessment according to a survey will be the future research of this study.

A Sourcing Model from a Cost Heterogeneous Supply Base

Jishnu Hazra, hazra@iimb.ernet.in
B. Mahadevan, mahadev@iimb.ernet.in
Indian Institute of Management, Bangalore, India

Abstract

In this paper we analyze a scenario where a buyer procures capacity from one or more suppliers in the presence of demand uncertainty. The buyer does not have perfect information of suppliers' unit production cost. The supplier, of course, has knowledge of its own cost function but like the buyer does not have information on other suppliers' unit cost. Under this scenario we explicitly derive suppliers' capacity reservation price, which is a function of their capacity, amount of capacity reserved by the buyer and other parameters. The buyer's decisions are how much capacity to reserve and from how many suppliers. We develop closed-form solutions under a special case when the buyer's demand is deterministic.

Keywords: supplier selection, capacity reservation, electronic procurement, demand uncertainty

Introduction

Rapid globalization of markets aided by advances in the Internet and electronic markets has in recent times thrown new opportunities for Supply Chain Management (SCM). Several studies predicted that electronic markets will play a significant role in redefining buyer – supplier relationships (Elmaghraby, 2000). A variety of Business-to-Business (B2B) market places are available today and organizations could put a combination of these to use through an E-procurement plan (Mahadevan, 2000). E-procurement offers several new advantages to industrial buyers. Many of them stem from the ability to reach a wider set of suppliers than before. For instance, a registered user of Alibaba.com gains access to several thousand trade leads in 27 industry categories and 900 product categories posted by potential buyers and suppliers.

The flip side to the increased globalization of the supply chain is the new set of challenges that firms face today. Consider the following trends in SCM. A recent study by The Economist Intelligence Unit based on a worldwide survey of 1,656 executives belonging to the auto component sector suggested that there will be a big shift in the manufacture of auto components to countries like India and China (EIU, 2006). The Swedish car manufacturer Volvo reported that the casting and forging components sourced from India are 50% cheaper than those sourced from Europe (EIU, 2006). One sees a similar trend even in other sectors such as Aerospace and Defence. Anselmo (2005) suggested that a major shift in spending by aerospace manufacturers is likely in the next three years towards countries such as India, China and Eastern Europe.

We analyze a typical situation involving suppliers who differ from one another with respect to the cost of capacity to be procured and identify useful strategies for the buyers to minimize their procurement cost. Our work is at the intersection of supplier selection and capacity allocation using supply contracts. While supply contracting literature addresses various contracting mechanisms employed between a chosen set of suppliers and a buyer, we extend this work by studying the effect of cost heterogeneous mix of the supply base typical of today's global markets.

A few studies in the recent past have studied SCM problems pertaining to a cost heterogeneous supply base. Li and Debo (2009a) analyze optimum strategies for contracting with a high cost and a low cost supplier and concluded that in periods of demand uncertainty the high cost supplier is more favored. In another paper (Li and Debo, 2009b), the authors model a situation involving multiple suppliers whose cost information is private and explores the value of commitment through long term contracts with suppliers. They use a competitive bidding process to elicit suppliers' cost. A supplier selection scenario in which the buyer does not know the competing suppliers' cost and a queuing model to minimize its procurement and operating cost is analyzed in Cachon and Zhang (2006). The suppliers are assumed to have a similar capacity but vary in their costs. They model a situation in which the buyer will sample the participating suppliers' cost from a uniform distribution $[b_l, b_h]$. In this paper we make a similar set of assumptions about suppliers' capacities and costs.

Elmaghraby (2000) reviews the trends in the sourcing literature and identifies a central issue of multiple sourcing: the number of vendors to be selected. In a multiple-supplier, single-buyer setting, the presence of multiple

suppliers will permit the buyer to setup a competitive mechanism such as a bidding process for capacity allocation among the selected suppliers. An excellent review of the supply chain contract literature appears in Cachon (2003). We refer the readers to the respective papers for details.

Our study differs from the earlier studies on the issue of capacity reservation price. Earlier studies in capacity contracts often assumed the capacity reservation price to be exogenous. We however, explicitly model this situation and derive price capacity curves for suppliers. Although suppliers have an option to sell capacity in both the spot market and through pre-negotiated contract with buyers, they face different sets of costs (Grey et al. 2002). Consequently, suppliers will deploy alternative strategies for pricing their capacity in these markets. We believe that business environment aspects such as search cost differentials and risks associated with selling capacity in the open market would influence suppliers' pricing strategies and capacity allocation through contractual agreement with the buyers. We therefore derive an expression for pricing of supplier's capacity.

The rest of the paper is organized as follows: We begin by motivating the research problem in section 2 with a review of pertinent literature. In section 3 we characterize the cost heterogeneity of the supply base and describe the problem. We also present the context and the decision issues for the buyer and the supplier. In section 5 we analyze the cost heterogeneity of supply base and derive solution procedures and useful policy framework. We finally conclude the paper by discussing key managerial implications of the study in section 6.

Model

Consider an item or a component that a buyer would like to procure for which there are n pre-qualified suppliers available to supply as per specifications. The buyer's demand is a stochastic variable D , sampled from a distribution $F(x)$. The decision to reserve capacity is made at the beginning of the season when it has information only of demand distribution. Similar to Cachon and Zhang (2006), the suppliers who can provide the required item have a finite capacity denoted by μ . However, there could be significant variations in the unit cost of the capacity offered by suppliers. The supplier's manufacturing cost is private information and not known to the buyer or to other suppliers. However, the buyer knows that the suppliers' unit cost are sampled from a distribution $U(v_l, v_h)$. Cost differentials occur primarily as a result of variations in input factor cost. Shifting of major manufacturing activities to China, software development activities to India and textile manufacturing to China, Latin and Central America and South Asia are attributed to cost structure differentials.

The salient features of the supplier selection process are as follows: The buyer pre-qualifies the number of suppliers (denoted by $n > 1$) to participate in a competitive bidding process, through a RFQ, along with bidding rules and other terms of fulfillment. A preliminary qualification for the supplier to be enlisted for participating in the auction is that the supplier's capacity is at least as large as the capacity sought to be reserved through the contract. The assumption is necessary to avoid infeasibility of the solution in the event the number of suppliers selected for award of contract is just one. Similar assumptions have been made in Bernstein and Vericourt (2008). The buyer will also *a priori* announce the number of suppliers, m ($1 \leq m \leq n-1$), that will be selected before the start of the bidding process.

The buyer utilizes a *pay-to-delay* contract to reserve capacity from a set of suppliers. Let us denote the capacity procured through contract by Ω . All m suppliers, finally selected, will get an equal allocation of the capacity at the price of the first rejected supplier. Therefore, the capacity awarded to each supplier is Ω/m . Equal allocation has been adopted by earlier researchers. (See for example, the review paper by Elmaghraby, 2000 and Seshadri, 2005 for details).

The buyer obtains quotes from the participating suppliers in the form of a price-capacity curve and uses it as the basis for allocating the order among the suppliers so as to minimize the total expected cost of the items procured. The spot market is not capacity constrained in the near term. After observing the demand the buyer will procure additional capacity from the open market in case her demand exceeds the total capacity reserved with the suppliers.

The enlisted suppliers, on the other hand, will also sell the remaining capacity (the unsuccessful suppliers will sell the entire capacity) in the spot market. In our model we assume that demand for suppliers' capacity is uncertain and is independent and identically distributed. Therefore the suppliers may not be able sell his entire capacity in the spot market. We also assume the contract between the buyer and the suppliers will not have any impact on average unit price in the spot market which is denoted by P_o .

The Suppliers' Problem

We first derive the price a supplier is likely to quote in the competitive bidding process for obtaining a contract. Using this information, we further determine the price for awarding the contract.

Consider the i^{th} supplier who has the option of selling his capacity to a specific buyer through a contract and also through the spot market. While attempting to sell his capacity in the spot market, the supplier finds that the demand is stochastic. We denote the demand for supplier's capacity in the spot market by a random variable \mathbf{X} . The demand distribution for supplier's capacity, in the spot market, is assumed to be independently and identically distributed. The random nature of demand imposes a financial burden on suppliers because of the risk of unsold capacity.

We assume that the supplier will sell his capacity in the spot market at an average unit price of P_o . The supplier's production cost is linear in number of units produced and is given by $v_i x$, where v_i , ($v_i > 0$) is the unit production cost and x is number of units produced. Since the supplier is likely to face uncertain demand in the spot market he will consider selling some capacity to the buyer through a contract at a lower price, as long as his total expected profit is at least as large as the case when he sells his entire capacity in the spot market. Based on these considerations, we derive the price – capacity curve for a supplier who would like to sell his capacity to the buyer through contract.

The expected profit for the i th supplier offers if he offers his entire capacity in the spot market is given by

$$P_o E\{\min(X_i, \mu)\} - v_i (E\{\min(X_i, \mu)\}) \quad (1)$$

The first term in the above expression is the expected revenue earned and the second term is the expected production cost. The E in the equation is the expectation operator.

Suppose the supplier offers ω (where $\omega \leq \mu$) units of capacity to the buyer through a capacity reservation contract. He will have to sell $\mu - \omega$ units of capacity in the spot market. His expected profit, if he wins the contract, will then be:

$$P_i(\omega)\omega + P_o E\{\min(X_i, \mu - \omega)\} - v_i (\omega + E\{\min(X_i, \mu - \omega)\}) \quad (2)$$

In (2), $P_i(\omega)$ is the price supplier i quotes to the buyer, which is a function of units of capacity, the buyer procures from this supplier through a capacity reservation contract. The second term in equation (2) is the expected revenue the supplier earns from the spot market and last term is the expected production cost. The supplier will commit ω units of capacity provided (2) is at least as large as (1). Therefore the price-capacity curve is given by:

$$P_i(\omega) = \frac{(P_o - v_i)\{E(\min(X_i, \mu)) - E(\min(X_i, \mu - \omega))\}}{\omega} + v_i \quad (3)$$

We now assume that the demand for capacity in the spot market for the suppliers is uniformly distributed $(0, b)$, $b > 0$. For such a demand distribution it can be shown that the price quoted by the i^{th} supplier when $\mu \leq b$ as:

$$P_i(\omega) = P_o - \left(\frac{P_o - v_i}{2b} \right) (2\mu - \omega) \quad (4)$$

It is evident that the price quoted by the supplier is always less than the average spot market price. Furthermore, this price decreases as the supplier's capacity increases. This fact is valid for any probability distribution of demand for supplier's capacity in the spot market. The reason why price decreases with supplier's capacity is due to the fact that with an increase in ω the risk of unsold capacity is reduced. This is because for an increase in ω the supplier has to sell less capacity in the open market and there is a higher probability of success of selling the entire remaining capacity. Essentially, for a higher expected capacity utilization the supplier would charge a higher reservation price to the buyer.

In general, contractual agreements with buyers provide numerous benefits arising out of stable capacity and production planning. These translate into better up-stream planning and material and cost control. However, the proposed model indicates motivations for the suppliers to participate in the contract. The supplier's capacity utilization increases when she commits ω units of capacity to the buyer. The expected capacity utilization is denoted by ρ .

When the supplier commits ω units of capacity to the buyer her expected capacity utilization is given by

$$\rho = \frac{\omega + E[\min(X, \mu - \omega)]}{\mu} = 1 - \frac{(\mu - \omega)^2}{2b\mu}.$$

The algebraic details are omitted as it follows from simple algebra. If the supplier sells her capacity only in the spot market then her expected utilization is given by $1 - \mu/2b$. The supplier's capacity utilization will increase if he sells part of his capacity to the buyer through a capacity reservation contract.

The Buyer's Problem

The total procurement cost optimization problem for the buyer is given by:

$$\begin{aligned} \text{Min } C(\Omega, m) &= \Omega E\left(P_{[m+1]}\left(\frac{\Omega}{m}\right)\right) + P_o E \max(0, D - \Omega) \\ &\text{subject to} \\ \Omega - m\mu &\leq 0 \\ m &\leq n - 1 \\ \Omega, m &\geq 0 \end{aligned} \tag{5}$$

In equation set (5), $E\left(P_{[m+1]}\left(\frac{\Omega}{m}\right)\right)$ is the expected unit capacity reservation price of the first rejected supplier. This will be the unit price that the buyer will pay to the m selected suppliers to reserve capacity. Using the price curve of the suppliers as derived earlier, we develop an expression for capacity reservation price of $(m+1)^{th}$ supplier before we proceed with our analysis of the buyer's problem. The constraint ensures that the reservation quantity (Ω/m) from each selected supplier does not exceed its capacity (μ) .

Let us now consider the multiple suppliers setting. Once the buyer makes an appropriate choice of Ω , she will allocate this equally among the m selected suppliers. However, in order to determine the price at which the buyer reserves the capacity, she needs to know the price of the first rejected supplier.

Typically, in many situations the buyer may not know exactly the suppliers' unit cost. In our paper, we assume that the buyer knows the value of all parameters (in equation 4) except each supplier's unit production cost. We proceed to determine the expected price of the first rejected supplier.

Let $P_{[1]}(\frac{\Omega}{m}) \leq P_{[2]}(\frac{\Omega}{m}) \leq \dots \leq P_{[m+1]}(\frac{\Omega}{m}) \dots \leq P_{[n]}(\frac{\Omega}{m})$ denote the order statistics of the unit capacity reservation price

(bids) received and $P_{[m+1]}(\frac{\Omega}{m})$ is the lowest bid amongst the rejected suppliers. Similarly, let

$v_{[1]} \leq v_{[2]} \leq \dots \leq v_{[m]} \leq \dots \leq v_{[n-1]} \leq v_{[n]}$ denote the order statistics of suppliers' costs.

From (4), it is clear that. $E\left(P_{[m+1]}(\frac{\Omega}{m})\right) = P_o - \frac{1}{2b}\left(2\mu - \frac{\Omega}{m}\right)\left(P_o - E(v_{[m+1]})\right)$

From the buyer's perspective the v_i 's are uniformly distributed between v_h and v_l , one can get closed form expression for the expected value of the order statistics. Using the order statistics for v , we obtain,

$E(v_{[m+1]}) = v_l + \frac{m+1}{n+1}(v_h - v_l)$. Substituting it in the above equation and simplifying we get an expression for

expected unit price to be paid for reserving the capacity of the selected suppliers

$$E\left(P_{[m+1]}(\frac{\Omega}{m})\right) = P_o - \frac{1}{2b}\left(2\mu - \frac{\Omega}{m}\right)\left(P_o - v_l - \frac{m+1}{n+1}(v_h - v_l)\right). \quad (6)$$

Therefore, equation (6) gives the unit expected price at which the buyer will award the contract to the first m lowest cost suppliers. Substituting (6) into the buyer's objective function in (5), we can re-write the cost equation, for the buyer, as

$$C(\Omega, m) = \Omega \left[P_o - \frac{1}{2b}\left(2\mu - \frac{\Omega}{m}\right)\left(P_o - v_l - \frac{m+1}{n+1}(v_h - v_l)\right) \right] + P_o E \max(0, D - \Omega) \quad (7)$$

Model Analysis

We now analyze the case for the stochastic demand. We assume that D , the buyer's demand, is a random variable representation by a distribution $F(x)$. The buyer would like to minimize the cost of procurement given the stochastic nature of the demand and the existence of n qualified suppliers to choose from. The buyer's problem boils down to an optimal choice of Ω and m . We consider two cases of this problem and derive expressions and insights into the problem. We assume that the buyer's demand distribution is continuous and differentiable in its domain.

Proposition 1: The optimum number of suppliers, m^* , and the quantity reserved, Ω^* , is given by

$$m^* = \min \left(\sqrt{\frac{\Omega^*}{2\mu} \left(\frac{(P_o - v_l)(n+1)}{(v_h - v_l)} - 1 \right)}, n-1 \right)$$

and

$$F(\Omega^*) = \frac{\left(P_o - v_l - (m^* + 1) \frac{v_h - v_l}{n+1} \right) \left(\mu - \frac{\Omega^*}{m^*} \right)}{bP_o} \quad (8)$$

In the above equation $F(.)$ is the distribution of the buyer's demand. For a general demand distribution it is not possible to get an explicit solution for Ω^* but it is possible to obtain the solution for m^* and Ω^* numerically. However, explicit solution can be derived when D is uniformly distributed.

Corollary 1: If the buyer's demand D is deterministic and is given by Ω (that is $\Pr(D = \Omega) = 1$) then the optimum number of suppliers, m^* , is given by

$$m^* = \sqrt{\frac{\Omega}{2\mu} \left(\frac{(P_o - v_l)(n+1)}{(v_h - v_l)} - 1 \right)}. \quad (9)$$

In Corollary 1, the buyer's mean demand forecast is relatively accurate and is given by Ω . In this model the buyer does not have to procure from the spot market and instead gets her entire requirement from the reservation contract with the suppliers. The size of the supply base increases with $\sqrt{\Omega}$ which makes the contract relatively stable in the sense that small variation in demand forecast will not change the size of the supply base.

Through numerical analysis we have found that as demand uncertainty increases, the buyer will reduce the supply base. Moreover, the quantity allocated per supplier will also reduce. The optimal reserve capacity is less than the buyer's mean demand. An intuitive explanation to this follows from the fact that the buyer has to take-or-pay for the reserved capacity (take-or-pay contracts are discussed in Cachon 2003 and references therein). In other words if the buyer reserves "excess" capacity with the suppliers then that is lost if demand realization is low. With an increase in demand uncertainty the buyer becomes conservative and reserves less capacity and would prefer to source most of his requirement from the spot market. On the other hand, when the demand variability tends towards zero the optimal number of suppliers that will be selected is given by equation (9), which is to be expected.

Conclusions

This paper addresses the capacity reservation issue in detail and analyses alternative strategies that a buying firm would like to adopt. Suppliers participating in such contracts are likely to quote higher price at higher levels of utilisation and will have several motivational elements to participate in the contract. The optimal number of suppliers to contract capacity remains robust to changes in model parameters. However, variability of demand distribution has significant effect on the optimal capacity to contract.

Future work on extending the model includes analysing for other probability distributions for demand and suppliers' capacities. The assumption of a uniform distribution for spot market demand and suppliers' capacity has, on the one hand enabled greater analytical treatment of the model, and on the other hand makes the problem less general. However, we utilise this trade-off to develop greater understanding of the problem and derive some managerial insights.

Furthermore, modelling transaction costs related to the pre-selection process and dealing with multiple suppliers in a post-selection setting will sharpen the insights. In this paper we have not modelled the transaction costs of dealing with the m suppliers. For a coordination cost function of the form Cm^α , where $\alpha > 1$ and C is a positive parameter, the cost structure will continue to be convex. Therefore, the structural properties of our model will not change, although one can expect the value of m to be lower than what our model has currently estimated. However, modelling transaction costs related to the pre-selection process and dealing with multiple suppliers in a post-selection setting in a more general form will sharpen the insights. Another interesting question to study is the structure of the contract and the policy framework in cases where cost and capacity are correlated.

Note: We omit the proof and algebraic details for all propositions in this paper for the sake of brevity. The proofs are available with the authors.

Abstract

Effective strategic marketing practices play a crucial role in the success of both large and small firms. In spite of their recognised importance to firms, a review of Small and Medium Enterprise (SME) literature and high technology marketing literature revealed a gap in understanding the marketing practices of small and medium high technology firms. In the high technology sector, small and medium Information and Communication Technology (ICT) companies are increasingly expanding their role in the information intensive global economy. The impact of marketing practices on the performance of such companies receives little research attention, even though it is recognised that marketing practices contribute significantly to firm performance. This research explores the marketing practices that are adopted by small and medium ICT firms, and proposes a conceptual model of the strategic marketing practices adopted by these firms and their influence on firm performance.

1.0 Introduction

Small and medium enterprises (SMEs) constitute a substantial part of many economies of the world and they play a pivotal role in the economic development of individual countries (Kuratko et al., 2001; Graham, 1999; Knight, 2000; Hill, 2001; Siu, 2000, 2001). SMEs exert a strong influence in many economies as a major source of employment (Chuong Sum et al, 2004; Ayyagari, et al., 2007) and exports (Lages and Montgomery, 2004). Particularly, SMEs play a major role in the technological progress of many countries as they account for high proportions of innovations in products and services (Chuong Sum et al., 2004; Beaver and Prince 2002; Storey, 1994; Kuratko et al., 2001).

Because of their impact on the economy and their contribution to the society, much importance is given to all those studies that contribute to the success of SMEs. A review of SME literature shows that marketing is increasingly recognised as the key to small business growth and therefore, there is a growing research interest in the marketing practices of SMEs (Gilmore et al., 2001; Blankson and Stokes, 2002; Hill, 2001; Siu, 2000; Siu et al., 2004; Morrison et al., 2003; Lee et al., 2001). Most of these studies have indicated the role of marketing to be critical in the sustainability of the small and medium firms. It is posited that small business failures can result from lack of marketing and poor marketing practices, including planning and implementation (Hogarth-Scot et al., 1996; Zatzalo and Gray, 2000; McCartan-Quinn and Carson 2003). Effective marketing plans in a small business are found to enable the firm to become more responsive and adaptable to the market place (Brooksbank, 1999) and it provides a framework for business objectives, decisions and actions (Pelham and Wilson, 1995). Also studies done by Brooksbank and Taylor (2002) in New Zealand, indicate that in small firms, strategic marketing practices are associated with high performance.

Despite the increased recognition that marketing is crucial for the growth and sustainability of small firms, it remains under researched in SMEs. The researchers in small business marketing concede that the marketing theory development in SMEs is limited and insufficient (Davies and Klassen, 1991 cited by Siu and Kirby, 1998; Lee et al., 1999; Hill and Wright, 2001; Sengupta and Chattopadhyay, 2006; Simpson et al., 2006). It is evident that there is insufficient knowledge about marketing in small business and an appropriate small business marketing theory,

specifically related to the understanding and knowledge of strategic marketing, is absent (McPherson, 2007; Sengupta and Chattopadhyay, 2006; Lee, Lim and Tan, 1999).

The revolution of Information and communication (ICT) sector with the liberalization of trade restrictions and globalization has resulted in an increase in the number of high technology firms all over the globe (Galbraith, Rodriguez and Denoble, 2008). Locke (2004) contends that the two forms of technology- communication technology and information technology, converged creating a new type of technology known as ICT. The communication technology consists of the hardware equipment, organisational structures and social values by which individuals collect, process and exchange information with other individuals. Information technology refers to computer and electronic-based technology, generally encompassing the development, installation and implementation of computer systems and applications. Thus ICT facilitates the exchange of information on a many-to-many basis specifically through computer and electronics based communication systems. These firms are viewed as a source of flexibility and innovation, and are identified as significant components of economic strategies for job and wealth creation. Keogh and Evans (1999) contend that these new technology based firms are viewed as having a very important role to play in the economy, as they potentially grow into major employers and go beyond their local region into international markets. They also make a major contribution to industrial innovation and technological change (Akgun, Lynn and Byrne, 2004).

ICT is classified as a high technology product as it exhibits characteristics similar to those of high technology products. Like high technology products, ICT products are also characterised by a high degree of market, technological and competitive uncertainty (Mohr 2000, Kaynak and Hartley, 2005). Their markets are also characterised by a continuous shortening of product and market cycles (Benkenstein and Bloch, 1994), high research and development expenses and rapid obsolescence of products. Hence all those studies that helps to understand the marketing environment of high technology firms are referred in this research.

The importance of marketing in bringing high technology to the market is well documented by various researchers (Berry and Taggart, 1998; Boussouara and Deakins, 1999; Uslay et al., 2004; Traynor and Traynor, 2004; Meldrum, 1995; Davies and Brush, 1997). It is argued that, high technology firms find it increasingly difficult to maintain competitive advantage through technological superiority alone (Traynor and Traynor, 2004). This is because the technological competence like innovation and agility contributes to only short term competitiveness (Kaynak and Hartley, 2005). As the firm progresses in size, competitiveness and sophistication of technology, more sophisticated marketing strategy is critical along with the technological superiority (Traynor and Traynor, 2004; Weinstein, 1994). As a consequence of the technology oriented-culture, firms struggle to match their capabilities with customer needs. This calls for the need for a greater marketing oriented culture in high technology firms, as marketing is identified as the single dominant interface between the firm and the customers (Uslay et al., 2004; Boussouara and Deakins, 1999).

Research done on the marketing of high technology products asserts that it differs significantly from the marketing of other low technology products (Gardner et al., 2000; Mohr, 2000, 2005; Meldrum, 1995; Yadav, Swami and Pal., 2006, John et al., 1999). Despite the differences in the marketing practices and the importance of marketing to the success of ICT firms, very little detailed study has been undertaken into the strategic marketing practices of these firms (Berry and Taggart, 1998; Hills and Sarin, 2003). The gap in literature for the general theory development related to the marketing for high technology firms is also been identified by Uslay, Malhotra and Citrin (2004). In their study they note that there is a need for both conceptual and empirical research regarding the marketing of high technology products.

The above discussion on the background of the study brings out two strands of literature that defines the central problem which needs to be addressed – the lack of research on marketing in SMEs in general and the gap in literature on the marketing practices of ICT SMEs in particular. This establishes the need to understand the marketing practices adopted by the ICT SMEs and eventually their impact on firm performance. This research aims to address this gap in the marketing literature and thereby seeks to enhance the understanding of the marketing practices in ICT SMEs.

The aim of this research is to contribute to both to theory and practice, by seeking to answer the broad question: *How do the marketing practices adopted by ICT SMEs contribute to firm performance?* By answering this question, the research aims to identify a set of best marketing practices for the ICT SMEs. In this paper, we discuss the

development of a conceptual model of the marketing practices adopted by small and medium ICT firms and their influence on firm performance.

2.0 Theoretical background and conceptual framework:

This section is organised as follows: Section 2.1 gives an overview of the contingency theory and its applicability in understanding the marketing practices of ICT SMEs. Section 2.2 presents the preliminary conceptual framework that is proposed for the marketing practices in small and medium ICT firms.

2.1 An overview of the contingency theory and its applicability for the current research

Contingency theory suggests that there is no universal set of strategies which is optimal for all businesses or firms, and therefore different strategies should be designed for firms operating in different environmental contexts (Gardner, et al., 2000, Zeithaml et al., 1988). Contingency approaches are positioned within management as mid-range theories between the two extreme views which states that either universal marketing principles exists and are equally applicable to different sizes of firms, or each small firm is unique and each situation should be analysed separately.

According to Zeithaml et al., (1988), contingency theory involves three types of variables - contingency variables, response variables and performance variables. Contingency variables are those situational characteristics which are usually exogenous to any firm. In most instances, the opportunities to control or to manipulate these variables are very limited. Response variables are the firm's actions taken in response to current or anticipated contingency factors. Performance variables are the dependent measures. They represent specific aspects of effectiveness that are appropriate to evaluate the fit between contingency variables and response variables for the situation under consideration. Based on this theory, Zeithaml et al., (1988) posited that, for a firm, if there are any differences in the situational characteristics, it will result in differences in structures, strategies and decision processes adopted by the firm. Hence, if the situational characteristics are different for the firms under study, a different set of marketing strategies should be designed and adopted by the small and medium ICT firms, which will influence the performance of these firms.

A review of literatures shows the applicability of contingency theory in understanding marketing planning and implementation in both small and medium enterprises and high technology firms like the ICT firms. It has been widely recognised that the marketing practices adopted by SMEs are generally different from those found in larger firms (Gilmore et al., 2001; MacGregor 2004; Carson and Cromie 1990). SMEs are known to have three broad constraints on the firms marketing activity. They are limited resources like finance, marketing knowledge and time, limited marketing expertise and limited impact on the market place (Carson and Cromie, 1990; Gilmore et al., 2001; Hogarth-Scott, Watson and Wilson, 1996, MacGregor 2004). They are also said to have much less control over their external environment (Westhead and Storey 1996; Hill and Stewart 2000 cited in MacGregor 2004; Wolff and Pett, 2006). It is argued that these characteristics influences the marketing practices adopted by the SMEs. Hence, Siu and Kirby (1998, 2002) proposed the use of contingency approach which acknowledges that various factors affects the small firms' marketing performance and that there is no universal set of strategic choices that is optimal for all businesses regardless of their resources or business environment in which they operate.

It is evident from literature that, the marketing of high technology products differs significantly from the marketing of other low technology products (Gardner et al, 2000; Mohr, 2000, 2005; Meldrum, 1995; Yadav, Swami and Pal., 2006, John, Weiss and Dutta, 1999). Various studies have identified unique circumstances which give rise to challenges and issues in high technology marketing. Mohr (2000) and Mohr, Sengupta and Slater (2005) posit that high technology marketing is influenced by different industry/market situations. The marketing environment is characterised by the interaction of three common characteristics. They are market uncertainty, technological uncertainty and competitive volatility. The interaction of these three characteristics typifies a high technology marketing environment. The three identified characteristics are discussed below.

Market uncertainty refers to the ambiguity about the type and extent of the customer needs that can be satisfied by a particular technology. According to Mohr et al., (2005) market uncertainty arises from consumer fear, uncertainty and doubt about what needs the new technology will address and how well it will meet those needs

Technological uncertainty is, not knowing whether the technology or the company providing it, can deliver on its promise to meet specific needs. Five factors give rise to technological uncertainty (Mohr et al., 2005). The first comes from questions about whether the new innovation will function as promised. The second relates to the timetable for the availability of the new product. The third technological uncertainty arises from concerns about the supplier of the new technology-about effective servicing. Fourth, the concern over the unanticipated side effects. Finally, the technological uncertainty is brought about by the rapid obsolescence of technology.

Competitive volatility refers to changes in competitive landscape. There are three sources of competitive volatility (Mohr et al., 2005). Uncertainty over which firms will be new competitors in the future makes it difficult for the firms to understand the high-technology markets. New competitors from outside existing industry boundaries bring their own set of competitive tactics which the industry incumbents may be unfamiliar with. New competition often arises as product form competition, or new ways to satisfy customer needs and problems.

The marketing of high technology products occurs at the intersection of the above discussed variables, viz, market uncertainty, technological uncertainty and competitive volatility (Mohr, Sengupta and Slater, 2005). This marketing environment is best described as the uncertain and turbulent which differentiates high technology marketing from the marketing of other low technology products. Based on the contingency approach, this difference in the business environment calls for modification of the standard marketing strategies and tactics that are to be adopted by the high technology firms (Uslay et al., 2004; Mohr 2000; Yadav et al., 2006; Gardner et al., 2000; Weerawardena and O’Cass 2004, Meldrum, 1995). Cravens et al., (2000), points out that the rapid advancement in technology and the turbulent marketing environment necessitates the businesses to have more distinctive marketing strategies which should be implemented effectively for success in high technology markets. The research done by Gardner et al., (2000), is an example of the application of contingency theory to study marketing of high technology products. They used the contingency theory to study the environment, strategy and performance link for high technology products, based on the premise that high technology marketing environment is different.

Applied in the present research context this framework implies that, because the marketing practices of both SMEs and ICT firms are influenced by their unique situational or contingency factors, a different set of marketing strategies should be designed for small and medium ICT firms which influences the performance of these firms and thus their survival and growth in the market.

Also, contingency theory is applied in this research as there are no other proven theories for the marketing of ICT products in the SME sector. There are no available conceptual or empirical models which have been used in the previous studies on the marketing practices of ICT products in either large or small and medium enterprises.

To summarize, contingency theory is found to be more appropriate for the study on the marketing practices adopted by the ICT SMEs. This is supported by scholars in SME marketing and high technology marketing. The next section explains the conceptual model that guides the study and discusses in detail, the relationships between the constructs in the framework.

2.2 Conceptual model of the strategic marketing practices of ICT SMEs and their influence on firm performance.

The conceptual model is presented (see figure.1) and its development has been facilitated by integrating literature in the areas of marketing practices of large and small firms. It is developed to address the existing gap in the current literature in the area of marketing practices and firm performance in the SME sector with reference to the ICT firms.

The proposed conceptual framework posits that the strategic marketing practices of the firm leads to customer satisfaction which in turn influences the performance of the firm. The predictor variables that are identified in this study are marketing research, segmentation, targeting, differentiation, positioning marketing mix and social media. Firm performance is the dependent variable and customer satisfaction is the intervening variable. The relationships among the constructs are explored in the discussion that follows.

FIG.1. CONCEPTUAL FRAMEWORK OF THE STRATEGIC MARKETING PRACTICES OF ICT SMES AND THEIR INFLUENCE ON FIRM PERFORMANCE.

2.2.1 Strategic marketing management

This includes the strategic analysis, planning and implementation of marketing strategies to deliver value to satisfy customers and to achieve corporate financial objectives (El-Ansary, 2006; Benkenstein and Bloch, 1994). It facilitates effective decisions that lead to the creation of economic value to satisfy customers and results in higher firm performance (Slater and Narver, 1995; Doyle and Wong 1998; Slater, Hult and Olson, 2007). The strategic marketing practices used in the framework as dependent variables are adopted from the marketing strategy formulation and implementation processes as defined by El-Ansary (2006). The marketing strategy formulation process, which is the core marketing strategy, is defined as the total sum of the integration of segmentation, targeting, differentiation and positioning strategies designed to create, communicate and deliver an offer to a target market. This involves understanding customer behaviour (market research), social media, segmenting the market, selecting target segments, designing the offer to fit target market needs, differentiating the offer and positioning it in the customers mind. The marketing strategy implementation process or the marketing management is defined as the process of creating the value (product/price), communicating the value (promotion) and delivering the value (channels of distribution). Thus it is the process of deploying the marketing mix to create, communicate and deliver value.

Studies done on marketing parameters in SMEs are widely dispersed. Watkin (1986) identified strategies to gain competitive advantage through market segmentation in small enterprises. Peterson (1991), revealed the use of target marketing in small firms. The high performing small firms in mainland China are found to use strategic marketing practices like marketing research and positioning through product mix, promotion mix and distribution mix (Siu, 2000). Small firms are also found to be product oriented and price oriented and use some form of marketing mix to grow their business (Carson, 1990). Upon the review of literature, Boussouara and Deakins (1999) concluded that small firms widely use market segmentation, targeting and positioning to compete in its chosen market and most firms adopt the use of the elements of the marketing mix (product, price, place and promotion). Based on the above discussions, the preliminary conceptual model is developed integrating the literature available on marketing in large and small firms. For this study, the elements of the strategic marketing practices of the small and medium ICT firms are chosen as the predictor variables. The strategic marketing practices are identified to

include marketing research, segmentation, targeting, positioning, marketing mix practices and social media practices in the conceptual framework.

In literature, plenty of evidence exists proving the contribution of strategic marketing to firm performance. For example, Doyle and Wong (1998), found a strong correlation between marketing and business performance. In their study, they contend that marketing strategy and marketing planning are also highly correlated with performance. Knight (2000) argued that in the globalised environment, adopting suitable marketing strategies to suit the uncertain and turbulent environment is positively associated with firm performance.

It is acknowledged that application of strategic marketing management practices in high technology SMEs increases customer satisfaction and thus enhances firm performance (Mohr, Sengupta and Slater, 2005). Stratis and Powers (2001) also contend that under conditions of strategic uncertainty, strategic marketing management processes are significantly more important as determinants of long term performance. Since high technology environments are fraught with change and uncertainty (Mohr, Sengupta and Slater, 2005), the application of strategic marketing management practices in small and medium ICT firms increases customer satisfaction and thus enhances firm performance.

2.2.2 Customer satisfaction

Firms seek to increase customer satisfaction because satisfied customers ultimately lead to financial benefits to the firms who serve them (Ranaweera and Prabhu, 2003; Gupta and Zeithaml, 2006). There is significant evidence in the marketing literature that customer satisfaction is an important driver of firm's profitability. For example, Anderson, Fornell, and Lehmann (1994) and Rust, Moorman, and Dickson (2002) report a positive impact of customer satisfaction on financial performance, such as return on investment and return on assets. Yeung and Ennew (2000) in their study suggested that customer satisfaction has a positive impact on profitability. A study on the personal computer industry by Smith and Wright (2004), suggests that the firm's ability to satisfy its customers provides a sustainable competitive advantage that allows higher average prices, higher sales growth and higher return on assets. Customer satisfaction is also recognised as one of the market assets that can be leveraged to produce superior financial performance (Clark, 1999).

According to Yu (2003) and Graver (2003), managers always seek to improve organizational effectiveness by identifying organizational metrics in response to competitive market place, which will contribute to long term success. They contend that organizations are touting for continuous improvement strategies to stay ahead of the competition. In order to drive the continuous improvement, researchers are placing more importance on measuring organizational performance from the customer's perspective. A growing number of organizations are using customer satisfaction measures in developing, monitoring and evaluating product and service offerings (Anderson et al., 1994). This is because, the firm's ability to satisfy customers provides a sustainable competitive advantage which is necessary to operate in today's competitive global environment (Smith and Wright, 2004; Graver, 2003; Kotler, 2007).

Customer satisfaction is a more fundamental indicator of firm's performance due to its link to behavioural and economic consequences that are beneficial to the firm (Anderson et al., 1997). According to Gupta and Zeithaml (2006), customer satisfaction is expected to lead to repurchase behaviour (behavioural consequence), which translates into increased sales and profits (economic consequence). Also, customer satisfaction is the central element in the marketing exchange process (Martin-Consuegra, 2007). The marketing concept starts with a well-defined market, focuses on customer needs, coordinates all the activities that affect customers, and produces profit by satisfying customers (Kotler, 2007). Hence it is appropriate to use customer satisfaction as an intervening variable.

2.2.3 Firm performance

Firm performance measures attempt to evaluate the extent to which the firm's financial and other objectives are achieved (Jarvis et al., 2000; Knight, 2000). It has been acknowledged that performance is a complex and multidimensional construct (Wolff and Pett, 2006). Firm performance may at various times be reflected by financial outcomes, sales or market growth, customer satisfaction, or establishing a foundation upon which future growth may take place (Wolff and Pett, 2006). From the marketing practice perspective, performance is seen to be influenced

primarily by the firm's management of the marketing mix, the usefulness of its marketing research, the appropriateness of its positioning strategies and the nature of its marketing goals (Ellis, 2005).

Within SME research, the issue of firm performance has also taken a place of prominence as a dependent variable (Wolff and Pett, 2006). Given the resource constraints of small firms and their susceptibility to distress, hardship, and outright failure with respect to environmental change and uncertainty, a better understanding of the contributing factors and mechanisms for high performance is desirable and has significant implications for SME owner managers. This study focuses on the achievement of firm performance by small and medium ICT firms, through customer satisfaction, by the execution of the strategic marketing practices.

Many different criteria for evaluating performance have been used (Cameron, 1986, cited by Carpano and Chrisman, 1995). According to Rust, Moorman and Dickson (2004), the measures of performance often prioritise profit maximisation (Jarvis et al., 2000). SMEs typically initiate ventures with several objectives, the most important of which are financial (Cavusgil and Zou 1994). The financial measures of performance includes profitability measures indicated by return on investment, profit margins (Jarvis et al., 2000; Anderson et al., 1994); shareholder value (Gronholdt and Martensen, 2006); sales, market share and cash flow (Clark 1999, rust et al., 2004).

2.2.4 Marketing Research

Marketing research is a major source of information for marketing decision making, as it serves as the firm's formal communication link with the environment (Hart and Diamantopoulos, 1992). It helps in the identification of viable market opportunities, reduction of uncertainty and a better coordination of marketing activities. Market research is the most important basis for modifying products to meet the needs of consumers (Knight, 2000). In high tech markets marketing research is diligently used to gather information from the marketplace, to incorporate consumer needs into the product development and the marketing process (Mohr, Sengupta and Slater, 2005).

Marketing research is identified as a quality practice in smaller firms. It helps to identify customer needs. As firms meet these needs, the level of customer satisfaction increases, providing smaller firms with the competitive advantage which is vital for their operations (Kuratko et al., 2001). Analoui and Karami (2002) in their investigation found the positive impact of marketing research on firm performance. The positive effect of marketing research on firm performance is also identified in the study on marketing strategy making process by Lee et al (2006). In SMEs, it was found that company performance is positively associated with self-generated market research.

2.2.5 Segmentation

Segmentation helps to homogenize the market heterogeneity, that is, through segmentation, customers are aggregated according to similar buying needs and behaviour will tend to demonstrate a more homogenous response to marketing programmes (Dibb, Stern and Wensley, 2002). It is a known fact that businesses adopting a market segmentation approach can enhance their firm performance. According to Dibb et al., (2002), segmentation enhances marketing effectiveness and improves an organization's ability to capitalise on marketing opportunities.

Claycamp and Massey (1968) contend that marketers are interested in the segmentation concept because of its profit implications. Also Frank et al., (1972), cited by Dibb et al., (2002), infers that market segmentation is grounded in economic pricing theory, which suggests that profits can be maximized when pricing levels discriminate between segments. O'Donnell et al., (2002), found that small firms tend to be more successful when they adopt concentrated marketing segmentation or niche strategies. There is evidence that segmentation leads to a better understanding of customers (Dibb et al., 2002). Lai and Cheng (2005), in their research identify that market segmentation improves customer satisfaction.

2.2.6 Targeting

The steps in target marketing are to identify profitable customers, learn their values, analyse the offerings they need and use, focus marketing on them and monitor their satisfaction (Duboff, 1992, cited by Cahill, 1997). Target marketing is important, argues Cahill (1997), in that it forces a strategic focus to the firm to determine the best fit between the customer and its product, and to be customer focussed.

When target market is well-conceived, it can produce stronger customer satisfaction and brand loyalty and give firms an edge against competitors (Peterson, 1991). El-Ansary (2004) also points out that targeting ensures

customer satisfaction and thus enhances customer loyalty. Slater et al., (2007) in their study on high technology markets, found that targeting of appropriate market segments is a critical marketing activity with the ultimate goal of achieving superior performance. A study on successful marketing practices by Brooksbank (1991), points out the consistent usage of targeting in the marketing planning process contributes to firm performance in successful firms.

2.2.7 Differentiation

Differentiation seeks to make the offering distinct and different in the market-place (Hooley et al., 1998). A firm can differentiate its market offering along five dimensions - products, services, personnel, channel and image (Kotler, 2007). The pursuit of a differentiation strategy enables a firm to target and profit from niche market more effectively (Li and Li, 2008). El-Ansary (2006) has conceptualized that differentiating a product ensures customer satisfaction and increases their loyalty towards the product. The differentiation strategy enhances customer satisfaction by meeting a particular need through innovative products, superior quality and technology, a differentiated brand image, good service and so forth, which distinguishes the brand from its rivals (Li and Li, 2008)

Porter (1980, 1985), cited by Hooley et al., (1998), suggests differentiation as one of the fundamental approaches to create advantage over their competitors. Doyle and Wong (1998), points out that the long term performance of the business depends most crucially on its ability to create a differential advantage. It is posited that the differentiation strategy ensures durable performance superiority after it is established (Knight and Cavusgil, 2004, Li and Li, 2008)

2.2.8 Positioning

The end result of any positioning strategy is the successful creation of a customer-focussed value proposition, a cogent reason why the target market should buy the product. Positioning is important for any type of product and refers to the way in which a market perceives a particular offering in relation to its alternatives (Meldrum, 1995). Strategic positioning can also be referred to as a strategic action to find the best mix of strategies to defend a firm against the competitive forces in the industry (Kim et al., 2008).

Positioning is a marketing process which helps in designing value to the customer to ensure their satisfaction and gain their loyalty (El-Ansary, 2006). Hooley et al., (2001) contend that positioning satisfies targeted customers. Positioning enhances the competitive advantage of firms and is geared towards creating value for any firm and its offerings, thus enhancing firm performance and reducing systematic risk (Kim et al., 2008). A study by Blankson et al., (2008), acknowledges the importance of positioning strategies' capability in contributing to firm performance.

2.2.9 Marketing mix

The goal of the marketing mix is to satisfy customers through offering the right product at the right price with the right promotion and place (i.e., distribution channels) in order to satisfy customers' needs better than competitors, and thus achieve the firm's corporate objectives (Indounas, 2006; Zineldin & Philipson, 2007). Covillo et al., (2006), in their study, explain that firms use marketing mix to attract and satisfy customers.

The marketing mix of successful firms is found to possess a strong competitive advantage which is seen as key to competitive success (Brooksbank, 1994). El-Ansary (2006) also contends that the marketing mix is a strategic marketing implementation process through which the firm's corporate financial objectives are attained.

Market driven product strategies are found to deliver superior value to the customers and thereby enhance customer satisfaction (Cravens et al., 2000). Product plays a central role in determining a firm's performance. Cravens, Piercy and Prentice (2000), posited the positive impact of product strategy on firm performance. Carpano and Chrisman (1995) investigated the relationship between international product strategies and firm performance. It was found that the extent to which a product is standardized influenced a firm to unlock opportunities for competitive advantage and thus has strongest implications for competitive success.

According to Hermann et al., (2007), price is an important element in consumer's purchases and therefore it has large influence on customer satisfaction judgements. In his study, price fairness perceptions are found to be positively correlated to customer satisfaction. Pricing directly influences the inflow of resources- that produces revenue (Martin-Consuegra et al., 2007; Kotler, 2007; Vaidyanathan and Aggarwal, 2003). Lancioni (2005) pointed

out that a company's pricing strategy has a substantial economic impact on the firm performance. Pricing is a powerful marketing tool and leads to profitability in the long-run (Indounas, 2006).

Narus and Anderson, (1996) have identified that effective distribution of products and services satisfies customer needs. According to Chaturvedi (2005), the distribution channels are often a long term mechanism in reaching, satisfying and keeping customers for life. Increasingly it is being recognized that distribution represents an untapped opportunity for major cost savings and productivity improvements (Narus and Anderson, 1996). El-Ansary (2006) contends that the channel of distribution has a positive impact on firm performance.

Promotional mix provides the main channels of communication utilised by a firm to present its messages to potential customers. The concept of promotion is replaced with the concept of "Integrated marketing communication". The modes of integrated marketing communication are means to communicate with target customers with the goal to increase sales and profits (Peter and Donnelly, 2007). Promotions have enormous impact on sales and brand loyalty (Gardner and Trivedi, 1998). Price promotions cause short term increase in sales (Trivedi and Morgan, 1996). Promotions are found to have an impact on sales volume (Kotler, 2007), which is a financial measure of firm performance. El-Ansary (2006) posits that an effective promotional mix contributes to firm performance along with the other marketing mix elements.

Promotion, being a strategic marketing process, forms part of the value-creating activities of a firm for its customers (Trivedi and Morgan, 1996). El-Ansary (2006) conceptualizes that promotional strategies leads to customer satisfaction. Some researchers suggest that promotion leads to customer satisfaction and customer satisfaction with a promoted brand leads to increased repeat purchasing even after the promotion has been withdrawn (Rothschild and Gaidis, 1981 cited by Gardner and Trivedi, 1998).

2.2.10. Social Media

Social media marketing is the contemporary form of word-of-mouth marketing, done with the intention of influencing the customer communications by professional marketing techniques through the World Wide Web (Kozinets et al., 2010). Social media facilitates the companies to talk to their customers directly and also the companies to listen to what their customers are saying about them and their products and services, thereby enhancing the relationship between them (Defelice, 2005). Because social media helps to know the pulse of the customer and deepens the relationship with the customers, it is proposed that it would influence customer satisfaction. It is found to drive customer purchase intentions, build brand image thereby influencing the performance of the firms (Murdoch, 2009).

The above discussion explains the individual constructs in the conceptual framework. The relationships among the predictor variables, dependent variables and the intervening variable have been explored.

3. Conclusion

As noted, SMEs are a key segment and driver for most of the economies. Understanding how these SMEs achieve high performance has significant implications for the SME owner/manager and the economy in which the SME operates. High levels of performance can facilitate firm growth and subsequent profit performance, which in turn can yield employment gains and contribute to the general economic growth of the nation. Given the resource constraints of small firms, and their outright dependence on environment changes and uncertainty, a better understanding of the contributing factors and mechanisms for high performance is desirable.

A key contribution of the research to the literature is the identification of the industry-specific marketing practices adopted by the ICT firms. ICT sector is a priority sector and is clearly of growing importance in many economies. Given the importance of the ICT sector for the economy, insights into their marketing practices enhances the understanding of their contribution to firm performance. The present study assumes significance in that it identifies and documents those marketing practices that are adopted by the small and medium ICT companies in New Zealand and India. The study would provide the SME owner/managers with information on the successful marketing practices for the ICT market, which would enable the owner/manager to adapt them to the firm's requirements.

A Communication-Based Conceptual Mapping of the Supply Chain and its Link with Corporate Reputation

Rossella C. Gambetti, rossella.gambetti@unicatt.it
Mattia Giovanardi, mattia.giovanardi@unicatt.it
Università Cattolica del Sacro Cuore, Italy

Abstract

This exploratory qualitative study highlights communication support to supply chain management, emphasizing how relationships and processes are affected by communication flows and depicting the links among supply chain processes, communication and corporate reputation. Our study provides a preliminary communication mapping, emphasizing key stakeholders involved in supply chain management, communication roles enhancing logistics performances, and channels supporting information and physical flows among partners. It is based on a literature review, multidisciplinary academic meetings, interviews with supply chain directors of a global company operating in a reputation-sensitive environment, and desk analysis of company's documentation. Findings offer a preliminary conceptual framework of communication along the supply chain, pointing out its primary role in identity management and image building, and its supporting role in strategic and operational activities. Findings reveal that communication acts as "cultural glue", "trade-off and compensation", "relationship development and maintenance", and "alignment and integration" along the supply chain, fostering corporate reputation.

Theoretical Background: State of the Art and Research Gaps in Supply Chain Management and Strategic Corporate Communication Literature

The supply chain activities are focused on optimizing upstream and downstream stakeholder relationships with the aim of increasing profit margins and sustain competitive advantage (Christopher, 2005; Crespi, 2009; Chopra and Meindl, 2010). Previous studies highlighted the existing links among supply chain management and the network approach to the analysis of the industrial contexts, based on the concept of *exchange-relationships* between customer and supplier. These relationships find their basis in the "social exchange" theory (Thibaut and Kelley, 1959), which emphasizes the function of communication as a fundamental tool to create, develop and maintain trust and commitment among the parties (Anderson and Narus, 1990; Anderson and Weitz, 1992). Other supply chain studies emphasized that each business acts concurrently both as a supplier of certain actors and as a customer of others, having to manage lots of relationships with a variety of downstream and upstream publics, whose complexity varies according to the company positioning inside its own network (Kothandaraman and Wilson, 2001; Huemer, 2002, Tunisini, 2003; Bocconcelli and Tunisini, 2007). From the integration and the interdependence between the firm and its network partners are generated continuous exchanges of resources both material and immaterial (e.g. knowledge, information, culture, trust, commitment, etc.), intense processes of coordination among the different activities, and economic value for all the involved parties (Tunisini, 2003). An effective supply chain based on shared information and trust between partners leads then to successful supply chain implementation. More recent studies highlighted the different value creation logics developed in stakeholder relationships to deliver superior performance (Jayaram et al., 2004; Hammervoll, 2009a, 2009b; Helm and Jones, 2010), as well as relationships drivers and evolutionary phases (Chu and Fang, 2006; Eggert et al., 2006; Claycomb and Frankwick, 2010).

Even though supply chain management literature is rich and valuable, currently there is a lack of studies both pointing out the different roles that communication can play in facilitating the interaction dynamics between business partners and supporting process performances, and investigating the existing links among supply chain processes, communication, and corporate reputation. At this regard, an effective management of business

relationships encouraged by a systematic mapping of communication roles and channels supporting supply chain phases could outline distinctive competences and help the firm defining its corporate positioning.

Communication has been identified in the strategic corporate communication literature as a primary business function (Brioschi, 1990; 2008; Brioschi and Caprara, 2010) necessary to coordinate the mutual exchange of information flows and relationship-based resources among business partners (Itami and Roehl, 1987; Corvi and Fiocca, 1996). As a "glue" of each activity (Corvi, 2007), communication has a notable impact on the social dimension of the relationship, being considered as a business function of creation and maintenance of trust between parties (Anderson and Narus, 1990). In business-to-business relationships, the interactive dimension of communication, defined as the main relational vector between the firm and its environment (Fiocca, 1993), allows the activation of the mutual adaptation process among the actors, supporting the continuity of the relationships in the long period (Dwyer et al., 1987; Fiocca et al., 2009). Communication is thus identifiable as a variable of relationship development and coordination among organizations (Mohr and Spekman, 1994). Furthermore, communication has been indicated in the literature as a fundamental embedded component of each business process, as well as a strategic dimension supporting corporate decision-making of the executive committee of a company (Invernizzi, 2000; Invernizzi et al., 2009).

Even though strategic corporate communication literature is wide and articulated from a theoretical standpoint, it currently lacks a pragmatic contextualization in the business environment. In this respect, applying corporate communication conceptual principles to supply chain process dynamics can offer a valuable contribution to the understanding of the strategic role of communication in supporting value creation processes and enhancing corporate intangible assets such as culture, identity, image and reputation.

Study Objectives and Method

Our paper is based on an exploratory qualitative study aimed at building a preliminary conceptual mapping of communication roles and channels supporting strategic and operational supply chain management. The study is based on an in-depth literature review on supply chain management and corporate communication, followed by the application of communication theoretical principles to supply chain management practices, resulting in a preliminary mapping supported by field managerial expertise, highlighting communicational effects on supply chain processes and corporate reputation. In particular, our study is aimed at:

- mapping key internal and external stakeholders involved in the various processes of the supply chain;
- underpinning the various roles that communication plays in supporting supply chain management, depicting how relationships and processes are affected by communication flows;
- pointing out communication channels and tools supporting information and physical flows among intra- and inter-firm stakeholders;
- depicting the links among supply chain processes, communication and corporate reputation.

As for the method, the adoption of a qualitative approach appeared to us appropriate to a study aimed at mapping and understanding communication flows along the supply chain since the general knowledge aims of qualitative research are to: explore a thematic area which is little known and on which existing literature is limited; map and make sense of complex situations and mutable phenomena, like those featuring supply chain processes; get a deep understanding of a phenomenon, with the aim of pointing out topical concepts and main issues, as well as ideal situations (principles and practices); build an overall conceptual framework, emphasizing in this case the role of communication in supporting supply chain processes and reputation building (Seale et al., 2007; Morse et al., 2009). In particular, our study followed a two-step approach to pursue the identified objectives, encompassing:

- *the building of a preliminary conceptual mapping*, emphasizing key internal and external stakeholders involved in supply chain management phases, communication roles enhancing logistics performances, and channels that can be used to support supply chain processes. This conceptual mapping reveals how communication fosters different drivers of corporate reputation along the strategic and operational phases of the supply chain. It combines a literature recognition dealing with uptodate theoretical principles of supply chain management and current significant issues in strategic corporate communication theory, with a series of interdisciplinary research

meetings among scholars having expertise in the fields of corporate communication, reputation management and supply chain management;

- a *preliminary testing, integration and revision of the conceptual mapping*, based on both in-depth interviews with the key informants in charge of the basic supply chain processes of a global company recognized for its significant productive and commercial presence worldwide, showing an integrated supply chain and operating in a reputation-sensitive environment, and a desk analysis of the company's basic documentation related to supply chain management.

The chosen firm is Campari Group, a global company with headquarters in Italy, worldwide leader in the beverage industry, listed on the Italian Stock Exchange and showing a globally integrated supply chain.

Campari Group operates in a highly reputation-sensitive environment for two basic reasons:

- products of the beverage industry have a strong impact on crucial aspects of daily individuals' life, such as their growth, their health, and their psycho-physical well being;
- raw materials and products in the beverage industry are highly perishable, underpinning the necessity to guarantee product freshness and rigour of quality controls along the value chain and requiring a high timeliness and accuracy in supply chain management to gain competitive advantage.

Since its establishment in 1860, Campari Group has developed a worldwide presence in 190 countries. The group has a rich brand portfolio covering three main segments: spirits, wines, and soft drinks. The interviewed managers are the Global Supply Chain Director of the Group, the Global Purchasing Director, the Global Operations Director and the Customer Management Director. Their long-term expertise in supply chain management allowed us to revise and consolidate the preliminary conceptual mapping, integrating academic and managerial views of how communication can support and enhance supply chain performance, fostering corporate reputation.

In our opinion the study offers a valuable contribution both at a conceptual and at a managerial level, since it represents a first attempt to cast light on the strategic importance of optimizing communication flows inside a firm's primary processes and with its external partners in order to enhance corporate value creation and competitive advantage opportunities in the current reputation-sensitive, turbulent environment.

Supply Chain Management: a Communication-Based Conceptual Mapping

The Role of Communication in Strategic Supply Chain Management

Strategic supply chain management can be identified under the four following profiles and is supported by a communication action carried out at various levels:

- a *competitive and value-creation profile*, related to the strategic role that the supply chain plays as a bridge between the firm and its market.

Such role should be supported by a managerial effort of the Supply Chain Directors to manage their functional identity and image towards all the firm's stakeholders. The supply chain identity should be based on a settled yet dynamic knowledge system regarding production processes and customer/supplier relationship management, contributing to the firm's value creation and competitive advantage. Communication in this case acts strategically at two levels: 1) it fosters the supply chain identity inside the firm, spreading among the personnel both the values stemming from the quality and customer relationship culture of the firm (*value-based communication*) (Fiocca, 2002), and the competences and skills aimed at increasing their intellectual capital, as well as the service quality they deliver (*educational communication*) (Invernizzi, 2004). In this sense, communication plays the role of *organizational glue* and *knowledge vector* inside the firm. The most appropriate communication channels are interpersonal meetings among supply chain managers (strategy & coordination meetings) and between them and their personnel (e.g. periodical meetings, plant visits, annual convention), together with corporate website pages illustrating the supply chain mission, vision and values. Furthermore, ongoing updating of personnel competences through academic and professional education or on-the-job education (e.g. educational seminars and workshops) is essential for both the strengthening of the supply chain identity and the improvement of its customer oriented performance; 2) it supports the inside and outside image building (*image-building communication*) (Brioschi, 2008). The strategic role played by the supply chain in the firm must be made clear to both internal stakeholders (e.g. the

CEO, the Board of Directors with a particular focus on the HR and the Corporate communication Director, and other functional or business unit directors) and external ones through a transparent, timely and up-to-date information activity both face-to-face and Internet-based, aimed at creating visibility and consensus on the strategic contents, the operational modes, and the overall performances of the logistics system. Communication roles in this case are devoted to *culture diffusion, visibility building, identity amplification and stakeholder activation* with the aim of improving internal and external supply chain image, legitimating it as a strategic function, and strengthening stakeholders' perception of its contribution to the firm's profitability. The most adequate communication channels are the annual convention where supply chain news and performances are illustrated in detail, meetings with the corporate communication function to obtain visibility and media coverage of supply chain performances, corporate website pages dedicated to the supply chain, and periodical meetings between supply chain managers and personnel to monitor the internal image through the analysis of ongoing surveys;

- a *projecting profile*, related to the involvement of the Supply Chain Directors in the strategic decisions regarding both the *logistic network design* (and the consequent choices regarding service internalization or outsourcing and location of production sites) and the *integration of logistic systems and business processes* (Bowersox et al., 2002).

Communication plays in this case a fundamental role at three levels: 1) it encourages the diffusion and the homologation of cultural values and managerial principles (Nelli, 1994) inside the firm and its logistic network (*value-based communication*), facilitating supply chain design implementation in the case of both vertical integration and outsourcing of supply chain processes. The specificities of a firm's organizational culture represent an important differentiating factor among companies, resulting therefore often heterogeneous or even conflicting inside an enterprise network, and thus requiring a process of integration and harmonization; 2) it supports decision-making related to location of production and distribution sites, encouraging retrieval and exchange of internal and market information flows necessary to make location decisions. In this case communication plays a strategic-reflective role (*strategic-reflective communication*) (Invernizzi, 2004), supporting the external context analysis, and reporting (reflecting) market expectations inside the firm so as to sustain strategic decision-making in the long term; 3) it fosters the development and the strengthening of partnership relationships (*relational communication*) (Fiocca, 2002; Invernizzi et al., 2009) based on trust, conflict reduction and sharing of risks and benefits among the several supply chain actors, encouraging the global optimization of logistic system integration. In this case communication channels are based on strategic interpersonal meetings involving top management representatives, periodical coordination meetings among supply chain managers, and the annual convention;

- a *mid-term production planning profile*, involving the Supply Chain Directors in the search for the right balance between market needs and material and human resources required (Cavalieri and Pinto, 2007).

In this case communication is aimed at analysing and interpreting the environmental, market and organizational context. Such activity of context monitoring enables communication to offer a strategic contribution to the demand forecasting process, fostering the information gathering necessary to procurement decision-making, and supporting the analysis of human resources needs as well as information and physical flows ones. By doing this, communication helps formulating production strategies which are aligned with both competitive dynamics and market expectations (*strategic-reflective communication*). Such alignment results in an improvement of product and production processes. Moreover, the diffusion of the CPFR (Collaborative Planning, Forecasting and Replenishment) systems has emphasized the role of communication in supporting: reciprocal commitment and mutual learning in the development of collaborative and integrated plans (*collaborative communication*) (Mohr et al., 1996). Communication channels are based on six-monthly interpersonal strategy & coordination meetings, annual production planning meetings, and quarterly functional ones;

- an *operational coordination profile*, involving the Supply Chain Directors in a rational and consistent order cycle management, activating an ongoing interaction among the procurement, production, distribution, and marketing functions (Chopra and Meindl, 2010).

In this case communication accomplishes the task of coordinating physical and information flows (Nelli, 1994; Invernizzi, 2000) with the aim of synchronizing supply chain processes, encouraging efficiency and timeliness in typical intra-functional, inter-functional and inter-firm relationships of production cycle management (*functional communication*) (Fiocca, 2002; Invernizzi, 2004). In order to activate stable coordination mechanisms it is

fundamental to develop an effective information-sharing platform among the various nodes of the logistic network. In this regard, SAP systems offer visibility, transparency, and consistency of information inside the firm, whereas it is still not so spread the use of ICT systems supporting integrated planning activities. Furthermore, the coordination of information flows regarding the production cycle requires that communication fosters the integration and the homologation of processes structures and languages (*value-based communication*). Besides, communication is aimed at balancing the different functional interests and objectives (that can be even conflicting sometimes) as well as supporting mutual adaptation among the supply chain actors, by activating delicate trade-off mechanisms in the relationships with both external business partners and internal business units (*adaptive communication*) (Hakansson, 1982; Grönroos, 2004). Communication channels are based on periodical interpersonal meetings involving supply chain managers to share and align the guidelines of operational coordination.

The Role of Communication in Operational Supply Chain Management

The operational phases of the supply chain are based on four main macro-processes (Mentzer, 2001; Cavalieri and Pinto, 2007): *procurement* (sourcing and purchasing), *production planning and control*, *stock and inventory*, and *distribution* (shipment and transportation). Such phases depend upon an intense information exchange inside the firm and with external partners, emphasizing the role of communication as interconnector among the network nodes.

Procurement. The procurement process comprises a wide range of activities which are part of two main processes: *sourcing* and *purchasing*. The *sourcing* process is aimed at defining the service and material procurement strategies, identifying, evaluating and selecting suppliers, negotiating with them purchasing terms and monitoring their performance. At an intra-organizational level, communication coordinates internal information flows (Nelli, 1994) related to both suppliers' identification and selection, and the definition of procurement strategies. At an inter-organizational level, communication supports negotiation processes between the firm and its partners (suppliers, sub-suppliers, and service providers). Promoting collaboration among the actors, communication facilitates the building of relationships based on trust and reciprocal esteem (*relational communication*), increasing their length and loyalty over time (Grönroos, 2002). To do this, the most appropriate channels are interpersonal meetings with suppliers to synchronize on corporate values and service culture, and build long-term relationships of mutual advantage. As regards the *purchasing* process, it is based on the analysis of corporate requirements, issuing of the purchase request, issuing and evasion of the purchase order, and invoicing. Following the increasing managerial complexity of the purchasing process, it is important for the actors involved to access a huge amount of information. The use of the Internet has facilitated and accelerated data retrieval through *e-procurement* solutions. These solutions support intense communication flows between the parties, being one of the main tools to enhance the role and the strategic contents of the purchasing function. Under this profile, communication seeks to optimize coordination of both information and physical flows (Nelli, 1994; Invernizzi, 2000) of the purchasing process, fine-tuning its activities. This with the aim of regulating the order and related terms transmission to achieve production goals (*fine-tuning communication*) (Rampini, 1990).

Production Planning and Control (PPC). PPC systems are aimed at managing the firm's production capacity both immediate and short-term, including comprehensive planning, detailed operations scheduling and costs control. To minimize total production costs a typical behavior adopted consists in decentralizing production activities. Decentralization, though, increases the complexity of the production system requiring a centralization of its managerial responsibility. Communication plays in this case a significant role in the management of information flows among multi-site production systems, aligning systematically the requirements of the different functions and business units. In particular, communication encourages the coordination of the production capacity management (Cavalieri and Pinto, 2007), facilitating the timely sharing of information among the nodes in order to streamline the processes of the production cycle, (*functional communication*), reducing inventory levels and sustaining the interactions among the actors. In this respect, communication has supported the shift from transactional logistics, focused on the efficiency of the single operation, to relational logistics, focused on optimizing information and physical flows. Communication must be in this phase extremely lean, simple, and efficient (Christopher, 2000). Once completed the end product, the order issuing by the customer is generally preceded by a negotiation phase to define transaction terms. In order to support this delicate customer relationship activity, communication guarantees the ongoing, direct and real-time interaction between the company and its customer with the aim of helping the firm

getting the order at the best contractual terms. Communication, thus, acts as a relational vector (Fiocca, 2002) to develop positive attitudes and behaviours, and maintaining collaborative relationships with the customer (*relational communication*). Communication channels are typically based on corporate ERP systems, Intranet and other web-based tools. These channels are used to manage monthly production planning meetings either face-to-face or computer-mediated.

Stock and inventory. The process of inventory management represents today a critical success factor in supply chain management. Stock can be located in different sites (by suppliers, customers, peripheral warehouses, etc.) to meet customers' needs. Stock location significantly affects operational, financial and economic performances. Namely, the closer stock is to the customer, the timeliest can be its delivery. Furthermore, the storage of slow moving goods by suppliers allows the use of warehouses close to the customers for fast moving goods, relying on a collaborative warehousing system (*stock pooling*). Communication plays in this case a central role in supporting the stock pooling among the different storage sites. Through the stock transfer among the nodes, the pooling group shares resources reducing the stock-out and providing the best service at the lowest cost. Collaborative stock management requires then an intense sharing of information flows to optimize the overall performances of the logistic network (*collaborative communication*). Moreover, communication plays the role of vector of the key corporate culture values towards the various nodes of the pooling group (*value-based communication*), in order to encourage a synergistic collaboration among the actors based on ongoing interaction, confrontation and negotiation. Stock management related activities depend upon a continuous information exchange capable of developing commitment, motivation, participation and consensus among the network nodes (*commitment communication*) (Del Mare et al., 1990; Rampini, 1990). Among the most used communication channels to exchange information inside the pooling group, the adoption of a *Quick Response (QR)* system based on *EDI (Electronic Data Interchange)* solutions allows the ongoing monitoring of retail sales of single products in all the supply chain, facilitating the programming activity, guaranteeing the right assortment level, and thus reducing uncertainty and increasing the flexibility of the production system. Other common communication systems are the *Continuous Replenishment (CR)* and the *Vendor Managed Inventory (VMI)*.

Shipment and transportation. In the frame of the distribution system, the logistic channel is the set of resources and structures aimed at supporting the information and goods flows from the producer to the customer. Such flows are *inbound* (concerning raw materials, components and products) and *outbound* (finished products). As regards outbound flows, a common distribution strategy is the *Direct Shipment* which eliminates every intermediate warehouse, reducing costs and waiting times. On the contrary, the distribution strategy making use of intermediate warehouses, called *Distribution and Warehousing Centres*, allows the firm to obtain transport scale economies, reducing distance and delivery times. Another distribution strategy is the *Pick-up point*, where it is the customer itself picking-up the goods at a specific pick-up point. As for the transportation, it can be managed directly using transport means owned by the firm, or indirectly, applying to shipment companies. In the distribution process, information flows regard mainly order and transportation related documents accompanying the goods in the delivery process. Usually the shipment and transportation phase is underestimated from a communication standpoint. However, clear and comprehensive information related to delivery terms (*functional communication*) as well as the ability to cope with errors, unforeseen events, misunderstandings, and delivery delays represent important communication skills to show the firm's customer orientation (*relational communication*). The most appropriate communication channels are the Intranet or other web-based platforms and electronic mailing. Furthermore, communication flows are important both in the choice of the logistic operators (e.g. carriers) and in sharing with them managerial principles and established operational procedures (*value-based communication*). To do this, interpersonal meetings and electronic mailing are the most appropriate communication channels. FIGURE 1 provides a comprehensive mapping of the roles played by communication in strategic and operational supply chain, highlighting both stakeholders involved in each phase and communication channels/tools activated to manage relationships with them.

Discussion and Managerial Implications

This study has pointed out the central role that communication plays along supply chain processes. In particular, communication plays a *primary role* in the identity management and image building phases of the supply chain, representing strategic activities supporting all other processes: these phases are based on communication and totally depend upon the firm's ability to manage information flows with intra-firm and inter-firm stakeholders. Communication is critical in creating, settling and spreading the supply chain culture inside the firm, that is the awareness both of its values, function, and contribution to corporate value creation, and of its success drivers. The supply chain mission and vision statements must be shared among all supply chain employees and other business functions and units, as well as with the top management and the board of directors. Communication is also critical in building and strengthening the identity of the supply chain, by enhancing its service quality and customer orientation through ongoing education and learning programs aimed at improving personnel's competences and skills. Currently it still persists a strong "internal myopia" in the supply chain regarding the value of education, and often the focus of educational seminars is purely operational, whereas little or no attention is given to education on cultural and strategic aspects of the supply chain. This has a negative impact on the self-awareness of the value of the supply chain function inside the firm that is also reflected outside. Namely, supply chain is often still considered by the top management as a mere operational function supporting business performances on which to gain cost economies not to weigh down on other value creation functions. Communication is then fundamental in promoting the distinctive features of the supply chain identity as well as its competitive and sustainability performances to internal audiences, external partners and other stakeholders to obtain their consensus and enhance the supply chain image.

Furthermore, communication plays a fundamental *supporting role* in all the other strategic and operational phases of the supply chain. At this regard, communication accomplishes four basic functions: 1) "*cultural glue*" among internal functions, plants and units located in different countries, and external business partners. This function is aimed at homogenizing cultural values to integrate and develop synergies with partners sharing both the same principles related to quality and service standards and the same market orientation; 2) "*trade-off and compensation*" of interests and objectives among the various functional units, which are often guided by different and even conflicting business logics. In this respect, supply chain is often subjected to marketing. In the bargaining power dynamics among the functional units, marketing, owing to its capability to drive sales, normally obtains what it asks for. Supply chain, on the contrary, being considered as a cost-optimization function, sometimes finds it difficult to have its requests considered strategic by the top management. In this case, ongoing face-to-face communication between the supply chain director and the top management is aimed at emphasizing – especially in the current period of global economic downturn affecting marketing and other revenues-driving functions – how the supply chain can be not only a cost-optimization function, but also a revenues-driving one; 3) "*relationship development and maintenance*" with business partners in order to support trust-based long-term exchanges. Integrated and trust-based partnerships with suppliers and customers generate both competitive and reputational advantages in terms of better service quality, market know how, innovation, cost efficiency and time-to-market. It currently persists in supply chain management a kind of closed, "grain bin-based orientation" to relationship management with business partners. This attitude is being gradually substituted by an open, "inclusion-based orientation" to relationship management, focused on a bidirectional and frank information exchange with business partners according to a win-win communication logic; 4) "*alignment and integration*" of information and physical flows, aimed at coordinating and streamlining all operational processes to optimize costs, exploit synergies and develop highest consistency of goods and information along the supply chain.

Moreover, communication is typically *face-to-face*, normally based on interpersonal meetings, when it has to support the strategic phases of supply chain management, whereas it is typically *computer-mediated*, normally based on Intranet ERP and EDI solutions, when supporting operational phases. *Face-to-face communication* is particularly appropriate when the aims are to: spread and homogenize cultural values inside the firm and with business units located in different countries, balance and compensate divergent functional interests and logics, and develop trust-based relationships with business partners. *Computer-mediated communication* is particularly useful when the aims are to: integrate and coordinate information and goods flows, and meet and align the needs and

expectations of the different business functions. Finally, communication offers through its functions and forms (e.g. value-based communication, strategic-reflective communication, relational communication, adaptive communication, functional communication, etc.) a fundamental contribution to the building of corporate reputation, meant as a socially shared judgement expressed by all stakeholders as regards the firm in its whole, based on its previous behaviours and performances and highlighting its capability to create value for all its stakeholders over time (Fombrun and Rindova, 1998). In particular, it emerges from this study that communication supports four basic typologies of reputational drivers (Hakansson, 1982; Fombrun and Shanley, 1990; Fombrun, 1998; Fombrun et al., 2000; Walsh et al., 2009):

- *knowledge drivers*, such as cultural sedimentation and homogeneity as well as supply chain personnel's intellectual capital based on up-to-date competences and skills;
- *managerial drivers*, such as strategic vision, long-term orientation as well as internal and network leadership of supply chain directors;
- *relational drivers*, such as internal and external consensus and emotional appeal by all stakeholders, as well as risk, uncertainty and conflict reduction, trust, reciprocal commitment, mutual learning, and collaborative business development with business partners;
- *performance drivers*, such as product, service and process quality, process efficiency, service timeliness and accuracy, and routine and praxis alignment.

In this regard, FIGURE 2 offers a comprehensive overview of the existing links among supply chain processes, communication and corporate reputation. As for the *managerial implications*, our study has highlighted the strategic role that communication plays both in managing and in supporting supply chain processes to create value and enhance corporate reputation. Nevertheless, a comprehensive, consistent and mature supply chain culture is still to be created. Furthermore, even though the strategic role of communication is currently a widely accepted truth, the self-awareness of the supply chain function is still low, often resulting in an underestimation of its contribution to corporate value creation on the part of the top management and in a diffused subjection to other revenues-driving business functions such as marketing. The urgent need for supply chain managers is now to “enact” communication according to a managerial perspective. In particular, they should: invest in strategic supply chain management education beyond operational aspects to increase not only knowledge, competences and skills in the personnel, but also their understanding of the role of the supply chain in the overall economy of the firm in order to enable them to enhance their self-awareness and deliver better value; adopt formal practices and tools to homogenize culture and align the personnel on shared values and principles, since simply stating that communication is an important “cultural glue” is not enough; communicate more both inside and outside the firm about the distinctive features, and the competitive and sustainability performances of the supply chain to increase the appreciation of its doings by the top management and the other functional directors. The *original value* of this study is based on the fact that it represents a first attempt to carry out a conceptual and operational systematization of the role and the applications of communication along the supply chain. The study has also an heuristic value since it casts light and generate knowledge on a phenomenon – the communication processes along the supply chain and their potential impact on firm's reputational drivers – which has been little known and inquired so far. Moreover, the study offers a multidisciplinary perspective combining supply chain management and communication academic expertise. Furthermore, it carefully integrates the academic and the managerial standpoint in the development of the proposed conceptual mapping. In the end, this is a study where in-depth interviews with key informants are not typically used to build a best practice case study on the basis of which induce a theoretical framework, but as a tool supporting and enhancing the building of a combined deductive-inductive conceptualization.

Limitations and Future Research Directions

The conceptual mapping presented in the study is preliminary since it is based on an exploratory study, therefore it needs to be both consolidated through a wider range of interviews with supply chain managers of companies operating globally in a highly reputation-sensitive environment (e.g. the food and beverage industry) and deepened by combining other research methods to enrich and integrate data collection, so as to support and refine the

conceptualization proposed. In this regard, the evidences here illustrated represent the first step of a more comprehensive and thorough qualitative study that we are currently projecting, designed according to a Grounded Theory approach (Glaser and Strauss, 1967; Morse et al., 2009). Such comprehensive study will be aimed at exploring and understanding the whole communication process activated along the supply chain, underpinning the key points where communication is a fundamental vector of successful supply chain implementation. Furthermore, the study will provide a detailed mapping of the internal and external contextual dimensions positively or negatively affecting the communication process, in order to offer managerial insights for making an effective and efficient use of communication resources.

Customer Relationship Management with Help of Data Mining Techniques

*Peter Štarchoň, peter.starchon@fm.uniba.sk
Lucia Vilčeková, lucia.vilcekova@fm.uniba.sk
Comenius University in Bratislava, Slovakia*

Abstract

This paper considers the strategies of customer relationship management using software solutions. Based on data mining techniques like segmentation, cross sell, up sell and association analysis, the focus is directed to putting information technologies and customer satisfaction together. There is an increasing awareness that strategic thinking and acting is necessary to stay successful in a competitive world, in particular in mature markets. Companies are being confronted with saturated markets, customers can choose from variety of products and services; they became very demanding and expect high value for their money. Data mining helps businesses use technology and human resources to gain insight into the behavior of customers and the value of those customers. There are several methods and concrete examples provided in this article to show how to achieve the companies' objectives for organic growth by addressing their business activities to the right customers.

Customer relationship management builds mutually beneficial relationships with customers and to achieve this goal companies need to customize the value proposition in order to attract and retain targeted customers. Customer loyalty is fickle and companies face the challenge to detect customers who are highly valuable for the business but are likely to change to competition and with the right management CRM can become the strongest tool to ensure that customers become and remain loyal, it can help to manage relationships more effectively, with lower costs and at the same time can increase the viability of products and services.

Quality CRM is grounded on high quality customer-related data and enabled by using information technology. In 2010, CRM IT solutions, were weathering the economic downturn better than many other enterprise software applications, The recession in 2009 had less of an impact on CRM software than on other software segments, according to a recent European survey conducted by Gartner, Inc. (www.gartner.com). The worldwide market for business intelligence (BI) software, where data mining is one of common BI functions, is forecast to grow 9.7 percent to reach US\$10.8 billion in 2011. (www.gartner.com). The United States are the world leader in CRM usage and spending, but Western Europe is predicted for the period of 2008 – 2012 to have a much faster growth, reaching 22 percent annually, than the USA (www.marketingcharts.com). A Cahners research survey reveals that the United Kingdom leads Europe in forecast CRM deployments with 29 percent of respondents indicating they plan to implement CRM software solutions. Spain finished second with 19 percent, followed by Scandinavia at 16 percent. Survey results also show that the telecommunications and consumer goods industries forecast the largest CRM growth with the healthcare and automotive industries following close behind (www.crmforecast.com).

Companies collect data from a number of sources. Customer related information can be sales data (purchase history), financial data (payment history), marketing data (loyalty scheme, campaign response), etc. Fast growing of data amounts has exceeded human ability to evaluate it without suitable tools by far and it is not possible to evaluate all these data manually. Only small amounts of data can be evaluated using standard techniques or even manually. Saturated markets demand decision based more on exact evaluations rather than on marketers' intuition or previous experience, simply because marketers can never extract the valuable knowledge from the vast amount of data. Data mining is an advanced data analysis involving data warehouses where big quantities of data are being stored and accumulated. Data mining techniques are made to uncover important data patterns contributing greatly to business strategies; it enables marketers to extract valuable information from enormous amount of data. It is a solution to a problem many companies face: an overabundance of data, little time and limited staff to transform simple data into meaningful information.

Companies already know that data is extremely valuable and it needs to be understandable, valid, novel and useful to make companies more competitive and profitable. An important part of CRM is analyzing customer information to better address the objectives of a company and deliver the right message to the right customer. It involves use of data mining models in order to understand and predict their behavior. Data mining refers to mining or extracting knowledge from large amounts of data. It converts data into knowledge.

The customer lifecycle provides a good framework for applying data mining to CRM. Marketers say there are three ways to increase a customer's value: 1) increase their use (or purchases) of products they already have; 2) sell them more or higher-margin products; 3) keep the customers for a longer period of time (Rygielski, Wang, Yen, 2002). With help of software solutions a simple customer lifecycle can be prolonged and bring more money to a company. As seen on Figure 1, data mining solutions help an enterprise manage customer lifecycle in an organized way. It enables companies to be more efficient by acquiring new customers, identifying better cross sell and up sell possibilities, to manage customer retention or recover potentially valuable customer relationships.

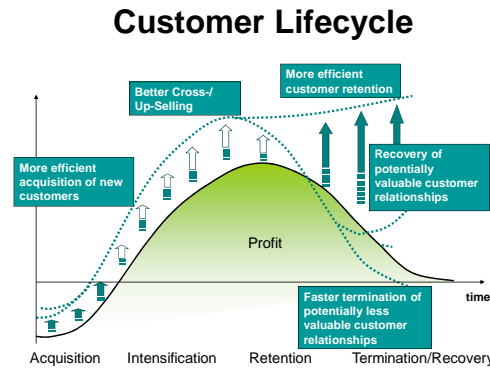

FIG. 1 DATA MINING METHODS AND CUSTOMER LIFECYCLE
Source: SAS Slovakia

There are 3 basic models of data mining which can be used in CRM and prolong the lifecycle of a customer: Propensity models, Cluster models and Association and sequence models (Tsipstsis, Chorianopoulos, 2009). Some basic principles of the models and their possible usage in marketing practice are described below.

1. Propensity models

The goal is to classify the cases into predefined groups, meaning they can predict an event. The generated models can be used for cross sell and up sell campaigns. Cross sell is marketing tool which uses selling or suggesting related or complimentary products to a customer. Up sell means suggesting a premium product, an upgrade. Data mining models can identify those customers who have higher propensity to purchase additional services or products of a company. Up sell initiative detects customers who are characterized by high probability of purchasing a higher level product or service. Data mining models can uncover how likely or unlikely a customer is to purchase specific product or service and also the most effective distribution channel can be determined. The most common use in marketing is offering quantity alternatives with incentives such as discount (buy two, get one free), free shipping, etc. with increased size of an order. A bank can offer customers holding a standard card an upgrade to a gold card, which is, indeed, more profitable for the company. A company can sell an extended service contract for an appliance or luxury finishing of a vehicle. Sales person can suggest customers an upgrade in form of a premium brand instead of a regular one. Companies can use cross sell in form of telling or displaying "Customers Who Bought This Item Also Bought...". Businesses can also build onto or create customized shopping cart solutions that use an advanced algorithm to recommend to shoppers the products that other customers purchased when purchasing that particular item, or that can determine items to recommend based on the buying habits of the shopper.

2. Cluster models

The goal is to analyze the data and identify the natural grouping of records. These models are used for customer segmentation. Customer segmentation is a process by which subjects are categorized into groups that share similar characteristics based on one or more attributes. Data mining can identify natural grouping of customers based on given characteristics based on observed data patterns. Traditional customer segmentation is usually based on experiential classification or simple statistical methods which are often not complex enough to

provide the needed information or information that actually is available, but the patterns are hidden in the data and cannot be discovered unless using sophisticated software and data mining methods. When segmentation models are properly built they can uncover groups with similar profiles and lead to rich segmentation schemes with business meaning and value. These models can also be used to prioritize customer handling according to the importance of each customer. Banks can for example use segmentation and divide their customers into subgroups according to how they use their credit cards, what kind of items they purchase, how much money they spend, how often they use their cards...A chain store may need the information whether its outlets are similar in terms of social neighborhood, size, staff numbers, vicinity to other stores, etc. The most basic use of segmentation in marketing is grouping customers according to similar attributes for the purpose of understanding how to market each customer segment. An analyst can group research findings, or can evaluate performance of various distribution channels, e.g. telephone or online sales.

3. Association and sequence models

The goal is to detect associations between discrete events, products, attributes where sequence models detect associations over time. The technique used for this kind of analysis is called Market Basket Analysis and can be described as determination what products or services customers buy together. This kind of analysis identifies relationships or affinities between entities and/or between variables. These relationships are then expressed as a collection of association rules. A typical example is in the retail business where historic data might identify that customers who purchase sugar and bread also purchase the milk. Retailers can use this type of information to identify new opportunities for cross- selling their products to the customers. Using market basket analysis helps companies to make suitable offers to their customers because they have a higher level of knowledge and know the buying behavior of their customers. Information obtained from given analysis can be for example used for supermarkets to reorganize their layout, taking products frequently sold together and locating them in close proximity. It can also be used to improve the efficiency of a promotional campaign when products that are associated would not be advertised at the same time.

The goal of all these methods is solving problems in better and easier and more effective ways, to provide customer insight, enable personalized interactions and hence increase profitability through data analysis. Data mining helps an enterprise to enable its marketing departments to identify and target their best customers, manage marketing campaigns and generate quality leads for the sales team. It also assists the organization to improve telesales, account, and sales management by optimizing information shared by multiple employees, and streamlining existing processes (for example, taking orders using mobile devices). Using data mining techniques also allows the formation of individualized relationships with customers, with the aim of improving customer satisfaction and maximizing profits; identifying the most profitable customers and providing them the highest level of service. The results of analysis provide employees with the information and processes necessary to know their customers understand and identify customer needs and effectively build relationships between the company, its customer base, and distribution partners.

Discussion

Customers are the most important asset for any organization. There is no successful business without satisfied customers. The key message is that there is not such a thing as average customer. They are different people with different needs, behaviors and potential. Thus there are some similarities in their behavior and with help of statistics and mathematics these, often hidden, patterns can be discovered. That is why every company should use strategies for building, managing and strengthening loyal and long lasting customers. CRM implementations require deployment of IT solutions based on customer-related data which help the company to communicate different offers to specific customers with the goal to optimize the processes within the company over the long term.

The need to use data mining as a part of customer relationship management comes from growing volumes of data and limited human capacity to deal with all the data, the business environment changes, customer become more informed and demanding, markets are saturated. Companies focus on customer and try to serve him in the best possible way.

The main challenges that a marketer must face when data mining becomes a part of CRM are:

- *Use of multiple data mining techniques*: to analyze CRM data properly, it needs to undergo different analysis, to be explored from different angles. It requires application of different data mining techniques.
- *Understanding the data*: data comes from multiple sources, in different patterns and codes. Analysts always need to understand these data before they are able to conduct any analysis.
- *Security issues*: companies have a lot of personal information about customers available online; therefore they need sufficient security systems to protect that information.
- *Real-world validation*: discovered patterns are often treated as hypotheses that need to be tested on new data using rigorous statistical tests for the actual acceptance of the results.
- *Privacy issues*: many of the information in a database are private and marketers must be aware of that and be able to clearly decide what kind of information can be used for marketing purpose.
- *Acquiring data*: many times collecting data for CRM is still a problem. Getting the right data that can be used for an analysis can be costly and time consuming.
- *Data preparation*: Data-mining requires a consolidated and cleaned data in a database. 70 to 85 percent of the work in building models using data mining relates to the cleaning and preparation of data prior to a specific analysis.
- *Model refreshing*: Data mining models have to be updated because of changes in environment also in customer attitudes.

The use of software solutions and data mining techniques is an inevitable part of successful customer relationship management but we need to understand it is not a core process of the CRM solutions, it just provides the right information and it only works when the extracted data comes into action. Customer relationship management uses variety of tools and techniques to do so. The trends for 2011, according to CRM professionals, are social CRM, mobile CRM and a continued emphasis on the customer experience (searchcrm.techtarget.com). Social CRM is based on communication with customers through social networking sites, such as Twitter and Facebook. Mobile CRM uses wireless devices such as iPhone, Blackberry or other smartphones and androids to communicate with customers. Customer experience management is looking at the company and its products and services through customer's eyes. It is a process of managing customer's experience from the moment of the first contact with the company and throughout the whole time. A positive customer experience can construct an emotional bridge between a company and its customers that in turn enhances customer loyalty. CRM should be more than just gathering data and evaluating them, it should be a part of holistic marketing and the customer should always be in the center of all the activities of an enterprise.

Abstract

The purpose of this study is to establish a new conceptual model of self-congruity, which incorporates brand and self-image, and the consumer culture. This study espouses the consumer culture framework of Steenkamp and de Jong (2010) in order to discover a way in which to overcome the limitations of using Hofstede's cultural framework, and measure the consumer culture on the individual level. Considering the nature of this topic, catching-up intention and facts, a mixed method will be selected as the major research method, combined with focus groups, interviews and surveys. This working paper will demonstrate the relevant frameworks and processes. The conceptual model this study has been established will be presented based on the literature review, as well as the suggested research method and possible outcomes.

1 Introduction

In current consumer behaviour research, the self-congruity theory has been studied in numerous ways, particularly focusing on the concept of "symbolic purchase" in the retail industry. Brand personalities, a crucial component of brand equity, are not only associated with a product's functional attributes, but also influenced by other virtual factors, such as consumers' self-image (Aaker, 1997). Consumer researchers assume that product/brand image interrelates with self-concept, that is, that self-image and product/brand image are congruent and therefore influence consumers' buying behaviour and brand performance (e.g. Adam, 2005; Kressmann et al., 2006; Kuester et al., 2007). Empirical studies have determined that the notion of self-congruity plays a significant role in the evaluation of global brands. Self-image also significantly influences purchase intention (Jamal & Goode, 2001). However, the results of recent studies differ exceedingly from the above expectation. Different corresponding types of self-image congruities should be outlined (Ibrahim & Najjar, 2008), since Sirgy et al. (2000) have indicated different dimensions of self-concept. On the other hand, Azoulay and Kapferer (2003) criticised the brand personality scales by challenging the conceptual validity of Aaker (1997)'s framework. Furthermore, while existing studies of self-image congruence regarding global consumer brands encountered problems with widespread implementation, a broader application of self-congruity theory could overcome these difficulties by extending product categories and target consumer groups (Kwak & Kang, 2009). Moreover, the global measurement for self-image congruence provides more clear and accurate scales rather than the traditional measurement most previous studies used.

On the other hand, it has also been observed that cultural issues significantly impact brand image and self-concept. Hofstede's cultural framework has been applied extensively, but various limitations have been identified regarding its use in assessing cross-cultural issues (Smith & Bond, 1998). Recent empirical studies of cross-cultural issues use different image congruence models and apply them to just a few countries, making it difficult to generalise their findings. Therefore, Steenkamp and de Jong (2010) have developed a whole new framework for examining cultural issues in consumer behaviour research.

The purpose of this study is to establish a new conceptual model of self-congruity: the proposed model incorporates brand image, self-image, and cultural values. The research adopts the method of Steenkamp and de Jong (2010) to investigate cross-cultural issues, which will be applied more comprehensively to measure image congruence. Moreover, in order to discover a way in which to minimise the limitations of using Hofstede's cultural framework, this study espouses the consumer culture framework of Steenkamp and de Jong (2010), which would be more applicable to consumer behaviour research regarding consumer cultural issues. Considering the nature of this topic, catching-up intention and facts, a mixed method will be used as the major research method. It will be combined with focus groups, interviews and surveys. The theoretical contribution of this study will be that the new self-congruity model can be used in various domains of global consumer brands. With regard to managerial contribution, this study could also enable global brand managers to effectively produce or modify their brand strategies.

2 Theoretical Background

The literature review aims to seek gaps in the previous studies regarding the three areas: brand image, self-concept, and culture. It also provides the theoretical foundation to establish the conceptual framework for the current study. In the meantime, the literature research will determine the selection of industry sectors and suitable brands for this research to study on. The research questions carry out through the process of the literature review. They are: (1) How is brand image measured in relevant studies? (2) What is the role of self-concept in consumer behaviour research? (3) How does culture serve as a source and relate to the symbolic meaning of products and brands? (4) How do these three subjects work and influence each other? The methodologies adopted in the relevant research have been analysed during the literature review process as well in order to find out better research method for the current study. The following section will determine the key issues addressed in the previous literature.

2.1 Brand Image

Kotler et al. (2005, p. 282) define brand image as “*the set of beliefs that consumers hold about a particular brand*”. Brand image, as the perceptions of brand traits or prototypical buyers, is often represented by qualities to which the consumer relates, such as reputation (Kotler, 2003). The perception is reflected by the brand associations held in the consumer’s memory (Keller, 1993). It would also be a challenge to change on brand image is established (Kotler, 2003). From consumer’s perspective, brand image is the result of the cumulative effects of the company’s marketing mix activities (Roth, 1995). Moreover, Keller (1993) identifies that brand associations include the attributes of product-related or non-product-related. These associations could be different based on the favorability, strength, and uniqueness. This also includes the symbolic and functional meaning of products. A congruence theory of brand image developed by Keller (1993) indicates that brand associations share content and meaning with other attributes and associations. This type of associations can help consumers to recall the brand and connect to the brand node in consumer’s mind. However, brand image is not always easy to built for service intangibility and variability (Kotler, 2003), which also take time to develop and prevents duplication by competitors. Therefore, from this perspective, brand image is significant to all marketers. Nevertheless, Wood (2000) states that brand image is impossible to quantify.

2.1.1 Symbolic or Functional

Another importance of brand image is that a brand can be either symbolic or functional, although some authors argue that a brand could not be both symbolic and functional because the two aspects serve in different purposes (Park et al., 1991; Park et al., 1986). However, the empirical study shows that consumers do not only focus on symbolic side of a brand, but they also prefer the functional performance of the product (Bhat & Reddy, 1998). Jaffe and Nebenzahl (2006, p. 19) state that “brand names serve as abstract symbols for attributes of products”. In addition, a number of researchers recognise that products have symbolic images that are often more important to a product’s success than its actual physical attributes and characteristics (Aaker, 1991; Graeff, 1996). The current study started with the brand concept developed by Park et al. (1986) who proposed brand concept management (BCM), which states that a brand concept can be either symbolic or functional. They suggested that a brand concept should be remain for the brand’s life in order to maintain its consistency once the concept is selected for the brand (Park et al., 1986). Their conceptual framework directly relates to the current study. However, the assumption made by Park et al. (1986) was based on brand concepts being unidimensional without empirical studies to examine their assumption. Thus, how to measure and scale whether a specific brand is functional or symbolic is the problem and needs to be solved. Furthermore, there is an argument that Park et al. (1986) assert that brands should be positioned to appeal to being either functional or symbolic; otherwise, they could not clearly relate the brand to either their functional or their symbolic need.

The research of Bhat and Reddy (1998) might give a clarification to Park et al. (1986). They suggest that consumers see a brand’s functionality and symbolism as separate phenomena. However, they continue to say that consumers accept brands that had both symbolic and functional meaning (Bhat & Reddy, 1998). Additionally, the current research notices that Bhat and Reddy (1998, p. 40) state, “if the associations representing the different brand concepts do not fit well, the resulting confusion among consumers can

result in a brand being perceived as neither functional nor symbolic and thus not really useful to consumers". Therefore, from the above points of view, that can help the present research to pay more attention on the relationship between the two aspects of a brand. It also significantly influences on the consistency of self-image and brand image. What is more, Bhat and Reddy (1998) conducted an empirical study to measure BCM. They used focus groups to generate the items used in the questionnaires. The measurement scales are not based upon any conceptual framework, which might cause problems with generalising knowledge.

2.1.2 Brand Personality

The symbolic use of brands often involves consumers' perceptions of endowing brands with human personality traits Aaker (1997). Plummer (1984) declared that personality of brand itself is one of the components of brand image. He characterises brand with such attributes like "youthful," "colorful," or "gentle". Those attributes could also reveal emotions induced by brand (Keller, 1993). Aaker (1997, p. 347) formally defined brand personality in his paper formally as "the set of human characteristics associated with a brand". She cited Sirgy (1982) to designate the elusiveness of how and when brand personality could develop a relationship with the consumer's personality and then influence consumer preference. Aaker is the first one to explore the effect of the "Big Five" dimensions into consumer behaviour – sincerity, excitement, competence, sophistication, and ruggedness - on brand personality. She reviewed numerous studies regarding the "Big Five," which were first documented by Digman (1990), and brought it to the highest organisational level by citing Goldberg (1993). Aaker provided a systematically generalisable scale across product categories that can measure brand personality. She also developed a theoretical framework of brand personality. Aaker's framework has a far-reaching impact on future studies. It is essential to the current study, because it could also help to build up the scales for measuring self-congruity. Moreover, the contribution of Aaker's research can also provide a general understanding about the symbolic use of brands. It partially filled in the gap in the work of Park et al. (1986). The variables Aaker analysed made a huge impact on brand personality, which would link brands' symbolic meaning to consumers' self-image.

However, Azoulay and Kapferer (2003) have criticised the brand personality scales by challenging the conceptual validity of Aaker (1997)'s framework. They do not agree that brand personality scales actually measure brand personality but, rather, brand identity. In fact, brand personality is one of the dimensions of brand identity (Kapferer, 1992, 1998). Hence, Aaker might have combined different levels of brand identity and mixed all the aspects into brand personality only (Azoulay & Kapferer, 2003). On the other hand, Aaker (1997) recognised the difficulties of applying the scale of measuring brand personality in different cultural contexts. Those dimensions might not all be valued across cultures, which remind us to carefully choose the measurement scales in the current study.

2.1.3 Measurement of Brand Image

Based on the literature review, brand personalities and the brand-consumer relationship seems significantly influence brand image. Viot (2003) developed a set of brand image dimensions from the brand identity concept to explain the effect of brand image of consumers' brand (Fig.1). In his framework, there are four components to define brand image dimensions: brand personality, brand values, brand-consumer relationship, and consumer image. The components of Viot's (2003) definition of brand image dimensions are consistent with Kapferer's (1992, 1998) brand identity prism. Viot's (2003) also used a second-order factor analysis to demonstrate how the four modules related to inner and social dimensions of brand image. The brand personality and brand symbolic values are two features of the inner dimension, whereas the brand-consumer relationship and user image are related to the social dimension of brand image.

However, there is no consensus on how to measure brand image (Martinez & de Chernatony, 2004). In the brand identity literatures, researchers have used different methods to measure brand image from the variable angles of the brand (e.g. Aaker & Joachimsthaler, 2000; Hsieh, 2002; Aaker, 1997; de Chernatony, 2001; Kapferer, 1998; Keller, 2001). Hsieh (2002) argued that image dimensions as consistency with consumers' various desires were represented as members of the higher-order category, which served as the foundation of brand associations. Therefore, identifying brand image dimensions is critical for the current study. Hence, despite the framework of Viot (2003) might be the most comprehensive model regarding brand image dimensions located in the literature, the framework has not been tested by empirical studies. Except brand personality, the rest of three brand image dimensions of Viot (2003) still need to be justified

in order to apply them onto self-congruity theories. On the other hand, Martinez and de Chernatony (2004) contended that Aaker's (1996) approach based on measuring brand equity might be appropriate for use for brands in different product categories. There are also a compilation of image dimensions including 50 pairs of brand image attributes have been widely practised to measure image congruence (i.e. Malhotra, 1981; Graeff, 1996; Dennis et al., 2002a). Hence, the current study will use choose suitable brand/self-image attributes within from the 50 brand image dimensions for the chosen brands.

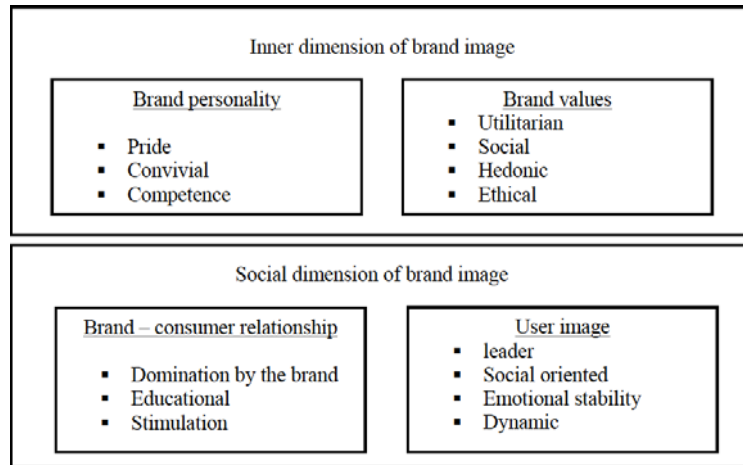

FIG.1: BRAND IMAGE DIMENSIONS (Viot, 2003)

2.2 Self-concept

Self-concept is defined as “the totality of the individual’s thoughts and feelings having reference to himself as an object” (Rosenberg, 1979, p. 9), but it is treated in variable ways. Previous research has identified that consumers’ purchasing is based on products and brands’ symbolic values as well as functional properties (Aaker, 1997; Kwak & Kang, 2009; Adam, 2005; Bhat & Reddy, 1998; Dennis et al., 2002b; Hsieh, 2002; Kapferer, 1998; Levy, 1959; Markus & Wurf, 1987; Sheth et al., 1991). Brand name capture the symbolic value connected with a brand or product, as well as the realisation of the symbolic value represented by consumers’ consumption of those products or brands (Kapferer, 1998). Hence, brand image can ensure favoritism and purchase intention when it comes to match consumers’ self-image. This is called self-congruity defined by Sirgy (1985, 1986).

The problem of self-congruity theories is that those analyses cannot be generalised across all categories of products (Sirgy, 1982). Sirgy’s (1985) hypothesis test indicates a significant relationship between self-congruity and ideal congruity towards purchase motivation. He used 30 personality images as attributes to measure the products’ image and the participants answered the questions in the form of questionnaires. Sirgy’s (1985) study shows that self-congruity mechanisms may have greater influence on consumers than ideal congruity dynamics. He also assumed that purchase motivation may be differently affected by self-esteem and self-consistency motives. It brings notice to the current study that differences in individuals’ personalities can affect purchase motivation regarding self-image/brand image congruity. However, Sirgy’s (1985) work still has the same problem as his another work back to 1982 (Sirgy, 1982). The result might not be able to apply in broader areas. The outcomes might be different to apply Sirgy’s assumption into different product categories, although they proposed a new method later on to measure self-congruity that could minimise some of the limitations of the traditional method (Sirgy et al., 1997). Moreover, the samples have limitations.

The study of Graeff (1996) links considerably to the two papers published by Sirgy (1982, 1985). He argued that consumer’s product evaluation and buying intention could be significantly influenced by the degree of the congruence of brand image and the consumer’s self-image (Coward et al., 2008; Graeff, 1996; Walchli, 2007). However, a question is also raised by Graeff (1996) regarding whether the result can be applied to both public and private brands. The limitation could also be a single choice of product, which means the result might not be suitable for products with different natures from those studies. Another

contribution is that the result of his research is extrapolated into managerial implementation. Graeff emphasised the effect of advertisements on consumers' purchasing evaluation. Thus, it means that marketers could influence the purchase intention of consumers whose self-images are quite different from brand images via advertisements that focus on functional product quality.

Sirgy et al. (2000) have also developed an integrative model of self-congruity and retail patronage that involves retail environment, retail patron image, self-congruity, and retail patronage. Retail patronage actually involves such key concepts as brand image, store choice, and frequency of visits (Pan & Zinkhan, 2006). It is crucial to understand this concept for retail managers who intend to identify and attract their target customers (Pan & Zinkhan, 2006). The model illustrates that the degree of self-congruity is determined by the retail patron's image, which is evaluated in terms of the consumer's self-concept (Sirgy et al., 2000). The significance of this model for the present research is to demonstrate the importance of self-congruity to the retailing industry and give the inspiration of how to develop the model in light of self-congruity and retail brands.

2.3 Image Congruence

There are two parts of image congruence: self-image and brand image. Sirgy et al. (1997) propose two methods of measuring self-image congruence: traditional measurement and direct or global measurement. However, Sirgy et al. (1997) discover that the traditional method has three key problems: discrepancy scores, irrelevant images, and the use of the compensatory decision rule. Hence, they propose another method which is called global measurement. Global measurement would have more clear and accurate scales which would be suitable for both brand image and user's self-image. The method cues subjects to conjure up their own image of the product user (Sirgy et al., 1997). Then, the method guides them to indicate their global perception of degree of match or mismatch between how they see themselves (self-image) and the product-user image, which means this measuring process catches self-image congruence directly (Sirgy et al., 1997). In fact, the global measurement for self-image congruence aims to discover the image trails which is both suitable to the brand image and self-image. Hence, the present study will adopt the global method to measure the image congruence.

2.4 Culture issues

2.4.1 National culture

Most studies regarding national cultural issues cited Hofstede's (1983b, 1984b) work. Hofstede (1983b, 1984b) developed a conceptual framework for culture dimensions as a theoretical basis or justification for the choice of countries in many studies. This typology of Hofstede's (1983b, 1984b) cultural dimensions sufficiently describes the main aspects of culture (Lu et al., 1999; Nakata & Sivakumar, 1996). However, (Smith & Bond, 1998) argued that Hofstede (1983a, b, 1984a) was particularly careful to emphasise that his core values applied to national cultures rather than individuals. The significant limitations were obvious in Hofstede's (1983a, b, 1984a) studies. They included the target sample and the scales of individualism. Therefore, the current study must not only consider Hofstede's (1983a, b, 1984a) framework, but also integrate the recent studies of cross-cultural issues.

Roth (1995) has developed a conceptual framework that can be applied in foreign markets by identifying a variety of cultural and socioeconomic environmental characteristics. One precondition that must be mentioned here is that those characteristics hypothetically affect brand image performance. Roth (1995) connected Hofstede's (1984b) influential work to brand image evaluation. Three culture dimensions linked to brand images and consumer needs, which are power distance, uncertainty avoidance, and individualism. However, Roth (1995) does not quite clearly indicate a specific situation, such as how to make distinctions between nations in which there exist high power distance and low individualism cultures. With the trend of globalisation, a fusion of eastern and western culture has been taking place. On the other hand, Roth (1995) also realises that regional culture within countries has exerted considerable influence on brand image performance. Thus, cross-cultural issues appear to be significantly important, especially for international enterprises.

Another important framework of national culture was developed by Inglehart and Baker (2000). It is more useful for consumer and brand/product research because it is grounded in materialism and modernisation theory (Steenkamp & de Jong, 2010). The national-cultural value theory of Inglehart and

Baker (2000) emphasises on both national and individual levels, which Steenkamp and de Jong (2010, p. 22) summed up as “two concepts occupy a central position in both consumer culture theory and globalisation theory”. The bipolar dimensions including four clusters of national-cultural values were identified by Inglehart and Baker (2000) which are traditional versus secular-rational values and survival versus self-expression values (Steenkamp & de Jong, 2010). The traditional versus secular-rational dimension reflects the contrast between societies with the importance of religion, family and politics. On the other hand, the involvement of the polarisation between materialist and postmaterialist values is a central component of the survival/self-expression dimension (Inglehart & Baker, 2000). Hence, this framework is more suitable for the current study and it will be applied into the conceptual model instead of using Hofstede’s framework.

2.4.2 Self-congruity and cross-cultural issues

Quester et al. (2000) empirically apply the self-congruity theory into different cultural contexts from the perspective of market behaviour; the current research might use a similar approach. Quester et al. (2000) notice that two determinants of market behaviours, consumer behaviour and the managerial decision-making process, can be influenced by culture (Tse et al., 1998; Usunier, 1996). Nevertheless, an analysis of Quester et al. (2000) reveals the difficulties of generalising and predicting such results. Through this paper, the present study understands that the role of the self-congruity concept in consumers’ choices in cross-cultural contexts still needs to be further investigated. How to generalise such knowledge is the crucial matter the current study needs to consider. Moreover, due to the complexity of self-congruity, self-image congruence models include the actual self-congruity model, the ideal self-congruity model, the social self-congruity model, the ideal social self-congruity model, and the affective self-congruity model (Sirgy et al., 1991). The nature of this complexity might make it difficult for the current study to evaluate self-congruity across different retail product categories. Aside from involvement in cross-cultural issues, this difficulty would be a significant hurdle to overcome.

2.4.3 General Values

Basic human values theory has two core components: Openness to Change versus Conservation and Self-Enhancement versus Self-Transcendence (Schwartz, 1992, 1994; Schwartz & Sagiv, 1995). Values are defined by this theory as desirable, trans-situational goals which are important in different ways as guiding principles in human’s lives (Ros et al., 1999). 10 motivationally distinct types of values relate dynamically to one another (Ros et al., 1999) and can be arranged around the perimeter of a circle (Steenkamp & de Jong, 2010): universalism, benevolence, conformity, tradition, security, power, achievement, hedonism, stimulation, and self-direction. According to the analysis of Steenkamp and de Jong (2010, p. 23-24), “associations of any external variable should decrease monotonically when going around the circular structure of value types in both directions from the most positively associated value type to the most negatively associated value type” (Schwartz & Sagiv, 1995). Moreover, during to globalisation, the consumers who value stimulation will have more significant influences on global products (Steenkamp & de Jong, 2010) which fits the purpose of the current study.

2.4.4 Consumer Culture

From another perspective, culture is a system of shared meanings (Smith & Bond, 1998). Smith and Bond (1998) asserted that the studies of value differences provided the best conceptual frameworks to guide cross-cultural research. They stated that consistency across cultures could be shown by the structure of individual values (Smith & Bond, 1998). Value differences across countries was crucial when the selected values were different both within and across countries, which could help to explain cultural differences (Smith & Bond, 1998). They also categorised the levels of cross-cultural studies as culture-level and individual-level comparisons. Hence, it is fundamental to recognise the differences between as culture-level and individual-level in any cross-cultural research.

The value classifications are in the two different levels: culture-level and individual-level (Smith & Bond, 1998). It seems Hofstede’s (1983b, a, 1984a) cultural framework was more closely related to culture-level. Consequently, it could demonstrate a limitation of Hofstede’s (1983b, a, 1984a) framework to some extent. However, Schwartz and Sagiv (1995) found that the problem of establishing criteria from sample deviation for separating actual cultural differences was rarely addressed by previous cross-cultural

researchers who conducted studies of values. Schwartz and Sagiv (1995) claimed that indexes of value types could be constructed from single values, the meanings of which were reasonably similar across cultures, if scholars wanted to compare value priorities across cultures (Schwartz & Sagiv, 1995).

Consumer culture is highly dynamic and subject to change (Slater, 1997). Hoyer and MacInnis (2009) provided a more reasonable and appropriate framework for consumer behaviour research regarding cultural issues. They state that ideas or values as cultural principles are the implication of cultural categories (e.g. time, space, and occasions), which could transfer meanings to the product and the consumer respectively (Hoyer & MacInnis, 2009). Consumers also attempt to discover meaning in their lives throughout the consumption of products that are generally recognised as international and transcending individual national cultures (Steenkamp & de Jong, 2010). Hence, in the recent study of Steenkamp and de Jong (2010), they classify consumer culture values into three categories by recognising that consumer culture deals with the consumption of products, across times, and across space consistent with Hoyer and MacInnis (2009) by considering materialism, innovativeness, nostalgia, ethnocentrism, and environmentalism (Fig.2). The first two consumer values are related primarily to products, nostalgia to the time perspective, and ethnocentrism and environmentalism to the social and physical context (Steenkamp & de Jong, 2010). This set of consumer values is comprehensive, but they are among the more important consumer values to study as antecedents of attitudes toward global and local products (Steenkamp & de Jong, 2010).

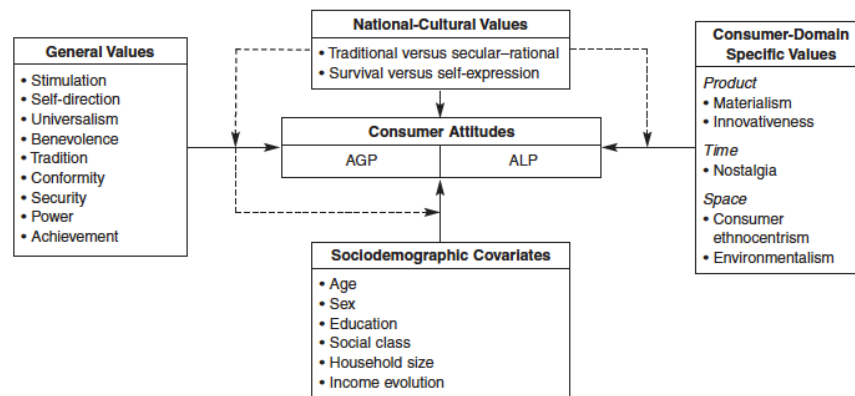

FIG.2: VALUES-BASED FRAMEWORK OF ANTECEDENTS OF AGP AND ALP

The feature of consumer culture could be defined during products consumption (Arnould & Thompson, 2005), which should resonate with consumers when they value materialism (Richins & Dawson, 1992). In addition, new products play an important role that could stimulate consumption to a higher level (Ritzer, 2007). Accordingly, when consumers value a new product, they relate to the core of consumer culture (Steenkamp & de Jong, 2010). People tend to be more prospective than living in the past (nostalgic), which is crucial for researchers to figure out how they continuously respond to this dynamism (Steenkamp & de Jong, 2010). At the same time, the sales of locally conceived products as well as globally conceived products are independent to each other in the terms of sociological notions of groups (Shimp & Sharma, 1987). However, people with high ethnocentrism could fill more strong tension between them (Shimp and Sharma, 1987). Finally, critical theorists criticise that environment have impact on consumer culture consumption frequently (Steenkamp & de Jong, 2010). This claim might be especially resonant with those consumers who are high on environmentalism (Steenkamp & de Jong, 2010).

2.5 The conceptual model

Based on the literature review, this study establishes a conceptual model to measure the image congruence toward global consumer brands from a cross-cultural perspective (see Fig.3).

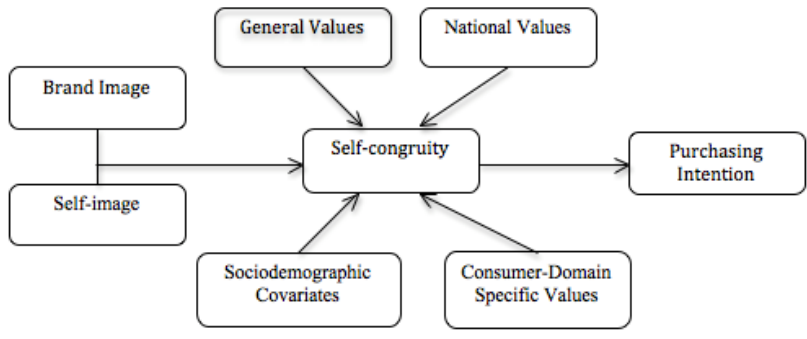

FIG.3: THE CONCEPTUAL MODEL

3 The Suggested Research Method

To present, this study has identified the general problems of the concepts and frameworks regarding brand image, self-concept, and cultural values. In view of the complexity of these subjects, it is impossible to generate a universal model that measures self-congruity across all product categories in all cultural contexts. Many studies have considered self-congruity, but they used limited product categories in only two specific countries. The problem with such findings is that they are difficult to generalise, creating a gap to be explored for the current research. Assuming that culture can be measured, this study will seek a way to discover how to evaluate self-congruity across product categories. Considering that global consumer brands are one of the most common industries in the international retail business, the project will focus on examining self-congruity among those brands that are distributed through retailers. Moreover, considering a conceptual framework has been established, the study will go to the stage of data collection.

This study has conducted two focus groups in order to select a group of brands within four product categories based on the consumer culture studies of Holt (1998; 2002), McCracken (1986), Steenkamp and de Jong (2010), and Tomlinson (1999) which could represent global consumer brands. Four brands have been chosen based on the in-depth interviews those are Apple, Zara, Häagen-Dazs, and IKEA. The study has also conducted 69 pre-tests to select suitable brand/self-image dimensions among 50 image attributes. As a result, 21 image dimensions will be used in the following questionnaire. Fig.4 shows the research approach of this study.

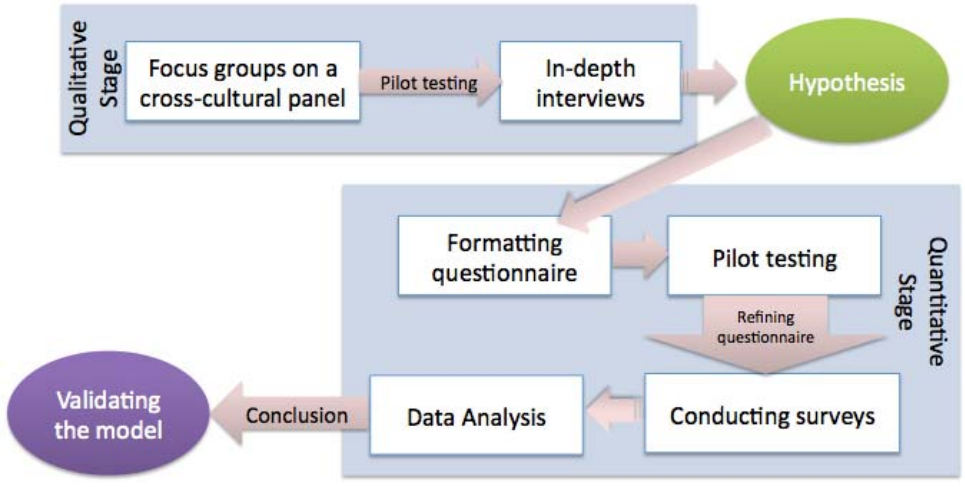

FIG.4: GRAPHICAL REPRESENTATION OF RESEARCH

The first stage is based on the literature review, and a conceptual framework has been developed. In the second stage, focus groups, in-depth interviews and pre-test were conducted in order to clarify the traits and scales associated with brand image and self-image regarding the selected global consumer brands to measure self-congruity. The selection of the global brands will be based on the consumer culture studies of Holt (1998; 2002), McCracken (1986), Steenkamp and de Jong (2010), and Tomlinson (1999). The results of focus groups and interviews will also contribute to the refinement of the model and strengthen the development of hypotheses. In the third stage, surveys will be conducted in three countries: China, the Netherlands, and the United Kingdom. The sample size will be expected more than 300 for each market. The final stage is to analyse the data using structural equation modeling (SEM). SEM allows for the quick creation of models with which to test hypotheses and confirm relationships among observed and latent variables, moving beyond regression to gain additional insight.

4 Conclusions

This study has reviewed the significant features of the three subjects in terms of brand image, self-concept, and cultural issues. Consumer researchers have recognised that product/brand image is intertwined with self-concept. That is, the congruency of self-image and product/brand image influences the consumer's buying behaviour and brand performance (e.g. Adam, 2005; Kressmann et al., 2006; Kuester et al., 2007). Sirgy et al. (2000) report there are different self-concept dimensions. Thus, this study should include different types of corresponding self-image congruities (Ibrahim & Najjar, 2008). Moreover, studying value differences could lead to the development of a better conceptual framework to assist cross-cultural researchers (Smith & Bond, 1998). In hopes of achieving these aims, this study has critically reviewed relevant research investigating this issue at both the culture and individual levels. The most suitable framework of consumer culture for this study developed by Steenkamp and de Jong (2010).

Theoretically, This study would be the first to apply the consumer cultural framework of Steenkamp and de Jong (2010) to self-congruity for cross-cultural studies, and would give practitioners an alternative framework to improve the effectiveness of their marketing. Second, this study would be the first to measure image congruence by integrating national-cultural values, consumer cultural values, and general values as the measurement of cross-cultural issues. Third, the model could extend the application of the existing self-congruity frameworks across more product categories and different cultural contexts.

In practice, the framework that this study will develop can help brand managers to understand the differences between the congruence of their brand images and consumers' self-image in a cross-cultural context. They can utilise this information both in their home country and in a number of culturally diverse nations. Brand managers need to understand the crucial role of self-congruity in predicting consumers' intentions (Ibrahim & Najjar, 2008). The model will help them to establish and implement strategies in order to enter into new countries and build their market share in different cultures. The managers will also be able to evaluate and amend their current marketing strategies using the framework, thereby maintaining and enhancing their compatibilities and market shares.

Based on the literature review thus far, this study has proposed a conceptual model to measure self-congruity regarding the research topic. The methodology and research approach are proposed in terms of the previous literature research. SPSS will be used as a statistical tool to analyse the data, whereas Amos will be utilised to discover the relationships between variables and validate the model.

An Approach to Engaging with Customers Enrolled in Rewards Program

*G. Shainesh, shaineshg@iimb.ernet.in
V Nagadevara, nagadev@iim.ernet.in
Indian Institute of Management Bangalore, India*

Abstract

Several organizations, across industries, are collecting large amounts of customer data in their transactional and operational systems. Very often this data is used to profile customers, estimate their current value and future potential and drive relationship marketing programs. In this study, we propose an approach to engaging with customers enrolled in a loyalty program through promotions across different segments, geographies, channels and promotion types. We use data from a hotel chain to segment customers through a classification tree (CT), regression analysis to identify characteristics that are important in each of these segments and finally optimization to maximize revenue from customers across geographies. Our proposed approach will help managers, working within budget constraints, to choose the most appropriate promotional strategy to build stronger relationship with their valued customer segments.

Introduction

Businesses aim to retain customers based on the realization that it is cheaper to retain an existing customer than earning the equivalent revenue from a new customer. But it is not enough to retain customers. The challenge is to repeatedly draw them to buy. To achieve this end, many businesses have launched rewards programs patterned on the lines of "frequent flier" programs of the airlines. It is easier to engage with customers enrolled in these rewards programs as companies have data on demographics, purchases, preferences, revenues, profits, etc. collected over a period of time as well individual customer's response to communications. The wealth of data creates a potential to influence customer usage and buying behavior which impacts profitability. Bell, Deighton, Reinartz, Rust and Swartz (2002) highlight the impact of loyalty programs on profitability through an analysis of HHonors, the loyalty program of the Hilton chain of hotels. Only 9% of its almost 18 million guests who stay in a Hilton hotel in a year belong to HHonors but they account for about 56% of the chain's profits. The skew is even more pronounced among the upper tier of customers belonging to the elite silver, gold, and diamond status. These top 3% groups contribute 46% of Hilton's profitability.

Other studies have reported similar skew in revenues. According to a survey, the frequent travel segment represents \$ 40 to \$ 50 billion in revenues each year (Brown, 2004). These guests spend only a part of their annual expenditure on hotels in their preferred hotel chain. A considerable percentage (estimated to be over 60 percent) is spent in competing hotel chains. Many of these heavy users are enrolled in the loyalty programs of competing chains thus there is potential to their increase the share of wallet of these customers. Persuading such customers to increase their share of spending with a specific chain can add potentially increases revenues as well as profitability. Hotel chains, to achieve this objective, are trying to make their loyalty programs more focused while making them more attractive to the members. This requires appropriate classification of the members (proper segmentation) as well as better understanding of individual customer in each of these segments for engaging with them on a continuous basis through multiple channels of communications and promotions.

Objectives

The objectives of our paper are

1. To identify characteristics of customers enrolled in the rewards programs across key value segments,

2. To identify characteristics that are important in each of the segments, and
3. To identify appropriate promotional strategies to engage with customers.

Literature Review

Successful marketers study consumer needs to develop insights about customer segments, sometimes a very small subset of their overall customer portfolio, to lead product development initiatives and manage existing products for profitable growth. Successful segmentation programs based on customer loyalty are dynamic, grounded in data, and learn from the concerns of loyal and profitable consumers.

Markey, Ott and Toit (2007) identified three skills prevalent at successful companies. These companies combine loyalty and segmentation tools to excel at –

1. Using insights from their analysis to deepen relationships with their loyal and profitable customers.
2. Looking inward to identify and tap capabilities to meet target customers' needs in unique ways.
3. Engaging customers in an ongoing dialogue that guides decisions about how their products, services and business evolve resulting in a spurt in innovation.

McDonald and Dunbar (2000) propose a customer-centric approach to market segmentation by utilizing information already held by or accessible to a company. Their framework is built on the key insight that customers segment themselves by the way they obtain value. Therefore, it doesn't matter how the company segments its market, it is how the customers segment in their market that is important. Schweidel, Fader and Bradlow (2008) analyzed the limited information residing in a telecom firms databases to help understand service retention within and across cohorts of customers.

Based on a competitive test in a simulated direct marketing scenario, Linder, Geier and Kölliker (2004) investigated the predictive performances of artificial neural networks (ANNs), classification trees (CTs) and logistic regression (LR) and concluded that the performance of all methods increased with the size of the sample size. They also found that the combination of the prediction scores of ANNs, CTs and LR into a single model revealed synergistic effects among the three modeling approaches and resulted in better results than any single model. They concluded that the combination of ANNs, CTs and LR into a single model mostly resulted in the best prediction, suggesting that model combination might be a safe way of maximising predictive performance. Classification trees have been used by researchers to predict alumni donations for higher education (Weertsa and Roncab, 2009).

The process of identifying market segments should logically begin from the observed differences in behaviour, and, through understanding this behaviour, develop an understanding of customers' differing requirements through the study of such variables as 'perceived benefits' or similarly 'customer needs'. 'The belief underlying this (benefit) segmentation strategy is that the benefits which people are seeking in consuming a given product are the basic reasons for the existence of true market segments. Experience with this approach has shown that benefits sought by consumers determine their behavior much more accurately than do demographic characteristics or volume of consumption' (Haley, 1995: 60).

It should be further emphasised that such a 'behavioural', needs or benefits-based approach, however, is likely to be specific to a product or product category and, as such, more difficult and time-consuming than an a priori approach (Neidell, 1983) to segmentation which simply classifies segments in terms of customer characteristics. The inherent shortcoming of the latter approach is that it is likely to produce segments that are plausible and even vividly descriptive, as are the 'VALS' segments, but which are unlikely to be predictive of actual purchase behaviour - the ultimate objective of analysis.

Beyond identifying segments, there is the further task of evaluating and choosing between segments. This process of selecting among available segments will frequently revolve around an assessment of the value of the various segments (most commonly their revenue potential) and the degree of fit with the organisation's marketing activities.

Elliott and Glynn (1998) had recommended integrating behavioural segmentation and customer value to reflect the joint combination of 'customer needs (or 'benefits'), as a means of properly understanding the customer and responding to the precepts of the marketing concept, and some analysis of 'usage' as a means of understanding their current and future value. 'Needs' reflects what the customer is looking for from their service provider, the complementary process of estimating 'value' represents what the service provider is looking for in its customer mix. Thus, for the process of segmentation to be complete requires both types of analysis.

Segmentation plays a significant role in relationship marketing where it is more interested in enhancing the existing customer relationships thus generating a need for a better understanding of the existing customer base. Analysis that facilitate the calculation of customer relationship profitability, is a useful starting point for segmenting customer bases and a basis for formulating marketing strategies (Storbacka, 1997). By using empirical data collected from a leading hotel chain, the paper illustrates different ways of segmenting customer bases for effective relationship strategies with existing customers and 'attraction' strategies for new customers.

Organizations have started adopting customer portfolio analysis to classify customers or segments according to present and future value. It can be used to derive implications for resource allocation to customers or customer segments, with the objective of increasing customer equity defined as the sum of the lifetime value of its customers. Customer portfolio management involves a combination of the two stages of classification and resource allocation. Homburg, Steiner, and Totzek (2009) developed a segment based customer-lifetime-value model and capture customer dynamics by analyzing how customers switch between segments of different values across time. They found that general customer characteristics and aggregated transaction characteristics indicate future segment dynamics, while specific product usage data differentiate customers according to current value. Thus transactional characteristics better predict current customer profitability, while customer characteristics indicate changes of customer value in the long run.

Customer lifetime value (LTV) models have long been used to focus direct marketing campaigns by allocating resources to those customers who are deemed to offer the most value to the company. After developing frameworks for creating customer segments which forms the basis for customer portfolio management, the strategic marketer continually identifies and improve customer management strategies that lead to the greatest impact on marketing performance.

The review of literature helps identify several options available to marketers for using data available in their databases. The data includes customer level details on transactions, purchase, usage, survey responses, response to promotions, demographics and interactions with service employees, etc. In the next section, we describe the research methodology.

Methodology

Detailed data is obtained from the loyalty programme of a major hotel chain. The database consisted of various demographic characteristics as well as contribution to revenue. The customers (members of the loyalty programme) are categorized into three segments namely, Low, Medium and High, based on revenue from customers during one year. Initially, the differences in demographic characteristics of each of these segments are identified. It is necessary to estimate the importance of each of these characteristics in determining the segment that the customer belongs to. As many of the characteristics are categorical or ordinal in nature, the usual techniques such as regression and correlation cannot be used. Although Chi-square technique is eminently suited for this type of data (categorical or

ordinal data), it cannot provide the relative importance of each of these characteristics. So we used Classification Tree to predict the category to which the customer belongs. The accuracy of this prediction of group memberships is tested and also the characteristics of customers in each segment are identified. These characteristics can be used to classify customers into respective categories (High, Medium and Low Value).

In the next stage, we carried out Regression Analysis to identify factors which determine the revenue from each customer. This was separately conducted for the four main geographies as geography had emerged as an important predictor in the Classification Tree.

Finally we propose an optimization process to allocate the promotional budget across customers enrolled in the rewards program through different channels for each segment. The optimization builds on the results of the Classification Tree and Regression Analysis to help tailor the promotions at the segment level.

Results and Discussion

As mentioned earlier, all customers were classified into three categories, namely Low, Medium and High. Table 1 presents the summary of the average spend by each category under different heads namely, Food and Beverages (F&B), Room Revenue and Other Revenue. Other revenue includes various revenue items such as laundry, business center, health club, telephone and internet services etc.

Needless to say, the average spending of the High Category customers is significantly higher in all the three types of revenue. On the other hand, the percentage of F and B Revenue to the total revenue was the lowest among the High Category customers. The corresponding percentage was the highest for the Medium Category. The percentage of Room revenue was the lowest for the Medium category. In other words, High Category customers spend a relatively lower percentage on Food and Beverages while the Medium Category customers spend a larger percentage on Food and Beverages.

TABLE 1: SEGMENT-WISE SPENDING (AVERAGE)

	Average spend			
	F & B	Other Revenue	Room Revenue	Total Revenue
Low	81,879.96	54,532.89	398,423.88	534,836.72
Medium	131,459.95	86,335.28	576,964.64	794,759.87
High	223,200.34	187,976.50	1,225,424.71	1,636,601.55
	Percentage of revenue type (Percentage to total revenue)			
	F & B	Other Revenue	Room Revenue	Total Revenue
Low	15.31%	10.20%	74.49%	100.00%
Medium	16.54%	10.86%	72.60%	100.00%
High	13.64%	11.49%	74.88%	100.00%

The data was used to build a classification tree to classify the customers into Low, Medium and High categories. The rules derived from the classification tree are applied to the data set to determine the prediction accuracy. Table 2 presents the prediction accuracy of the classification tree.

TABLE 2: PREDICTION MATIX

	Segment	Prediction		
		Low	Medium	High

Actual	Low	88.33	8.56	3.11
	Medium	8.14	85.27	6.59
	High	5.04	5.81	89.15

The classification tree was able to predict 88 percent of the Low Category correctly. Similarly, it is able to predict 85 percent of the Medium Category and 89 percent of the High Category correctly. Thus the predictions accuracies of the classification tree were satisfactory.

A close perusal of the structure of the tree revealed that three important variables influence the classification by the tree. These variables are

1. Country (Nationality)
2. F & B Revenue (contribution) and
3. Other Revenue (contribution)

The impact of these three variables is discussed in the following sections.

1. Country (Nationality): The customers are grouped into 4 groups based on their nationality, namely India, United Kingdom (UK), United States of America (USA) and Other countries (Others). Table 3 presents the country-wise revenue for each of the three categories. Among the Low category customers, those from United Kingdom spend the highest where as those from India spend the lowest. Similarly, among the Medium category, those from Other countries spend the maximum, where as those from the USA spend the least. Finally, the High category is characterized by the USA (who spend the highest) and UK (who spend the least amount). Thus, there is a clear distinction in the spending pattern based on the nationality among the three categories.

TABLE 3: SEGMENT-WISE AND COUNTRY-WISE SPENDING

		INDIA	UK	USA	Others
Segment	Low	527,959	556,287	555,218	529,046
	Medium	795,521	787,023	776,161	802,803
	High	1,702,342	1,524,206	1,874,612	1,549,543

2. Food and Beverage (F&B) Revenue: F&B revenue accrues through 11 different sources such as F&B Chamber, Coffee Shop, Continental Restaurant, etc. Table 4 presents the revenue contribution of each of these sources by category of customers. The highest percentage of Indian Restaurant, Oriental Restaurant and Room Service appear to come from Low category customers (out of the three categories). Similarly, highest percentage of Multi Cuisine, Mini Bar and Outdoor appear to be coming from Medium category customers. The highest contribution to the remaining 5 sources comes from the High Category customers. In other words, the contribution in percentage terms is dominated by different categories in different sources of Food and Beverage.

TABLE 4: ITEM-WISE SPENDING UNDER F & B CATEGORY (PERCENTAGE)

	F&B-Chambers Revenue	F&B-Coffee Shop / Lobby Lounge Revenue	F&B-Continental Restaurant Revenue	F&B-Mini-Bar Revenue	F&B-Indian Restaurant Revenue	F&B-Multi Cuisine / Alternate Cuisine Revenue	F&B-Oriental Restaurant Revenue	F&B-Pastry Shop Revenue	F&B-Room Service Revenue	F&B-Bar / Lounge Bar / Night Club Revenue	F&B-Banquets / Outdoor Revenue
Low	1.02%	19.56%	5.50%	3.63%	6.04%	6.07%	8.49%	0.23%	33.84%	8.00%	7.61%

Medium	1.15%	20.11%	4.63%	4.44%	5.38%	6.58%	7.54%	0.25%	28.49%	9.41%	12.02%
High	3.56%	20.51%	9.07%	4.23%	4.89%	4.84%	6.62%	0.63%	32.01%	9.57%	4.06%

3. Other Revenue: From among the three categories of customers, Low category appears to contribute the highest percentage in terms of revenue from Health Club and Beauty Salon. The highest percentage of revenue from Laundry and Miscellaneous comes from High Category customers. The highest percentage with respect to other items such as Fax, Internet and Telephone (local and STD) is contributed by the Medium category customers. Table 5 presents the percentage contribution of “Other” revenue, category wise.

TABLE 5: ITEM-WISE SPENDING UNDER “OTHER” CATEGORY (PERCENTAGE)

	Other-Business Centre / Fax Revenue	Other-Internet Revenue	Other-Telephone - Local Revenue	Other-Telephone - STD / ISD Revenue	Other-Health Club / Beauty Salon Revenue	Other-Laundry Revenue	Other-Miscellaneous Revenue
Low	9.35%	4.87%	4.13%	48.40%	3.06%	19.51%	10.67%
Medium	10.57%	6.09%	4.28%	49.01%	2.47%	20.19%	7.40%
High	10.26%	2.84%	4.26%	44.00%	1.44%	23.44%	13.76%

The classification tree helps identify important variables which determine the type of category of the customers namely, Low, Medium and High. The prediction accuracies of the classification tree are more than satisfactory. A further analysis of the data pin points the different sources of revenue (in terms of percentages) contributed by different categories.

Regression Analysis

The hospitality industry is characterized by the same customer wearing different hats when travelling for different purposes. A corporate executive is booked as a ‘Corporate Segment’ when travelling on official work and as ‘Leisure Segment’ while on personal and recreational visit. In the next stage of analysis, we used regression analysis to identify the contribution of each segment to revenue. The Classification Tree analysis clearly showed that there are significant differences in the contribution to revenue based on the Country (Nationality) of the customer. Hence, separate regression equations are fitted for each of the 4 country groups with ‘Revenue’ as the dependent variable. Table 6 presents the regression coefficients, statistically significant at 0.01, for these equations. The Coefficient of Determination (R^2) varied between 0.512 and 0.848. The regression fit was the best with respect to the customers from the USA with an R^2 of 0.848. Three segments namely Long Stay (LSY), Others (OTH) and Corporate (CORP) are significant in all equations. Leisure (LSE) segment was significant with respect to UK and Other countries, whereas Complimentary (COMPY) segment is significant only for India. It is important to note that the coefficients of these variables are very different across countries. The implication is that the contribution of different segments varies significantly according to country of the customer.

TABLE 6: REGRESSION COEFFICIENTS OF EQUATIONS FOR DIFFERENT REGIONS

		USA	INDIA	UK	Other
	Intercept	559676.1	611543.4	448751.0	412724.8
LSY	Coefficient	2292.986	3112.356	2837.291	3213.397
OTH	Coefficient	13571.28	3128.372	3434.925	4411.795
CORP	Coefficient	2863.882	2937.54	3966.563	3896.826

LSE	Coefficient			11223.74	3271.984
COMPY	Coefficient		-7700.02		
	R-Square	0.848	0.624	0.523	0.512

The classification tree helped us identify the variables that are important in determining the spending category of the customers. The country of origin is one of the important variables and hence the relationship between various segments and the revenue was estimated through regression equations, estimated market-wise. The significance of the regression coefficients also indicates that the contribution of different segments differs across markets. Obviously, the hotel chain will have to adapt different strategies for different segments in each of its markets. It can use various channels of communication for addressing different segments. The effectiveness of various channels is likely to vary across different regions for each of the segments. This effectiveness in terms of a “hit rate” can be estimated in the form of yield, measured in room nights under each of the segments, based on historical data and with certain amount of experimentation. At the same time the budget available for such a communication campaign is limited. This limited budget needs to be distributed across various segments, covering different regions. Obviously, the objective of such exercise is to maximize the revenue (or profit) arising from all the segments and regions and channels. Thus, the problem reduces to optimal allocation of the limited budgetary resources to maximize the revenue (or profit). Such issues are best addressed through a linear programming approach. A possible linear programming formulation for maximizing the revenue with limited budget is presented below. This formulation takes into account, the following constraints:

1. There is a limit to the total budget available for the campaign
2. There are certain pre-determined lower and upper limits that are needed to be adhered to in distributing the available budget between different channels and regions (this will ensure some amount of visibility in all the regions across all channels). If necessary, the management can decide to limit the lower bound or upper bound (thresholds) for a particular channel or region to be zero.
3. The spend in a particular region/market should not exceed a predetermined percentage of the total spend.

Based on these constraints, we propose the following optimization model to maximize revenues -

$$\text{Max } \sum C_{ij}X_{ij}$$

C_{ij} = Revenue in i^{th} region for j^{th} type of segment e.g. conference nights, leisure, longstay etc.

X_{ij} = Number of nights in the i^{th} region (geographical market e.g. USA, UK, India etc.) for the j^{th} type of segment

Subject to

$$L_{ij} \leq B_{ij} \leq U_{ij}$$

B_{ij} = Budget targeted for the i^{th} market and j^{th} Segment

L_{ij} = Minimum amount

U_{ij} = Maximum amount

$$\sum_j B_{ij} \leq Q_i \sum \sum B_{ij}$$

Not more than Q_i percentage of total budget in the i^{th} market

$$\sum_k Y_{ijk} B_{ijk} = X_{ij}$$

Every rupee budgeted for i^{th} market for the j^{th} segment through k^{th} channel will yield Y_{ijk} room nights (based on historical data for promotion efficiency of channels viz. telecall, email, sms, mailer, etc. This can also be determined through promotional experiments)

$$\sum_k B_{ijk} = B_{ij}$$

The total budget through the all the k channels is equal to the budget in i^{th} market for j^{th} segment

Conclusions

The starting point for our research was the need to utilize the data residing with service firms with whom customers interact regularly and details of such interactions are captured in the firm's database. At the same one has to remember, that building strong relationship with customers requires a deeper understanding of their needs and current interactions with the focal firm's competitors. As highlighted by Du, Kamakura and Mela (2007), while companies are collecting voluminous data of their customers' interactions, they often face a dearth of information on external (outside the firm) customer activities. This leads to customer relationships being managed by using a view of customers that is based mostly on internal records. This inward focus often results in misleading measures of a customer's market potential. Du et. al. (2007) state that customers with high value, based on internal records, may have modest growth potential if few requirements are served by competing firms. On the other hand, customers who have a high transactional volume with competing firms may be good targets for growth if the firm can attract a larger share of their business.

Analysis on Market Expansion Strategy of Luxury Brands in China: The Evidence of LV (Louis Vuitton)

Mingxia Zhu, zhumingxia@263.net

Xiaolin Zhang, xiao_lin_zhang@hotmail.com

University of International Business and Economics (UIBE), China

Abstract

China has become the second largest consumer market of luxury goods and is expected to be the number one in the next five to ten years. Some luxury brands are expanding rapidly in China. In this paper, we take LV as an example and build a model to analyze geophysical exploration pattern, by assuming that LV chooses a exploration pattern so that the 'total cost' the consumers paid to reach their nearest LV store is minimized. We also use optimization programing and Monte Carlo simulation to examine several series of data to determine the goodness of the geophysical exploration model. We find that the use of distance data between cities and GDP, Tertiary Industry GDP data, respectively, can provide a model with good descriptiveness and predictability of the geophysical exploration pattern of LV in China.

I Introduction

According to the BCG report (2010), the global market for luxury is close to €1 trillion. It is worth noticing that there has been a shift from traditional luxury markets (France, Italy, England etc.) toward new luxury markets, such as China, Russia, and Brazil and so on. Chinese consumers are enthusiastic about spending on luxury items, and luxury consumption in China shows a trend of constant renewal.

Many luxury pioneers have entered into Chinese market by working with licensees since 1990s. After two decades of nurturing, China' luxury consumption has become a strong force in the global luxury market and is experiencing a sustaining growth. Even under global financial crisis it performed pretty well. China is expected to become the world's largest luxury market in the next five to ten years. Furthermore, global luxury brands are expanding their business rapidly in China. In this paper, we focus our study on the business expansion strategy of luxury brands in China.

II Literature Review

D . L . Huff(1963) developed famous Huff's retail model which is "generally used to determine trading areas around particular facilities." Huff's model based on gravity principle and presents that the size of shopping district is determined by the shopping areas attractions for consumers and obstacles which consumers feel.

Huff David L. (1966) presents a computer-programmed solution for retail location choice. In this article, Huff chose a set of locations, and calculated corresponding net profit. The optimum location is the place where firms can generate the biggest net profit.

Zhou Shangyi, Zuo Yi'ou, Wu Qjian (2008) built a modeling of KFC's spatial diffusion in Beijing City.

Their paper builds models to analyze how foreign catering chain store is spatially diffused within Beijing City. This paper design three new spatial variables in the model and finally Ring Order Model and Radius Model didn't pass the tests while Alpha model passes. The conclusion is that economic factors have greater influence on KFC's diffusion.

Yu Xiang-yang, Wang Xin-zhong (2003) tries to discover the special formation and distribution laws of the commercial entertainment places in urban areas. This paper studied the contents and structures of the commercial entertainment places in urban areas, as well as their relationship with the quality of the urban social life spaces.

Gong Xiaoyin (2009) presents some strategies regarding to the retail industry location choices based on the theory of population economics. Gong Xiaoyin suggested that population is a key factor to determine the location choice strategy for a retail industry.

IV Geophysical Exploration Pattern of LV: OPT Model

In this paper, we develop a geophysical exploration model of LV. This article assumes that LV expand its business by opening stores under a rational thinking, in other words, LV is a 'rational man/woman'. In order to attract the potential customers and stimulate sales, LV chooses a pattern to open new stores among cities so that it minimizes the total cost paid by the LV product consumers to reach LV stores.

In addition, the number of stores opened every year is constrained and predetermined by its financial budget, which means that the number of stores opened in a specific year is an exogenous variable. In our study, we collected location information of stores opened each year since 1992, when LV opened its first store in Beijing. We focused our study only on mainland market and ignored the number of stores opened in Hong Kong, Macao and Taiwan.

In this paper, we developed geophysical exploration model, using population and distance between cities as variables. We adopted Monte Carlo (MC) simulation to calculate the *Simulated Pattern* (see *Definition (9)*) and compared with the *Historical Pattern* (see *Definition (8)*), and tested the goodness of LV geophysical exploration pattern in China market. We called this model as *Optimize Model*, or *OPT Model*.

4.1 Core Concepts

It is assumed that there are two factors were considered when LV locating their shops geographically. One is the economic status of the candidate city, which is proxied by population, GDP, GDP per capital, or other variables. The other is the total cost paid by the consumers to purchase LV products, which, in this paper, is proxied by the distance that the consumers move to reach a LV nearest store.

To summarize, we assume that the geophysical exploration pattern of LV is which that minimize the 'total cost' the consumers in different cities paid to reach their nearest LV store.

4.2 Definitions

In our paper, the following words have special meanings:

- (1) *Major Cities*: Provincial capitals and cities specially designated in the state, defined by *China Statistic Yearbook 2010*.
- (2) *Consumers*: LV product consumers.
- (3) *Population*: The total population in *Major Cities* at the end 2009.
- (4) *Distance*: The straight-line distance between two *Major Cities*.
- (5) *Minimum Distance*: The *Distance* between a *Major City* and the nearest LV store. When there has been a LV store in a *Major City*, the *Minimum Distance* for that city is zero.
- (6) *Scene*: The specific set of cities where LV has opened stores for a given time. For example, the *Scene* in 1998 is that, LV has opened stores in Beijing, Shanghai, Dalian, Guangzhou and Shenzhen.
- (7) *Pattern*: The change of the *Scene* over time. For example, one possible *Pattern* may be the following: in the first year when LV entered China, it opened a store in Shanghai; in the second year, it opened three stores in Beijing, Chengdu, Wuhan, respectively; and in the third year, it opened two stores in Hangzhou, Xi'an, respectively; and so on. Each *Pattern* is constructed by a series of *Scenes*.
- (8) *Historical Pattern*: The actual *Pattern* that LV opened stores in major cities in the past years. In our investigation, we find LV actually opened one store in Beijing in 1992; in 1995, it opened the second store in Shanghai; and then Dalian, Guangzhou and Shenzhen in 1998; and so on.
- (9) *Simulated Pattern*: The Monte Carlo simulated *Pattern* according to *Historical Pattern*, holding the number of cities in every *Scene* unchanged, while the cities in the *Scene* are randomly chosen. For example, one *Simulated Pattern* may be the following: in contrast to *Historical Pattern*, LV opened one store in a randomly chosen city, for instance, Nanjing (rather than Beijing) in 1992; in 1995, it opened the second store in a randomly chosen city, Xi'an (rather than Shanghai); and then Qingdao, Chengdu and Wuhan (rather than Dalian, Guangzhou and Shenzhen) in 1998; and so on.
- (10) *Historical f*: The f value (see assumption (5)) over time calculated by using *Historical Pattern*.
- (11) *Simulated f*: The f value over time calculated by using *Simulated Pattern*.
- (12) *Historical F*: The F value (see assumption (6)) calculated by using *Historical Pattern*.
- (13) *Simulated F*: The F value calculated by using *Simulated Pattern*.

4.3 Assumptions

To build our models, we assume that:

- (1) The *Consumers* of LV products live in nowhere but the *Major Cities*.
- (2) LV opens stores only in *Major Cities*.
- (3) LV faces financial budget constraints. The number of stores opened in a specific year is limited by its own predetermined budgets. That is, in other words, the number of stores opened in a specific year an exogenous variable.
- (4) *Consumers* are rational individuals, they buy LV products in nearest stores, either in the Major City they live in (when there is not a LV store in the Major City they live) or in another nearest Major City (when there is not a LV store in the Major City they live).

(5) LV is a rational enterprise. It tries to construct a *Scene* to minimize the total cost the *Consumers* paid to reach their nearest LV store. For a specific year i , the total cost the *Consumers* paid is determined by the following formula:

$$f_i = \sum_{j=1}^n P_j \cdot D_j$$

Here, P_j is the total number of LV-product *Consumers* of *Major City j*, and D_j is the *Minimum Distance* between *Major City j* and the nearest LV store. When there has been a LV store in *Major City j*, $D_j=0$.

(6) To justify the goodness of the *Patterns*, we introduce F value, where for every *Pattern*:

$$F = \sum_{i=1}^m f_i$$

(7) LV stores are identical. They provide identical products and services. Furthermore, rents, ⁽ⁱⁱ⁾ salary levels and other cost related to the location of the stores are identical.

(8) The percentage of *Consumers* in the *Population* in each and every *Major City* is constant.

(9) The growth rate of *Population* of every *Major City* is identical over time.

(10) The opening of more than one store in the same *Major City* has no influence on the f value. We only consider the year of the first store opened in every *Major City*.

4.4 Explanations and Inference of the Assumptions

Since the potential consumers of LV products are the high-income consumers in cities. To simplify our model, we assume that all *Consumers* are living in the *Major Cities*, as the *Assumption (1)*.

After our investigation, we found that LV had opened stores in 28 cities in 2010, among which, there were only 4 cities that were not provincial capitals or cities specially designated in the state (*Major Cities*), as defined by *China Statistic Yearbook 2010*. The 4 cities were Wenzhou, Sanya, Suzhou and Wuxi. Due to the difficulties to obtain the authoritative data of these 4 cities such as city's total population, GDP, GDP per capita, etc., our paper ignored the stores opened in these 4 cities and assumed that LV only set up stores in the *Major Cities*, as assumed in *Assumption (2)*.

In this paper, we assumed that LV expanded its business by opening new stores in *Major Cities*. However, the year of opening new stores and the number of new stores opened in a year is constrained by the predetermined financial budget. In this paper, we do not discuss the financial condition of LV. Based on the considerations above, we have assumed *Assumption (3)*.

Just as described in *Assumption (4)*, we think *Consumers* always spend their money on LV products in the nearest store. *Assumption (4)* ensures that D_j is the *Minimum Distance*.

In the *Assumption (5)*, $P_j \cdot D_j$ can be reasonable considered to be the 'total cost' the *Consumers* in *Major City j* paid to reach the nearest LV store. And f_i can be viewed as the 'total cost' over time in the i th year.

It is a natural logic to assume that LV optimizes the *Pattern* to minimize the 'total cost' over time, that is, to minimize the sum of f_i , as we assume in *Assumption (6)*.

We don't want to discuss the cost difference of opening stores in different *Major Cities*, so we have

Assumption (7).

Assumption (8) and *Assumption (9)* is reasonable, given that we don't want to discuss the consumer structural change or demographic change in this paper. And together, these two assumptions ensure that it is reasonable to use *Population* to proxy the number of *Consumers* in every *Major City*.

In our paper, we focus on the geophysical exploration among cities, rather than an exploration within a city. So we have *Assumption (10)*.

4.5 Data Collecting

4.5.1 Cities and Years

We collected the specialty store number LV opened in China Mainland market according to statistics on LV official website (<http://www.louisvuitton.com/>). So far, LV has opened 36 stores in 29 cities, including 7 flagship stores and 29 specialty stores. In addition, we obtained the year when the stores opened via LV official website and internet news.

Note that we ruled out the store opened in 2011 in Zhengzhou city because year 2011 has not yet completed. And as mentioned above, we ignore the 4 stores opened in non-Major Cities, namely Wenzhou, Sanya, Suzhou and Wuxi.

In summary, we have collected 24 pairs of data, each pair of data includes the cities and year LV opened stores, the data cover the year from 1992 when LV first entered China to the end of 2010.

TABLE 1: CITIES AND YEAR OF LV OPENED STORES

City	Year	City	Year	City	Year	City	Year
Beijing	1992	Hangzhou	2004	Kunming	2007	Taiyuan	2009
Shanghai	1995	Xiamen	2004	Tianjin	2008	Harbin	2009
Dalian	1998	Qingdao	2004	Changchun	2008	Ningbo	2009
Guangzhou	1998	Xi'an	2004	Wuhan	2008	Hohhot	2010
Shenzhen	1998	Shenyang	2007	Changsha	2008	Fuzhou	2010
Chengdu	2002	Nanjing	2007	Urumqi	2008	Nanning	2010

4.5.2 Major Cities and relative data

We use data from government sources in *China Statistical Yearbook 2010*, including population, total GDP, GDP of secondary and tertiary industry of the *Major Cities*. We use the data above to calculate GDP per capita.

4.5.3 Latitude and Longitude of Major Cities

In order to get the Distance between two Major Cities, we collect the longitude and latitude for each Major City through Google Earth Software (version: 6.0.1.2032 beta).

4.6 Data processing

4.6.1 Historical Pattern

Using historical data (cities and years), we can construct historical *Scene* and *Historical Pattern* from year 1992 to

2010.

4.6.2 Distance

We use the latitude and longitude information collected above, to calculate the *Distance* matrix between every two *Major Cities*, using geometry formulas.

4.6.3 Minimum Distance and Historical f

For every historical *Scene*, we use MATLAB® (version: 7.6.0.324 (R2008a)) to find *Minimum Distances* D_j for every *Major City*.

After that, *Historical f* can be derived using formula (i), for given *Minimum Distances* D_j and population, GDP, GDP per capita, etc.

After using *Historical Pattern*, we get *Historical f* value (using *Population-Distance* data) as following table, where f is in (million persons*thousand km):

TABLE 2: HISTORICAL f VALUE (USING POPULATION-DISTANCE DATA)

Year	f_i	Year	f_i	Year	f_i	Year	f_i
1992	272.44	1997	203.70	2002	87.61	2007	54.96
1993	272.44	1998	135.18	2003	87.61	2008	35.49
1994	272.44	1999	135.18	2004	70.73	2009	29.26
1995	203.70	2000	135.18	2005	70.73	2010	23.47
1996	203.70	2001	135.18	2006	70.73		

And we draw the *Historical f* curve (using *Population-Distance* data) from year 1992 to 2010 as following figure:

FIG.1: HISTORICAL f VALUE OVER TIME (POPULATION-DISTANCE OPTIMIZATION)

4.6.4 Monte Carlo simulation and Simulated f

We generate 10^5 *Simulated Patterns*, by employing MATLAB® Monte Carlo (MC) simulation programing.

And then, as illustrated above, we repeat the process of determining *Minimum Distance*, and calculating *Simulated f* for each *Simulated Patterns*.

The figure of *Simulated f* values over time is obtained by MATLAB®:

FIG.2: MC SIMULATED f VALUE OVER TIME (POPULATION-DISTANCE OPTIMIZATION)

The figure is drawn in contrast with the bold line, which stands for the *Historical f* value over time, while the colored dashed line stands for the *simulated f* value over time.

4.6.5 Using GDP and other data

After replacing the *Population* data with GDP, GDP per capita, GDP of secondary and tertiary industry, and repeating the process above, we can get the *Historical* and *Simulated f* values and figures of GDP, GDP-per-capita, GDP of secondary and tertiary industry versus *Distance*.

4.7 Results

To determine the goodness of the *Historical Patterns*, we use F value, as defined by *Assumption (6)* and formula (ii). And furthermore, we introduce G value, the determinant factor of Goodness, where:

$$G = \frac{\text{the number of Simulated } F \text{ value that is smaller than Historical } F}{\text{the total number of MC simulation}} \quad (\text{iii})$$

One can consider the G value to be the probability that a randomly created *Simulated Pattern* is better than the *Historical Pattern*.

As long as F can be reasonably viewed as the ‘total cost’ of the *Consumers* paid to reach their nearest LV store over time, the smaller the F value, the better the *Pattern*. We compare each and every *Simulated F* values with *Historical F*, and get a G value.

The *Historical* and *Simulated F* shows that, when using *Population-Distance* data, the G value is about 24.747%, the indication is that, when the *Pattern* is randomly simulated, the probability of the *Simulated Pattern* is better than the *Historical Pattern* is 24.747%.

The G values using different series of data are shown in the following table:

TABLE 3: *G* VALUES

Data	<i>G</i> value
Population- <i>Distance</i>	24.747%
GDP- <i>Distance</i>	0.844%
GDP-per-capita- <i>Distance</i>	6.783%
Secondary-Industry-GDP- <i>Distance</i>	2.671%
Tertiary-Industry-GDP-- <i>Distance</i>	0.292%

V Conclusions

We found that, when randomly chosen, the probability that the *Simulated Pattern* is better than the *Historical Pattern* is 24.747%, when *Population* and *Distance* data were used.

The idea of optimizing *Patterns* is to minimize the ‘total cost’ over time to reach the LV stores, while the ‘total cost’ over time is represented by the *F* value. In other words, LV chooses geophysical exploration patterns to getting their stores as closer as possible to their *Consumers*.

The replacement of *Population* data is reasonable because, it is natural to think that LV also wants to choose geophysical exploration patterns to getting their stores as closer as possible to national wealth, which may be represented by GDP, GDP per capita, Secondary or Tertiary Industry GDP.

Our results show that, when replaced *Population* data with other series of data, the goodness of the *Historical Pattern* (*G* value) varies. The GDP-*Distance* and Tertiary-Industry-GDP-*Distance* data provide a better fit to the *Historical Pattern*, and the *G* values are 0.844% and 0.292% respectively. While the GDP-per-capita-*Distance* and Secondary-Industry-GDP-*Distance* optimization show a weaker descriptiveness and predictability, GDP-*Distance* optimization perform even worse.

The results indicate that, a GDP-*Distance* and Tertiary-Industry-GDP-*Distance* optimization could be an efficient model to describe and predict the geophysical exploration patterns of LV.

Is There Free Lunch in the Stock Market?

—A Theoretical Analysis Based on Stochastic Process

Ming Men, Ming_men@yahoo.com

Tianbi Men

School of International Trade and Economics, China

Abstract

There are different theoretical view points regarding whether there is “free lunch” in the stock market. Some economists believe that there is no free lunch in the stock market based on the “Hypothesis of Efficient Capital Market.” However, some other economists gradually realize that some form of “free lunch” can be obtained with nicely designed investment strategies. In this paper, we assume that the stock returns are following the Geometric Brownian Motion. Then we calculate the probabilities of portfolio’s return rate which is greater than that of the government bonds based on Ito’s Lemma and find the conditions for free lunch in the stock market. Finally, we analyze the factors affecting the probabilities and propose some suggestion to the investors.

Introduction

There are different view points regarding whether there is “free lunch” in the stock market. When buying shares, investors are trying to figure out which stock will bring them the highest returns. In real investment world, we know that some investors are extremely successful. This is because they apply unique investment strategies and advanced analytical methodologies and commit to long term engagement.

For example, the price of stocks held by the well known investor Warren Buffet has been increased for more than 2000 times in the past 30 years, while the Standard & Poor index has been increased for merely 50 times during the same period. For years, Buffet stands in the first three positions in the Forbes’ list of Global Richest People. American News and World Report summaries Buffet’s investment rules as follows. First of all, don’t be cheated by returns. Buffet is more likely use earning per share, EPS, to evaluate the profitability of the listed companies. When calculating EPS, you divide net income by the number of shares outstanding. EPS measures the company’s profit per share and hence better reflects its profitability. Based on this investment rule, Buffet selects those shares whose EPS is greater than 15%. In Buffet’s investment basket, Coca-Cola’s EPS is greater than 30%, and American Express’ EPS goes as high as 37%. Second, investors should look forward. Buffet is called the “Oracle of Omaha” because he is always trying to figure out whether the company is able to grow in the future, whether or not the company can be successful in the next 25 years. As Buffets said:,you need to look forward through the front window, rather than look back through the back mirror. Third,investors should look for those stocks that have long-term growth potential. These companies will make your forecast more save. For example, Buffet did not choose IT companies. He chose companies with steady demand instead, such as Coca-Cola. Finally, be patient. If you buy and sell stocks frequently, you will miss wonderful opportunities. Buffet’s rule is that investors should not buy and sell frequently. You should buy only when the good shares appear.

On the other hand, economists tell us that there is no “free lunch” in the stock market. The well known American economist Paul Samuelson once said that you can decide stocks by throwing dart on the financial column of the Wall Street Journal, and you choose those share which are hit by the dart. “This is crazy”, said another well known American economist, N. Gregory Mankiw. “However, you have a good reason to trust it. It is not misleading” The reason is the so called “Efficient Market Hypothesis, EMH.”

EMH actually means that there is no “free lunch” in the stock market. There is no such thing that costs nothing in the world. In a normal efficient market, no investor can expect to earn abnormal returns. Just as the story in *New Explanations of the World* says, in a crowding orchard, if there are some fruits left on the trees, you should not pick them up. Because they are probably sore. Following the same logic, if the fruits are sweet, they must be picked up already by other people.

Then the question is: should the investors follow the theory of EMH to select shares randomly, or should they know the secret word “open sesame” to pursue high returns in the stock market? In this paper, we first construct a theoretical stochastic model to calculate the probability that the return rate of shares greater than that of government bonds. Then we analyze the conditions for the “free lunch” in stock market. In addition, we discuss about the factors affecting the probability. Last but not least, we come up with some suggestions for the investors based on our findings.

The rest of the paper is arranged as follows. Section 2 reviews the related literature. Section 3 sets up theoretical model and explains its assumptions. Section 4 analyzes the factors affecting the probabilities. Finally, Section 5 summarizes our discussion and gives investment suggestions.

Literature review

EMH was first orientated in early 1920s. The founding father of this theory is Louis Bachelier, a French mathematician. Bachelier (1900) first used stochastic process to estimate the economic value of financial products. Osborne (1959) came up with the theory of Random Walk. He believes that the movement of stock prices is similar to that of chemical molecules Brownian Motion in which the path of the molecules can not be predicted precisely. Eugene Fama (1970) argued that the stock price time series do not have “memory”. Therefore, investors are not able to predict future trend of the stock prices based on historical data.

This conclusion is somewhat disappointing to the stock analysts. They make great effort to analyze listed companies’ financial report so as to determine the economic value of their stocks. If the stock prices are totally random, is there any economics rule to follow when investors trying to make right decisions? Paul Samuelson believes that this is exactly an efficient market formed by economics rules.

The key points of EMH are as follows. First, investors are rational¹. Listed companies are strictly supervised. Investors try their best to analyze fundamental information of the firm so as to evaluate the profitability of the shares. They discount the future value of the shares and try to make decision by weighting the returns and risks that are taking. Second, stock prices reflect the equilibrium of investors’ supply and demand of the stock. In another word, the number of investors who believe that the stock price is over valued is exactly the same as the number of investors who believe that the stock price is under valued. If some investors find that these two numbers are not equal, there exist arbitrage opportunities. These people will buy or sell stocks

immediately to take the free lunch in the market until the two merges into one. Finally, stock prices reflect all available information about the asset. Stock prices will change according to information changes. When a piece of good news or a bad news comes to the market, stock prices start to move. When every investor gets the information, stock prices are adjusted to their new equilibrium.

Of course, EMH is only a theory. In reality, neither every investor is rational, nor information is efficient at any time. Therefore, sometimes, a miracle may appear in the stock market. Mankiw once said, "The theory may not be right completely. However, EMH as a description of the capital market is better than you can imagine." According to EMH, market price will be adjusted until there is no arbitrage opportunity, namely, when there is no "free lunch" in the market.

Nevertheless, economists realize recently that some nicely designed form of "free lunch" can be obtained in the theoretical models about financial market. This is directly conflicting with fundamental economics principles. How can we interpret this interesting issue? Harrison and Kreps (1979) first noticed that there likely exists an "arbitrage strategy", which can give a positive return in a given limited period of time regardless whether there are inputs or not. In the book of Ingersoll (1987), we can find an example of this strategy. Just as in the Coin-Flipping Game, the stake is doubled when you fail until you win the game. Therefore, it is called the "Double Strategy."

Harrison, Kreps and some other economists realize that the limitation on trading volume can sterilize the "Double Strategy". The key point is how to limit the trading volume so as to sterilize the "Double Strategy", but not other strategies which benefit the investors. Starting from this point, Heath and Jarrow (1987) proved that the margin requirement can sterilize arbitrage strategies and allow other stock option trading strategies to work at the same time. Dybvig and Huang (1988) argued that low level wealth constraint is able to sterilize arbitrage strategies and allow investors to apply any trading strategies that satisfy the condition of standard integration, such as non-negative wealth restrictionⁱⁱ.

Omberg (1989) proposed a totally different approach to solve this problem. He believes that the probability of the "Double Strategy" to generate unlimited loss is close to zero, and the probability of the strategy to generate limited returns is close to 1. The expected utility of the "Double Strategy" is negatively unlimited large for risk averse function under all wealth level. Hence, there is no need to impose trading limit for stock brokers because this strategy is extremely unattractive to them.

However, this is only part of the answer. At least there are some stock brokers whose behavior satisfies the expected utility theorem. There are still some attractive arbitrage strategies for them. For example, if the utility function of a broker is risk seeking under low wealth level, then the "Double Strategy" will be profitable. While for those brokers whose absolute risk tolerance is decreasing as the wealth grows, Kim and Omberg (1990) found some trading strategies which can both satisfy the expected utility test and possess arbitrage features.

This paper contributes to the literature of financial free lunch in the following aspects. Assuming that stock return rate follows geometric Brownian Motion and applying Ito's Lemma, we calculate the probability of the stock return that is greater than that of the government bonds. Then we obtain the conditions for the "free lunch" in stock market and analyze the factors affecting that probability.

The model

Assume that at time t , an investor needs to decide whether to invest in government bonds or stocks. The question is that at time T , will the return of stocks be greater than that of government bonds? If yes, what is the probability?

Assume that the stock index S follows Geometric Brownian Motion.

$$\frac{dS}{S} = \mu dt + \sigma dW \quad (1)$$

Here, μ stands for the expectation of stock returns, and σ stands for the standard deviation of stock returns.

Actually, we are more interested in the stochastic process which $d(\log S)$ follows because the lognormal distribution better describes the sharp-peak and fat-tail characteristics of the security returns.

$$\text{Assume that } f(t, S) = \log S, \quad (2)$$

Hence,

$$\frac{\partial f}{\partial S} = \frac{1}{S}; \quad \frac{\partial f}{\partial t} = 0; \quad \frac{\partial^2 f}{\partial S^2} = -\frac{1}{S^2} \quad (3)$$

According to Ito's lemmaⁱⁱⁱ:

$$df(t, X) = \left[\frac{\partial f}{\partial t} + \frac{\partial f}{\partial X} \mu X + \frac{1}{2} \frac{\partial^2 f}{\partial X^2} \sigma^2 X^2 \right] dt + \frac{\partial f}{\partial X} \sigma X dW \quad (4)$$

Take these results into equation (1), we have

$$d(\log S) = \left(\mu - \frac{\sigma^2}{2} \right) dt + \sigma dW \quad (5)$$

This enables us to get a solution for the stock price. When integrate equation (5) on the interval $[0, T]$,

$$\int_0^T d(\log S) = \left(\mu - \frac{\sigma^2}{2} \right) \int_0^T dt + \sigma \int_0^T dW \quad (6)$$

We obtain

$$\log(S_T) - \log(S_0) = \left(\mu - \frac{\sigma^2}{2} \right) T + \sigma [W(T) - W(0)] \quad (7)$$

Take logarithm and note that $W(0) = 0$, we obtain S_T as the function of S_0 :

$$S_T = S_0 \exp \left[\left(\mu - \frac{\sigma^2}{2} \right) T + \sigma W(T) \right] = S_0 \exp \left[\left(\mu - \frac{\sigma^2}{2} \right) T + \sigma \phi \sqrt{T} \right] \quad (8)$$

If invested in the government bonds, the future value of S over a period of $T - t$ will be

$$S(t) \exp \{R(T - t)\} \quad (9)$$

Then, the probability of the event that the return of stock greater than that of the government bonds, p , can be shown by the following equation.

$$p = \Pr \left[S(t) \exp \left\{ \left(\mu - \frac{\sigma^2}{2} \right) (T - t) + \sigma \phi \sqrt{T - t} \right\} > S(t) \exp \{R(T - t)\} \right] \quad (10)$$

According to the calculation of JamilBaz and George Chacko)^{iv}(2004),

$$p = \Phi \left[\left(\frac{\mu - R}{\sigma} - \frac{\sigma}{2} \right) \sqrt{T - t} \right] \quad (11)$$

Here, Φ represents the accumulative standard normal distribution.

In order to make the probability non-negative so as to let the return of stock greater than that of government bond, we need

$$\frac{\mu - R}{\sigma} - \frac{\sigma}{2} \geq 0$$

This means

$$\sigma \leq \sqrt{2(\mu - R)} \quad (12)$$

This is the condition for the event that the return of stock greater than that of the government bonds to happen. In another word, if the standard deviation of the return of stock is less then the square root of 2 times the risk premium, then the investor can enjoy “free lunch” in stock market.

Factors analysis

From equation (12), we know that the probability of the event that stock return is greater than that of government bonds is mainly rely on three factors, risk premium, standard deviation of stock return and the square root of holding period of stock. We analyze the three factors one by one in the following paragraphs.

Portfolio risk premium

Under normal conditions, security risk premium is positive. This is because investors usually believe that the expected return of risky securities is higher than that of risk-less securities. The risk premium of securities is correlated with the relationship of security returns and state price density^v. From equation (11), we know that

the higher the portfolio risk premium ($\mu - R$), the greater the probability of the event that the stock return is greater than that of government bonds. Although these two are not correlated proportionally, they are correlated positively. In another word, the probability of the event that stock return is greater than that of government

bonds is an augmenting function of portfolio risk premium. This agrees with the common knowledge of investors. However, we will see later that investment returns are obtained in a relatively long time. Investors should not be lured by the short-term risk premium. However, in the reality, it is extremely hard for any investor not to be lured by short term benefit.

Assume that the portfolio standard deviation is 25% and the holding period of the portfolio is 25 years, based on equation(11), we can analyze the impact of portfolio risk premium on the probability of the event that stock return is greater than that of government bonds. In this case, the probability can be written as

$$p = \Phi \left[\left(\frac{\mu - R}{\sigma} - \frac{\sigma}{2} \right) \sqrt{T - t} \right] = \Phi \left[5 \times \left(\frac{\mu - R}{0.25} - 0.125 \right) \right] = \Phi [20(\mu - R) - 0.625] \quad (13)$$

Table 1 shows the result. From Table 1, we know that portfolio risk premium has significant impact on the probability of the event that stock return is greater than that of government bonds. When the portfolio risk premium is 5%, the probability of the event that stock return is greater than that of government bonds is close to 65% ; When the portfolio risk premium is 10%, the probability of the event that stock return is greater than that of government bonds is over 90% ; When the portfolio risk premium is 20%, the probability of the event that stock return is greater than that of government bonds is close to 100%.

Portfolio risk

Investors usually pay more attention to returns than risks. Theoretically, it is understandable. This is because risk is measured by the standard deviation of the portfolio returns. It is hard for investors to understand the concept of standard deviation, not to mention calculating and applying the concept.

From equation (11), we know that the smaller the portfolio risk σ , the greater the probability of the event that the return of stock greater than that of government bonds. Furthermore, from equation (12), we know that there is limit on portfolio risk σ , which should not be greater than the square root of 2 times the risk premium.

Assume that the portfolio risk premium ($\mu - R$) is 7% and the holding period of portfolio is 25 years, based on equation (11), we can analyze the impact of portfolio standard deviation on the probability of the event that the stock return is great than that of government bonds. In this case, the probability can be expressed as follows.

$$p = \Phi \left[\left(\frac{\mu - R}{\sigma} - \frac{\sigma}{2} \right) \sqrt{T - t} \right] = \Phi \left[5 \times \left(\frac{0.07}{\sigma} - \frac{\sigma}{2} \right) \right] = \Phi \left[\frac{0.35}{\sigma} - 2.5\sigma \right] \quad (14)$$

Table 2 shows the result. From Table 2 we know that just like portfolio risk premium, portfolio standard deviation has significant impact on the probability of the event that stock return is greater than that of government bonds. When portfolio risk premium is less than 10%, the probability of the event that stock return is greater than that of government bonds is 100%. When portfolio standard deviation reaches 20%, the

probability of the event that stock return is greater than that of government bonds is also close to 90%. When portfolio standard deviation reaches its limit, 2 times the square root of risk premium, 37% in our example, the probability of the event that stock return is greater than that of government bonds is still over 50%.

Portfolio holding period

Regarding the holding period of portfolio, the result of theoretical analysis is quite different from investors' common sense. Investors usually believe that the return of investment is correlated with natural time in terms of years. However, the result of theoretical analysis tells us that the return of investment is correlated with the square root of time, rather than time itself. In other words, in stochastic process, the return of stock varies as the square root of time changes, rather than time itself as investors usually imagine. To be precise, investors need to be more patient in order to obtain higher return from their investment.

Assume that the portfolio risk premium $(\mu - R)$ is 7%, and the portfolio standard deviation is 25%, based on equation (11), we can analyze the impact of the holding period on the probability of the event that stock return is greater than that of government bonds. In this case, the probability can be written as follows.

$$p = \Phi \left[\left(\frac{\mu - R}{\sigma} - \frac{\sigma}{2} \right) \sqrt{T - t} \right] = \Phi \left[\left(\frac{0.07}{0.25} - \frac{0.25}{2} \right) \sqrt{T - t} \right] = \Phi [0.16 \sqrt{T - t}] \quad (15)$$

Table 3 shows the calculation result. From Table 3, we know that the impact of holding period on the probability of the event that stock return is greater than that of government bonds is not very significant. When the holding period is 1 year, the probability of the event that stock return is greater than that of government bonds is over 50%. However, to increase the holding period will not do much for increasing the probability of the event that stock return is greater than that of government bonds. For example, when the holding period is 10 years, the probability of the event that stock return is greater than that of government bonds is only close to 70%. When the holding period is 30 years, the probability of the event that stock return is greater than that of government bonds is just over 80%. Even if the holding period is 100 years, the probability of the event that stock return is greater than that of government bonds is less than 95%. We know from equation 15 that the probability of the event that stock return is greater than that of government bonds is positively correlated with the square root of holding period, rather than the holding period itself. The basis for this relationship is the hypothesis of randomness of stock returns.

Conclusions

Based on the above analysis, we get the following conclusions.

First, the impact of portfolio risk premium on the probability of the event that stock return is greater than that of government bonds is significant. In our example, when the portfolio risk premium is 5%, the probability of the event that stock return is greater than that of government bonds is close to 65%. When the risk premium is 10%, the probability of the event that stock return is greater than that of government bonds is over 90%. And when the risk premium is 20%, the probability of the event that stock return is greater than that of government

bonds is close to 100%.

Second, the impact of portfolio standard deviation on the probability of the event that stock return is greater than that of government bonds is also significant. In our example, when the portfolio standard deviation is less than 10%, the probability of the event that stock return is greater than that of government bonds is 100%. When the portfolio standard deviation is 20%, the probability of the event that stock return is greater than that of government bonds is close to 90%. When portfolio standard deviation reaches its limit, 37% in our example, the probability of the event that the stock return is greater than that of government bonds is still over 50%.

Finally, the impact of holding period on the probability of the event that stock return is greater than that of government bonds is not very significant. Increasing holding period will not increase the probability of the event that stock return is greater than that of government bonds significantly. This is because we assume that the stock return moves randomly. The probability of the event that stock return is greater than that of government bonds is correlated with the square root of the holding period, rather than the holding period itself.

Back to the question at the very beginning of the paper, is there “free lunch” in the stock market? The conclusion of this paper shows that there is “free lunch” in the stock market under some conditions. If investors choose high risk premium and low risk portfolio and hold them for long period, then the probability of their returns higher than that of government bonds will be greater. In other words, in order to harvest the “free lunch”, investors must have smart eyes enabling them to find out the portfolio which will bring them higher return in the long run. Second, investors need to manage investment risks effectively. Although high returns are associated with high risks theoretically^{vi}, in the reality, the winners of the stock market are usually those who are able to manage the investment risk timely and effectively. Finally, be patient enough. Frequent buying and selling can only increase the income of stock brokers. Buffet once said: “In the long run, the price of common stock is clearly correlated with firms’ fundamental economic value^{vii}.” If investors really want higher returns, they must invest for longer period, just like what Buffet has done. This is because that the growth of the stock prices is correlated with the square root of the time, rather than time itself. These are the suggestions for the investors based on our conclusions of the paper.

Abstract

Purpose - The aim of this paper is to understand the perceptions of the quality of logistics services provided by 3PL providers to avocado packing companies that export to the United States.

Design / methodology / approach - This is an empirical nature investigation which shows a model for assessing the quality of logistics services by land, where they surveyed companies exporting avocados to the market in the United States of America, which applied a measuring instrument which contains 111 items distributed in the following independent variables: Infrastructure, Communication, Marketing, Human Resources, Technology, and the dependent variable Logistic Service Quality; also, using Likert scales where the evaluators were logistics managers, who issued their perceptions of their three major 3PL providers.

Keywords: Customer services quality, Supply chain management, and third-party logistics

Paper type: Empirical Research

1. Introduction

In recent years, companies have increasingly embraced one-stop global logistics services. By allowing companies to concentrate on their core competencies, these third-party logistics (3PL) providers can improve customer service and reduce costs. A 3PL provider can act as a lead logistics provider or a fourth-party logistics (4PL) provider aligned with a host of 3PL providers (Vaidyanathan, 2005). In today's environment, organizations are searching for new business practices and solutions that can provide them successfully. Outsourcing is one of these business practices that can lead to greater competitiveness (Embleton & Wright, 1998) in (Percin, 2009). Outsourcing is simply the transferring of an internal service function to an external organization that otherwise would be difficult to acquire, or costly to have in-house (Ketler & Walstrom, 1993), (Razzaque & Sheng, 1998). In the recent past, logistics outsourcing or third-party logistics (3PL) has received considerable attention from logistics researchers. Three research areas for 3PL have attracted interest among the researchers (Boyson, Corsi, Dresner, & Rabinovich, 1999): first, the primary reasons for outsourcing logistics functions; second, measuring the contribution of logistics outsourcing to a firm's capabilities; and lastly the selection of 3PL provider for outsourcing relationship.

Outsourcing of logistics function is a business dynamics of growing importance all over the world. A growing awareness that competitive advantage comes from the delivery process as much as from the product has been instrumental in upgrading logistics from its traditional backroom function to a strategic boardroom function (Razzaque & Sheng, 1998). In order to handle, its logistics activities effectively and efficiently, a company may consider the following options – it can provide the function in-house by making the service, or it can own logistics subsidiaries through setting up or buying a logistics firm or it can outsource the function and buy the service. Currently, there has been a growing interest in the third option, i.e. outsourcing of logistics functions to third party logistics service providers.

The Third party logistics (3PL) has demonstrated its importance globally, but the quality to that provided this service is that you have to measure and evaluate. Despite evidence from around the world suggesting that effective quality management practices can lead to improved organizational performance (Ahire, Golhar, & Waller, 1996), (Kumar & Gupta, 1993), (Samson & Terziovski, 1999), (Taguchi & Clausing, 1993) the importance of quality management to logistics systems is yet to be fully realized. Quality is acknowledged as a critical component in the value-adding process of product creation and delivery. Orders requiring rework have been estimated to cost in excess of eight times the cost of those properly produced and delivered (Bowersox, Carter, & Monczka, 1985) in (Sahay & Ramneesh, 2006).

The 3PL services are widely prevalent in North America (Lieb, 1992), (Lieb & Randall, 1996) and Europe (Lieb, Miller, & Wassenhove, 1993) and have been examined in a number of previous studies. Similar studies have focused on logistics issues in Bulgaria (Bloomen & Petrov, 1994), South Africa (Cilliers & Nagel, 1994), Australia (Dapiran, Lieb, Millen, & Sohal, 1996), Korea (Kim, 1996), Asia Pacific (Millen & Sohal, 1996), Singapore (Bhatnagar, Sohal, & Millen, 1999), India (Sahay & Mohan, 2006) and Indochina (Goh & Ang, 2000). These countries have availed large benefits of 3PL services over the last few years.

Quality management involves being proactive in performing the right activity, the right way the first time, and continuing to perform tasks to the required level. In logistics, this could translate into strategies aiming to make order cycle times shorter and more predictable, as well as maintaining certain levels of in-stock availability and specific fill rates on customer orders. More recently (Anderson, Jerman, & Crum, 1998) and (Forker, 1997) demonstrated that a significant relationship exists between level of quality management practices and logistics operational performance. The importance of quality in this context is obvious.

2. Literature Review

The 3PL provider performs one or more of the logistics activities relating to the flow of product, information, and funds that could be performed by the firm itself. Traditionally, 3PL focused on specific functions such as transportation, warehousing, and information technology within the supply chain. Armstrong's Guide to 3PL & Global Logistics Services (Armstrong & Associates, Inc., 2001) in (Chopra & Meindl, 2007) describes some of the services offered by 3PL, as shown in table 1.

TABLE 1: SERVICES PROVIDED BY 3PLS		
Service Category	Basic Service	Some Specific Value Added Services
Transportation	Inbound, outbound by ship, truck, rail, air	Tendering, track/trace, mode conversion, dispatch, freight pay, contract management.
Warehousing	Storage, facilities management	Cross-dock, in transit merges pool distribution across firms, pick/pack, kitting, inventory control, labeling, order fulfillment, home delivery of catalog orders.
Information technology	Provide and maintain advanced information/computer systems	Transportation management systems, warehousing management, network modeling and site selection, freight bill payment, automated broker interfaces, end-to-end matching, forecasting, EDI, worldwide track and trace global visibility
Reverse Logistics	Handle reverse flows	Recycling, used-asset disposition, customer returns, returnable container management, repair/refurbish
Other 3PL services		Brokering, freight forwarding, purchase-order management, order management, order taking, loss and damage claims, freight bill audits, consulting, time-define delivery
International		Customs brokering, port services, export crating, consolidation
Special skills/ handling		Hazardous materials, temperature controlled, package/parcel delivery, food-grade facilities/equipment, bulk

Five streams of literature relate to logistics provider models (Rabinovich A. , 1999): strategic decision making in organizations, industrial buying behavior, transportation purchasing, supplier selection, and logistics relationships. Among these topics, supplier selection, or how to evaluate 3PL providers and form strategic alliances with them, has been inadequately addressed in the current literature. Strategic alliances allow companies to reduce conflict, reciprocate regarding mutual goal-related matters, increase efficiency and stability, and establish marketplace legitimacy (Cooper & Gardner, 1993). Logistics managers consider perceived performance, perceived capability, and responsiveness as important factors in selecting logistics providers (Menon, 1998). In general, it appears that market and firm characteristics influence the choice of

logistics providers (Van Damme & Van Amstel, 1996), and managers achieve customer service improvement and cost reduction by outsourcing logistics services (Rabinovich E. , 1999).

One study applied transaction cost economics to logistics provider selection to explore the conditions under which logistics functions are separated (Aertsen, 1993). About 60% of the Fortune 500 companies surveyed reported having at least one logistics provider contract (Lieb & Randall, 1996). A conceptual model of the logistics provider buying process has been presented in five steps, in which companies identify the need to outsource logistics, develop feasible alternatives, evaluate and select a supplier, implement service, and engage in ongoing service assessment (Sink & Langley, 1997).

A major shortcoming of the 3PL literature is the lack of consideration of IT as a primary component of logistics-providing solutions. The integration of IT with the logistics providers and their customers— known as Inter-organizational Systems (IOS) — essentially supports the outsourcing of logistics activities (Lewis & Talalayevsky, 2000). IT is a critical factor for 3PL performance since the logistics provider must integrate systems with its clients. IT links members of a supply chain, such as manufacturers, distributors, transportation firms, and retailers, as it automates some element of the logistics workload, such as order processing, order status inquiries, inventory management, or shipment tracking (Vaidyanathan, 2005).

The 3PL services can be relatively limited or comprise a fully integrated set of logistics activities. Two surveys (Rabinovich A. , 1999) (Sink & Langley, 1997) identified the following as significant outsourcing functions: 1) Transportation, 2) Warehousing, 3) Freight consolidation and distribution, 4) Product marking, labeling, and packaging, 5) Inventory management, 6) Traffic management and fleet operations, 7) Freight payments and auditing, 8) Cross docking, 9) Product returns, 10) Order management, 11) Packaging, 12) Carrier selection, 13) Rate negotiation, 14) Logistics information systems.

Figure 1 describes a 3PL evaluation process, which includes a preliminary screening based on qualitative factors such as reputation. Depending on qualitative and feasibility factors, a short list of 3PL providers is obtained. An evaluation criterion is sent to the short-listed 3PL providers. After receiving the completed evaluation list, the prospective providers are interviewed. After the desired features and criteria are compared and analyzed, a 3PL provider is selected. This process has been tested in a Fortune 100 company and yielded good results. The basic process, as follows, was obtained from previous research (Sink & Langley, 1997).

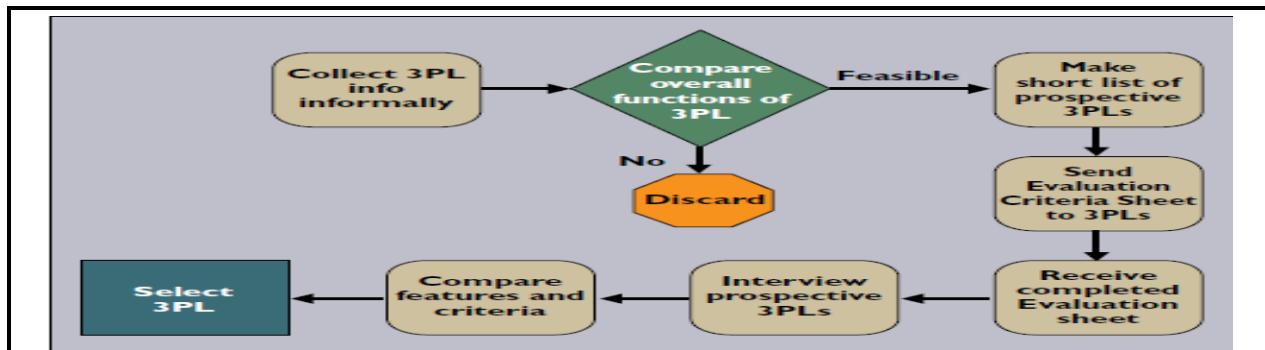

Figure 1: Services Provided by 3PLs

Source: Vaidyanathan, G. (2005). A framework for evaluating third-party logistics. *Communications of the ACM* , 48 (1), 89-94.

Evaluation criteria.

To evaluate prospective provider, a set of criteria must be defined. These evaluation criteria typically include quality, cost, capacity, delivery capability, and financial stability. In addition, cultural compatibility, customer references, financial strength, operating and pricing flexibility and IT capabilities play predominant roles (Sink & Langley, 1997). Performance metrics that must be part of the evaluation criteria include shipment and delivery times, error rates, and responsiveness to unexpected events (Menon, 1998).

According to Menon (1998), Sink & Langley (1997) the following set of factors can be used to evaluate a 3PL provider: a) Information Technology, b) Quality c) Cost, d) Services, e) Performance metrics, f) Intangibles.

Using the six factors against the framework we created for 3PL provider evaluation, we derived the criteria shown in Table 2.

Table 2 Criteria for 3PL evaluation					
Information Technology	Performance	Cost	Quality	Service	Intangibles
<ul style="list-style-type: none"> • Transfer of data at scheduled intervals from 3PL to customer • Transfer of data in real time • Connectivity to warehouse locations to the data center • Encryption of data • Automated technology to capture data for all shipment, directed put-away, picking, and cycle counting • Accuracy of data transmissions with existing clients • Validation and verification of data from flat file transmissions and XML transmissions and usage of standards 	<ul style="list-style-type: none"> • Historical On-time delivery schedules and deviations • Historical Inventory Carrying Rate • Historical average obsolescence rates • Historical forecast errors in a year • Historical average lead times • Historical shipment errors in the past • Historical productivity metrics • Historical DTT (Delivery Turnaround Time) • Historical quality of units delivered/month • Historical late/lost delivery 	<ul style="list-style-type: none"> • Cost of warehousing • Cost of IT services for effective information flow • Cost of transportation • Cost of logistics, supply chain and inventory management 	<ul style="list-style-type: none"> • FAA/FDA or other compliance requirements for warehousing • ISO procedures for units handling, storing, and preservation • ISO procedures for Pick, Pack, and Ship facilities and quality requirements • ISO procedure for delivery • Six sigma and commitment to continuous improvement • Facilities and personnel to identify, correct, collect, index, access, file, store, maintain and dispose quality records in accordance with ISO 	<ul style="list-style-type: none"> • Physical warehousing services • Security and scalability services in warehousing • Monitoring/Tracking efforts in warehousing • Historical delivery and reverse logistics metrics • Historical order Management Metrics • Historical transportation Management Metrics • Customer support services (24x 7 help desk) • Historical average time to settle warranty claim • Summarized reports available on monthly basis 	<ul style="list-style-type: none"> • The intangibles include questions on the business growth of the prospective 3PL to make sure that they will be conducting business for some time. • Financial stability • Strong profitability • Experience with similar companies • Global scope

3. Methodology

This research has a descriptive-correlational design, it describes the object of study and second because it determines the correlation with the proposed independent variables with the quality of service of 3PL logistics companies exporting avocados in Michoacán, Mexico. The model used in this research is part of the theory that you want to contribute to understand the relationship between the independent variables - infrastructure, communication, marketing, human resources and technology, with the dependent variable - Logistic Service Quality 3PL -.

a) Universe and Sample

The universe used in this study is 95 companies engaged in export of Mexican avocados to different parts of the world, mostly United States of America market with an estimated 95% confidence level with a maximum error of 0, 05%, therefore, the size of the sample turns out to be 76 companies to be surveyed and have achieved a response rate of 85%, that is to say 65 surveys were applied. Once selected the appropriate

research design and adequate sample according to our research problem, the next stage is to collect relevant data on the variables involved, for this purpose was made measuring instrument to provide measurements what they purport to measure.

b) Measuring Instrument

The questionnaire used contains 111 questions, which leads to the following numerical ranking of the variables, were for infrastructure 27 questions, communication 32, marketing 12, human resources 29, and ultimately, technology 11. The application of the questionnaire had duration of 40-50 minutes because some questions require analysis by the respondent. The survey was conducted in person to managers of exporting company's avocado.

c) Rating Scale

Hernandez & Fernandez (2010), measurement is the process of linking abstract concepts with empirical indicators. This requires a suitable measuring instrument to record observable data that truly represent the concepts or variables that are occurring, in order to measure the impact the independent variables - Logistic Service Quality 3PL-

All measurements must meet two requirements in data collection, which are essential, such as reliability and validity. It is said that a questionnaire is reliable when measured with the same accuracy, gives the same results, in subsequent applications made in similar situations (Santillana, 1998). The validity generally refers to the degree to which an instrument actually measures the variable it purports to measure, ie are we measuring what we think you are measuring? If so, the measure is valid, if not is (Kerlinger & Lee, 2002).

d) Likert Scale

In this investigation, a scale was used Likert type, which is in strict sense, an ordinal measurement, which "consists of a set of items presented in the form of affirmations or judgments before which the reaction of the subjects is requested. That is to say, each affirmation appears and it is requested to the subject that extern its reaction choosing one of the five points of the scale. To Kerlinger & Lee (2002) state, that the Likert scale is a set of questions about attitudes, which all have the same value and in which individuals may respond gradually to "agree or disagree".

The way to get the scores on the Likert scale is the sums of the values obtained for each question, with the support of an escalograma designed expressly analyze the results. The final score of the subject is interpreted as its position on the scale to the object of study (Valenzo, 2007).

With these results, we proceeded to classify items high or low favorable to the variables analyzed, later to make the final weighting of response alternatives, this is intended to establish the values of this scale and range positions. Based on these considerations, the allocation of scores on the scale of measurement was composed of the following values determined: 1, 2, 3, 4, 5, for each item, corresponding to these numbers the following concepts: 1) Very Low quality 3PL service, 2) Low quality 3PL service, 3) Regular quality 3PL service, 4) High quality service 3PL and finally 5) Very High Quality 3PL service.

Since the Likert scale is additive, the scores are obtained by adding the values understood each question in the questionnaire, noting that the number of response categories is the same for all questions. In a Likert scale, the maximum score equals the number of items multiplied by the highest score for each alternative response, while the minimum score is the result of the number of items multiplied by the lowest score of the answer choices (Navarro & Pedraza, 2004). In the global analysis and detailed in this research require the following: a) general scale to measure service quality in 3PL enterprises exporting avocados in Michoacán Mexico.

This scale considers the entire questionnaire for measurement. The scale is formed with a maximum of 555 points (111 questions multiplied by 5 is the highest value of each) and a minimum of 111 points (111 times 1 is the lowest score for each question.) It is then that the scale is between the values from 310 to 62 points.

The intermediate level is obtained by performing a subtraction between the maximum and minimum value and the result is divided between the categories used in our case is five. As shown below: Maximum 555 (-) 111 minimum = 444 divided by 5 = 88.8 scale points in each of the scales (table 4).

4. Findings

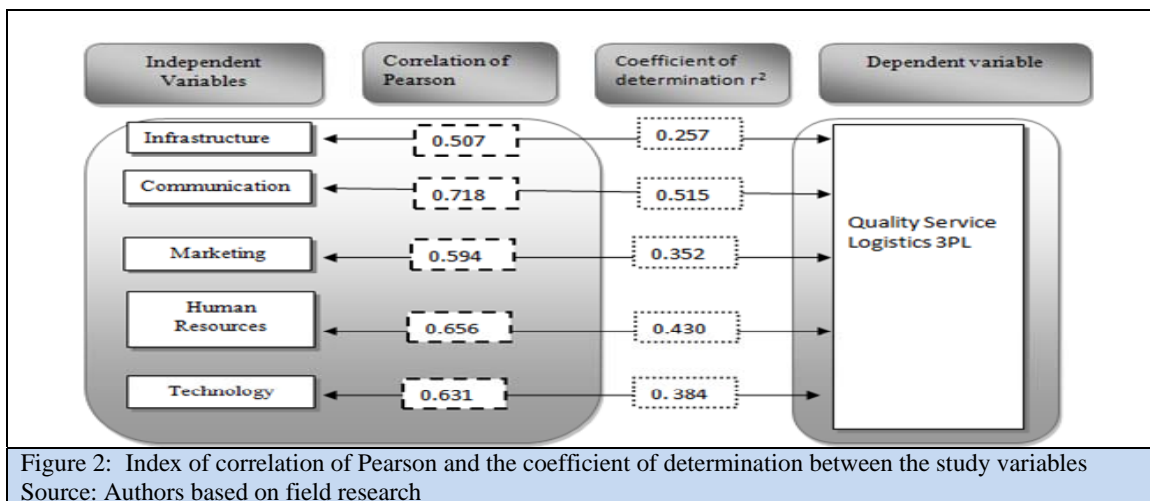

In this section, we analyze the results of field research, through which it was possible to derive quantitative aspects of the dependent and independent variables, where all responses were processed statistically in SPSS. The staff of managers surveyed as exporters of avocados in Michoacán, Mexico. In the table 3 shown the reliability Analysis measuring instrument.

Table N° 3 Reliability Analysis of Questionnaire	
Cronbach Alpha	No. of Items
.915	111
Source: Authors based on field research	

Table # 4 shows the results of field work in which is expressed with an arrow where the average using descriptive statistics. The score was 399.83 points is that managers of firms exporting avocados from Michoacán, Mexico evaluated through the 111 questions to your service providers with a high quality in the Service 3PL.

Table 4 Range of scales of the Quality Service Logistics 3PL				
Very High Quality in the Service 3PL	High Quality in the Service 3PL	Medium Quality in the Service 3PL	Low Quality in the Service 3PL	Very Low Quality in the Service 3PL
555	466.2	377.4	288.6	199.8
399.83				
Source: Authors based on field research				

Below in Figure # 1 shows the results of field work where the variables show that the highest correlation and therefore are further explained that the quality logistics service 3PL and are as follows: communication (0.718), followed by human resources (0.656), technology (0.631), Marketing (0.594) and finally infrastructure (0.407) correlation.

It then shows how they are distributed the results of 3PL Logistics Service quality in avocado exporters of Michoacán, Mexico.

Table 5 Distribution of frequencies of the variable quality of the logistic service 3PL			
Puntos	Frecuencia	Porcentaje	Porcentaje

			acumulado
Very High Quality in the Service 3PL 555- 466.2 points	9	13.8	13.8
High Quality in the Service 3PL 466.3 – 377.4 points	23	35.3	49.1
Medium Quality in the Service 3PL 377.5- 288.6 points	21	32.3	81,4
Low Quality in the Service 3PL 288.7- 199.8 points	7	10.8	92.2
Very Low Quality in the Service 3PL 199.9- 111 points	5	7.8	100,0
Total	65	100,0	

Fuente: Información obtenida de la investigación de campo

In the Quality in the Service 3PL variable yielded the following results, on the high quality service focused 3PL is where the largest number of companies (23) representing 35.3%, followed closely by a medium quality in the service 3PL (21) constituting 32.3%, only 9 companies evaluated with a high quality service in the 3PL that means 13.8%, however the results also showed a low and very low quality in the 3PL Service a 10.8% and 7.8% respectively. Likewise also making a more general analysis can be seen that 67.6% of those who evaluated their logistics service providers in a medium to high quality service that provides these companies to outsource the service time of transport to carry avocados to international markets, mainly the United States of America.

5. Conclusions

After to have realized a theoretical revision that will take us to the obtaining of the variables to measure the quality in the logistic service 3PL and after to have raised the surveys with the measuring instrument to the managers of the exporting companies of avocado; we conclude that according to the obtained results the propose variables for this investigation have different impacts in the quality in the logistic service of this group of companies.

In agreement with the index of correlation of Pearson it is possible to be appreciated the different correlations that explain the quality in the logistic service 3PL, the variable communication has high a noticeable correlation in 71,8%, followed by the variable human resources what is explained in a 65.6%, work in equipment in a 66.8%, technology 63.1%, marketing 54,9%, infrastructure 50.7% having a moderate, substantial correlation, and these explain to the dependant variable quality in the logistic service 3PL.

In which referring to the general results the average of the survey ones is located in 399.83 points that 3PL corresponds to the rank of High Quality in the Service. Also one concludes that the model to measure the quality in the logistic service 3PL proposed in this study, is approved in his independent variables - human communication, resources, work in equipment, technology, marketing and infrastructure-.

To if also, the work of field gave answer to the objective raised initially which consists of determining to what extent the quality in the logistic service 3PL was important at the time of evaluating to its three main logistic suppliers.

Of this form and on the basis of the mentioned thing previously, we can affirm that to the quality in the logistic service 3PL that prevails in the exporting companies of avocado in Michoacán, Mexico is high reason why we can also intuit that he is favorable for the good performance of the workings, as well as the implementation of policies destined to increase the efficiency, the productivity and the competitiveness in the international markets.

Cultural Distance and Entry Mode Choice: Evidence from the North-Adriatic Area

*Rubens Pauluzzo, rubens.pauluzzo@uniud.it
University of Udine, Italy*

Abstract

The progressive strengthening of economic and political relations in the North-Adriatic area and their gradual formalization encouraged by the new institutional structures of Euro-regions are phenomena of central importance to the actual economic environment of the countries involved. These conditions significantly affect the strategic choices of local firms interested in penetrating the other markets of the area. In spite of the geographical proximity between Italy, Austria, Slovenia and Croatia, cultural differences still act as relevant determinants in leading foreign investment strategies. The aim of this study is to investigate the role played by cultural distance between Italy and Austria, Slovenia and Croatia, in influencing entry mode choices and strategies followed by companies of the North-eastern Italian region of Friuli-Venezia Giulia. The study was undertaken during the period January to December 2007 and involved the submission of a questionnaire to a sample of 129 companies. Multiple statistical analysis were used in this study. These procedures include exploratory factor analysis and Structural Equation Modelling (SEM).

Introduction

The progressive strengthening of economic and political relations in the North-Adriatic basin and their gradual formalization promised by the new institutional structures of Euro-regions are phenomena of central importance in the actual international economic landscape. These relationships significantly influence the strategic choices of companies that belong to this region and, on a wider scale, the socio-economic structure of the countries involved.

Companies around the world are immersed in an increasingly complex and competitive environment. New pressures have gradually transformed the global competitive landscape, requiring changes in the international strategic approaches. Each company has been forced to choose different strategies and organizational responses to meet the changes that constantly affect their respective areas of reference. Nonetheless, only few players have achieved significant results, thriving in the international competitive arena. Most of them have been merely surviving, struggling to adapt to a complex and contradictory demand (Bartlett, Ghoshal, 1998). Nowadays, running a business means managing the opportunities and challenges of international markets. Under the pressure of regionalization and globalization processes, the definition of success transcends national borders. Even the concept of domestic business has become a sort of anachronism: the modern company does not have a place to hide, it has no place to go, but everywhere (Adler, 2002).

The process of ongoing globalization, has partially rejected the wishes of those who saw in this economic and social phenomenon the basis for the creation of a cultural "melting pot". Although the seeds of the Western tradition have reached the "four corners of the World" and despite the metropolises and megalopolises seem similar in architecture and lifestyles of their populations, cultural differences remain below this facade. Often, just scraping the surface of this Westernized World allows us to discover a reality far more complex and multi-faceted.

The echoes of these matters have quickly reached the economic environment, exacerbating the difficulties of the operators in managing intercultural relations. In order to survive and thrive in the business environment of the twenty-first century, individuals and institutions have to incorporate cultural sensitivity and competence in their strategies and organizational structures. However, culture should not be considered as a mere shortcut to address these issues, but as an element able to promote the awareness and knowledge needed to pursue the path of international success (Morris, Gelfand, 2004).

The relevance of cultural aspects and their influence on the strategic choices of firms also affect the

countries and regions of the North-Adriatic basin. Despite the geographical proximity between Italy, Austria, Slovenia and Croatia and the gradual economic integration of the area, cultural differences still remain and impact on investment decisions and characteristics. The knowledge of the main cultural factors is a prerequisite to facilitate international business growth paths and a better comprehension of the motivations that drive local consumers and human capital as well as the characteristics of the relations with the various stakeholders.

This study aims at suggesting a study model, in order to investigate the role played by cultural distance between Italy and other countries of the North-Adriatic area, in particular Austria, Slovenia and Croatia, in influencing market entry strategies and policies. In particular, the analysis will be focused on the companies of the Italian region of Friuli-Venezia Giulia. The choice of this region lies in its geographical proximity with the countries involved in the study and in its stable and strong socio-economic relationships with them.

The study was undertaken during the period January-December 2007 and involved the submission of questionnaires by email and fax to the business executives of the identified Italian companies operating in Austria, Slovenia and Croatia. Multiple statistical analyses techniques were used in this study. These include exploratory factor analysis and Structural Equation Modelling (SEM).

Literature Review and Hypotheses

The main literature on internationalization has stressed the influence of firm characteristics on the choice of foreign markets entry modes. Kogut and Singh (1988) and Caves and Mehra (1986) stressed the importance of the experience in the international arena as an essential factor to promote a more effective level of control over foreign assets. The international experience leads to a better management of uncertain situations and reduces the risk perceived by companies in their international evolutionary paths (Johanson, Vahlne, 1977; Barkema, Vermeulen, 1998; Slangen, Hennart, 2007). Similarly, Barkema, Bell and Pennings (1996) suggested that companies engaged in international expansion paths need to acquire adequate knowledge of foreign markets. Previous experiences allow to reduce cultural barriers. In this sense, the international experience represents a mechanism to approach the culture of the local market (Shenkar, 2001). Based on these considerations, companies that have gained previous experiences on foreign markets have a greater ability to manage uncertain situations and are believed to have a deeper level of control over their foreign businesses.

Similar considerations are developed with regard to the company size. The creation of new enterprises in local markets, or the acquisition of existing businesses, often require more resources and efforts, both from the financial as well as the managerial point of view (Caves, Mehra, 1986). As a consequence, companies show a higher propensity to choose forms of acquisition when their size is larger (Kogut, Singh, 1988).

Therefore, the characteristics of the company influence the choice of foreign markets entry modes. As a result, it is believed that companies tend to prefer methods of internationalization (INTM) characterized by a greater degree of control when they have characteristics (FCAR), such as international experience and company size, that can reduce the level of uncertainty and the perceived risk in the local market. These considerations jointly support a potential positive relationship between FCAR and INTM.

Hypothesis 1: FCAR has a positive influence on INTM

The entry mode choice can also be influenced by the characteristics of the local context. Several studies have suggested that the legislative framework, the institutional and competitive environment, together with the geographical distance from the home country, have a profound impact on companies' strategic decisions.

Entry barriers, risks and uncertainties related to the socio-economic environment of the local market increase the difficulties that companies have to face (Gomes-Casseres, 1990; Hill, Hwang, Kim, 1990; Kim, Hwang, 1992; Hennart, Larimo, 1998; Delios, Beamish, 1999). Local legislative contexts characterized by high degrees of corruption, high risks that counterparts do not fulfill their contractual obligations, for example, exacerbates information asymmetries and, by this way, the risk faced by foreign companies. This supports entry solutions with lower levels of control, in order to reduce the risk borne (Gatignon, Anderson, 1988; Agarwal, Ramaswami, 1992; Brouthers, 2002; Ackerman, 2005). Similarly, Roberts and Greenwood (1997) and North (1990) suggested that

companies interested in markets with high legal restrictions tend to prefer methods of internationalization with lower levels of control. Conversely, favorable local governments attitudes, with reference to the presence of foreign firms, tend to favor entry strategies more focused on control logics (Gomes-Casseres, 1990).

Collins and Rodrik (1991) also stressed that geographical proximity is an important factor in the choice between exports and investments. Geographical proximity, in fact, reduces entry barriers, the costs of managerial coordination and control, as well as the costs of monitoring the behavior of foreign agents (Shenkar, 2001). Therefore, it is believed that the increase in the geographical distance between the country of origin and destination expands the risks borne by foreign companies, forcing them to choose strategic solutions with a lower degree of control.

Eicher and Kang (2004) also showed that the local competitive environment can influence entry decisions of foreign firms, raising entry barriers able to increase their costs. In particular, such actions may deter companies, especially small ones, from investing locally.

Therefore, it is believed that companies tend to prefer methods of internationalization (INTM) characterized by a lower degree of control when the local market characteristics (MKT) may increase risk and uncertainty levels. As a result, a negative relationship is likely to exist between MKT and INTM.

Hypothesis 2: MKT has a negative influence on INTM

Several scholars have stressed the influence of cultural issues on the choice of foreign markets entry modes. Operating in a foreign market means getting in contact with different realities, characterized by different customs and habits, ways of thinking and acting, both from the socio-cultural as well as the organizational and managerial point of view. The company, with its own national and organizational culture, is linked to several counterparts that do not share its cultural vision. This makes it difficult to achieve adequate levels of performance (Cavusgil, Knight, Riesenberger, 2008, Hung, 2003; Ponthukuchi, Damanpour, Choi, Chen, Park, 2002, Adler and Graham, 1989; Adler, 1983).

Many international initiatives fail to achieve the expected results because of the national culture is incompatible with that of foreign counterparts (Cartwright, Cooper, 1993). Cultural differences affect company's interpretations and answers to strategic and managerial issues, increasing transactional difficulties of international activities (Park, Ungson, 1997). Lane and Beamish (1990) emphasized that the influence of national cultures on behavior and management systems often leads to unresolved conflicts.

The differences between cultures create different psychological environments for international activities. These differences lead to different practices and management styles that influence the perceived risk of the company (Newman, Nollen, 1996, Cartwright, Cooper, 1993). The degree of cultural adaptation to a specific market is directly related to the success of this combination (Nes, Solberg, Silkoset, 2007; Ponthukuchi, Damanpour, Choi, Chen, Park, 2002, Cartwright, Cooper, 1993).

In particular, with reference to the key success factors of internationalization, it is possible to identify an evolutionary path characterized by the gradual shift from objective determinants (foreign markets, export incentives), to less tangible determinants, such as cultural and psycho-cognitive management aspects (Muller, 1991; Dichtl, Köglmayr, Müller, 1990).

Therefore, it is believed that cultural factors influence the perceived costs and risks that companies have to bear when operating in the international arena (Kogut, Singh, 1988). Johanson and Vahlne (1977), and the Scandinavian school (Johanson, Wiedersheim-Paul, 1975; Luostarinen, 1980; Engwall, 1984; Welch, Luostarinen, 1988; Forsgren, 1989; Axelsson, Johanson, 1992) stressed that this distance, defined psychological, is related to the degree of uncertainty with regard to the main features of the foreign market. These scholars showed that the progressive reduction of the perceived risks and the related increase in international experience influence the international evolution of the company from an approach merely based on exports towards a deeper presence in the foreign market.

Hennart and Larimo (1998), on the basis of the theory of transaction costs, suggested that cultural distance is a factor able to influence the degree of difficulty in acquiring an adequate knowledge of the local market. They showed that the higher the level of cultural distance, the higher the difficulties to be faced, the greater the cost

needed to acquire a satisfactory level of knowledge of the local market. Brouthers and Brouthers (2001), Erramilli and Rao (1993) and Kogut and Singh (1988) also stressed that a higher level of cultural distance is related to a lower degree of control over foreign activities. This pushes companies to prefer, for example, co-operative entry modes (joint ventures) to direct control ones (wholly owned subsidiaries), in order to reduce the uncertainty surrounding the internationalization process and the relative costs. Similarly, Brouthers (2002) emphasized that companies tend to prefer entry methods characterized by a lower degree of control when the risk associated with the investment is high. This allows them to increase their knowledge of foreign markets through relationships with local partners (Barkema, Bell, Pennings, 1996; Beamish, Banks, 1987) or to reduce their risk exposure through the progressive reduction in the use of resources (Kim, Hwang, 1992; Erramilli, Rao, 1993; Delios, Beamish, 1999). Gatignon and Anderson (1988) also stressed that, with increasing cultural distances, companies try to reach higher levels of flexibility by choosing entry modes characterized by a lower degree of control.

Therefore, it is believed that cultural differences increase foreign market entry costs, by reducing the operational benefits and hindering the firm's ability to transfer their core competencies to the foreign markets. Companies tend to prefer methods of internationalization (INTM) characterized by a lower degree of control when the cultural distance (CD) between home and local market is high. As a consequence, these facts support a negative relationship between CD and INTM.

Hypothesis 3: CD has a negative influence on INTM

The predicted hypotheses are presented in FIG. 1.

FIG. 1: STUDY MODEL

Method and measures

Sample

Data were collected from a population of 1,509 companies of the Italian region of Friuli-Venezia Giulia, analyzed by "Impresa e Economia" in 2007. After selecting companies of most representative sectors operating in Austria, Croatia and Slovenia, a sample of 129 firms was identified. 43 companies (33.34% of the total) were located in Austria, 41 in Croatia (31.78% of the total) and 45 in Slovenia (34.88% of the total).

The study was undertaken during the period January to December 2007 and involved the submission of questionnaires by email and fax to the business executives of the identified Italian companies.

Multiple statistical analysis techniques were used in this study. These procedures include exploratory factor analysis and Structural Equation Modeling (SEM). The three hypotheses were tested with SEM techniques based on a latent structure model with explicit causal relations, developed with LISREL (Linear Structural RELationship) 8.51 (Jöreskog, Sörbom, 2001).

Measures

The questionnaire showed 18 items adapted from the main literature that collectively provided responses for the four study variables. These variables were: 1. Firm characteristics; 2. Market characteristics; 3. Cultural distance; 4. Method of internationalization.

The firm characteristics construct measures the main peculiarities of the company which may affect their internationalization paths and strategies. The construct was scored with a three item scale adapted from the studies by Kogut and Singh (1988), Barkema, Bell and Pennings (1996), Johanson and Vahlne (1977) and Caves and Mehra (1986): firm size, firm longevity and international experience. Firm size was measured by the number of employees and turnover in the period 2004-2006, firm longevity was measured by the number of generations of the company, while international experience was measured by previous international experiences of the company and the number of languages spoken by business executives. The Cronbach alpha of the construct was 0.666.

The market characteristics construct studies the main contextual factors that can influence the choice of the internationalization method. It was evaluated with a four item measure adapted from the work of Shenkar (2001), Delios and Beamish (1999), Gatignon and Anderson (1988), Collins and Rodrik (1991), Gomes-Casseres (1990) and Hill, Hwang and Kim (1990): competitive environment, legal framework, institutional context and geographical distance. The items were measured as perceptual phenomena of the influence of each factor on the international investment strategy of the company. The four items are rated on a four point interval scale from a null influence (scored as one) to a significant high influence (scored as four) The Cronbach alpha of the construct was 0.887.

The cultural distance construct measures the cultural differences between Austria, Croatia and Slovenia and Italy. The construct was adapted from the studies of Kogut and Singh (1988) and Hofstede (1991). In particular, using the dimensions proposed by Hofstede, a composite index was identified based on the deviation along each of the four cultural dimensions measured for each country from Italy ranking: individualism, masculinity/femininity, power distance and uncertainty avoidance (long-term orientation was not included in the index because no values were calculated for the countries surveyed). The deviations were corrected for differences in the variances of each dimension and then arithmetically averaged. The composite index is represented by the following formula:

$$CD_j = \sum_{i=1}^4 [(I_{ij} - I_{it})^2 / \bar{\sigma}_i^2] / 4 \quad (1)$$

where I_{ij} is the index for the i_{th} cultural dimension and j_{th} country, $\bar{\sigma}_i^2$ stands for the sample variance of the index of the i_{th} dimension, it indicates Italy and CD_j is the cultural distance of the j_{th} country from Italy. The following table summarizes the values calculated by Hofstede for the countries analyzed and their cultural distances from Italy.

TABLE 1: CULTURAL DIMENSIONS AND CULTURAL DISTANCE FROM ITALY

	PDI	UAI	MAS	IDV	CD
Italy	50	75	70	76	-
Austria	11	70	79	55	1.07
Croatia	73	80	40	33	1.75
Slovenia	71	88	19	27	3.23

Note: PDI: Power distance; UAI: Uncertainty avoidance; MAS: Masculinity; IDV: Individualism; CD: Cultural distance.

The study also considers the relative cultural distance of each country in order to identify a more complete construct. The Cronbach alpha of the construct was 0.875 for the cultural distance between Italy and Austria, 0.813 for the cultural distance between Italy and Croatia and 0.871 for the cultural distance between Italy and Slovenia.

The method of internationalization construct measures the main internationalization choices of the company. The construct was assessed with a two item scale adapted from the work of Reiffenstein, Hayter and Edgington (2002): internationalization mode and international planning. Internationalization mode was measured

with reference to the type of internationalization followed by the company (direct and indirect exports, supply contracts, license agreements, joint ventures, foreign direct investments and acquisitions), while international planning was measured with reference to the presence of a strategy or an action plan at the beginning of the internationalization process. Item one is rated on a five point interval scale from direct and indirect exports (scored as one) to foreign direct investments and acquisition (scored as five). Item two is measured as dummy variable (1=yes, 0=no). The Cronbach alpha of the construct was 0.779.

Analysis

Prior to testing and estimating causal relationships between observed and latent variables, an exploratory factor analysis was undertaken to determine whether or not earlier research findings on the identified constructs could be confirmed. The factor analysis, incorporating the varimax option, assessed the validity of the measurement. Internal consistency reliability was tested and the Cronbach alpha results of 0.779, 0.666, 0.887, 0.758 were obtained for the constructs of INTM, FCAR, MKT and CD respectively. The analysis supported the dimensional concept used and provided fullest evidence of construct validity. Tables 2 shows the results of the exploratory factor analysis.

TABLE 2: EXPLORATORY FACTOR ANALYSIS

Items	Variables					
	M	SD	INTM	FCAR	MKT	CD
Internationalization mode (Y1)	1.398	0.881	0.807			
International planning (Y2)	1.526	0.503	0.584			
Firm size (X1)	4.542	0.953		0.763		
Firm longevity (X2)	1.589	0.855		0.684		
International experience (X3)	1.675	0.438		0.537		
Competitive environment (X4)	2.680	0.787			0.890	
Geographical distance (X5)	2.621	0.970			0.857	
Legal framework (X6)	2.249	0.648			0.881	
Institutional context (X7)	2.177	0.693			0.805	
Cultural distance ITA-HRV (X8)	1.482	0.361				0.769
Relative cultural distance Austria (X9)	1.023	0.033				0.942
Relative cultural distance Slovenia (X10)	1.795	1.072				0.769
Cultural distance ITA-AUT (X8)	1.048	0.032				0.974
Relative cultural distance Croatia (X9)	1.238	0.350				0.979
Relative cultural distance Slovenia (X10)	1.795	1.072				0.769
Cultural distance ITA-SLO (X8)	2.504	1.049				0.937
Relative cultural distance Austria (X9)	1.023	0.033				0.942
Relative cultural distance Croatia (X10)	1.238	0.350				0.979
Eigenvalues			4.687	3.029	1.367	1.060
Percentage of variance explained			51.609	16.826	7.597	5.892
Cumulative percentage of variance			51.609	68.435	76.031	81.923
Cronbach alpha			0.779	0.666	0.887	0.758

Note: M: Mean; SD: Standard deviation; Principal components analysis; varimax rotation, Kaiser normalization; KMO=0.639; Sig. 0.000.

As stated before, the three hypotheses were tested with SEM techniques based on a latent structure model with explicit causal relations. The estimated SEM follows a logic based on two steps. The first one is related to the process of estimating parameters, based on an interactive procedure aimed at minimizing the gap between data produced by the model and observed data. The second step is based on a comparison of the theoretical model with the data observed. If the gap between the matrix of the observed covariance and the expected matrix, generated by the program, is higher than the gap attributable to the stochastic error, the model is rejected. The analysis will then

determine if the model is able to represent the examined phenomenon, through four different sets of fit indices. These indices are represented by the χ^2 test, the Overall model fit indices, the Incremental fit indices and the Residuals indices.

Results

Results for Austria

The integrated exam of the fit indices, with reference to the cultural distance between Italy and Austria, confirms whether the model is able to fit the data or not. χ^2 scores 54.59 with 48 degrees of freedom, p-value 0.24. Overall model fit indices show reasonable fit results. The Goodness of fit index (GFI) scores 0.93 and the Adjusted goodness of fit index (AGFI) 0.89. Critical N (CN) scores 148.70. Incremental fit indices show even better results. The Normed fit index (NFI) scores 0.92, the Non-normed fit index (NNFI) 0.97, while the Comparative fit index (CFI) scores 0.98. Residuals indices confirm that the assumed model is able to explain most of the observed data. The Root mean square residual index (RMR) scores 0.041, the Standardized RMR 0.061 and the Root mean square error of approximation index (RMSEA) 0.033, with 90 per cent confidence interval between 0 e 0.069.

Hypothesis 1 predicted a positive causal relationship between FCAR and INTM. Lisrel model and statistical tests support this hypothesis for Austria (t-value=1.86; p-value<0.05). These data confirm Hypothesis 1. Hypothesis 2 predicted a negative causal effect of MKT on INTM. Lisrel model does not support this hypothesis for Austria (t-value=2.31; p-value<0.05). Data fail to confirm Hypothesis 2. Hypothesis 3 predicted a negative causal relationship between CD and INTM. Lisrel model and statistical tests support this hypothesis for Austria (t-value=2.50; p-value<0.05). Hence, hypothesis 3 is confirmed. A summary of these results is presented in table 3.

TABLE 3: ESTIMATION, T-VALUES, P-VALUES AND CONFIRMATION OF HYPOTHESES FOR AUSTRIA

Hypotheses	Rel.	Estimation	T-value	Confirmation
H1: Firm characteristics have a positive causal effect on the internationalization method of the company.	FCAR → INTM	0.18*	1.86	Confirmed
H2: Market characteristics have a negative causal effect on the internationalization method of the company.	MKT → INTM	0.37*	2.31	Not Confirmed
H3: Cultural distance have a negative causal effect on the internationalization method of the company.	CD → INTM	-0.36*	2.50	Confirmed

Note: *: p-value<0.05; **: p-value<0.01.

Results for Croatia

With reference to the model that measures the cultural distance between Italy and Croatia, χ^2 scores 51.10 with 48 degrees of freedom, p-value 0.35. Overall model fit indices show reasonable fit results. GFI scores 0.94, while AGFI 0.90. CN scores 160.29. Incremental fit indices show good results. NFI scores 0.95, NNFI 0.99 and CFI scores 0.99. Residuals indices confirm that the assumed model is able to explain most of the observed data. RMR scores 0.038, Standardized RMR 0.060 and RMSEA 0.022, with 90 per cent confidence interval between 0 e 0.063.

Hypothesis 1 predicted a positive causal relationship between FCAR and INTM. Lisrel model and statistical tests support this hypothesis for Croatia (t-value=1.65; p-value<0.05). These data confirm Hypothesis 1. Hypothesis 2 predicted a negative causal effect of MKT on INTM. Lisrel model supports this hypothesis for Croatia (t-value=2.35; p-value<0.05). Data confirm Hypothesis 2. Hypothesis 3 predicted a negative causal relationship between CD and INTM. Lisrel model and statistical tests support this hypothesis for Croatia (t-value=2.19; p-value<0.05). Hence, hypothesis 3 is confirmed. A summary of these results is presented in table 4.

TABLE 4: ESTIMATION, T-VALUES, P-VALUES AND CONFIRMATION OF HYPOTHESES FOR CROATIA

Hypotheses	Rel.	Estimation	T-value	Confirmation
H1: Firm characteristics have a positive causal effect on the internationalization method of the company.	FCAR → INTM	0.14*	1.65	Confirmed
H2: Market characteristics have a negative causal effect on the internationalization method of the company.	MKT → INTM	-0.37*	2.35	Confirmed
H3: Cultural distance have a negative causal effect on the internationalization method of the company.	CD → INTM	-0.31*	2.19	Confirmed

Note: *: p-value<0.05; **: p-value<0.01.

Results for Slovenia

The integrated exam of the fit indices, with reference to the cultural distance between Italy and Slovenia, confirms whether the model is able to fit the data or not. χ^2 scores 58.51 with 48 degrees of freedom, p-value 0.14. Overall model fit indices show reasonable fit results. GFI scores 0.93, while AGFI 0.88. CN scores 139.75. Incremental fit indices show better results. NFI scores 0.92, NNFI 0.96 and CFI scores 0.97. Residuals indices confirm that the assumed model is able to explain most of the observed data. RMR scores 0.035, Standardized RMR 0.062 and RMSEA 0.041, with 90 per cent confidence interval between 0 e 0.074.

Hypothesis 1 predicted a positive causal relationship between FCAR and INTM. Lisrel model and statistical tests support this hypothesis for Slovenia (t-value=1.66; p-value<0.05). These data confirm Hypothesis 1. Hypothesis 2 predicted a negative causal effect of MKT on INTM. Lisrel model does not support this hypothesis for Slovenia (t-value=1.84; p-value<0.05). Hence, data do not confirm Hypothesis 2. Hypothesis 3 predicted a negative causal relationship between CD and INTM. Lisrel model and statistical tests support this hypothesis for Slovenia (t-value=1.76; p-value<0.05). Hypothesis 3 is confirmed. A summary of these results is presented in table 5.

TABLE 5: ESTIMATION, T-VALUES, P-VALUES AND CONFIRMATION OF HYPOTHESES FOR SLOVENIA

Hypotheses	Rel.	Estimation	T-value	Confirmation
H1: Firm characteristics have a positive causal effect on the internationalization method of the company.	FCAR → INTM	0.36*	1.66	Confirmed
H2: Market characteristics have a negative causal effect on the internationalization method of the company.	MKT → INTM	0.26*	1.84	Not Confirmed
H3: Cultural distance have a negative causal effect on the internationalization method of the company.	CD → INTM	-0.35*	1.76	Confirmed

Note: *: p-value<0.05; **: p-value<0.01.

Discussion and conclusion

The study attempted to analyze the role played by cultural distance, together with firm and market characteristics, in influencing the choice of foreign markets entry modes. In particular, by considering the cultural distance between Italy and Austria, Croatia and Slovenia, the study tested that a larger cultural distance between home and local market forces companies to choose entry forms characterized by a lower degree of control. Conversely, the study model showed that firm characteristics, such as size, longevity and international experience, may facilitate internationalization strategies more oriented towards a higher degree of control. However, the analysis has not identified a unique role played by market characteristics in affecting entry mode choices of Friuli-Venezia Giulia companies in each of the countries analyzed.

Hypothesis 1 confirms that the characteristics of the company can positively influence entry mode choice. In particular, better international experiences, larger size and higher longevity of the company increase the ability to handle uncertain situations and reduce the perceived market risks leading towards entry modes characterized by higher degrees of control. As stated by Kogut and Singh (1988) and Caves and Mehra (1986), international experience is an essential factor to facilitate a more effective level of control over foreign assets. As a consequence, larger companies can better deal with the financial and managerial efforts needed to compete on the global markets. The hypothesis is confirmed with reference to each market analyzed. Therefore, Friuli-Venezia Giulia companies tend to prefer internationalization strategies with higher degrees of control in Austria, Croatia and Slovenia when their size and international experience allow them to reduce local market uncertainty and risk perception.

Hypothesis 2 suggests that the characteristics of the local market can affect the internationalization method. In particular, the main features of the economic and commercial framework of local markets can increase the level of uncertainty and perceived risk of foreign companies. As stated by Anderson and Gatignon (1988), Roberts and Greenwood (1997), North (1990), Collins and Rodrik (1991) and Eicher and Kang (2004) uncertain conditions affecting local legislative, institutional and competitive environment, together with the geographical distance from the home country, increase the level of perceived risk. This will force companies, in particular those characterized by smaller size and lower levels of international experience, to adopt strategic decisions focused on a lower degree of control. The study confirms hypothesis 2 only for the Croatian market. The reasons for this result may lie in the characteristics of the different local contexts. In particular, Austrian and Slovenian markets tend to be perceived as less risky and the investment in those countries characterized by a lower degree of uncertainty. It is believed that the fact that Austria and Slovenia are members of the European Union can overcome certain economic and legislative barriers and promote higher levels of co-operation across borders. As stated by Gomes-Casseres (1990), favorable local governments attitudes, with reference to the presence of foreign firms, tend to facilitate entry strategies characterized by a higher degree of control. Conversely, the main characteristics of the Croatian market tend to increase the degree of risk perceived by the companies of Friuli-Venezia Giulia encouraging entry strategies with a lower level of control.

Hypothesis 3 confirms that the cultural distance may influence the choice of foreign markets entry modes. As stated by Johanson and Vahle (1977) and Hennart and Larimo (1998), cultural distance can increase the degree of difficulty in acquiring adequate levels of local market knowledge as well as the perceived costs and risks. In order to reduce the uncertainty surrounding the process of internationalization and to maintain higher levels of flexibility on global scenarios, Brouthers and Brouthers (2001), Erramilli and Rao (1993), Kogut and Singh (1988) and Gatignon and Anderson (1988) suggested that, with increasing cultural distance, companies tend to prefer entry modes characterized by a lower degree of control. The study confirms the hypothesis with reference to each market analyzed. Therefore, even if the cultural distance from Italy is different for Austria, Croatia and Slovenia, Friuli-Venezia Giulia firms tend to consider it as a determinant able to exacerbate uncertainties, misunderstandings and risks.

The study has some boundary conditions that should be considered when interpreting the results. The empirical findings concerning the impact of cultural distance on foreign markets entry methods are mixed. As stated before, cultural distance increase the risk level of the target market, forcing companies to implement entry strategies characterized by a lower degree of control in order to reduce the perceived uncertainty and information costs. Nonetheless, Shenkar (2001) and Brouthers and Brouthers (2001) stressed that part of the literature (Shane, 1994; Padmanabhan, Cho, 1996; Anand, Delios, 1997) suggests that, at least in some situations, high levels of cultural distance are associated with entry methods with high levels of control, in order to better monitor foreign activities, to absorb part of the uncertainty through the centralization of decision-making and to reduce communication costs and opportunistic behaviors. The explanation for these discrepancies lies in the strong contextualization of the results. It is believed that cultural distance can have different meanings depending on the markets and cultures under investigation. Besides, the study uses a concept of cultural distance based on four elements. Reducing a single culture to a limited set of determinants represents an oversimplification, even though this may be considered useful when comparing different cultures. This approach, in fact, does not allow to assess the presence of subcultures and reduces the role of cultural determinants on a regional basis. Further analysis should be implemented to gain a better

comprehension of the influence of cultural determinants on the internationalization process of companies in the North-Adriatic basin.

The implications of this study have been evaluated both from the theoretical as well as the empirical point of view. The study may provide an additional perspective to the existing body of knowledge, by stressing the significance of cultural factors in influencing the strategies implemented in the North-Adriatic area. In particular, most part of previous researches has not investigated the role played by cultural differences in affecting the choice of foreign markets entry modes with reference to the area analyzed. The study also shows that cultural issues should be carefully considered by firms, together with other contextual factors, in order to implement and manage sound entry strategies in the markets involved. Indeed, a better comprehension of cultural differences could provide a competitive strategic tool to overcome cultural barriers and, by this way, to boost companies' competitive advantage.

Curtin University of Technology Australia

Abstract

Current view on brand community conceptualizes the construct as a collection of highly homogeneous members despite some recent evidence that community members might be heterogeneous. Extant scholars call for more research to establish sources of such heterogeneity. This article shows that members of a brand community e.g. fans of a sports club, can be meaningfully segmented into clusters based on relationships that consumers may have with a brand community e.g. with the product, brand, organization, and other consumers. Using data from a large survey, we apply cluster analysis techniques to meaningfully segment the fans of a sports club. Further, based on arguments from sports marketing literature, we establish that these clusters can vary significantly in terms of their psychological underpinnings like different motivations to consume sports.

Keywords: Brand community, motivation to consume sports, cluster analysis.

Introduction

Recent research in marketing focuses on how customers are becoming more endogenous to the firm by co creating value through building brand communities (Schau, Muniz & Arnold, 2009). Such an approach has been strongly endorsed by other researchers (Keller, 2003) who recommend that customers and brands are increasingly getting interconnected, achieved by a state of emotional attachment e.g. resonance with the brand. Indeed, such value creation activities are occurring within brand communities (Muniz & O'Guinn, 2001; McAlexander, Schouten, & Koenig, 2002); thereby motivating firms to increase collaboration with their customers. Hence, by proactively creating context for customer interaction, firms can cultivate customer relationship that can strengthen brand community which might in turn potentially translate into brand loyalty and other implied benefits to the marketers (Schouten, McAlexander, & Koenig, 2007).

Marketing scholars (e.g., Muniz & O'Guinn, 2001; McAlexander et al., 2002) currently promote the view that brand communities are collections of highly homogeneous members marked by shared consciousness, rituals and traditions. Recent research has however challenge this notion of homogeneity (Ouwensloot & Odekerken-Schroder, 2008) thereby forewarning that treating brand community members as a single homogeneous group may be a mistake. A similar line of work (e.g., Schau et al., 2009; Sherry et al., 2001) also supports such notion of heterogeneity. We endorse this view and argue that the concept of brand is complex (Muehlbacher et al., 2006) and members can indeed differ in many respects (Schau et al., 2009). We completely agree with recent evidence provided by Ouwensloot and Odekerken-Schroder (2008) that members may have different motives to join a brand community and they can be clustered into different segments based on their attitudes towards the four relationship dimensions which connects a consumer within a brand community e.g. with the brand, product, company, and the other consumers, following customer centric model of McAlexander and his colleagues (2002). In the current work, we take the novel approach to extend the concept of brand community to the sports market (McAlexander et al., 2002). Following cluster analysis techniques, we show that fans of a sports club can be indeed categorized into multiple segments. We further establish heterogeneity of such segments based on different motivations to consume sports (Trail & James, 2001; Funk & James, 2001).

In doing so, we address several current gaps in the literature. First of all, we answer Ouwensloot and Odekerken-Schroder's (2008) call for future research to inquire into psychological aspects of heterogeneity (e. g., based on involvement) amongst brand community members. We note that such psychological underpinning of a

customer's perception towards brand community remains unexplored (Carlson, Suter, & Brown, 2008; McAlexander, Kim, & Roberts, 2003). Second, we study a community where consumers mentally admire a brand (e.g., a sporting club) but are not administratively connected to the organization; an issue again of paramount importance and worth investigating (Ouwensloot & Odekerken-Schroder, 2008). Finally, we also extend theory in brand community area by showing that notion of brand community applies to sports market; again following recommendation from Mc Alexander and his colleagues (2002) to extend its applicability beyond consumer market..

The rest of the article is organized as follows. We begin with review of extant literature on the research topic, followed by the development of hypotheses, explanation of research methodologies, analysis of results and the ensuing discussion, and finish off with a conclusion on the study's contributions, limitations, as well as future research directions.

Theory and hypotheses

Brand community heterogeneity

Muniz and O'Guinn (2001, p. 412) referred to brand community as a "specialized, non-geographically bound community that is based on a structured set of social relations among admirers of a brand." This definition of brand community has been accepted by many field researchers (e.g., McAlexander et al., 2002, 2003; Andersen, 2005; Algesheimer, Dholakia, & Hermann, 2005; Bagozzi & Dholakia, 2006). The concept of brand community has been based on sociological premises of shared consciousness (Hickman & Ward, 2007; Carlson et al., 2008), shared rituals and traditions (Muniz & O'Guinn, 2001), and sense of moral responsibility (McAlexander et al., 2002), all these elements essentially denoting the strength of integration amongst the members in the community, which produces a shared or collective identity (Algesheimer et al., 2005; Bhattacharya, Rao, & Glynn, 1995; Tajfel & Turner, 1985). Recent proponents of brand community theory suggest communities may be conceived and nurtured in the physical world as well as the virtual world and consumption communities are no longer bound by spatial constraints (Devasagayam & Buff, 2008).

While the above body of research strongly suggests the notion of strong commonality amongst members of brand community, recent work suggests that brand community members can be heterogeneous. For example, Schau et al.'s (2009) work suggests that community engagement practices (e.g., members competing on brand devotion, knowledge etc) might act as the basis for individual differences. This notion of intra group distinction and similarity has also been supported through earlier works of scholars like Schouten and McAlexander (1995) and Sherry et al. (2001). In a similar notion, Ouwensloot and Odekerken-Schroder (2008) provide evidence that brand community members can be indeed meaningfully segmented based on their different motivations to join the community. Using relationship variables from the customer centric model of brand community (McAlexander et al., 2002; Muniz & O'Guinn, 2001), the researchers came up with six different types of brand community members e.g. enthusiasts, users, behind-the-scenes, not-me's, average, and socializers and further showed that they differed significantly on consumption motivation.

A few major concerns however underlie the work of Ouwensloot and Odekerken-Schroder (2008). Firstly, the researchers highlight that consumption characteristics alone cannot clearly and unequivocally define the characteristics of segments in a community and therefore recommended future research to scrutinize other sources of heterogeneity. Secondly, their work also neglected the role of involvement, especially its conceptualization as a multifaceted concept, in order to promote a deeper understanding of the characterizations of segments within a community. Finally, we answer their call on research with more brand communities to generalize conclusions drawn from their work. In the current research, we follow a similar procedure as followed by Ouwensloot and Odekerken-Schroder (2008) to segment brand community members e.g. Manchester United football club fans and argue that such segments can differ significantly on sports consumption motivation.

Motivation to consume sports and brand community members

Sport consumption, unlike consumption of traditional products, is one that involves experiential and hedonic dimensions of consumption. According to Schaaf (1995, p. 22), in the context of sports marketing, the

“product” is either the entertainment of competition (the uncertainty), or a product/service associated with the excitement of the event, or both”; a notion supported by other scholars e.g. Chadwick (2009, p. 192). Motivation to consume sports can have different underpinnings like psychological e.g. fulfilment of emotional and intellectual needs, experience of positive feelings and thought states (Smith & Stewart, 2007), socio-cultural e.g. strong family and social interaction, cultural connections, travelling together to see sport (Smith & Stewart, 2007; Fink, Trail, & Anderson, 2002) and social belongingness e.g. sense of identification with the team etc (Smith & Stewart, 2007). Recent work by researchers e.g. Trail and James (2001), tries to capture the many facets of motivation based on earlier work in the field (e.g., Wann, 1995; Milne & McDonald’s, 1999; Sloan, 1989). In fact, Trail and James (2001) develop Motivation Scale for Sport Consumption (MSSC) thereby capturing various motivations like vicarious achievement, knowledge acquisition, drama, aesthetic qualities of the game/sport, appreciation of athlete’s skills, physical attraction to athletes, escape, family, and social interaction.

Current scholarly works in this area show that sports consumers may indeed vary in terms of their motivation and involvement. Firstly, along the lines of Ouwersloot and Odekerken-Schroder (2008), we argue that different motives to consume sports may lead to different levels of appreciations of the aspects of community life i.e. the four relationships consumers may have with a brand community –product, brand, organization, and other consumers. For example, social interaction motive e.g. desire to identify with something bigger than oneself (Wann, Brewer, & Royalty, 1999), to feel part of a tightly bound community (Cooke, 1994; Smith, Patterson, Williams, & Hogg, 1981) may lead one to emphasize on inter-customer relationships. Similarly, a focus on aesthetic quality of sports may warrant close ties with the product while vicarious achievement may demand closer ties with the organization. Given the exploratory nature of this study, we are not focussing on individual hypotheses but rather forward a general notion that the four relationships constructs of customer centric model of brand community will be evaluated in a relatively differentiated fashion based on the sports consumption motivation of an individual.

We therefore propose the following:

- H₁ Members in the brand community of a sports team can be classified into different clusters based on their attitudes toward the four relationship constructs depicted in the consumer-centric model of brand community.*
- H₂ Membership clusters in the brand community of a sports team will differ significantly in terms of their attitudes toward the motives for sport consumption.*

Methodology

Sample

A paper and pencil survey was conducted at a large Western Australian University. A total of 248 responses (28 females) completed the study. For a summary of the sample characteristics, please refer to Table 1.

Survey instrument

The survey instrument was divided into different sections. The first section consisted of 22 items related to the seven motives for sport consumption. In the second part, brand community was measured with 16 items that Ouwersloot and Odekerken-Schroder (2008) used. Finally, participants answered demographic questions. More importantly, we used a screening question that read “Are you a fan of Manchester United Football Club” in order to select fans only to operationalize our brand community construct.

Scales and measurements

The MSSC as originally developed by Trail and James (2001) had nine motives, but the current study only included seven – vicarious achievement, aesthetics, drama, escape, knowledge, appreciation of physical skills, and social interaction. The motives of family and physical attraction to athletes were omitted from the study as they were found to be irrelevant (following current research e.g., Fink et al., 2002). Items were measured using a 7-point Likert scale – ranging from strongly disagree (1) to strongly agree (7). The reliability of the scale was found to be acceptable ($\alpha = 0.78$ to 0.88).

Brand community was measured with 16 items that Ouwersloot and Odekerken-Schroder (2008) used for their study. These items were developed based on the original brand community scale developed by McAlexander et al. (2002). Items were slightly reworded to suit the context of this study. For example, items in the customer-brand relationship, the “brand” was Manchester United; the “product” was changed to “soccer games”. As such, some of the items which would originally be “I consider my (brand) as my number one choice of [product]”, “I love my (brand) [product]”, and “My (brand) [product] is fun to {consume}”, would read “I consider (Manchester United) as my number one choice of [soccer teams]”, “I love (Manchester United’s) [soccer games]”, and “(Manchester United’s) [soccer games] are fun to {watch}” respectively. The scale reported to have good internal consistency with $\alpha = 0.89$ to 0.93 .

Analysis and results

Cluster analysis

Following Ouwersloot and Odekerken-Schroder (2008), we did a cluster analysis with the brand community scale. The four constructed relationship scores were used as a basis of segmentation. Ward’s method of hierarchical clustering technique was adopted with squared Euclidean distances as the dissimilarity measure. Following recommendations by Malhotra (2007, p. 646), an agglomeration table was constructed to determine the number of clusters. The table suggests that the sample is made up of either three or four clusters. In order to decide on the number of clusters extant recommendations (Funfgeld & Wang, 2008; Malhotra, 2007) along with study of dendrogram was undertaken. As such, a three-cluster solution was proposed with respect to the current sample of Manchester United fans in the soccer team’s brand community. This hierarchical clustering technique was then further refined by applying a *K*-means clustering procedure, a non-hierarchical clustering technique; thereby ensuring that the cluster-means are refined and cases are reallocated based on their similarity within cluster and dissimilarity between clusters.

In order to examine and study each of the clusters, Ouwersloot and Odekerken-Schroder (2008) suggested that interpretation of the results of a cluster analysis is based on three inferences. First, the absolute scores on each of the relationships are taken into account. A score around the mid-point of the seven-point scale indicates that the relationship is neither important/relevant nor unimportant/irrelevant. High scores denote that the relationship is valuable or important, low scores mean the relationship is not regarded valuable or important. Second, the scores on each relationship for a given cluster are compared to the average of the whole sample. Third, the scores on the four relationships are compared within a cluster. This may lead to such inference as “for cluster 1, one type of relationship is more important than another relationship.” This interpretation of the cluster analysis is usually summarized by naming the identified clusters to capture their most distinctive characteristics and features (Ouwersloot & Odekerken-Schroeder, 2008). The following section examines and studies each cluster with relation to their characteristics and features and names are given to a specific cluster. A finalized table consisting of the number of cluster cases, the four relationship scores and community average can be found in Table 2.

Clusters of Manchester United fans

Cluster one. The first cluster in the Manchester United brand community consists of members with a relatively high score in the relationship with the product (5.42), represented in this study by the games of soccer that Manchester United Football Club produce, average score in the relationship with the brand (4.81), being Manchester United, and low scores in the relationships with both the company (3.23) and other customers (3.49). This pattern of results are similar to the “not-me” cluster found in the Ouwersloot and Odekerken-Schroder’s (2008) study. It can be assumed that this type of members are still fairly new in adopting Manchester United as their favourite team, thus explaining their slightly higher than average score in the relationship with the brand. However, these members are very much interested in the game of soccer, acknowledging their admiration for the product. It can also be noted that these members are fans of soccer in general, where they show an appreciation for the games of soccer that

Manchester United produce, but are not loyal fans of Manchester United, at least not in a very passionate and fanatic way.

Cluster two. The second cluster in the Manchester United brand community consists of members with high scores across all four relationships in the consumer-centric community model (McAlexander et al. 2002). Specifically, the members in this cluster have mean-scores of 6.64 on the relationship with the product, 6.53 on the relationship with the company, 6.62 on the relationship with the other consumers in the community, and 6.59 on the relationship with the brand. This is consistent with the findings of Ouwersloot and Odekerken-Schroder's (2008) where they too found a cluster of members who had high scores on all four relationship constructs, of which they were labelled "enthusiasts". In comparison with the average mean-scores of the total sample, the members in this cluster have all four scores remarkably higher. In this particular cluster, members are highly interested in the soccer games that Manchester United play, the Manchester United brand itself, the other Manchester United fans, and the company behind Manchester United. These members assess all four relationships in the consumer-centric community model (McAlexander et al., 2002) as important, valuable, or appreciated (Ouwersloot & Odekerken-Schroder, 2008). As this cluster is similar to the "enthusiasts" category found in Ouwersloot and Odekerken-Schroder's (2008) study, it will therefore be referred to as the "enthusiasts".

Cluster three. Specifically, the members in this cluster have high scores on the relationships with the product (6.67) and the brand (6.44), but average scores on the relationships with the company (4.25) and other consumers (5.51) within the brand community. Relatively, in comparison with the average mean-scores of the total sample, the members in this cluster have higher scores on both relationships with the product and the brand, but have average and somewhat identical scores with the average means-scores of total sample on the relationships with the company and other consumers in the community. This is also consistent with the findings of Ouwersloot and Odekerken-Schroder's (2008) where they found a cluster that was labelled as "average", of which the members had low to average scores on all constructs in comparison to the average of the whole sample, where the scores on the relationships with the product and the brand were quite high. As such, it could be inferred that the members in this community have high attitudes toward the product and the brand. That is, these members assess the relationships with the brand and the product as important, valuable, or appreciated (Ouwersloot & Odekerken-Schroeder, 2008). Specifically, these members appreciate the soccer games that Manchester United produce and the Manchester United brand itself, but do not show as high of an appreciation for the company and the fellow Manchester United fans in the community. As this cluster is also similar to the "average" category of brand community members found in Ouwersloot and Odekerken-Schroder's (2008) study, it will therefore be referred to as the "average".

Our results of cluster analysis thus produced three distinct clusters that we refer to as "not-me", "enthusiasts" and "average" following similar pattern of findings in Ouwersloot and Odekerken-Schroder's (2008). Thus hypothesis 1 is supported.

Motivations for sport consumption

Results of one way ANOVA showed significant differences between the three clusters on the seven motives to consume sports.

Results of omnibus F test indicated that there is a significant difference between the three clusters of fans with relation to the motive of beauty ($F(2, 245) = 11.95, p < 0.001$). Results of contrast analysis further showed that there is significant difference between "not me" and "enthusiasts" (Ms of 5.47 vs. 6.11, $t(77.34) = 3.16, p < 0.01$), as well as between "average" and "not me" (Ms of 6.24 vs. 5.47, $t(63.79) = -4.06, p < 0.001$). No significant difference is observed between "enthusiasts" and "average" (Ms of 6.11 vs. 6.24, $t(168.29) = 1.10, p = 0.14$).

Results of F test again indicated that there is a significant difference between the three clusters in the motive of drama ($F(2, 245) = 5.36, p = 0.005$). Results of contrast analysis showed that there are significant differences between "not me" and "enthusiasts" (Ms of 5.46 vs. 6.04, $t(88.59) = 2.87, p < 0.01$) and between "not me" and "average" (Ms of 5.46 vs. 5.84, $t(68.95) = -2.04, p < 0.05$). However, difference between "enthusiasts" and "average" (Ms of 6.04 vs. 5.84, $t(164.13) = -1.45, p = 0.075$) was not significant.

Significant differences were found in the "escape" motive ($F(2, 245) = 13.65, p < 0.001$). Contrast results showed significant differences between "not me" and "enthusiasts" (Ms of 4.51 vs. 5.64, $t(245) = 4.82, p < 0.001$),

between “enthusiasts” and “average” (Ms of 5.64 vs. 4.91, $t(245) = -3.92, p < 0.001$), and also between “average” and “not me” (Ms of 4.91 vs. 4.52, $t(245) = -1.78, p = 0.04$).

With regard to the motive of knowledge acquisition, Omnibus F test revealed that there is a significant difference between the three clusters of fans ($F(2, 245) = 5.75, p < 0.01$). Contrast analysis signified that significant differences were found between “not me” and “enthusiasts” (Ms of 5.51 vs. 6.06, $t(245) = 3.38, p < 0.001$) and between “average” and “not me” (Ms of 5.90 vs. 5.51, $t(245) = -2.49, p < 0.001$). However, there was no significant difference between “enthusiasts” and “average” (Ms of 6.06 vs. 5.90, $t(245) = -1.24, p = 0.11$).

Results of F test again indicated that there is a significant difference between the three clusters in the motive of physical skills ($F(2, 245) = 14.94, p < 0.001$). Results of contrast analysis showed that there are significant differences between “not me” and “enthusiasts” (Ms of 5.59 vs. 6.25, $t(81.13) = 3.13, p < 0.01$), between “enthusiasts” and “average” (Ms of 6.25 vs. 6.46, $t(142.07) = 1.72, p < 0.05$), and between “average” and “not me” (Ms of 6.46 vs. 5.59, $t(58.51) = -4.57, p < 0.001$).

With regard to the motive of social interaction, there was a significant difference between the three groups ($F(2, 245) = 5.36, p = 0.005$). Contrast analysis revealed that there were significant differences between “not me” and “enthusiasts” (Ms of 5.08 vs. 5.81, $t(245) = 3.18, p < 0.01$) and between “average” and “not me” (Ms of 5.68 vs. 5.08, $t(245) = -2.72, p < 0.01$). However, there was no significant difference between “enthusiasts” and “average” (Ms of 5.81 vs. 5.68, $t(245) = -0.71, p = 0.24$).

Finally, members of the three clusters also differed significantly in relation to the motive of vicarious achievement ($F(2, 245) = 10.43, p < 0.001$). Results of contrast analysis again showed that there were significant differences between “not me” and “enthusiasts” (Ms of 5.48 vs. 6.19, $t(70.30) = 3.30, p < 0.01$) and between “average” and “not me” (Ms of 6.19 vs. 5.48, $t(62.71) = -3.40, p < 0.001$). There was no significant difference between “enthusiasts” and “average” (Ms of 6.19 vs. 6.19, $t(179.23) = -0.02, p = 0.49$).

In summary, we receive part support for our second hypothesis. A table summarising the means for the three clusters on the seven motives can be found in Table 3.

General discussion

This study set out to determine if within a brand community, there would be different types of members. In line with work by Ouwersloot and Odekerken-Schroder (2008) we indeed found evidence of three clusters through the application of McAlexander et al.’s (2002) consumer-centric community model, which focuses on four relationships that a brand community member has: with the brand, the product, the company, and other consumers within the community. The three clusters of fans found in our study were referred to as not-me, enthusiasts, and average fans. The results of this cluster analysis were largely consistent with findings of Ouwersloot and Odekerken-Schroder’s (2008).

We further extended the study and provided evidence that brand community clusters can indeed differ in terms of their motivation to consume sports. Evidence from our three clusters e.g. “not me,” “enthusiasts,” and “average” showed interesting findings. Enthusiasts differed significantly from “not me” across all the seven motivations to consume sports, showing that sports occupies central part of their lives, thereby showing deep psychological attachment to it. Significant differences across seven dimension of sports consumption motivation emerged between “average” and “not me” as well, with the former more interested in soccer and the club while the later showed only appreciation for the game. Interestingly, between “average” and “enthusiasts”, the former dominated the later on the appreciation of physical skills motive while the later dominated the former on escape motivation.

Results from our findings can be of practical relevance too. The major managerial contribution of this study is that within brand communities, marketing managers can adopt the application of cluster analysis to segment apparently homogeneous sports fans. The fact that all fans are not identical calls for differentiated segmentation and targeting strategies. Thus based on our results, it certainly makes sense if managers design tailor made marketing communications aimed at enthusiasts who are apparently the most important segment and the key reason to a brand’s survival and flourishing in the market. Next, a suitable strategy would be to convert “average” into

“enthusiasts”. Based on our cluster analysis results, it seems that “average” comprises of fans who are interested in the product and the brand and as such additional incentives e.g. a free ticket to a community gathering may motivate them to join the community. Finally, managers may like to note that there is a third small segment e.g. “not me” who are interested in the sports but have not quite developed psychological connections with other relationship dimensions of a brand community. As such judicious approach is required to see whether this group of people can be nurtured to help them develop more favourable attitude towards the brand in future.

A number of limitations can be identified in this study. Firstly, some of our results suggest that heterogeneity may be attributed to a fan’s psychological attachment which in turn may evolve over time. As such a longitudinal research is certainly warranted for future inquiry. Secondly, the current study is mainly an exploratory one, future studies should be structured in a way that explains the findings included in this study with more details and deliberation. For example, future studies should examine the reasons why enthusiasts and average fans differ in particular motives for sport consumption such as escape and skills appreciation, considering that both groups of fans have near-identical scores on the product dimension of McAlexander et al.’s (2002) consumer-centric model of brand community. Finally future research should replicate our findings in a different context e. g. product category and understand cross cultural implications on brand community membership.

Abstract

What possible integration is there between business marketing and area development? The "Land of Value" (LOV) case.

This paper focuses on the theme of territorial marketing from the perspective of local businesses, with the main objective being to highlight the possible role that these organizations can play in using the territory to full advantage. The survey is based on the case of an SME, operating in the high technology sector, which has developed a network that integrates different territorial components (agriculture, tourism, culture, accommodation and catering services, commerce, etc.) in order to offer its visitors a particularly positive experience. The basic idea is that providing a welcoming environment can combine the aims of business with the features peculiar to the geographic area. The study therefore brings to light the possible convergence between territorial marketing and relationship marketing.

Keywords: territorial marketing, relationship marketing, network, local enterprises, business marketing, experience.

1. Introduction¹

For some time now territorial marketing has been the object of numerous studies and debates which have not only emphasized its growing relevance, but also brought to light some issues connected to its realization.

As concerns the first aspect, it is widely recognized that marketing represents a valid support tool for the governance of territories or single geographical areas which find themselves more and more in competition with one another with regard to attracting and retaining the loyalty of resources necessary for their development (Boisot, 1990; Kotler *et al.*, 1993; Caroli, 1999 and 2006; Silvestrelli and Agazzani, 2002). As a matter of fact, there have been multiple cases in which the principles and tools of marketing have been used in order to create synergetic supply systems able to attract new territorial components and capable of enhancing existing ones, including business enterprises and their productions.

As for the second aspect, one point to be underlined is just how difficult it is to integrate the various players (both public and private), necessary to carry out more effective and efficient promotional actions. Another critical area concerns the definition of an organizational configuration that can manage the promotional intervention and that can satisfy the need for coordination (Golfetto, 2000; Gregori, 2005); in this regard, mention can be made of some positive experiments that came to light in several studies, although there is still ample room for improvement.

It should be noted, moreover, that in the scientific literature which deals with territorial marketing the focus has often been placed only on certain aspects, such as lumber and sustainable development, entrepreneurial incentivitation and the capacity to attract investment (Aiello and Donvito, 2007), or promotion of tourist destinations and territorial brands (Baker and Cameron, 2008; Rodríguez-Díaz and Espino-Rodríguez, 2008; Wang, 2008; Pencarelli and Gregori, 2009; Haugland *et al.*, 2011). It cannot escape notice that the perspective often adopted is that of local public administrators.

The present paper favors the local business enterprise perspective, with the intent of highlighting the potential of same which can be expressed through an adequate awareness of its role within the territorial system and an

appropriate management of its relationships with the other players that are part of it, with a view to fostering mutual optimization.

To this end, the case for proposed study is “Land of Value” (LOV), a project carried out by the “Loccioni Group” which is a Marche region, medium sized enterprise in the high technology sector; LOV stands out as a “virtuous” example of integration between business strategy and territorial marketing. In fact, the company has created a transversal network in a multi-dimensional approach to the territory (hospitality, tourism, culture, nature, food industry production, etc.) so as to offer its visitors – be they clients, suppliers or other partners – a welcoming environment and a positive experience during their stay, in an effort to share the values of the area. By using the positive experience as a lever, the company is thus putting into motion a relationship marketing strategy, as it contemporaneously promotes the image of the reference territory, its productions and its local services.

Here follow the principal objectives of this analysis:

- examine the organizational problems and modes of intervention inherent to the development of a similar integration project;
- highlight the derived benefits to the territory;
- underline the impact such a project has on company performance, through a cost-benefit analysis over the long term;
- emphasize the role that could be played by SMEs in territorial marketing.

Regarding the methodology adopted, a number of personal interviews were conducted with the owner and managers of the company under study; particular attention was placed on the points of view expressed by the heads of the marketing and communication areas, by the promoters and by the coordinators of the project. The present contribution can therefore be positioned in the field of research on relationship marketing and territorial marketing; in addition, reference is made to business network theories (Håkansson and Snehota, 1995).

2. Territorial marketing from a business perspective

In recent years a number of studies have been conducted on the topic of territorial marketing for which, nevertheless, no single shared conception has come about (Gregori, 2005); in fact, a variety of different theoretical approaches leading to diverse interpretations are observed, depending on the objectives established and the territorial context used as a reference.

One widely accepted view sees territorial marketing as a technique based on the principles and tools that are typical of a business function – i.e., marketing – in the aim of augmenting the value of a territory or of an area where action is intended by transforming its resources and features into competitive advantage. As stated by Caroli (2006, p. 85), *«the territorial marketing function must fulfill the task of facilitating the evolution of the tangible and intangible factors at work in a geographical area towards the goal of strengthening the capacity of that area to attract and retain within it those components of territorial demand (segments of physical persons and of financial organizations) that are best suited to foster the sustainable development of the area itself»*. Furthermore, the author points to a process of analysis, formulation and activation of a supply strategy aimed at satisfying the needs of a market “internal to” and one “external to” the area of interest.

For territories and single geographic areas there exists, in fact, an ever more pressing need to think out and plan, keeping the laws of competition in mind (Caroli, 1999), and it would seem opportune and essential that these areas adopt a “proactive” approach in dealing with the “market”ⁱⁱ.

It is in this context, then, that territorial marketing is garnering particular attention from the scientific community, but not only.

From a theoretical point of view, the concept has been affected by an important evolution denoted by the passage from a “transactional” view to a “relational-network” view (Aiello and Donvito, 2007).

Whilst in the first case, the territory tends to be considered to be a complex product with which one aims to satisfy both the current and potential demandⁱⁱⁱ, in the second case it is considered to be a network of relationships, where, in particular, the interactions among the various players- both internal and external- are analyzed. It can be further

stated that, «in every geographical context, the relationships among the players represent an absolutely primary aspect of that context, for they strongly influence the social dynamics and the competitiveness of the economic activities carried out within it » (Caroli, 2006, p. 25).

Therefore, the relational-network approach appears to be best suited to fully appreciate the problematic issues and the opportunities for development of territorial marketing because it makes it possible to see how the interactions among the various players could be reflected in the attraction capacity of a given territory.

On this subject, it is worth noting the following points:

- a) for the territorial marketing actions to be successful, it would be useful and necessary to involve both public and private entities, as well as to «overcome conflictive and competitive attitudes in order to enhance and safeguard the territory, a shared asset» (Ferrari, 2000, p. 262);
- b) it is quite commonly recognized as auspicious the idea of aiming for a greater integration among the various territorial contexts (nature, culture, production system, tourism, etc.) in order to obtain a better overall effect, especially with reference to communication and promotion activities^{iv}.

This leads us to affirm that it is the degree to which the various components of the area are able to collaborate and cooperate which makes a difference, in terms of effectiveness and efficiency, when talking about territorial marketing actions.

One would ask, then, what roles the various actors can play in achieving an enhancement of the territory, in consideration of the fact that they are part of relationship networks that interact, in turn, with other networks, and they are also involved in a trade relationship with the territory itself.

Hence, we believe it would be interesting to adopt the local business perspective and analyze the value these businesses attribute to the territory, from the standpoint of their competitive development strategies; this, particularly in light of the important economic and social function they carry out, in an awareness that *they can not only be the recipients of territorial marketing actions, but they can also take an active part in them.*

The fact that the competitiveness of a business depends more and more on the competitiveness of the economic, social and territorial systems in which they are collocated is certainly nothing new. According to the resource-based view, in fact, the specific tangible and intangible resources present in a given area can represent significant sources of competitive advantage^v.

These concepts assume added significance, however, when seen in light of the on-going intensification of the globalization process and the increasing mobility of individuals and companies.

On this point it must be noted that in a context of progressive growth of international trade and relations, a number of companies have adopted strategies in which they re-locate their production activities abroad, moved by the need or the opportunity to operate in conditions deemed more “favorable”, compared to those available domestically. For territories which undergo such processes there is therefore the need to compensate for the loss of businesses which had been located there by attracting new ones (Rullani, 1999).

Other enterprises, especially SMEs, are strongly bound instead to the territory where they were founded, as they grow in symbiosis with it and contribute to its attractiveness, by investing in and developing significant intangible resources, such as cognitive and relational systems, work culture and professional vocations, quality culture and a more widespread tendency to innovate. This occurs with the heightened awareness of the important added value that the territorial system is capable of giving to what they are offering.

Hence, it is in this sense that «enterprises and territories co-evolve in the search for competitive advantage, as each one reciprocally represents a critical resource for the competitiveness of the other» (Valdani and Ancarani, 2000, p. 23).

It would be wise, then, to investigate the strategic relationship between local enterprise and territory, from the viewpoint of mutual enhancement.

Local enterprises, in much the same way as to other internal actors, represent both resource and user in their own territory and their interdependence and interactions, even with external subjects, have an effect on the attraction capacity of the territory itself. Following this line of reasoning, it can be said that the object of territorial marketing should not only be to sell the “territory-product” to external clients, usually identified as multinationals which display a certain amount of indifference, however, towards the territories, but, in the words of Rullani (1999), «should first of all be to look after the relationships with internal clients, by turning to the business enterprises that

are already present in the territory to be enhanced». Besides attracting “external clients”, territorial marketing should therefore «facilitate the development and retention of internal clients» (p. 27), who could otherwise see an advantage in leaving. Thus, the aim of territorial marketing is that of keeping the system vital^{vi}, in the interest of both internal and external demand.

Not to be overlooked is the fact that, often, territorial areas appear to be operating with what is known as a *product-based* approach, whereby attention is mainly focused on creating and improving the infrastructures. Furthermore, «the competitive challenge between territories tends to shift towards incentives, typically fiscal in nature, which nevertheless offer short term advantages and are at risk of degenerating into dangerous price spirals so characteristic of the hypercompetitive dynamics associated with both enterprises and territories» (Valdani and Ancarani, 2000, p. 37).

So, we can plausibly affirm that geographical areas, rather than compete on available facilities and cost advantage, should enhance their specific intangible resources by putting into effect a strategy of qualitative differentiation. More specifically, it would seem most advantageous to develop systems of relationships because it is from these that derive those sought-after resources, i.e. knowledge, competencies and synergies, so necessary for creating more defensible competitive differentials in a Knowledge Economy, not only for the territories but for the enterprises located there, as well^{vii}.

3. The relationship between relational marketing and territorial marketing

Relational marketing offers a concrete response to the newly emerging needs of markets, especially the industrial ones, because it takes a long term perspective and provides tools suitable for managing the interactions between suppliers and clients (Grönroos, 1994). From the standpoint of the theoretical underpinnings which characterize relational marketing, it has been the sociological, economic and organizational disciplines which have contributed to laying down a substratum, although it cannot yet be called an actual, shared marketing paradigm (Coviello *et al.*, 2001; Palmer, 1996). Relational marketing places its primary focus on studying the relationship between business enterprises in more or less industrial contexts, but to treat it as a paradigm would imply associating it with an interpretative schematheory (Aijo, 1996) which, to date, seems not to have yet been conceived. One sure element that emerges, however, is how central and interactive the relationships are that develop between the parties, seeing as both players involved carry out an active role in the transactions that are created. So then, the primary task of marketing, at a strategic level, should be that of *establishing, developing and maintaining* the relationships with clients, rather than focusing on the management of the marketing mix variables (Ford, 1980). What has just been said about managing client relations leads to the necessary evaluation of each relationship from the point of view of its potential, of the resources that it requires and therefore, of the efforts needed.

Basically, the entire organization should develop the ability to understand the “objectives” of each of the single relationships that have come about and this implies an efficient and effective management of the *company's relational assets* (Costabile, 2001). The complexity in which firms operate, besides pushing them to study those relational assets that are directly ascribable to the company itself, has also meant extending the field of analysis to include a study of the multitude of relationships that grow up between players external to the company (Håkansson and Snehota, 1995). The reason for the birth of the network approach to studying relationships is to be found in just such a context where it is difficult to fully understand each single relationship taken out and isolated from the rest of the ties that the company establishes in an business context (Campbell, 1984; Smith and Easton, 1986). Even though the relationships are nearly dyadic, one must consider how they fit as part of network mechanisms far more ample and complex to be analyzed.

The key dimensions of relationships inside a network are:

- the players
- the activities
- the resources

Each player acts within what is defined as the *networks context* (Håkansson and Snehota, 1989), that is, a space in which the player builds relationships with other players (who, in turn have other relationships), exchanges resources

and carries out activities, with the objective of reaching a “position” within the network. The degree of complexity of such a mechanism is very clear, intuitively, for a player’s level of knowledge about the breadth of his network or, his *business horizon* (Ford *et al.*, 1998), can vary significantly.

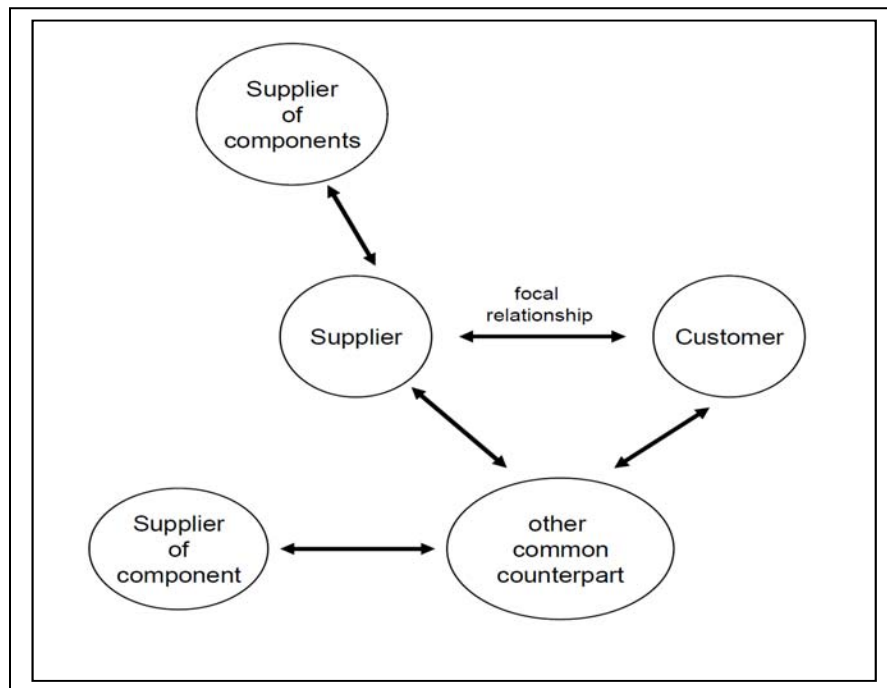

Figure 1 shows a network context in which the multiple relationships which characterize it are clearly evident, starting from the main one between supplier and client. The main aspect that emerges and that must necessarily be central to our conceptualization regards both the complexity of the context and the possible presence of relationships that are external to the central one and which could influence the entire network system.

Clearly, a “non controllable” environment such as the network takes on particular importance vis-à-vis the territorial dimension in which the company itself is naturally involved.

Having taken into consideration the observations made regarding the rise of relational marketing and particularly of its substance, it would appear obvious then that the relational dimension, when speaking of a territory, can be a highly significant one. As asserted by a number of scholars (Caroli, 1999; Vescei, 2001), given the systemic nature of the territorial supply which derives from infrastructures but also from interdependent intangible assets (relationships), the actors like, for instance, business enterprises, are obviously called upon to interact in the territory itself. Knowing how to manage and nurture such relationships thus turns into a fundamental asset for any organization.

The relational dimension which is reinstated and utilized in a territorial context rests on certain basic, rather interesting assumptions. The organizational management of relationships both internal and external to the company, in particular, presupposes an effort made by the company to also utilize management tools as sources of possible competitive advantage. In this view it could prove necessary to adopt new approaches to managing the relationships that a business enterprise owns in a territory. Furthermore, the analysis of information coming from the territory could also prove to be strategic, in consideration not only of the direct and contemporary relations among the various companies, but also of the relationships afferent to the network in which the company operates.

FIGURE 1 – AN EXAMPLE OF A NETWORK

Source: our adaptation of Anderson *et al.* (1994)

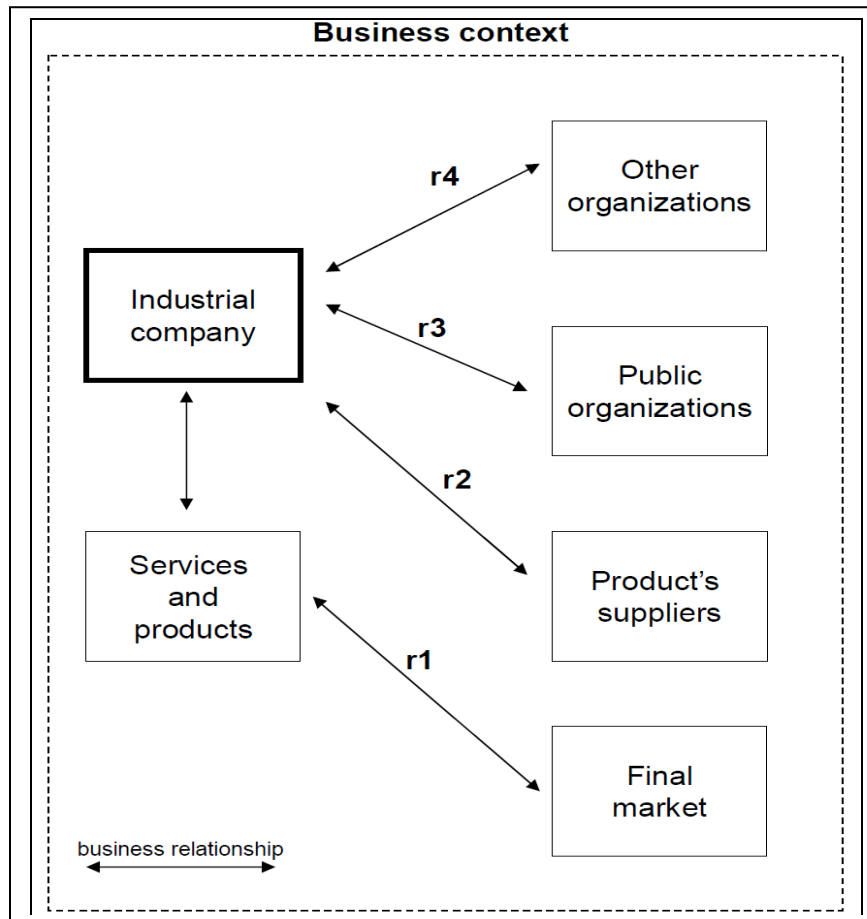

The points of contact between relational marketing and the “marketing” component of the territory would appear to be quite strong, therefore, and could be ascribable to:

- the complexity of the relationship and of the territory in terms of substance;
- the high complexity and value of the supplier – client exchange;
- the mutual effort, on the part of the players, to make the business relationship successful.

Thus, it becomes evident how, in such a context, the importance of a territory is concentrated in the notion of created value for its clients, i.e. its users or those who benefit from its resources. From here, it is a short step to seeing the importance of possessing a thorough knowledge of both the needs and the expectations of the clients who make up the demand, both current and potential.

To understand the importance of the relationships which grow out of a territorial context, Figure 2 could be helpful.

FIGURE 2 – SOME INTERACTIONS BETWEEN ENTERPRISE AND TERRITORY

Source: our data

It is evident that numerous relationship flows develop between the industrial enterprise and the various players in the network, identified as the market made up of industrial clients, the suppliers of goods and services and other organizations operating in the territory. Through the relationships that are created between the enterprise and the players, but also among the individual groups of actors themselves, there takes place an exchange of both tangible and intangible resources such as knowledge and experience. A true circuit is thus created, affecting both the territory and the external environment and, in a parallel manner, the environment in turn affects the relationships that are being formed and those already established (Ford *et al.*, 1998). In order for the interaction mechanism between subjects and territory to fully achieve its highest potential, some additional conditions are also necessary:

- information must be disseminated in a continuous and systematic way;
- the actors must have access to the information in an efficient way.

The principles enunciated by relational marketing can supply both the tools and the methods suitable for managing such complexity.

4. A virtuous example of territorial enhancement: the “Land of Value” (LOV) case^{viii}

The case under study presents an interesting company project aimed at enhancing the territory; it is called “Land of Value”, or LOV.

The project was conceived and promoted by the Loccioni Group (Box 2), a family-run enterprise^{ix} which operates in the high technology sector and is located in the township of Rosora, in the inland area of the province of Ancona, in the Marche region. With an annual turnover of 50 million Euros on average and approximately 300 employees, the Group represents a fairly significant business entity for the territory in question^x. The enterprise has strong ties to this territory, as evidenced by the fact that the only two production facilities are located just a short distance one from the other, in the original area where the company was founded.

Box 2 – Background information on the Loccioni Group

The Group was founded in 1968 by Enrico Loccioni, who also founded I.C.I.E. (which, in 1974, became General Impianti), as an artisanal business for electrical installations. Over the years, it adopted major diversification strategies which helped the Group to grow considerably, as subsequent additions were made: A.E.A. (Applicazioni Elettroniche Avanzate) in 1980, SUMMA in 1991 and BLU SOLUTIONS in 2004. Currently, the Group is actively involved in different types of business activities, in particular, manufacturing measurement systems and instruments, quality testing and monitoring of products and processes, as well as providing integrated solutions for industrial monitoring of quality, for industrial automation and for Information and Communication Technology; the Group also provides solutions for energy savings in terms of rationalized use and management^{xi}.

In addition, the Loccioni Group promotes and integrates a number of networks for companies, territorial entities, research bodies because it firmly believes that the network system represents a tool for growth, improvement and innovation. Examples of such networks are:

- Netpeople (to bring together companies’ competencies and know-how).
- Nexus (a multi-sector network created for local territories to communicate and interact, so as to maximize both the territory’s features and the individual and company-owned knowledge contained therein).
- Crossworlds (to promote innovation through a technological transfer from the automotive towards other worlds).
- U-net (a network that includes universities and research institutions).

Finally, the Group is also actively and intensely involved in collaborating with the Polytechnic University to create study and research projects, as well as to finance scholarship grants for doctoral studies.

Source: our data

In recent years the enterprise has seen an important evolution take place in terms of marketing. Prior to 2005, there was essentially no marketing function within the group as there were only two people who took care of communication activities (website, communication material), organized internal events or decided which trade fairs to attend. Any strategic marketing activity was practically nonexistent.

In 2005 a specific marketing department was established, whose function was to undertake research activities in order to gain an understanding of market dynamics so as to provide useful support, primarily:

- a) to upper-level management: in terms of analyzing possible “market frontiers” or choosing a “niche technology” in which to position themselves;
- b) to the R&D department: by carrying out analysis of new ideas or new projects in the research portfolio, in terms of potential market position;
- c) to the sales division: by studying potential markets.

Over the last two years growth of the marketing area has been intense.

The support tools for marketing activities have been fully implemented (CRM software, planning tools such as budgets) and a person has been appointed to be specifically responsible for this function^{xii}; previously, in fact, one person covered both the marketing and the communication areas.

It should be emphasized that *the marketing function’s principal task is to develop and maintain long-term relationships with loyal clients* (Gummeson, 2006), when considering the company to be “technologically irreplaceable”. The relationships created with current and potential partners are, in fact, seen as a central element in the Loccioni Group’s development strategies and so it is in this sense that marketing is increasingly being recognized as having a fundamental role.

Furthermore, the particular attention paid to relational aspects has heightened the awareness of how important it is, for the success of a company, to share certain values held in one’s own territory. Values like family, quality and respect for the environment have, for some time now, pervaded the group’s company culture and represent pivotal points for the entire organization and contribute to its growth^{xiii}; it follows, then, that there is a greater desire to communicate and give value to the culture which connotes the enterprise and its territory, along with the all of the experiences and sensations that the latter can offer, *with the knowledge that they can represent an important resource for the development of relationships*.

It is this attitude that gave rise to the project entitled “Land of Values” (LOV), aimed at creating a particularly positive experience for visitors coming to meet their business counterparts at the Loccioni Group^{xiv}.

The project consists in creating a network of collaborators with hospitality facilities (mainly *agri-tourism*, B&B and *country house* accommodation) and restaurants that best represent the local territory, so people will come to appreciate the typical aspects and strengths of the area^{xv}. Specifically, a number of different farms and agri-tourism facilities are involved in order to also offer visitors a sampling of local food products in addition to hospitality characterized by a direct contact with nature (an increasingly sought-after and appreciated feature, especially by those who live in a large metropolis)^{xvi}. Further collaborative efforts are planned with tourist associations and several local agencies and operators interested in spreading awareness of territorial assets and heritage (natural, historical, cultural, artistic). So, for example, visitors are taken to the huge underground karstic cave complex known as the “Frassassi Caves” (located in nearby Genga), to museums in the surrounding towns, to cultural and artistic events held locally and on shopping expeditions to area outlets. The intent, then, is to create for visitors – bethey clients, partners or suppliers – a familiar and friendly environment, while at the same time communicating and sharing the values and the culture that characterize the business enterprise and its territory^{xvii}. The basic idea is that by offering a welcoming environment and creating a positive experience^{xviii}, it is possible to combine business interests with the pleasures of the particular features of the geographic area^{xix}. It cannot escape notice, then, that this constitutes an interesting example of convergence between relational marketing and territorial marketing^{xx}. As a matter of fact, with its LOV project the company not only achieves the objective of increasing its relational capital (Costabile, 2001), but at the same time, it takes on an important role in a network that facilitates communication and synergetic promotion of the area of reference (see figure below).

Important advantages are observable for the Loccioni Group and for the operators involved, as well as for the territorial system itself.

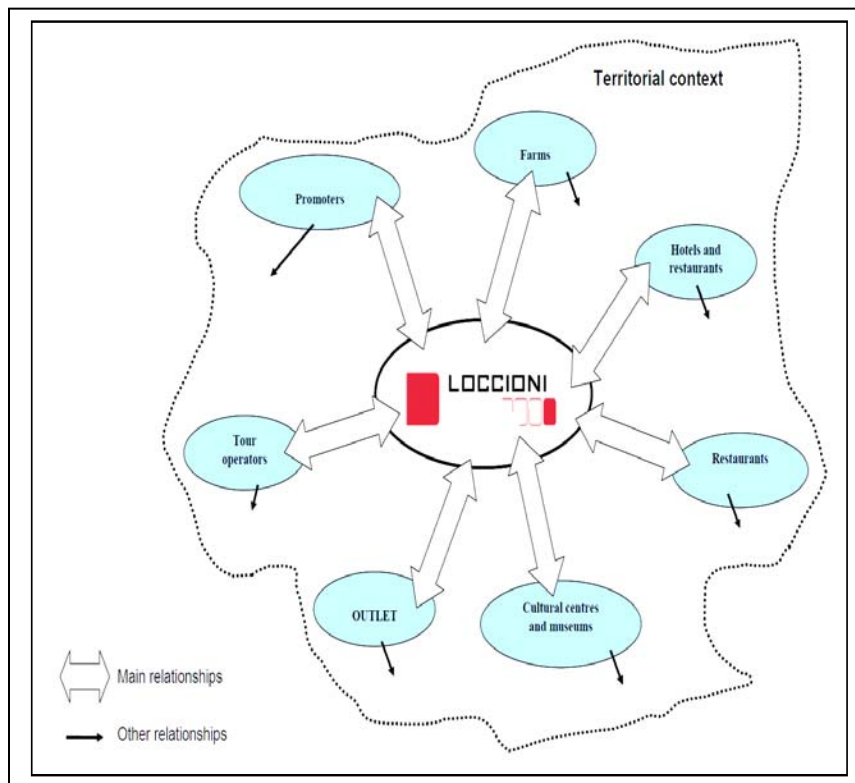

With reference to the first, widely positive feedback was had from guests, many of whom take advantage of the free ‘incoming’ service to organize their personal vacations. The project has received a favorable evaluation from internal collaborators who consider it a valid support for organizing client/supplier visits (in particular because it allows them to optimize the time needed to manage the relationships) and a useful tool for improving interactions with them. Moreover, the project has also boosted the Group’s image, as it has earned recognition as a finalist in the

competition for the 2008 “Sodalitas Social Award” (national award for business projects in the field of Social Responsibility).

Although it is extremely difficult to determine the direct impact that LOV has, or has had, on company performance, it nevertheless appears evident that it has contributed positively to the achievement of important company goals and objectives, in spite of the global economic crisis.

As regards the players and the territory, first of all, there have been advantages reaped in terms of increased visibility. By way of example, between 2007 and 2009 several thousand visitors, including foreigners, were affected by the project, in that they have had the opportunity to become familiar with the area and its features. Thus, increased value is assigned to the territory, its activities and assets contained therein^{xxi}.

FIGURE 3 – LOV BUSINESS NETWORK

Source: our data

With specific reference to tourism operators in the hospitality sector, they have had the opportunity to serve new market segments; the chance to interact with business travellers has meant that these figures can now better understand the needs of the businessman (shuttle service, Internet access, late check-in, etc.) and can respond by offering improved service, thus becoming more competitive^{xxii}. This means then, that the overall attitude towards hospitality in the area is improved^{xxiii}; business tourism can, in effect, be catered to year round^{xxiv}.

For local farm and winegrowing businesses, LOV offers an interesting solution to the issue of promoting their products and represents an alternative source of income.

It bears pointing out how the Loccioni Group has invested in hospitality services for its partners; in quantifying these services for accommodation, including meals and promotional gadgets such as food and wine souvenirs, from

2007 to the present, the investments have amounted to over two hundred thousand Euros. To these sums must be added the indirect economic returns, taken in consideration of the fact that many visitors, once they have come on business, return to the area on holiday, attracted by the excellencies of the territory and the services offered.

From an organizational viewpoint, in the selection phase for who should be involved, the group reference persons carried out on-site visits to farms and wineries, to hospitality and catering establishments, to evaluate the level of quality of the facilities, the service and the products offered; they definitely excluded standardized offers that lacked personality, whilst they gave preference to those who were able to combine simple hospitality with typical and quality products, because the latter were judged to be more suitable, offering the type of hospitality that is in keeping with the values that the territory intends to communicate.

Some difficulties were encountered in obtaining the collaboration of local accommodation facilities. There was a certain attitude of distrust vis-à-vis the project which had generated some erroneous opinions; the common fear was that the various hotels and such would have to contribute to the cost of communication (paper and digital brochures, web pages, dedicated newsletters) and to managing reservations and transfers. This was perceived as a service that was very similar to what is offered by any tour operator. The company put in considerable effort to overcome these obstacles so to make people understand the objectives of the LOV project and see it as something for the complete benefit of the territory, from which everyone taking part in the project stood to gain.

The results outlined above and the fact that the project is now in its fourth year are proof that it has been, and is, successful; they show just how important the capacity for integration among the players is for the enhancement of a territory.

5. Concluding remarks

Making use of territorial marketing territoriale is becoming more and more common, in light of the growing competition among geographical areas to attract and retain the resources necessary for their development.

From a theoretical point of view, the concept has seen a significant evolution which has resulted in attention being focused not so much on the available resources *per se* in a given area, but on the interactions among the players in that area. This would lead to the question of what role can be played by them in the overall enhancement of the territory.

This study, specifically, looked at the issue from the perspective of local enterprises. For them, on the one hand, there is the prospect of relocation to territories that are capable of offering specific advantages; on the other hand, there is the option to continue to co-evolve right along with the territory of origin, by investing heavily and by actively helping to develop relational systems and share the territorial values.

The "Land of Value" (LOV) case study has brought to light a number of interesting aspects.

First of all, it must be emphasized that reciprocal promotion not only provides the opportunity to integrate the various dimensions of the territory (production, nature, culture, etc.), but this interaction also constitutes a significant resource in terms of relational capital growth for enterprises.

Another aspect to highlight is the organizational function that a local SME can carry out in an effort to promote its territory; the Loccioni Group is a specific example of this in that it has assumed an important position in a network made up of a variety of different territorial players and, in doing so, has facilitated a fairly significant degree of synergetic promotion.

In this sense, the project represents an interesting example of convergence between relational marketing and territorial marketing.

Not to be overlooked is the important experiential aspect which becomes a particularly effective competitive factor. In this case, the reason lies in the fact that the experiences had by the various subjects involved in the project, as visitors and consumers, are considered germane to a B2B context.

The case study thus serves to illustrate a correct approach to territorial enhancement which, in turn, has a positive impact on a specific business project; hence, there is growing interest on the part of public operators to support such initiatives.

End Notes

ⁱ Even if the research work and paper have been conducted on the basis of a close collaboration between the authors, the paragraph 1 is attributed to S. Cardinali, the paragraph 2 to G.L. Gregori, the paragraph 3 and to A. Perna, the paragraphs 4 and 5 to V. Temperini.

ⁱⁱ They are, in fact, more and more involved in growing competition to attract and retain the resources necessary for their growth, which process has already begun (Marenga, 2005) by:

- a) the progressive physical transferability of tangible and intangible resources;
- b) the breaking down of barriers to the physical movement of individuals and businesses who periodically look for areas which would allow them to carry out their business in the most favorable conditions.

ⁱⁱⁱ Based on this line of reasoning, territorial marketing consists, therefore, of a process aimed at increasing the attractiveness of an area, by defining its (Kotler, Haider and Rein, 1993):

- features in terms of combination of facilities and services;
- “price policy” which essentially coincides with a system of incentives in favor of current and potential users of existing services and infrastructures;
- distribution methods for local services and products;
- communication and promotion activities aimed at creating a positive image for potential users.

^{iv} Integration of the territorial components, even transversally vis-à-vis the various dimensions or contexts, would indeed appear to be increasingly indispensable to the fulfillment of the needs and expectations of the variegated demand in a territory. By way of example, the evolution of demand in the tourism sector has led to a situation in which it is increasingly less likely that expectations can be satisfied by offering a single attraction.

^v As observed by Varaldo (1995, p. 41), when choosing a business location a more integrated vision takes into account the fact that «it is no longer just the natural or physical features, but also the intangible ones (qualified personnel, area universities, technological competencies, advanced services, etc.) that affect the effectiveness and efficiency of a local business enterprise and of a non-local business that operates in a certain area».

^{vi} Golinelli (2002) qualifies a territory as a “vital system”, defining it as «that system which pursues the goal of survival through the production of economic and social value for supra-systems which create expectations and exert pressure in terms of settlement and spatial location» (p. 15).

^{vii} On this point, it must be noted, though, that «the value created by territory-product for its users derives not so much from the potential of the single elements which constitute it, but rather, and above all, from the synergies that are activated (either naturally or, more often, as a consequence of deliberate strategies) among the tangible and intangible components existing inside the territorial system and in those systems to which it is connected» (Caroli, 2006, p. 146).

^{viii} The present case study was the fruitful outcome of the close collaboration, over many years, between the “Loccioni Group” and the Department of Industrial Management and Organization at the Polytechnic University of the Marche.

^{ix} The controlling share of capital is owned by the founder and his family, of which some members are also directly involved in company management, in different capacities and in different roles under various aspects – strategic, administrative and marketing – in close contact with the heads of those functions.

^x To put it in perspective, the township of Rosora has a resident population of just over 1,900; the surrounding area includes a number of peripheral townships and villages (Arcevia, Castelplanio, Cupramontana, Maiolati Spontini, Mergo and Poggio San Marcello) with an overall population of about 23,500.

^{xi} In keeping with this approach, we mention the creation of the “Leaf House”, the first “carbon neutral” residential building of its kind built in Italy, consisting of six apartments laid out on two floors; the building is located in the vicinity of the Loccioni Group headquarters. This eco-sustainable project was the fruit of collaboration among several partners who are members of the network of business relationships, each of which contributed its own competencies; for further discussion on this topic, see Temperini (2009).

^{xii} The current marketing director coordinates about ten people who report to him, interacts directly with the entrepreneur, with whom decisions are made jointly.

^{xiii} Due to the need to save the environment Loccioni has spread on the business context the values around eco-sustainability by organizing strong communication initiatives (Bullis, 1997).

^{xiv} The acronym LOV intentionally makes the phonetic association with the word ‘love’, to evoke the care and attention showered on the company’s visitors and partners.

^{xv} Particularly the role of small family enterprises operating in the tourism sector has been relevant in order to spread culture; also, their attractiveness can be considered (Getz D., Carlsen J., Morrison, 2004).

^{xvi} The growing desire to *go back to nature*, to seek and re-discover the beauties of nature and to somehow re-establish contact can be seen in the rise of so-called “ecotourism”. It is a particularly interesting form of tourism for many Italian communities, also in light of the fact that there exists a segment of tourist demand that is made up of people who *are willing to spend more money in an effort to preserve the local environment* (Sambri-Pegan, 2008).

^{xvii} Companies need to strongly communicate intangible factors such as own cultural values of the territory; it can be strategic to develop also business opportunities (Nes, Solberg and Silkoset, 2007).

^{xviii} The experiential aspect (Pine-Gilmore, 2000) takes on greater and greater significance as an effective competitive factor and has been the object of several consumer studies and market research (Schmitt, 1999); nevertheless, an interesting area for analysis is prospected by B2B contexts.

^{xix} Due to the sharing of territorial values with customers and suppliers a company can enhance the trust of the business relationships (Huang, Gattiker and Schwartz, 2008).

^{xx} In the conviction, though, that territorial marketing cannot be viewed as mere promotion, but rather, as a strategic re-formulation of what the territory has to offer (Bellini, 2000).

^{xxi} We have to consider that local investments on the territory could be stimulated by the integration between companies by managing business relationships; in fact we can observe a positive relation between level of foreign investments and tourism development (Sanford Jr and Dong, 2000).

^{xxii} SME operating in the tourism are creating new business relationships in order to develop other services complementary to the core business: the aim is to offer more value by integrating several activities into the company (Kandampully, 2006).

^{xxiii} It is important to highlight that exchanging knowledge between the network’s actors can have positive effects on the territory (Tzortzaki, Mihiotis and Agiomirgianakis, 2011), also the business network can positively affect the learning process among actors (Lemetyinen and Go, 2009).

^{xxiv} Ferrari-Adamo (2005) make the observation that the highly seasonal nature of tourism demand reduces «the interest to invest in the sector and weakens the supply of services in the low season, further aggravating the phenomenon itself; this is reflected in the extremely low user indices, both gross and net, for hospitality facilities, reduced rates of return on investment, difficulty in finding qualified personnel and many other problems» (p. 86).

Creativity and Competitiveness for Luxury Brands

LI Yang, liyang0701@yahoo.com

ZHOU Ting, tinazhou.uibe@gmail.com

The University of International Business and Economics (UIBE), China

Abstract

Creativity is the most important component of luxury products which distinguishes them from mass consumer products. It is the originality and creativity which gives the luxury brands shine and glamour even for those emphasizing heritage and tradition. In this sense, luxury can be considered as a part of creative economy.

The paper identifies the features of creativity and the sources of creativity in the luxury industry. It also tries to find out the intrinsic value and competitive advantages of luxury brands. By combining these factors, the paper help understands how luxury can maintain the highest market level among all industries.

Introduction

After centuries of Industrial development, undifferentiated market is no longer attractive to consumers. Technological advancement is no longer the sole propeller of market development. Entering the 21st century, economists, experts in management and entrepreneurs are all exploring the new momentum for economic and market development. And there is a consensus among more and more people that creativity is the intelligent creation of human mind. It promotes the accumulation of cultural heritage. It is also an economic force which creates wealth and job opportunities, drives sustainable development, technological and commercial innovation, and enhances municipal and national competitiveness.

Creativity and innovation is the main source of competitive advantage for all trades, especially for luxury goods and services. Luxury customers deem luxury products as pursuing their life-time dreams and they are eager for the aesthetical creativity in the brands. Creativity is the most important component of luxury products which distinguishes them from other mass consumption products. Looking back, even before the concept of luxury brands, there had been inseparable ties between luxury products and creativity. Also, creativity is the core value of luxury brands. Successful luxury brands are a combination of tradition and creativity. Tradition is what makes luxury brands classical and gives them everlasting attraction, while creativity gives them brand-new vibrancy and glory in all time.

No trades escaped the impact of the global financial crisis started in 2008. Faced with plummeting sales and worsening financial indicators, the luxury industry which claimed so proudly that it had never be hit by economic cycles had to admit reluctantly that it was no longer immune to market ups and downs. Limited disposable income of consumers and severe credit crunch forced luxury brands to compete for market shares and customers. Due to limited resources, they focused more on innovation and creativity than traditional marketing mix to offer differentiated products and services hold onto their existing customers and create new demands.

Luxury as Part of Creative Economy?

Creativity (UNCTAD, 2008) refers to the formulation of new ideas and to the application of these ideas to produce original works of art and cultural products, functional creations, scientific inventions and technological innovations. Creativity is found in all societies, it is associated with originality, imagination, inspiration, ingenuity and inventiveness. Creativity is also present at all levels of business from the management of a company to the lower level operations of the company. However, creativity is not necessarily an economic activity but may become so when it produces an idea with economic implications or a tradable product. This transition from the abstract to the practical, from the idea to the product, is hard to define. Thus, when comes to the concept of creative economy, there

is no unique definition and it is still evolving.

However, the UNCTAD Report does offer a definition which can be summarized as follows:

- The creative economy is an evolving concept based on creative assets potentially generating economic growth and development;
- It can foster income generation, job creation and export earnings while promoting social inclusion, cultural diversity and human development;
- It embraces economic, cultural and social aspects interacting with technology, intellectual property and tourism objectives;
- It is a set of knowledge-based economic activities with a development dimension and cross-cutting linkages at macro and micro levels to the overall economy;
- It is a feasible development option calling for innovative multidisciplinary policy responses and inter ministerial action;
- At the heart of the creative economy are the creative industries.

As for the definition of creative industries, John Howkins in his book (Howkins, 2007) identified four industries, i.e., copyright industry, patent industry, trademark and design industry to constitute the creative industries and the creative economy. This rather narrow definition was confirmed and adopted by some countries including Britain and Australia. However, according to the UNCTAD Report, “creative industries” are the cycles of creation, production and distribution of goods and services that use creativity and intellectual capital as primary inputs. Thus creative industries constitute a vast and heterogeneous field from traditional arts and crafts, publishing, music, performing arts to such as film, television and radio broadcasting, new media and design which are more technology-intensive and services-oriented. They comprise a set of knowledge-based activities that produce tangible goods and intangible intellectual or artistic services with creative content, economic value and market objectives.

Looking back, even before the concept of luxury brands, there had been inseparable ties between luxury products and creativity. Also, creativity is the core of luxury brands. Successful luxury brands are combination of tradition and creativity. Tradition is what makes luxury brands classical and gives them everlasting attraction, while creativity gives them brand-new vibrancy and glory in all time. Thinking a bit wider, luxury is not just a trade, it is a market level which is at the top of all trades, and it is a different way of understanding a customer and of managing a business. We can even say that luxury is a culture and a social marker. Almost all successful luxury brands, while adapting to world changes and new cultural trends, they themselves have always been culturally innovative.

Like César Ritz – the King of hoteliers, the hotelier to Kings, the inventor of a new spirit of luxury hospitality – dreamed of creating something new and original, a hotel that would be the quintessence of elegance and would bring together all the refinements that a Prince could dream of for his own House. He successfully brought about an unparalleled series of cultural innovation – F&B, Five o’clock Tea, women’s access to restaurants, pink apricot lamps, carpets, and so on.

In this sense, we can safely say that luxury genuinely a part of creative economy to produce tangible goods and intangible intellectual or artistic services with creative content, economic value and market objectives.

Basic Features of Creativity in Luxury Industry

1. Relevancy

Creativity can come from both spontaneous inspiration and careful observance of daily everyday life. Either way, it is not unconstrained and wild imagination. Rather, it is a combination of earthly factors and intelligent thinking of human mind. The competitive features of luxury determine that its creativity must have very strong relevancy with capital, culture, art, technology, psychology/attitude and law. Every relevant factor has strong influence on the luxury industry and on the other hand, these factors can also become important source of creativity for the industry.

2. Originality

Since the birth of first luxury brand – Hennessy X.O. – in 1724, most luxury brands have had a history of more than one hundred years and even two centuries for some. What give these luxury brands timeless attraction and

international reputation? That is, originality. Creativity in luxury is strongly original which in some cases breaks away from tradition and people's expectation. This originality is embodied not only in the design of products, brand logos, advertising, but also history and culture of the brands.

3. Impact

Luxury clientele are different from consumers of ordinary industrial products. What affect them most are not price and functionality, but their perception and sensation. Most luxury consumers are well-educated and have high disposable income, which often give them exquisite taste. It is sometimes hard to impress them with plain and common products. Thus, most luxury brands try to leave impacts on the minds of their clients. This impact is evoking the deepest of humanity, without it, consumers will not remember the product or the brand.

4. Extension

Almost all luxury brands started with specification in certain field. For instance, Louis Vuitton started with leather suitcase, Hermes with saddles. With the expansion of the brand and the their businesses, the creativity of the luxury brands has extended to almost all possible products and services. Many luxury brands cover a wide range of businesses like clothing, fragrance, eyewear, scarf, bag, cosmetics, accessories and so on. This extension of branding strategy helps luxury brands maintain their traditional advantage in their former fields, while obtaining new advantage in related areas.

5. Artistry

Looking back ,luxury products have always maintained a constant and intimate relationship with art since its birth. They become even more intimate, especially with contemporary art since entering the 21st century. Although historically art was essentially religious, art in its modern conception has become profane, it remains a sign of culture, of the capacity to appreciate the intangibles, and not only to possess them through effect of accumulated wealth. Luxury brands wish to create this vertical dimension. Art also makes it possible to nurture the specific relationship between luxury and time, i.e., the timelessness. Art, by its essence, aims at eternity: the work will survive the creator and, over time, his epoch. This is how luxury attempts to signal that it is not simply merchandise.

6. Icon

Most luxury brands have a legendary iconic figure, like Yves Saint Laurent, Coco Chanel, Christian Dior, Gucci, Armani and so on. These icons and designers are geniuses whose works cannot be copied. Over time, they have become an inseparable part of the brands. They not only built the brands, but also gave them life through their genius creation. The legends of these icons also add value to the products that they represent.

7. High Value-added

Economic principle tells us that the value of certain product is primarily based on people's perception of its utility. For creative products, their market price is often determined by people's perception against the products. With economic development and more affluent material life, consumers put more emphasis on pursuing spiritual enjoyment. Therefore, creative products which are full of cultural and spiritual content tend to have higher value-added. Apart from the superb quality these products possess, people enjoy the satisfaction that they get from the consumption and the desirable way of life. Creativity gives high added value to luxury brands, enable them to pursue highest profit rate in their industry.

Sources of Creativity in Luxury Industry

Creativity comes from many sources, some from unintentional, spontaneous insights. But mostly creativity is coming from intentional thinking or activity looking for answers or to please customers. The sources of creativity in luxury industry to some extent are similar as in all other trades, but some are unique to the luxury.

1. Experience

All creativity is based upon experience to some extent. Though innovation from experience may sometimes be strong and powerful, it takes rather long time for experience to become creativity. On the other hand, experience may also become barriers to creativity and hinder the creative process.

2. Customer Requirements

If salespeople, service staff and product developers listen to customers' opinion and encourage them to talk more, they will find that customers will always become an important source of creativity. Also customers may discern more precisely what and where the problems are. Most companies, including luxury companies understand the importance of customers requirements and consider them as one major source of new ideas.

3. Art

Art, and contemporary art nowadays, has been a very important source of creativity for luxury brands. There are numerous examples like the collaboration between LV and Steven Sprouse and Richard Prince. Art gives unlimited power of imagination to luxury goods, endowed the tangible products with sophisticated cultural content. However, this creativity, from art to luxury goods is not just simple imitation. Rather, the key to the successful interaction between art and luxury is the culture connotation in the art which gives luxury everlasting charm.

4 . Social Culture

As said before, luxury is in itself a culture. Most successful luxury brands have been culturally innovative. They not only adapt quickly to social changes, but most of the time they think ahead of their times and give their customers what they have not even dreamed of, sometimes even influence the social and cultural structure and help create new trends.

Conclusion

Creativity in luxury industry is one of the many contributors that make the luxury products attractive to their customers in all times. It has some unique characteristics which distinguish luxury industry from other ordinary merchandise trades. Creativity in luxury can come from many sources, some are also particular for the luxury alone. Creativity, together with other features of luxury, guarantees its highest market level among all trades.

Personal and Cultural Values as a Determinant Of Future Work and Consuming Behavior Of An Individual

Marija Tomašević Lišanin, PhD

Kristina Ozimec, M.A., kristina.ozimec@efzg.hr

University of Zagreb, School of Economics and Business, Croatia

Yifan Li, PhD

Fudan University, Management School, China Marketing Research Centre, China

Abstract

Values are hypothetical constructs valuable in analysis of human behavior. Being learned through socialization process values are prone to social influence. Values have important role in motivational framework and they are recognizable through goals that person considers important and strives to attain in life. Better understanding of the process values have on motivation may be beneficial to increase goal commitment. Except to human resource managers study of values gives also valuable insights to marketing and sales specialists considering consumer behavior while through values observed in working environment including social interaction, social status, material rewards preference, and self-fulfillment they can learn about consumption patterns. The importance of work in the life of an individual forms a set of attitudes and beliefs that are responsible for the selection of goals in corporate and private surroundings. Despite globalization challenge there are cultural differences in meaning of work across different societies and different times implicating different inputs for organizational strategies. The purpose of this paper is to analyze cultural differences and similarities in working values between Croatian and Chinese senior business students. Living in a collectivistic society forms another pattern of values than does living in an individualistic society having impact on developing organizational strategy as well as some implication on marketing strategy.

Key words: work values, cultural differences, Croatia and China, sales, consumer behavior

Introduction

Values are mental concepts studied throughout many social sciences. Values are considered to be cognitive elements that stimulate motivation for behavioral response. Using concepts derived in social psychology we can explain and to some degree predict human behavior. Therefore prior to undertaking a serious research some social psychology terms related to understanding people and reasoning are to be introduced. Social perception is the process through which we try to understand other people and ourselves. People acquire judgments, attitudes and beliefs through socialization experience. People living and growing in similar environments may learn to interpret any elements of this environment in a similar way. People exposed to different stimuli tend to see world in divergent perspectives. The process of social perception contributes to our thinking about the world. Social cognition is the process through which we interpret, remember and then we use information about the world and ourselves (Aronson et al., 2009). The consequences of human values manifest in many social phenomena. Values are therefore interesting research field contributing to psychology, sociology, economics etc. Values studies are also very applicative in business especially in marketing and human resources. The relationship between personal values and consumer behavior has been to some degree investigated in marketing literature (Kahle et al., 1986). As a means of expression, consumers use brands and products in order to communicate their self-concept to their reference group

Personal Values

Values are usually mixed up with other concepts such as attitude, social norm and need. The definition of values should be distinguished from these concepts but it should as well be systematically related to these concepts. A

value is an enduring belief that a specific mode of conduct or end-state of existence is personally or socially preferable to an opposite or converse mode of conduct or end-state of existence. A value system is an enduring organization of beliefs concerning preferable modes of conduct or end-states of existence along a continuum of relative importance (Rokeach, 1973). Values are attitudes that reflect a principle, standard or quality considered by the individual as the most desirable or appropriate. Values are stable and enduring views that a specific behavior or goal is preferred to another behavior or goal.

An attitude differs from a value in that an attitude refers to an organization of several beliefs around a specific object or situation. A value on the other hand refers to a single belief of a very specific kind. It concerns a desirable mode of behavior or end-state that has a transcendental quality to it, guiding actions, attitudes, judgments and comparisons across specific objects and situations and beyond immediate goals to more ultimate goals (Rokeach, 1973). Apparently values occupy a more central position than attitudes within one's personality and cognition and they are therefore determinants of attitudes and behavior. This greater centrality of values to attitudes has been noted by some other authors as well, e.g. „attitudes themselves depend on pre-existing social values“ (Allport, 1961). Attitudes simply appear to be function of values. When comparing values to social norms it is noted that values are more internal while norms are more externally imposed and they are just a mode of behavior. Values, as standards for establishing what should be regarded as desirable, provide the grounds for accepting or rejecting particular norms. When it comes to distinguishing values and needs a motivation approach is to be referred to while the motivation system seems to have the properties of a need and also the properties of a value what is especially evident at achievement motive. Values are the cognitive representation and transformation of needs and man is the only animal capable of such representations and transformations (Rokeach,1973). The key to identifying the structure of value relations is the assumption that actions taken in the pursuit of each type of values have psychological, practical and social consequences that may be compatible with the pursuit of other value types. Analyses of the conflicts and compatibilities likely to arise when people pursue these types of values simultaneously suggest a potentially universal set of relations among values (Ros et al., 1999).

Values in Work environment

A theoretical setting of personal values is applied in studying work where work goals are seen as manifestation of human values. Because beliefs about work do not belong to the category of innate predisposition but stem from everyday experience, they are largely determined by sociocultural factors (Super & Šverko, 1995). Across different societies work has a different meaning for individuals. People try to attain various goals through their work. They pursue material wealth, social status, social interactions and self-realization. Researchers are trying to structure and organize values people are expressing through their work. To better understand work values of an individual researchers are analyzing what people search for in their work and what is the role of intrinsic motivation compared to extrinsic rewards in job satisfactions.

Work values represent important and relatively stable goals that people seek to attain in their work - economic security, simulative social interaction and use of their abilities. It is generally supposed that the more important such values are to individuals the more important the work role will be in their lives (Super & Šverko, 1995). So, the various work goals are ordered by their importance as guiding principles for evaluating work outcomes and for choosing among different work alternatives.

Cultural differences in Values

It is usually assumed that people around the world don't share the same values implying that there are cultural and national differences in value systems. For many years now, journalists, political scientists, sociologists and psychologist have discussed the differences between two major cultural clusters of attitudes called Western and non-Western values. According to philosophical tradition developed by Weber the most fundamental values of Western civilization are work, achievement, striving for efficiency and consumption of material goods. It is then argued that

in non-Western civilization these values are somewhat important but not considered critical. The essence of non-Western values is respect for tradition, reverence to authority and overall stability (Shiraev & Levy, 2010). As Hofstede (1991) described it following cultural dimensions reflect four major ways people cope with their most important problems: individualism and collectivism, power distance, masculinity and femininity and uncertainty avoidance. In another study Schwartz (1997) argued about cultural differences in individual values and he suggested individual values as being connected to the way various groups cope with basic societal problems. Three basic issues make various social groups different from one another and these are: the extent to which people are independent of or dependent on groups, their views on prosperity and profit and their views on whether it is appropriate to exploit, fit in, or submit to the outside world. Predominant cultural values that have been developed in a community or country can determine people's views on a wide range of social, political and personal issues.

Research goals

The purpose of this paper is to give an overview of previous research on values and to indicate the importance of value research in working environment and consumer behaviour. This paper is based on preliminary research on work values on Croatian and Chinese senior students and will be extended in following papers after the research and all data collecting will be completed.

As in late 1980s the research on working values in Croatia was conducted in this paper we made a comparison between working values hierarchies in late 1980s and hierarchy obtained in 2010. We did not find past working values research on Chinese population using Working Values Scale Inventory, so we will discuss cultural differences and chinese value transition on theoretical base. Two hypothesis were tested in this paper:

1. Working Values in Croatia today will be more intensively oriented toward Self-Actualization values than in 1980s.
2. There will be cultural differences between Croatian and Chinese sample evident in values hierarchy.

Methodology

To measure working values of an individual the international edition of the values scale was used. This value scale was developed as a part of international Work Importance Study (WIS) project under the supervision of Donald E. Super in late 1980s. In the scope of that project International Value scale and 11 national value scales were developed. The WIS Values Scale includes includes eighteen values plus two optional values. The international Values Scale contains fifty four items. The items are sentences that are to be evaluated on 4-point scale (*of little importance, of some importance, important, very important*) to indicate how important particular statement is. After developing value scales several analyses have demonstrated the validity of the Value Scale through internal construct validity, focusing on the interrelation of the inventory items and scales, and external construct validity, dealing with their relationship to other observable behaviors. The factor structure of Value Scale was analyzed and meaningful results were obtained revealing fifteen interpretable factors.

TABLE 1: VALUES SCALES AND SAMPLE ITEMS

	Values Scale	Sample Items
1.	Ability Utilization	Use all my skill and knowledge
2.	Achievement	Have results which show that I have done well
3.	Advancement	Get ahead
4.	Aesthetics	Make life more beautiful
5.	Altruism	Help people with problems
6.	Authority	Tell others what to do
7.	Autonomy	Act on my own
8.	Creativity	Discover, develop or design new things
9.	Economics	Have a high standard of living
10.	Life-style	Living according to my ideas
11.	Personal Development	Develop as a person
12.	Physical Activity	Get a lot of exercise
13.	Prestige	Be admired for my knowledge and skills
14.	Risk	Do risky things
15.	Social Interaction	Do things with other people
16.	Social Relations	Be with friends
17.	Variety	Have every day different in some way from previous
18.	Working Condition	Have good space and light in which I work

There were International (English) and National (Croatian) official Values scale versions available and Chinese version was developed by double back translation. It was translated from English to Chinese by English-Chinese speaking Chinese person and from Croatian to Chinese by Croatian-Chinese speaking Chinese person.

In total there were 342 participants in this research while 231 participant were from Croatia and 111 participant were from China. 60% of participants were female and 40% were male. Participants were 21.5 years old in average and their average GPA was 3.5. All participants were 3rd and 4th year students from Croatia and China studying at Business and Economics Schools at University of Zagreb and Fudan University.

Research Results

In this part the data concerning the hierarchy of values and average importance of values are presented. Sample's means were used to constitute the value hierarchies. In Table 1 is given the hierarchy of values based on the Work importance Study research in 1987. Five most important values as considered in 1987. were Personal Development, Ability Utilization, Achievement, Social Relation and Economics. Three least important values were Variety, Risk and Authority.

TABLE 2: HIERARCHY OF VALUES IN CROATIA IN YEAR 1987

1. Personal Development	10. Creativity
2. Ability Utilization	11. Advancement
3. Achievement	12. Lifestyle
4. Social Relation	13. Physical Activity
5. Economics	14. Social Interaction
6. Working Condition	15. Prestige
7. Altruism	16. Variety
8. Aesthetics	17. Risk
9. Autonomy	18. Authority

The obtained Value importance means range from 8,46 to 10,80 for Croatian Sample and from 4,90 to 6,94 for Chinese sample. In Table 3 it is seen that top five working values among Croatian students are Personal Development, Achievement, Social Relations, Ability Utilization and Advancement while top five working values among Chinese sample are Ability Utilization, Personal Development, Working Conditions, Aesthetics and Lifestyle.

TABLE 3: HIERARCHY OF VALUES IN CROATIA AND CHINA IN 2010.

Croatia		China	
Personal Development	10,80	Ability Utilization	6,94
Achievement	10,58	Personal Development	6,30
Social Relations	10,48	Working Conditions	6,17
Ability Utilization	10,42	Aesthetics	5,68
Advancement	10,41	Lifestyle	5,64
Economics	10,18	Achievement	5,62
Prestige	10,05	Social Relations	5,48
Working Conditions	9,98	Autonomy	5,33
Aesthetics	9,90	Prestige	5,31
Lifestyle	9,71	Physical Activity	5,13
Creativity	9,70	Creativity	5,06
Altruism	9,62	Altruism	5,06

There is a general trend that average importance of values has lower values for Chinese sample and all the differences between average importance of values between Croatia and China are statistically significant. As more data on Chinese sample are being collected this tendency to lower values importance means will be tested and discussed in final paper on this research. No gender differences and socio-economic differences in hierarchy of Values were found between the samples.

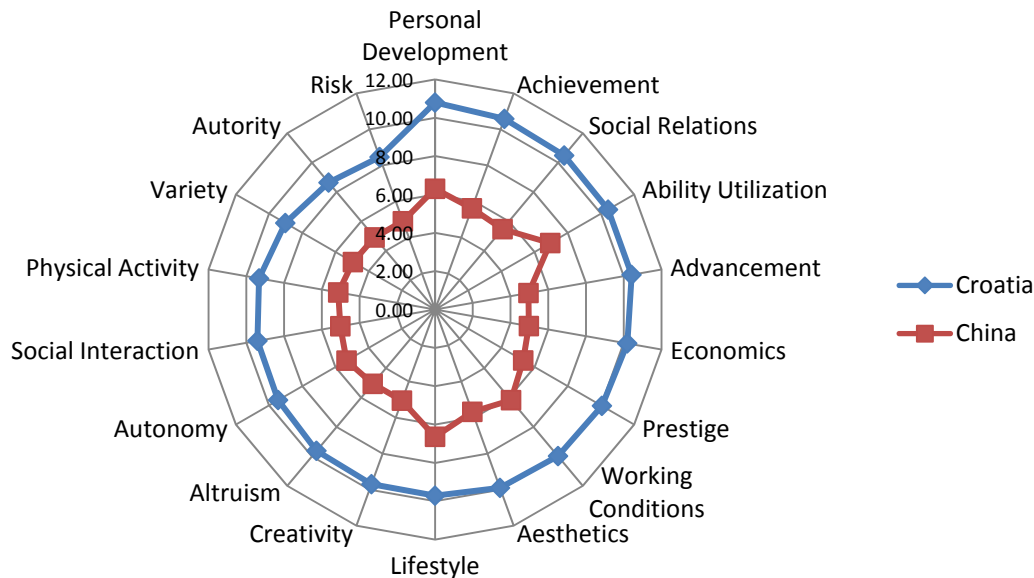

FIG. 1: COMPARISON OF VALUE IMPORTANCE IN CROATIA AND CHINA

Discussion

Most of the Croatian value studies date back to 1970s and 1980s when Croatia was part of former socialist Yugoslavia. These studies were sociological studies stressing the conflict between the values of traditional preindustrial culture and new value system reflecting the introduction of modern industrial technology and socialist ideology. There were also studies that have paid attention to the position of pay in worker's value hierarchies and studies oriented to occupational choices. The most interesting study for our research was study undertaken by Super and Šverko (1987) in the scope of Work Importance Study which was based on the same Values Inventory as it was used in our research. In this preliminary research we refer to the factor structure of Values scale obtained in that previous research and afterwards we will perform factor analyses on our data to check the stability of factors. The five derived factors were labeled as follows: Orientation Toward Self-Actualization (Ability Utilization, Achievement, Personal Development, Aesthetics), Individualistic Orientations (Lifestyle, Autonomy, Variety, Creativity), Social Orientation (Social Interaction, Social Relations, Altruism), Utilitarian Orientation (Economics, Advancement, Authority, Prestige, Working Conditions) and Adventurous Orientation (Risk, Physical Activity).

We believed that because of changed political and economic system and shift from socialist system to open capitalist economy there would be some changes in hierarchy of values. But contrary to our expectations the rank order of importance of values doesn't almost at all appear different today than it was back in 1987. Four out of five top ranked values are the same. Only value labeled Economics indicating satisfied income, safe job and stable life standard has been replaced by Advancement. If we consider the value hierarchies more closely we can notice two very indicating switches and jumps in hierarchy between 1987 and 2010. In 1987 research Advancement value indicating opportunities to improve position on one's work place and to go up in position hierarchy was ranked on eleventh place and in 2010 it was on fifth position. And Prestige value indicating respect, position and influence in society moved from fifteenth position to seventh place. These two shifts in values could actually reflect the changes in political and economic system as well as social changes under the flooding of capitalist materialistic symbols. Top five working values on Croatian students are Personal Development, Achievement, Social Relations, Ability Utilization and Advancement. Among those top five values there are three of four values that are considered to belong to Self-Actualization Factor. These three values are Personal Development, Achievement and Ability Utilization. Values on Self-Actualization factor are typical intrinsic values that are important in the satisfaction on higher-order needs. Other two values in top five selection in Croatia are extrinsic values defined and Advancement that have projections on Utilitarian Orientation and Social Relations that belongs to social orientation factor. Top five working values among Chinese students are Ability Utilization, Personal Development, Working Conditions, Aesthetics and Lifestyle. Among Chinese sample there are also three out of five top important values that reflect Self-Actualization factor. These values are Personal Development, Ability Utilization and Aesthetics and they are all intrinsic values. Other two values belong to Utilitarian Orientation represented with Working Conditions value and Individualistic Orientation represented with Life-Style value.

It is pretty unexpected finding that one individualistically oriented value appears so highly in value hierarchy in Communist country but that could be due to Chinese fast growing and turbulent economy that is involving more and more western values in Chinese traditional Value system. As our sample were senior university students we have to keep on mind that they are new Chinese one child generation that is transforming some traditional patterns and setting new society steps that will affect value system as well. More advanced and versatile job opportunities will impact working values and logically it will also impact consumer behavior while better working opportunities and conditions set different consuming style pattern as well. Working conditions value that rank on third place in Chinese sample and on eight place in Croatian sample also indicates fast changing economic and social circumstances while in last decade China has undergone rapid working conditions change which is still in process. In Croatia on the other hand working conditions are not much questioned while economy is not industrially based and has never experienced difficult working conditions to Chinese degree.

It seems that our participants in both cultures place a strong emphasis on the importance of the higher-order needs of Self Actualization and at the same time they are attaching less importance to other orientations. At the same time people are workers and consumers and it is expected their values will reflect in both areas. Application of the theory and methods of research on basic individual values has the potential of further contribution to the study of work and consumer behavior.

In future extensive research it is planned to make a replication of the study on students and sales force and marketing employees treating them as working population and consumers at the same time.

Conclusion

Countries differ in "mentality" meaning complex set of beliefs, habits, attitudes, values etc. It has been assumed that each culture sets a value on each of the major life roles that vary from one culture to another and are different in different times. Hierarchies of values obtained by ranking the arithmetic means of values appear to be very similar in both samples and they show significant degree of mutual agreement. Our subjects in both samples give priority to values associated with Self-Actualization while putting less emphasis to Social and Utilitarian Values. Our findings indicate that similar value pattern exists at both Croatian and Chinese sample and these results challenge many

stereotypes that may have been valid 30 or 40 years ago. Application of the theory and methods of research on basic individual values has the potential of further contribution to the study of work and consumer behavior.

Retail Therapy : Do Foreign Brands Give More Satisfaction Than Local Brands?

*Hetty Karunia Tunjungsari, hetty.karunia@yahoo.com
Universitas Tarumanagara, Indonesia*

ABSTRACT

Consumer spending and buying behavior driven by the desire to alleviate negative mood, known as retail therapy, are widely recognized in today's life. Smart marketers striving to provide best offerings to satisfy this kind of customers, yielding customers' satisfaction with their shopping experience and conclusively create customer loyalty. This research explored whether retail therapy performed by Indonesian's consumers. Moreover, we also investigated the influence of brand preferences, foreign vs local brands, in generating consumer's satisfaction after having retail therapy done. Our findings expand the retail therapy literature within the context of brand preference, that foreign brands give more satisfaction compared to local brands.

Keywords : retail therapy, foreign brand, local brand, consumers' satisfaction

Research Background

Consumer's spending and buying behavior driven by a desire to alleviate negative mood are widely common in everyday's life. Consumers are indulged with alluring shopping programs designed by marketers with the chase of enjoyable shopping experience as important precursor of shopping satisfaction. It is inevitable that on one side marketers spot the opportunity to attract customers attention to their mall, especially those who like to spend and purchase at the time of experiencing a negative mood. Conversely, smart marketers see the opportunity as a distinctive competence to provide best services for these specific customers, create inimitable atmosphere to enhance consumers' satisfaction. At the end of the shopping experience, consumers' satisfaction will become a proper indicator of future consumer loyalty.

Indonesian consumers have several unique characteristics compared to other countries. Kharis (2011) confirmed unique characteristics of Indonesian hedonic consumers as short term oriented, religious, high need of prestige, strong subculture, and high preference of foreign brands. Further, Kharis acknowledged unplanned buyer as another characteristics demonstrated by most Indonesian hedonic consumers. Otherwise, there has not been researched that some these Indonesian shoppers are also shopped consciously in terms of retail therapy. The circumstances that retailers continuously improve their offerings and increasingly create numbers of shopping mall in several major cities in Indonesia, such as Jakarta, Surabaya, Medan, Makassar and many others, instigate the opportunity to explore consumers' retail therapy behavior. Research found that consumers can shop more convenience and get more satisfaction within a large range of shopping programs during retail therapy. Fortunately, increasing consumers' satisfaction with their shopping experiences also generate more benefits for retailers.

This study proves that retail therapy is performed by the Indonesian consumers to overcome their perceived negative mood. This paper will first begins with a brief literature related to retail therapy then followed with hypotheses proposed in the study. The next section will presents research methodology conducted from data collections to hypotheses testing. At the end of the paper we will discuss about research findings, research implications and limitations of the study. The research questions of this study were : 1) Does retail therapy motivation influence consumer's satisfaction? 2) Do foreign brands create different level of satisfaction compared to local brands during retail therapy? 3) What product that gives highest satisfaction for Indonesian consumers in retail therapy?

Literature Review

Mood in marketing research

Research on mood proves that consumers who experiencing negative mood have a higher desire to possess a product, spend money, and consume a product than consumers at neutral feeling (Kacen and Friese, 1999; Kang,

2009; Ragunathan and Corman, 2004; Rucker and Galisky, 2008). Negative mood will improve one's self focus and encourage consumers to take some actions in order to reduce negative effects of this mood (Kacen, 1998; Kacen and Friese, 1999; Luomala, 2002). They will also engage in compensatory consumption (Woodruffe, 1997; Woodruffe-Burton, 1998; Yurchisin, Yan, Watchravesringkan, and Chen, 2008). Negative mood occurs for many reasons, One's experiences coming from internal causes (from their own actions) or external causes (from outside customers). Unpleasant events experienced by consumers in their everyday life such as traffic jams while driving to or going home from work, feeling angry from being disgraced by superiors, frustration from not getting fans concert tickets which was keenly awaited, the sorrow of losing the loved one, and many other reasons which can be happen to anyone in a random manner.

In terms of mood repair, consumers even do retail therapy (retail shopping) consciously with the aim of improving mood when experiencing anger, anxiety, or sadness (Kang, 2009). Kang further finds that marketers are beginning to realize the needs of consumers associated with retail shopping and start creating a variety of facilities to be able to provide a more enjoyable shopping experience for consumers. Because there is satisfaction attainment after engaging in retail therapy, this activity considered as a positive activity since it helps consumers to overcome their perceived negative mood and get back to their daily routines lively. The fact that consumers do retail therapy in their consciousness demonstrates that this activity is different from the compensatory consumption, one that tends to end up with disappointed feeling after making purchases in shopping experiences.

Shopping as mood alleviation method

Shopping behavior to improve one's mood is part of self-regulation methods. Károly (1993) states that self-regulation is a process, both internal and/or transactional, that enable individuals to direct the activities of objectives achievement within a certain time and in the context of the changing situations. Furthermore Luomala et al (2004) defines self-regulation of mood as individual behavior that is driven by the mood which has been done to achieve the goal to extend or enhance positive mood or to remove or overcome the negative mood. In this study, the mood repair hereinafter defined as individual behavior that is driven by the negative mood and performed with the aim to eliminate or overcome the negative mood.

Retail Therapy

Retail therapy literatures come in two approaches, the consumption in the mood repair and compensatory consumption. Within the mood repair literature, retail therapy is a strategy for self-regulation of negative moods. While in the compensatory consumption literature, retail therapy is an activity undertaken as compensation for psychological deficiency experienced by consumers. Research shows that consumers who make purchases in these two situations are both experiencing a negative mood and spending their money to cope with negative mood (Kang 2009). However, as self-regulation's strategy, in retail therapy conscious consumers use shopping activity to cope with negative mood and tend to obtain higher satisfaction after having retail therapy done. Consumers who engage in retail therapy does not always end up with product purchases, browsing experience while in the store for some consumers have been enough to give the effect of mood repair and create a positive evaluation of the stores visited. Definition of retail therapy in this study is then the behavior of consumption, including spending and purchases, to improve one's negative mood.

Retail Therapy Motivations

This research will discuss retail therapy from the viewpoint of mood repair, to emphasize the positive benefits obtained by consumers from shopping activities done. Products purchases in therapy shopping play an important role in improving mood, reinforce the reason that there are different consumers experience when making retail therapy and engaging compulsive buying. Referring to Luomala et al (2004), when consumers activity in the mood repair has the power of therapy, particularly therapy through consumption, mood repair activity through retail therapy can provide such benefits as distraction, self-indulgence, and activation for consumers.

Distraction, self-indulgence, and activation were 3-related benefits that become one's motivation of spending and purchasing in retail therapy (Kang 2009). Distraction is the benefit of gaining pleasure from the thought of purchasing a product. Self-Indulgence is the benefit gained when a person feels happy after going shopping to get something they like for themselves. While browsing in the store to look for information for purchase in the future or learn the latest trends identified as activation benefit. People who want to benefit distraction and self-

indulgence used retail therapy for the purpose of mood repair, while the activation related to the purpose to eliminate the feelings of sadness or depression.

Furthermore, Kang (2009) identifies consumer motivations in making retail therapy as : positive distraction, escape, indulgence, elevation of self-esteem, activation, sense of control, and social connection. Each consumer motivation represents the underlying reason for purchasing activity and consumer spending in overcoming their negative moods or emotional needs through retail therapy :

- Positive distraction is the motivation to forget the negative mood in search of entertainment via shopping.
- Escape is the motivation related to physical activity undertaken as a contribution to the negative mood, through physical experience gained from shopping environment.
- Indulgence consists of the responses that focused on maximizing pleasure in reducing the negative effects of mood, where the shopping experience will give pleasure in a short time and have broad impact.
- Elevation of self-esteem consists motivation to benefit from a varying ways such as feeling happy to meet with someone, feeling to get the desired identity, feeling proud, confident, and others.
- Activation consists of motivation indicating that the shop can make a person active in a variety of ways, such as the stimulation of feelings, learning new things and feeling up-to-date, and mental stimulation and physical abilities.
- Sense of control is intended to gain control over something when someone loses the control he/she had.
- Social connection is the motivation for someone to get an ideal of social relationships through the people they met while shopping, which they do not get in everyday life.

Brands in Retail Therapy

Recently, competition among brands has become more complicated as the number of foreign brands increase in developing markets. Consumers in developing markets possess various motives for purchasing foreign brands, including higher prestige and higher satisfaction. Research into the underlying reasons that drive this purchase decisions is significantly important, since the findings will provide marketer a better understanding of why consumers in developing countries choose to purchase foreign brands instead of local brands (Steenkamp, Batra, dan Alden 2002; Wong and Zhou 2005). Even though research on foreign brands have been widely noted in the literature, there is still a lack of research on consumer's satisfaction between local brand and foreign brands within retail therapy context.

In retail therapy, the higher level of negative mood perceived by consumers, the greater the tendency to engage in hedonic shopping (Kang, 2009). Furthermore, Kang also found that the more expensive the price of a product purchased during a retail therapy, the higher the level of satisfaction obtained by the consumer. This fact bring forth the proposition that differences in brands, local and foreign, will be analogously to the consumers satisfactions as well as price. Consumers' perception that foreign brands have a higher hedonic value than local brands will provide different levels of consumers' satisfaction in retail therapy.

Research Hypothesis

Based on literature review above, we proposed research hypotheses as follows:

Hypothesis 1 : Positive distraction motivation of retail therapy has significant influence on consumers' satisfaction

Hypothesis 2 : Escape motivation of retail therapy has significant influence consumers' satisfaction

Hypothesis 3 : Indulgence motivation of retail therapy has significant influence on consumers' satisfaction

Hypothesis 4 : Elevation of self-esteem of retail therapy has significant influence on consumers' satisfaction

Hypothesis 5 : Activation motivation of retail therapy has significant influence on consumers' satisfaction

Hypothesis 6 : Sense of control motivation of retail therapy has significant influence on consumers' satisfaction

hypothesis 7 : Social connection motivation of retail therapy has significant influence on consumers' satisfaction

Hypothesis 8 : There is significant different level of consumers' satisfaction between local brands and foreign brands purchasing within retail therapy

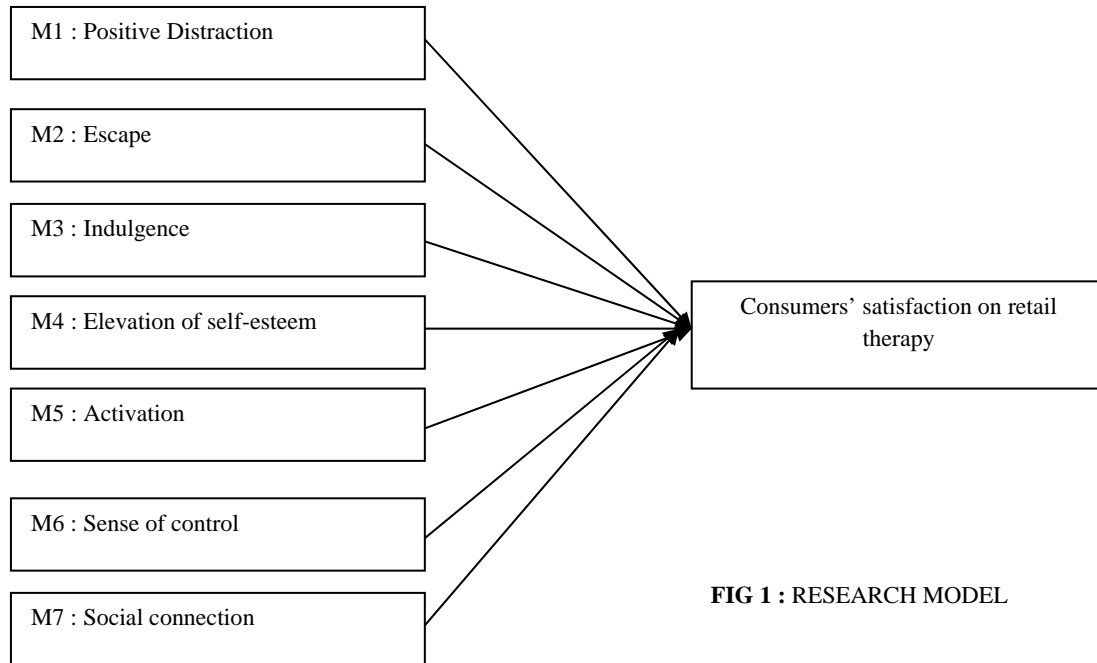

FIG 1 : RESEARCH MODEL

Research Methodology

The population of this study were undergraduate students from private universities located nearby 4 leading shopping malls in Jakarta. Samples were taken randomly using convenience sampling method with a total number of 200 students. Given the nature of retail therapy as mood alleviation method investigated in this study, the use of students as actual consumers is considerably appropriate. The respondents' age ranged from 18 to 22 years old (with an average age of 20 years old), 69.5 percent were female and more than 78 percent came from Jakarta. A mug with handpainted design was offered to each respondent as an appreciation for their participation.

The questionnaire was adapted from Kang (2009). The first part of the questionnaire was designed to clearly differentiate whether the respondent is a retail therapy shopper. The second part measured respondents' motivation on retail therapy, and the last part measured their satisfaction from purchasing local brands versus foreign brands during retail therapy. Respondents were asked to indicate their responses on 7 point Likert scales ranging from 1 (very disagree) to 7 (very agree) which measured their motivations, brand preferences, and satisfactions in the context of retail therapy. Relevant demographic information was also elicited. The data was collected across six product categories : fashion, gadget, electronic and home appliance, automotive accessories, jewelry, and others Variables, definition, and indicators are presented at table 1 below.

TABLE 1 : VARIABLES, DEFINITIONS AND INDICATORS

Variables	Definitions	Indicators
<p>Motivation of Retail Therapy</p> <ul style="list-style-type: none"> • Positive distraction • EscapE • Indulgence • Elevation of self-esteem • Activation • Sense of control • Social connection 	<p>Consumers motivation to take benefit of retail therapy shopping</p> <ul style="list-style-type: none"> • Motivation to forget negative mood via shopping • Motivation related to do physical activity (go shopping) as a contribution to negative mood • Motivation to maximizing pleasure in reducing negative mood • Motivation to benefit from meeting someone, get identity, feeling proud, confident, etc by doing shopping • Motivation that shop can make a person active by stimulating feelings, learning new things, feeling up-to-date • Motivation to gain control over something through shopping • Motivation to get ideal social relationships through shopping 	<ul style="list-style-type: none"> • Shopping will make me forget my bad mood • When I feel upset I go shopping to buy things that will make me happy • When I'm getting angry, shopping will make me feel relieved • I like to go shopping when I am in bad mood • Walking in the shopping mall aisle and find something nice to buy will make me feel better after having bad days in my college • When I feel bad I like to spend hours shopping things to please my self • Shopping is the best medication for bad mood • After having a difficult exam I deserve a great shopping time • I feel proud after buying things at exclusive shopping mall in town during bad mood alleviation • Meet someone I know during shopping get me more confidence feeling • I feel no more bad mood after shopping at leading shopping mall in town • I feel happy after purchasing new released product at my favorite shopping mall • I like the up-to-date feeling of recognizing the latest product trend offered in the leading shopping mall • Go shopping after failing exam get me a feeling that I can have a better control of my next exam • After having bad days I feel better to go shopping with my best friends
<p>Brand Preferences</p>	<p>Consumers preferences on product brand purchased during retail therapy</p>	<ul style="list-style-type: none"> • When I go shopping, I like to buy product with foreign brands better than local brands
<p>Consumer satisfaction</p>	<p>Consumers satisfaction after engaging retail therapy</p>	<ul style="list-style-type: none"> • I feel satisfy with my shopping experience • I feel satisfy with shopping programs offered by leading shopping mall in town • I feel satisfy with the product I buy during negative mood alleviation

Results, Implications, and Limitations of Research

Research measurements for this study are confirmly reliable and valid. Cronbach's alpha estimate is 0.684 and factor loadings of all items confirming strong validity in wich it exceeded the recommended level 0.5. All hypotheses in this study were significantly supported. Each retail shopping motivations significantly influence consumer satisfaction after having retail therapy. Table 2 presents summary of significance level and t value for each motivations (M1-M7). All regression models for each motivation-satisfaction relationship are significance at 95% confidence level. Therefore, hypotheses 1 until 7 are statistically supported.

TABLE 2
SUMMARY OF SIGNIFICANCE AND T-VALUE

Model	Sig.	t-value
M1	.000	14.889
M2	.000	14.215
M3	.000	14.451
M4	.000	13.908
M5	.000	11.998
M6	.000	15.629
M7	.000	11.783

From the statistical test of consumers' preferences between local brands and foreign brands during retail therapy shopping 42 students or 79 percent of total respondents score foreign brands higher than local brands. Figure 2 shows pie chart of consumers' brand preference in retail therapy. Students were also proven to have higher satisfaction when buying foreign brands (Mean 5.5380; sig. 0.00) compared to local brands (Mean 5.1190; sig 0.00).

FIG 2 : CONSUMER'S LOCAL VS FOREIGN BRAND PREFERENCES

Consumers' product category choices during retail therapy was significantly high on fashion product, both for local and foreign brands (64.5 percent). In table 3 we can see frequencies of each product category chosen by respondents and figure 3 presents this product category pie chart.

TABLE 3 : PRODUCT CATEGORY CHOICE FREQUENCY AND PERCENTAGE

Product category	Frequency	Percent
fashion	129	64.5
gadget	13	6.5
electronic	9	4.5
automotive	13	6.5
jewelry	5	2.5
others	31	15.5
Total	200	100.0

FIG 3 : PRODUCT CATEGORY CHOICE CHART

When we take a closer look on product brand choices, students preferred to buy foreign brands (49.5 percent) than local brands (15 percent). Other comparisons of students' choices between local brands and foreign brands are presented at table 4 and 5 below.

TABLE 4 : FREQUENCY AND PERCENTAGE OF LOCAL BRAND CHOICE

Product	Frequency	Percent
fashion	30	15.0
electronic	2	1.0
automotive	2	1.0
jewelry	2	1.0
others	6	3.0
Total	42	21.0

TABLE 5 : FREQUENCY AND PERCENTAGE OF FOREIGN BRAND CHOICE

Product	Frequency	Percent
Fashion	99	49.5
Gadget	13	6.5
Electronic	7	3.5
Automotive	11	5.5
Jewelry	3	1.5
Others	25	12.5
Total	158	79.0

Results of this study invigorate the retail therapy literature in the relationship between consumers' motivations and consumers' satisfaction after engaging retail therapy (Kacen 1998, Kang 2009, Yuchirsin et al 2008). Marketers can use this evidence to develop a more appropriate retail marketing strategy Indonesian consumers. Since consumers' satisfaction can be the precursor of consumers' loyalty in the long term, this study give directions about how Indonesian consumers' perceived that foreign brands will create better satisfaction compared to local brands. International marketers might see positive opportunities to introduce their products in Indonesian markets, especially for fashion products as fashion products were also proven by Woodruffe (1998) and Kang (2009) to be highly chosen by consumers.

According to this study, Indonesian consumers did not buy local brands' gadget, but 6.5 percent of gadget with foreign brands were bought during retail therapy shopping. This can be explain from varying point of views, that Indonesian consumers might perceived foreign brands have higher quality than local brands, inadequate information about local brands, or as simple as prefer to buy other things for their retail therapy. Further study can investigate the underlying reason for this circumstance to better understand Indonesian consumers' product preferences. Other product categories such as electronic and home appliances, automotive accessories, jewelry and others also differ in percentage between local brands and foreign brands. There are extensive area to be research within the context of consumers' preferences of local vs foreign brands.

This study have several limitations. First, we only collected data from students of several major universities which locations are closely to 4 leading shopping malls in Jakarta. Students' purchase power might have influence on product category chosen. There is a need to investigate a broader range of consumers, from different age group or different environment (employment status, ethnic groups, income levels, etc). Secondly, previous research noted that women have higher satisfaction than men after purchasing product at retail therapy condition. This study only recorded a higher frequency of women respondents. Finally, this study was done only in Jakarta which might not accurately represented Indonesian consumers as a whole. To give a better information about Indonesian consumers for local and international marketer, further research is needed to be done in other major cities in Indon

Abstract

In view of this transformation in the distribution and supply area, we have observed therefore an increased complexity in market management issues which make the relationship between the marketing, sales, logistics and production functions more critical. Managing the flow of product returns is increasingly recognized as a strategically important activity that spans different functions within and across firms, particularly marketing and operations. In order to explore the phenomenon of returns management fashion sector, particularly in the footwear industry, a qualitative research methodology was chosen to generate depth of understanding given the limited current understanding of the research topic under consideration. Our results suggest that managing returns is recognized as an increased role in sales management activity in order to keep customer and how the phenomenon is linked with different business functions within firm

Introduction

Italian and international footwear industry has characterized by substantial changes relative to demand, supply and distribution in the last forty years (Moore and Fairhurst, 2003; Buxey, 2005; Camuffo et al., 2008; Gregori et al., 2009; Hsu and Chang, 2008). As regards demand, it has become increasingly more frequent to see a consumer who is more aware, who exhibits more varied behavior patterns and for whom the “experience”-based buying process is becoming more and more significant. As for the competitive system on the supply side, there has been a rise in international competition with the advent of new players in Eastern Europe and Southeast Asia; these manufacturers, initially specialized in low quality (and low price) products, have improved their production processes which are now capable of also turning out higher quality footwear. Finally, a shift has been recorded in retailing as well, with the birth of distribution chains, the creation of partnerships such as franchising chains and the development of factory outlets (Gregori et al., 2009).

It should also be noted that the intangible components of the products, such as image and post-sale service, become competitiveness elements among different firms. One of the complexity elements that we have found, and that is becoming increasingly more relevant, is the management of returns, that is, the whole of material flows connected to financial and information flows that for any reason travel back along the supply chain. The interest in this sector and phenomenon also stems from the observation of a few current trends: sales predictions that are increasingly more difficult to make, given the variability and unpredictability of the market; a difficult integration between marketing and logistics/production; the unavoidable need of the firms carrying recognized and prestigious brands to control the flow of returns, and the need to guarantee a high value-added post-sale service. Wehlage, 2009). The product returns process has emerged as a key element that can influence the customers’ purchase decisions and thus, an effective product returns process is viewed as a competitive advantage. Post-purchase behavior could be influenced by a variety of factors including product-related variables, consumers’ personal characteristics, and variables associated with the store (Kang and Johnson, 2009; Kincade et al., 1998).

Many companies see, from a practical perspective, customers’ product returns as a major inconvenience and an eroder of profits; after all, products returns cost manufacturers and retailers more than \$ 100 billion per year, on an average loss per company of about 3.8% in profit (Petersen and Kumar, 2010; Blanchard, 2007). Customer returns

routinely reduce the profitability of retailers by 4.3 percent and that of manufacturers by 3.8 percent (Richardson, 2004). In view of this transformation in the distribution and supply area, we have observed therefore an increased complexity in market management issues (sales predictions, orders management) which make the relationship between the marketing, sales, logistics and production functions more critical. Managing the flow of product returns is increasingly recognized as a strategically important activity that spans different functions within and across firms, particularly marketing and operations. Returns management can make it possible to gather information from the customers in an efficient way through the return flows.

We focus specifically on managing commercial returns in the shoes industry in a business to business context.

Returns management includes several activities characterized by an inter-functional logic. These activities are *return avoidance* (activities aiming at minimizing upstream the number of returns) and *gatekeeping* (activities for the control of returns flow) as well as *reverse logistics* (*collection, transport, receipt, sorting*) and, last, the activities to redirect and allocate returns. Particularly we focus on avoidance that aims at to find ways of minimizing return requests (Lambert, 2004), this activity differentiates returns management from earlier reverse logistics, because by successfully applying avoidance, the returns are not sent backwards. While gatekeeping is the screening of return requests and the returned item with the aim to assure that only allowed returns are accepted (Rogers et al., 2002). There are many types of returns, Rogers et al. (2002) grouped in five categories: consumer returns, marketing (commercial) returns, asset returns, product recalls and environmental returns. We focus our paper on commercial/marketing returns, for example unsold products or job-outs or product quality reasons that retailers return to manufacturer. Briefly commercial returns are all those returns where a buyer has a contractual option to return products to the seller (Flapper et al., 2005; De Britto and Dekker, 2004).

By its own nature, a returned product involves several functions inside an organization, managing returns might be complicated by the boundary spanning nature of this process within different business functions and across supply chains (Rogers et alii. 2002). Indeed recently the literature suggests, across several related disciplines, such as logistics (Guide and Van Wassenhove, 2001; Stock and Mulki, 2009), marketing (Petersen and Kumar, 2009), operations management (Kocabasoglu et alii, 2007; Frankel and Russo, 2011), and particularly supply chain strategy (Hofmann, 2010), that the returns process is, in fact, cross-functional.

Analyzing the role played by the returns management process within the customer value creation is certainly of some interest not just for the inter-functional aspect but also for the role it plays in relationship management strategies. We make no distinction between consumer-originated returns (e.g., defective product and/or buyer's remorse) or customer (retailer) originated returns (unsold product being returned from the retailer). Thus, we want to understand how a shoemaking manufacturer can manage commercial returns in order to improve functional integration.

Many are the causes that make returns management inefficient (and not effective), such as a lack of coordination among the various actors of the supply chain in terms of information, material and financial flows, a strategic management of the operations connected to this phenomenon, an integration between the various process functions, the management and the agreements of the marketing channel, the promised service level regarding customer complaints. For this reason, the problem of managing returns should involve the whole firm, as well as the retailers and suppliers, without limiting the issue to the mere management of logistics operations when the problem arises, and stressing even the most strategic aspects with a view to recovering efficiency, improving effectiveness and creating value (Jayaraman and Luo, 2007; Mollenkopf et al., 2011c).

The focus of our paper is to investigate the returns management process in the shoemaking context. In particular, our research questions are:

- what is the role of commercial returns across the different business functions?
- what is the role of returns management process in sales management strategy, specifically regarding gatekeeping, returns avoidance and returns policy in the footwear industry?

The gap in the literature we wish to fill specifically refers therefore to the management of returns in the footwear industry, paying special attention to functional integration, gatekeeping and avoidance in managing returns in the different activities in a business-to-business context.

In the following sections we will review the relevant literature and foundations of our research, describe our research site and methodology and discuss implications in five different shoes companies.

2 Literature review

The literature on product returns is rooted in both marketing, customer service, production and logistics disciplines, with an early focus, respectively, on reverse channels and reverse logistics (Lambert and Stock, 1982).

Several studies consider the management of returns as a way to minimize and control their environmental impact, from cradle to grave (Andel, 1995; Barry et al., 1993; Witt, 1993; Jahre, 1995; Walther et al., 2005) and green logistics (Gungor and Gupta, 1999; Geyer and Jackson, 2004; Murphy and Poist, 2003). Other authors (Stock, 1998; Carter and Ellram, 1998) have identified the drivers (legislators, customers, suppliers, enterprises) and the hindrances (mainly cultural and regarding the commitment of stakeholders and the upper management) to the development of reverse logistics programs. Other contributions have proven important (Thierry et al., 1995, Rogers and Tibben-Lembke, 1999) to better investigate the strategic impact of reverse logistics in terms of competitiveness and cost reduction, inventory management, particularly in a remanufacturing context (Kleber et al., 2002; Kiesmuller and Scherer, 2003), concern for environmental and packaging problems (Kocabasoglu et al., 2007). Particularly noteworthy are further studies by Stock et al. (2002), which stress the existence of a strong correlation between good returns management and returns policies, not only as a cost but also as a tool to improve customer service (Petersen and Kumar, 2009; Anderson et al. 2009; Russo, 2008). Further research has been carried out by other scholars that are closer to quantitative rather than managerial approaches and focus their attention on the mathematical models that support reverse logistics; particularly interesting are the approaches relative to the concept of closed-loop supply chain (Dekker et al., 2003). Blackburn et al. (2004) recommend the need to make disposition decisions as soon as possible in the returns process due to the time-sensitivity of most returned goods.

In the supply chain literature, Rogers et al. (2002) see the returns management process as a part of the overall supply chain strategy of a firm. Their focus on returns avoidance, gate-keeping, reverse logistics and disposal demonstrates the need to manage returns across multiple functional areas and within firms across the supply chain. Returns avoidance is a relevant part of the returns management process and includes the activities that prevent and eliminate the causes of returns (defective product and packaging design, compliance with legal requirements, poor demand management). While gatekeeping involves the screening and authorization of products entering the return flow, disposition refers to inspection activities, the decisions to refurbish/remanufacture or resell or scrap the products that are returned from customers (Rogers et al., 2002). Product returns are a critical component of customer service in retail environments (Yalabik et al., 2005) and retailers have extended liberal return policies to their customers (Piron and Young, 2000). While customers value return policies that are lenient, such policies are costly to operate and subject to customer exploitation (Kang and Johnson, 2009; Wood, 2001).

However, the majority of scholars tend to focus on one aspect only of this phenomenon, such as the correlation between returns policies and customer retention (Petersen and Kumar, 2010), product recovery to reduce production costs (Guide and van Wassenhove, 2003), reverse logistics (Stock, 2009) and the relationship between reverse logistics and green logistics (Jahre, 1995; Geyer and Jackson, 2004; Murphy and Poist, 2003). Consequently, Rubio et al 2008 call for more strategically focused research in order to develop a framework for future research.

The notion of functional integration and its associated benefits has been addressed by the marketing, logistics and operations literature for many years (Kahn and Mentzer, 1998; Ellinger, 2000, Verma et al., 2001; Kim et al., 2003; Lambert, 2004; Piercy, 2006; Menon et al., 1996; Kahn, 2009). Much of the early literature on functional integration focused on factors that hinder or enhance functional integration, such as conflict or cooperation between departments, the role of top management and the impact of the traditional silo mentality within firms and the resulting lack of interaction between functional areas (Gupta et al., 1986; Ruekert, 1987; Dastmalchian, Boag 1990, Dewsnap, Jobber 2000; Rouziès et al. 2005; Malghe 2009; Troilo et al. 2009).

Mollenkopf et al. (2007) provide evidence of the cross-functional nature of returns management across strategic and operational levels within a firm. At the strategic level, an organization must develop policies, processes and structures to handle the reverse flow of product, information and finances. At the operational level, the returns management process involves the physical flow of product, information and finances. Stock et al. (2009) have made various proposals showing how marketing, logistics, accounting and production need to be involved to manage returns. Yalabik et al. (2005) also study the optimal amount of logistics investment (which reduces the costs of returning) as well as the optimal marketing investment (which decreases the probability of returns) and they identify different components of an integrated returns-management system: the refund policy, the marketing promotion strategy, and the logistics process of physically recovering and handling the returned goods. More recently, Mollenkopf et al. (2007b) addressed the importance of functional integration for Internet retailers' marketing and operations in consumer service recovery situations.

3 Methodology

In business-to-business research, study profiles are continuously evolving, with new practices. This research is of an explorative kind, just like other case studies of the literature (Gummesson, 1991; Eisenhardt and Graebner, 2007; Graebner and Eisenhardt, 2004; Ellram et al., 2008; Daly et al., 2009). Therefore the multiple case study seemed to us a good study method to analyze a phenomenon that has never been investigated in the footwear industry (Yin, 2003; Meredith, 1998; Borghini et al., 2010; Piekkari et al., 2010).

In order to analyze the phenomenon of returns management, a qualitative research methodology was chosen to generate depth of understanding, given the limited current understanding of the research topic under consideration (Flint et al. 2002, Strauss and Corbin, 1998). The main reason was the unexplored nature of this phenomenon in the footwear industry and the poor knowledge of the operational context inside the company.

We conducted interviews with 16 senior managers from different functions of 5 firms in the shoes industry in order to cover production, financial, marketing and customer service areas. The cases selection process wants to achieve the target to cover the typical business models in Italian footwear industry (SDA Bocconi report, 2007): Company 1 (so called "partner" business model), Company 2 (so called "brand integrated" business model), Company 3 and Company 4 (so called "niche" business models), Company 5 (so called "generalist" business model). Briefly we would like to show how different business models should create customer value through managing returns in business to business context. To ensure rigor and solidify our knowledge in this specific industry, we also thoroughly interviewed a senior consultant, with a considerable experience in the different firms and the specific industry. The involvement of several firms allows analysis of returns management methods in the same competitive sector although with different distribution, production, logistics and commercial practices.

It should also be noted that returns management becomes particularly relevant when examining the role played by this process across different functions (logistics, marketing, production, sales, finance).

This fact-finding purpose called for a qualitative research method (grounded theory approach, Dubois and Gadde, 2002; Strauss and Corbin, 1998) which aims at discovering models and good practices rather than verifying theories.

The study of the enterprises was as follows: on desk, involving the gathering of secondary sources (questionnaire data, Internet sites, other) to profile the enterprises before the interviews; bracketing interviews, whereby each researcher has preliminarily presented his/her expectations from the interviews and research, in order to avoid the emergence of preconceptions that might induce interviewees to back the researcher's theory (Briggs, 1986); laying out of the open structure of the interview to identify the relevant research variables (taken from the research macro-areas); in this way we avoid the emergence of preconceptions that might induce interviewees to back the researcher's theory.

Interviews were held individually with participating managers, with each interview lasting 60-120 minutes. The in-depth interviews were open-ended and discovery-oriented, starting with a grand tour technique borrowed from ethnography (McCracken 1988). An interview protocol guide with the main topics of research was used to follow up the grand tour technique. These topics were taken from previous research works on returns management, functional integration and sales management (Carter and Ellram, 1998; Weiz and Bradford, 1999; Rogers et al. 2002; Flint and Mentzer, 2006; Piercy 2006; Mollenkopf et al., 2007a). During the research, new topics emerged from the interviews. These were digitally recorded and transcribed verbatim, as were the debriefing discussions held by the research team after each set of interviews (Strauss and Corbin, 1998). The debriefing sessions reflect our attempt to solidify our perceptions and thoughts with respect to what we were hearing. All interviews were conducted in Italian.

4 Results and discussion

4.1 Functional integration and returns avoidance

In footwear industry returns classification is not limited exclusively to the so-called “defective or low-quality products” or “product replacement” but it included end-of-season unsold merchandise (marketing returns). In our research, bearing in consideration the actor which create the returns process, we found two kinds of returns: 1) *consumer returns* come back to the retailer after the use has taken the product home. The consumer might have a change of heart about the product, or there might be a defect issue (sometimes this is a perceived defect issue, in which the supplier can find no fault with the product upon inspection and testing). 2) *store-level returns* represent unsold product or defect product that the retailer wishes to clear off its shelves or out of its back rooms. We focus on commercial/marketing returns, particularly on the return situation across the retailer/supplier echelon in the supply chain.

In general, for this kind of returns, the manufacturer adopts policies towards single-brand points of sale that allow them to order any product quantity, guaranteeing in return the collection of returned items at no additional cost. However also for unsold items, just like for returns due to quality problems or products to be replaced, in a cost management perspective, we should consider the loss of sale of displayed shoes that have no market, picking, packing and temporary storage at the point of sale, freight cost, cost of returns authorization procedures and subsequent payment of credit and, finally, the activities to decide the following destination of the merchandise which is usually shipped to the outlet stores.

Keep in consideration the main results of our research an important focus is on returns avoidance activity; as Stock et al. (2006) defined this is the “basic strategy” of managing returns. In the footwear firm returns avoidance is transversal to the enterprise and involves production, research and development, distribution and, finally, end customers. The contributions of production, quality control and research and development should be mainly guided by these activities, with a commitment to improving product quality and design in the light of the reasons that have caused products to be returned. Every function or actor may give his/her contribution, from production, management control up to product distribution in the best way, in order to avert products from being fatally introduced in the returns flow and therefore generate a cost. In a few instances, even customers are those who provide precise instructions or information on how to improve a product that proved non-functional with respect to its intended use.

Product quality and usability are different issues than a mere quality control at the production level and evidently call for an integration of information and objectives among the company functions. Marketing policies for the launch of new products should also be based on information on the causes of returns and related complaints during the campaigns of previous years.

The sales areas for the Italian and foreign markets are certainly more exposed to the problem and deal with it on a daily basis, perceiving it completely unstructured and out of control especially in the foreign markets. Furthermore, the effort to understand the causes of returns, given the peculiarity of the shoes, requires an inter-functional collabo-

ration which however proves to be complicated and slightly rewarding, as a after sales manager told us: *“We go to the production and modeling departments and we say ‘look, we had this problem, how should we go about it? Moreover, no one is ever responsible for anything. You go to production and they say it is the modeling’s fault, you go to modeling, and they say it is the cutting’s fault. In other words, it is nobody’s fault, even though people when they see that a product has been returned –however annoying this may be – ought to acknowledge what is going on.”*

Only those in charge of customer service have understood the added value embedded in the returns and know how to learn from them in view of an overall product quality improvement: *“One always looks at the negative side, certainly, because a returned shoe is always a nuisance, one may say ‘damn it, they returned it!’ However if one looks at the – quote!- ‘positive side’ saying ‘ok, we really shouldn’t use at all this type of hide for this shoe because it is impossible to use it here, or on this model, this type of hide is not suited for it, this shoe designed with these holes is not ok, this may even open a discussion and allow correction of mistakes that maybe, due to a lack of time or... they were overlooked before. This is the philosophical quality of returns”.*

All production activities play a critical role in avoiding returns, by improving product quality/design/comfort and monitoring the qualitative performance of suppliers if people are aware that product quality needs an interfunctional contribution in order to be achieved. However, the customer service and sales area would like to see *“more collaboration from production.. if only we could get more collaboration ..”*

It is a common occurrence in the shoe-making industry that much attention is paid to the design and aesthetic features of the shoes, with little importance attached to convenience and user’s experience. Returns are a good sign of the existence of a wearability or usability problem and should be considered a valuable indicator of the production cycle performance. Instead, many sales managers observed: *“Sometimes, more attention should also be paid to the convenience and use of the products, because shoes are certainly very beautiful, boots are very beautiful but when wearing them problems may arise that maybe one didn’t think of before.”*

It should also be said that another relevant element for returns avoidance is the ability to follow fashion trends as well as recommend to the customers the best choices to support sell-out, in terms of lines, models, colors, materials and sizes. Therefore the knowledge provided to retail customers on main fashion trends and real market opportunities constitutes a critical element to transfer knowledge to the customers also in view of preventing commercial returns. However it should not be overlooked that a driver for value creation comes from market knowledge. This aspect becomes particularly relevant for small clients such as multi-brand points of sale or small chains. The Sales Manager of the Company 2, speaking of a client, remarked: *“you haven’t sold it because you made it of a color that has been made only by you, that is, I mean ...”*

At least in four out of five enterprises we observed therefore a lack of an effective returns avoidance process. Only in Company 1 we found a real effort to learn from returned shoes for quality problems, implementing a structured attention to the selection of raw materials suppliers, from hides and vamps to leather.

Overall, we noticed that the returns process is perceived by the various functions in a different way. For example, the administration and control area accepts it passively, as a financial manager reported to us: *“We deal with returns passively, when a customer notifies the sales area saying ‘we are returning a few pairs because they are ripped”.*

It seems that each function or area perceives, manages and organizes returns autonomously with respect to the functional objectives, thus creating within an enterprise closed silos that do not ease the flow of information from one department to another, in order to draw a benefit in terms of effectiveness and efficiency. It is not clear, for example, how production receives useful information from the market to improve products. As for our entire sample, especially Company 2, Company 3 and Company 4, this informative activity is carried out in a non-structured way. In fact, it is neither formalized nor shared by the upper and operational management. Moreover the sales staff may act with a variable level of autonomy which is formally recognized only in part: *“our boss ... is aware of this occurrence (replacement of unsold items) but he would prefer this not to be done”.* This is confirmed by the person in charge of sales in the major foreign market of Company 4: *“In theory, quality control is done and also in practice. However if I were to identify in the department the person who is in charge of quality control I would not find it.”* This result highlight the lack of functional alignment in many footwear firms.

4.2 Marketing, sales and gatekeeping

The involvement of the marketing function, which also includes customer service, mainly consists of an attention for post-sale activities. The marketing/sales area is usually in charge of authorizing returns of merchandise to the enterprise.

The marketing area takes care of authorizing returns and somehow passively deals with “*small and large packages*” and writes reports. On the contrary, the production planning and quality control function considers returns “*very low in terms of percentages because the enterprise..*”

Process control and visibility should be a value-added element for a product with a prestigious competitive positioning for the firms interviewed which it is necessary to control the distribution as well as the returns channel. Instead: “*I’ve got it all handwritten, but I have no idea of how many pairs return or how many I manage to replace, repair and therefore reship to the customers. That I don’t know.*” In effect, we observed that in Company 2, Company 5 and Company 4 much care was taken of the returns from customers, to protect the brand and enhance the relationship with the retailers. However, in practice we seldom found the company functions aligned in the pursuit of the common goal of making returns management one of the value-creating elements.

In many cases, there seems to be no processing of the data originated from the returns, such as for examples the causes that have led a given (single or multi-brand) point of sale to recall a product or a customer to report it as defective. It is indispensable to adopt a common standard among the various geographic areas to guarantee visibility to all actors along the supply chain, as well as a homogeneous classification of returns.

The marketing area is mainly in charge of providing the information on customers’ complaints as well as timely and factually informing the customers on the advancement of repair works. On the contrary, the production planning and quality control area considers the returns issue: “*very low in terms of percentages because the enterprise, going back to the quality issues we mentioned before, has many check points*”.

It is clear that this perspective is strictly a manufacturing perspective that somehow recalls the traditional consideration on returns, i.e., a problem of excess production requirement or, more specifically, a problem of quality control during the manufacturing of shoes.

Moving on the sales activities it could be notice that, procedures (in many cases only informal and occasional) largely differ from one another and oftentimes managing returns and liaising with the customers is the responsibility of several people (sales manager, customer service, marketing). We also found that the returns process is handled by the staff with a personal approach. In many instances, the returns management method is the result of a subjective choice, which varies based on the person adopting it as well as on the customer/market that has generated the returns.

Also gate-keeping is an interfunctional and inter-company activity and sales department plays an important role in this process, i.e., an activity occurring within the enterprise functions and between manufacturer and retailer (points of sale). The main purpose of gate-keeping is to evaluate whether returns are rightly returned. This activity mainly consists of carefully examining the returns that may potentially enter into the pipeline of returns’ flow. Gatekeeping activities refer to the ability of an enterprise to limit the number of returns (Rogers et al., 2002). Regarding the activity of gatekeeping, the authorization to accept the returns is given by the sales department only. In this case, the preferred choice is always to accommodate the customer’s request and to instruct the administration and finance departments to pay back the customer. In this situation, abuses on the part of customers are not infrequent. In fact, during not particularly happy seasons, customers may transform unsold items in defective items, exploiting to their advantage the intrinsic characteristics of shoes (“each hide differs from another”, “it is therefore easy to reject a pair of shoes for any reason”).

Authorizing returns and the following decision to accept returned merchandise from customers has clear implications for the sales management and operations of an enterprise. In fact, these activities will have an impact on the duties of the staff in charge of recovering, shipping, receiving, assessing, repairing and allocating the returns.

Effective gatekeeping requires a good knowledge of the costs connected to returns activities. Only if marketing, sales and operations work together, sharing information, it will be possible to decide whether the merchandise is authorized to enter the return flow or not. Sales procedures (in many cases only informal and occasional) largely differ from one another and oftentimes managing returns and liaising with the customers is the responsibility of several people (sales manager, customer service, marketing).

Some products may generate higher costs when recovered because they have no intrinsic value that may justify the authorization to return. This is why a strict collaboration between the point of sale and sales staff is desirable to avoid further costs for the enterprise and therefore wastage of value.

However, apart from knowing the value of returns over sold merchandise, we have found no activity aiming at determining all the costs (activities and persons) that are connected to the returned products: loss in sales, reverse logistics, inspection, renovation, shipment to outlets, and finally, disposal. The preferred choice on the part of those who receive the complaints seems to be offering a customer service: *“In any case, it is a shoe worth 250 Euros or 300 Euros or even 500 Euros in the case of boots. Would you keep it like that, paying it 500 Euros, with a ripped accessory, with any type of defect? Even we must get into the mentality of those who buy and in any case comply with it”*.

We found no relevant gatekeeping activity at points of sale, but just an effort to avoid acceptance of *“shoes in indecent conditions.”*

One of the key elements – although slightly considered – to contain the number of returned products is a good management of sales predictions (demand management), especially in a fashion sector like the footwear industry. However, Company 4 sales policy for single-brand stores so requires:

“In order to sell one thousand pairs of shoes it is necessary to have in stock two thousand pairs – according to the sales manager. In other words, to offer, to have a real thousand pairs of shoes good for sale, twice as many must be kept in store, i.e., twice as many available shoes”

On a strategic level – despite the peculiarity of this industry – returns are a symptom of a lack of coordination among marketing, sales and operations and reveal the need to manage distribution as well as return flows.

5. Key findings, managerial implications, limitations and future research

In this section we will review the main key findings and managerial implications of our results. We will then describe limitations and future research.

One of the element that has emerged from our investigation is certainly that the functions involved consider returns a multidimensional aspect that generates much complexity to manage the process. We have found in fact a rather variegated classification of commercial returns, which may be due to quality problems, non-compliance with orders, late shipment and delivery, unsold items from customers, and unsold items from direct or single-brand points of sale not always easy to identify. This classification – often scarcely structured – is coupled with the nature and resulting value of returns, which can be items to be disposed of, repaired or sold at a discounted price (second-choice or last season products).

Another element to be noted is the importance of returns management in the relationship between supplier and customer and the key role of marketing/sales/customer service. In fact, it is part of the elements embedded in the customer service of the shoe-making enterprises and therefore an element that creates value between buyer and seller. At the same time, commercial returns are a relevant part of the relationship with the customer. In fact, “the voice of the customer” may be heard during this process and constitutes a substantial part of the value creation and transmission process between supplier and customer. However we have mentioned several times that this objective is not shared by all enterprise functions, which results in the shoemaking enterprises not putting into practice effective policies of returns avoidance, improved product quality, gatekeeping and containment of reverse logistics.

Then the third element to be considered is the operational and strategic role of products return. So the main operational problem in managing returns in the footwear industry are the so-called “defective or low-quality products” or “product replacement” excluding end-of-season unsold merchandise (*marketing/commercial returns*), which however account for a considerable percentage of the marketed products. However, only customer service managers have understood the added value embedded in the returns and know how to learn from them in view of an overall product quality improvement

Despite this, managing returns is often considered, as in the case of Company 2, Company 3 and Company 4, exclusively a post-sale competence, disregarding the fact that the causes of returns may also lie in other functions. This is one of the reasons that should most induce the managers to consider returns management and avoidance a transversal process of the enterprise that can actually create value for the customers, through improved product quality and service, and similarly contain the number of returned products to be recovered by the enterprise.

On a strategic level – despite the peculiarity of this industry – returns are a symptom of a lack of coordination among the various functions and reveal the need to manage distribution as well as return flows. Seasonal overstocks, unbalanced sell-in and sell-out levels at points of sale, weak gatekeeping activities are a few elements that reveal the inability of the enterprise to create value, effectively managing returns. This situation is often generated by a lack of coordination among the various company functions which results in end-of-season returns, particularly considerable for the Company 2 and Company 5 enterprises. Let us take for example the cost to return, inspect and assess the merchandise, indirect administration costs (issue of bills, invoices, packing lists, credit notes, etc.) and time-related issues (shipment/return may take weeks).

We wish however that our study may help future research to confirm in other contexts the evidence we gathered.

Future research in this specific industry should certainly investigate more in-depth the retailers to also describe the methods by which customers perceive the value transmitted through returns management. Furthermore an issue that we have analyzed only in part is the analysis of the value attributed to after-sales and returned products in contexts that are different from a geographical and competitive standpoint.

Sourcing Reform Competency and Effective Collaboration: A Resource Based View

Sudhi Seshadri, sudhi@smu.edu.sg
Singapore Management University, Singapore

Abstract

Firms in the Asia Pacific region are rapidly globalizing their sourcing processes and effective collaboration with suppliers across borders is necessary for superior sourcing performance. Recent work in Resource Based View calls for business process level research into the resource-performance link and for survey research into global sourcing. We report on a survey research study with managers in several countries the region, and develop a model that links a latent managerial resource, *Reform Competency*, to competencies based in practices, such as *De-Constraining*, *Re-Branding* and *Re-Optimizing*, in order to test hypotheses based on predictions of RBV. We find that *Reform Competency* is positively associated with these competencies and a sourcing performance measure, *Effective Collaboration*. We discuss the contributions and highlight the managerial implications of our results for managers engaging in specific practices.

Introduction

Previous research has examined a broader question of the link between firm resources in general and firm level performance within the Resource Based View (Wernerfelt 1984; Barney 1991). In more recent work, Ray, Barney and Muhanna (2004) redirect research to the larger question of functional level performance measures. Our focus here on sourcing practices, goals and performance furthers this direction of research. As companies globalize, perceptions of managers regarding change in functional practices in different regions of the world are of great interest. Nath, Nachiappan and Ramanathan (2009) point out the dearth in perceptual survey research in the domain, and Quintens, Pauwels and Matthyssens (2006) call for non-western locations for further survey research, notwithstanding the pioneering survey research of Luo et al (2005) in China. Our research study develops a theoretical model based in RBV. Specific managerial competencies we find theoretical and empirical support for are De-Constraining, Re-Branding, and Re-Optimizing. These competencies are more than short term initiatives, and are driven by an intangible managerial capability we term the “Reform Competency” sourcing resource. This resource also has an impact on sourcing performance, as captured by “Effective Collaboration” in sourcing. We report on scales to measure practice driven competencies, resource and performance constructs. Overall, our results shed light on practices and support the resource based view that sourcing resources do have significant effects on performance at the functional business process level of sourcing.

Following sections develop the theoretical model and hypotheses; presents our model estimation and results; and discuss the implications of our findings, their limitations and future research directions. The paper concludes with a summary of the main contributions.

Theoretical Model and Hypotheses

In this section we define and support how practices form four primary unidimensional goal constructs: Effective Collaboration, De-Constraining, Re-Branding, and Re-Optimizing. We then hypothesize a model where a latent sourcing resource, Reform Competency, drives the last three goals, and delivers superior performance measured by Effective Collaboration.

Effective Collaboration: Effective Collaboration captures a dimension of business process sourcing performance. The measure is homogenous, has a single dimension, and is related to the buyer’s goal of capturing additional value, namely value creation of an incremental nature, for a downstream customer through effective collaboration with suppliers accompanying changes in sourcing. This is one candidate measure of superior performance at the sourcing business process or functional level. The practices that underlie this construct are sourcing outcomes with suppliers

rather than competencies. We use three indicator items - speed of supplier response to changed customer requirements; supplier participation in obsolescence planning; and supplier involvement in specification development.

Value is created when suppliers respond more quickly to changes in the business environment. Previous work has revealed that manufacturing time is a quarter of total lead time in made-to-order goods, and supplier lead time is crucial (Zhaohui 2001). Often innovation in modular design serves to improve response time to design changes. The sourcing function is more highly valued as suppliers respond more rapidly to changes in requirements.

Compression of technological cycles, to sometimes as low as six months or less, offers scope for continual product improvements. The sourcing function improves its performance by phasing out older products from suppliers, and replacing them with improved versions. Participation by suppliers in product enhancements and obsolescence planning makes the process more effective. Changing regulation and customer expectations provide the necessary pressure for raising the bar on specifications. In the life cycle of the offering, as products mature, value shifts to modular component suppliers – where innovation is more likely taking place (Fine, Vardan, Pethick, and el-Hout 2002). Careful planning by equipment and component suppliers is necessary for financial lock step with other complementary modules in the sourcing cycle.

Decision making on what aspects of design and engineering should be outsourced involves the sourcing function. Takeishi (2001) studies the automaker's integrated internal processes with suppliers is related to effective coordination “between engineering and *purchasing* functions [emphasis in original], implying that effective external coordination needs effective internal coordination.” The outsourced components require active participation of suppliers in specification development. The role of early supplier involvement (ESI) is well known. Due to long lead times in excess of a year being the norm on engineered-to-order procurement, value gains to the firm’s product from outsourcing engineering are often difficult to trace. However, growth in outsourcing - as much as 150 % according to one study (Dekkers 2002) – is an indication of the value suppliers can bring to the specification development process.

Clearly, it is strategically important for suppliers to be closely involved with any specification development or modification in the buyer’s RFQ. This is obvious for modified rebuys, or new buys. But even straight rebuys from incumbent suppliers offer potential for re-specification. Sourcing managers are interested in quality enhancing and process cost reducing improvements in re-specification of procured items. External learning is strategically important to the firm, and is mainly driven by sourcing. Especially important is “*supplier input into new product or process design and supplier involvement in quality and in continuous improvement practices and routines* (Schroeder, Bates and Juntilla 2002).”

Rapid response, participation in planned obsolescence and supplier involvement in specification development constitute Effective Collaboration at the functional level of sourcing. This performance would improve with sourcing Reform Competency as a latent, multidimensional resource driving the other sourcing goals (we discuss this below). Following the definition from Ray et al (2004), we view sourcing resources as intangible assets which are inherently heterogeneous that firms use to develop and implement their sourcing strategies. Hence,

Hypothesis 1: Effective Collaboration has a positive association with Reform Competency.

To qualify as a strategic resource an organizational process competency must be difficult to substitute, scarce and not easy to develop in the short run. Therefore, we need to link resources to sourcing competencies that are distinct, and under infrequent conditions combine with each other to represent a heterogeneous sourcing resource. The next three competencies - De-Constraining, Re-Branding, and Re-Optimizing - form multi-dimensional exogenous indicators of an underlying sourcing resource, Reform Competency. We next identify the dimensions of sourcing practices for these goals, and hypothesize their relationship to Reform Competency.

De-Constraining: The De-Constraining goal construct captures the firm’s ability to tackle capacity constraints. Its key dimensions are expanding the firm’s physical supply base by qualification of suppliers; and progress payments to suppliers to help smaller suppliers manage their financial capacity.

Qualifying more suppliers will improve the capacity in the supply base potentially available to the firm. Inventory management can be improved with additional sources, where more than one supplier is used for equivalent purchased products. Some intuition into this practice is that better quality increases product cost, and a substitute lower net cost (even if lower quality) product is desirable as buffer in volatile markets. The lower quality

stock is surplus inventory, but sometimes used to meet peaking demand. If additional suppliers are used, inspection or rework could be applied only to main bulk sourced items, thus obtaining economies by foregoing inspection or rework on the additional lots (Chen, Yao and Zheng 2001).

Earlier work has noted advantages from tackling capacity constraints by allowing smaller suppliers to participate in sourcing (Yildirim 2003), and it might often be the buyer's policy to support additional small sellers. Liquidity for smaller suppliers and facilities funding are frequent constraints. Many governments, for instance, procure from small businesses and must frequently provide work-in-progress payments to finance supply.

Resource constraints have historically been circumvented with work-in-progress payments by large buyers, such as government and institutions. The US Department of Defense has long had policies on work-in-progress payments that reduce the contractor's dependence on debt financing (The Defense Financial and Investment Review, DFAIR 1985; IV-6). Such financial arrangements serve to provide incentives to suppliers, making the firm's business more attractive. This adds financial capacity to the expanded physical capacity in the supply base that comes from qualifying more suppliers. Overall, De-Constraining can potentially be achieved through qualifying more suppliers and assisting them with progress payments.

The association between De-Constraining and Reform Competency are captured in the following hypotheses.

Hypothesis 2: De-Constraining has a positive association with Reform Competency.

Re-Branding: Re-Branding is the firm's ability to enhancing its brand objectives by encouraging suppliers to showcase their competencies. Representative dimensions of supplier competencies that gain visibility and enhance brand image are eco-sustainability advantages; and supplier quality certification awards.

There is growing concern about sustainability in global business practices, and product life cycle assessments from depleted resources and carbon emissions. "Green procurement" policies provide incentives to suppliers to adopt ecologically sound practices, and all members of the supply loop benefit. Environmental stewardship is documented in previous work on sourcing as particularly relevant to the firm's brand image, as the entire value chain for the product is assessed in carbon footprinting (Rothenberg 2007).

Kroll, Wright and Heiens (1999) find support for relative product quality and a broad range of competitive business performance measures. Their performance measures include pre-appropriable measures (see Ray et al 2004) such as market share, as well as other measures such as variance and absolute value of return. Specific company wide programs, such as Six Sigma or the Capability Competency Model, are oriented toward infusing all firm functions with a quality assurance concept. Suppliers must provide assurances though certification. As sourcing markets globalize, the number of firms competing in any program multiply. Buyers are often procuring novel products and services and have little experiential base to accurately discriminate supplier quality. Global quality certification standards vary greatly due to their international origins. There is buyer pressure to develop a comprehensive governance structure both for cross certification comparisons, as well as cross-functional comprehensive quality certification. In sum, Re-Branding is indicated by encouraging suppliers to adopt green policies in sourcing, and to participate in certification processes. Hence,

Hypothesis 3: Re-Branding has a positive association with Reform Competency.

Re-Optimizing: Re-Optimizing captures the firm's ability to use learning in the supply chain so as to better align supplier self-interest and endowments with the value creation objectives of the firm. This re-optimization may be achieved through appropriate adjustments of agency incentives and productive resources available in the supply chain. Practices that support re-optimization are renegotiations; and horizontal or vertical resource sharing.

The need to provide right incentives through contracting to suppliers for innovation is well-recognized in the Organizational Economics literature. There appears to be strong information acquisition based reasons to recommend multiple sourcing with short-term contracts as a governance mode (Ramsay and Wilson 1990). Renegotiation of contracts becomes necessary as learning in the sourcing process leads to design changes. Gulati, Lawrence and Puranam (2005) study governance of adaptation in sourcing and find performance differences across modes of procurement. Poppo and Zenger (2002) find support for the proposition that modes, such as formal contracting and relational governance, are complementary and can support each other. One survey showed contractual safeguards with single sourcing appear to be inadequate, and long-term relations as well as short-term

ones with suppliers are governed by short-term contracts (Park, Reddy, Sarkar 2000). The use of short term contracts leads to frequent renegotiation.

One way to share resources is to subsidize an initially higher cost supplier with more than its due share of business in order that it benefit from learning curve effects. Managers factor in the learning curve for suppliers in their cost reduction strategies (Dobler, Burt and Lee 1990). Sourcing managers are concerned about maintaining an expectation of cost competitiveness in their supply base, and often resource sharing with suppliers to speed them on the learning curve may be necessary. Initial parallel sourcing may provide incentives for sellers to invest in quality improvements while learning in a sequential fashion. The buyer parallel sources for a predetermined number of time periods and then awards the entire supply contract to the best single source. This hybrid sourcing form may be better than awarding the entire contract to a single source at the start. Deng and Elmaghraby (2002) derive optimal terms for parallel sourcing to lead into sole sourcing, and describe industry applications and examples of such hybrid sourcing. Under such arrangements, buyers may provide incentives for horizontal resource sharing between suppliers in order to reduce costs. A rationale for equal production splits in multi-sourcing with learning specificity is that sourcing unequal volumes from different suppliers not bestow unequal advantages to suppliers. If the buyer uses an unequal production split, the supplier with the larger production award would likely have lower marginal costs at the time of re-negotiation. This expectation of unequal marginal costs would then lead to non-competitive behavior by the disadvantaged bidder (Lee 2000). Overall, renegotiations and resource sharing are indicators of Re-Optimizing. Hence,

Hypothesis 4: Re-Optimizing has a positive association with Reform Competency.

Hypotheses 2, 3 and 4 relate goal commitments as multiple exogenous indicators to our latent sourcing resource.

These hypotheses together provide a framework for linking Reform Competency with underlying managerial practices and situational factors. De-Constraining the supply base offers the opportunity to Re-Optimize, and communicate the improvement through Re-Branding. The framework further allows us to gauge the impact sourcing efficiency has on Effective Collaboration. Figure 1 summarizes the model and our hypotheses. The next section develop the empirical sections of the paper.

Results

An online survey instrument was developed, and posted on the university web site. All communications were in English. Data collection was done from July 2008 to November 2009. Purchasing Managers' names and phone numbers were generated from the *OneSource* online database for countries in South East Asia. These managers were based in Singapore, Malaysia, Indonesia, Thailand, Hong Kong, and Philippines. A total of 265 such potential participants were identified as the sample. Responses to the first page item on how the downturn was affecting procurement spend indicated 133 respondents visited the site and began the survey, an item response rate of 50.12 percent. There were 51 usable responses for section 3, which was the crucial section for our hypotheses. This indicated an overall completion rate of 19.25 percent, and of 38.35 percent from those who visited the site. The sample of 51 firms with complete responses represented about US\$ 28 billion in total revenues; employing about 94,000 persons; sourcing from about 1,400 supply locations; with a procurement spend of about US\$ 13 billion.

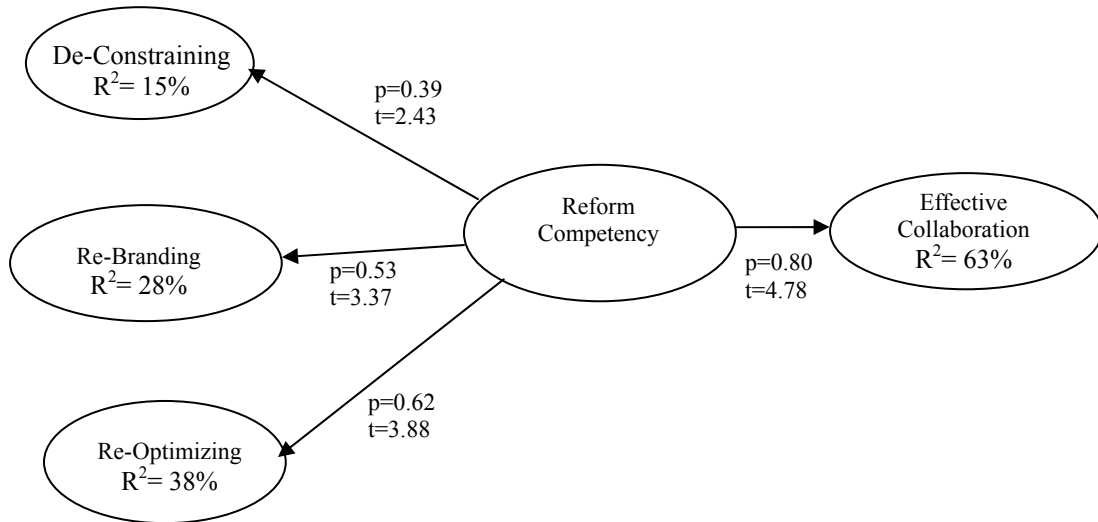

We operationalized our measurement scales using the process recommended by Gerbing & Anderson (1988). A structural equations model was estimated on the data using LISREL 8.52 (Jöreskog and Sörbom 2002). We find that all path coefficients are significant at the 0.05 level for one tailed tests and as hypothesized (see Table 5). All the usual goodness of fit indicators for our model are at acceptable levels (RMSEA = 0.00; NFI = 0.95; AGFI = 0.91; and $\chi^2/df = 1.84/2$; Mueller 1996).

TABLE 1: MODEL ESTIMATION AND FIT STATISTICS

Hypothesized Path	Standardized Estimate	t-statistic	Conclusions
H1: Reform Competency → Effective Collaboration	0.80	4.78	Supported
H2: Reform Competency → De-Constraining	0.39	2.43	Supported
H3: Reform Competency → Re-Branding	0.53	3.37	Supported
H4: Reform Competency → Re-Optimizing	0.62	3.88	Supported
<u>Goodness of Fit Statistics</u> Degrees of Freedom = 2 Minimum Fit Function Chi-Square = 1.84 (P = 0.397) Root Mean Square Error of Approximation (RMSEA) = 0.00 Normed Fit Index (NFI) = 0.95 Non-Normed Fit Index (NNFI) = 1.02 Comparative Fit Index (CFI) = 1.0 Standardized RMR = 0.058 Goodness of Fit Index (GFI) = 0.98 Adjusted Goodness of Fit Index (AGFI) = 0.91			

Reform Competency as a resource has a significant and positive effect on Effective Collaboration. The completely standardized coefficient is 0.80. Hypothesis H1 is supported at better than the 0.05 level. Reform Competency explains 63 percent of the variation in Effective Collaboration.

FIGURE 1: MODEL AND ESTIMATES.

The latent construct Reform Competency drives three goals of sourcing. The highest effect is of Re-Optimizing (standardized coefficient of 0.62). A close second is Re-Branding (coefficient of 0.53). The third effect is of De-Constraining (coefficient of 0.39). Reform Competency therefore underlies the practices that comprise all three sourcing goal competencies. The squared multiple correlations indicate it explains 38, 28 and 15 percent respectively of the variation in these goals (Figure 2 summarize the effect sizes, significance and the predictive value of the model). We next turn to a detailed discussion of these results.

Discussion

Improved Reform Competency is positively and significantly associated with goals which orient the firms towards De-Constraining its supply capacity, Re-Branding of suppliers, and Re-Optimizing supply. Reform Competency is also positively and significantly associated with sourcing Effective Collaboration. These results provide support to the Resource Based View of the firm, specifically to the proposition that a set of sourcing goals viewed as a resource improves operational level performance of the sourcing function. In this sense, sourcing is strategic, based on the recognition that “... *prior activities, routines, and business practices can become part of the path-dependent processes through which a firm develops its resources and capabilities, which in turn condition its ability to implement future activities, routines and business practices* (Ray et al 2004; p. 36).

Intangible managerial resources of goal commitments and ensuing emphases on practices have been studied by Crook et al (2008). Reform Competency is a managerial resource and in our model it is inferred as a latent variable from multiple sourcing goals. In other words, specific multidimensional practices associated with goals are impacted positively and significantly with this resource. Suppliers may expect these practices to be encountered more often with buyers who excel in Reform Competency. Buyers can be expected to qualify more suppliers, and provide them with progress payments (goal of De-Constraining); encourage suppliers to adopt ecologically sound practices, and participate in quality certification and awards competitions (Re-Branding); and renegotiate frequently and receive shared resources for cost reduction (Re-Optimizing). The efficacy resource mediates the degree to which these goals and associated practices are observed, and a large portion of the variation observed in these goals is due to the Reform Competency of the buyer ($R^2 = 15\%$, 28% and 38% respectively).

Effective Collaboration entails collaborative support provided to the firm from practices adopted in the sourcing function. In this sense it is a functional level performance measure not affected by the accounting practices of appropriability (Ray et al 2004). A high ($p=0.80$) and significant ($t=4.78$) path coefficient between resource and performance in sourcing, and a high explained variation (63%) supports the claim that the strategic resources-performance relationship is strong when performance measures are unaffected by potential appropriation (Crook et al 2008). Practices that we find constitute a uni-dimensional Effective Collaboration goal are suppliers' rapid response to changing requirements; supplier understanding of technology cycles and planned obsolescence; and supplier involvement in specification development. All these practices provide sustained sourcing performance in the long term, and hence are Effective Collaboration. As Effective Collaboration is an outcome measure, and is uni-dimensional, our model does not treat it as a latent variable. It is completely mediated by Reform Competency which explains close to two-thirds its total variation ($R^2 = 63\%$).

Managerial concerns: Practices based strategic recommendations are arguably superior to initiatives based recommendations in the long run. In a recent article, a director of the supply chain practice of Deloitte Consulting in Southeast Asia points out that while initiatives such as e-procurement, B2B exchanges, and reverse auctions have followed each other, sustainable savings to bottom line impacts on COGS or SGandA have been elusive. Instead, the article recommends sourcing management in recessionary times should take a long term approach for sustainable savings. To quote:

“Spend management *is not structured around initiatives but rather around on-going management processes for spend categories* for which objectives, stakeholders, roles, responsibilities, and new processes are developed (Rawlings 2009; italics in the original).

The article stresses the importance of identifying *performance goals* and monitoring them to guide the organization. Our operationalization of sourcing resources and performance driven by goals and practices serves this purpose.

Limitations and Future Research: The research has some important limitations. The sample size was smaller than expected. Mueller (1996; p. 26) indicates that the ratio of sample size to number of estimated parameters in a model should be 5:1 as a minimal requirement. While this ratio was more than doubled in our hypotheses tests, additional sample size and higher ratios is preferable would have allowed a more elaborate model with moderation effects to be tested. Further research on how sourcing practices can link with sourcing goals is necessary to develop more robust measurement scales. Clearly, the measures and model will benefit from larger

datasets that allow scale validity and reliability checks across geographies and business cultures. Finally, as the study assured anonymity and employed the survey approach, it was not possible to link extensive financial information for classification. It was not possible therefore to use standard organizational performance measures for the resource-performance link and test the mediating and moderating effects of sourcing performance on business performance. We conclude with the key insights from the research.

Conclusion

Purchasing practices are well known to direct effort at better management of material flows and inventory; at quality improvement; at improving supplier relations; at lowering total cost of ownership including reducing administrative cost; and at improved competitive advantages. Texts in Business Marketing (for example, Hutt and Speh 2008, p. 36) discuss purchasing practices from an operational perspective. However, many questions of a strategic nature are unanswered: Is there a specific goal driven structure to sourcing practices? How strategic are sourcing goals as resources affecting functional level performance? With these motivating questions, the research develops measures that operationalize goals and practices. De-Constraining, Re-Branding and Re-Optimizing are goals that are associated with specific practices, and are exogenous indicators of a latent sourcing resource, Reform Competency. Resource multi-dimensionality and the impact of the sourcing resource on sourcing performance are hypothesized as path effects in a Structural Equations Model and tested with empirical survey research with purchasing managers based in South East Asia. We find that Reform Competency is positively associated with Effective Collaboration. Overall, the results support predictions of the Resource Based View of the firm.

Quality and Ethical Sourcing among Smallholder Coffee Producers in Papua New Guinea

Peter J. Batt, p.batt@curtin.edu.au
Roy Murray-Prior, r.murray-prior@curtin.edu.au
Curtin University, Perth, AUSTRALIA

Abstract

In order to participate in the emerging speciality coffee market, there is a requirement for traders to implement third party certified quality assurance systems to verify that appropriate practices to protect the environment and worker welfare have been followed. This paper explores both the opportunities and impediments associated with the introduction of ethical procurement systems in the Papua New Guinea coffee industry. While remoteness and inaccessibility supports sustainable production systems, without a significant improvement in the way in which smallholder farmers process their coffee, price premiums in the long-term cannot be justified. Poor infrastructure, high costs and the high likelihood that collaborative marketing groups will fail present additional impediments.

Introduction

Consumers today are becoming increasingly conscious of the need to promote sustainability. This emerging paradigm captures consumers growing concerns about the long-term sustainability of global food production systems, the depletion of natural resources, greenhouse gases and climate change, pollution and the destruction of wildlife habitats. Concurrent with this, is a growing concern for the manner in which our food has been produced. This includes such aspects as food safety and the adherence to prescribed religious practices, worker welfare, child labour, non discriminatory working practices and rewards commensurate with effort. For others, it also includes the humane treatment of animals and appropriate livestock husbandry.

Generally speaking, ethical consumerism is about using purchasing power to make the world a better place (Lewis, 2006). Consumers want to see food companies becoming more ethical, caring and compassionate about the product, the consumer and the world we live in. However, consumers are not the only drivers of the demand for more sustainable food production systems. Consolandi, Innocenti and Vercelli (2009) report that there has been a sharp rise in Corporate Social Responsibility (CSR) to upgrade the ethical standards of firms beyond that which is required by law. CSR refers to a business philosophy that aims to create a better society and a cleaner environment (European Commission, 2001). Being very large, high-profile organisations, most food manufacturers and retailers are very sensitive to any criticism or exposure by the media, lobby groups or from their customers. Consequently, most either have or are in the process of establishing one or more third party certified quality assurance systems to ensure that the food is safe and that prescribed labour practices and environmental management guidelines have been followed. However, Browne et al. (2000) adds an additional dimension, arguing that ethical trade is primarily concerned with the trading relationships between the developed and developing worlds. Ethical trade is a development tool, often supported by NGO's as a means of facilitating the entry of disadvantaged Third World producers into modern food markets.

Coffee is one of the world's most widely traded commodities. In 2009/10, over 134 million bags (60 kg) of coffee were produced of which 97.5 million bags were exported (ICO, 2011). With consumption estimated to approach 130 million bags, coffee prices have steadily increased over the last twelve months. While coffee consumption in much of the developed world is stable, per capita consumption in the emerging economies is trending upwards, fuelled by the global diffusion of a café culture. The most significant impact of the café culture has been a marked increase in the demand for specialty coffee. These superior quality coffees, which often offer unique cup characteristics, have most often been grown at higher altitudes under ideal climatic and soil conditions (Giovannucci and Ponte, 2005).

However, in order to achieve a premium price, there is a parallel requirement for these specialty coffee chains to introduce third party certified quality assurance systems that focus not only on the desired product attributes, but also include various environmental and social criteria. Reynolds (2009) reports that the market is “booming” for sustainable coffees with desirable social and ecological traits. Organic coffee is the most popular sustainable coffee, with sales of 72,000 tons per year. A further 52,000 tons of certified Fair Trade coffee is consumed each year. Some gourmet coffee companies use Fair Trade certification along with organic, shade-grown and other labels such as Rainforest Alliance or the Smithsonian Institute Bird Friendly coffee to satisfy consumers demand and to convey their coffee’s multidimensional profile.

Confronted with the need to maintain a positive image or at least to avoid negative publicity, many large corporations have also established their own quality labels, the most notable of which is Starbucks’ CAFÉ practices. Furthermore, private labels for responsible, sustainable and/or ethical coffee are rapidly expanding their combined market share (Ruben and Zuniga, 2011).

This paper will explore both the opportunities and the constraints associated with the introduction of ethical sourcing in the Papua New Guinea coffee industry.

Coffee Production in Papua New Guinea

Papua New Guinea (PNG) currently produces around 1 million bags of Arabica coffee per annum. Coffee is the second most important agricultural export crop in PNG, earning an average of K 340 million per year, which is 43% of agricultural exports, 10% of all exports and 5% of the nations GDP. More than 397,000 rural households cultivate coffee and over 2.5 million people depend upon coffee as their major source of income (Batt et al., 2009).

In PNG, coffee is produced by three groups: smallholders, block-holders and plantations. Over the past ten years, the contribution made by the latter two groups (often called the estate sector) has fallen to around 165,000 bags (9,900 tonnes) or 15% of total production. Smallholders, on the other hand, are responsible for 85% of total production (935,000 bags or 56,100 tonnes). The decline in the estate sector, which was largely responsible for establishing PNG’s reputation in the market as a producer and supplier of some of the finest coffee in the world, has resulted in a perception among buyers that the quality of PNG coffee has fallen and as a result the price of PNG coffee has fallen relative to the world price.

Traditionally, smallholder coffee growers in PNG harvest their cherry and through some very rudimentary on-farm processing systems, pulp, ferment, wash and dry the coffee to produce parchment (Batt et al., 2009). Once dried to 12-14% moisture content, parchment can be stored at the village level for several months. Whenever the need arises for cash, the parchment is then sold to roadside traders or directly to the dry factories, where the parchment is machine dried, hulled and polished to produce green bean. After processing, the green bean is purchased by exporters, who then blend, bag and transport the coffee to Lae, where it is subsequently re-packed into bulk shipping containers for export. In this generic market segment, price competition is intense, with roasters generally buying from whichever exporter offers the lowest price on the day - subject to confirmation after inspecting a sample. With only five roasters controlling 54% of the world market, traders and exporters have little countervailing market power.

For those smallholder growers close enough to deliver cherry to a wet mill on the same day of harvest, or where the wet mill arranges transport to collect the cherry, the wet mills, most of which are affiliated to an exporter, can produce coffee not dissimilar to the plantation grades. At this level, the key difference between that coffee which is destined for the generic market and that which is destined for the specialty market is the more consistent means by which the smallholder cherry is processed. Otherwise, with the exception perhaps of bean size (for the plantations and block-holders are more likely to use fertilisers and more appropriate agronomic techniques to improve productivity per unit area), there is little difference between smallholder cherry and plantation cherry.

However, in the specialty market, buyers invariably require their suppliers to institute various quality assurance programs. Currently, the most commercially significant quality assurance system operating in PNG is CAFÉ Practices. Introduced by Starbucks, CAFÉ Practices seeks to reward preferred suppliers who can demonstrate that the coffee has been sourced from growers who produce the coffee in an environmentally sustainable manner. In addition to the standards which specify the characteristics of the bean, permitted defect levels and the cup quality,

producers must meet strict controls on the use of shade, land management practices, chemical and fertiliser application, water use and pollution, conservation and biodiversity (SCS nd). In addition, processors and traders must ensure that growers have been treated fairly and equitably and have the right to collectively bargain. Additional conditions must also be met with regard to worker welfare (including the use of child labour) and minimising the impact of processing on the environment. For those businesses fortunate enough to meet the rigorous standards established by Starbucks, accreditation provides significant financial benefits, not only in higher prices, but it may also provide a means of securing working capital in an industry which most financial institutions are reluctant to enter.

Through such mechanisms as Fair Trade and Organic, it is also possible for smallholder coffee growers to enter the specialty market. Fortunately, in many of the more remote locations of PNG, while the high costs of transport may significantly reduce the net return to growers, the high costs of transport also preclude the use and purchase of inputs. As a result, such “natural” coffees, with appropriate certification, may readily find a niche market. Although organics is the most rapidly growing segment of the market, it commands at best only 2% of the market (Wheeler, Kufinale and Alu 2003). Furthermore, this segment of the market is beset by inconsistencies and confusion in the proliferation of different labels which attempt to either enhance or claim affiliation with the product without the rigorous application of the certifying procedures which define the term organic. Despite the high costs associated with certification, the Coffee Industry Corporation (CIC) reports that organic coffee receives a price premium of at least 32% over the generic Y grade (fob Lae)(Dambui et al. 2006). However, the value of the premium is very much dependent on: (i) the quality of the coffee itself; (ii) the overall price level in the market; and (iii) the customer to whom the coffee has been sold.

Additional value may be extracted by pursuing registration under one of the Fair Trade labels. Like the organic movement, the Fair Trade initiative authenticates the product, but does not actively trade in it (Wheeler, Kufinale and Alu 2003). Fair Trade aims to provide smallholder coffee producers with an opportunity to negotiate better terms of trade and to extract higher prices from roasters. Under Fair Trade: (i) the roaster (or buyer) must facilitate access to credit for up to 60% of the value of the contracted coffee; and (ii) the purchasing price must be fixed in accordance with the standard conditions of trade set by the Fair Trade initiative. Fair Trade has established a minimum price when coffee prices are low. This is currently set at USD 1.21 per pound. When prices fall below this level (for example around USD 0.60-0.80 per pound at the beginning of this decade) growers received a considerable premium. However, when prices are above this level, registered growers receive a Fair Trade premium of USD 0.15 per pound. Of this, USD 0.05 goes to the growers and the remaining USD 0.10 covers the additional costs, but discretionary payments may then be made to growers as a reward for better quality. Organic certification adds a further premium of USD 0.15 per pound, providing a total premium of USD 0.30 per pound for coffee that has both Fair Trade and Organic certification.

Impediments to Ethical Trade

PNG currently supplies the majority of green bean as a generic Y grade coffee at a discount ranging from USD 0.05 to 0.18 per pound (Batt et al., 2009). While opportunities exist to improve the quality of the smallholder coffee produced through training and the adoption of standardised processing systems, the potential gains available to the industry range from only USD 0.05-0.12 per pound. A far greater economic benefit can be achieved by moving more PNG coffee from the generic to the specialty coffee market. On the demand side, the specialty segment of the market is expanding. However, the key limitations in this market are; (1) the ability of smallholder coffee growers to produce parchment which delivers the desired taste in the cup consistently; (2) the costs and the investment in time required to achieve certification; (3) the annual costs of auditing and verification; (4) the need for functional collaborative marketing groups; and (5) on-going financial and technical support from the trader or exporter.

Smallholder processing

In the 2007 calendar year, certified Organic and Fair Trade coffee accounted for 3% of PNG green bean exports, with 26% classified as Organic, 57% as Fair Trade-Organic and 17% as Fair Trade (Dambui et al., 2006). While

there is much debate about the extent to which the market for both Organic and Fair Trade will continue to increase, there is an opportunity for more PNG producers and exporters to target this premium market. However, unless the quality of the coffee delivered meets customer's specifications, appealing to consumer's environmental or social conscience through eco-labelling or Fair Trade will ultimately fail. In coffee supply chains, quality is ultimately determined by the cup characteristics: taste, body and aroma. As many of these characteristics are intangible until the parchment is processed, most smallholder growers seem largely unaware of the impact that improper processing and handling may have on the cup quality.

In order to produce good quality parchment, only uniform red ripe cherries should be picked and processed on the same day of harvest. This requires access to running water and a pulper, both of which can be problematic for smallholders. Pale under-ripe cherry will not pulp. Under-ripe material that does go through to green bean will introduce raw, green or grassy flavours. On the other hand, over-ripe cherry is not only difficult to pulp, but the parchment will be badly discoloured. Mixed pickings containing under-ripe and over-ripe cherry will ferment unevenly and introduce bad flavours and taints (CRI, nd).

Fermentation requires the parchment to be held for 34-36 hours to allow the mucilage or mesocarp to ferment and disintegrate so that it can be washed off the bean. This is undertaken in specially constructed fermentation pits, bags, wooden boxes or other perforated containers. Generally speaking, the quicker the fermentation process proceeds, the less chance there is of taints and off-flavours developing. Prolonged contact of the beans with the solubilised mucilage and other fermentation products will damage the quality of the coffee by discolouring the parchment and introducing a "fruity" or "winey" flavour. During the fermenting process, the coffee should be washed every day with clean running water. Delays in washing can result in flavour taints similar to over ferment, while the use of dirty water can introduce a "muddy" taint.

The parchment must then be dried, generally in a two-stage process. For the first 2-3 days, the parchment is dried in the shade to prevent shrinking and cracking of the bean. The parchment is then sun dried, preferably on raised benches to reduce the moisture content to 12-14%. Sun drying improves the visual quality of the parchment, reducing much of the brown discolouration and enhancing the blue-green colour of the coffee bean. However, delays in drying the parchment, especially during the early stages, can introduce musty smells and taints, and, in the worst case, introduce the phenolic Rio taint, which in the 1980's, resulted in the suspension of PNG coffee imports to Germany.

At the point of purchase, the quality of parchment is assessed on a number of physical parameters such as: colour, odour, moisture content and freedom from trash and defects. According to an overall assessment of the sample(s), most of which are very subjective, the parchment will be classified and the growers and or roadside traders paid the prevailing market price. Ideally, as cupping is the most critical component of the quality control process, processors should take a sample of the parchment and dehusk, roast and taste it. However, as the quantity that the mills receive from individual smallholder growers often amounts to only 1 or 2 bags, it is simply not practical. At the roadside, equipped with only a set of scales, traders have no capacity to identify and segregate the better quality parchment and hence, most smallholder coffee farmers perceive that there are few incentives to produce better quality coffee.

As both Fair Trade and Organic growers use similar processing systems to those used by producers for the mainstream generic Y grade coffee, customers are likely to complain about the inconsistent cup quality and markets will be lost. Lewis (2006) similarly describes how, if Fair Trade is to become mainstream, producers must overcome consumers' perceptions that product quality is low. However, higher prices do provide both the means and an incentive to overcome these issues. Fortunately, each of the major faults: (1) immature and over ripe fruit; (2) over ferment and inappropriate washing; (3) inadequate drying; and (4) poor storage can be reduced by training and the adoption of standardised processing systems. However, without electricity and without water, growers are unable to pulp cherry on the same day as harvest for they are often too tired after spending all day in their coffee gardens and in many instances, they have had to manually carry the cherry some distance. Unfavourable weather conditions can make it difficult to sun dry the parchment. Enclosing wet coffee in sails on the ground for extended periods of time can result in moulds and in the most severe case, phenolic coffee. Furthermore, there is a high likelihood of product deterioration through poor and inappropriate storage in the home (smoke damage), for parchment is to most growers, the major means of providing cash to meet anticipated household and social expenses.

Fortuitously, by following well established best manufacturing practices, it is possible for smallholder cherry to be processed to the same standards as cherry derived from the plantation sector. On a per kg equivalent basis, the prices received by smallholder growers selling cherry are 35% higher than the prices received by growers selling parchment (Batt et al., 2009). In addition, those growers selling cherry do not incur the costs of either transport or processing, as most wet mills collect the cherry directly from the farm or some designated collection point. However, despite the higher price paid for cherry on a per kg basis, most growers seem unable to calculate the added value.

For the processors, purchasing cherry entails significantly less risk, for quality can be readily assessed by observation at the point of delivery. Processors should only purchase uniform red ripe cherry. Although 2-4% of under-ripe and over-ripe cherry is acceptable, larger amounts will introduce pulping problems, uneven fermentation and reduce the cup quality. For the growers, the sale of cherry results in significantly less work and thus, where labour must be employed, a significant savings in cash reserves. However, the key constraint is time, for the cherry must be processed on the same day of harvest. Ordinarily, the wet mills will only purchase cherry within a radius of 20-30 km from the mill, depending on whether the road is trafficable to trucks.

In a market that is currently constrained by a growing shortage of coffee, given that most of the coffee in PNG is sold under the terms of the European Coffee Agreement, traders and exporters face significant penalties if they are unable to deliver coffee to their customers on time. Keen competition between the wet mills to secure the smallholder growers cherry is driving the price upwards, but it is also resulting in a marked increase in the incidence of cherry theft. Stolen cherry is generally of poor quality, for when strip picked, it contains a higher proportion of under and over-ripe cherry. Processors buying poor quality cherry will find it difficult to achieve a premium price in the specialty market, for the cup quality will inevitably be compromised. Unless cherry theft can be curtailed, there is evidence to suggest that growers at all levels (smallholders, block-holders and plantations) are reducing the level of investment in their coffee gardens. Replanting, pruning and weed control are simply not being undertaken, for growers fear that they will not recoup their investment.

Furthermore, there has been a marked increase in inter-firm trading between coffee growers. Those growers selling cherry to their neighbours are more often the smaller growers. Many of the larger growers to whom the cherry is sold are registered growers under one of the many schemes operated by traders and exporters. Under their generic quality assurance program CAFÉ Practices, Starbucks require all their suppliers to be registered as a means of providing traceability, thus providing a means of verifying that the social and environment conditions have been met. As various incentives are payable to the exporter, a proportion of which is transferable to growers, depending on the level of registration achieved, it is in the growers best interest to sell as much cherry as possible.

Issues associated with certification

Within each of the ethical quality assurance programs is a desire to support more sustainable methods of production and to enhance worker welfare through the payment of minimum wages and the assurance of a safe working environment. The additional premiums available to growers from the implementation of these quality assurance systems vary considerably depending on the market acceptance of the standard as do the costs and time required to achieve certification.

Irrespective of whichever quality assurance system a trader or exporter may seek to implement in PNG, there are a number of institutional impediments which must first be overcome. At the farm level, the payment of a minimum wage is problematic. In many instances, landowners permit other members of their extended family to reside on the property without the payment of rent in exchange for the provision of labour. Similarly, for those who do not own land, they may be remunerated for their labour through the provision of fresh vegetables rather than cash. Furthermore, it is not unusual for school children, particularly during the vacation period, to assist their parents in harvesting the coffee, often without remuneration.

As the majority of smallholders practice mixed subsistence farming, often growing vegetables between or adjacent to the coffee trees, the application of chemicals and fertilisers to the vegetable crop may contravene the requirements under both Organic and Fair Trade certification. Furthermore, where chemicals are applied, there are

problems associated with the disposal of containers and even the storage of chemicals will prove problematic, as most growers store them in the house.

At the village level and in those instances where the quality assurance scheme is group based, there must be a functional cooperative or collaborative marketing group. Considerable time, costs and support is required to establish and maintain these groups. Leadership is critical and needs to come from the growers themselves rather than to be imposed from outside. Within each of these groups, practices and procedures must be followed and any product which fails to meet the prescribed standards must be excluded. Under Fair Trade, the group must be able to show that it has democratically decided how to invest the Fair Trade premium.

At the processor, trader and exporter level, not only must they have confidence in the people appointed to monitor quality at the village level, but they must implement a means by which they can trace the product to its source. This requires not only the registration of growers, but a means by which each growers output can be verified. Not unexpectedly, where higher prices are paid for either cherry or parchment, individual growers may find that they can profit by purchasing coffee from neighbouring growers. Unlike HACCP-based quality assurance systems where the main reason for traceability is to either identify the source of the contamination or the need to recall contaminated product, in the PNG coffee industry, the main reason for traceability is to ensure that the premiums paid to traders and exporters have indeed been paid to the individual growers and or the communities from which the coffee was sourced. By necessity, this requires accurate records of all transactions with growers to be maintained, at considerable extra cost for the exporter.

In addition, in order to achieve accreditation under each of the various environmental impact components and to address work safe practices, traders and exporters are required to assist their growers. Training is required in agronomic practices that prevent erosion and the subsequent contamination of waterways and streams; the appropriate application of chemicals and the responsible storage and disposal of containers; and the provision and use of protective equipment (gloves and masks).

While achieving Fair Trade certification takes from 3-6 months, Organic certification takes from 2-3 years (Batt et al., 2009). As smallholder growers are motivated primarily by price, it is necessary for traders and exporters to pay above market prices in order to secure the growers' coffee during the transition period. Furthermore, the growers themselves are unable to pay for the annual costs of auditing and verification. Even for Fair Trade, inspection costs up to AUD 500 per day plus airfares and accommodation. Because of the remoteness and the large number of growers involved, the process often takes considerable time and effort.

At the wet factory, and at considerable cost, processing lines often require modification to prevent the contamination of waterways. In several instances, processors have sought to identify alternative uses for the disposal of the pulp. For those traders and exporters who sell certified Organic coffee, it is important to realise that it is the entire supply chain which is certified. By necessity, this requires certified Organic coffee to be physically separated from other coffees, often requiring a significant investment in additional processing and storage capacity.

Collaborative marketing groups

Because of the small volume of parchment each individual grower produces, smallholder growers are unlikely to benefit from any improvement in quality without a commensurate increase in scale. This is best achieved through the formation of collaborative marketing groups, where the members, either collectively or individually, follow a strict quality assurance system to reduce the variation in quality. By offering a long line of more consistent quality parchment, direct to processors and exporters, it is possible to secure a higher price.

However, the formation and on-going management of these collaborative groups is not without problems. In the past, most collaborative marketing groups in PNG have failed as a result of mismanagement, incompetence, corruption and conflicts of interest. There is also some doubt as to whether collaborative groups are a viable form of organisation in PNG, given the traditional tribal structure of society and the role and importance of the "big men". Of particular importance is the issue of leadership to ensure that group members are not only fully informed, but that, in the event of the leader's demise, the group has the capacity to continue (Murray-Prior, Sengere and Batt, 2009).

More fundamental however, is the need for collaborative marketing groups to provide returns that are at least equal to, if not greater than those the members could achieve by transacting individually. While the expectation

of higher prices is the major motivation for the formation of collaborative marketing groups, the inability of the groups to deliver higher prices will correspondingly provide one of the major factors leading to their demise.

Appropriate recording systems must be established to ensure that members are paid what they are due and appropriate control systems established to ensure that those growers who follow the prescribed quality systems are adequately rewarded and those who do not are sanctioned. Not unexpectedly, collaborative marketing groups cannot function without good management, a willingness among the members to work together, and mutual trust and respect.

Financial considerations

At the individual farm level, the major problem for smallholder coffee growers is the need for cash to meet anticipated household and farm expenses. As household expenses (including school fees) and social obligations receive first priority, there are often insufficient funds available to provide for the costs of labour to prune the coffee trees and to provide fertilisers and chemicals. Even if growers can be encouraged to save a greater proportion of the income generated from the sale of coffee, under the prevailing social system in PNG this will prove to be difficult, as related family members are still able to call upon any readily accessible funds. To overcome this constraint, several processors and traders are voluntarily withholding a proportion of the income received from coffee sales to pay for anticipated household and farm expenses. Not unexpectedly, those growers who choose to leave some funds with downstream buyers are not only more likely to receive cash advances, but they are also signalling their intention to enter into a long-term relationship.

In agricultural markets where prices are determined primarily by supply and demand, growers are more certain of their costs than they are of their returns. Not unexpectedly, with limited financial resources, the amount of money smallholder coffee growers are willing to invest to sustain their coffee trees is very much dependent on the prices they expect to receive. At the individual farm level, the CIC (2002) reports that there is a significant and positive relationship between productivity and price (after a one year lag), with price explaining 82% of production levels. Historically, as farm gate prices have declined, smallholder coffee growers have allowed their trees to go into a sedentary stage during times of low prices and will only harvest sufficient coffee to meet their immediate requirements for cash or to meet social obligations. As a result, soil fertility has declined, trees are ageing, there is minimal pest control and with general mismanagement, productivity per unit area has generally declined.

Even although prices have increased over the last few years, there is little evidence of any renewed interest or enthusiasm to invest in coffee. At the farm level, an increasing demand for cherry has simply resulted in a marked increase in cherry theft. Unable to protect their investment, growers are reluctant to rehabilitate their coffee gardens, knowing full well that they are unlikely to benefit. Furthermore, the benefits of rehabilitation are generally achieved two to three years after the intervention. In a highly volatile market, there is an element of risk that any investment may not be recovered. Even when prices do rise, a household will only harvest as much coffee as they can carry and process in a day.

Institutional impediments

At an industry level, discussions with industry players identified three major variables that currently constrain both the production and the quality of the coffee produced in PNG: (1) the poor state of the roads and transport infrastructure; (2) lawlessness; and (3) insecurity of land ownership and tenure.

The poor state of the roads limits the capacity of smallholder coffee growers in remote areas to: (i) access wet mills and thus by default, the growers must produce parchment; (ii) even when parchment is produced, during the wet season, the roads are often impassable and hence: (a) the growers cannot get their coffee out; (b) the parchment must be stored for long periods of time in often substandard conditions with a commensurate reduction in quality; and (c) where it is possible to fly the coffee out, the costs of transport are substantial, thus reducing the potential return to the growers.

Lawlessness needs to be considered from the perspective of both cherry and parchment for the issues are vastly different. In the case of cherry, with the expansion of the specialty market, high cherry prices have encouraged

theft from both smallholder coffee growers and the larger block-holders and plantations. Cherry theft most often results in strip picking, where both red and green cherries are mixed in the bag. When processed, any more than 4% green cherry is said to adversely influence the cup taste, introducing raw or grassy flavours. However, many roadside traders and wet mills continue to buy inferior quality cherry, thus providing a means for the disposal of illicit cherry. In the case of parchment, theft by both individuals and organised gangs is not uncommon from the grower's property, drying beds, in transit, or from the processing factory. However, the theft of green bean is more opportunistic and most often associated with accidents or roll-overs in transit.

Problems associated with land tenure are most often demonstrated by a failure to invest in the rehabilitation of coffee gardens on the basis that another tribe or clan may harvest the coffee and thus secure the benefits. However, at an individual level, tribal conflict may result in the complete destruction of coffee gardens.

The lack of finance was evident at three levels: the individual level, the cooperative level and the community level. For individual growers, the lack of capital relates to the inability to purchase inputs (pesticides and herbicides, fertilisers and labour to rehabilitate the trees) and hand pulpers. At the cooperative level, the lack of finance prevents cooperatives from being able to pay the growers on delivery for either the cherry or parchment that is supplied. At a community level, the lack of infrastructure includes the lack of water and electricity and in some communities, the lack of appropriate roads to transport the parchment to dry factories.

However, it is also evident that there is a significant cultural difference between most smallholder farmers, the plantation managers and exporters (Murray-Prior and Batt, 2007). Most of the large plantations, processing factories and export operations are managed by expatriates whose cultural backgrounds are vastly different to the clansmen. With only a limited understanding of the dynamics of the world coffee market, many smallholder growers believe that they have been taken advantage of by traders and exporters. However, there is evidence to suggest that smallholder coffee growers in PNG receive between 68-80% of the fob price (Lae)(Batt et al., 2009).

Conclusions

While it is possible to move more smallholder coffee into the specialty/ethical coffee market, the generic market should not be excluded. For various reasons including equipment failure, power cuts, or an over-supply of cherry, the quality of the parchment produced by the wet mills may fail to meet the quality standards demanded by the specialty market. Rather than to risk damaging their reputation in the market, exporters will divert such coffee from the specialty market into the generic Y grade market to recover some of the costs.

Even where a smallholder coffee grower may choose to sell their cherry directly to a wet mill, the need for an alternative route to market is also evident. During the off-season, it is not unusual for some cherry to be produced. Known as the fly crop, the quantities of cherry available may be insufficient to recover the cost of despatching a truck to collect it. Thus the only option for the grower, if they have time, is to harvest and process the cherry themselves. When the need for cash arises, the parchment is then sold to roadside traders.

A similar situation may arise for those growers selling parchment through collaborative marketing groups. When sudden and unanticipated social obligations arise, parchment may be sold through the roadside traders for immediate cash. While the net returns may be higher selling through the collaborative marketing group, given the delays in payment, the grower would otherwise be unable to meet their social obligations. Consequently, there are some very strong social and economic drivers supporting the retention of two parallel coffee supply chains in PNG.

Cross-Functional Coordination through Sales and Operations

Planning

Abstract

We analyze the design and pilot-implementation of Sales and Operations Planning (S&OP) at a South-East Asian site of a global producer of ingredients. In this single case study research we find that when S&OP participants become more knowledgeable about other functions' capabilities they become more successful in *negotiating* with external partners. Also, the perceived *fairness* of decision making is found to contribute to the willingness of participants to engage and commit to S&OP. We further find that the engagement of *product designers* in S&OP can lead to better supply chain performance as they identify and approve alternative components or processes to *ease supply constraints*. Finally, we observe that an *advanced organization structure* and *vigilance about forward momentum* can help companies implement and sustain S&OP in challenging environments.

Key words – Sales, Operations, Planning, Cross-functional, Coordination

1. Introduction

To match supply with demand in the intermediate term, companies must develop well-coordinated demand and supply plans. To facilitate this coordination at an organizational level, many companies have implemented “Sales and Operations Planning” (S&OP) processes. These are cross-functional processes in which participants from Sales, Marketing, Logistics, Manufacturing, Purchasing and Product Development engage in regular, structured communication and decision-making to achieve effective coordination and improved profitability. Over the past twenty five years, companies have increasingly experimented with such planning processes, consulting companies have specialized in them (Ling and Goddard, 1988), and several books providing practical implementation guidelines have appeared (Wallace and Stahl, 2008a; Dougherty and Gray, 2006). In addition, researchers have developed dynamic models that describe the maturity of S&OP processes (Grimson and Pyke, 2007;

Lapide, 2005) and explain their success (Oliva and Watson, 2007). Descriptions of S&OP processes have also started to appear in textbooks for Operations Management (Jacobs and Chase, 2008) and Supply Chain Management (Simchi-Levi *et al.*, 2007).

The wide adoption of S&OP by practitioners offers interesting opportunities for empirical studies to further develop the theory on cross-functional coordination in organizations. Through direct observations of the structures created, processes used, information exchanged, and decisions made in S&OP, researchers can generate new hypotheses regarding the content, structure and process of cross-functional coordination. This paper reports on such a research study.

We report on the findings of an empirical, case-based study of S&OP implementation in at a production site in Southeast Asia. The company successfully introduced a structured S&OP process and the positive results of the implementation after four monthly planning cycles led to a decision to expand S&OP to other Asian sites, with significant benefits expected. Interestingly, the company was able to introduce S&OP at a production site that faced a wide range of difficulties and tense relations between the functions (most executives agreed it was “a burning platform”).

In our study, we directly observed the design and pilot implementation of this S&OP process and subsequently compared it with documented standards in order to learn from the variance and thus generate novel hypotheses regarding the structure, content, and process of cross-functional coordination.

With respect to *structure*, our observations support the hypothesis that an advanced organization structure for S&OP can contribute to the success of S&OP in challenging circumstances. By comparing with existing S&OP maturity models (Grimson and Pyke, 2007), we noted that the company gave priority to developing the organization dimension of the S&OP process while adopting a slower development path on the dimensions of meetings, measurements, technology, and plan integration. This implementation course coincided with positive outcomes in an environment that was not conducive to cross-functional coordination.

With respect to the *content* of cross-functional coordination, we found that S&OP contributed to an improved awareness of operational delivery capabilities within the Sales group, thereby increasing the group's confidence in dealings with customers. This reveals an interesting new role for cross-functional communication: improved knowledge about capabilities of other functions not only leads to better decisions but also increases organizational confidence levels and thus, negotiating positions with external partners. In a second *content*-related finding we confirmed an important role for product designers in S&OP: in the case of supply challenges they can identify and approve alternative components or processes in order to ease supply constraints.

Our study also offers insights for the *process* of cross-functional coordination. Oliva & Watson (2007) found that the success of S&OP in achieving coordination between functions driven by different incentives relies on an organizational process that creates a virtuous cycle of participant engagement leading to organizational benefits, which then further increase engagement. They found that this virtuous cycle works well if fueled by three types of process quality: informational quality, procedural quality (the steps by which information is converted into plans), and, perhaps most importantly, alignment quality (the extent to which the different functions commit themselves to a set of well-aligned functional plans). Our study's observations of four S&OP cycles led to two additional hypotheses regarding the nature and role of process quality in the success of S&OP. A first hypothesis proposes that "fairness" or reciprocity between functions is an important component of procedural quality and a second hypothesis suggests that there is a threshold level of process quality below which S&OP cannot sustain itself without maintained top management effort and involvement.

In the remainder of this paper we first present a targeted view of the existing literature on S&OP in Section 2. We then explain the case study methodology in section 3 and present the case study in Section 4. In section 5 we analyze the case to generate hypotheses and discuss and conclude our findings in Section 6.

2. Literature Review

2.1 Aggregate Planning and Cross-Functional Coordination

S&OP is a sophisticated, effective and efficient process for aggregate production planning (e.g. Jacobs and Chase, 2008; Simchi-Levi *et al.*, 2007). By forecasting and planning demand according to product families 12-18 months ahead, the organization can plan sales, production levels, inventories and capacities for that same time horizon. S&OP differs from traditional aggregate planning by emphasizing the *process* of planning – the process steps, as well as participants' roles and responsibilities in S&OP, are highly specific. More so than in traditional aggregate planning, S&OP acknowledges that planning success depends on key communication links between different functions, high-quality and timely inputs from knowledgeable and engaged participants, interactive forums to discover and discuss relevant issues, and executive authority to drive and implement decisions.

Many observers also indicate that S&OP delivers benefits beyond those of traditional aggregate planning. According to Bower (2006), S&OP builds an atmosphere of collaboration, adds accountability for performance against measurement and fosters the desire to improve. Vollman *et al.* (2005) assign a strategic role to S&OP because it supports the creation of detailed functional plans that are driven by “one set of numbers” and because it allows management to make critical trade-off decisions and better align business activities with the firm's strategic objectives. These observations indicate that S&OP is becoming a wide-spread organizational tool for coordinating the different functions in an organization. The study of S&OP implementations can thus not only offer new insights about aggregate planning but also about the content, structure and process of cross-functional coordination (Galbraith, 1973, 1977; Thomson, 1967).

In the remainder of this literature review, we offer a brief description of the standard process steps, reported benefits, key success factors, and dynamic models for S&OP. In addition, we

will describe specific aspects of S&OP in innovation-driven, finish-to-order (FTO) environments as they are relevant to the company in the study.

2.2 S&OP Process Steps

At the start of every S&OP cycle, in the *data gathering* step, the IT function is responsible for updating relevant files with production, sales, inventory, backlog, and other data from the previous month (Wallace & Stahl, 2008a, p.55). The fresh data supports the generation of initial sales forecasts that are unbiased, unconstrained and adjusted for changes in relevant external variables – this is best achieved with the support of statistical models (Lapide, 2004).

The *demand planning* step comprises updating forecasts with information on customer orders, the market environment or other demand-influencing events (Oliva & Watson, 2007). It is potentially the most challenging S&OP task for large organizations with differing demand forecasts between departments. The step includes: forecasting performance review, addition or updating of new product forecasts, forecasting of new order volumes, iterative application of external factors/assumptions, financial conversion and reconciliation, and executive authorization (Wallace & Stahl, 2008b).

The *Supply planning* step ensures that all resources and materials required for production to meet the aggregate demand forecasts are available. This involves the creation of master production schedules by product family and may incorporate production rules for sequencing, lot sizes and manufacturing frequency. The master schedule then triggers plans for the appropriate mix, components and resources, using tools like materials requirement planning (Dougherty & Gray, 2006).

In the *pre-meeting*, Sales, Marketing and Operations representatives meet to make decisions regarding supply and demand mismatches, agree on a single set of recommendations for the executive meeting and prepare outstanding areas of disagreement for resolution during the

executive meeting (Wallace & Stahl, 2008a). This allows the executive meeting to run efficiently and effectively.

Top executives and departmental directors participate in the *executive meeting*, which aims to review key metrics, resolve disputes, achieve consensus, make key business decisions, approve S&OP plans and hold people accountable. Also, alternative scenarios should be reviewed and trade-off decisions and impacts of demand, supply or financial alternatives analyzed (Tohamy & McNeill, 2008).

Finally, most authors stress the importance of *measurement of results* of S&OP by monitoring key performance indicators (KPIs) (Tohamy and McNeill, 2008). Forecasts of sales, production and inventories/backlogs are easily evaluated using methods such as mean squared error or mean absolute error (Diebold, 2008). Other common measures include expediting frequency, quality and utilization. Development cost, time-to-market and ramp-up time are critical metrics for new product development (Grimson and Pyke, 2007). S&OP implementation progress can also be assessed by asking participants for opinions and suggestions for improvement, informally or formally (Wallace and Stahl, 2008a).

2.3 S&OP Reported Benefits

This section details the main benefits of S&OP, with references to case studies from academic and practitioner literature relevant to firms operating in innovation-driven (with frequent new product introductions), FTO environments.

Eli Lilly and Company, a global pharmaceutical company heavily reliant on product innovation, credited *improved customer service* to their implementation of S&OP (Dougherty and Gray, 2006, p.225). S&OP helped to cushion unpredictable demand, especially during periods of new product launches and high asset utilization. At Engineered Materials Solutions, Inc. (EMS), an innovative North American producer of clad metals, S&OP-driven collaboration between Sales and

Operations resulted in more strategic placement of inventory, thereby increasing on-time delivery (Dougherty and Gray, 2006, p.245).

Well-functioning S&OP processes have also enabled some companies to *increase sales*, since minimum service levels are necessary for survival, and superior customer service through operational excellence can constitute competitive advantage (Bower, 2006). Over 21 months of S&OP implementation, the use of appropriate data management tools allowed Eclipse, Inc., a design, fabrication, and assembly company, to better anticipate and prepare for increased customer demand, coinciding with a 39% increase in sales volume and an increase in profitability by several percentage points (Dougherty and Gray, 2006, p.222).

During supply planning under S&OP, reviewing slow-moving inventory can prompt discount and distress channel sales initiatives, thereby *reducing discards of obsolete inventory*. Obsolescence can be further reduced through review of the product portfolio (usually during the pre-meeting) to decide which SKUs to discontinue – from there, the target SKU and its components are actively managed to ensure the lowest cost of run-out and exit (Bower, 2006). For example, S&OP helped Norse Dairy Systems, a producer of filling and packaging equipment for ice-cream dairy products, reduce discards by 55% (Dougherty and Gray, 2006, p.266).

At AGFA US Healthcare, a Belgium-based producer of medical imaging products, continuous review and updating under S&OP improved forecast accuracy, *lowering inventory* from 120 to 40 days' over three years (Dougherty and Gray, 2006, p.174)). Similarly, a 62% reduction in inventory at EMS increased operating cash flow while meeting customers' delivery expectations (Dougherty and Gray, 2006, p.244). The equipment group of Norse Dairy Systems increased inventory turns by 22% and reduced average inventory by \$600,000 over a year (Dougherty and Gray, 2006, p.266)).

At EMS, better cross-functional collaboration increased reliance on demand projections from Sales rather than on Operations' forecasts, *improving forecast accuracy* by 90% across all product subfamilies (Dougherty and Gray, 2006, p.244)). At a consumer electronics company in Northern

California, adherence to S&OP plans and better forecasting improved forecast accuracy by 40 percentage points (Oliva and Watson, 2007).

S&OP gives rise to other *soft benefits* as well. Through S&OP, people learn about other functions' roles and therefore know "who to talk to" for information and authorization, leading to better and faster decision-making and improving interdepartmental teamwork. As S&OP increases performance reliability, customers become more likely to collaborate in forecasting and new product development, leading to improved communication and satisfaction. At Eli Lilly, S&OP increased the clarity and speed of decisions and plans by increasing sales affiliates' accountability and enhancing their understanding of forecasting's impact on manufacturing (Dougherty and Gray, 2006, pp.234-235)). Also, at BASF, the world's largest chemical company, the wide implementation of S&OP has created formal and comprehensive cross-functional structures for communication and collaboration, increasing responsiveness to market conditions and aiding survival in difficult economic climates (Atkinson, 2009).

2.4 S&OP Key Success Factors

The literature also identifies a set of key success factors for S&OP implementation.

When top managers, the leaders and decision makers in S&OP, advocate complete participation and compliance, the process is said to enjoy *high-level executive endorsement*, and other organizational members, recognizing S&OP as the main process for reconciling supply and demand problems, will be fully committed (Dougherty and Gray, 2006, p.49). At Norse Dairy Systems, senior management leadership was considered instrumental in ensuring participation from all functions (Dougherty and Gray, 2006, p.267).

Wallace and Stahl (2008a, p.84) stress that obtaining *departmental buy-in and participation* is essential as S&OP is a "people project" – the human element is often what derails process implementation. Without identifying the "customers" of S&OP (i.e. participants from different

functions) and addressing differences in their interests, preferred measurements and modes of information delivery, S&OP risks delivering information that is neither clear nor actionable. In a smooth running process, the S&OP process owner or executive champion identifies disagreements that might cripple S&OP (e.g. opinions about forecasts, metrics of S&OP success, information presentation format), and generates solutions to bridge the interdepartmental gap (Harrison, 2009).

Continuous feedback and improvement is important to increase process quality – improvement can be internal (improving process conduct) or external (improving business performance). Internal improvement occurs when the S&OP process owner or design team takes note of participant feedback and has the courage and determination to refine the process accordingly. The initial issues are usually meeting mechanics, formats, data accuracy, and process requirements. As S&OP gradually helps management hit performance targets, the focus shifts to external improvement, i.e. finding methods to achieve higher targets (Boyer, 2009). S&OP works well if it becomes a vehicle for improving underlying processes – for example, S&OP participants can investigate how existing service levels can be sustained with lower inventory levels, or how production rates can be more flexible within a given time fence (Wallace and Stahl, 2008a, pp.154-155).

Since S&OP requires accurate and timely data, *IT support* is found to be essential. Large companies implementing S&OP may find themselves quickly overwhelmed by large volumes of manual data entry, increasing delay, errors and inefficiency. Hence, it is recommended to automate data gathering and entry as early as possible, preferably during the pilot stage (Wallace and Stahl, 2008a, pp.105-106). At a global producer of mechanical drilling devices for petroleum and natural gas extraction, multiple acquisitions meant the company used many different information systems, and the resultant lack of prompt historical data limited the benefits from S&OP. Because of the firm's conflict-averse culture, the S&OP executive champion did not confront IT, so data entry was never automated and interest in S&OP withered before the pilot phase (Wallace and Stahl, 2008a, pp.73-74).

The success of S&OP also depends on *integration with the development and introduction of new products*, for which demand and supply planning is challenging because of the lack of sales history and the uncertain impact on required resources. Through S&OP, participants can revise launch dates, review forecasts' impact on manufacturing, suppliers and sales resources, and determine the steps necessary to surmount the uncertainty. At Coca-cola, MIDI, Interbake, Norse Dairy Systems and UMC, formal new product reviews are synchronized with monthly S&OP meetings (Dougherty and Gray, 2006, p.84).

A final factor that drives increased benefits of S&OP is *customer and supplier involvement*. The planning of supply and demand that takes place in S&OP is thereby extended both up and down the supply chain, usually after the internal process has reached a sufficient maturity level (Lapide, 2005).

2.5 S&OP Dynamic Models

In addition to the static view, the literature also contains various dynamic models of S&OP success. First, maturity models suggest that S&OP can be implemented gradually, with increasing levels of effectiveness, by following a sequence of implementation actions coordinated across different dimensions. Lapide (2005) highlights three dimensions of S&OP maturity: meetings, processes and technology, while Grimson and Pyke (2007) identify five dimensions. To the dimensions of "meetings and collaboration" and "information technology", they add "organization", "measurements" and "S&OP plan integration" (the mutual adjustment of functional plans for profit maximization).

One dimension of maturity-type thinking is the effective use of S&OP applications – these possess process automation and simulation functions to manage several supply and demand elements, (Lapide, 2004-05). Process maturity models help companies decide when they are ready to acquire expensive, advanced S&OP applications. Firms in the "marginal" (sporadic meetings, disjointed demand and supply plans) or "rudimentary" stage (routine meetings with spotty attendance, internally reconciled demand plans, supply plans aligned to demand plans) are served

well with spreadsheets or standalone planning software, which are limited in performance, version control and data harmonization. Only “classic” processes (full and regular attendance, jointly-aligned demand and supply plans, supplier/customer collaboration) can effectively leverage integrated software applications (Lapide, 2005).

A second type of dynamic model is Oliva and Watson’s (2007) system dynamics framework, which suggests that departments’ misaligned incentives may increase their participation in S&OP to advocate their own interests, thereby achieving integration across departments. Their empirical study also proposes that participants will remain engaged as long as S&OP delivers informational, procedural and alignment quality. If these findings are confirmed, S&OP can be an important mechanism for cross-functional coordination in companies where direct incentive alignment is not an option. They also propose that alignment quality is more powerful than informational or procedural quality.

2.6 S&OP in Innovation-Driven, Finish-To-Order Environments

The company in our case study introduces new products frequently. In such innovation-driven environments (e.g. pharmaceuticals, medical equipment, aircraft), competitive advantage hinges on developing, marketing, producing and delivering new products in the demanded quantities and with the required speed. With future demand, profitability, resource consumption and cannibalization sales uncertain, such companies need processes facilitating the reporting, tracking and revising of new product forecasts and assumptions (Kahn, 2006).

Also, the company uses an FTO production strategy – they must finish products only after receiving customer's orders, i.e. with a much shorter lead time than with MTO. Hence, they must manage raw material and component inventory to balance timely delivery with holding costs (Wallace and Stahl, 2008a, pp.27-32). Further, given natural forecast inaccuracy, the planning process must be sufficiently flexible to respond rapidly to demand changes by altering supply chain

strategies (Dilger, 2009). S&OP fosters such flexibility by facilitating frequent and effective interdepartmental communication and collaboration.

3. Research Methodology

We applied the single case study research methodology (Yin, 1984) in this paper. Mentrix' S&OP implementation is suitable for single case study research because it is both representative and critical. It is *representative* because the company set out to implement a planning method purported to bring benefits to a wide range of manufacturing companies and it is *critical* because the implementation was attempted in an environment that was not conducive to cross-functional coordination. The case study was also revealing because it was not retrospective but prospective. As researchers we had the opportunity to influence the starting point of the S&OP design by presenting the S&OP literature review (section 2) to the project leadership and also at an executive briefing for the project. This created an interesting experiment since we could then observe precisely where the company would vary from the documented standards and generate hypotheses by analyzing these variations.

We used a diverse set of data collection methods to gain a cross-validated understanding of the industry, the company, its organization structure, supply chain and existing planning processes, as well as the factors driving the S&OP project. We visited one of the companies' manufacturing plants and were given a detailed briefing on the S&OP initiative. We also conducted semi-structured interviews with four senior managers from key functions in Food Ingredients Asia regarding the need for S&OP, and analyzed reports from interviews the company had conducted with 11 project stakeholders. We then directly observed the project kick-off meeting, and two of the authors worked with the S&OP design team during a 12-week engagement. In addition, we maintained regular email correspondence and meetings with project leaders and were given access to archival data of the Executive Meetings (meeting minutes, presentations, and voice recordings of the meetings). After the second cycle, we obtained formal feedback on process implementation from

nine key participants through phone interviews or email questionnaires. After the fourth cycle, we conducted semi-structured interviews with four key participants to better understand the content, process and results of S&OP up to that time.

4. Background and Situation

The company studied is a global producer of ingredients for consumer goods. To disguise its identity we use the fictional name Mentrix and we have also changed names, locations and figures.

4.1 Industry Overview

Mentrix operates in a particular, highly innovative, \$20bn sector of the food ingredients industry. Five producers dominate this market sector with over 60% of market share and spend about 7-8% of revenue on R&D to constantly develop new products.

4.2 Company and Pilot Site

In this sector, Mentrix has a well-established history and is one of the leading companies with manufacturing and sales presence in more than 40 countries through more than 50 sites and over 5000 employees. Mentrix spends 8% of revenue on R&D, constantly innovating new products and techniques. has a highly matrixed organization structure, operates an extensive supply chain network and delivers innovative products in a mainly finish-to-order (FTO) strategy. The observed S&OP pilot implementation took place from May to October 2010 at a production site in Jakarta, Indonesia which faced many demand and supply reconciliation issues due to rapid growth in the region.

Approximately five years ago, Mentrix acquired a major competitor, Table Industries, as part of its strategy of focusing on developing markets and capturing opportunities in key segments. The Jakarta site, which served Table's customers in Southeast Asia, was selected for the S&OP pilot.

4.3 Organization structure

Globally, Mentrix is divided into Operations and Commercial, with consolidated responsibility only at board level. Commercial is organized regionally, comprising three functions – Sales, Marketing and

Development & Application (D&A) – while Operations is organized locally but supported regionally (Planning, Quality Management and Engineering).

Mentrix Indonesia has a highly matrixed organization structure, where Operations, Sales and D&A report to Singapore-based regional managers. Resolution of site-level issues might require, for example, interaction between the ASEAN Sales Director and the APAC D&A Director, who both report to the Asia Commercial Manager. Operational issues could potentially be resolved only at the global level.

Sales interacts directly with customers and responds to requests for new products by documenting project briefs in the Opportunity Management System (OMS), through which D&A manages new wins. The Indonesia Sales Manager reports to the ASEAN Sales Director, who then reports to the Asia Commercial Manager. Sales' performance is measured by revenue, customer satisfaction, and service level.

Marketing identifies, develops and launches new product concepts through market research on consumer trends and formulates pricing policies. Marketing is organized by end-use (beverages, snacks, confectionery etc) and the Head of Marketing reports to the Asia Commercial Manager. Marketing's KPIs are revenue, profit margin, and new wins.

For each customer project brief in the OMS, the D&A team creates, modifies and/or recommends ingredients from its vast library of ingredients. The Indonesia D&A Manager reports to the Asia D&A Director, who reports to the Commercial Manager Asia. KPIs for D&A are the win rate and the opportunity pipeline.

Operations is responsible for production, planning, order management, warehousing, logistics and distribution. The Indonesia Operations Manager, along with local support functions, report to the Head of Operations Asia, who in turn reports to the Head of Global Operations. Their KPIs include service levels, raw material inventory levels, discards and order expediting costs.

Procurement sources for appropriate vendors and negotiates contractual terms, with the aim of attaining reliable and affordable long-term supply. Procurement's KPIs include costs and lead time of inputs (raw materials, packaging and equipment).

Finally, Planning verifies sufficiency of raw material to fill each order and orders as required. Once all raw materials are available, Planning creates and releases shop orders to Production for manufacturing. Planning also sets raw material inventory policies and creates shop orders to maintain inventory of intermediate products independent of sales orders. The Regional Planner reports directly to the Head of Operations Asia.

4.3 Existing Planning Processes and the Need for S&OP

Before a new forecasting tool was introduced in Q1 2010, Mentrix Indonesia's forecasting process mostly relied on Sales' subjective inputs. Also, forecast horizons for different customer-SKU accounts varied significantly and poorly matched the lead times required by Operations. Likewise, missing forecasts were filled by Operations in a process that was not interactive. The new forecasting tool used simple statistical updating models to create an initial set of forecasts that Sales was then allowed to update as they saw fit. However the demand planning process was still largely based on Sales' inputs and assumptions and other functions did not review or adjust the forecasts.

Although over 80% of raw materials (by weight) are procured from nearby vendors, products requiring proprietary ingredients from Mentrix affiliates in Europe or America comprise just under 70% of revenue. Proprietary ingredients' long lead times (up to 3 months) makes their availability unpredictable, further complicating raw material planning. These frequent raw material challenges and concerns about production capacity constraints created a need for more regular, reliable and organized supply planning.

Finally, new product introductions further complicated demand and supply planning due to the lack of historical sales to assess the level of resources required. Mentrix expected that S&OP could mitigate this problem through regular structured communication between participants.

4.4 Pilot Site's Challenging Environment

In the Food Ingredients industry, customers are often food manufacturers with tight production schedules and prompt delivery expectations. Timely order fulfillment is difficult because of unpredictable raw material lead times due to dependence on naturally fluctuating supplies of agricultural commodities. Furthermore, high inventories of raw material are necessary due to unpredictable new product demand while their perishability implies frequent discards.

Figure 1: Service Levels for Indonesia and Average of all other Asian sites (Jan-May 2010)

In Indonesia specifically, performance consistently lagged behind other Asian sites (Figure 1), suffering significantly in the peak season of Q1 2010. Problems were further aggravated by exceptional sales growth (averaging 7.5% during 2005-2008) and constraints in labour, time and other resources. In addition, compliance with trade and customs regulations in different country markets complicated performance to plans.

Moreover, tighter market conditions and intense regional competition resulted in customers becoming increasingly demanding, frequently requesting for early delivery. This phenomenon disrupted production schedules and dampened Sales' confidence in Operations' ability to fill orders promptly. Furthermore, some customers further burdened Mentrix's capacity by placing orders and then refusing receipt until needed, effectively treating Mentrix's storage facilities as their free warehouse. This customer postponement behavior increased tension between Sales and Operations, and could not be resolved at the site-level due to the matrixed organization structure.

4.5 Project Description

The Head of Operations Asia, one of the key drivers behind the project, was familiar with S&OP's value proposition from his previous experience of guiding an S&OP implementation at a medical device company, and later as a management consultant. At Mentrix Indonesia, he noticed how the rift between Sales and Operations caused performance issues similar to other pre-S&OP environments – subsequently, internal interviews revealed opportunities for S&OP to improve interdepartmental communication and understanding. Mentrix Indonesia itself made a suitable pilot site due to its simple production processes, large room for improvement and manageable scale. In 2009, the Global Head of Operations approved the S&OP project in Indonesia since it involved little funding and financial risk.

In May 2010, the S&OP project began with an Executive Briefing in Jakarta to convince participants of the potential benefits so as to attain their genuine interest in and commitment to S&OP. The participants responded positively, enthusiastically voicing their expectations and concerns about the process (which were addressed promptly). The following S&OP team structure was established:

Role	Owner	Responsibilities
Overall Process Owners	<ul style="list-style-type: none"> • Head Sales ASEAN • Head Operations Asia • Head Technical Asia 	<ul style="list-style-type: none"> • Approve demand and supply plans • Make joint decisions to resolve cross-functional gaps
Overall Process Coordinator	<ul style="list-style-type: none"> • Supply Chain Manager ID¹ 	<ul style="list-style-type: none"> • Ensure discipline in S&OP conduct • Ensure action plans are executed accordingly
S&OP Meeting Chair	<ul style="list-style-type: none"> • Head Sales ASEAN 	<ul style="list-style-type: none"> • Leads the S&OP meeting
Demand Review Owners	<ul style="list-style-type: none"> • Sales Manager ID • Technical Manager ID 	<ul style="list-style-type: none"> • Produces demand plan in the standard format according to published timelines
Supply Review Owner	<ul style="list-style-type: none"> • Operations Director ID 	<ul style="list-style-type: none"> • Produces supply plan in the standard format according to published timelines

Figure 2: Roles and responsibilities for S&OP pilot in Mentrix Indonesia (ID)

The design team, consisting of a project manager (PM) and supply chain analyst (SCA), created a dashboard application in a Microsoft Access environment, combining data from Sales' forecasting tool, Operations' materials planning system and Finance's monthly reports to generate comprehensive reports on raw material impact, fill rates, the demand plan (see Figure 3 below), and capacity constraints.

¹ The current supply chain manager resigned for unrelated reasons before the first Executive Meeting; this role was played by the SCA in the interim.

Figure 3: The S&OP dashboard (Demand Plan view)

The proposed monthly S&OP cycle comprised four main steps:

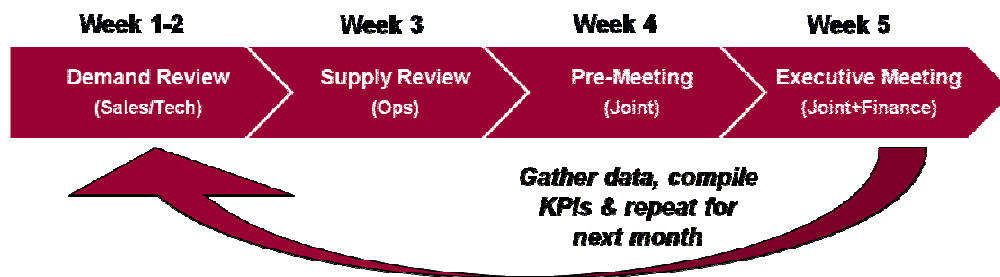

Figure 4: Simplified process structure for S&OP pilot in Mentrix Indonesia

For the Demand Review, Sales used the new forecasting tool to generate six-month demand forecasts. Although D&A was to participate in the Demand Review, D&A's OMS had yet to be interfaced with Sales' forecasting tool. Hence, the demand plan did not consider products under development.

Next, in the Supply Review, the forecasts were fed into Operations' material planning system to generate a six-week materials requirement plan. The six months' of forecast data was used when identifying capacity constraints and assessing the impact of raw material constraints on fulfillment.

The Pre-Meeting was a series of unstructured, informal cross-functional communications via email due to the limited opportunities for the participants to meet physically, especially for those based in Singapore. The main objective was to set the Executive Meeting agenda.

During the Executive Meeting, participants (including those from HR, Finance and Procurement) reviewed previous action items and KPIs, and highlighted problematic raw material and capacity constraints using the S&OP dashboard. The agenda overwhelmingly addressed operational issues as these were the main source of service failures.

The data for key KPIs originated from disparate sources and were unavailable at the start of the month, so data was gathered throughout the cycle. Hence, the full set of KPIs was ready only a few days before the Executive Meeting, so most KPIs reviewed throughout the cycle were for the previous month.

At the point of writing, Mentrix Indonesia has undergone four cycles of S&OP (June 28, July 27, September 6 and October 4, 2010). Incremental changes were made between cycles, according to what participants felt was needed to improve process effectiveness and resolve the site's specific issues. The process shows signs of stabilization – in the latest cycle, the newly appointed Supply Chain Manager took over the role of overall process coordinator. This structural change allowed the S&OP design team to move smoothly on to planning for ASEAN S&OP.

In the next section, we analyze the S&OP implementation by comparing it with the factors and frameworks from the literature review in order to derive new hypotheses regarding the content and process of cross-functional coordination.

5. Analysis

In this section we compare Mentrix Indonesia's S&OP implementation with documented standards for S&OP process structure, reported benefits, key success factors, and implementation dynamics. In many instances this comparison provides confirmation of established theory but it also generates

distinct observations that enable us to formulate five novel hypotheses regarding the structure, content and process of cross-functional coordination.

5.1 Comparison with Classic Process Structure

Figure 5 shows the typical steps in an S&OP process as well as the salient aspects of the Jakarta implementation at Mentrix, which we describe in more detail below.

Figure 5: Variances with classic S&OP process structure

The *data gathering* phase in the Jakarta S&OP involved updating monthly KPIs just in time for the Executive Meeting. Mentrix expected that, by further speeding up the data gathering process, it would be able to highlight KPI issues as well as address their causes and decide on remedial actions in the executive meeting.

Demand planning followed a clear process and the new forecasting tool and reviews of forecast accuracy and service failures had increased Sales' forecast accountability. Mentrix used a six-month forecast horizon (shorter than the typical 12-18 months) because most raw materials and capacity expansions could be procured within this time horizon. In future enhancements for demand planning Mentrix intended to define meaningful product groupings in order to benefit from forecast aggregation and incorporate data on "near wins" (deals that the Sales group was close to winning) to reduce the service level vulnerability for new products. Financial conversion and executive authorization could also be added in future S&OP cycles if additional involvement from Finance and Commercial could be secured.

In *supply planning*, Mentrrix planners used demand forecasts to plan raw material orders six weeks ahead – this process revealed potential savings from using more reliable suppliers and more timely submission of customs documentation for import and export. Hence, Procurement joined S&OP from the second cycle onwards, introducing a hitherto uncommon type of cooperation. The full six-month forecast was used to aid capacity planning – during the Executive Meeting, Operations reported on the addition of labour and machinery to alleviate production bottlenecks.

In the first four S&OP cycles, it was decided not to use a *Pre-Meeting* in order to keep the overall process manageable. Combined with staff turnover issues that led to the lack of an S&OP coordinator with cross-functional legitimacy, this meant that there was no natural mechanism to achieve interdepartmental consensus or ensure that all participants performed their assigned duties prior to the executive meeting. Hence, the *Executive Meeting* agenda featured many operational issues (e.g. capacity plans, customs issues, raw material constraints) and participants spent a significant amount of time reconciling different points of view (e.g. should D&A approve alternative ingredients or should Procurement secure alternate suppliers?). In their feedback on the initial process, participants expressed some dissatisfaction with the highly operational nature of the agenda of the Executive Meeting, not because the issues were not important but because it kept them from addressing issues with more cross-functional relevance, such as joint risk-taking for profit maximization.

5.2 Comparison with Reported Benefits

Customer service in Jakarta improved during S&OP implementation due to better KPI tracking and operational improvements independent from but parallel to S&OP (service levels increased to 90% in June and over 95% in July, August and September).

It was not yet possible to observe if there have been reduced discards since Jakarta does not discard expired inventory until the end of each calendar year. However, inventory levels, which had

risen 130% from February to July, saw a gradual decline of 9% from July till October, coinciding with the introduction of S&OP.

Forecast accuracy improved Mentrix Indonesia – the measure for forecast accuracy increased from 30-35% to around 50% over the first two months of S&OP implementation. Review of forecast accuracy KPIs, more rigorous forecasting procedures and better interdepartmental communication under S&OP helped Sales generate better forecasts after realizing that accurate forecasts can increase service levels without increasing inventory. Further improvement could be expected when the forecasting process is enhanced with the use of product groups and customer involvement.

The creation of a regular forum for cross-functional communication, often impeded by interdepartmental barriers in Mentrix's highly-matrixed structure, also led to important *soft benefits*. In particular, S&OP allowed D&A and Operations to jointly identify possible raw material bottlenecks for new wins, engendering mutual trust. Participants also reported less miscommunication and finger-pointing in everyday interactions.

Another interesting benefit that arose, not previously described in the literature, was the following. Several participants indicated that when news of improved service levels and operational improvements were communicated in the S&OP Executive Meetings, account managers in Sales were reassured in Operations' delivery capability and gained confidence in dealing with customers for a variety of matters. Also, when D&A was able to solve a problem with import-restricted raw materials by approving the relocation of certain production steps, Operations' confidence in liaison with customs officials increased. These observations show a novel mechanism by which cross-functional coordination generates benefits, leading to our first hypothesis:

H1: S&OP induced knowledge of other functions' capabilities leads to greater confidence in dealing with external partners.

5.3 Comparison with Key Success Factors

The Jakarta S&OP process enjoyed *endorsement from high-level executives* from all three main departments (Sales, Operations and D&A) – they were present at all meetings (or participated via teleconference), and gave positive feedback on all aspects of S&OP. Other participants were thus more accepting of S&OP and willing to offer constructive suggestions (e.g. managers from Sales and D&A expressed interest in participating in agenda-setting). Further, although the management of S&OP from Singapore led some in Jakarta to view it as externally “imposed”, the prominent senior stakeholder support in the S&OP organization structure helped to ensure engagement and overcome other teething challenges.

There was *departmental buy-in and participation* – as mid-level managers recognized the importance of S&OP as a structured, regular forum for inter-departmental communication to align business objectives, improve mutual accountability and take shared-risk decisions, they demonstrated willingness to shape it to better address their needs. Participants’ contributions (including those of secondary functions, i.e. Procurement, Finance, HR) improved solutions’ quality and amenability, and their withholding of judgment of the process gave it time to produce results.

Participant feedback, sourced after the Executive Briefing and Executive Meetings, led to new elements in the second planning cycle, such as KPI review, demand plan validation and the inclusion of Procurement. D&A and Sales also expressed a desire for more broadly relevant issues to be on the agenda to reduce the disproportionate focus on operational issues. However, mostly due to a lack of resources, this reshaping of the agenda had not yet taken place and there was an open question about how long one can wait to act upon specific feedback before participants start to disengage.

IT support was largely absent from Jakarta’s S&OP – the IT department would have had a lower priority for S&OP since Mentrix was preparing for a business-wide SAP deployment. Fortunately, the IT skills of the S&OP design team were sufficient to incorporate the various

departments' data (which they were willing to share freely) into an intuitive S&OP dashboard application, which was received warmly when presented during the Executive Meeting of the second cycle. Monthly KPIs are external of this dashboard, and require a manageable degree of manual data entry. Although it is a challenge for the Jakarta team to drive both S&OP and SAP implementation, the S&OP design team plans to incorporating the dashboard's functionality into SAP, thereby automating and institutionalizing data processes and reports needed to run S&OP efficiently in the future.

Product innovation was involved from the outset. As expected, it was hoped that D&A would start influencing the demand plan through the addition of "near wins" information into the dashboard. In addition, as operational difficulties were raised in S&OP, it became clear that D&A could investigate the feasibility of reformulating products with different ingredients or authorize modifications to manufacturing procedures to enable solutions. While not unheard of, the inclusion of this type of planning in an S&OP process leads to the following hypothesis about the benefits of including product designers in S&OP:

H2: Engaging product designers in S&OP can lead to better supply chain performance if they can generate and approve alternative solutions to supply constraints.

There were no plans yet for *suppliers' or customers' involvement* in the Jakarta S&OP – interdepartmental communication and collaboration was not yet mature enough for external participation, so supplier/raw material issues were being tackled through reformulations and sourcing for alternate suppliers. However, since Mentrix's affiliates often act as each other's suppliers and customers, an ASEAN-wide S&OP should deliver some of the benefits typical of supply chain partner involvement. Such an expansion of the S&OP process would complicate it and preclude more gradual learning but the product variety and rapid innovation in the food ingredients industry meant S&OP required scale and integration for noticeable results.

5.4 Comparison with Dynamic Models

In a final comparison, we evaluate Mentrix' S&OP process in Jakarta using two S&OP maturity frameworks and a system dynamics framework from the existing literature.

On the three criteria of *Lapide's (2005) "Four-Stage S&OP Process Maturity Model"* – we assess Mentrix's process to have reached a "Rudimentary" level (see figure 6).

Criterion	Mentrix's Maturity Level			
	<i>Marginal</i>	Rudimentary	<i>Classic</i>	<i>Ideal</i>
Meetings	Executive Meetings are formal, routine and regularly attended, but there is no proper Pre-Meeting. Participants have yet to show willingness to attend more than one S&OP meeting a month.			
Processes	<i>Marginal</i>	Rudimentary	<i>Classic</i>	<i>Ideal</i>
	Operations formulates the supply plan separately from but based on the demand plan.			
Technology	<i>Marginal</i>	Rudimentary	<i>Classic</i>	<i>Ideal</i>
	The demand and supply plans are developed separately but are interfaced through the dashboard. Conclusions from dashboard analysis are shared and ad hoc solutions undertaken, but the demand plan is not revised.			

Figure 6: Mentrix S&OP maturity in Lapide (2005)

Grimson and Pyke's (2007) "S&OP Integration Framework" provides a more distinct assessment.

Mentrix's S&OP can be classified as "Advanced" in Organization and "Standard" or below on other dimensions (see Figure 7).

Criterion	Mentrix's Maturity Level				
	<i>No S&OP</i>	<i>Reactive</i>	Standard	<i>Advanced</i>	<i>Proactive</i>
Meetings & Collaboration	Although there are no pre-meetings, there is top- and mid-level participation in regular Executive Meetings where issues pertinent to Sales and Operations are discussed and conflicts resolved.				
Organization	<i>No S&OP</i>	<i>Reactive</i>	<i>Standard</i>	Advanced	<i>Proactive</i>
	A conscious effort was made to secure executive support, participants have formal roles and responsibilities and a coordinator was designated to drive the process.				
Measurements	<i>No S&OP</i>	<i>Reactive</i>	Standard	<i>Advanced</i>	<i>Proactive</i>
	Regular updating and reviewing of KPIs, in particular service levels and forecast accuracy, increasing forecast accountability and reliability. New product introduction and S&OP effectiveness are not yet tracked.				
Information Technology	<i>No S&OP</i>	<i>Reactive</i>	Standard	<i>Advanced</i>	<i>Proactive</i>
	Information from departmental planning tools is centralized in an automated way through the S&OP dashboard. Dashboard access is still limited, and OMS data is not yet incorporated.				
S&OP Plan Integration	<i>No S&OP</i>	Reactive	<i>Standard</i>	<i>Advanced</i>	<i>Proactive</i>
	The demand plan drives the supply plan in a one-way relationship. Capacity utilization and raw material inventory information does not inform the demand plan.				

Figure 7: Mentrix S&OP maturity in Grimson and Pyke (2007)

We thus note that Mentrix quickly established a high level of maturity in the “Organization” dimension of S&OP and allowed other dimensions to develop later. Together with the analysis of the challenging context and the reported results this observation leads to a third hypothesis:

H3: An advanced organizational structure is an important success factor for S&OP in environments that are not conducive to cross-functional coordination.

So, although Mentrix’s process was relatively unsophisticated – the site’s existing problems and rudimentary levels of data, process and technology components led to an operational emphasis initially – the advanced organizational structure maintained the engagement.

A final dynamic model we assess is Oliva and Watson’s (2007), described earlier. We find that their *components of cross-functional planning alignment* were largely present in Mentrix’s S&OP. The functions had diverging objectives (Operations – service levels, Sales – revenue, D&A – new wins) which constituted misaligned incentives, but because these functions perceived important benefits to S&OP participation, they attended meetings regularly and provided relevant

inputs. Informational quality was ensured through the availability of data from the material planning system, the forecasting tool and Finance's reports. Procedural quality was exemplified through the use of all relevant data concerning problematic finished goods / raw materials and the contribution of function-specific insights yielding "natural" solutions. Alignment quality was achieved through the use of clear action plans and follow-ups during each executive meeting. Over time, participants, perceiving S&OP to be yielding positive results, increased their engagement and thus the likelihood and magnitude of subsequent process benefits. In one potential enhancement of Oliva and Watson's (2007) model, we noted a specific component of procedural quality in the S&OP process that drove further engagement. It is captured in our fourth hypothesis:

H4: "Fairness" in decisions increases participants' engagement in S&OP.

For example, Operations agreed to increase inventory levels in order to offer demanding customers in a nascent market shorter lead times, and Sales agreed to tighten the policies by which customers were allowed to postpone delivery of produced orders. These were signs of a reciprocating culture whereby each department or function achieves its primary objectives while fairly taking turns to compromise on secondary ones, creating positive results and maintaining a level of engagement needed to further fuel the process.

A final observation regards the need for maintained top management support for S&OP. The participants in S&OP at Mentrix were conscious that it required extra effort, and lacked clear positive feedback since any incidental increases in key KPIs could not be definitively credited to S&OP. At the time of writing, senior executives acknowledged that the process was at risk of "losing momentum" and were planning steps to improve the process by scaling it up to a regional-level S&OP process. Senior executives at Mentrix felt the need to continually manage the process to prevent it from stagnating or regressing. Mentrix's experience appears to imply that Oliva & Watson's (2007) reinforcing loop of process quality and participant engagement will only activate

after a threshold level of process quality is reached through maintained top management effort.

These observations lead to our final hypothesis:

H5: S&OP requires maintained top management effort until it reaches a threshold, self-sustaining level of process quality.

6. Discussion and Conclusion

6.1 Implications for theory

In this case study, comparing our observations of Mentrrix Indonesia’s S&OP with documented process standards, key success factors, reported benefits and dynamic models for S&OP enabled us to highlight observed variances and derive a set of five novel hypotheses regarding the content, structure and process of cross-functional coordination (see Figure 8).

Cross-functional coordination	Hypothesis
Content	S&OP induced knowledge of other functions’ capabilities leads to greater confidence in dealing with external partners. (H1)
Content	Engaging product designers in S&OP can lead to better supply chain performance if they generate and approve alternative solutions to supply constraints. (H2)
Structure	An advanced organizational structure is an important success factor for S&OP in environments that are not conducive to cross-functional coordination. (H3)
Process	“Fairness” in decisions increases participants’ engagement in S&OP. (H4)
Process	S&OP requires maintained top management effort until it reaches a threshold, self-sustaining level of process quality. (H5)

Figure 8: Hypotheses regarding cross-functional coordination

To discuss these hypotheses it is useful to recall the context first. The described S&OP implementation was Mentrrix’s first formal introduction of a regular, structured, cross-functional, intermediate-term planning process globally. The need for such a process was felt strongly because

the company's organization structure created joint responsibility for functional goals only at the very highest levels of the organization, strongly limiting the traditional drivers for cross-functional coordination at lower levels. The pilot site in Jakarta was chosen because performance had been deteriorating and the relationships between Sales, Operations and Product Development had been put to test repeatedly. The project was thus seen not only as an opportunity to introduce modern cross-functional planning methods to the company but also to accelerate the operational and cultural changes required at Mentrix Indonesia. Staff turnover was another challenge for the project – there was no suitable candidate on site to coordinate the S&OP implementation process, resources were strained due to the planned region-wide SAP deployment, and the scope of potential benefits was limited due to the implementation in a single site that was highly dependent on other sites in the regional supply chain.

To manage these risks and opportunities, the S&OP design team opted for an advanced organization structure together with a simple process and flexible objectives. The organization structure was rated advanced (Grimson and Pyke, 2007) because it reserved highly visible and active roles for top executives from the Asia region and clearly defined participant roles and responsibilities. Process-wise, the S&OP implementation was relatively simple, relying mostly on existing processes for the demand and supply planning phases and replacing the typical S&OP pre-meetings with a series of communications, leaving many issues to be resolved in highly operational Executive Meetings. The process thus is considered “Rudimentary” under Lapide's (2005) S&OP framework, and is largely “Standard” under that of Grimson and Pyke's (2007). Investment in S&OP tools remained rudimentary as well and “plan integration”, or the systematic pursuit of profit maximization opportunities, was not yet developed.

The fact that Mentrix successfully implemented S&OP and achieved positive results despite the many challenges led to our hypothesis about the importance of organizational structure in cross-functional coordination (H3). It was difficult to imagine similarly positive outcomes without the advanced organization structure Mentrix had put in place for its S&OP process.

The case also highlighted a novel component in the content of cross-functional coordination (H1), with interesting implications. Cross-functional coordination is usually seen as a form of information processing to support optimal decision-making, and not as a process that enhances confidence in negotiating with external partners. This novel hypothesis (H1) can lead to interesting models for firm strategy and structure in which cross-functional coordination not only leads to enhanced value *creation* but also to enhanced value *capture* in negotiations with external partners.

The case also illustrated that product designers can increase supply chain performance by creating flexibility in component use. This type of coordination content may not be novel but the case leads to the hypothesis (H2) that this type of supply planning can be a useful as a regular element in intermediate-term planning processes.

Finally, the case also highlights the importance of the process of S&OP implementation. Our observations confirm that participant engagement is critical for the success of cross-functional coordination and our final two hypotheses add to the understanding of how this engagement can be maintained. We note that it is important to achieve a level of “fairness”, a balance of give-and-take between functions, in the decision-making process under S&OP (H4). Several S&OP participants reflected that such balance had been achieved in decision-making and that this was important. Our hypothesis can be seen as contributing to a growing body of evidence that operations management cannot be isolated from behavioral aspects of human interaction (Loch and Wu, 2008), and that executives need to consider fairness in order to achieve successful cross-functional coordination. Hypothesis H5, finally, contributes to the dynamic view of S&OP reviewed in section 2.5. Because cross-functional coordination is not typically driven by formal organizational reporting lines, such processes are more sensitive to slow-downs or reversals; executives’ management and monitoring efforts are needed to drive the process forward until the process’ quality (and thus participant commitment and interest) is sufficient to make the process self-sustaining (H5).

6.2 Practical Implications

The analysis of Mentrix's experience offers some practical implications. In an environment that is not conducive to cross-functional coordination, it may be necessary for senior stakeholders to take on visible and active S&OP roles from the very beginning. Such advanced organization structure not only impresses on other participants that S&OP is important and permanent, but can make up for the implementation's natural limitations. The "soft benefits" of S&OP can be powerful – by learning about other functions' capabilities, participants can gain greater confidence in dealing with external partners. Also, in innovation-driven environments like the food ingredients industry, product designers can have surprisingly extensive roles in S&OP – they can assist in matching supply with demand regularly, throughout a product's life cycle, when supply constraints emerge. Finally, in order to keep participants actively engaged in S&OP, executives may not only need to manage the quality of the process but also the fairness and balance of the decision outcomes with respect to the different participating functions.

The Relationship between IPO Underpricing and Equity Ownership of Major Shareholder: An Empirical Study of Taiwanese Firms

Joe Ueng, Ph.D., ueng@stthom.edu
University of St. Thomas, USA

Ching Liang Chang
Yuan Chi University, Taiwan

Abstract

This study investigates the relationship between IPO under pricing and equity ownership of major shareholders. We test five hypotheses. First, the greater the price of underestimating the extent, the greater the return on investment; Second, the price undervalued the greater the lower the greater the external equity; third, IPOs, the shares dispersed, agency costs significantly greater than zero; fourth, IPOs expected after the operation Performance is not significantly greater than zero; finally, equity dispersed in varying degrees, there were significant differences in performance. Focus on March 1995 to December 2005, the company handling IPO study. Research methods including the use of regression equation, t test and analysis. Research results showed that the price of our underwriters to underestimate the degree of information asymmetry can not explain the theory and (winner's curse), but the major shareholder equity significantly reduce the extent of positive effects. Shares lower after the increase the agency costs, the company operating performance did not significantly greater than zero, and past research IPO operating performance after the discovery of consistent decline. Largest shareholder equity to reduce the extent of more than 10% and less than 10%, there were significant differences in performance.

Key words: major shareholders equity, initial public offering IPO, supervision, and the beginning of remuneration

Introduction

For nearly three decades, there are many that explain why the IPO IPO (initial public offering) would be to underestimate the phenomenon of prices. Different versions have different viewpoints, including the price undervalued the company and the issuer, underwriters and investors relations. Rock (1986) winner curse (winner's curse) rooted in asymmetric information theory, focusing on the price of underestimating the relationship with investors. If the investors with adequate information is divided into two types of inadequate information. When the market is more inefficient, information sufficient to invest more people to use their information advantage, but they think is most worthy of the purchase of shares, and will not buy those who could not produce the value of the future but the underwriters of the stock price is very low; information insufficient investment in people, because of their knowledge together with the application of competition arising from the winner's curse phenomenon, with the result that those who obtain sufficient information investors do not want to buy shares, or stock prices too high, therefore, the purchase of more losses more. Assuming that the lack of information investors is more likely to underestimate the purchase price of the shares, then the greater the underestimation of the extent, the greater the excess demand. Although the number of such assumptions has some authenticity, but further analysis, you will find that the greater the underestimation of the extent, the greater the excess demand is not a healthy relationship, because the lack of information investors can understand the other investors to purchase the situation, to adjust their needs. If they know that other investors do not want to buy, they will stop their purchase of lower demand, even underestimated the extent of great. We feel that no matter which type of investors, investment in initial public offerings of stock care about is that it is a low-risk high-reward investment, since the first day of trading day, stock prices generally rose mostly show. Therefore, this study attempted to look into the price of underestimating the rate of return and investment relations in order to underestimate the degree of underwriting price variables, return on investment as a

result of variables, whether there is a significant test both positive linear relationship and it is expected the two are closely, that is to underestimate the extent of the price the greater the greater the return on investment.

Investigate the price undervalued the company ownership structure and distribution, including Booth and Chua (1996) stake in scattered [Note1] hypothesis, the issuing company deliberately underestimated the cost in order to generate the excess demand, it can have a large number of small shareholders. Therefore, the greater the degree of price underestimated, resulting in greater equity dispersed. Because when a company's decision to publicly traded, whether taken before the original shareholders of unlisted (otherwise known as business owners) to release stock or increase the release of new shares, business owners will inevitably diluted share, holding the rate of decline (Liu-Wei Qi, 2005). Stake in the outcome of decentralization will lead to the problem of inadequate supervision, which is regarded as a kind of control over the interests of the internal people want most of the results. Brennan and Franks (1997) proposed oversight considerations hypothesis that insiders do not want IPO shares released from over-concentration in the hands of a few, especially the active investors (active investors) or institutional investors (institutional shareholders), because these investments people can afford to oversee the company. So when the company to open the way for IPO application, it will be underestimated by the price in order to cause the excess demand, in the event of excess demand, insiders do not have to worry about the release of new shares and no one to buy, and can take the initiative to rule out the huge amount of purchase orders, so that scattered in small stake in the hands of investors, small investors are generally free-riders (free riders) there is no oversight capabilities, it can avoid exposure to IPO after the supervision or risk removal from office. This hypothesis revealed two variables, price and external equity reduced underestimated, and a positive relationship between the two, that is, the greater the underestimation of the price, the greater the lower external equity. In order to verify this relationship, Field and Sheehan (2004) study of 952 listed companies in the United States the first sample showed underwriting prices underestimate the relationship between ownership structure and quite weak, and the major shareholder after the listing of the shares was no significant impact. Perhaps this is because the United States more hierarchical structure (dual-class) shares, and its design is to let the content of external persons who hold high-low control over cash flow rights shares, it underestimated the extent of the price than the single-level structure (single-class) for Small (Smark and Zutter; 2003). However, there is no multi-layered structure of China's stocks; according to China's situation should be similar evidence.

Li chuan an and Liu Wei Qi(2005) study indicated that, IPOs have a stake in the effectiveness of decentralization. Enterprises after the listing of shares distributed as a result of the outcome, the company managers to hold more than just part of the company's equity, resulting in managers that their efforts will eventually be shared with others, making the incentive for managers of efforts to decline, with the result that they may not in pursuit of the whole the best interests of shareholders for the ultimate goal. Privileges which have happened is the consumer, business investment and a lack of agency problem (Jensen and Meckling; 1976), resulting in increased agency costs. China's business environment prevailing in relations between the family business or commercial enterprise (La Porta et al., 1999; Claessens et al., 2000; Faccio and Lang, 2002), by pyramid structure (pyramidal structure) and cross-shareholdings (cross holdings), so that control of cash flow is much larger than the right to more easily lead to inadequate consumption and investment privileges, so in IPOs before the agency costs that already exist in the enterprise. Therefore, this study forecasts after IPOs, equity dispersed, agency costs significantly greater than zero, that is, agency costs still exists.

IPOs continue to be explored after the direction of stock prices is under long-term performance. Loughran and Ritter (1995) found that under the IPOs after a long-term stock price performance, and non-publicly traded companies, compared to the annual remuneration of about 5.2 percent less in the market after five years. Anlin Chen et al., (2004) study of 1991-1998 in China IPOs because China or restrictions, and they confirmed that if the market price as a "real" price, investors will lead to excessive short-term reaction is caused by the beginning of abnormal return, but under long-term response to the shortage of produce, which, under long-term answer to why the share price of IPOs after the poor performance issues. Another direction is the operating performance in the past literature as found in the operating performance of the phenomenon of recession. In fact, this study testing agency costs, so that mentioned above can go in both directions to explore. The first one direction, we can investigate whether the

pricing of the investment agency costs, that is, whether the requirements of return on agency costs by adding premium to the stock prices fell 【Note 2】 ; second direction, we can investigate the existence of agency costs, the operating performance of a proxy for ROE and ROA is significantly greater than zero. According to Jensen and Meckling (1976) agency theory, agency costs that managers and investment between the interests of inconsistencies, therefore, expected operating performance is not significantly greater than zero. We feel that, assuming the stock market is efficient, stock prices are based on investor expectations of future earnings, rather than determined by the flow of current transactions, stock prices, one of the reasons for the decline of the surplus for the future than expected. So after IPOs generally found that the phenomenon of business performance and long-term recession IPOs under the stock price after the poor performance of the problem is echoed each other, at the same time in view of China's enterprises are high-control over the low cash flow right to the risk of moral hazard. We set the direction of the research performance, this is because previous studies only explored in a separate ownership structure or business performance, not only at the same time this study was to explore these two issues, but also to further investigate the extent of dispersion of different options, whether there are significant performance differences, We expect that there were significant differences in performance, the evidence just to fill loopholes in the previous knowledge (knowledge gap).

In short, empirical investigation of this study IPOs Underpricing largest shareholder equity and external relations will carry out test five hypotheses. First, the greater the price of underestimating the extent, the greater the return on investment; Second, the price undervalued the greater the lower the greater the external equity; three, IPOs, the shares dispersed, agency costs significantly greater than zero; four, IPOs expected after the operation Performance is not significantly greater than zero; five, equity dispersed in varying degrees, there were significant differences in performance.

This study is divided into five chapters. Recalling chapter underwriters' prices at home and abroad underestimate the empirical findings and the interpretation of this phenomenon. Chapter III of research methods, including variable definitions, sample selection, hypothesis development and testing methods. Chapter IV hypothesis test results. Finally, for the conclusions and discussion.

Literature review

The empirical results show that the past literature, many companies apply for IPOs, there will be underestimate the phenomenon of prices. Rock (1986) winner's curse hypothesis, that the investor information asymmetry exists between the situation, and its investors into the market investors adequate information (informed investors) and the lack of information investors (uninformed investors), investors sufficient information will make use of all of its information, to determine the true value of the stock, to decide whether to purchase shares; the lack of information investors are just the opposite. When the listing of new shares worth investing the time, informed investors will warm requisitioning, causing the relative knowledge of investors the opportunity to purchase reduced; the other hand, when the investment is not worth the listing of new shares, the informed investors will not purchase, However, investors will continue to unknowingly purchase, so the value of the future but could not produce a very low stock price underwriting or overvalued stock prices mostly unwitting investors from the acquisition, resulting in more losses in the purchase of more. Assuming that the lack of information investors are more likely to underestimate the purchase price of the shares, then the price underestimated the lack of information is designed to attract investors to purchase, the price undervalued the greater will be the greater the excess demand, so there appears to be market price undervalued phenomenon (Beatty and Ritter, 1986). This hypothesis can not be the most convincing hypothesis is that extreme on the market there are only two types of investors, and quoted in the story of the contents of the complex. Even if the information is not sufficient investment in people can also understand the other investors to buy the situation, it will become investors sufficient information to know what new shares listed on it is worthwhile to buy, those who are not worth buying. C. F. Hong Zheng Wen, Wu Qing Shan, and Chen An Lin

(2003), that is the issue of underwriting the price undervalued the company deliberately set below the market price underwriters agree that the outcome of the price. Many countries there are also listed on the opening price being paid a phenomenon, such as Levis (1990) to 1985-1988 years 123 London stock market shares for the first time listed underwriters samples and found that the market adjusted 8.6 percent for the beginning of remuneration. Judging from the cross-country studies, Loughran, Ritter, and Rydqvist (1994) confirmed that its study of 25 countries are still underestimate the phenomenon of underwriters prices, and prices in developing countries than to underestimate the extent of developed countries is even more serious. Wu and Xue Yue -Yu (2004) in November 1989 to April 2000 period, in Taiwan for an initial public offering of stock, and then allowed to concentrate on the Taiwan Stock Exchange trading of 227 companies, conducted after the public offering of stock trading price performance and found that the sub-sub-samples of different placement system beginning abnormal return on average significantly higher than zero. If the holders of new shares over 280 business days, long-term abnormal returns by deflating the beginning of abnormal returns are negative after a further year or listed in other industries to compare, but also the prevalence of a similar phenomenon, the evidence means abnormal return exists only in the initial stage. C. F. Hong, Wu and Chen (2002) directly to verify the non-rational investment behavior of the new shares listed on the early and long-term impact of rewards, empirical results show that investors for the new shares listed on the excessive reaction is the beginning of the formation of abnormal returns one of the reasons (Chen An Lin, 1999), in addition to the market for the listing of the initial investment behavior irrational amendment will enable the long-term low remuneration.

The beginning of the interpretation of abnormal returns, most of the early focus on the theory of information asymmetry (Myers and Majluf, 1984), that the managers and the investing public information asymmetry between the problems. Easy to have a manager so-called "internal information" (insider information), which is not easy to outside people informed about the true value of the company's important information. Asymmetric information, the investing public, as the company issuing shares as a negative signal, so the price of shares will be reduced and called for a higher stock price return, which is the cost of adverse selection. Therefore, when the initial public offering of stock, the manager in order to attract investors to buy shares and the compensation of its commitment to the risk of asymmetric information, often underestimate the underwriting price on its own to absorb the cost of adverse selection. If Chen Xuan Ji, Ye Xiao jun, and Chen Zuo Chao (2003) study, underwriters set the price lower than the market price to attract investors to subscribe. Hu De Zhong and Ma Dai (2004) and so that the IPO discount to non-message to a compensation for investors. In addition to information asymmetry, the Jiang Shuo Zhen, Liu Wei qi and Zhang Yu-shan (2005) based on "equity allocation of corporate governance mechanism and the value of the company is a very critical impact" on the hypothesis that the existence of the so-called best if the company ownership structure, the initial public listed on the introduction of new shareholders, is indeed the best adjustment for the ownership structure and improve the corporate governance mechanism, the best time. Basically, IPO was considered decision on the best opportunity to shareholding structure. If business owners think that a particular ownership structure of the company's most beneficial when in the IPO to the shareholding structure for the goal to determine the best price and stock underwriting the way to achieve the maximization of corporate value. Zingales (1995a) that the transfer of control over the decision for a company listed on the important factors behind. Mikkelson et al. (1997) study of U.S. companies IPO, after the discovery in the IPO, with control of the business owners only 44%, Pagano et al. (1998) on the IPO Italian study found that, IPO decreased about 30 percent, but after about three years, declined by only 5%. Thus, when a publicly traded company's decision, whether to take business owners to release stocks or to increase the release of new shares, business owners will inevitably diluted share, holding the rate of decline (Liu Wei Qi 2005).

Brennan and Franks (1997) that the business owners, as have the corporate control is a very valuable when handling initial public offering, the underwriters will be taken so that the price undervalued equity decentralized strategy. They studied the British IPO, underwriters showed prices caused by over-subscribed underestimated (oversubscription), enables companies to select a single rule out the huge amount of micro-purchase requisitions, and thus able to master the new investors shareholding ratio to below the threshold below However, its only 43 samples to verify the company. Follow-up there Smark and Zutter (2003) to 2622 U.S. IPO as a sample, it will be a

multi-level structure (dual-class) to distinguish the company, these companies issued in the IPO shares with limited voting rights, the results indicate the company underestimated the extent of underwriting the price has been lower than a company the right to an **【Note 3】** that in the future there will be no new challenges to the control of major shareholders, the more there will not be underestimating the extent of underwriting the price. Above Britain and the United States initial public offering market, empirical research, consistent underwriting prices have underestimated phenomenon. The United States because of how the hierarchy of the shares issued in IPO shares a multi-level structure, underestimated the extent of underwriting prices lower than other companies.

However, Stoughton and Zechner (1998), Mello and Parsons (1998), Maug (1998), Li Chuan An and Liu Wei Qi (2005) that based on maximizing the value of the company, business owners will want to enhance our corporate governance standards with the company's largest shareholder value, and therefore underestimate the underwriting price to play as a major shareholder monitoring incentives. Ma and Hong (1998) the first to attempt to develop an integrated information asymmetry and the shareholding structure, they can reduce the auction bidding information asymmetry but external equity will increase.

Research Methodology

Definition of variables

Reference Pham, Kalev, and Steen (2003) ways to return to opening the market-weighted index, adjusted rate of return, which is opening the market adjusted compensation (market-adjusted initial return, MAIR) as underwriters to underestimate the extent of the price proxy.

(A) Underestimate the extent of underwriting the price. $MAIR = \frac{P_x - P}{P} - \frac{M_1 - M_0}{M_0}$. P_x : the market

price of new shares, 5 days, the highest price **【Note 4】**, P : the initial public offering price when the underwriters, M_1 : IPO market price of the market the same day, the weighted index, M_0 : Listing (counter) market day weighted stock price index.

(B) to attract the return $CR = \text{Max} \{ 5 \text{ days return} \}$

(C) a major shareholder equity stake equal to the ratio of concentration of more than 10% combined, according to the definition of the Taiwan Stock Exchange, shares in the ratio of 10 percent or more for the large shareholders (blockholders). However, companies listing prospectus disclosed by major shareholders for more than 5% shareholding or shareholding ratio of the top ten persons. In this study, the Taiwan Stock Exchange norms, to more than 10% shareholding for a major shareholder.

(D) IPO before and after the major shareholders to reduce the level of equity (BOWNb-a) equal to the former major shareholders of unlisted equity concentration (BOWNb) by major shareholders after the listing of equity concentration (BOWNa).

(E) Return on assets (ROA) and return on equity (ROE) as a proxy for business performance. Literature in the past to explore an initial public offering (cabinet) changes in operating performance reasons, generally focus on policy changes and financial relations. In this study, agency costs (agency costs) into consideration in order to understand the IPO after the agency costs and operating performance are significantly greater than zero. Agent Cost (AGC) based on Ang, Cole, and Lin (2000) definition, AGC1 equivalent to operating expenses divided by sales and AGC2 sales divided by assets.

(F) Reference Demsetz and Lehn (1985) and Himmelberg, Hubbard and Palia (1999) variable model, according to the Taiwan market at the same time, the choice of six control variables. Company size (Size) with total assets of the first three annual arithmetic average, the share price risk (Risk) on the standard deviation of return, debt ratio (Debratio) arithmetic average of the first three years, research and development costs divided by net operating income (RDratio) before Annual arithmetic average — if not stated the cost of research and development, research

and development costs for 0, virtual variables (RD_dummy) located 1; have set out in R & D costs, RD_dummy located 0, such a deal is necessary to remove samples. The use of competitive auction, bidding auction virtual variables (BID_dummy) for 1, did not use the bidding auction for 0.

Sample selection and data processing

Samples during the consideration of the Taiwan Stock Exchange in March in 84 years the implementation of the auction bidding system, easily give rise to new IPO price fluctuations, it selected 84 years from March 1 to 94 years beyond the December 31 Taiwan Stock Exchange the first stock listed or OTC companies, for a total of 975. Finance and insurance of which 72 and 25 securities industry, to step down came from the listed OTC 37, more than 134 companies together will be removed. In this paper, the study underestimated the price limit underwriting company, when not pre-market price can not be obtained or underwriting ratio = (non-listed before the highest price ÷ IPO underwriting market price) is less than 1, do not underestimate the underwriters said the price of these two conditions for a total of 103 filters. Listed shares one year after the concentration of information is not easy to acquire, Hong Kong Daily News of Taiwan's economic stake in the structure of the database module, equity dispersed only annual data, but the company regularly publishes financial statements, it is not a quarterly basis and will expose the shareholding spread information. In this study limited to one year after listing, the deletion of 194, research and development costs can not be made a number of 109, and then removed, the final effective sample size 435 companies.

Data from the Taiwan Stock Exchange Prospectus and financial statements, MOPS, like Wang Securities Information Network and the Hong Kong Daily News of Taiwan's economy.

Hypothesis development

Field and Sheehan (2004), Brennan and Franks (1997), Stoughton and Zechner (1998), Myers and Majluf (1984) and Rock (1986) and other research established the empirical hypotheses as follows.

Hypothesis I: *underwriting prices underestimate the extent and rate of return to attract non-linear relationship between the regression coefficients. $\beta_1 = 0$.*

To test the degree of underestimation of underwriters price to attract a significant return on whether or not a linear relationship. Based on past literature, the two share points from the diversification strategy, set out to underestimate the phenomenon of underwriting prices. Brennan and Franks (1997) and so that the discount is to allow the post-IPO equity dispersed to avoid the loss of control. If the company business owners hope that after the IPO is still able to maintain control over the prices set underwriters will consider, after the listing of options to minimize the possibility of focus. Therefore, the tendency to take the underwriting discount to attract more investors to subscribe for (over-subscription) (Chao Yao Jun, 2004), selective exclusion of major shareholders of the huge potential purchase. However, Stoughton and Zechner (1998) that the business owners hope that after the listing of equity concentration, the emergence of new major shareholders in order to enhance monitoring, so in order to underwrite the new prices as a major shareholder underestimated compensation (Mello and Parsons, 1998; Maug, 1998) . Li Chuan An and Liu Wei Qi(2005) and other studies have shown that the best strategy for business owners will be held for the release of as much as possible to maintain a minimum standard, the price of underestimating the IPO for the business owners to choose the inevitable price for the business owners underestimate the inducible to make positive investment in people (active investors) decided to provide funds to the company and is willing to effectively supervise the company, so that the incentive to raise the value of the company, the results and Stoughton and Zechner (1998) line of argument.

Hypothesis II: *underwriting prices underestimate the extent of the major shareholder with a stake in reducing the degree of negative relations, multiple regression coefficients. $a_1 < 0$.*

To test the degree of underwriting the price undervalued shares with major shareholders to reduce the extent of whether or not it has a significant positive relationship. Zingales (1995a) that the transfer of control over the decision for a company listed on the important factors behind the (Mikkelson et al., 1997; Pagano et al., 1998). Demsetz and Leha (1985) and Carl and Steiner (1999) pointed out that if companies have a higher risk operating environment, external monitoring an effect more difficult. At this point the value of the company equity managers can only rely on the strength of internal oversight, but in view of "manager risk aversion" hypothesis, managers may not be willing to hold too many options, so the strength of internal oversight is likely to be minimal, not even. In order not to hamper the value of the company, the former major shareholders of unlisted will want to bring the transfer of control to effectively oversee the new majority shareholder, for IPO is an available opportunity. Jiang Shuo Zhen, Liu Wei QI, and Zhang Yu-shan (2005) also stressed that the initial market introduction of new shareholders, is indeed the best adjustment for the ownership structure and improve the corporate governance mechanism, the best time. If business owners think that a particular ownership structure of the company's most beneficial when in the IPO to the shareholding structure for the goal to determine the best price and stock underwriting the way to achieve the maximization of corporate value.

Hypothesis III: *major shareholder equity reduced, the agency costs without significantly greater than zero.*
 $\mu \leq 0$ ◦

To test the major shareholder equity reduced, the agency costs are significantly greater than zero. Li Chuan An and Liu Wei QI (2005) study indicated that, IPO shares have the effect of dispersion. Jensen and Meckling (1976) study found that business after the listing of shares distributed as a result of the outcome, the company managers to hold more than just part of the company's equity, resulting in managers that their efforts will eventually be shared with others, making the incentive for managers of efforts to decrease and its that may not in order to obtain the best interests of all shareholders for the ultimate goal. Incentives and other privileges of consumption and thus increase the burden of enterprises need to increase agency costs. Such as Myers and Majluf (1984) that asymmetric information can cause lack of business investment (underinvestment) problem, so that lower enterprise value. Therefore, information asymmetry in the circumstances, if the lack of appropriate regulatory mechanisms to eliminate the agency problem, which may cause the operating performance after the listing of enterprises with poor results (Li Jian Ran, and Luo Yuan-Ming, 2002).

Hypothesis IV: *lower after major shareholder equity, the company operating performance without significantly greater than zero.* $\mu \leq 0$ ◦

To lower the test after a major shareholder equity, the company operating performance are significantly greater than zero. Post-IPO operating performance whether there are differences? Niu Feng and Zheng Min-Chong (2003) analysis of the use of DuPont financial variables, for OTC, listed before and after the performance as a proxy for the net rate of return, such as eight variables were significant changes, and then regression analysis to explore the changes in operating performance and financial policy changes relations, a total of 13 kinds of regression model. Regression results show that enterprises in the OTC when the annual use of investment and dividend policies on the net return on a significant negative influence, and use its own funds and apply for cash replenishment, etc., the net rate of return on a significant positive influence. OTC companies in 2 years after the use of investment in its after-tax margin with significant negative influence, and use its own funds after-tax margin for a significant positive influence. Integrated their studies, which show that part of being a proxy for a significant impact, while some have a significant negative impact. Li Jian Ran and Luo Yuan-ming (2002) also used return on equity for the business performance indicators and found that after the IPO business performance tends to decline, they summed up enterprises operating performance after the listing of the three reasons for the recession. First of all listed companies in order to beautiful (cabinet), often carried out a surplus of manipulation, such manipulation will be in the rotation after the listing year by year, until five years after the listing will be finished turning. Second, after the listing of shares dispersed enterprises, external equity decentralized free-rider problem easily (free rider) rather than actively oversee the company, managers equity dispersed, managers make efforts to decrease the incentive, which may cause

enterprises operating performance after the listing of recession (Jensen and Meckling, 1976). Finally, there is deliberately selected enterprises listed on the timing (Hu De and Ma Dai, 2004), will drop in profitability prior to IPO, if the performance of enterprises after the listing of a recession, in fact, not a cause, because even if it does not apply for IPO, Performance results of a recession will also. In this study, from the dismantling of financial variables starting to IPO shares lower after the largest shareholder of the company as a sample, to investigate whether there is a significant business performance greater than zero.

Hypothesis V: *largest shareholder equity in varying degrees to reduce operating performance was no significant difference. $\mu_1 = \mu_2$.*

To test the major shareholder equity reduced to varying degrees, whether there are significant performance differences. Zhan Jin-hong and Yang Li Hong (2001) pledge from the equity point of view to explore the shareholder structure of listed companies in China with the operating performance and found that China's widespread holdings by directors and supervisors in order to obtain funds for a pledge, which makes internal shareholders holding Although unchanged in nominal terms, but actually the fact that the transfer has also deepened the enterprise managers and external shareholders agent problem. This hypothesis to a major shareholder equity to reduce the level of greater than 10% and less than 10%, district business performance in two samples test whether there are significant differences.

Test

methods

Statistical testing methods include the simple (complex) regression equation, t test and analysis.

(A) The first hypothesis of a simple regression analysis, since the variables for the underwriters to underestimate the extent of the price (MAIR), according to curry favor with variable rate of return (CR), models are as follows:

$$C R = \beta_0 + \beta_1 M A I R + \varepsilon \quad (B)$$

adopt multiple regression test hypothesis II, regression analysis, aimed at testing underestimated the extent of the price the greater the underwriting, IPO shares lower after the major shareholder of the greater extent, the two variables whether there is a significant positive relationship. Models include variables for the underwriters to underestimate the extent of the price, depending on variables as the major shareholder equity and reduce the degree of control of six variables:

$$BOWN_{b-a} = a_0 + a_1 MAIR + a_2 \ln Size + a_3 Risk + a_4 Debt_{ratio} + a_5 RD_{ratio} + a_6 RD_dummy + a_7 BID_dummy + \varepsilon$$

(C) before and after the screening of IPO shares to reduce the level of major shareholders (BOWNb-a) greater than zero samples, using t test, test hypothesis three, IPO after the agency costs are significantly greater than zero, and then test the hypothesis four, operating performance is significantly large zero.

(D) before and after the IPO shares to reduce the level of major shareholders (BOWNb-a) greater than zero samples to deal with National Cheng Kung University in less than 10 percent and 10 percent two samples, using ANOVA to test whether there are significant inter-group differences.

Empirical results and analysis

Descriptive statistical analysis

Descriptive statistical results are listed in Table 1.. The first column is a study of 26 variables; the second ~ 7 column is number of samples, average, median, minimum, maximum and standard deviation. Underestimate the degree of price discovery underwriters (MAIR) the average of 17.4 percent, the first listing of shares means the

average rate of return 17.4%, and Ibbotson, Sindelar, and Ritter (1988) in 1960-1987 the empirical results, the first time the U.S. market The average stock listed underwriters early days for the 16.3 percent return on each other echoes, but higher than the Levis (1990) to 1985-1988 years 123 London stock market shares for the first time listed underwriters samples, early on the market-adjusted return on average 8.6% ; 50% of samples below the 17.9 percent rate of return and the remaining 50% is located above the 17.9 percent; the first listing of the standard deviation of stock returns 0.1433 listed below 0.2697 after one year, after two years of 0.3126 and 0.2451 after three years, indicating the first times listed on stock returns than risk-free. Attractive rate of return (CR) on average 11.0 percent, Figure 1. Trend line shows, MAIR increases greater than CR, MAIR an upward trend in the tendency to continue, while the CR gentle upward trend in the tendency is both long-term relationship under the linear constraints phenomenon. The former major shareholders of unlisted equity concentration (BOWN_b) an average of 21.6 percent, one year after the majority shareholder equity concentration (BOWN_{at+1}) on average 3.4 percent, after two years (BOWN_{at+2}) 1.9%, year-on-year decline, although the three-year After (BOWN_{at+3}) rose to 2.2 percent, but still revealed a greater degree of equity to reduce. Agency costs (AGC1) operating expenses accounted for an average of one year after the sale of 43.5 percent, 45.8 percent after two years, 46.8 percent three years later; agency costs (AGC2) one year after the asset sales accounted for an average of 15.9 percent, 21.8 percent after two years, three years later, 20.9 percent, both indicators to measure agency costs are the expression of a major shareholder equity increased to reduce agency costs after. Operating performance (ROA) after one year an average of 6.1 percent, 5.9 percent after two years, three years after 4.9 percent; operating performance (ROE) average 5.2 percent a year later, after two years of 4.3 percent, 4.2 percent three years later, that is, IPO operating performance after the signs of recession. Other control variables size (Size), debt ratio (Debt-ratio), research and development costs divided by net operating income (RD-ratio) respectively, the average was 12.7 billion Yuan, 41.3 percent, 12.7 percent, said total assets of these three annual average of about 13 billion IPO companies, the extent of the liabilities as high as about 5.2 billion, the high financial leverage may also be a major shareholder equity is to reduce one of the reasons why. Price risk (Risk) a year later (Risk_{t+1}) an average of 52.2 percent, after two years (Risk_{t+2}) 56.9%, after three years (Risk_{t+3}) 44.9%, in such a high-risk, describe the beginning IPO remuneration being exists only in the beginning. Research and development costs of virtual variables (RD_dummy) show an average of 11.2 percent without setting out research and development costs, the standard deviation of 0.3782. Bidding auction virtual variables (BID_dummy) show an average of 36.7% using bid auction, the standard deviation of 0.4427.

FIGURE 1.MAIR WITH CR HISTOGRAM, LINE GRAPH

Underwriters' price underestimated the degree of return to attract non-linear relationship

Simple linear regression analysis results are listed in Table 2., We found that the overall test results ($\beta_1 = 0.009$, P value of 0.000000, less than the significant level $\alpha = 0.05$), a hypothesis was not supported, to underestimate the extent of underwriting prices to attract a significant positive return relations. However, MAIR regression coefficient test (test statistic is 0.098419, less than 1.960), one hypothesis has gained support. The correlation coefficient ($r = 0.004730$) did not significantly different from 0 **【Note 5】**, a hypothesis supported prices underestimate the extent of underwriting and to attract the return does not have a significant linear relationship. Model with an appropriate indicator of coefficient of determination (R^2 for 0.000022) and adjusted coefficient of determination is R^2 negative (-0.002287), indicating that MAIR return to attract little explanatory power. This is the total return of the test results to differ. We have also done a significant level $\alpha = 0.005, 0.001$ of control, still found regression coefficient test and total test results are inconsistent. According to test results with the regression coefficient test for dealing with conflicts of principle, the total test significant regression coefficient test was not significant, regression model is not available. Therefore, a hypothesis to be supported to underestimate the extent of underwriting prices to attract the return can not be explained, or that the underwriters not to underestimate the price to attract new investors, with Myers and Majluf (1984) asymmetric information theory and Rock (1986) winner curse (winner's curse) argument inconsistent. Asymmetric information theory suggests that because the manager than the outside investors have more information on the value of the company, stock issued to investors transmission behavior of the negative message. Managers in order to attract investors to buy their shares, we must discount underwriters. Winner curse argued that the issuing company without the information in order to attract investors is willing to lower the price to compensate investors' underwriters.

Third, prices underestimate the extent of underwriting a major shareholder with a stake in reducing the extent of the relationship between negative

A total of three multiple regression test hypothesis II, the test findings are summarized in Table 3.. Model a price according to underestimate the extent of underwriting (MAIR) for the variables, not listed before and one year after the major shareholders of listed equity to reduce the level of (BOWNb-at +1) as dependent variables and control variables to establish, with a total test results (P value of 0.011180 , less than 0.05), the second hypothesis was not supported. MAIR regression coefficient is positive and significant level ($a_1 = 0.473863$, P for value 0.012237 but less than 0.05). Control variables, firm size (Size) a negative impact, not significant ($a_2 = -0.062765$, $P = 0.151059$, is greater than 0.05), larger companies, major shareholders equity to reduce the extent of the smaller; one year after the share price risk (Riskt +1) with positive effects, amounting to a significant level ($a_3 = 0.017073$, $P = 0.007275$, less than 0.05), with MAIR are significant positive effects, the greater the risk of the coming year, a major shareholder equity to reduce the extent of the greater; debt ratio (RD-ratio) with positive effects, no significant level ($a_4 = 0.065757$, $P = 0.171655$, is greater than 0.05); research and development costs divided by net operating income (RD-ratio) with positive effects, no significant level ($a_5 = 0.060877$, $P = 0.236173$, greater than 0.05); research and development costs of virtual variables (RD_dummy) with positive effects, no significant level ($a_6 = 0.097008$, $P = 0.052917$, is greater than 0.05); bidding auction virtual variables (BID_dummy) a negative impact, amounting to a significant level of ($a_7 = -0.129285$, $P = 0.007884$, less than 0.05), bidding auction price reaction so that the true value of underwriters, the price is not easy to underestimate, not easy to reduce the stake. Second, the overall pattern of the test findings (P for a value of 0.005372, is less than 0.05), the second hypothesis was not supported. Third, the total test model results (P for value of 0.018539, is less than 0.05), the second hypothesis was not supported. Only a control variable exceptions, three years after the share price risk (Riskt +13) is still a positive influence, but not significant level ($\beta_3 = 0.033879$, $P = 0.490436$, is greater than 0.05), which mode of one or two significant level of the results are inconsistent. A result of this study is not the direction, not in depth. Based on the above findings, the second hypothesis does not stand up prices underestimate the extent of underwriting a major shareholder equity significantly reduce the extent of positive effects, the greater the degree of underwriting price underestimated, the greater the reduction in shareholders equity, the test findings and Jiang Shuo Zhen, Liu Wei QI, and Zhang Yu-shan (2005), Li Chuan An, Liu Wei QI(2005), Zingales (1995a), Mikkelson et al. (1997), Pagano et al., (1998), Stoughton and Zechner (1998 study the same argument, but with the Field and Sheehan (2004) U.S. IPO research, underwriting underestimate the extent of the price of listed shares after the major shareholders did not significantly impact the rate of inconsistency.

In order to assess the estimated value of regression coefficient of reliability, this study, variance inflation factor (variance inflation factor, VIF) 【Note 6】 and Pearson product-moment correlation coefficient of correlation coefficient matrix model to test whether there is between variables multicollinearity, Table 4. Listed in the test findings. Since any of the correlation coefficient between variables not been more than 0.38, indicating since the

correlation between variables was not high. Furthermore, we also calculated VIF values are less than 3 was found, far less than 10, the regression model does not have enough to affect the interpretation of the results of multicollinearity.

A multiple regression mode I :

$$BOWN_{b-c,t+1} = 0.73 + 0.47MAIR - 0.06 \ln.Size + 0.02Risk_{t+1} + 0.07Debt_{ratio} + 0.06RD_{ratio} + 0.10RD_dummy - 0.13BID_dummy$$

Multiple regression model II:

$$BOWN_{d+1-c,t+2} = 0.76 + 0.66MAIR - 0.06 \ln.Size + 0.08Risk_{t+2} + 0.06Debt_{ratio} + 0.05RD_{ratio} + 0.10RD_dummy - 0.12BID_dummy$$

Multiple regression model of the III:

$$BOWN_{d+2-c,t+3} = 0.75 + 0.16MAIR - 0.07 \ln.Size + 0.03Risk_{t+3} + 0.06Debt_{ratio} + 0.06RD_{ratio} + 0.11RD_dummy - 0.13BID_dummy$$

Fourth, the major shareholder equity reduced, the agency costs without significantly greater than zero

Using t test, test a year later, after two years and three years after the agency costs are significantly different from zero, test results such as Table 5.. Found a year later, after two years and three years after the value and the t-value reached the significant level, the hypothesis was not supported three that shares lower after a major shareholder to increase the agency costs. If Li Chuan An and Liu Wei Qi (2005) research, IPO shares have scattered effect, purchase IPO external investors for small, passive investors (hereinafter referred to as retail), retail investors holding shares of public companies, large the majority of free-riders, the supervision of the company could do nothing about it, or even indifferent. At the same time, if the majority shareholder equity also reduced, it will be impossible to actively supervise or interfere with the company's management policies, or to replace the high-level managers, addressed to improve the agent of this.

Fifth, a major shareholder equity reduced, the operating performance without significantly greater than zero

Test results such as Table 6. Below, found a year later, after two years and three years after the value and the t-value did not reach significant level IV support the hypothesis that lower after a major shareholder equity, there is no significant improvement in operating performance, post-IPO operating performance and the discovery of a recession in line (Li Jian Ran, Luo Yuan-Ming, 2002; Hu De, Ma Dai, 2004), while other studies of people from within the changes in ownership. 【Note 7】 Also found the perspective of business performance recession. Test the conclusions in line with the "promotion of the value of the company have to rely on supervisory power" of the hypothesis (Jensen and Meckling, 1976).

Sixth, the major shareholder of different options to reduce the level of operating performance was no significant difference

Such as Table 7. analysis showed that the operating performance (ROA) in the market a year later, after two years and three years after the value P is 0.000000, 0.000000 and 0.000001, respectively, are significantly less than the standard $\alpha = 0.05$; business performance (ROE) In the listing year later, after two years and three years after the value P is 0.000000, 0.000411 and 0.000042, respectively, are significantly less than the standard $\alpha = 0.05$, hypothesis five did not receive support, said a major shareholder equity to reduce the level of greater than 10% and less than 10 %, there were significant differences in performance. There is another test of this hypothesis purpose, would like to know in order to stake more than 10% for the major shareholders, which is 10 percent for an important

threshold. In this study variables framework, 10% change in ownership can be seen as an important difference between the baselines.

Conclusions and Discussions

2001 is expected future economic prospects are likely to deteriorate further to reduce the IPO initial public offering market, the United States and Europe being the most obvious impact of reducing the second largest market. But as early as the 1970s, before and after, IPO price is undervalued, and has aroused the attention of this phenomenon in many countries the incidence of duplication of the stock market, and is seen as 10 financial study puzzle. Financial economists to solve this puzzle, many of the arguments put forward to underestimate the phenomenon of price have done a reasonable explanation, but it may not be able to obtain empirical results support evidence of this study was to try before and after the major shareholder of IPO shares to reduce the degree of underestimation of the extent of underwriting prices relations, and attempts to explore the "IPO after the performance whether there are significant differences."

There are four main research results, first of all, to underestimate the extent of the price of our underwriters can not explain the theory of information asymmetry and curse winner (winner's curse), or that underwriting is not to underestimate the price to attract new investors. Secondly, the price of underestimating the extent of underwriting a major shareholder equity significantly reduce the extent of positive effects, with Jiang Shuo Zhen, Liu Wei Qi, and Zhang Yu-Shan (2005), Li Chuan An, and Liu Wei Qi (2005), Zingales (1995a), Mikkelson et al. (1997), Pagano et al., (1998), Stoughton and Zechner (1998) study the same argument, we have found that price risks (Risk) and the price of underestimating the extent of underwriting (MAIR) on the major shareholder equity are positive effects to reduce the degree of risk The greater the lower the greater the degree of equity. Beatty and Ritter (1986) extension of Rock (1986) model, that is expected to underwrite the stock prices of IPO shares to underestimate the uncertainty of a positive correlation, the theory suggests that the risk of small companies than larger companies, their underwriters underestimated the extent of the price should be more serious. Another effect of shares of listed companies' uncertainties as to whether they belong to high-tech industries, high-tech industries in the future development and potential for greater profit, while its overall risks and uncertainties are relatively more expensive. Many high-tech industry such as technical R & D investment, the public may not understand because of technology can not assess the high-tech industry investment risk and value, but the manager of high-tech companies because of their expertise may be able to more accurately assess the investment project risk and profitability. Therefore, the high-tech companies a higher degree of information asymmetry, and its IPO discount should be greater motivation to recover the price also more serious, two factors are expected to reward the beginning of high-tech industries will be higher. Third, the largest shareholder after the stake to reduce to improve the agency costs, the company has not significantly improved operating performance, and past research IPO operating performance after the discovery of consistent decline. Finally, major shareholder equity to reduce the level of greater than 10% and less than 10%, there were significant differences in performance.

This study and previous studies of different, not dismantling the financial variable is the reference Li Chuan An and Liu Wei Qi(2005) from the active supervision of investors could enhance the value of the company's arguments to major shareholders to reduce the level of equity underwriting View IPO price underestimated phenomenon. Concentration of large shareholders equity, according to the definition of the Taiwan Stock Exchange, shares in the ratio of 10 percent or more for the large shareholders (blockholders), there were more than 5% shareholding or the shareholding ratio of the top ten for the majority shareholder. Although this study used the Taiwan Stock Exchange norms, to more than 10% shareholding for a major shareholder, but in view of relations between the enterprises of China's family prevails, the correct degree of concentration of ownership should be adopted La Porta et al., (1999), Claessens et al ., (2000) and Faccio and Lang (2002), such as the concept and method of calculation. In particular, during the three regression model validation, although the underwriters to underestimate the extent of the price coefficient is positive and significant level, but quite inconsistent coefficient. It is clear to holding more than 10% for the major shareholders are not in all circumstances are correct measure, it is suggested that follow-up researchers and scholars in the light of the foregoing definition of the way.

Research restricted interoperability is the definition of variables and measurement error to the beginning of the price paid for the underwriters to underestimate the extent of a proxy, the listing of new shares equivalent to the beginning of remuneration entirely attributable to the company deliberately set underwriting price is lower than the market price. In fact, the beginning of compensation may be part of the reason is due to investors chasing irrational price behavior, which is not completely underestimated the price is underwriting results. Research and analysis among the underwriters price data underestimate the extent of that day, but the majority shareholder equity is the year to reduce the level of information, it is difficult to obtain because the concentration of Japanese equity information, Hong Kong Daily News of Taiwan's economic stake in the structure of the database module, equity concentration is only available annual data, but the company regularly publish financial statements, it is not a quarterly basis and will expose the degree of concentration of ownership of information, as well as control variables are also used in information rather than on information, including company size, debt ratio and the ratio of research and development costs, which there is no information on the three days. Underwriters in the above prices underestimate the degree of interoperability and the definition of research on variables is not easy to obtain information or no information on cases, the use of information may result in the results of the analysis of bias, this study of the two restrictions.

Abstract

The transformation of the current society from an industry-based economy to a knowledge management and innovation-based economy is changing the design and implementation of business strategies and the nature of the competition among the organizations which are mainly small and medium-size enterprises (SMEs). They struggle to survive in a market which is more demanding and competitive, so they see knowledge management as one of the most effective strategies that may help to enable the innovation activities into the businesses. For these reasons, this research paper has as a main goal to analyze the relationship between knowledge management and innovation in Mexican SMEs. The empirical analysis used 125 manufacturing SMEs (each SME having from 20 to 250 employees) as a sample to be carried out. The obtained results indicate that knowledge management has a positive impact in products, process, and management systems innovation.

Keywords: *Knowledge Management, Innovation, SMEs.*

Introduction

The globalization of economy and a more demanding market with a high level of market demand are pushing the companies, mainly the small and medium-sized enterprises (SMEs), to re-structure their business strategies in order to update them to the current market demand. Similarly, different firms are considering knowledge management as a strategy that allows them to improve their level of competition (Audretsch & Thurik, 2000; 2001; 2004) because knowledge is considered as an essential element to obtain a higher level of competitiveness and innovation in organizations (Corso *et al.*, 2003; Chirico, 2008). For this reason, SMEs have to improve their business skills in order to manage more efficiently the knowledge generated by their employees so they can adapt faster to the external and internal changes that will allow them to apply innovation activities and, as a consequence, improve their economic fringes (Teece *et al.*, 1997; Eisenhardt & Martin, 2000).

In this sense, the current environment of business is changing rapidly from an industrial-based to a knowledge-based (Drucker, 1994; Van de Ven, 2004; Lu *et al.*, 2008) by means of two essential elements. On one hand, we have the globalization of economy (Lu *et al.*, 2008) while on the other hand we have fast technological changes (Santos *et al.*, 2004; Peng, 2006). Basically, the swift development of information technologies and the use of internet in most firms facilitate the interaction with clients, suppliers, other business people and consumers (Chen, 1997) which produce important changes in the nature of the organizations. Thus, this new business environment is requiring from SMEs to build and improve their skills based on a specialization of knowledge and innovation in order to improve their productivity and provide goods and services that are more adequate to their consumer than the ones provided by their competition (Lu *et al.*, 2008).

As a result of these changes, most managers are implementing new strategies for the creation, development and retention of knowledge generated by employees which allow the survival and development of such SMEs. Then, the knowledge management is present in the current literature as one of the most important elements that enable the design and implementation of innovation activities as an integral part of the business strategies of the firms (Hitt *et al.*, 1998; Lee & Grewal, 2004; Miller *et al.*, 2007). Furthermore, the increase in innovation activities can be the result of a more effective SMEs knowledge management, particularly the activities of innovation in products, processes and management systems (Moshen & Khadem, 2010), because the new products, processes and management systems innovations is the result of the interaction between knowledge management and technology (Handzic, 2004).

In this sense, most studies that link knowledge management and innovation have analyzed these elements from the perspective of large firms in developed countries, so there are few ones that have paid attention to SMEs (Thompson & Leyden, 1983; Acs, 1996), and even fewer ones that are related to the field of developing countries

(OECD, 2003; Bozbura, 2007). By comparison, one of the major contributions of this paper is the relationship between knowledge management and SMEs innovation activities in a developing country (Mexico). Also, most researches that are based on these two characteristics have applied qualitative methods; which gives this one another contribution by providing information about how knowledge management contributes to improve the innovation activities in SMEs by means of applying quantitative methods and using structural equation models for such methods.

The rest of the research paper has been structured in the following way: the second section provides a theoretical framework, the previous empirical researches as well as the formulation of hypotheses of the research. The third section deals with the methodology, the sample and the variables used in the research. The analysis of results is made in the fourth section. The final section presents the main conclusions and implications of this paper.

Literature Review

Knowledge management (KM) has been widely analyzed and discussed in the last decade in different fields and contexts (Lopez *et al.*, 2004) such as the construction industry (Maqsood & Finegran, 2009), pharmaceuticals (Normann & Ramirez, 1993; Powell, 1998), electronics (Sieloff, 1999), information and communication technology (Rantapuska & Ihanainen, 2008) as well as manufacturing (Andrews, 1996; Lu *et al.*, 2008; Moshen & Khadem, 2010). Similarly, it has been identified as an essential element that greatly facilitates the innovation and performance of the Firms (Kamara *et al.*, 2002).

On one hand, KM has been analyzed and discussed depending on the number of dimensions. One of the most studied classifications is the one that presents two basic types: *information* and *know-how*. *Information* refers to concepts, data or symbols that can be transmitted between two or more companies (Kogut & Zander, 1992), whereas *know-how* refers to the accumulation of practical skills or the experience that enable people to perform activities in an easy, efficient way (von Hippel, 1988). With this, the acquisition and processing of information and know-how done by the companies will impact in a different way their results and performance (Lu *et al.*, 2008). Similarly, KM has also been classified as *explicit* and *tacit* (Polanyi, 1966). *Explicit KM* is the one that can be easily transferred from one person to another, whereas *tacit KM* is the one that is difficult to put into words and access as it commonly develops based on the experience, attitudes, feelings and other factors which can be transferred only by means of interaction with other people (Tsai, 2001; Tsang, 2002; McFadyen & Cannella, 2004).

On the other hand, the firms that acquire more capabilities so their employees obtain and share the tacit knowledge will be able to create a higher level of innovation in their activities by means of the creation and development of new knowledge, that can be incorporated in the innovation or changes in the products or services that they produce for the benefit of their consumers (Kogut & Zander, 1992). However, the use and generation of knowledge is different in small and medium-sized enterprises (SMEs), because they have different levels of generated KM into the firm as well as in the outside. As a consequence, these differences can affect the level of innovation and performance significantly (Lu *et al.*, 2008). For this reason, it is important to consider and analyze how the knowledge has been generated, acquired, shared and spread out in the organizations as this will allow SMEs to achieve a higher level of innovation and performance (Huff, 2000; McFadyen & Cannella, 2004; Argyres & Silverman, 2004; Hansen *et al.*, 2005; Turner & Makhija, 2006).

Thus, managers will have to pay more attention to the creation and spread of tacit knowledge inside SMEs, because this type of knowledge is the one that fosters a higher level of innovation in the firms (Lu *et al.*, 2008). At the same time, managers have to improve the processes for the creation of tacit knowledge (Dew *et al.*, 2004; Thorpe *et al.*, 2005) since the management style affects the use and creation of both explicit and tacit knowledge in a significant way (Ekanem & Samllbone, 2007). Therefore, managers will have to strengthen the SME employees experience, intuition attitude and values just as much as the external resources such as the events with clients, benchmarking and an increasing interaction with the different providers (Bharati & Chaudhury, 2006), because the different suppliers can strongly promote the development of innovation in SMEs (Rantapuska & Ihanainen, 2008). That is why the use and development of knowledge in SMEs is usually flexible, unstructured and socially related to the experience and the employees relationships (Thorpe *et al.*, 2005).

The most recent classification of KM in the current literature is the one presented by Bozbura (2007) who considers that KM can be analyzed by means of four dimensions: *training and mentoring employees*, *policies and strategies of knowledge management*, *knowledge capturing and acquisition from outside*, and *effects of the organizational culture*. It can be understood from this classification that human resources is the most important element in the organization, because it is the resource that generates and develops the required creativity to produce new knowledge that enables companies to improve their level of innovation and development. Accordingly, the

implicit knowledge of employees is the essential element that directly affects the activities of the organizations. Thus, the management of human resources is the most important part of SMEs KM (OECD, 2003).

The human resources in the firms, mainly the one of SMEs, increases significantly the tangible activities of the profitable operations such as the acquisition of tools and equipment as well as the intangible activities such as the clients' satisfaction (Fitz-enz, 2001). Human resources are so important that every time more and more SMEs are investing important amounts of economic resources in their employees in order to increase their capabilities, experience and knowledge to improve company's environment in a substantial way (Ulrich, 1997). All this, increases the capabilities of the employees and this can directly affect the SMEs financial performance. Hence, employee's training has a direct relation to knowledge management in the firms (Becker *et al.*, 2001).

Conversely, the mission, vision and management strategies and processes of SMEs can be essential factors that improve skills and strengthen the employees' creativity since these elements can be labeled as policies and strategies that directly affect the firms KM. Likewise, the creation and acquisition of knowledge is another essential element for KM because knowledge can be obtained by means of established relationships between SMEs and their clients, suppliers, competition, society and even official institutions. Finally, in order to make employees share the knowledge or information they have with the rest of the company's members inside their SMEs, it is necessary to design and use efficient ways of communication, this will allow the firms to have an efficient KM. Then, the working conditions, team work, means of communication to share knowledge and the creation of a favorable environment to promote the free expression of opinions can be defined as the direct effects of organizational culture in KM (Zack, 1999; Bontis, 2000; Buckley & Carter, 2000; OECD, 2003; Bozbura, 2004; 2007). This model is the one that will be taken for this research in order to measure the KM.

The current literature shows different investigations where they directly relate KM and SMEs innovation activities. One of the most referred papers is the one presented by the researchers Ruggles and Little (1997). In it, a metaphor is presented and explained by the authors in the following way:

“The environment in which new ideas are created can be seen as a greenhouse or garden. Within this greenhouse, gardeners (i.e., managers) try to create conditions that will least inhibit the growth of a prize-winning (high value) flowers. That is, greenhouse gardeners can change the light, moisture, food mixture, etc. in the hope of beneficial results, but they cannot actually make the plants grow. Similarly, management has the ability to influence certain factors; i.e. capital resources, physical surroundings, and employee skill levels, for example, but the actual creation of new ideas is uncontrollable”.

In this model, the *soil* and *food* refer mainly to the knowledge generated in the company. It refers to the knowledge and personal experience, to the economic resources such as the acquisition of equipment, tools, and so on, that are accessible for all the personnel. This model also refers to the people, who are considered as the seeds that in which the new concepts can be generated and, at the same time, be the main element of the innovation processes.

Another model, presented by Swan *et al.* (1999), postulated two perspectives that were called *cognitive model* and *community model*. The cognitive model commonly denotes a perspective in which the generated knowledge can be picked up and codified by each one of the employees of the firms (Sorensen & Lundh-Snis, 2001), whereas the community or social model is based in the development of technology.

The model presented by Van de Ven and Engleman (2004) considers four basic elements that are derived from the present relation between KM and innovation. The first one is the *human* element which consists in motivating the employees of the firm to be more innovative by means of searching and developing both the new knowledge as well the existing knowledge in the SMEs. The second element is the *process* which consists in the way how the SMEs managers develop and implement new ideas in the organization processes. The third element refers to the *structural problems* which consist in the use of infrastructure between the company and its suppliers to obtain the knowledge that will help them to generate, facilitate, stand and promote the innovation activities in SMEs. Finally, the fourth element, *leadership*, consists in the generation and adequate management of an environment that enable facilitate the innovation activities in the organization.

Finally, the model proposed by Tranfield *et al.* (2006) shows three different stages in the KM-innovation relationship which were called *discovery*, *realization* and *nourishment*. The discovery stage consists in the need to look for and create ideal environments (both internal and external) to develop the innovation potential that lies within the organization. The realization stage consists in how the organization, along with the available elements, can achieve the implementation and development of innovation activities by means of different steps that in the end allow either the development of new products and services or the development of new management processes or methods in the organization.

From the models discussed earlier, it can be inferred that the innovation activities can be the most effective result of KM in which the innovation of products, processes and management systems are the essential components in the success and development of companies in the new millennium (Mohsen & Khadem, 2010), due to the fact that the new products and services obtained from the interaction between knowledge and technology are changing the way of dealing and competing of businesses in the new economic environment (Handzic, 2004). Hence, it has been demonstrated in the ongoing literature that innovation is a paramount element for the survival and development of SMEs as well as an important objective of the KM activity (Ruggles & Little, 1997; Nonaka & Nishiguchi, 2001). Based on this information, the following hypotheses can be formulated:

H1: Higher level of knowledge management, higher level of product innovation

H2: Higher level of knowledge management, higher level of process innovation

H3: Higher level of knowledge management, higher level of management systems innovation

Figure 1 shows the theoretical model of this research and the general approach of the proposed hypotheses.

FIG. 1: THEORETICAL MODEL

Methodology

In order to validate the stated hypotheses within the proposed theoretical model, an empirical research was made by taking into consideration the manufacturing SMEs of Aguascalientes (Mexico). To sum up, the analyzed context is the effect the KM exerts in the innovation activities of manufacturing SMEs from a developing country, which is the case of Mexico. In the first stage of the research, an “*Panel Empresarial*” took place. In it, different people (such as businesses people, chairpersons, managers, CEOs from financial institutions [both public and private], representatives of Mexican government institutions, as well as university researchers) participated, discussed and analyzed the importance and relationship between KM and SMEs innovation activities in Aguascalientes. The results obtained in this first stage made possible a better understanding of the current situation in this sector and the opportunity to define accurately the survey that was later applied to the SMEs managers.

In order to obtain the reference framework, the methodology used in this paper consisted in obtaining the directory of small and medium-sized enterprises which had between 20 and 250 employees. This was made possible with the obtainment of the 2009 directory from the Sistema de Información Empresarial de Mexico (Mexican

Business Information System, or SIEM) for Aguascalientes State which accounted for 130 manufacturing firms registered until July 30, 2009. Due to the small amount of companies that fulfilled the required characteristics, it was decided to make a census with a level of reliability of 99% and a maximum error of $\pm 1\%$. Similarly, the survey was designed to be answered by the SMEs managers. It was applied in the format of personal interview to the 130 selected firms. From these, only 125 replied back which gives us a response rate of 96%. Table 1 summarizes the most relevant aspects of the research.

TABLE 1: RESEARCH DESIGN

Sample size	125Firms
Sampling error margin	+/- 1% global level, confidence level 99% (p=q=0.5)
Filed work	October to December 2009

Development of Steps

Prior to the analysis of the results of this paper, an analysis of reliability and validity of the used parameters was carried out. Knowledge management was measured by means of four dimensions: training and mentoring employees, policies and strategies of knowledge management, knowledge capturing and acquisition from outside, and effects of the organizational culture. The training of employees was measured with a scale of five items which was adapted from Bontis (2000) and OECD (2003). The scale to measure KM policies and strategies was adapted from Bozbura (2004; 2007) with 13 items. The scale to measure the creation and acquisition of external knowledge was adapted from the OECD (2003) and Bozbura (2007) with 5 items. Finally, the scale to measure the effects of organizational culture was adapted from OECD (2003) and Bozbura (2007) with 4 items. All the items were measured in a 5-point Likert scale with 1= Strongly disagree and 5= Strongly agree.

In order to measure innovation, the survey required from the managers to indicate if the firm had implemented innovation activities during the last two years prior to their application (1= Yes and 2= No). In order to measure the importance of the innovative activity, the survey requested the managers to evaluate, by means of a 5-point Likert scale (1= Not important and 5= Very important), the product innovation, the process innovation and the management systems innovation (Zahra & Covin, 1993; Kalantaridis & Pheby, 1999; Frishammar & Hörte, 2005; Madrid-Guijarro *et al.*, 2009).

Reliability and Validity

In order to evaluate the reliability and validity of the measurement scales, a Confirmatory Factorial Analysis (CFA) was carried out by using the maximum likelihood method in EQS 6.1 software (Bentler, 2005; Brown, 2006; Byrne, 2006). Similarly, the reliability of the proposed measurement scales is evaluated from Cronbach's alpha coefficient and the composed reliability index (CRI) (Bagozzi & Yi, 1988). All the values from the scale exceeded the recommended level of 0.7 for Cronbach's *alpha* as well as the CRI that provides an evidence of the reliability that justifies the internal reliability of the scales (Nunally & Bernstein, 1994; Hair *et al.*, 1995). Accordingly, other methods of estimation were used when it is assumed that the normality is present. For this, we followed the suggestions from Chou, Bentler and Satorra (1991) and Hu, Bentler and Kano (1992) for the correction of the statistics of the estimation model used. In this way, the robust statistics (Satorra & Bentler, 1988) will be used to provide a better evidence of the statistical adjustments.

¹ Source: *Mexican Business Information System*(SIEM) 2009.

The adjustments used in the method were the Normalized Adjustment Index (NFIT), Not-Normalized Adjustment Index (NNFIT), Comparative Adjustment Index (CFI) and the Root Mean Square of Error Approximation (RMSEA) (Bentler & Bonnet, 1980; Byrne, 1989; Bentler, 1990; Hair *et al.*, 1995; Chau, 1997; Heck, 1998). The NFIT, NNFIT and CFI values between 0.80 and 0.89 represent a reasonable adjustment (Segars & Grover, 1993), and a value that is equal or superior to 0.90 is an evidence of a good adjustment (Jöreskog & Sörbom, 1986; Byrne, 1989; Papke-Shields *et al.*, 2002). The RMSEA values that are inferior to 0.080 are acceptable (Jöreskog & Sörbom, 1986, Hair *et al.*, 1995). The results of the final application of CFA are presented in Table 2 and they suggest that the final measurement model provides a good adjustment of data ($S-BX^2 = 596.7760$; $df = 356$; $p = 0,000$; $NFIT = 0.930$; $NNFIT = 0.966$; $CFI = 0.971$; and $RMSEA = 0.074$). As evidence of the convergent validity, the results from the CFA indicate that all the items of the related factors are significant ($p < 0.001$), the size of all the standardized factorial loads are superior to 0.60 (Bagozzi & Yi, 1988) and the average of the standardized factorial loads of every factor exceed without any problems the value of 0.70 (Hair *et al.*, 1995). Finally, the variance extracted index (VEI) was calculated for every pair of constructs, which results in a VEI that is superior to the 0.50 recommended by Fornell and Larcker (1981).

	ING3	0.946***	27.378				
$S-BX^2$ (df = 356) = 596.7760; $p < 0.000$; $NFI = 0.930$; $NNFI = 0.966$; $CFI = 0.971$; $RMSEA = 0.074$							
^a = Value parameters in the identification process							
*** = $p < 0.001$							

In regard to the evidence of discriminant validity, the measurement is given in two ways that can be observed in Table 3. First, with a confidentiality interval of 95%, none of the individual elements of the latent factors from correlation matrix contain the value 1.0 (Anderson & Gerbing, 1988). Second, the variance extracted between each pair of constructs is superior to its corresponding VEI (Fornell & Larcker, 1981). Based on these criteria, it can be concluded that the different measurements used in this paper show sufficient evidence of reliability as well as convergent and discriminant validity.

TABLE 3: DISCRIMINANT VALIDITY

Variables	1	2	3	4	5	6	7
1. Training and mentoring employees of KM	0.656	0.171	0.139	0.194	0.128	0.094	0.104
2. Policies and strategies of KM	0.268 - 0.560	0.532	0.166	0.164	0.109	0.145	0.107

7. Management systems innovation	0.174 - 0.474	0.172 - 0.484	0.205 - 0.569	0.146 - 0.482	0.514 - 0.834	0.654 - 0.874	0.917

Diagonal represent the average variance extracted, while above the diagonal the shared variance (squared correlations) are represented. Below the diagonal the 95% confidence interval for the estimated factors correlations is provided.

Results

The proposed conceptual model was analyzed with this research by using the structural equations model (SEM) with the EQS 6.1 software (Bentler, 2005; Byrne, 2006; Brown, 2006). In order to obtain the statistical results of the research hypotheses, a SEM was carried out with the same variables to prove the structure of the model and obtain the results that could allow the contrast of the established hypotheses. The nomological validity of the theoretical model was analyzed by the chi-square performance test in which the theoretical model was compared with the measurement of the model. The results indicate that the non-significant differences of the theoretical model are good in the explanation of the relations observed between the latent constructs (Anderson & Gerbing, 1988; Hatcher, 1994). The final results obtained from SEM are presented in Table 4.

TABLE 4: STRUCTURAL EQUATION MODEL RESULTS

Hypothesis	Path	Standardized path coefficients	Robust t-value
H1: Higher knowledge management, higher product innovation.	Knowledge Management → Product Innovation	0.320***	8.313
H2: Higher knowledge management, higher process innovation.	Knowledge Management → Process Innovation	0.380***	9.188
H3: Higher knowledge management, higher management systems innovation.	Knowledge Management → Management Innovation	0.456***	10.573

$S-BX^2_{(357)} = 267.5603$; $p < 0.000$; NFI = 0.894; NNFI = 0.948; CFI = 0.965; RMSEA = 0.074

*** = $P < 0.001$

In regard to hypothesis **H1**, the results obtained (seen in Table 4), $\beta = 0.320$, $p < 0.001$, indicate that knowledge management has significant and positive effects in product innovation. In regard to hypothesis **H2**, the results obtained, $\beta = 0.380$, $p < 0.001$, indicate that knowledge management has significant and positive effects in process innovation. Finally, in regard to hypothesis **H3**, the results obtained, $\beta = 0.456$, $p < 0.001$, indicate that knowledge management has significant and positive effects in management systems innovation. To sum up, it can be proved that knowledge management has significant and positive effects in SMEs innovation activities.

Discussion and Conclusions

The results obtained in this research show that KM encourages the innovation activities in three different ways. First, it helps SMEs to locate innovative knowledge in the external environment of the organization, own that knowledge and transfer it to all the personnel of the company and incorporate it efficiently to the productive activities, which generates changes or improvements to the products created. Thus, the knowledge generated in universities, research centers, government institutions and other organizations that produce similar or identical products allows SMEs to acquire and develop knowledge that turns into superior skills of the human resources, which derives in an improvement of the competitive advantage of firms by means of the generation of new products in the target market. Similarly, in a market that is every time more globalized and highly competitive, just like the one where most SMEs are currently established, the survival and development of this kind of firms depends on the constant change or improvement of the products made to adapt them to the constant preferences and needs of the consumers; and in order to do this, they need the knowledge generated outside the firms.

Second, KM helps SMEs to improve their level of competitiveness by enhancing the production processes because it gets, assimilates and uses the innovative knowledge from the external environment in favor of the organization. KM usually promotes and regulates the adoption cycle of the innovation activities of the firms, mainly the production processes, because it requires important monetary investments, on one hand, for the automation of production processes by acquiring new technology; and, on the other hand, to have an efficient record of the production and predictive, corrective maintenance of machinery and equipment. Similarly, it is necessary to have innovative initiatives in the delivery methods, higher levels of cooperation with the suppliers to diminish risks and a more efficient and effective production schedule. Hence, SMEs requires external innovative knowledge that is spread in the industry so KM enables this process into the organization in order to generate new knowledge. This will facilitate its fast internal dissemination of the operational processes of the firms which will cause changes or improvements in the production processes.

Third, KM helps SMEs to get a better development by means of a change or improvement in the management systems. The limited use of explicit or processual knowledge that exists inside SMEs as well as the tacit knowledge that is in the people's skills and experience affects the specific behavior of employees and the organizational culture, which usually causes that different SMEs do not accept the new knowledge that is outside the firm. That is why managers will have to put into effect changes or improvements in the management systems of SMEs to facilitate the transference of explicit and tacit knowledge among all the employees in the organization. Thus, the changes or improvements in the management systems will have to guarantee the optimal use of the available knowledge (both inside and outside the organization), because the use of internal knowledge can create a high demand of the external available knowledge that would directly result in improving the management systems in order to use such knowledge efficiently. This could be perceived in a better output and a better level of innovation in the firms. In order to take external knowledge and incorporate it with the existing knowledge in the SMEs it is necessary to improve and upgrade the process of KM and provide the necessary skills so the firms to become learning organizations.

The main objective of this research aimed to identify the relationship between KM and innovation by using a sample of 125 Mexican SMEs manufacturing firms. The empirical evidence in this paper allows us to conclude that KM has a positive and direct effect in product innovation as well as the processes and management systems of manufacturing SMEs. These results are similar to the ones obtained by Thompson and Leyden (1983), Acs (1996) and Lu *et al.* (2008), where they concluded that instead of having SMEs generating new knowledge they normally look for and get new knowledge outside the organization through social bonds that they keep with clients and suppliers. For this reason, it can be concluded that a good combination of internal and external knowledge can make SMEs more innovative.

This research has some limitations. Firstly, the sample only considered manufacturing SMEs with 20 to 250 employees in Aguascalientes (Mexico), so further investigations might take into account smaller firms, from other sectors and from other country. Secondly, the research only considered four dimensions or factors in order to measure KM; further investigations might consider other variables such as human resources, aptitude, creativity, level of education and working experience, among others. Similarly, the research could include moderating variables such as the characteristics of the industry, the ownership of the firms, the competitive strategy and the structure of the organization. Finally, another limitation of this research is the fact that the survey was done only with the SMEs managers. It would be interesting for future investigations to consider in the survey the employees, clients and suppliers of the organization so it is possible to know the opinion of other participants of the firms.

Abstract

Clusters were regarded as the important factor of the regional and consequently global economic growth. One of the important cluster features is higher innovativeness compared with companies that do not cooperate closely. Due to real evidences for such statements, economies of agglomeration and cluster theory is used in real economies of many countries. Governments usually support creation and growth of the clusters. This is not yet the case of Slovakia. The clusters in Slovakia were established by self-governing regions or municipalities and entrepreneurs. So far fourteen clusters are active in Slovakia. All Slovak clusters were established without direct support of the central government. The spectrum of cluster organizations is relatively wide – from automotive, electrical engineering, power engineering, polymers technology, engineering to IT and tourism. The paper presents overview of existing technological and tourist clusters organizations in Slovakia. It also points out current problems and formulates recommendations.

Introduction

Cluster is usually defined as geographic concentration of interconnected companies and institutions in a particular field. Clusters encompass an array of linked industries and other entities important to competition such as suppliers, providers of specialized infrastructure, governmental and other institutions etc. Cluster theory explains why certain industrial concentrations have maintained and enhanced their market dominance. Interestingly clusters promote both competition and cooperation because they occur in different dimensions and among different players (Porter, 1998). During their lifetime, the clusters pass through different phases of growth concerning the number of engaged organizations. Interestingly, these phases need not co-align with industry life cycle. In addition to that, clusters within same industry may grow at different rates (Pouder and John, 1996).

Clusters offer many benefits for their members. For instance, positive relationship between the regional size and labor productivity at the level of individual companies was shown by empirical analyses. It means that companies become more productive by being located in agglomerations and larger regions (Andersson and Lööf, 2009). It indicates that clusters enhance companies' productivity.

Firms benefit from economies of agglomeration by attracting alliance partners, the private equity partners as well as by their ability to innovate. Simultaneously, marginal benefits to clusters size decrease when clusters get large. It means that diseconomies of agglomeration could play important role when clusters exceed about 65 firms (Folta, Cooper and Baik, 2006).

Firm's membership in cluster provided unique opportunities especially for small and medium-sized enterprises (SMEs) to stay competitive on a regional, international and even global scale (Morosini, 2004). Therefore, clusters are important microeconomic factor determined regional and consequently global economic growth.

Moreover, links between regional specialization defined as clustering degree, and innovative performance measured as patenting levels was observed. It could be concluded that regions in Europe with many clusters are top performers; vice versa regions without clusters are performing bad (The European Cluster Observatory, 2009). Additionally, firms are more likely to innovate if located in a region with dense presence of other firms in the same industry. On the other hand, the effect of other industries proximity does not seem to be significant. In addition, it is widely recognized that innovation tends to be stronger in clusters (Baptista and Swann, 1998), and also innovators tend to emerge in locations where the highest technological opportunities are present (Iammarino and McCann,

2006). Firms in clusters are usually very active in joint innovation-related projects. Therefore such clusters are labeled to clusters of innovation or knowledge intensive clusters.

Cluster of innovation is defined as environment that promotes the creation and development of high potential entrepreneurial ventures. Clusters of innovation are characterized by increased mobility of resources, fast business development and also strong networks creation (Engel and del-Palacio, 2009). Knowledge intensive clusters (also so-called high tech clusters) have a high share of knowledge handling labor employed. Hence such cluster growth leads to an increased demand for highly educated labor. It also results in an overall increase of the region's knowledge intensity (Karlsson, 2007). It is widely recognized that highly educated experts are important innovation drivers.

Also, informal contacts among the employees are considered to be one of the main carriers of knowledge between firms in a cluster because such contacts represent an important knowledge diffusion channel (Dahl and Pedersen, 2004). Importantly, new technological knowledge could flow locally more easily than over great distances owing to its uncodified nature. Spillover effects related to R&D activity are usually geographically localized; therefore they are important in the clustering process (Jaffe, 1989) and overall innovation activities.

Additionally, there are evident many cluster benefits to the regional economies. In addition the clusters may become the attractors for foreign direct investments, because dense network of domestic firms can compensate for policy-induced distortions and be appealing for the investments from abroad (Yehoue, 2009).

Ten years ago the Lisbon strategy of the European Union has been approved. According to this strategy, the Europe should develop the most competitive economy in the world. In this strategy the roles of the business clusters and the research and development, human resource development and the development of the knowledge based society are acknowledged as the important factors of the competitiveness. Slovakia as the member state of European Union would like also to become the research and development country, a country which wants to develop the modern industrial and postindustrial structures. The goal is for Slovakia to provide an appropriate and competitive environment for sustainable development and growth through a highly-qualified workforce (Švač and Javorek, 2009).

Slovak business clusters could be suitable factor that could help to meet these targets, and it is therefore necessary to know clusters limits and development barriers. In addition, clusters could also stimulate economic growth of Slovak firms/sectors. Therefore, detailed clusters status understanding could ideally lead to overall economic environment enhancement and thus stimulate economic growth through synergies and externalities.

This paper present result of the pilot research focused on Slovak cluster initiatives. For detailed understanding of the Slovak cluster status and challenges, further precise research has to be done.

Characteristics of the Slovak regions

Slovak Republic consists of 8 self-governing regions (Fig. 1). These regions are as follows: Bratislava, Trnava, Trenčín, Nitra, Žilina, Banská Bystrica, Prešov, Košice.

Due to historical evolution there are huge differences among these regions. Generally, economy of the west Slovakia is significantly better developed compared with the rest of the country.

FIG. 1: MAP OF THE SLOVAK SELF-GOVERNING REGIONS

The highest numbers of employees have been located in the Bratislava self-governing region (321,200), likewise the same region has had the lowest unemployment rate in Slovak Republic. The highest unemployment rate during the Q1-Q3 2010 was observed in Prešov that has been accountable for 19 % of total unemployment in Slovak Republic (Tab. 1).

TABLE 1: SELECTED CHARACTERISTICS OF THE SLOVAK SELF-GOVERNING REGIONS

Self-governing region	Companies		Individuals		Employment		Unemployment	
	No	%	No	%	No	%	No	%
Bratislava	47,789	34.1	62,580	15.2	321,200	14	20,800	5.2
Trnava	12,974	9.3	44,888	10.9	265,100	11.5	37,700	9.5
Trenčín	11,832	8.5	45,336	11	270,100	11.8	28,900	7.3
Nitra	13,937	10	52,117	12.7	294,800	12.8	58,000	14.6
Žilina	13,340	9.5	58,611	14.3	285,200	12.4	47,200	11.9
Banská Bystrica	12,464	8.9	44,857	10.9	256,100	11.1	63,000	15.8
Prešov	13,032	9.3	60,058	14.6	310,600	13.5	75,600	19.0
Košice	14,612	10.4	42,886	10.4	294,800	12.8	66,600	16.7
Slovakia	139,980	100	411,333	100	2,297,800	100	397,700	100

Source: Statistical Office of the Slovak Republic.

These trends well correlate with the overall economic structure of the Slovak self-governing regions. Bratislava region is attractive for the highest number of companies as well as individual entrepreneurs. Bratislava self-governing region has the lowest unemployment rate for long period of time because of high quality regional economic environment, excellent geographic position and highly qualified labor force. Other regions with lower unemployment rate have lower number of companies and individual entrepreneurs.

Growth poles of the Slovak regions

It is widely accepted that regional governments together with the central bodies are responsible for region's economical development. Therefore, growth poles of all Slovak regions were analyzed in Regional Innovation Strategies prepared by self-governing regions. Growth poles represent regional strengths and they are considered to be the pillars of their present and future prosperity. Identified growth poles become integral part of the central government strategies focused on Slovak economy development.

All regions detected a few growth poles that correlate with the current regional economic structures. While region Košice identified the lowest number of growth poles, region Trenčín identified seven perspective growth poles.

TABLE 2: GROWTH POLES OF THE SLOVAK SELF-GOVERNING REGIONS

Self-governing region	Growth poles
Bratislava	Logistics Information and Communication Technologies Automation, measurement and control Chemical Engineering and Biotechnology
Trnava	Energy security and renewables Automotive Electrical engineering
Trenčín	Small-scale chemistry Chemical Specialties Industrial Ecology Advanced materials Mechatronics Semiconductors
Nitra	Agriculture Food technology and their Biotechnology Traditional and nontraditional foods and their safety Plastics Processing Biotechnology Ecology and environmental science in relation to food industry
Žilina	Information and communication Technologies Bearing industry Engineering Industry Air and Rail Transport Selected areas of medicine
Banská Bystrica	Timber industry Ecology and Environmental Technologies Renewable energy Metallurgy, processing and recycling of light metals Working machinery and equipment and their systems
Prešov	Automation and mechanization of industry Packaging Materials Selected health and pharmacy
Košice	Biotechnology – probiotics and biomodulators, applications of bioactive substances Metallurgical Industry

Source: *Innovation Policy of the Slovak Republic for 2008 to 2010.*

A growth poles overlapping is evident between Banská Bystrica and Trnava regions, where Renewables are considered as the same growth pole. In the case of Bratislava and Prešov the Automation has been detected in both regions as joint denominator. These relatively small overlapping indicate sectors heterogeneity in the view of regional economic structure. It could be concluded that detected growth poles do not reveal emerging sectors in any of the Slovak regions.

Slovak business cluster initiatives – the cluster mapping

The important step in identifying the cluster initiatives was their mapping. This was done based on a questionnaire survey conducted in March/April 2010. A questionnaire was sent to cluster managers. All questionnaires were returned, which represents a 100 % response.

Based on the results of survey it was identified that fourteen cluster organizations are active in the Slovak economy. In addition to them there are other clusters that are, however, in the very early stage of development. They do not yet exert the real activities and their future development is unclear. That is why they have been excluded from our analyses. Cluster initiatives in Slovakia could be divided into two groups: technological clusters and clusters in tourism. Both subgroups are presented in Tab. 3 and Tab. 5, respectively.

Technological clusters

At present Slovakia is considered to be predominately an industry-based economy. Therefore, technological clusters are important kind of clusters in Slovakia.

Currently nine technology-based clusters operate in Slovakia (Tab. 3). Many of these cluster organizations are not strongly geographically localized, but their operation area represented by cluster firm's members is cross-regional, for instance Cluster AT+R (advanced technology and research operate in three self-governing regions (Žilina, Prešov, Košice). Cluster headquarters are located in five self-governing regions. It means that three self-governing regions still have no cluster organization at their territory. Clusters were founded by self-governing regions, firms, universities and high professional schools. It means that self-governing regions were usually major actors in the formation of cluster seed in early stages of the development, since clusters stimulate regional development, and they could help to overcome a few region economic weaknesses. Nearly all clusters are region centered because headquarters are located in the capitals of the regions. Only one cluster headquarter (1st Slovak Engineering Cluster) has not been located in regional metropolis.

TABLE 3: SLOVAK TECHNOLOGY-ORIENTED CLUSTERS

Cluster organizations	Location of the cluster's head office		Founders	Date of establishment
	Region	City		
1 st Slovak Engineering Cluster	Banska Bystrica self-governing region	Detva	self-governing region, companies, universities, high-schools	XI.4.2008
Automotive Cluster - West Slovakia	Trnava self-governing Region	Trnava	self-governing region, Trnava city	XII.7.2007
BITERAP	Košice self-governing region	Košice	companies	XI.30.2004
Electro Cluster - West Slovakia	Trnava self-Governing Region	Galanta	self-governing region, Galanta city	V.23.2008
Energy Cluster - West Slovakia	Trnava self-Governing Region	Trnava	self-governing region, Trnava city, The Union of the Towns and Cities of Slovakia	XII.2.2009
Cluster AT+R	Košice self-governing region	Košice	self-governing regions, companies, university	VII.14.2010
Košice IT Valley	Košice self-governing region	Košice	self-governing region,	III.6.2007

	region			companies	
Slovak Plastic Cluster	Nitra region	self-governing	Nitra	companies, high-schools	III.23.2009
Z@ict	Žilina region	self-governing	Žilina	self-governing region, companies university	VI.30.2008

All technology-oriented clusters have at least seven members, except of Electro Cluster – West Slovakia which has 3 members only (Fig. 2). Nevertheless, this cluster is relatively powered because of its active participation in several international projects. Other clusters have been engaged in many domestic and international projects as well.

FIG.2: NUMBER OF ACTORS IN TECHNOLOGY-ORIENTED CLUSTERS

The highest numbers of members have Automotive Cluster – West Slovakia (30), 1st Slovak Engineering Cluster (22), Košice IT Valley (27) and Slovak Plastics Cluster (45) (Fig. 2). None of them is already saturated in terms of firm's membership, but contrary all technology-oriented clusters are open to new firms members, for example Slovak Plastic Cluster expects to have about 60 members, Automotive Cluster – West Slovakia about 40, 1st Slovak Engineering Cluster about 30 and IT Valley 45 members in the nearest future.

Similarly almost all clusters have many important actors in their proximity, e.g. Slovak Plastic Cluster highlighted about 160 players, Automotive Cluster – West Slovakia 60, 1st Slovak Engineering Cluster about 60 and IT Valley 70 actors interesting for them.

Interestingly, defined growth poles relatively well correlate with the orientation of the technology-based clusters (Tab. 4), excluding the clusters founded in Košice self-governing region (BITERAP, Cluster AT+R, Košice IT Valley). It implies that defined growth poles relatively well correlate with region's economies. In the case of Košice region Biotechnology and Metallurgical Industry were identified as major growth poles because of US Steel Košice is the biggest plant in the region. It indicates that new emerging high tech sectors such as IT, automation and robotic have appeared in the Košice region. On the other hand, as described above Cluster AT+R is oriented on Automation and Robotics, and it is cross-regional cluster. In addition, Prešov self-governing region defined Automation and mechanization of industry as key growth poles. It implies that cluster AT+R covers Prešov Self-governing region orientation and consequently could stimulate growth of this region as well.

Future cluster prosperity will depend on strengthening the cooperation with Slovak and foreign R&D centers. Mainly technology oriented universities such as Slovak University of Technology in Bratislava and The Technical University of Košice, and also Slovak Academy of Sciences (SAS) should become the main innovation

drivers in the technology oriented clusters. The attainment of these goals represents the huge challenge of redefining priorities of the Slovak public R&D centers (universities, SAS) focusing their activities on applied research and the expectation of the real economy.

TABLE 4: SLOVAK TECHNOLOGY-ORIENTED CLUSTERS

Cluster organizations	Focus	Location	Relevant growth pole
1st Slovak Engineering Cluster	Engineering	Banska Bystrica self-governing region	Metallurgy, processing and recycling of light metals Working machinery and equipment and their systems
Automotive Cluster - West Slovakia	Automotive	Trnava Self-Governing Region	Automotive
BITERAP	IT	Košice self-governing region	none
Electro Cluster - West Slovakia	Electrical engineering	Trnava Self-Governing Region	Electrotechnical Industry
Energy Cluster - West Slovakia	Power engineering	Trnava Self-Governing Region	Energy security and renewables
Cluster AT+R	Automation, robotics	Košice self-governing region	none
Košice IT Valley	IT	Košice self-governing region	none
Slovak Plastic Cluster	Polymers technology	Nitra self-governing region	Plastics Processing
Z@ict	IT	Žilina self-governing region	Information and communication Technologies

In addition the instruments of the technology transfer has to be further developed, which should enable the better valorization of the results of research and development. Currently the technology transfer offices are being established on Slovak technology universities. Potentially they should become the important contact points for innovative companies and clusters as well. Besides, the innovation generated infrastructure such as science parks and incubators should be intensively promoted. Moreover, the venture capital infrastructure should be further developed.

All technology oriented Slovak clusters are innovation oriented, and therefore their core activities are mainly education, joint projects (e.g. R&D projects), PR and marketing activities, and also international networking. Since all clusters have relatively short history, their real activities portfolios will have to expand in the future.

Clusters in tourism

Clusters in tourism are important kind of clusters that are developing quickly. They offer higher flexibility, enable the sharing of marketing information; they are the catalysts of resource development, innovation and knowledge transfer. Such tourist alliances usually generate quality improvement of services, the enhanced visibility, cross-marketing activities with other cluster members, and the involvement in important events (Novelli, Schmitz and Spencer, 2006).

Currently five cluster organizations in tourism are really active in three Slovak self-governing regions (Tab. 5). It indicates that five self governing regions have no real clusters in tourism at their territory. All tourist clusters operate at specific tourist attractive micro-regions. Interestingly, three clusters (Orava, Liptov, Turiec) operate in the same self-governing region (Žilina). All clusters were founded by companies, municipalities and self governing region.

TABLE 5: SLOVAK TOURIST CLUSTERS

Cluster organizations	Head office		Founder	Date of Establishment
	Self-governing region	City		
Tourist Cluster –West Slovakia	Trnava self-governing region	Trnava	self-governing region, Galanta city	XII.1.2008
Cluster Liptov	Žilina self-governing region	Liptovský Mikuláš	cities, companies	VIII.8.2008
Cluster Orava	Žilina self-governing Region	Dolný Kubín	villages, companies	VIII.5.2008
Cluster Turiec	Žilina self-governing Region	Martin	cities, companies	VII.7.2009
Balnea Cluster Dudince	Banska Bystrica self-governing region (BBSK)	Dudince	city, companies	VI.6.2008

Intensive clustering activity fostered by entrepreneurs indicates that tourist-related companies are more active compared with the technology clusters. The strong clustering activity is the result of the strong competition among Slovak, cross-border regions and adjacent foreign tourist regions.

Only one cluster (Tourist Cluster –West Slovakia) is region centered because it has CEO located within the region capital (Trnava), while others are micro-region centered. Interestingly clusters Liptov, Orava and Turiec have joint borders but historically, culturally, geographically they have operated at different (micro) regions. Except of Balnea Cluster Dudince oriented on health tourism others are focused on traditional tourism–stimulating activities. Slovak tourist clusters have at least five members (Fig. 3). The highest number of members has Cluster Orava (14), Balnea Cluster Dudince (8) and Cluster Liptov (7). Likewise to technology-oriented clusters, tourist clusters also expect increased interest in membership, and emphasize that there are numerous important actors in their proximity, that can potentially become the cluster’s members.

FIG.3: PLAYERS RELEVANT TO THE CLUSTERS IN TOURISM

For example Cluster Orava expects that its membership will grow up to 30 members, Cluster Liptov 28 and Tourist Cluster – West Slovakia up to 12 members in the future. Number of important actors varies among the clusters, for example Cluster Orava highlighted about 50 relevant actors and Cluster Turiec about 50, while Tourist Cluster – West Slovakia approximately 17 players only. Due to specific focus of the Balnea Cluster Dudince there are no other important actors because all relevant players are already cluster members and Cluster Liptov did not answer this question. Currently, targeted marketing is the core activity of the Slovak tourist clusters focused on Slovakia and also central Europe counties (Hungary, Czech, Poland). In addition, the joint projects, events and also public relations activities represent the important part of their activities. Similarly to the technology-oriented clusters they have the potential to boost the cluster activities in the near future. Destination management of the clustered regions is facing to the new challenges of deeper competition/cooperation between all European regions, and especially in the Central European Countries.

Cluster expectations, problems and challenges

There is no principal difference between technology-oriented and tourist clusters in terms of their principal barriers and future development limits. Generally, both kinds of clusters are under-funded. It could be concluded that cluster long term sustainability is strongly determined by targeted cluster policy or any other external stimuli and the initial public subsidies. Additionally cooperation between cluster players has to be enhanced by boosting real activities because there is huge potential for joint pro-innovation activities stimulating firm's growth. Many countries have well working cluster policies that overcome barriers of the cluster development. This is not yet a Slovak case. Therefore, the development of cluster policy represents the significant challenge for policy makers in Slovakia. All studied clusters were established without central government subsidies in early stages of their development. It indicates that future cluster-policy should stimulate growth of the relatively well working clusters. We can anticipate that future cluster establishment will also be spontaneous. Hence there is no reason for subsidizing of a new cluster creation. This supporting philosophy was fully accepted by cluster managers during the joint cluster workshop. Moreover the spontaneous creation of new cluster initiatives (excluded from this analysis) supports this result. Since Slovak National Innovation System does not bring the expected results, there is rising challenge in the field of its rearrangement. Especially technology-oriented clusters emphasize necessity of the so-called Regional Innovation Centers which could help to clusters innovate more systematically. At present the further development of cluster activities as well as the enhancement of mutual cooperation is coordinated by the association of Cluster Union of Slovakia. Founders of the Cluster Union are as follows: Slovak Plastic Cluster, 1st Slovak Engineering Cluster, Košice IT Valley, Cluster Liptov, Cluster Orava and Cluster Turiec. The ratio between technology-oriented and tourist clusters is equal. One of the important goal of the Cluster Union is to enhance overall pro-cluster environment and to lobby for improvement of the cluster and innovation policy in Slovakia. Currently, Clusters Union of Slovakia took active part in a several international projects focused on networking and economy-related policies. In such a way the Cluster Union is becoming the important player in the Slovak economy.

Conclusions

Clusters are important factor of the regional economic growth in many countries. Therefore clusters are becoming vital part of many economies because they provide unique opportunities to stay competitive due to improvement of the pro-innovation environment. This is case of many developed countries as well as Slovak Republic. Slovak Republic consists of 8 self-governing regions. Owing to its different evolution there are huge differences between the Slovak regions. Generally, economy of the west Slovakia is significantly better developed compared with the rest of the country. It is widely recognized that regional governments are directly responsible for regional economic growth. Therefore, regions growth poles of the Slovak regions have been analyzed in Regional Innovation Strategies prepared by all self-governing regions. Identified growth poles correlate with the current regional economic structures and clusters established at their territories. Currently fourteen cluster organizations are active in Slovakia. All Slovak clusters were established by regional municipalities, self-governing regions and entrepreneurs without direct support of central government. The spectrum of cluster organizations is relatively wide – from automotive,

electrical engineering, power engineering, polymers technology, engineering to IT and tourism. Currently nine technology-based clusters operate in Slovak Republic. Many of these cluster organizations are not strongly geographically localized. Their operation area represented by members is cross-regional. Cluster head offices are located in five self-governing regions. Clusters were founded mainly by self governing regions and companies. Nearly all clusters are region centered because their head offices are located in the regional capitals. All Slovak technology-oriented clusters have been engaged in many domestic and international projects as well. Especially the foreign projects were the important channel for transfer of know-how from countries with longer cluster initiatives traditions into Slovakia. All technology-oriented clusters have potential for their further growth. Likewise the technology clusters, the clusters in tourism are quickly developing. Currently five cluster organizations in tourism are really active in three Slovak self-governing regions. The tourist clusters focus their activities at specific tourist attractive micro-regions. Less attractive region did not record so far the clustering activities in the area of tourism. No differences between technology-oriented and tourist clusters in terms of development limitations were observed. Both kinds of clusters are having the funding problems. Therefore cluster policy represents the significant challenge for policy makers in Slovakia. Further cluster-policy should stimulate growth of relatively well working clusters. Since all Slovak cluster organizations were established without direct support of the central government, perspective cluster policy should be oriented on boosting cluster activities/growth. Moreover the important factor of cluster development is specifically tailored innovation infrastructure, that is important denominator future competitiveness of the associated organizations in the clusters.

Abstract

Small firms represent a significant part of the workplace-learning context in New Zealand, and in other East Asia economies. Organisations large and small provide opportunities for their employees to learn in a variety of ways. Employee cohorts range from the Novices (18 to 24), the Semi-Experienced Specialists (25 to 44) and the Matured Specialists (older than 45 years). In this study we explore if these 3 groups of employees differ in their perception of learning opportunities available to them in their workplace. Data were gathered from employees in mostly small batch manufacturing firms that produce products designed to customer specifications, such as special-order machine tools, custom clothing, and printing. We used ANOVA to analyse the data as it helps to identify if there are significant differences between these three groups of employees in their perception of different aspects of workplace learning.

Key Words: Employee learning, ANOVA, New Zealand, SME's

Introduction

Organisations large and small provide opportunities for their employees to learn in a variety of ways. Employee cohorts range from the Novices (18 to 24), the Semi-Experienced Specialists (25 to 44) and the Matured Specialists (older than 45 years). In this study we explore if these 3 groups of employees differ in their perception of learning opportunities available to them in their workplace. The areas of learning opportunities available to employees in the small and medium manufacturing sector in New Zealand were identified as: a) Organisational support for learning; b) Supervisor's proximate support for learning; In addition we also investigated a) employees satisfaction with their workplace learning and b) their methods of learning.

Small firms represent a significant part of the workplace-learning context in New Zealand, and in other East Asia economies. For example, almost 99 percent of New Zealand enterprises employ 49 or fewer full time equivalent employees, and these firms account for approximately 54 percent of all people employed in enterprises. In regard to other East Asia economies, small enterprises create most of the employment in East Asia and are the backbone for regional economic growth (Harvie & Lee, 2005). Accordingly, development of small firms in the East Asia has a crucial role in new employment creation and sustained economic growth in the region. This includes development of the human capital in these firms through learning processes.

Theoretical Background

An adaptation of Lewin's (1951) B-P-E model served as the framework for the study. The B-P-E model (as detailed below) postulates a relationship among three major components of learning/facilitating interactions. This relationship has been reiterated and extended by several authors (Bandura, 1977; Hunt & Sullivan, 1974; Kidd, 1973; Knowles, 1990; Mackeracher, 1996). Furthermore, according to Davis and Luthans (1980), the B-P-E model has been widely adopted by the organisational behaviour field as a theoretical framework to explain behaviour.

Behaviour is a function of the interaction between Person and Environment:

$$B = f(P, E).$$

When we apply the B-P-E model to the learning/facilitating context, the "P" stands for Person (the learner), and can include any characteristic of a learner (for example, motivation, self-efficacy, and attitudes) that affects learning. The "B" stands for Behaviour, and can include any outcome (for example, the knowledge, skills and attitudes that are learned, and how the learner responds to the learning process) that occurs during, or after the learning/facilitating interaction. The "E" stands for Environment, and can include any factor within the learning situation or context which might effect or affect learning, including, for example, learning interventions, quality of the physical environment, social support, and learning potential of the work system. The facilitator can be thought of as a very influential component of the learning environment, through the provision of guidance, information, feedback, reinforcement, and support (MacKeracher, 1996).

Data Collection

Data was gathered from employees in mostly small batch manufacturing firms that produce products designed to customer specifications, such as special-order machine tools, custom clothing, and printing. It could reasonably be assumed that workplace learning is particularly important in such firms. Small batch manufacturing is close to traditional skilled-craft work, because people are a large part of the production process (Daft, 2000). Furthermore, employees are likely to often encounter novel work problems when products are made to customer specifications. Apart from the need to solve novel work problems, other situations that prompted learning in these firms included the arrival of newcomers and their needs' to be socialised and trained, the need to comply with health and safety requirements, and continuous improvement efforts.

To recruit participants, lists containing contact (and other) details of small manufacturing firms were purchased from a commercial database supplier. Using these lists as the sampling frame, a systematic sampling procedure (Zikmund, 2000) was employed to randomly select 120 firms that would be invited to participate in the study. Pre-notice letters were mailed to owner-managers of these firms. The letter provided notice that the recipient would be receiving a telephone call to request help with an important study. The owner-managers of 31 firms agreed to allow their staff to participate in the study. Within these firms, all employees in the operating cores were invited to complete the questionnaire.

Three methods of survey implementation were used: (1) on-site group administration; (2) the drop-off-and-collect method; and (3) the postal system. Giving questionnaires to an assembled group of staff to complete was the most efficient method. Following Dillman (2000), a protocol for group administration of the questionnaires was developed to keep the questionnaire completion environment the same for all groups and individuals. The in-person drop-off-and-collect method of survey administration involved visiting owner-managers at their firms to drop-off questionnaires and to agree on suitable times to collect completed questionnaires. Some owner-managers preferred to have the questionnaires delivered and returned by mail. Using these three methods, 464 useable questionnaires were received from employees in the participating firms. Of this total, 76 respondents were in the 18-24 category (novices), 255 were in the 25-44 category (semi-experienced specialists) and 133 were over 45 years (Matured specialists category).

Questionnaire Development

The questionnaire was divided into four sections (A, B, C, and D). In sections A, B and C, positively (and a few negatively) stated propositions and a seven-point scale (7 = strongly agree, 1 = strongly disagree) were used to measure employee perceptions of work environment characteristics, immediate workplace supervisors' proximate support for learning, and (dis)satisfaction with learning, respectively. Negatively worded items were reverse coded.

In section D, questionnaire items measured the employees' perceptions of the usefulness of seven 'aids to learning'. These 'aids to learning' consisted of three sources of learning (immediate supervisor; other managers; and workmates) and four methods of learning (everyday work activities; on-the-job training; observing and listening; and trial and error). Responses were recorded on a five-point scale (5 = extremely useful, 1 = not at all useful).

Results

After determining the mean values for the three groups, it is necessary to determine if there are significant differences between the three groups of employees. We used Analysis of variance (ANOVA) to analyse the data as it helps to identify if there are significant differences between these three groups of employees in their perception of different aspects of workplace learning. As an analytical technique, ANOVA is capable of statistically differentiating between the three different groups. The results of our analysis clearly indicate that there are significant differences between the different groups. Table 1 below provides the ANOVA results and identifies the variables in which the differences between the groups are statistically significant.

TABLE 1: SUMMARY OF THE ANOVA RESULTS*

Var. No.	Variable Description	F-ratio	Sig. Level
A5	In my workplace training is arranged for me	3.71	0.03
A8	In my workplace people take time to figure out ways to improve	4.22	0.02
A9	In my workplace people feel encouraged to experiment to learn new ways of doing things.	3.77	0.02
A13	In my workplace managers share learning experiences	3.99	0.02
B1	My immediate supervisor discusses my performance	4.20	0.02
B2	My immediate supervisor asks what I need to learn	2.24	0.10*
B6	My immediate supervisor provides on the job training	3.40	0.03
B7	My immediate supervisor arranges help from others	3.51	0.03
C2	I am satisfied with my personal development since joining this organisation	2.56	0.08*
E1	I learn from my immediate supervisor	2.67	0.07*
E2	I learn from other managers in my organisation	3.50	0.03
E3	I learn from my workmates	10.49	0.00
E5	I learn from on the job training (direct instruction)	7.11	0.01
E7	I learn from trial and error	3.4	0.03

*Significant at $p < 0.10$

Only the variables with significant mean differences between the three groups are presented. The ANOVA results showed that there are significant differences between the three groups of employees across fourteen variables of the 31 variables used to assess these different dimensions (see Table 1).

Learning opportunities

An examination of the mean values of the four items used to assess the opportunities for learning in the workplace reveals that all the employees agreed that there were opportunities to — A1: learn different tasks ($\bar{x} = 5.55$); A2: take on challenging tasks ($\bar{x} = 5.43$); A3: choose their own methods of working ($\bar{x} = 4.69$) and A4 to use their abilities ($\bar{x} = 5.45$). The mean values of the novices were higher than the other two groups for all 4 items. However, there were no significant differences between the novices, the semi-experienced and the matured specialists.

Organisational support for learning

It can be seen from the mean values of the nine items used to measure this dimension that for 4 items they were either greater than or very close to 5 indicating that all 3 groups agreed to these statements. These are identified as — A5: training is arranged for you ($\bar{x} = 5.06$); A6: no informal training available ($\bar{x} = 4.99$); A7: managers tolerate mistakes ($\bar{x} = 5.43$); A8: take time to figure out ways to improve ($\bar{x} = 5.26$)

The level of agreements is lower across the three groups for another four variables — A9: feel encouraged to experiment ($\bar{x} = 4.88$); A10: ideas for change welcomed ($\bar{x} = 4.77$); A11: little encouragement to learn skills ($\bar{x} = 4.78$); A13: managers share learning experiences ($\bar{x} = 4.59$). Interestingly all groups disagreed that A12: learning new skills are rewarded ($\bar{x} = 3.87$)

Patterns in the means suggest that the means for novices had a higher level of agreement for all the 9 items that measured organisational support for learning. Further, ANOVA results reveal that there are differences between the three groups of employees in respect of — A5: training is arranged for you; A8: take time to figure out ways to improve; A9: feel encouraged to experiment and A13: managers share learning experiences. Novices viewed these more favourably than semi-experienced or matured specialists. The mean values for novices are above 5 for all these variables, except A13 with a slightly lower mean.

Supervisor's proximate support for employee learning

In this section we examine if Supervisor's proximate support to learning is viewed favourably. There were opportunities for one-on-one interactions between the supervisor and the employees in these firms. Hence employees are in a position to assess supervisors support to workplace learning. The mean values for the three groups of employees are provided in the Appendix.

The results show that in respect of 7 items (B1 to B7) that assessed supervisors' proximate support for learning, the level of agreement was highest for B4: available to talk about problems ($\bar{x} = 5.58$) followed by B5: works with me to solve problems ($\bar{x} = 5.31$); B7: arranges help from others ($\bar{x} = 5.22$); B6: provides on the job training ($\bar{x} = 5.04$); B3: provides constructive feedback ($\bar{x} = 4.784$); B2: asks what I need to learn ($\bar{x} = 4.45$); and B1: ($\bar{x} = 4.62$).

The mean values for all the 7 items are higher for the novices as compared to either semi-experienced or the matured specialists. ANOVA results show that there are significant differences between the three groups for 4 of the 7 items assessing supervisors' proximate support for learning and they are – My immediate supervisor B1: discusses my performance, B2 asks what I need to learn, B6: provides on the job training and B7: arranges help from others.

Satisfaction with learning

Four items, C1 to C4 pertaining to satisfaction with learning mostly elicited high mean values of above 5. The exception was C3: my training didn't cover basics ($\bar{x} = 4.85$). Higher mean value were recorded by C2: satisfied with personal development ($\bar{x} = 5.54$); C1: satisfied with what I have learned ($\bar{x} = 5.51$); and C4:

organisation has helped me develop ($\bar{x} = 5.23$). ANOVA results indicates that there are differences between the three groups in respect of one item namely, C2: satisfied with personal development.

Sources and methods of learning

Items in this section (D) were measured on a 5 point scale (1= not at all useful; 5 = extremely useful). 7 items were used in this section and three of these measured Sources of learning (D1 to D3) while the remaining 4 assessed methods of learning (D4 to D7).

The mean values of D1: my immediate supervisor ($\bar{x} = 3.63$); D2: other managers in my organisation ($\bar{x} = 3.23$); D3: my workmates ($\bar{x} = 3.77$). suggest that employees regarded their workmates as the most useful source of learning. Immediate supervisors were also useful sources of learning while other managers in the organisation were not regarded highly as a source of learning. ANOVA results show that there are significant differences between the novices, the semi-experienced and the matured specialists with regard to all the three items which were used to measure sources of learning.

In terms of methods of learning, D6: observing and listening ($\bar{x} = 3.95$) recorded the highest mean followed by D4: everyday work activities ($\bar{x} = 3.75$); D7: trial and error ($\bar{x} = 3.56$); and D5: on-the-job training ($\bar{x} = 3.53$). ANOVA results indicate that there are significant differences between the three groups of employees in terms of D5: on-the-job training and D7: trial and error.

Implications

The results of the study reveal that, of the 31 variables used to assess these different dimensions, the semi experienced group of employees recorded the lowest means for 21 items whilst the highly experienced specialist recorded the lowest means for 9 items and the novices recorded the lowest mean for only one item. These different groups of employees are not a homogenous group but are significantly different in their perception of a) Organisational support for learning; b) Supervisor's proximate support for learning; c) satisfaction with their workplace learning and b) their methods of learning.

Hence we cannot assume that employee learning processes will be identical or that employees will perceive work environment conditions and the workplace supervisors' proximate support for learning similarly. Therefore managers should adopt different approaches to facilitate engagement in workplace learning by the different cohorts of employees.

The growing awareness of the need to foster learning at and through work has far-reaching consequences for managers, who are expected to manage the workplace as a place fit for learning. The literatures that focus on workplace learning, organisational learning, and the learning organisation encourage managers to move away from a directing role and towards that of coach and facilitator, and thus take on increasing responsibility for supporting the learning of their staff (Ellinger, Watkins, & Bostrom, 1999; Hughes, 2004; Lang & Wittig-Berman, 2000; Sambrook & Stewart, 2000).

One of the widely debated issues is the development and management of formal and informal learning among employees in SMEs. This study clearly shows as to how employees differ with age. Some experts in the field maintain that age differences are critical and that the learning needs and methods of twenty year-old in this decade is different from those of a person say, fifty year-old employee. Others dispute that contention and argue that cohort and generational effects are not critical. This study provides empirical evidence and suggests that learning programs need to vary for these increasingly different cohorts of employees.

APPENDIX 1: ABBREVIATED QUESTIONNAIRE ITEMS AND GROUP MEANS

<i>Items</i>	<i>Novices</i> (\bar{x}_N)	<i>Semi Experienced</i> (\bar{x}_{SE})	<i>Matured Specialists</i> (\bar{x}_{MS})
Work Environment Characteristics			
<i>Learning opportunities</i>			
A1*: opportunities to learn different tasks	5.54	5.49	5.68
A2*: opportunities to take on challenging tasks	5.51	5.43	5.39
A3: opportunities to choose own methods	5.01	4.65	4.69
A4: opportunities to use abilities	5.53	5.45	5.42
<i>Organisational support for learning</i>			
A5: training is arranged for you	5.44	4.92	5.11
A6: no informal training available	5.14	4.94	4.98
A7: managers tolerate mistakes	5.54	5.44	5.31
A8: take time to figure out ways to improve	5.59	5.12	5.35
A9: feel encouraged to experiment	5.09	4.72	5.09
A10: ideas for change welcomed	4.80	4.67	4.96
A11: little encouragement to learn skills	4.75	4.71	4.93
A12: learning new skills rewarded	3.97	3.81	3.93
A13: managers share learning experiences	4.84	4.41	4.80
Supervisors' Proximate Support for Learning			
B1: discusses my performance	5.11	4.46	4.63
B2: asks what I need to learn	4.80	4.34	4.47
B3: provides constructive feedback	5.05	4.72	4.74
B4: available to talk about problems	5.78	5.57	5.48
B5: works with me to solve problems	5.48	5.32	5.19
B6: provides on the job training	5.44	4.98	4.90
B7: arranges help from others	5.62	5.17	5.09
(Dis)Satisfaction with Learning			
C1: satisfied with what I have learned	5.71	5.44	5.55
C2: satisfied with personal development	5.81	5.43	5.59
C3: my training didn't cover basics	5.20	4.78	4.79
C4: organisation has helped me develop	5.45	5.20	5.18
Methods of Learning			
<i>Sources of learning</i>			
D1: My Immediate supervisor	3.87	3.57	3.59
D2: Other managers in my organisation	3.19	3.13	3.44
D3: My workmates	4.20	3.66	3.72
<i>Methods of learning</i>			
D4: Everyday work activities	3.83	3.71	3.79
D5: On-the-job training	3.82	3.37	3.67
D6: Observing and listening	4.05	3.93	3.93
D7: Trial and error	3.75	3.60	3.36

* Items in this section (D) were measured on a 5 point scale (1= not at all useful; 5 = extremely useful). All the other items were measured on a 7 point Likert scale (1= strongly disagree; 7 = strongly agree).

Innovation Performance and Economic Performance of SMEs in Bangalore: An Empirical Analysis

*M H Bala Subrahmanya, bala@mgmt.iisc.ernet.in
Indian Institute of Science, Bangalore, India*

Abstract

This paper is an attempt to probe how entrepreneurship and firm level factors promote technological innovations and thereby facilitate economic performance of Small & Medium Enterprises (SMEs) in the context of auto components, electronics and machine tool sectors in the city of Bangalore, India. Based on primary data from 157 SMEs for a period of five years (2001/02-2005/06) and by means of step-wise regression analysis, this paper throws light on how entrepreneurship and other firm level factors influence innovation and how entrepreneurship, firm level factors and innovations determine economic performance of SMEs. Innovative SMEs mostly comprise technically qualified entrepreneurs, exclusive design office, and carry out innovations with external support. Together they determine the innovation performance of SMEs in terms of innovation sales. Innovation sales and factor inputs enable entrepreneurs, particularly of younger firms, to achieve better economic performance in the form of higher growth of sales turnover.

Introduction:

Innovations are a necessary precondition for a knowledge-oriented business which promote not only the economic competitiveness of the whole country, but also the welfare of each entrepreneur and the society (Ciemleja and Lace, 2008). Among firms of different sizes, Small and Medium Enterprises (SMEs) across industries and economies have the unrealized innovation potential (Chaminade and Van-Lauridsen, 2006; The World Bank, 2010). This is attributed to their inherent characteristics such as flexibility, better adaptability and receptivity, effective internal communication, simple organizational structure, etc. (Ussman, et al, 2001). Although SMEs typically face considerable resource constraints, they are often successful innovators (Rosenbusch, et al, forthcoming). The success of small firm innovation would invariably revolve around the personality of the entrepreneur/s and characteristics of the firm.

Considering the above, this paper attempts to understand how entrepreneurship and firm level factors promote innovation and thereby facilitate economic performance of SMEs? This question has been probed in the context of auto components, electronics and machine tool sectors in the city of Bangalore, India covering 157 SMEs. Primary data were gathered using a structured schedule for a period of five years: 2001/02-2005/06 on quantitative variables such as employment, investment and sales turnover, apart from data on background of entrepreneurs, firm characteristics, nature of innovations and innovation sales. We have used step-wise regression to determine how entrepreneurship and other firm level factors influence innovation and how firm level factors and innovation performance determine economic performance over a period of time.

Firm level factors, innovation performance and economic performance of SMEs:

Technological innovation is a key factor in a firm's competitiveness. Technological innovation is unavoidable for firms which want to develop and maintain a competitive advantage and/or gain entry into new markets (Becheikh, et al, 2006). Among firms of different sizes, SMEs are generally more flexible, adapt themselves better, and are better placed to develop and implement new ideas. These qualities along with their simple organizational structure, their low risk and receptivity are in fact essential features facilitating them to be innovative (Harrison and Watson, 1998).

Therefore it is appropriate to examine the internal factors closely which might influence SME innovation capability either with or without external support. Several empirical studies with reference to diverse economies have identified various internal factors that would influence SMEs to obtain external support and innovate.

According to Radas and Bozic (2009) innovative performance of SMEs is influenced by internal factors involving characteristics and policies of SMEs and external factors of opportunities that SMEs can seize from its environment. Important internal factors for SMEs to develop their innovative capabilities are owners' technical education and prior work experience, technical skills of the workforce, and investment in R&D and training (Romijn and Albaladejo, 2002).

Researchers found the background and role of entrepreneurs crucial for SME innovations. This observation was found to be upheld in different countries and different industries. Ciemleja and Lace (2008) found that innovative activity of the enterprise is directly connected with the educational level of managers. Unskilled management of SMEs reduces its innovative ability. Technical education background and work experience of entrepreneurs in the same industry generate necessary technological capability and thereby facilitate the technological innovations of small firms (Bala Subrahmanya, 2007). Academic experience of the CEO, among others, was an important determinant of innovation performance of SMEs in the bio-technology industry of South Korea (Kang and Lee, 2008). Science or engineering educational qualification of entrepreneurs and university trained engineers and designers as a percentage of total work-force are some of the important internal factors which influenced innovation capability of SMEs in China (Tie-jun and Jin, 2006). This brings out that it is not only the technically qualified owner/manager but also proportion of technical work-force in total work-force which matters for a firm's innovation capability.

Another internal factor that would determine innovation capability is the presence of an exclusive design office. A design office is more oriented towards the development and improvement of existing products than radical innovation. The design office is composed of engineers and technicians. It gives a better picture of innovative activities in SMEs. Firms which are endowed with this office have already structured their innovative capabilities and they rely less on informal knowledge (Bougrain and Haudeville, 2002). A SME with technically qualified owners/managers who have innovative attitudes, a relatively high proportion of technically qualified or skilled labour force and have an exclusive design office would be able to scout for, seek and successfully obtain appropriate external support. Most innovative small firms are involved in extensive and diverse links with a variety of external sources of knowledge and expertise (Freel, 2000). Acquiring knowledge and skills through external collaboration has become an effective and efficient way towards the success of innovations of SMEs (Kaminski, et al, 2008).

Further, firms which engage themselves in more frequent innovations are likely to have stronger innovative capabilities and therefore firms which engage in innovation only occasionally or infrequently with relatively weak innovative capabilities may find fewer firms willing to enter alliances with them (Sen and Egelhoff, 2000). Among firms, new ventures benefit more from innovation than aged and established SMEs. Considering the trade-off between flexibility and specialization of resources as companies mature, the flexibility of new firms might be more beneficial for innovation success than specialization of assets found in established firms. As such the flexibility of new firms might enable them to adapt to changing environments or induce rapid industry changes themselves (Rosenbusch, et al, forthcoming). Marques and Ferreira (2009) reveal that firm level factors such as quality of entrepreneurship, life cycle, age and size of firms along with external partnerships or cooperation have a significant influence on a firm's innovative capacity and this in turn has an influence on firm's sales turnover.

SMEs which develop innovative capability with or without external support achieve either cost effective, quality improved, improved versions of existing products or altogether new products. This is a desirable outcome as it enables them to gain and maintain technological advantage over competitors (Lee, 1998). If they succeed, they would realize a greater share of such innovated products in their total sales. As a result many such innovative SMEs might achieve a higher growth of sales turnover. However not many empirical studies, which have studied SME innovations, have focused on probing the relationship between innovation and firm performance (Hoffman, et al, 1998). A major difficulty in observing the effect of innovation on growth is that it may take a firm a long time to convert increases in economically valuable knowledge (i.e. innovation) into economic performance.

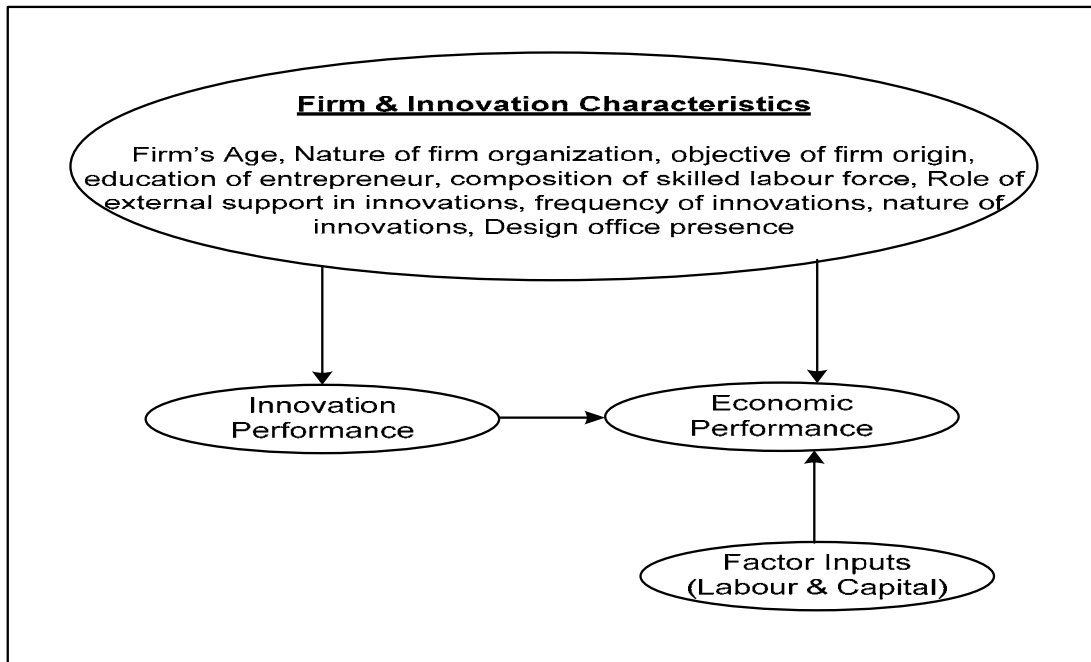

Roper (1997) focusing on product innovations of SMEs in Germany, UK and Ireland revealed that innovated products significantly contributed to the sales growth of innovative SMEs, which grew faster than non-innovative SMEs. He found a strong association between innovation and sales growth. Engel, et al (2004), similar to Roper, found that sales turnover of innovative SMEs grew faster than that of non-innovative SMEs in the craft dominated industries of Germany. They ascertained a significant relationship between the share of innovative sales

and sales turnover change of firms. Coad and Rao (2008) probed the relationship between innovation and sales growth for incumbent firms in the high-tech sectors of the US. Their findings revealed that a firm, on average, might experience only a modest growth and may grow for a number of reasons that may or may not be related to innovativeness. But innovation is of crucial importance for a handful of ‘superstar’ fast-growth firms. It is with this backdrop that the present study attempts to probe the relationship between entrepreneurship & firm level factors and innovation performance as well as between innovation performance and economic performance of SMEs in the context of Bangalore in India.

Conceptual Framework:

The relationship between entrepreneurship, firm level factors, innovation performance, factor inputs and firm performance is described in Fig 1. In a SME, the entrepreneur/s or founder/s lead and drive the organization and its activities. Therefore, whether a SME will innovate or not would depend on the nature of entrepreneurship. The nature of entrepreneurship can be defined in terms of age of firm or entrepreneur/s, educational background, nature of firm organization, firm size and objective of firm origin. In addition, it is entrepreneur/founder who decides on the composition of labour force, obtaining external support, presence of a design centre, frequency of innovations and nature of innovations. Thus nature of entrepreneurship and firm level factors together would have a profound influence on firm level innovation performance. Along with the growth of factor inputs, nature of entrepreneurship, firm level factors and innovation performance will have an impact on firm’s economic performance. The extent of influence of these factors on firm performance would however vary from firm to firm or from sector to sector.

FIG 1: INNOVATION PERFORMANCE AND ECONOMIC PERFORMANCE OF SMEs

Analysis and Results:

The descriptive statistics of the variables of 157 SMEs relating to firm level characteristics, innovation features, firm level economic variables and sector specific firms are presented in Table 1. The Bangalore SMEs vary not only in terms of firm level characteristics including that of entrepreneurship and growth of factor inputs but also in terms of innovation features including innovation sales, and firm performance indicator, ie, sales growth. Table 2 presents correlation coefficients between these variables for the whole sample (all the coefficients which are $> \pm 0.15$ are statistically significant at 0.05 level). What is significant to note is that there is a relatively strong positive correlation between innovation sales (IS) and sales growth (SG).

Note: For description of variables, see Table 1.

The relationship between the objective of setting up a firm (FO) and sales growth as well as between technically qualified entrepreneur (TE) and sales growth is positive though relatively low. All these positive relationships are statistically significant. There is a statistically significant negative relationship between the age of firms (FA) and sales growth. The relationships between sales growth and the remaining variables are not statistically significant. The objective of setting up a firm (FO) has a moderate positive relationship with innovation sales. Similarly, external support for innovations (SIE) and technical entrepreneur have statistically significant positive relationships with innovation sales. Technical entrepreneur has a significant positive relationship with the objective of setting up a firm. Most of the remaining relationships lack statistical significance.

Given the moderately strong positive relationship between innovation sales and sales growth of SMEs, it would be appropriate to examine the firm-wise trends of both these variables. Fig 2 presents the firm-wise trends of innovation sales and sales growth of SMEs, which broadly indicate the close relationship between the two.

To begin with, it is appropriate to examine how entrepreneurship and firm level factors influence innovation performance of SMEs in terms of innovated products as a percentage of total sales. To ascertain the influence of these variables, we carried out a step-wise regression analysis with the following regression function:

$$IS = f(FA, FO, SLP, TEd, FORd, DOd, FI, PTId, PSId, SIIEd, LI, Ad, Ed) \quad (1)$$

Where IS = percentage of innovated products in total sales during 2001/02- 2005/06

FA = Firm's age in years (as of 2005/06). An older firm with experience might be able to innovate better compared to younger ones.

FO = Objective of setting up the firm. The objectives have been ranked from 1 to 5. This has been ranked as follows: Those which came up exclusively to enjoy government sponsored benefits have been given the lowest rank (1), those which came up only as a source of employment (2), those which came up to serve large enterprises' demand (3), those which came up to exploit market opportunities (4), and those which came up exclusively to implement innovative ideas have been given the highest rank (5). Those which have come up exclusively to implement innovative ideas or to exploit market opportunities might innovate much more than those which have come up as a means of employment or just to enjoy government sponsored concessions and benefits.

FIG 2: INNOVATION PERFORMANCE AND ECONOMIC PERFORMANCE OF SMEs

SLP = Percentage of skilled labour in total employees. It is believed that higher the percentage of skilled labour in a firm, more beneficial for it to implement innovations.

TEd = Dummy variable to distinguish the Owner/Managing Partner/CEO who is technically qualified (1) in the form of a Diploma, Degree (BE or equivalent/ME or equivalent/Ph.d) from those who are non-technically qualified (0). Other things remaining the same, technically qualified Chiefs will be able to carry out innovations relatively better than non-technically qualified Chiefs.

FORd = Dummy variable to distinguish Proprietorship (1) from Partnership and Private Limited Companies (0). An individual proprietor who has better control and can keep close watch on the enterprise and communicate effectively within might be in a better position to carry out innovations compared to partners and private limited companies.

DOd = Dummy variable for the presence of an exclusive Design Office (1) in the enterprise, (0) otherwise. For a high-tech MSME, product design plays an important role in introducing a new or improving an existing product. Therefore presence of an exclusive design office will help in the process of innovations.

FI = Frequency of innovations. The frequency is ranked from 1 to 5 as follows: those which carry out innovations once in 13 months or more are ranked the lowest (1), those which carry out innovations once in 10 to 12 months (2), those which carry out once in 7 to 9 months (3), those which carry out innovations once in 4 to 6 months (4), and those which carry out innovations in one to three months are given the highest rank (5). Other things remaining the same, if a firm carries out innovations more frequently, it will be able to achieve more innovation outcomes.

PTId = Dummy variable for those which carry out only product innovations (1) and (0) for others.

PSId = Dummy variable for those which carry out only process innovations (1) and (0) for others.

The above two dummy variables will distinguish them from those which carry out both product and process innovations together.

SIIEd = Dummy variable for those which carry out innovations by combining internal capabilities with external support (1), and (0) otherwise.

The above dummy variable will distinguish them from those which carry out innovations exclusively with internal capabilities. It is often argued that MSMEs in general have resource constraints and therefore, they will be better off to undertake innovations with external support.

LI = Labour intensity which is measured in terms of value added per unit of labour and is used as a control variable for firm size.

Ad = Dummy variable to distinguish Auto Component MSMEs (1) from Electronics and Machine Tool MSMEs (0).

Ed = Dummy variable to distinguish Electronic MSMEs (1) from Auto Component and Machine Tool MSMEs (0).

To ascertain the influence of independent variables on innovation performance, we use stepwise backward elimination regression with innovation sales percentage (2001/02-2005/06) as the dependent variable along with the independent variables explained above. The analysis is done by using Stata 11 software and we report the regression coefficients with t values, F value and R square. Similarly, to examine the influence of innovation performance on sales growth performance, sales growth (2001/02-2005/06) is taken as the dependent variable along with independent variables used for the previous analysis, employment growth (%), investment growth (%) and innovation sales percentage (average for 2001/02-2005/06) to perform stepwise backward elimination regression analysis (using Stata 11). The advantage in using backward elimination regression is that it starts with a regression equation including all the independent variables, and then deletes independent variables that do not contribute significantly. Sequential search methods which include backward elimination regression among others, offers a perfect solution to researchers because it results in a model with maximum predictive power with only those variables that contribute in a statistically significant amount (Hair, et al, 2007).

The results of stepwise backward elimination regression analysis are given in Table 3. The model is statistically significant as indicated by the F value and it explained more than a quarter of the total variation in innovation performance as reflected in the R^2 value. This may be considered satisfactory because the independent variables are mostly qualitative variables and they did not include exclusively two crucial explanatory variables of innovation, namely, personnel devoted and capital expenditure incurred on innovations (since these data were not gathered). There is no problem of multicollinearity between the independent variables. The stepwise elimination resulted in the removal of sector dummies, age of firms, dummies for product innovations and product & process innovations, and frequency of innovations indicating that they did not influence firm level innovation performance.

The regression model contains six specific factors which influenced innovation performance. First is the objective of firm origin. Those firms which came up either to implement innovative ideas or to exploit market opportunities have achieved innovation sales much more than those which came up either to enjoy government benefits or as a means of employment. Second, those firms which have carried out innovations with external support have excelled in innovation performance compared to those which have relied only on internal efforts. Third, those which have technically qualified entrepreneurs have performed more innovatively than the rest. Fourth, those which have an exclusive design office have achieved higher innovation sales compared to those which did not have any exclusive design office. Finally, a higher share of skilled labour proved counter productive for innovations as it has a negative influence on innovations. The nature of firm organization did not make any difference to innovations since the coefficient is significant only at 0.15 level. Over all these results indicate that firm level technological capability as reflected in the technical background of entrepreneur, presence of an exclusive design office, and objective of firm origin and external support play a crucial role in innovation outcomes.

TABLE 3: INFLUENCE OF ENTREPRENEURSHIP & FIRM LEVEL FACTORS ON INNOVATION: STEPWISE REGRESSION RESULTS

Dependent variable = IS				
Number of observations = 157				
F (6, 150) = 8.64; Prob > F = 0.00				
R- squared = 0.26				
Variable	Coefficient	t	p>	t
FO	2.16	4.04	0.000	
SIIE	4.39	3.18	0.002	
TEd	2.86	1.82	0.071	
SLP	-0.06	-1.73	0.086	
DOd	2.78	1.65	0.100	
FORd	-2.35	-1.45	0.150	
Constant	5.33	1.79	0.075	

After the examination of factors which influenced SME innovation performance, we ascertained the role of innovation performance along with firm level factors and growth in factor inputs of labour and capital in firm's sales growth performance with the following regression equation:

$$SG = f(IS, FA, FO, SLP, TEd, FORd, DOd, FI, PTId, PSId, SIIEd, LI, EG, KG, Ad, Ed) \quad (2)$$

The results of stepwise backward elimination regression analysis are given in Table 4. The multiple regression model is statistically significant and it explained 56% of the variations in sales growth performance. The problem of multicollinearity did not exist between the explanatory variables. The stepwise backward elimination regression eliminated dummy for nature of firm organization, dummy for external support of innovations, percentage of skilled labour, dummy for product and process innovations, dummy for exclusive design office, dummy for technical qualification of CEO, and dummies for industry sectors since these variables did not have sufficient influence on sales growth. The stepwise regression model clearly reveals the importance of innovation performance for sales growth performance of SMEs. In addition what matters is the objective of firm origin. Those firms which came up to implement innovative ideas or to exploit market opportunities grow faster than those which came up to enjoy government benefits or as a means of employment. In addition, both employment and investment growths encourage the sales growth of firms. Further, the control variable (labour intensity) has a statistically significant positive influence on sales growth.

What is significant is that age of firms has a negative influence indicating that younger firms grow faster. Similarly, firms which engage in more frequent innovations suffer in growth compared to those which carry out innovations less frequently. This could be because more frequent innovations might divert the precious scarce resources of the firm away from production operations thereby affecting growth compared to those which do not seek such diversions due to their infrequent innovations.

TABLE 4: INFLUENCE OF INNOVATION PERFORMANCE & FIRM LEVEL FACTORS ON ECONOMIC PERFORMANCE OF SMEs: STEPWISE REGRESSION RESULTS

Dependent variable = SG				
Number of observations = 157				
F (7, 149) = 8.64				
R squared = 56				
Variable	Coefficient	t	p>	t

FO	1.58	1.90		0.060
FI	-1.82	-2.61		0.010
LI	2.31	1.61		0.109
Constant	4.44	1.15		0.251

Conclusions:

We found that an innovative entrepreneur is more often technically qualified and he strategically builds up internal firm capability by setting up an exclusive design office in-house. In addition, he attracts and supplements external support for undertaking innovations and bringing out innovated products as part of total firm sales. Innovation sales and factor inputs enable entrepreneurs, particularly of younger firms and those who have formed start-ups with the objective of implementing their innovative ideas or exploiting market opportunities, to achieve better firm performance in the form of higher growth of sales turnover. Such innovators carry out innovations rather judiciously infrequently. Given this, policy support to encourage innovative start-ups and enable SMEs to access external support would go a long way in enhancing their ability to achieve technological innovations and such innovative firms with growth of factor inputs would be able to achieve better economic performance in the form of higher sales growth.

These findings have significant policy relevance. Innovation literature argues that the central concern of developing countries is the absorption and adaptation of the backlog of existing knowledge with the long-term goal of gaining technological independence by developing their own path of technological development (path-creating catching-up) (Godhino and Fagerberg, 2005). Our findings support the view that there is ample scope for promoting learning and knowledge absorption by MSMEs in India through extending policy support to their innovative activities. As the present study has found out innovation performance of firms strongly depends on the synergies and external linkages in the local environment which offers insight into the decisive importance of interactions among firms, governments, and research institutes in the innovation process. This assumes added significance due to our other finding that proprietorship form of organizations lacks the ability to perform as innovatively as partnership or private limited form of organizations. Further, interaction among firms, governments, and research institutes provide feedback mechanisms that involve learning, which determines the level of innovative activities (Rosenberg, 1982; Lundvall, 1992).

Learning within the context of an innovation process consists of an interactive process that reflects the strength of the interrelationships among different sectors, institutions, and agents, including firms, training institutes and universities. Bangalore, which is considered one of the global hubs of technological innovation, ideally would give ample scope for nurturing these interactive processes. The same may hold good for other cities and even MSME clusters located elsewhere in the country. This is because clusters provide a favorable environment for innovation and technology diffusion (The World Bank, 2010). Therefore forming an exclusive “Innovation Policy” to focus on “entrepreneurial firms” and “their linkages” with external organizations such as R&D establishments, Institutes/Universities and Large enterprises, apart from promoting MSME networking, would facilitate the heralding of a new innovative culture for the promotion of competitiveness of firms and industries. In this context, Micro, Small and Medium Enterprises Development Institutes (MSMEDIs) may be revamped as the nodal agency

for promoting linkages and networks revolving around MSMEs for aiding and promoting their innovations. The next step should be to apply the same strategy with respect to District Industries Centres (DICs) across the country.

Abstract

The present competitive scenario is challenging firms and economic systems to find new forms of competitive behavior, consistent with the emerging request of sustainable development. On the one hand, this issue has been explored from a firm-based perspective. Those studies highlight the strategic options a single firm can adopt to be competitive by leveraging the environmental and social dimension. On the other side, the link between economic, environmental and social sustainability can be observed on a territorial dimension, by including in the analysis the relationships between business activities and the local areas in which those firms are located. The paper investigates whether industrial district characteristics are consistent with the three fundamental dimension of economic, social and environmental sustainability. The empirical analysis is based on qualitative case studies of two Italian industrial districts specialized in the production of leather (Arzignano) and tiles (Sassuolo). Managerial and policy implications are provided.

Introduction

The importance of the environmental matter for industries and policy makers has been rising exponentially at the international level in recent years. The usually negative externalities that the business behavior produces on the environment have limited the attention of economic players on the sustainability issue. The firms' increasing attention in the last years on the topic of environment is due to the transformation of the competitive scenario, where new challenges comes from the consumption side as well as in terms of policy programs. Environmental-related product and process investments do not involve only firms competing in small niches, but they become a priority also for firms and institutions on a larger scale. The present competitive scenario is challenging firms and economic systems to find new forms of competitive behaviors, consistent with the emerging request of sustainable development. On the one hand, this issue has been explored from a firm-based perspective (e.g., Porter and van der Linden, 1995; Orsato, 2009). Those studies highlight the strategic options a single firm can adopt to be competitive by leveraging the environmental and social dimension of its business. On the other hand, the link between economic, environmental and social sustainability can be observed on a territorial dimension, by including in the analysis the relationships between business activities and the local areas in which those firms are located (e.g., Coté and Cohen-Resenthal, 1998; Dansero, 1996).

The wide literature on industrial districts (e.g., Becattini et al., 2009) depicts a specific model of economic development where the economic systems and the social fabrics are interconnected and support one another, rooted into specific territorial areas. This model contributed to the economic success of many countries (e.g., Italy) and regions (e.g., Silicon Valley) and has been used by policy makers (e.g., The European Cluster Memorandum, 2007) to promote local developments and economic growth. How are industrial districts able to incorporate the environmental issues in the behavior of local firms? Which is the role of social structure and local institutions in this process? The paper investigates whether industrial district characteristics are consistent with the three fundamental dimension of economic, social and environmental sustainability. The first section discusses the literature on sustainability. The second session analyzes the district model and the emerging trends refereed to environmental issue. The third section focuses on the empirical analysis, based on qualitative case studies of two Italian industrial districts specialized in the production of leather (Arzignano) and tiles (Sassuolo). Managerial and policy implications are provided in the conclusive section.

Sustainable Development And Competitiveness Of Firms And Territories

Environmental Sustainability And Firm Strategies

There is a large and growing set of contributions that explore how firms may take into account the environmental side of their activities and relate it to positive economic performances. The analysis of the role of environmental sustainability into business can be explored from different perspectives. A first set of studies consider how firm can build “green strategies” (e.g., Orsato, 2009): by including the respect of the environment in its strategic options the firm can enhance its competitive advantage. Sustainability strategies can refer to product – i.e., eco-branding - or process innovation – eco-efficiency - oriented to reduce costs or increase market control through differentiation. By adopting sustainability strategies the firm can also be able to cope with the emerging market requirements related to the respect for the environment the consumerism trend underlines (see the debate on Corporate Social Responsibility, e.g., Porter and Kramer, 2006) and produce appreciable social impacts (i.e. in terms of quality of life).

In this business-oriented approach, we can also include studies focused specifically on green innovation. In the literature, there are many classifications of green innovations, which focus mainly on the degree to which they contribute to environmental improvements. Renning (2000) identifies four different typologies of eco-innovations that actors may implement: i) technological, which can then be divided in curative, which other author refers to also as end-of-pipe, and preventive; ii) organizational, meaning organizational changes in order to achieve certain environmental goals, usually linked with the realization of Environmental Management Systems (EMS) such as ISO14001 or EMAS; iii) social, meaning the necessary co-evolution of lifestyle and consumption dynamics to complement technological changes; and iv) institutional, which involves not only industrial actors but also local agencies, NGO, governmental and trade agencies to manage problems of sustainability and may imply local networks, new regimes of global governance and even international trade arrangements. Green innovation usually asks for collaboration among the players involved, due to the high degree of uncertainty about the innovation path in the environmental domain and the variety of knowledge to be used.

Another stream of business studies focuses on the impacts of the green approach to the supply chain (e.g., Seuring and Müller, 2008). Since sustainability strategy usually requires a transformation in the inputs used for product or processes as well as reorganization in the way the firm approaches manufacturing and sales processes, firms have to develop also a new “green” approach to supply chain management (SCM). In this perspective research emphasizes how the management of environmental-related processes cannot be limited to the firm’s boundaries. Rather, it has to include also suppliers as key partners in the achievement of sustainability. Crucial SCM activities such as supplier selection and monitoring become even more important whenever the environment is concerned.

Combining Economic, Social and Environmental Sustainability: the Role of Governance

Literature on green strategies emphasizes the relevance of enlarging the green approach beyond the firm’s boundaries to include other economic players. In order to understand the trajectories of the greening of industries, the scope of the analysis should be enlarged to include not only firms, but also value chains, which are able to include multiple players in the process of value creation based on green options (Jeppesen and Hansen, 2004).

However, the analysis of the territorial dimension is also crucial in this respect since the spatial dimension of economic activities influences the scale of environmental impacts (local, regional, national or international one). At the same time, the territories in which industrial activities are located can hardly affect business initiatives towards sustainability also due to the social context (Clini et al., 2008). Local communities may push firms to transform their economic behavior to reduce negative consequences locally. The environmental effects of specific forms of consumption may also transform the social perception of specific products or processes (Blanding, 2010) and influence firm’s strategies. The basic idea lying behind the concept of sustainable development is actually that the three dimensions, economical, social and environmental are intrinsically interconnected. A key challenge to promote a sustainable production system is that to reconcile economic growth with social and environmental concerns. In a long run perspective the sustainability of a firm so as of an economic system depends on the satisfaction of the three dimensions simultaneously.

It becomes thus crucial to consider how the environmental-friendly options are included into business practice. By using the governance framework proposed in the global value chain theory (Gereffi et al. 2005), we can observe multiple actors involved. In the governance analysis not only the role of firm has to be considered, but also the responsibility of institutions, which can influence in a radical way – e.g. by law – firms' green-related investments and strategies. Compared to market-based mechanisms, relational governance structure based on interaction among firms may represent a suitable condition for joint economic and environmental enhancements. The relationship between suppliers and lead firms willing to lower the ecological footprint may represent both the driver to the greening of production and the channel to gain the knowledge and resources necessary to implement more environmental-oriented processes and products – also with positive impacts on the local environment. Studies on the applications of code of conducts in global production networks proved the importance of trust, long term relationship and cooperative attitude to support the effectiveness of such instruments, especially in less developed countries (Locke et al., 2006). On the contrary, governance structures with higher power asymmetries – when large corporations are involved - implying higher degree of control on value chain partners' activities, may ensure the improvement of their environmental performance. Direct control and technology transfer may represent useful instruments to fulfill environmental standards. A captive governance structure may therefore ensure the necessary effort at the suppliers or customers to reduce pollution and emissions.

Literature on industrial districts proved the existence of relational forms of governance that rules the industrial system and the coordination of activities among firms, whose competitive and innovative results were enabled by a flexible and distributed governance structure, based on trust, geographical proximity and a system of values and norms shared by firms specialized in specific market fields, facilitated but not led by the presence of institutions. We argue that such model of economic organization becomes an interesting economic, social and institutional context where to observe how the environmental-related strategies are developed at the local level and the governance processes behind them are organized.

Local Networks Of Small Firms And Environmental Chances

Cluster Characteristics: Economic And Social Linkages

The extensive literature on industrial districts (i.e. Becattini et al. 2009) stresses the strong competitiveness of local manufacturing systems, characterized by a local division of labor among firms and population (social network). Recognizing the embeddedness of industry specialization into local contexts and the interdependence of economic activities with social ties is one of the main contributions of such theoretical study to explain the success of districts worldwide (especially Italian ones). Aggregation in terms of local proximity is fundamental because of positive benefits in terms of rapid information circulation and frequent interaction among economic players.

In its original definition, the district supply chain is self-contained within the local boundaries, except for raw materials and final products. If the competition is strong among firms specialized in the same manufacturing phase, suppliers and buyers are linked by high cooperation. Spatial proximity plays a critical role in the district dynamic, reducing firms' transaction costs in terms of control, information sharing, and coordination. Physical contiguity among players allows frequent interaction, based also on common languages and routines, which are made possible by strong social and trust-based relationships among firms. "Local environment" in industrial districts should not be considered merely in terms of raw material inputs in production processes, but a source of different elements for businesses, such as natural resources, human capital, entrepreneurial skills, high specialized workers, shared knowledge and tacit know-how (Dansero, 1996).

Industrial districts were able to develop profitable innovative process, strictly related to their industry specialization and their peculiarity (Lorenzoni and Lipparini, 1999). Firms share manufacturing activities with partners in a collaborative environment, which stimulate reciprocal learning and product improvements. A flexible and dynamic labor market, where workers' mobility is very high and especially oriented to start new own companies (entrepreneurship), enhances this mechanism. A mix of market and community (Dei Ottati, 1994) governs industrial districts, where the self-interested behavior is almost always substituted by the aim of general community benefits.

In addition, district local institutions are very important in defining potential homogeneous evolution paths, sustaining district's stability and internal cohesion. These institutions represent the collective interests of all the

different district players, as political institutions, industrial associations, commercial institutions, service centers, or research centers. District institutions are places of meetings, discussions, and identifications. Hence, the neutrality of these institutions transforms them into third parties upon which to develop innovation across firms (Becattini et al. 2009).

Sustainable Development in Industrial Districts

The notion of district itself described above is changing to face new opportunities and threats related to the competitive scenario (e.g. Corò and Grandinetti, 1999; Chiarvesio et al. 2010). Among the many chances districts are facing – such as internationalization issues related to green management, sustainable development, and corporate social responsibility are becoming crucial also for district firms and local systems of SMEs.

Due to the strong interdependence between the economic and socio-territorial dimension of district activities, local manufacturing systems directly test the environmental consequences of business actions. Because of the high level of specialization that characterizes industrial districts, the territorial areas in which those activities are carried out may suffer from high negative environmental impacts. As described above, studies on green supply chain emphasize that the management of environmental related processes is not limited to the firm's boundaries but has to be addressed on a broader scale. From this point of view the high division of labor among district firms ask for an integrated approach to sustainability, where the role of all the firms involved, but also local institutions is crucial. Institutions at the local level can play an active role in supporting a more environmental-friendly business approach to be consistent with market desire and social requirements. The local social structure – that has traditionally supported the activities of networks of SMEs in the district model – may react negatively to potential environmental damages and push local firms to cope with environmental constraints. Hence, industrial districts can be considered at the frontier in the implementation of sustainability due to the characteristics of this model of economic organization, where the industrial activities are strongly embedded into small local areas and the social community influences local enterprises (Battaglia, 2010; Frey and Iraldo, 2008).

Sustainability represents a strategic issue for many industrial districts, affecting directly firms and district performance and competitiveness (Cariani, 2010; National Observatory on Industrial Districts, 2009; National Observatory on Industrial Districts, 2010; Tessitore et al., 2010). The traditional districts' attention to innovation, the ability to renew products and processes, enhance business models and value chains to maintain a competitive advantage. However, those elements have to be reconsidered to face sustainability. If environmental policy can increase firm's competitiveness and performances, districts can act as a buffer of these effects. Investing at district level can be necessary in order to overcome local SMEs' weaknesses – technical, financial, managerial – and to renew the elements of district competitive advantage.

Districts Go Green: Two Case Studies

Methodology

Based on the theoretical description above presented, the empirical research aims at analyzing how industrial districts are able to incorporate the environmental issues in the behavior of local firms (economic and environmental sustainability) and which is the role of social structure and local institutions in this process (social sustainability and the form of governance adopted to drive a sustainable approach within the local network of SMEs). The arguments have been analyzed through a qualitative analysis of two Italian industrial districts: the Arzignano tannery district and the Sassuolo ceramic-tiles district.

The selection of the two districts was based on two criteria: 1) specialization in highly environmental impactful industries and 2) the long industrial history of the districts that can affect before others their attention on environmental problems. Both districts are located in North-East Italy and their production activities have a high environmental impact. On top of that they have an ancient origin, which allow assessing on a long period the district dynamics in response to environmental pressures and social changes.

Consistently with the literature review, the main areas investigated were as follows: a) the environmental pressures associated with the industrial development of the districts; b) the answers implemented by the district over the years (in terms of infrastructures built, widespread of green technologies and process innovation, product innovation,

diffusion of certifications and environment management systems); c) the actors involved, in order to understand how the typical district governance structure can act for a better sustainability of the area and d) the consequences and impacts of different actions. The main goal was to evaluate how the three dimensions of sustainability – economic, social and environmental one – were interconnected in the district model and whether the district characteristics positively influence the identification of green solutions.

District analyses were carried out from September 2007 to February 2008, starting with a desk analysis of the districts' main characteristics (origins, evolution paths, current scenario) and focusing on sustainable strategies implemented and approaches developed for green innovation of products, processes and competitive strategies. The analysis has been completed by vis-à-vis interviews to relevant actors: for the Arzignano district the representative of the district (also President of Confindustria Vicenza – Tannery Section) and the Director of Provincia di Vicenza – Environmental Services (also the promoter of Giada Project); for the Sassuolo district the representative of Assopiastrelle (the association of tile producers), and the director of Centro Ceramico (Italian Center for Research and Testing for the Ceramics Industry). Interviews aims were to deepen the role of districts relational governance structure in facing sustainable issues and to better understand how green innovation has been introduced in industrial district.

The Arzignano District Case Study

District overview – The tannery district of Arzignano, located in the Chiampo Valley – between Padua and Verona, is the first industrial area in Italy for tanning processing. It counts more than 850 companies (the 94% under 49 employees) and 11,600 employees (see the National Survey on Italian Districts, 2009). District firms have an international leadership in the quality tannery processes and make leather products for the furniture, automotive and fashion industries.

Natural capital (water availability and tannins in the area) and social capital (knowledge of the tanning process) are the basis of the origins of the district. The industrial district emerges in the '50s, based on this traditional artisanal experience and on the know-how on the chemical tanning process, and rapidly develops in the 60s and 70s, thanks to the flexibility and the capability to deliver high volumes of tanned leather in a short time. It is in those years that mechanical and chemical players for the tanning industry started to develop. A high level of international business integration, the increasing competition of emerging countries, an aging and fragmentation of demand and an increasingly stringent environmental legislation are the reference elements of the competitive environment in the 80s and 90s. In this scenario, the district firms' strategies have recently been oriented towards higher value-added activities of the value chain, those closer to the final market, the internationalization of business, both manufacturing and commercial one (diversification of export markets strategies) and the entry into new market niches.

Pressures occurred – Starting the 60s and 70s, with the tumultuous developments of the district, pressures on local natural capital grew, both endogenously - related to water waste, water and air pollution, production rejects - and exogenously – new standard pollution constraints (especially with reference to the water pollution – Italian Merli Law No 319/76 on the Protection of Waters).

Moreover, in more recent years, the attention to local environment is a condition *sine qua non* in order to compete in some markets (e.g. automotive, where German customers require their suppliers to certain standards including environmental compliance), as well as a broader conception of well-being is emerging at local level, by different stakeholders (entrepreneurs, workers, local community in general). Based on this new demand, the economic wealth is only one aspect of quality of life standards required by the local community.

District responses – Since the early 70s, in response to these pressures the district has undertaken an intense activity of sustainability upgrading, with a gradually more integrated and systemic approach. The first activity was related to water management and sludge issues: even before the enactment of the Merli Law on Water Protection, the district build an infrastructure, which have represented a "baseline" investment for the improvement of the local environmental situation and the lay of further district development. In 1974, in fact, a consortium composed by a network of tannery businesses, with the support of local administrations, created an industrial sewage and a water treatment plant. The consortium played an important role in controlling water pollution levels both at water treatment plant and at single-firms level (in accordance with local institutions), by managing a system of depuration

tariffs related to the quantity and the quality of water and refuses (if a firm adopts a sustainable process, it will pay a lower tariff), and promoting the adaptation to the rules and the technological innovation (laboratories, tariffs and finance). In this way local firms have been encouraged and supported to reduce water waste and refuses since the 70s. From the 90s a public company named Acque del Chiampo manages the water treatment plant and the waste disposal of sludge and others rejects from the water treatment.

Another important element is related to expertise and know-how accumulation on environmental matters and solutions related to the tannery process along the value chain. Thanks to cooperation along the supply chain among tanneries and local businesses operating in leather machinery or chemicals, environmental innovation has spread. With chemicals supply tanneries have studied less environmental impact chemical products for the tannery process. Suppliers of machinery have developed new equipment for a better sustainability of the tannery process at different stages (beginning treatments of leather, systems for emission reduction, etc.). In the Arzignano district there has been a specialization of the tannery supply chain on environmental innovation of products and processes, but also its completion, with the emergence of new players, for example specialized in the recovery of waste produced by tanning industry: refuses are re-used for example for agricultural purposes and in the construction industry.

In 2007, the Arzignano district, thanks to the Giada Project promoted by local institutions, was the first Italian tannery district to achieve the European EMAS certification for “homogeneous production area”. In addition, the district has drafted and proposed the international reference standard EPD for leather products, with which district firms can maintain a competitive advantage in the production of “sustainable leathers”.

Actors involved – Sustainable strategies have been pursued by district tannery firms with a cooperative approach: for example, the sustainable management of water resources and refuses originates from a common need of all the firms and the answer has been at system-wide scale. In sustainable strategies all firms along the district value chain have been involved: chemical suppliers, machinery suppliers, recovery firms. In the evolution of the district toward more sustainable tannery processes also local institutions have contributed supporting firms. In particular, a local Agency named Giada has been established in 2004 on the initiative of the Province, with participants the 16 municipalities of the area and industrial and technical partners such as the local environmental prevention and control agency (Arpav) and associations of local firms (Assindustria Vicenza, Association of SME, craftsmen CNA Vicenza). The Giada Agency has planned and widespread “an approach of integrated environmental management for the territory” at the district level, based on the participation and mainstreaming of the contributions of local institutions, businesses, local community, with a long-term view.

Main results – The initiatives covered all over the years from the district have allowed the reduction of water, air and soil pollution thanks to process innovation into the firms and new district infrastructures; the constant analysis and monitoring of district environmental situation; the achieving of EMAS environmental certification for the district area and the drafting of EPD standards. These results have positively influenced the competitiveness of district firms and their international leadership. On the other hand, air pollution and the social acceptance of tannery production still represent a critical issue for the area.

The Sassuolo District Case Study

District overview – The district of Sassuolo, located near Modena and Reggio Emilia, is the most important Italian network of firms specialized in the tiles industry, with over 80% of Italian production and about 12% of world production. In the area there are about 600 companies (the 75% under 49 employees) for a total of 23,000 employees (see the National Survey on Italian Districts, 2009). The district is characterized by the presence of few world leader firms in ceramic tiles, really structured and able to organize the district supply chain: ceramic companies, but also other players operating in complementary activities and services such as mechanical-ceramic, design and decoration of tiles, production of enamels, paints and glues, packaging and logistics services.

The origin of the district is essentially connected with the availability of water, raw materials (clay from quarries in the Apennines) and to a tradition in ceramics production that developed since the eighteenth century. At the beginning of the ‘900, it also increased the availability of labor force, coming from agriculture. After World War II, following the strong expansion of the construction industry, the district strongly grew and progressively

structured, developing also new manufacturing processes that became standard for the industry (such as single-cooking tiles in the 70s and the glazed porcelain tiles in the 90s). Recent decades have seen an increasing orientation of district firms towards exports, which currently represent the 70% of the overall production, a gradual process of concentration around the major industrial groups, able to organize and oversee strategic developments in the district supply chain, and an increasing marketing and communication effort.

Pressures occurred – The high concentration of firms in a densely populated area has become since the early 70s a critical issue for the development of the district. The main pressures were related to fluorine and lead emissions in the atmosphere, but also to water consumption and pollution, waste management and in the last years road traffic (due to the progressive supplying of raw materials outside the district and to the expansion of sales market) and energy consumption (the tile manufacturing process requires non only a large quantity of water, but also energy-intensive process). For these reasons, dealing with environmental issues could represent for the firms a successful strategy in order to lower production costs. Moreover, in recent years a growing environmental awareness has emerged by consumers, as well as the growth of new market segments, such as that of green building, that evaluate the environmental sustainability of buildings also from materials used (life-cycle approach).

District responses –The first initiatives promoted by the district since the 70s focused on reducing the environmental impacts of firms' concentration in terms of emissions into the atmosphere, through plants with systems for VOCs (Volatile Organic Compounds) and fumes reduction. The diffusion of cleaner technologies for the tile production processes has also provided assistance for the recovery and reuse of production waste and sludge, which are released back in the production cycle as raw materials, and for the reuse of water through recycling plants, with high cost savings. More recently, the problem of energy consumption has been addressed by many companies through the introduction of cogeneration systems.

Interventions to reduce critical factors, starting the mid 70s, were designed according to a simple scheme, first tested to reduce emissions and then applied to other critical issues and include:

1. mapping of the critical issues for the area;
2. ensure a regulatory intervention framework by the local authorities;
3. research and implementation of innovative solutions in collaboration with equipment suppliers (in some cases through the adaptation of technologies already in use in other sectors to the tile industry, as in the case of emissions from the steel industry);
4. support to the solutions adoption by businesses, also in collaboration with the local financial system in case of investment needed;
5. monitoring by the local authorities, to ensure compliance with regulations.

In the last years the district approach on the environment have shifted from a logic of action "end of the pipe", focused on single environmental issues, to a more integrated and active approach, in which improving the environmental sustainability is considered a new economic opportunity of development for the district. Since the early 90s, in fact, the district adopted a more integrated management of the natural capital that led also to a growing awareness of the businesses about a market increasingly sensitive and the opportunity to exploit and communicate environmental investments made.

Following this approach the district has enhanced the development and diffusion of process innovation, the adoption of process certifications (EMAS certification), but it has also carried out product upgrading strategies. Some lead firms, such as Iris Ceramica SpA, have not only obtained the Ecolabel certification for some products, but have also specifically developed a range of biocompatible tiles, suitable for bio-building, which have been certified by ANAB. A group of firms in the district has participated to the promotion of global standards for tiles (Ecolabel), as well as, in collaboration with the Bologna Ceramic Centre, to the testing of LEED standards (Leadership in Energy and Environmental Design) applied to ceramic tiles. Among these initiatives it is interesting also the patenting of innovative products related to the environment, such as solar tiles and anti-smog tiles, showing the intent of district businesses to enter into new market niches related to green building. An increasing attention has been given also to the communicative aspect, with the creation of the portal dedicated to tiles sustainability and to the environmental management at system level with the drawing up of the Environmental Integrated Statement of the district area.

Actors involved – The responses of the district to environmental, social and economic pressures have been characterized by a cooperative approach among different actors involved: leaders firms, suppliers and others support sectors, institutions, banking system and university and research world. In this scheme an important role in Sassuolo district is played by leading firms, thanks to their approach on product and process innovation and to their capability to widespread innovation in the area. Many times they have developed a strictly collaboration with ceramic-machinery producers and research center. Particularly significant was also the creation in 1976 of the Bologna Ceramic Centre by University of Bologna and Assopiastrelle that carry out technological support for the sector, as well as deals with the design of new processes and products on behalf of businesses.

Main results – The decision taken by the district to follow the path of sustainable development has produced tangible results. A first result refers to the reduction of environmental impact of tiles production processes and related costs of production due to the diffusion of BAT – best available techniques for the sector. Results are significant: the reduction of CO₂ emissions from '80s to nowadays instead of facing a constant increase in volumes produced; the reduction of processing waste, which are reused in the production process or other sectors (97% of sludge, 99% of the ceramic waste and 21% of the exhausted lime is reused in the production cycle, in the same site in which they were produced or in other site in the district); water savings resulting from the use of water recycling plants by 90% of businesses; the reduction of energy consumption from 12 GJ/t (gigajoules per tonne) in mid-'70s to the current 6 GJ/t and the introduction of co-generation plants (satisfying the 28% of energy needs of the district). A second result is the district opportunity to preserve and enhance its competitive advantage, due to know-how firms and equipment manufacturers developed in terms of environmental-friendly processes before competitors. A third critical goal achieved is the opportunity to set up international standards that become a point of reference for the entire sector. However, other key issues such as levels of traffic and dependency on external sources of production are still critical in the district.

Discussion

The analysis of Arzignano and Sassuolo districts showed how their competitiveness has been strictly linked to local environment from the beginning, in terms of raw materials, but also human capital, knowledge diffusion, supply chain relationships. The network of SMEs supported by local institutions and the social community act promoting, planning and acting sustainable strategies for the local area. The district model based on firms' proximity, industrial homogeneity and relational governance structure in particular has been effective in facing sustainability at system level, in order to reduce negative externalities (pollution, traffic, etc.) due to the localization of many firms in the same area.

We observed that the key elements that characterize the district model, making it competitive in the world, have been important also in facing sustainability challenge. Among the most important are:

- the high homogeneity of industrial processes and widespread of technological bases;
- the collaboration and competition among firms;
- the institutional support to local development;
- the high level of social cohesion.

First of all, the high homogeneity of industrial processes and the widespread of technological bases permit to firms to face sustainability with a common approach. If the theoretical analysis pointed out how industrial districts were able to develop profitable innovative process and products strictly related to their industry specialization, from the analysis of Arzignano and Sassuolo districts this has been confirmed with reference also to green innovation. Firms have to face the same environmental problems due to manufacturing and logistics activities: water consumption and treatment, air pollution problems and industrial waste, and for this reason the research of a common answer is probably easier and more efficient and effective.

The analysis of two districts also showed the need for an integrated approach to sustainability, where the relational dimension appears to be an effective form of governance. Beyond the competition relations among local firms operating in the district supply chain, the collaboration among firms and research centers, testing centers, advisory agencies and the like, the collaboration among end-firms and technology suppliers (especially for raw materials and machinery) have been fundamental for improving the district sustainability, with positive social,

economic and environmental impacts. Institutional and private actors suggest technological solutions, introducing innovation in machineries or in production processes or in the raw materials. Firms cooperate to solve common issues, such as high-energy costs, high production waste, etc. and solutions are widespread among other firms quickly. The final result of these processes is the increase of sustainability-oriented actions in the local area.

Another element highlighted from the literature on districts and confirmed by the analysis of Arzignano and Sassuolo district is the role of institutional support in promoting and wide spreading sustainable strategies: local actors promote a cultural evolution of firms toward sustainability and support firms in their innovation processes, with the creation of a network of specialized services for sustainable development. In this network we can find consortium, research centers, testing centers, actors involved in the management of environmental services (treatment plant), etc.

Finally, the high level of social cohesion and cultural homogeneity in local area among entrepreneurs, employees, local communities is an other important element not only for the economic growth of the area, but also for the social acceptance of industrial activities and the improvement of sustainable strategies, both in terms of pressures realized as well as in terms of management and monitoring of initiatives undertaken.

Conclusions

The paper explores how the industrial district model copes with the environmental issue, based on an original interpretative perspective and extended case studies. Our empirical analysis confirms the capabilities of the district model to support local sustainable development, with an integrated approach among different actors, thanks to the characteristics of flexibility, high-specialization, local proximity and cultural homogeneity. The evidence of these evolution paths toward sustainability has been verified with reference to the three perspectives of sustainability considered: economic, environmental and social.

From an economic point of view, districts show high innovation capabilities related to single firms, research centers, local institutions but also related to collaboration strategies among these actors. Innovation capabilities, flexibility, knowledge creation and diffusion among firms have always been the strengths of the district models and these capabilities are stressed also in the case of sustainable strategies. Districts' ability of reinventing their processes and products, reacting to market changes have been fundamental also in facing sustainability issues and in promoting green innovation.

From an environmental point of view, the district model seems to be effective in reducing negative externalities of firms' concentration within the same area. The degradation of local environment is limited in districts by the small size of firms, the social links between the firms and the local community, common projects and investments that make possible moving to less polluting processes not only for one or a few number of firms, but for the majority of them. This process happens even in case of highly polluting industries, like tannery.

From a social point of view, the cohesion among entrepreneurs, employees and local community produces a high sensibility toward the topics of sustainable development in the area. In particular, a great role is played by local entrepreneurship in creating the premises for participation and acceptance of the firms at the territorial level.

The analysis of the case studies arises the crucial process of knowledge creation and sharing that enhances the competitiveness of the districts and, with a broader perspective, their sustainability. Knowledge management related to products, processes and technologies "green-oriented" has been supported by the spatial and cognitive proximity among the players involved, but also benefit from external linkages promoted by firms and institutions.

From a managerial point of view, our analysis show that an extended approach toward green strategies – beyond the firm's boundaries to include also other actors within the value chain – is crucial in order to effectively design and manage environmental-compliant processes and products. Moreover, the collaboration with other firms – competitors included – as well as with research centers and service institutions is relevant since it allows developing new technical and commercial knowledge able to cope with the requests of the new competitive scenario. As far as the policymaking is concerned, case studies show that the development of shared services tailored on the needs of the firms oriented to green strategies is important, but should be designed in collaboration with the firms involved (at least those more proactive in promoting green strategies). At the same time, institutions can play a crucial role in

developing a new firm's green culture not only by law, but also offering their support in the firm's innovation processes.

Further research should explore and compare the green strategies of other industrial districts on an international basis. Moreover, additional research should juxtapose the forms of governance of districts and large corporations in the management of sustainability to evaluate the impacts on the three perspectives adopted.

ABSTRACT

*“The flight of women entrepreneurship in India is
progressing from take off to touch the Sky”.*

Women entrepreneurship in India is a visionary goal, the time of which has come. India is collectively moving from a narrowly defined objective of increasing the number of women in entrepreneurship to a broader and long term vision for setting the tone and strong vision and sustained agenda for bringing more entrepreneurs into top positions and lateral segments of Indian business.

Participation of women in economic activities is now emerging as a universal phenomenon because of increasing level of women education, their ambitions and aspirations, economic needs and unemployment problems. Today's Indian women are aware of their rights, skills, traits, capabilities and opportunities. The glass ceilings are shattered and hurdles have been overcome and now Indian women are found indulged in every line of business like engineering, electronics, fabric manufacturing, eatables, handicrafts, pharmaceuticals, agriculture, poultry, dairy, fisheries, canning, jewellery designing, architects, toy making and many more. *Parmeshwar Godrej, Kiran Majumdar Shaw, Shahnaz Hussain, Priya Paul, Blossom Kocchar, Sudha Narayanamurthy, Nita Ambani* are acting as inspirational pillars to many other aspiring entrepreneurs.

For a country like India, women entrepreneurship is of vital importance to achieve rapid, all round and balanced economic growth. If national development has to be purposeful and relevant, women have to be full-fledged participants in economic activities. The development of women as entrepreneurs will generate multi-faceted socio-economic benefits to the country.

Women entrepreneurship is an extremely challenging venture, hence this study attempts to explore avenues, challenges and prospects of Indian Women entrepreneurs. After exploring thorough review of literature, the following research gaps were identified.

- Very few studies are carried out on Indian women entrepreneurs.
 - Human Resource Development model has not been identified.
- Thus, the present study was undertaken with the following objectives:-
1. To identify the motivating factors behind women entrepreneurship.
 2. To find out the traits and qualities of Indian women entrepreneurs.
 3. To explore problems and prospects in the way of entrepreneurship.
 4. To suggest HRD Model for aspiring women entrepreneurs

The study was carried out on 120 women entrepreneurs of India. The sample was chosen by Purposive Random Sampling. A well-constructed questionnaire was administered on the sample to elicit their response. The data collected was statistically analysed using various tools. A Human Resource Development model has been developed based on the results of the study.

EMANCIPATION OF INDIAN WOMEN ENTREPRENEURS:

A SUGGESTIVE HRD MODEL

INTRODUCTION

Entrepreneurship is the lifeblood of any economy. It is a continuous process and it is growing from centuries to centuries. Entrepreneurship is now recognised both in the developed and in developing societies as an essential resource in the development process. The entrepreneurship have acquired special significance in the context of economic growth in a rapidly changing socio-economic and socio-culture climate, particularly in women. The entrepreneurship is a purposeful activity indulged in initiating and maintaining economic activities for the production and distribution of wealth. It has been recognised as an essential ingredient of economic development and an integral part of socio-economic transformation.

Women are emerging as a good potential source of entrepreneurship. Women entrepreneurship has cut across the barriers of education and affluence. Manufacture and marketing of women centred products are not the only areas of women enterprise, but the Indian women today is fast moving and functioning within every conceivable area of women enterprise competing with their male counterpart. Engineering spare parts, electronic items, computers, software, readymade garments etc. now are all areas of women enterprise.

Indian women entrepreneurs are touching new heights of success but still the growth rate of women entrepreneurship is slow. Entrepreneurship happens to be one of the best ways towards self-sufficiency and poverty alleviation for women in a country where employment is not guaranteed. Indian women entrepreneurs may be classified into three groups:-

- (i) The first group consists of women with adequate education and professional qualifications and are heading large industrial units.
- (ii) The second group of entrepreneur consists of middle class women with education but lack skill and training and are engaged in handicrafts and cottage industries.
- (iii) The third group of entrepreneurs are illiterates, financially weak and are engaged in family business.

With job opportunities drying up both for men and women, the latter find it easier to go for business due to flexibility of handling work both at home and outside. The new industrial policy of the Govt. of India has laid special emphasis on the need for conducting special entrepreneurial training programmes for women to enable them to start their own ventures. Financial institutions and banks have also set up special cell to assist women entrepreneurs. The entry of women into the world of business and entrepreneurship is an auspicious sign, which should be encouraged.

Keeping the objective of emancipation of Indian women entrepreneurs in mind, this research was planned to find out their vision, abilities, competencies, skills, perception etc. On the basis of all this, a HRD model for women entrepreneurs was developed.

Research Methodology

Selection and adoption of appropriate scientific methodological approach is the most important element of conducting a research investigation. It adds to the precision, reliability and validity of the research findings. The study was carried out on 120 women entrepreneurs of India. The sample was chosen by Purposive Random Sampling. A well-constructed questionnaire was constructed and administered on the sample to elicit their response. The questionnaire contained both open ended as well as close-ended questions. The questionnaire was designed in such a manner so as to elicit maximum information from the respondents. The questions were simple, clear, undisguised, well organised and to the point. Pre-testing of the questionnaire was done and some questions were reframed after it.

Structured Questionnaire Tool was divided in following sections:-

Section A

This section contained general information like name, age, marital status, qualification, profession, experience, achievement etc.

Section B

This section contained both open-ended as well as close-ended questions on motivational factors, traits and qualities essential for good women entrepreneurship, problems and hurdles faced by women entrepreneurs etc.

The data collected was statistically analysed using various tools. Data analysis was done in order to search out meaningfully the trend and establish relationships that exist among various data groups. The primary data collected through survey method with the help of the questionnaire has been analysed by using MS Excel and SPSS (Statistical Package for Social Sciences) 18.0 version. Various tools and techniques were used to analyse the data gathered. A Human Resource Development model has been developed based on the results of the study.

RESULTS AND CONCLUSION

Women entrepreneurship is full of potentialities, realms and aspirations and hence there lies a lot of scope for women entrepreneurship in India. For a clear understanding of emancipation of Indian women entrepreneurs, it was found necessary to understand the factors, which motivated them for entrepreneurship, their traits, skills and qualities, problems and prospects faced in this arena. For it, a questionnaire was designed for women entrepreneurs. The results of the study will prove beneficial for integrating and involving them in the mainstream of development. The results are presented as under:

What motivates women to aspire for careers like medicine, entrepreneurship, politics, administration, law and education is an interesting thing to explore and analyse. If the women entrepreneur feels motivated, her behaviour will bring about the desired action. **Table 1** shows the source who motivated women entrepreneurs to take up professional challenges.

Analysis of the table indicates that majority (61.7%) of the respondents were self-motivated. Motivation is an important factor for taking up any career option and today's women seek independence, autonomy, higher income and opportunities. Hence, inner instinct plays a very important role. Parents motivated forty-five percent respondents to take up their respective profession and thirty-five percent respondents were motivated by their spouse. Indian women give more emphasis to family ties and relationships. Married women have to make a perfect balance between career and home. The interest of the family members is a determinant factor in the realization of women folk career aspirations. Few women leaders were motivated by their children (7.5%), friends and relatives (5.8%), role model (10.0%) and mentor (4.2%).

TABLE 1: MOTIVATIONAL FACTORS FOR WOMEN ENTREPRENEURS

S. No.	Motivational factors	Frequency	Percentage
1.	Self	74	61.7
2.	Parents	54	45
3.	Spouse	43	35.8
4.	Children	9	7.5
5.	Friends and relatives	7	5.8
6.	Role model	12	10.0

* Figures are not mutually exclusive

According to Sunita Chugh and Punam Sahgal, women and men have different motivations for working. Women at workplace would like to do 'different' and 'satisfying' jobs, not necessarily jobs, which give them more 'power'. The need to strive and reach the top, respect, prestige and power may be more important for men than for women.

Women possess some inbuilt qualities that has developed right entrepreneurship qualities in them. The analysis of graphs reveals that majority of the respondents agreed or strongly agreed about the qualities essential for nurturing good women entrepreneurship. Qualities were categorized viz. self-qualities, decision making qualities and team dynamics. Not a single women leader elicited her response on disagree or strongly disagree points. However, very small percent of women entrepreneurs were neutral regarding some of the qualities.

Discipline, hard work, decision making power, communication skills and motivating skills were found to be some essential qualities as 90.8%, 82.5%, 81.7% and 79.2% respondents strongly agreed for the same.

Review of literature also supports the above interpretation. Ruder Mann *et al.* suggested that roles women play in their personal lives provide psychological benefits, emotional advice and support, practice at multitasking, relevant background, opportunities to enrich interpersonal skills and leadership practice that enhance effectiveness.

Today, women have a much more significant presence and they are seen as innovators, risk takers and decision-makers. This is all because of certain factors that mark an impact on their lives and are responsible for behavior paradigm shift. Factors like confidence, intelligence, experience, decision-making abilities, patience, time management, family support and positive thinking are considered to be essential for women entrepreneurship development.

GRAPH 1: PERSONAL QUALITIES FOR SUCCESSFUL WOMEN ENTREPRENEURS

GRAPH 2: DECISION MAKING QUALITIES FOR SUCCESSFUL WOMEN ENTREPRENEURS

GRAPH 3: TEAM DYNAMICS QUALITIES FOR SUCCESSFUL WOMEN ENTREPRENEURS

Another objective was about the common problems faced by Indian women entrepreneurs. The respondents were asked to tick the most appropriate degree on a five-point scale. Factor analysis is performed to reduce and classify the problems into factors.

TABLE 2: PROBLEMS FACED BY INDIAN WOMEN ENTREPRENEURS

S.No.	Qualities	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
A. Family problems						
1.	Lack of motivation and support from spouse	24.2%	69.1%	6.7%	–	–
2.	Lack of encouragement by other family members	23.3%	66.7%	7.5%	2.5%	–
3.	Less acceptability by friends, relatives, neighbours and community	14.2%	43.3%	20.0%	20.8%	1.7%

S.No.	Qualities	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
4.	Child rearing responsibilities	44.2%	48.3%	4.2%	3.3%	–
5.	Busy with other priorities of life	18.3%	66.7%	7.5%	5.0%	2.5%
B. Organizational Problems						
1.	Gender discrimination	25.8%	44.2%	17.5%	12.5%	–
2.	Lack of support by colleagues	10.8%	53.3%	25.0%	10.9%	–
3.	No recognition of one's worth	15.0%	46.7%	26.7%	8.3%	3.3%
4.	Organizational politics	20.8%	53.3%	19.2%	6.7%	–
5.	Poor working environment	10.0%	44.2%	25.0%	20.8%	–
C. Self problems						
1.	Inadequate or limited resources	13.3%	43.3%	20.8%	15.8%	6.8%
2.	Lack of opportunities and poor time management	25.0%	54.2%	15.8%	5.0%	–
3.	Health issues	20.0%	54.2%	17.5%	8.3%	–
4.	Restriction of working hours	18.3%	65.0%	6.7%	6.7%	3.3%
5.	Limitation to move out	23.4%	58.3%	10.8%	7.5%	–
D. Common problems						
1.	Coping with male ego and male stereotypes	35.0%	52.5%	7.5%	5.0%	–
2.	Cultural taboos	25.8%	51.7%	16.7%	3.3%	2.5%
3.	Social restrictions	23.4%	58.3%	10.8%	4.2%	3.3%
4.	Harassment/Teasing	21.7%	49.2%	19.2%	3.3%	6.6%

S.No.	Qualities	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
	by males					
5.	Physical strain	24.2%	32.5%	28.3%	12.5%	2.5%

Analysis of the above table reveals that Indian women entrepreneurs are confronted with specific problems viz. family problems, organizational problems, self-problems and common problems. Majority of the respondents agree that lack of motivation and support from spouse, lack of encouragement by other family members, child rearing responsibilities and busy with other priorities of life are the common family problems faced by women entrepreneurs.

Lack of support by colleagues and organizational politics were reported as major organizational problems by 53.3 percent respondents.

Forty-four percent women entrepreneurs agreed that gender discrimination and poor working environment are also important organizational problems.

Restriction of working hours, limitation to move out, health issues and lack of opportunities and poor time management were reported as major self-problems by majority of the respondents. However, a small percent of respondents were neutral or disagreed regarding self-problems.

Fifty percent of the respondents agreed that Indian women entrepreneurs face common problems like coping with male ego and male stereotypes, cultural taboos, social restrictions and harassment and teasing by males.

Mean and standard deviation of scores were calculated from the data collected to mark down the intensity of the problem separately in **Table 3**.

TABLE 3: DESCRIPTIVE STATISTICS OF THE INTENSITY OF THE PROBLEMS

Code	Problems	Score	Mean	Standard Deviation
1.	Lack of motivation and support from spouse	496	4.13	0.634
2.	Lack of encouragement by other family members	489	4.08	0.688
3.	Less acceptability by friends, relatives, neighbours and community	417	3.48	1.029
4.	Child rearing responsibilities	520	4.33	0.714
5.	Busy with other priorities of life	472	3.93	0.827
6.	Gender discrimination	457	3.81	0.990
7.	Lack of support by colleagues	436	3.63	0.840
8.	No recognition of one's worth	434	3.62	0.954

Code	Problems	Score	Mean	Standard Deviation
9.	Organizational politics	466	3.88	0.812
10.	Poor working environment	409	3.41	0.957
11.	Inadequate or limited resources	423	3.53	0.943
12.	Lack of opportunities and poor time management	476	3.97	0.829
13.	Health issues	462	3.85	0.857
14.	Restriction of working hours	476	3.97	0.721
15.	Limitation to move out	477	3.97	0.804
16.	Coping with male ego and male stereotypes	501	4.18	0.774
17.	Cultural taboos	474	3.95	0.887
18.	Social restrictions	473	3.94	0.901
19.	Harassment/Teasing by males	461	3.84	0.889
20.	Physical strain	436	3.63	1.061

KMO and Bartlett's Test of Sphericity

The value of KMO statistic (0.723) is acceptable (> 0.5). So, this led the confidence regarding the appropriateness of factor analysis for the data.

The approximate Chi-square statistic is 696.688 with 190 degrees of freedom is significantly ($P < 0.05$) because of having the significant value less than 0.05. Therefore, KMO and Bartlett's test showed that factor analysis is appropriate or in other words data is fit for factor analysis (Table 5).

TABLE 4: KMO AND BARTLETT'S TEST

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.723
Bartlett's test of sphericity	Approx. Chi-square	696.688
	df	190
	Sig.	.000

Factor Extraction Using Principal Component Analysis

The next in the process was to decide about number of factors to be derived. Often, among the many variables that researcher analyze, a few variables are more related to each other than they are to others. Factor analysis allow the researcher to look at these groups of variables that tend to relate to each

other and estimate what underlying reason might cause these variables to be highly correlated with each other.

The scree plot for the analysis shows that 5 factors have Eigen value greater than 1, hence this is suggested to derive five factors for the problem in hand (Fig. 1).

FIG. 1: SCREE PLOT

SPSS 18.0 was used to classify 20 problems/variables into smaller number of factors. Factor analysis was used to determine whether there were any common construct that represents respondents concerns. The problems were analysed using Varimax Algorithm of Orthogonal Rotation – the most commonly used method. Evaluation of resulting constructs and naming of factors is largely subjective. Hence, to identify the key problems that women leaders face and so as to group them into specific factors, factor analysis was done by using Principal Component Analysis.

TABLE 5: TOTAL VARIANCE EXPLAINED

Component	Initial Eigen values			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %
1.	4.640	23.202	23.202	4.640	23.202	23.202	3.034	15.170	15.170
2.	2.178	10.891	34.093	2.178	10.891	34.093	2.717	13.587	28.757
3.	1.738	8.690	42.783	1.738	8.690	42.783	2.053	10.263	39.020
4.	1.503	7.513	50.296	1.503	7.513	50.296	1.920	9.601	48.621
5.	1.263	6.315	56.611	1.263	6.315	56.611	1.598	7.989	56.611
6.	.996	4.978	61.589						
7.	.904	4.518	66.106						
8.	.885	4.426	70.532						
9.	.774	3.869	74.401						
10.	.695	3.473	77.874						
11.	.680	3.401	81.276						
12.	.602	3.010	84.285						
13.	.579	2.897	87.182						
14.	.534	2.668	89.850						
15.	.529	2.647	92.496						
16.	.406	2.031	94.527						
17.	.365	1.825	96.352						
18.	.293	1.464	97.815						
19.	.252	1.258	99.074						
20.	.185	.926	100.000						

According to Kaiser's Criteria by retaining only the problems with Eigen values greater than one, the inference can be drawn that 23.202% of variance is explained by Factor 1; 10.891% of variance is

explained by Factor 2; 8.690% of variance is explained by Factor 3; 7.513% of variance is explained by Factor 4; 6.315% of variance is explained by Factor 5 and together, all the five factors contributed to 56.611% of total explained variance.

TABLE 6: COMPONENT MATRIX

	Component / Factor				
	1	2	3	4	5

18.	0.657				
19.	0.805				
20.				0.509	

Extraction Method: Principal Component Analysis

Rotation Method: Varimax With Kaiser Normalization

a. Rotation converged in 6 iterations

Each factor is constituted of all those variables that have factor loading > 0.5 . Therefore, the five factors were identified (Table 8).

TABLE 8: GROUPING OF KEY VARIABLES BASED ON FACTOR LOADINGS

Problems	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5
Harassment/teasing by males	0.805				
Cultural Taboos	0.761				
Social restrictions	0.657				
Busy with other priorities of life	0.601				
Coping with male ego & male stereotypes	0.553				
Lack of encouragement by other family members		0.832			
Lack of motivation & support from spouse		0.811			
Less acceptability by friends, relatives, neighbours and community		0.571			
Lack of support by colleagues		0.528			
Limitation to move out			0.700		
Poor working environment			0.699		
Gender discrimination			0.540		
Health issues				0.755	
Lack of opportunities and poor time management				0.728	
Child rearing responsibilities				0.517	
Physical strain				0.509	
No recognition of one's worth					0.744
Organizational politics					0.696

Factor 1: Psycho emotional dynamics

Harassment/teasing by males, cultural taboos, social restrictions, busy with other priorities of life and coping with male ego and male stereotypes constitute psycho emotional dynamics.

Factor 2: Family dynamics

Family problems play a major role in women leadership. Lack of encouragement by other family members, lack of motivation and support from spouse, less acceptability by friends, relatives, neighbours and community and lack of support by colleagues constitute family dynamics.

Factor 3: Socio cultural dynamics

Limitations to move out, poor working environment and gender discrimination constitute socio-cultural dynamics.

Factor 4: Environmental dynamics

Health issues, lack of opportunities and poor time management, child rearing responsibilities and physical strain constitute environmental dynamics.

Factor 5: Power dynamics

No recognition of one's worth and organizational politics constitute power dynamics.

Based on the above results, a HRD model can be suggested for Indian women entrepreneurs.

Navigators	Risk Takers	Decision Makers	Torch Bearers
1. Physical attributes	Emotional intelligence	Managing people	Inspiring others
2. Mental competencies	Skills and competencies	Managing resources	Problem solving
3. Personality traits			
4. Technical competence	Social perception	Managing Conflict	Role model for others

Benefits to Women Society and Nation
1. Entrepreneurs can become powerful agents of social change
2. Rapid economic growth
3. Better family life
4. Acceptance in the society
5. Determinants of changing educational, cultural and political climate

6. Important human resource in nation building

Fig. 2: HRD Model

In this model, women entrepreneurs are represented as Navigators, Risk Takers, Decision makers and Torchbearers. Just as a plant needs soil, water and sunlight for its development, women entrepreneurs need various skills, traits, attributes and competencies.

Indian women entrepreneurs are self-motivated and have various traits and qualities, which make them competent for their profession. They face certain problems but still they are stepping out and carving their own niche. Women entrepreneurs are considered as agents of change in the socio-economic development of a country. And entry of women into the world of business and entrepreneurship should be encouraged.

Abstract

Despite the sector or the firm's size, the choice of the strategies is worth; it is about a set of different aspects included by firms into their own strategic and operating procedures as corporate culture, strategic human resources management, empowerment, corporate social responsibility and sustainability, environmental issues focusing on product innovations and advanced technological processes.

The general aim of this study is to analyze how Piedmont (North-West Italy) SMEs are facing the challenges and changes that are happening into the business environment and what kind of strategies and tools they exploit to become more responsible, sustainable and competitive in order to create value for themselves and their stakeholders and to compete at a global stage.

Moreover, the paper is focused on setting up a rulebook for family business SMEs in which are specified suggestions about overcoming the crisis and achieving long terms goals.

Keywords: innovation, corporate social responsibility, entrepreneurship, SMEs.

Introduction

Changes and Challenges for Small and Medium Enterprises

Since 2008 the world has been facing the most damaging financial and economic crisis. The largest developed countries, notably those where the crisis originated, have entered into recession as well as the developing countries (International Labour Organization and International Institute for Labour Studies, 2009).

All the companies and the nations all over the world are now seriously affected by the effects of the crisis itself which has also generated many questions and concerns about the behaviours and the way of working of both the global multinational companies and the small and medium enterprises.

Furthermore, many other changes are really affecting the enterprises' activities at different levels and competitiveness too, since they represent such opportunities to take and threats to avoid for players who want to compete at a global stage successfully.

The first phenomenon which has to be taken into great consideration is surely the globalization; it has gained in importance because it represents a source of growing and changing and a potential cause of conflicts with and among stakeholders at the same time.

The term globalization refers to a series of relevant changes which have been happening to the society over the last decades; it includes: firstly, the decrease in national and geographic boundaries which allows companies to compete into a free trade area; secondly, the industries deregulation and the privatization; eventually, the fast development of information and communication technologies which impacts on both the improvement of companies' working and their activities which now may be judged by public opinion much more than in the past years (Perrini and Tencati, 2008).

The over competition, the rapid development of innovation technologies and the shortening of the product lifecycle (Perrini and Tencati, 2008) are pushing the companies to worry about their processes and their competitive

advantages focusing on investments in research and development so to obtain a higher quality in products and services which may ensure market share growth and increase in profitability.

Moreover, other *key elements* (which have been considered for designing our survey to Piedmont Small and Medium Enterprises) are gaining in importance due to much many concerns about the future of society, economy and environment, such as:

- **INNOVATION:** the focus on innovation is absolutely essential because it represents the key to economic recovery, “the motor to revitalize the Single Market” (Business Europe, 2010) and the best way to create new jobs opportunities. Moreover, the global economy itself puts pressures on companies to exploit the opportunities created by the market in order to become more innovative and meet the new consumers’ needs by bringing goods and services to those previously unable to access them (Johnson, 2010);
- **CORPORATE SOCIAL RESPONSIBILITY TOWARDS STAKEHOLDERS:** the attention to both stakeholders with the aim of improving life conditions of the individuals into the whole community and to the new customers’ needs and demands according to the steady increase in issues such as fair trade and cause related marketing principles. Consumers and stakeholders are paying more and more attention not only to the goods and services quality and innovation but also to the sustainability and responsibility of the company/brand they choose. This is the reason why concerns about transparency on markets (Perrini and Tencati, 2008) are gaining in importance too. It regards the corporate governance activities, the communication strategies within the market, the management strategies, the employment policies and the Corporate Social Responsibility programmes in general.
- **CORPORATE SOCIAL RESPONSIBILITY CONCERNING QUALITY, ENVIRONMENT AND ETHICS:** the attention to environmental issues and ecology is worth and more and more connected to the quality of products themselves. Nowadays market requires a more secure access to energy through the diversification of energy sources and consumption efficiency is indispensable. Nuclear power, renewable energies, carbon capture and storage and other new technologies are essential to meet this challenge (Business Europe, 2010). Natural resources will become increasingly scarce and expensive (Werbach, 2009) and it necessarily will imply a more responsible use of energies, raw materials and water, the recyclability as well as the decrease in using toxic substances. To sum up, the fight against climate change remains at the highest level of priorities (Business Europe, 2010). Ethics means focus on human resources. According to this, HR management is to create a sustainable working environment based on the value creation through career development, job protection, growth in productive employment by investing in professional skills and knowledge, focus on health and safety policies, respect of the ethics principles of human right especially into the developing countries¹. Managing human resources is both the tool and the objective of more sustainable and responsible companies. Corporate Social Responsibility itself reflects the focus on responsibilities and relations between an organization and people within whom it operates, since CSR was defined as “all the ways in which a company relates to society from purchasing to product disposal, from human resources to human rights” (Crowe, 2002).

Most companies are now aware of the importance of responding to these social, economic and technological changes and challenges and they absolutely know that how they respond will profoundly affect their competitiveness and perhaps even their survival.

How sustainability and CSR are connected to companies’ competitiveness?

The companies’ competitiveness has been always defined as the capacity to grow, to produce more and higher quality products and/or services and to keep or gain market shares in international and domestic market (European Commission, 2008); in other words “A firm is competitive if it can produce products or services of superior quality or lower costs than its domestic and international competitors. Competitiveness is than synonymous with a firm’s long run profit performance and its ability to compensate its employees and provide superior return to its owners” (Francis, 1989).

This definition is valid to a certain extent; the meaning of competitiveness has really changed itself to become more coherent within significant wide range of pressures and challenges into the business environment.

Nowadays, the concept of competitiveness can be applied at different levels, from the firm (*micro level*) to the sectoral, regional and national (*macro*) level (European Commission, 2008) with more and more consciousness about the great influence that enterprises have on their sectoral, regional and national business environment and society.

According to this statement, since competitiveness at macro economic level means sustainable standards of living, also companies are involved in contributing to achieve this goal: the more the companies are aligned with this object, the easier is to reach the goal of better quality of life in general, because enterprises are strictly the input of society well being. In this sense, they play a crucial role in managing different types of external and internal relations with different types of stakeholders (employees, end users, suppliers and community); for this reason, the firm was defined as a person, as an economic agent and corporate citizen (Ahmed and Machold, 2004), taking into account the new “moral contract” with employees and society (Ghoshal, Bartlett, and Moran, 1999) on which firm’s activities are founded in order to obtain the value creation at all levels.

Therefore, the concepts of sustainability and responsibility have started to play an effective role into a whole business community, not only due to the mounting pressure from stakeholders² on sustainability and responsibilities as tools that can affect every value creation lever over both short and longer term (Boston Consulting Group, 2009), but also because the whole community may be affected by companies’ operations.

Sustainable development stands for seeking to meet “the needs and aspirations of present generations without compromising the ability to meet those of future” (Brundland Commission, 1987); in other words, a better quality of life for everyone, now and for generation to come, concerning people, planet and profit. Indeed the concept refers to economic growth, society development and environmental care at the same time³.

Corporate sustainability can be truly reached by the implementation of the frameworks of Corporate Social Responsibility, which are based on concerns about: environment, human resources and society, quality and improvement in production, processes and delivery of goods and services, relations between stakeholders and stockholders by the implementation of a set of specific standards or codes in order to demonstrate and communicate to the whole community the company’s attitudes and responsible behaviours⁴.

Corporate Social Responsibility was define by the European Commission as “a concept whereby companies integrate social and environmental concerns in their business operations and in their interactions with their stakeholders on a voluntary basis” (European Commission, 2001). It is something referred to how companies do their profit and how they are brought into constructive relationships with a new range of stakeholders (European Commission, 2008).

The extent to which social and environmental issue are integrated into the core business strategy of an enterprise will be an important determinant of its ability to find business opportunities in responding to societal challenges (European Commission, 2008) and to compete more effectively.

According to this, the issue is how enterprises might react to the challenges and changes that are happening into the business environment so that they can reach their corporate sustainable success and lead their sectoral, regional and national business context to sustainable growth.

Global companies as well as small and medium enterprises have to focus their efforts on: innovation, research and development to better adapt themselves to the new economic context, the implementation of such sustainable policies and strategies in order to satisfy their stakeholders’ needs and demands, the corporate governance so that it will be able to create and to promote sustainable conditions for obtaining the long term success, by enhancing capabilities in innovating organizational models, management practices and products and/or services. These policies are to obtain competitive advantages in terms of both differentiation and cost leadership (Porter, 1980) among other competitors.

Corporate social responsibilities policies may impact on differentiation, in terms of: improved brand reputation, access to new markets and niches, improved perception of how well company is managed, improved ability to attract and retain top talent, enhanced stakeholders/investors relations (Haanaes, Balagopal, Arthur, Kong, Velken, Kruschwitz, and Hopkins, 2011), better workplaces which can be more conducive to better innovation of products/services and business models and processes as well (European Commission, 2008), improved competitive positioning, customer loyalty (European Commission, 2007).

Some of the impacts of corporate social responsibility policies implementation on cost leadership are: reduced costs due to energy efficiency and materials or waste efficiencies, increased margins or market share due to sustainable positioning, reduced risks, increased employees productivity (Haanaes, Balagopal, Arthur, Kong, Velken, Kruschwitz, and Hopkins, 2011), many costs are saved from continuous improvements, low potential litigation expenditures, lower insurance and lower energy costs (Miles and Covin, 2000).

What happens when sustainability and CSR are linked to firms' size?

A huge difference in attitude towards corporate social responsibility policies and sustainable development seems to emerge when taking into account the size of the companies.

On one hand, the bigger the size the firm is, the easier seems to respond to the issues of the business environment. Big global companies have the banks and governments overconfidence and therefore a greater access to money to invest in their know-how and skills for developing innovations, they have tools and supports to better implement such sustainable policies and standards that can contribute to a number of social, environmental and economic policy objectives (European Commission, 2008). According to the second annual Sustainability and Innovation survey conducted by the Massachusetts Institute of Technology in 2011, "big companies are more willing than smaller companies to be sustainability embracers" (Haanaes, Balagopal, Arthur, Kong, Velken, Kruschwitz, and Hopkins, 2011); it may be because of the higher amount of resources to spend, more experience to be exploited, higher visibility which let them to be more convinced that sustainability-driven efforts and focus on key environmental issues will add to profitability.

On the other hand, focusing the attention on small and medium enterprises, it seems clear that due to their smaller disposal of resources (both financial and human) it is more difficult to start to invest for developing a sustainable approach of business, even if the future returns in terms of profitability are surely convenient. Smaller businesses see a few concentrated sustainability-related advantages but they are planning to invest more money and management in sustainability-driven strategies (Haanaes, Balagopal, Arthur, Kong, Velken, Kruschwitz, and Hopkins, 2011) and are taking a broader view on the implementation of such sustainable policies concerning CSR and innovation as tools for improving their value creation process and overcoming the crisis period - as it will be shown empirically hereinafter, when analyzing the results of our survey.

In fact, the concept of corporate social responsibility is not totally new for small and medium enterprises, they have always done things that could today be called with the term CSR, even if they do not know or use the term themselves (European Commission, 2007): they provide great employment, harness their motivation by informing and consulting them, create participative workplace and are striving to create sustainability also in relation to their local community. Obviously, these concepts have always been less formal and more intuitive than in bigger companies, but SME's speed and flexibility enables them to capitalize on two principal opportunities: improved brand reputation and sustainability-enabled access to new market (Haanaes, Balagopal, Arthur, Kong, Velken, Kruschwitz, and Hopkins, 2011).

Since today "we cannot achieve the goal of the growth and jobs strategy without small and medium enterprises" (European Commission, 2007) and "being a good corporate citizen requires more than business as usual - it requires investments in society and environment" (Clinton, 2009), we will try to understand how some selected SMEs located into a North Western region of Italy (called Piedmont) conduct their business to be more responsible, sustainable and competitive in order to increase their value creation.

Method of the Survey and Sample Summary

Micro, small and medium enterprises have been for years the engine of the European economy (Verheugen, 2003) and a very relevant part of any national market; they represent the 99% of all enterprises in Europe and provide around 75 million jobs (European Commission, 2005). SMEs contribute significantly to employment and to promote economic growth (International Labour Organization, 2004) by producing both outputs to customers and goods and services to large enterprises as strategic key suppliers. These enterprises may be small individually but together they may have a large role to play into the business community as essential and crucial source for fostering competitiveness, entrepreneurial spirit and innovation as well.

The meaning of the term SME has been changing since the year 2003. According to the new SME definition given by the European Commission in 2005, it is necessary to consider three main factors such as the headcount, the annual turnover or the annual balance sheet total in order to classify micro, small and medium enterprises⁵. In general, the category of SMEs is made up of enterprises which employ fewer than 250 people and which have an annual turnover not exceeding 50 million Euros, and/or an annual balance sheet total not exceeding 43 million Euros (European Commission, 2005).

Considering the Italian economic scenario it is clearly seen that micro enterprises represent the 98% of the total amount of companies and the 85% of the Gross Domestic Product comes from enterprises with less than 250 employees.

In Italy – and in particular in Piedmont (North-West Italy region) – the most small and medium enterprises are also family-based companies operating within a system of governance and intrinsic features full of both advantages and disadvantages related to the possibility to become more effective voice of business in international context and create the expected value. It is both useful and necessary to analyze some of the features of family-based small and medium enterprises to better understand the surveyed sample, composed by these types of firms.

Firstly, family-based SMEs are an important source of economic growth, job creation and economic and social cohesion (European Commission, 2005); the commitment to the company's values is much higher among the employees working into a family-business context also because in most cases they are headed by an owner/manager who has the capacity to positively influence the whole organization and its relation with stakeholders by great creativity and strong entrepreneurial spirit.

Secondly, these kinds of firms are characterized by a greater flexibility, a bigger sense of respect for the authority, a less organizational staff turnover, a long term vision – with a positive impact on performances – and an important convergence between management and ownership aims (AIDAF, 2009).

Eventually, family-based small and medium enterprises greatly depend on entrepreneurs, the individuals who are able to influence the decisions inside the firms, using their innovative ideas and taking the risks necessary to lead the firm on top.

However, this model of governance within small and medium enterprises has its negative aspects and many weaknesses and risks to face.

The first one is connected to the generation exchange, in the meaning that on the total amount of family businesses only the 50% survives during the second generation and only the 15% exceeds the third one. This is mainly due to the lack of suitable programmes of succession which could cause great problems of governance and could stop the development process.

Besides, the second risk is what it is generally called *systemic risk*, related to the incapacity of predicting the sector trend in which the companies are in. Usually family-based SMEs are local players with a limitative perspective; they frequently have difficulties in access to capital or in obtaining credit – particularly in the early start up phase (European Commission, 2005) – and the restricted resources may reduce the access to new technologies and innovation too.

Furthermore, some weaknesses can be found in human resources area: they have less in-house expertise as lack of specialized employees and qualified managers.

Since these kinds of companies are becoming more and more relevant for the business community, in 2010 the Piedmont SMEs Association (API), the Marnetto Foundation and La Repubblica newspaper, in collaboration with the Turin Chamber of Commerce, the Unicredit Bank, Unicredit Corporate Banking and Private Banking and with the scientific support from the University of Turin and Polytechnic of Turin, have realized – for the second year – the “Chiave a Stella” award, which is an initiative for living prominence to Piedmont SMEs and their capacity to link innovation and tradition, the product excellence and the territory development (in Italy as well as abroad), in a responsible and sustainable manner.

The awards were addressed to every Piedmont SME (both manufacturing and service sectors) with revenues from 500.000 and 25 million Euros, with two different classes of awards: one for companies from 500.000 to 3 million Euros annual revenues and the other for companies from 3 million euros to 25 million euros revenues per year.

The technical commission composed by seven members from the sponsors and collaborators of the project, examined one hundred general questionnaires which were submitted to one hundred small and medium enterprises and then selected a total amount of 20 enterprises (10 for the category 500.000 – 3 million Euros and 10 for the category 3 – 25 million Euros) using the following evaluation criteria.

The two winners (one per each category of awards) have been chosen among those 20 companies which were examined by more detailed questionnaires and were interviewed by members of the University – Faculty of Economics – and Polytechnic of Turin.

The “Table 1” shows the 20 considered companies and the evaluation criteria used for selecting them: the 2009-2007 positive revenue variation, the import-export situation for each company and the adoption of a research and development strategy; by reading the last column of the table we can easily understand the sector/industry in which every SME operates.

TABLE 1: “CHIAVE A STELLA” AWARD 2010 SUMMARY (RESEARCH CONSIDERED SAMPLE)

SMEs	Revenues Variation ('09-'07) Mln Euros	Italian Last Revenue (%)	Abroad Last Revenue (%)	R&D Strategy	Sector/Industry
PR. TARGET	1,9075	100	0	Yes	B to B (road sign)
TEKNO ALFA	1,375	30	70	Yes	B to B (machineries design and building)
AXIS	1,72	91	9	Yes	B to B (automation for industrial)
CMP BRESSO	0,8	90	10	Yes	B to B (moulding)
REYNALDI	1,185	88	12	Yes	B to C (natural cosmetics)
LAZZERO TEC	1,106	60	40	Yes	B to B (vacuum pump)
REDAT	1,009	75	25	Yes	B to B (turbo chargers)
SIMPRO	0,957	88	12	Yes	B to B (production machineries)
FACEM	0,523	60,49	39,51	Yes	B to C (domestic tools)
TRAFILPLAST	0,934	97,26	2,74	Yes	B to B (plastic drawn products)
CASEIFICIO PEZZANA 2	1,03	95	5	Yes	B to C (cheese factory)
TAUROCAF	1,109	97	3	Yes	B to C (coffee candies)
MECAR	1,141	100	0	Yes	B to B (machine shop)
SIVE	0,698	35	65	Yes	B to B (varnishing)
SICMAT	0,721	10	90	Yes	B to B (manufacturing machine tools)
CRIOTEC IMPIANTI	0,659	87	13	Yes	B to B (plants design)
S.I.B.- SIDERAL	0,59	90	10	Yes	B to B (manufacturing tools)
LECCE PEN AND COMPANY	0,344	33,66	66,34	Yes	B to B and B to C (recycled plastic tools)
SEA & SYMPHONY	1,55	77	23	Yes	B to B (boat tools)
TRE ERRE	0,58	100	0	Yes	B to B and B to C (furniture and building)

Since these twenty companies are improving their performances in terms of economic results as well as long term goals (incremental and radical innovation) and they have been classified as the most representative and successful family-based small and medium enterprises into the Piedmont context, we have decided to conduct a more detailed and focused empirical analysis on each of them. The analysis was based on their approach to innovation, sustainability and Corporate Social Responsibility linked to the *key elements* -which are really affecting companies' strategies - mentioned in the introductory part of the present paper. The research on the above described

sample was conducted through a questionnaire sent by e-mail with link to Survey Monkey⁶ website – on which the questionnaire was set up by us and from which we have processed the data.

The questionnaire is divided into three main sections intended to deepen the sample adopted strategies and tools regarding the innovation, the corporate social responsibility towards stakeholders and the corporate social responsibility concerning quality, environment and ethics, in order to respond to the following general main questions:

1) Section I: Innovation.

What is the link between innovation and firm's success?

2) Section II: Corporate Social Responsibility towards stakeholders

Are these successful SMEs responsible within their stakeholders? How do they build responsible relations?

3) Section III: Corporate Social Responsibility concerning quality, environment and ethics

Do they consider quality, environment and ethics in business? How do they take care about these issues?

A total of 20 questionnaires have been returned and checked by the researchers to ensure that they were valid. All the questionnaires have been used for our data analysis.

For a complete version of the questionnaire, please see the Annex 1 hereinafter.

Results from the Survey

Concerning the innovation topic, our findings indicate that the average amount spent in Research and Development (R&D) is about 110.000 Euros per year (the 10% of the total revenues) with an 8% average increase if compared to the three past years. Moreover, the employees engaged in the R&D represent the 10% of the total amount of the workforce of our sample.

The majority of these firms (80%) are used to plan in advance a specific R&D strategy including objects, resources, skills, risks evaluation, processes and the estimation of economics indicators.

The 95% of the surveyed sample is involved in product innovations and from the research it emerges that a consistent part of these innovations are related to the environmental issues; the 50% of the companies are developing process innovations mainly connected to the reduction of energies and reuse of water or other type of resources, a smaller part of the sample (20%) is oriented also to the business model innovations and the most are focused on the development of both the sells into foreign markets and web platforms.

Since all the surveyed firms are strongly developing different specific innovations, the 65% of them uses patents in order to protect their projects, with an average amount of three patents per firm. Moreover, the 50% of the sample has got registered trademarks with an average amount of three per firm.

Processing the data, it is interesting to analyze how these family business companies develop their innovations. As can be seen in the "Fig.1" below, the most of them are used to develop innovations by themselves, within the organization's workforce. Even if the role and the importance of the partnerships in managing innovations are still low among the surveyed sample, all of them have declared that they are trying to get in touch with Universities, Research Institutes and other companies (competitors and not) in order to build or improve their relations with them so that they may obtain more effective product or process improvement by comparing and sharing ideas with others and by taking advantages of the expertise inside other types of organizations.

FIG. 1: INNOVATION AND PARTNERSHIPS

Concerning the financial-side of the innovation projects, only the 5% of the sample takes advantages of the bank loans and the 20% of the specific public projects funds. On the contrary, the most of them are able to develop innovations by exploiting their own financial resources.

Despite the degree of the innovation shared in the market, the 58% of the sample has declared that the microenvironment in which they are competing is characterized by a high competition level; so how to maintain a long term competitive advantage? Our survey clearly shows that the only way to overcome the over competition is to be a “market nicher” being focused on customers by offering them tailored products.

In regard to the Corporate Social Responsibility and the relations with stakeholders, we can talk about the spread of communication towards them, the attention to employees and the end-users’ satisfaction.

Firstly, even if only the 35% of the firms is used to draw up Social or Sustainability Reports in order to formally communicate their activities to stakeholders, the most of them (90%) have declared that they consider the compilation of such Statements absolutely relevant for better communicate about themselves and what and how they are doing and all of them have said that they will be working on it in the next years.

Secondly, concerning the employees, it is possible to highlight that all the firms pay a particular attention to them through the provision of training in order to improve their productivity and the service provision in order to increase their commitment to the firm itself. The training activities cost about 10% of the total amount of revenues per year, with an average of three courses provided by each company per year. Every surveyed enterprise has declared to offer more than 2-3 services to its employees, as the following “Fig.2” clearly represents.

FIG. 2: SERVICES PROVISION TO EMPLOYEES

Eventually, the customers' satisfaction is relatively high if we take into consideration the fact that even if the most of the products offered by the firms are tailored and built on specific needs which change from time to time, the percentage of the repeated purchases by clients is about 40% on the average. This could be due to the continual attention to customers' needs and demands and to the quality offered thanks to steady improvements of processes and products obtained by a high spread of innovation among all the sample. Customers' care and quality are surely two indispensable competitive advantages for increasing business performances.

Concerning Corporate Social Responsibility towards quality, environment and ethics, the "Fig. 3" below clearly shows that the most of the companies (the 70% of the sample) have already implemented the ISO 9001 standard on quality for demonstrating their ability to consistently provide products that meet customers' satisfaction through the continuous improvement of processes and the high quality of training to the human resources.

Moreover, all the firms are used to do internal quality control to ensure the conformity of products and procedures.

As the "Fig. 3" describes, the environmental responsibility within them is basically related to a variety of different actions to become simply more efficient in reducing, recycling and reusing raw materials and waste materials, minimizing the impact of transportation, energy and water usage, trying to reduce the pollution as well. Only the 25% of the surveyed SMEs have implemented the certified Environmental Management System ISO14001 and only the 20% use the Eco Management and Audit Scheme (EMAS, voluntary initiative designed for improving companies' environmental performances).

This could be due to the fact that there are some barriers for SMEs to comply with environmental legislation: firstly, it does not often take into account the specificities of SMEs operations; secondly, monitoring the environmental indicators represents high costs as well as the implementation of a system of reporting.

None of the firms are used to draw-up the SA8000 standard on ethics and only one of them has implemented the OHSAS 18001 (Health and Safety Standard). As a matter of fact, these standards are more common in multinational companies which base their production in developing countries and have more concerns in order to assurance their respect of human rights and labour standards.

FIG. 3: QUALITY AND ENVIRONMENTAL STANDARDS AND PROCEDURES

Discussion and Design of the Rulebook for SMEs

Given our findings from the questionnaires to Piedmont family business small and medium enterprises, it seems clear that these surveyed most successful SMEs have implemented and now are strengthening the use of strategies of social responsibility and innovation and development as critical key factors of their core business.

Both the implementation and the use of these strategies and other tools connected to the business responsibility and sustainability growth are generally known as critical elements for obtaining a long term success, as it is shown by an international empirical research conducted by Pricewaterhouse Coopers on 1124 Chief Executive Officers in

2009 (Pricewaterhouse Coopers, 2009). According to these results, the most relevant key success factors a company should focus on and implement are: ability to attract and retain talents, capacity to adapt to changes, strong brand and reputation, high quality in customer service, pro-active responses to the market needs, technological innovation, efficient supply-management, access to financial resources, ability to implement and manage successful partnerships, effective corporate social responsibility programmes and access to natural resources which are also economically sustainable (raw materials, water, energies, etc..).

In 2010 another empirical research conducted by Fortune, combined the America's Most Admired Companies (AMAC) survey with the World Most Admired Companies (WMAC) one to generate a global ranking which analyzes what kinds of features distinguish the "best" from the rest, despite the size of the company; some of them are represented by the ability to retain talents, to implement responsible policies and strategies and the attitude to continuous innovation (Royal and Stark, 2010).

According to our results referred to excellent SMEs and to these two researches it clearly emerges that the focus on innovation, human resources management, CSR and sustainability truly represent the best ways to reach the expected value creation.

At this point, we have all the elements at our disposal to set up a rule book (based on the empirical research on our sample) concerning behaviours and strategies a family business small and medium firm should use and strengthen in order to better perform; our suggestions for SMEs are related to five main strategic areas: entrepreneurship, innovation, environment, human resources ethics and communicating corporate social responsibility.

Strengthen the rule of entrepreneurship. As emerges into the first part of the paper, small and medium enterprises depend more than other types of companies on their entrepreneurs. The entrepreneur plays many important roles inside the firm, with very relevant impact on human resources area, product, process or business model innovation, implementation of corporate social responsibility programmes and many other strategies connected to internationalization, global sourcing policies, decentralization, etc.. generally concerning the increase in company's market share.

The ideas, the creativity and the spirit of innovation are common core features of entrepreneurs; they can be found in all professions but a unique definition groups them together: "entrepreneurship is the process of creating something different with value by devoting the necessary time and efforts, assuming the accompanying financial, psychic, and social risks, and receiving the resulting rewards of monetary and personal satisfaction" (Bowen and Hisrich, 1986). It is clear that the behaviour, the spirit and the perspectives of a single entrepreneur can really affect the destiny of the whole organization, from its creation to its survival and growth.

General and specific entrepreneurs' skills, knowledge and abilities are relevant also to existing SME managers and to wider SME workforce as much as an entrepreneur is able to share them within the whole organization. Firstly, one of his main features is the knowledge in recognizing available opportunities that can be significant for his business activities; secondly, the attitudes, the use of his own initiative, and the adaptability to the external environment are key factors for the firm's success; eventually, the skills include strategic thinking, self confidence and the ability to deal with business environment changes and challenges by strengthening his company and make people aware about new strategies which have to be adopted (OECD, 2010).

In particular, having recognized the great impact and importance sustainability and responsibility may have on firm's performances, public opinion and stakeholders' satisfaction, the entrepreneur is the only person inside the firm who really can make those aspects happen.

"When one's business and life are inseparable, as is often the case in owner-managed business and entrepreneurship, personal ethos and business behaviour are inseparable" (Fuller and Tian, 2006). This is the reason why if an entrepreneur has his own responsible behaviour, he truly can transmit this behaviour to the whole organization and affect the ethical perspective of the firm he owns and runs in a positive manner.

Some suggestions for entrepreneurs – which are listed below – are both useful and necessary to foster his rule into family business SMEs in order to strengthen them and to create more effective internal business environment:

- setting up clear and shared strategies among employees;
- recognizing the strategic importance of collecting and assessing information on the competition in the market;

- fostering the exchange of information at the internal level by planning, organizing and communicating the desired objectives;
- “because a chaotic external world requires internal cohesion and flexibility” (Werbach, 2009), it is necessary to create such a flexible, creative and open environment in which employees feel empowered to take risks;
- fostering innovation by using entrepreneur’s capacity and skills as well as by creating a situation of freedom, time for experimentation, flexibility, trust and dynamism in which employees may come up with new ideas to be supported;
- having attitude to team building and attribution and rewarding of success;
- having the ability to attract, motivate and retain talents, also in order to avoid the risk of succession: if no one inside the entrepreneur’s family has the aim to cover his position in the future, he will soon be able to identify a suitable manager for leading the firm;
- seeking for new technological opportunities with a proactive orientation to changes (OECD, 2010);
- making the best of personal networks and activating partnership with Universities, Research Institutes and the inter-firm collaboration;
- combining the perspective of innovation with the environmental-sustainability one; environmental-responsible business process often provide a range of new opportunities for entrepreneurs (Shaper, 2005);
- leading the firm to CSR policies implementation since the smallest organizations may have the greatest opportunity to base their entire culture on sustainability related positioning (Haanaes, Balagopal, Arthur, Kong, Velken, Kruschwitz, and Hopkins, 2011).

Be steady innovators. The rule of entrepreneurship is strictly connected to the possibility to foster innovation inside the family business SMEs. Since these kinds of smallest organizations are defined as the motor of the European economy, the implementation of innovation policies surely represents one of the most relevant way through which this motor can continue to work.

According to this statement, encouraging innovation in SMEs remains at the heart of policy initiatives for stimulating economic development at the local, regional, national and European levels (Edwards, Delbridge, and Munday, 2005). The little amount of resources (both financial and human) at disposal of smallest organizations remains a limitation factor to continue improvement and adoption of new technologies, that they may exceed by using their competitive advantage in flexibility, dynamism and creativity fostering by entrepreneurs.

Nowadays, innovating is a difficult process for all companies (even big global ones), since both new technologies and information and communication technologies become more complex and pervasive (Edwards, Delbridge, and Munday, 2005). Moreover, end-users will no longer be satisfied only about quality and product function and features; they want more in terms of well-made and reliable solutions and, in this sense, product innovation needs process innovation as keys to success (Johnson, 2010). Eventually, CSR can be a route to innovation and can be perceived in terms of both potential cost-savings and new value creation for stakeholders.

Given these challenges, SMEs should consider those following suggestions to become better innovators:

- be partnership-friendly innovators*: exploiting the advantages of partnerships; they should work with academic institutions and other firms through innovation networks in and between sectors, regions and nation – states (Edwards, Delbridge, and Munday, 2005). Sharing ideas and involving people with different perspectives may open opportunities in innovation;
- be consumer-friendly innovators*: trying to compete through product innovation (to meet the needs of high quality), process innovation (by improving manufacturing, customer relationship management, technical support services, quality assurance and control) (Johnson, 2010), as well as business model innovation. This represents the only way to have different competitive advantages in performance, reliability, convenience and costs in order to better respond to the new consumers’ demand mainly based on customization, attention to social and environmental issues, competitive price and shifting to a niche segment;
- be environmental-friendly innovators*: combining the use of social, environmental and sustainability drivers to create new ways of working (business models) new products, services, processes and market spaces (European Commission, 2008);
- adopting a clear strategy of innovation which includes objectives, resources, skills, risks, processes and indicators and then protecting the innovation with patents and registered trademarks.

In conclusion, the extent to which partnership, attention to new customers' needs, social and environmental issues are integrated into the core business strategy of an enterprise will be an important determinant of its ability to exploit business opportunity in innovating.

Take care of environment. Interests and worries about the environmental issues has rocketed during the last few decades. The need for reducing the environmental impact of products and processes is an ongoing issue which should be addressed by the management of all organizations and – in particular – by the entrepreneurs of the smallest ones, since they represent the 99% of the total amount of European enterprises and they contribute the 64% of the industrial pollution in Europe (European Commission, 2010).

If, on one hand, there are many costs – saving effects from environmental sustainability such as lower energy costs or lower waste of resources; on the other hand, some other costs are strictly connected to the implementation of formal standards or regulations on environment.

Despite of this, it is both useful and necessary to include the implementation of such official regulations or standards into the following list of suggestions for SMEs:

- implementation of the ISO 14001 standard or the EMAS regulation or other specific national schemes which may lead the organization to superior benefits, such as: enhanced quality of management, improved quality of training (especially for “green skills”), improved working condition and safety, improved quality of environmental information, demonstrated legal compliance, encouraged innovation, communication and demonstration of environmental sustainability which can contribute to create a better firm's image among stakeholders, improved procedures and environmental performances, financial benefits, improved employee qualifications and commitment (based on Hillary, 2004);

- if certified environmental management systems are not implemented yet or they can not be implemented, create programmes sensitizing on environmental issues and simply improve the awareness of formal environmental management system, environmental laws and/or remediation processes within the organization (Shaper, 2005);

- adapt the green business perspective to new products or processes (e.g. biodegradable materials or processes aimed at reusing water or other types of resources);

- look more actively toward clean technologies through the collaboration with suppliers and sector organizations or through applied research schemes (European Commission, 2010).

To conclude, it is important to underline the fact that SMEs can do any type of effort but they surely need much many supports for easier certification processes: from alleviating the costs of complying with environmental legislation to the creation of tools and facilities to gather free and clear information and the simplification of the administrative requirements for reporting on environment (European Commission, 2010).

Get the employees engaged and satisfied. Since the employees are (at every level) the real engine of any organization, nobody has doubts concerning the treatment every leader (manager, director, chair man and – most of all – entrepreneur) must reserve to them; at every stage of their career they must be motivated, they have to feel themselves embedded in the organization in which they work. According to many authors, people are the key to growth in good times and survival in bad moments (Winston, 2009); people detain human capital and intellectual capital (Casalegno and Pellicelli, 2008), which are considered and valued by Fitz-Enz (1998, 2000, 2001) as profit levers in the knowledge economy. People are knowledge lever (Bahra 2001); employees represent the most important intangible asset in any organization (Kiessling, Harvey, 2006). According to Fitz-Enz, this asset can and should be measured as a fundamental asset for achieving competitive advantage; this is a precious resource, a lever to create organization's value. This is what the literature is always saying, but what is really happening in the moment of crisis the whole world is still facing of? For the majority of the times, firms seem do not care about the “human factor”, just thinking about the costs reduction; employees are costs and – moreover - they are perceived in this way in small or medium realities. But if a SME wants to overcome the competition leveraging on technology and on something more than tangible assets, employees must be taken into account; if the innovation comes from the inside – from the minds of whom we can call “knowledge workers” - it is a valuable intangible asset which competitors cannot imitate and a company can achieve this result only when employees feel themselves as a part of the whole organization. Indeed competitive advantages are earned when it is possible to build a link between employees' and company's goals; this kind of link is effective only when exists a corporate culture able to make employees share the same values the organization has. Eventually, it is necessary to pay attention to the recruiting,

the selection of new employees, the training and the reward management; these are important tools for building the most effective connection strategies inside the organization (Casalegno, 2008). Not everything concerning the ethical human resource management is left to the management free will, which sometimes can be arguable; the European Economic Community, the United Nations, the International Labour Organization (ILO), the Organization for Economic Co-operation and Development (OECD) have been legislating during the last twenty years about human rights and the firm citizenship culture. For item, the Global Compact, launched in the year 2000 by the United Nations, encourages companies to incorporate the ten human rights principles in their own strategy and to consider a broad range of stakeholders in setting strategy (Rose, 2008).

At the international level companies are adapting themselves to ethical norms and measures concerning the employees' safeguard; for item they are doing it in UK, where the ethical conduct in business practice and HR procedures is no longer a matter of choice for companies and organizations in general (Rose, 2008). In conclusion, in Italy firms are trying to adapt (and in the future, they must do that, if they want to have an useful tool to make their people capital more effective and engaged) to the international norms even if the adaptation – at the moment – is not mandatory and perceived as necessary (especially for companies mainly operating into the national market); the certifications on ethics and health and safety at work are not well-known and complex to adopt and to put in practice. Talking about the employees aspect, these certifications – concerning spaces, procedures and internal services conformity to the law – are important internal communication tools through which every employee can feel safer and more aware that the own goals are closed to the ones of the organization which he is working in.

Increasing the Corporate Social Responsibility (CSR) Communication. The business innovation degree regards in part also to the environmental respect and – in an extended sense – to the social responsibility towards every stakeholder. “CSR is about businesses and other organizations going beyond the legal obligations to manage the impact they have on the environment and society. In particular, this could include how organizations interact with their employees, suppliers, customers and the communities in which they operate, as well as the extent they attempt to protect the environment” (Lea, 2002).

Corporate Social Responsibility takes actions beyond the environmental and economic/business and aims at implementing legal obligations in the triple bottom line approach, in which the economic, the social and the environmental perspectives are all relevant.

According to the results coming from our analysis, only the 35% of the considered enterprises have drawn up a Corporate Social Report. So we have to underline that it might be preferable to increase this practice in order to involve the stakeholders in the corporate activities and obtain more overconfidence from the financial actors within the community.

Actually many researches demonstrate the positive relation between environmental performance and financial performance (Kenneth, Archie, and Hatfield, 1985). Also Fombrun and Shanley (1990) established that investing in CSR attributes and activities may be important elements of product differentiation and reputation building. As Dahlsrud (2008) underlines “Due to globalization, the context in which business operates is changing at an increasingly rapid pace. New stakeholders and different national legislations are putting new expectations on business and altering how the social, environmental and economic impacts should be optimally balanced in decision making. Thus, in such a context, CSR management tools are needed, in addition to the previously established patterns, to develop and implement a successful business strategy”.

End Notes

¹ The principles of ethical practices in hiring and treatment of employees and the related production of goods and services are defined by the Standard Accountability 8000. It was released by the Social Accountability International in 1997, based on the International Labour Organization principles and agreements, the Universal Declaration of Human Rights and the UN Convention on the Rights Of A Child.

The standard contains eight guidelines regarding: child labour, forced labour, health and safety, freedom of association and right to collective bargaining, discrimination, disciplinary practices, working hours, remuneration, management system (Social Accountability International, SA8000, 2001).

² Interest and power of influence are intrinsic features of stakeholders. Every day companies have to focus their efforts on setting up strategies and policies to face challenges and taking advantages of the opportunities created by the stakeholders (Carrol and Buchholtz, 2003).

³ The principles of sustainability in managing people, planet and reaching profit are generally knew as Triple Bottom Line principles. This term was coined by John Elkington in 1994.

⁴ The main standards and codes a company might implement and use as certifications or documents demonstrating its Social Responsibility are: Standards on quality and environment published by the International Organization for Standardization; ISO 9001 which specifies requirements for a quality management system and ISO 14001 which specifies requirements for an environmental management system both to enable an organization to develop and implement a policy and objectives taking into account specific rules of conduct (for further information about other standards, including the new ISO 26000:2010 on sustainable development and social responsibility, see the website

www.iso.org); the Standard Accountability 8000 on ethics, the OHSAS 18001 which provides and international occupational health and safety management system specification (www.ohsas-18001-occupational-health-and-safety.com); the Code of Ethics (referred to corporate or business ethics) and the Code of Conduct (employee ethics); the Social and Environmental Statements.

⁵ Micro enterprises employ fewer than 10 people and have an annual turnover or an annual balance sheet total not exceeding 2 million euros; small enterprises employ fewer than 50 people and have no more than 10 million euros of either annual turnover or annual balance sheet total; the medium-sized enterprises have no more than 250 people employed, an annual turnover not exceeding 50 million euros and an annual balance sheet total not exceeding 43 million euros (European Commission, 2005).

⁶ Survey Monkey is a private American company that enables users to create and publish their own Web-based surveys and view results graphically. It was founded in 1999 by Ryan and Chris Finley.

Annex 1 – Questionnaire Complete Version

Corporate Social Responsibility and Innovation as drivers to SMEs Success

1. INNOVATION

The first part of the survey is intended to analyze the attitude to continuous innovation

1. Research and Development amount per year

2. Percentage of increase/decrease in R&D during the last three years

3. R&D employees' number

4. Number of partnerships with Universities and/or local Research Centers

5. Bank loans - specific public project funds for developing innovation

- yes
 not

6. If yes, please specify the amount

2. CORPORATE SOCIAL RESPONSIBILITY - STAKEHOLDER

The aim of the second part of the present is to analyze CSR towards Stakeholders

1. Do you publish Social/Environmental Report or Sustainability Report?

- yes
 not

2. Total amount of the employees' training (last fiscal year)

3. Number of training curricula in which your employees are enrolled

4. Number and type of services for the employees

- Baby parking
 Gym
 Parking
 Meal tickets
 Mobile phone
 Car
 PC
 Medical care

5. Employment conventions and standard implementation (Italian and International level)

- OHSAS 18001 (Safety and Health)
 ILO CONVENTIONS ON DECENT WORK

Other (specify)

6. Percentage of repeated purchases on the total amount of sales (last fiscal year)

3. CORPORATE SOCIAL RESPONSIBILITY- QUALITY, ENVIRONMENT AND ETHICS

1. ISO 9001

- yes
 not

2. Internal quality control

- yes
 not

3. ISO 14001

- yes
 not

4. EMAS

- yes
 not

5. Recycling and water reusing

- yes
 not

6. SA 8000

- yes
 not

The Impact of Top Management Team on Innovation and Performance

Abstract

This paper examines the impact of TMT characteristic on firm innovation and performance. We focus on the education, functional background heterogeneity and international experience of TMT reflecting TMT's ability to possess innovative activities. The relationship between TMT characteristic, innovation, and performance are empirically investigated in a sample of 581 Taiwanese listed companies in electronics industry. The result shows that TMT' international experiences positively related to innovation. Moreover, innovation is negatively related to performance.

Key words: Top Management Team, Innovation

Introduction

Previous studies found the characteristic of Top Management Team (TMT) have impact on performance. Particularly, TMT diversify such as age, education, tenure and functional background influence on strategic decision and performance. However, previous empirical studies found the mix results of TMT and performance. The heterogeneity of TMT represents diversify of skill, knowledge and experience will benefit for innovative thinking and performance but also hamper flexibility, time of decision making and task implement. Studies suggest the better understanding of mix results is trying to find other intervening or mediating mechanisms between TMT characteristics and organizational outcomes. In this study, we argue the effect of TMT will affect on performance through strategic behavior of innovation.

In this study, apply upper echelons researchers (Bantel and Jackson, 1989; Boeker, 1997; Hambrick and Mason, 1984; Wiersema and Bantel, 1992) to examine those the characteristic of TMT diversify on strategic decision. We investigate the influence of TMT education heterogeneity, functional heterogeneity and international experience on innovation. Engaging in innovative activities will further benefit for firm performance. Given our interest in: (1) predicting the relationship between education heterogeneity, functional heterogeneity and international experience of TMT and innovation; and then (2) examining the influence of innovation on firm performance.

Research background and Hypotheses development

Education Heterogeneity and Innovation

Demographic characteristics have been proposed as the primary determinants of each individual's cognitive base, values and biases (Hambrick and Mason, 1984). Education background is viewed as an important factor influence on TMT's strategic decision. It is related to forming of value building, preference and knowledge accumulation. Educated individuals are more likely to consider the external environment, with higher tolerate ambiguity, and be able to deal with complexity (Dollinger, 1984).

Innovation is more likely when people of different disciplines, background, and areas of expertise share their thinking. In creative work due to the innovation requirement, it is essential to have people approaching a problem from different perspectives used for reduce uncertainty and ambiguity. Sometimes the complexity of a problem demands diversity, creativity from different perspective. Diverse groups are expected to be more externally focused

and creative when making decisions (Jackson, 1992). TMT with heterogeneous education background training will benefit for various innovative thoughts and contribute TMT to have multi-ideas and to provide more innovative solutions.

H1: the TMT's education background heterogeneity is positively related to innovation.

Functional background heterogeneity and Innovation

The functional background heterogeneity is related to TMT's openness and tolerance of risk. Appropriate heterogeneity of TMT is crucial in the innovation process. TMT with diversify functional experience bring different ideas and visions. Different work experience background enable TMT with higher possibilities to receive creative ideas derived from more considerations. Innovative decisions are translated based on their ability and knowledge learned and experienced before. Cognitive diversity rooted in different working experiences which promotes constructive debate and strategic innovation, in the form of technological and administrative innovation, and entry into new product markets (Bantel and Jackson, 1989; Boeker, 1997; Wiersema and Bantel, 1992).

TMT with experience different functional tasks will have higher willingness to receive and undertake novel and unprecedented strategies. It is also easier to receive changes, bring knowledge to organization and pursue risky strategies. Thus, heterogeneous functional background benefits to outward-oriented differentiation strategy and to implement a strategy with a broader scope. Diversifies work background also enhance managers' task-related knowledge, industrial technology trends. It make him/her with more open and risk-taking orientation to make investments in innovation that are necessary to capitalize on these market changes as they have more experience in the industry. It also brings continuous new thoughts development, build innovative organizational cultures and aggressive R&D activities. In other words, TMT with more diversified functional experience is more able to enhance firms' innovative competence and novel strategies. Thus, in this study, we propose:

H2: the TMT's functional background heterogeneity is positively related to innovation.

TMT's International experience and Innovation

The international knowledge associated with international environments help the firms to reduce the awareness of the uncertainty of foreign market. Those international experiences can be gained from foreign education or working aboard experience. International education and work experience are viewed as important determinants of executive global skills and mind-sets (Hannerz, 1996; Hordes et al., 1995; Carpenter and Fredrickson, 2001). TMT's international experience further can lower the time of learning market and probability of failure in market. TMT with international experience can increase firms' flexibility and have more innovative activities. Previous international experience leads TMT have better sensitivity of international environment change. TMT use can leverage their knowledge and capabilities to evaluate and manage environmental changes and take a response to uncertain environment quickly.

H3: the TMT's international experience is positively related to innovation.

Innovation and performance

Facing dynamic market change, innovative activities make firms can upgrade competitive position against other competitors. Technology innovation can provide production with higher quality and lower production cost; products innovation can attract more market and increase profit; managerial innovation can lower managerial and staffing cost. By innovative activities, firms can lower production cost, provide more qualified products and operation efficiency and therefore benefit for performance (Hitt et al., 1994). Engaging in innovative activities not only contribute for the competitive position also benefit for profit. Thus, this study proposes:

H4: Firms with more innovation will have better performance.

Methods

Sample and Data

The sampled firms were 581 Taiwanese firms in electronic industry which is listed of Taiwan Stock Exchange

in 2007. We collected the detailed demographic data on the TMT and information of innovation and performance from the companies' annual reports. Information about the TMT's education, functional background and international experience was collected from executive biographies published on companies and in annual reports. We used the data at the firm level for all variables.

Measurement

Dependent Variables

Performance

A variety of measurements have been used in previous studies to measure firm performance. Return of assets (ROA) is often considered an indicator of performance.

Innovation

In this study, we measure firm innovation as the ratio of expenditures by a firm on research and development to the firm's sales, namely R&D intensity.

Independent Variables

In this study, TMT was defined as the officers who were members of the manager board or executive committee as identified in the firm's annual reports. Those managers are as a group and have power of important strategic decisions and this definition was used wisely previous research (Pettigrew, 1992; Nielsen, 2010).

Education Heterogeneity

TMT educational background diversity was measured of Blau's heterogeneity index: $H = 1 - \sum_{i=1}^n S_i^2$, where H is the homogeneity index, S is the percentage of TMT members with a dominant educational track i , and n is the number of different educational backgrounds (Wiersema and Bantel, 1992). We coded TMT's educational background to six categories; law, liberal arts, business, science, and others. This indicator varies between 0 and 1, where values close to 1 indicate higher diversity in educational backgrounds and low values indicate that one educational background of the TMT.

Functional Background Heterogeneity

We collect TMT members' previous working background; however, we do not have information about the number of years of previous working experience. Thus, we verify the diversified working experience by coding 1 if the member has previous work experience in different function from current position; 0 if the member has the work experience in the same function with current position. Summing the number of members' different functional experience then divide it to the total number of TMT.

International Experience

Following previous studies, we measured international experience by using the number of TMT member who has experience of study or work abroad (Wiersema and Bantel, 1992; Daellenbach, McCarthy and Schoenecker, 1999). We code "1" if they educated or worked outside Taiwan and "0" if they don't have any foreign study or working experience. We sum the number of TMT members who has international experience and divide to total number of TMT.

Control Variables

We measured TMT size by using the number of all managers of TMT. These data were available from annual reports. Innovation also be influenced by the number of employees of a firm, since larger firms are more likely to have larger scale of TMT. Thus, this study use firm size measured by number of employees as control variable.

Results

Table 1 shows the results of the effects of TMT characteristics on innovation. Model 1 showed that education heterogeneity were negatively associated with firm innovation ($\beta=-0.116$, $p<0.05$), which was conflict with our statement. Hypothesis 1 is not supported. Model 2 shows the influence of functional heterogeneity on firm innovation. The result suggests functional heterogeneity does not drive a firm's innovation. Therefore, Hypothesis 2 is not supported. Model 3 show the relationship between TMT's international experience and firm's innovation and the result indicate international experience is benefit for innovation ($\beta=0.193$, $p<0.05$). Hypothesis 3 is supported.

Model 4 shows the influence of innovation on performance. The results indicates the relationship between innovation and performance is insignificant ($\beta=-0.041$, $p>0.1$). This finding suggested that a firm's innovative activities do not impact a firm's performance, which did not support Hypothesis 4.

Table 1 Regression result

Variables	Model 1		Model 2		Model 3		Model 4	
	E.H →Innovation		F. H→ Innovation		International Experience →Innovation		Innovation →Performance

Discussion and Conclusion

This research is aim to examine the influence of TMT on firms' innovation and the effect of innovation on performance. In hypothesis 1 and 2, we propose educational heterogeneity of TMT will benefit for the firms' innovation and internationalization. However, both of hypotheses are not supported. In hypothesis 1, the result, opposites of our argument, indicates that the lower heterogeneity of TMT will tend to progress more innovation. Diversified educational background of TMT also brings different ideas, perspective, and ways of thinking. The huge diversity may generate conflict and hamper innovation. Therefore, there is a negative relationship between educational background heterogeneity and degree of innovation.

According hypothesis 2, we propose TMT with more diversify of functional background will have higher degree of innovation. Functional background may affect differences on individual knowledge because of the prevalence of cross-functional teams in complex organizations. Such differences are important prerequisites to deal with the overload of complex and unstructured information, common in TMT decision-making contexts (Hambrick 1995). Thus, too many differences on functional background may not benefit for the degree of innovation.

According to Hypothesis 4, we proposed firms with more innovation will perform better. This statement is not supported may due to the lag effect of innovation on performance. The outcome of innovation is showed in later year. Particularly due to huge R&D and marketing spending in the early product stage, it may not show the benefit of firm's revenue immediately. Hence, the result of innovation will not have the influence on performance improvement, not in the same year immediately.

Limitation and Future Research

This study has several limitations. In measuring TMT heterogeneity, age and seniority or experience of TMT did not included in this study. Related research indicates that the willingness to change the status quo of people with different tenures and ages will be different. The shorter the average tenure of top management team, thoughts tends to be more innovative and unwilling to maintain unsatisfied status quo. The younger the manager, the more willing in taking risk of change, enabling enterprises to have a higher degree of innovation. Therefore, this paper suggests more consideration of possible future research in this area so that the results will be more complete. Furthermore, we did not consider different innovative types, in term of patents and new products development, as variables those can affect business performance. Company with more new product development and innovation, tends to manifest on

patent application for the purpose of protecting their products; and continuous new product development aims to create revenue for the company. Thus, new product development is also one of innovation index can be measured in future studies.

R&D, distance, level of development and technological intensity of merchandise trade

Štefan Bojnec, stefan.bojnec@fm-kp.si
University of Primorska, Slovenia;

Imre Fert, imre.ferto@uni-corvinus.hu
Corvinus University of Budapest Hungary

Abstract

This paper focuses on merchandise trade by four technological intensity groups of products (low, medium-low, medium-high, and high technological intensity) between OECD countries. We employ the baseline adapted gravity model on panel dataset in which merchandise trade is explained by the economy size, level of economic development, distance, and proximity variables of having a common border, speaking a common language, and having a free trade agreement. In addition to the baseline adapted gravity model, our special focus is on the impact of the research and development (R&D) expenditures on merchandise trade by technological intensity of products. Finally we test whether greater R&D expenditures mitigate the effects of distance on trade and whether greater R&D expenditures help to overcome the level of economic development on trade. We find that R&D is positively associated with merchandise trade in exporting and importing OECD countries. R&D mitigated the effect of distance. R&D play important role in developing OECD countries in catching-up merchandise trade. Having a common border, common language, and regional free trade agreement membership positively enhances merchandise trade between the analyzed OECD countries by technological intensity of products.

Introduction

The purpose of this paper is to understand the impact of research and development (R&D) on manufacturing trade using the panel gravity equation model for OECD countries. Theories in the literature explain various internal and external factors of technological sources, technology acquisition, R&D intensity and innovation at academia, firm, industrial sector, and nation levels. The previous research in international trade has underlined the role of tariffs, quotas, other formal and informal barriers to trade (e.g. Anderson and van Wincoop 2004, Baier and Bergstrand 2006), information distance costs (Rauch 2001), and unobserved trade costs. However, the changing global competitiveness and trade patterns between the nations have generated a search for the determinants which are causing these changes. R&D intensity and innovation activities are seen as key factors in explaining the changes in technological gaps and in competitiveness in world trade (e.g. Wakelin 1998). There is a growing literature on the determinants of trade performance, either for one country (e.g. Özçelik and Taymaz 2004), or for more or a group of countries (Roper and Love 2002), in order to assess and point to a role for R&D intensity and innovation activities as factors influencing the trade performance of developed industrialized countries (Fagerberg 1988, Greenhalgh 1990) and developing countries (Montobbio and Rampa 2005).

This paper investigates the impact of R&D intensity by analyzing the determinants of the bilateral manufacturing trade flows between OECD countries. We employ adapted gravity equations to identify the effects of R&D on bilateral manufacturing trade using a panel data analysis. Among possible explanation for differential in merchandise trade performances by technological intensity of products between OECD countries might be differential in R&D expenditures, transportation costs, and level of economic development. First, we employ baseline adapted gravity model on panel dataset in which merchandise trade by technological intensity is explained by the economy size, which is expressed by gross domestic product (GDP) in exporting and importing OECD countries, level of economic development, which is expressed by GDP per capita in exporting and importing OECD countries, then by the distance between the countries' capitals, and the OECD countries proximities in terms of

having a common border, speaking a common language, and having a free trade agreement. Second, in addition to the baseline model, our special focus is on the impact of the R&D expenditures on merchandise trade by technological intensity of products. We expect that greater R&D expenditures improved innovation by the increase of exports in differentiated products by the decrease in transportation costs. Therefore, third, we test whether a greater R&D expenditures mitigated the affects of distance on trade, and fourth, whether a greater R&D expenditures helped to overcome the level of economic development on trade.

So far there are scare similar studies in the literature. Therefore, our paper aims to contribute to the literature in three significant directions. First, the starting point of our investigation is the relationship between R&D and manufacturing trade performance in the OECD countries using a panel data analysis by applying the adapted baseline gravity equation model. We integrate the Ghazalian and Furtan (2007) econometric approach in our estimation. Second, we analyze whether the R&D intensities have mitigated the effect of distance on manufacturing trade, and therefore we check the rationale for long-distance on manufacturing trade. We employ the Freund and Weinhold (2002, 2004) specification for the investigation of the effects of R&D on distance and long-distance into the adapted gravity equation model. Third, we investigate for the impact of the level of development on manufacturing trade and check the sensitivity of the panel regression results to the choice of R&D by investigating the effects of R&D by the level of countries' economic development.

The rest of the paper is organized as follows. The first section presents the literature review. In the next section after that we present the methodology and data used by focusing on the R&D intensity in the adapted gravity regression analysis. After that, we present and discuss the regression results for alternative specifications of adapted gravity models. In the final section we summarize the main findings and give conclusions.

Literature review

The literature provides a theoretical background for export and R&D relationship at both macroeconomic and microeconomic level. Since our study focuses on the macroeconomic level, we concentrate mainly on the former literature. The macroeconomic research offers two main theoretical perspectives to account for the relationship between R&D and exports. First, the neo-endowment models which concentrate on trade specialization on the basis of factor endowments, such as materials, labor capital, knowledge and human capital (Wakelin 1998). Second, neotechnology models which predict innovative industries will be net exporters instead of importers. The latter type of models provides an extension of the conventional technology-based models such as the product life-cycle theory (Vernon 1966) and technology gap theory (Posner 1961).

In his seminal work, Krugman (1979) showed that countries and products can be ranked by technological level and that economies ahead on this scale specialize in the technological intensive goods. Increasing returns to scale and product innovations generate trade specialization and first mover advantages. But in equilibrium, imitation reduces technological gaps between countries, and the monopolistic power of leaders is temporary. In addition, he argued that the causal chain ran from R&D and innovation to international trade and not the other way round.

Grossman and Helpman (1995) argued that, in a framework of monopolistic competition, a country could shift its export demand curve outwards by increasing the quality of goods it produces; meanwhile, it could shift its import demand curve inwards by increasing the quality of goods produced for the domestic market. These demand-shift factors can possibly be proxied by factors that represent improvements in product quality, i.e. R&D and technological innovation.

A wealth of literature provides evidence at the macroeconomic level on the linkage between a country's export performance and its R&D, creativity/innovation. Various empirical studies confirm the importance of R&D, technology and innovation as one of the major factors contributing to facilitating entry into global markets and thereafter maintaining competitiveness and boosting export performance (e.g. Fagerberg 1988, Greenhalgh 1990, Wakelin 1998, Montobbio 2003, Narula and Wakelin 1998, DiPietro and Anoruo 2006).

In addition, there are a growing number of studies at firm level on the export-R&D relationship, taking into account the heterogeneity of firm characteristics amongst exporting and non-exporting firms (Roper and Love 2002). A firm's export orientation has been extensively investigated in the literature, and various empirical studies

have emphasized the role of technology and innovation as one of the major factors contributing to facilitating entry into global markets and thereafter maintaining competitiveness and boosting export performance (Barrios et al. 2003). Contrary to the uniformly positive export and R&D-innovation linkage revealed in the macro economics literature, some empirical studies at the firm level present contrary findings. For instance, Lefebvre et al. (1998) and Sterlacchini (2001) found that the association between R&D investment and export intensity was insignificant. Moreover, based on Japanese manufacturing firms, Ito and Pucik (1993) found that R&D intensity was a significant determinant of a firm's export performance only when size was dropped from the regression.

The literature highlights three channels for R&D and innovation influencing the level of trade (Ghazalian and Furtan 2007). First, R&D and innovation may foster the product differentiation, allowing for more product variety choices and higher quality products for consumers. Second, R&D and innovation may reduce the production costs, making firms more competitive on the international markets. Third, R&D and innovation may reduce the transaction costs along the supply chain and between trading partners, making exports more competitive. For example, the literature on international trade emphasizes the role of institutions and infrastructure in export growth (e.g. Anderson and Marcouiller 2002, Dollar and Kray 2002, de Groot et al. 2004, Depken and Sonora 2005, Levchenko 2007). Bojnec and Fertő (2010) find that the use of the Internet has also encouraged exports of manufacturing and agro-food goods between the developed OECD countries. Our specific contribution is investigation of the association between R&D and merchandise trade for the four groups of products classified by the OECD classification of technological intensity of products.

Methodology and data

Traditional gravity trade theory indicates that bilateral trade is positively associated with their national incomes and negatively associated with their geographical distance (e.g. Frankel and Rose 2002). We apply standard gravity model variables including market size, which is real gross domestic product (GDP) of host i and destination j countries, geographical factors like the distance between capital cities (Distance) and common border (Contiguity), common cultural linkage (Language), and a dummy variable for Regional Free Trade Agreement (RFTA) membership as explanatory variables. First, we specify the following adapted baseline gravity model:

$$\ln X_{ij,t} = \alpha_0 + \alpha_1 \ln GDP_{i,t} + \alpha_2 \ln GDP_{j,t} + \alpha_3 \ln GDPCAP_{i,t} + \alpha_4 \ln GDPCAP_{j,t} + \alpha_5 \ln Distance_{ij} + \alpha_6 Contiguity_{ij} + \alpha_7 Language_{ij} + \alpha_8 RFTA_{ij} + u_1 \quad (1)$$

The trade data used is supplied by the OECD Bilateral Trade Database at the two-digit level of the International Standard Industrial Classification (ISIC) of all economic activities in US dollars. We use data for the manufacturing exports (X_{ij}). The sample contains 18 OECD countries¹ between 1995 and 2003 resulting in 2,754 observations. GDP is a proxy for the market size, and GDPCAP is a general proxy for economic development for both exporter and importer countries. The source of data is the World Bank, World Development Indicators (WDI) database. The $Distance_{ij}$ variable measures the geographic distance between the countries' capitals i and j , whereas the other dummies reflect whether i and j share: a land border ($Contiguity_{ij}$), their primary language ($Language$), and membership in a RFTA. The source of these data is the Centre d'Etudes Prospectives et d'Informations Internationales (CEPII): <http://www.cepii.fr/anglaisgraph/bdd/distances.htm> database.

The literature argues that richer and larger exporters and importers trade more, as do countries linked by regional trade agreements, a land border, or a common language; and landlocked and physically large countries do less trade, while that trade falls with geographic distance. Distance can have an influence on technology transfer (Eaton and Kortum 2002, Kneller 2005).

Second, we are interested in the role of R&D with innovation in manufacturing trade. The previous section provides some evidence on how R&D inputs/innovation-related variables are expected to directly raise export intensity. Thus, we employ an augmented adapted gravity model with R&D expenditure variables:

$$\ln X_{ij,t} = \beta_0 + \beta_1 \ln GDP_{i,t} + \beta_2 \ln GDP_{j,t} + \beta_3 \ln GDPCAP_{i,t} + \beta_4 \ln GDPCAP_{j,t} + \beta_5 \ln Distance_{ij} + \beta_6 Contiguity_{ij} + \beta_7 Language_{ij} + \beta_8 RFTA_{ij} + \beta_9 R\&D_{it} + \beta_{10} R\&D_{jt} + u_1 \quad (2)$$

The variables of a particular interest are the expenditures on R&D as a proxy variable for innovation. The data for governmental R&D outlays are collected from the OECD STAN R&D dataset. The R&D intensity is

measured as the OECD R&D expenditure for total manufacturing (in million current US\$ in 2000 purchasing power parity – PPP – prices). In the light of previous research, we would expect that the higher the R&D intensity, the higher would be the export activity performance.

Third, we investigate the effects of R&D on distance. R&D with pertaining innovation may also reduce the transaction costs fostering the merchandise exports. Thus we check whether R&D intensity influences the distance effect between trading partners. Following Freund and Weinhold (2004) we re-estimated our model to check the effect of R&D intensity on distance:

$$\ln X_{ij,t} = \beta_0 + \beta_1 \ln GDP_{i,t} + \beta_2 \ln GDP_{j,t} + \beta_3 \ln GDPCAP_{i,t} + \beta_4 \ln GDPCAP_{j,t} + \beta_5 \ln Distance_{ij} + \beta_6 Contiguity_{ij} + \beta_7 Language_{ij} + \beta_8 RFTA_{ij} + \beta_9 R\&D_{it} + \beta_{10} R\&D_{jt} + \beta_{11} R\&D_{it} * Longdistance_{ij} + \beta_{12} R\&D_{jt} * Longdistance_{ij} + u_1 \quad (3)$$

where $Longdistance_{ij}$ is a dummy variable, which equals one if the distance between countries i and j exceeds the average distance between all the analyzed OECD countries. The rationale for use of the interaction effect of R&D and $Longdistance$ is that with more R&D intensity it would be possible to overcome the greater distance. If a particular R&D variable has reduced (increased) the effect of distance on manufacturing trade, then the regression coefficient on the interaction $R\&D * Longdistance$ term should be positive (negative).

Fourth, we test the effects of the level of economic development on merchandise trade by technological intensity of products. Barrios et al. (2003) argue that the effects of R&D do matter more for exports to technologically advanced countries, such as the European Union and other OECD countries where exporters have to improve technology in order to be able to compete on those markets successfully. Thus the effects of the R&D variables are empirically tested in association with the level of economic development:

$$\ln X_{ij,t} = \beta_0 + \beta_1 \ln GDP_{i,t} + \beta_2 \ln GDP_{j,t} + \beta_3 \ln GDPCAP_{i,t} + \beta_4 \ln GDPCAP_{j,t} + \beta_5 \ln Distance_{ij} + \beta_6 Contiguity_{ij} + \beta_7 Language_{ij} + \beta_8 RFTA_{ij} + \beta_9 R\&D_{it} + \beta_{10} R\&D_{jt} + \beta_{11} R\&D_{it} * GDPCAP_{it} + \beta_{12} R\&D_{jt} * GDPCAP_{jt} + u_1 \quad (4)$$

The rationale for use of the interaction effect of R&D and GDPCAP is that more economically developed countries with high higher GDPCAP invest more in R&D intensity and thus they can increase merchandise exports through higher-valued product differentiation.

Finally, there are some issues that we have to address when we estimate such panel models (Ghazalian and Furtan 2007). First, heteroskedasticity may occur because trade between two smaller countries or between a smaller and larger country is probably more volatile than trade between two larger countries (Frankel 1997). The panel dataset is also subject to the existence of autocorrelation. Contemporaneous correlation across panels may occur because exporting to one country can take place as an alternative to exporting to another country. Similarly, adjacent exporter(s)/importer(s) time specific shocks result in larger correlated error terms of their trade with their partners. To deal with issues of contemporaneous correlation we apply the panel corrected standard error model (PCSE) which controls for heteroskedasticity and the AR(1) type of autocorrelation and contemporaneous correlation across panels (Beck and Katz 1995, 1996).

TABLE 1: MERCHANDISE EXPORTS BY TECHNOLOGICAL INTENSITY (BILLIONS OF CURRENT PURCHASING POWER PARITY DOLLARS)

	High technology	Medium high technology	Medium low technology	Low technology
1995	1401.5	2725.7	1019.7	1361.6
1996	1421.3	2777.4	1027.6	1365.0
1997	1582.1	2860.8	1037.0	1346.8
1998	1692.3	3012.4	1049.9	1361.8
1999	1861.2	3153.9	1037.8	1382.5
2000	2111.6	3237.0	1135.3	1370.8
2001	1980.0	3117.5	1098.8	1344.8
2002	1962.0	3300.1	1113.3	1385.1
2003	2096.5	3779.9	1300.3	1563.7

Source: own estimations based on the OECD Bilateral Trade dataset.

Table 1 presents summary statistics on structures and patterns in merchandise exports by technological intensity of products. As can be seen there is an increase in exports in each of the four categories of exports by technological intensity of products. However, the increase is much bigger for medium high and high technologically intensive products than for low and medium low technologically intensive. This is consistent with our theoretical expectations. The most important single export category of products by technological intensity is the medium high technologically intensive products.

Our variable of a specific interest is R&D expenditures. Table 2 presents the structure and patterns in development of the R&D expenditures by technological intensity of products. The increase is seen for each of the technological group of products. However, the greatest share with fast growth is observed for high technologically intensive products, followed by medium high technologically intensive products. As expected, less R&D expenditures is invested into low and medium low technologically intensive products.

Econometric results

The baseline adapted gravity model estimations

Table 2 presents our regression results based on the baseline adapted gravity model without R&D variables by technological intensity of merchandise products. The size of GDP has a positive and statistically significant impact on bilateral merchandise trade for exporting and importing countries. The size of the economy and its growth over time encourages bilateral merchandise trade between the OECD countries. In the case of exporting countries, the regression coefficients are higher for high and medium high technologically intensive products than for medium low and low technologically intensive products. This suggests that the size of GDP and its increase in exporting countries are in a greater extent pertained to high and medium high technologically intensive products. On the other hand the regression coefficients for the size of GDP in importing countries are more equal.

Similarly to the size of GDP, the level of development measured by GDPCAP has also a positive and statistically significant impact on bilateral merchandise trade for exporting and importing OECD countries. The coefficient of elasticity for exporting countries is the highest for high technologically intensive merchandise exports, followed by medium high technologically intensive merchandise exports. In the case of importing countries, medium low technologically intensive merchandise trade has the highest coefficient of elasticity.

As expected, the Distance between the countries' capitals has a negative and statistically significant impact on bilateral merchandise trade between the OECD countries. The regression coefficient is the highest for medium low technologically intensive merchandise trade indicating the importance of geographical proximity and trade costs

in conducting international merchandise trade business. The medium low technologically intensive trade has also the greatest response on a fact of the having common border as suggested by the regression coefficients of the Contiguity, and vice versa in the case of having the RFTA, which seems to be the most important for low technologically intensive merchandise trade. The empirical results for Language are mixed, of a positive sign and significant for high and low technologically intensive merchandise trade and of a negative sign and significant for medium low technologically intensive merchandise trade.

In the process of international expansion, R&D with innovation is a significant determinant for the development of competitive advantage (Krugman 1979). In general, a positive relation between a country's export performance and its R&D intensity /creativity/innovation has been confirmed by previous studies (e.g. Greenhalgh 1990, Verspagen and Wakelin 1997, DiPietro and Anoruo 2006).

Table 4 presents the econometric results of the effect of R&D on merchandise trade by technological intensity of products. The coefficient of elasticities for the size of GDP in exporting and importing countries remain of a positive sign and significant, but by their absolute size there is a drop in the size of the coefficient of elasticity for high technologically intensive exports in exporting countries. This implies possible correlation between high technologically intensive trade and R&D expenditures in the OECD exporting countries. The size and the signs of the associations and statistical significance of the regression parameters for the other explanatory variables from the baseline adapted gravity model are less substantial.

The regression coefficients that are pertaining to the R&D expenditure variables are positive and statistically significant at. The absolute size of the coefficient of elasticity is higher for exporting than for importing countries. The coefficient of elasticity that is pertaining to the R&D expenditure is the highest for high technologically intensive merchandise export in exporting countries, and for medium low technologically intensive merchandise trade in importing countries. Therefore, these econometric results confirm the importance of R&D expenditure for competitiveness in high technologically intensive merchandise export as well as for other merchandise export. It can play also significant role in export as well as mitigating import of merchandise products in importing countries.

The effects of R&D on distance

N	2751	2754	2753	2754
R ²	0.9797	0.9899	0.9828	0.9906
Rho	0.694	0.584	0.876	0.9563

Notes: * p<0.1; ** p<0.05; *** p<0.01. Parameters are estimated by the Prais-Winsten estimator. The common AR(1) parameter is denoted by rho. The z values are computed from standard errors that are corrected for heteroscedasticity and contemporaneous correlation of error terms across panels.

As in the previous recorded econometric models, the model specification assumes and empirical estimates in Table 5 confirm that the regression coefficient pertaining to the Distance is negative. However, the regression coefficients have changed only slightly when the (R&D*Longdistance) variables are included in the models. The regression coefficients on R&D variables remain positive and statistically significant. These results indicate that R&D intensity has strong impacts on the distance and merchandise trade, particularly for encouraging merchandise trade by exporting countries. This is further confirmed by the regression coefficients for the interaction (R&D*Longdistance) variables. There is a positive and statistically significant association for exporting countries, and except for high and medium high technologically intensive merchandise trade for importing countries. These results imply that the R&D variable has reduced the effect of distance on bilateral merchandise export for exporting OECD countries, and except for high and medium high technologically intensive merchandise trade, as well as in importing OECD countries. The OECD countries, which have invested more in R&D have also expanded and strengthened their

merchandise exports on longer distances. The merchandise import specialization by importing OECD countries has become also stronger in medium low and low technology intensive merchandise trade.

The effects of R&D on merchandise trade and the level of economic development

The effect of R&D on merchandise trade and the level of economic development, it is included in the adapted gravity regression model by the interaction effect of the R&D variables and GDPCAP variables. Table 6 presents the regression results by technological intensity of trade. The positive and significant regression coefficients for the economic size GDP variables and for the GDPCAP variables in general increased for exporting and importing countries. The negative absolute size of the Distance variable on bilateral merchandise trade has increased, and particularly substantially has increased the impact of the R&D variable on merchandise exports in the OECD exporting countries as well as for medium high and medium low technologically intensive trade in importing OECD countries. These findings clearly confirm the important and statistically significant role of the R&D variables for increases of bilateral merchandise exports in exporting OECD countries, and for import specialization by increase in merchandise trade of medium high and medium low intensive products in importing OECD countries. However, the regression coefficients that are pertaining to the interaction R&D*GDPCAP variables are negative and statistically significant, except for insignificant regression coefficient that is pertaining to the interaction R&D*GDPCAP variable for medium high intensive merchandise export for exporting countries, but also negative and statistically significant for medium high and medium low merchandise trade in importing countries, indicating the increasing importance of developing OECD countries in competitive merchandise exports in high, medium low and low technologically intensive merchandise exports as well as less successful import specialization in medium high medium low technologically intensive products in developed OECD countries in bilateral merchandise trade between the OECD countries.

Conclusion

Using adapted gravity trade model on panel data variables for OECD countries, we have investigated merchandise trade by technological product intensity with specific focus on association between merchandise trade in association with R&D, distance, and level of economic development. Different countries perform differently in output and trade

specialization by technological intensity of products. We focus on merchandise exports by four technological intensity groups of products (low technological intensity, medium-low technological intensity, medium-high technological intensity, and high technological intensity) between OECD countries. Differential in export performances by technological intensity of products between OECD countries has been explained by differential in research and development (R&D) expenditures, distance with transportation costs, and level of economic development. The greater R&D expenditure mitigates the importance of the distance for exporters by expanding their export opportunities, and reduces the distance for importers' countries. With the R&D investments, the developing OECD countries are catching-up in merchandise trade. The R&D expenditures in the economically most developed OECD countries have not been sufficient to sustain a competitive position in merchandise exports as well as in manufacturing import specialization particularly for medium high and medium low technologically intensive products.

The baseline adapted gravity model on panel dataset confirms that merchandise exports is explained by the economy size (GDP) in exporting and importing OECD countries, level of economic development (GDP per capita) in exporting and importing OECD countries, distance between the countries' capitals, and the OECD countries proximities in terms of having a common border, speaking a common language, and having a free trade agreement. In addition to the baseline model, we tested the impact of the R&D expenditures on merchandise exports by technological intensity of products and find that greater R&D expenditures are likely to improve innovation and thus positively affect the increase of exports in differentiated products by the decrease in transportation costs. Moreover, we confirm that greater R&D expenditures mitigate the effects of distance on exports. Finally, greater R&D expenditures helped to overcome the level of economic development in exports.

To sum up, we find that R&D is positively associated with merchandise trade in exporting and importing OECD countries. Estimations suggest that R&D mitigated the effect of distance particularly for low and medium-low technologically intensive products in OECD exporting countries, and particularly for medium-high and high technologically intensive products in OECD importing countries. R&D fostered merchandise exports from less to more economically developed OECD countries. Gross domestic product and gross domestic product per capita in exporting and importing OECD countries positively affect merchandise trade by technological intensity, and vice versa distance. Having a common border, common language, and regional free trade agreement membership positively enhances merchandise trade between the analyzed OECD countries by technological intensity of products.

The Internet Innovation: Creative Destruction of traditional business models

Ralf Lehmann, ralf.lehmann1@gmail.com,
Comenius University Bratislava, Slovakia

Abstract

Over the last 30 years the Internet has grown exponentially and is today influencing many kinds of business. Internet Companies have established new kinds of business models, significantly different from traditional business. Many „free“ offerings are indirectly paid by some kinds of new currencies of the Internet: Attention (number of clicks), recognition (number of links, followers or friends), personal data and information. This can endanger competing traditional business models. Some examples are discussed and indicators for higher risk are described.

Development of the Internet

Internet develops to the “World Wide Web”

The Internet started as an universal platform for the exchange of data between different computers in 1980 with the first 20 Internet – Hosts, growing to over 1000 Internet – Hosts in 1990. The deciding step leading the Internet to be the ubiquitous media of information exchange did Berners-Lee 1990 with the conception of the “World-Wide-Web”. The abstraction of the technical IP-addresses by user-friendly Web-addresses in “Hypertext”-protocol and the derived Email – Addresses became the most important applications in the Internet, so that it grew to more than 750 Million Internet Hosts today. Beginning with the first Website of Berners-Lee in 1991 the Information in the World-Wide-Web grew until now to more than 100 Million Websites. The underlying technology development shows that the three key indicators – computing power, storage capacity and network capacity – have doubled every 18 to 24 months over the last 50 years, causing related costs to halve every 18 to 20 months. This trend – first stated in “Moore’s Law” in 1965 is to be continued for at least the next decade and shows further potential for growth. Corresponding to the number of Internet Hosts the number of Internet Users grew up to a saturation of 97% in the German population group of young adults. Figure 1 shows, by comparing this group with the population group of 50-59 year old people, that over the next generation when the so called “Digital Generation” growth up, the same level of saturation will be reached in the complete German population.

FIG 1: USAGE OF INTERNET IN DIFFERENT AGE GROUPS, DATA FROM STATISTISCHES BUNDESAMT (2009A)

Web2.0 and Social Media

In the first phase of the World Wide Web the Information flow in the Internet was mainly directed from the Internet Hosts to the users, with the creation of the Websites depending on Internet specialists and programmers. This changes fundamentally with new web applications and platforms enabling participation of the users without special Internet knowledge. In 2005 O'Reilly established the term „Web2.0“ for the upcoming architecture of participation in the World Wide Web. As core competency of the upcoming Web 2.0 enterprises in the Internet he sees some criteria, where excellence in one of them is more significant than smaller steps in all. These are: the control over unique, hard-to-recreate data sources that get richer as more people use them, trusting users as co-developers, Harnessing collective intelligence, Leveraging the long tail through customer self-service, Software above the level of a single device, Lightweight user interfaces, development models and business models. Figure 2 shows the usage of the medias of participation as Chat, Forum, Instant Messaging, Blog and up-/download of audio visual content compared to the traditional categories as searching for information and Email over the Internet Users in groups of different age in Germany. The Figure shows that the usage of the Internet is significantly different, with a totally different usage profile in the “Digital Generation”.

FIG 2: TYPES OF INTERNET USAGE DIFFERENTIATED BY AGE, DATA FROM STATISTISCHE BUNDESAMT (2009B)

Even more significant is differentiation of the age groups regarding the usage of “Social Network Sites”. A Social Network Site is a Web Application enabling the User to create a public or semi-public profile inside the borders of this Web Application, to create a list of connected other Users, called e.g. “Friends”, “Contacts” or “Followers” and to show the list of the own connections, to see the list of connections of others and to interact with this lists. Figure 2 shows the huge difference in the usage of this Social Networks over the age groups. Projecting all this developments in the future, a significant change can be expected for the Usage of Media in enterprises with the openness and participation of Web2.0 and Social Networks. This is summed up by a statement of the author of “The digital Generation” Tapscott: „This new generation of workers is forging a new way of doing Business – using Web 2.0 communication tools to create a collaborative workplace that democratizes and accelerates the performance of an or-

ganization“ (Tapscott, 2009, S. 182). A similar picture shows a study of IBM: „...a typical 21-year-old in the United States entering the workforce today has played video games for 5.000 hours, exchanged 250.000 e-mails, instant messages and phone text messages, has 10.000 hours of cell phone use and has spent 3.5000 hours online“ (IBM, 2008, S. 7)•

New Business Models of the Internet

Changes in Behavior and Motivation

The Need Theory of Maslow, as shown in Figure 3, is still one of the best-known behaviour theories (Maslow, 1943)•. His theory based on the assumption, that psychological needs coming from the biological heritage of men, control our behaviour. He proposes five layers of needs, for which men will aim for, respective which missing fulfilment will trigger an action and likewise block the perception of the next higher layer.

This layers are in the sequence from the base to the top: first the „physiological needs“, as the fundamental biological needs food, sleep and sex, second the “safety need” as the pursuit for a predictable safe, that means not existentially threatening environment, third the „Belongingness“ is the need for a feeling of belonging to other persons or groups of persons, fourth the „Esteem“ as the need for recognition and respect by others or for own respect and fifth the “Self-actualisation” finally as the urge to fulfil the own potential and to develop it’s own personality as far as possible.

FIG 3: MASLOW'S PYRAMID OF NEEDS

Based on Maslow’s Motivation theory Alderfer proposed 1972 his ERG-theory with only categories of needs: „existence“, „relatedness“ and „growth“, which are related to Maslow’s five layers. „Existence“ matches the physical- and safety needs, „Relatedness“ matches the social needs „Belonginess“ and „growth“ finally matches the individual need „Esteem“ and „self-actualization“. In the modern welfare society we can see, that the physiological needs“ and the safety needs are normally satisfied. The percentage of food spend of the average family income is only 11% in Germany and 7% in the USA, in contrast to 48% in Namibia or even 63% in the Sudan (Statistisches Bundesamt, 2011). Therefore the higher layers come into focus and the traditional economic bases, as „working for money“ loose their fundamental importance. Many people strive for the needs of “Esteem” and “self-actualization” by spending more and more of their time for “Open Communities” and participation in the Web2.0. The differences to the economic model of the “Homo Oeconomicus”, always acting rational and primarily optimizing his material benefit is growing. The traditional economic science is loosing the base. A new discipline of economics, the “Happiness Research” tries to close this gap, by including the “Life Happiness” of people in the analysis (compare Frey et al, 2008). Coming from the assumption of men striving for “Life Happiness” as their ultimate goal this

interdisciplinary science asks if we should not think in the category of “Gross National Happiness” instead of “Gross Domestic Product”.

New Currencies in the World Wide Web: Attention, Clicks, Data

A characteristic of many business models of the Internet is the network effect. This enforces low entry cost into new business models and encourages business models, which are free for the user. The new business models of the Internet are governed by the laws of market economy, and are overlaid by the monetary, not directly measurable, values of “attention” (traffic) and “recognition” (number of links, “friendships”, “followers”). These values are especially significant for the “digital generation”. This increases the importance of non-monetary components, as shown by the free collaboration of users in Web 2.0 and the spreading of free “open source” software. An explanation for the increasing significance of non-monetary motives is supplied in the “needs theory” of Maslow. It is shown that people do not always act according to rational reasons. “Happiness research” is described as a possible explanation of their behaviour. IBM describes the expected impact on the providers of telecommunications services in „The changing Face of communication“ as a significant shift of the traditional communications market to communications in the “Shared Social Space” and to the “Open and Free” model: „A new ecosystem is emerging from these long term shifts in communication trends that will require bold significant changes by existing telecom providers. The option of doing nothing is not a luxury many providers can afford, as revenues from traditional services continue to decline and highly resourceful Internet information providers and IT companies enter the communications space to claim a larger share of communication time.“ (IBM, 2008, S. 2)

Examples for new Business Models: Amazon, Google and Wikipedia

The impact of this change can be seen in the new business models of the World Wide Web. We have to change from exclusively looking at the material and monetary exchange and look at a new „currencies“ in the World Wide Web: Attention (online time), Acknowledgement (Clicks) or other transactions (Input of Data and other User Content). With this exchange is in sequence with the traditional market transactions we can systematically describe the new business models, by differentiating the goods traded and the property rights of this goods:

- What is traded: real goods, real services, digital goods (pictures/videos, music), software, virtual goods, information, internet services
- Against what: money, attention/online-time, Clicks on e.g. banners, user data and information on user behaviour,
- In whose property: Goods/services of own production, goods in own possession, goods in possession of third parties.

Following this systematic Figure 4 show the leading business model of the, with 21,8 Billion Dollar turnover and 129 Billion Dollar market capitalization, leading global Internet company “Google”.

FIG 4: BUSINESS MODEL "ADWORDS" OF GOOGLE

Google is a company founded in 1998 as search engine based on the innovative searching algorithm „Page Rank“, with the target „to organize the available information of the world and to make it open and usable for everyone“. In its Business model „AdWord“, shown in Figure 4, Google enables its advertising customers to place their message over simple web based interfaces to a pricing related to the attractiveness of the related search question. Then Google places the advertising message in relation to the interests of the users of its websites, which are always developed and enlarged by new innovative offerings, free of monetary charge for its customers. With this business model Google has earned almost 4 Billion Dollar in the third Quarter 2009, that is 66,5 percent of its turnover and even more share of its earnings of 1,7 Billion Euro. Google's second business model "AdSense" makes it possible for partner Websites of Google to place adverts of Google's advertising customers – chosen by Google fitting to the content of advert and website. Figure 5 shows this business model, that earns 30,5 percent of Google's revenue.

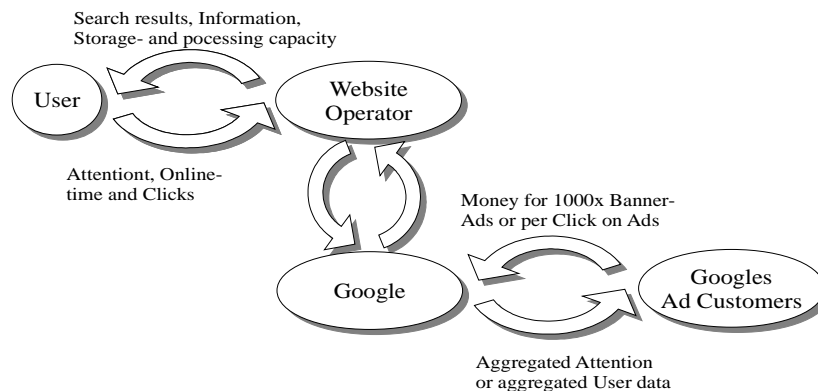

FIG 5: BUSINESS MODEL "ADSENSE" OF GOOGLE

This revenues of the second business model are to be seen in relation to the "Traffic Acquisition Costs" of 1,6 Billion Dollar, where 90 percent are paid to the "AdSense"-Partners of Google. The much higher margin of the first business model explains the high motivation of Google to the on-going development of its own innovative web offerings – documented in the R&D expenses of 13 percents of the revenue, feeding the "Googlelabs" with experimental new web applications, which are brought in the mainstream offerings when successful. The destruction of business models of competitors, offering similar, but paid services can be the consequence. An example is the former paid Email Service of YAHOO, being highly profitable with the offering of free Email Accounts with restricted memory capacity of 10 MByte, which could be enlarged against monthly fees. When Google offered free of charge Email Accounts with the 100 times larger capacity of 1 GByte, the market changed permanently. Similar Impact has the "Google Maps" application for the commercial offerings of other routing planners and some navigations systems.

The World Wide Web as driver of the fifth Long Wave of Innovation

Theory of the Long Waves of Innovation

FIG 6: WAVES OF BUSINESS CYCLES

Looking from macroeconomic perspective on economic segments or markets, where such a process of innovation happens, this innovation replaces an existing factor combination. Schumpeter calls this replacement “Creative Destruction”. He describes this process as “.. process of industrial mutation.. that incessantly revolutionizes the economic structure from within, incessantly destroying the old one, incessantly creating a new one. This process of Creative Destructions is the essential fact about capitalism” (Schumpeter, 1942, S. 83). While the initiation of a successful innovation often starts with many prospering new enterprises and a raising productivity in the Boom Phase, the replacement of the old factor combination mostly leads to the adjustment of the factors of production. There will be unproductive factories and people with skill no more needed, leading to a phase of Downturn. This will lead to the phase of Depression, often under the level of productivity before the change, until the adjustment process in the phase of recovery brings a new higher equilibrium. Figure 6 shows this sequence.

This long-ranging Business Cycle is known as „Kondratieff-Cycle“, covering a period of 50-60 years and is based on the described adoption processes to changing base technologies over generations, often requiring complete other

FIG 7: LONG WAVES OF CHANGES

professional education and training or complete new infrastructure layers. “Each Kondratieff-Cycle is a specific

historic reorganisation process of the society, leading to complete new value chains “ (Nefiodow, 2006, S. 211). Figure 7 shows the five waves of change, as described by Schumpeter and Nefiodow.

Examples of Creative Destruction: Photography, Music, Books

Looking into the change by the wave of information technology we can see that the enterprises of different segments are affected in different ways and in different timing. Figure 8 shows some segments, which are already affected.

FIG 8: SEGMENTS AFFECTED BY THE WAVE OF INFORMATION TECHNOLOGY

The **music industry** was one of the first segments affected. One reason for the early impact on this segment can be found in the quite easy digitalization of music. Some reasons for the specific hard impact of change in the music segment gives a Study of the Max-Planck-Institut “Das Internet und die Transformation der Musikindustrie“ (Donata, 2008), resulting from an only small ability of anticipation and adaptation. These four reasons are: difficult anticipation and complex implementation, organizational inertness, underestimated technology and overestimated power of music companies. These reasons may intensify the impact of the change, but finally the crisis of the music companies is consequence of digitalization, showing two phases. In the beginning we saw a short time effect, even triggering a boom of selling music by having many former analogue collections of music digitalized. But the following phase with the changing behaviour of music consumers - which are less and less music buyers - will show it’s complete impact only after one or two generations. The respective destruction of the business model of selling music “record carriers” is still on going and will especially hurt the music publishers as intermediaries between musicians and music consumers. Musicians and music consumers may even profit by the change: the consumers by falling prices and broader offerings, also outside of the mainstream music, the musicians by more independency from the publishers and more direct contact to the consumers.

In the **photo industry** the first phase of digitalization has finished with almost the same business model. The segment sees itself again on track as stated by the German photo industry alliance: „Die Foto- und Imagingindustrie ist mit der Absatzentwicklung ihrer wichtigen Produkt-segmente in 2009 – trotz Wirtschaftskrise – durchaus zufrieden und blickt optimistisch in das photokina-Jahr 2010“ (Photoindustrieverband, 2009) . But this is not taking in account the second phase of changing with different behaviour of the consumers. These changes will in mid term cause a significant decrease of the production of physical photos – which are now printed and not chemical developed as before the digitalization. The integration of the camera functionality in the omnipresent Mobil phones and Smartphones and the changing consumer behaviour away form physical photos will hurt the segment again decisively.

The next change of the **book industry** is the EBook in all its manifestations. Since 2009 the „Kindle“ is global available and also usable in Germany with Internet connection in 100 countries without additional costs.

However, the offering of more than 450.000 books is mainly in English language and because of the German price regulation in the book industry the German publishers until now do not support the Kindle and try their own proprietary EBook solutions. But because these do not cover the scope of the business model Amazon, the leading Internet bookseller, and on the other hand try to copy the protected pricing of the physical books, the success is very limited and Amazon dominates with 90 percent market share. A further push comes from Apples initiative in the EBook market with the iPad and the business model “iBookstores” comparable to Apples dominating music store “iTunes” based on the open standard for EBooks Epub. Most of the American publishers and even some German publishers have announced their participation. Like in the music industry this new business models will mostly hurt the publishers by reducing their profit and authors as well as consumers may profit. Even radical new models appear: the authors can publish EBooks completely without a traditional publisher – and also in small niches with only few globally distributed consumers. So also the impact of this changes will dramatically influence all intermediaries like publishers and bookstores but may be positive for authors and consumers.

Summary and the next Creative Destructions coming

Risk Factors and recommended proceedings

The changes triggered by the Internet can be seen especially where the digitalization can include the goods and services in the sphere of the Internet. Figure 9 gives a good overview of the industry and service segments involved.

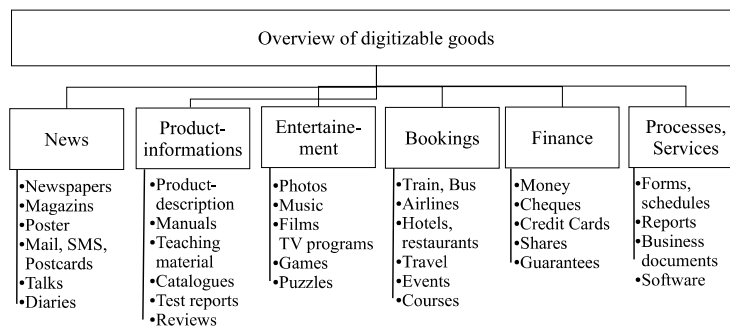

FIG 9: OVERVIEW OF GOODS THAT CAN BE DIGITALIZED, OWN PICTURE AFTER STAHLKNECHT (2009, PAGE 798)

Further the Internet gives transparency on a global level and connects directly users or consumers with the producers of the respective goods – giving all intermediaries in the traditional value chains a challenge to explain their costs in competition to the new Internet Business Models. Some examples show further segments with radical changes coming.

Next Sectors in Change:

Even when the **Software industry** has only 40 years of history, with the biggest software company Microsoft founded in 1975, it is facing a tremendous change with complete different business models threatening the position of the market leaders. The threat is coming from three different sides: first the upcoming open software projects like Linux and OpenOffice are with the contribution of thousands of volunteers a real competition to the paid alternative. Even when Windows and Microsoft Office still dominate the respective markets the free competitors have a significant impact on the pricing. Second threat is the growing offering of applications out of the Internet Cloud:

What means the user needs only a (free of charge) Web-Browser to use the Software running in distant data centers – and in combination with the Cloud Service Provider using open and free software this threat is even bigger. The third and newest threat is new business model of Apps Stores introduced by Apple with the iPhone and just transferred to the Apple Personal Computers. Software sold over the respective App-Store is sold to significantly lower prices and with some 30 percents provision paid to the App-Store Owner.

The business model of **telecommunications** enterprises with the billing of minute prices is more and more reduced and will vanish completely with the diffusion of Internet telephony. Whereas some twenty years ago even local calls from stationary telephones brought good margins this reduced more and more on one side to long-distance and out of country calls and on the other side to mobile telephony. And even this vanishes with voice as an application based on a flat rate Internet connection – independent from the differentiation of mobile or stationary telephony.

The segment of **credit card payment** is today dominated by the three enterprises Visa, American Express and Master Card. It has a yearly earning of around 8 Billion Dollars and is until now so stable that in America examination have started, to check if the three dominating enterprises protect their market against upcoming competitors. But also this segment is threatened by an innovations: the Near Field Communication (NFC) is a module of the next generation of mobile phones and smartphones that enables secure payment over this technology. With Apple announcing to integrate this technology in it's new iPhone generation it can be expected that Apple and others will integrate innovative payment methods based on this technology in their existing business models – and so take away an significant part of the business of the three traditional credit card companies.

This are only three examples. More can be easily found, and others will show up over time. All companies should be aware of the challenges of digitalization and especially of new Internet Business Models based on other currencies and therefore endangering all traditional models based on payment of money.

Abstract

Today a large number of different initiatives to promote entrepreneurial actions have been initiated to respond to different societal challenges (such as aging population, regional inequalities, etc.). However, there seems to be a lack of systematic approaches to evaluate the impact of these various entrepreneurial initiatives at the individual level. As a result to this challenge, an effort is currently under the way to develop an instrument (called *Entre Intention*) to measure the impact of entrepreneurial initiatives at the individual level.

The aim of this research paper is to present the results of a pilot study through which the new instrument was piloted. The developed instrument was largely based on the Theory of Planned Behavior (TPB) by Ajzen (1991). The empirical data of the pilot study came from Spain and Finland, where the instrument was used amongst first year undergraduate students. In this paper, we will describe the content of the instrument and the preliminary observations.

Introduction

At current societies, especially in Western countries, a large number of different initiatives to promote entrepreneurial actions have been initiated to respond to different societal challenges (such as aging population, regional inequalities, etc.). However, there seems to be a lack of systematic approaches to evaluate the impact of these various entrepreneurial initiatives at the individual level. This kind of information would help the further development of these initiatives. As a result to this challenge, an effort is currently under the way to develop an instrument (called *Entre Intention*) to measure the impact of entrepreneurial initiatives at the individual level.

The developed instrument is largely built on the Theory of Planned Behavior (TPB) by Ajzen (1991) because of its detailed and consistent theoretical specification and the great amount of cross-disciplinary research devoted to testing, advancing and criticizing the model (Armitage and Conner, 2001; Sheeran, 2001). According to Ajzen (1991), the TPB is designed to predict and explain human behavior in specific contexts by looking at the individuals' intention to perform a given behavior. Intentions are assumed to be "indications of how hard individuals are willing to try, of how much of an effort they are planning to exert, to perform the behavior" (Ajzen, 1991, p.181). The stronger the intention to engage in a behavior, the more likely should be its actual performance. As such, the intention to perform a behavior has been described as the best single predictor of an individual's actual behavior (Bagozzi et al., 1989; Fishbein and Ajzen, 1975; Krueger and Carsrud, 1993). We set a purpose to develop an instrument to measure the impact of entrepreneurial initiatives on the development of entrepreneurial intentions and its antecedents, that is, attitudes, perceived behavioral control, and subjective norm.

While the overall purpose our research program is to develop and test an instrument to measure the impact of entrepreneurial initiatives on the development of entrepreneurial intentions and its antecedents, in this paper our objective is to present the results of the pilot study where we tested the instrument for the first time. The empirical context of the pilot study is made of two higher education institutions (one in Finland, one in Spain) and concerns their first-year students at undergraduate programs. In the end of this paper, we will discuss the implications of the empirical observations of our pilot study.

Literature review and conceptual framework

The TPB suggests that intention is the immediate antecedent of behavior and, thus, the stronger the intention to engage in specific behavior, the more likely should be its actual performance (Ajzen 1991). The core of the TPB is the idea that intentions have three conceptually independent determinants, namely attitude towards the behavior, subjective norm and perceived behavioral control (Ajzen, 1991, p.188).

Attitude towards the behavior refers to the degree to which a person has a favorable or unfavorable evaluation or appraisal of the behavior in question. The more positive an individual's perception is regarding the outcome of starting a business, the more favorable their attitude towards that behavior should be and, consequently, the stronger the individual's intention to go ahead and start a business should be.

Subjective norm refers to the perceived social pressure to perform or not to perform that behavior. It is based on beliefs concerning whether important referent individuals or groups approve or disapprove of an individual establishing a business, and to what extent this approval or disapproval matters to the individual. Generally speaking, the more the opinion of a particular referent group or individual matters to the individual and the more encouraging the individual thinks it is of enterprising activity, the stronger should be the individual's intention to start a business.

Perceived behavioral control refers to the perceived ease or difficulty of performing the behavior. It is based on beliefs regarding the presence or absence of requisite resources and opportunities for performing a given behavior. In general, the greater this perceived behavioral control, the stronger the individual's intention to start up in business should be.

Closely related to the perceived behavioral control is the perception of one's *entrepreneurial skills*. The better one evaluates his/her skills in carrying out entrepreneurial task, the more positive impact this should have on the development of entrepreneurial intentions. Entrepreneurial skills refer to abilities that are usually linked to entrepreneurs such as risk taking propensity (Cantillon), ability to organize (Say) and innovativeness (Schumpeter). As such, a new scale was included in the instrument to measure respondent's entrepreneurial skills.

The following figure presents the developed model of our study.

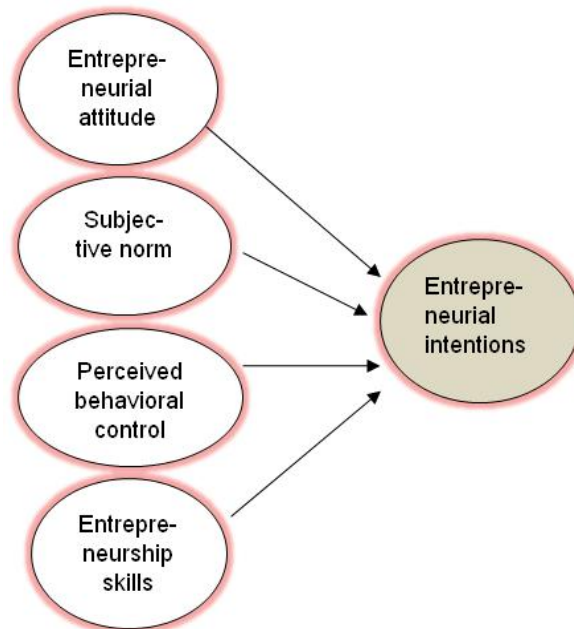

FIG. 1. CONCEPTUAL MODEL

Ajzen's (1991) model has been widely used in entrepreneurial research, and especially amongst student populations. For example, Krueger (1993) and Krueger, Reilly and Carsrud (2000) looked at the entrepreneurial intentions of US university business students, whereas Fayolle, Gailly and Lassas-Clerc (2005) focused on students in a French elite business school. Kolvereid (1996) investigated the employment status choice intentions of Norwegian undergraduate business students and Tkachev and Kolvereid (1999) studied the entrepreneurial intentions of Russian students.

Moreover, all the above mentioned studies have found support for the Theory of Planned Behavior (that is, attitudes, subjective norm and perceived behavioral control) all contributed significantly to the explanation of the variance in intentions, with some interesting nuances. Kolvereid's (1996) results show that demographic variables such as gender, family background and former self-employment have only an indirect influence on intention. The study of Krueger and his colleagues (2000) offered strong statistical, though not complete, support for the model. More specifically, the subjective norm was non-significant. The authors suggest that subjective norm may only be important in ethnic groups who have strong traditions of entrepreneurship. These results are consistent with Boissin et al. (2009), who also used the TPB model of Ajzen to analyze the differences among French and American students. Their results show that entrepreneurial intentions are more positive and advanced among American students than among French students. TPB explained more than 50% of total variance in both countries. However, the subjective norm was insignificant factor in explaining the formation of entrepreneurial intentions. Thus, Boissin et al. (2009) question the influence of subjective norm in the TPB model as well as the effect of culture and context on subjective norm. In their recent study, Engle and his colleagues (2010) come to a different conclusion. The authors observed among twelve-country study that the antecedents of entrepreneurial intentions vary according to the studied countries and that subjective norm was significant contributor to the development of entrepreneurial intentions in every country. As such, the explanatory power of social norm requires further research in international context.

Based on the previous review, in our empirical testing we are interested in investigating (i) whether the level of entrepreneurial intentions varies as a function of country origin, (ii) whether the relative importance of the three antecedents of entrepreneurial intentions varies as a function of country of origin, and (iii) whether the background variables exercise similar effects on the formation of entrepreneurial intentions in different countries.

Methodology

Data collection method

The Entre Intention instrument has been developed and piloted in Finland. The scales for this Finnish version were developed largely based on Kolvereid (1996). However, in some parts of the instrument, new scales (e.g. attitudes, entrepreneurial skills) were proposed and tested using national data during 2008-2009. Common method variance did not seem to be of concern (using Harman's one factor test).

The data for the pilot study was collected using a self-administered questionnaire in fall 2010. In each degree program, a teacher was responsible in administering a printed questionnaire to the first-year and second year students in their educational field (in Finland 6 and in Spain 7 different educational fields). From Finland we got 668 responses (response rate app. 85%) and from Spain 967 responses (response rate app. 48%).

Variables

Entrepreneurial Intentions. An index of entrepreneurial intention was created by averaging the eight items (min = 1, max = 7, mean in total sample = 3.7, Std. Dev. = 0.9). The variable demonstrates good reliability (Cronbach's Alpha = in total sample 0.87, in Finnish sample 0.92, in Spanish sample 0.83)

Subjective Norm. The variable Subjective Norm has three items. Originally each item had a seven-point scale from 1-7. For the statistical analysis the scales were transformed to -3 - +3 scale. In addition, motivation to comply was measured by three items (seven-point scale from 1 to 7) referring to each of the aforementioned belief questions. The belief based items (coded as ranging from -3 to 3) and the corresponding motivation to comply items (coded as ranging from 1 to 7) were multiplied, and then added to create an index of Subjective Norm (min = -63, max = 57, mean in total sample = 0.3 Std. Dev. = 16.3). The variable demonstrates good reliability (Cronbach's Alpha = in total sample 0.87, in Finnish sample 0.85, in Spanish sample 0.88).

Perceived Behavioral Control. An index of Perceived Behavioral Control was created by averaging the five item scores (min = 1, max = 7, mean in total sample = 3.9, Std. Dev. 0.9). The variable demonstrates good reliability (Cronbach's Alpha = in total sample 0.74, in Finnish sample 0.86, in Spanish sample 0.72).

Attitudes towards entrepreneurship. An index of Entrepreneurial Attitude was created by averaging nine item scores (min = 1, max = 7, mean in total sample = 5.2, Std. Dev. = 0.8). The variable demonstrates good reliability (Cronbach's Alpha = in total sample 0.83, in Finnish sample 0.84, in Spanish sample 0.84).

Entrepreneurial skills. An index of entrepreneurial skills was created by averaging eight item scores (min = 1.9, max = 7, mean in total sample = 5.0, Std. Dev. = 0.9). The variable demonstrates good reliability (Cronbach's Alpha = in total sample 0.85, in Finnish sample 0.86, in Spanish sample 0.86).

When all the items used to create the main variables were factor analyzed (Principle component with Varimax rotation), the resulting structure reflected eight components. The items attributed to Entrepreneurial intentions loaded to its respective variable, the items attributed to Subjective norm, Perceived behavioral control and Entrepreneurial skills were spread to two different components. The items of the Entrepreneurial attitudes were spread to three different components.

Control variables

In order to control for effects that might otherwise influence the formation of entrepreneurial intentions among students, we controlled for various effects. *Gender* is operationalized as the gender of the respondent and is included as a dummy variable, with a value of one for female respondents and zero for male respondents. *Age* is operationalized as the age in years of the respondent. *Nationality* is included as a dummy variable, with a value of one for Finnish and foreigners and zero for foreigners. *Earlier start-up experience* is controlled for by the inclusion of a dummy variable with a value of one for respondents who had started earlier their own business and a value of zero otherwise. *Entrepreneurial role models* is controlled for by the inclusion of a dummy variable with a value of one for respondents who knew an entrepreneur in their close family a value of zero otherwise. *Earlier entrepreneurial courses* is controlled for by the inclusion of a dummy variable with a value of one for respondents who had participated in entrepreneurial courses before their current studies and a value of zero otherwise. *Earlier work experience* is controlled for by the inclusion of a dummy variable with a value of one for respondents who had more than 6 months work experience before the current studies and a value of zero otherwise. *Mother's professional background* was included in the analysis as a dummy variable with the value one given to respondents who indicated that mother used to be an entrepreneur and a value of zero otherwise. *Father's professional background* was included in the analysis as a dummy variable with the value one given to respondents who indicated that father used to be an entrepreneur and a value of zero otherwise.

Common method variance

We tested the possible effects of common method variance for the variables collected using Harman's one factor test (Harman, 1976). If common method variance was a serious problem in the study, we would expect a single factor to emerge from a factor analysis or one general factor to account for most of the covariances in the independent and dependent variables (Podsakoff and Organ, 1986). All the items used to create the main variables, a total of 36 items, were factor analysed using principal axis factoring where the unrotated factor solution was examined, which was recommended by Podsakoff, MacKenzie, Lee and Podsakoff (2003: 889). Kaiser's criterion for retention of factors was followed. The sample size seemed to be high enough for the factor analysis, at least based on the Kaiser-Meyer-Olkin measure of sampling adequacy (KMO = 0.903).

Factor analytic results indicated the existence of eight factors with Eigen values greater than 1.0. The ten factors explained 57 percent of the variance among the 36 items, and the first factor accounted for 23 percent of the variance. Since several factors, as opposed to one single factor, were identified and since the first factor did not account for the majority of the variance, a substantial amount of common method variance does not appear to be present. Thus, we conclude that common method variance bias is not a threat to the validity of the results. One should bear in mind though that this procedure does nothing to statistically control for the common method effect: it

is just a diagnostic technique (Podsakoff et al. 2003: 889). As a result, the presence of common method problems cannot be fully discarded.

Respondents

The mean age of the respondents in Finland was 21,4 and in Spain 20,2 years. In Finnish data 58 % of the respondents were female, while in Spain it was 57 %. In Finland, 61% of the respondents had an entrepreneur in their close family, and 4 % of the students had an earlier experience of establishing an own business at the moment when they started their studies at the university. Correspondingly, in Spain also 4 % of the students had an earlier experience of establishing an own business, and 52 % of the students had an entrepreneur in their close family. The Table 1 describes the other background variables and earlier experiences of the respondents.

TABLE 1. BACKGROUND CHARACTERISTICS OF THE RESPONDENTS

Background characteristics of the respondents	Finland	Spain	Total
Starting a business at the time of survey	1 %	3 %	2 %
Earlier an entrepreneur (succession)	1 %	3 %	2 %
Earlier an entrepreneur (start-up)	4 %	4 %	4 %
An entrepreneur in close family	61 %	52 %	55 %
Earlier participation in entrepreneurship courses	25 %	14 %	19 %
Earlier work experience more than 6 months	54 %	51 %	52 %
Mother's professional background as an entrepreneur	17 %	15 %	16 %
Father's professional background as an entrepreneur	33 %	27 %	30 %

Results

The use of the same instrument in two different countries revealed some interesting results. As can be seen in Table 1, the level of entrepreneurial intentions varies according to the country of origin as the Spanish students had statistically significant higher level of entrepreneurial intentions. In fact, the Spanish students had consistently higher values in the most of the variables studied. More specifically, Spanish students seem to demonstrate higher level of entrepreneurial intentions, possess more positive entrepreneurial attitudes and perceive having higher entrepreneurial skills compared to their Finnish colleagues. The Finnish students, on the contrary, perceive having higher behavioral control over starting a new business compared to their Spanish colleagues. As such, it seems that while Finnish students perceive of being capable of starting new businesses more than their Spanish colleagues, they have less desire to start businesses compared to their Spanish colleagues. It is also notable that perception of behavioral control and entrepreneurial skills do not seem to follow a clear logic: Finnish students score higher in perceived behavioral than their Spanish colleagues but lower in entrepreneurial skills.

TABLE 2. GENERAL RESULTS IN FINLAND AND IN SPAIN

Variable / Sample	Entrepreneurial intentions	Subjective norm*	Entrepreneurial attitudes	Perceived behavioural control	Entrepreneurial skills
Spanish	3.8 (0.98)	0.59 (17.69)	5.3 (0.86)	3.7 (1.02)	5.2 (0.94)
Finnish	3.5 (1.07)	-0.04 (14.05)	5.0 (0.78)	4.1 (0.65)	4.9 (0.82)
Probability	P=0.000	No significant	P=0.000	P=0.001	P=0.001

Note: Data shows mean (std. dev.).

* All the variables are measured with scales from 1 to 7 except subjective norm scale that is measured from -57 to +60.

Table 3 shows the comparisons in different study fields between Finland and Spain. The differences are statistically significant in the field of Business and Social Sciences and in the field of Engineering (p=0.000). In both of these fields Spanish students scored higher values in entrepreneurial intentions. Only in the field of Natural Resources and Environment Finnish students possess higher entrepreneurial intentions.

TABLE 3. ENTREPRENEURIAL INTENTIONS IN DIFFERENT FIELDS OF STUDY IN FINLAND AND SPAIN

Intentions in different study fields	Whole sample		Finnish		Spanish		Probability
	mean	st.dev.	mean	st.dev.	mean	st.dev.	
Humanities and education	3.3	0.9	-	-	3.3	0.9	-
Business and Social Sciences	3.9	1.1	3.4	1.1	4.1	1.0	0.000
Culture	3.6	0.9	3.6	0.9	3.7	0.9	0.610
Engineering	3.7	1.0	3.4	1.0	3.9	0.9	0.000
Natural Resources and Environmet	4.0	1.3	4.1	1.4	3.9	1.1	0.635
Natural Sciences	3.5	0.9	-	-	3.5	0.9	-
Tourism and Catering	4.1	1.1	4.0	1.1	4.2	1.0	0.552

We also tested how well the antecedents of the intentions explain the formation of entrepreneurial intentions by using standard linear regression. The Table 4 presents the results of standard linear regression.

TABLE 4. LINEAR REGRESSION

Explained (adjusted R ²)	variance	Whole sample	Finnish sample	Spanish sample
		45%	52%	43%
Attitudes		0.28 (.000)	0.27 (.000)	0.23 (.000)
Subjective norm		0.43 (.000)	0.40 (.000)	0.46 (.000)
Perceived behavioral control		0.13 (.000)	0.21 (.000)	0.16 (.000)
Entrepreneurial skills		0.06 (.002)	0.05 (.092)	0.03 (.438)

Note: Standardized coefficients reported.

As can be seen from the Table 4, the relative importance of different antecedents of entrepreneurial intentions does not vary according to the country of origin. Both in Finland and Spain the best antecedent of intentions seems to be Subjective norm followed by Attitudes and Perceived behavioral control. The role of Entrepreneurial skills in explaining the formation of entrepreneurial intentions is somewhat questionable, at least in the Finnish and Spanish sub-samples. In the Spanish sub-sample, there are much more spread between the explanatory power of different antecedents (from 0.16 to 0.46), whereas in the Finnish sub-sample there is less differences between the explanatory power of different antecedents (from 0.21 to 0.40). The role of Subjective norm in explaining the formation of entrepreneurial intentions is relatively high among the Spanish students compared to their Finnish colleagues, whereas the role of Perceived behavioral control is more present among Finnish students. Last, the four antecedents seem to explain the formation of entrepreneurial intentions better among the Finnish students than among the Spanish students when we comparing the explained variance.

The next step in our analysis was to include relevant control variables in to the models (nationality, age, gender, existence of entrepreneurial role models, mother's professional background as an entrepreneur, father's professional background as an entrepreneur, former work experience and earlier participation in entrepreneurship courses). As can be seen in Table 5, the percent of the variance explained by the model increases among the whole sample, when these control variables are included in the model. However, former work experience and earlier participation in

entrepreneurship courses were not utilized in the final model, because those variables did not add to the adjusted R-square and did not have any statistical significance.

In the Finnish sub-sample, none of these control variables showed statistical significance. Thus, the best fit model elements among Finnish sub-sample are presented in Table 4. Tested variables can be seen in Table 5 so that the comparison can be made with the Spanish sub-sample. In Spanish sub-sample, entrepreneurial skills and the existence of entrepreneurial role models did not have any statistical significance. Compared to the Finnish sub-sample, family background - especially father's professional experience as an entrepreneur- had a greater influence on entrepreneurial intentions. Subjective norm is a strong predictor in the Spanish sub-sample, and it is understandable that family background has some influence on entrepreneurial intentions. Age and gender had a statistical significance in the Spanish sub-sample but not in the Finnish sub-sample. As such, the influence of background variables on the formation of entrepreneurial intentions seems to vary according to the country of origin.

TABLE 5. LINEAR REGRESSION WITH CONTROL VARIABLES.

	Whole sample	Finnish sample	Spanish sample
Explained variance (adjusted R²)	49%	53%	46%
Attitudes	0.24 (.000)	0.26 (.000)	0.22 (.000)
Subjective norm	0.41 (.000)	0.37 (.000)	0.43 (.000)
Perceived behavioral control	0.15 (.000)	0.21 (.000)	0.14 (.000)
Entrepreneurial skills	0.05 (.015)	0.08 (.020)	0.02 (.407)
Age	-0.05 (.006)	-0.03 (.374)	-0.07 (.004)
Gender	0.08 (.000)	0.06 (.062)	0.09 (.000)
Existence of role models	0.05 (.038)	0.04 (.238)	0.04 (.141)
Mother's professional background as an entrepreneur	0.07 (.000)	0.06 (.075)	0.08 (.002)
Father's professional background as an entrepreneur	0.08 (.000)	0.06 (.078)	0.10 (.001)
Nationality	-0.14 (.000)	-	-

Note: Standardized coefficients reported.

Implications and further lines of research

Our development project has produced the first version of the instrument to measure the impact of entrepreneurial initiatives on the individuals. We have pilot tested the instruments among first year students of undergraduate programs in two higher education institutes in Finland and Spain. This paper examined the determinants of entrepreneurial intentions among Finnish and Spanish students. Two research questions were put forward. The first questioned concerned whether the level of entrepreneurial intentions would differ based on the country of origin. As it turned out, the Spanish students have higher entrepreneurial intentions than their Finnish colleagues. The second research question asked whether the relative importance of the antecedents vary as a function of country of origin. It turned out that the relative importance of the antecedents did not vary according to the country of origin. The third and final research question asked whether the relative importance of different background/control variables would vary according to the country of origin. We observed some variation in this regard. Nationality, gender and family background were scientifically significant predictors of entrepreneurial intent among the whole sample. However, in the Finnish sub-sample gender and family background did not show scientific significance contrast to the Spanish sub-sample. The results suggest that predictors of entrepreneurial intent may differ by culture.

Our observations point out that the Finnish students seem to show a greater self-confidence in starting businesses, while the Spanish students demonstrate superior trust in their own skills. And yet, the role of entrepreneurial skills in explaining the formation of entrepreneurial intentions was found to be somewhat questionable. In front of such an

observation, one could ask whether we should focus our educational system on fostering the 'sense of control' in our students, rather than their entrepreneurial skills.

Moreover, the fact that the biggest contributor to the formation of entrepreneurial intentions is Subjective norm - the perceived social pressure to perform or not perform the behavior – also cast doubts on the ability of educational system to contribute heavily to the formation of entrepreneurial intentions. Indeed, the social pressure, stemming from friends, family and important others, is to large extent outside the influence of the educational programs of higher educational institutions.

Later, follow-up studies with the same students will allow us to use longitudinal designs to detect development patterns in the formation of entrepreneurial intentions. The next follow-up of data collection will be implemented in the autumn of 2011. Moreover, more international partners will join this research project in the future, and this will provide us with a good basis for international benchmarking and comparison in recognizing good and working practices in promoting student entrepreneurship. One significant practical contribution of developing this Entre Intentio measure has been to “catch” those students most likely to embark on entrepreneurship, at which special measures can be targeted right from the beginning of their studies.

Abstract

The advantages of industrial clusters as drivers of regional and national development have been widely noted. These advantages have prompted various administrations to propose the creation of clusters as a development policy. The state of Tamaulipas in Mexico has not been an exception. The purpose of this paper is to examine the current situation and characteristics of industrial clusters in Tamaulipas, particularly in those industries that are strategic in terms of competitiveness (petrochemical, automotive, electric-electronic, and information technology). The study used case study methodology. The results show that industrial clusters contribute to regional development by increasing the competitive advantages based on the attractiveness of its geographical location, socio-cultural identity, and internal networks. However, the clusters analyzed have the disadvantage of having little presence in foreign markets. This paper helps to clarify the virtues and problems of industrial clusters in Tamaulipas that attempt to increase their competitiveness through international cooperation.

Keywords: industrial clusters, regional development, public policies.

Introduction

There is a growing recognition that industrial clusters play a fundamental role in regional development. Consequently, the factors that impact the performance of these clusters have generated interest from academics, entrepreneurs, and policymakers around the world (McCann, 2008; Nesta, Patel, & Arundel, 2003). In many countries, a form of economic geography has developed, and public policies have been elaborated to promote the creation of clusters (Grajirena, Gamboa, & Molina, 2004).

However, the literature contains few studies that have analyzed whether public policy in agglomerations fulfills its responsibilities and whether it is the most appropriate for businesses (Barkley & Henry, 2001; Hanink & Cromley, 2008). Therefore, this paper conducts a comparative analysis of four clusters located in Tamaulipas, Mexico (petrochemical, automotive, electric-electronic, and information technology) with the purpose of learning about the factors influencing clusters' performance and evaluating their impact on the public policy that prompted their creation and development. The four clusters have emerged based on public policies that have encouraged regional development through the dominant economic sectors in the area. Each cluster has distinct implications for public administration, and each has evolved differently. In this regard, the clusters' development is detailed in critical areas of its performance. To explore this development, we first analyze the most important dimensions and factors influencing the clusters' performance according to the literature. Second, we explain the methodology used in the development of the empirical work. Third, we briefly describe the clusters being analyzed. Fourth, we describe the main results of the study. Finally, we address the most relevant conclusions of the study.

Performance of the Clusters

Based on an analysis of the literature, one can deduce that the performance of clusters is multidimensional. Thus, the dimensions of their performance are classified based on the unity in which they are manifested: the cluster in general (creation of businesses (Fuchs & Knock, 2005; Glaeser, Kerr, & Ponzetto, 2010) and the innovative capacity (Boix

& Trullén, 2010; Cotic-Svetina, Jaklic, & Prodan, 2008; Folta, Cooper, & Yoo-suk, 2006)), and in the businesses that integrate (survival of businesses (Rosenfeld, 2002; Yamawaki, 2002), exportation (Albino, Carbonara, & Giannoccaro, 2005; Colgan & Baker, 2003), economic performance (sales level (Visser, 1999; Yamawaki, 2002), increases in employment (Colgan & Baker, 2003; Visser, 1999) and productivity (Fan & Scott, 2003; Suarez-Villa & Walrod, 1997)).

According to the literature, the previous dimensions of performance are affected by different factors that are present in the economic and social environment. After analyzing the importance and the effects of these dimensions on clusters' performance, we classify these factors into three categories: a) the environment, b) characteristics of the cluster, and c) factors intrinsic to the businesses that are members of the cluster (see Table 1).

TABLE 1: CAUSES OF CLUSTER DEVELOPMENT

Causes related to the cluster's environment	Causes related to the cluster's characteristics	Causes intrinsic to the business that developed the cluster
Location	Research Agencies	Specialization
Social Capital	• Universities	Human Capital
• Role of Public Administrations	• Technology Centers	• Knowledge Management
◦ Public Policies	• Public Agencies	◦ Exchange of knowledge
• Sociocultural Identity	Internal Services	◦ Improvement of Human Capital
Local Demand	Internal Networks	

First, in regard to the environment, the causes that have been shown to influence cluster performance are a cluster's geographic location (Folta et al., 2006; Keeble, 1997; Suarez-Villa & Walrod, 1997), public policies (Eshima, 2003; Romijn & Albaladejo, 2002; Van Looy, Debackere, & Andries, 2003), socio-cultural identity (Nassimbeni, 2001; Nicolini, 2001), and local demand (Nicolini, 2001; Rabellotti, 1999).

Second, the causes related to the intrinsic properties of the clusters included the following: relationships with research organizations, among them are universities (Albino et al., 2005; Romijn & Albaladejo, 2002; Van Looy et al., 2003), technology centers (Albino et al., 2005; Izushi, 2003; Romijn & Albaladejo, 2002), and public agencies (Lemke & Östhol, 2005; Yamawaki, 2002); services (Gabaldón-Estevan & Fernández-de-Lucío, 2006; Nicolini, 2001); and internal networks (Fuchs & Koch, 2005; Nassimbeni, 2001; Rogers, 2004).

Finally, the causes relating to the proper functioning of internal clusters and their member companies are specialization (Boix & Trullén, 2010; Nicolini, 2001), the exchange of knowledge (Bell & Albu, 1999; Gordon & McCann, 2005; Segün, 2010), and the improvement of human capital (Bell & Albu, 1999).

Methodology

A study of clusters requires the analysis and interpretation of the internal process and culture that characterize each of their components. Therefore, qualitative methodology is more appropriate (Colgan & Baker, 2003), and the most effective method for conducting this investigation is the use of multiple case analyses (Eisenhardt, 1989; Meredith, 1998; Yin, 1989).

Due to the nature and variety of what has been defined as a cluster, it has assumed a definition that includes a geographically centered reality that integrates diverse businesses and institutions (learning and related institutions) and is maintained by an active industrial association with a strong and explicit culture of clusters.

Considering the established aims of this study, we decided to use the analysis of clusters in different sectors of activity that are located in the same geographic territory and managed by the regional government. The selection of the four clusters (petrochemical, automotive, electric-electronic, and information technology) was based on the above definition and on criteria of specialization in regional competitive industries that had developed cluster associations. These clusters are geographically distributed along the state of Tamaulipas: one on the south

(petrochemical), two at the north (automotive and electric-electronic), and the last one at the center and south area (information technology). We contacted the associations that have experience managing these clusters so that we might gain insight from their experiences. The main areas investigated were the above factors: a) related to the cluster's environment; b) related to the cluster's characteristics and c) intrinsic to the businesses that integrate the cluster. The main goal was to evaluate how these were influencing the clusters performance.

The analyses were carried out from June 2009 to August 2010, starting with the study of their main characteristics. The analysis has been completed by interviews to relevant actors. We contacted five members of the petrochemical cluster: three companies, an industrial association, and a political agency. Nine members of the automotive cluster were interviewed: seven companies, an industrial association, and an educational institution. In the electric-electronic cluster, we communicated with eight members: six companies, an industrial association, and an educational institution. We had access to thirteen members of the information technology cluster: nine companies, three educational institutions, and one technological center.

Clusters analyzed

The Petrochemical Cluster

The petrochemical cluster emerged in 1980 due to the growth of installation of plants in the Altamira area and the founding of the industrial organization Asociación de Industriales del Sur de Tamaulipas, A. C. (AISTAC). The petrochemical cluster is one of the most important clusters in the state of Tamaulipas and is composed of thirteen companies in the petrochemical and derivative sectors. The AISTAC manages the cluster, promotes and strengthens synergies among its members, provides representation to members, and contributes to sustainable development in the area.

The Automotive Cluster

The automotive cluster formally became a cluster in May 2009; its base is in Matamoros, a city located in the northern part of the state and at the United States-Mexico border. Some of the cluster's plants are between twenty-five and thirty years old. This cluster is composed of ten companies and is supported by local educational institutions. Founded in 1972, the industrial organization Asociación de Maquiladoras de Matamoros, A. C. (AMMAC) has been one of the principal drivers of this cluster. The AMMAC represents the interests of its members and encourages their development. In addition, the public agency Secretaría de Desarrollo Económico y del Empleo (SEDEEM) has contributed to the cluster's consolidation by establishing management for the cluster.

The Electric-Electronic Cluster

This cluster was formally created in May 2007, and its base is in Reynosa, which borders the United States. Ten companies and three educational institutions participate in this cluster. The SEDEEM has had an equally important role in the growth of this cluster. In addition, the industrial organization Reynosa Asociación de Maquiladoras and Manufactureras, A.C. (RAMMAC) has strengthened this cluster. Among its missions, the RAMMAC seeks to promote cooperation among its members, share information, improve techniques and strategies, and procure communication and cooperation within the local community.

Information Technology Cluster

Information technology cluster in Tamaulipas (cluster TITAM) emerged on June 27, 2005, due to the initiative of four entrepreneurs in the sector; this cluster's base is in Tampico. It obtained formal status as a cluster in June 2007, and it was the area's first cluster in this sector. The cluster is comprised of more than thirty members that are primarily small and medium-sized enterprises. Thirteen educational institutions in the region attend the meetings organized by the management of this cluster.

The state government has played an important role in the consolidation of this cluster. Additionally, this cluster has the support of various regional government agencies, including the SEDEEM through the department of Dirección de Promoción and the technological business incubator Incubadora de Empresas de base tecnológica Victoria Emprende of the municipal council for economic development Consejo Municipal de Desarrollo Económico de Victoria, A.C. (COMUDE).

Results

To analyze the primary causes that influence the performance of clusters in Tamaulipas, a comparative analysis was conducted among four sectors in the present study. We analyzed the impact of environmental factors, the characteristics of the clusters, and the factors intrinsic to the companies within each cluster.

Environmental factors

The *geographic location* of the automotive cluster positively impacts the creation and survival of new companies. This positive impact results from the cluster's proximity to the United States, the availability of products and service companies related to the sector, and the qualifying work that facilitates the installation of providers connected to the sector.

Location influences the petrochemical cluster at the exportation level. This influence results from the cluster's proximity to the port of Altamira; respondents have identified this port ideally suited for managing its products and facilitating shipment to their clients abroad. Foreign sales do not represent a significant portion of the business in this cluster.

This factor is also important for all clusters under analysis because it relates to the region's employment rate. In the petrochemical and information technology clusters, companies have access to a diverse group of graduates seeking employment and possessing the necessary preparation and skills. Meanwhile, in the automotive cluster, the variety of companies belonging to the regional auto body repair industry has attracted skilled labor from other states. In the electric-electronic cluster, this impact emerges due to the large quantity of graduates from various educational institutions in the area that were created as a result of the presence of international corporations.

Additionally, the *geographic location* helps to increase the productivity of the four clusters. The information technology cluster enjoys low production costs in comparison with the larger cities in the country and greater governmental support due to its proximity to the state government of Tamaulipas. Meanwhile, the petrochemical cluster is favored due to its proximity to the port of Altamira and its ability to transport raw materials (generally from the United States). In addition, this cluster has lower operation costs compared with clusters in other parts of the country (for example, water costs). The cluster is close to the main terminal of chemical products in the country. Meanwhile, specialization in the automotive industry has created technical knowledge in the city, and this knowledge has contributed to the employment of companies in the area and the ability of these companies to continuously adapt. In the electric-electronic cluster, the proximity to the United States and the international bridge at Nuevo Laredo is essential to its members' productivity.

Moreover, *public policy* positively influences the growth of innovative capacity for the information technology cluster. Federal public policy, which created a program to support software development, has facilitated the creation of the TITAM cluster by the regional administration and contributed to increased innovation.

One of the most important factors influencing the performance of most clusters is the *socio-cultural identity* of their members. This factor has contributed to the creation of enterprises in the information technology cluster because five of its members combined their skills and efforts to start a new company. Additionally, this factor has driven the innovative capacity of this cluster, in which companies cooperate to develop innovative projects, such as a robotics school for children and adolescents in the city of Tampico. Furthermore, the *socio-cultural identity* positively influences the sales growth of companies in the information technology and automotive clusters. First, entrepreneurs exchange information about potential clients and about sector trends. Second, monthly meetings organized by the AMMAC association of the automotive cluster present opportunities to meet new companies that arrive in the area and to learn about their products and services.

Similarly, the *socio-cultural identity* contributes to the productivity of many of the companies under analysis. In the information technology cluster, companies combine their resources and knowledge to conduct joint projects. In the automotive cluster, members take advantage of each association meeting as an opportunity to meet potential clients. In the petrochemical cluster, companies benefit from the proximity by benchmarking and jointly resolving common problems.

Regarding environmental factors, the *local demand* positively influences sales growth in the information technology cluster. Due to insufficient local demand, many software companies in other regions have searched for markets throughout the rest of the country. The *local demand* is strengthened by the presence of potential markets in the area (e.g., application services and small to medium-sized companies in the northern zone of the state).

Factors related to the characteristics of the clusters

With respect to the clusters' characteristics, we observe that *universities* have an important impact on the productivity of the four clusters analyzed because they are an important source of students who participate in social services and apprenticeships, which can assist in decreasing a company's costs. In the petrochemical, automotive, and electric-electronic clusters, the *universities* have created programs of study that adapt to the needs of companies in the area. Additionally, incorporating students in their businesses allows companies to identify students who have the required skills for later employment; the electric-electronic and automotive clusters have frequently taken advantage of these opportunities.

Although they are not formally integrated with the cluster, *internal services* have a positive influence on the capacity to export of the companies associated to the petrochemical cluster because Altamira's port contains all the crucial services necessary to send and receive merchandise. Similarly, *internal services* impact the productivity of companies in the electric-electronic and petrochemical clusters. In both clusters, this impact has emerged due to the local presence and diversity of service companies that are necessary for the proper functioning of the plants. With respect to the petrochemical cluster, the area has maritime terminals, logistics companies, shipping, storage, and other services. The electric-electronic cluster has logistics companies and shipping services, which are helpful for enabling new service providers to be known at the monthly the RAMMAC association meetings.

Internal networks are also important to the development of clusters. In the information technology cluster, these networks have emerged due to the trust that prevails among companies in the sector located in the southern part of the state. Due to the close relationship that exists among five entrepreneur members of the cluster, these members have created a new company that is in the process of opening. In addition, the networks among these entrepreneurs have promoted their innovative capacity, primarily through the development of joint projects, such as the creation of the school of robotics for children and adolescents; this school is considered one of the cluster's most important achievements. Similarly, members of the information technology cluster take advantage of internal networks in promoting their sales because the cluster's members refer potential clients to one another.

Additionally, *internal networks* are essential to the growth of productivity in all of the clusters studied because their members share information about the sector (e.g., clients, providers, new trends). The members of the information technology cluster that develop software create alliances to conduct projects that could not be accomplished individually. The members of the automotive cluster, in which the AMMAC association is the most important element, create synergies that reduce costs (e.g., rent and the use of storage and joint applications to the government). In the petrochemical cluster, in which the AISTAC association plays an important role, plants share a maritime terminal for receiving shipments of raw materials. In the electric-electronic cluster, the RAMMAC association creates incentives for communication among members; these incentives lead to joint training, benchmarking, communication with the government, and reduced competition among network members.

Factors intrinsic to the business that integrate the cluster

Finally, among the factors that are intrinsic to the companies that compose the clusters, *specialization* can result in diverse positive results. This factor enabled the creation of a company in the information technology cluster by five software developers with a great deal of experience in the sector. In addition, *specialization* in the

automotive and electric-electronic clusters has facilitated the settlement of companies in the area due to its proximity to the United States, the existence of infrastructure and skilled labor, and the presence of important corporations in those cities for more than two decades.

Specialization positively impacts the innovative capacity of the information technology cluster because its members jointly develop products and services and obtain grants for innovative developments within the sector. Moreover, in the information technology cluster, *specialization* influences the sales growth of companies that create commercial associations to raise their market power. This factor also encourages job creation in the automotive and petrochemical clusters because the settlement of diverse automotive plants in the city attracts skilled labor and creates technical knowledge. Meanwhile, the petrochemical cluster has access to institutions of higher education (technical universities) that have adapted their career program to suit the sector's needs and thus facilitated the integration of its graduates.

Furthermore, *specialization* has contributed to increases in productivity in all of the clusters analyzed. Members of the information technology cluster have experienced decreased costs as a result of creating synergies for the joint development of products. Members of the automotive cluster share information through various committees of the AMMAC association to reduce costs, gain certifications, and train their workers. Meanwhile, the petrochemical and electric-electronic clusters benefit from the infrastructure and skilled labor.

Finally, the study of clusters in Tamaulipas shows that *improving human capital* through training increases productivity for the companies in the four clusters analyzed. The positive impacts observed include the following: motivation, acceleration of the learning process, quality of work (electric-electronic), creativity, better relationships with clients and providers, loyalty (automotive), efficiency (information technology), reduction in the number of accidents, and labor stability (petrochemical).

Conclusion

In summary, the petrochemical, automotive, electric-electronic, and information technology clusters in Tamaulipas have different characteristics that drive regional development. Productivity is the dimension of performance that members of these clusters most emphasize. The creation of new companies, the growth of innovative capacity, and the increase of sales and of employment contribute to the development of these clusters.

The main factors that drive cluster development include the clusters' geographic location, socio-cultural identity, internal networks, specialization, and improvement of human capital. The positive influence exerted by socio-cultural identity among members of a cluster is particularly important because it is the principal driver of the synergies created within those clusters. This factor can contribute to increasing the level of exports and the innovative capacity of companies. Similarly, specialization can be used as a regional competitive strategy that may assist companies in investing in employee training. Although clusters already include a large share of companies, educational institutions, and representatives of public agencies, the integration of more active members would be beneficial, particularly of service companies.

Moreover, the clusters analyzed continue to face various difficulties. The area's infrastructure could be improved, especially roads, to increase investment. Similarly, public agencies should act as facilitators for clusters because their management implies a delay in decision making and diversity of processes, which are also present in the assemblies developed to support the industry.

Although universities located in the areas maintain associations with clusters by attending meetings and promoting apprenticeship agreements for companies, they could also be useful in performing joint actions, including training and the development of new products. Similarly, the region requires that research centers and public agencies collaborate with the clusters to develop improvement and increase innovation in a joint effort with the companies that belong to the clusters. Although this study is qualitative, it has contributed to the understanding of a phenomenon that is difficult to quantify (Colgan and Baker, 2003). Additionally, conducting a comparative study contributes to the cost-benefit analysis of adopting clusters as a regional development strategy (Barkley and Henry, 2001). Certainly, this study is a launching pad for future studies in Mexico that examine the relevance of informal relationships for the development of this phenomenon.

The Effect of Organizational Factors on the E-Commerce Adoption among Small and Medium Sized Enterprises in Saudi Arabia

Abdul Rahman Nasser A. Almoawi, aysoub@hotmail.com
Rosli Mahmood, rosli@uum.edu.my
Universiti Utara Malaysia

Introduction

The information and communication technology has rapidly and radically changed the way various organizations conduct their businesses. The use of e-commerce opens up the opportunity for firms to reach their customers anytime and anywhere, and enable a firm to gain a competitive advantage over its competitors (Soliman & Janz, 2004; Li, 2008). E-commerce involves the trade of goods and services in an electronic manner, such as by computer-based transactions from businesses that utilize internet networking systems as well as several technologies that are digital in nature (Lauden & Laudén, 2000). However, the small and medium enterprises (SMEs) are generally slower in adopting this technology compared to large firms, and this makes SMEs more vulnerable to changing economic conditions as they may have relatively lower level of competitiveness. SMEs are considered as major economic players and a potent source of economic growth for most nations (Taylor & Murphy, 2004; Ramdani, Kawalek & Lorenzo, 2009). Thus, SMEs should have greater ability than the large firms in the adoption of administrative services and guidance to new and innovative ideas because of their flexibility (Rao, Metts & Monge, 2003).

The advantages of e-commerce adoption are numerous and have been well acknowledged empirically by numerous studies. It can help SMEs to gain better access to information and expertise, reach new markets and customers, and manage the business more efficiently and effectively (Wilcott, Kamal & Qureshi, 2008), and create innovative products and be competitive (Barba-Sanchev, Matinez-Ruiz & Jimenez-Zaroo, 2007). E-commerce adoption can also lower production and labour costs, add value to product and services, increase a firm's competitive advantage (Nguyen, 2009; Premkumar, 2003), and enhance the business process (Acar, Kocak, Sey & Ardit, 2005). Thus, the use of e-commerce by the SMEs is a challenge in both developed and developing countries. This paper considers the challenges faced by SMEs in Saudi Arabia in adopting e-commerce to improve their businesses. To be competitive in the globalization era, SMEs in Saudi Arabia also need to develop new strategies and employ new technologies.

SMEs in Saudi Arabia

SMEs represent more than 93 percent of the total business establishments in Saudi Arabia (Ismail, 2004). Their role in the economic development become more important after Saudi Arabia joined the WTO, where the businesses require more technical expertise than in the past. E-commerce activities of SMEs are determined by the extent to which they use the technology to coordinate their international and inter-regional operations. However, like their counterparts in most countries, SMEs in Saudi Arabia also face various obstacles in the adoption of technology, particularly the e-commerce (Li, 2008). The main reasons cited for the non usage of e-commerce among the SMEs is due to a lack of training facilities, and also their belief that there is no need for the use of technology in their work (CITC, 2007). Therefore, efficiently adopting the technology among the SMEs has become a national agenda. The government has initiated the essential policy framework for a nationally comprehensive ICT and or e-commerce strategy that SMEs have made use of to adopt sound ICT strategies, including expansion programs on the internet. These initiatives have enabled SMEs to achieve some corporate goals with remarkable success (Soliman & Janz, 2004). To accelerate the adoption of this technology, the policy makers are also searching for answers about the important factors that would influence the SMEs to adopt the e-commerce. One of the factors rooted in the OTE Model developed by Tornatsky and Fleisher (1990) is the organizational context. The organizational context contains all the internal factors that could affect the firm's innovation adoption in terms of organizational and managerial skills. The organizational factors related to e-commerce adoption among SMEs include the firm size, owner's attitude and innovativeness (Iacovou, Benbasat & Dexter, 1995; Dholakia & Kshetri, 2004; Sabherwal, Jeyaraj & Chowa, 2006; Thong, 1999; Chang-Shuo, 2006).

Objectives of the Study

The objective of this study is to determine the effect of the organizational context on the extent of e-commerce adoption among SMEs in Saudi Arabia. The characteristics in the organizational context seem to be the primary focus of many studies on SMEs. Specifically, the objectives of this study are:

1. To determine the significant relationship between firm size and the extent of e-commerce adoption among SMEs in Saudi Arabia,
2. To determine the significant relationship between owner/manager's attitude and the extent of e-commerce adoption among SMEs in Saudi Arabia, and
3. To determine the significant relationship between owner/manager's innovativeness and the extent of e-commerce adoption among SMEs in Saudi Arabia.

Hypotheses Development

One of the most vital elements that will influence the adoption of e-commerce technology by SMEs in Saudi Arabia is the nature of the firm, including the different characteristic elements manifested within the organization such as the firm size, and owner/manager's attitude and innovativeness.

Firm Size

Firm size is one of the most influential factors of internet adoption among SMEs (Karakaya & Khalil, 2004). The size not only influences a firm's ability and readiness to adopt e-commerce, it also influences the extent to which technology will be adopted by the firm (Chang-Shuo, 2006). Thus, larger firms tend to adopt technology at higher levels, while smaller firms are inclined to adopt technology at lower levels (Cragg & Mills, 2009). A firm with a large amount of transactions and data is also more likely to adopt e-commerce as this can be of great assistance in streamlining operations and offering process efficiency within the firm (Thong & Yap, 1995). Thus, the following hypothesis:

H1: There is significant relationship between firm size and the extent of e-commerce adoption among SMEs.

Owner/manager's Attitude

The adoption of e-commerce relies heavily on the acceptance of the technology by the business owners (Lubbe & Heerden, 2003). If the owner does not identify with the usefulness of the technology or has limited understanding of its potential then naturally the owner will be reluctant to adopt e-commerce. Previous studies have also found that management's attitude and support of the owners had a positive relationship with the e-commerce adoption (Seyal & Rahman, 2003; Levy & Powell, 2003; Chang-Shuo, 2006). The need for commitment and support from the owners or top management during the process of assessment of the innovation or technology is of utmost importance. This commitment and support ensures that there is an obligation within the resources, which in turn will create conducive environment within the firm for the adoption process of the technology. The following hypothesis is thus postulated:

H2: There is significant relationship between owner/manager's attitude and the extent of e-commerce adoption among SMEs.

Owner/manager's Innovativeness

Owner's innovativeness was found to be the strongest determinant for the adoption of information systems (Lee & Runge, 2001), while it also affected the cultural dimensions (Thatcher, Srite, Stepina & Liu, 2003). An innovative owner will definitely identify the advantages of incorporating e-commerce into the business, and accordingly be able to create new benefits through an innovative utilization of the e-commerce technology (Sanchez, 2002; Al Qirim, 2005). Therefore, the following hypothesis is formulated:

H3: There is significant relationship between owner/manager's innovativeness and the extent of e-commerce adoption among SMEs.

Methodology

Sampling

The sampling frame of this study comprised of all SMEs operating in the Kingdom of Saudi Arabia, irrespective of whether they were using e-commerce applications or not. The sampling frame consisted of 78,488 firms. A SME is a firm or business that employs not more than 250 workers. These firms are distributed among thirteen regions across the Kingdom. Most of these firms were concentrated in the three main areas namely; Riyadh, Eastern Saudi Arabia and Mecca. This study used a self-administered questionnaire survey. The questionnaire was mailed to the owner/managers of the firms. Owner/managers were targeted as respondents of this study because they are likely the key informants who are directly involved in the overall running of the business. As such they are in better positions to understand the current operations and future trend of the firms.

A total of 1150 questionnaires were sent to the owner/managers who were systematically and randomly selected from the population in the sampling frame. Direct phone calls as a reminder of those respondents that delayed in responding were made to increase the response rate. A total of 423 were finally received, out of which 400 were usable resulting in a response rate of 34.78 percent. This is relatively high for a mail-survey research (Sekaran, 2003).

Scale Reliability

The instruments used in this study were developed from prior research and previously tested for reliability. Some of the questions used were slightly modified to make them more relevant to the purpose of the study. Table 1 below shows that all the constructs have Cronbach Alpha values of more than 0.7 which is higher than recommended by Hair, Black, Babin, Anderson and Tatham (2006).

Table 1: The number of items of the variables and alpha values

Variable	No of items	Alpha value
Owner's attitude	4	0.861
Owner's innovativeness	11	0.737
E-commerce adoption	7	0.946

Factor Analysis

Construct validity in this study was validated through factor analysis. Principal component analysis was applied to determine how and to what extent the items are linked to their underlying constructs (Zhang, Waszink & Wijngaard, 2000). According to Hair et al (2006), factor loadings greater than 0.30 are considered as significant; loadings of 0.40 are considered as more important, while loadings that are greater than 0.50 are very significant. Thus a factor loading of 0.40 was used as the cut off point for this study. From Table 2, all three factors and most the items were loaded on the correct factors. However, five items under owner's innovativeness did not sufficiently loaded on the correct factor and were removed.

Table 2: Factor Analysis

Variable	Scale Item	Factor 1	Factor 2	Factor 3
Attitude	1	.676		
	2	.559		
	3	.729		
	4	.660		
Innovativeness	2		.667	
	4		.834	
	5		.757	
	7		.730	
	8		.713	
	9		.430	
E-commerce adoption	1			.777
	2			.882
	3			.927
	4			.812
	5			.500
	6			.593

Results and Discussion

Sample Characteristics

A demographics profile of the respondents is illustrated in Table 3 below. The geographic location of the firm is 44.0 percent in Riyadh, 33 percent in Eastern Saudi and 23 percent in Mecca. Majority of the firms have more than 25 employees (61 percent). More than 22 percent of the firms have been operating for over two decades, 29.75 percent have been in the business between 11 and 20 years, while only 25 percent of the firms have been established between 5 and below years. The profile of respondents was also sorted by gender, age and education level. A significant number of respondents were male and only 35 (8.75 percent) of them were female. Most of them were at the age of 40 years and above, and majority of them attained the academic qualification higher than the high school level (79 percent).

Table 3: Characteristics of Respondents

Characteristics	Frequency	Percentage
<i>Gender</i>		
Male	365	91.25
Female	35	8.75
<i>Age (years)</i>		
18-29	62	15.50
30-39	84	21.00
40-49	153	38.25
50-59	74	18.50
60 and above	27	6.75
<i>Education</i>		
Below high school	32	8.00
High school	52	13.00
Associate	192	48.00
Bachelor	96	24.00
Master	22	5.50
Doctorate	6	1.50
<i>Location of firm</i>		
Riyadh	176	44.00
Eastern	132	33.00
Mecca	92	23.00
<i>Number of employees</i>		
25 and below	156	39.00
26-50	102	25.50
51-100	46	11.50
101-150	29	7.25
151-250	67	16.75
<i>Tenure in business (years)</i>		
5 and below	100	25.00
6-10	91	22.75
11-15	64	16.00
16-20	55	13.75
Above 20	90	22.50

Correlation Analysis

Pearson Product moment Correlation Coefficients were computed between the extent of e-commerce adoption and each of the independent variables. As can be seen in Table 4 below, when considering the independent variables individually, all variables show significant relations with e-commerce ie size of firm ($r = 0.19$, $p < .001$), attitude ($r = 0.17$, $p < .001$) and innovativeness ($r = 0.11$, $p < .001$). Each of these variables was positively related to the extent of e-commerce adoption such that increases in those variables were related to a greater extent of e-commerce adoption.

Table 4: Correlations between e-commerce and the independent variables

	E-commerce
Size of firm	0.19**
Attitude	0.17**
Innovativeness	0.11*

* $p < .05$ ** $p < .001$

Multiple Regression Analysis

The result for the multiple regression analysis is presented in Table 5 below. When all three independent variables were considered simultaneously in the regression model, the two variables that had the strongest positive significant correlations with e-commerce remained significant, where attitude ($B = .27$, $p < .001$) and size of firm ($B = .16$, $p < .001$). Innovativeness which had a significant positive correlation with the e-commerce was no longer a significant predictor.

Table 5: Multiple regression analysis

Predictors	Beta	SE B	Et	T	Sig.
Firm size	0.10	0.03	.16	3.51	.000**
Attitude	0.44	0.10	.27	4.53	.000**
Innovativeness	0.07	0.05	.07	1.40	.162

** $p < .001$

The results of the regression analysis provided support that there is a significant relationship between the firm size and the extent of e-commerce adoption. Firm size was also one of the most determinant factors of e-commerce adoption among SMEs in Saudi Arabia. In addition, it had the strongest positive significant relationship with e-commerce adoption. This shows that size can influence the extent to which technology will be adopted by the firm. The larger the firms, the higher will be the adoption levels of technology, while the smaller firms may incline to adopt technology at the lower level (Cragg & Mills, 2009). The findings of this study are also in line with those of Teng (2000), Dandridge and Levenberg (2000), Karakaya and Khalil (2004), Al Qirim (2005) and Chang-Shuo (2006).

The results also support the hypothesis that there is significant relationship between owner/manager's attitude and the extent of e-commerce adoption. According to Lubbe and Heerden (2003), the attitude influences a firm's ability and readiness to adopt e-commerce. Moreover, if the attitude of the owner is positive, that he or she is well aware of the intricacies of the computers and has some knowledge of technology and how to reap its benefits, then the business is likely to adopt e-commerce. The findings corroborate previous studies such as Seyal and Rahman (2003), Levy and Powell (2003), Chang-Shuo (2006), and Nasco, Toledo and Mykytyn (2008). They all found that the management's attitude and support had positive relationship with e-commerce adoption.

The third hypothesis of this study was not supported. The result reveals that there is no significant relationship between owner's innovativeness and the extent of e-commerce adoption. Interpretation of this finding could lead to two possibilities regarding the owner's innovativeness among SMEs in Saudi Arabia. On one hand, it could be used alone to determine its impact on the adoption of e-commerce, and on the other hand it could be used in the same context with other factors taking into account the desire of the owners to accept new thing that will improve their budget against unexpected risks in the future. However, the result of this study is not in line with previous studies such as those of Thong (1999), Thong and Yap (1995) and Al Qirim (2005). But it supports the study by Chang-Shuo (2006) who found that innovativeness was not statistically significant to the extent of e-commerce adoption among SMEs.

Conclusion

The results of this study shed several interesting insights about e-commerce adoption by SMEs in Saudi Arabia. First, the size has an influence on the firm to adopt e-commerce. The larger the firm size, the more willing of the firm to adopt e-commerce. Moreover, larger firms have more ability to adopt e-commerce by hiring employees with specialized skills. SMEs, on the other hand, do not have enough resources and are

less likely to make large investment to take advantage of the competitive significance of the e-commerce adoption. Nevertheless, personal computer has made computing accessible to businesses of all sizes. Technical advances have made computers more powerful and less expensive giving many SMEs the potential to use software to make the business more competitive. Second, the owner/managers' attitudes play crucial role in promoting the e-commerce adopting. Owner/managers who have positive attitudes toward e-commerce are more likely to support and adopt the technology for the firms. Therefore, owner/managers would be well-served by becoming informed and educated about the benefits of e-commerce for business transactions. Nurturing a positive attitude among them will help with effective adoption of e-commerce within the SMEs. Finally, the innovativeness of the owner/managers is not significantly related to the e-commerce adoption, and thus does not play a significant role in the acceleration of the adoption and usage of e-commerce within the SMEs in Saudi Arabia.

This study may not only expand the current body of knowledge on the e-commerce, but also provide useful findings to SME owner/managers and policy makers in Saudi Arabia to further understand the e-commerce adoption. This will help them to develop better strategies regarding e-commerce in SMEs to gain potential benefits and competitive advantages.

Abstract

The ‘flexible firm’ refers to a process of continuous change which requires high trust and high skill workplaces. It is primarily the rapid rate of innovation and change in products and technologies that asks for the capacity of the workforce to create knowledge. Thus, highly-educated and well-trained people represent a key resource. In addition consumers have become more demanding than ever before, enhancing competition in the market place which in turn forces firms to organize production in such a way as to remain innovative and flexible. Simultaneously, the relationship of knowledge workers and employers in the knowledge economy has become a key area of interest for organizations, policy makers and, primarily, academics.

The paper deals with the results of the research whose objective was to identify the rate of utilization of flexible work arrangements in knowledge-intensive businesses in Slovakia today and in the near future.

Introduction

EC Green Paper *Partnership for a New Organisation of Work* (1997) is perceived to be the formal grounds for the shift from traditional work organizations to ‘the flexible firm’ as the European Commission wanted organizations to embrace the trajectory towards becoming such ones. Atkinson is believed to have coined the term ‘flexible firm’ in which organizations combine a mix of numerical flexibility, functional flexibility, contracting out and flexible remuneration as an answer to changing market circumstances, resulting in a core staff of employees who are functionally flexible, and several periphery groups of non-permanent employees, self-employed persons and subcontractors.

The definition of European Commission differs from this one. The ‘flexible firm’ refers to a process of continuous change which requires high trust and high-skill workplaces. Three factors represent this change: First, the rate of innovation and change in products and technologies is so rapid that the competitive advantage of companies and countries lies in the capacity of the workforce to create knowledge. Therefore (highly-educated and well-trained) people represent a key resource. Second, consumers are more demanding than ever before, enhancing competition in the market place which in turn forces firms to organize production in such a way as to remain innovative and flexible. The third factor is ICT. One of the main effects of the new ICTs has been a dramatic reduction in the cost and time for storing, processing and transmitting information with fundamental consequences for organizing the production and distribution of goods and services and for work itself.

In the context of knowledge-based economies, employers claim that flexible work options to keep knowledge workers, i.e. key employees, are vital for the success of the organizations. Soon it became clear that pay and benefits will get people to show up for work, but they will not generate attitudinal commitment so that a valuable employee would not only become a high performer, but also will stay with the company. It is often argued by successful employers that a professional worker desires family-friendly programs, flexible work arrangements, and particularly, career development opportunities. They remain with the organization as long as the work environment allows them to continually learn, to grow intellectually and to work on interesting projects and last but not least to balance their professional and private life. In this context, the question is “how” to institute a flexible work, not “if”.

The above mentioned European Green Paper stresses the need for policies which support fundamental organizational renewal and enhance a productive balance between the interests of business and the interests of workers. This brings two main trends the organization can implement – a more human oriented one versus a path to more efficiency. Knowledge-based economy inevitably turns towards human factor orientation model, i.e. the orientation is on workers and their knowledge as a key resource. It is accompanied with high level of decentralization. Decentralized organizations are flexible themselves. Human factor in this model is seen as human capital which is indispensable factor of production instead of a debit item. Human factor orientation is closely linked with the ability to innovate and be creative, attention to quality of work and life, functional flexibility, and stressing the company’s knowledge as a key competitive factor (Hamel and Prahalad, 1994; Nonaka and Takeuchi, 1995).

FIG.1: DECENTRALIZATION – HUMAN FACTOR ORIENTATION MODEL (adopted from Oeij and Wiezer, 2002)

		Human factor orientation	
		<i>Low</i>	<i>High</i>
Decentralization orientation	<i>Low</i>	Rigid efficiency	Social rigidity
	<i>High</i>	Flexible efficiency	Humanized Flexibility

This shifts the focus to work organization. In its nature, work organization is a static concept, it is managerial behavior that makes it dynamic. Drivers for managerial choice are as follows (adopted from Oeij and Wiezer, 2002):

Extra-organizational (environmental):

1. Market circumstances
2. Use of and access to technology
3. Financial situation (investment, financing)
4. Legislation
5. Political stability (includes national culture)
6. Labor market situation
7. Industrial relations
8. Governmental policy making

Intra-organizational (endogenous):

1. Employees interests (job satisfaction)
2. Organizational culture, relations and communication
3. Organizational policy (financial, technologic, HRM)
4. Management’s view and competence on business, technology and social aspects

As mentioned above, management has the autonomy in making choices about these drivers which will have consequences for the structure of work organization, working conditions and, indirectly, have an impact on quality of work. Quality of work is regarded as a characteristic of individuals, more specific, as an evaluation from employees of their working conditions in the pursuit of the following four objectives (based on Quality of Work and Employment Indicators, 2001): job security (effects of status, income, social protection, worker’s rights); health and well-being (effects of occupational accidents and diseases, exposure to risks); competence development (effects of opportunities for training skills, career development); combining working and non-working life (effects on time,

equal opportunities, discrimination, social structures). It brings about subjective evaluation of the effects of work organization, the working conditions and managerial behavior at job level by workers themselves.

It is approved that working patterns have changed in many countries during the last decades. Most researches have been carried out to identify changes in male and female tenure as well as their preference for one or another work arrangements be them part-time jobs, temporary jobs or short-hour jobs. However, the influence of socio-cultural changes goes much further. The need for knowledge embodied in knowledge workers as a condition for establishing the organization's competitive advantage becomes the imperative for introducing specific working environment to retain such key employees and satisfy their needs. The change towards "high performance work practices" is evident and is introduced within the principles of "high trust", "high skill" and extensive employee involvement in decision-making. Through better communication and consultation the creativity of employees in the organization is harnessed. There is a greater focus on development of individuals. In practice this means staff's involvement in the empowerment to make decisions, rewards for creativity and help in developing and realizing their potential. Organizations tend to encourage their employees to play more roles than usual which means to move towards multi-oriented attitudes. To be multi-effective means to enhance one's knowledge and experience through the variety of work and permanent development that includes motivation to learn, motivation to be functionally flexible (multi-effective), motivation to operate under flexible working times (numerically flexible), the motivation to be mobile (geographically mobile and mobile on the labor market) and to be well-disposed towards (organizational) change.

Flexible Work Arrangements in Knowledge Intensive Business Services (KIBS)

There is no one single definition of flexibility, but we take for flexibility "a share of atypical workers as opposed to full time workers with permanent contracts and traditional work arrangement". As for types of flexible work arrangements, de Nanteuil's typology (De Naunteuil, G., 2000) based on combinations of variables is quoted most (FIG.2). It is obvious that knowledge workers will tend towards qualitative flexibility, be it internal or external.

FIG.2: FLEXIBILITY: THE FOUR DIMENSIONS (adopted from Goudswaard, and De Naunteuil, 2000)

	Quantitative flexibility	Qualitative flexibility
EXTERNAL FLEXIBILITY	Employment status (fixed term, temporary agency work, work on call...) <i>Numerical flexibility</i>	Production systems (subcontracting, use of self-employed workers...) <i>Productive/geographical flexibility</i>
INTERNAL FLEXIBILITY	Working time (overtime, weekend work, varying work hours...) Wage (stock options, performance-related pay) <i>Temporal/financial flexibility</i>	Work organizational (job rotation, multitasking, responsibility of workers over planning, budget...) <i>Functional/organizational flexibility</i>

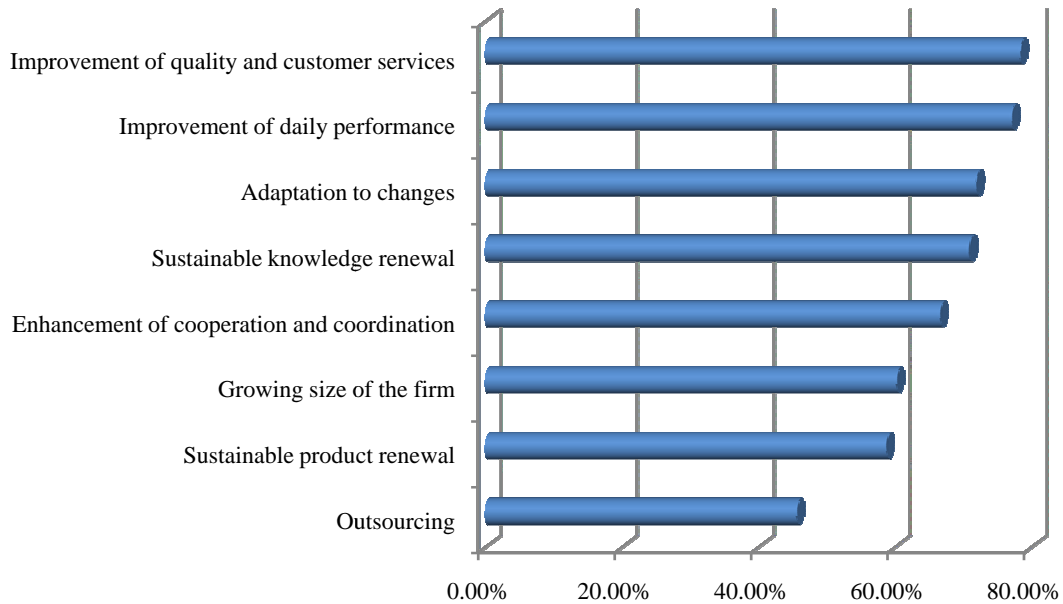

Research and Methodology

The objective of the research was to identify the rate of utilization of flexible work arrangements in knowledge intensive businesses in Slovakia today and in the near future. The sample consisted of 91 organizations in the selected sectors of the knowledge-intensive business services within the following NACE categories (some of them combined): IT Services (J62 and J63); Financial and Legal Services, Accounting (K64.9, K66.1 and M69); Consultancy in Management (M70); Architectural and Engineering Activities – Technical testing and Analyses (M71); Advertising and Market Research (M73); Employment Activities ((N78); Education Services (P85.5).

The data were collected within structured interviews with the relevant organizations' managers and processed in Microsoft Excel application. The methods of descriptive statistics were used to gain the results. The surveyed flexible forms of work arrangements included: teleworking from home once a week, telework, mobile

work, part-time work and flexi-time. FIG.3 introduces the reasons for KIBS to implement flexible work arrangements.

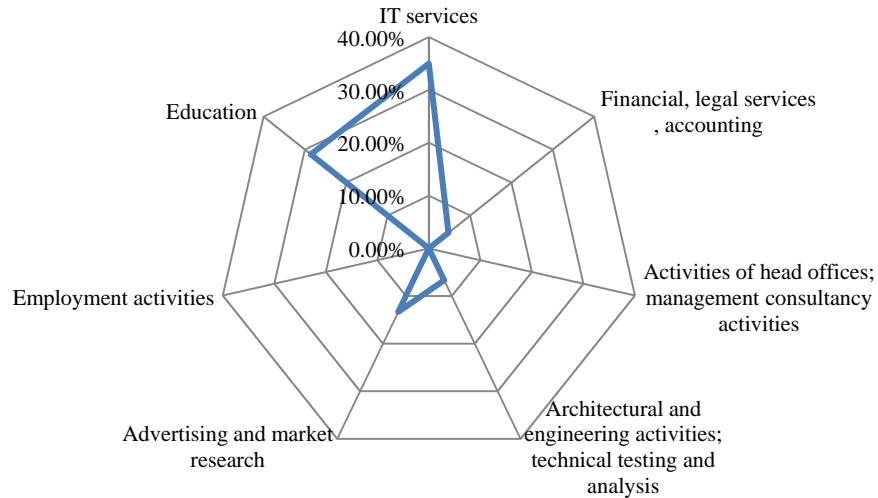

FIG.3: REASONS FOR ORGANIZATIONAL CHANGE IMPLEMENTATION

Teleworking from Home Once a Week

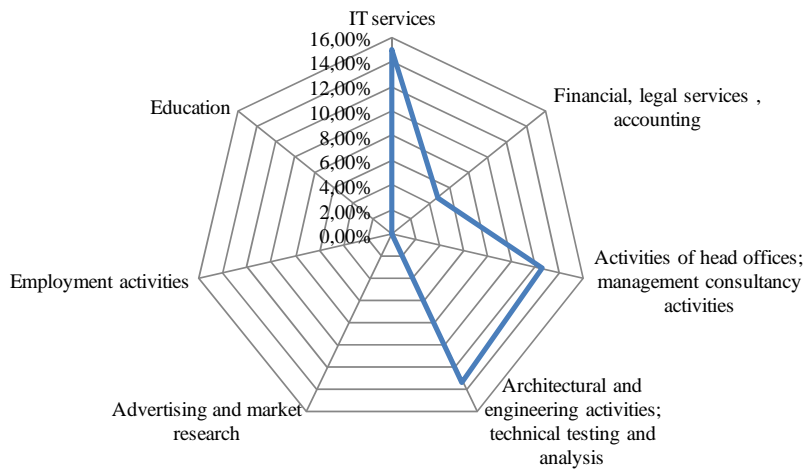

FIG.4 depicts teleworking from home once a week (in contrast with regular telework) and shows that this type of flexible work arrangement is mostly utilized in IT and Education Services. On the contrary, such an arrangement is not used in Employment Services at all. This type of flexible work arrangement is not planned to be used more intensively in Advertising Services and Education, however its utilization will increase in IT Services even more.

FIG.4: TELEWORKING FROM HOME ONCE A WEEK

Even though this form of flexible work is not introduced in Employment Services, however, it is planned to be utilized by a number of organizations (see FIG.5) in the near future. At present, this form of flexible work arrangement is used least.

FIG.5: TELEWORKING FROM HOME ONCE A WEEK TO BE INTRODUCED IN THE NEAR FUTURE

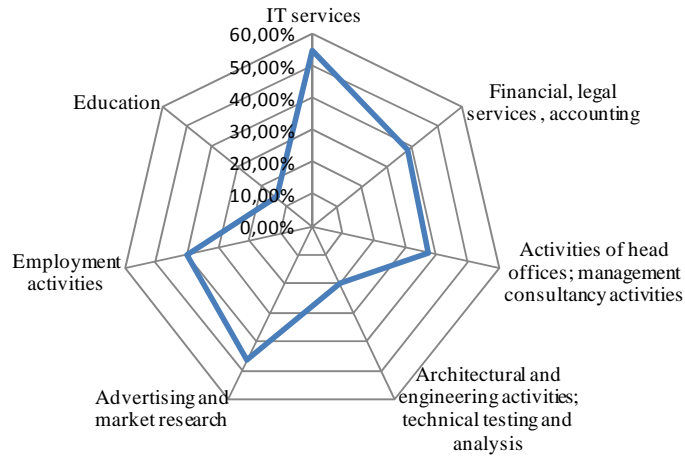

Telework

Here we differentiate between teleworking from home once a week and teleworking from home several times a week. The findings show that telework is used more frequently than teleworking from home once a week

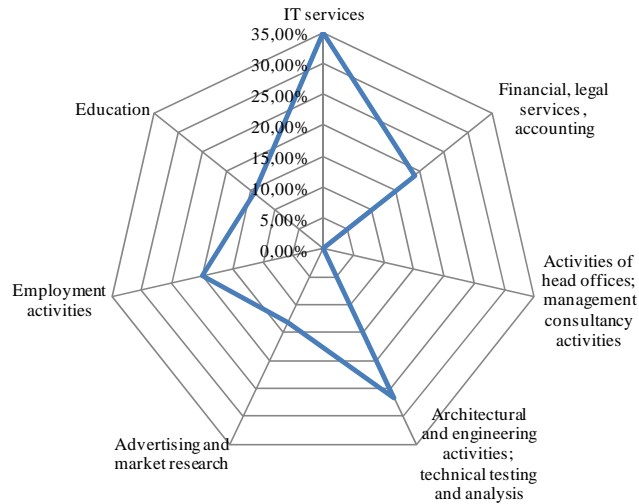

and it is taken for a standard form of flexible work arrangement. Traditionally, it is mostly utilized in IT sector, followed by Advertising and Market Research, least in Education and Architectural and Engineering Services (FIG.6).

FIG.6: TELEWORK

This is to be changed soon. The most evident planned increase in telework will be in IT Services and Architectural and Engineering Services (over a quarter of the organizations claim that they will introduce telework soon). As comes from FIG.7, the surveyed organizations in Management Services do not plan to implement telework at all.

FIG.7: TELEWORK TO BE INTRODUCED IN THE NEAR FUTURE

Mobile Work

This form of flexible work arrangement again requires specific technologies to allow for its implementation. This is why it is mostly utilized in IT Services, followed by other sectors with Education Services accounting for its least usage. It must be stressed, however, that this form is used to a level in all surveyed sectors (see FIG.8). This is

actually the form of work that moves the services closer to the client and thus its growth is planned in all surveyed businesses. In most of them it accounts for 50% increase; the minimum growth is planned in Management Services (see FIG.9).

FIG.8: MOBILE WORK

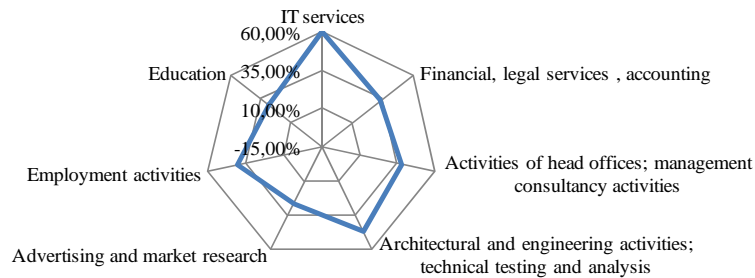

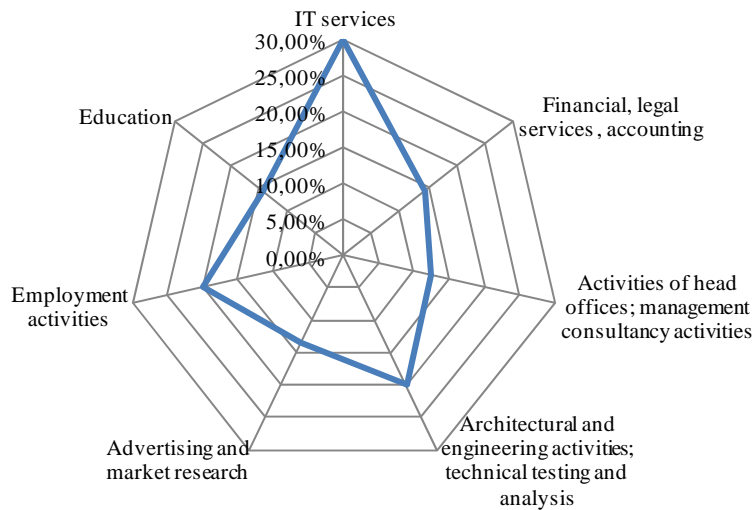

FIG.9: MOBILE WORK TO BE INTRODUCED IN THE NEAR FUTURE

Part-time Work

Part-time work is widely used in Education Services (85.71% of the relevant organizations claim use of this work arrangement). The second position is occupied by Advertising and Market Research Services. On the other hand, it is least used in Architectural and Engineering Services and Management Services (see FIG.10). Similarly to mobile

work, part-time work accounts for the highest level of increase in the future and its wider implementation is planned in all the surveyed sectors (see FIG.11).

FIG.10: PART-TIME WORK

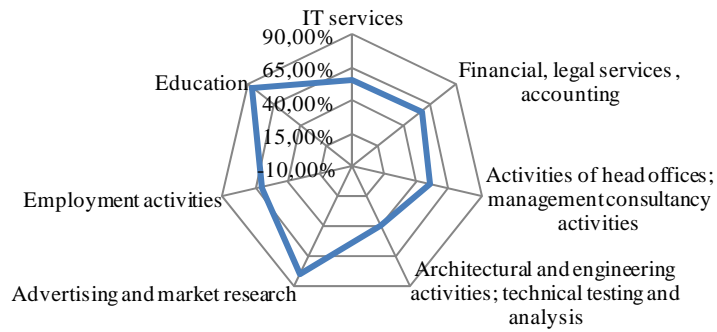

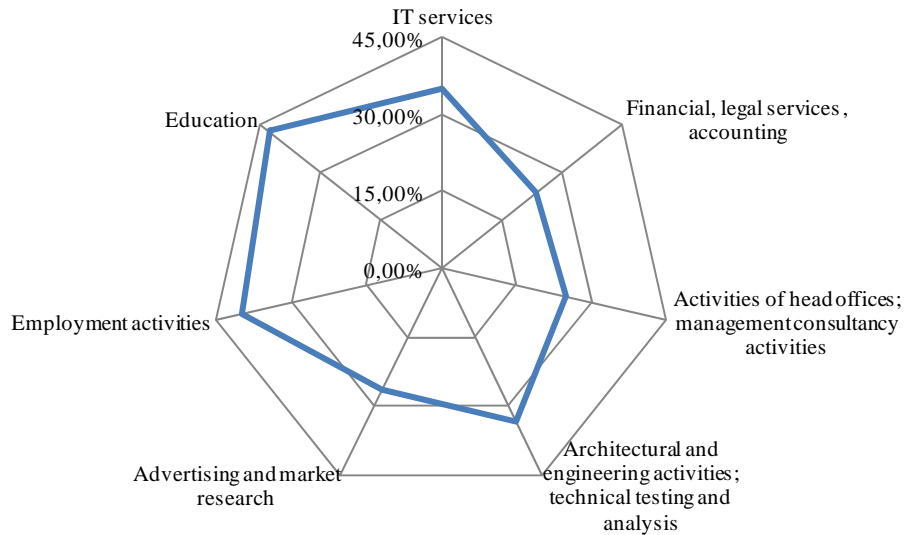

FIG.11: PART-TIME WORK TO BE INTRODUCED IN THE NEAR FUTURE

Flexi-time

Flexi-time is traditionally utilized in Slovak organizations and it represents the mostly used flexible work arrangement. As comes from FIG.12, it is widely used in all the surveyed sectors, mostly in IT Services, least in Education. FIG.13 shows that its use in future will be growing as well.

FIG.12: FLEXIBLE WORKING TIME

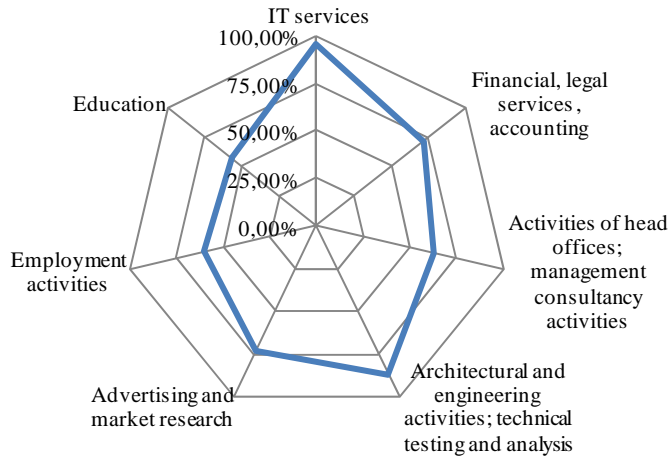

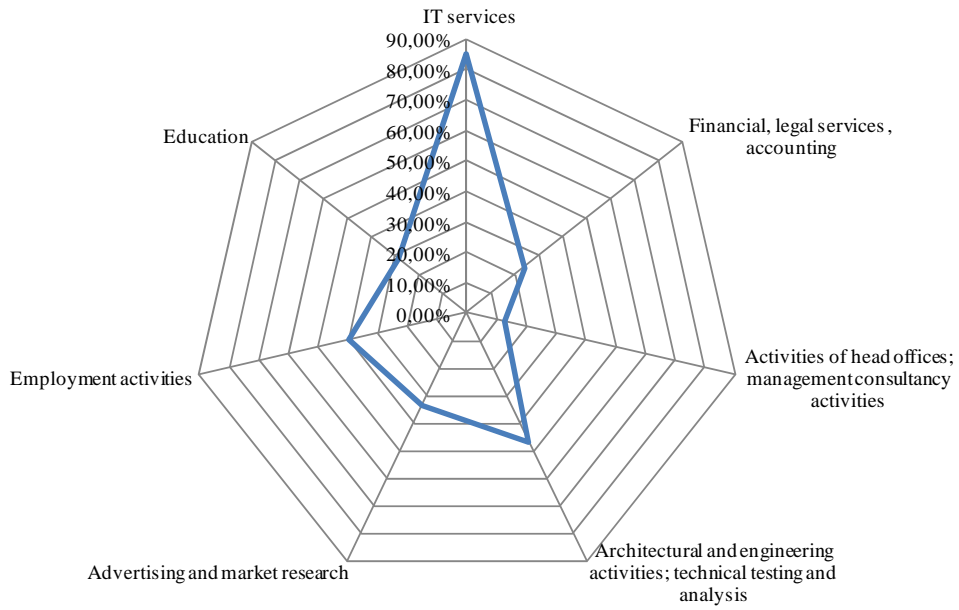

FIG.13: FLEXIBLE WORKING TIME TO BE INTRODUCED IN THE NEAR FUTURE

Conclusion

As for the flexible work arrangements, the firms in the intensive knowledge business services mostly use flexible working time (72.29%) as an effect of the strong customer-orientation of the firms in question (see FIG.14).

The other flexible work arrangements can be ordered as follows: part-time work (61.126%), mobile work (38.96%), telework (35.93%), teleworking from home once a week (12.62%).

The survey of the planned flexible work arrangements covered introduction of new ones or increasing their use. The planned organizational innovations can be summarized as follows: flexible working time (38.55%), part-time work (32.38%), telework (18,53%), mobile work (17.77%), teleworking from home once a week (6.51%) (see FIG.15).

The data suggest that the ratio between telework and mobile work will change in the future. Currently the higher use of mobile work will be substituted by telework.

The KIBS in Slovakia utilize flexible work arrangements above the national average.

FIG.14: SUMMARY OF FLEXIBLE WORK ARRANGEMENTS UTILIZED IN SLOVAK KIBS

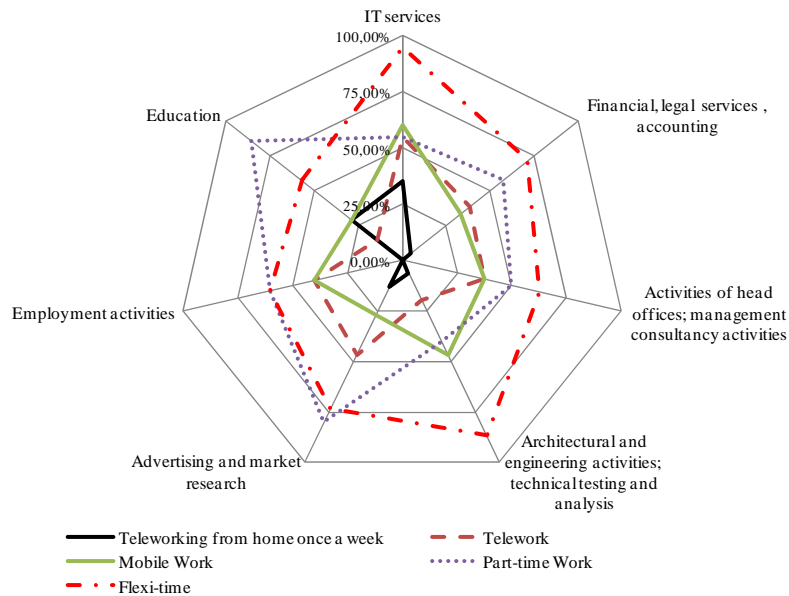

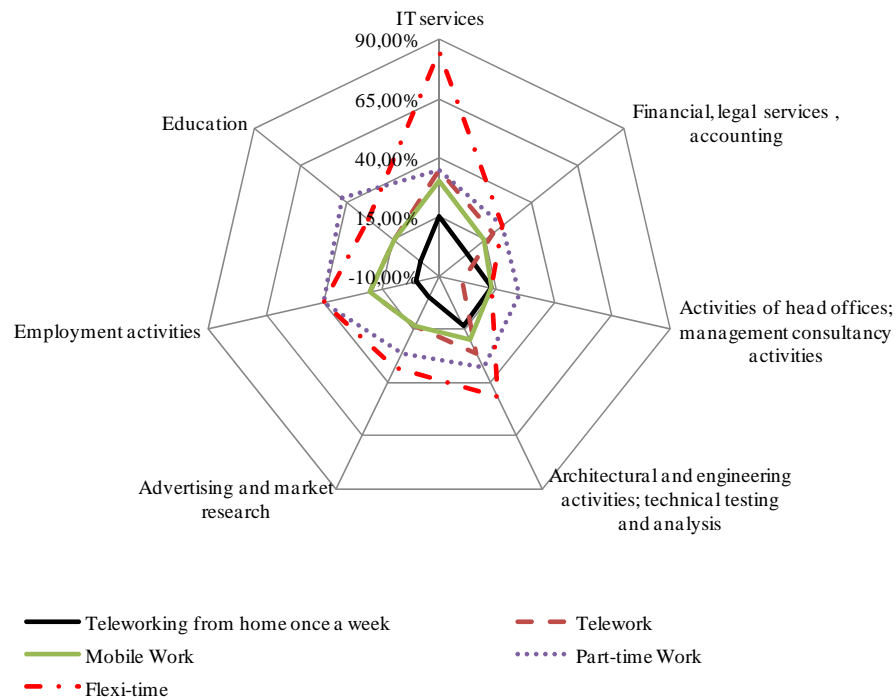

FIG.15: SUMMARY OF FLEXIBLE WORK ARRANGEMENTS TO BE IMPLEMENTED IN SLOVAK KBIS IN THE NEAR FUTURE

All the identified changes show serious interest of the surveyed organizations in cutting costs, moving services closer to clients and taking their comfort into account (mobile work and flexi-time) on the one hand, but also the respect for the preferences of knowledge workers in order to attract and retain them. In this respect, Slovak KIBS follow the overall trend in implementation of flexible work arrangements.

Holistic Systemic Failure Prevention in the Software Development Process

*Alfons Unmuessig, Alfons.Unmuessig @t-online.de
Milan Fekete, Milan.Fekete @fm.uniba.sk
Comenius University in Bratislava, Slovak Republic*

Abstract

This work aims to propose a qualitative model for the new software failure prevention. Software failure prevention methods and models have made substantial progress in recent years. But this still falls short of the needs of today and the future. One contribution is a qualitative model that takes into account key determinants and their interlinked effects. The model is based on System Dynamics and the elements involved in the software development process, e.g. the human being, management, members of staff, work psychology, quality, methods, organizations, customer, culture etc. Current research status comprises 15 identified important key determinants, their respective strength, interrelationships and dynamics. The model is operationalized with a software tool capable of modelling all the key determinants defined, their effect directions and other data of the comprehensive matrix they make up. With the research results made, the new failure prevention model shows promise. The research is due to continue further in order to contribute to improved failure prevention in the software development process.

Keywords: Holistic Systemic, software, failure prevention, System Dynamics, qualitative model, the human being, process, methods, technology, organization.

Introduction

Over the past years, software complexity has been rising steadily, with more complex processes in all areas of life progressively automated through software. Spectacular software failures over the last years have put man and nature at risk, causing extensive cost and frustrating customers. Consequently, software failure prevention in the software development process is growing in importance. Today's failure prevention techniques have made substantial progress over the last years in a contribution to better failure prevention. This paper aims via comprehensive systemic approach that takes account of key determinants and their interlinked effects to further improvements to software failure prevention. The model is not meant to replace current failure prevention procedures but rather to consequently expand and complement the procedures.

The key focus in the research effort is on the first two phases (Requirement Analysis and Specification) of the software development process. Based on the results of the research of available sources and in author's own experience, 50 to 70 % of all failures come about in these two first development phases, with most of them only found in later phases.

Desk Research and Theoretical Background

Software Development Process

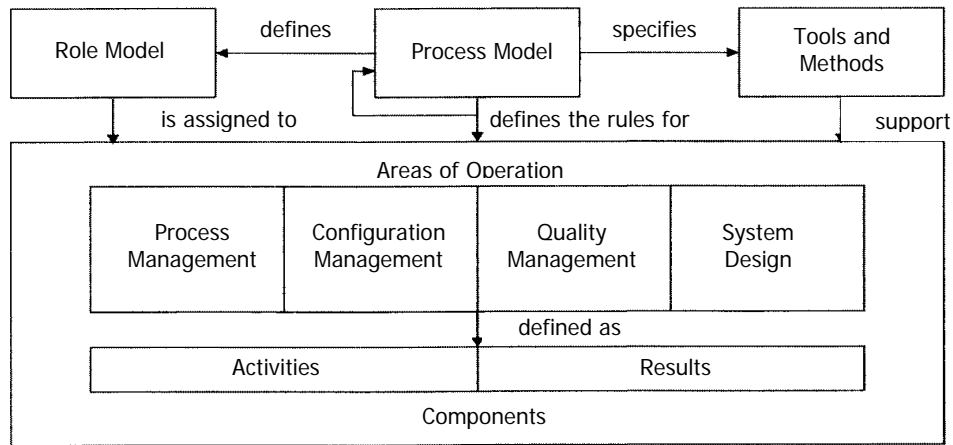

Methods

Different methods have found their use in the software development process. Consequently, the process may be implemented with various tools and methods. The methods and CASE (= Computer Aided Software Engineering) tools employed are major determinants of productivity and failure prevention efficiency (Balzert 1998, p. 15).

Process-/Procedure Models

For the development of software, process and procedure models are currently applied. A process model structures the software development process into activities and results (see Fig. 1). The model defines the rules governing the scope of the activities, their course and output. The activities and results fall under different types of operations such as project management. Process models further also define the relevant roles, tools and methods.

FIG. 1: PROCESS MODEL
(Source: Bunse 2008, p. 4)

Software Failures

Software failures mainly are a result of human error in the development process. As the development process entails several phases, the failures may result e.g. from: Misconceptions in initial requirements; Design inadequacies; Programming errors. Failures not detected in the respective stages of development phases may add up and multiply in the follow-up development phases by causing further failures. Hence a failure summation effect applies (Wallmüller 2001, p. 15).

Software Failure Prevention

Failure prevention is a key activity in the software development process. Late failure detection adds up massively to costs. According to the various analyses and author's own experience, failure elimination costs as a variable multiply by a factor of about five to ten for each phase in the sequence. Consequently, failure prevention should be pursued as the primary aim. The following **analytical, constructive, organizational** and **psychological** failure prevention actions and **Software Process Improvement Models** are important Inputs for the present Holistic Systemic Failure Prevention Model. They are a part of a number of different sources of applicable determinants.

Outline of the four classes of actions:

1. Analytical Quality Actions

Analytical quality actions are implemented e.g. in order to verify current quality levels. The examinations do not establish absolute certainty as regards conformity/non-conformity of a product.

2. Constructive Quality Actions

Constructive quality actions mainly aim at the failure prevention.

3. Organizational Quality Actions

Organizational quality actions include the design, implementation and maintenance of e.g. a corporate Quality Management System, Project Management System, and others.

4. Psychological Prevention Actions/People Actions

Software development should not be considered only as a purely technical procedure. A software development is carried out by the human input (the development team), communication processes, leadership, quality culture and other variables that this entails are key to the quality output.

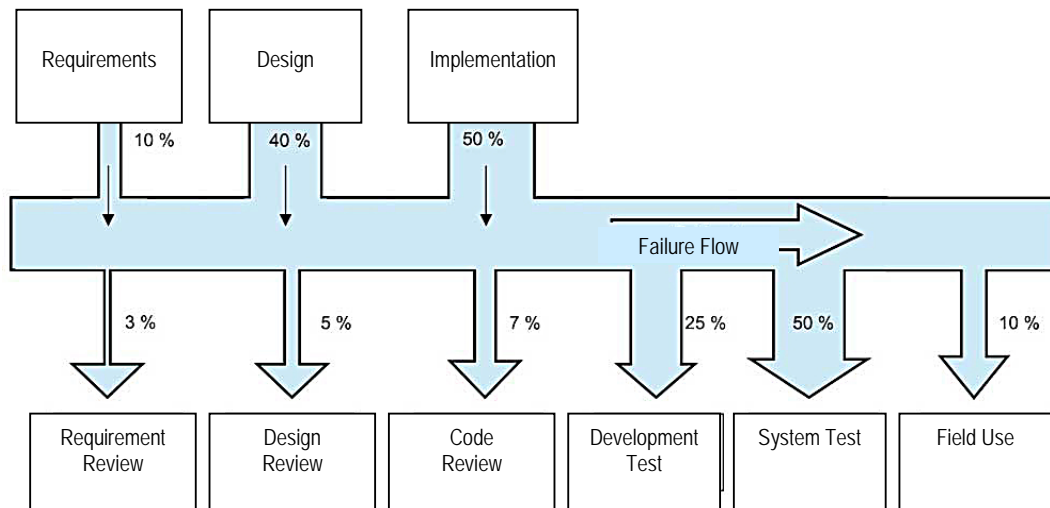

Software Process Improvement Models for Failure Prevention

Process improvements may be implemented in a number of different ways such as with the help of the classical PDCA (Plan, Do, Check, Act) cycle or by way of capability maturity models. An advantage to using capability maturity models is that they systematically impose successful practices on different models. Examples of capability maturity models include CMMI or SPICE (Hörmann, 2006, p. 5).

Costs and Benefits of Practical Software Failure Prevention

Fig. 2 shows that most failures are produced in the first two phases of Requirements and Design but are only recognized in later phases. For instance in the Requirements phase, 10% failures are produced but only 3 % detected by the Requirement Review. Such circumstances always have a negative effect on costs.

FIG. 2: PHASES OF OCCURENCE AND ELIMINATION OF SOFTWARE FAILURES
(Source: Masing 2007, p. 835)

Summary of Desk Research and Theoretical Background

Software Development Process

In software development processes, a progress has been made in recent years. This has been facilitated e.g. through the use of process models, optimization in processes, new and improved methods, professional project and risk management, new and improved tools and other systematic means. Further improvements are needed e.g. in requirement analysis.

Failure Prevention in the Software Development Process

Failure prevention has also experienced improvements in recent years credit to optimization in software development processes. The newly implemented processes in failure prevention such as design-related quality actions, quality methods and particularly the use of capability maturity models all add up to the difference. Nevertheless, the number of failures still remains high. Further research is needed in the software development and failure prevention.

This paper aims at helping to optimize failure prevention specifically in the phases of the Requirement Analysis and Design by means of a comprehensive and interlinked perspective that includes the human factor.

Method

The research is performed using a theoretical and an empirical concept respectively.

Concept Design

Based on the insights gained with scientific methods in the research of available sources, a concept design is compiled for holistic systemic failure prevention. Related themes and topics such as organization, leadership and quality culture are also included in the examination. The holistic systemic concept is very closely related to the complex network systems.

The assumptions drawn on and based on the research of available sources and authors' personal experience will be complemented by an empirical survey. The persons interviewed include managerial functions and experts in the areas of Software development and Software Quality Management. The expert interviews are not a part of this paper, as they will be done in a later research phase.

Finding the Method/Model for Solving Problems in Complex Network Systems
Method / Model

For the present model of "Holistic Systemic Failure Prevention", a method/model is required to deal with the complex network systems. The methods for dealing with complexity are subjected to 26 criteria according to Grossmann (Grossmann 1992, p. 44). Some of the criteria are: providing for a large number of components; reflecting mutual relationships between the components; providing for changing cause and effect chains. Further needed is the emphasis on facts, clarity, dynamics, creativity, inclusion of social aspects and human interactions, openness and promotion of integration.

In order to be able to effectively deal with complexity and hence to facilitate holistic systemic failure prevention, a model has to include both the factual and behaviour-related dimensions. In Grossmann (1992, p. 188), nine concepts are investigated. A conclusion based on comprehensive analysis of the nine concepts has left two remaining: Thinking in Networks and the Sensitivity Model (SM). The final decision was – after a consideration of various aspects – for "Thinking in Networks".

For operationalizing the "Sensitivity Model" and "Thinking in Networks" methods/models, software tools have been developed by universities and industry. For purposes herein, the "Consideo Modeler" modelling tool by Consideo GmbH in Lübeck, Germany, has been chosen that is based on the "Thinking in Networks" model.

Systemic Thinking / Cross-linked Thinking

Systemic thinking amounts to identifying mutual interdependencies and the rules behind causal interactions (Hamilton 2007, p. 110). Fig. 3 shows an example systemic software development process. Hints and ideas for solving the problem of "comprehensive interlinked failure prevention in the software development process" have been supplied among others by the following authors who spearheaded research into systemic thinking:

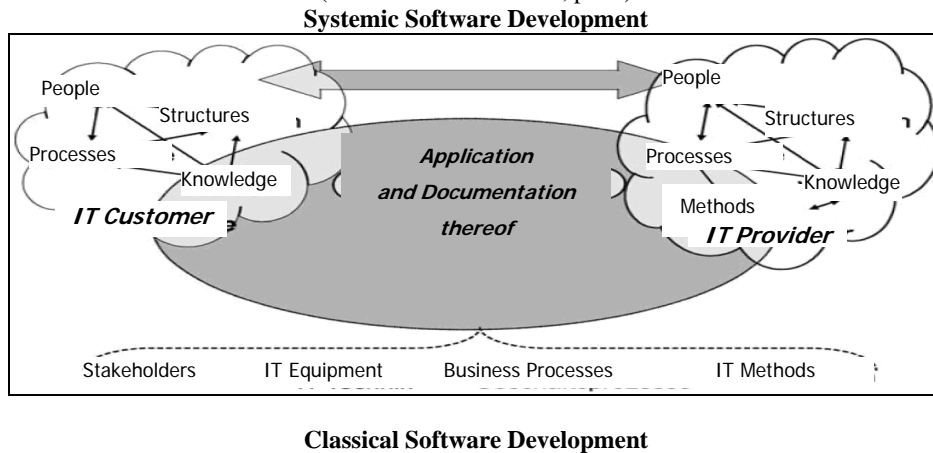

(Dörner, 2008); (Gomez/Probst, 1987); (Gomez/Probst, 1997); (Senge, 1996); (Vester, 2007)

Systemic thinking relies on six steps:

- (1) *Defining objectives and modelling the problem situation*
- (2) *Analyzing causal chains*
- (3) *Exploring and interpreting possible trends in the future based on the current status*
- (4) *Exploring control options*
- (5) *Planning strategies and actions*
- (6) *Implementing the problem solution*

FIG. 3: SYSTEMIC SOFTWARE DEVELOPMENT

(Source: Hamilton 2008, p. 91)

The Model Concept
Model Structure

Applicable determinants are identified based on the insights of a number of disciplines. The key focus areas are:

- Processes, activities, methods and models from software development and quality management
- The human factor
- Other disciplines dealing with failure prevention such as medicine, aviation, work psychology etc.

The model amounts to a generic model that in its practical application splits further into sublevels. In this paper, one such "sublevel" is presented. The determinants at work, their interlinked effects, effect directions and effect intensities are modelled with the "Consideo Modeler" tool.

Objective

- The model is meant to represent in a true-to-reality manner the complex applicable interdependencies and causal chains
- The use of insights from other sources and disciplines such as medicine, psychology and culture shall provide new incentives to further improve software failure prevention.

System Theory-based Assessment

In order to develop a network matrix model for analyzing the problem and finding solutions, insight is needed into causal relationships between the variables involved (Gomez/Probst 1997, p. 72).

Interdependencies are quantifiable through three aspects.

1. In their effect: - Is there a promotive or inhibitive/stabilizing effect?
2. According to intensity: - Is it weak, moderate or strong?
3. According to temporal presence: - Is the causal effect short, medium or long in duration?

Identifying the Determinants

For identifying relevant determinants, the following "sources" are used: techniques, models and activities used in software development and in quality processes, case study, human factor-related aspects and insights from other disciplines. For further details, refer to "Software Failure Prevention" herein and relevant sources, such as Masing (2007), Balzert (1998), Gerlich (2005), Hoffmann (2008).

Examination of Applicable Determinants Based on:

- **Case Study**

In order to determine applicable determinants for purposes of comprehensive failure prevention based on real customer projects, the authors and their team carried out an RCA in the firm with a follow-up evaluation of the results. The results of the case study largely confirm the desk research findings and provide additional new insights of use in the future failure prevention.

- A higher number of reviews of specifications and design documents greatly improve failure prevention and hence also help to reduce failure costs.
- With software developers, testers and quality experts working closely together, a team spirit is promoted and a boost to quality culture is achieved that benefits failure prevention.

- **Determinants that Relate to the Human Factor**

At present, software still is prevalently compiled by humans. This means the key failure source for software errors is the human factor. Generally at the individual human level, the cause and effect logic does not always apply. The human performance potential is shaped by a comprehensive variety of factors. Fig. 4 provides a visual analogy to the causal origin of human failures in the form of the Swiss Cheese Model based on J. T. Reason (1990/2008).

FIG. 4: SWISS CHEESE MODEL: THE CAUSALITY OF HUMAN ERROR (Source: in reference to J.T. Reason

)

J. T. Reason essentially differentiates between **latent and active** failures. **Latent** failures relate causally e.g. to the organization where some activities are not defined in operating instructions for the respective task/workplace. **Active** failures refer to human error while performing the actual task.

- **Determinants from other Disciplines**

The following variables have been derived from other disciplines such as work psychology, organization theory and culture: workload and stress at work, emergent software failures, corporate culture and quality culture.

Comments on Target Variable and Determinants

- **Target Variable**

The target variable is identifiable with the factor of "**successful failure prevention**" in the centre of Fig. 5.

- **Determinants**

The following determinants affect the target variable directly or indirectly.

- **Clearly defined customer requirements**

The core element in failure prevention is a precise definition of requirements.

- **Employee workload and stress**

The above and further determinants that relate to this area have a negative effect in failure prevention by causing e.g. lower employee concentration.

- **Attained level of process maturity**

Capability maturity models such as SPICE and CMMI amount to dedicated tools for process improvement purposes, hence also determinants in failure prevention. Process maturity levels are measured in grades where for instance in CMMI, the top grade is Level 5.

- **Emergent software failures**

Emergence refers in philosophy and psychology to a phenomenon where specific properties or behaviour of a whole cannot be derived from the sum of behaviour of its individual parts (Hamilton 2007, p. 119). Applied to software, emergent failures may come about through instable hardware.

- **Staff expertise and empirical experience**

Professional expertise and empirical experience of individuals are essential to the failure prevention.

- **Application software complexity**

Complexity of target application software also is a key determinant as it may drive complex and to some part, in conjunction with instable hardware, even emergent failures.

- **Leadership qualities in management**

Leadership is defined in expert sources in a number of different ways, some of which are: Being a role model (Seghezzi 2007, p. 79) and actively dealing with topics (in reference to Strunz 2001, p. 168); Directing staff towards a vision so that they respond in a motivated manner; Making staff understand the context by means of suitable communication (employee orientation).

- **A learning organization**

Continuous learning in organization is a factor of essential importance in complex systems. Available sources such as Senge (2008) provide comprehensive examinations of the topic.

- **Motivated employees**

Motivation is interpreted as the cause for a specific human behaviour (Strunz 2001, p. 49). As a result, the employee becomes directed towards a specific objective. Applied to the effort herein, the objective is "to avoid software failures". Available sources deal comprehensively with the topic which is why it shall not be discussed in more detail herein.

- ***Open and fair communication & feedback***
Within the comprehensive variety of communication, open communication that includes feedback promotes fairness, the will to listen and the readiness to report failures including software failures without fear. Open communication also promotes motivation.
- ***Requirement analysis quality***
The quality of the requirement analysis and understanding customer needs and expectations is a difficult and complex task as the process frequently involves two individuals or cultures that think in different patterns. The customer defines and/or proclaims their expectations in a particular 'language' which differs from that of the supplier and/or software developer. A 'language' signifies in this context also a different culture.
- ***Quality culture***
For successful failure prevention, the quality culture practiced by the firm is key to the quality culture that grows out of corporate culture is an integral part of enterprise quality (Seghezzi 1996, p. 181). Managerial functions should be a role model in quality matters in their everyday stances and attitudes.
- ***Unstable hardware***
Unstable hardware frequently drives emergent software failures that are difficult to identify. The process of failure location entails a complex effort that often branches into wrong directions with frustration as a result.
- ***Corporate culture***
Corporate culture is the entirety of shared values, standards, stances and attitudes that shape the decisions, actions and behaviour of the members of the organization. Consequently, the attitudes towards successful failure prevention essentially grow out of the corporate culture. For further discussion, refer to Schein (2003).
- ***Causal interdependencies, their effect directions and effect intensities***
In the following parts, some causal interdependencies, their effect directions, effect intensities and temporal variations are briefly outlined. In the network matrix visualization in Fig. 5, the effect direction always is indicated by an arrow and the effect intensity by the line width and/or the attached numerical indication, where 10 = weak, 17 = moderate, 25 = strong. Strikethrough arrows indicate a temporal delay. One strikethrough in a line that connects the determinants amounts to one temporal unit. The temporal unit (second, minute ...) is definable in Consideo Modeler. In this particular model, a temporal unit is approximately equal to one year.
- ***Clearly specified customer expectations → successful failure prevention***
Clear and precise specifications of customer expectations are the initial reference basis in failure prevention, hence have a direct effect. They strongly affect failure prevention as wrong or missing specifications may have fatal consequences.
- ***Clearly specified customer expectations → application software complexity***
Clear and precise specifications moderately lower the complexity of application software.
- ***Clearly specified customer expectations → requirement analysis quality***
The quality of customer expectations has a moderate positive effect on requirement analysis quality.
- ***Workload and stress → motivated employees***
Higher workload and stress intensity has a moderate negative effect on employee motivation.
- ***Emergent software failures → successful failure prevention***
Due to non-controllability of emergent software failures, they have a moderate negative effect on successful failure prevention.
- ***Emergent software failures → motivated employees***
Emergent software failures also have a fair negative effect on employee motivation.

Further interdependencies and their respective effect directions and intensities are provided in the network matrix visualization in Fig. 5 and the weighting matrix in Fig. 6.

Results

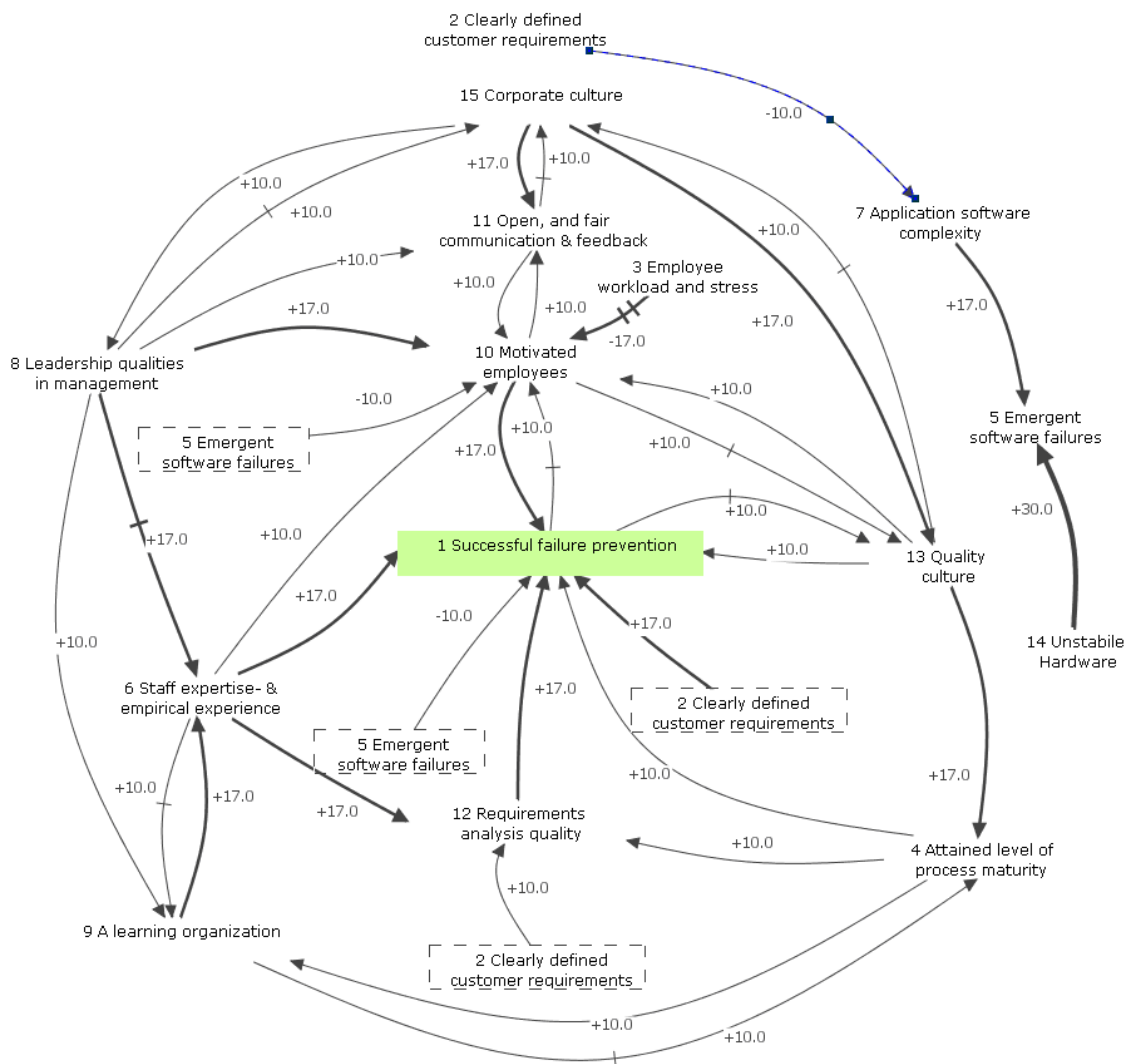

Visualization of Interdependencies, Mutual Effects and Effect Intensities of Determinants

By means of Consideo Modeler, the determinants are comprised into a generic model with a network matrix structure and analyzed.

Visualizations and Analyses

The following Fig. 5 shows the interdependencies, effect directions and effect intensities of applicable determinants. The target variable of "successful failure prevention" is shown in the middle. For each determinant, its interdependencies (arrows), effect intensities (numerical indications) and a plus or minus sign are indicated. A plus sign before the numerical intensity signifies in addition to the effect direction its promotive effect, a minus sign its inhibitive effect.

FIG. 5: THE DETERMINANTS IN A NETWORK OF INTERDEPENDENCIES
(Authors' own visualization using Consideo Modeler)

The following Fig. 6 shows the weighting matrix that provides percentage indications of the effects of the different determinants within the network (effect direction FROM/TO on the y- and x-axes respectively).

The visualization informs of the weighting of the different factors. For instance a learning organization (y-axis, row 10) participates with 17 % in the effect on professional expertise and empirical experience (x-axis,

column 7). The sum of values in each column of the weighting matrix must not exceed 100%. A sum lower than 100% indicates that there are additional determinants to those that are included in the systemic visualization.

Explanation of Elements in the Result Matrix:

Based on the cause and effect relationships including their respective effect directions, intensities and temporal delays (and the resulting self-amplified and balancing feedback loops), the result matrix in Fig. 7 provides all the determinants that directly or indirectly affect the chosen factor, which is in this case the **target variable of "successful failure prevention"**. On the x-axis is the total effect intensity (sum of direct and indirect effect intensities of each determinant relative to a chosen factor (positive or negative). The y-axis shows changes in the effect intensity of the determinants on a timeline (increase or decrease). This gives rise to four different quadrants shown in Fig. 7 (the result matrix):

1. The upper right area (progressively promotive): determinants that in the short term have positive effect, with an outlook of even more pronounced positive impact in the mid to long term. The weight of the determinants grows over periods of time as they are largely involved in self-amplified feedback loops and/or trigger the loops. The determinants are the most effective levers for positive development in a chosen factor.
2. The lower right area (degressively promotive): determinants that in the short term have positive effect, with mid- to long-term outlook of less strong positive impact. The weight of the determinants declines over periods of time as they are largely involved in balancing feedback loops and/or trigger the loops.
3. The lower left area (progressively inhibitive): determinants that in the short term have negative effect, with an outlook of even more significant negative impact in the mid to long term. The weight of the determinants grows over periods of time as they are largely involved in self-amplified feedback loops and/or trigger the loops. The determinants are the most effective levers for negative development in a chosen factor.
4. The upper left area (degressively inhibitive): determinants that in the short term have negative effect, with an outlook of less pronounced negative impact in the mid to long term. The weight of the determinants declines over periods of time as they are largely involved in balancing feedback loops and/or trigger the loops.
5. The numerical codes and names of the determinants are provided on the right in the matrix.

FIG. 7: RESULT MATRIX, short-term perspective
 (Authors' own visualization using Consideo Modeler)

Analysis of determinants in the result matrix

The analysis of the result matrix provides the gist of output of the present effort. The matrix entails a comparison of the effects of determinants on a freely choosable factor which is in this particular case the **target variable of "successful failure prevention"** assigned as a **number 1**. For each determinant included, its effect intensity is shown via the x- and y-axes relative to a chosen factor (here: the target variable) The result matrix in Fig. 7 shows the short-term effects and Fig. 8 the long-term effects respectively of the determinants on successful failure prevention.

FIG. 8: RESULT MATRIX, long-term perspective
 (Authors' own visualization using Consideo Modeler)

Discussion and Conclusion

Discussion

In this part, the **short-term effects** held in **Fig. 7** and the **long-term effects** held in **Fig. 8** are discussed as the applicable determinants including respective impacts and possible actions.

The determinants No. 10 (Motivated Employees) and No. 13 (Quality Culture) in the upper right quadrant in Fig. 7 have a strongly positive effect in the short term (on an ad hoc basis) which even grows further in intensity over the long term as seen in Fig. 8. The weight of determinants grows, hence they are identifiable as key levers in comprehensive failure prevention. This is evident also from the new position of the target variable identified as No. 1 in the upper right quadrant in the visualization.

The determinants No. 2 (Clearly Specified Customer Expectations), No. 4 (Level of Process Maturity) and No. 6 (Staff expertise and empirical experience) in Fig. 7 have a strong effect in the short term (as they score high on the x-axis) but a relatively moderate positive effect in future projection (as they show no increase on the y-axis, see Fig. 8). The remaining determinants Nos. 8 (Leadership qualities in management), 9 (A learning organization), 11 (Open and fair communication) and 15 (Corporate culture) in the quadrant, though having a positive effect, show minimum increase in the effect intensity in the future. This is evident from Figures 7 and 8. The determinant No. 12 (Requirements analysis quality) in Figures 7 and 8 has constant effect intensity both in the short and long term at identical x-axis values. Consequently, the variable exhibits no dynamics.

The determinants No. 3 (Employee workload and stress), No. 7 (Application software complexity) and No. 14 (Unstable Hardware) in the lower left quadrant in Fig. 7 already have a negative short-term effect on the target variable. Fig. 8 implies further moderate negative developments in the long term in both the x- and y-axis values in relation to the target variable. The determinant No. 5 (Emergent Software Failures) has a fairly strong negative effect in the short term given its distinct x-axis value that further grows in the long term with an even more pronounced y-axis value.

Conclusion

The model output and discussion based on a quality-oriented approach comprise the short- and long-term status and trends in applicable interdependencies and the significance of individual determinants. The results provide indications as to where actions/system interventions are needed. The most significant determinants with positive effect in failure prevention numbered 2 (Clearly defined customer requirements), 6 (Staff expertise-& empirical experience), 10 (Motivated employees) and 13 (Quality culture) need reinforcement.

The determinants numbered 8 (Leadership qualities), 9 (A learning organization), 11 (Open, and fair communication & feedback), 12 (Requirements analysis quality) and 15 (Corporate culture) positioned in the upper right quadrant of "progressively promotive" have a moderate effect intensity, hence necessitate reinforcement through adequate measures.

The determinants numbered 3 (Employee workload and stress), 5 (Emergent software failures), 7 (Application software complexity) and 14 (Unstable hardware) have an effect direction that runs contrary to failure prevention, hence need optimization through targeted system interventions. The actual causes are identifiable with emergent software failures, workload and stress at work and application software complexity. The causal background needs to be analyzed of the 3 determinants with negative effect and the causes avoided in the future.

The model can be further optimized in a two additional ways.

1. Expand the model with further determinants with subsequent new verification and optimization.
(this model expansion by the authors is currently under development)
2. Develop and analyze a highly comprehensive quantitative model

Generally, a note is due that any actions and model expansions made need to be verified for their interlinked effects and balanced accordingly as the determinants function in a matrix of mutual relationships and consequently also need an assessment in a relationship matrix.

As a further research task, the model expansion may be recommended to cover the entire software lifecycle.

Value Creation for Software Engineering in Product Development

*Anne-Maria Aho, anne-maria.aho@seamk.fi
Seinäjoki University of Applied Sciences, Finland*

*Lorna Uden, l.uden@staffs.ac.uk
Staffordshire University, United Kingdom*

Abstract

Research in software engineering typically ignores product development in industrial companies. Software development is becoming increasingly important for product development in the machinery industry. Traditionally, in machinery industry, the product's competitive edge is based on the characteristics of the physical product. Today, a product's competitive edge is mainly in the embedded software of the product. In general, the concurrent product development has been widely researched within the field of product development as well as the role of software development in the field of strategic management. However, in the specific context of the strategic role of software engineering process as a part of multi-disciplined product development, this topic has not yet been researched. The study seeks to fill this research gap. Its purpose is to shed light on how value creation can be improved by developing dynamic capability into the software engineering process for product development in machinery industries.

Introduction

The machinery industry employs 131 000 people in Finland and has a turnover of EUR 24 billion. There is demand for companies in this sector to know how to apply new technologies rapidly to customer-driven products and production processes. It is increasingly popular for companies to form co-operation networks that produce total solutions that are tailor-made to meet the customers' individual needs. This allows each company to focus on their core competence and this can create jobs in subcontractor companies. (Niemelä, 2010)

According to the Industry Report (Jääskeläinen 2009) of machinery industry, the future operation and development of products requires a combination of expertise, and development that typically take place in the networks, which can be international networks. The key challenge in the machinery and appliance industry in the future will be how to use a globally produced technological-scientific, commercial information and business knowledge in their businesses. Future competition will be based on who is best to utilize the information of different disciplines by combining them with each other into new innovative products and production methods. The focal success factors for the industry will be based on a combination of technology and business knowledge and skills.

Software products are increasingly becoming more important in the machinery industry. Traditionally, the product's competitive edge of mechanical engineering is based on the characteristics of the physical product. Today it is increasingly embedded in software-based products. Software production in machinery has a strategic role in the company's successful competitive advantage. It has shifted from a complementary role to the focus of the product development in machinery industry.

Empirical findings from our studies, based on cases from a multinational group of companies specializing in sheet metal working technology located geographically differently in different countries and in the software engineering process, also confirmed our findings. The case studies were taken with interviews from 40 software engineers. (Aho, 2011)

According to industry reports of mechanical industries (Jääskeläinen 2009) the following drivers of change are influencing the strategic position and value creation in the machinery industry. Firstly, customers are requiring detailed and comprehensive solutions. Secondly, the competitive position is changing in the business. The price of the product and the core competences of the companies are now the deciding factors for competition. Thirdly, technological development increases the role of embedded software, which means that the role of the software engineering process is becoming increasingly important in the product development process. Fourthly, knowledge

about competitors and technological development by companies are not systematically obtained. Currently the software engineering practices are non-systematic and unprofessional.

Based on the changing environment and the new role of software engineering process for machinery product development in the future, a new kind of software process model is needed, in which different perspectives of the development process are considered. There is also the need for continuous learning that allows us to anticipate and adapt to a changing environment. This means that the software engineer for the machinery product development not only requires technical knowledge, but also understands business skills in order to respond to changing requirements. In order to meet these needs, software engineers in the mechanical industry should:

- Better understand customers;
- Improve quality and integration of processes;
- Improve the profitability process;
- Continue to improve the development process.

This involves taking a new approach to develop products by focusing on providing value to the customers with quality development. It means understanding marketing and improving the software engineering process. In this study, dynamic capabilities are examined due to the strategic role of the software engineering process and the fact that the demands of environmental changes necessitate dynamic capabilities in order to build, integrate and configure resources.

It is our belief that value creation, based on dynamic capability in the software development process, is needed to develop better products. This paper begins with a brief review of the product development for mechanical engineering followed by the software engineering process for the machinery industry. This is followed by a brief review of dynamic capability. Subsequent sections discuss how value creation for dynamic capability is needed to help address the changing needs of the product development processes in machinery industry. The paper concludes with further suggestions for research.

The current ways of developing the products

The main purpose of the product development of a for-profit enterprise is to result in products that can be produced and sold profitably. Successful product development is typically evaluated by following the profit related dimension: Product quality, product cost, development time, and development cost and development capability. The assessment of successful product development consists also of safety standards, ecological matters and employment policy (Ulrich and Eppinger, 2004).

The traditional approach for the development of manufacturing systems considers the elements of the system, i.e., mechanical, electronic and software. They are developed independently and in the end integrated to form the final system. This kind of method is being criticized as unsuitable for the complexity and the dynamics of today's systems (Thramboulidis, 2005).

The empirical context of this study is the software engineering process as a part of a multi-disciplinary product development process in a machinery company. The multi-disciplinary product development includes mechanical, electrical, automation and production engineering processes. Typical products of the company are for working metal manufacturing systems and machinery, such as punching machines and laser cutters. The challenges of the software engineering are multi-dimensional. Firstly, the software engineering process is within a multi-disciplined product development. Secondly, it is increasingly important to understand customers' business in order to respond to the changing customer needs. The study aimed to deal with the mentioned problems as shown in FIG. 1. (Aho, 2011)

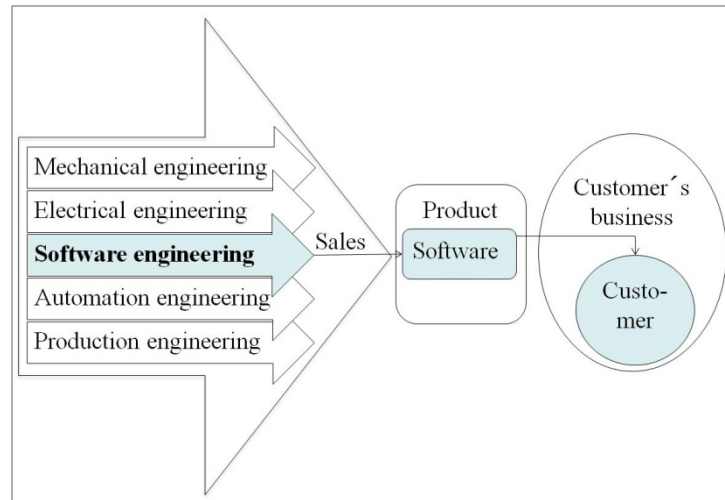

FIG. 1. THE CONTEXT OF THE STUDY

Concurrent engineering is a systematic approach to the integrated and concurrent development of a product and its related processes. In addition to this it emphasizes customer expectations and team values of cooperation, trust and sharing. This enables decision making with long periods of parallel working by all life-cycle perspectives (Thramboulidis, 2005). This model provides a high quality and well-integrated R & D project, but it does not take into account the significance of the multi-disciplinary nature of the development areas required. In addition, there is a risk that the various development areas are not equal, due to the organizational culture.

Changing business environments and the changing role of the software process require a different perspective on the product development process and software engineering process. The concurrent engineering approach provides several exploitable elements for the improvement of value creation logic, such as creating closer co-operation inside the multidisciplinary product development process. However this approach does not deal with the communication problems in current product development. Communication between mechanical and software engineering is often one sided.

Leonard-Barton (1992) studied the nature of core capabilities and core rigidities product development focusing on the predominant paradox between them. Core capabilities are generally defined as clusters of distinct technical or managerial systems and skills, which are deeply rooted in values and can be seen as core rigidities. According to Leonard-Barton (1992), the focal challenge for product development projects is to take advantage of core capabilities without destroying the innovations and the abilities for change.

Schimmoeller (2010) studied the success factors of new product development processes by reviewing previous literature and found that the use of cross-functional teams is a primary key success factor. However, there is limited research on the influence of cross-functional teams on product performance. Schimmoeller (2010, p. 31) argues that the speed of product development is in the field of product development research because it provides competitive advantage. Furthermore, according to him, costs of the development process are seen as a less significant factor. Another purpose of this study is to meet the challenges of multi-disciplined product development by developing a new software design model that takes into account the need for cross-functional communication.

The current approaches to designing software

The term software engineering methods refers to the structured approaches to software development that include system models, notations, rules, design, advice and process guidance (Sommerville 2000, p. 6). Their aim is to facilitate the production of high-quality software in a cost-effective way. Several standards, methods and models have been developed for quality assurance in software products, such as IEEE/EIA 12207 (IEEE Standards Association 2010; Singh 1998; Xu and Ramesh 2007), ISO 9000 (International Organization for Standardization 2010; Dobbins 1996), CMM/CMMI (Software engineering Institute 2010; Paulk 2001; Phillips 2009), SPICE (ISO)/IEC 15504 (Dorling 2006; International Electrotechnical Commission 2010) and RUP (Krebs 2007).

The Structured Analysis (DeMarco, 1978) and JSD-methods (Jackson System Development (Jackson, 1983) were the first developed methods in the 1970s. The main purpose of these methods was to identify the basic functional components of a system and these kind function-oriented methods are still widely used. Object-oriented methods (Booch, 1994) were developed in the 1980s and 1990s and they supplemented the function-oriented methods. Currently these different approaches can be seen integrated into a single unified approach built around the Unified Modeling Language (UML) (Fowler and Scott, 1997; Rumbaugh, Jacobson, Booch, 1999). According to Sommerville (2000, p. 11), there is no ideal method and different methods have different areas where they are applicable.

The traditional approach of software engineering considers software as an object to be engineered, which means that it is developed, built and deployed. These so called plan-driven methodologies are based on discipline and control and they require heavy processes to assure the quality of the software. Turner and Boehm (2003) have analyzed the properties of plan-driven and agile methods to find a balance between flexibility and discipline in software projects. According to these authors, the most important result of their study was the conclusion that the most critical success factors are much more related to people factors.

A typical software development process is incremental and therefore iterative process models have been developed, for instance agile software development methods (Agile Manifesto, 2010). According to the manifesto the following matters are valued:

- Individuals and interactions over processes and tools
- Working software over comprehensive documentation
- Customer collaboration over contract negotiation
- Responding to change over following a plan (Agile Manifesto 2010)

The software process models are abstract representations of the activities involved in producing software. Selecting the right development model can contribute to the development speed, improve quality, project monitoring and controlling, minimize duplication of work and improve the relationship with customers. (McConnell, 1996; Sommerville, 2000; Pressman 2000). Systematic development of software has been found to have a good impact on productivity and quality improvement. Recently, software engineering methods have emphasized the customer's role in the product development process and the customer orientation methods have become more frequent.

We concur with Boehm (2003:1) that current software engineering practice and research is done in a value-neutral setting. The role of software is increasingly related to system's cost, schedule and value. Also, according to Boehm (2003) and the Standish Group's CHAOS report (1995) most failures of software projects are due to value-oriented shortfalls such as user input, incomplete requirements, changing requirements, lack of resources, unrealistic expectations, unclear objectives, and unrealistic time frames. In order to develop useful software products value-based software engineering is needed. Boehm presents (2003:1) an agenda for a discipline of value-based software engineering. It includes value-based requirements engineering, architecting, design and development, verification

and validation, planning and control, risk management, quality management, and people management. Boehm (2003:1) introduces seven key elements for value-based software engineering as follows: benefits realization analysis; stakeholder value proposition elicitation and reconciliation; business case analysis; continuous risk and opportunity management; concurrent system and software engineering; value-based monitoring and control; and change as opportunity. This research aims to integrate value considerations into software engineering principles and practices.

According to recent research on process modeling all processes are situational. Considering the research in the area of agile software engineering and situational and flexible development practices, we can see that many of the agile methods have been developed based on practical experience and have been implemented and confirmed in industrial contexts (Hansson et al. 2006). Abrahamsson et al. (2003) argue that more empirical research is needed regarding the implications of different methods and practices for different sizes and types of companies. Xu and Ramesh (2003) presented a model for the utilization of knowledge in defining and tailoring a software process. Based on that model they have created a prototype tool for the understanding, re-use and maintenance of the process knowledge. However, the present study represents a fairly unique situation based on the fact that the software engineering process is a part of multi-disciplined product development and the environment is industrial.

Cao (2010) highlights the challenges of current software development projects. This is a need in order to improve the predictability of the process and have the flexibility to adapt to the changing environment. Cao's (2010) research contributes to the understanding of how to build dynamic capability into trustworthy software development. The author adopts dynamic capability as the ability to manage conflicting demands of trustworthiness and flexibility. In order to improve productivity and have the flexibility to cope with a changing environment, it is important that we take value creation into account in the software development process, using dynamic capability.

Dynamic capabilities

Despite the fact that the value creation logic of the product development and software development process has been improved by several different methods described above, the changing role and environment of the software engineering process requires a new perspective. Based on this, the value creation logic is examined through the perspective of dynamic capabilities.

According to the resource-based view of the value creation process, the role of resources is in a strategic position for creating competitive advantage (Barney 1986). Teece, Pisano and Shuen (1997) expanded the resource-based view to the rapidly changing environments. They argued that the authors of strategic management have concentrated on the analysis of firm-level strategies for sustaining and ensuring existing competitive advantage and neglected the factors of dynamic markets. Teece et al. (1997, p. 516) define dynamic capabilities as *"the firm's ability to integrate, build, and reconfigure internal and external competences to address rapidly changing environments"*.

The resource-based view concentrates on the development and protection of valuable resources, while dynamic refers to capacity to renew (Teece et al., 1997; Nelson and Winter, 1982). The concept of dynamic capabilities refers to the firm's willingness to re-develop the processes and routines in order to develop and renew the organizational capabilities (Teece et al., 1997; Wheeler, 2002). According to Teece et al., (1997) the firm's ability to renew and develop their organizational capabilities is significant for the firm in addition to their ability to exploit their existing resources and organizational capabilities. In dynamic markets this ability will become increasingly important and it is insufficient to have strong resources and organizational capabilities: continuous development and renewing its resources and organizational capabilities are required (Teece et al., 1997; Wheeler, 2002). Eisenhardt and Martin (2000) seem that dynamic capabilities are the organizational and strategic routines by which firms confront the changing environment.

The role of the software engineering process has changed from being supplementary in mechanical product development to become the focus of the process. This means that we must also change the approach that we use to

develop the product. The role of the software engineering process today is very much a multidisciplinary process within a changing environment. In order to cope with this, we need a new model to develop software in machinery industry. This means the use of dynamic capability in value creation with the different stakeholders of the value network in the product development process.

Improvement of the software development process alone is not enough. We must change the ways we develop the products. This proposed new model will need to take into account the following issues:

- Development of new capability to better understand the customers;
- Development of individual competences of the software engineers;
- Continuous improvement of quality and integration of processes;
- Development of dynamic capabilities in the software engineering process.

Conclusions

Traditional software development methods for the product development in current machinery industry are not adequate. To be competitive, it is important for companies to take into account the competitor position and new technological development. This means understanding the environmental and organizational requirements concerning the required resources and the value configuration. A new software development model is needed that is customer-oriented, multidisciplinary, comprehensive, market oriented, and innovate. We have developed a value creation model based on the integration of resources consist of process improvements, the reconfiguration of resources based on better customer understanding, improved profitability , improved development and learning skills. This model is currently under empirical validation.

Abstract

One of the strategies adopted in the Philippines to facilitate a more consistent supply of good quality vegetables from smallholder farmers is the clustering approach, whereby a small group or cluster of smallholder farmers is organized to deliver a pre-determined amount of produce to a focal customer (CRS-Philippines, 2007). Developed from the CIAT Territorial Approach, the CRS Eight Step Clustering Approach for Agro-enterprise Development employs a participatory action learning process, where the cluster members proactively plan their production to meet the specific quality and delivery requirements of their focal customer. The clustering approach is a strategy which allows smallholder farmers to access higher value chains. Evidence is provided to demonstrate how several of the clusters facilitated have utilised the skills and knowledge acquired in servicing their focal customer to develop new products for new markets, to adopt alternative low cost systems of production to reduce their reliance on external inputs, to reduce postharvest losses and product deterioration through improved packaging, to improve access to low cost community-based loans and to take advantage of local and national government grants that provide production inputs and support the development of community-based infrastructure projects.

The marketing system for vegetables

Like most developing countries, agricultural produce in the Philippines is traditionally sold through the spot market where both the farmers and the traders attempt to maximize their revenue. In the vegetable industry, smallholder farmers trading independently are seldom able to influence the price, especially in times of surplus. As the traders are in a better position to determine the price, most vegetable farmers are price takers and have therefore little choice other than to let their produce go at the price given by the trader as they have already harvested and seldom have any opportunity to store it until prices improve. Consequently, the majority of fresh vegetables in the Philippines are traded through the traditional supply chain (Murray-Prior et al., 2004), where market intermediaries are the dominant players reaping most of the benefits from the value created across the chain (Digal et al., 2006).

Increasingly, food retailing and processing is becoming more internationalized, causing significant changes in the market that impact on smallholder farmers. However, smallholder farmers have difficulty supplying the more sophisticated demand of the modern chains. Smallholder farmers may be excluded from agribusiness development because they are not equipped to handle the demands of the increasingly sophisticated market. They need to organize to meet the growing demands of institutional and modern markets (Vorley et al., 2007).

In Mindanao, the Philippines, 80% of farmers earn PhP 3000 per month and have only 2 to 3 years education. The lack of capital and knowledge prohibit them from tapping into the demand for higher value products.

This paper discusses how the clustering strategy used in Mindanao, specifically the provinces of Bukidnon, South Cotabato, Compostella Valley and the vegetable production areas of Davao City; provide an enabling environment for smallholder farmers to serve higher value markets and to take concrete actions to improve their production and marketing system.

Clustering approach to agro-enterprise development

Developed from the CIAT Territorial Approach, the Catholic Relief Services in the Philippines have formulated an Eight Step Clustering Approach for Agro-enterprise Development for Small Farmers. A participatory action learning process is employed, whereby the cluster members proactively plan their production to meet the specific quality and delivery requirements of their focal customer. The first five steps are preparatory activities that emphasize the need for the farmers to learn new skills, access new information and adopt new innovative approaches to identify and to respond to market opportunities. The two subsequent steps require the cluster to undertake test marketing, and where it is successful, to scale-up their activities. The final step of cluster strengthening requires the cluster members to develop new skills, new values and to identify alternative methods for organising the cluster (CRS-Philippines, 2007).

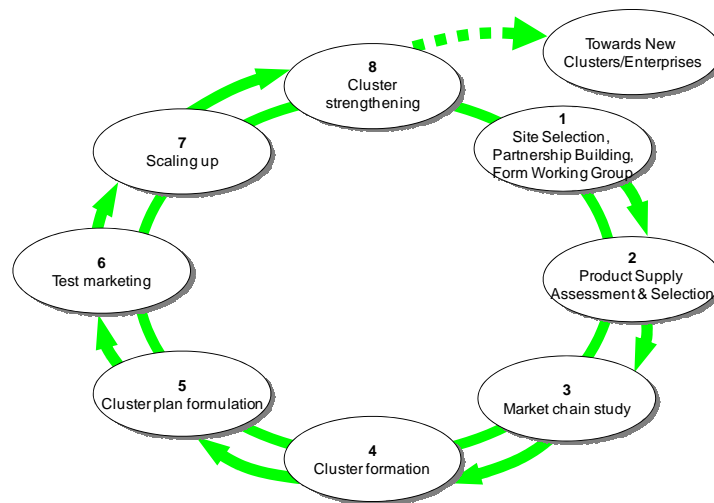

FIG. 1: THE CLUSTERING APPROACH TO AGROENTERPRISE DEVELOPMENT

In an action research project running from 2008 to 2012, involving the University of the Philippines Mindanao, UP Strategic Research Foundation, Philippines and Curtin University, Western Australia, the clustering approach briefly described above was used. Through a participatory learning process, vegetable farmers from Bukidnon, South Cotabato and Davao City were trained and facilitated using the eight steps. Thirty clusters were formed involving 293 farmers.

TABLE 1: NUMBER OF CLUSTERS

	Farmers	Clusters
Bukidnon	63	7
South Cotabato	135	9
Davao City	144	12
Campostella Valley	14	2
TOTAL	293	30

During the clustering process, the farmers underwent training on understanding their market which provided them the opportunity to visit buyers and interview retailers. They gained the firsthand experience of doing simple market research and mapping their chains. Based on the information they gathered and analysed, they decide as a group which markets they want to serve and which products to offer. They had training on record keeping, facilitation of meetings, production techniques and clusterenterprise plan formulation.

The clusterenterprise plan is a simple business plan which contains information about their desired market, planting calendar, commitment of each cluster member in terms of volume and type of vegetableto plant for the cluster market, the tasks and responsibilities of each member, the policies and procedures of the cluster and the working capital needs and sources. This type of planning opens the understanding of the farmers that they can plan what they plant and schedule the harvest such that they harvest regularly. They also get to supply additional markets while continuing to supply their traditional spot market buyers.

Data for this paper were gathered from farmers during their cluster meetings, interviews with key informants from trip reports of project personnel, and bi-monthly project reports per research area.

Emerging product and process innovations

The 8-step clustering approach to agro-enterprise development empowers cluster farmers to act as one. This new environment gives them access to higher value institutional markets which they are otherwise unable to supply as individuals and the enabling environment to venture into varied ways of improving themselves.

Develop new products for new markets

In order to lessen the farmers' risks, existing products are selected for the initial attempts for cluster marketing. This allows the cluster members to get their feet wet in working with each other and tests their commitment to the cluster enterprise plan without having to learn how to produce new types of vegetables.After the cluster has adjusted to working with each other, new products can be attempted.

In Bukidnon Province, where 7 clusters were facilitated, one cluster was committed to supply a food processor with sweet pepper. The food processor was a new market for this cluster, but they were familiar with the production of sweet pepper. When the demand of the food processor expanded, another cluster which did not previously plant sweet pepper started planting the crop in order to ensure a regular supply for the food processor. For this second cluster, this is a venture into a new product for a new market. In the same province, another cluster was formed composed of corn farmers, who began planting tropical vegetables like squash, eggplant, sweet pepper and bitter gourd, in response to the demands of a vegetable consolidator. For the third cluster, they went into planting several new products for a new market.

For the clusters in South Cotabato, 2 clusters were planting sweet pepper to supply a food processor. They had to shift to a different variety of sweet pepper because of the food processor's specifications. The new variety had a better qualityfruit anda longer shelf life. Before clusters were formed, farmers planted whatever seeds were available locally. Because of clustering and their knowledge of the market requirement, farmers shifted to *Cayenne Premium* variety. With Cayenne Premium, farmers can sell their mature green fruit to the local markets andtheir mature red fruit to the processor at a significantly higher price.

Most of the clusters discussed above were to supply a food processor in Davao City. However, the clusters experienced some problems with the payment arrangements of the accredited supplier of the food processor. This accredited supplier was to act as a conduit between the clusters and the food processor. Compounding this, the food processor stopped buying sweet pepper because its demand for sweet pepper was bundled with carrots, garlic and onions. Since the accredited supplier could not find enough suppliers for the other commodities, the food processor stopped buying sweet pepper. Farmers were then left with thousands of hills of sweet pepper and no institutional market. It was in this seemingly difficult problem that clustering proved to be an advantage. The cluster farmers put their heads together and sought for other markets for their sweet pepper. They found a wholesaler in the largest wet market in Davao City who was willing to buy the sweet pepper.

Adopt alternative low cost system of production to reduce reliance on external inputs

The clustering approach begins with the identification of partners which may be other NGOs or local government units. In all of the project areas, development oriented foundations trained cluster farmers to make concoctions derived from different fruits and plants and other local products as an alternative to conventional fertilizers. Some planted marigolds as an insect repellent for fruit fly, or used extracts of tubli (*Derris elliptica* Benth.), which is a poisonous vine, as an insecticide. These natural farming practices were introduced to them by their municipal agriculture offices and some non-government organization like the Landcare Foundation of the Philippines Inc (LFPI).

Some farmers also attended seminars about natural farming and shared it to their neighbouring farmers. As a result, farmers began using fermented fruit juice (FFJ), fermented plant juice (FPJ), indigenous micro-organisms (IMO), chicken dung and vermi-compost as part of their crop nutrient management protocols. According to the farmers, these products were as effective as conventional fertilizers, but the ingredients were found mostly in their immediate locality and more importantly, cost practically nothing. In contrast, a litre of liquid-based fertilizers cost PhP 35-80 a litre while PhP 1.63-6.25 per kg for solid-based fertilisers (Real et al., 2010).

In one instance, a vegetable marketing cluster in Maragusan, Campostella Valley discovered that the marketing skills they had learned were equally useful in enabling them to develop a market for agricultural inputs. As a large corporation, with a certified organic banana plantation required a regular supply of organic inputs. Rather than to grow vegetables, the group diverted their activities towards the production of FFJ and FPJ.

Improved postharvest practices

In almost all the clusters in the three areas of Bukidnon, South Cotabato and Davao, product handling has been improved. Previous harvesting and transportation practices exposed the vegetables to bruising and mishandling. Vegetables were normally packed into sacks and often dropped onto the ground, sat upon and/or stepped upon. Most of the clusters no longer use sacks, but now use plastic crates to minimize bruising. Buyers also prefer that the vegetables they buy be delivered in crates rather than sacks.

In the past, farmers would often sell their fresh vegetables without grading. While they managed to sell everything that was harvestable, the prices were correspondingly lower. Sorting (grading) is a new procedure for most cluster farmers. Some buyers want a specific quality grade and the farmers have learned to sort and classify their vegetables based on the customers' specifications. As a result, the farmers receive a different price for different product grade, providing perhaps for the first time, an incentive for producing better quality produce.

With the opening of new markets, there were also changes in terms of packaging, transportation, and sorting practices in Ned, South Cotabato. Before clustering, farmers packed their sweet pepper in sacks and sold them directly to the local market in Isulan. The products were transported (by skylab) to Isulan which is 70-90 km from their area. This resulted in much physical damage to the crops like bruises and cracks. Farmers estimated losses of 5 to 10 kg from transportation. With the requirements of the market to produce better quality sweet pepper, farmers utilized cartons to protect the fruit from bruising. Before the cluster was introduced, individual farmers were not able to sell their sweet pepper because of high cost of transportation. With clustering, even small volume can be included because products are now consolidated.

Improved access to low-cost community-based loans

When the farmers were not organized into clusters, many of them depended on traders to finance their production inputs. They had no option but to sell their produce to the trader who financed them, sometimes for lower prices. In the province of South Cotabato, the cluster members formed a partnership with ICTUS (Integrated Cooperative Toward Unified Services), a member-owned cooperative that provides saving and lending services, including input financing. The cluster obtained an input financing loan for its members. In order to get a loan, the cluster members had to first become a member of the cooperative bank and attend a pre-membership seminar. A membership fee and initial savings also had to be deposited totalling Php 1,700 per farmer. Of the 18 cluster members, four could afford this initial cost, and the remainder could find half the amount – with LFPI (Landcare Foundation of the Philippines) contributing some funds to meet the short fall that was repaid at a later date. A loan was released to the 18 members of the cluster for PHP10,000 each in the form of inputs. Members could get cash for a maximum of 25 per cent of this amount. The Ned clusters were able to pay their dues after earning income from sweet pepper farming. Some of the farmers were able to access 2nd loan from ICTUS.

Another cooperative bank provided production loans to some Bukidnon cluster farmers in order to start up the production of sweet pepper. A development foundation provided financial assistance to some bitter melon clusters, for the purchase of production inputs such as seeds, fertilizers and pesticides.

Improved access to local and national government grants

Individual farmers cannot access any assistance nor financing because the assistance cannot be monitored nor the results guaranteed. As members of clusters, however, they can get themselves registered as an association or a people's organization. As such, they have a chance to benefit from assistance. Bukidnon, clusters were provided 6 rainshelters by the Department of Agriculture, each one costing PHP150,000. The farmers provided labour as their counterpart.

Clusters in Davao City received assistance from the City Agriculturist Office of Davao in the form of production inputs like seeds and organic fertilizers. They were also given plastic crates and seedling trays.

For South Cotabato, one of the Municipal Agriculture Offices (MAO) provided material support like a shredding machine and seedlings for the cluster in their area. Most of the local government units assisted through technical support, training and assistance for monitoring the clusters. Some clusters were supported by other foundations through trainings and seedlings.

Conclusion

Clustering is a form of collaborative marketing group that has provided a way for smallholder farmers to access new and modern markets. It does not have the membership costs associated with being a cooperative nor the attached bureaucracy of a registered association. But it provides the smallholder farmers are ideal starting point to move toward working with other smallholder farmers to gain a competitive advantage. In the process of reaching the goal of better market access, smallholder farmers were able to learn new ways of producing vegetables with lower input costs, acquire skills in leadership and self-governance, conduct meetings, negotiate with buyers, make and implement their cluster rules. They have possible access to financing and development assistance and more importantly, they have a chance to be included in the development of modern chains.

Acknowledgements

This work is funded by the Australian Centre for International Agricultural Research through the project Hort/2007/ 066/Component 4: Analysis of selected value chains in the southern Philippines. Grateful

acknowledgement to all partners and NGOs in the field, including the municipal agricultural officers in each of the areas where the project is conducted.

Sustainability of Microenterprises in Indian Food Industry: Interventions and Impacts

Gopal Naikk, gopaln@IIMB.ERNET.IN

Mathew Abraham

IIM Bangalore, India

1. Introduction

Indian agriculture and food sector have undergone significant changes in the last decade with the liberalisation of the economy and opening up of international markets. In India, like in most developing countries, agribusiness is the single largest economic sector, providing employment to more than 50% of the entire country's workforce. Yet agriculture contributes to only 18% of GDP and 10% of total exports. India is a major producer of many agricultural and allied products in the world. It produces 16% of world's milk, 28% of tea and one of the largest producers of grains, cotton, sugar, spices and fruits and vegetables. Despite this achievement, its current share of world's processed food trade is only 1.6% (Singh 2007) and losses in some sectors such as horticulture, are believed to be more than 30%.

Apart from liberalisation of the economy, other factors such as globalization, rapid urbanisation and rise in per-capita income have contributed to changes in Indian food sector. These changes have opened up significant opportunities in retailing, value added foods and processed food segments. Urbanization has increased the scope for food marketing and distribution through economies of scale, while reducing transaction costs and increasing the size of the market (Pingali, 2001). A number of corporate initiatives have begun investments in the food sector to meet the rising market demand, through forward integration and supply chain management. However, the outreach of such initiatives is limited, as they are influenced by factors of convenience and commerce, limiting them to only certain areas. Barring a few initiatives, the food sector in India remains an unorganised sector with many small producers and complex and inefficient supply chains, that are struggling to keep pace with the changing market requirements.

A large number of small producers dominate the food sector both, at the raw material production and processing stages, primarily due to restrictive government policies. The market orientation of these producers are limited as the supply chain in the food sector and the agricultural sector in general is fragmented and is characterised by many intermediaries, poor infrastructure and information flow. As a result, producers have limited access to information, technology and investments to develop their business activities to meet the demands of the market. These factors hinder the development of economies of scale, market orientation, the development of quality in products and therefore, the ability to compete in the international market.

In the case of perishable products, the absence of cold chains coupled with the lack of marketing infrastructure leads to low quality, high wastage and low price realisation. This poses challenges particularly to small producers in terms of high costs of production, high transaction costs and restricted market access. Low shelf life of food products requires advanced technical knowledge, proper technology and management skills to keep the quality of the produce even at the minimum required level. Quality improvement and standardization, in such situations, are an integral part of market access and trade as they can enhance marketability, competitiveness, market efficiency and creditability of goods transacted in the markets. The implementation of grades and standards helps in reducing uncertainty and transaction cost helping markets to develop, benefiting both consumers and producers. Grades and standards help in the generation of market information that aids primary producers adopt 'best practices', reduce wastage and increase price realisation by improving production processes to adhere to the quality requirements of the markets. Standards help in addressing the imbalances between expected marginal social benefit and marginal

social cost by reducing information asymmetries to both producers and consumers. Thus, standardisation helps to improve efficiency of production and product movement and enable economies of scale (Sykes 1995).

In the present Indian agribusiness scenario, interventions, external as well as internal, are needed to bring about change in the markets and supply chains, through development of quality and adherence to standards, enabling small producer to compete fairly in the markets.

This paper uses two initiatives in Indian agribusiness to examine how standards and good supply chain management can help bring about substantial change, increasing marketability and price realisation to the primary producer, through technological innovations and information dissemination. The first case is a study on Amul and Bangalore Dairy, a cooperative initiative, where the introduction of Bulk Milk Coolers (BMC) have helped improve the quality of milk by reducing spoilage and pathogen content of milk. The study looks at how BMCs introduced at village level cooperatives have helped bring down milk spoilage from 28.7 lakh kgs to 1.7 lakh kg over a period of 14 years. This has helped reduce cost of production and increased returns to the primary producers. It is an example of the development of a cold chain that has aided in the improvement of quality and reduction in wastage. The second case is a study on the street food vendors of Karimnagar, where standardizing of mobile food vendors (MFV), with the help of Dr. Reddy's Foundation (DRF) has helped improve the quality of food served on the streets and vendors get better remuneration for their service. This civil society initiative has helped increase gross income of the vendors by an average 41%, while reducing wastage by over 60%. The implementation of standards has also helped in improving hygiene and cleanliness of street food, thus improving its marketability.

2. Implementation of Standard and Quality Improvement in Dairy Products- a Case study of Amul and the Bangalore Dairy

India is one of the largest milk producers in the world and a majority of its primary producers are small and marginal farmers. As these primary producers have limited access to marketing and infrastructural resources, most states in India have cooperative unions for producers that help them market their produce. The birth of cooperative movements in India was in the dairy sector and in this respect the story of the Kaira District Milk Cooperative Union (known as Amul) is unique. This initiative began in 1947 in the village Anand in Gujarat, where milk producers with state support joined hands to have a stake in their produce and share the profits gained by selling their produce. The success of Amul as a cooperative movement led to the adoption of the Kaira model as a blueprint in all milk cooperatives in the country, under the three phases of "Operation Flood". Today almost all states in the India have their own dairy cooperatives supporting millions of small and marginal farmers.

Gujarat Cooperative Milk Marketing Federation (GCMMF) the state-level apex body of milk cooperatives under which the Kaira District Milk Cooperative Union now comes under, was founded in 1973 with the aim of providing remunerative returns to the farmers while providing economical and quality products to consumers nationwide. GCMMF markets its products under the brand of *Amul* and is India's largest food product marketing organization.

In Karnataka, Karnataka Cooperative Milk Producers' Federation Limited (KMF), the state-level cooperative was setup in 1974. It was India's first World Bank funded dairy development program. Modelled on the Anand pattern, the KMF today is the third largest milk cooperative in India and the largest in South India in terms of procurement and sale. The KMF markets its products under the brand name *Nandini* and unlike *Amul* its markets are limited to Karnataka.

During its initial years, the focus of these cooperatives was primarily on liquid milk. Overtime they progressively moved onto higher value milk based products. Quality and price competitiveness, the core philosophies for the cooperatives, have helped them remain competitive in the wake of emerging competition from multinational companies like Unilever, Nestle and Britannia. A key source of competitive advantage has been their ability to

implement best practices across all elements of the network: the federation, the unions, the village societies and the distribution channel.

Due to its high perishability, milk and milk products have one of the most stringent codes of standards. Conforming to standards depends much on how milk is handled throughout the supply chain. This in turn is linked to technology use and good supply chain management, particularly in the context of a cooperative setup, where producers are many. The espousal of standards, both regional and international has been integral to the growth of both the GCMMF and KMF. Quality certifications like ISO and HACCP has helped them build and maintain their reputation in the market.

Technological innovations at the grassroots through the adoption of Bulk Milk Coolers (BMC) at the village society level have helped improve the quality of milk in the cooperatives. In their efforts to diversify to higher value products, this innovation has helped in the reduction of sour milk content and spoilage during transportation and storage. This case primarily focuses on how BMCs have brought about change in the supply chain of milk by reducing cost of transportation, helping dairies increase production and quality of the products they produce and helping farmers get better returns for their produce. The study analyses the benefits this change has brought upon quality as well as costs of production of milk and milk products that has helped *Amul* and *Nandini* remain competitive in the market in the wake of emerging market competition and expansion.

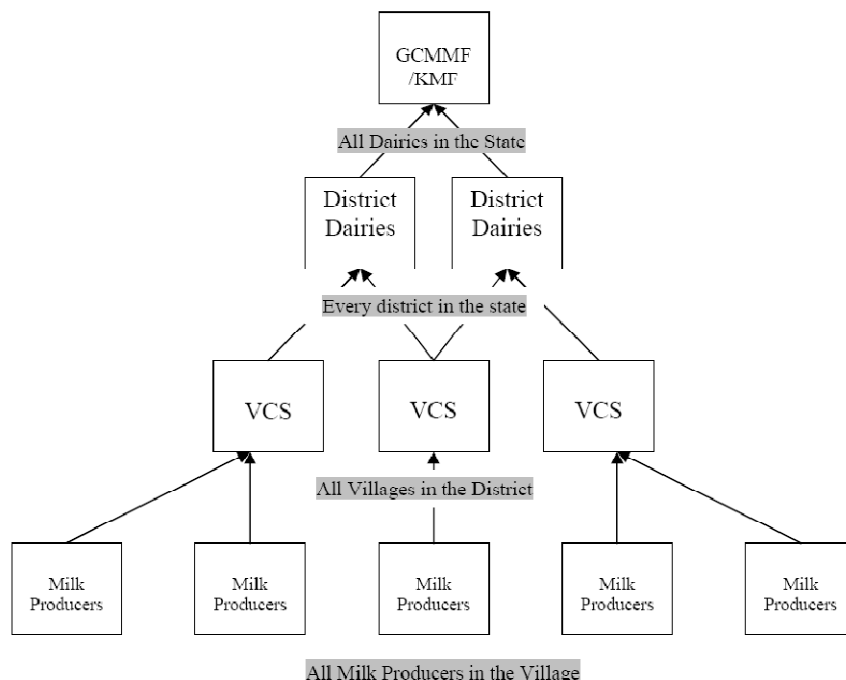

2.1 The Milk Cooperative Structure and Supply Chain

The structure of both the GCMMF and KMF (Figure 2.1) supply chain is based on the three tier model, which comprises of the milk producer and the village cooperative at the village level, the district dairy and the district unions at the district level and the state marketing federation representing all dairies at the state level.

The village cooperative societies (VCS) and the district cooperative societies (DCS, the KMF equivalent of the VCS) on an average have about 200 members each from whom milk is collected every day. Each member of the VCS has a commitment to supply a certain amount of milk to the society. Payments are made based on test results used to determine quality of supplied. The procured milk is then sent to the district dairy for processing. The role of the federation at the state level is to market the products under their respective brands and plan strategies and investments for the market as well as the cooperative.

Milk is collected from the farmers according to the infrastructure the village cooperatives have. Cooperatives without BMCs collect their milk in cans of 40 kilos each, before transporting it to chilling centers at the district level. From the chilling plants, the milk is sent to the processing and packaging centre. Because milk under normal conditions spoils faster, milk in non-BMC centers is collected twice a day. Villages with BMC facilities have their milk collected once a day as cold storage prevents spoilage. The milk collected from these centers is sent directly to the processing plants.

FIGURE 2.1: THE STRUCTURE OF THE COOPERATIVES

2.2 Implementation and Benefits of BMCs

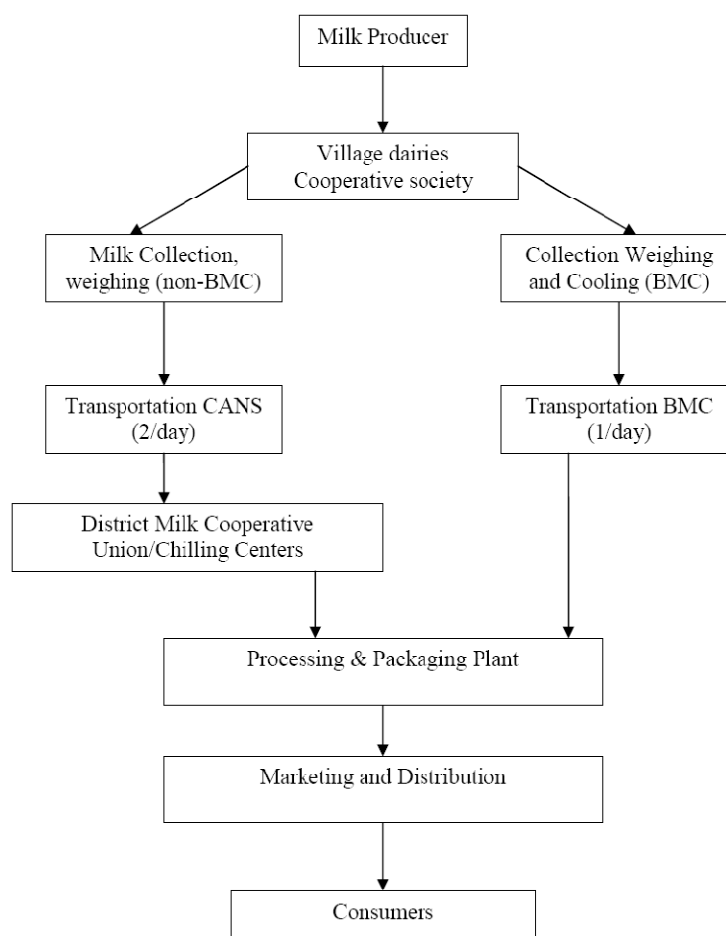

The supply chain in these cooperatives consists of two patterns of procurement, the cans and bulk milk coolers (BMC) procurement. Over the years, the number of VCS/DCSs having BMCs has increased drastically though cans are still used for transportation. Figure 2.2 shows the supply chain of these two methods of procurement from the village level to the final marketing stage at the state federation.

Bulk Milk Coolers at the village level were introduced in 1993 in Anand and 2003 in Bangalore Dairy for storage and preventing milk from turning into curd or getting sour. Table 2.1 show the composition and scale of operation of both *Amul* and Bangalore Dairy. In Anand, 16% of the VCSs have BMCs installed in them, and in DCSs under the Bangalore Dairy although there are only 85 BMCs, 172 DCSs are attached to them giving 15% of the total number of DCSs access to BMCs. Though *Amul* has a smaller number of VCS compared to the Bangalore Dairy, it has higher production per society. Therefore both *Amul* and Bangalore Dairy have similar production figures. The percentage of milk produced by BMCs to the total production per day is 11.1% and 16.5% for Bangalore Dairy and *Amul*, respectively.

TABLE 2.1: CAPACITY AND PRODUCTION FIGURES OF AMUL AND BANGALORE DAIRY

	Amul	Bangalore Dairy
<i>Total Number of VCS/DCS</i>	1018	1675
<i>Number of VCS/DCS with BMC</i>	168	85 plus 172 (total 257)
<i>Number of VCS/DCS without BMC</i>	850	1418
<i>Average production of VCS/DCS per day</i>	800.48	540
<i>Average Production of BMC VCS/DCS</i>	134,500	100,000
<i>Average Production of non-BMC VCS/DCS</i>	680,400	800,000
<i>Total Milk Production per Day</i>	814,893	900,000

FIGURE 2.2: MILK PROCUREMENT THROUGH CANS AND BMC

2.2.2 BMCs and Improvement in Quality

The introduction of BMCs has brought about considerable change in quality of milk collected and transported for processing by the village cooperatives. Changes can be observed in the reduction of sour milk content, flavour, bacterial count, fat percentage and solid non-fats (SNF) content. Table 2.2 compares various characteristics of BMC and non-BMC milk collected by the Bangalore Dairy. As the temperature of milk in BMCs is kept at 6-7 °, the milk stays fresh and acidity and alcohol free as fermentation levels are low. The Methylene Blue Reduction Test (MBRT), which reveals the level of bacteria in milk, has a timing of 180-240 minutes in BMC milk compared to 15-30 minutes in milk collected in cans showing reduced bacterial formations. The standard plate count (SPC) and the coliform count in BMC milk is also low as a result of cooling.

TABLE 2.2: COMPARISON OF QUALITY CHARACTERISTICS OF BMC AND CAN MILK

Parameters	Can Milk Quality	BMC Milk Quality
<i>Temp. of Milk</i>	25-32°C	6-7°C
<i>Flavour</i>	Slightly Acidic	Fresh
<i>Acidity</i>	0.16-0.18	0.15
<i>MBRT*</i>	15-30 mins	180-240 mins
Bacteriological Quality		
<i>SPC, cfu/ml⁺</i>	1-2 crores	10-20 lakhs
<i>Coliform</i>	2-10 lakhs	20-40 thousand
<i>Alcohol Test</i>	Positive	Negative

* = Methylene Blue Reduction Test

+ = Standard Plate Count, Colony Forming Unit/millilitre

While collection practices of BMCs have given the milk union the advantage of bacteria free, fresh and adulteration free milk, there are many processing advantages dairies able to reap as a result of this. For example, milk free of alcohol is suitable for the preparation of products that require sterilization. The processing of milk determines the quality and shelf life of milk only to a certain extent. The improvement of quality before the processing stages has helped improve the shelf life of milk in the market.

Figure 2.3, shows the volume and percentage of sour milk from 1992 to 2007 in *Amul*. The percentage of sour milk has dropped from 1.3 percent in 1992 to almost .05% in 15 years. Similarly, the volume of sour milk has dropped by almost 1.70 million kilos. A considerable improvement in fat content and SNF can be seen from milk collected from village cooperative with BMCs. The fat content in milk has risen by 1.35% and fat rate by 85.35 per kg (Figure 2.4).

FIGURE 2.3: VOLUME OF SOUR MILK AND PERCENTAGE OF SOUR MILK (1992-2007)

Source: GCMMF

FIGURE 2.4: CHANGES IN FAT AND SNF CONTENTS

2.2.3 Framework for Analysis

We assess the impact of introduction of BMCs on key stakeholders in the supply chain. The stakeholders we considered are: milk producers, village cooperative societies and district cooperative societies. In order to compute change in the profits (π) of milk producers (f), village cooperatives (vc) and district cooperatives (d) the following framework was used:

$$\pi_i = P_i Q_i - C_i$$

where $i = f$ (farmers) or vc (village cooperatives) or dc (district cooperatives), π_i is the profit, P is the price received and Q is the quantity sold and C is the cost. We examine the changes in the profit ($\Delta\pi$) for different stakeholders due to introduction of BMC.

Milk Producers

The benefits to milk producers arising out of introduction of BMC can be represented as follows:

$$\Delta\pi_f = \Delta P_f (Q_f + \Delta Q_f) + P_f \Delta Q_f - \Delta C_f$$

The equation captures the benefit both due to increase in the yield and price. The introduction of BMCs has brought considerable benefits to farmers supplying milk to the village cooperatives in terms of quality, yield and returns. The normal shelf life of milk that is not refrigerated is normally four and a half hours after milking. During this period farmers need to get their produce to the village cooperatives and they in turn have to send it to the chilling plant. Often this time constraint leads to reduction of SNF, fat content and also souring and curdling of milk affecting its quality.

Yield is another important aspect in milk production, which is determined by a number of factors ranging from health and breed of the livestock to feed. According to the International Livestock Research Institute, the timing between milking also has an effect on yield and quality. In the can system of procurement, there are normally two procurements a day from each village cooperative. The producer has to time the milking according to the collection timings, reducing the time between each milking. This drastically influences the fat and SNF content in milk as well as yield, which is reduced by almost a litre if the timing between milking is less than 12 hours¹. The premium price paid to farmers in Karnataka, for milk with 3.5% fat content and 8.5% SNF is 12.95 Rs. This premium increases by .05 Rs for every .01% of SNF and fat giving farmers better returns.

Village Cooperative Societies

The benefit to the village cooperative societies is represented in the equation below:

$$\Delta\pi_{vc} = \Delta P_{vc} (Q_{vc} + \Delta Q_{vc}) + P_{vc} \Delta Q_{vc} - \Delta C_{vc}$$

As there is no increase in quantity at the village cooperative level, the first part of the equation representing change in price because of increasing quantity is 0. The benefits at the VCS level are largely due to reduced spoilage and sourness of milk, and lower maintenance cost in the case of *Amul*. In village cooperatives under Bangalore diary, the maintenance cost is borne by the district cooperatives, therefore there is no cost incurred there. This is represented in the second part of the equation as change in quantity minus costs. The increased price due to better premiums for quality is considered in price.

District Cooperative Societies

The benefits to district cooperatives arising out of the introduction of BMC can be represented as follows:

$$\Delta\pi_{dc} = \Delta P_{dc} (Q_{dc} + \Delta Q_{dc}) + P_{dc} \Delta Q_{dc} - \Delta C_{dc}$$

The benefits gained at the district cooperative level represented in the equation above takes into account, the gains from reduced spoilage of milk, and decreased costs of transportation and chilling. The additional cost of maintenance of BMCs at the village cooperative levels in the case of Bangalore Dairy is also considered in the costs.

2.2.4 Cost Analysis

Though the initial implementing and maintenance costs of BMCs are high, the streamlining of the supply chain has helped cut costs at various stages while bringing benefits to the cooperatives as well as the primary producer.

Initial Costs and Maintenance

While the cost of BMCs varies with the size of the plant, there is a big difference in the price in GCMMF and Bangalore Dairy (Table 2.3). The difference however, is in the procurement patterns between the two unions. Though there is a central subsidy for BMCs in *Amul*, the VCSs bear the cost of the equipment as well as its maintenance costs. In DCSs of the Bangalore Dairy the district cooperative bears the cost of both purchasing the BMCs as well as its maintenance.

TABLE 2.3: COST OF BMCS IN GCMMF AND BANGALORE DAIRY

BMC Capacity	Price of BMC –GCMMF (Rs)	Price of BMC- Bangalore Dairy (Rs)
1000 kg	450000	600000
2000 kg	600000	800000
3000 kg	750000	1200000
5000kg	1000000	1500000

The other expense incurred with the implementation of BMCs is its running and maintenance. The rate of maintenance would vary depending on the power supply situation, the use of generators, oil and servicing of the machine. On an average, the BMC centre incurs a cost of Rs1.8 per litre of milk on maintenance in Bangalore Dairy and Rs 0.28 in Amul (Rs 0.14 fuel, Rs 0.14 maintenance). Though general maintenance of village cooperatives using cans is low there are other expenses incurred for purchasing and also maintenance and cleaning of cans. The average cost of a stainless steel can is Rs 3000 and its aluminium cap costs Rs 300. The average life span of a can is a year although rough and continuous handling sometimes reduces it to 7-8 months. With the help of BMCs this expense has been reduced along with expenses of cleaning and storage, which requires manpower and boilers for steam and hot water.

Transportation

The introduction of BMCs has made the transportation of milk easier while reducing transportation costs. The average transportation costs of *Amul* and Bangalore Dairy are given in table 2.4. A major cost reduction is achieved as a result of frequency of transport. The non BMCs use two types of trucks, the 6 ton truck that can carry 140 forty litre cans and a 3 ton truck with the capacity of 80 cans, twice a day. BMCs in its place use insulated tankers of 9000 litres to transport milk to processing units only once a day.

TABLE 2.4: THE COST PER LITRE MILK TRANSPORTATION IN BMC AND NON-BMC CENTRES

	Amul (Rs)	Bangalore Dairy (Rs)
<i>Non BMC</i>	.30	.32
<i>BMC</i>	.18	.26

The other advantage of using tankers for transportation is that there is a reduction in spoilage if the vehicle breaks down, absence of theft and loss from leakage, thus reducing the weight volume mismatch between the village cooperatives and the processing plants.

Processing Costs

A major reduction in the cost of processing is the chilling cost at the chilling plants, where can milk incurs a cost of Rs 0.32 per litre. Although BMC milk needs to be chilled before processing the temperature reduction is only 2-3 degrees compared to can milk, which requires a drop in temperature from 35 degrees to 3 degrees. The advantages of pre chilled milk is that at the pasteurization stages, milk is heated only to 72-75 degrees while can milk need 80-85 degrees of heat as a result of high bacterial count. The cost of processing is given in Appendix I. In practice however, after the chilling stage milk from cans as well as BMCs are mixed together taking away the advantages it has in terms of cost of processing. If a viable number of BMCs are established in village cooperative, processing can be separately done for BMC milk which will help reduce costs.

Reduced Damages and Bonus

There has been a substantial reduction of spoilage and curdling of milk with the introduction of BMCs. In *Amul*, spoilage of milk has been reduced by 3-4% per VCS, while the DCSs in the Bangalore Dairy have recorded a high rate of 10%. This translates to better bonuses to the farmers at the end of the year.

Bonuses are incentives given yearly to farmers for their produce according to the quality of the milk they produce. The introduction of BMC has helped farmers get a higher bonus premium for their produce as the quality of milk sent to the processing centres have improved. In the case of *Amul* farmers have got a .05 % incentive from the district cooperative societies for better quality milk with additional Rs 0.03 and Rs 0.02 per litre for hygiene standards and low bacterial content. In the Bangalore Dairy, the final profit to the district cooperative society is shared among producers at the end of the year. The imbursement structure of the profits is given in table 2.5.

TABLE 2.5: BONUS STRUCTURE OF THE BANGALORE DAIRY AT ALL LEVELS

Particulars	Percentage of Profit	Assessment = 100
<i>Reserve Fund</i>	25%	25
<i>Building Fund</i>	10%	10
<i>Share Dividend</i>	10%	10
<i>Education Fund</i>	2%	2
		47
<i>Balance</i>		53
<i>Bonus</i>	65%	34.45
<i>Charity Fund</i>	10%	5.3
<i>Cattle Development Fund</i>	10%	5.3
<i>Employee Bonus</i>	10%	5.3
<i>Propaganda Fund</i>	5%	2.65

Along with technological changes brought about to improve the quality of milk there have been initiatives to improve practices and production methods through information dissemination to farmers. Apart from technical assistance given to the VCSs, farmers are trained in the health and hygiene practices for animals and milk production. Information regarding the benefits and technicalities of technological innovation along with information regarding standards are given to farmers to improve practices.

The success story of *Amul* and Bangalore Dairy as a cooperative accomplishment has innovation, technological development and strategy as an integral part of it. In order to compete in the market with other established multi national brands quality standards have become a priority and

the GCMMF has adapted well to it. The GCMMF and KMF adheres to the certification of the International Standards Organization (ISO) and has also implemented Hazard Analysis and Critical Control Point (HACCP) certification and process and has since established a traceable system.

2.3 Economics of Quality in Bangalore Dairy and Amul

In order to determine the economic benefits brought about by the implementation of BMCs at all levels of the supply chain, a cost analysis was done on a per animal basis to determine the benefits to farmers, village cooperatives as well as the district cooperatives. Tables 2.6 and 2.7 shows the cost and benefits at different levels of the supply chain. Differences in costs between Amul and Bangalore Dairy chains can be observed at the village cooperative and district cooperative levels. The major differences in costs are with reference to rate of spoilage, maintenance and transportation costs, which are higher at the Bangalore Dairy. The maintenance cost in village cooperatives of the Bangalore Dairy is borne by the district cooperatives, which is an additional cost to their total operating costs. Milk yield changes that is possible due to proper intervals of milking in case of BMC has not been considered in the analysis.

TABLE 2.6: COST ANALYSIS (PER ANIMAL BASIS) OF THE BANGALORE DAIRY SUPPLY CHAIN (2009)

Particulars	BMC Milk		Non-BMC	
	Cost/litre	Per Animal	Cost/litre	Per animal
Milk Producers				
<i>Total Yield*(litres)</i>		10		10
<i>Price of Milk (Rs)</i>	12.95	129.5	12.95	129.5
<i>Additional price due to SNF/FAT increase+(Rs)</i>	1.5	15	0	129.5
<i>Loss due to Sourness</i>	0	0	3% or .3 litres loss (9.7 Litres remaining)	Rs 2.6 #
<i>Total Revenue (Rs)</i>		144.5		126.4
<i>Price Realized by Farmers (Rs)</i>	14.45	144.5	12.69	126.4
Village Cooperative Society				
<i>Loss due to sourness</i>	0	144.5	3.5% or .33 litres loss (9.37 Litres remaining)	Rs 3.07 #
<i>Maintenance Cost</i>	1.8 per litre (borne by District)		0.25 per litre (borne by district)	
<i>Final Selling price to District (.50 Rs + Premium Fat/SNF) (Rs)</i>	14.95	149.5	13.45	126.0265
<i>Margin to Society</i>	0.50	5.0	0.23	2.19
District Cooperative				
<i>Transportation</i>	0.26	2.6	0.32	3.20
<i>Loss due to sourness</i>	0	0	3.5% or .32 litres (Rs 4.30)	4.30
<i>Chilling</i>	0	0	0.32	3.20

<i>Processing</i>	1.49	14.9	1.49	14.9
<i>Carry over cost from DCS (maintenance)</i>	1.8	18.0	0.25	25
<i>Operating Expenses and loss</i>	3.55	35.5	2.81	28.1
<i>User Cost of capital per litre</i> [^]	0.38	3.8	-	-
<i>Total Expenses + loss</i>	3.93	39.3	2.81	25.92
<i>Revenue for Farmers and Society</i>	14.95	149.50	12.92	129.2
<i>Cost to DCS</i>	3.93	39.3	2.81	28.1
<i>Net benefit</i>	11.02	110.2	10.11	101.1

* Increase in yield at the farm level is also possible as a result of increased intervals between Milking.

+ A 1 and 2% increase is seen in fat and SNF, where milking intervals are longer.

Price of milk with sour milk @ 4 Rs per litre

^ User cost of capital is the opportunity cost and depreciation divided by the capacity utilization of the BMC in a Year (assuming utilization = 80%)

Table 2.7: Cost Analysis (Per Animal Basis) of the Amul Supply Chain (2009)

Particulars	BMC Milk		Non-BMC	
	Cost/per litre	Per animal	Cost/litre	Per animal
Milk Producers				
<i>Total Yield* (litres)</i>		10		10
<i>Price of Yield (Rs)</i>	12.95	129.5	12.95	129.5
<i>Additional Price due to SNF/FAT increase+(Rs)</i>	1.5	15	0	129.5
<i>Loss due to Sourness</i>	0	0	1% or .1 litres (9.9 litres remaining)	Rs0.89#
<i>Total Revenue (Rs)</i>		144.5		128.61
<i>Price realized by farmers (Rs)</i>	14.45	144.5	12.86	128.6

<i>User Cost of capital per litre ^ (Rs)</i>	.30	3.0	-	-
<i>Total Expenses + loss (Rs)</i>	2.01	20.1	2.78	27.88
<i>Revenue for Farmers and Society (Rs)</i>	14.60	146	12.86	128.6
<i>Cost to DCS (Rs)</i>	2.01	20.1	2.78	27.8
<i>Net benefit (Rs)</i>	12.59	125.9	10.08	100.80

* Increase in Yield at the farm level as a result of increased intervals between Milking.

+ a 1 and 2% increase is seen in fat and SNF, where milking intervals are longer.

Price of milk with sour milk @ 4 Rs per litre

^ User cost of capital is the opportunity cost and depreciation divided by the capacity utilization of the BMC in a Year (assuming utilization = 80%)

2.3.1 Assessment of Impact of BMC

The benefits and costs to farmers, village cooperatives and the district cooperatives in both Amul and Bangalore Dairy supply chain is given in Table 2.8. The net benefit is obtained for the whole supply chain. BMC benefit is substantial for producers both in the Amul and Bangalore Dairy chain. As far as the village cooperatives are concerned the benefit is marginal in the case of Amul as the cost of maintenance of BMC is borne by them. However, the District Cooperatives in Amul chain are able to reduced cost substantially. Overall we There is positive net benefit in both the chains and is particularly significant (10%) in the case of Amul chain.

TABLE 2.8: BENEFITS/COSTS (RS PER LITRE) TO VARIOUS STAKEHOLDERS IN THE SUPPLY CHAIN

	With BMC	Non-BMC	Difference
<i>Price realization for Milk Producers</i>			
Amul	14.45	12.86	1.59
Bangalore Dairy	14.45	12.69	1.76
<i>Benefit to Village Cooperatives</i>			
Amul	0.15	0.14	0.01
Bangalore Dairy	0.50	0.23	0.27
<i>Cost to District cooperatives</i>			
Amul	2.01	2.78	-0.77
Bangalore Dairy	3.93	2.81	1.12
<i>Net Benefit</i>			

Amul	12.59	10.08	2.51
Bangalore Dairy	11.02	10.11	0.91

*Assuming market Price $P_d = 16$ Rs

In the case of Bangalore Dairy the maintenance costs is high due to irregular power supply and therefore BMC requires the use of generators. In comparison, Amul shows a profit at all stages of the value chain. The analysis does not consider the other tangible and intangible benefits at the processing stage. BMC milk with high fat and SNF contents is used to make high value dairy products, which brings higher return to the Dairy. As the proportion of BMC milk compared to can procured milk is low, separate processing is not viable, so in most dairies, once milk is cooled both the BMC and can milk is mixed before processing. BMC milk at the processing stages has the advantage of requiring lower heat for pasteurization as well as cooling for further storage. This could help in reducing fuel and electricity costs during processing. But unless more BMCs are installed for supplying for separate processing this will not be profitable.

3. Standards and Improvement in Food Quality – A Case on Mobile Street Food Vendors in Karimnagar, Andhra Pradesh

Street food plays an important role in urban life in India, as it provides livelihood support to a number people in the lower income group as well as inexpensive and nutritious food to consumers from different socio-economic strata. Middle-income urban groups also often consume street food, as the prices are low (Bhowmik, 2005). However, many urban consumers do not use street food due to poor hygiene and quality of food sold by the vendors.

Food vending is not a licensed or regulated practice in India. In the absence of such mechanisms in the market, there is information asymmetry and uncertainty about the quality of food and goods sold by the vendors. Street food is often characterized by poor hygiene and low quality. For consumers there is a high level of uncertainty about street food due to the lack of information regarding its quality. Limited access to clean water and poor hygienic practices make consumers prone to water borne diseases like cholera, dysentery and diarrhoea, limiting the outreach of street vendors to only certain income groups. Among poor income groups, the average expenditure on food may go up to 70 per cent (Malik, 2006). A study conducted on street food in Kolkata by the FAO, reports that street food is the cheapest and most nutritious food that can be obtained outside home. A typical meal of 500 grams at the cost of 0.25 dollars can provide up to 1000 calories with 20-30 grams of protein, 12-15 grams of fat and 174-183 grams of carbohydrates (FAO, 2002). In India, for the lower and lower middle income groups, the pushcarts are an alternative to restaurants. For the migrant population in many towns and cities, street food is the major source for nutrition (Bhowmik, 2005).

3.2 Standards in Street Food and the ‘Aarogya’ Project

The concerns of street food quality are common to most developing countries, where the problem of hygiene and quality make people prone to diseases and epidemics. For more than a decade now the Codex Alimentarius Commission (CAC), FAO/WHO has helped create regional guidelines for street food standards in countries in Africa, Asia and South America. The FAO has been giving technical assistance to many countries to formulate their standards in street food that in the past been have caused many epidemic outbreaks. (FAO 2002).

In Karimnagar, 80% of street food vendors prepared food items at home and transported for sale. Improper handling of food items during storage and transportation made food prone to contamination. For vendors who prepared their food on site, there were dangers of health risks as the necessary infrastructure was not in place for the preparation of contamination free food. Infrastructural and sanitary facilities, clean water supply, waste handling requirements, and general hygiene established by the health system for preparing and handling food were absent.

Dr. Reddy’s Foundation (DRF) is a not-for-profit establishment set up in 1996 aims at creating opportunities and equality in education and livelihood. The ‘Livelihood Advancement Business School’ (LABS), a flagship program of DRF, promotes programs targeted at youth and women in the age group of 18 -30 years from economically weaker sections of society to enable them to access opportunities for sustainable livelihoods. One of the major programs of LABS is the Aarogya – safe food, safe water project aimed at upgrading the socially underprivileged Mobile Food Vendors (MFVs) sector.

The Aarogya program collaborated with the Municipal Corporation of Karimnagar and Nizam Institute of Medical Sciences, Hyderabad. As a part of the project, various community agencies, civic authorities, citizen groups, industry representatives and academic institutions got involved and were sensitised in this matter. According to the Social Audit Report, this pilot project was executed in a way that it could be easily replicated through sustainable model with minimal inputs at the end of the assignment period. The pilot project involved identifying, training and implementing street food standards to 75 Mobile Food Vendors (MFV) in the town. Specific training modules on personal hygienic, maintenance, health and hygiene, customer relations, cleanliness and the impact of standards on business and community were delivered to the participants. (Social Audit Report, *AAROGYA, 2007*). Training was conducted for the vendors and they were provided with scientifically built carts and access to clean water. Health camps and medical checkups were also conducted for vendors, to educate them on safe practices and ensure good health.

3.3 The Impact and Assessment of Standardization under the *Aarogya* Project

In order to assess the impact of standardization on MFV in Karimnagar, this explorative study examined how standards has helped improve hygiene and food preparation methods, change in perception of quality and hygiene, the extent of price realization and increase in scope of opportunities for micro-enterprises. As per our findings, the results showed that only 60% of MFVs are practicing what they learned in their training, while the remaining have retained their earlier practices or have given priority to convenience when it came to the guidelines that were to be put in practice. Some vendors who did not go for training learnt and adopted some of the practices from the neighbouring MFVs.

The noticeable changes made by MFV’s after the training programme is given in table 3.1 below.

TABLE 3.1: CHANGES BROUGHT ABOUT BY THE PROGRAMME

Before	Now
<ul style="list-style-type: none"> MFV’s had no licensing and no security in business 	Fully certified by Karimnagar Municipal Corporation (KMC)
<ul style="list-style-type: none"> No infrastructure – carts were old and inconvenient. 	Scientifically designed carts provided
<ul style="list-style-type: none"> Lack of clean water for consumption and food preparation 	Water is now provided by the KMC
<ul style="list-style-type: none"> Lack of awareness on food hygiene standards 	After training 60% of MFVs are following hygienic practices
<ul style="list-style-type: none"> Lack of brand identity 	‘AAROGYA’ is used as a certified brand.
<ul style="list-style-type: none"> Lack of financial assistance 	Credit provided by Union, UTI, PNB, SBI and ANDHRA banks.

<ul style="list-style-type: none"> • Poor food-handling practices and poor sanitation condition at the site 	Now only 40% of MFVs facing these problems
<ul style="list-style-type: none"> • No regulation to control and monitor street food vendors 	No regulation still.
<ul style="list-style-type: none"> • Lack of support from government 	Now 77 percent MFVs water facilities and certification
<ul style="list-style-type: none"> • Poor levels of awareness of food vendors/consumer 	Largely the programme has brought about awareness to both consumers and vendors.

3.3.1 Implementation and improvement in hygiene and food quality

Improvement in hygiene and food quality can be seen from the change in methods and infrastructure used in preparing street food, access to clean water and in basic sanitary practices. The water used by food vendors need to be clean for cooking, drinking, dishwashing, etc., as water can be the source of many water borne diseases like typhoid, cholera and dysentery. Before standardisation of water use, MFVs used mostly tap water for cooking. Now, the KMC has facilitated the access of the municipal water supply to the street vendors through tankers. According to the KMC, 77% MFVs now have access to the municipal water (Figure 1).

The survey on customers shows that 80% of them do not drink water from the MFVs. This was due to uncertainties about clean water. Before the Aarogya program, most of the MFVs only strained the water using a cloth. Seven percent of the vendors used water without straining it. After the Aarogya program, most of the vendors have access to clean water from the municipality and most of them boil water before use (Figure 2)

The training has also helped in the improvement of sanitary and cleanliness practices among the vendors. Washing of hands is important in preventing contamination of food during its preparation and serving stages. Figure 3 shows the change in habits before and after training and standardization. Though a larger proportion of vendors have changed their practices, 53% of vendors still wash their hands using only water. However, 37% of vendors now use soap or washing powder to wash their hands.

Figure 1: Source of Water Before and After *Aarogya*

Figure 2: Washing of Hands Before and After *Aarogya*

Figure 3: Purifying Water Before and After *Aarogya*

3.4 The Economic Impact of Standardisation on Mobile Food Vendors

The benefits of adhering to standards in street food can be seen in the improvement of food quality and cleanliness as well as in the economic benefits to the food vendors. There have been substantial changes in earnings, cost of production as well as food wastage after the implementation of standards under Aarogya. The break up of the changes in costs, earnings, food wastage and income of vendors under the Aarogya programme are shown in figures 4 to 8.

Figure 4 compares the average cost of raw materials purchased by vendors for their business per day before and after the implementation of Aarogya. The paired t-test done on the survey data shows significant difference in costs before and after (Table 2) implementing the project. The mean difference in the cost of raw materials has gone up 33.1% as a result of implementing standards, due to increased business.

Better preparation methods and cleanliness of vending carts has helped bring down the rate of spoilage and wastage of food (Figure 5). The paired t test done on the extent of wastage (Table 3.2), shows the difference in the wastage before and after is significant and the mean percentage decrease in wastage is 59.7%.

According to the vendors, after training and implementation of standards, their gross earnings per day have increased substantially (Figure 6). Table 3.2 shows the results of the paired t-test before and after the implementation of Aarogya. The mean percentage increase in gross earnings shows an increase of 41.6%.

Figures 7 compare the total expenditure of vendors before and after the implementation of standards under Aarogya. In terms of total expenditure, there has not been a substantial increase though the number of vendors spending less than 200 rupees per day has decreased to 3% from 17%. There is an average increase of expenditure by 13.5%.

Figure eight show the increase in the per day gross earnings of vendors who participated in the training programme. A majority of them (54%) say their earnings have increased Rupees 200 or less, while 33% and 13% of vendors say that their earnings have gone up by Rs 200-500 and above Rs 500, respectively. The vendors were also asked about the increase in the number of customers after they had implemented standards. The figure shows 38% of them said that there was an increase of about 20 customers while 31% said there was an increase of about 30 customers. Four percent of them said that there been increase by more than 30 customers after the implementation of standards.

Table 3.2: Paired T-Test Results to Determine Changes before and After Aarogya

Paired Difference					t	df	Sig.(2-tailed)
Before & After	Mean	Std. Error Mean	95% Confidence Interval of the difference				
			Lower	Upper			
Cost of Materials	108.33	12.47	82.81	133.84	8.68	29	.000
Wastage	-29.66	4.56	-38.99	-20.33	-6.50	29	.000
Gross Earnings	325	46.22	230.46	419.53	7.031	29	.000
Total Expenditure	58.66	14.52	28.95	88.37	4.03	29	.000

Figure 4: Cost of Raw Materials Before and After *Aarogya* (In Rupees)

Figure 5: Wastage Before and After *Aarogya* (In Rupees)

Figure 6: Gross Earnings Before and After *Aarogya* (In Rupees)

Figure 7: Total Expenditure Before and After *Aarogya* (In Rupees)

Figure 8: Increase in Gross Income and Number of Customers

No significant difference in prices among items of food was observed in different areas during the study. The prices charged by vendors were competitive and some vendors used selling strategies like variations in quantity served to increase their sales. None of the vendors have increased their prices after the implementation of standards and any increase in price was because of genuine increased costs in operation or raw material. During 2007, prices among some vendors rose only by Rs.1/item.

3.5 Consumer perceptions on quality and hygienic conditions

In order to determine and understand the changes that were brought about as a result of implementing standards from a customer's point-of-view, they were asked about the changes they noticed after standardisation. Twenty eight percent of the customers said that they visited the MFVs due to the attractiveness of the carts and changes they noticed in the behaviour of the vendors. Ten percent said that the branding and certification of the MFV had made a difference in their decision. Better food preparation and marketing techniques like sampling comparatively made only a small difference to the respondents of the survey. When asked about suggestions for further improvement,

84% of the customers said that they had no suggestions (Figure 9). Only 7% of the customers said that they need water facilities for washing and drinking.

Figure 9: Customers reasons for Increased Sales and Further Suggestions

Street food vending is an important service as well as an opportunity many low income people in the changing urban scenario. To the lower and lower middle income groups, it provides cheap and accessible food and to the urban poor it provides an economic opportunity. However, the regulation and standardization of street food is also important, as the risks involved with regard to public health and safety are high. The success of street food standardization in various developing countries of Africa, South America and Asia under various initiatives shows that a successful implementation of street food standards increases business through an increased customer base while lowering instances of disease and epidemic outbreaks.

Despite its initial success, there are a number of challenges at hand for both the DRF as well as the street food vendors. Aspects like waste management, cleanliness of the vicinity, follow up and adherences to standards are the challenges that still need to be addressed at different levels. Poor monitoring and coordination of street food as well as the voluntary nature of standardization may still pose the challenge of health risks.

Conclusions

The standardization program piloted in Karimnagar and introduction of BMCs in Amul and Bangalore Dairy are examples of the importance of standards and certification, technological innovation and good supply chain management to ensure quality and marketability of food products. The study highlights how changes in technology and practices enable micro enterprises to effectively compete in the food value chain and thus help improve their sustainability.

In the case of Amul and Bangalore Dairy, the establishment of a cold chain with the help of BMCs has helped all stakeholders in the supply chain by increasing yield and quality of milk, reducing milk spoilage, and lowering cost of production. This has had a major impact on costs and marketability of milk and milk products later stages of the

value chain benefiting both the cooperative as a whole as well as the primary producers. In the case of the food vendors in Karimnagar, the improvement in hygiene and food preparation practices have helped in making street food safer while increasing marketability and sales. This has helped increase access to street food, broadening customer bases of the vendors as quality assurance has led to reduced uncertainty. Standards in street food and technological innovation through the BMCs have helped reduce wastage adding to the benefits of the producers.

Standards and good supply chain management can help increase market access, information flow and supply and demand orientation of the producers helping them adopt good practices at all levels. In order to bring about inclusive economic growth and aid primary producer's and micro enterprises to access markets, emphasis need to be given for implementation of standards and infrastructural development.

Abstract

The article examines the importance of innovation in the Commission Federal of Electricity (CFE), and discusses the type of innovations that are developed in electricity industry. According to the Oslo manual, there are four types of innovation: product, process, marketing and organization; but design innovation also plays an important role in the success of some enterprises.

This is based on an empirical investigation of key executives in at the Commission Federal Electricity (CFE). Based on executive perception, the study presents the perceived importance of innovation in management activities, as an important source of competitive advantage.

The paper compares theoretical perspective on innovation with existing practices in leading Electricity Company in Mexico.

Keywords: Innovation, Competitive Advantages, Electricity Industry

1. Introduction

Today the companies have challenges due to technological advances, the evolution of the expectations of the clients and the short product life cycle. The innovation plays a fundamental role to face those challenges and to promote a competitive advantage that would improve and to maintain the sustained business performance (Becheikh, Landry, & Amara, 2006).

In this article the authors emphasize the importance of the innovation in the competitiveness of the organizations, and highlight this activity is not something accidental or fortuitous but the actions related to the innovation have become a culture in the organization.

This empirical research was conducted by the Institute of Economic and Business Research (ININNE) at the Universidad Michoacana de San Nicolás de Hidalgo. The study focused on CFE, which was created under the CFE, to organize and direct the national development of power generation systems, transmission and distribution of electricity. The electricity industry in Mexico is in charge of the Federal Electricity Commission (CFE). The CFE is an organization with a strong vertical integration, which is also the only company in Mexico responsible for the provision of public electricity service throughout the national territory (Balart & Rojas, 1999). Due to the strategic importance of CFE, the key executives in the CFE of the central western Mexico carried out this study to measure perception of innovation (s).

This study used the classification of 1974 when CFE was divided throughout Mexico into thirteen Divisions, which currently manage, distribute and sell the electricity generated in its area of jurisdiction (González Pérez, 1996).

2. Literature review

In recent years, the world has witnessed the power of innovation and its various constituents in revolutionizing the business and economic landscape. With the advancement of the knowledge economy, the world is also seeing how innovation empowers individuals, communities and countries with profound impact on business.

,politics, and society. What is equally evident is the increasing role that innovation plays in accelerating economic growth and promoting development(Dutta, 2010).

Innovation is an important factor of economic development and increased productivity and therefore of the competitiveness of the regions and the nations (OCDE, 2009).

Today, many highly competitive companies in the world are turning their attention towards innovation, continue to invest on innovation in order to improve performance Vast majority of senior managers emphasize that innovation is one of their top priorities and a key driver of growth (Emerald, 2008).

Peter Drucker suggested in 1965thatone day knowledge would replace the machinery, capital, materials and labor will become the most important factor in production (Drucker P. , 1965), More over Nonaka and Takeuchi, (1995)indicate that knowledge and innovation have been the main factor of success in Japan on business and has provided some competitive advantages. On the other hand, it is unquestionable that innovation can be applied to products, services and procedures. This can be a continuous evolution(Verzyer, 1998).

The National Innovation Initiative(NII) defines innovation as the intersection of invention and insight, leading to the creation of social and economic value(Competitiveness, 2005).Drucker emphasized the importance of innovation as it is crucial for survival (Drucker P. , 1999)Oslo manual defined innovation as the implementation of a new or significantly improved product (good or service), or process, a new marketing method, or a new organizational method in business practices, workplace organization or external relations.(OSLO, 2006). It highlighted four types of innovations: product innovations, process innovations, marketing innovations and organizational innovations.

Undoubtedly, the link between innovation and economic change is of central interest. Through innovation, new knowledge is created and diffused; expanding the economy is potential to develop new products and more productive methods of operation. Such improvements depend not only on technological knowledge, but also on other forms of knowledge that are used to develop product, process, marketing and organizational innovations. Specific types of innovation can differ greatly in their impact on firm performance and on economic change. For this reason, it is important to be able to identify the implementation and impacts of different types of innovation.

Nevertheless, in agreement with the investigation developed by the Council of Design of the United Kingdom shows that design plays a fundamental role in the success of some company leaders, in which the key element is the innovation(Emerald G. , 2008). The design is increasing its position as a key factor in the innovation process, and investment in design is one of the greatest assets for businesses and nations. In other words, the design must be understood as a strategic resource used to heighten the competitiveness of the companies (Power, 2004). The phenomenal market success of products such as Apple's iPod and products made by companies like Sony, LG and Samsung are widely attributed to the ability of companies to use the design effectively throughout their business strategies(Nussbaum, B., 2005).

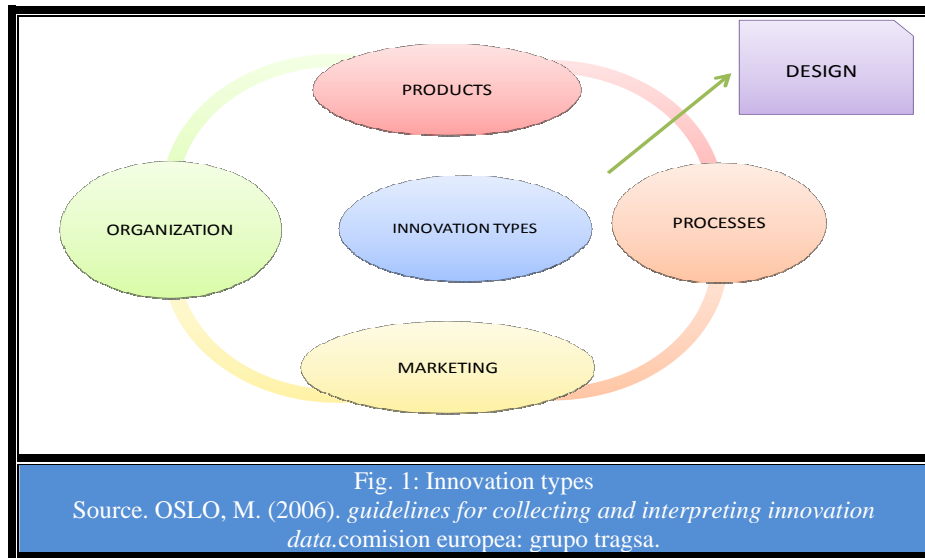

The traditional industries, such as, furniture, textiles and dress making, also sustain their businesses by re-invent themselves through effective use of the design(Lorenzen, 1998); (Rantisi, 2002); (Leslie & Reimer, 2003).

Other studies emphasize that, "the Innovation is intrinsically a dynamic phenomenon and needs to be examined of that way. To observe the innovation requires an understanding of the processes through which this happens" (Malerba & Brusoni, 2007). Furthermore, the accelerating pace of change and increasing complexity and uncertainty, the ability of firms to adapt in their external environment, characterizes this and to remain competitive is closely related to their capacity to innovate and continuously upgrade and renew their knowledge bases, products and structures (Johannessen, Olaisen, & Olsen, 1999).

Is evident, the existing studies on the phenomenon of innovation highlight four different perspectives. First individual innovation, second, the company or an organization, as a source of innovation third, the emergent scholastic networks in innovation work insist on the importance of external relations, especially with other companies. Finally innovation systems, nowadays so popular that emphasizes the complex network interactions and the institutional environment to facilitate relations of economic agents. The formation of innovation networks reflects the fact that companies do not innovate in isolation from the surrounding environment. Therefore, as mentioned above innovation processes depend on a variety of factors. Some of the important ones are the size of the firm its structure, technology-intensity of the company, etc.

Pavitt (2005) argues that at the level of the firm, innovation processes needs to be divided, into three overlapping sub-processes. 1.- Cognitive, how firms generate and maintain the know-how to conduct theirtasks;2.- organizational, how firms operate internally or in collaboration with other firms and organizations; and3.- economic, how firms establish internal incentives to ensure innovation proceeds quickly

and in the desired direction. In addition, innovation is vital for the long-term growth and performance of organizations. Top executives in business organizations are aware of that. In a recent survey (78 percent), approximately of the 540 CEOs interviewed said that “stimulating innovation, creativity, and enabling entrepreneurship” is a top priority of their organizations. Motivating innovation remains, however, a challenge for most organizations (Manso, 2007). So all the concepts mentioned previously force us to ask, what are the sources of innovative ideas used in the processes of innovation in the CFE? ¿What are the types of innovations more frequently generated in the CFE. In order to answer these questions this research provides empirical evidence from different sources of innovation and the generation of some type of innovation in the CFE, which are show in figure 1.

3. Methodology

This empirical investigation was in the Federal Commission of Electricity (CFE) with the objective of finding out the relationship between the variables that create different types of innovation and sources of innovation. The author chose this company because of its reputation as a world-class company. The results presented in this paper are based on responses to a questionnaire survey of heads of departments and managers in the CFE, in the last quarter of 2010. The questionnaires contained 40 questions and 116 responses were obtained. The first part contained general questions, the second part included questions on five types of innovation, and the last part contained questions that are intended to identify the main sources of innovation. The research methodology used a descriptive -correlational-causal design, because it describes the object of study; and second it determines the correlation and causality that have the independent variables relating to five (5) different types of innovation. The questionnaire obtained executive perceptions using Likert scale type of questions. That is to say, it presented each statement and asked the respondents choose any one of the five points in the scale. Each point has a numeric value. Thus, the subject obtained a score over the final affirmation and its total score obtained by summing the scores in relation to all affirmations (Hernandez Sampieri & Fernandez, 2010).

Based on the responses, the author classified the responses as high or low and obtained final weight in response alternatives to establish the values of this scale and range positions. Based, on the second considerations, the allocation of scores on the scale of measurement was composed of the following values determined. 1, 2, 3, 4, 5, for each item, corresponding to these numbers the following concepts: 1) Very low level of innovation, 2) Low level of innovation, 3) regular level of innovation, 4) High level of innovation and 5) Very high level of innovation. As the scale of Likert is additive, the scores are obtained by adding the values understood in each question in the questionnaire, remembering that the number of categories of answer is the same for all the questions. In a Likert scale, the maximum score equals to the number

of items multiplied by the highest score for each alternative response. While the minimum score is the result of the number of items multiplied by the lowest score of the answer choices (Navarro Chavez & Pedraza Rendon, 2004). For the global and detailed analysis of this research, a general scale is required to measure the level of innovation in the CFE in the Division Center the West of Mexico. This scale considers the entire questionnaire for its measurement. The scale is conformed to a maximum of 200 points (40 questions multiplied by 5, which it is the maximum value in each) and a minimum of 40 points (40 multiplied by 1 that are the smaller score for each question). Then the level is between the values of 200 to 40 points. The intermediate level is obtained to perform a subtraction between the maximum and minimum value and the result is divided between the categories used in our case is five. This will be presented to give the overall results below:
 Maximum value 200 (-) 40 minimum = 160 divided by 5 = 32 points in each ranges.

No.	Table 1: Reliability of Independent variables	Alfa de Cronbach
1	Products and Services	.914
2	Process	.891
3	Marketing	.750
4	Organization	.909
5	Design	.832
No.	Dependent variable	Alfa de Cronbach
1	Innovation and Reliability of the measuring instrument	0.959

4. Findings

In this section, the results obtained from the empirical investigation were analyzed and the quantitative character of the independent and dependant variables were examined to analyze the propensity that the CFE maintains to carry out innovation activities. An important aspect of this research is the measurement of the reliability of the measuring instrument. A questionnaire is reliable, when it measures with the same precision, gives the same results, in successive applications realized in similar situations (Santillana, 1998). The number of questions contained in the measuring instrument applied is 40 and its Alpha of Cronbach is 0.959, from equal way we proceeded to measure the reliability of each one of the variables (to see table N° 1).

In the measuring instrument used in this study, addressed questions considered at the beginning to know the present situation of the activities of innovation in the CFE, which turned out to be very beneficial since very interesting information of the consulted sources obtained as described below. The staff surveyed considered that this company is a world class for the following reasons, it is profitable (45%), good quality service (30%), a competitive company (20%) and has a care full approach to the environment (5%).

The 60% of respondents considered that the current level of innovation in the CFE is low; however, 70% of respondents felt that the budget for innovation in CFE is high; on the other hand, 85% of respondents said sometimes the CFE established agreements with universities to conduct research on innovation. In relation to the level of support, the CFE provides for innovations in the internal activities 60% of respondents said that support is high, 70% of respondents considered that the level of importance of innovation in the CFE is high. However, the level of innovative ideas proposed by the workers is low according to respondents, and finally 60% stated that the ideas of workers, its implementation is low.

Pearson Correlation

The correlation coefficient of Pearson product-moment (r), is applied to two variables at least, this is a parametric correlation coefficient that accurately indicates when two things are correlated, to what extent a change corresponds to a variation in another. Their values vary from +1.00, which means perfect positive

correlation, through zero meaning complete independence or a correlation to -1.00, which is a perfect negative correlation. A perfect correlation of +1.00 indicates that when a variable moves in one direction, the other moves in the same direction and with the same intensity.

Figure 2 shows the correlations and the coefficient of determination of the different variables that explain innovation in the CFE. The correlation coefficient (R) is a measure of the degree of association between two variables. Therefore, the first variable products and services have a high correlation of 0.826 with the dependent variable, the process variable the correlation is very significant and which is 0.924, the marketing variable has a high correlation of 0.809, the correlation of the variable of organization is high 0.881 and finally the design variable has a correlation of 0.643. On the other hand the coefficient of determination is the proportion of the dependent variable explained by the independent variable and is therefore between 0 and 1, that is to say as R² approaches 1, the regression equation is more reliable.

It is evident and highlights the impact of the product innovations and services, processes and designs show with the dependant variable innovation in the CFE, whereas marketing research and organization are those of smaller impact. Therefore, with the results it is evident that there are different skills in CFE workers and that simultaneously has relationship with the generation of different types of innovation (product and services, processes, marketing, organization and design). It is unquestionable also, that exists a positive relation between innovation and the performance of the company as they demonstrate in different studies (Crépon, Duguet, & Mairesse, 1998). Based on the foregoing, it is important to note that respondents have formal education 75% have a bachelor's degree and 25% with master's degree, of such form that often the acquired sophisticated abilities through the professional education are more important successfully to manage the innovating activities in the company (Gray, 2006).

Innovation is a constant process of search and exploration that gives rise to new products, processes, marketing, organization and design innovations. Nevertheless, the majority of the investigators have focused in the technological and technical innovations that correspond to innovations of products and processes (Lundvall, 1992). Similarly, innovation is the result to an interactive process of generation, dissemination and use of knowledge (Bottazzi & Peri, 2003). The figure N° 3 shows the technological and non technological innovation types, therefore, in this way and after analyzing the results obtained in this investigation, it is possible to have a clear idea of the types of innovations realized in the CFE.

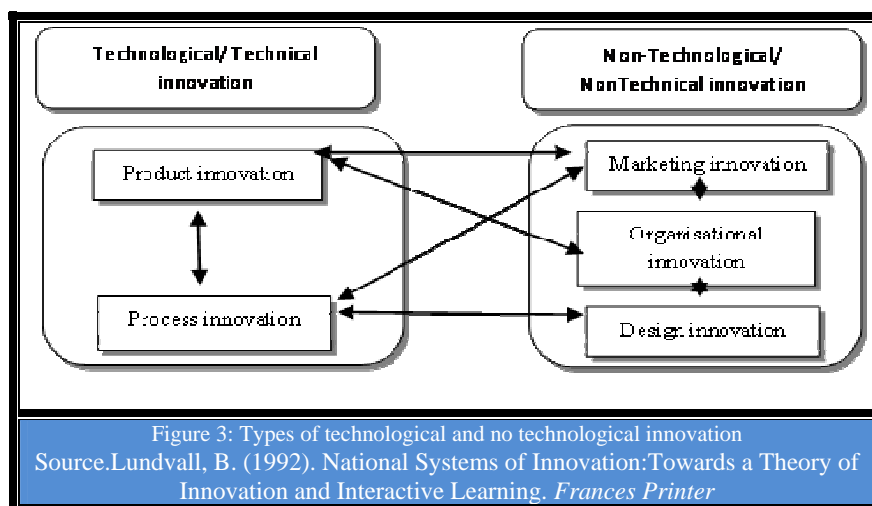

There are reasons that lead companies to make innovations can be quite varied, among the most prominent are the following: obtaining higher added value, product differentiation, enhance the efficiency of the business, obtaining financing, achieve quality standards. Therefore, this variety of motivations can push to the companies throughout the way of the innovation. The mentioned motivations above are proactive and reactive; the companies that are more successful in the innovation of processes usually are motivated generally by proactive factors.

Independent Variables	Correlation of Pearson	Coefficient of determination R^2	Dependent variable
Products and Services	0.896	0.802	Innovation
Process	0.924	0.853	
Marketing	0.809	0.654	
Organización	0.921	0.848	
Design	0.643	0.413	

Figure 2: Index of correlation of Pearson and the coefficient of determination of study variables
Source: Authors based on field research

The technological strategy adopted by a firm depends on the reasons that motivate the firm to innovate. Empirical works have shown that, at the industry level, a greater range of innovation objectives is associated with greater rates of innovation, while at a firm level innovation objectives affect the ability affirms to innovate successfully (Cohen & Malerba, 2001).

The results were obtained by applying a measuring instrument to the middle and senior managers in the CFE, in central western Mexico. This questionnaire has the intention, to know the main type's innovation in this company, for such effect proposed the model of variables as it shows the figure N° 1, in addition, the findings by each one of the variables are detailed.

The responses relating to the variable product and service innovation investment in research and development of new products and services during the past year indicate, a low level of generation of innovations. In addition, incentives for workers to submit proposals for innovation are often low. In addition, the degree of implementation of the innovative ideas proposed by the workers is high and frequent, the main benefits that the CFE obtained with the application of innovations in products and services has increased its competitiveness, the image improved and increased business efficiency and finally contributed to the environment.

As for as the process variables are concerned, the current efficiency level of the processes by which CFE operates are high and the investment made to innovate is high and frequent. In addition, the data shows that the workers consider the CFE, as a highly competitive the international level and finally the innovations of the processes developed in the CFE are very frequent.

The marketing variable has a limited budget to innovate, although marketing is of great importance to improve the image of the CFE; result suggest that the innovation in the methods of commercialization and promotion are little and the profit objectives established through the marketing research is low.

The results show that the current organizational model in the CFE has a high efficiency; also very often CFE offer programs of innovation incentives to employees to increase the innovations of this type and therefore the level of proposed innovations made by the workers is high. The CFE has a high level of exigency with their suppliers; frequently it provides quality certificates to them. The company also has a high level of collaboration with the universities to promote innovation.

The results relating to design variable indicate a low level of innovation in this variable. Finally, with respect to competitiveness of the service, the respondents consider It high.

The general results of this study show a support to the internal strategy of innovation of the company, however, this organization maintains an intense network of external collaboration with different partners within the electrical industry, which could be a subject of another study. Moreover, this organization maintains a constant relation with the universities in which the collaboration is based on the type of innovation that seeks to introduce. Similarly, it is interesting too be serve that the company recognizes innovations of the five types (see Figure N4).

The organization is the main type of innovation that is carried out in this company, is a non-technological innovation (see Figure N 3) It represented 38% of the total of innovations generated in the CFE. On the other hand, product and services innovations is the third type is most frequently noted in the company as

they represent the 17%, marketing innovation has 7% of participation; and finally, the design innovations have 3% being this type with smaller frequency in the total innovations generated in the CFE in central western Mexico.

Similarly, the information collected in this study identified the sources of innovation in the CFE, therefore, it is inferred that there is a direct relation between the internal source of intelligence and the generated type of innovation. The main sources of innovation are the department of production and Research and Development(R &D) because they generate a high level of information; another important source, are the employees of the company and the general direction of the company is considered an efficient source of information.

With respect to the overall performance on innovation in the CFE and according to the compiled information, this company has a regular level of innovation as shown in Table No. 2. Therefore, the general level of innovation shown by the CFE is not enough for a company that is considered world class as the company advertises, remember that a company of this type has a high level of innovation and aimed primarily at products, services and processes, this is obviously only one element of many of world-class company has.

5. Conclusions

Today innovation is one of the main competitive advantages of enterprises. Therefore, it is important that the CFE has to redirect their efforts towards innovation, as part of its work culture. This study has noted existence of a wide area of opportunity for research on innovation in the company.

It is evident that the amount and type of innovations generated in the CFE are not sufficient to be considered to a world-class company; in addition, it is necessary to remember that this company is a monopoly in the generation, distribution and commercialization of the electricity in Mexico.

The innovations generated in the CFE are, non-technological, the main type corresponds to organizational innovations, and second in importance are the processes, and this last one is of technical character.

Over the past years, technological innovation has become increasingly critical for firms as they struggle to achieve and maintain competitive advantage, and consequently technological innovation management has become one of the most attractive and promising areas of study in the field of managements.

The main sources of innovation are in the production area, the employees and the direction and therefore it is important to extend these sources in other areas of the company.

For innovation, a firm must have the right organizational conditions, such as sufficient qualified personnel, sufficient knowledge, and a flexible organization structure, but it must also have the right mix of financial resources. Without these right conditions, innovation hardly can take place.

Since CFE is a monopoly in the generation, distribution and commercialization of electrical energy in Mexico, it is evident that the lack of competition might have a correlation with the innovating attitude of this organization.

Finally, it is appropriate to extend this research to find a relationship between the sources ofthe innovations generated in CFE and external innovation.

Abstract

Inside a territorial unit that delimits geographically an Industrial District, the companies coexist and support a relationship of cooperation and competence. Nevertheless, it is possible to question the competitiveness of the cluster or industrial district with regard to other territorial units inside the same industry or sector. The aim of the research is to propose a way of measuring the competitiveness derived from the potentials of the industrial district, as foundation to generate the competitive advantage of the companies that form the cluster.

Though it is necessary to identify a cluster inside a territorial unit, this aspect is not sufficient to establish the competitiveness against other clusters of the same industry or sector. To establish these differences must help to promote the skills and strengths to drive develop strategies. For such purpose, the relevant literature was checked as fundamentals to measure the competitiveness. The aim of the metrics is to propose strategies that improve competitiveness of the industrial district.

Finally we conclude: which aspects must be considered to establish the measurement of the competitiveness in a cluster or industrial district.

What does mean competitiveness?¹

It has written a vast literature in the last thirty years with regard to the competitiveness. Bibliography that it is from diverse approaches of study. Some of them take a special theoretical aspect and others from a particular political point of view. It is a word used often, and in some times abuses term in texts of contemporary economy. This topic was declared by Paul Krugman in a essay where he discusses that: "the Competitiveness is a dangerous obsession" (Krugman, 1994).

A strong trend exists among politicians and journalists to use the word competitiveness as fashionable expression. Without bearing in mind his context and they use the term of a vague way to define some problem. This imprecision in the employment of the word ends to express different enough contexts.

On the other hand, the majority of the economists argue a discussion on the competitiveness in terms of increase in the standards of living. Whereas in some popular debates they argue that the competitiveness can measure up to indicators that have or not some relation with the standards of living or the economic well-being of a country (Bougrine, 2001).

This way the discussion does not achieve another thing that confusion in the knowledge of the topic and an unnecessary complexity. Krugman in his book *Pop Internationalism* (1997), expresses:

"The matters on competitiveness are, as an empirical, almost completely groundless matter [...] the obsession with the competitiveness not only is incorrect but dangerous. [...] thinking about terms of competitiveness one leads a wrong economic policy on a wide range of matters"

When the concept competitiveness has been defined in an erroneous way, obviously the translation of a measure it will be wrong. Hereby, to base the prescription of an economic policy with a theoretical questionable base will give like proved a quantitative debatable evaluation.

It is known, thanks to the literature on industrial organization, that this skill it is affected to a great extent for factors like costs, prices, quality and product differentiation, among others. In this respect, the competitiveness is equivalent to the (international) competence among transnational corporations. Nevertheless, the concept also is used widely to refer to the performance.

To answer the question of this paragraph we approach to a holistic definition of competitiveness that can be summarized like:

"The competitiveness is relative and not absolute. It depends on the shareholders and the value of the client, financial strength that determines the aptitude to act and react inside the competitive environment and the potential of the people and technology in the establishment of the necessary strategic changes. The competitiveness only can be supported by a balance adapted among factors that can be of opposite nature. " (Feurer R. and K. Chaharbaghi, 1994)

The present research has as principal aim to establish a base line to measure the cluster or industrial district competitiveness. It tried to do not give Importance to the industries, not in the individual thing to the companies nor institutions. This paper does not seek to follow any debate, which they coincide principally with the competence more than the competitiveness or along the lines developed by the evolution of the economy. It begins for defining the competitiveness, to continue with the levels and his measures of evaluation, finally to propose variables to measure the competitiveness in a cluster that they measure the performance of strategies applied to the industrial district.

Levels of competitiveness

In the specialized literature on topics of competitiveness, several levels are discussed: the competitiveness of a country, the competitiveness of an industry and the competitiveness of a company. Let's see below these levels and his measures of evaluation.

Macro Level: the competitiveness of a country.

Several factors combine to change the perception of competitiveness. On one hand economic theories, due to the importance of several issues that includes sustainable development and a more interdisciplinary approach. On the other hand, the concept increases its use in the speech to talk about some economic facts, no matter how vague the term is used as a slogan or dissertation.

Frequently to assess the economic performance of a nation can be confusing and misleading if it starts up from the definition of competitiveness. The U.S. government may be established, among other qualitative factors, environmental conditions, industrial relations, human resource development, and etcetera. In addition to quantitative factors such as the costs of labor and other input prices, increased productivity, among others (Cellini and Soci, 2002)

Qualitative and quantitative factors mentioned above, can assess competitiveness in a given and defined context. But even though the information is useful, it not provides a historical explanation and performance events in the country. However international organizations such as OECD and the World Economic Forum among others, are trying to point out and compare the countries macro-economic development. In other words, measure their competitive position by:

- Performance in trade agreements such as Trade Balance, Import and Export Index.
- Price and profit index as consumer prices, producer prices, GDP, or the average export price.
- Relative Unit Labor Costs.
- The ability of a country to trade in world markets.

The OECD uses quantitative indexes in its various publications, including The Economic Outlook and Main Economic Indicators. These reports are based mainly on cost and price differentials. Although recent OECD studies uses imports and exports as a measure of competitiveness, it is not possible to infer the economic performance through the balance of trade (Bougrine, 2001).

Each index proposed may be arguable and debatable because the bases do not apply to all countries in the same way, due to economic conditions. There are variables that influence the index performance in a positive or negative way, as a result giving erroneous results.

Meso Level: competitiveness in a sector or industry

At this point we analyze the intermediate indexes between the competitiveness of a firm and macro level. We will refer to the industry or sector in which we are interested to evaluate. As the sources of competitive advantage, in most literature is based on the endowment of natural resources and labor, the poles of industrial development in the economies of agglomeration become relevant to study this level.

Porter (1991) adopts a measure the relevant competitive advantage (RCA) calculated on the basis of an industry or product type:

$$RCA_{ij} = (X_{ij}X_i)/(X_j/X) \quad (1)$$

Where: “ X_{ij} ” represents exports of the industry “ i ”, located in the country “ j ”; “ X_i ” represents world exports of the same product; “ X_j ” is total exports of country “ j ” and “ X ” are the total world exports. If the RCA is greater than one, then the industry “ i ” located in the country or regio) “ j ” has a comparative advantage internationally. Porter added that industries to be competitive must also have a positive trade balance, unless your RCA is greater than two (Porter, 1991).

On the other side Steinle (1992), proposes to measure competitiveness through thirteen variables, including: Total employment, product differentiation, income growth and value-added, adequate commercial network, and so on. As we can deduce, it is not easy to obtain these indicators clearly, especially if each industry or sector has unique aspects in each region and country. It is not possible to generalize their application.

Since an industrial district evolves and changes over the time, modifying the elements of assessment, there is another proposal that addresses these sociological elements (Becattini, 1991). The proposal weighted accumulation of human capital as a determinant to measure competitiveness. The proposal highlights the formal education level and firm size. As a summary, the variables that may impact the region competitiveness, defined by the various proposals are:

- Social policies to promote access and mobility of materials, such as transport and communications, in general the infrastructure.
- Demographic and social conditions that influence the labor market.
- Environmental conditions.
- The enterprise network relationship from an industry or sector, this includes the link with other levels such as local, regional and international levels.
- Research and development efforts.

In essence the various proposals and studies on this level of competitiveness highlighted social cohesion as a fundamental element to the competitive position of regions.

Micro level: the competitiveness of a company.

A basic way to measure competitiveness is by assessing the economic unit called the firm. Initially, two aspects are considered in determining that an economic unit or firm is competitive: the profitability and productivity. In other words, if an economic unit does not meet the market shares and production costs, among others, the firm will not be efficient and will be less competitive.

But the competitiveness of the economic unit is irrelevant without the relative comparison with other companies. Therefore, comparing the results of competitors and companies in the sector or industry at the regional, national and international measurement makes sense. However, the competitiveness measured and compared between competing firms can not be a parameter to assess in the short term. Results on competitiveness in a short period of time, can respond to the outcome of a particular strategy that alters its measurement. (Bougrine, 2001).

Therefore, the measurement of competitiveness in the economic unit or between firms in a sector is not absolute but relative parameter. We should consider factors affecting profitability in a long period of time. On the other hand, we should keep in mind that the market structure as a condition that can change the evaluation and measurement of competitiveness. (Cellini and Soci, 2002).

How can we measure something that has no clear definition?

In many different ways you can measure competitiveness, according to the definition applied. There is a proliferation of empirical literature based on the indicators likely or unlikely to support such as productivity, the terms of business income, real, unit labor costs relating, among others. The range of results and different proposals arise after reviewing the publications of some authors.

The economic unit is not an isolated entity, responds to the conditions of an environment through the implementation of strategies. The firms often are associated in a particular industry sector or which show a dichotomous condition. On the one hand the confrontation and antagonism, while on the other hand, the cooperation and unity.

In essential issue of competitiveness is complex. Propose a single model which includes measurement and discard factors to evaluate the performance of a company seems arbitrary. Often the methods proposed meet the needs to justify policies. Therefore, the application of a general and absolute method to measure the competitiveness is not viable. Each industry or sector has particular influence factors and weighted. Without considering all factors affecting an industry or sector will generate biased results.

Then, when we propose a method of measuring competitiveness is to identify how particular factors influence the performance of an industry or sector. The relationship of these factors in economic units should be considered through a long period of time. The proposals will change over time because the results are unique, special and limited periods.

Proposal applied to the garment industry in the metropolitan area of Guadalajara.

There are quantitative factors to measure the competitiveness that are considered essential. Most of the theories proposed by several authors agree on factors to identify the measurement of competitiveness. However, few authors evaluate qualitative factors such as:

- Ability to technological innovation.
- Infrastructure of roads road.
- Foreign network of suppliers, competitors and distributors.
- Political system, legal framework.
- Information systems and communication.

Among others, these factors can be difficult to measure but are a strong influence on the outcome of the competitiveness. The variables considered may change or be modified by various factors that affect a particular industry or sector.

The firms forming a cluster or industrial district in the apparel sector in the metropolitan area of Guadalajara, coexist in a competitive relationship and cooperation. Conditions in the garment sector aimed at specific variables that may not be considered in other sectors or industries. The first step is to identify a cluster geographically within a territorial unit (Fregoso, G. and Radillo, R., 2009).

But identifying a geographic region is not sufficient to establish the competitiveness against other clusters of the same industry or sector. To determine the degree of collaboration or competition with employers in the cluster was evaluated as an initial stage the following factors:

- Innovation Capacity
- Foreign Network
- Information System

The results suggest inferences to search for factors of competitiveness in clusters or industrial districts in the garment industry.

For this research we made a survey of employers affiliated to the chamber of the garment industry within the industrial district and belonged to a production group. Total affiliates are 263, but only 104 employers were surveyed because have belonged to a production group. The employers surveyed representing 39.5% of the total membership of the chamber. The results showed that:

- 53% of respondents did not allow entry to the premises of any unionized company.
- 48% of respondents lack confidence in the group.
- 84% of respondents do not seek help from guild members or to solve their problems or to be more productive.
- 50% of respondents do not share information with members.
- 82% of respondents do not share equipment or machinery with the members.
- 88% of respondents do not share designs, models or molds.

From the results we can infer that the distrust between the union members is the main factor for not being competitive in the cluster. The development of the apparel industrial district will not be whit a miscommunication and mistrust.

Conclusion

The development of this work led to achieve the aim: to establish a baseline on the issue of competitiveness as the basis of the proposal for its measurement in a cluster or industrial district. We conducted a review of the literature on competitiveness and sustain the proposed measurement factors to assess a cluster. There was also the basis for further research in other industrial sectors.

This work provides several contributions to the literature on competitiveness. First, it establishes a framework on competitiveness. It also provides a basis for questioning the measurement of competitiveness for different international organizations.

At last, with the factors proposed to measure competitiveness in the cluster, we do not seek an explanation of the results in the apparel sector. Therefore we assume the various limitations of the study to measure the factors and infer the results.

Finally, the review of literature on competitiveness and provide the basis for questioning the measurement of competitiveness through factors considered absolute, leads us to set questions for future research. Similarly, we suggest take further study and implementation of various factors on competitiveness.

End Notes

- [1] Competitiveness is a concept not clearly defined; rather it is a confusing term. Today the term competitiveness is frequently repeated in speeches and contemporary items. When used in relation to a nation, industry or company, the argument must be specific.
- Competitiveness is a word introduced in the eighties and in a dictionary of Spanish Economy (Tamames, 1988) is defined as the ability to compete, especially in foreign markets. According to this definition, the term refers to the ability of companies to gain access to foreign markets and maintain or increase market share.
- In the dictionary of the Spanish Royal Academy, established that the competitiveness comes from the Latin term *Competere*, which means "strive together", and more formerly "agree" from *cum* and *Petere*, "try."
- Over time the original meaning of cooperation was finally replaced by the current opposite connotation: The ability of two or more companies to contend with each other. Aspiring, some and other the attainment of a goal.
- The Webster dictionary refers to or relating to a situation where individuals or groups try to win or contend or be more successful one than others, arising out of or involves competition.

On Biotech Start-ups' R&D Continuity in Financial Crisis: Application of Sequential Compound Chooser Options

*Takao Fujiwara, fujiwara@ace.tut.ac.jp
Toyohashi University of Technology, Japan*

Abstract:

As the research background, there is a high possibility of difficulty of research and development (R&D) continuity for biopharmaceutical start-ups due to the long valley of deficit since the financial crisis in 2008. The research question is; how is it possible to promote the continuity of R&D of biotech start-ups between the passive attitudes of venture capital and the continual progress of life science. As the research approach, the effectiveness of real options is promising for applying to overcome the valley of deficit. We will examine specifically Dixit model on the business entrance and exit. The research objective is to examine the flexibility value of compound chooser option for switching chance between two types of projects, that both have independently each negative NPV, one is the base case and the other is inserting the indication expansion. We could find the possibility of positive NPV by just only selection chance between alternatives.

Introduction

As the research background, it is high possible that the continuation of the research and development (R&D) at biopharmaceutical start-ups become difficult since the financial crisis in 2008, because of the long valley of deficit for such start-up financing. Then the research question is; how should it be to facilitate the continual maintaining of R&D projects in biotech start-ups at the trade-off situation between the investment reluctance of venture capital (VC) from financial crisis and the innovative progress at basic research of life science as aptamer, siRNA, iPS cells, and personal medicine? As the research framework, the effectiveness of real options approach is partially approved to overcome the valley of deficit (Smith, 2004). Then we will focus on the Dixit model on business entry and exit. This model has an analogy between the deferring characteristic of investment decision making related to sunk cost under uncertainty and the hysteresis as a physical concept. The research objective is to examine the economic value of the deferring of investment decision making for overcoming the valley of deficit with the compound chooser option by inserting the indication expansion stage before the stages of the new drug application and market introduction, in addition to the stage of market introduction by using the sequential compound option, based on the assumed cash flow of drug development process.

1. Status quo of biotech financing

1-1. The condition of IPO of Biotech Start-ups in Japan

The Japan Biotechnology Council was established by 20 companies of main biotech start-ups and venture capital firms on July 1st in 2009, in addition to existing Japan Bio-industry Association, for the proposal drawing to government to support biotech start-ups, because there are so far very fewer social systems to support the roles of biotech start-ups on commercializing the basic research findings at life science than that of the USA. There are 26 public biotech start-ups in Japan as of September 1st in 2010. There were recent IPOs by 4 companies in 2008, by 4 companies of JCL Bioassay, Tella, CanBas, and D.Western Therapeutics Institute in 2009, and by Cell Seed as a regenerative medicine company at JASDAQ, new market on March 16th, 2010. Thus, there is a tendency of IPO number of biotech start-ups along with improving the eco-system supporting the growth and survival of biotech start-ups.

But there are some cases that VC firms are making biotech start-ups which are poor in R&D money to buy back stocks by the reason of expiration of funds, in the severe condition of IPO markets because of financial crisis. On the other hand, Takara Bio and R-Tech Ueno are making the positive ordinary profits from contact manufacturing for other companies. OncoTherapy Science is also making the positive ordinary profits from March 2009 by multiple out-license agreements as each anti-cancer peptide vaccine agreement with Otsuka Pharmaceutical in January 2008, and with Shionogi in February 2009, and pharmaceutical agreement for central nervous system with Otsuka in June 2010. This company has started the phase I/II clinical trial for angiogenesis

factor inhibitor, OTS102 based on an anti-cancer drug target VEGFR (vascular endothelial factor receptor) 2 for the milestone improvement.

Thus the number of public companies is only about one twentieth in about 500 domestic biotech start-ups, less if comparing with one fifth in the USA, where there are about 300 public in 1500 biotech start-ups, But there are some companies that can make sure enough R&D money by strategic partnerships as license agreements.

1-2. The Situation of Biotech Finance in the USA

At the end of 2008, US biotech industry made the positive net income \$3.7billion (B) for the first time in history since 1976 with the cash and equivalents \$75.6B, the sales/revenue \$99.5B and the R&D cost \$23.7B in terms of statics of public biotech companies (Burrill, 2009). Afterwards in the end of 2009, it was still at the exit or matured stage across breakeven point with the increased positive net income \$4.3B, the cash and equivalents \$747 B, the sales/revenue \$91.6B, and the R&D cost \$19.3B (Burrill, 2010).

In the end of 2009, the industry market capitalization is \$346B, with the decrease of \$58B from previous year. But there are each increase of total capital raised \$8.8 B to \$18.9 B, and total partnership capital \$16.9B to \$63.9B. For instance, total raised change from IPO (Initial Public Offering) is \$0.5B increase to \$1.1 B, from follow-on is \$4B increase to \$5.7B, from PIPE(Private Investment in Public Equity) \$0.6B increase to \$1.6B, from debt is \$3.5B increase to \$6.3B, and from VC is \$0.3B decrease to \$4.2B.

Within 2009, there were at least 10 cases of partnerships in \$B level, as the \$1.9B cooperative research on drug discovery between PTC Therapeutics and Roche, the \$1.5B license on pain-killer between Nektar Therapeutics and AstraZeneca, and the \$1B license agreement on obesity drug between Amylin Pharmaceuticals and Takeda Pharmaceutical. Thus there are the increase trends in risk averting type of financing.

As the ecosystem for biotech start-ups in 2009, there were mega mergers and acquisitions as Genentech acquired by Roche with additional \$46.8B payment, Wyth bought by Pfizer with \$68B, and Schering-Plough merged by Merck with \$41B. Behind such movement, big pharmaceuticals firms are worried about patent cliff of blockbuster drugs as Lipitor and Singular in their pipelines. Then they are getting biotech R&D ability and biotech drugs on the market as Avastin, Enbrel, and Remicade from such M&A. It seems their change from chemical to biotech companies.

Additionally, the stock prices of such big pharmaceuticals firms as Pfizer and Merck had significantly declined during December 2007 and early 2009 as main "Lehman Shock" period. Otherwise, the stock prices of Gilead Sciences and Celgene were relatively stable during financial crisis. This means the sustaining of robustness to financial crisis and fluctuation of capital market based on the expectation for innovative technology. And before the acquisition, the whole company value of Genentech was estimated at \$100B, bigger than that of Pfizer which had not acquired Wyth yet. Furthermore recently the stock prices of Human Genome Sciences, Dendreon and Targacept have jumped up reflecting the smooth progress of their pipelines.

Thus ability of technology development can show the robustness to financial crisis. Big pharmaceuticals firms are exposed to the pressure of transformation from chemical to biotech firms from regulation reinforcement, patent cliff of their blockbuster drugs, price discount demand, and introduction of generic drugs. Big biotech firms are relatively robust and considering the financial crisis rather the chance. And biotech start-ups have technology development capability but lack the financial robustness. Hereafter the partnership and M&A between biotech start-ups and big pharmaceuticals or big biotech firms are forecasted for considerable increase. For example, there can recently be found the large scale of such partnerships even in phase I testing or preclinical stage from past in phase II testing stage.

2. Representative Theory on Decision Deferring Function of Real Options

On the relationship between the uncertainty and the decision deferring of the business start and exit, a theory building was tried to modify Marshal's threshold criterion with sunk cost and analogy of hysteresis.

Assuming μ business growth rate, ρ CAPM (Capital Asset Pricing Model), $\rho > \mu$ the relationship of both, σ volatility, c variable cost of operation, e sunk cost of the entry time, and x sunk cost of the exit time, each trigger criterion of Marshal's investment and abandonment is

$$C_I = c + \rho e$$

$$C_A = c - \rho x$$

These mean that each optimal behavior is the entry if a price is bigger than the Marshal's investment criterion C_I , and the abandonment if a price is bigger than the Marshal's abandonment criterion C_A . Within both criterions like hysteresis curve, the optimal behavior is to continue the business even in deficit when the path is $C_I \rightarrow C_A$, but not to enter the business even in positive profits. Thus each path shows the inertia of sustenance influenced by sunk cost (Figure1).

FIGURE-1 INVESTMENT DECISION DEFERRING AND HYSTERESIS

However if price behavior can be assumed as random walk based on geometric Brownian motion for Dixit's model on business entry and exit under uncertainty, each trigger price for entry P_H and for exit P_L respectively is:

$$P_H = \frac{\rho - \mu}{\rho} \frac{\beta}{\beta - 1} C_I$$

$$P_L = \frac{\rho - \mu}{\rho} \frac{\alpha}{\alpha + 1} C_A$$

where,

$$\beta = \frac{(1-a) + [(1-a)^2 + 4b]^{1/2}}{2}$$

$$-\alpha = \frac{(1-a) - [(1-a)^2 + 4b]^{1/2}}{2}$$

$$a = \frac{2\mu}{\sigma^2}$$

$$b = \frac{2\rho}{\sigma^2}$$

where if $\sigma \rightarrow 0$, then from $P_H \rightarrow C_I$ and $P_L \rightarrow C_A$, both prices approach to Marshall's criteria (Dixit, 1989). And for $\sigma > 0$, $e > 0$, $x > 0$, along with range expansion between P_H / C_I and P_L / C_A , the interval of maintenance of the status quo becomes large. That is, when the trigger price of entry P_H becomes larger than C_I or the exit price P_L becomes less than C_A , each interval that a firm endures the business operation in deficit or that a firm is reluctant to enter to the business expands. And along with the increase of μ , both P_H / C_I and P_L / C_A decline, then it is possible for the firms enduring even in deficit to increase. Thus this explanation seems to match with the present situation of US biotech industry which in total 1500 biotech start-ups, majority is in deficit except a few dozens.

Next, if introducing a neutral alternative as operation suspending in Dixit & Pyndyck model, similarly as restarting cost as the sunk cost of operation suspending expands, following tendency is expected that the suspended operation is hard to start or inversely restarted operation is difficult to stop (Dixit & Pindyck, 1994). These decisions and decision reservations of business entry or abandonment, and continuity of R&D as learning option are considered as applicable to the decision making in drug development process at biotech start-ups.

3. Application of Compound Chooser Option to Drug Development: Numerical Calculation

Here we apply compound chooser option to a drug development project at drug discovery biotech start-ups, based on an assumed case data (Copeland & Antikarov, 2001).

3-1. Assumptions of the Case

Firstly as 2 drug development projects, we separate a case of inserting immediately new drug application after clinical test stage and the other case of continuing further the indication expansion after the clinical test stage without immediate new drug application. As both cases are subject to the same patent effective expiration limit, if doing the indication expansion, the equivalent period is assumed to shorten after the product on the market. And the both projects assume the risk adjusted net present value (raNPV) are negative without options (Figure-2).

rt	Project with Indication Expansion						Base Case								
	0-05 Time Point	Stage	CR(Out)	POS	Prob.	PV of CR(Out)	raNPV of CR(Out)	Sum of raNPV of CR(Out)	CR(Out)	POS	Prob.	PV of CR(Out)	raNPV of CR(Out)	Sum of raNPV of CR(Out)	
0	Drug Discovery							19,402,000.02	Drug Discovery					23,027,702.8	
1	Pre-Clinical Test	3.8	0.4	0.4	0.4	3,619,047,619			Pre-Clinical Test	3.8	0.4	0.4	3,619,047,619		
2	Pre-Clinical Test	3.8	1	0.4	0.4	3,446,712,018	2,826,320,855	Sum of PV of CR(Out)	Pre-Clinical Test	3.8	1	0.4	3,446,712,018	2,826,320,855	Sum of PV of CR(Out)
3	Phase I	6	0.65	0.26	0.26	5,183,025,91	3,184,604,159	161,619,644	Phase I	6	0.65	0.26	5,183,025,91	3,184,604,159	
4	Phase I	12	0.4	0.104	0.104	9,872,429,688	3,278,447,008		Phase II	12	1	0.104	9,872,429,688	3,278,447,008	
5	Phase II	12	0.4	0.104	0.104	9,872,429,688	3,278,447,008		Phase III	15	0.55	0.0872	11,193,23,095		
6	Phase II	15	0.55	0.087	0.087	11,193,23,095			Phase III	15	1	0.0872	10,860,2,995

FIGURE-5 COMPOUND CHOOSER OPTION

3-3. Characteristics of the Results

The project without the indication expansion is a sequential compound option, and considered as the sequence of binomial decision making on entry or exit at each stage including respective clinical trials. On the other hand, the indication expansion is an alternative of searching and decision deferring stage, keeping away from immediate conclusion, after clinical tests. This relationship can be identified by the long effective area of selection deferring of the indication expansion in parallel with upside utilizing function and downside hedge function for enlargement of value up rate of the indication expansion, from mapping on option selection between the level of binomial value change and project selection shift stage for each binomial value level (Table-1).

TABLE-1 SELECTIVE MAP ON BOTH TYPES OF PROJECTS

M:Market Introduction, I:Indication Expansion, S:Stop

Even for the project without the indication expansion, there is an opportunity of increasing the business value by itself (Figure-6). However, it is possible to decide whether which strategy must be selected between the market introduction and the indication expansion, if we could make index from value up ration of the indication expansion for variable level of the business value (Figure-7~9).

FIGURE-6 PROJECT VALUE WITH VOLATILITY BY MARKET INTRODUCTION

FIGURE-7 PROJECT VALUE WITH INDICATION EXPANSION VALUE UP RATIO

FIGURE-8 VOLATILITY AND INDICATION EXPANSION VALUE UP RATIO

FIGURE-9 MARKET INTRODUCTION AND INDICAITON EXPANSION

The compound chooser option can be consisted of the combination of the market introduction project having the long period of the product on the market if succeeded in launching the drug on the market, with the indication expansion project possessing functions of both the utilization of upside opportunity and the hedge against downside risk in addition to the function of learning option with decision deferring. Thus the compound chooser option can be considered as one of tools to cope with the irreversibility with the sunk cost under uncertainty.

Conclusion

Here we examined the characteristics of decision deferring option, the effectiveness of decision deferring option with the indication expansion, and condition of utilization among flexibility functions of real options including compound chooser potion. In the past, decision deferring has been discussed mainly from only the sunk cost perspective. But if making indicators for project selection from option flexibility related to value up ratio of the indication expansion on both upside and downside, it is understandable to enlarge its application. And basically R&D itself can be considered as decision deferring stage of business entry and exit as assort of learning option.

Importance and Characteristics of SME and FDI in Selected CEE Countries

*Alessio Lokar, profalokar@gmail.com

Abstract

SME and FDI contribute to the development of a national economy: it's an input of capital to the domestic economy, bringing also managerial and technical know-how to foster a economy, which doesn't develop so much through scientific programming and modelling. If people from abroad bring into a given country expertise of know how and locals show the will of copy and set competition with them, this fact might be a powerful measure, in order to enhance the domestic economy.

Based of this being the paper analyses situation in selected countries of CEE: firstly to find out the reality and secondly, how much it weighs in the development of local economies: Slovenia, Slovakia, Poland, Russia and etc. The study method based on data analyses of business creation and development, SMEs and FDIs, studying time series of data, comparing domestic to foreign business and sectional studies across the countries considered.

Some recent economic environment aspects in the EURO area

The 2008/09 crisis left a strong impact on the world economy, including the nations of the EURO area. There are several expert attempts to formulate explanatory models of the phenomenon, proposing also solutions. Important to that regard is an article published by the Nobel laureate (Krugman, 2011). It starts by saying that the localization of the crisis in Greece could be considered as a reminder of classical tragedies.

However, the described financial phenomena don't have much to do with the classical world as they are typically modern. It is difficult to press them into traditional explanatory models, which we can see from the fact that their behaviour is surprisingly different from expert predictions, so that their outcomes are difficult to be forecasted. In Figure 1 the public debt to GDP ratio of several countries is shown.

RANK	COUNTRY	Public Debt as Percentage of GDP
2	JAPAN	196.40
5	GREECE	144.00
8	ITALY	118.10
9	BELGIUM	102.50
11	IRELAND	98.50
15	PORTUGAL	83.20
27	SPAIN	63.40
66	SLOVAKIA	41.00
82	SLOVENIA	35.50

FIG.1: PUBLIC DEBT TO GDP RATIO FOR SELECTED COUNTRIES (CIA, 2010)

Let's carry out some considerations regarding this aspect. Looking at the indicator in Fig.1, one would expect the spread of tragedy (crisis) from Greece to Italy, Belgium, Ireland, Portugal and Spain, if taking into consideration only the countries from the EURO area. Some experts and many financial speculators have been expecting the above kind of sequence. As a matter of fact, only Ireland has been hit after Greece up to now, whereas the other countries of the area have been spared.

The problem is that such synthetic indicators, constituted by a lone figure-indicator, are not able to express all the wealth of the real phenomenon (Lokar and Bajzikova, 2010). Also the Greek crisis was like an alarm signal for the EURO governance and after it broke out, measures were taken to reduce the financial danger and its extension to the EURO area. We can list the following ones:

1. Creation of an EU-wide fund, to keep the money in reserve for the rescue of distressed countries, deterring also speculation.
2. The intervention of the European Central Bank (ECB), which started to buy bonds of the countries in distress. As we already showed, until now, only Greece and Ireland had the need of this kind of help.
3. Moreover recently, the European Financial Stability Facility (EFSF) was created, bearing the task of issuing EURO bonds, backed by the states of the EURO area. The institution obtained immediately an AAA rating and the first bond issue was sold instantly. For instance, only Japan, bought 25 percent of it (International Herald Tribune, 2011).
4. In our opinion though, there is another relevant aspect to be taken into consideration: the public debt of each country is a peculiar phenomenon typical for the country, connected to its economic history, culture and behavioral characteristics.

For instance, Italy has a very high public debt, almost 20% bigger than its yearly product (GDP), high on a world-wide ranking of countries with the highest debt (Fig.1). On the basis of this sole figure and following Krugman's line of thinking, one would aspect that the country is on the brink of tragedy.

But in Italy things are different than one would judge on the basis of mere numbers. Namely, the Italian debt is owned traditionally by the citizens of the country itself in the form of family savings.

It has been an Italian tradition to save private money by buying state bonds, which appear also on the passive part of the balance sheets of smaller and bigger banks of the country. Citizens are investing their money preferably in the state, which is considered a more secure move than stock-exchange investments, even though the returns are lower. The average Italian citizen is rather risk-adverse. It may be a negative characteristic for business, but it is a positive one for the state as it is not difficult to collect the money needed for its spending. And to be sure, there is a substantial difference in state owing money to its own citizens, rather than to foreign states or speculators. The state may expect better treatment from its citizens, as they are bound together with the state by strong trust and interests. Therefore, the almost 120% DEBT/GDP ratio of Italy may be something basically different, compared to lower ratios in other countries. This aspect doesn't appear by the mere index figure observation.

Similar considerations of local particularity could become apparent also for indexes of other countries, which may also carry peculiarities that are not immediately apparent to an observer without a deeper knowledge of the local situation.

For instance, Spain has a much lower debt/GDP ratio than Italy, but observers stress out a big mortgage bubble in that country, which doesn't appear in the overall state debt/GDP ratio. This could be considered a negative aspect of the Spanish debt. On the other hand, this debt seems to be mostly present on the balance sheets of local banks, the so called "cajas", which may in fact have a positive aspect in the Spanish situation. The state could be of less concern about smaller local banks, supposing, that it is not its business to take care of them, turning it to local elements and administrators, considering also possible break-downs and rescue efforts. But, of course, it is a matter of quantity: if most Spanish "cajas" would go bankrupt for such a reason, it would also become a state concern. If only some of them show up the distress, the situation could appear easier to tackle with.

In fact it is a matter of quantity. But the impression is that such quantitative measures, are the most difficult to get out precisely. Does the local government have the needed knowledge? Such an assumption often appears to be not true.

For similar reasons we think that Krugman's proposals to the EU of how to tackle and solve the EURO crisis, must be taken into consideration with some caution, more in the sense of an useful contribution to a wider debate, but still away from the solution of the problem.

Cases of the EU situation in comparison to the US

In the described article, Krugman supposes that a crisis, similar to the European one, is much easier to solve in the US, which has not only one currency, the dollar, but also one central federal administration, a guarantee for coordinated measures. In Europe there is no such prerequisite of the same relevance in order to unify different points of view and different local situations.

Another important aspect which he points out is given by the homogeneity of the cultural environment in the US, permitting better mobility of the work-force from one part of the country to another and thus contributing to the solution of the problem. In the US people can move more easily from an area with job-offer scarcity, to another one in a better economic conjuncture, where there are more jobs offered. From economic textbooks it is well known that the least mobile of the three classical production factors is "earth", a little more mobile is "work-force" or people involved in economic activities, and the most mobile one is capital, which finds ways to go everywhere, searching for advantage.

In order to get mobile, people must overcome geographical and cultural barriers, which are curbing their movement. Within the US, Krugman maintains, such barriers are almost non-existent: there are no borders, the same cultural and language environments exist everywhere, similar rules and laws are enforced in the states of the federation, one federal government reigns on the top of the system.

But also in Europe there is less and less difficulty to move people from one area to another, which facilitates personal and business mobility.

Business and Personal cases of Mobility in Europe

Let's explain the issue using some real cases. One year ago in Udine, a small city in the North-east of Italy the local newspaper – *Messaggero Veneto* published the number of immigrants present in the city. The immigrants comprised about ten percent of the total population, which is a pretty high figure. Immigrants were also ranked by countries of provenience: the most numerous was the group originating from ex-Yugoslavia and the second one was the group from Nigeria. People from other EU countries may even not have been taken into consideration as, on the basis of the Schengen agreement, they were treated as domestic citizens.

Also in Slovenia, another EURO country, one can see a lot of immigrants from ex-Yugoslavia: in the past, they have been part of one unified state and they are therefore encountering low cultural and language barriers, moving into the country, which eases the integration in the cultural and language environment of the Slovenian state.

For instance, a symbolic aspect of this reality is well shown by the fact that the mayors of Ljubljana, the capital of Slovenia and Koper, the main sea port, are both of Serbian descent. Serbia and Slovenia have been both part of ex-Yugoslavia. Notwithstanding their descent and possible prejudices, at local elections they got the confidence of the local population, which is a sign of integration ease and low cultural mobility obstacles.

Not only personal, but also business mobility can be shown in most European environments, as can be demonstrated on the following cases: in order to extend the Slovenian highway system, a double two kilometres long tunnel has to be built close to the city of Koper, the main sea port of the country. The public bid for the work, was won by the Slovenian company CPM, based in Maribor, another Slovenian city. CPM started the work in association with an Austrian company, ALPINE BAU from Salzburg. Some months after the works had started; CPM went bankrupt, as the company was not able to pay suppliers and outsourcers. The local newspaper published,

as a matter of fact, that one of the unpaid outsourcers was a SLOVAK company. As a consequence of the bankruptcy of CPM the original operations of the company would be conducted by the following three partners: the Austrian company ALPINE BAU, the Slovak company plus another Slovenian company. These are examples showing that the EU situation is substantially not different from the one in the US. When money is involved, people and managers do everything in their power to reach the goal, trying to overcome obstacles and hurdles.

Of course, in order to fully confirm Krugman's idea that the US is better from the point of view of job mobility, one would have to quantify more precisely the above phenomena, either in the US or in EUROPE, in order to be able to carry out more careful comparisons.

In a recent article on the subject (Silverberg, 2011) argues that the solution of the EURO crisis is rather simple. The countries in distress should not raise their wages, leaving them unchanged for a while, in order to differentiate themselves from the faster developing countries of the Union. These countries as a consequence and sign of their success can afford to raise their wages. To show the truth of this assert, Germany the economically most successful EU state, is already doing it. Big German companies like VOLKSWAGEN have a kind of business organization with worker representations in the management boards. The representatives are monitoring the situation all the time: as soon as it appears sound enough, they ask for wage increases (They already did it: some days ago, the worker board members of VW asked for a six percent wage increase and the Italian company FIAT promised recently to their Italian workers that they will increase the wage at the German level). If the wages of the distressed countries are not increasing meanwhile, a differential in wages and economic level builds up, and worker mobility starts to rise in order to reinstate the over-all factor equilibrium.

Of course, as we already stressed it out, in economics all these phenomena are much easier to tell than to quantify.

Quantifications of business and factor mobility

In order to try to do that, we will exhibit some graphs and tables. Fig. 2 presents the unemployment figure of four countries (Lokar, Bajzikova and Mason, 2010): Poland, Russia, Slovakia and Slovenia. It permits either a cross-country comparison or a time comparison, as the time series involved are covering the period 2002-2011.

As the exhibit shows, unemployment was around 20 percent at the beginning of the period in Poland and Slovakia, whereas it was much lower in the same period in Slovenia and Russia: around 10 percent (As far as Russian data are concerned, it must be warned that methodologies of unemployment detection may differ from country to country, so that it is not sure that they are fully comparable. In the period 2006-2008 it decreased to 10 percent in all countries taken into consideration, due to several Foreign Direct Investments (FDI), i.e., mobility of foreign companies to the countries considered. In this regard, the companies SAMSUNG, VOLKSWAGEN and PEUGEOT in Slovakia may be quoted, RENAULT in Slovenia, FIAT in Poland and others.

The years 2008-2009 were critical, as we know, and we can see that unemployment rose again in the observed countries, even if not to the same level, like at the beginning of the period.

FIG.2: UNEMPLOYMENT RATE OF FOUR CONTRIES IN % (LOKAR, BAJZIKOVA AND MASON, 2010).

In 2011 reduction of unemployment can be seen, as a consequence of the end of the crisis. Fig. 3 shows the data of Inward FDI, as a percentage of GDP for the four countries. We can observe two phenomena: large oscillations in data, which is understandable as FDI may change a lot from one year to another on the basis of decisions of foreign business to enter in one country or another. The other phenomenon is a positive trend for all the countries, of which the champion looks like to be Slovakia, following Poland, then Russia and Slovenia. However, it is important to show that inward mobility of foreign companies is growing for all the described countries.

FIG.3: FDI AS % OF GDP FOR THE FOUR COUNTRIES (LOKAR, BAJZIKOVA AND MASON, 2010).

In order to get some more quantifying of the described business phenomena, the data in Fig.4 are shown, regarding business in Slovenia. As far as enterprises are concerned, we can see that large enterprises, with more than 250 employees are only 0.25 percent of the total, but they are employing 33.21 percent of the work-force and creating 34.90 percent of the revenue. Medium-sized companies are 1.45 percent of the total, with 24.59 percent of employed persons and 24.32 of revenue. Small companies represent 5.02 percent of total with only 17, 49 of employment and 21.49 percent of revenue, micro companies are 66.16 percent of the total with 8.38 percent of employment and 5.10 percent of revenue.

Advancing a judgement of this situation, we may say that the legacy of the previous, so called socialist system is still present, when business was induced and maintained by the state. It was typical for that system, to get the economy of a given country characterized by few large companies, as middle and small companies, the so called SMEs, were curbed. In the socialist period individual entrepreneurship was considered something negative. In the transition to the market system small and medium companies started to be fostered by means of individual company foundations, and this was done often even by restructuring the former big companies. The main problem now is to understand how successful the new-founded companies have been, as in the market system economic success of a given country depends mostly on the foundation and successful running of small and medium companies (SMEs).

This is still the main problem in a country like Slovenia: are the new individual initiatives showing signs of success, to overcome the importance of big companies in the economy? The overall success of transition depends for the most part on this aspect. In order to get an answer to this question we computed the data of the last row of Fig. 4. They show the relative productivity figure per employed person, in the Slovenian companies of different sizes:

$$P = \frac{\left(\frac{\text{REVENUE}}{\text{TOTAL REVENUE}} \right) * 100}{\left(\frac{\text{EMPLOYEES}}{\text{TOTAL EMPLOYEES}} \right) * 100}$$

We can see that it is highest for small companies of the class 10-49 employees, for which we can suppose that they are newly founded private companies, as the former socialist companies have been mostly bigger in size. The second rank position is given by large companies, which are probably former companies founded in the socialist period, or some FDI companies. Middle-sized companies are placed at the third place whereas the small and very small companies exhibit the lowest productivity levels.

Total	micro		small	medium-sized	large
	0-1	2-9	10-49	50-249	250 +
A: Percentage on Total enterprises	66.16	27.11	5.02	1.45	0.25
B: Percentage on Total employed persons	8.38	16.33	17.49	24.59	33.21
C: Percentage on Total revenue	5.10	14.20	21.48	24.32	34.90
D: Personal productivity: C/B	0.61	0.87	1.23	0.99	1.05

FIG.4: SLOVENIA: ENTERPRISES BY ORGANIZATIONAL FORM AND SIZE CLASS BY NUMBER OF PERSONS EMPLOYED IN 2008 (Statistical Yearbook, 2010).

Conclusions

In the first part of the paper some statements were taken into consideration, regarding the crisis of the EURO area economic environment, as well as the measures realized to save and enforce the EURO system. It is also shown, how the most popular indicators used at present do not fully exhibit the information needed to explain the economic situation of single countries as well as the area as a whole. Therefore these indicators cannot create sufficient basis to take the decisions needed to tackle with the situation. One of the main problems indicated by some authors, is the assumption that inside the EURO block, work-force and business mobility is low if compared to the American one. In the US there exists a homogeneous cultural and economic environment, which makes it possible to move labour as well as business from areas in distress to areas where demand of factors exceeds offer and thus recreates the equilibrium after the global crisis hit individual areas and states. In order to confirm this hypothesis, business and personal mobility cases are presented. The cases show that also in the EURO area the mobility of labour and business is present, moving factors and business from critical points to those where demand exceeds offer. It is also shown that in countries, which have been part of the former socialist system, there is a productivity shift from the traditional large enterprises, founded and run in the Socialist era, to the new ones, privately and individually founded and managed. This is another kind of mobility, typical for the countries of the EURO area, which have been part of former socialist economic system. It is another sign that the development of the EURO area system is functioning in a sound manner.

The Problem of Sustaining the Growth of Small and Medium Enterprises in a Typical Sub-Saharan African Context

*Ellis I. Idemobi, Ph.D ellisenterpriseskills@yahoo.com
Anambra State University, Nigeria*

Abstract

This paper focused on factors that impede the sustainability of small and medium enterprises (SME) and by extension entrepreneurship development in a typical sub-Saharan Africa context in South-East Nigeria. The study was necessitated by available statistics showing that over 70% of small and medium enterprises in the study area (the industrial layout of South-East of Nigeria where this level of business is predominant) die within five years of establishment. The study used the analytical survey method in carrying out the investigation. By applying chi-square (X²) inferential statistics to a sample of respondents collected from the study area, it was found that poor infrastructural facilities (especially electricity, water and roads), lack of access to formal sources of credit, high incidence and prevalence of violent crime leading to high operational costs are the major impediments to sustaining the growth and survival of small and medium enterprises. It was specifically found that due to high cost of production especially the high cost of self-generated electricity, small and medium enterprises collapse at an alarming rate in Nigeria. The study recommends that the government should urgently address the issue of poor infrastructural facilities especially electricity supply as well as establish an SME stimulus package to rejuvenate SME development and sustainability. This has become critical in view of the potentials of the SME sector in entrepreneurship development, poverty reduction, employment generation and wealth creation.

Introduction

Since Nigeria's independence in 1960 all her National Development Plans (1962 – 1985; 1986-1990; 1991-2000; 2001- 2010) had laid emphasis on strategies of government-led industrialization through the encouragement of local manufacturing industries (Ile 2001). This was in recognition of the leading role the sector was expected to play in industrialization strategy of the government as well as the overall development of the economy. The South-East part of Nigeria which is the area for this study is a major commercial and industrial nerve center in Nigeria. The population density of the area is among the highest in the country according to Ukwu (1977). South-easterners are highly motivated and commercially mobile people. They have a very strong mercantilists spirit, which makes them venture-some and daring in business risk taking. They create the environment for buying and selling anywhere. According to Ile, (2001), these traits account for the spirit of entrepreneurship that is a common feature of Nigerian South-easterners. According to the Anambra State Handbook (2002) one of the special characteristics of Nigerian South-Easterners is the immense resourcefulness of its people who carry on a most animated business relationship with people everywhere in Nigeria.

Thus, highly resourceful and industrious people of the South-east of Nigeria have done remarkable entrepreneurship with great energy and determination. As Onyemelukwe (1983) puts it, though the rich human resources of the area are not in question, perhaps nowhere is the tenacity of the people more evident than in the vigorous struggle for personal achievements. Indeed the Igbo philosophy of individualism has over the years encouraged the preponderance of small-scale business enterprises in South-east of Nigeria according to Akpala (1984).

The importance of this small business sector to the South-east of Nigeria and indeed Nigerian economy in general cannot be overemphasized. Indeed in terms of contribution to Gross Domestic Product (GDP) and employment generation, the small business sector appears to be more important than the large- scale business sector. The experience from India, China, South Korea and Singapore, perhaps, account for the belief in business and government circles that the "surest route to industrialization is through small industries" (Okoye, 1985). To this end, the government of Nigeria and those of the South-east states have over the years designed several schemes to assist private entrepreneurs.

Indeed Nigeria's fourth National Development Plan (1981-1985) stressed the importance of rapid economic growth especially in the non-oil sector and greater local participation in ownership and management of productive

enterprises. This notwithstanding, Jegede (1990) wrote that many government policies and strategies remain unimplemented due to economic crisis, which have beset the Nigerian economy since the late 1970s. Eze (1984) captured this trend of thinking when he opined that bad economic management on the part of past leaders has boomeranged on everybody. The oil boom of 70s that dictated the entire frivolous and wasteful attitude of the government including the relegation of the agricultural sector and private initiative, has now given way to hunger, squalor, spiraling inflation, disease and mass unemployment.

Indeed available evidence shows that a number of factors militate against the development and sustainability of this important sector of the Nigerian economy. It has long been the concern of researchers to properly isolate the factors that cause failure of small business concerns in Nigeria and this effort focusing on the South-east of Nigeria is one of them.

Statement of the Problem

Small and medium enterprises all over the world have been recognized for the contributions they make to the growth and development of the countries respective economies. This class of enterprises account for over 95% of enterprises and over 60% of available employment in OECD countries according to Ile, N. (2002). In Nigeria, these enterprises constitute the majority of companies in the private sector and account for about 55% of total employment and about 50% of industrial output (Ebong, 2007). However, over years the fortunes of these enterprises have dwindled around Nigeria especially in the South-east and as some writers put it, this may in no distant future lead to total extinction of this class of businesses given the prevailing unfavourable conditions existing in the sector Ikeme (2007); (Mohammed (2006); Afolabi and Gibbs (1986); Kilby (1988). Available statistics show that over 70% of small and medium enterprises in the study area (the South-East of Nigeria where this level of business is predominant) die within five years of establishment (Idemobi 2006). The problem of this study therefore is to locate what could be responsible for this high rate of failure and what can be done to ameliorate the situation.

Brief Literature Review

Poor infrastructural facilities had always been the bane of many businesses in Nigeria especially in the South-east. Iwayemi (1988) emphasized the importance of energy to the sector in the socio-economic development of Nigeria and concluded that strong demand and increased supply would stimulate increased income and higher living standards. Okafor (2008) used descriptive analysis to corroborate the views of these authors by arguing that poor and inefficient electricity supply has adverse implications for industrial development in Nigeria.

Oke (2006) attributed the non-competitiveness of Nigeria's export goods to poor infrastructure especially electricity supply, which drives the running cost of firms. Archibong (1997) argued that the positive side of governments structural adjustment programmes could not be fully established due basically to numerous bottlenecks, rigidities and poor infrastructure especially electricity supply. This had always undermined the effectiveness of fiscal and other incentives designed to stimulate the growth and diversification of the economy.

Objectives of the Study

The present developmental situation in Nigeria in general and the South-east in particular today is sure to improve significantly if the problems that militate against the growth of small and medium enterprises could clearly be identified and remedies provided by government to sustain their growth and contributions to economic growth.

The broad objective of the study therefore is to critically examine the problems which could lead to non-sustainability of small and medium scale industries in the South-east of Nigeria. But more specifically, the study intends to:

- (i) Examine the effect of poor state of infrastructure on the development and sustainability of the sector;
- (ii) Examine the effect of insecurity as manifested in economic kidnapping and other forms of violent crimes on the sector; and

- (iii) Examine the effect of lack or poor access to finance especially from formal sources on the sector.

Research questions

The study was guided by the following germane research questions:

- (1) To what extent can poor state of infrastructural facilities impede the development and sustainability of small and medium scale enterprises in Nigeria?
- (2) Does insecurity pose any serious challenge to the development and growth of small and medium scale enterprises in Nigeria?
- (3) To what extent can lack or poor access to finance especially fro formal sources, constitute hindrance to the sustainability of the small and medium scale enterprises in Nigeria?

Research Hypothesis

The following null hypothesis was formulated to guide the study:

1. Poor state of infrastructure will not impede the development and sustainability of small and medium scale enterprises in Nigeria.
2. Insecurity does not pose any serious challenges to the development and growth of small and medium scale enterprises in Nigeria.
3. Lack of access to finance especially from formal sources does not constitute hindrance to the sustainability of the small and medium scale enterprises in Nigeria.

Methodology

The method used in the study was a descriptive survey design, carried out in seven major industrial cities in the South-east of Nigeria. The choice of the study area was informed more than anything else by the fact that there are sufficient numbers of the size of the industry under study in the area.

Population of the Study

The population of this study consists of all the small and medium scale enterprises located in seven major industrial cities of Onitsha, Awka, Aba, Nnewi, Umuahia, Enugu, and Abakaliki in the South-east of Nigeria. According to Umolu (2007) the size of businesses that fall into this category are those that employ between thirty (30) and one hundred and one (101) employees. Statistics provided by the National Bureau of Statistics (2008 Survey) show that the population of this level of industries still operating in the area is three hundred and eighty (380).

The Sample and Sampling Technique

A sample of 120 of the specified category of industries was collected for the study through a purposive method. According to Kilby (1971), purposive type of non-probability sampling is suitable for obtaining ideas, good insights into a situation as well as experienced and critical appraisals of issues. Furthermore, the choice of purposive sampling design was informed by the fact that the researcher wanted to include only those who can answer critical questions concerning the study in the sample.

Procedure for Data Collection and Analysis

A pre-coded questionnaire was designed to elicit information from the respondents. A relatively comprehensive instrument whose converge was carefully defined by the scope of the investigation was designed and issued to

companies' chief executives only or their approved representatives. However, method of data collection was not limited to the use of instruments only. Interview method was also used to collect data from the respondents. As a face to face interview procedure, all the 120 instruments were retrieved and edited for analysis. In other words, non-response rate was zero.

The data generated from the study were analyzed using simple summary statistics of percentages especially in answering the research questions while chi-square (χ^2) test of independence was used to verify the null hypotheses at 0.05 level of significance.

Table 1: Respondents Opinion on the State of Infrastructure and Sustainability of Small-Scale Industries in Nigeria

S/N	Questions	Respondents opinion on state of infrastructure and business sustainability			
		Yes	No	Don't know	Total
1.	Is it true that the condition of road network in and around your location is seriously impeding your movement and that of your goods and services?	80	33	7	120
2.	Do you think the present state of electricity supply can make you stop production if it persists?	94	23	3	120
3.	Is it true that more than 30% of your over head is spent on alternative power supply?	83	31	6	120
4.	Have you ever stopped work due to non-supply of electricity to your factory?	79	38	3	120
5.	Is water supply any problem to you in doing your business?	81	34	5	120
6.	Can you afford private arrangement like, sinking of borehole to service your business?	69	44	7	120
7.	Would you say that cost of doing business in your area is fairly reasonable?	59	48	13	120
8.	Do you think this situation could improve to get better than the present in the near future?	68	41	11	120
	Total	613	292	55	960

$$\chi^2_{calculated} = 34.276$$

$$\chi^2_{tabulated} = 23.685$$

Table 1 above is the presentation of the respondent's opinion on poor state of infrastructural facilities and the sustainability of small and medium scale enterprises in Nigeria. With a sample of 120 representatives of such category of businesses under study, as specified in the scope of this study, questions which ranged from availability to functionality of infrastructural facilities were asked and the responses as could be seen from the above table were quite revealing.

Hypothesis One:

H₀: Poor state of infrastructural facilities will not impede the development and sustainability of the small and medium scale enterprises in Nigeria.

H₁: Poor state of infrastructural facilities will impede the development and sustainability of the small and medium scale enterprises in Nigeria.

To test the hypothesis as stated above, Chi-square (χ^2) test of independence was applied to the data on Table 1 and the test was carried out at 0.05 level of significance and 14 degrees of freedom (df). The hypothesis sought to find out if poor state of infrastructure could impede the development and sustainability of the small and medium scale enterprises in the country, using the South-east of Nigeria study area.

Table 2: Properties and the Result of the Chi-square (χ^2) test

Hypothesis	Sample size (n)	Degrees of Freedom (df)	Significance level (α)	Chi-square values		Decision on null hypothesis
				$\chi^2_{calculated}$	$\chi^2_{tabulated}$	
I	120	14	0.05	34.276	23.685	Rejected

The result of the test of hypothesis as shown above shows that the calculated χ^2 value (34.276) is greater than the tabulated χ^2 value (23.685). Therefore, the null hypothesis was rejected while the alternative which suggests that poor state of infrastructure could impede development and sustainability of the small-scale industries in Nigeria was accepted. Of course, to suggest otherwise would have been a very doubtful result especially when it is obvious that such environmental factors has astronomically increased the costs such industries have had to cope with in their operations in recent time.

Poor supply of electricity in particular has sent many of these categories of industries packing because they cannot afford to sustain their operations on generating sets as the major source of power supply. Similarly, poor road network as well as non-availability of public water supply has all combined to pose serious challenges to the development and sustainability of small and medium scale enterprises in the country.

In a related situation, the state of insecurity was considered to be very vital to the survival of any business enterprise especially now that the activities of the men of the under world is on the increase all over the country. Violent crimes especially economic kidnapping has made business environment very precarious. Therefore, Table 3 below is the presentation of the respondents' opinion on the effect of insecurity on the development and sustainability of small and medium scale enterprises in the country.

Table 3: Impact of Insecurity on the Development and Sustainability of Small-Scale Business

S/N	Questions	Respondents opinion on Effect of insecurity on Business Sustainability			
		Increased	Constant	Declining	Total
1.	How would you rate the performance of your business in the last 2 years?	40	31	49	120

2.	Can you rate performance in the area of opening up new sales outlets in the last 2 years?	33	45	42	120
3.	How would you rate performance of security operatives in protecting lives and property in your area with regard to incidence of kidnapping in particular in the last 2 years?	21	22	77	120
4.	What is your rating of the way new investors are establishing new businesses in your area in the last 2 years?	39	40	41	120
5.	How would you rate your performance in regard to profit making in the last 2 years?	28	48	44	120
Total		161	186	253	600

$$\chi^2_{calculated} = 37.970$$

$$\chi^2_{tabulated} = 15.507$$

Table 3 above is the presentation of respondents' opinion on the effect of insecurity on business development and sustainability in the country. The table shows that there has been a steady decline in all the parameters used for measuring performance in the sector. This was made more vivid in the number of respondents that said there has been a near collapse in the security of lives and investments when viewed from the frequent cares of kidnap especially in the South-east zone of the country.

Hypothesis Two:

H₀: Insecurity does not pose any serious challenges to the development and growth of small and medium scale enterprises in Nigeria.

H₁: Insecurity poses serious challenges to the development and growth of small and medium scale enterprises in Nigeria.

To test the hypothesis as outline above, Chi-square (χ^2) inferential statistics was applied to the data on Table 3 and the test was carried out at 0.05 level of significance and 8 degrees of freedom (df). The hypothesis sought to establish whether insecurity as it is at the moment poses any serious danger to the development and sustainability of small-scale enterprises in the country. The result of the test is presented on Table 4 below.

Table 4: Properties and the Result of Chi-square (χ^2) test

Hypothesis	Sample size (n)	Degrees of Freedom (df)	Significance level (α)	Chi-square values		Decision rule on null hypothesis
				$\chi^2_{calculated}$	$\chi^2_{tabulated}$	
II	120	8	0.05	37.970	15.507	Rejected

The result as presented above shows that $\chi^2_{calculated}$ (37.970) is greater than $\chi^2_{tabulated}$ (15.507). Therefore, the null hypothesis was rejected while the alternative was accepted meaning that insecurity poses great danger to the

development and sustainability of businesses in this category. This is a landmark revelation which calls for more proactive approach in the issue of security because no serious minded business person will take his/her investment to a place where security of lives and property cannot be guaranteed.

Access to finance was considered equally important to businesses and in order to find out how much of it is available to this category of businesses especially from formal sources, the following table was raised from the opinion of the respondents to determine the impact on development and sustainability.

Table 5: Impact of Lack of Access to Formal Sources of Funding

S/N	Questions	Opinions on Access to Formal Sources of Funds			
		Alternative responses			Total
		Yes	No	Don't know	
1.	Generally speaking, would you say that you access credit with relative ease?	30	79	11	120
2.	Apart from your retained earnings and informal savings and loan associations, can you access credit from a more formal source?	28	83	9	120
3.	Do you often meet the quantum of funds required by your business from the informal sources?	43	67	10	120
4.	Is it true that inability to provide acceptable security/collateral by your business is responsible for your poor access to formal sources of credit?	25	90	5	120
5.	Do you think, not having access to sufficient funds can cripple your business?	54	48	18	120
6.	In your opinion, would you say that the government is doing enough in the area of facilitating access to funds by SMEs?	29	81	10	120
	Total	209	448	63	720

$$\chi^2_{calculated} = 40.964$$

$$\chi^2_{tabulated} = 18.307$$

Table 5 above is the presentation of respondent's opinion on impact of inadequate financing on the sustainability of small and medium scale enterprises in the country. The trend of responses shows that poor access to credit can hinder development in the sector and prevent sustainability. Total reliance on retained earnings and other informal sources of credit often does not meet the financial needs of the industries as could be seen from the opinions of the respondents.

Hypothesis Three:

H₀: Lack of access to finance especially from formal sources does not constitute hindrance to growth and sustainability of small-scale industries in Nigeria.

H₁: Lack of access to finance especially from formal sources constitutes hindrance to the growth and sustainability of small and medium scale enterprises in Nigeria.

To test the hypothesis, the data on Table 5 was considered and the test was carried out at 0.05 level of significance using the chi-square (χ^2) test of statistics which was considered very adequate for the test. The degrees of freedom (df) permissible for the test is 10.

Table 6: Properties and the Result of the Chi-square (χ^2) Test

Hypothesis	Sample size (n)	Degrees of Freedom (df)	Significance level (α)	Chi-square values		Decision rule on null hypothesis
				$\chi^2_{calculated}$	$\chi^2_{tabulated}$	
III	120	10	0.05	40.964	18.307	Rejected

The result of the test as presented on the above table shows that $\chi^2_{calculated}$ (40.964) is greater than the value of $\chi^2_{tabulated}$ (18.307). Therefore, we reject the null hypothesis and accept the alternative which suggests that lack of access to finance especially from formal sources constitutes impediment to the development and sustainability of small and medium scale enterprises in the country. The implication of the above result is that insufficient funds can hinder development of a business outfit as well as stop it from being sustained. It could prevent the enterprise from realizing its full potentials.

Discussion of Research Results and Conclusions

Small and medium scale enterprises are critical to the promotion of sustainable economic growth and poverty reduction in the country. But for the sector to perform such functions these identifiable unfavorable business environment must be addressed. The factors as identified and examined in this study include: weak and inadequate infrastructure (roads, power and water supplies, telecommunication etc). Others are the state of insecurity arising from the activities of men of the underworld as well as poor access to credit facilities. Consequently, many producers have to provide their own alternative, which adversely affects cost structure and the competitiveness of the enterprises. The need for the government to intervene in a more meaningful way has been underscored. This is to enable the small and medium scale enterprises cope better with the challenges inherent in today's complex and highly volatile operating environments. The study recommends that the governments at the national and state levels should urgently address the issue of poor infrastructural facilities especially electricity supply as well as establish an SME stimulus package to rejuvenate SME development and sustainability. This has become critical in view of the

potentials of the SME sector in entrepreneurship development, poverty reduction, employment generation and wealth creation.

Abstract

In light of the fact that customer driven innovation is fundamental to productivity and success of a firm, we present in this paper a framework for customer-driven innovation. We first describe the Customer Innovation Eco-System, and then present a generalized conceptual model for analysis and management. Integrated in this model is an approach to adaptive pricing.

Introduction

There has been much research in customer-driven innovation. The focus of this paper is on innovation. One of the traditional approaches to innovation has been product/service innovation (focusing on attributes and features) by the firm. Many firms, such as 3M, INTEL, and HP, have successfully adopted the path of product innovation, and maintained product and technological leadership.

However, over the last several years, the attention of executives and researchers (Desouza and Awazu 2004; Ulwick and Bettencourt 2008) has increasingly shifted to customer-driven innovations. In customer-driven innovations both the customer and the firm work together to create and design the innovation but the customer is the key player in this working relationship. The interaction is dynamic, with appropriate mechanism to support the interaction.

Recent research supports the customer-driven approach to innovations. Sawhney (2006) describes twelve ways for a firm to innovate, and one of the celebrated approaches to innovation is customer care and experience. Urban (2005) argues for customer advocacy and trust-based marketing. Von Hippel (2002) has empirically shown that users are the most successful drivers of innovation. Treacy and Wiersema (1997), while discussing the modes to market leadership, identify customer care and experience as one of the distinct modes to achieve such leadership.

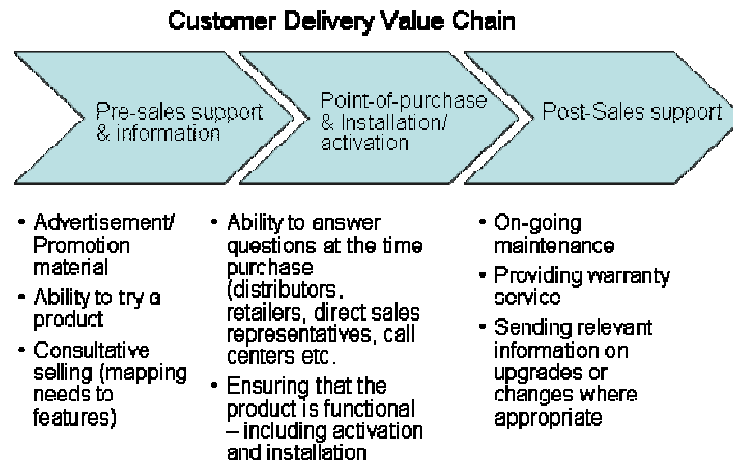

We present in this paper a framework for customer-driven innovation. We first describe the Customer Innovation Eco-System, and then present a generalized conceptual model. Finally, we offer a model for adaptive pricing relevant to customer-driven innovations.

Customer Innovation Eco-System

We postulate that customer-driven innovation is a function of “*customer-contact points*” and “*customer offer zones*.”

Value-Chain, and Customer-Contact Points: Customer experience is impacted by all customer-contact/touch points from pre-purchase process to post-purchase service and support as shown in Figure 1. Therefore, a customer may engage in innovation at any of the interface points.

FIGURE 1

The value chain includes accessibility of information about the product/offer, interaction with stake-holders during purchase (either distributors or direct sales), performance delivery of the product relative to the expectation of customers, post-sales support (including servicing the product under warranty, or offering maintenance on an on-going basis,) and other value added services (such as the creation of a network community as in the case of iTunes after the purchase of iPod from Apple.)

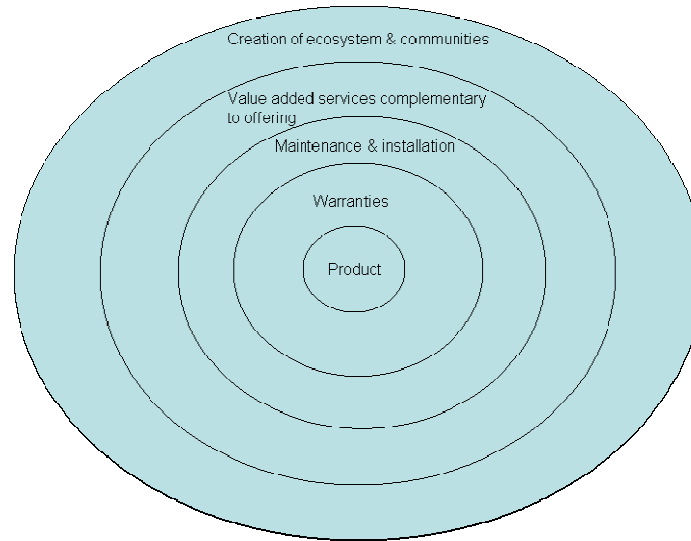

It is important to make every customer touch point rich and meaningful to maximize the customer-driven innovation. Customer innovation can be maximized by offering the best information to customers, and developing an ability to understand the customer needs at each one of the touch points. The goal is to build a bond and trust with the customers through the entire value chain. For example, even when a product is self sustaining, it is important to offer accurate and easy-to-understand information through promotions or labels or any other communication medium. On the other extreme, when several intermediaries (e.g. wholesale distributors, retailers, or value added resellers) are involved during the sales process, it is important to ensure that they are well trained on products/offerings and have the ability to understand relevant customer needs.

Value added Eco-System, and Customer Offer Zones: In addition to the customer delivery value chain (see Figure 1), there are many other opportunities for customer-driven innovation because the customer “service” and “experience” offerings should go beyond the pure products-related offering (e.g. basic installation/maintenance service) to an extended set of offerings (e.g. post-purchase consultative facilitation, design of warranties.)

This set of extended offerings will create a *value added eco-system*, which will provide consumers both tangible and intangible benefits that go beyond the mere adoption/consumption/usage of the product. The *eco-system* will enhance the total “experience” of the customer. We call these *extended offerings of the eco-system as “customer service offer zones”* (see figure 2 for an illustration of the “offer zones.”)

As we move through “offer zones” (from the inner core of pure products to the creation of more extended value driven “related” offerings that can further enhance the use of the core products), the customer is presented with new and different opportunities for adding value and innovating. In summary, there are many opportunities and challenges for a *customer to create and innovate*.

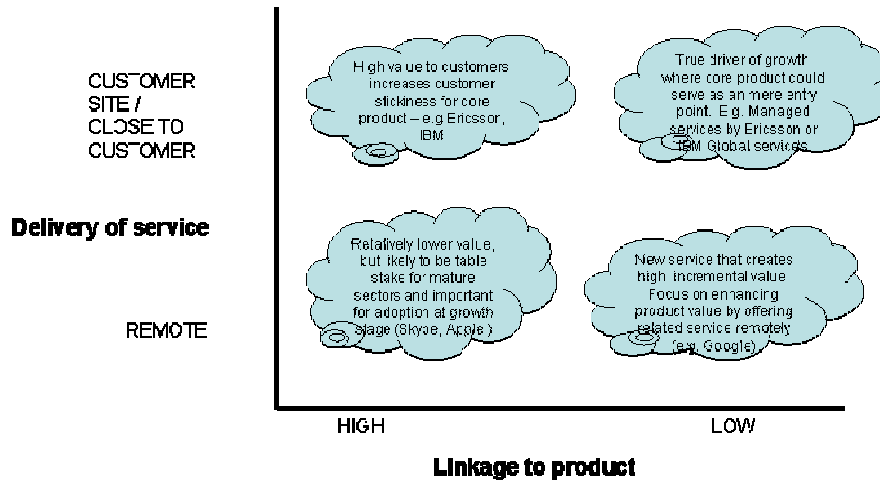

FIGURE 2: CUSTOMER EXPERIENCE AND SERVICE: CUSTOMER “OFFER ZONES”

Customer Driven Innovation Framework

Following our discussions, we propose a framework to understand customer-driven innovation. This framework offers an approach to relate the “customer offer zones” (measured by linkage to products – how closely are they related to products) and delivery of service. The x-axis defines the level of linkage of offerings (and “customer offer zones”) to the core product. When such linkage is high, then the offerings are close to the core product i.e. not many significant additional offerings beyond the core product are made (smaller number of “customer offer zones.”) However, when the linkage is relatively low, a number of additional offerings beyond the core product are made (smaller number of “customer offer zones.”) The y-axis is defined as the mode of delivery of customer experience and service. Such service may be delivered on-site close to the customer, or more remotely.

Figure 3: Customer Service Value Framework

The level and the manner of customer-driven innovation is different in each one of the four quadrants. For example, if a service is delivered on-site, either directly by the product manufacturer or a distributor, the extent of bonding with customers is likely to be very strong. However, significant customer stickiness can also be created by an increase in network effect, even if the service is delivered remotely. Examples of this include Google and Skype, where the service offered is remote but the value is created through a network effect and provision of relevant information in the right format.

Another set of examples is the offer of managed services by communications equipment suppliers like Ericsson and Siemens/Nokia and Lucent. They offer high value service to customers to manage and monitor a carrier’s network remotely in addition to offering field service support. They also offer related services like financing or a “build operate and transfer with traffic” in order to reduce capital exposure risk for carriers in emerging markets. Thus, type of service can be a very important determinant on how the service is offered.

The customer-driven innovation can be defined *a set of processes for facilitating design and creation of improvements, enhancements, and value-additions to the product/service by the customer.* This is a function of “customer offer zones (customer contact points) and mode of delivery.

Adaptive Pricing Framework

One of the most important attributes of offerings is price. We posit that price, too, should also be customer-driven. Adaptive pricing allows for this customer-driven pricing. Adaptive pricing consists of two main elements: (i) Let the customer/user set any price he/she considers fair after the purchase/consumption experience; and (ii) Let the firm/seller or a marketplace of firms track that price and use that information to determine whether to make further offers of that kind to that user/consumer in the future (Reisman, 2010). Adaptive pricing “creates a dynamically adaptive cycle of offers, prices, feedback, and further offers that rewards those who pay fairly and cuts off those who do not (Reisman, 2010).” Consumers become part of the decision-making, and thus feel empowered by added trust and flexibility.

For example, some music and downloadable games including Radiohead in 2007 have experimented with different versions of adaptive pricing and found moderate success. In case of Radiohead, while a reported 60% downloaders did not pay at all, enough did (paying an average of \$8.05 in the US and \$4.64 elsewhere), to make that experiment modestly successful.

Generally in a market process firms with least cost of production tend to appear. Firms work with the customers/consumers to meet the customers' needs. They possess the relevant information on their production technology, prices of inputs (input prices) and output prices. They can also work together with the customers to shape the output prices. On the other hand customers/consumers know their preferences and prices of goods and services as well as the remuneration for offering their inputs (factors of production). It should be noted that the customers/consumers can be persuaded to acquire new tastes and preferences.

As the firm increases its operation more resources (in terms of materials, capital, labor, energy, etc) tend to be utilized. Assume that there are no artificial and natural barriers hindering the expansion of the industry, as resources move into the expanding industry, so too with contracting industry resources move out. Firms in the industry produce where the output maximizes their profits – where respective marginal cost equals the price of the output. There is the industry or firm dynamics as there are continuous changes in the market conditions – like new products being produced, etc. But as the industry expands and demands more inputs, the price of inputs tends to increase.

Firms would generally adjust the scale of their activities (operation) to fit together with the demand of the customers (consumers) at the “prevailing price” and conditions. Changing conditions may change also the scale of operation (and output) of the firm/industry and consequently the prices (Browning and Browning 1986; Nechyba 2011). At a given market price, each firm in the industry produces at the output that maximizes its profit. But firms that do not create and innovate may find themselves going out of business.

In certain industries, increase in the output of few firms may not affect the input prices but if the changes are of big magnitude in the industry, the prices of the input may change. For instance, increase in the auto mobile production would increase the input prices such as steel. Still, the nature of the industry may be such that an increase in the demand of its inputs may not affect the prices of the inputs. This may be in a situation where the input of the industry is a very small fraction of the input market. For instance, an increase in the production of paper clip may have very little effect on the price of steel.

In an increasing-cost industry, an expansion in its operation or output would result to increase in the prices of its inputs. High input prices generate high production cost. The increases in operation or output lead to increase in input price consequently increase in cost of production. Hence, the industry produces higher output at higher output price.

While in a decreasing cost industry due to increase in demand the industry increases its output by lowering input prices. For instance, it is often seen in the industries such as digital cameras watches, color TV, personal computer video cassette recorder, small calculators have had a sharp drop in (output) prices since the introduction of these products. The reasons may be because of rapid technological improvement advances as well as a monopoly but later became competitive. In the production process of the industry, more output is therefore produced at a lower production cost; consequently output is sold at a lower price.

The production of the firm/industry generates the supply of that producer and the preferences of the customers generate the demand for the producer. Both the demand and supply of the product and services determine the market price and quantity, produced and demanded; consequently this also determines the level of employment. The expansion of the firm/industry operation/activities means increase in resources (factor inputs) usage. Hence, as the price and output are determined, implicitly the employment level with inputs prices is determined from the price and output.

Let us say an industry has n firms ($i = 1, 2, 3, \dots, n$). The revenue of firm i from its total output (x) is Px_i where P is the price of output. The total revenue for the whole industry is PXT with industrial total output XT . Assume that the output of all the other firms (excepting for i) is X_0 . Therefore, their total revenue is PX_0 . Thus the revenue of firm x_i is given as

$$x_i P = XTP - X_0P \quad (1)$$

We can derive the elasticity from the demand function but for simplicity let us derive it from the output of the firms and industry.

$$x_i = XT - X_0 \quad (1.1)$$

A change in the output of firm i means a change in the total output of the industry. That is,

$$\Delta x_i = \Delta X_T - \Delta X_0 \tag{2}$$

To obtain proportionate change divide equation 2 by x_i

$$\Delta x_i / x_i = \Delta X_T / x_i - \Delta X_0 / x_i \tag{3}$$

To transform (3) into shares and elasticity we divide and multiply the right side of (3) by their respective outputs and then divide by the proportionate change in price to give the following relation.

$$\Delta x_i / x_i * P / \Delta P = \Delta X_T / X_T * P / \Delta P (X_T / x_i) - \Delta X_0 / X_0 * P / \Delta P (X_0 / x_i) \tag{4}$$

Equation (4) gives the demand curve for the industry, firm x_i and supply curve of the other firms in the industry in terms of elasticities.

$$\epsilon_i = \epsilon S_i - \delta S_0 \tag{5}$$

where ϵ_i elasticity of firm i with output x_i . S_i gives proportion of the firm i's output in the total industry and S_0 reflects the share of i's output to the other firms, and δ is the elasticity of supply of the other firms. These values could be calculated without deriving the full demand and supply curves with their arguments.

If the elasticity of demand for i firm is larger, the smaller would be the i's share of output in the total industry's output. This would also reflect a greater elasticity of demand for industry's output and larger elasticity of supply for the other firms.

Generally while adaptive pricing can be practiced by a dynamic firm that innovates and takes care of customer needs or being customer-centered, it has to balance this with the elasticity of demand for its product or service. The pricing must therefore also be carried out within the context of the type of industry – constant-cost, increasing-cost or decreasing cost industry. But the principal factor driving the pricing is the elasticity of demand. If a firm is able to expand its customers and sustain their loyalty then the demand elasticity can become more inelastic – thus as holding the customers to the product and the firm, the firm can have some dominant role in setting the price.

In this article, we have thus presented a framework to enhance customer-driven innovation. We have also presented an approach to customer-driven adaptive pricing.

A Model Of The Process Of Women's Entry Into Business Ownership: A Study Among Malay Businesswomen In Malaysia

*ROHANA YUSOF, rohana@uum.edu.my
Universiti Utara Malaysia, Malaysia*

Abstract

Women from western and develop countries entering business ownership is increasing in numbers and more women in Asia, particularly in Malaysia are also becoming self-employed despite many tangible and intangible obstacles. In face of these barriers, they demonstrate a strong determination to succeed. Hence this paper will attempt to present a theoretical model of the economic and social factors associated with Malay businesswomen in the rural environment. Insight into the influences of socio-economic factors on entrepreneurship is based on a study of 31 Malay rural businesswomen from the District of Pendang, Kedah. This study has shown that a combination of individual needs and experience are not the only reasons why women start their own business ventures. In each case, other event and external factors have catapulted the women into business ownership. Hence this paper has set out theoretical and methodological implications which have added to our knowledge about the theory of the origins of entrepreneurship among rural businesswomen.

1. Introduction

Many studies have been conducted on women entrepreneurs since the beginning of the 1980s (Aldrich, 1989; Belcourt, 1987; Bowen & Hisrich, 1986; Brush & Hisrich, 1988; Cromie & Hayes, 1988). From the overview of research on entrepreneurship it is suggested that 'research on entrepreneurship has focused on three major areas: background factors and personal characteristics, psychological attributes and traits, and situational factors, as researchers work towards developing a model which explains and predicts entrepreneurial tendency at the micro level' (Stevenson, 1990:439). Stevenson argues that by using the existing 'male-based' models several stereotypes have subsequently emerged from the literature which continues to influence the interpretation of research findings on attitudes, expectations, and motivation of entrepreneurs, and what is known about the nature of female entrepreneurs is for the most part based on male-centred notions.

Recent research has focused on a new trend of women's participation in the labour force in Great Britain, the United States, Asia or even in the Third World. A recent phenomenon in the global situation has been the rise in the numbers of women entering into the so-called male domain of work that is self-employment or starting up a business and becoming an entrepreneur. According to Rees (1992) the potential of self-employment and small business proprietorship is that it may be a mechanism to challenge the restrictions of existing gender relations in the labour market. For example in early 1989, three quarters of a million women of working age reported that they were self-employed in Britain (Rees, 1992:158).

Extensive literatures and debates in the 1990s focus on women and the enterprise culture. Among issues debated and discussed by feminist researchers are the conceptualizing of female entrepreneurship, the growth of self-employment of women or the 'new entrepreneurs', the factors which obscure and obstruct women's enterprise, measuring women's entrepreneurialism, women's motivations for setting up in business, successes and failures, and the development of skills and training in entrepreneurship.

Women from western and develop countries entering business ownership is increasing in numbers and more women in Asia, particularly in Malaysia are also becoming self-employed despite many tangible and intangible obstacles. In face of these barriers, they demonstrate a strong determination to succeed. Hence this paper will attempt to present a theoretical model of the economic and social factors associated with Malay businesswomen in the rural environment. Insight into the influences of socio-economic factors on entrepreneurship is based on a study of 31

Malay rural businesswomen from the District of Pendang, Kedah. This study has shown that a combination of individual needs and experience are not the only reasons why women start their own business ventures. In each case, other event and external factors have catapulted the women into business ownership. Hence this paper has set out theoretical and methodological implications which have added to our knowledge about the theory of the origins of entrepreneurship among rural businesswomen.

1. Method Of Study

In this study in-depth interviewing and focus group work were carried out, followed by a survey in the form of a questionnaire. Miles and Huberman (1994) suggest that in many qualitative studies some quantifying may also be useful. Here the two main reasons for presenting the data in both ways, (qualitative and quantitative) are triangulation and complementarily. In-depth interviewing has been the major instrument of data collection of this study. The interview sessions were characterised by open-ended questions with broad guidelines in an 'interview guide'. More probing questions followed depending on the respondent's responses. All too often respondents are restricted in the responses they give in questionnaire surveys by the available options listed on the questionnaire.

This study, have focused on the District of Pendang in the state of Kedah Darul Aman in the north of Malaysia. This district and state are categorized as developing states with the majority population being ethnic Malay, especially in rural areas. There are significant reasons for selecting this area. Firstly, there is a need to conduct a study of the rural women in this area as no previous study has been done. Secondly, it is clear that there has been an 'emergence of a particular group of women entrepreneurs' who have the potential to contribute to the nation's economy and the labour market. Recent studies have been conducted on female entrepreneurship but not many have focused on a rural setting.

This study managed to select 31 cases was based on the following criteria: (i) Women who had been in business for more than 2 years. This is to ensure they are committed to business and have experience of being a businesswoman in a business environment, (ii) The women selected were spread over a variety of different types of business at various Amanah Ikhtiar Malaysia Programme centres and could be categorized as petty traders, owners of family farms and plantations and micro-enterprise owners, (iii) Women/participants were all able to make their loan repayments as scheduled by the evaluation committee of Amanah Ikhtiar Malaysia and had a substantial monthly income (a criteria set by Amanah Ikhtiar Malaysia in considering the participants as 'successful' in business), (iv) Participants were all accessible, (v) Participants were all willing to participate in the study.

2. Factors of Women's Entry Into Business Ownership

This study indicated there are various factors associated with the reasons why Malay businesswomen make the decision to go into business. The data indicated several categories which emerged during the analysis. The categories matched those in earlier studies such as unemployment, financial reward, poverty and the desire to improve the quality of their family life. In trying to pinpoint the factors that explain why these women went into business, we can look at both 'push' and 'pull' factors.

i. Motivations for Entry into Business Ownership

What motivated these women to go into business? This study has sought to explore the question of why the women decided to be self-employed and in particular to go into business. The respondents quoted a number of reasons in common with earlier studies: getting extra income for the family, because the opportunity was there, encouragement from friends and families, because it was the only way to do the kind of work they wanted to do, being in business fitted in with their lives, because they already had business skills and knowledge, economic necessity and survival and the availability of start-up capital

This study revealed that economic necessity and survival among these Malay rural women were the primary reason given for becoming involved in their present business venture. Other reasons such as the availability of capital for start-up, the desire to do business and opportunity were also cited by the women.

One woman described the reasons that contributed to her decision to go into business:

“I believe that going into business can be a way of earning extra income for the family. Besides that I want to have my own income. Maybe it feels good to be your own boss. I am jobless and I need to improve my quality of life and support my family.” (PM)

Another respondent had similar views, and she explained her reasons:

“...there is extra income for the family; before, the only income came from my husband. When I have my own income there is some freedom. So I want to be a bit more independent.” (SJI)

However, she also said that by being in business, she has time for the family too:

“I have worked for the government, but working time was so rigid and we had to follow rules and regulations, with no flexibility. I am not cut out to be a wage earner.” (SJI)

However, the dominant factor cited for going into business was that it was a way to earn extra income to improve the quality of their family life and not live in poverty, which was summarized by several respondents:

“I have a strong desire to improve my family’s quality of life. I know that by being an entrepreneur I am able to change the situation.” (HA)

“I put my first reason as earning extra income for the family, as you know that I have a large family to take care of. I feel I need to help my husband to support our family.” (FB)

“My husband’s income is too little to support the family and we had a difficult time. I foresee that if I don’t do anything we could end up in poverty. These thoughts have made me aware of the possibility of starting up a small business at first.” (RH)

However, two respondents said that their main reason for deciding to become self-employed and starting a business was the death of their husband. This reason was seen as the trigger factor that immediately influenced their decision to go into business. Here the two women explain their reasons:

“I had to work to earn a living; I am the breadwinner, I have had to keep my family going since my husband died. As a woman, this is the only skill I have: baking bread, cookies and cakes. So this is the only type of work that provides an income for me. I had low academic qualifications, it is impossible to get well-paid work.” (RS)

“I felt I had a big responsibility to feed and take care of my children when my husband died. So with the few skills I have, I decided to earn a living through my own efforts and start this tailoring business, because I can do this from home.” (SH)

The study reveals that these women had financial and personal needs they were determined to fulfil, and that business ownership was an avenue to that fulfilment. The changes in family structure and standards of living require many women to provide for their own financial needs and for the family, especially for their children’s education. Married women provide an income for the family other than their spouse’s income but for single women it is the sole source of income to support themselves and their children.

The interviews revealed that these women take their role as income provider seriously. The time they spend working hard running their businesses is as important as their role as mothers and wives, as the quotes from the two women above show. This result supported the findings of other research which concludes that women’s motivations for going into business are influenced primarily by the need to contribute to the family income (Kalsom et.al,1999; Rosli, Habshah & Asiah,2002; Norsiah et.al, 1996). According to Habshah (2004) and part of the income generated by rural women business owners goes to pay for the family’s education and other needs. A personal interest in business came second, and then encouragement from the family to go into business.

Women business owners are not, however, a homogenous group and reasons and motivations for starting-up a business vary considerably. Obviously there are various factors and influences which shape the start-up process and subsequent business outcome. According to Goffee and Scase (1986) the age, education, family background and occupational experience of entrepreneurs are all important, and for women in particular marital status and domestic commitment seem to be significant factors. What are the factors accounting for this variation with particular reference to Malay rural businesswomen? The data collected during this study indicated that ‘antecedent factors’ and ‘individual dimensions’ had an influence on women’s decisions to set up in business.

ii. ‘The Antecedent Factors’ Contributing to Business Start-up

Gartner (1985) suggested that work experience, entrepreneurial parents, age and education have an influence on entrepreneurship. Robinson (1989) found that gender, marital status, education background and work experience have a significant relationship with entrepreneurship. Timmon’s (1986) argued that work experience, particularly a thorough operating knowledge of the business one intends to start, is important in determining the success of the business venture. Bird (1989) too pointed out that relevant work experience can contribute to the development of skills, abilities and competencies in entrepreneurship. The question, however, arises as to what experiences contribute to the development of entrepreneurial behaviours among the Malay businesswomen studied here?

It is for this reason that in this section of the analysis I have sought to focus my analysis on the theme of ‘experience’ and attempted to identify the types of experience that contribute to the development of entrepreneurial behaviour among the women under study.

Having established the category of ‘experience’ and its sub-categories which emerged from the theme, by using the various literatures reviewed and the interview data and observations, I established 3 sub-categories: i) working experience, (ii) socialization, (iii) educational attainment.

What I hope to achieve in this section of my analysis is to proceed from the generation of identifiable categories to the foundation of certain propositions. On the basis of analysis of the interview data, I wish to establish several propositions related to the theme of experience as one of the factors influencing Malay women's entry into business ownership. The first proposition is that experience gained from working (either paid or unpaid) provides a useful and valuable training ground for the businesswomen. They gain skills and knowledge from work they have done which contribute to their ability to become businesswomen. The second proposition is that formal educational attainment has not been a direct factor influencing the women to decide to take up a business venture. The third proposition is that there are characteristics necessary for running a business operation which could have been developed during childhood and adolescence. If these propositions can be substantiated, the findings and analysis of this research will serve as a contribution to knowledge in the field of women's studies and entrepreneurship, and these propositions might serve as working hypotheses and provide a basis for further research.

Working Experience

Experience emerged as a category which indicates what kinds of experiences lead to an entrepreneurial venture. As the respondents narrated their experiences, few spoke of childhood experiences and work experiences that preceded their decisions to start-up a business venture of their own. What are the relevant work experiences that contribute to the development of a business venture? Gibb (1987) identified that when someone works alongside a small business owner the manager contributes to the development of the workers' knowledge of business. But how do different types of work experience in different environments or organizations contribute to the development of enterprising and entrepreneurial behaviour among the Malay businesswomen in the study?

Almost fifty percent of the Malay businesswomen in this study indicated they were involved in some form of entrepreneurial activity before starting their own business. They gained skills, knowledge and confidence either from some form of employment or from the domestic tasks they did before they started their business. These businesswomen have shown that there is a link between previous experiences and the type of business they chose to set up. One respondent recalled her experience in a business environment:

"I used to work as a salesgirl in Parkson for 3 years in the food and bakery section. Then I moved to the City Cake House in Kuala Lumpur for another 2 years. This is when I was young. I learned about the cake making business. This helps me to manage my own cake house." (RS)

However, many of the respondents (10 respondents) made a strong association between previous experience and the type of business they started. They claimed that their experiences, and in particular their working experience in a business organization, were valuable and useful because they gave them the opportunity to acquire knowledge of marketing skills and understanding how a business operates. This is how they described their experience:

"I was a paid worker in a company which deals in Malay traditional medicines for two years with Seri Rimba in Kota Sarang Semut and another eight years at Lambaian Besar in Simpang Empat. So I gained a lot of knowledge while working, like how to do marketing and a little bit of book-keeping." (AA)

“I got business experience from working before with my parents. I realized that by helping them then, I developed some ideas especially about marketing strategies.” (AJ)

One respondent revealed that her unpaid work helping her friend produce Malay traditional snacks, ‘kerepek’, was a source of organizational experience. She spoke of the marketing techniques she learned through this unpaid work. She described her work and the benefits of her previous experience:

“I was a house-wife before I started this business. I use to help a friend of mine producing ‘kerepek’. I was not paid, it was voluntary work. When I had the free time I would go to her barn just to give a hand. She would just give me some ‘kerepek’ to take home. Eventually I began to learn how to make this product and how she does her marketing.” (PM).

Apart from these experiences, analysis suggests that a number of respondents turned their household skills into a business, skills which can be categorized as ‘informal experience’. The analysis showed that the woman’s sewing skills were translated into tailoring services, cooking was translated into mini restaurants and the sales of products such as biscuits, cakes and cookies. These respondents explained the history of their idea and the origins of their business start-up:

“I learned from my mother how to sew and make clothes when I was very young and I took sewing classes after I finished school. I have the skills, so I thought this would be a good idea for business to open up a tailoring business.” (CKM)

“I had some knowledge and skills in making Malay traditional cakes and biscuits that I learned from my mum. First I started making those goodies for my family, who said they liked them, so it became my hobby. I tried making a few extra to offer to my neighbours. They said they were good, so I tried selling them from house to house in my neighbourhood. Eventually I thought this would be a good idea for a business.” (ZA)

What these findings and analysis suggest is that these rural women moved into self-employment as part of their strategy, as women with little formal business education for getting into business ownership. Their move into business ownership was achieved by building their business ventures up from their unpaid domestic skills or even their hobbies. As the owner of a tailoring shop described her situation before start-up:

“I was a housewife, staying at home looking after my children and the house. During my spare time I made clothes for my children. Sometimes my friends asked me to make their ‘baju kurung’ (Malay dress) and paid me for the service. I used to think of sewing as part of my domestic chores and as a hobby. But eventually...I realised it could be turned into a business venture.” (CKM)

Socialization

Social learning theory recognizes the importance of the upbringing process (socialization) and provides an explanation for entrepreneurship. Those whose parents or relatives are involved in business, it is argued, socialize in a way which nurtures their entrepreneurial tendencies (Salleh Hj Din,1997:45). Several studies (Litvak & Manse,1971; Hisrich & Brush,1985; Ronstadt,1984; Blythe,1989) suggest that family and friends serve as role models for aspiring entrepreneurs. Living alongside their parents who are in business and working alongside them may provide early experiences for those women to gain opportunities to develop the behaviours that would later be built into the process of developing their entrepreneurial skills. One respondent, talked about her relationship with her family who are also in business:

“My parents, my husband and my brother are business people. I became interested because when I had time after school I used to watch and help them with their business activities. After I finished school I worked with my brother in the rubber sheet trade. They gave me confidence and support and they always say ... you must have confidence...” (AMN)

Another respondent explained that she gained some skills and knowledge about her business from her husband:

“My husband had some experience working on a duck farm ... so I had some knowledge about the nature of this business from him ... he taught me some of his skills especially the rearing of the ducks and the marketing procedure.” (NAAZ)

It is clear that living with and helping parents or spouses who are in business stimulates and enhances the individual's characteristics which are critical to entrepreneurial behaviour such as determination and self-confidence. Several respondents mentioned this:

“I had some experience and knowledge of managing sundry stores through my husband who works in a supermarket called Depo Pernas Edar in Alor Setar. I used to observe his determination and confidence to succeed. He gave me words of encouragement too...so I learned a lot from him about running the shop and building up my self-confidence.” (SH)

“I lived with my sisters before I got married, and they are businesswomen. So I used to help them with their daily ‘business activities’. While watching, I learned and began to imitate my sister's character and behaviour. They used to encourage me and eventually I realized I really wanted to set up a business of my own and have confidence and be successful like them.” (LD)

From the sociological point of view, there is evidence in this study to suggest the importance of role models influencing the entrepreneurial behaviour of the Malay rural businesswomen. This suggests that the successful businesswomen in this study attribute their success in part to the values learned in early childhood or adolescence. The encouragement, skills and nurturing provided by their parents, siblings and close friends appear to have had an influence on their decision to set up in business on their own. Only a few of the respondents, however, believe that the socialization process did not influence their business activities, as the following two quotes show:

“None of my family members are business people. My husband is only a farmer. I was a full time housewife. But before I got married I worked in a school canteen. I got paid for work as a cleaner. However, I became interested in business after I was married when I was in my late 30s. This is when I registered as a participant in the AIM Project.” (HA)

“My interest in business began after I got married. My parents are not in business. I used to go to the Sunday Market in the village and saw a few women doing business. My family had no influence whatsoever. With the help of a friend I attended a women's development workshop in the village nearby and I became interested in business and started to make plans to set up my own business.” (FB)

Educational Attainment

The respondents in this study had varying levels of educational background including primary school, secondary school and a religious school. None had a diploma or a degree from a university. The statistics

for their levels of education is shown in the earlier qualitative analysis which shows that 8 respondents had primary education, 12 had lower secondary education, 10 had higher secondary education and one respondent had only religious education. Generally their level of formal education attainment is very low, but a few businesswomen claimed that school was a factor influencing their decision to become entrepreneurs. Two of the respondents explained that the subject of Commerce provided them with some background knowledge which was useful later for their business:

“At school, I learned a bit about the economy and commerce but it gave me some awareness and awakened my interest in the basics about business.” (MD)

When asked how their level of education had contributed to their decision to start a business venture, some respondents said they could not see how school had contributed to their going into business. None of them said that formal business education had been the reason for starting a business, though a few that pointed out that their education had only provided them with basic skills reading, writing and maths.

“I don’t really have a formal education in entrepreneurship or any training but I went to school until secondary level, and I learned to count, to read and even write business letters. But most of all I learned from watching and helping my husband with his business and then attended workshops to get more knowledge book-keeping, marketing and the handling of perishable goods.” (NMI)

“My highest educational attainment is only at primary level. I began to be interested in this bakery business after marriage and gain some knowledge and business skills from , an agency which does workshops on business which I was able to attend.” (RH)

It can be argued here that women in this category are ‘pushed’ into entrepreneurial activity for lack of other business opportunities. Moving on from this argument, the combination of individual needs and experience was generally not enough to lead these women into starting up a business enterprise. In each case there are other events and external factors that catapulted the women into initiating a business venture. As described by Shapero (1984), there is an event that either pushed a person away from one situation into entrepreneurship or pulled a person into the entrepreneurial arena. It is obvious that there are different explanations and characters for who is in the ‘push’ group and who in the ‘pull’ group, but it is important to note this finding in relation to the literature on poorly educated women, rather than to put all the women into the same category.

This study indicated that women set up a business venture for a variety of reasons. In some cases, there is little real choice and business ownership is a last resort because it is impossible to obtain paid employment in the labour market because of a lack of good academic qualifications and because they need flexible working hours to fit in with their family commitments. According to my analysis of the data from these Malay businesswomen, starting a business is often seen as a means whereby an income can be obtained in a manner compatible with other obligations.

Three of the respondents said the main reason they ventured into business was because of the opportunities it offered. The respondents explained their reasons:

“Yes, there are things that motivated me, my ambition, I have some skills already and most important the opportunity is there, the AIM Project (for financial help) and I see that there is a demand for the products. So you see, I believe I should seize the opportunities on offer.” (AA)

“I started my business way back in July 1993 because I realized then that demand for my product was high...there isn’t any other producer in the vicinity. So I decided to take this situation as an opportunity to produce on a bigger scale and not to wait any longer.” (PM)

“What really triggered my decision to start right away was because I noticed an increase in demand and interest in fashion in the Malay women in my community so I assumed that this would be an opportunity and that it would be a good market.” (RH)

As expected, the study revealed that unemployment is the most common factor that motivates the women to start up a business, followed by the financial reward (to earn extra income), and the flexibility to work while also fulfilling domestic responsibilities and to improve the quality of family life or get out of poverty. As can be seen, the most dominant motivating factor for going into business for these Malay rural women is the economic factor. The majority of the women were housewives prior to start-up so getting a job and earning extra income is the dominant motive for going into self-employment, although there may well also be other motivating factors.

Historically, entrepreneurship was not a traditionally popular Malay occupation of that earlier generation as most Malays then were engaged in agriculture-based occupations, while those who were slightly more educated chose to go into teaching or the civil service. The majority of the respondents clearly expressed that flexible working hours are also why they chose to be self-employed. They expressed their concern about their domestic duties and childcare responsibilities, and self-employments meant they could choose where to set up their business premises. ‘In a typical rural setting, young Malay women are told that their primary roles in life are to be wives to their husbands and a mother to their children’ (Strange,1978).

The ‘multiple role’ played by these businesswomen in their daily lives comes to the surface through the narratives in this study, and I would suggest that their multiple identity roles impel them to seek to empower themselves in a number of different ways. I define empowerment here as the woman’s ability to improve herself physically and spiritually and to be involved in creating income for herself and for the family and to increase their social participation within their community. More importantly, these women indicate that their businesses have given them financial independence. Their involvement in running businesses is empowering because it allows them to gain control over their physical wellbeing and achieve greater economic independence. To explain the phenomenon, I went back to some of the interview data and narratives:

“My social life has been great. I met new friends, too. We usually had our meetings in the AIM headquarters as most of us are in this project. So we exchange ideas and discuss our problems and we feel we have a bit of freedom. Actually before I got involved in business I was always at home... Now I have some spare cash to spend, too.”(BM)

“...I don’t regret getting involved in the hard work of being in business ...in fact by doing this I gain some autonomy and freedom...to spend my own money, because all this while I have depended on my husband’s income.” (AJ)

“...my life has changed greatly. I have more friends now, I have learned to be more sociable, and I attend social activities in my community, go shopping, and buy new dresses. I feel healthier, and sometimes I go for a facial. You get lots of exercise working and this is probably good for me too.” (FB)

Most social activities participated in by some of the women take place outside the home. For the purpose of analysis, social activities will be focused on in the businesswomen’s involvement in their local committees and their involvement in development activities in their local community, which are a form of empowerment for them. Although not many women have the chance to hold office, many are directly involved with Amanah Ikhtiar Malaysia activities. I obtained the following narratives:

“I have been with the Amanah Ikhtiar Malaysia project for quite some time. I am the treasurer at my centre, so I feel great holding this position and getting involved with other social activities too...” (AA)

“... well I feel great and happy with my life now, making new friends and being involved in some of the community social activities... I believe that since I got into business the local committee comes to me for advice and I feel more respected.” (RH)

“... I manage to improve my family’s quality of life - everyone is happy now. I have many acquaintances now, my friends have become my customers, my social life is interesting and lively now, and I have been elected to the committee for the local community women’s group and I feel great...” (NAA)

In the above narratives it is important to note that through their active participation, either as an ordinary member or as an office bearer, they believe that their voices can be heard and that they are of service to other women. These findings are consistent with studies of self-employed rural women from the SEWA movement in India. It suggests that once a women takes the step of becoming involved in local social activities she ‘yearns for more’ to improve her living conditions, to broadening her knowledge and become more confident in taking further steps towards improving life for her family and herself and perhaps setting up in business, as exemplified by the following two women:

“One thing I learned is that every Malay rural woman needs to get more knowledge in whatever field, whether in business or in home care, in family care, in improving your life....anything. So women, especially in rural areas like Pendang, should not just daydream, they have to go out and see the world, learn. This is what I have gained by going into business...” (RS)

“Well...at the beginning my aspirations and vision about going into business were about providing extra income and lessening my husband’s burden. But now I realize that I can go further, but I need the family’s support too. My aspiration is of course to expand and diversify the business to a wider market with bigger networks.”(RH)

The findings from this study shed some light on the businesses of the women entrepreneurs in the rural area. As discussed earlier, a strong combination of push and pull factors influenced the women entrepreneurs’ involvement in business. Since most of the women who entered the business world did so from a need to contribute to the family income, and not simply out of personal interest, it was only fair that they should get support in running the business from their husbands and children

iii. Push and Pull Factors

In addition to personal factors which were previously assumed to be the starting point, and having an idea for creating a business venture, there are factors that ‘pull and push’ an individual towards business ownership. The positive displacement factors which push the individual towards business ownership include the positive influence of reward (income received), the availability of financial support, opportunities of resources, demand for the product and the rural entrepreneurship development programme (Amanah Ikhtiar Project). The negative displacement factors that pull the individual towards business ownership include the spouse’s income being insufficient to support the family, obligations to support parents and siblings and the need to raise the family’s standard of living.

Besides these factors, it has been argued in this study that another precipitating factor is the religious factor (in this case the teachings of Islam) and the influence of other critical agents, such as the individual triggering factor influencing these women to set up a business venture. However, it is suggested that the impetus for creating a business venture is a combination of both push and pull factors together with the religious factor which forms a person's aspirations in line with culturally imparted religious values.

3. Formulating A Model of The Process of Women's Entry Into Business Ownership

This study has shown that women's entry into business ownership is a process, in accordance to Shapiro and Sokol's (1983) argument that the process of change in an individual life path can be described in terms of vectors, directed forces that keep the individual moving in a given direction at any given time. The great majority of individuals are held on a given path by the sum of the vectors in their lives: a job, family situations, and the powerful force of inertia, the daily pushes and pulls that make up individual lives. It takes a powerful drive in a new direction or the accumulation of many detracting forces before an individual is pushed into or consciously opts for a major change of life path.

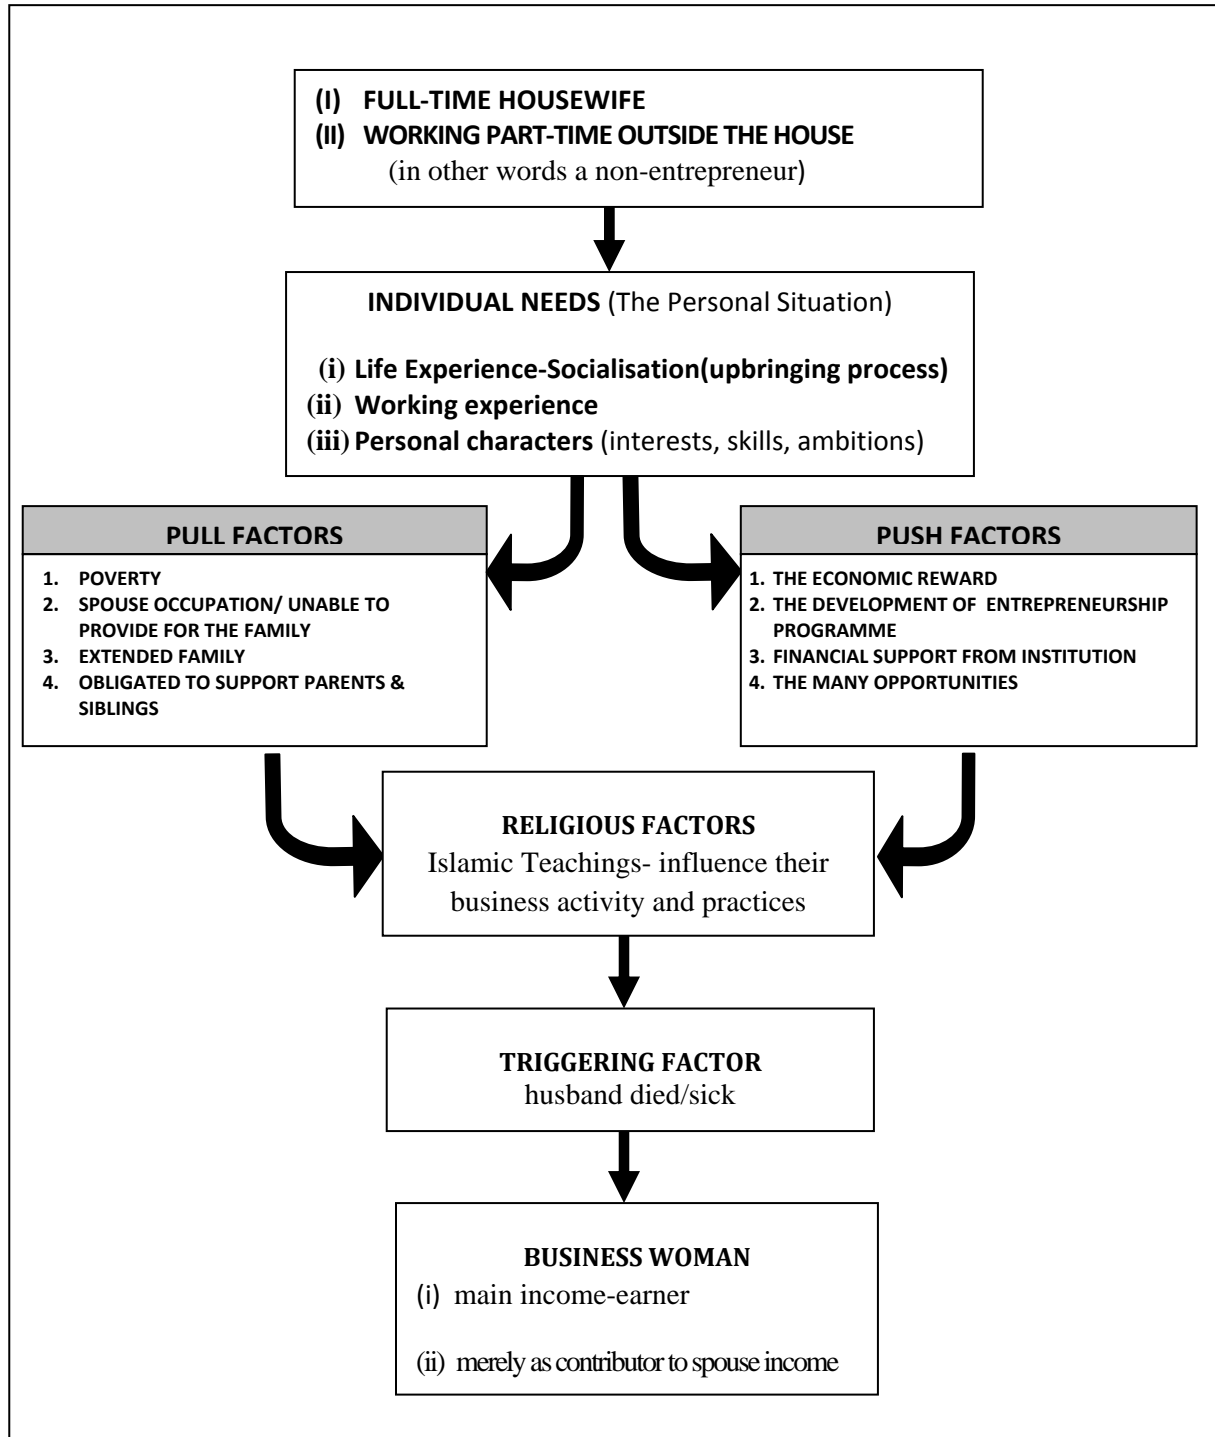

The thesis recognizes that the process of starting a business is highly interactive, a combination of many factors which include individual factors, antecedent factors, individual needs, cultural and environmental factors to motivate the would-be entrepreneur. Entrepreneurship development may be viewed as the process of acquiring the necessary knowledge, skills and attributes to undertake a systematic, high-risk business venture for economic viability and profitability. The findings were conceptualized into a model that illustrates the process of movement in creating a business venture. This innovative finding would fit within the broader effort of feminist scholarship to decentre the experience of white, Western, upper-middle class, urban women by expanding the field to include the experiences and understandings of groups of women outside these conventional categories.

This study supports previous research from the Western background on women business owners, which found that socio-economic factors have a strong influence on the decision to create a business venture. The findings of the study revealed that this group of Malay rural businesswomen is 'pulled' into self-employment and that the majority were unemployed before start-up. However, unemployment was not the sole determining factor in the self-employment decisions of these women. The 'push' factors, such as economic rewards and interest, were also cited as motivations by the women. However, this study also revealed that religious factors had a particularly strong influence on why they decided to become self employed businesswomen.

My analysis of the experiences of the businesswomen under study found that their faith, the teachings, values and beliefs of Islam, had directly or indirectly encouraged and persuaded them to go into business. Their religion provided practical legislation for proper business conduct, so a Muslim who decides to go into business has no reason to be apprehensive as long as they abide by the guidelines provided by the Qur'an. Muslims have faith that having a business and creating wealth through earning '*halal*' income and from their own efforts creates the promise of 'rewards' in the life of the hereafter. My analysis of Malay rural businesswomen's entry into entrepreneurship showed that religious faith and teaching played a vital role in their decision to go into business.

The model shown below displays the various factors that interact with one another and form the significant contributing factors which led the women to start a business venture and finally to become a businesswoman. The cultural factors and triggering factors exert an influence that emerged during the study.

A Model of the Process of Women's Entry into Business Ownership

4. Conclusion

This study challenges the well-established assumption that 'entrepreneurs are born, not made'. It has explored a variety of influences and the findings underline the value of considering business-ownership among women as a social process open to a variety of influences. In light of these findings it is therefore important to elaborate the relevance of the key antecedent influences.

Firstly, I wish to establish that for the women going into business is a form of social mobility, out of employment into self-employment. Almost all the respondents had moved upwards in class before contemplating starting their own business. However, the evidence suggests that the move to self-employment was mainly because they were left with no option but to work hard and to be thrifty and flexible in order to seize every opportunity to improve them and become more resilient and independent.

The study confirms the importance of family influences and life experiences while educational background appeared to play only a minor part. The ideas and ambitions of the entrepreneurs and the formation of their initial motivation were the crystallization of a wide range of influences in their lives, including the socialization process, their working experiences, socio-economic status and their personal characteristics (interests, skills, aspirations, confidence, whether they were a knowledge-seeker or not or a religious person). Acquisition of business ideas can be viewed as an ongoing process developed according to the knowledge of both the individual and the range of social situations she finds herself in. Additionally, I believe that social intervention (government policies, development agencies, etc) contributed to activating the individual towards creating a business venture. The entry of these Malay businesswomen into business can be summarized by the following categories: (i) through interest: a vocation turned into income-generation; (ii) through economic necessity (felt need, personal requirements); (iii) through intervention programmes such as government incentives and entrepreneurial development policies. (the Amanah Ikhtiar Malaysia); (iv) through 'accidental' causes (presentation of an unforeseen opportunity or misfortune); (v) through inheritance, by continuing what their parents started.

Abstract

India has large shortfalls of electric-power generation, and Solar photovoltaic (PV) energy is an alternative energy source that the Ministry for New Energy Sources is promoting to alleviate this problem. Innovation characteristics such as relative advantage, compatibility, complexity, trialability and observability are important determinants in decision makers developing an interest in the innovation. The Directory of Hotels and Resorts in India was used as the sampling frame to draw a representative sample. The data was collected from the Utility Managers of these hotels, using a structured questionnaire. The results show that PV systems are perceived to have relative advantages over conventional systems; they are compatible; they are not seen to be complex systems; trialability and observability of PV systems were made possible through the various demonstration sites. Consequently, it is not surprising that utility managers are highly interested in PV systems.

Key Words: Innovation, Photovoltaics, Renewable Energy

Stream: Sustainability & Inclusive Development

1.0 Introduction

Energy is one of the most important inputs for the economic development of a country because its availability improves the standard of living. India has large shortfalls of electric-power generation, so the Government of India has introduced reforms in the power sector and is encouraging large-scale generation by private sector and joint sector participation. Undoubtedly, there is a shift towards decentralized power generation and private entrepreneurship in power generation.

Solar photovoltaic (PV) energy is one of the special-purpose decentralized forms of power-generating units that the Ministry for New Energy Sources is trying to promote in an attempt to alleviate the power problem in the country. However, the availability of a new technology does not guarantee a high level of interest of the same and, consequently, it is necessary to understand the characteristics of the innovation that influence potential adopters' interest in PV systems.

2.0 Theoretical Background

Rogers (2003) innovation-decision model is used as the theoretical framework for this study. Blackwell, D'Souza, Taghian, Miniard, and Engel (2007) have noted the contribution of Rogers work in relation to the five general characteristics of innovation that could affect its acceptance. These five attributes include *relative advantage, compatibility, complexity, trialability, and observability*. The *relative advantage* of an innovation is defined as "the degree to which an innovation is perceived as being better than the idea it supersedes" (Rogers 2003 p. 229); i.e., it is the extent to which an innovation is perceived as being better than its traditional alternatives. This includes perceptions of relative economic advantage, social prestige or other benefits (Rogers 2003; Brockman & Morgan 1999). Economic advantages of an innovation that lead to improvements in profitability are an important factor that influences the adoption decision of firms (Frambach 1993); e.g., PV systems may be perceived as advantageous because they are less polluting, provide long-term cost advantages or increase self sufficiency.

Compatibility is defined as "the degree to which an innovation is perceived as consistent with the existing values, past experiences and needs of potential adopters" (Rogers 2003 p. 240). It is the extent to which an innovation meshes with personal values, past experiences, goals of the user or with the norms of the social

system (Lovato & Chiasson 2001). There are many individuals and organisations that recognise that PV systems are good for the environment. PV systems are compatible with the values of these individuals and firms. However, in most countries the dominant mode of obtaining energy is through centralised production and distribution via the grid system. This system of producing and distributing electricity is undoubtedly strongly entrenched all over the world. However, PV systems are remarkably different in that they can be designed to fit specific needs. PV systems can be located close to the users of electricity. Conceptually PV systems differ from conventional mode of generating and distributing electricity. Therefore, PV systems may not be compatible with the existing norms of the social system where traditionally people expect their power requirements to be met through the grid system. Frambach (1993, p. 27) has stated that “the more an innovation is compatible with the current situation of a potential adopter and his needs, the lesser are his switching costs and uncertainties, the more probable it is the innovation will be accepted”.

Rogers (2003, p. 257) has defined complexity as “the degree to which an innovation is perceived as relatively difficult to understand and use”. The rate of adoption of an innovation that is perceived to be complex will be slow. According to Brockman (1999) complexity includes factors such as radicalness, disruptiveness, uncertainty and ambiguity. Potential adopters may view PV systems as complex and difficult to use. Adoption of PV systems involves radical changes to the way in which organisations seek to meet their power requirements. PV systems may also be regarded as being disruptive to a firm’s dependence on the grid or diesel generating systems when there is a power shutdown. These factors are likely to slow down the rate of adoption of PV systems.

Trialability is defined as “the degree to which an innovation may be experimented with on a limited basis” (Rogers 2003, p. 258). It is the extent to which the innovation can be experimented with or tried on a limited basis before the adoption decision is made. This enables the potential adopter to understand how the innovation works and to examine the features and benefits that it offers under working conditions. It helps to dispel fears and to reduce the uncertainty associated with the innovation. The initial costs associated with PV systems are high and the nature of the product do not allow for trial and testing of the system by potential adopters. However this can be overcome by the setting up of demonstration projects, which is discussed later.

Observability is defined as “the degree to which the results of an innovation are visible to others” (Rogers 2003, p. 258). An innovation is more likely to be adopted when others can see the results of its performance and its demonstrated success. Observability refers to the visibility of the results and, like trialability, it reduces ambiguity and uncertainty (Brockman & Morgan 1999). The communication of the results assumes importance in increasing its visibility. Once again, in the context of a technology like PV systems, demonstration projects have a role to play in making the results available to those who are interested and to the wider public.

Innovation characteristics such as relative advantage, compatibility, complexity, trialability and observability are important determinants in persuasion or developing an interest in the innovation. They influence the formation of a positive or negative attitude toward the innovation. In this stage the decision maker actively engages in information search, evaluates this information and interprets the information. As the psychological involvement with the innovation grows, characteristics of the innovation such as the relative advantage, compatibility and complexity contribute to an individual’s perception of the innovation. The decision-maker, then, may examine the suitability of the innovation to meet either a present need or a situation that is expected to arise in the future.

There is an element of uncertainty associated with every innovation, which prompts the decision maker to seek information to evaluate the innovation. The individual seeks answers to questions such as: What are the advantages and disadvantages of the innovation? What are the costs and benefits? This information may be available either from secondary sources or from scientific and technical evaluation of the innovation. However, decision-makers tend to be more confident about the information obtained from those who have adopted the innovation and have personal experience with it.

Kaplan (1999, p.470) preferred to call this stage in the innovation-decision process as ‘interest’ rather than ‘persuasion’. He posited that interest is “a state in which potential adopters arrive at some level of affective investment in a technology and are able to express an attitude that a respondent at the knowledge stage cannot”. He considered that potential adopters show more interest in an innovative technology as they acquire and gain more knowledge about the technology.

The adoption and acceptance of PV systems depends on a variety of socio-techno-economic factors (Rubab & Kandpal 1996). The commercialization and the diffusion of photovoltaics in developing countries

such as India is still at the infancy stage. The government has an important role to play in promoting and fostering the adoption of PV technology and the nature and costs associated with the technology do not facilitate 'trial' of the innovation. Therefore, it is necessary to set up demonstration sites where potential adopters can experience the PV technology, conduct trials and observe the results.

Demonstration projects have an important role to play in educating users and the general public about the benefits of PV systems. Demonstration plants are being set up in developing countries as they serve to create awareness. However, their numbers are limited in many of these countries primarily due to lack of awareness about its potential and the current national economic trends. More demonstration sites are needed in different parts of these nations in order for them to significantly raise the level of awareness of PV systems (Adurodija, Asia & Chendo 1998).

Despite the limitations, there have been ongoing efforts to popularise the use of PV systems because of its inherent advantages over diesel generators and its low negative affect on the environment (Adurodija, Asia & Chendo 1998). Recognising the scope and potential for use of PV technology in India, the government undertook various initiatives to develop and promote the use of PVs in the late 1970s. Realising the importance of demonstrating a variety of applications, in 1980 the Government of India embarked on a programme to develop and demonstrate PV applications. This was done with a view to bringing PV technology to a stage of commercial production in the country (Sastry 1997).

Demonstration projects facilitate trials of PVs and provide data for comparison with conventional systems (Nayar 1997, Koner & Dutta, 1998). The publication of these results leads to these projects serving as centres for dissemination of information on PV systems. Similarly, there are a number of projects in developing countries, which are funded by agencies such as the Global Environmental Facility (GEF); they often start as pilot projects and they play an important role in promoting the use of PV systems. The scope of these projects is much wider and they contribute to the upgrading of the domestic PV manufacturing industry. They enhance the delivery and installation infrastructure that is available in the country as they provide technical assistance, technician training and other valuable inputs (Marawanyika 1997). Qualified and trained workers install PV systems. End-users are trained on preventive maintenance. These measures increase the quality of the installation infrastructure (Gope, Aghdasi & Dlamini 1997).

A wide range of PV applications has been used for demonstration purposes in developing countries. Pioneering work following this has led to the adoption of PV as a power source for these applications. A good example of this is the work initiated in 1977 by Mali Aqua Viva (MAV) a Non Government Organization in Mali. They successfully pioneered the introduction of solar pumps, which led to other organisations such as USAID and UNDP adopting PV as a power source for water pumping. In 1987 the government set up a national organisation to coordinate PV pumping and the number of sites using PV pumping has been steadily increasing. Other PV applications that have been successfully integrated into the community include PV lighting systems and PV powered refrigerators which are used in health centres and clinics in Africa (Gope, Aghdasi & Dlamini 1997).

3.0 Research Design

3.1 Questionnaire Design

A combination of extensive literature review, and results of the pre-tests led to the development of the final questionnaire, which was used as the survey instrument in this study. Higher order scales such as interval scales are more powerful than nominal scales. They are more useful since they allow stronger comparison and stronger conclusions to be made. Hence Likert scales (1 = Strongly Disagree to 7 = Strongly Agree) were used to enable respondents to indicate their degree of agreement or disagreement with a series of statements.

Eleven variables were used to measure the innovation characteristics of Photovoltaic Uninterrupted Power Supply Systems. These variables relate to attributes specified by Rogers (2003) — relative advantage (2 items), compatibility (3 items), complexity (4 items) and trialability (2 items). Respondents' perceptions to these attributes were measured using seven point Likert scales. The scale was primarily drawn from Choffray and Lilien's (1978) study on developing an operational model to assess industrial response to marketing strategy.

Further Demonstration sites/projects of PV systems have an important role to play in creating awareness, disseminating information, facilitating trials, providing comparative data and promote the use of PV Systems. These 4 dimensions of demonstration sites were also assessed using the same Likert scale. It is envisaged that for a high tech innovation like PV systems, the characteristics of the innovation along with the

role of demonstration sites are expected to influence the interest of decision makers in these PV systems. Two items measured on the Likert scale assessed the interest of respondents in PV systems.

3.2 Sampling and Data Collection

The Directory of Hotels and Resorts in India was used as the sampling frame as it provided a comprehensive listing of the target population. The hotels were categorized according to their star ratings and adequate care was taken to ensure a representative sample. The sample size is 205. Sampling error and non-sampling errors are two key factors, which affect the overall quality of data (Malhotra 2006). Sampling error is the difference between the result of a sample and the result of a census conducted using identical procedures. It is a statistical fluctuation that occurs because of chance variations in the elements selected for a sample. Sampling errors arise from errors in constructing a sampling frame and selecting a sample. Adequate steps were taken to minimise potential sources of error during the process of data collection.

The target population consists of 769 hotels and as in the case of many industrial products a census approach was feasible since the target population was not very large. The questionnaires were initially administered to the population through mail surveys. The mail survey was administered across all the elements of the target population. However, low response rates (3%) necessitated a change to the adoption of administering the questionnaires through trained interviewers. Stratified random sampling was used to ensure that the sample adequately represented the population. More particularly, the proportional stratified random sample was used to ensure that the number of sampling units drawn from each stratum was in proportion to the relative population size of that stratum. The target population comprises of 769 hotels of different star ratings and these are spread across the country. The sample distribution of these hotels across the four different regions and across the different star ratings are given in Table 1.

TABLE1: SAMPLE DISTRIBUTION OF HOTELS

	North		South		East		West		All India	
	N	(%)	N	(%)	N	(%)	N	(%)	N	(%)
4, 5 star hotels	20	(37%)	12	(22%)	4	(8%)	18	(33%)	55	(27%)
3 star hotels	23	(35%)	18	(29%)	8	(12%)	17	(26%)	65	(32%)
1, 2 star hotels and Govt. Approved Hotels	25	(30%)	23	(27%)	6	(7%)	31	(36%)	85	(41%)
Total	68	(34%)	53	(26%)	18	(9%)	66	(32%)	205	(100%)

In order to ensure randomness of the sample drawn, a computer program called 'Research Randomizer' was used to generate random numbers from the list of hotels in the different regions. The distribution of hotels in the sample has been maintained to be the same as the population distribution of hotels across the four different regions in India. In choosing the stratification variable, Malhotra (2006) recommends that the elements within the stratum should be as homogeneous as possible whereas the elements in the different strata should be as heterogeneous as possible. This criterion has been followed and the star rating of the hotels has been used as the stratification variable. Therefore in selecting the sample for administering the questionnaires through trained interviewers, the process of stratification and randomization was followed in order to minimise sampling errors. Thus, great care was taken to avoid imbalances in the representativeness of the sample. The data was collected by a prestigious market research firm in India in six Indian cities spread across the different regions of the country.

The sample size of 205 was spread across six Indian cities covering the different regions of the country. The data was collected from the Utility Managers of these hotels, using a structured questionnaire, by a prestigious market research firm in India. The results of the descriptive analysis are presented in this paper.

4.0 Results

In terms of relative advantage, the respondents agreed that PV systems have proven advantages over existing systems ($\bar{x} = 4.69$) and are beneficial in the long term ($\bar{x} = 5.02$). The Utility Managers tended to agree that the adoption of PV systems were consistent with the business needs ($\bar{x} = 4.69$), the values and beliefs of their company ($\bar{x} = 4.78$) and had the support from top management of the company ($\bar{x} = 4.49$). Thus PV systems are compatible with the values of these firms.

Managers disagreed that PV systems are difficult to understand ($\bar{x} = 3.53$) and to use ($\bar{x} = 3.63$). They also agreed that skills ($\bar{x} = 4.44$) and training ($\bar{x} = 4.38$) required to adopt PV systems were available. As such they did not perceive PV systems to be complex. Organisations were keen to run some sort of trial of PV systems before committing more resources although they recognized that independent trial of PV systems are not possible ($\bar{x} = 4.18$) and even a small trial of PV systems involve a major financial commitment ($\bar{x} = 4.45$).

This difficulty was overcome by various demonstration projects that facilitated trials of PVs ($\bar{x} = 5.54$), promoted awareness of PVs ($\bar{x} = 5.67$), provide comparative data of PV systems against conventional systems ($\bar{x} = 5.40$), disseminated information ($\bar{x} = 5.42$) and fostered the use of PV systems ($\bar{x} = 5.62$). The initiatives taken by the Indian Government in setting up various demonstration projects around the country made various aspects of PV systems to be observable.

There is evidence to support a high level of interest in PV systems as they indicated that they would like to know more about PV systems ($\bar{x} = 5.69$) and that they are very interested in PV systems ($\bar{x} = 4.98$).

5.0 Conclusion

PV systems are perceived to have relative advantages over conventional systems; they are compatible; they are not seen to be complex systems; trialability and observability of PV systems were made possible through the various demonstration sites. The four dimensions of demonstration sites play a pivotal role in stimulating a high level of interest in PV systems. Consequently, it is not surprising that utility managers are highly interested in PV systems.

A limitation of the study is that it is restricted to the hospitality sector. It will be worthwhile to extend the study to other sectors of the economy as well. Qualitative research will help to provide insights into aspects that have not been picked up by the quantitative findings of this study.

Abstract

Australian federal government policy over the last ten years has renewed the focus on closing the gap between Indigenous and non-Indigenous Australians, targeting chiefly improvements in health and economic participation among Indigenous people. Thus far, however, the results have been mixed, in part because of the endurance of Indigenous socio-economic disadvantage in Australia which cannot be expected to be undone within a matter of years. Failure to deliver better policy outcomes, however, can also be seen as a function of an inflexible policy design, which aims at the mainstreaming of Indigenous communities on non-Indigenous terms, whilst militating against the potential for Indigenous entrepreneurial activities especially in rural and remote regions.

Against this policy background, this paper reports on local entrepreneurial activities by local Yolngu clans in East Arnhem Land in the Northern Territories (NT). In particular, attention is directed to local for-profit and not-for-profit activities by members of the Gumatj clan south of the regional centre of Nhulunbuy and the Rirratjingu operations in the town Yirrkala respectively. The paper describes how the ventures run by the Gumatj and Rirratjingu clans offer pathways for the creation of income, employment and social capital within the respective local communities whilst also being axiomatic in the protection of cultural vitality and integrity. The findings point to the need for more flexible approaches to policy design and delivery, enabling the establishment and growth of Indigenous business activities outside the economic mainstream targeted by federal government policy. As such, the authors echo calls in the literature for policy support for what has been described as the ‘hybrid economy’, which allows for participation in both economic and cultural activities both of which are crucial for Indigenous future well-being as they are for any cultural group.

Introduction

Since white settlement Indigenous Australians have suffered socio-economic disadvantage under the rule of their white colonisers (Attwood, 1989), and to this day rate as the most economically, socially and culturally disadvantaged population segment in Australian society (Steering Committee for the Review of Government Service Provision, 2009). Despite the end of 140 years of so-called protection under the ‘missionary project’ in the 1970s which marked the advent of Indigenous self-determination under the Whitlam Labor government (Markus, 1994) and self-governance in the 1990s (Fletcher, 1994), Indigenous disadvantage still proves pervasive. The last decade saw renewed political interest in ‘closing the gap’ between Indigenous and non-Indigenous Australians.

Under the Howard Coalition government this goal was pursued under the banner of ‘practical reconciliation’ to reduce Indigenous material disadvantage (Altman, 2004), a policy focus that was maintained by the Rudd Labor government from 2007 onwards.

Closing the gap is a political attempt at achieving statistical equality between Indigenous and non-Indigenous Australians in areas such as health, life expectancy, employment and education. While the need for equality is beyond dispute, the closing the gap policy framework is criticized, however, for being neither new nor promising. This is because similar policy initiatives were attempted already under previous governments in the late 1980s (see the Hawke government’s Aboriginal Employment Development Policy) and because policy frameworks such as this have commonly failed to address the causes of Indigenous disadvantage in the past (Altman, 2009; Pholi, Black, and Richards, 2009). One key objective of the closing the gap framework is to halve the Indigenous employment gap within 10 years by way of fostering Indigenous participation in the formal economy. While this approach is purported to afford Indigenous Australians with a choice between mainstream work and welfare, the uptake of mainstream work may not only necessitate migration from home communities it may also run counter to Indigenous cultures, goals and aspirations (Peterson, 2005). Furthermore, especially in remote parts of Australia where Indigenous communities have adapted strategies to blend market engagements with customary practices with the assistance from the now dismantled Community Development Employment Program (CDEP) the current push for normalization under the closing the gap framework has the potential to disrupt local efforts to build economically sustainable and culturally germane livelihoods. Notwithstanding the support of some Indigenous leaders (e.g., Pearson, 2000) for a push towards economic mainstreaming, such attempts are criticized by others for homogenizing cultural diversity through the creation of economic sameness, leaving little room for alternative approaches to Indigenous economic participation (Altman, 2009; Altman and Hinkson, 2010). Statistical equality is thus seen to come at the expense of cultural difference.

Against this policy background and the larger debate about achieving Indigenous equality in Australia this paper reports on two examples of Indigenous entrepreneurship in East Arnhem Land in the Northern Territories, which offer insights into alternative pathways to Indigenous economic participation. The ventures described here are the entrepreneurial activities of two Yulgnu clans operating near the mining town of Nuhlnunbuy which provide opportunities to local community members for economic engagement on Indigenous terms, blending semi-formal employment with customary practices and local traditions. Both cases are treated here as exemplars of what is described as hybrid economy models (Altman, 2007), which overcome the economy-culture dichotomy. The Indigenous entrepreneurship examples lend support to calls for more flexible policy delivery to achieve Indigenous equality and offer prompts for more targeted policy support.

Indigenous Disadvantage and Political Responses

Overall, statistics on disadvantage in Australia compare poorly to the OECD average in light of widening gaps in income, wealth and opportunity (Leigh, 2007; Organisation for Economic Cooperation and Development, 2009a; UNICEF, 2007), affecting particularly the country’s youth (Boese and Scutella, 2006; UNICEF, 2007), its seniors (Organisation for Economic Cooperation and Development, 2009b) as well as people with disabilities (The Physical Disability Council of Australia, 2003) and ethnic minorities (Dawkins, Gregg, and Scutella, 2002). Above all, however, Indigenous Australians rate as the most disadvantaged population group in Australia (Foley, 2003) due to a long history of discrimination, dispossession and ‘protection’, which led to the subjugation as well as social and economic exclusion of Indigenous people (Markus, 1994). While the 1970s saw a policy shift toward self-determination and subsequently reconciliation, Indigenous Australians still face socio-economic disadvantage and discrimination, a situation reflected starkly in the national statistics (Steering Committee for the Review of Government Service Provision, 2009).

Indigenous people only make up only 2.5 per cent of the country’s population, yet as a population group they are overrepresented in the country’s welfare statistics (see Australian Bureau of Statistics and Australian Institute of Health and Welfare, 2008; New South Wales Department of Education and Training and Charles Sturt University, 2009; Steering Committee for the Review of Government Service Provision, 2009). In expounding, Indigenous Australians have a lower life expectancy, dying 10 to 12 years earlier when compared to the rest of the country. They earn just over half the country’s average weekly income, are three times more likely to be unemployed and twice as likely not to complete high school compared to non-Indigenous Australians. Indigenous adults are also twice as likely to suffer from psychological distress and are more than twice as likely to be hospitalized as other Australians. Indigenous people are also overrepresented in the national crime and prison statistics, being 17 times more likely to be arrested, 15 times more likely to be imprisoned and 16 times more likely to die in custody than non-Indigenous Australians. Overall, Indigenous people make up 20 per cent of the prison

population in Australia today. In light of these statistics it seems reasonable to suggest that the political reforms of recent decades have proved ineffective thus far in overcoming the disparities between Indigenous and non-Indigenous Australians and the associated social exclusion and social tensions.

The more recent political attempts at addressing Indigenous disadvantage under the banner of 'closing the gap' focus chiefly on the lack of formal economic participation by Indigenous people, which is seen to be responsible for the low socio-economic status of Indigenous Australians and their comparatively poor health statistics. The political challenge in this regard is seen to be the creation of employment prospects for Indigenous people, especially in rural and remote areas where despite many years of economic boom in the resources sector, Indigenous participation remains low whilst welfare dependence continues to be high (Altman, Gray, and Levitus, 2005; Brereton and Parmenter, 2008). The remote regions of Australia, which this paper focuses on, present a special political challenge due to the unique combination of geographical remoteness, sparse populations and the absence of mainstream employment. In addition, Indigenous land ownership and strong ties to customary life fuel ongoing conflicts between dominant non-Indigenous and Indigenous worldviews in these parts of the country (Altman, 2007). Consequently, mainstreaming attempts of Indigenous communities in remote regions have proven difficult in the past.

Over many years, a high proportion of Indigenous Australians benefited in social and economic terms from participation in CDEP-funded programmes, which were originally designed to provide a bridge between welfare and mainstream employment (Altman and Gray, 2005). The late 1990s saw much political enthusiasm under the federal Howard government to reform Australia's welfare system, focusing also on the CDEP scheme due to the growing perception of its role in the maintenance of Indigenous welfare dependence (Spicer, 1997). Despite evidence of social and economic improvements in the lives of Indigenous people through participation in CDEP-funded projects (Altman and Gray, 2005; Morphy and Sanders, 2002), the fear of ever-expanding demands for welfare support led to a review by government of the welfare system (McClure, 2000), which culminated in the design of a so-called 'new participation framework' under the banner of mutual obligation (Commonwealth of Australia, 2001); this triggered the dismantling of CDEP funding. The aim of this new policy approach was purported to help Indigenous people lessen their reliance on income support and achieve economic self-sufficiency. This objective is to be achieved by way of Indigenous people seeking to improve their chances of obtaining employment, actively looking for work and giving back to the communities that support them (Newman, 1999). This approach, however, raises a series of concerns.

Closing the Gap On Non-Indigenous Terms

There is little disagreement about the role of economic participation in the improvement of people's socio-economic status, their health and well-being per se (Sen, 1999). However, in the Australian Indigenous context, especially in rural and remote parts of the country, there is dispute about the adequacy of mainstreaming attempts targeting Aboriginal people who have strong cultural ties, engage in customary practices and have strong attachments to their land. The government's mainstreaming efforts are driven by a belief that the free market philosophy can succeed in rural and remote Australia and bring about growth and development as experienced across the rest of the country. Such an approach assumes the adequacy of this development blueprint in both geographical and cultural terms. Many years of successive governments attempting to address Indigenous employment, especially in remote Australia, have been unable to raise Indigenous economic participation figures markedly, underscoring the view that universal mainstreaming approaches are ill-suited for communities whose cultural and economic circumstances are very different from those of dominant society. While overall 20 000 new Indigenous public and private sector jobs were created between 2002 and 2007 (Australian Bureau of Statistics, 2008), between 71 000 and 106 000 new jobs would need to be created to meet the policy target of halving the employment gap by 2016 (Biddle, Taylor, and Yap, 2008). Not only is this an ambitious policy goal, it will also be a particular challenge to meet this objective through job creation in rural and remote parts of the country, which explains growing calls for regionally differentiated policy responses to address Indigenous unemployment and disadvantage (Altman, Biddle, and Hunter, 2008).

The closing the gap policy framework aims at so-called 'work readiness', seeking the creation of 'real jobs' for Indigenous people. However, as suggested earlier, finding mainstream employment in remote Australia is limited due to geographic isolation alone. In recognizing the absence of commercial opportunity in remote Indigenous communities, policy-makers promote the idea of people moving to places where such opportunities exist. The consequent uprooting of Indigenous people, as required under this policy approach, is problematic, however, for it requires Indigenous people to leave their ancestral lands in search of mainstream employment. In this regard, their low educational status and economic marginality do not bode well for successful labour migration. In addition,

orthodox forms of employment harbour the risk of undermining ongoing Indigenous involvement in cultural practices and customs due to the inflexibility of the dominant, non-Indigenous approach to paid employment (Altman, 2007). Indigenous economic mainstreaming, as pursued under the closing the gap policy framework, is thus being criticised for driving cultural shifts by way of imposing requirements for geographic dislocation and militating against ongoing cultural engagements. It also risks reducing culture to a matter of “individual choice, the kind of activity people might participate in *after* they have secured an education, a job and a mortgage, as a lifestyle option rather than a form of ontological anchorage” (Altman and Hinkson, 2010: 191 (original emphasis)).

The logic of the market, which the closing the gap framework promulgates, tends to undervalue traditional Indigenous practices and gives little attention to their market and non-market values, which explains a government focus on policy prescriptions that favour non-Indigenous forms of employment. In the face of mounting mainstreaming pressures there is growing recognition, however, of the value of what Altman (2007) describes as hybrid economic activities in Australia’s remote regions, which blend cultural, customary and economic practices, which serve the protection of social, cultural and environmental values whilst also providing economic returns in areas such as land management, health and the arts. Importantly, it is the protection of these socio-cultural values that are seen as instrumental in achieving and maintaining health and well-being (Pholi, et al., 2009) and thus indispensable for closing the gap between Indigenous and non-Indigenous Australia. In this context, the cases reported on in this paper will illustrate further how Indigenous approaches outside policy parameters for Indigenous mainstreaming not only help protect Indigenous values but also offer alternative pathways for Indigenous economic participation, and thus help overcome the culture-economy dichotomy the closing gap approach is seen to create.

Indigenous Entrepreneurship

The dominant policy discourse in Australia over recent years may lead to the erroneous conclusion that entrepreneurial activity is foreign to Indigenous people. Perceptions such as these may also arise in view of the seemingly non-materialistic and collectivist nature of Indigenous lifestyles (Schwab, 1995) as wealth accumulation and private ownership are not necessarily seen by Indigenous people as sources of success or social status in the way they are framed by the dominant, non-Indigenous culture (Altman, 2000). The seeming lack of aspiration for mainstream symbols of success is thus prone to be interpreted as profligacy, fecklessness, laziness or lacking in pride and self-esteem; misperceptions such as these serve to drive social exclusion and vilification (Brenner and Theodore, 2002).

Aboriginal enterprises and entrepreneurial activity, however, have a long tradition. In fact, Aboriginal enterprises are known as some of the world’s oldest recorded business undertakings (Foley, 2011), which dispels the myth that Aboriginal communities can solely be understood in hunter-gatherer terms as is often suggested (e.g., Broome, 1994). East Arnhem Land, for example, which this paper focuses on, provides good historical evidence of the business and trading activities of local Yolngu people, dating back to the 17th century. For hundreds of years there was a flourishing trade between Yolngu and the Macassans from southern Sulawesi, Indonesia of goods such as trepan, sea cucumber and tools (Berndt and Berndt, 1999; Worsely, 1955). In the early years of the 20th century, however, these trading activities were legislated against by the South Australian government, and further commercial and trading restrictions were placed on Aboriginal people by the Australian government; restrictions that were in place until the 1960s (Smith, 2006). In other words, not only have Indigenous Australians a long history of entrepreneurial and enterprising activities, these very activities were suppressed by their colonisers who only in recent decades have been trying to revitalise and stimulate Indigenous economic pursuits.

Despite a discernible void in the literature in the area of Indigenous entrepreneurship in Australia, there is growing interest in, and academic focus on Indigenous entrepreneurship per se, which has been evolving into a discrete area of inquiry (Hindle and Moroz, 2010). Even though definitions of Indigenous entrepreneurship today remain fragmented (Paredo and Anderson, 2006), enterprising activities by Indigenous people are largely perceived as a means of overcoming economic disadvantage and social exclusion (Hindle and Moroz, 2010) and as means of liberation and self-determination (Foley, 2003). In addition, many definitions of Indigenous enterprise highlight the centrality of social and cultural norms relating to Indigeneity (see Dana and Anderson, 2006). Thus, Indigenous entrepreneurship can usefully be understood in terms of pursuing economic opportunity for the purpose of diminishing Indigenous disadvantage through culturally viable and acceptable forms of wealth creation (Hindle and Moroz, 2010). Such understanding of Indigenous entrepreneurship highlights that the generation of profits and income is vital to achieve financial autonomy, while culture, family and community form equally central dimensions of Indigenous enterprise (Hindle and Moroz, 2010; Moylan, 2008). In other words, there is a focus on the delivery

of benefits to Indigenous communities (Lindsay, 2005); yet, these go beyond, albeit important, socio-economic improvements. It is this social orientation evident in Indigenous entrepreneurship that led to theorising about its close alignment to social entrepreneurship (Brueckner, Paulin, Davis, and Chatterjee, 2010; Pearson and Helms, 2010a) which regards social value creation as a measure of entrepreneurial success in contrast to profitability in the conventional entrepreneurial context (Nicholls, 2006). The entrepreneurial activities described below will serve to illustrate further the foregrounding of social, community-focused aspects.

An East Arnhem Land experience

The two cases presented here are based on ongoing research efforts (see Pearson and Helms, 2010a; Pearson and Helms, 2010b; Pearson and Helms, forthcoming) seeking to document and analyse Indigenous entrepreneurial activities in East Arnhem Land. Attention is directed at the work of local Yulgnu people from the Gumatj and Rirratjingu clans near the towns of Nhulunbuy and Yirrkala in the North-East of East Arnhem Land.

The Gumatj operations under the leadership of Galarrway Yunupingu aim at local income and employment generation and the provision of benefits to local community members by way of harnessing local resources and skills and creating partnerships with local and outside organisations. Local hardwood timber represents a relatively abundant local resource found in the tropical savannah forests on traditional Gumatj land in the area. In the face of acute housing shortages and substandard living arrangements for many Yulgnu people living in the area – a persistent problem substantial government spending in recent years was unable to address (Mercer, 2009; Toohey, 2009) – the opportunity was identified to use local timber resources for housing construction whilst providing employment and training opportunities for local Yulgnu. The Gumatj Corporation formed partnerships with Forestry Tasmania, the Architectural Division of the University of Tasmania and Fairbrother Builders and was successful in securing Commonwealth government subsidies through the Jobnet work programme which in conjunction with the receipt of mining royalties provided the needed knowhow and financial capital to commence utilising local timber resources for the purpose of housing construction.

Based on a Memorandum of Understanding between the project partners, Forestry Tasmania staff provided training to local community members and offered instruction in the cutting and processing of timber while the Architectural School of the University of Tasmania Construction made available architectural drawings and milled timber lists for the accommodation to be built by local Yulgnus. Beyond financial support, links to government facilitated logistical support and reductions in red tape, and Fairbrother representatives oversaw building construction. Local hardwoods were cut and processed on site in the forested areas south of Nhulunbuy using a mobile Lucas mill (see Fig. 1). The milled timber was then transported to different locations to commence building construction.

FIG. 1: TIMBER MILLING NEAR GARRATHIYA

Over a period of two years between 2009 and 2010 building projects were completed at the Garrathiya cattle station near Port Bradshaw and in Dhanaya. The buildings at Garrathiya comprised of a bunkhouse to accommodate up to 12 local Yulgnus working at the cattle station as well as an ablution block and a large kitchen area while a 240m² multi-bedroom house was constructed in Dhanaya (see Fig. 2). Both projects were completed on time and within budget at comparatively lower cost to equivalent construction work undertaken by non-Indigenous contractors. Local contractors were used only for plumbing and electrical work.

FIG. 2: BUNK HOUSE AT GARRATHIYA AND LIVING QUARTERS IN DHANAYA

The above housing construction projects were community-based ventures (after Peredo and Chrisman, 2006), that served the purpose of fostering community involvement, skill transfer as well as providing direct and indirect economic benefits. The work was embedded in existing social structures and cultural connections with the country, offering an opportunity for Indigenous people to work on their ancestral lands together with other community members. Involvement in the project thus did not come at cultural expense. In fact, participating Yulgnu people were able to engage in cultural activities such as group hunting, fishing or ceremonial activities, allowing for a blending of customary and commercial activities. Participation in the project also enabled the transfer of technical knowledge, providing local Yulgnu with marketable skills (e.g. timber cutting, milling, construction) which are seen as critical for entry into mainstream employment. The community focus of the projects, that is building much-needed accommodation for clan members, also helped promote a sense of citizenship, sharing and contribution to the community, whilst also fostering participants' personal sense of achievement and self-esteem.

Further projects currently underway aim at building on the approach taken for the housing construction process, using existing low cost infrastructure, local resources and partnerships for local capacity building. In addition to further housing projects undertakings such as furniture making with the support of external craftsmen as well as the planned introduction of a mobile slaughter house for meat production from local cattle grazing operations serve the purpose of widening opportunities for community members to receive marketable skills and gain employment whilst being axiomatic in the improvement of local living conditions (e.g. furniture, low cost nutrition). Instead of risking losing ties to local culture and customs, participants can maintain local traditions and customary practices and at the same time take steps toward more formal economic participation.

The second case reported here describes the entrepreneurial activities of members of the Rirratjingu clan in the town of Yirrkala, located 20 km south of Nhulunbuy. Specifically, the focus here is on the Dudungurr Nursery, a not for profit enterprise which at the time research commenced was part of the local Bunuwal Group overseen by the Rirratjingu Aboriginal Corporation. Since late 2009 efforts have been underway to revitalise the operations of the

Dudungurr Nursery which ceased in years previously following the abolishment of CDEP funding and the dismantling of Landcare. Whilst managed by Gareth Wise - a non-Indigenous ethno-botanist, the nursery is community owned and staffed by local community members. The focal point of the operation is the collection, storage and propagation of native seeds and plants used for landscaping and revegetation work (see Fig. 3). Nursery activities are self-funded through ground maintenance and landscaping contracts with local authorities, businesses and residents as well as through the sale of native plants.

FIG 4: SEED COLLECTION AND LAND REVEGETATION

The nursery provides a platform for community members to become involved in semi-formal economic activities that serve social, cultural, environmental and economic goals. To illustrate, the nursery deliberately ‘overstaffs’ to ensure that a critical mass of workers are present each day, recognising that not all nursery staff will attend work. This practice provides flexibility to nursery workers and eliminates the pressure from a rigid ‘nine-to-five’ work routine by running on ‘Indigenous time’. Therefore, non-attendance merely results in non-payment but not reprimand. This in turn also provides opportunities for attending cultural events or participating in customary practices such as local arts, hunting and fishing. At the same time, the work at the nursery is itself a form of cultural expression. The aims and nature of nursery operations are well aligned with locals’ connections to the land and their sense of custodianship. Plant and seed collection activities also ensure the keeping alive, passing on and recording of local knowledge of native flora which are intrinsically linked to local customs and traditional laws. Traditional healing practices, for example, rely on traditional knowledge about native plants, which places the nursery at the very centre of local culture. In economic terms, nursery work provides a source of income and helps staff acquire technical skills not only in botanical work but also in areas such numeracy and literacy as well as project and time management (e.g. landscaping contracts, plant watering regimes); thus improving local opportunities for mainstream employment.

Staff attending work at the nursery also receive training in managing their financial affairs, receive advice on lifestyle and have access to counselling. The nursery also provides an in-house banking service, which is a voluntary initiative enabling staff to have part of their income quarantined to achieve personal saving goals, to prevent ‘humbugging’ from family and other clan members or to ensure that tea, coffee and food are provided during breaks (smokos) at work, which for many staff are the only regular meals during the week. Upon successful project completion nursery staff also receive rewards in the form of group activities that help build team cohesion and maintain a group focus. These rewards are often structured around customary practices such as camping, hunting and fishing, which also help maintain the connection to the land and traditional practices, especially for the younger generation.

The non-Indigenous management of the nursery enables staff to traverse culturally, exposing them to non-Indigenous ways of working in a culturally safe place. The nursery functions in this regard as a third space enterprise (after Moje et al., 2004), providing a space for crossing between Indigenous and non-Indigenous culture and building a bridge between Indigenous and non-Indigenous knowledges. The sharing of knowledge in this third space creates room for mutual learning. Non-Indigenous ways of knowing are enriched through insights into traditional and cultural knowledge whilst Indigenous exposure to non-Indigenous, economy-relevant ways of knowing offer opportunities for, and increase chances of success in mainstream economic participation.

Whilst non-profit in orientation, the nursery also harbours the potential for growth in commercial terms in that opportunities exist to tap into areas such as tourism, traditional healing, education and bush food, only to mention a few, and efforts are currently underway to explore these options. Noteworthy in this regard is the observation that such an expansion would not compromise the socio-cultural functions of the organisation but instead would serve to increase its capacity to fulfil these roles as they are mutually reinforcing. Fig. 4 provides a summary depiction of the multiple roles and functions of the nursery operations.

FIG. 4: MODEL OF THE DUDUNGURR NURSERY

Discussion and Concluding Comments

The entrepreneurial examples detailed above shed light onto the potential of alternative Indigenous business models, which currently fall outside orthodox mainstreaming attempts. It was shown that the operations of both Gumatj and Rirratjingu clans offer promising pathways for Indigenous economic participation, allowing for culturally safe ways of learning about the non-Indigenous, economic way of life. This approach is in contrast to the dominant policy approach which envisages Indigenous labour migration to places of economic opportunity with all the concomitant risks explored previously. The cases reported here illustrate how economic opportunities were created locally, which eliminated the need to sever local ties to culture and land. These findings are congruent with research pointing to growing evidence of Indigenous hybrid economies in remote Australia where economic and cultural activities were found to coexist and to be blended (Altman, 2007). This blending not only provided livelihood opportunities for participants in these business ventures, it also fostered the provision of social (e.g. provision of housing), cultural (e.g. preservation of botanical knowledge) and environmental services (land management) that are largely unnoticed within the so-called 'real' economy (Pearson, 2000). Therefore, much care should be taken so as not to mandate Indigenous mainstreaming into the 'real' economy by policy decree if the paternalism of the past is not to be repeated (Pholi, et al., 2009) but also to ensure that the *real* value of work already undertaken is accounted for and recognised.

In terms of policy implications, it needs noting also that the two Indigenous ventures described here hinge to varying degrees on skills and expertise external to the respective organisations. Referred to here are skills and an expertise in identifying funding opportunities, grant writing capabilities, capitalising on formal and informal networks or simply being able to temper some of the organisational goals and visions to ensure financial feasibility or compatibility with the rules and customs of the formal economy. While access to these skills currently helps attain the goals of both organisations, they may not be relied upon in the long-term. In other words, there is a vulnerability concerning the longevity of these ventures. This also relates to the question of organisational leadership and the task of keeping visions and aspirations alive. In this regard, current government measures to support Indigenous entrepreneurial activity makes access to assistance dependent on having access to the skills required to meet bureaucratic requirements such as the ability to write business plans and produce cash flow

forecasts (Pearson and Helms, 2010a). As such, targeted policy measures that provide assistance to Indigenous enterprises in overcoming structural impediments for access to funding and operational support may prove effective in fostering both the uptake and survival of Indigenous business ventures. Such an approach may usefully be coupled with measures that help maintain and build the local social capital needed for the creation of business ventures in contrast to attempts that seek the migration of talent to places of economic opportunity away from local Indigenous contexts. (Altman, 2007; Foley, 2008).

This paper described two distinct examples of Indigenous business ventures operating in remote parts of East Arnhem Land. Both operations were shown to facilitate the development of local people and their communities, playing a vital role also in the maintenance of culture and land. The Gumatj operations can be seen as more actively geared towards becoming a fully-fledged business venture – also in non-Indigenous terms – in the medium-term, especially in light of new plans for the production of marketable commodities such as furniture and meat. In contrast, the Rirratjingu nursery venture was found to serve primarily socio-cultural and environmental goals, and while potential for a more active economic engagement exists, the organisation is likely to maintain its customary emphasis. This variety of approaches is indicative of the potential in remote parts of Australia for the establishment of business ventures that not only help meet policy goals for Indigenous economic participation but also serve vital environmental and socio-cultural functions. The East Arnhem Land experience briefly sketched here also underpins the need for policy formats that cater for a variety of different business models some of which may well remain outside the bounds of the formal economy. Rather than viewing these ventures as economically deficient and in need of mainstreaming, reflection is needed on the true values they provide and the true cost their normalisation would entail.

Challenges in the Development of Technological Capabilities: Business Models and Entrepreneurial Culture in Emerging Economies

Universidad de Guadalajara, Mexico

Abstract

Small and medium firms in emerging economies tend not to use technological innovation as a competitive strategy, but rather to passively assimilate technology as embedded in capital goods. However, as these economies become increasingly subject to international competitive pressures, the need for improving technological capabilities increases in many sectors, whereas many conditions in the economic environment are still not conducive to the development of technological capabilities in small firms.

We present here results from a study that uses a database of approximately 400 small and medium enterprises in Mexico, and a set of 35 in-depth interviews dealing with the ways in which entrepreneurs and owners/managers perceive the need for greater technological capabilities, and the process through which they develop them. Results help us identify key managerial and entrepreneurial characteristics associated with the development of technological innovation capabilities in the firm. We also identify characteristics in the business environment that constrain or enhance their chances of success in this endeavor, and discuss policy implications for regional and federal programs that aim to support SME's.

Business Strategy and Technological Capabilities in Emerging Economies

An important fact in describing and understanding the role that technology and innovation play in emerging economies is that firms in them have had to compete in their own domestic markets with multi national corporations and with more mature firms that have been evolving for decades before them. Small and medium enterprises in latecomer economies have had to compete against firms that are way ahead of them in learning and developing business capabilities. Firms in developing countries tend to adapt knowledge that has been developed in industrialised countries to their industrial sectors' absorptive capacity and local market demand (Katz 2001, Mathews 2001, Viotti, 2002), or simply adopt technologies as incorporated in capital goods. In some instances, they even use obsolete machinery that has been discarded from more competitive economies.

Drawing on technology acquired abroad or assimilated from foreign-based firms, local firms imitate, copy, or generate products that are technologically similar to existing ones in developed economies (Katz 2001, Aulakh et al. 2000). Firms adapt such knowledge to local needs, a process which usually does not require cooperation with organisations like universities or banks, or among firms themselves (Kroll and Liefner 2008).

A useful conceptual framework in trying to understand constraints that small firms face when attempting to adapt to new competitive environments can be built on the basis of theoretical advances in the area of business models and business model dynamics (Casadesus-Masanell and Ricart 2010, Morris et al. 2005, Osterwalder et al. 2005). As firms make choices in order to create and capture value, they respond to conditions in their environment that represent opportunities or threats. Whether these decisions correspond to an explicit design or whether they are reactive responses to unforeseen situations, they configure business models that define their strategies in creating and capturing value, the operational architecture they will use to achieve this, and their interaction patterns with other organizations in their environment. Initially, almost every firm will have a period of experimentation, as they learn along the way which strategies and operational

configurations are more conducive to their survival and growth, but as long as they are successful in this task they will tend to stabilize over time, switching their skills from experimentation to exploitation of fruitful operational arrangements.

Once their choices give rise to a specific business model, their strategic and tactical choices are constrained: they cannot easily take advantage of, or in many instances even realize, opportunities that their business model is not well equipped to handle (Casadesus-Masanell and Ricart 2010). As technology and innovation is not usually part of their business model in emerging economies, entrepreneurs and managers in small firms will tend not to consider options in that arena, when faced with competitive pressures. In many instances for example, and particularly in the Mexican case, import substitution policies precisely created a context in which technology was something to be acquired as part of capital goods, instead of being created in-house. However, as markets have been rapidly opened in recent years, such firms have faced competitive pressures they are ill equipped to handle. After decades of operating under business models that did not require endogenous innovation and technology, they have had enormous difficulty in realizing the need for them and, even when they do this, they have had little resources and capital to develop the needed capabilities.

Firms in less-developed economies have also had to compete on the basis of business ecosystems that provide them with lower levels and quality of support from other organizations (Bell and Pavitt 1993, Iammarino et al. 2008). Thus, firms in industrialized nations that come to operate in countries with less developed economies face weak competition, and are able to easily establish technological superiority and market dominance, while endogenous firms face a lack of high-level human resources and technological infrastructure to compete, thus being relegated to compete on the basis of cheap unskilled labour in their products and production processes, and therefore to low value added markets (Katz 2001, Kroll and Liefner 2008).

In this context, firms created in emerging economies tend to seek lower value-added markets in order to survive, and to acquire technology developed abroad (as embodied in capital goods, which are usually obsolete in the countries where they were produced). Financial capital tends to be scarce, and concentrated in few families, so firms are set in a context where survival depends on lower prices, rather than on differentiation and innovation. As has happened in many developing countries (such as Mexico, Brazil and Chile, for example), government policies have tended to be protectionist, resorting at least for some periods to import substitution strategies. In very few cases (such as Korea, China and other newly industrialized countries) have aggressive policies aimed at developing endogenous technological capabilities been implemented.

In this way, firms in emerging economies have had little resources, government support and fertile business environments on the basis of which to compete internationally or even to defend their domestic markets. Technological innovation has therefore been absent from their business practices in most cases, and business education has only been rudimentary and based on trial and error survival tactics. Moreover, previous studies have documented the fact that Mexican firms tend to exhibit a low level of adaptability to changing circumstances, and that cohesiveness of top management teams around founders' centrality in decision making tends to become a strategic liability for them (Greer and Stephens 2001, Athanassiou et al. 2002).

Thus, small firms in Mexico, as very likely in the rest of Latin America, have tended to remain rigidly fixated on old business models and practices, even in light of increasing domestic and international competition. Few of them have embarked in processes that aim to improve their competitiveness. Once the initial stages experimentation and survival give way to a relatively stable operation, they tend to give up searches for better business models and more competitive operating practices, and choose rather to exploit old and well-known routines, as opposed to learning new behaviours (March 1991).

More recently, however, a growing segment of local firms have been able to compete out of low value added markets and into more profitable ones. Whether they have learned along the way (usually across generations), or whether they are founded by entrepreneurs with international-level education and outlook, these firms are beginning to systematically use technological innovation to successfully compete in both domestic and the international markets (Iammarino et al. 2008, Fontes and Coombs 2001, Perez and Soete 1988).

However, in view of the fact that many small firms in western Mexico have shown a lack of capability for change in their strategies and business models, there are several questions that

arise when trying to understand those factors that may influence their ability to learn and to mature towards better practices and be more competitive: How do firms shape their business models, and how do these business models shape the search space in which they seek tactical and operational solutions to the problems they face? Do firms evolve, at least to a significant extent, as a function of firm age? Do they, for example, initiate their existence with very rudimentary business practices and operating systems, and later evolve them into more sophisticated versions, or are their business models and routines imprinted rigidly into their structures and culture, once they are able to survive in the market? Is their ability to evolve into higher order capabilities a function of the entrepreneurial profile of their founder? Do such capabilities evolve as business goals grow more ambitious over time?

Thus, the goal of this study is to search for variables that may account for a firm's propensity to evolve towards international-level practices and systems in order to jump out of the spiraling trap that falling back into low value added markets represents. Understanding of these processes should be useful in improving the overall competitiveness of national economies by guiding policy making; it should also be relevant in pulling more traditional and less competitive industries forward, in order to avoid the gap between traditional and more dynamic sectors within an economy.

Method

As part of our group's consulting and research activities, case studies are systematically conducted and subjected to a diagnostic instrument designed to evaluate the firms' level of development with respect to a set of more than 70 variables. Variables are defined in each case as Guttman scales with 5 levels each.

Variables are grouped by functional area (management, production, commercialization, finance, human resources and organization), and three groups of variables that cut across functional areas: business culture, technological capabilities and exports capabilities. Case study coding for all of these variables is carefully tailored to ensure inter observer reliability: each case study is coded by three independent groups, and those cases where significant discrepancies are found are excluded from the database.

All of the variables are defined in terms of actual practices and behaviours observed in firms, rather than on the basis of normative managerial recommendations, as is usually the case with operational audits. Each variable's lower values reflect those practices used by firms with less experience, technical level and capabilities, while higher levels describe more sophisticated and powerful operating procedures, approaching world class firms' behaviour.

Variables selected for this analysis correspond to theoretically based concepts. Entrepreneurial orientation, for example, is a construct that represents management's proactiveness, goals and strategic outlook (Lumpkin and Dess 1996), which has also been grounded on empirical evidence (Wang 2008, for example). Technological capabilities, as relevant to firms in emerging economies, follow Bell and Pavitt's approach (Bell and Pavitt 1995, Bell and Pavitt 1993), which has also been extensively documented for studies of Latin American firms. The database used has been coded with these constructs in mind. For this analysis a database of 363 small and medium sized firms in Western Mexico were used. Mean age of the firms is 25.15 years, and their mean size is 61.8 employees. Firms included in the database come from different industrial and service sectors, as shown in Table 1. No attempt was made to obtain a stratified sample, since the main constraint in the country is usually the extreme secretiveness of owners and founders of firms, which leads them to refuse to provide access to outsiders. In many instances, this access was obtained mainly on the basis of consulting activities that our group carries out regularly, in order to develop more competitive capabilities in them.

CHEMICAL AND PHARMACEUTICAL	8
SERVICES	82
	n= 363

Thirty five semi structured interviews with higher management in firms (usually their owner/founder) were conducted in order to assess their accounts of how they have come to develop specific business and technological capabilities, and of the way these capabilities relate to their business goals and strategies. Interviews were designed in order to qualitatively assess entrepreneurs' backgrounds, the ways in which they acquired their managerial and technical capabilities, and their business goals and strategies, with the goal of inductively identifying patterns in their origins as entrepreneurs and in their business/ managerial culture.

Thirty five interview transcripts were then coded with the aid of content analysis software (QSR NUD*IST) in order to ascertain the relationships these goals and strategies may have with theoretically based categories, and in order to inductively build new categories that may be more adequate in describing small firm behaviour in emerging economies.

Even though qualitative data is not easy to integrate as scientific evidence, it does help understand the ways in which quantitatively measured variables interact in specific cases, thus providing a better foundation for the comprehension of causal relationships that quantitatively assess (Lee 1991).

Results

In order to quantitatively assess patterns in learning behaviours among firms studied, a subset of variables reflecting processes likely to influence a firm's proclivity to improve their operating systems and procedures toward more competitive levels was selected. Data shows that there are important differences among those variables studied as predictors of overall maturity level (OVALLMAT) that a firm achieves in terms of the set of variables coded for in the database, excluding the values of the variables used as predictors. Table 2 summarizes correlation coefficients for the variables studied.

TABLE 2: CORRELATIONS AMONG BUSINESS CULTURE VARIABLES

	OVALLMAT	FIRMAGE	GOALS	SIZE	ENTREPOR
OVALLMAT	-				
FIRMAGE	0.338	-			
GOALS	0.561	0.126	-		
SIZE	0.308	0.331	0.193	-	
ENTREPOR	0.828	0.251	0.698	0.261	-
IDT	0.841	0.312	0.407	0.298	0.606

Because of the size of the sample, all of the variables selected for this study have a statistically significant ($p < .01$) correlation with overall maturity level (OVALLMAT), which is our dependent variable. However, it is worthwhile noting that the highest correlations with this variable correspond to entrepreneurial orientation (ENTREPOR) and technological capabilities (TECHCAP), while the smallest correlations exist between firm age (FIRMAGE) and management's goals (GOALS) on the one hand, and firm size (SIZE) and GOALS on the other. At first glance, this can be interpreted as a relatively weak relationship between the size of the firm (in terms of number of workers) and its business goals. That is to say, the level of the firm's goals is only weakly correlated to its age or to its size (as measured by its number of workers). Contrary to what could be expected, the correlation between firm age and its overall maturity level is also among the lowest values in the table. That is to say, a firm's overall competitiveness is not merely a function of its age: firms do not necessarily continue to evolve into more advanced practices over time. Also, the relatively low value (0.338) of the correlation between a firm's size and its overall maturity level seems indicate that its competitiveness is not primarily a function of its growth. Although this correlation is significant (as are all of those included in the table simply because of the sample size), its value is smaller than others.

On the other hand, the significantly higher correlation between the overall competitiveness of the firm (OVALLMAT) and its technological capabilities (TECHCAP) calls attention to the close relationship that exists between a firm's level of technological capabilities and its ability to evolve into world class standards. Together with entrepreneurial orientation in the management team (ENTREPOR), technological capabilities in the firm are an important predictor of its competitiveness.

Interviewees' accounts of their entrepreneurial development show qualitative differences in their training and business experience that provide insights into the nature of the processes that account for the associations among the variables described above. More technologically dynamic firms, as compared to less flexible and more traditional firms for example, tend to be founded by technically trained entrepreneurs with experience in large transnational firms or with international-level education. This background provides them with both technical expertise and more competitive business and managerial skills. In what follows, some illustrative responses are reproduced:

How did you acquire the managerial skills necessary in founding and developing your firm?

"First, because of my professional training, and second because of the opportunity I had to work for different major laboratories for many years, where I participated in the development of production processes, new products, marketing; and all of that helped me prepare to start my own business."

A significant difference is also evident when comparing interviewees' accounts of the way in which they have built a successful firm. Such difference has to do with their predisposition

and ability to interact with other organizations and sources of knowledge in order to solve technical problems:

"Well, as far as technological capabilities, we rely on support from (the local public) university and from an external advisor, who helps us in developing synergistic formulations for our products (...) that enable us to use antibiotics that increase the range of effects on the animals and have good results, that helps us a lot (...)"

"(...) commercially we have we have opened distribution channels and tried to go directly to producers, we leverage trade associations such as (...) we also participate in national and local trade exhibitions and conferences (...) and try to reach decision makers, be they veterinarians, farm owners and the like (...)"

Learning and knowledge management are important for technologically dynamic firms, as opposed to more traditional firms. In technologically active firms usually proactive views in this aspect shape decision-making in most functional areas:

"Our administrative manager is continually in training, be it on accounting and fiscal requirements and procedures, in human resource management, and so on (...) the purchasing manager has to deal with raw material imports, dealing with international and local suppliers and needs to participate in updating courses frequently, as well as our sales assistants and production supervisors."

The same is not true, however, for more traditional firms, where personal experience and knowledge of a trade have frequently been the basis of stability for the firm. Patterns in their responses reveal a lack of entrepreneurial orientation, as well as little predisposition towards collaboration with other organizations and development of new skills and capabilities, which usually are the product of the firm's strategic space as defined by its founder:

How did you acquire the managerial skills necessary in founding and developing your firm?

"Well, it is rather the founder's skills. He used to be a physician, but then went on to create the company. He is the one who knows the business. (...) in the technology arena we are obsolete. I know of new, bigger, faster machines that are now used in (printing industry), but we don't have them (...) there haven't been significant changes in the company in a long time (...) No, we do not collaborate with other firms in this or other industries (...) firms should be independent, printing firms should always be independent."

How do you see your firm in five years? In ten years?

"I hope we do get to five years hence, I hope we can continue to operate the same as we are now, at least the same as we are now (...) Ten years? Ten years is even more uncertain, just imagine... 2019 ... if we can get over the present crisis I hope we are doing better."

Thus, interviews show the ways in which variables of interest are related to each other in specific cases, even though the corresponding evidence can only be shown in an illustrative manner. In this last interview fragments, for example, it can be seen that firms where more elementary operating procedures tend to shy away from technology and from interaction with other organizations. This isolation tends in its turn to respond to those characteristics and values that founders imprint in the firms culture (Jones, Macpherson and Thorpe 2010, Schein 1985)

Discussion

It seems surprising that the overall maturity level of a firm is not primarily a function of its age or size, since it can be argued that firms that survive and grow over time would do so mostly because

of their ability to adapt to changes in their environments and to improve on their business models and practices.

The fact that correlation of overall maturity level with technological capabilities is greater than correlation between overall maturity level and entrepreneurial orientation level seems to imply that technological capabilities are a better indicator of overall maturity for the firm than even proactiveness and entrepreneurial capabilities by themselves.

The fact, as well, that business culture variables (such as goals and entrepreneurial orientation) are less correlated than technological capabilities to overall maturity level indicates that a firm's ability to evolve into world class practices and operating systems is more strongly manifested in those organizations in which technology has been adopted as a tool in competitive strategy. That is to say, when incorporated into their business models, technology is likely to represent itself a source of pressures towards further modifying the firm's architecture and operating systems. Technological change represents increasing demands and opportunities for change in the firm's strategic and tactical choices, thus providing a continuous influence in the firm's ability to adapt to external circumstances. This would make sense, as technologies tend to have a short life cycle, and obsolescence is always a looming danger, but also because technological capabilities represent also opportunities for further enhance the firm's ability to create and capture value. Besides that, technological change tends to imply organizational change, at least in the long run. Both processes would tend to push the firm towards continuous experimentation and exploration in its business practices.

It should be evident, however, that a directionality in the causal relationship between technological capabilities and overall maturity level in the firm cannot be established, since both overall competitiveness would lean the firm towards searching for more technological capabilities as it operates in more competitive environments, but the process in the opposite direction seems concomitant as well.

These previous arguments are reinforced by the fact that interviewees provide credible and consistent qualitative accounts of the way in which developing technological capabilities is associated with a different mindset in the case of more technologically dynamic firms. Although not statistically oriented at this stage in our research, this analysis provides evidence of differences in patterns and backgrounds in more traditional firms, as opposed to those that have developed more significant technological capabilities.

The contribution that this study aims to make to the scientific literature, however, rests more on the fact that the correlations documented here call attention to processes that have still not been sufficiently documented in previous studies. More specifically, we aim to contribute to the understanding of those processes that trigger (or fail to do so), firm dynamism and learning in less developed countries. This understanding is all the more important because governments need it in order to devise policies that may improve these processes for firms in them.

The fact that the level of technological capabilities in firms is such a strong predictor of their competitiveness level, for example, should point in the direction of policies and programs that increase incentives for firms to improve their efforts to use technology and innovation as part of their survival and growth strategies. That, by itself, should signal to policy makers that the country, for example, should invest more in science, technology and innovation.

Such knowledge should also be important for practitioners such as business consultants and for entrepreneurs and higher management in firms struggling to gain competitiveness in emerging economies. Perhaps for many of them it would turn out to be too late to attempt to reorient their strategies towards a more technologically solid approach. R&D is a most expensive, though profitable endeavour, and most of them are running out of investment resources, but the alternative is even less attractive.

Strategic Enterprise Management and SEM Product of SAP

Branislav Čík, branislav.cik@sap.com
Michal Greguš ml., michal.gregus.ml@fm.uniba.sk
Faculty of Management, Comenius University in Bratislava, Slovakia

Abstract

Product design, purchasing, production, sales, distribution or service are processes supported by current ERP systems. In some cases human activity was replaced by system decision. One example is automated disposition, when system follows consumption and warehouse status and automatically purchases if needed. Even though it is always possible to improve operational processes, real challenge stays in connecting high level targets with daily operational processes. Current approach in the most companies is far away from ideal. Certainly, not all ideas are possible, it is not feasible to expect from system to manage a company, but it should support data analysis and support of management strategy tools as good as possible. It is exactly this connection of strategy with operational processes that is the main task of SEM (Strategic Enterprise Management).

Introduction

Strategy processes start with an analysis of the environment of the company, continue through the formulation of strategy, go to higher level strategy and then the strategy is broken down to operational processes. Methods of strategic management as benchmarking, scenario analysis, simulation, portfolio analysis, balanced scorecard are in practice commonly used methods. Operational methods as target costing, prognosis, consolidation, budgeting are processes supported frequently by non-integrated systems.

The SEM software product was developed to help to operationalize the high level strategy to specific plans. According to SAP product description the key messages of SEM are:
“SAP Strategic Enterprise Management supports and enables strategic management processes such as strategic planning, resource allocation, risk management, performance management and value communication.
SAP SEM links strategic enterprise management systems with the business execution system (e.g supply chain management / extended financials/ HR) and thus closing the loop. It enables constant improvements of the strategy through ongoing learning.”

Strategy Loop

Contrary to the ‘waterfall’ strategy process, SAP understands strategy as a multi-loop process. Instead of sequential tasks the strategy utilization is split into 3 interactive loops:

1. Strategic planning loop

All loops are starting with external communication. Interests of different stakeholder groups are matched into the high-level strategy definition. Long-term internal strategy is adjusted to expectations won from external communication. The long-term strategy is split to mid-term and the anticipated developments are described in alternatives. One alternative is chosen, out of which specific initiatives are launched. The time will verify the chosen alternative, new expectations and lessons learned will lead to new strategy adjustments.

2. Strategy and business management loop

In the second loop the targets are set for launched initiatives from the first loop. In the next step the forecast is completed for the organizational units of the company. Based on actual figures forecast and the strategy is assessed, if necessary adjusted from ‘bottom’ (actual figures and forecast were the trigger, not new external expectations or strategy definition).

3. Performance management process

The last loop refines the forecast into operative plans and business as usual is executed. If necessary, operations of daily business are adjusted to meet the plan so that performance measurement confirms or tops the plan.

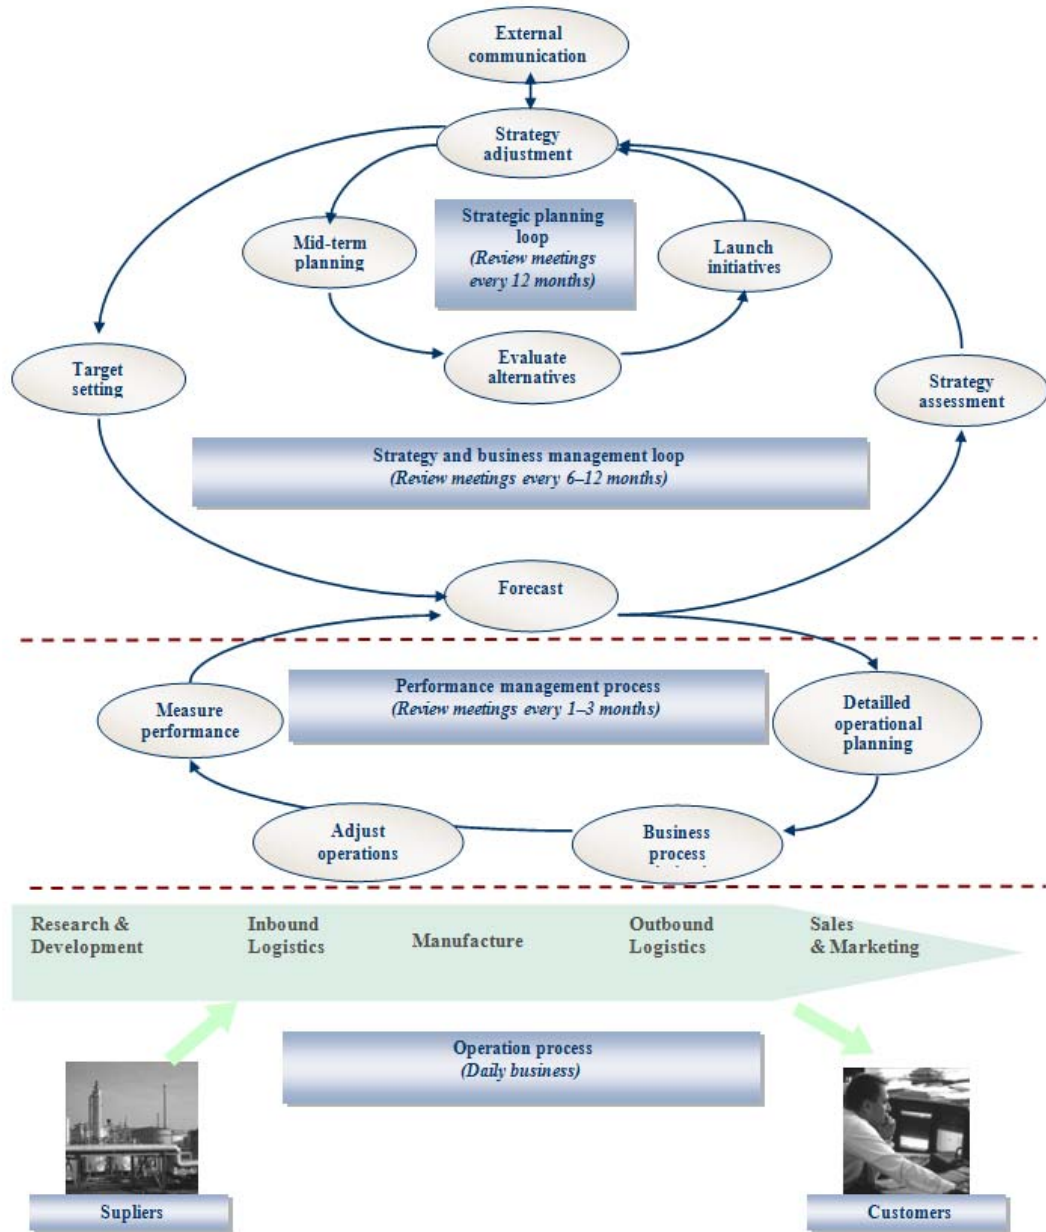

FIG. 1

Component Architecture

The daily business processes are handled by the transaction systems. For example leading ERP (Enterprise Resource Planning) software company SAP offers R/3 (R stands for real time, 3 for third generation) suite, which can provide company backbone in generic areas:

- financials
- controlling
- logistics
- production planning
- human resources

Industry sector specific functionality is delivered by SAP in Add-Ons. For instance handling of insurance or oil products is applicable process in particular industry. Following Add-Ons have been developed by SAP:

- Insurance
- Banking
- Oil&Gas
- Consumer Products
- Aerospace&Defence
- Utilities

Not only operative processes are crucial for the survival. At present day supportive processes as customer care or optimization are critical competitive advantages. SAP delivers in this area product customer relationship management (CRM) and for the optimization of the logistical supply chain APO (Advanced Planner and Optimizer).

The actual data resulting from operational and supportive processes need to be combined together and reported to obtain cross-process analytical information. This role is performed by component of Business Intelligence – Business information warehouse. The data warehouse product fulfills all OLAP (Online Analytical Processing) related requirements.

The Strategic Enterprise Management components are using Business Information Warehouse as its foundation.

SEM Components

The Strategic Management Product (SEM) includes following components:

- Stakeholder Relationship Management
- Corporate Performance Management
- Business Consolidation
- Business Planning

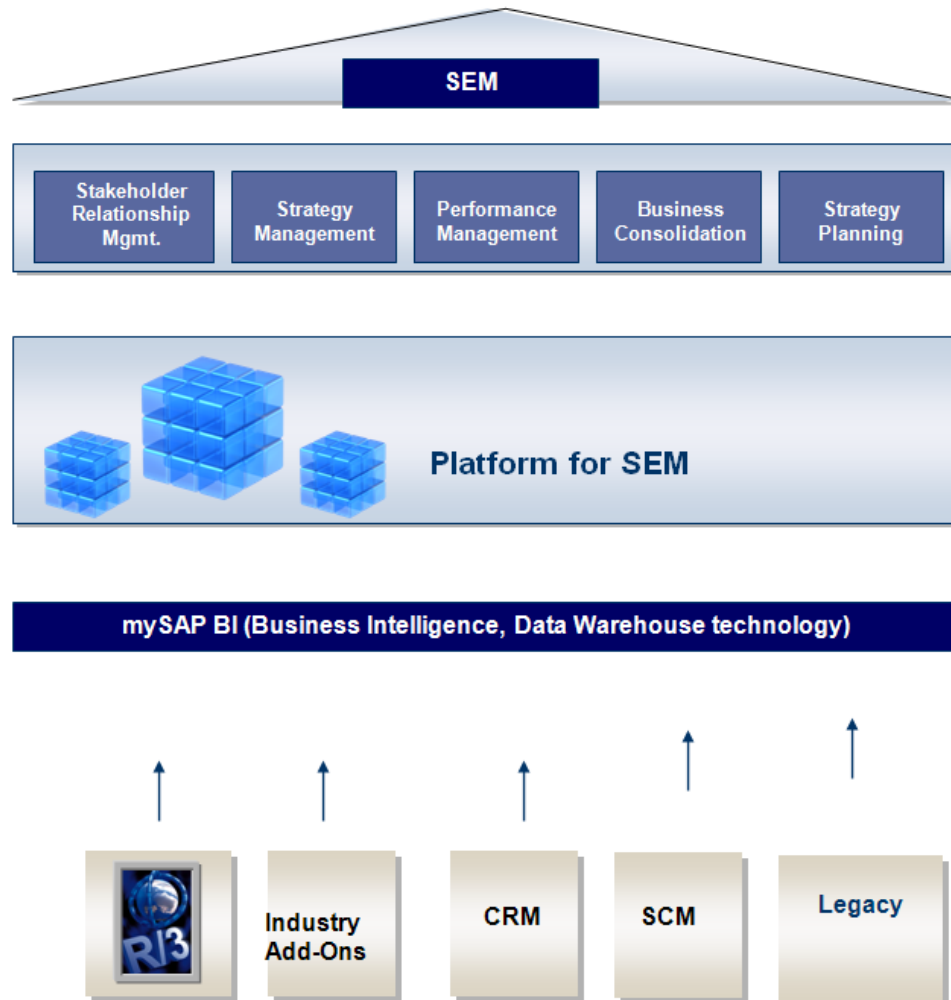

FIG. 2

Stakeholder Relationship Management

This component of SEM supports organization in external communication (first task of the strategy loop) with the interest groups. The SRM allows communicating the strategy to major stakeholders and collecting feedback. Major features are:

- Management of stakeholder relationships
- Integration of Stakeholder into strategic Management Process
- Investor Portal

Today, the long-term success and prevention of hostile takeovers of an enterprise depends increasingly on its ability to establish solid relationships with its related stakeholder groups. Even though the prioritization of the interest groups may vary, no company can afford today to ignore them. High-quality, in long term developed partnerships with the stakeholder groups signifies valuable 'intangible assets'. Fast spread of information via internet

leads to the fact, that even small groups, for instance environmental activists, may influence the capital market's valuation of the enterprise.

SEM-SRM was designed to support the communication of enterprise strategy, current plan data, and strategic initiatives to the predefined stakeholder groups. In some cases the strategy and operative plans may depend on stakeholder expectations – therefore the communication should not be designed in one way only: dialogue should be the aim. Only known expectations could be incorporated into strategic management processes.

The distribution of annual reports or forecasts relied in past on mailing list. SRM supports such old fashioned method, because this technique is still in use. The restricted sharing of information can be solved by internet. World Wide Web pages are a must in corporate world today. The homepage can be identified by any interested person through search engines. SRM assists in collection of contents for stakeholder homepage. In addition, the push technique is represented by e-mail distribute lists.

Not only outgoing e-mails are handled by SRM, also incoming e-mails are processed in order to check if the stakeholder already knows to choose how to react. Specific mailing groups, for example small private investors, can be very large numerically and may imply time and resource consuming care. The SAP offers generic workflow functionality, which can be called by SEM-SRM in order to activate investor relations queries in a workflow process and thus handle them semi-automatically.

The central foundation of SRM is the stakeholder database. In this database contact information related to a stakeholder is stored, categorized and managed. A company can achieve better overview on the investor structure. Categorization of stakeholders improves distribution of group tailored information.

In addition to stakeholder handling, the management of unstructured information is becoming more and more important as the availability and quantity of information exploded by utilization of world wide web. For instance stock prices can be identified on stock exchange web site, the material price on supplier's intranet, market sales volume on analyst page. The problem of strategy relevant data is sourcing and structuring. Business Information Collection (BIC) can help to automate the compilation of structured data, for example key figures from the ERP system, stock prices from commercial database providers via the Internet. The editorial workbench can provide assistance to build the strategy related information database. The handling of the search procedure is supported by administration functionality for the web search engines. The search query is sent to particular search engine in its syntax, received information is indexed and stored on database. The own structured multi dimensional information (for instance sales per period per customer segment) is enriched by unstructured information like market volume or market share of the competitors. Compiled analytical information can be forwarded via mailing list to affected decision makers.

Corporate Performance Management (CPM)

The role of Corporate Performance Management is to provide computer aided balanced scorecard solution (Strategy Management) with additional key performance indicator administration tool (Performance Measurement). Key functionality of both components is:

Strategy Management

- Balanced Scorecard
- Risk Management
- Strategy Templates
- Value Driver Trees
- Value Based Management

Performance Measurement

- Management Cockpit
- Measure Builder
- Measure Catalogs
- Benchmarking

The CPM module of SEM allows collection, description, reporting, visualization, of key performance indicators and their tree-form relations (for Instance Dupont's ROI tree). The key performance indicators may be combined in dimensions of a balanced scorecard. The indicators do not have to be of financial or calculated nature – soft factors like employee satisfaction as an intangible asset can be recorded as well.

The Balanced Scorecard conception developed by Robert S. Kaplan and David P. Norton is a visualization proposal to refine, integrate different aspects and communicate the enterprise strategy. Major aim is to translate high-level figures into operational targets for all levels of the enterprise. SAP solution offers flexible management and visualization of measures in views, cause and impact chains and developed initiatives. SAP SEM has been the first software on the market certified by the Balanced Scorecard Collaboration, which has been established by the founder of the methodology - David Norton.

In addition to balanced scorecard, management 'war-room' concept is supported by CPM module. The Management Cockpit is an ergonomic approach for arrangement and visualizing of key performance indicators. Four walls of an executive meeting room are covered by structured business graphs. The visualization on the walls is achieved via LCD panels connected to computer set up with special graphic capability. The graphs are rendered by a server on basis of actual company figures. The meetings of executive or supervisory board can rely on recent figures presented in decision taking friendly technique. SEM-CPM offers software solution for the Management Cockpit.

The CPM module can unify past actual figures with plan data. Close integration of CPM with Business Planning allows deployment of corresponding plan figures. Variation analysis supports strategy and operations adjustment process.

Business Consolidation (BCS)

The financial flows of international operating companies are spread across multiple entities. The integration of financial flow into global balance-sheet provides BCS (Business Consolidation) component of SEM. Main tasks of SEM BCS are:

- Legal Consolidation
- Management Consolidation

Common accounting rules like IAS, US GAAP, German HGB, Slovak and other local rules can be covered for configurable legal structures. In parallel more precise management consolidation can be executed for user-defined organizational units numerous user-specified organizational hierarchies. Generic monitoring and status management of the involved tasks and high level of automation considerably accelerate the consolidation process.
